The climate is rather warm. The thermometer seldom descends below 64° or 68°. In May it ranges between 72° and 77°, and in June about 80°. Winter is characterised by abundant showers of rain. Sometimes however not a drop of rain falls for nine or ten months, the consequence of which is famine. The prevailing wind is the eastern trade-wind, which blows strongest in autumn. The south-west wind prevails in winter, and the north wind is frequent in summer. Thunder-storms are of rare occurrence. The climate is very healthy, and diseases are rare. The fruit-trees are chiefly the cocoa-nut, bread-fruit, and papaw. The inhabitants also cultivate bananas, plantains, sweet-potatoes, and taro. From the bark of the mulberry-tree they make their garments. The wild cotton is superior to that which is cultivated in some other islands, and the sugar-cane is abundant, large in growth, and of excellent quality. Tobacco is extensively cultivated. There are no animals except hogs and rats. Fish is abundant, and constitutes one of the most common articles of food.

The inhabitants belong to the same race that peopled the Society and Sandwich Islands. Their complexion is of a dark copper. The men vary in height between 4 feet 10 inches and 6 feet, and many of them are said to be remarkable for their symmetrical forms. They

tattoo the body. The inhabitants were formerly reported to be cannibals. The Marquesas are now under the protectorate of France with the exception of Huahine, Raiatea, and Borabora, which were excepted from the protectorate by the convention of June 19, 1847. The total area of the French part of the group is estimated at 508 square miles, and the population at 20,200. The Marquesas are also called the *Mendana Archipelago*, from the discoverer Mendana.

(Cook; Krusenstern; Langsdorf, *Voyages*; *London Geographical Journal*, iii. and vii.)

MARSA'LA, a fortified sea-port town at the western extremity of Sicily, built near the site of the ancient Lilybœum. The ancient port is filled up, but there is good anchorage, sheltered by a small island which lies off the coast, and which is mentioned in the history of the siege of Lilybœum by the Romans. The town was built by the Saracens, and contains about 10,000 inhabitants. It is inclosed by bastioned walls, and contains a cathedral, several convents, a gymnasium, cavalry barracks, and an old castle. The country around produces very good white wine, which is prepared for exportation by English mercantile houses established there, and is known by the name of Marsala. It is exported in large quantities to Malta, and also to England. Other exports are corn, cattle, oil, and salt. There are very few remains of antiquity, except some traces of former aqueducts and tombs scattered about the country.

MARSAN, a subdivision of Gascogne, in France, now included in the department of Landes. Mont de Marsan was its capital. [LANDES.]

MARSEILLE, a sea-port and city in France, capital of the department of Bouches-du-Rhône, is situated on the coast of the Mediterranean, 410 miles in a direct line S.S.E. from Paris, in 43° 17' 4" N. lat., 5° 22' 26" E. long., and had 185,082 inhabitants in the commune according to the census of 1851. The city is connected with Paris by railway through Avignon, Lyon, and Dijon, which is now (Dec. 1854) completed, with the exception of the section between Lyon and Valence.

Marseille was founded about B.C. 600 by the inhabitants of Phocæa, a Greek town which was a member of the Ionian confederation. The Phocæans founded several colonies in the western part of the Mediterranean, of which Massilia, or Massalia, was perhaps the earliest. The leader of the colony, Euxenus, married Petta, daughter of Nanos king of the Segobrigians, a tribe probably of Ligurians, and obtained permission to found a city. (Athenæus, *Δειπνοσοφισταί*, lib. x.; Justin, 'Hist.' c. xliii.)

The new colony was early involved in hostilities with the native tribes, Ligurian and Celtic, over whom the Massilians obtained several victories, and established new settlements along the coasts, in order to retain them in subjection. The surrounding barbarians acquired from the new settlers some of the arts of civilised life: they learned to prune and train the vine, and to plant the olive. The Massilians had also to contend with the power of the Carthaginians (the commercial rivals of the Greeks in western Europe), whom they defeated in a sea-fight of early but uncertain date. The town it is said received a new accession of Greek citizens when the Phocæans finally left their native seat in Asia Minor, to avoid subjugation by the Persians, B.C. 544. (Thucyd., lib. i. c. 13.)

The Massilian constitution was aristocratic; their laws and their religious rites were similar to those of the Ionians of Asia. The worship of the Ephesian Artemis, or Diana, was cherished with peculiar reverence, both in Massilia itself and in its colonies. The governing body was a senate of 600 persons, called Timuchi, who were appointed for life. This senate had fifteen presidents, who formed a sort of committee, by which the ordinary business of the government was managed. Of this committee three persons possessed the chief power. The Timuchi were chosen from among those who had children, and in whose families the right of citizenship had been possessed by three generations. (Strabo, lib. iv.)

The Massilians, like the Phocæans, were a naval people; they had several colonies or posts on the coasts both of Gaul, Spain, and Italy: as Emporium, now Ampurias, in Spain; Rhœ Agatha, now Agde; Tauroeis, or Tauroentium, now Tarente, near La-Ciotat; Antipolis, now Antibes; Olbia, perhaps the port and castle of Leoube, between Hieres and St. Tropez; and Nicæa, now Nice. They early and steadily cultivated an alliance with the Romans. In the civil war of Pompey and Cæsar they embraced the party of the former; and receiving L. Domitius, one of his most zealous partisans, within their walls, and appointing him governor of the city, they closed their gates against Cæsar, under pretence of preserving neutrality (B.C. 49). Cæsar, hastening into Spain against Afranius and Petreius, after building and equipping a squadron with marvellous celerity, left his lieutenant C. Trebonius with three legions to carry on the siege, and appointed D. Brutus to command his fleet. The townsmen were twice defeated at sea during the siege, which continued till Cæsar's return from his victory over the Pompeians in Spain, when they surrendered to him. Cæsar did not reduce them to entire subjection, but left two legions in garrison while he marched forward into Italy. (Cæsar, 'De Bell. Civ.' i. and ii.)

The municipal government of Massilia remained unaltered, but its political independence was virtually overthrown. The attention of the Massilians was now more directed to literature and philosophy, of which indeed they were already diligent cultivators. Their city became

to the west of Europe what Athens was to the east, and the most illustrious of the Roman youth resorted thither. (Cicero, 'Pro. Flacco'; Livy, xxxvii. 54; Tacitus, 'Agricola,' c. 4.)

For more than three centuries the history of Massilia presents no event of interest. In the troubles which followed the abdication of Diocletian and Maximian, the latter (A.D. 310) attempted to resume the purple at Arles, to the prejudice of the emperor Constantine, his son-in-law; but being baffled in his attempt, fled to Massilia, which he vainly attempted to defend. The city surrendered, or was taken by Constantine, and Maximian became his own executioner.

In the reign of Honorius, Massilia repelled the attempt of the Visigothic king Ataulphus to take possession (Photii, 'Biblioth.'): but it afterwards became the prey of Burgundians, Visigoths, and Franks. It was taken from the Franks by Theodoric the Ostrogoth king of Italy. While under the Frankish sceptre the town suffered from the Lombards, who sacked it (A.D. 576), and from the Saracens, who seized it, but were quickly driven from it by the Franks, about the middle of the 8th century. In the division of the empire of Charlemagne among his descendants (856), Marseille was included in the kingdom of Provence, under Charles, younger son of the emperor Lothaire; and afterwards it made part of the kingdom of Provence, or Bourgoigne Cis-jurane, under Boso (879). The union of this kingdom with that of Bourgoigne Trans-jurane under Rudolph II. (930), and the subsequent acquisition of the united kingdoms by the emperor Conrad le Salic (1032), brought Marseille into the condition of a remote dependency of the German empire. During these changes, from the 10th century Marseille was under the immediate dominion of its own viscounts.

The Marseillois appear to have been actively engaged in the Crusades; and in the third Crusade, several armaments sailed from their port. The commerce of the town at this time was great, and the townsmen were in league with some of the great trading cities of Italy for the purposes of trade or of defence. In the beginning of the 13th century they freed themselves from feudal subjection to their viscounts and to the counts of Provence, and organised themselves into a municipal republic, under a chief magistrate called the podestat; but in a few years they were deprived of many of their privileges by Charles of Anjou, count of Provence, brother of Louis IX. It was from Marseille that Charles set sail for the conquest of Naples.

In the year 1421 Marseille was taken by the king of Aragon, and a considerable part of it sacked and burned. Upon the retreat of the Aragonese (1423), it was further plundered by marauders from the surrounding country. The town recovered however from this severe blow, and became the ordinary residence of René, duke of Anjou and Lorraine, who died here in 1480. Upon the death of Charles, count of Maine, successor of René, Marseille came directly under the government of the French crown, to which it has ever since remained subject.

The Constable De Bourbon at the head of an army of Imperialists besieged Marseille (1524), but was bravely repelled by the townsmen. In the year 1536 the town was again unsuccessfully attacked by the Imperialists under Charles V. in person and the Duke of Alba. In the reign of Louis XIV. the municipal privileges of the city were diminished, and forts were built, as much probably to control the townsmen as to defend the place. In 1720, 40,000 or 50,000 of the inhabitants were swept away by pestilence. Belzunce, bishop of Marseille, the municipal officers of the town, and three physicians of Montpellier, distinguished themselves by the courageous performance of their duties at this trying season. In the first French revolution a band of political fanatics went to Paris, and were among the leaders in the attack on the Tuileries, in August 1792. The townsmen attempted, but in vain, to support by an insurrection the Girondists against the party of the Mountain.

The city of Marseille is built on the coast of the Mediterranean, which here runs north and south. The harbour is formed by a small inlet of the sea, running eastward into the very heart of the city, which is built round it. Its immediate site is a rich valley or hollow inclosed on the land side by hills, of which the highest is that of Notre-Dame de la Garde, on the south, surmounted by a fort. From the summit of the hill of Viste, on the north side of the town, over which the road from Paris leads, 3 miles distant, a fine view is obtained of the town and of the numerous country houses (said to be 6000 or 6000 in number) which occupy the surrounding part of the valley. The town was once fortified, and there are some remains of its walls and bastions. The entrance from Paris is by a fine broad planted road or wide street, called 'Le-Cours,' which extends into the heart of the town, and is prolonged in a direct line, by a street of less width, quite through the town. To the east of this street is the old town, occupying a triangular point north of the harbour. The principal streets in the old town are the Rue Sainte-Marthe and the Grande Rue, which traverse it from east to west. These are cut nearly at right angles by the streets Belzunce, Négrel, and de-l'Évêché, and a number of others. All these streets are narrow, and on each side rise rows of very high and massively built houses. There are several large and regular squares in the old town, of which the principal are the Place Neuve, and those called des Grands-Carmes, du Palais, de Luiche, de Jauguin, de l'Observance, and La Place-Vivauz.

West of the Cours lies the new town, which consists of broad straight streets, provided with paved foot-paths and lined with high well-built houses. The street of Aix traverses the new town from north to south, and abuts on the Place Castellane. It is elegantly built and above a mile long. But the finest street in the new town is the Rue Cannabiere, combining great width with elegance of structure, and commanding a view of the harbour, the shipping, and the hills behind. A quarter of the town, inclosed by canals cut from the harbour, and called 'quartier-du-canal,' consists of well-built streets, the lines of which intersect in a well-built square. The squares of the new town are all regularly built and tastefully ornamented; in the principal are the Place Royale, and those of St-Feréol, Monthion, du Grand Théâtre, and de la Port-de-Rome. The port, an oval of more than half a mile long and about a quarter of a mile broad, and capable of containing 1200 vessels, is surrounded by fine quays. There are several promenades, the finest of which are the Esplanade of Tourrette, on the shore in the old town, and the Boulevard des Dames. The course, which connects the streets of Aix and Rome, also forms a fine central promenade: it is bordered with trees and ornamented with fountains and lined with elegantly constructed houses. The town-hall, built by the architect Puget, faces the harbour; the ground-floor is used as the exchange; the great council-chamber has some fine paintings. A new exchange was commenced in 1852. There are a new market-house supported by thirty-two columns of the Tuscan order, a fish-market, and other markets; a lazaretto on the shore, north of the city, one of the finest and best managed in the world. There are also a mint; two theatres, the chief of them one of the finest in France: a splendid hospital; a triumphal arch, a column, and several handsome public fountains. Water is brought from the little rivers Huveaune and Jarret by an aqueduct almost entirely subterranean, and recently an aqueduct (one of the most stupendous works of the kind in the world) has been constructed to convey the water of the Durance to the city. A notice of this aqueduct is given in the article BOUCHES-DU-RHÔNE. Many houses have wells.

Marseille is the third city in France for population, being exceeded only by Paris and Lyon. It has always depended for its prosperity on commerce. The harbour is perfectly safe. A lighthouse on Planier Island (43° 11' 54" N. lat., 5° 13' 59" E. long.) and buoys mark the approach from the south to the harbour, which is frequented by vessels of all nations. Opposite the mouth of it, which is narrow, not permitting the entry of more than one ship at a time, are the three small islands of If (having a castle, once used as a state prison, and numerous batteries), Ratonneau, and Pomègue, which are both fortified. The islands of Pomègue and Ratonneau are connected by a dyke, or break-water, so as to form, with the addition of a jetty, a quarantine harbour for vessels coming from places suspected of contagion. This harbour is called Port-Dieu-Donné; its shores are lined with quays and ship-building yards, and it is altogether a busy place, which bids fair to become of great importance. The entrance to the port is defended by the cross-fire of two forts: Fort St-Jéan on the north, and Fort St-Nicholas on the south. Very extensive docks for the accommodation of shipping have been recently constructed.

The port is liable to be filled by the mud brought down by the rain from the neighbouring hills, but dredging machines are continually at work to keep it clear. Frigates enter with difficulty; ships of the line anchor in the road between the islands of Ratonneau and Pomègue, near the quarantine harbour. This anchorage is secure. The total number of vessels that entered and left the port in 1852 amounted to 15,366, measuring 1,672,323 tons, and worked by 133,960 men. Six screw-steamers ply regularly to Liverpool; two screw-steam companies trade with Italy; a steam company trades to Morocco and Spain, another with Algérie, and another employs its vessels in the coasting trade. The trade of Marseille has greatly increased since the conquest of Algérie by the French. The French trade with the Levant is entirely carried on from the port of Marseille. The imports are of raw cotton, sugar, coffee, dye-woods, corn, coal, linen, thread, manufactured goods, hides, wool, tallow, timber, colonial products, &c. The exports are of wines, brandy, corn, dried fruits, perfumery, oil, soap, hosiery, damask and other linens, woollens, silks, leather, madder, hides, and colonial produce. In 1843 the imports and exports amounted in value to about 8,000,000*l.* sterling each. The customs duties of the port in the same year amounted to 1,200,000*l.* sterling. Since 1848 the trade has more than doubled.

The chief manufactures are soap, marocco and other leather, glass, porcelain, hats, caps, starch, gunpowder, snuff, alum, sulphur, vitriol, nitre and other chemicals, glue, wax-candles, straw-hats, and cutlery. The refining of sugar and salt; calico-printing; the distillation of brandy, essences, and liqueurs; cork-cutting; and the preparation of anchovies, salt provisions, dried fruits, olives, and wine for exportation, are carried on. The city is, from its commercial character, the resort of foreigners of all nations; and the variety of costume, continual bustle, and medley of languages which this occasions are among the most striking features of the place.

Marseille abounds with hotels and has public baths and handsome coffee-houses. The mistral, a keen, parching, and often tempestuous wind, blights all verdure, and its blasts are interchanged with the scorching rays of an unclouded sun; swarms of gnats infest every

corner night and day, and the scorpion is often found in the houses, occasionally in the beds.

Marseille has a custom-house, a stamp-office, an exchange, and a board of trade; tribunals of first instance and of trade, and a council of Prud'hommes. Among its educational establishments, which are numerous, are an academy of sciences and belles-lettres, an atheneum, a medical society, a school of hydrography of the first-class, an endowed college, a secondary school of medicine, a school of music, a diocesan seminary, and a preparatory theological school. It has also a botanical garden, a school for deaf-mutes, a public library of 50,000 volumes and above 1000 manuscripts, a picture gallery, collections of coins and natural history, and an observatory. The observatory is a large and lofty building, the top of which commands a fine view of the town, the harbour, and the neighbouring country. The ground-floor is occupied by the naval school, the school of geometry, and the school of practical mechanics. Astronomy and navigation are favourite studies at Marseille.

The parish and other Catholic churches and chapels are 20 in number. The Calvinists have a consistorial church and the Jews a consistorial synagogue. There are several hospitals and other charitable institutions. The most ancient church is that of La-Major, which has however been so altered and repaired that it has generally the appearance of a modern edifice. It contains an altar with a bas-relief of the 11th century. The church of the monastery named after St. Viator, who suffered martyrdom here under Diocletian (July 20, 303), and whose remains are here buried, is also an ancient structure, but of no architectural pretensions. The church is the only part left of the monastery. The Carthusian church outside of the town is a fine ecclesiastical edifice, superior to any church in Marseille. There is a new cathedral being built, which promises to be a splendid structure. Beyond a few pieces of ancient sculpture, and the remains of one or two ancient monasteries, Marseille is singularly deficient in external evidence of its remote origin. The hotel occupied by the prefect of the department in the new town is a handsome and elegant edifice, by far the finest civic structure in Marseille.

The diocese of Marseille comprehends the town and its arrondissement. The bishop is a suffragan of the Archbishop of Aix. The see was founded in the third century. The town is the head-quarters of the 9th Military Division, which includes the departments of Basses-Alpes, Vaucluse, Var, and Bouches-du-Rhône. [See SUPPLEMENT.]

MARTIGUES, LES. [BOUCHES-DU-RHÔNE.]

MARTIN, ST., one of the Leaser Antilles, lies to the south of Anguilla, from which island it is separated by a deep channel, about 4 miles wide in the narrowest part. St. Martin is about 12 miles long and of a very irregular shape; its area is about 90 square miles. It contains a great number of rocky hills. The soil of the valleys and plains is sandy, and not very productive; there are no rivers or running streams on the island. The little rain which falls is collected into cisterns. The produce consists of sugar, rum, cotton, tobacco, and cattle. The island also contains some valuable salt-ponds.

St. Martin was originally settled by Spaniards, but they abandoned the island in the middle of the 17th century. After this it was held jointly by the French and the Dutch, the former taking the northern and the latter the southern half, which contains the salt-ponds. Marigot, the French town, stands in 18° 4' N. lat., 63° 10' W. long. Philipsburg, on the south-west side, in 18° 1' N. lat., 63° 7' W. long., has a commodious harbour with from 8 to 10 fathoms water. The population of the French part of the island is about 4000, of the Dutch 950.

MARTIN-DE-LONDRES, ST. [HÉRAULT.]

MARTIN-EN-RÉ, ST. [CHARENTE-INFÉRIEURE.]

MARTINIQUE, one of the French West India Islands, the most northern of the Windward Isles, is 10 leagues S.S.E. from Dominica. Its greatest length is 50 miles from north-west to south-east, and the mean breadth is about 16 miles; in form it is very irregular, and its surface is very uneven, being generally occupied by conical-shaped hills. Three mountains of considerable height are visible on approaching the island in any direction; one of these, Mont Pelée, on the north-west side, is an extinct volcano; the summits of the three are mostly covered with clouds. The island contains a great number of streams, and the coast, being indented by numerous bays and inlets, affords many good harbours. There are two towns, St. Pierre and

Port-Royal, both on the west side of the island; the former is in 14° 44' N. lat., 61° 14' W. long., and the latter (which is the capital) in 14° 35' N. lat., 61° 7' W. long. Port-Royal, the residence of the governor, stands on the north side of a deep and well-sheltered bay, protected by a fort which covers the whole surface of a peninsula and commands the town and harbour. During the war and while Martinique was in possession of the English, Port-Royal was the general rendezvous and head-quarters of the fleet stationed in the West Indies. The Diamond Rock, which is about 3 leagues south-south-east from Port-Royal Bay, was taken possession of by the English between the breaking out of the war in 1802 and the capture of the island in 1810, and was commissioned and rated as a sloop of war in the British navy. St. Pierre is an open roadstead, affording very indifferent shelter to shipping, but it is the principal place of trade in the island, and is said to be the handsomest town in the West Indies. It consists of three spacious streets parallel to the beach, and several transverse streets. Streams of water are conveyed through the principal streets, and impart a degree of freshness to the air most desirable in so warm a climate.

The population of the island, including liberated slaves, on Jan. 2, 1848, numbered 120,179, thus distributed:—The town and commune of St. Pierre, 20,360; Port-Royal, or as it is otherwise called, Fort-de-France, 12,611; and the remainder among the other 21 communes of the island.

The chief products of the island are sugar, molasses, and rum. Other products are coffee, cotton, cacao, and cloves. The quantity of sugar exported from Martinique to France in 1848 was 19,731,392 kilogrammes; in 1849, 18,391,600 kilos.; in 1850, 14,242,200 kilos.; in 1851, 19,715,530 kilos.; and in the first six months of 1852, 15,829,633 kilos. The island is subject to earthquakes and yellow fever, and often makes great ravages among the population.

Martinique, the native name of which is said to have been Madiana, was discovered by the Spaniards in 1493; colonised by the French in 1635; taken by the English in 1762, and again in 1794 and 1810; and restored finally to France in 1814. Its original inhabitants were Caribs, of which race there is none left on the island. [See SUPPLEMENT.]

MARTLEY, Worcestershire, a village and the seat of a Poor-Law Union in the parish of Martley, is situated near the left bank of the river Teme, in 52° 14' N. lat., 2° 21' W. long., distant 8 miles N.W. by W. from Worcester, and 118 miles N.W. by W. from London. The population of the parish in 1851 was 1309. The living is a rectory in the archdeaconry and diocese of Worcester. The church, which is of the 13th century, has a good painted east window. There are National schools, in which are incorporated an old foundation for a boys school, and one founded about a century ago for girls. Martley Poor-Law Union contains 28 parishes and townships, with an area of 50,731 acres, and a population in 1851 of 13,791.

MARTOCK. [SOMERSETSHIRE.]

MARTOS. [JÆRN.]

MARVEJOLS. [LOZÈRE.]

MARWAR. [HINDUSTAN.]

MARYBOROUGH, Ireland, the chief town of Queen's County, is situated on the Triogue, a tributary of the Barrow, in 53° 2' N. lat., 7° 18' W. long., 51½ miles S.W. by W. from Dublin by road, and 50½ miles by the Great Southern and Western railway. The population of the town in 1851 was 2079, besides 55 in the hospital, 223 in the lunatic asylum, and 278 in the jail. The town consists of a long irregular street on the Dublin and Limerick road, with several branches on both sides. It contains a neat church erected in 1803, a Roman Catholic chapel, three chapels for Dissenters, and two National schools. In the town are the county court house, the jail, the infirmary, a large infantry barrack, a bridewell, and a fever hospital. The Lunatic Asylum for Longford, Westmeath, King's County, and Queen's County, is a spacious and handsome building, standing in a well-planted inclosure of 22 acres. The assizes are held in the town, as are also quarter and petty sessions. Fairs are held eight times a year. The market-day is Thursday. In the centre of the town are the remains of an ancient castle. The town was named after Queen Mary, in whose reign the county was formed.

MARYLAND, one of the United States of North America, being the most southern of what are known as the Middle States, lies between 38° and 39° 43' N. lat., 75° 3' and 79° 32' W. long. It is bounded E. by the Atlantic Ocean and the state of Delaware, N. by Pennsylvania, W. by a straight line along 79° 32' W. long. from the Pennsylvania boundary to the Potomac, which divides it from Virginia down to 39° 10' N. lat., from which point to Chesapeake Bay it is bounded W. by the Potomac River, which separates it for 320 miles from Virginia, and S. it is bounded by Chesapeake Bay and the state of Virginia. The area is about 11,000 square miles. The total population in 1850 was 583,034, or 53 to the square mile. The federal representative population according to the Census of 1850 was 546,886, in which number three-fifths of the slaves are included. This, according to the present ratio of representation, entitles the state to send six representatives to Congress. To the Senate, like each of the other United States, Maryland sends two members.

Coast-line, Surface, &c.—The surface of Maryland consists of three great natural divisions, known as the Eastern Shore, the Western Shore, and the Mountainous Country. The Eastern and Western

Shores are divided by Chesapeake Bay and the Susquehanna River. The Eastern Shore, or the country east of Chesapeake Bay, has a level surface as far north as Chester Bay, where it begins to be undulating, and towards the boundary of Pennsylvania isolated hills make their appearance. The soil is generally thin and slender, but tolerably well cultivated. Along the shores both of the Atlantic and Chesapeake Bay marshy tracts of some extent occur. The largest is the Cypress Swamp, which partly belongs to Delaware, and is wooded. It is situated near the northern extremity of Sinepuxent Bay, a shallow arm of the sea, from one to five miles wide and nearly 30 miles long, which is formed by a long narrow stretch of sandy beach, which is a prolongation of the coast of Delaware. The water of this bay is comparatively fresh. Along the eastern side of Chesapeake Bay several indentations occur, forming harbours for vessels of moderate size, as Pocomoke Bay, Fishing Bay, Choptank Bay, and Chester Bay. There are several islands belonging to Maryland in Chesapeake Bay, of which the largest is Kent Island.

The Western Shore, or the country on the western side of Chesapeake Bay, is of the same description as the Eastern Shore, but rather less fertile, its surface being mostly composed of a quartzose sand, without a sufficient quantity of clay to render it productive. But there are some productive tracts of considerable extent, as in the neighbourhood of Annapolis. North of the river Patapsco the country along the Chesapeake Bay is undulating, and possessed of a greater degree of natural fertility. The bays and inlets along the western are not so numerous as those along the eastern shore, but they are more important. The principal are those formed by the Potomac, the Patapsco, on which Baltimore the chief commercial city stands, the Severn, on which Annapolis the capital of Maryland is built, the Bush River, Herring Bay, &c.

About 20 miles from the Western shore the country rises into hills which extend westward to the foot of the Blue Ridge, a part of the Appalachian range, a distance of about 40 miles. In this hilly tract the fertility of the soil varies greatly; the extremes of fertility and sterility are frequently found in a very limited space. The country west of 77° 30' W. long. is mountainous, being traversed from south to north by six or seven of the ranges which compose the Appalachian system. These ranges form long, narrow, steep, and almost parallel ridges of nearly equal height, running in nearly straight lines in a generally north-east and south-west direction. These ridges, as we proceed westward, are the South-East Mountain Ridge, sometimes called Parr's Ridge, which terminates with Sugar-Loaf Mountain on the Potomac; Cotoctin Mountains, crossing the Potomac at the Point of Rocks; South Mountain Ridge, better known as Blue Ridge, which crosses the Potomac at Harper's Ferry; the Kittatiny Ridge, which crosses the Potomac at Hancock; Rugged Mountain Ridge, Wills Mountain Ridge, and in the extreme west the great Alleghany Ridge. The valleys which are inclosed by these ridges are generally wide and fertile; they are from 500 to 800 feet above the level of the sea; and the ranges rise to an elevation of from 2000 to 2500 feet. The mountain district is so extremely irregular in outline, that though it occupies the whole breadth of the state, and is above 100 miles wide at the eastern, and 35 miles wide at the western extremity, it is compressed in the middle to less than three miles; the boundaries of Virginia and Pennsylvania there approaching to within that distance of each other.

Hydrography, Communications, &c.—Chesapeake Bay, which divides Maryland into two parts, belongs, above the mouth of the Potomac, wholly to this state. It is the deepest indentation of the eastern shore of North America between Florida Reef and the Bay of Fundy, and it is one of the finest æstuaries for commercial purposes in the world. From the entrance of the bay to the river Susquehanna is about 180 miles: of this, the lower portion, from the entrance to the mouth of the Potomac, nearly 80 miles, belongs to Virginia; the bay above the Potomac, a length of more than 100 miles, belongs to Maryland. The width of the bay averages 25 miles in its lower, and 10 miles in its upper part. Its area is estimated at 3500 square miles. It receives several important rivers, the chief on the west side being the Potomac and James, with the Susquehanna, Patapsco, Patuxent, Rappahannock, and York, which bring down all the waters from the eastern declivities of the Appalachian Mountain ranges between 37° and 43° N. lat.; it receives on its east side the Elk, Chester, Choptank, Nanticoke, and Pocomoke. It contains numerous good harbours, is generally 9 fathoms deep, and is navigable throughout.

Maryland is well supplied with navigable rivers. The most important is the Potomac, which belongs throughout equally to Maryland and Virginia. It rises within the Appalachian Mountains, with two branches: the northern branch rises in 39° 10' N. lat., on the eastern declivity of the Backbone Range, and runs in a generally north-eastern direction for about 70 miles, forming the boundary between the two states. Twenty miles below Cumberland it is joined by the South Branch, which rises in the centre of Virginia, about 38° 25' N. lat., and runs north-east for above 100 miles in a valley inclosed between the Alleghany and Kittatiny chains, before it unites with the northern branch. After this junction the Potomac flows in an eastern direction through mountain ranges with great rapidity, until it turns south-east, and before it breaks through the Blue Ridge, the most eastern chain of the Appalachian system, is joined from the

south by the Shenandoah, the largest of its affluents, which rises in Virginia, near 38° N. lat., and flows over limestone rocks, in a wide and fertile valley between the Kittatinny and Blue ridges, for about 180 miles. The united stream passes through the Blue Ridge at Harper's Ferry, by a gap which has all the appearance of being the effect of a violent disruption in the continuity of the mountain chain. The river now enters the plain country, through which it flows in a south-east direction, with rather a rapid course: the last falls occur a few miles above Georgetown, 8 miles above Washington, to which place the tide ascends. Below the head of tide-water the Potomac becomes a deep and wide river, and passing Washington and Alexandria, it has a general east-south-east course to Chesapeake Bay, which it enters in 30° N. lat. At its mouth the Potomac is 7 miles across. At the falls above Georgetown it is 10 feet deep, and at Alexandria 18 feet; ships of the line ascend to the Washington navy-yard. Around all the falls canals have been constructed. The whole course of the river exceeds 500 miles: large boats ascend it 50 or 60 miles above Harper's Ferry, and smaller ones much higher. The chief tributaries of the Potomac belonging to Maryland, are the Monocacy River, the Antietam, and Conococheague Creeks.

The *Patapsco*, the second largest river, rises on the eastern border of the hilly country, in 39° 20' N. lat. Its general course varies between south-east and south, and it flows about 100 miles; towards its mouth it becomes a bay, from 2 to 3 miles wide. It is navigable for vessels of 250 tons to Nottingham, 50 miles from its outlet, and boats ascend 14 miles higher, to Queen Anne's Town. The *Patapsco* forms the harbour of Baltimore. This river likewise rises in the eastern portion of the hilly region, north-west of the source of the Patuxent; after a course of about 30 miles in an east-south-east direction, it falls over a ledge of rocks, and before it enters Chesapeake Bay it widens into an estuary 10 or 12 miles in length. Vessels of 600 tons can sail to Fell's Point, the lower harbour of Baltimore, and boats may ascend to Elkridge Landing, 8 miles above Baltimore. On its banks are several extensive mills. The *Susquehanna* river traverses the northern part of Maryland for 15 miles, before it falls into Chesapeake Bay. The tide ascends to Fort Deposit 5 miles from its mouth; above this are falls. The Elk, Chester, Choptank, Nanticoke, and Pocomoke belonging to the Eastern Shore, mostly rise in Delaware, and are navigable for 30 or 40 miles. The *Youghiogheny* is the only Maryland river which does not flow into Chesapeake Bay. It rises in the extreme west of the state, shortly after passes into Pennsylvania, and there unites with the Monongahela, a tributary of the Ohio, which falls into the Mississippi, and empties itself into the Gulf of Mexico.

There are several short canals in the state. Some of the earliest constructed were those out for avoiding the falls and rapids in the upper course of the Potomac, but they have been to a great extent superseded by the Chesapeake and Ohio Canal, extending from Alexandria to Cumberland 191 miles, on the Virginia side of the river, and the Baltimore and Ohio railway. The Chesapeake and Delaware Canal, which is carried across the neck of the Delaware peninsula, and of which about half is in Maryland, is noticed under DELAWARE. Besides these there is the *Susquehanna* and Tide-Water Canal, constructed to assist the navigation of the *Susquehanna*.

The turnpike roads are generally good. Perhaps the most important lines are that from Baltimore to Hagerstown and thence to Cumberland, and the great national road from Cumberland westward. The total length of railway completed in Maryland in 1854 is said to exceed 500 miles: but all the longer lines belong in part to other states. The Baltimore and Ohio railway, running from Baltimore to Wheeling on the Ohio in Virginia 387 miles, belongs in part to Virginia and Ohio as well as to Maryland: it has two branches which belong to Maryland; the Washington 31 miles long, from Relay House, 7 miles S.W. from Baltimore to Washington, and the Frederick branch 3 miles long. This line opens a ready communication between the middle and western states, and is of great commercial importance to both. The Philadelphia, Wilmington, and Baltimore railway, 100 miles long, connects the cities so named; about half its length belongs to this state. The Baltimore and *Susquehanna* line, from Baltimore to York in Pennsylvania, has two-thirds of its extent in Maryland; the Westminster branch, from Relay House to Owings Mills, 7 miles, is wholly in the state. The Newcastle and French Town line, 16 miles long, connects Newcastle in Delaware with French Town in Maryland. The Annapolis and Elk Ridge railway, 21 miles long, belongs throughout to Maryland; it connects the capital with the Baltimore and Ohio railways.

Geology, Mineralogy, &c.—The geological features of Maryland are varied and interesting. Through the western side of the western shore and the eastern part of the mountain district runs a belt of eruptive and metamorphic rocks, from 50 to 100 miles wide, but covered in the centre by a band of uncomformable red-sandstone. The hills included in this series are generally round topped, and seldom rise more than 900 feet above the level of the sea. West of the red-sandstone they rise much higher. The rocks in the eastern part are granite, gneiss, mica, and talcose-schists, serpentine, primary limestone, &c. On the west these rocks are bounded by a narrower belt of the Lower Silurian formation, extending like the hypogene series in a north-east and south-west direction across the state. West of the

Lower Silurian, and following its general outline, is a still narrower belt of Upper Silurian strata; both the series being bent, folded, and fractured in a very remarkable manner. The country west of the Upper Silurian series consists almost entirely of Devonian strata, covered in places by small basins of the Carboniferous formation. The Upper Carboniferous strata, or coal-measures, occur in numerous small detached basins, outlying portions of the great Alleghany coal-field of Ohio, Pennsylvania, &c. These upper carboniferous strata consist of shale, grit, sandstone, limestones, argillaceous iron-ore, and coal, and dip on every side towards the centre of the basin. The north-eastern angle of the state, from the head of Chesapeake Bay, is for the most part occupied by Cretaceous strata, chiefly greensand and marl; but the Cretaceous rocks are to a great extent covered by more recent deposits. The whole of the state east of Chesapeake Bay (except the small portion occupied by the Cretaceous rocks), belongs to the tertiary formation, as does also the level tract along the western shore of the bay.

Maryland is rich in minerals, though they have as yet been only partially rendered available. The first place is claimed by the coal. The area of the coal-fields is estimated at 135 square miles; and the whole thickness of available coal at 45 feet. The coal is of excellent quality, but much of it lying in the midst of a wild forest region the larger part has been left undisturbed, and is likely for a long period to remain so. Iron is also extensively found. Brown hematitic ore, producing iron of excellent quality, occurs on the borders of the primary limestone district. Iron-ore also occurs extensively in the upper carboniferous strata. Titanated iron, which has been worked successfully, occurs in the gneiss rocks of Hartford county. Copper is obtained largely in the new red-sandstone strata. The serpentine rocks yield a large amount of peroxide of chrome, extensively used in the making of dyes and pigments. The primary limestones yield a beautiful saccharoidal marble, in much request for building purposes in Washington and Baltimore; and the conglomerates of the new red-sandstone series are much admired as an ornamental stone.

Climate, Soil, Productions.—The climate is rather mild in the level part of the country; but the winter is severe enough to block up the harbour of Baltimore with ice for some weeks. The range of the thermometer in Baltimore is from 9° to 92°; the mean annual temperature exceeds 53°. In the level and hilly districts the summer heat is modified by sea-breezes; but in the valleys between the mountains it is frequently almost insupportable, and these valleys experience very severe winters. The prevailing winds blow from north-west and south-east. Rain is rather abundant, the mean annual fall amounting to about 40 inches, and it occurs nearly in equal proportions throughout the year. Drought is rare. On the low shores of Chesapeake Bay agues and intermittent fevers are prevalent during summer and autumn. The mountain districts are very healthy.

As has been already mentioned, the soil of the level tracts known as the Eastern and Western Shores is everywhere more or less sandy; but marls, shell-lime, marsh-mud, peat, and other substances used as fertilisers abound, and with careful cultivation render the soil very productive. The valleys between the mountain ridges have an excellent soil; the slopes afford good grazing-ground. Wheat, maize, and tobacco are the staple productions; rye, oats, and barley are grown, and cotton is said to flourish in the southern counties. South of Baltimore a very choice kind of tobacco known as Kitesfoot is grown. The whole country was originally covered with a dense forest, of which a considerable part still remains, composed of a great variety of trees, especially oak, hickory, chestnut, ash, walnut, pine, the cedar, locust, and the tulip-tree, with a great variety of herbaceous plants. Along the coasts of the Atlantic and the adjacent swamps a wild grape grows, the fruit of which yields a pleasant wine. In the upper valleys hemp and flax are produced in considerable quantities. Vegetables of various kinds are abundant. The common fruits of England, as apples, pears, plums, and peaches, succeed in most places, and are of good quality.

The common domestic animals succeed well in Maryland. The forests abound with nuts suitable for fattening hogs, which are suffered to run at liberty in the woods, and when fattened are killed and exported in great quantities. The wild animals have nearly disappeared from the plains, but in the forests on the mountains wolves, bears, and deer are still found. The wild turkey is still seen in the western districts; the land-tortoise is also common. Fish is abundant, especially in the Potomac.

Manufactures, Commerce, &c.—Manufacturing establishments are rather numerous, but chiefly concentrated in the neighbourhood of Baltimore. The principal articles made are iron utensils, woollen and cotton goods, hats, paper, ropes, leather, sugar, and tobacco. Vessels are built at Baltimore and Annapolis.

In commercial importance Maryland ranks fifth or sixth of the states of the Union. The maritime commerce is almost entirely in the hands of the inhabitants of Baltimore; Annapolis and Easton having only a small portion of it. The exports consist of flour, wheat, rye, and Indian corn, flax-seed and flax-seed oil, salt beef and pork, butter, hogs' lard, whisky, lumber, and a considerable quantity of tobacco, which is greatly esteemed in the European market. The imports are colonial merchandise from the West Indies, wines and spirituous liquors, tea and spices, hardware and other manufactured

goods. The value of the imports in the year ending June 1st 1852 was 6,719,986 dollars.

Divisions, Towns, &c.—Maryland is divided into 20 counties. Annapolis is the political capital, but Baltimore is the commercial metropolis, and much the largest and most populous city in the state—ranking indeed in these respects as the third city in the United States. ANNAPOLIS and BALTIMORE are described under their respective titles. There are few other towns with any considerable population; the more important are noticed below: the population is that of 1850:—

Cumberland, the capital of Alleghany county, is situated on the left bank of the Potomac, at the confluence of Wills' Creek, 146 miles W.N.W. from Annapolis: population, 6073. Cumberland is the centre of the Alleghany mining district, and the most populous place in the state except Baltimore. It contains the usual county buildings, a market-house, several churches and schools, two banks, &c. Several of the public buildings are handsome structures. The coal of the district is semi-bituminous, and in considerable demand for ocean steamers. The Baltimore and Ohio railway passes through Cumberland; the great national road leading to the Mississippi commences, and the Chesapeake and Ohio Canal terminates here. Short lines of railway connect the mines with the town. Three newspapers are published here weekly.

Fredericktown, a city, and the capital of Frederick county, is situated on Carroll's Creek, a feeder of the Monocacy, 63 miles W.N.W. from Annapolis: population, 6028. In number of inhabitants Fredericktown ranks third among the cities of Maryland; but in wealth it is inferior only to Baltimore. The city is regularly laid out and well built, and the streets are wide. It contains a court-house, jail, and other county buildings, 17 churches, a college or high school and other institutions belonging to the Roman Catholics, library and scientific institutions, &c. Some of the churches are spacious and handsome, and the court-house is a substantial structure. Fredericktown is the centre of a rich agricultural and mineral district, contains several factories, and has an extensive trade. A branch railway connects it with the Baltimore and Ohio railway. Five newspapers are published here weekly.

Easton, the capital of Talbot county, stands on the Treadhaven Creek, 12 miles above its confluence with the estuary of the Choptank River, and 27 miles S.E. from Annapolis: population, 1413. Easton is a busy place, and contains a neat court-house, 4 churches, and some other public buildings, but is chiefly noticeable as the largest town on the eastern shore. Two newspapers are published here weekly.

Hagerstown, the capital of Washington county, on the right bank of Antietam Creek, 22 miles above its confluence with the Potomac, and 87 miles N.W. from Annapolis: population 3879, of whom 485 were free coloured persons and 183 slaves. The town stands in the midst of a rich agricultural district; is regularly laid out, has broad streets, is well built, and contains a court-house, jail, town-hall, several churches, two banks, &c. Seven weekly newspapers are published here. The town is situated near the border of Pennsylvania, and a short railway, called the Franklin, connects it with the railways of that state. Chester, on the river of the same name; Denton, on the Choptank; Elkton, on the Elk River, near the north-eastern angle of the state; Havre-de-Grace, on the Susquehanna; Port Tobacco, at the head of Tobacco River; Princess Anne, on the Manokin; Rockville, on Rock Creek, a tributary of the Potomac; Snow Hill, on the Pocomoke; Vienna, on the Nanticoke; and Upper Marlborough, on the Patuxent—are places of local consequence, and carry on a considerable trade, but neither of them has a population much exceeding 1000.

Government, &c.—The original constitution of Maryland was adopted in 1776, and subsequently amended more than twenty times. It was superseded by the present constitution, which was framed and adopted in 1851. By the new constitution the suffrage is vested in every free white male citizen of the United States, 21 years of age, who shall have resided in the state one year, and in the place for which he proposes to vote six months preceding the election. The legislature consists of a Senate of 32 members, elected for four years, and a House of Delegates of not less than 65, nor more than 80 (at present 74), members, elected for two years. The governor is elected for four years.

As regards provision for education Maryland is behind many of the states of the Union.

Maryland was first settled as a place of refuge for the persecuted Roman Catholics of England by Lord Baltimore in 1634, when 200 Roman Catholics established themselves at St. Mary's, and the country received the name of Maryland from Henrietta Maria, the wife of Charles I. The number of settlers soon increased, not only by emigration from England, but also by the addition of Nonconformists from New England and Virginia. During the Commonwealth the oppression of the Catholics retarded the growth of Maryland, though it enjoyed a more liberal constitution than the other colonies. In 1699 the seat of government was fixed at Annapolis, where it has ever since remained. Maryland took an active part in the war of independence; and formed one of the 13 original states of the Union. Except during the war with England in 1812, when the British naval forces did considerable mischief to the towns along

Chesapeake Bay, the subsequent history of the state is confined to its internal affairs.

(Kennedy, *History and Statistics of the State of Maryland* (Official Report), 1852; *Seventh Census of the United States* (General Report), 1853; *Statistical Gazetteer of the United States*, 1853; Haakill and Smith, Lippincott, *Gazetteers of the United States*; Ducatel, *Geology of Maryland*; Marcou, *Geological Map of the United States*; *American Almanac*, 1854.)

MARYPORT, Cumberland, a market-town and sea-port, in the parish of Canonby Cross, is situated on the sea coast, at the mouth of the river Ellen, in 54° 42' N. lat., 3° 28' W. long., distant 29 miles S.W. from Carlisle, 311 miles N.W. by N. from London by road, and 328 miles by railway, via Carlisle. The population of the town of Maryport in 1851 was 5698. The living is a perpetual curacy in the archdeaconry and diocese of Carlisle. The town is governed by 13 Trustees, appointed under an Act of Parliament, 4 by the lord of the manor, and 9 by the rate payers.

In the year 1750 there was only one house on the present site of the town of Maryport. The chapel of ease was built in 1760, and enlarged in 1837-38. A very handsome market-house and a new bridewell have been recently erected, and a new harbour formed. There are chapels for English and United Presbyterians, Wesleyan and Primitive Methodists, Independents, Baptists, Quakers, and Roman Catholics; National and British schools; a mechanics institution; a temperance and general reading-room and library; a hall for the Odd Fellows society; and a savings bank. Checks and linens are made. The manufacture of black-lead pencils is carried on. Ship-building and other occupations connected with shipping employ many of the inhabitants. Large quantities of coal and coke are brought to the port and shipped for Ireland. Lime and stone are also exported, and cattle, timber, flax, and iron imported. The number of vessels belonging to the port on December 31st 1853, was 107 of 16,650 tons burden, with 3 steamers of 233 tons. The number of sailing vessels entered at the port during 1853, was—inwards 383, of 32,860 tons; outwards 2703, of 213,888 tons. There is communication by steam-vessel with Liverpool twice a week in summer. The market-day is Friday. Fairs are held on May 28th and November 12th. Numerous visitors resort to Maryport during the summer season.

MARY'S, ST., ISLAND. [AZORES; SCILLY.]

MARY'S, ST., RIVER. [CANADA.]

MARYSVILLE. [CALIFORNIA.]

MAS-D'AGENOIS. [LOT-ET-GARONNE.]

MASCARA. [ALGERIE.]

MASHAM. [YORKSHIRE.]

MASOVIA. [POLAND.]

MASSA, a small duchy on the west coast of Italy, which, with the annexed territory of Carrara, constituted for a long time a sovereign principality under the family of Cibo. It now belongs to the Duke of Modena. [CARRARA.] The territory of Massa extends about 8 miles from the sea-coast to the Alpe Apuana, or mountain group which divides it from the province of Garfagnana. To the south-east Massa borders upon the territory of Pietra Santa, belonging to Tuscany; and on the north-west it adjoins Carrara: its breadth between these two limits hardly exceeds 6 miles. The small river Frigido flows through the territory of Massa from the mountains of Carrara to the sea. The town of Massa is in the lower part of the country, not far from the sea, on the high road from Genoa to Lucca and Pisa. It is surrounded by fine gardens and plantations of fruit-trees. Massa is a neat town: it is the seat of a bishop, whose see comprises the duchies of Massa and Carrara. There are a palace, a cathedral with some good paintings, a town-house, a fine public garden with orange-trees and a handsome marble bridge over the Frigido. It is the residence of the governor, and has a court of appeal for Massa [CARRARA] and Carrara. The town of Massa contains about 7000 inhabitants, who manufacture silk, and trade in marble.

MASSACHUSETTS, one of the United States of North America, lies between 41° 15' and 42° 52' N. lat., 69° 54' and 73° 34' W. long. It is bounded N. by the states of New Hampshire and Vermont; W. by New York; S. by Connecticut and Rhode Island; and S.E. and E. by the Atlantic Ocean. The length from east to west is about 160 miles; the general breadth from north to south is about 50 miles; but at the eastern extremity it expands to 90 miles, while a long narrow tongue of land, known as the Peninsula of Cape Cod, extends nearly 60 miles beyond the mainland, and south of this peninsula lie two islands, Martha's Vineyard and Nantucket, which form a part of Massachusetts. The area of the state is about 7250 square miles; the population in 1850 was 994,514, or 137.17 to the square mile. The inhabitants being all free, the ratio of representation entitles the state to send eleven representatives to Congress. To the Senate, like each of the states of the Union, Massachusetts sends two members.

Coast-line, Surface, &c.—Narraganset Bay, which lies chiefly within the state of RHODE ISLAND, enters by its most north-eastern inlet into Massachusetts, where it receives the Taunton River, the most considerable of all the streams which fall into that bay; the tide ascends this river to Dighton, 8 miles above its mouth. Farther east is Buzzards Bay, a deep indentation stretching in a north-eastern direction into the mainland. From its entrance between Seaconet

Point and the south-western of the Elizabeth Islands, a chain of 16 small islands which stretch in a north-western direction from an elbow of Cape Cod Peninsula to its innermost corner, Buzzard's Bay, is 35 miles long, but it lessens in width from 10 miles to 1 mile. The innermost corner is divided from Cape Cod Bay by an isthmus 5 miles in width. This bay is very much indented by small but serviceable bays on both shores; it is shallow, especially towards its inner part, yet vessels of considerable draught ascend to New Bedford, 16 or 17 miles from its entrance. The shores are low and sandy. On the east of Buzzards Bay begins Cape Cod Peninsula, which first stretches from the mainland, a little north of east, 35 miles, varying in width from 3 to 20 miles: it then changes its direction to north and north-west, for about 30 miles, with a mean width of 2½ miles, and terminates in Cape Cod. The difference in the rise of the tide, south and north of the peninsula, is remarkable. In Buzzards Bay and in Nantucket Bay it rises from 3¼ to 4 feet, and in Cape Cod Bay to 16 feet. Cape Cod Peninsula incloses the southern portion of a large bay, which is generally called Massachusetts Bay, though that name is now limited to the northern portion of it, and the southern, which is inclosed by the peninsula, is called Barnstable Bay, or Cape Cod Bay. This large bay extends northward to Cape Anne in the form of a parallelogram, 55 miles long from south-south-east to north-north-west, and 25 miles in width. From Cape Cod to Cape Anne it is open 44 miles to the Atlantic. It contains the important harbours of Plymouth, Boston, and Salem. North of Cape Anne the shores are somewhat high and rocky.

South of Cape Cod Peninsula are the islands of Nantucket and Martha's Vineyard. Nantucket is about 15 miles long, and 4 miles wide, rises to a very moderate height, and is level. Its sandy soil is almost entirely sterile, and the inhabitants live by fishing. It constitutes, with some smaller islands adjoining it, a separate county, having a population of 8452 in 1850. Martha's Vineyard is about 16 miles long and 8 miles in its greatest breadth: the surface is level and the soil sandy, but productive in some places. Together with some smaller islands lying near it, Martha's Vineyard constitutes Duke's County, which in 1850 contained 4540 inhabitants. The wide bay which is inclosed by these islands on the south, and by Cape Cod Peninsula on the north, is called Nantucket Bay.

The surface of Cape Cod Peninsula consists of two inclined plains, which attain some elevation where they meet. Between Hyannas Harbour and Barnstable, the highest level is about 80 feet above low-water in Nantucket Bay; but on the isthmus which unites the peninsula to the continent, it is only 40 feet. The soil of this tract is sandy and light, and of an inferior quality, but cultivated with great industry. Much of this peninsula however is quite destitute of vegetation. The country along the western side of Buzzards Bay and the shores of Massachusetts Bay is similar in soil. At the back of this level tract is a hilly region, which in the north-eastern districts extends nearly to the shores of the sea, and westward to the valley of the Connecticut River. Its surface is agreeably diversified by hills and depressions. The soil of the valleys is deep and strong, and cultivated with much care. In this part some hills rise to a considerable elevation, the highest, Mount Wachusett, attaining 2021 feet. Hills of smaller elevation extend towards the Connecticut River, but they approach the banks of the river only near Northampton and Hadley. North and south of these places the Connecticut runs through a valley from 2 to 3 miles wide, which is covered by an alluvium of great fertility. West of it the country immediately rises into high hills, which gradually attain the elevation of mountains; Berkshire, the most western district of the state, being traversed from north to south by two continuous ridges of the Green Mountains, called the Hoosic and Taghkanuc ridges, whose more elevated parts are above 3000 feet high: the highest point is the Saddle Mountain 3800 feet. The valleys of this district have a very fertile soil.

Hydrography, Communications.—Massachusetts is in every part well watered; but the streams are valuable rather for agricultural purposes, and as affording abundant mill-power than for navigation. The western and mountainous region is traversed by the *Housatonic*, which rises near the north-western corner of the state, and traverses it by a southern course of nearly 50 miles, when it enters Connecticut; it is a very rapid river and not navigable in Massachusetts. The *Connecticut* enters Massachusetts from New Hampshire, and traverses it by a course of about 70 miles, including its numerous bends. By means of short canals carried round its falls it has been rendered navigable for the whole of its course in Massachusetts. [CONNECTICUT.] No considerable river falls into Massachusetts Bay. *Charles River*, which falls into Boston Harbour, though its whole course does not exceed 30 miles, is navigable for about 8 miles for large boats, the tide flowing up to Dedham. The *Merrimac* rises in New Hampshire on the western declivities of the White Mountains, north of 44° N. lat., and runs nearly due south, 50 miles, when it receives a branch from Winnepiseogee Lake, and then runs for 52 miles south-south-east, till it is met by the Nashua River from the south-south-west. Below the junction with the Nashua, the Merrimac turns east and then north-east for about 40 miles, when it falls into the Atlantic after a course of more than 150 miles. In its natural state the Merrimac opposed great impediments to navigation, but by means of short canals carried round the several falls and rapids, an uninterrupted navigation has

been effected as far up the river as Concord in New Hampshire. The tide ascends to Haverhill, 18 miles from its mouth.

The state possesses several canals, but since the introduction of railways they are comparatively little employed for commercial purposes. The waters of some of them have been rendered available for mill-power. The following are the chief canals: there are numerous short ones for improving the navigation of rivers, &c. The Middlesex Canal begins at Charlestown opposite Boston, and terminates at Chelmsford on the Merrimac; the length is 27 miles. By it the countries on both sides of the Merrimac are united with the town of Boston. The Blackstone Canal extends from Worcester (which is about half way between Boston and the Connecticut River) to Providence in Rhode Island, 47 miles, of which 16 miles are in Rhode Island. The Hampshire and Hampden Canal, 22 miles long, branches off from the Connecticut River at Northampton, and unites with the Farmington Canal at the southern boundary-line of Massachusetts.

Massachusetts was the first state in the Union to adopt the railway; and the railway system is still more complete than in any other state, nearly every place of any importance being now brought into communication with the trading centres of this and the neighbouring states. The whole length of railways in the state at the commencement of 1854 was about 1300 miles. Main lines extend through the state from Boston through Worcester to Albany, and to Troy on the Hudson, placing Massachusetts in connection with the great districts of the lakes and the far west. Others of equal importance extend from Boston and Worcester through the manufacturing and commercial districts into the states of New Hampshire and Maine.

Geology, Mineralogy, &c.—The Green Mountain districts of the western part and the Alleghany districts of the eastern side of the state, comprise rocks of Igneous and Metamorphic formations, including granite, porphyry, gneiss, slates, primitive marble, serpentine, &c. Extending northward from the head of Narraganset Bay is a bed of Upper Carboniferous strata, or coal measures, including a small basin of anthracite coal, which extends into the eastern part of the state of Rhode Island, and is regarded by geologists as "especially remarkable for its geographical position, and the metamorphic phenomena to which it has been subjected at the epoch of the granitic and porphyritic eruptions that gave birth to the chain of the Alleghany." The valley of the Connecticut River where it crosses this state is occupied by strata of new red-sandstone, with intruded copper trap. The peninsula of Cape Cod and the connected islands are of tertiary formation. Both miocene and pliocene strata have been identified in the islands of Martha's Vineyard and Nantucket.

Massachusetts is not rich in minerals, but abounds in valuable building stones, the working of which forms an important branch of the industry of the state. Iron is the mineral most worked. It is found in various parts of the state in the form of bog-iron, and iron pyrites, or sulphuret of iron. Anthracite coal is somewhat extensively obtained west of the Taunton River. Lead mines are worked in the valley of the Connecticut. Plumbago, found at Worcester and Stockbridge, is employed in the manufacture of pencils and crucibles. Some copper is found in the Connecticut valley district. Veins of fibrous gypsum, gypsum in masses, and salt-springs occur in the new red-sandstone district. Kaolin, or porcelain clay, is abundant. Alum is obtained from the white clay of Martha's Vineyard. The granite of Massachusetts is of fine quality; it is largely quarried in many parts of the state, but that obtained in Quincy and its vicinity, being in great request for public buildings, is exported to every Atlantic port. The gneiss also yields an excellent building stone. The primary limestone of Berkshire affords a white marble, which admits of a fine polish, and has been employed in the construction of some of the best known buildings in the Union. Serpentine, suitable for ornamental building purposes, is quarried in Middlefield, Westfield, Newbury, and elsewhere. Slate for roofing is obtained in several places. Peat, available for fuel, occurs in many parts where wood is scarce.

Climate; Productions.—The climate of Massachusetts is less extreme than that of the states lying immediately north of it; yet it is much colder in winter and warmer in summer than the southern districts of Great Britain, though the difference of latitude amounts to about 9 degrees. The extremes of temperature are from 20° below to 100° above zero. The annual mean temperature, as taken at the observatory of Harvard College, deduced from 12 years observations, is 47.24° Fahr. The winter commences about the middle of December and terminates about the middle of March. During winter snow covers the ground and the rivers are frozen hard enough to bear loaded waggons. The spring terminates in the middle of May. The summer is hot, and at the solstice the thermometer frequently rises to 77° every day for a month and more; sometimes it attains in the night 100°; it sometimes descends to 60°, whilst at noon it is 90°. The summer lasts to the beginning of October, when the weather grows rapidly colder. The prevalent winds are from the north-west and north. The north-west wind prevails, except during the summer, when the wind blows mostly from the south or south-west. The annual quantity of rain amounts to more than 40 inches.

As Massachusetts was early settled a greater portion of its surface is cultivated than in most of the other states, and agriculture has been more improved. The farms generally average from 100 to 200 acres. The principal agricultural productions are maize, wheat, oats

rye, potatoes, hops, beans and other vegetables, and pumpkins, which last are used as food for swine and cattle. Forests still cover a considerable portion of the surface. In the plains the white pine grows on a soil consisting of light loam, and the yellow-pine on sand and gravel. The hilly and mountainous country produces oak, walnut, birch, maple, ash, cedar, cherry, and chestnut. In the valleys and on the banks of the rivers there are elm, cherry, maple, and aspen. Some marshy places are covered mostly with white cedar. All the fruit-trees of England are cultivated.

Cattle are of a good size in the mountainous and hilly country west of Connecticut River. Fish abound in the rivers and in the sea. The whale fishery in the sea between Massachusetts and the Great Bank of Newfoundland is still important, though the larger kinds of whales have disappeared. The fishery of cod in Massachusetts Bay and on the banks near Nantucket is very important, as is also that of mackerel.

Manufactures, Commerce, &c.—The manufactures of this state are more considerable than those of any other state of the Union, if its extent and population are considered. The most important branches are the construction of vessels, the manufactures of cotton and woollen goods, of iron, paper, leather, and glass; sperm-oil, candles, and soap; sugar; boots and shoes; rope and cordage; lumber and wooden ware; carriages and railway cars; cutlery; machinery, engines, and agricultural implements and tools; cabinet ware; tobacco and snuff; spirits; straw-bonnets, hats, and all the ordinary articles of domestic use.

The commercial relations of this state with foreign countries and the other states of the Union are extensive and important. The most important articles of export are dried and salt fish, train and spermaceti oils, salted beef, flour, soap, candles, leather, and cotton-goods. The imports consist mostly of colonial goods, brought from the West Indies, as coffee, sugar, molasses, indigo, iron, and hemp, together with the manufactured goods of England, especially silk, linen, and woollen; and iron from Russia and Sweden; a considerable trade is also carried on with China, Brazil, and the West Indies. Massachusetts has a larger import trade than any state of the Union, except New York: in the export trade it is exceeded by New York, Louisiana, and Alabama. The imports for the year ending June 30, 1852, were valued at 33,504,789 dollars. The exports for the same period were valued at 16,546,499 dollars, of which domestic produce amounted to 14,144,001 dollars, and foreign produce to 2,402,498 dollars. The whale, cod, and mackerel fisheries are important branches of the industry of the state.

Divisions, Towns, &c.—Massachusetts is divided into 14 counties. Boston, noticed in a separate article, is the political capital, the commercial metropolis of Massachusetts, and the most important city in the New England states. The following are the other more important towns; the population is that of 1850, but the Census Report does not very clearly distinguish between the population of the towns here called villages, and that of the townships, which in this as in some of the other states, are called 'towns':—

Andover, on the right bank of the Merrimac, 21 miles N. by W. from Boston: population, 6945. The town contains several churches and schools, and is the seat of Andover Theological Seminary, one of the chief theological colleges in the Union. There are considerable manufactories and mills, for which there is abundant water-power. *Barnstable*, on Barnstable Bay, 62 miles S.E. from Boston: population, 4902. It is a busy sea-port town, and the capital of Barnstable county, and contains the usual county buildings, churches, and schools. Most of the inhabitants are connected with the fishing trade. *Cambridge*, population 15,215, and *Charlestown*, population 17,216, two of the largest suburbs of Boston: the places are connected by bridges. They contain many excellent public buildings, manufacturing and commercial establishments, and literary institutions. Cambridge is the seat of Harvard University and observatory; Charlestown of the state prison, and a United States navy yard. At the back of Charlestown is Breed's Hill, better known as Bunker's Hill, the scene of a noted skirmish between the English and American forces in 1775; the site is marked by a granite obelisk. *Edgartown*, on the east side of Martha's Vineyard, the capital of Duke's county, population 1990, has a safe and convenient harbour, and carries on a considerable business connected with the whale fishing and coasting trade. *Fall River*, a manufacturing town, and port of entry, is built on the Fall River, the outlet of Watuppa Pond, at the confluence of Taunton River, 46 miles S. from Boston: population, 11,524. Fall River village which had only 1594 inhabitants in 1820, has now come to be one of the chief manufacturing centres of the state. It has several large cotton and woollen factories, print and bleaching works, iron foundries, boot and shoe manufactories, &c.; carries on some foreign and an extensive coasting trade; and is largely engaged in the whale, cod, and mackerel fisheries. *Fitchburg*, on the Nashua River, 42 miles W.N.W. from Boston: population, 5120. The town has of late years grown into considerable importance from having become a great railway centre, several of the principal lines forming a junction here. The Nashua River affords a great amount of water-power, and there are extensive cotton and woollen factories, paper-mills, &c., in the town and its vicinity. Granite of fine quality is quarried in the neighbourhood. *Gloucester*, situated on Cape Anne, 27 miles N.N.E. from Boston, population 7786, has a good harbour open

at all seasons. The inhabitants are employed in commerce, ship-building, and the fisheries. *Lowell*, on the right bank of the Merrimac, at the confluence of the Concord River, 26 miles N. from Boston: population, 33,383. Lowell is the principal seat of the cotton manufacture in New England, and is commonly designated in American works 'the Manchester of America.' The spot on which Lowell is built was in 1821 selected as the site on which to erect some extensive cotton-mills. The village, then known as East Chelmsford, contained 200 inhabitants in 1820. The great amount of water-power rendered available by the enlargement of the Pawtucket Canal, and the construction of the Merrimac Canal, led to the rapid extension of manufacturing operations; and in 1826 a charter of incorporation was granted, erecting the village into a town by the name of Lowell. At its incorporation Lowell contained 17,633 inhabitants; in 1850 as we have seen it had 33,383; and in 1853 it is said to have had over 40,000 inhabitants. In March 1836 Lowell was incorporated as a city. The factories are chiefly the property of companies, or corporations. In 1850 it had 10 companies making cotton or woollen goods. These companies possessed 40 mills, with a capital of 12,500,000 dollars; and employed 2802 males, and 8254 females; working 9906 looms, and 325,520 spindles. There were besides a bleaching company, which employed 220 hands; and a machine making company, which employed 700 hands. The females employed in the mills are lodged and boarded in buildings erected for the purpose, and careful provision is made for their personal comfort, and moral superintendence; and these arrangements and the superior educational facilities afforded to the work-people generally have attracted much attention in this country as well as in America. The 'female operatives' of Lowell for some years published a monthly periodical entitled "The Lowell Offering, a Repository of Original Articles, written exclusively by Females actively employed in the Mills," which displayed a very respectable amount of knowledge, tact, and skill in writing. Besides the companies' mills there are factories belonging to individuals, which employ about 1500 hands: they consist of paper, powder, planing, and batting-mills, foundries, &c. The city is regularly laid out, and has several good buildings. The principal public edifices are, the court-house, the market-house, the mechanics hall, hospital, &c. There are 23 churches, a city high school, 10 grammar schools, and 46 primary schools, two savings banks, and other educational and benevolent institutions. Four railways diverge from the city. *Lynn*, a city and port, on the north side of Massachusetts Bay, 10 miles N. by E. from Boston, population 14,257, contains 15 churches, 10 school-houses, an academy, several literary, scientific, and benevolent institutions, two savings banks, insurance offices, banks, &c. The principal occupation of the inhabitants is the manufacture of shoes, for which Lynn has long been famous. In 1850 there were in the city 89 shoe manufacturers, and the number of persons employed in the manufacture was 10,058. *Marblehead*, also on Massachusetts Bay, occupies the peninsula between Salem and Nahant harbours, about 4 miles N.E. from Lynn, and 14 miles from Boston: population, 6167. It is a busy fishing town, with a good harbour for vessels of the largest size. Coasting steamers call here several times daily. *Nantucket*, on the north side of Nantucket Island, 90 miles S.S.E. from Boston: population, 8452. The village is situated at the bottom of the bay, which is 6 miles long, and almost entirely land-locked. The harbour is a good one, and on the projecting points of land at its entrance, which are three-quarters of a mile apart, are two lighthouses. Nantucket was the first place in America which engaged in the whale fishery, and is still more largely engaged in it than any other town in the Union except New Bedford. *New Bedford*, a city, port of entry, and one of the capitals of Bristol county, on the right bank of the Acushnet, 4 miles above its entrance into Buzzards Bay, 51 miles S. by E. from Boston: population, 16,443. It is built on ground which rises rapidly from the river, is regularly laid out, and contains a town-hall, the custom-house, court-house, several churches, the Friends' Academy for Ladies, &c. The harbour is spacious, and affords secure anchorage for vessels of large size. New Bedford is the principal entrepôt of the United States whale fishery; two-thirds of the tonnage employed in the whale fishery belong to this port. The business of the city is chiefly connected with the whale fishery; the manufactories are of oil and candles, cordage, iron-hoops, copper and iron rivets, and Prussian blue; there are extensive cooperages. Ship-building is carried on to some extent. The New Bedford and Taunton railway connects the city with the railway system of the state. *Newburyport*, a city, port of entry, and one of the capitals of Essex county, is built on rising ground, on the right bank of the Merrimac, 4 miles from its mouth, 34 miles N.N.E. from Boston: population, 9572. It is regularly laid out and well built. The chief public buildings are—a custom-house, a court-house, jail, 10 churches (in one of which, the first Presbyterian church, is the tomb of the celebrated George Whitfield, who died at Newburyport); a lyceum, an academy, a high school, an endowed classical school, and several primary schools. Five large cotton-factories are in the town. The harbour is capacious and safe, being protected by a breakwater, but the entrance is obstructed by a sand-bar. Some foreign and coasting trade is carried on, but the cod and mackerel fisheries are of more importance. *Northampton*, the capital of Hampshire county, on the right bank of the Connecticut, 81 miles W. by S. from Boston: population, 5278. The town is regularly laid out, contains many

handsome buildings, and stands in the midst of a district celebrated alike for the fertility of its soil and the beauty of its scenery. It contains the usual county buildings, 8 churches, schools, &c. There are manufactories of cotton and woollen goods, silks, ribands, &c. A fine bridge above 1000 feet long crosses the Connecticut, and connects Northampton with Hadley, celebrated for its manufacture of brooms, and for the tobacco and broom-corn grown in its vicinity. *Pittsfield*, the most populous place in the extreme west of the state, is built on the right bank of the Housatonic, in the upper part of its course, 120 miles W. from Boston: population, 5872. The town, which is regularly laid out, has a square of four acres in the centre, on the sides of which the principal buildings are placed. It contains several churches and schools, the Berkshire Medical Institution, &c. The supply of water-power is large, and there are a cotton-factory, several tanneries, grist- and saw-mills, a brewery, &c. The Western railway passes through Pittsfield; the Housatonic line terminates and the Pittsfield and North Adams line commences here. *Plymouth*, a port of entry, and the capital of Plymouth county, is situated on the south side of Plymouth Harbour, 35 miles S.E. from Boston: population, 6024. Plymouth is celebrated in American history as the landing-place of the Nonconformist settlers, or 'Pilgrim Fathers,' as they are now commonly designated, who arrived here on December 22nd, 1620, and formed the first settlement in New England. The town is compactly built; the dwelling-houses are chiefly of wood, but some of the public buildings are substantial and handsome structures. Besides the usual county buildings there are 6 churches and several schools, and a fine granite edifice called Pilgrim Hall. Plymouth has some manufactories, and is engaged in the foreign and coasting trades, and in ship-building; but the principal dependence is on the cod and mackerel fisheries. *Quincy*, on the south side of Boston Harbour, 8 miles S.E. from Boston, population 5017, is celebrated for its extensive granite quarries, which employ above 1000 men, and furnish granite for the buildings of most of the principal cities of the Union. There are also considerable manufactories. *Roxbury*, 2 miles S. by W. from Boston, with which it is connected by a narrow neck of land: population, 18,364. Roxbury, though incorporated as a distinct city, is so closely united with Boston in all respects as to be in effect a suburb of it. Extensive manufactures are carried on here of cordage, carpets, worsted and silk goods, patent leather, India-rubber goods, iron-castings, railway-iron, steam-engines and boilers, lead, white-lead, chemical preparations, turpentine, shoes, hats, &c. *Salem*, a city, port of entry, and one of the capitals of Essex county, is built on a narrow point of land on Salem Harbour, Massachusetts Bay, 14 miles N.E. by N. from Boston: population, 20,264. The city is regularly laid out, and many of the public buildings are substantial and handsome structures. The principal are—the city-hall; the custom-house; market-house; almshouse; jail; mechanics-hall; museum of the East India Marine Society, which contains an excellent collection of works of nature and art; athensium; hall of the Essex Institute; 20 churches; and numerous schools. An aqueduct supplies the city with excellent water. The manufactories are on an extensive scale: they consist of cotton factories, cordage and twine factories, iron and brass foundries, machine shops, chemical works, manufactories of patent leather, boots and shoes, &c. The harbour admits vessels drawing 14 feet of water to unload at the wharfs. There is some foreign trade, though less than formerly; the coasting trade is important, and some vessels are engaged in the cod and mackerel fisheries. Five lines of railway diverge from Salem. *Springfield*, a city, and the capital of Hampden county, on the left bank of the Connecticut, 81 miles W.S.W. (98 miles by railway) from Boston: population, 11,766. Main-street, in which are the principal business establishments, the public buildings, the leading hotels, and the railway station, is very wide, and runs parallel to the river for above two miles; it is intersected by other streets at right angles. Four of the great lines of railway meet at Springfield, and the city has in consequence become an important centre of travel and traffic; and numerous hotels, several of them on a large scale, have been erected for the accommodation of travellers. The public buildings are—the court-house and other county buildings; 12 churches, some of which are of elegant design; several schools; and the United States armoury and arsenal. The manufactures of Springfield consist of locomotives, railway cars, and railway machinery; steam-engines and boilers; fire-arms; sheetings, sattinets, &c. *Taunton*, on the Taunton River, 28 miles S. by E. from Boston, population 10,441, contains a court-house, 10 churches, several schools, &c. The place is much resorted to in summer, and there are several good hotels for the accommodation of visitors. Railway cars, steam-engines, machinery, and castings are largely made; and there are extensive manufactories of printing-cloths, Britannia-metal ware, nails, &c. The Taunton is navigable for sloops of 50 tons up to the village. Branch railways connect Taunton with the railway system of the state. *Worcester*, a city and the capital of Worcester county, is pleasantly situated in the valley of the Blackstone River, and is surrounded by hills of moderate elevation, 45 miles W.S.W. from Boston by railway: population 20,271 in 1853. The city is regularly laid out, the houses are generally well built, and some of the public buildings are of a superior order. The principal thoroughfare, Main-street, is about two miles long, broad, straight, and lined with trees; it contains the chief public buildings, churches, hotels, and private residences. Outside the city are the state lunatic asylum

on the east, and the Roman Catholic College of the Holy Cross on the south-west. Manufactures of various kinds are very extensively carried on in the city and its suburbs. Five important lines of railway meet at Worcester.

Government, &c.—The first state constitution was framed in 1780, and amended in 1821 after the separation of Maine, which had previously formed a part of Massachusetts. Since that time it has undergone several modifications. By the constitution as it now stands, the right of voting is vested in every male citizen 21 years of age (paupers and persons under guardianship excepted), who has resided the past year in the state, and the past six months in the place of voting; and who shall have paid any state or county tax within the last two years. The legislative body, styled the General Court, consists of a Senate of 40 members: and a House of Representatives, consisting of members varying in number according to a certain ratio of representation, but at present (1854) consisting of 356 members. The members of both houses, as also the governor, are elected annually.

The public debt of the state, absolute and contingent, on the 1st of January 1853 was 6,685,705 dollars; but of this 5,049,555 dollars represented the "liability of the state for scrip loaned to the various railways," leaving as the debt of Massachusetts on its own account the sum of 1,636,149 dollars. The total revenue of the state for the year ending January 1st, 1853 (including a balance of 76,322 dollars on hand from 1852, and a temporary loan of 550,000 dollars borrowed in anticipation of revenue) was 1,781,703 dollars; the total expenditure for the same period (including 475,000 dollars, loans repaid) was 1,515,559 dollars. The "ordinary revenue" for the year was 598,170 dollars, the ordinary expenditure 674,222 dollars. The state militia in 1852 was composed of 122,343 men, of whom 550 were commissioned officers.

History.—This part of the American continent was probably discovered by John Cabot at the end of the 15th century, but though visited several times during the following century, no settlement was made. The first specific account of the country was contained in the accounts of the voyage of Bartholomew Gosnold, who sailed from England in 1602 and discovered the promontory which he called Cape Cod. The descriptions of the country, written by John Brereton, Gabriel Archer, and Gosnold himself, excited much interest, and a company was chartered by James I. in 1606, to which this country was granted under the name of North Virginia. The first settlement however was only formed in 1620 at Plymouth, by about 120 families of Nonconformists, who had fled to Holland, and thence proceeded to Cape Cod. They framed a constitution, and took an oath to keep it. It afterwards became the groundwork of the constitution of the state. The first regular house of representatives was organised in 1639. The progress of the colony was very slow in the beginning, especially on account of the oppression to which the inhabitants were subjected during the reign of the Stuarts, before the time of the Commonwealth and after the Restoration. Though they were relieved by the revolution of 1688, and the increase of the colony was thus promoted, its population in 1730 did not exceed 120,000 individuals. In the revolutionary war Massachusetts took a leading part, by resisting the demands of the English government, and creating a military force. Hostilities were commenced by the battle of Lexington in Massachusetts. Massachusetts formed one of the 13 original states of the Union: it ratified the constitution of the United States, February the 6th, 1788.

MATLOCK, Derbyshire, a watering-place in the parish of Matlock, is situated on the left bank of the river Derwent, in 53° 7' N. lat., 1° 32' W. long., distant 17 miles N. by W. from Derby, 144 miles N.W. from London by road, and 148½ miles by the North-Western and Midland railways. The population of the parish in 1851 was 4010. The living is a rectory in the archdeaconry of Derby, and diocese of Lichfield.

Matlock Bath, as the town is still frequently called, is situated in a deep and narrow valley. The town has grown up within the last century and a half. The church, erected in 1842, stands in a conspicuous situation; it has a spire 129 feet high. The Independents have a chapel. Visitors are attracted by the beauty of the scenery, the salubrity of the air, and the beneficial qualities of the hot and mineral springs. The hot springs have a temperature of 68°, and contain much free carbonic acid. The only manufacture is of vases, tazze, and other elegances which are made from the fluor-spar and Derbyshire marbles. There are several caves and 'petrifying springs.' Baths, hotels, and lodging-houses for the accommodation of visitors are numerous and handsome. Matlock High Tor is a precipitous limestone rock, rising from the river to a height of 306 feet. Matlock

village is much older than Matlock Bath, from which it is two miles distant. The inhabitants are chiefly employed in lead-mines and quarries.

MAURITANIA, or MAURETANIA, which derived its name from its inhabitants Mauri or Maurusii, was bounded W. by the Atlantic, N. by the Mediterranean, S. by the Gætuli, and E. by Numidia, thus corresponding to the northern part of Morocco and the western part of Algiers. The country of the Mauri was originally separated from that of the Massæyli by the Molocath (Strabo), or Mulucha (Plin., v. 1), the modern *Mulwia*; but the Roman province of Mauritania included the country inhabited by both these people.

Before the war with Jugurtha, the Romans had little or no knowledge of Mauritania; of which Bocchus was at that time the ruler. (Sallust, 'Bell. Jugurth.', c. 19.) Mauritania was afterwards given by Augustus to Juba II., his paternal kingdom of Numidia having been erected into a Roman province. Juba died about A.D. 17, and was succeeded by his son Ptolemæus, who was put to death by Caligula. Mauritania was shortly afterwards divided into two provinces by Claudius (A.D. 43); which were called respectively Mauritania Tingitana and Mauritania Cæsariensis. (Dion Cassius, lx.) Tingitana, the western province, which derived its name from Tingis (*Tangier*), was divided from the other province Cæsariensis by the Molocath; and Cæsariensis was separated from Numidia by the Ampsagas (*Wad-el-Kebir*). Mauritania Cæsariensis was subsequently subdivided into two provinces: the western part retained the name of Cæsariensis, but the eastern was called Sitifiensis, from Sitifi (*Setif*), a town on the borders of Numidia.

Mauritania contained many towns of considerable importance under the Roman empire. Of these, the principal in Mauritania Tingitana were, Rusadir (*Mellilah*), a sea-port and a Roman colony, west of the Molocath; Tingis (*Tangier*), at the entrance of the Strait of Gibraltar, which received especial marks of favour from Augustus Cæsar (Dion. xlviii.), and became a Roman colony under Claudius (Pliny, v. 1); Zilis or Zelis (*Arzila*), made a Roman colony by Augustus under the name of Julia Constantia Zilis, and placed under the same jurisdiction as the province of Bætica in Spain (Pliny, v. 1): it was situated a little to the south of Cape Spartel, which is called Cotes by Strabo, and Ampelusis by Mela (i. 5); Linx, Lixus, or Linga (*Al-Avriah*), a Roman colony, 32 Roman miles S. from Zilis, situated on a river of the same name now Wad-al-Khos. Banasa, a Roman colony, 50 Roman miles S. from Lixus, situated on the Subur (*Sebo*); and, 50 miles S. from the Subur, Sala (*Sales*, or *Sla*), of which there are extensive ruins.

The chief towns in Mauritania Cæsariensis were:—Saldæ, Sarda, or Saldæ, a sea-port and a Roman colony, which divided the kingdom of Juba from the province of Numidia (Strabo); Julia Cæsarea (*Zerzhal*), situated on the coast west of Saldæ, a Roman colony, which was originally called Iol (Strabo; Pliny, v. 1); Siga (*Takumbrit*), which Pliny (v. 1) erroneously places opposite Malaga in Spain; and in the interior, south-west of Cirta, the important town of Sitifi (*Setif*), a Roman colony.

The physical features, &c. of Mauritania are described under ALGÈRE and MAROCCO.

MAURITIUS, formerly *Isle de France*, an island and a British settlement, is situated in the Indian Ocean, between 20° and 20° 34' S. lat., 57° 20' and 57° 46' E. long. The greatest length, north to south, is 38 miles; the greatest breadth, east to west, is 27 miles; the circumference is about 120 miles. The area is about 700 square miles. The population in 1851 was 180,823; the emancipated slaves and their families numbered 48,330. The general population, as distinguished from the Indians and emancipated slaves, was 54,497. The white population consists for the most part of the descendants of French families, and they speak the French language.

The island is surrounded by a coral reef, generally running parallel to the shores at a distance varying from a furlong to a quarter of a mile, and mostly dry at low water. In this reef occur ten or twelve breaks, by most of which vessels of considerable burden can reach the island. The interior of the island contains numerous hills and mountains, mostly isolated. The most elevated are near Cape Brabant on the south-east coast, where they rise to about 3000 feet, and near Port Louis on the north-east coast. The mountain called Peter Botte, which belongs to the latter group, has an elevation of 2600 feet. The origin of the island is obviously volcanic. The soil is fertile, but generally shallow.

The hilly districts in the interior of the island are covered with trees, but there is no timber fit for ship-building. The ebony wood is of inferior quality, but the iron-wood and red-wood are valuable. There are cocoa-nut palms, tamarind-trees, mangroves, and bamboo.

The rainy season lasts from November to March or April. The

climate is damp through a considerable portion of the year. In the dry season the wind generally blows from the south-east. The highest temperature is about 87° Fahr., the lowest 60°, the mean annual temperature 78°. The island is periodically exposed to tempestuous weather, and is occasionally visited by terrific hurricanes.

Yams, cassava, and maize, are cultivated for food. Esculent roots and vegetables, European as well as tropical, thrive well and abundantly; wheat and rice are raised. The best fruits are mangoes, shaddock, and pine-apples.

Sugar is almost the only object of cultivation for export. Improvements have of late been introduced into the manufacture. The sugar crop for the year 1852 amounted to 75,000 tons. Silk-worms are reared, but the quantity of silk produced is small.

Horses are few, and seldom bred in the island. Mules and asses are principally used for the saddle. Cattle are scarce, on account of the want of good pasture. Cattle are imported from Madagascar; goats and sheep are numerous on the island; hogs abound, and form a material part of the food of the people.

Port Louis, the capital of the island, is situated near the north-western extremity, on a small bay or inlet, in 20° 9' S. lat., 57° 29' E. long. A reef runs out from the mouth of the inlet, passing close to Tonnelier Island, a coral rock, near which vessels usually anchor when the wind blows out of the harbour. The harbour is capacious, and during the fine season is perfectly safe. The town is built at its extreme south-western corner. In 1850 it was constituted a municipal corporation. The town contains about 35,000 inhabitants. It has a citadel, completed in 1843, good barracks, a new court-house, bazaar, a royal college, a theatre, and at a short distance an hospital. There are a library containing more than 60,000 volumes, mostly French, a good botanical garden, and some docks for the repair of vessels. The harbour and town are well fortified.

On the eastern coast is *Grand Port*, which is large, but its entrance is difficult, being narrowed by several shoals. It can only be entered and left with a fair wind, as it is impossible to tack. It is not much frequented. *Makeboury* is a small town on the south-east coast, with a good harbour, which was opened to foreign shipping in 1836.

Mauritius is under the care of a governor and a legislative and executive council, whose authority extends to the group of coral islands called the SEYCHELLES. The revenue for 1852 was 311,854*l.*; the expenditure was 283,053*l.*

The value of the imports into Mauritius in 1852 was 1,052,351*l.* 6*s.* 9*d.*, that of the exports was 1,100,546*l.* 14*s.* 6*d.*

The commercial relations of Mauritius extend to Batavia, Bombay, Surat, Muscat, the Persian and Arabian Gulfs, the western coast of Africa, the Cape of Good Hope, and Madagascar, but a considerable portion of its produce comes to England. Besides sugar, small quantities of indigo, cloves, and some woods are exported. The island receives from England and India silk and cotton goods; and from England cloth, wine, oil, hats, iron and steel utensils, with some smaller articles. Madagascar supplies the Mauritius with cattle and rice, and receives in return manufactured goods. Arabia and Persia are supplied with sugar from the Mauritius, and send in return dry fruits and some smaller articles.

Mauritius, with the neighbouring island of Bourbon, was discovered by the Portuguese in 1505; they took possession of Mauritius in 1545, but apparently formed no settlement on it. The Dutch surveyed it in 1598, and called it Mauritius, in honour of Maurice, stadtholder of the republic of the Netherlands. They did not however settle here till 1640, about which time they fixed themselves on the shores of Grand Port. They abandoned the island in 1708. In 1715 the French took possession of the island, formed a settlement at Port Louis, and called the island *Isle de France*. They remained in the undisturbed possession of it till the year 1810, when it was taken from them by the British, to whom it was secured at the peace of 1814, and who have retained it in their possession ever since. A bishop of Mauritius has just (December 1854) been appointed by the British government. There are 18 government schools, attended by 1853 pupils in 1852; and a royal college, with 276 pupils in 1852, an income of 3054*l.*, and an expenditure of 3610*l.* during the same year. In 1852 there returned to India 2398 adult male and 361 female immigrants, with 72 children. In the rural districts court-houses and jails have been recently erected, and a little attention has been given to the construction of new roads, and the repair of the highways now in use. [See SUPPLEMENT.]

MAURS. [CANTAL.] MAUVESIN. [GERS.]

MAWES, ST. [CORNWALL.]

MAYAGUANA. [BAHAMAS.]

MAYBOLE, Ayrshire, Scotland, a burgh of barony and market-town in the parish of Maybole and district of Carrick, is pleasantly situated on a small eminence surrounded by hills, about 5 miles from the sea-coast, and 9 miles S. from Ayr, in 55° 20' N. lat., 4° 42' W. long. The population of the town in 1851 was 3862. The burgh is governed by 17 councillors. Many of the inhabitants are employed in hand-loom weaving for Glasgow manufacturers. The church is a large but inelegant structure. There are several schools, a savings bank, and some benevolent institutions. Maybole is the capital of Carrick was once the winter residence of many noble families; and in it was held the court of Bailyery for the district. At the east end of

the town stands the ancient seat of the Casallia family. A portion of a collegiate church, founded in the 15th century, still remains, as well as the house, now the Red Lion Inn, wherein John Knox and Quintin Kennedy, abbot of Crossraguel, held their disputation.

MAYENNE. [MAINZ.]

MAYENNE, a department in the west of France, is bounded N. by the departments of Manche and Orne, E. by the department of Sarthe, S. by Maine-et-Loire, and W. by Ille-et-Vilaine. Its form approximates to that of a parallelogram, 54 miles long from north to south, and 40 miles broad from east to west. Its area is 1998 square miles. It lies between 47° 45' and 48° 35' N. lat., 0° and 1° 15' W. long. The population in 1841 was 361,392; in 1851 it amounted to 374,566, giving 187.94 inhabitants to a square mile, or 13.36 above the average per square mile for the whole of France. The department is formed out of the western part of the old province of Maine and the northern part of Anjou; and is named from its principal river the Mayenne.

The surface of the department is uneven, strewed with hills, and in some places cut up by valleys and ravines. The Armoric Hills run across the department in the north, and send out a branch southward, which forms the watershed between the Vilaine and the Mayenne. From a distance the country has the appearance of a vast forest, such is the number of trees planted in the hedge-rows that inclose each field. The population of Lower Maine does not, as is the case in most parts of France, live in hamlets or villages, but is scattered among isolated farmhouses, each of which stands among thick hedges, and contains a family that is supplied with every necessary of life, both of food and clothing, from the land and their own industry. This isolated and independent existence has left its impress on the people in a certain rudeness of address, an honest but obstinate adherence to old usages, and a consequent aversion to things called improvements. The soil in the arrondissement of Château-Gontier, and in part of that of Laval, is productive in bread-stuffs of all kinds; in the rest of the department the land is poor, and does not yield enough for the consumption of the inhabitants. Meadow land is scanty, nevertheless a great number of beasts are fed, which form a source of considerable profit to the farmer. Flax, hemp, and fruit-trees are extensively cultivated. Other products are chestnuts, nuts, some bad wine, and cider fruits yielding 6,833,288 gallons of cider. Well-woolled sheep, pigs, and fowls are numerous. Bees are kept in great numbers.

The department belongs almost entirely to the basin of the Loire, and is drained chiefly by the *Mayenne* (the ancient *Meduana*), which rises in the south of the department of Orne, and running nearly south past the towns of Mayenne, Laval, and Château-Gontier, divides the department of Mayenne into two pretty equal parts. A few miles below Château-Gontier, it enters Maine-et-Loire, where it receives the Oudon on the right bank, and the Sarthe, swelled by the Loire, on the left; from its junction with the Sarthe to its entrance into the Loire at Ponts-de-Cé, about 5 miles south of Angers, this river takes the name of Maine. Small steamers ply up to Angers, and barges up to Laval. The principal feeders of the Mayenne in this department are the Varenne, the Calmont, and the Ernée, on the right bank, and the Jouanne, and the Onette, on the left bank. A small portion of the west of the department is included in the basin of the Vilaine. [ILLE-ET-VILAINE.] A narrow band along the east of the department is drained by feeders of the Sarthe. The south-western districts are drained by the Oudon.

The department is crossed by 5 state, 11 departmental, and a great number of bad cross roads. It is also traversed by the railway from Paris to Brest, which passes through Laval.

In geological structure the department belongs nearly altogether to the primitive formations. Iron-mines are worked for the supply of eight smelting furnaces and ten forges. Coal-mines are worked near Laval. Marble, granite, flint, building- and lime-stone, and slate are quarried. White sand, used in the manufacture of glass, is raised. Sailcloth and linen are the chief manufactures; cotton-stuffs, hair-cloth, linen thread, and paper are made. About 215 fairs and markets are held in the year.

The climate is healthy, and resembles that of the south of England.

The department was comprehended in ancient times in the territory of the Diablintes, the Arvii, and the Andes, or Andecavi, three Celtic tribes included in Lugdunensis Tertia. *Næodunum* and *Vagoritum*, the respective chief towns of the Diablintes and the Arvii were within the limits of the department. Of the first there are important remains about 6 miles south-east from Mayenne, at the village of Jublains, which in sound preserves the name of the Diablintes almost without alteration. There are the walls of a Roman station forming nearly a square of 600 or 700 feet each way, with towers on the sides and at the corners. The walls are scarcely more than 7 or 8 feet high, and about 9 feet thick, composed of layers of square stone, alternating with three tiers of brick, and the whole united by a very hard cement. It is one of the most firmly-built and best preserved Roman forts in France. Within the inclosure are the traces of buildings probably occupied by the garrison of the fort. A subterranean apartment, which probably formed part of a Roman villa, was discovered near the fort, with a mosaic floor and painted walls. An ancient well has also been discovered, and medals and rings have been dug up. There is near

Jublains a granitic rock presenting a resemblance to a chair, supposed to be a Druidic monument. There are some remains of *Vagoritum* at a place called Arve, or Erve, on the river Erve, a feeder of the Sarthe, which drains the east of the department. From these names (*Jublains* and *Erve*) it is inferred with great probability that the towns took at a later period the names of the people to whom they belonged. In the country between Jublains and the Erve there are some Druidical stone circles and other Celtic monuments.

The department contains 1,275,607 acres. Of this surface 875,521 acres are arable; 171,344 acres are grass land; 65,186 acres are covered with woods and forests; 27,351 acres are laid out in nurseries, plantations, gardens, &c.; 50,367 acres consist of heaths and moors; and 9951 acres are covered with rivers, ponds, brooks, &c.

The department is divided into 3 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Laval	9	92	130,523
2. Mayenne	12	110	165,181
3. Château-Gontier	6	72	78,862
Total	27	274	374,566

1. In the first arrondissement the chief town is *Laval*, which is also the capital of the department. It is situated in 48° 4' 7" N. lat., 0° 46' 16" W. long., 247 feet above the level of the sea, 152 miles W. by S. from Paris, and has 17,538 inhabitants in the commune. The principal part of the town stands on the slope of a hill, on the right bank of the Mayenne, and consists of irregularly-built, narrow, steep, and crooked streets of timber-framed houses, each story of which overhangs the one below it, so that a considerable part of the buildings overhang and darken the dreary streets. From the midst of these dismal buildings, and close to the river, rises the extensive old castle of the lords of La-Tremouille, surmounted by a lofty round tower, which formed the keep; this castle is now used as a prison. Near the castle an old bridge thrown across the river leads to a new suburb, regularly built with wide straight streets, on the left bank of the river. Another suburb called *Avenières* is interesting on account of its elegant church, which dates from 1040. The principal buildings in the old town are—the churches of La-Trinité, Des Cordeliers, and St.-Vénérand; two hospitals, founded about the year 800; the public library; and a large and handsome linen-market. The town has a tribunal of first instance, a tribunal and chamber of commerce, and a college. It is the centre of a large manufacture of table and household linen and linen-yarn, for the sale of which there are weekly markets; calico, flannel, cotton-handkerchiefs, serge, soap, leather, &c. are also made; and there is a good business done in flax, wine, brandy, clover-seed, timber, iron, marble, &c. The town grew up round a castle built by the counts of Maine to check the inroads of the Bretons. The castle was burnt by the Northmen, but rebuilt in 840, and surrounded, together with the houses grouped about it, with a turreted wall. In the 12th century Laval gave a title to a barony whose possessors were all surnamed Guy in honour of Guy IV., who had distinguished himself in the Crusades under Godfrey de Bouillon. The barony was raised to a county by Charles VII., and into a duchy by Louis XI. in 1481. Laval was taken by the English under the great Talbot in 1466, but the French recovered it the following year: the town still retains its walls. It was taken in 1793 by the Vendéans, who in October of that year, under the command of Larochejacquelin, defeated with terrible slaughter a large army of republicans, commanded by General Léchelle, near the town. The railway from Paris to Brest passes through Laval. *Argenté*, 6 miles E. from Laval, stands on the slope of a hill near the Jouanne, and has marble quarries, tanyards, and about 2000 inhabitants. *Chailland*, 12 miles from Laval, near the Ernée, has coal-mines, iron-forges, smelting-furnaces, and a population of 2600. *Evron*, situated in a remote but fertile district, 16 miles N.E. from Laval, has a population of 4130. The town originated in a Benedictine abbey founded here in the 7th century by Hadouin, count of Maine. The abbey-buildings, which are extensive and still entire, are now occupied by nuns, who devote their labours to the instruction of female teachers for the education of the female poor. The abbey-church is one of the finest in all the department. The ancient chapel of St.-Crespil, near the abbey-church, and the market-house, are notable buildings. This town has a good weekly corn-market, linen-manufactures, and some trade in wine, wool, and brandy. The country about Evron is extremely retentive of wet and boggy in winter, so that the roads are almost impassable. This kind of soil covers the watershed between the Sarthe and Mayenne, to which rivers and small streams run from it in various directions.

2. In the second arrondissement the chief town, *Mayenne*, stands on the steep slopes of two hills united by a bridge across the river Mayenne, 18 miles N. by E. from Laval, in 48° 18' 17" N. lat., 0° 38' 55" W. long., 333 feet above the level of the sea; and has tribunals of first instance and of commerce, a college, a council of prud'hommes, and 9588 inhabitants in the commune. Mayenne was formerly defended by strong fortifications which withstood the English under the Earl of Salisbury for three months in 1424, when it capitulated. It gave

title to a barony in the house of Guise, which François I. erected to a marquisate in 1544, and Charles IX. into a duchy in favour of Charles de Lorraine, who became head of the French political party called the League. The streets are ill laid out, irregularly built, with old odd-looking houses, and so steep that it is not unusual to see eight horses and four bullocks yoked together drawing a single carriage. On the top of the hill on the right bank there are two large squares, in one of which is the town-house. The old castle of the lords of Mayenne stands on the right bank of the river, and commands the bridge; a large building near it serves for the linen-market. Linen, calicoes, and cotton-yarn are the chief industrial products of the town, which has also bleach-mills and dye-houses. *Ambrières*, 6 miles N. from Mayenne, is a well-built town of 2453 inhabitants. A castle now in ruins, built here by the Conqueror, is the most interesting object in the town. The corn-market is held on a part of its site. *Bais*, a town of 2342 inhabitants, S.E. of Mayenne, was burned by the Vendéans in 1799. *Ernée*, prettily situated on the river Ernée, 14 miles W. from Mayenne, is a well-built town, with wide straight streets, and 5489 inhabitants, who manufacture linen-yarn and cloth. There are iron-mines and iron-forges near Ernée. *Gorron*, 12 miles N.W. from Mayenne, has a population of 2351. The ancient castle of Gorron, one of the frontier fortresses of Maine, has been entirely destroyed, and a corn-market erected on its site. *Lassey*, 12 miles N.E. from Mayenne, has 2565 inhabitants, and an ancient castle, the erection of which dates from the year 825, and which is the best preserved of the old fortresses of Maine. *Prez-en-Pail*, 20 miles N.E. from Mayenne, on the road to Alençon, has a population of 3495. *Villaines-la-Juhel*, E. of Mayenne, has 2500 inhabitants, who manufacture woollen-cloth.

3. In the third arrondissement the chief town, *Château-Gontier*, is situated in a beautiful plain, 16 miles S. from Laval, in 47° 49' 50" N. lat., 0° 42' 11" W. long., 192 feet above the level of the sea, on the left bank of the Mayenne, over which a stone bridge leads to a large suburb. Of the castle built here by Foulques Nerra, count of Anjou, who intrusted its safe keeping to a knight named Gontier (whence the name), there is scarcely a vestige. The town, which is ill laid out, but has well-built houses, possesses a tribunal of first instance, a college, and 6443 inhabitants, who manufacture linen, serge, hair-cloth, and leather; and trade in clover-seed, thread, iron, timber, and wine. The most notable objects in the town are—the square on the site of the old castle, and the promenade which commands a fine view of the picturesque banks of the Mayenne. *Coaze-le-Vivien*, N.W. of *Château-Gontier*, has 3408 inhabitants. *Craon*, formerly a fortified town, and famous for its siege by the Prince of Conti in 1592, is situated on the left bank of the Oudon, 12 miles W. from *Château-Gontier*, and has 3906 inhabitants, who manufacture coarse woollens, and trade in corn, linen, thread, &c.

The department forms with that of Sarthe the see of the Bishop of Le-Mans; is included in the jurisdiction of the High Court of Angers, and within the limits of the University-Academy of Rennes; and belongs to the 16th Military Division, of which Rennes is headquarters. It returns 3 members to the Legislative Body of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Statistique de la France; Official Papers.*)

MAYNOOTH, county Kildare, Ireland, a post- and market-town, in the barony of North Salt, is situated on the Royal Canal, 15 miles W. by N. from Dublin by the Midland Great Western railway, of which it is a station. The population in 1851 was 2201.

Maynooth consists of a single well-built street, at the east end of which is the entrance to Carston, the extensive demesne of the Duke of Leinster, and at the west end the royal college of St. Patrick. There are in the town a parish church, a Roman Catholic chapel and nunnery, a National school, and a dispensary. Maynooth College is a plain quadrangular structure, with a front 400 feet in length. The grounds attached to it occupy a space of 80 acres. The institution was founded in 1795 by an Act of the Irish Parliament for the education of candidates for orders in the Roman Catholic Church. In 1845 it was permanently endowed, out of the Consolidated Fund, for the support and instruction of 500 students, and of 20 senior scholars on the Dunboynes foundation—a revenue of 460*l.* derived from the estates of the late Lord Dunboynes. The buildings have been completed by a sum of 30,000*l.*, vested by the Act of 1845 in the Commissioners of Public Works for Ireland. They contain seven lecture-halls, a chapel, library, refectory, and professors' and students' apartments. The course of study occupies eight years, during which the students can leave the college only by special permission of the bishop of the diocese to which they respectively belong. Near the college are the ruins of Maynooth Castle, a seat of the Fitzgeralds, the ancestors of the Duke of Leinster; it was built in 1426. Fairs are held in the town on May 4th and September 19th.

MAYO, a maritime county in the province of Connaught, Ireland, is bounded E. by the counties of Sligo and Roscommon, S. by the county of Galway, and W. and N. by the Atlantic Ocean. It lies between 53° 27' and 54° 19' N. lat., 8° 31' and 9° 20' W. long. Its greatest length from east to west is 72 miles; from north to south 53 miles. The area is 2131 square miles, or 1,363,882 acres, of which 497,587 acres are arable, 800,111 acres uncultivated, 8360 acres in plantations, 848 acres in towns, and 56,976 acres under water. Next

to Cork and Galway, Mayo is the largest county in Ireland. In 1831 the population was 366,828; in 1841 it was 388,887; in 1851 it was 274,612.

Coast-line and Islands.—The length of the coast-line from the mouth of the river Moy on the north-east to the head of Killery Harbour on the south-west, exclusive of minor indentations, is about 250 miles. The only harbour generally frequented on the northern coast is that of Killala, in the Bay of Killala, which is formed by the estuary of the Moy. The bay is a square of about 5 miles, with a range of sand-hills extending across the bottom. In this range are two openings, one forming the bar of the Moy, and the other that of Killala Harbour. Formerly vessels for Ballina entered by the Killala bar; but since certain improvements were made in the Moy the navigation has been direct, and vessels of 200 tons now sail up to within a mile of Ballina. From Killala Bay westward to Benwee Head, a distance of 20 miles, the coast rises in lofty cliffs, affording little shelter for craft of any kind. Between Benwee Head and the Mullet is Broadhaven, a bay consisting of an outer and an inner harbour, the entrance to the latter being less than half a mile in width in 4 fathoms of water. The basin within runs up 7 miles to the town of Belmullet, and affords good anchorage throughout. The Mullet, extending 15 miles in length, is connected with the mainland by a narrow isthmus 5 miles long, which separates Broadhaven from the Bay of Blacksod. The southern part of the peninsula is low and sandy; but on the north are some inconsiderable eminences, of which Slieve More, rising over the entrance to Broadhaven, is the chief. Blacksod Bay affords excellent roadsteads and several sheltered spots well adapted for landing cargoes. The southern boundary of Blacksod Bay is ACHILL ISLAND. The upper end of the bay abounds with a multitude of safe and excellent anchorages among the numerous islands between the creeks of Newport and Westport. The mouth of the bay being covered for one-third of its breadth by Clars Island, the whole basin enjoys a considerable shelter from the swell of the ocean. The remainder of the coast of Murrisk between Clew Bay and the Killery possesses no harbours, but there is anchorage in westerly winds under the lee of Innisturk Island in the offing. Small islands, singly or in groups, lie in great numbers along the northern and western coasts.

Surface, Hydrography, and Communications.—The surface of the county embraces a part of the central plain of Ireland, with a large extent of wild and mountainous country between it and the sea. The mountain region consists of two principal districts separated by Clew Bay, which running inland 15 miles, by from 7 to 8 miles in width, meets the extremity of the plain at Westport. The mountain groups south of Clew Bay cover an area of about 15 by 20 miles, and stretch into the highlands of Joyce country and Connemara. [GALWAY.] The Furmnamore and Partry Mountains extend in a north-east direction from the head of Killery Harbour, and form a continuous range 15 miles long, rising abruptly over the western shores of Lough Mask and Lough Carra. Furmnamore, in the centre of the range, is 2210 feet high.

On both sides of the chain are bold ravines, traversed by streams descending on the one hand into Lough Mask, and on the other into the valley of the Owen Errive River, which runs southward into the head of Killery Harbour, and into the valley of the river Ayle, which runs northward. The Ayle dips underground on emerging from the mountain district, and passing eastward for two miles under the limestone rock of the plain, rises again and flows southward into the head of Lough Mask. The group of Muilrea skirts the northern shore of Killery Harbour, and extends inland. Muilrea Mountain, which rises over the entrance to the harbour, is the highest ground in the county, being 2682 feet in altitude. Northward from the group of Muilrea the surface rises into undulating hills of from 900 to 1200 feet in height, the general slope of the country being towards the north-west. The northern verge of Murrisk is occupied through a length of 10 miles by the range of Croagh Patrick, running parallel to the shore, which rises in its highest summit to an altitude of 2610 feet.

North of Clew Bay the Croagh Moyle Mountains run in a south-westerly direction from the valley of the Moy to the head of the bay at Newport. The group of Nephin extends from Lough Fyough, near the northern shore of Clew Bay, to the western shore of Lough Conn, over which Mount Nephin, the highest point in the district, rises abruptly to an elevation of 2646 feet. In the valley bounded by these ranges lie Lough Beltra and Lough Lavalla. A tract of extremely desolate moorlands is bounded towards the east by the valley of the Moy, and towards the west by the Tyrawley and Nephin Beg Mountains. A ridge of low elevation divides this tract into two portions, the waters of one of which flow eastward by the Deel River to Lough Conn, and those of the other passing through a gap in the centre of the Nephin Beg range run westward by the Owenmore River to the head of Blacksod Bay. The chief height of the Nephin Beg chain is Slieve Cor, 2368 feet; Nephin Beg is 2012 feet. West of the Tyrawley and Nephin Beg Mountains are numerous lakes, of which the greatest is Carrowmore, which discharges its waters by the Owenmore River into Tullaghan Bay.

The valley of the Moy from the sea to Foxford, which is situated 15 miles above the mouth of the river, is open, and contains much improved and improvable land, especially in the neighbourhood of KILLALA and Ballina. Between Ballina and the range of Nephin is

Lough Conn, a fine sheet of water 8 miles in length by from 1 to 4 miles in breadth, communicating on the south by a very narrow strait in the neck of land called the Puntoon, with Lough Cullin, a smaller lake, through which it discharges its waters into the river Moy close to Foxford.

The valley at Foxford is contracted by the approaching ranges of the Croagh Moyle and Slieve Gamph Mountains, but southward from this point it opens into an extensive plain in which Slieve Carnon, 855 feet high, is the most considerable eminence. The main stream of the Moy, rising in the county of Sligo, runs westward through an open upland valley bounded on the north by the line of the Ox Mountains, and on the south by low undulating hills of from 600 to 700 feet in height, skirting the northern verge of the great plain. This vale is thinly inhabited, and much incumbered with mountain bogs, except towards the western extremity, where there is a good deal of cultivation round the small town of Swineford. Southward from the valley of the upper Moy, the district on the eastern verge of the county is bleak and swampy. A good pastoral tract extends from the Roscommon border on the east to the vicinity of Castlebar on the west, and from the Slieve Carnon on the north to the borders of Galway on the south. This tract is named generally the Plains of Mayo, though the name strictly applies to the rich grazing lands immediately south of Slieve Carnon. Farther south, the tracts of bog are more numerous than in the northern and central portion of the plain, occupying most of the valleys, and in several instances insulating the demesnes of the gentry. An open fertile district extends along the eastern shore of Lough Mask.

From Westport to Newport the head of Clew Bay is studded with 170 green pasturable islands, varying in size from a few acres to half a mile in length. The shore along the head of the bay is also good arable and pasture land, and is worn into numerous peninsulas and low promontories, many of them wooded, which greatly increases the picturesque effect. From within three miles of Westport to Castlebar lie a number of small lakes, the waters of which are discharged by a river passing through the town into the head of Lough Cullin.

The county has been of late years much improved by the construction of important lines of road. One leading from Castlebar to Belmullet, and another from Ballina to Belmullet, have opened the wild districts of Tyrrawley and Erris. The district of Murrisk has been opened by an excellent road from Westport to the head of Killery harbour, where it joins the government road, leading through Connemara. The champaign part of the county is in general well supplied with roads.

Geology, Mineralogy, &c.—The geological structure of Mayo, like that of Galway, exhibits an arrangement of primary and secondary rocks skirting a limestone basin. As usual, the champaign district and the field of limestone are co-extensive. In Clew Bay, as in many of the western bays of Ireland, while the promontories on each side are of primary rock, the bottom of the bay consists of stratified limestone, as appears from the multitude of limestone islands round its upper extremity. The verges of the plain are traversed by numerous subterranean channels. The southern half of Murrisk belongs to the grauwacke series; in the valley of the Ayle, a tract of yellow sandstone lies between the clay-slate of this formation and the stratified limestone. The northern division of Murrisk consists mainly of mica-slate with protrusions of granite and quartz, the chief quartz protrusion being the peak of Croagh Patrick. Along the north-western coast of Murrisk a tract of old red-sandstone appears, which rises again on the southern and eastern side of the island of Clare, overlying the granite of which the nucleus of that island consists. It re-appears in the northern mountain district. The limestone tract occupies the greater part of north-eastern Tyrrawley, but no where reaches the sea, from which it is separated by a field of yellow sandstone and conglomerate. The mica-slate field comprises all Erris, the Mullet, the island of Achill, and southern Tyrrawley as far eastward as great Nephin. Granite and quartz protrusions are of frequent occurrence, in this district generally constituting the loftiest and most striking elevations. Granite again rises on the opposite side of the valley of the Moy in the Slieve Gamph Mountains over Foxford, supporting flanks of mica-slate as in the range of Nephin. Throughout the primary district iron-ore is abundant, but remains unwrought for want of fuel. Marble susceptible of a good polish has been raised in several parts of the barony of Murrisk. Slates are quarried.

Climate, Soil, and Produce.—The climate of the western districts is damp and ungenial. That of the level part of the county, which is protected by the mountains from the prevalent winds, and lies open towards the east and south, is as mild as the climate of most of the midland counties.

The soils of the champaign tract are in general similar to those of other limestone districts: the best lie about Balla, Claremorris, and Hollymount on the south, and round Ballina on the north.

The tillage lands in the neighbourhood of Westport have been for the most part reclaimed from a comparatively moory state; but towards Newport the soil is naturally good, and produces large crops of the best oats. The chief occupations are agriculture and fishing. Pasturage is more general than tillage. In 1853 the number of acres under crop was 179,268, of which 3263 acres grew wheat; 81,451 acres oats; 7262 acres barley, bere, rye, peas, and beans; 53,412

AGRO. DIV. VOL. III.

acres potatoes; 12,308 acres turnips; 2470 acres other green crops; 1198 acres flax, and 17,904 acres meadow and clover. Of plantations, in 1841, there were 9356 acres, yielding oak, ash, elm, beech, fir, mixed timber, and fruit. In 1852 on 31,915 holdings there were 14,942 horses, 16,736 mules and asses, 133,870 head of cattle, 172,117 sheep, 30,570 pigs, 8072 goats, and 324,716 head of poultry. The fishery districts are Westport, Keele, Dulough, Dunkeehan, and Ballycastle, comprising 226 miles of maritime boundary, and in 1853 employing 486 registered vessels, and 2910 men and boys. There are considerable salmon fisheries on the Moy and other rivers of the county. The principal fishing-bank on the north lies between Downpatrick Head and Broadhaven, at about 3 miles from the shore, in 30 to 45 fathoms water, where turbot, sole, cod, ling, haddock, and hake are taken. Between the Stags of Broadhaven (insular rocks in the offing of that bay) and the island of South Inniskea is another bank, in 18 to 30 fathoms water, on which the same fish abound. Blacksod Bay and Clew Bay also contain extensive fishing-banks for turbot, sole, plaice, &c.; and vast quantities of oysters and lobsters may be taken on the shores of both. The herring-fishery is chiefly prosecuted near the mouth of Killery harbour.

Divisions and Towns.—The county is in the dioceses of Tuam, Killala, and Achonry. It is divided into nine baronies—Burrishoole, Carra, Claremorris, Costello, Erris, Gallen, Kilmaine, Murrisk, and Tyrrawley. The principal towns are Castlebar, Westport, Ballina, and Ballinrobe, which are noticed under their respective titles.

The following are some of the smaller towns and more important villages, with the population of each in 1851:—

Binghamstown-erris, a fishing village, built since 1821 on Saleen Creek, on the west side of Blacksod Bay, 52 miles W. from Castlebar by road, consists of mean dwellings laid down on a regular plan, and contains a parish church, a Roman Catholic chapel, and a dispensary. The harbour, consisting of a basin, with a pier 165 feet long, was completed by the Fishery Board. Fairs are held on the 1st of every month. CLARE, or CLAREMORRIS. *Cong*, population 519, a poor village near the head of Lough Corrib, 30 miles S. from Castlebar, contains a parish church, a Roman Catholic chapel, a dispensary, and the ruins of an abbey, in which Roderick O'Connor, the last native king of Ireland, after being dispossessed of his sovereignty, passed the last years of his life. Petty sessions are held in the town on the second Friday of every month. *Crossmolina*, population 1225, a market and post-town, on the river Deel, near the head of Lough Conn, 16 miles N. by W. from Castlebar by road, contains a parish church, a Roman Catholic chapel, a Methodist chapel, and remains of an old castle and of an abbey. Petty sessions are held monthly. Fairs are held ten times a year. There is a weekly market. *Foxford*, population 681, a market and post-town, on the right bank of the river Moy, near Lough Cullin, 13½ miles N.E. by N. from Castlebar, contains a handsome parish church, with a square tower, a Roman Catholic chapel, a market and court-house, and a dispensary. Petty sessions are held monthly. Thursday is the market-day. Fairs are held four times a year. NEWPORT.

Mayo returns two members to the Imperial Parliament. The county is in the Connaught circuit. The county prison is at Castlebar, where the assizes are held. Quarter sessions are held there and at Ballina, Ballinrobe, Belmullet, Castlebar, Claremorris, Swineford, and Westport. Petty sessions are held in 24 places. A savings bank is established at Castlebar, the deposits in which amounted on November 20th 1853 to 13,903*l.* 13*s.* 11*d.* In September 1852 there were 173 National schools in operation, attended by 9928 male and 8770 female scholars.

History and Antiquities.—This county formed part of the grant made by king Henry II. to William Fitz-Adelm de Burgho about the year 1180. Little is known of the proceedings of the settlers until the great rebellion succeeding the assassination of William de Burgho, earl of Ulster, in 1333. Immediately after the murder of the earl some of the younger branches of the Burke family, seeing that the entire province would be inherited by his infant daughter, seized on the counties of Galway and Mayo, and cast off allegiance to the English law, renouncing their English names, and identifying themselves and their followers with the native Irish. The name chosen by Edmund de Burgho, who seized on Mayo, was MacWilliam Oughter. From this time till the reign of Elizabeth the MacWilliam of the day exercised the authority of an independent potentate. In 1575 the MacWilliam, accompanied by the O'Malley and a number of the clan Donnell, came to Galway and made his submission, consenting to pay 250 marks per annum for his country, and to allow his followers to hold by English tenure. The county was shortly after again declared shire-ground. The Burkes however subsequently broke into rebellion, in which they were joined by other families. To appease these tumults Sir Richard Bingham marched to Ballinrobe on the 12th July 1586, and having razed several castles of the Burkes and Macdonnells, and defeated the rebels, succeeded in restoring the county to tranquillity. In 1793 a French force of 1100 men, under General Humbert, made a descent on Mayo, carried the towns of Killala and Ballina, and being joined by a large body of the peasantry defeated General Lake before Castlebar, but had to surrender at Ballinamuck.

The antiquities of the county are chiefly ecclesiastical. There are round towers at Killala, Turlogh, Meelick, and Balla. At Cong are the remains of a splendid abbey, founded in the 7th century, and

rebuilt by O'Connor in the 12th century. An archiepiscopal crozier of surprisingly beautiful workmanship, made by command of Turlough O'Connor, the father of Roderick, the last native king of Ireland, and preserved at Cong until recently, is now in the possession of the Royal Irish Academy. At Ballyhaunis are the ruins of a largely endowed abbey founded by the family of Nangle. At Moyne there are the fine remains of a Franciscan friary. Rossark abbey, in the same neighbourhood, built by the Joyces in the 15th century, is another very striking ruin. The remains of Ballintubber abbey, 7 miles from Ballinrobe, are among the most elegant specimens of early architecture in Ireland. It was founded by Cathal O'Connor about the close of the 12th century. Throughout the county there are many other remains of religious houses.

The chief military antiquities are Carrig-a-Nile, near Newport, said to have been a stronghold of Grace O'Malley, or Granu Aile, celebrated for her exploits against the English in the 16th century; Doona Castle, on the shore of Tullaghan Bay, another seat of the O'Malleys; and Inver Castle, on the shore of Broadhaven, which probably belonged to the same family.

MAYOTTA. [COMORO ISLANDS.]

MAYPU, RIO. [CHILL]

MAZANDERAN. [PERSIA.]

MEACO. [JAPAN.]

MEASHAM. [DERBYSHIRE.]

MEATH, a maritime county in the province of Leinster, Ireland, is bounded N. by Cavan, Monaghan, and Louth, E. by the Irish Sea and the county of Dublin, S. by Kildare and King's County, and W. by Westmeath. It is situated between 53° 22' and 53° 55' N. lat., 6° 13' and 7° 17' W. long. Its greatest length from east to west is 47 miles; from north to south 40 miles. The area is 906 square miles, or 579,899 acres, of which 547,391 acres are arable, 16,033 acres uncultivated, 12,767 acres in plantations, 467 acres in towns, and 3244 acres under water. The population in 1841 was 183,828: in 1851 it was 140,750.

Coast-line and Surface.—The coast, 10 miles in length, has a tolerably straight outline running south by east from the mouth of the Boyne to the boundary of the county of Dublin, near Gormanstown. The shore is low, skirted by sand-banks or hills, and broken by one or two small streams which flow into the sea. There is no harbour of importance.

The highest part of the county is near the western border, to the south of the Crosswater stream, which separates Meath from Cavan. The principal hill in that district is Sliebhnallagh, which rises to the height of 904 feet, between Oldcastle and Crossakeel. There are small patches of bog in many parts of the county. The general surface of the county is a continuation of the central plain of the island. Belonging almost entirely to the basin of the Boyne, it is broken only by gentle undulations or by detached hills of inconsiderable height. In the southern portion of the county the chief elevation is 558 feet, the height of one of several hills in the neighbourhood of Dunshaughlin.

Hydrography and Communications.—The Boyne touches the border of the county at its south-western extremity, and after dividing it for a few miles from the county of Kildare, flows in a winding channel north-east by Trim to Navan, where it receives the Blackwater, its chief tributary. The Menagh, which skirts the south-western border and unites with the Boyne where the latter first touches the county; the Blind, the Blackwater, which on the south divides Meath from Kildare, and the Deel, all small streams, join the Boyne before it reaches Navan. From Navan the Boyne flows east-north-east by Slane to the border of Louth, and thence along the boundary-line to the sea at Mornington below Drogheda. The Boyne is navigable in the natural bed of the stream to above Drogheda, and afterwards partly in the natural bed, and occasionally by a lateral cut or canal to Navan, about 23 miles from its mouth. The Blackwater touches the border of the county on the north-west side at the junction of the Crosswater, and after running a short way between Louth and Meath flows east-south-east 18 miles into the Boyne at Navan. The Nobber rises from some bogs and small lakes on the northern side of the county near Kilmainham, and flowing in a winding course first south-east then north-east enters Louth, and there unites with the Dee. The southern and south-eastern borders are watered by the affluents of the Liffey, or by some smaller streams which flow into the sea between the Liffey and the Boyne. Lough Sheelin, a lake of an oval form, 5 miles long, separates Meath and Westmeath from Cavan. Lough Bawn and other small lakes lie on the western border of the county. In the north the lake of Kilmainham, about a mile long, is formed by an expansion of the Nobber.

The Royal Canal enters the county near Killook, and runs for some miles within the border, occasionally quitting it for the county of Kildare. It is carried by aqueducts over the Blackwater and the Boyne, and soon after enters Westmeath. About 14 or 15 miles of this canal are within the county, which it connects with Dublin at one end, and the Shannon, near the town of Longford, at the other. The Midland Great Western railway, from Dublin to Galway, crosses the county close to the line of the Royal Canal. The Dublin and Belfast Junction railway passes along the coast, and a branch from Drogheda continues the communication inland to Navan.

The county is well provided with roads. The principal lines are the coast and inland roads to Drogheda, joining the Great Northern road to Armagh and Belfast; the Dublin and Londonderry road through Slane; the Dublin and Enniskillen road through Navan and Kells; the Dublin and Granard road by Trim and Athboy; and the Dublin and Sligo road by Clonard.

Geology.—Meath belongs chiefly to the great limestone district of Ireland, the southern part of the county, and considerable portions of the north and west, being occupied by this formation. A part of the limestone beds belongs to the calp or black shale series, composed of alternations of impure black argillaceous limestone with black shale containing balls of gray ironstone. From beneath the beds of the calp series those of the lower limestone crop out. The hilly parts of the county belong to the transition district, which extends from the coast of the county of Down into the counties of Longford and Roscommon. The rocks are grauwacke slate, fissile clay-slate, flint-slate, and chlorite slate. In this district limestone and marl are abundant.

Climate, Soil, and Produce.—The climate of Meath is colder than that of the western division of the island, but is less humid even than the climate of most of the eastern counties. Cold winds prevail during spring.

The soil is for the most part a deep loam of the richest character. Meath is the first county in Leinster for the quality of its grazing land. The mode of farming, though slovenly and defective, bears some resemblance to that of England. The employments are chiefly agricultural. Grazing is more attended to than tillage. Some coarse linens are manufactured. In 1853 the number of acres under crop was 203,528, of which 9563 acres grew wheat; 94,862 acres oats; 7434 acres barley, bere, rye, peas, and beans; 13,441 acres potatoes; 12,128 acres turnips; 5563 acres other green crops; 589 acres flax; and 59,953 acres meadow and clover. In 1852 on 10,897 holdings, there were 21,623 horses, 3579 mules and asses, 105,068 head of cattle, 151,422 sheep, 20,096 pigs, 7298 goats, and 242,203 head of poultry. The total value of the live stock here enumerated was estimated at 1,064,809*l.* The best breeds of cattle have been introduced. The horses are generally inferior. A large, long, blood horse, which sells for a high price, is much reared in the county.

Divisions and Towns.—The county of Meath is divided into 19 baronies,—Deece Lower and Upper, Drogheda, Duleek Lower and Upper, Dunboyne, Fors, Kells Lower and Upper, Lune, Morgallion, Moyfenrath Lower and Upper, Navan Lower and Upper, Ratoath, Skreen, and Slane Lower and Upper. The principal towns are NAVAN, KELLS, and TRIM, which are noticed under their respective titles. The following are the smaller towns and most important villages, with the population of each in 1851:—

Bohermeen, population 831 in 1841, had in 1851 fewer than 20 houses, and was therefore not returned as a separate village. Besides the parish church there is a large Roman Catholic chapel. Near Bohermeen are the extensive demesne of Allanstoun, the mansions of Oatlands, Durhamstown, and Robertstown, and Ardbraccan House, the palace of the Bishop of Meath. The episcopal residence, which is one of the finest in Ireland, was erected in 1766 on the site of a castle which had from an early period been the seat of the Bishops of Meath.

Athboy, population 1204, a market- and post-town, formerly a parliamentary borough, is situated on the Athboy River, 7 miles N.W. from Trim, and 36 miles N.W. by W. from Dublin. It contains a small church, a Roman Catholic chapel, a sessions-house, two free schools, a national school, and a dispensary. An almshouse for 12 poor widows is supported by Earl Darnley the proprietor of the town. Petty sessions are held monthly. Fairs are held 7 times a year.

Clonard, population of the townland of Anneville, or Old Clonard, 325 in 1861, is situated on the Boyne, 33 miles W. by N. from Dublin. Clonard in ancient times had an abbey which became the seat of a bishop whose diocese was augmented, previous to 1152, by the addition of the bishoprics of Trim, Ardbraccan, Dunshaughlin, and Slane; and was afterwards designated the diocese of Meath, but the cathedral continued to be at Clonard till 1206. About 1175 Hugh de Lacy erected here an Augustinian monastery. Clonard was the scene of conflict in 1641 and in the insurrection of 1798.

Duleek, population 1158 in 1841, but only 374 in 1851, is situated on the Nanny Water, 24 miles N. by W. from Dublin, and contains a parish church, erected in 1819, a Roman Catholic chapel, a National school, and a dispensary. There is an extensive flour-mill. Petty sessions are held monthly. Fairs are held 4 times a year. In the town are two stone crosses and the remains of an abbey or priory, and a monastic hospital. Duleek returned two members to the Irish Parliament.

Dunshaughlin has been already described. [DUNSHAUGHLIN.]

Nobber, population 266, situated on the road from Dublin to Clones, 40½ miles N.W. by N. from Dublin, contains a neat parish church, a Roman Catholic chapel, and a dispensary. Near the village is a large Danish camp, and in the churchyard are the remains of a structure supposed to have belonged to the Knights of St. John of Jerusalem. Fairs are held 6 times a year.

Oldcastle, the seat of a Poor-Law Union, will be separately noticed. [OLDCASTLE.]

Ratoath, population 396, formerly a parliamentary borough, is situated on the road from Ashbourne to Dunshaughlin, 15 miles N.W. by

N. from Dublin. It contains a neat parish church, a large Roman Catholic chapel, and a dispensary. There is here a remarkable Danish mound called the Moat of Ratoath. Fairs are held in the village on April 18th, June 1st, and November 20th.

Slane, population 526, a market- and post-town, is pleasantly situated on the left bank of the Boyne, 16 miles N.N.E. from Trim, and 28 miles N.N.W. from Dublin. The town consists generally of neat modern houses, and contains a parish church with a handsome spire, a Roman Catholic chapel, and a dispensary. In early ages Slane was the seat of a bishopric. Slane Castle, the seat of the Marquis of Conyngham, is on the bank of the river just above the town. In the grounds are a large chapel and lofty tower forming the remains of an abbey, founded in 1512 on the site of an earlier structure. There is a group of tumuli at New Grange a short way down the river; the largest is a mound 70 feet high, having at the top an irregular area, 300 feet in circumference. This mound, when opened, was found to conceal the entrance to a gallery leading to a remarkable excavation or cavern. Petty sessions are held monthly. Fairs are held on the 2nd of April, June, and September, and on November 8th.

Summerhill, population 208, about 6 miles S.S.E. from Trim, and 22½ miles N.N.W. from Dublin, is formed on a regular plan, and contains some well-built houses, a Roman Catholic chapel, and a dispensary. Adjoining the town is the demesne of Summerhill, the property of Lord Langford. Petty sessions are held in the town monthly, and fairs four times a year.

Tara, Tarah, or Taragh, population 122, is situated on the east side of the hill of Tara, 23 miles N.W. from Dublin. The parish church, built in 1823, forms a conspicuous object on the summit of the hill. Up to the close of the 6th century, it is said the kings, clergy, and bards of Ireland assembled every third year at the hill of Tara to settle the affairs of the kingdom, and elect a supreme ruler. In this neighbourhood the Danes were defeated in 980. Roderick, the last native king of Ireland collected his forces here before attacking the English at Dublin. In 1589, O'Neill assembled his troops at Tara Hill after laying waste the surrounding country, and in 1798 it was the scene of a skirmish between the insurgents and a detachment of fenibles. On the summit of the hill is a pillar stone, regarded by some as the coronation stone of the ancient kings of Ireland.

Meath returns two members to the Imperial Parliament. The county is in the diocese of Meath, with portions in Armagh and Kilmore. It is in the home circuit. The assizes are held at Trim, where the county prison is. There are bridewells at Trim, Navan, and Kells. Quarter-sessions are held at each of these towns and at Duleek and Dunshaughlin. Petty-sessions are held in 17 places. There are savings banks at Kells and Navan; the deposits on November 20th 1853 amounted to 22,341*l.* 17*s.* 1*d.* The county is in the military district of Dublin. There are barrack stations at Navan and Trim. The constabulary force, consisting of 466 men and officers, has its head-quarters at Navan. In September 1852, there were 144 national schools in operation, attended by 7092 male and 7088 female children.

History and Antiquities.—Meath appears to have been included by Ptolemæus in the territory of the Blainii, or Eblani, a nation whose sway extended over the counties of Dublin and Wicklow. At an early period Meath constituted one of the kingdoms into which Ireland was divided, and comprehended, it is likely, not only the present counties of Meath and Westmeath, but also the whole or part of those of Longford, Cavan, and King's County. Teamor, now Tarah Hill, near the Boyne, between Dunshaughlin and Navan, was the residence of the sovereign of Ireland, and the place where St. Patrick made his first efforts for the conversion of the Irish to Christianity. After the sovereignty of Ireland became a merely nominal supremacy, the kings of Meath constituted one of the two lines of the great family of the Hy-Nialla, by which the general government was alternately possessed.

In the invasions of the Northmen or Danes, the kingdom of Meath suffered severely. For several centuries it was exposed to their ravages, or to those of the Irish princes, with whom the kings of Meath were at war.

At the English invasion, Richard, earl of Strigul or Chepstow, commonly called Strongbow, took possession of Meath in 1171, which was conferred by Henry II. as a county palatine on Hugh de Lacy. In the general rebellion excited in the reign of Henry II., Meath was preserved to the English by the valour of William Petit, who defeated the Irish invaders in 1186. The power of one of the De Lacys, who had been created Earl of Ulster, having excited the jealousy of John, that king visited Ireland in 1210, and spent some months in reducing the fortresses in Meath and Ulster. The county was very much disturbed for upwards of 100 years afterwards. The native Irish repeatedly renewed their incursions, and in 1329 the English, under Lord Thomas Butler, sustained a severe defeat from them near Mullingar in Westmeath. Richard, duke of York, Lord-Deputy in the reign of Henry VI., erected castles along the border of Meath and other counties in order to repress them.

At the close of the reign of Henry VIII. the ancient county of Meath was divided; and West Meath, including the present counties of Westmeath and Longford, and part of King's County, was erected

into a separate county. Cavan, which was partly formed out of Meath, was erected into a separate county by Sir John Perrot, Lord-Deputy in the reign of Elizabeth. In the great rebellion of 1641 Trim was entered by the English troops, who designed to make it a military post; and an attempt of the Irish in 1642 to surprise the garrison was defeated by a bold and successful sally. Sir Charles Coote, one of the best officers of the English, and commander of the garrison, fell in the action. In 1647 Trim was unsuccessfully besieged by the insurgents under General Preston. It served as a place of retreat to some of the Royalists on their defeat at Rathmines, near Dublin, in 1649; but after the storming of Drogheda, and the massacre of the garrison by Cromwell, Trim was surrendered by the Royalists without resistance.

The battle of the Boyne was fought close upon the border of this county, between Drogheda and Slane. The two armies subsequently crossed the county from north to south. In the rebellion of 1798 some outrages were committed in the county by a party of insurgents, and a body of about 4000 men took post on Tara Hill, where they were defeated with considerable slaughter by the troops and yeomanry.

There are several remains of antiquity in the county. At Tarah, or Taragh, once the seat of the Irish monarchs, are considerable earthworks. Two splendid torques, or collars of pure gold, were dug up here in 1813. There are considerable ruins of the castles of Scorlogestown, Dunmoe, Athlumney, and Asigh. Slane Castle and one or two others have been fitted up as residences. There are round towers at Kells and at Donoughmore near Navan. There are numerous interesting ruins of ancient monastic edifices, particularly those of the monastery at Duleek, which present some remarkable traces of rude architecture. The ruins of Bective Abbey are extensive and picturesque.

The diocese of Meath is in the province of Armagh: it comprehends nearly the whole of the counties of Meath and Westmeath, a large part of King's County, and small portions of Cavan, Longford, and Kildare. The bishop of Meath takes precedence of all the bishops. The only dignitaries are the archdeacon of Meath and the dean of Clonmacnoise. The income of the diocese of Meath and Clonmacnoise is 4068*l.* Previous to 1152 the ancient sees of Clonard, Fore, Trim, Dunshaughlin, Slane, and Ardbraccan, with some smaller sees, were consolidated into the diocese of Meath, the seat of which was fixed at Clonard. Duleek, Kells, and Clonmacnoise were afterwards added to the diocese, the seat of which was transferred about 1206 to Newtown Abbey near Trim.

MEAUX. [SEINE-ET-MARNE.]

MECCA, a city in Arabia, capital of the Hedjaz, and the birth-place of Mohammed, is situated in about 21° 30' N. lat., 40° 20' E. long., and 70 miles from the Red Sea, in a sandy valley running north and south, and from 100 to 700 paces broad. The chief part of the city is placed where the valley is widest. In the narrower part are single rows of houses only or detached shops. The town itself covers a space of about 1500 paces in length, but the whole extent of ground comprehended under the denomination of Mecca amounts to 3500 paces in length. The heights that screen the valley are from 200 to 500 feet in height, barren and destitute of trees. Most of the town is situated in the valley itself, but there are some parts built on the sides of the hills.

The streets are in general broader than those of eastern cities, for the purpose of accommodating the vast number of pilgrims who resort to it. The houses are lofty and of stone; and the numerous windows that face the streets give to these quite a European aspect. Many of the houses are three stories high. In Mecca it was necessary to leave the passages wide for the visitors who crowd here.

The only public place in the body of the town is the large square of the great mosque, which is enlivened during the Hadj (Pilgrimage) by a great number of well-stored shops. The streets are all unpaved, and in summer the sand and dust are as great a nuisance as the mud is in the rainy season, during which they are scarcely passable after a shower.

Mecca is badly provided with water; there are few cisterns for receiving rain, and the well-water is brackish. The famous well of Zemzem in the great mosque is indeed copious enough to supply the whole town, but the water is not well tasted. The best water is brought by an aqueduct from the vicinity of Ararat, six or seven hours distant. There are two places in the interior of the city where the aqueduct runs above ground, and in these parts it is let off into small channels or fountains, at which some slaves of the Sherif are stationed to exact a toll from persons who fill their water-skins.

All the houses in Mecca except those of the principal and richest inhabitants are constructed for the accommodation of lodgers, and divided into numerous separate apartments, each consisting of a sitting-room and a small kitchen. Except four or five houses belonging to the Sherif, two 'medressa,' or colleges, and the mosque, Mecca has no public edifices of any importance.

The mosque, called Beitullah (God's House), or El Haram, is only remarkable for the Kaaba, or Holy House, which it incloses. The Kaaba stands in an oblong square, surrounded by colonnades; on the east there are four rows of pillars, and on the other sides only three. The pillars are united by pointed arches, every four of which support a small dome, plastered and whitened on the outside. The number of

these domes is 152, and that of the pillars is variously stated at 450 and 500. These columns are from one foot and a half to one foot and three quarters in diameter, and above twenty feet in height, but otherwise there is little regularity in them. No two capitals or bases are exactly alike. The capitals are of coarse Saracenic workmanship, and some, which had served for other buildings, have, by the ignorance of the workmen, been placed upside down upon the shafts.

Seven paved causeways lead from the colonnades towards the Kaaba, in the centre. The whole area of the mosque is upon a lower level than any of the streets surrounding it. There is a descent of eight or ten steps from the gates on the north side into the platform of the colonnade, and of three or four steps from the gates on the south side.

Towards the middle of this area stands the Kaaba, which, according to the belief of the Mohammedans, was constructed in heaven 2000 years before the creation of the world, and Adam, the first believer, erected the Kaaba upon earth on its present site, which is exactly below the spot which it occupied in heaven. It is an oblong massive structure, eighteen paces in length, fourteen in breadth, and from thirty-five to forty feet in height. It is constructed of the gray Mecca stone, in large blocks of different sizes, joined together in a very rough manner and with bad cement. It stands upon a base two feet in height, which presents a sharp inclined plane. As the roof is flat, it has at a distance the appearance of a perfect cube. The only door which leads into it is opened only two or three times in the year: this door is on the north side, and about seven feet above the ground: it is entered by wooden steps. At the north-eastern corner of the Kaaba, near the door, is the famous Black Stone, which every pilgrim kisses; it forms a part of the sharp angle of the building, and is four or five feet above the ground. It is an irregular oval, about seven inches in diameter, with an undulating surface, and seems to be a piece of basaltic lava. The four sides of the Kaaba are covered with a black silk stuff, hanging down and leaving the roof bare. This covering is renewed annually at the time of the hadj, and is brought from Cairo, where it is made at the expense of the Turkish sultan. An opening is left for the black stone. The Kaaba remains without a cover for fifteen days before the new one is put on. The black colour of the covering spread over a large cube in the midst of a vast square, gives to the Kaaba, at first sight, a very singular and imposing appearance. As it is fastened slightly, the least breeze causes it to move with a slow undulation, which is hailed by the assembled congregation as a sign of the presence of the guardian angels, whose wings by their motion are supposed to produce the waving of the covering. Seventy thousand angels have the Kaaba in their holy care, and are ordered to transport it to Paradise when the trumpet of the last judgment shall be sounded.

There are several other buildings within the area of the mosque, mostly appropriated to reading prayers, preaching, or the performance of devotions. The Zemzem, or Holy Well, is supposed to be the spring found in the wilderness by Hagar at the moment when Ishmael was dying of thirst. It seems probable that the town of Mecca owes its origin to this well; for many miles round no sweet water is found, nor is there in any part of the adjacent country so copious a supply. It is inclosed by a square building of massive construction, with an entrance to the north opening into the room which contains the well. This room is beautifully ornamented with marbles of different colours; and adjoining to it, but having a separate door, is a small room with a stone reservoir, which is always full of Zemzem water; this the hadjis get to drink by passing their hand with a cup through an iron-grated opening, which serves as a window, into the reservoir without entering the room. From before dawn till near midnight the well-room is constantly filled with visitors. It is considered a miracle that the water of this well never diminishes notwithstanding the continual draught from it. The water is supplied by a subterraneous rivulet.

The inhabitants of Mecca, with few exceptions, are Arabians. They have two kinds of employment, trade and the service of the Beitullah. During the hadj Mecca becomes one of the largest fairs in the East, and certainly the most interesting, from the variety of nations which frequent it. The merchants of the place make large profits during this time by their merchandises. They have also a considerable trade with the Beduins, and with other parts of Arabia. India goods, drugs, articles of dress, and corn, are the chief articles of trade. The greatest profit however is derived from supplying food for 60,000 hadjis, or pilgrims, and 20,000 camels. The only articles of manufacture are some pottery and beads; there are a few dyeing-houses in the city.

Mecca is governed by a Sherif, who is chosen from one of the tribes of Sherifs, or descendants of the Prophet, settled in the Hedjaz; they were once numerous, but are now reduced to a few families of Mecca. Although he obtains his station by the choice of the Sherif families, or by force, he holds his authority from the Turkish sultan. [ARABIA, vol. i., cols. 413, 414.] Only Mussulmans are allowed to enter Mecca.

Near Mecca is a hill called *Arafat*, on which, according to the belief of the Mohammedans, Adam, conducted by the angel Gabriel, met Eve, after they had been separated for 200 years, in consequence of their disobedience, and banishment from Paradise. It is the scene of an annual procession of the Mohammedans, at which certain prescribed ceremonies are performed; and no pilgrim, although he may have

visited all the holy places of Mecca, is entitled to the name of 'hadji' unless he has been present on this occasion.

(Burkhardt, *Travels*; Ali Bey, *Travels*.)

MECHELEN, MECHLIN, or MALINES, a large well-built town in the province of Antwerp, is situated on the Dyle, in 51° 2' N. lat., 4° 29' E. long., in a fertile plain, at the intersection of four railroads leading to Antwerp, Ghent, Brussels, and Liège, respectively distant 27, 35, 12, and 59 miles. The streets are wide, well paved, and kept remarkably clean. The large square, called La Place d'Armes, and the market-place, are in particular deserving of mention. The cathedral, dedicated to St. Rombaud, is the most remarkable building in the town. Its tower is 348 feet high, and contains a fine peal of bells: the nave was finished in 1437, the choir in 1451. The pulpit, representing the Conversion of St. Paul, and the Crucifixion by Vandyke, are the great ornaments of the interior. The side-chapels are adorned with numerous pictures. The organ is remarkable for its rich and full body of tone. Among the other churches of Malines are those of St. Jean, which contains the Adoration of the Magi by Rubens; and the elegant gothic church of Notre-Dame, in which is the 'Miraculous Draught of Fishes,' also by Rubens. The other principal buildings are—the arsenal, which contains a cannon-foundry; the town-house; the archiepiscopal palace; and the church of the Jesuits. Mechelen contains a college, an academy of painting, a society of fine arts, and a large building which serves as an asylum for 800 widows and aged women.

It appears that as early as the 5th century Mechelen was the capital of a lordship, which was afterwards given in 754 by Pepin to one of his relatives. It was subsequently destroyed by the Normans, and rebuilt in the year 890. In 910 it was ceded by France to the Bishop of Liège. At this time it occupied only the left bank of the Dyle, but was extended on the other side of the river in 970. Mechelen was sacked by the Spaniards in 1572, and by the army of the Prince of Orange in 1578. It was taken in 1706 by the Duke of Marlborough, and by the French in 1746, but was restored at the peace of Aix-la-Chapelle. In 1792 it was again taken by the French, who in 1804 destroyed its fortifications.

Malines is the seat of an archbishop, who is primate of Belgium, and has for his suffragans the bishops of Namur, Tournay, Aix-la-Chapelle, Trèves, Ghent, Bruges, Liège, and Mayence.

Mechelen carries on some trade by means of vessels of considerable burden which ascend the Schelde and the Dyle at high-water, the influence of the tide being felt a few miles above this town. The principal articles of commerce are—corn, oil, hemp, flax, and hops. The lace-manufacture of Mechelen, once of great importance, has greatly fallen off. The lace made here now is coarser and much less valuable than that made at Brussels. The railway terminus for the four lines above alluded to is about a quarter of a mile north of the town. It was originally intended to have the terminus in the middle of the town, but this project was successfully resisted by the authorities and the townfolk. The consequence is, that of the millions who pass through the terminus yearly a very small number enters the picturesque old city, and fewer still stop in it; and Mechelen has begun to have a deserted aspect. There are manufactories of hats, shawls, coarse woollens, and paper; cotton-mills, dye-houses, breweries, distilleries, and tanneries.

MECKLENBURG, a county in North Germany, lying between 53° 8' and 54° 2' N. lat., 10° 40' and 13° 45' E. long., consisting of the grand-duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz, and the principality of Ratzeburg, is bounded N. by the Baltic, E. by Prussia, S. by Prussia and Hanover, and W. by Lauenburg and Lübeck. The whole area is 5588 square miles, and the population in 1848 amounted to 642,391.

Surface, &c.—The surface of the country, being a part of the lowland of Northern Germany, may be described generally as a plain. There is a ridge or chain of hills, which, commencing in the Silesian Mountains, traverses the country, and extends in a north-west direction into Holstein. On both sides of this ridge there is some heath, moor, and sand, but a great portion of the land is fertile, and in parts covered with considerable forests. The soil is partly loamy and heavy, partly of a middling quality, and partly sand. In Mecklenburg-Schwerin there are 62 lakes at least one mile and a quarter long, besides many smaller ones. Lake Müritz, which is the largest, is 18 miles long and 8 miles broad. In Mecklenburg-Strelitz the county of Stargard alone contains 53 lakes at least one mile and a quarter long; the largest is the Tollen Lake, 7½ miles long. Some of the rivers fall into the Baltic, and others into the Elbe. Of the former the principal are the Trave, Stakenitz, Recknitz, Peene, Warnow, and Stuhr; the Warnow is one of the chief rivers: the length of its course is about 100 miles. At Rostock it suddenly expands to a breadth of 2400 feet, and falls into the sea at Warnemünde. The Elbe washes the frontier only at two places, near Dönitz and Boitzenburg, which lie on its banks. The rivers that fall into the Elbe are the Elde, which has a course of above 100 miles, and the Havel. The Peene and the Havel have their sources in Mecklenburg. The coast of the Baltic, which is but little indented, is generally steep, and high above the sea; and where it is lower, the country is protected from the incursions of the sea by sand-hills. Though Mecklenburg, on the whole, is not a picturesque country, there are some spots of very pleasing

appearance about many of the lakes, especially Lake Malchin, and near the sea-coast. The climate is healthy; but the weather is variable and frequently foggy, and the winter often very cold.

Natural Productions.—Agriculture is the chief employment of the inhabitants. Wheat, rye, barley, oil, seeds, oats, peas, and vetches are very abundant; the wheat is grown for exportation. The forests produce oak, beech, and fir-timber of excellent quality. The horses are light and active, show a good deal of blood, and are superior generally speaking to those met with in the rest of North Germany. Horned-cattle and sheep are numerous, and the quantity of butter made and the wool sold is very considerable. The wool fairs are held in Rostock, Gastrow, and Neu-Brandenburg in June. Swine are abundant. In parts wild boars, stags and deer, bustards, partridges, snipes, wild geese, and ducks are numerous. The geese of Mecklenburg are celebrated for their size and quality. Fish abound both in the sea and in all the lakes. The country is poor in minerals, and no mines of any kind are worked.

Trade and Manufactures.—The manufactures are inconsiderable, but great pains are taken to promote the woollen manufacture. Favourably situated as the country is between the Baltic and the Elbe, its commerce is far more important than its manufactures. The exports consist of the farm products before named, together with oil-cake, rags, bones, &c.; the imports of wine, spirits, sugar, molasses, coffee, iron, fish, manufactured goods, hemp, flax, oil, cheese, chalk for manure, pitch, &c. The revenue of Mecklenburg-Schwerin amounted to 3,251,174 thalers, the expenditure to 3,439,564 thalers in 1852-3.

The southern part of Mecklenburg is traversed by the Berlin and Hamburg railway, from the Hagenow station on which a line 71 miles in length runs north-eastward through Schwerin and Bützow to Rostock, with branches to Güstrow and Wismar.

Religion and Education.—The inhabitants in Mecklenburg-Schwerin, who are of Vandal and Slavonic origin, profess the Lutheran religion, with the exception of 687 Catholics, 181 Calvinists, and 3232 Jews; and in Mecklenburg-Strelitz about 800 Jews and 50 Catholics. The sovereigns are the heads of the Lutheran Church. There is a university at Rostock with faculties of Lutheran theology, law, medicine, and philosophy, 37 professors, and about 105 students. There are gymnasia for Lutheran pupils in Schwerin, Parchim, Güstrow, Rostock, Wismar, Neu-Strelitz, Neu-Brandenburg, and Friedland; and elementary education has been widely diffused since the reign of Frederick Francis.

The military force of Mecklenburg-Schwerin in time of peace is 2665 officers and men; in time of war 4572 officers and men. The peace establishment of Mecklenburg-Strelitz amounts to 742 men. Their contingents to the army of the Confederation exceed their ordinary establishment, that of Mecklenburg-Schwerin being 3580, and that of Mecklenburg-Strelitz 718 men. In the full council Schwerin has two votes and Strelitz one; in the select council they have together one vote, namely, the 14th.

Form of Government.—The grand-dukes, assisted by a ministry of state, have the whole executive power, but share with the estates the legislative power and the right of imposing taxes. The grand-dukes indeed govern their respective dominions independently of each other, but the estates of the two grand-duchies are inseparably united by a compact made in 1523, called the Landes-Union. The clergy, formerly the first estate, having been excluded after the Reformation, the assembly has since consisted of two estates. The first is called the equestrian order, which includes all the owners of noble estates (whether they are noblemen or not). They have great privileges and immunities, and are rich and powerful. There are about 572 land-owners who have seats and votes in the assembly. The second estate consists of the deputies of the 44 towns. They meet annually at Sternberg and Malchin alternately. In general above 200 members attend. The grand-duke alone has the right of introducing such measures ('propositions') as he deems necessary. The estates may accept or reject them; and they may likewise state grievances, and petition for remedies.

Mecklenburg was in ancient times inhabited by the Vandals. On their emigrating to the south they were succeeded by Slavonic tribes, of whom the most powerful were the Obotriti, to whose prince, Heinrich Burewin, son of Pridislaus, Henry the Lion gave his daughter Matilda. Pridislaus was declared in 1170 a prince of the empire, and was the ancestor of the succeeding sovereigns of Mecklenburg. These princes received the ducal title from the emperor Charles IV. in 1340, and assumed that of grand-duke on joining the German confederation in 1815. The house of Mecklenburg is the oldest reigning family in Europe—perhaps in the world.

I. Mecklenburg-Schwerin is divided into the circles of Mecklenburg, Wenden, the principality of Schwerin, Rostock, and the lordship of Wismar. It contains an area of 4824 square miles, and had a population of 542,768 in 1852.

Bützow, the capital of the principality of Schwerin, is situated on the Warnow, 19 miles by railway S.S.W. from Rostock, and has about 4000 inhabitants, who manufacture paper and playing-cards.

Güstrow, capital of Wenden district, and one of the finest towns in the grand-duchy, was formerly the residence of the princes. It is situated on the left bank of the Nebel, 27 miles by railway S.E. from

Rostock, and has about 9000 inhabitants. The most remarkable buildings are the cathedral, containing some costly monuments of the reigning family; and the old palace (now a house of correction), described as the finest princely residence of the middle ages in Mecklenburg. Güstrow is a walled town, and a place of some commercial importance. There are several breweries, distilleries, and factories in the town.

Rostock, capital of the circle of Rostock, a trading port, and the largest town in the grand-duchy, is situated in 54° 5' N. lat., 12° 20' E. long., on an eminence on the left bank of the river Warnow, 131 miles by railway from Hamburg, 187 miles by railway from Berlin, and has about 22,000 inhabitants. It is surrounded by old walls, and consists of the old, the middle, and the new towns. On the whole the old town is most irregular, the middle town the handsomest, and the new town the most regularly built. The principal buildings are the arch-ducal palace, the university, the court of justice, the town-hall, and the churches of St. Mary and St. Peter—the former contains the tomb of Grotius, and possesses one of the finest organs in northern Germany; the latter, built in the 12th century, is remarkable for its fine steeple, 420 feet in height. The university, founded in 1419, has 23 professors, and possesses a library of 120,000 volumes rich in Oriental and Spanish literature. Rostock is the principal trading port of Mecklenburg, and possesses about 150 ships. The chief exports are corn, wool, oil-cake, rags, bones, flax, horses, cattle, provisions, &c.: the imports, colonial produce, wine, manufactured goods, and bay-salt. The manufactures comprise woollen-cloth, chicory, soap, beer, spirits, refined sugar, vinegar, chemical products, &c. Between 200 and 300 vessels belong to the port, which admits only those of 8 or 9 feet draught; larger vessels load and discharge at Warnemünde, at the mouth of the Warnow, 9 miles N. from Rostock: 435 vessels cleared from Warnemünde in 1849.

Schwerin, capital of the grand-duchy and of Mecklenburg district, is situated in 53° 45' N. lat., 11° 30' E. long., on the western shore of the lake Schwerin, 55 miles by railway S.W. from Rostock, and has about 18,000 inhabitants. The town has a striking and important appearance when viewed from a distance. It is inclosed by walls pierced by seven gates. On a nearer view however it is a long, irregular, and plain town, containing a few fine buildings: among them are the grand-ducal palace, which is built on an island in the lake, and is an old fortified structure, containing a good picture-gallery and a museum; a modern building appropriated to state business; and an old gothic cathedral, 305 feet in length and 135 feet in breadth. There are also Lutheran and Catholic churches, a synagogue, and a mint. The manufactures, of vinegar, cloth, pottery, and tobacco, are not of much importance.

Wismar, a fortified sea-port on Wallfisch Bay, at the mouth of the Stuhr, in 53° 53' N. lat., 11° 35' E. long., 22 miles N. from Schwerin, has about 12,000 inhabitants. The harbour is not deep, but it is considered one of the safest in the Baltic. Wismar possesses from 60 to 70 vessels; the entries into the harbour in 1849 numbered, exclusive of steamers, 338 ships, carrying 16,473 tons; the departures were 343 vessels, carrying 17,631 tons. The harbour is admirably sheltered on all sides; the islands of Poel and Wallfisch lie across the entrance, and screen it from the northerly winds. The town is tolerably well built, the streets are broad and well paved. The principal buildings are three gothic churches, a handsome modern town-hall, and a fine lofty school-house. The exports consist chiefly of corn; the imports are mostly Swedish productions. Fishing, agriculture, and the manufacture of tobacco, sail-cloth, playing-cards, beer, spirits, and linen employ a large portion of the population. Wismar was bought by Schwerin in 1803 of the Swedish government for 1,200,000 dollars. Wismar was a member of the Hanseatic League.

Among the other towns of Schwerin are the following:—**Parchim**, situated on the Elbe, 20 miles S.E. from Schwerin, is a walled town with about 7000 inhabitants, who manufacture woollen-cloth, tobacco, leather, chicory, &c. **Ludwigslust**, a market-town, and station on the Berlin-Hamburg railway, 20 miles S. by E. from Schwerin, has a fine palace, in which the grand-duke resided till 1837, a tobacco factory, and about 6000 inhabitants. **Boitzenburg**, 18 miles by railway W. from Hagenow, stands on the right bank of the Elbe, the Mecklenburg tolls on which river are paid here. The town has ship-building docks, a considerable transit trade, and 3300 inhabitants. **Dobberan**, a bathing village near the Baltic coast, with a population of 3200.

II. Mecklenburg-Strelitz lies east of Mecklenburg-Schwerin, and has an area of 764 square miles, with a population in 1851 of 99,828.

Neu-Brandenburg, a pretty circular town, with broad straight streets, is built near the Tollen-see; manufactures of woollen-cloth, cards, paper, and tobacco are carried on. The grand-duke has a palace in the town and a country-house in the neighbourhood. There is an annual wool-fair; and horse-races are held in the vicinity; population, 6000.

Stargard (called *Old Stargard*), is a small town with about 1400 inhabitants, a few miles S. from Neu-Brandenburg.

Strelitz, capital of the grand-duchy, situated in 53° 21' N. lat., 13° 10' E. long., consists of the old and new towns, which though a mile apart form one city. Old Strelitz is the seat of leather, tobacco, and pipe manufactures; and four annual fairs are held there. New Strelitz, founded in 1733, is built in the form of a star, with eight

divergent rays. This town is the residence of the grand-ducal court. The most remarkable edifice is the ducal palace, which contains a library of 50,000 volumes and a curious collection of German antiquities. The inhabitants chiefly depend for their support on the expenditures of the court. The united population of the two towns is 9500.

Ratzeburg, a small principality belonging to Mecklenburg-Strelitz, and situated between Schwerin, Lübeck, and Lauenburg, has an area of 137 square miles, and a population in 1851 of 16,352. It is traversed by the river Trave, and is bounded W. by the Lake of Ratzeburg, by means of which timber, corn, pulse, flax, and cattle are sent to Lübeck for exportation. The inhabitants also carry on considerable fisheries. *Ratzeburg*, the chief town, mostly belongs to Lauenburg, with the exception of the cathedral and the hospital, which belong to Strelitz. [HOLSTEIN.] It is the seat of the government of the principality, and has a population of 3000. [See SUPP.]

MECKRAN. [BELOOCHISTAN.]

MEDELLIN. [ESTREMADURA, Spanish.]

MEDELPAD. [ANGERMANNLAND.]

MEDEMBLIK. [HOLLAND.]

MEDEYAH. [ALGÉRIE.]

MEDIA, a country of ancient Asia. In the time of Strabo it was divided into two divisions, Great Media and Media Atropatene. Great Media, which is a high table-land, is said by all ancient writers to have had a good climate and a fertile soil; an account which is fully confirmed by modern travellers. It was separated on the west and south-west from the low country watered by the Tigris and Euphrates, by a range of mountains known to the ancients under the name of Zagros and Parachoatras. It was bounded E. by a desert and the Caspian Mountains (the modern Elburz Mountains), N. and N.W. by the Cadusii, Atropatene, and the Matieni, thus answering for the most part to the modern Irak Ajemi. Atropatene, which corresponds to the modern Azerbaijan, extended as far north as the Araxes (Aras); it was much less fertile than Great Media, and does not appear to have been included in the Media of Herodotus. It derived its name from Atropates, who successfully opposed the Macedonians, and established an independent monarchy, which continued till the time of Strabo.

The principal town of Great Media was Agbatana, or Ecbatana, the summer residence of the Persian kings. [ECBATANA.] South-west of Ecbatana was Bactana, or Bagistana, now called *Baghistan*, or *Behistan*, and sometimes *Basitán*, where Semiramis on her march from Babylon to Ecbatana is said to have formed a Paradise or great park. On the perpendicular face of the rock that skirts the plain is a group of figures in low-relief, with long inscriptions in the cuneiform character, which relate to Darius, son of Hystaspes, and his victories. These inscriptions have been interpreted by Colonel Rawlinson, and copies with translations are given in the 'Journal of the Asiatic Society,' vol. x. It is situated on the great commercial road which, beginning at Ctesiphon, passed through the Median gates of the mountain range called Zagros, and terminated at Ecbatana. In the north-east of Great Media, near the Caspian Gates, was the town of Rhagæ, afterwards called Europus by the Macedonians, and Arsacia by the Parthians, which was founded, or rather colonised by the Macedonians under Seleucus Nicator. This town, of which the ruins are still visible at Rai, is frequently mentioned in the apocryphal book of Tobit, as the place where many of the Jews resided, who had been carried away captive by Shalmaneser. Near Rhagæ was the Nisæan plain, celebrated for its breed of horses, which were considered in ancient times the best in Asia. (Herod., iii. 106, vii. 40; Arrian, vii. 13; Strabo, p. 525; Ammian., xxiii. 6).

The mountainous country in the south-western part of Great Media was inhabited by the Mardi, bordering on the north-west of Persia; the Uxii, and Elymsii, east of Susiana; and the Cossei, south of Great Media. The King of Persia was obliged to pass through the country of the latter whenever he visited Ecbatana, and could only obtain a free passage by the payment of a considerable sum of money. The Cossei were defeated by Alexander, but they never appear to have been completely subdued by the Macedonians.

The chief town of Atropatene was Gaza, or Gazika, as it is called by Ptolemæus, at no great distance from the modern Tauris, or Taubrees. North-west of Gaza was a salt-lake, called Spauta, or Martianus (Urmiah, or Urumiyah). In the north-east of Atropatene, near the Caspian Sea, were the Kadusii, or Gelsæ, whence the modern name of Ghilan is probably derived.

According to Herodotus the Medes were originally divided into six tribes—the Bussæ, Parataceni, Struchates, Arizanti, Budii, and Magi (i. 101). They were originally called Arii (Herodot., vii. 62); which word appears to contain the same root as Ar-tai, the ancient name of the Persians (Herodot., vii. 61).

Media originally formed part of the Assyrian empire. Its history as an independent kingdom is given differently by Herodotus and Ctesias (whose account is preserved in Diodorus).

According to Herodotus there were four kings of Media: 1, Dejoceus, who reigned B.C. 710-657; 2, Phraortes, B.C. 657-635, greatly extended the Median empire, subdued the Persians and many other nations, but fell in an expedition against the Assyrians of Ninus (Nineveh); 3, Cyaxares, B.C. 635-595, completely organised the military forces of the empire, and extended its boundaries as far west as the Hælyæ. In an

expedition against Nineveh, he was defeated by the Scythians, who had made an irruption into southern Asia, and was deprived of his kingdom for 28 years. After the expulsion of the Scythians, he took Nineveh, and subdued the Assyrian empire, with the exception of the Babylonian district; 4, Astyages, B.C. 595-560, who was dethroned by his grandson Cyrus, and Media reduced to a Persian province. Ctesias makes the Median monarchy commence about B.C. 842, and to last 232 years. Xenophon makes a fifth Median king, Cyaxares II., succeed Astyages.

The Medes revolted during the reign of Darius II., the father of the younger Cyrus, about B.C. 408, but were again subdued. (Herodot., i. 130; Xenoph., 'Hellen.,' i. 2). They do not appear after this time to have made any further attempt at recovering their independence. On the downfall of the Persian empire they formed a part of the kingdom of the Seleucidæ, and were subsequently subject to the Parthians.

MEDINA, the second holy city of the Mohammedans, and the place where their Prophet was buried, is situated in that part of Arabia which is called El Hedjaz, or Hedj, about 25° 15' N. lat., 39° 30' E. long., and about 110 miles from the town of Yembo on the Red Sea, which is the harbour of Medina.

Medina is built on the elevated plain of Arabia, not far from the eastern base of the ridge of mountains which divide the table-land from the lower country between it and the Red Sea. The town stands on the lowest part of the plain, where the watercourses unite, which produce in the rainy season numerous pools of stagnant water, and render the climate unhealthy. Gardens and date-plantations, interspersed with fields, inclose the town on three sides; on the side towards Mecca the rocky nature of the soil renders cultivation impossible.

The city forms an oval about 2300 paces in circuit, ending in a point. The castle is built at the point on a small rocky elevation. The whole is inclosed by a thick wall of stone, between 35 and 40 feet high, flanked by about 30 towers, and surrounded by a ditch. Three well-built gates lead into the town. The houses are well built of stone, and generally two stories high. As the stone is of a dark colour, the streets have a gloomy aspect, and are for the most part very narrow, often only two or three paces across; a few of the principal streets are paved with stone. There are only two large streets which contain shops. The principal buildings within the city are—the great mosque containing the tomb of Mohammed; two fine medreses, or colleges; and the castle, standing at the western extremity of the city, which is surrounded by strong walls and several high and solid towers, and contains a deep well of good water.

The suburbs extend west and south of the city, and cover more ground than the city. They are separated from it by an open space. Towards this open space the suburbs have no walls, but on the outside they are inclosed by a wall of inferior size and strength to that of the city. Four gates lead through this wall from the suburbs into the open country. The greater part of the suburbs consist of large courtyards with low houses built round them, and separated from each other by gardens and plantations; they are inhabited by the lower classes of the town, and all those who are engaged in agriculture. The cattle are kept in the midst of the courtyard, where there is a large well, and the only entrance is shut at night. In the western portion of the suburbs are regular and well-built streets with houses resembling those of the city. There are two mosques in the suburbs, one of which is called Meudjed Ali, or the mosque of Ali, the Prophet's cousin.

The town is well supplied with sweet water by a subterranean canal which runs from the village of Koba, about three-quarters of a mile distant in a southern direction. In several parts of the town steps are made down to the canal, where the inhabitants supply themselves with water, which however contains nitre and produces indigestion in persons not accustomed to it. There are also many wells scattered over the town; every garden has one, by which it is irrigated; and when the ground is bored to the depth of twenty-five or thirty feet water is found in plenty. During the rainy season many torrents descend from the higher grounds to the lower depression in which Medina is built, and part of the city is inundated. This plentiful supply of water made this site a considerable settlement of Arabs long before it became sacred among the Mohammedans by the flight, residence, and death of the Prophet, to which it owes its name of Medina, or Medinet el Neby (the City of the Prophet).

The mosque containing the tomb of Mohammed bears, like that of Mecca, the name of Hûram, on account of its inviolability; but in other Mohammedan countries it goes by the name of Meudjed el Neby, the 'Mosque of the Prophet,' who was its founder. It is situated towards the eastern extremity of the city, and its dimensions are much smaller than those of the mosque at Mecca, being 160 paces in length, and 130 paces in breadth; but it is built much upon the same plan, forming an open square, with a small building in the centre, and surrounded on all sides by colonnades roofed with small domes, which are whitewashed on the outside.

Near the south-eastern corner of the Mosque stands the famous tomb, detached from the walls so as to leave between it and the southern wall a space of about 25 feet, and 15 feet between it and the eastern wall. The inclosure which protects the tomb from visitors, forms an irregular square of about 20 paces, in the midst of the

colonnade, several of its pillars being included within it; it is an iron railing painted green, about two-thirds of the height of the columns. The railing is of good workmanship in imitation of filigree, and is decorated with open-worked inscriptions in yellow bronze. It is of so close a texture that no view can be gained into the interior except by several small windows, about 6 inches square, which are placed in the four sides of the railing, about 5 feet above the ground. The inclosure is entered by four gates, three of which are constantly kept shut, and one only is opened every morning and evening to admit the eunuchs, whose office it is to clean the floor and light the lamps. The inclosure is called El Hedjra. Permission to enter it is granted gratis to people of rank, and may be purchased by other people, from the principal eunuchs, for about twelve or fifteen dollars; but on entering the inclosure nothing more is to be seen than what may be observed when peeping in at the windows of the railing. At the distance of a few paces from the railing a curtain of rich brocade is carried all round, equal in height to the railing. No persons whatever are permitted to enter within the curtain, except the chief eunuchs, who take care of it, and who put on during the night the new curtain sent from Constantinople, whenever the old one is decayed, or when a new sultan ascends the throne. The old curtains are sent to Constantinople, and serve to cover the tombs of the sultans and princes.

According to the historians of Medina the curtain covers a square building of black stone supported by two pillars, in the interior of which are the tombs of Mohammed and his two earliest friends and successors, Abu Bekr and Omar. These tombs are deep holes, in which the coffins are deposited; that of Mohammed is cased in silver. The floor between the curtain and the railings is inlaid with variously coloured marble in mosaic; glass lamps are suspended all round the curtains, which are lighted every evening and remain burning all night. The whole of the inclosure is covered with a fine lofty dome rising far above the domes which form the roof of the colonnades, and is visible at a great distance from the town. As soon as pilgrims to Medina catch sight of it they repeat some prayers.

Near the curtain, and within the railings, is the tomb of Setna Fatme, the daughter of Mohammed and wife of Ali; it consists of a catafalque forming a cube, covered with a richly embroidered black brocade, and without any other ornament.

Four gates lead to the interior of the mosque; a few steps are to be ascended from the neighbouring streets up to the gates, the area of the mosque being at a somewhat higher level, contrary to what is the case at Mecca. About three hours after sunset the gates are shut by means of folding doors coated with iron, and not opened till about an hour before dawn; but those who wish to pray all night in the mosque can easily obtain permission from the eunuch on guard, who sleeps near the Hedjra. During Ramadhan the mosque is kept open the whole night.

The inhabitants of Medina, like those of Mecca, are not Beduins, but strangers, who have come to the place as pilgrims and afterwards settled there, or they are descendants of such strangers. Medina is not so great a place of commerce as Mecca, and the merchants are not so rich, but it has the advantage of having a considerable tract around which is fit for cultivation, and there are many wealthy land-owners in the town, who let out their possessions to poorer people. Wheat and barley are cultivated, but the chief profit arises from the plantations of date-trees, the fruit of which is held in greater estimation than the dates of Egypt.

(Burckhardt, *Travels in Arabia*.)

MEDINA-DEL-CAMPO, and DE RIO SECO. [LEON.]

MEDITERRANEAN SEA, the name of the sea that washes the coasts of Europe, Asia, and Africa, between the Strait of Gibraltar on the west and Syria on the east. This sea was anciently called The Sea, or the Great Sea, by the Jews. The Greeks do not seem to have had any general name for the Mediterranean: Herodotus calls it 'this sea' (l. 185); and Strabo calls it 'the sea within the columns,' that is, within the Strait of Gibraltar (121, 491, Casaub.). Mela calls the whole sea by the name 'our sea' (nostrum mare), and observes that different parts have their several names. Pliny appears to have no general name for it. The term Mediterranean is not applied to this sea by any classical Latin writer. It was called 'bahr-roum,' or the Sea of Rome, by the Arabs.

The Mediterranean Sea is comprised between the parallels of 30° 15' and 47° N., and the meridians of 5° 30' W. and 40° E. The distance from Gibraltar to the farthest shore of Syria is about 2300 miles, and the narrowest part, between Sicily and Africa, is 79 miles across. The Mediterranean, including the islands, occupies an area of 734,000 square miles. The surface of country of which it receives the drainage is very difficult to estimate, but may be assumed to exceed this quantity.

On the coast of Africa the Mediterranean forms a few large bays but no inlets of any magnitude. Into the European continent, on the other hand, it sends large inlets, connected with each other or with the main portion of this sea by narrow straits. Such are the Adriatic, which separates Italy from Austria and Turkey, and is joined to the Ionian Sea by the Strait of Otranto; the Ægean Sea, or Archipelago, stretching northward from Crete, between Greece and Asia Minor, embracing the numerous Greek islands, cutting up the mainland on

each side, with numerous bays, gulfs, inlets, and harbours, and washing at its northern extremity the coast of European Turkey; the Sea of Marmora, extending nearly east and west, between European Turkey and Asia Minor, from the Strait of the Hellespont, or Dardanelles, which connects it with the Ægean on the south-west, to the Bosphorus, or Strait of Constantinople, on the north; the Black Sea, a vast gulf which washes Asia Minor on the south, Armenia and Circassia on the east, the Crimea and Russia on the north, and European Turkey on the west; the Sea of Azof, which separates the peninsula of the Crimea from Russian-Circassia, and is connected with the Black Sea by the Strait of Yenikaleh, or Kertsch, the ancient Cimmeric Bosphorus; and the Siwash More, or Putrid Sea, which indents with its innumerable shallow bays and inlets the north-eastern coast of the Crimea and the coast of a part of the Russian province of Taurida, being separated from the Sea of Azof on the west by an extremely long and remarkably narrow tongue of land called Kosa Arabatskaia. To the north of the Kosa Arabatskaia is a very narrow strait which forms the only communication between the Sea of Azof and the Putrid Sea. Westward the Putrid Sea extends to the isthmus of Perekop, which is only 6 miles wide. As all these seas have been noticed in separate articles, ADRIATIC, ARCHIPELAGO, AZOF, BLACK SEA, MARMORA, &c., it remains here to notice the great connected mass of the Mediterranean Sea.

The Mediterranean Sea extends in an eastern direction from the Strait of Gibraltar which connects it with the Atlantic (5° 30' W. long.), a distance of about 2300 miles; its most eastern part, the harbour of Iskenderun, on the coast of Syria, being in about 36° 10' E. long. It is divided into two parts by the projection of the Italian peninsula, the island of Sicily, and Cape Bon on the north coast of Africa, between which and the most western part of Sicily the width of the sea is only 79 miles. The coast of Africa eastward from Ceuta to Cape Bon is bold and high with few exceptions, and deviates but little from a straight line, the indentations being small. The principal bays and harbours in this interval are the Bay of Melillah (east of which is the low marshy flat at the mouth of the Mulwia), the bays Oran, Algier, Bonah (east of which is the bank celebrated for its coral fisheries), and Carthage.

This part of the basin of the Mediterranean extends no great distance southward, the most southern point being the source of the Mulwia, about 32° N. lat. The rivers which are of inconsiderable magnitude are the Mulwia (ancient Mulucha), near the boundary between Morocco and Algérie, the Wady-el-Kebir (ancient Ampaga), the Wady-Serbous, and the Wady-Magerdah (Bagradas), all of which flow from the Atlas Mountains and their eastern continuation through Algérie.

From Gibraltar the sea gradually trends towards the north-east along the south and east coast of Spain, where are the ports of Malaga, Carthage, Valencia, and Barcelona, and the Bay of Rosas. A little north of the Bay of Rosas the coast runs first north and then east, forming the Gulf of Lyon off the south of France, where the coast is for the most part low, and fringed with numerous shallow shore-lakes or lagoons. The chief harbours in the Gulf of Lyon are Cete and Marseille. Eastward from Marseille the coast is high, the lower offsets of the Maritime Alps reaching down to the shore. In one of the indentations of this part of the coast is the French naval harbour and station of Toulon. The most northern part of this western division of the Mediterranean is the Gulf of Genoa, which is bounded to landward by a bold coast formed by the declivities of the Ligurian Apennines. From the Gulf of Genoa the coast of Italy takes a direction of south-south-east to the Strait of Messina, which separates that peninsula from the island of Sicily. The coasts of Tuscany, the States of the Church, and a great part of the kingdom of Naples are low, marshy, and unhealthy. [MAREMME.] The chief ports are Leghorn [LIVOURNO], Civita Vecchia, and Naples; the principal gulfs are those of Gaëta, Naples, Salerno, Policastro, and Santa Eufemia, between which and Sicily are the Lipari Isles.

The largest rivers that flow into the western division of the Mediterranean are the Ebro and the Rhône. Its basin is bounded by the Apennines, the Alps, the Cevennes, the Pyrenees, the Sierra de Oca, Sierra de Deza, Sierra de Alcaraz, Sierra Segura, the Sierra Nevada, and Sierra de Ronda. The widest part of the sea is between Genoa and Bonah, about 500 miles. In this interval lie the islands of Corsica and Sardinia. Between Cete and Algiers the distance is about 450 miles. Off the coast of Spain lie the Balearic islands. The distance between Carthage in Spain and Oran in Algérie is hardly 130 miles. Farther west the sea narrows to about 100 miles. In the strait itself, which is about 10 miles wide at its narrowest part, are the harbour of Tangier on the African side, and the bay and harbour of Algeciras west of the rock of Gibraltar. The rocks of Ceuta and Gibraltar at the eastern extremity of the Strait are the ancient Abyla and Calpe; these are the Pillars of Hercules, whence the strait was named Fretum Herculeum, or Strait of Hercules. The western entrance of the Strait is formed by capes Trafalgar and Sparte. In the middle of the Strait there is a constant current from the Atlantic into the Mediterranean, and a counter current along each of the coasts. It is said that there is an undercurrent into the Atlantic through the Strait. The length of the western part of the Mediterranean from Cape Sparte to Cape Bon is about 1400 miles.

The length of the eastern division of the Mediterranean from Cape Bon to the harbour of Iskenderun on the coast of Syria is about 1300 miles. Its width between the Gulfs of Taranto and Sidra is about 550 miles; between Cape Matapan and the coast of Cyrenaica 230 miles; and between Egypt and Asia Minor on the meridian of Alexandria 350 miles. At Cape Bon (37° 4' 20" N. lat., 10° 53' 35" E. long.) the Mediterranean suddenly falls off to the southward, along the eastern shore of Tunisia, for more than 3 degrees of latitude, to the bottom of the Gulf of Khabs (the ancient Syrtis Minor). The coast of Tunisia is partly high, and in parts skirted by wide uncultivated plains; to the west of the Gulf of Khabs a little way inland is the great salt lake Al Sibkah, which lies on the northern edge of the Great Desert of Sahara. There are several islands along this coast—Pantellaria belonging to Sicily; the Karkenah group (Ramlah, Gerbah, and others), low islands covered with date-trees, and seated on a bank frequented by shoals of tunny fish; and in the south of the Gulf of Khabs Jerbah, the ancient Meninx, a flat fertile island, abounding in palm, olive, carob, and date trees. On the north side of the island is a pyramid constructed with the skulls of the Spaniards who fell here in 1588 in battle with the Turks.

To the east of the island of Jerbah, the coast of Tripoli trends southward gradually to between 15° and 16° E. long., where it again falls off rapidly, forming the Gulf of Sydra (the ancient Syrtis Major), which extends eastward as far as 20° E. long., and its most southern point is on the parallel of 30° 20' N. The part of the continent of Africa which forms the coast of this, the most southern part of the Mediterranean, consists of a narrow strip of habitable land, hemmed in between the sea and the Great Desert; and at one part traversed by 19° E. long., the sand of the desert actually forms for some short distance the shore of the sea. Eastward of this point lies the fine hilly and wooded region of CYRENAICA, which presents a high coast and trends rapidly to northward to the east of the Gulf of Sydra till it nearly reaches the parallel of 33° N. The coast then declines again gradually southward along the shore of Tripoli and Egypt, Arab's Gulf, west of Alexandria, reaching the parallel of 30° 50' N. lat. The Egyptian coast is low but diversified by the harbours of Alexandria, the Bay of Aboukir, and the mouths of the Nile, beyond which the Syrian Desert approaches the shore. In all this great interval, from Cape Bon to the borders of Palestine, there is not a single river of any magnitude except the Nile, and the basin of the sea comprises merely the narrow strip of hilly land that separates it from the Desert till it reaches the great river of Egypt, which links with the Mediterranean countries all Egypt, Nubia, a great part of Abyssinia, Sennaar, Kordofan, and other unexplored regions of central Africa. Tripoli and Alexandria are the most important towns on this part of the coast. The isthmus that connects Africa with Asia from the head of the Red Sea at Suez to the old Pelusian mouth of the Nile, is only 65 miles across. According to a survey, made in 1853, the surface of the Mediterranean, at the point just named, was one metre (3 feet 3½ inches) lower than the surface of the Red Sea in the Gulf of Suez.

The sea that washes the coasts of Syria and Asia Minor, is called the LEVANT. The Syrian coast runs nearly due north, being for the most part bold, rocky, and extremely ill provided with harbours or sheltered anchorages. The Bay of ACRA, north of Mount CARMEL, (the most remarkable headland on the coast), and BEYROUT, are the principal places of trade; between them, on their ancient sites, are Tyre (Sur) and Sidon (Saida), once famous for their commerce, colonies, and manufactures, now mere villages.

Yafa, or Joppa, is still the port of landing for pilgrims to Jerusalem. The rocky island of Ruad, the ancient Aradus, 2 miles off the coast of Phœnicia, was in ancient times covered with a city, founded by a colony from Sidon. It became a busy, industrious, and wealthy hive. There are some remains of its ancient structures still. The city was supplied with water from a submarine spring, which still supplies the fishing village that occupies the site.

The basin of the Mediterranean extends no great way from the Syrian coast. Jerusalem stands on the watershed between this sea and the Dead Sea. The high lands of Judæa, Samaria, and Galilee form the boundary, which in Upper Galilee, a little south of the latitude of Tyre, approaches within a few miles of the coast, but again takes a north-north-east direction, so as to inclose the region of Coele Syria, watered by the Nahr-el-Litany, the ancient Leontes, which enters the Mediterranean a little north of Tyre; and the Nahr-el-Asy (Orontes), which flowing northward, and passing Antioch, enters the sea a few miles south of Ras-el-Khanzir.

On the east and north of the Bay of Iskenderun there is only a narrow strip between the Jawur-Dagh and Durdun-Dagh, the ancient AMANUS Mountains, belonging to the basin of the Mediterranean. The Gulf of Iskenderun extends in a north-eastern direction for about 50 miles between the Cape of Khanzir in Syria and Cape Kara-Tash in the south-east of Asia Minor. The harbour of Iskenderun, on the east side of the Gulf, has some trade in the imports and exports of Aleppo and Antioch. The Jihun falls into the west side of the gulf, at the extremity of the Durdun-Dagh, and drains the south-western angle of Asia Minor. The Jihun in ancient times was called Pyramus, which entered the sea to the west of Cape Kara-Tash. The coast here, and for a long distance westward as far as the mouth of the

Tarsus River, is low and alluvial. About 70 miles S.W. from Ras-el-Khanzir lies the island of CYPRUS. Across this alluvial plain another considerable river—the Sihun, which has its source in the highlands on the left bank of the Kizil-Ismak, near 39° N. lat., flows into the sea between the Jihun and the Tersus-Chai, or river of Tarsus.

To the west of the Tersus-Chai the Taurus Mountains and their southern offshoots come close down to the coast, which is bold, rocky, and precipitous, but covered with luxuriant timber. Between the gulfs of Adalia and Makri there is a vast projection formed by another mountain mass from the Taurus. In all this coast of Asia Minor, from the Gulf of Iskenderun to the Yedi Burun, or Seven Capes, there are no harbours; but to the westward of the Seven Capes the coast of Asia Minor, both on the south and on the west along the Ægean, is cut up by innumerable bays, harbours, and inlets, forming countless islands, peninsulas, capes, and headlands. Off the south-west of Asia Minor lie the islands of Rhodes and Crete.

Crete, Scarpantos, and Rhodes form the natural boundary of the Ægean on the south. North-west of Crete lie the island of Cerigo (the ancient Cythera) and the Morea. The Morea on every side presents a bold high coast, indented however with many fine bays, studded with islands, and forming good harbours. On the east coast are the Gulf of Ægina (Saronic Gulf) containing the islands of Ægina and Salamis, and the Gulf of Nauplia (Argolic Gulf). On the south coast, between Cape Matapan and Cape Malea, is the Gulf of Kolokythi (Laconian Gulf); and west of the high Maniote region, which ends in Cape Matapan, is the Gulf of Koroni (Messenian Gulf), bounded on the west by Cape Gallo. On the west side of the Morea are the Bay of Navarino, sheltered by the Island of Sphagia, the ancient Sphacteria; farther north the Gulf of Arcadia (Cyparissian Gulf), off which lie the Strophades Islands; and the gulfs of Patras and Lepanto (Corinthian Gulf), which separate the Morea from the rest of Greece.

The part of the Mediterranean that lies between Greece, Italy, and Sicily was anciently called the Ionian Sea, which is joined to the Adriatic by the Strait of Otranto. In its eastern parts, along the coast of Greece, are the islands which form the Septinsular Republic of the Ionian Islands, under the protection of Great Britain. The principal bay on the east side of this sea is the Gulf of Arta, the ancient Ambracian Gulf, which formed part of the boundary between Greece and Epirus, as it now does between Greece and Turkey in Europe. On the Italian side, which presents numerous headlands, but has in parts a low coast, are the gulfs of Taranto and Squillace. The principal harbour on this coast is that of Taranto, the ancient Tarentum. Along the east of Sicily the offshoots of Ætna form a bold coast; but south of Ætna there are many small sheltered bays, the principal of which form the harbours of Catania and Syracuse. About sixty miles south of Sicily is the island of Malta, which belongs to Great Britain, and is considered the key of the Mediterranean. Nearly due east of Cape Bon, and traversed by 12° E. long., is the island of Pantellaria, the ancient Cosyria, which is wholly of volcanic origin.

The navigation of the Mediterranean must no doubt be of very early date. The story of Minos destroying pirates (Thucyd., i. 4) takes for granted the fact that there must have been merchant vessels carrying something worth stealing from the earliest recorded period. If with Strabo we take for granted the accuracy of Homer's descriptions, it by no means follows that the Greeks knew everything that could have been known to every other nation at that time; and the stories told of the jealousy with which the Phœnicians and Carthaginians guarded their discoveries prove at least that geographical knowledge was not common property; and with regard to these very nations, the knowledge which the Greeks could have had of them, among other barbarians, must have been inferior to that which we possess in the minute accuracy of the Scriptures alone. The foundation of Utica 130 years before Carthage proves a regular communication between this place and Syria at a distance of upwards of 1300 miles; and we may conclude that occasional voyages of these enterprising people had already extended the bounds of knowledge far beyond these limits.

The Mediterranean was divided by Strabo into three basins: the first comprised the sea between the Columns of Hercules and Sicily; the second, between Sicily and Rhodes; and the third, between Rhodes and the shores of Syria.

Strabo supposed that the parallel of latitude of 36½° passed through the Sacred Promontory (Cape St. Vincent), between the Pillars of Hercules (or Gibraltar and Ceuta), dividing this part of the Mediterranean in the middle of its breadth, which was believed by navigators to be 5000 stadia, or 429 nautical miles from the Gulf of Lyon to the shore of Africa, which is very near the truth. The sea here however lies altogether to the north of this parallel; and hence, as the configuration of the European shores seems to have been tolerably good, the coast of Africa must have been proportionally distorted. This parallel was carried through the straits of Sicily, Rhodes, and the Gulf of Issus, now the Gulf of Iskenderun.

In consequence of the above supposition, he placed Marseille to the southward instead of the northward of Byzantium. He supposed Sardinia and Corsica to lie north-west and south-east instead of north and south, and made the distance of Sardinia from the coast of Africa 2400 stadia, or 205 miles, instead of 100 miles, the true distance. From the Columns of Hercules to the Strait of Sicily he considers to be 12,000 stadia, or 1028 miles.

From Cape Passaro (Pachynum) to the west extremity of Crete he considered 4500 stadia, or 386 miles; it measures 400 miles; and he supposed the length of Crete 2000 stadia, or 171 miles, the true length being 140 miles. He supposed that a line drawn through Byzantium, the middle of the Propontis, the Hellespont, and along the capes of the coast of Asia Minor, would coincide with the meridian: this error placed Byzantium too far to the north, and not far enough to the east. From Alexandria to the east end of Crete he considered 3000 stadia, or 257 miles: it measures about 290 miles. From Alexandria to Rhodes he made 3600 stadia, or 308 miles: it measures 320 miles. He supposed the head of the Greater Syrtis to be 1000 stadia, or 86 miles, to the south of Alexandria: it is about 60 miles. From Cape Acamas (the west point of Cyprus) to Cape Khelidonia, he made 1900 stadia, or 163 miles: it measures 120 miles; and from Cape Pedalion (Cape Greco) to Berytus (Beirut), he made 1500 stadia, or 129 miles; it measures 90 miles. From Rhodes to Issus he considered 5000 stadia, or 429 miles: it measures 400 miles.

Many of the latitudes given by Strabo are very near, that is, within 10'; those of Marseille and Byzantium excepted, the former being 3° 43' too little, and the latter 2° 16' too much. The longitudes, which were all at that time referred to Cape Sacrum as the first meridian, and the extreme west point, as was believed, of the known world, are without exception too small; that of Carthage, the nearest to the truth, being 1° 9', and Alexandria, the most erroneous, 6° 40', too small.

On the shores of this sea have been transacted the most important events in the history of mankind, and its character seems to mark it as the theatre best adapted to the complete and rapid civilisation of the race. From the great diversity of soil and productions, under a varied and favourable climate, the colonists, from whatever points they first proceeded, would soon acquire those different habits under which their several energies and capabilities would be developed. The comparative shortness of the distances of the several places, by rendering navigation easy and pleasant in small and imperfect vessels, would, by facilitating intercourse from an early period, tend to diffuse and to promote civilisation; while commerce, by bringing together men of different habits, manners, and languages, and thus circulating practical information, would supply the materials for the perfection of the arts and sciences. On its shores in ancient times flourished the Phœnicians, Jews, Egyptians, Carthaginians, Greeks, and Romans.

This sea is navigated by vessels of no great size. There is a form of rig peculiar to the larger vessels, called 'polacca,' which has originated in the suddenness and frequency of squalls, which often require the sail to be instantly taken in: for this purpose the masts are made in one piece, and the topsails, on being lowered, can slide down without interruption. The Mediterranean, being studded with places of refuge, and in which gales, though frequent and violent, never last so long as to wear the ship or the spirits of the men, and in which, besides, vessels have from the earliest times to the present ceased to navigate in the winter months, may indeed be favourable to training men to a certain degree of expertness in managing boats, but could never originate that seamanship on the grand scale which the long and boisterous sea-voyages, the rugged and dangerous coasts, and long winter nights, force upon the hardier sailors of the northern regions. Steamers now ply regularly at all seasons between all the chief seaports of the Mediterranean.

The winds have been remarked as peculiarly variable in the Mediterranean, and three or four vessels have often been seen carrying different winds at the same time. The scirocco, or south-east wind (called solano on the coast of Spain), has always been noted throughout the Mediterranean for its depressing effects upon the animal system. It is usually accompanied with a gloomy sky and haze. In winter its effects are but slightly perceived. Water-spouts are very common. The Adriatic is infested by a northerly wind called Bora, which blows for a short time with great violence. The Black Sea has always been noted for its stormy character in winter; the west winds blow frequently with hurricane force.

The depth of the Mediterranean is without doubt very great, the sea being in most places unfathomable; and, unlike many other great expanses of water, soundings are comparatively of limited utility.

The Mediterranean, though poetically termed a 'tideless sea,' is not strictly so; since in its latitudinal extent between Venice and the Lesser Syrtis it experiences a rise and fall of from 5 to 7 feet. Tides are also felt, but somewhat irregularly, on the sides of the Gibraltar current, in the Gulf of Corinth, and in the Faro of Messina; and there is a curious reciprocal motion in the waters in the channel of the Eurippus, between Greece and Negropont. Strong currents occur, especially near Venice and the Faro of Messina. A westerly current sets along the coast of Karamania. It has been stated that an easterly current prevails constantly along the coasts of Africa and Egypt, but this, we believe, has not been substantiated.

An important source of commerce in the Mediterranean is the tunny fishery, especially on the coast of Italy, in the Strait of Messina, and along the coast of Sicily. The fish enter the Mediterranean in spring, keeping along the European shores, and leave it again at the close of the year by the coast of Africa. They are caught in nets so constructed that the fish are driven into compartments, where they are struck and killed. The tunny frequently weighs 4½ cwt., its flesh is

GEOG. DIV. VOL. III.

very nutritious. The tunny swims in compact shoals of conical form on a very broad base. The sword-fish generally pursues the shoals, and is taken by harpooning; its weight sometimes exceeds 2 cwt., its flesh resembles veal, and it is more delicate than the tunny. The anchovy abounds in most parts of the Mediterranean, and the mullet is very plentiful on the Italian coast. Other fish are also very abundant. The sponge is a valuable product of the Archipelago. Fruits of all kinds, corn, timber, raw silk, cotton, wine, dyestuffs, bark, and a vast number of other products enter into the native commerce of the Mediterranean.

MEDMENHAM. [BUCKINGHAMSHIRE.]

MEDOC. [GIRONDE.]

MEDWAY. [KENT.]

MÉEN, ST. [ILLE-ET-VILAINE.]

MEERPOOR. [HINDUSTAN.]

MEERUT, the chief town of one of the Regulation Provinces into which the sub-presidency of the north-western provinces in Hindustan is divided. The town is situated in 28° 57' N. lat., 77° 45' E. long., 38 miles N.E. from the city of Delhi. It is an ancient walled town of considerable size, and is one of the military stations of the British army. The town contains a British Protestant church, which is 150 feet long, 84 feet wide, and has a lofty and handsome spire; it is of brick, covered with stucco, and whitewashed, and is altogether a very striking building. There is also a British free school.

MÉES, LES. [ALPES, HAUTES.]

ME'GARIS, one of the political divisions of ancient Greece, was separated from Boeotia on the north by the range of Mount Cithæron, and from Attica on the east and north-east by the high land which descends from the north-west boundary of Attica, and terminates on the west side of the Bay of Eleusis in two summits, formerly called Kerata, or the Horns, and now Kandili. Megaris was divided from the Corinthian territory on the west by the Oneian range of mountains, through which there were only two roads from Corinth into Megaris: one of these, called the Soironian Pass, which is the steep escarpment of the mountains that terminate on the coast of the Saronic Gulf, passed by Crommyon, and along the side of the escarpment was the direct road from Corinth to Athens. This road, on the whole, is still in good condition. The other road, following the coast of the Corinthian Gulf, crossed the Geranean Mountains, which belong to the Oneian range, and led to Pegæ, on the Corinthian Gulf, and thence into Boeotia.

The area of Megaris is about 720 square miles. ('Fasti Hell.' ii, p. 385.) Megaris is a rugged and mountainous country, and contains only one plain of small extent, in which the capital, Megara, was situated. The rocks are chiefly, if not entirely, calcareous. The country is very deficient in springs.

Megara, which was about 20 miles from Athens, was built on two hills, on the summit of each of which was a citadel, named respectively Caria and Alcaethous. It was connected with the port of Nisea by two walls, which were built by the Athenians when they had possession of Megara, B.C. 461-445. Pausanias has described at considerable length the public buildings which existed in Megara in his time; but scarcely any remains of them can now be traced. In front of the harbour of Nisea was a little island called Minoa, which was occupied by the Athenians during the Peloponnesian war. (Pausanias, Thucydides, Strabo, Procopius; 'London Geographical Journal,' vol. viii.)

The port of Pegæ, or Pegæ, on the Corinthian Gulf, was the only other place in Megaris of any importance. Tripodiscus, situated on the road from Pegæ to Megara, is mentioned by Thucydides (iv. 70) and Strabo (p. 394), and is said by Plutarch ('Qu. Gr.' xvii. p. 387) to have been one of the five hamlets (κῆμαι) into which Megaris was originally divided; the names of which were—Heræa, Piræa, Megara, Cynosuria, Tripodiscus.

According to the traditions preserved by Pausanias, Megara must have been a very ancient city. It early became annexed to Attica, and was subsequently held by the Dorians and by Corinth. It gained its independence of the latter at a period which is uncertain, and rapidly rose to wealth and power, attested by the numerous colonies it sent out. Among these were—Selymbria, Chalcedon, Byzantium, and Megara in Sicily. The Megarians were powerful at sea, where they contended with the Athenians, from whom they took Salamis; and it was only after a long struggle that Athens regained possession of the island. The government was originally in the hands of the great Dorian landholders, but they were deprived of their power by Theagenes, who put himself at the head of the popular party, and obtained the sovereignty, about B.C. 620. He adorned the city with several public buildings. (Paus., i. 40, 41.) Theagenes was at length expelled from Megara, and shortly afterwards a most violent struggle arose between the aristocratic and democratic parties, of which a vivid picture is drawn in the poems of Theognis, a native of Megara.

For some time after the Persian wars Megara appears to have been constantly engaged in war with Corinth, and her enmity to Corinth was the occasion of her forming an alliance with Athens, about B.C. 461. (Thuc., i. 103.) Athenian garrisons were placed in Megara and Pegæ; but six years afterwards the Megarians renounced their alliance with Athens, and put to death the Athenian garrison at Megara. (Thuc., i. 114.) In the seventh year of the Peloponnesian war the democratic party formed a plan for surrendering the city to Athens, which was

defeated by the arrival of Brasidas with a Lacedæmonian force. We read little more of Megara in Grecian history. In B.C. 357 democracy was again the established constitution. (Diod., xv. 40.) Megara was taken and almost destroyed by Demetrius; it was also taken by the Romans under Metellus (Paus., vii. 15, § 4); it suffered greatly in the invasion of Alaric (Procop., 'Bell. Vand.' i. 1); and its ruin was completed by the Venetians in 1687.

Coin of Megara. British Museum. Actual size.

MEILLERAIE. [LOIRE-INFÉRIEURE.]

MEININGEN. [SAXE-MEININGEN.]

MEISSEN, a town in the kingdom of Saxony, is situated in 51° 10' N. lat., 13° 25' E. long., on the little river Meise or Misi, on and between hills on the left bank of the Elbe, over which there is a covered bridge, supposed to have been originally built in the 11th century; this bridge was destroyed in 1547, 1757, and in 1813, but has since been rebuilt. Meissen is one of the oldest towns in the country, having been founded in 922 by king Henry I., as a bulwark of his German settlements against the Slavonians. His son, Otho I., founded the cathedral and established a bishopric, of which the town continued to be the seat till the Reformation. The town is surrounded by walls, outside of which are several suburbs. The cathedral, a masterpiece of ancient German architecture, has a tower surmounted with a spire 60 feet high, composed of beautiful open-work; it is rich in ancient monuments. Adjoining it is the Princes' chapel, founded in 1425 by Frederick I., elector of Saxony, of the house of Meissen, for the hereditary vault of his family, in which there is a bronze monument of the founder. The palace of Albrechtsburg, near the cathedral, was formerly the common residence of the margraves, burgraves, and bishops of Meissen; but the margraves transferred their residence to Dresden in the 13th century. The palace was almost entirely rebuilt in 1471. Ever since 1710 it has contained the celebrated porcelain manufactory, the productions of which rival or surpass those of China and Japan in hardness, durability, beauty of form, and painted ornamentation. The former convent of St. Afra, on a lofty rock, which is joined by a stone bridge to the eminence on which the palace stands, is now converted into a school. There are manufactures of leather, hosiery, colours, camels'-hair brushes, &c.; but the chief source of profit is the making of wine.

MEJERDAH, the ancient *Bagradas*, a river in northern Africa. Its upper course lies within the territories of Algiers; in its middle course it forms the boundary-line between that country and Tunis, and in its lower course it traverses the northern district of the last-mentioned state. A great number of rivers rise in the mountains which between 36° and 36° N. lat., 7° and 8° E. long., constitute the most eastern of the elevated ranges of Mount Atlas; these unite about 35° 30' N. lat., and form the Wady Serat, or Mellag, the principal branch of the Mejerdah River, which bore in ancient times the name of *Bagradas*. In its course, which is nearly due north, it separates Algiers from Tunis, until it reaches 36° 10' N. lat., where it is joined by the Wady-Hamiz from the west, and takes the name of Mejerdah. Up to this junction its course exceeds 100 miles, and from this point it runs about 60 miles eastward through a hilly country. It then turns north-north-east, and continues this course until it falls into an inlet of the Bay of Tunis near Cape Farina, after a course of more than 260 miles. Near its mouth it passes the ruins of Utica. In ancient times its lower course was somewhat different; the river fell into the sea between Utica and Carthage, but much nearer the latter than it now does. The alluvial deposits of the river have caused considerable changes on the coast. [CARTHAGE.] In any other country the Mejerdah would be held to be an inconsiderable river; it is however the second river in size of those that enter the Mediterranean between Cape Bon and the Strait of Gibraltar, being exceeded in size only by the Mulwia; and yet it is fordable in many places near its mouth. The Mejerdah is used to irrigate the fields in the lower part of its course, where it flows through a wide and level valley. It overflows and fertilises the adjacent country in spring; the inundations are caused by the spring rains and the melting of snow on the mountains which surround its upper branches.

MEKINEZ. [MAROCCO.]

MEKRAN, or MUKRAN. [BELOOCHISTAN.]

MELAZZO. [MESSINA.]

MELBOURNE. [CAMBRIDGESHIRE; DERBYSHIRE.]

MELBOURNE, the capital of the colony of Victoria, or Port Phillip, Australia, is situated on the Yarra-Yarra River, near the head of Port Phillip Bay, 600 miles distant from Sydney by the overland route, and above 600 miles from Adelaide, the capital of South Australia. Melbourne has sprung into existence within the last 20 years; it increased rapidly after the discovery of gold in the colony in 1851, and is now a large and important city, the seat of an exten-

sive commerce. The streets are spacious and laid out with great regularity. Melbourne contains several fine buildings, among which may be named the cathedral, and several places of worship, including chapels for Episcopalians, Independents, Presbyterians, and Wesleyan Methodists; a court-house, the governor's residence, a post-office, a custom-house, a jail, the government offices, several boarding-houses, hotels, baths, and large commercial establishments. Extensive improvements are projected, including an ample supply of water to be brought into the city from a distance of 20 miles. The city revenue amounted in 1852 to 16,161*l.* 19*s.* 5*d.*, being more than double that of the preceding year. Of this revenue the corporation expended the principal part in public improvements. Melbourne is the seat of a bishopric; a corporate town with a mayor; the residence of the lieutenant-governor; and the seat of government.

The gold finding in the colony, which appears to continue without much diminution, attracts numerous emigrants to Melbourne, especially from Great Britain. The population of the city is probably now about 40,000. Vessels of 200 tons can ascend the river to Melbourne, larger vessels lie in Hobson's Bay. *Williamstown*, the port of Melbourne, is a small town built on a low sand-flat at Point Gallibrand, on the west side of Hobson's Bay, about 8 miles S.W. from the city. It contains some good houses. A railway connects Williamstown with Melbourne city. It is proposed to construct a pier at Williamstown, having a communication with the railway terminus, so that passengers and goods may be landed and sent on to Melbourne without difficulty. Statistics in reference to the shipping and commerce of Melbourne will be given more at length in our account of the colony of VICTORIA.

MELCOMBE REGIS. [WEYMOUTH.]

MELDRUM, or OLD MELDRUM. [ABERDEENSHIRE.]

MELFL. [BASILICATA.]

MELFORD. [SUFFOLK.]

MELIANAH. [ALGÉRIE.]

MELILLA, a sea-port town of Morocco belonging to Spain, is situated 11 miles S. from Cape Ras-ud-Dir, or Tres-Forcas, in 35° 8' 15" N. lat., 2° 58' 2" W. long., and has about 3000 inhabitants. The town stands on a peninsula about 40 feet above the sea, and united to the mainland by a rocky isthmus. Melilla is one of the Spanish presidios on this coast. It is impregnable on the land side, and towards the sea it is defended by strong ramparts. The fortress has large magazines and cisterns, and small vessels can enter the harbour. The presidios of Peñon-de-Velez and Aluzemas, or Alhucemas, two strongly fortified rocky islands between Cape Tres-Forcas and Ceuta, are also under the governor of Melilla. The Spanish garrison of Melilla numbers about 1000. The rest of the inhabitants are for the most part convicts and exiles. Melilla is said to derive its name from the Spanish word for honey, which is gathered of superior quality on the mountain slopes along this coast.

MELINDA, a sea-port situated on the eastern shores of Africa, near 4° S. lat., 40 E. long. In his first voyage, Vasco de Gama sailed along the eastern coast of Africa as far north as this place, where he got a pilot from the king to conduct his vessel to India. Gama describes the town as situated on a plain near the sea-shore, surrounded with gardens, and consisting of houses neatly built of hewn stone, with handsome rooms and painted ceilings. It was at that time evidently a place of some importance. In 1605 the Portuguese took possession of Melinda; and about 23 years later of Mombas also, which lies a short distance to the south; and as the harbour of the latter is much superior Melinda began to decline. It was taken from the Portuguese about the beginning of the last century by the Arabs, who in their turn were supplanted by the Galla, a savage nation, which has carried its conquests from the southern declivity of the Abyssinian Alps as far south as Melinda. On the site of the town are the ruins of Portuguese churches and other buildings.

MELITENE. [MALATIA.]

MELKSHAM, Wiltshire, a market-town and the seat of a Poor-Law Union in the parish of Melksham, is situated in 51° 22' N. lat., 2° 8' W. long., distant 7 miles W. by N. from Devizes, 96 miles W. by S. from London by road, and 100 miles by the Great Western railway. The population of the town of Melksham in 1851 was 2931. Melksham Poor-Law Union contains six parishes and townships, with an area of 16,233 acres, and a population in 1851 of 18,614.

At the time of the Domesday Survey the town appears to have been a place of some consequence. It afterwards declined, but was revived by the introduction of the cloth manufacture. Some years since mineral waters were discovered in the neighbourhood of the town; and hot and cold baths were established, and houses built for visitors to 'the Spa.' The town consists principally of one long winding irregular street. The principal part of the town is divided by the river Avon, over which is a stone bridge of four arches, from a suburb called 'the city.' The houses, which are of stone, are of neat appearance, and the town is lighted with gas, well paved, and drained. A spacious cheese-market, market-house, and town-hall in the Grecian style were erected in 1847 by a joint-stock company. The church is chiefly of the perpendicular style, with some Norman portions. In 1845 the tower was removed from the centre to the west end. The Wesleyan Methodists, Independents, Baptists, and Quakers have places of worship; and there are National and British schools, a mutual

improvement society, and a savings bank. The principal manufacture is that of broadcloth and kerseymer; rope-making is also carried on, flat-rope being largely made. Extensive flour-mills are on the river Avon. The market-day is Tuesday; a fair is held on July 27th for horses, cattle, sheep, and pigs. Petty-sessions and a county court are held.

MELOS. [MELO.]

MELROSE. [ROXBURGHSHIRE.]

MELSUNGEN. [HESSE-CARSEL.]

MELTON MOWBRAY, Leicestershire, a market-town and the seat of a Poor-Law Union in the parish of Melton Mowbray, is situated in a valley on the river Eye, or Wreak, in 52° 46' N. lat., 0° 53' W. long., distant 16 miles N.E. from Leicester, 105 miles N.N.W. from London by road, and 117½ miles by the Great Northern and Syston and Peterborough railways. The population of the town of Melton Mowbray in 1861 was 4391. The living is a vicarage in the archdeaconry of Leicester and diocese of Peterborough. Melton Mowbray Poor-Law Union contains 54 parishes and townships, with an area of 93,016 acres, and a population in 1851 of 20,530.

Melton is the seat of the well-known Melton Hunt. Stables to accommodate 500 horses have been provided. Many hunting seats are in the immediate neighbourhood. The town is watched, lighted, and paved, and the three bridges in and near it are kept in repair from trust property called 'the Town Estate.' The river is navigable to the Soar navigation at Syston. A canal unites Melton Mowbray with Oakham in Rutlandshire. The church is large, and has a fine tower, partly in the early English style. Independents, Wesleyan and Primitive Methodists, and Roman Catholics have places of worship. Melton Grammar school was closed in 1848. There are a National school and a Roman Catholic Free school; a literary institute with a museum; a mechanics institute; and a savings bank. The chief manufacture is that of bobbin-net lace. Pork pies are extensively made chiefly for sale in London, Manchester, and Leeds. Petty-sessions and a county court are held. The market is on Tuesday; six fairs are held in the year.

MELUN, a town in France, capital of the department of Seine-et-Marne, is situated on the Seine, 28 miles by railway S.E. from Paris, in 48° 32' 32" N. lat., 2° 39' 33" E. long., 229 feet above the level of the sea, and had 7528 inhabitants in the commune in 1851.

Cæsar, who mentions the place by the name *Melodunum*, describes it as being "a town of the Senones, situated in an island of the Sequana (Seine), in the same manner as Lutetia (Paris)." ('De Bello Gallico,' vii. 58.) It was taken by Labienus in his campaign against the Parisii. In the earlier times of the French monarchy Melun was a place of note; it was repeatedly taken by the Northmen and the English. It was taken by the English under Henry V. after an obstinate resistance in 1420; but in 1435 the inhabitants drove them out and admitted the troops of Charles VII.

The town is built on an island (the site of Melodunum) and on both banks of the river, the largest quarter standing on a slope on the right bank, and the three parts being united by two bridges. It is on the whole a well-built town; the banks of the river are lined with quays, and several new promenades have been formed. The principal square, which is regularly built; the church of St. Aspais, on the right bank of the Seine; the church of Notre-Dame, on the island; the former monastery of St. Père, now the residence of the prefect; the Carmelite convent, now converted into a court-house, a prison, a guard-house, and a theatre; the old monastery of La-Maison-des-Frères, which now serves for a cavalry barrack; and the central prison for five departments, are the chief structures in the town. The manufactures are woollen stuffs, printed calicoes, cotton twist, and leather. Melun has a tribunal of first instance, a college, and a good trade in corn, flour, wool, and cattle. It is a station on the Paris-Dijon railroad.

MENDHAM. [SUFFOLK.]

MENDOCINO, CAPE. [CALIFORNIA.]

MENDOZA, one of the provinces of the Argentine Confederation, South America, extends between 32° and 35° S. lat., along the eastern side of the Andes, for 150 miles from north to south, with a nearly equal breadth; and is bounded S. and S.E. by the province of Buenos Ayres, N.E. by that of San Luis, N. by that of San Juan, and W. by the republic of Chili. The population is variously estimated at from 35,000 to 45,000.

The surface of the country is described generally under ARGENTINE CONFEDERATION. The western side is mountainous, containing that portion of the chain of the Andes which includes the volcanoes of Aconcagua, Maypu, Rancagua, and Peteroa. The Andes are here crossed by the most frequented roads which lead over the mountain passes of Uspallata, Portillo, and Las Damas. Eastward the mountains decline into hills towards the Mendoza River, east of which are broad plains. Within this province are the southern part of the Vale of

Uspallata and the whole of that of Tunuyan. The valleys of Uspallata and Tunuyan are barren, and nearly uninhabited. The plain which stretches from the Andes eastward has a sandy soil and does not produce grain, or even grass, without irrigation, but when irrigated, it yields abundant crops of wheat, maize, barley, and lucerne; the lucerne may be cut 14 times in a year. The Desaguadero River forms the northern boundary-line of the province, and like the Mendoza affords remarkable facilities for irrigating the dry land along its banks. The confluence of the Desaguadero and the Mendoza forms a remarkable chain of lakes called the Guanacache; some distance south of which it forms with the San Juan and a portion of the Tunuyan rivers, another great lake called the Bevedoro. The main portion of Tunuyan now branches off some distance west of this lake, and forms a junction many miles south with the Diamante. The Tunuyan then receives another important tributary the Chadileuba, and soon after expands into another vast inland lake without any outlet, called, from the extreme saltiness of its waters, the Urrelauquen, or Bitter Lake. Rain and dew are very rare in Mendoza, except in the southern districts on the banks of the Rio Diamante, which forms the southern boundary-line of the province, where the rains are so abundant that corn may be raised without artificial irrigation. The chief productions of the province are wine and brandy, wheat, maize, fruit, tallow, and soap, which are chiefly sent to the provinces farther east, Buenos Ayres, San Luis, Cordova, and Santa Fé; with dried figs, raisins, peaches, apples, nuts, and olives, which go mostly to Chili, whither also from 300 to 400 mules and a large quantity of hides are annually sent. Silver-mines have been worked at Uspallata, and veins of copper are also known to exist, though they have not hitherto been opened. Limestone, slates, gypsum, alum, mineral pitch, bituminous shales, with traces of coal, have been found all along this portion of the cordillera of the Andes; a variety of saline deposits, including common and Epsom salts, are also found in the province. Like the other provinces of the Argentine Confederation, Mendoza is a federal state, owing little dependence upon the central government. The executive power is vested in a governor elected by the junta or provincial assembly.

Mendoza, the capital of the province and the centre of its commerce, is situated at the foot of the Andes, 2891 feet above the level of the Atlantic, in a country irrigated by numerous cuts from the Rio de Mendoza, in 32° 53' S. lat., 69° 6' W. long.: population, about 10,000. It is a neat and pleasant city; the houses, a large proportion of which are built of mud (adobe), are only one story high, and have porticoes. The Alameda, or public walk, is nearly a mile, well planted and kept, and is considered to be one of the finest in South America. The climate is dry and noted for its salubrity. Around the city are numerous well cultivated vineyards. *San Martin*, or *Villa-Nueva*, W. of Mendoza, is a thriving place, with some 1500 inhabitants.

MENEHOULD, ST. [MARNE.]

MENIN. [FLANDERS, WEST.]

MENLOUGH. [GALWAY.]

MENORCA, or MINORCA, is the second in size of the Balearic Islands. It is situated in the Mediterranean, off the eastern coast of Spain, between 39° 47' and 40° 21' N. lat., 3° 50' and 4° 23' E. long. It lies 24 miles E.N.E. from Mallorca, about 130 miles S.E. from Barcelona and the coast of Cataluña, 160 miles E. by S. from the mouth of the Ebro, the nearest part of Valencia, and about 190 miles N. from the territory of Algiers in Africa. The circumference is about 62 miles, and the area about 300 square miles. In form it is irregular; being in length 33 miles, and in the broadest part 13 miles. The population is about 44,000.

Coast, Surface, &c.—The coast is indented on every side with small bays or deep creeks, and surrounded with islets, rocks, and shoals. The surface of the country is a gently undulating plain, rocky and barren, or partially clothed with wild olives and corn. The southern shore is the most level. The soil is for the most part poor and sandy; but is much richer on the slopes of the hills than on the low grounds. The only eminence deserving the name of mountain is Monte Toro, 4793 feet high, in the centre of the island. It is in the form of a cone, with a flat summit surmounted by a convent which formerly belonged to the Augustines, and to which pilgrimages were made by the natives with bare feet. Mount St. Agatha, the eminence next in importance, is supposed to have been a military post in the time of the Romans, and traces of a Moorish fortification are still visible on its summit. Two miles south of Ciudadela is a curious grotto, called La Cava Perella, full of stalactites and stalagmites; and in the same vicinity is another cavern containing a pool or lake of salt-water.

The mineral productions of Menorca are limestone, freestone, marble of various colours, slate, of which a quarry is worked at Cape Mola on the east side of the island, gypsum, used for cement, and potters'-clay. There are a few lead-mines, very unproductive, and iron-ore is found in small quantities.

The spring of the year is generally clear, mild, and temperate; the summer is intensely hot; the autumn is the season of the annual rains, which are exceedingly heavy; the winter is often cold, though snow and ice are rare. On the whole the climate is less agreeable than that of Mallorca; the air is more humid; and the summer heats more oppressive, which arises from the comparatively level character of the island.

The vegetation of Menorca is very similar to that of Mallorca, though it is much less abundant, and the trees seldom attain to so large a size. Aromatic plants and herbs, many with medicinal qualities, grow in profusion. Wheat, barley, and a little maize are cultivated, though not enough for the consumption of the island. Olive-trees grow almost without culture; little oil is made from their fruit, which is generally preserved for eating. Vines are plentiful, and produce both white and red wine. Fruit is abundant: there are oranges, lemons, pomegranates, figs, apples, pears, and almonds; the melons are of superior flavour. Date-palms grow in sheltered spots, but yield no fruit. Capers grow spontaneously in all parts of the island. Flax, hemp, saffron, and the cotton-tree thrive well, but are little attended to. Vegetables are no less abundant than fruit, and consist chiefly of peas, beans, onions, cauliflowers, broccoli, tomatoes, endive, cucumbers, and gourds, all excellent in quality. The island is rich in cattle, sheep, goats, and pigs; and also in game, as partridges, quails, and rabbits; woodcocks, snipes, and teal are plentiful in winter. Fish, especially anchovies, with oysters, lobsters, and other crustacea, abound on the coasts. Lizards swarm, and there are a few venomous reptiles, but no beasts of prey.

The natives are engaged either in agriculture, fishing, or commerce. The imports consist of corn, oil, brandy, tobacco, coffee, sugar, spices, hardware and cutlery, linen and woollen goods, timber, cordage, tar, and gunpowder. The exports are wines, wool, cheese, salt, honey, and wax. The possession of Menorca by the English during the last century did much to promote its trade and commerce; but since the island has reverted to the Spaniards, trade and commerce have greatly declined.

Menorca is divided into four terminos, or districts—Ciudadela, Mahon, Alhayer, and the united terminos of Ferarias and Mercadal. In each is a town of the same name, the capital of the district.

Ciudadela, formerly the capital of Menorca, is situated on the north-west coast, on a small port, shallow and difficult of entrance. The city is fortified, and its walls are partly of Moorish, partly of more recent construction: its population is above 4000. The streets are narrow, crooked, and badly paved; many of the houses are neat, and some handsome. A cathedral, two parish churches, convents (now converted to civil and military purposes), an hospital, a barrack, with a government-house, are the public buildings.

Port Mahon, now the capital of Menorca, stands on the south-eastern shore of the island, in 39° 52' N. lat., 4° 21' E. long., 24 miles from Ciudadela, with which it communicates by a carriage-road. *Port Mahon*, the *Portus Magonis* of the Romans, is said to have been founded by and called after Mago, a distinguished Carthaginian commander. It is picturesquely situated near the bottom of a deep and narrow bay, on rocks much elevated above the sea, and in many places undermined by the waves. *Port Mahon* was formerly surrounded with walls, the only relic of which is a gateway of Moorish architecture. The streets are steep, narrow, crooked, and badly paved; the governor's house, town-hall, hospital, barracks, and other public buildings, are scarcely worthy of notice; the private houses are neat and clean, built with taste, but often without regard to comfort, for, many being on the English model, they are ill adapted to the sultry climate. Some of their roofs are tiled, and some flat-terraced in the oriental style: the population in 1845 was 13,102. The harbour of *Port Mahon* is one of the best in the Mediterranean. A large fleet of line-of-battle ships may ride within it, in seven or eight fathoms water, perfectly sheltered from every wind. *Port Mahon* alone made the possession of Menorca an object of contention among the maritime nations of Europe during the past century. In the harbour are four rocky islets: on one stands an hospital; on another a quarantine establishment; on a third a lazaretto; and on the fourth an arsenal with naval storehouses—all erected by the English.

The other ports of Menorca are—*Fornels*, a well-sheltered bay, capable of holding a large fleet; and *Adaya*, a small harbour, full of rocks and shoals, and only entered by fishing-craft.

Mercadal, 13 miles N.W. from *Port Mahon*, has a population of 4000. *Alhayer* and *Ferarias*, the other district-capitals, are little more than villages.

Menorca is not rich in antiquities. About two miles from *Alhayer* is a rude pyramidal ruin of Druidical character, ascribed to the Phœnicians, the earliest colonists of the island; but whether it be temple, tomb, or watch-tower, is yet disputed. Punic, Greek, Roman, Gothic, and Arab coins have been found; and also small statues of bronze, vases, lamps, urns, &c., chiefly of Roman origin.

In character and manners the inhabitants of Menorca resemble those of Mallorca. They are equally attached to their native soil, and to their customs and religion. The same dress and language are common to both.

A sketch of the history of the Balearic Islands has been given in the article *BALÆRIC ISLANDS*.

(*Dameto and Mut, History of the Balearic Kingdom*; *Armstrong, History of the Island of Minorca*; *Laborde, Itinéraire Descriptif de l'Espagne*; *St. Sauveur, Travels through the Balearic and Pithyusian Islands*; *Madox, Diccionario Geographico de España*.)

MERDRIGNAC. [CÔTES-DU-NORD.]

MERE, Wiltshire, a market-town, and the seat of a Poor-Law Union, in the parish of Mere, is situated in 51° 5' N. lat., 2° 15' W. long., distant 22 miles W. by N. from Salisbury, and 102 miles W.S.W. from London. The population of the parish in 1851 was 2991. The living is a vicarage in the archdeaconry and diocese of Salisbury. Mere Poor-Law Union contains 12 parishes and townships, with an area of 30,919 acres, and a population in 1851 of 8431. The manor of Mere belonged in the reign of Henry III. to the king's brother, Richard, earl of Cornwall and king of the Romans, who built a castle here, the site of which may still be traced. Mere consists chiefly of one street on the London and Exeter road. The town is lighted with gas. The church, which is on the south side of the town, is a handsome building, chiefly of perpendicular character, having a western tower, with battlements and pinnacles. Independents and Primitive Methodists have chapels, and there are National and British schools. An ancient market-cross stands in the centre of the town. Flax-spinning, silk-throwing, and brick-making employ some of the inhabitants. A little woollen cloth is made. The market is on Thursday, and there are large fairs on May 17th and October 10th.

MERGUL. [TENASSERIM.]

MERIDA. [ESTREMADURA, Spanish.]

MERIDEN, Warwickshire, a village, and the seat of a Poor-Law Union, in the parish of Meriden, is situated in 52° 27' N. lat., 1° 38' W. long., distant 6 miles W. by N. from Coventry, and 97 miles N.W. from London. The population of the parish of Meriden in 1851 was 965. The living is a vicarage in the archdeaconry of Coventry and diocese of Worcester. Meriden Poor-Law Union contains 18 parishes and townships, with an area of 48,118 acres, and a population in 1851 of 11,275. Besides the parish church, there are in Meriden National schools.

MERIONETHSHIRE, a county of North Wales, bounded N. by Caernarvonshire and Denbighshire, N.E. by Denbighshire, E. and S. by Montgomeryshire, S. by Cardiganshire, and S.W. and W. by Cardigan Bay, an inlet of the Irish Sea. It lies between 52° 31' and 53° 1' N. lat., and 3° 12' and 4° 8' W. long. The area of the county is estimated at 602 square miles, or 385,291 statute acres. The population in 1851 was 38,343.

Coast-line.—The northern part of the coast is formed by the estuary of which the *Traeth Mawr* and the *Traeth Bach* are portions. The *Traeth Mawr* (of which a considerable portion, now the *Vale of Tremadoc*, has been recovered from the sea by an extensive embankment) forms the boundary between Caernarvonshire and Merionethshire. The *Traeth Bach* belongs entirely to Merionethshire: it penetrates several miles inland, and receives the rivers *Fellrhyd*, or *Bychan*, and *Dwyrhyd*. It is dry at low water, except a narrow channel in the centre.

From the *Traeth Bach* the coast runs south about 6 miles past *Harlech* to the little headland on which stands the village of *Mochraes*, or *Mochras*. From the *Traeth Bach* to the town of *Harlech* the immediate neighbourhood of the sea is low and marshy. Between *Harlech* and *Mochraes* it rises into cliffs. It is skirted by sands dry at low water, and at some distance out to sea are three sandbanks, the '*Dutch Bank*,' the '*Pontigal Bank*,' and the '*Sarn-Badrig*' (*St. Patrick's Causeway*) or '*Sarn-Badrhywg*' (*Ship-breaking Causeway*), which runs from the immediate neighbourhood of the coast 22 miles out to sea in a south-west direction. It is dry at the ebb in spring tides, and in storms is marked by fearful breakers. From *Mochraes* the coast runs south-south-east 8 miles to the river *Maw*, at the mouth of which stands the town of *Barmouth*. From the *Maw* the coast runs southward 14 miles to the wide estuary of the *Dovey*, taking a circuit convex to the sea, and rising into cliffs midway between the rivers. At the southern extremity of these cliffs the river *Towy*, or *Diswynwy*, flows into the sea. The whole extent of the Merionethshire coast is about 38 miles.

Surface, Geology, Mineralogy.—Merionethshire is the most mountainous of all the Welsh counties, and contains some of the loftiest peaks in North Wales; there are however no peaks so high nor precipices so abrupt as those of Caernarvonshire. The principal mountain chain traverses the county from north-east to south-west, skirting the valleys of the *Dee*, the *Wnion*, and the *Maw*. The principal summits of this chain are—*Cader Berwyn*, or *Ferwyn*, on the border of this county and Montgomeryshire, 7 miles south from *Corwen*, 2563 feet above the sea; *Arran Mowddy*, near the *Wnion*, above *Dolgelley*, 2955 feet; and *Penny-Gadair* (summit of *Cader Idris*), 3 miles south-west from *Dolgelley*, 2914 feet. West of *Bala*, and near the centre of the county, is a group of mountains, of which *Arrenig Mawr*, 2809 feet, is the highest point. From this central group branches run westward to the sea in the neighbourhood of *Harlech*, and north-westward to join the group of *Snowdon*. There are no plains. Of these mountains the most celebrated for its picturesque character is *Cader Idris*. It consists of an immense rocky mass, of rather difficult ascent, on the summit of

which is a small plain, with two rocky heads of equal height, one looking to the north and the other to the south. The view from its summit is very extensive: the mountain rises so far above all the hills which lie farther east, that the Wrekin in the plain of Shropshire is visible from it. Its sides, though mostly destitute of vegetation, present some variety, from having several small lakes imbedded in the depressions of the rock. The rocks themselves are of primitive formation, consisting chiefly of different kinds of porphyry.

The county is almost entirely occupied with the slate rocks which predominate in North Wales. Along the valley of the Dee, as far up as Bala and the valley of the Alwen, a bluish-gray limestone is found, which is quarried for lime, the principal manure employed in the county. Great quantities of white limestone are quarried and burnt for lime near Corwen. This limestone is surrounded on every side by primitive argillaceous slate, which occupies the eastern side of the county. The slates of this formation are quarried in the neighbourhood of Corwen. In the western part of the county the rocks are chiefly slaty, forming abrupt and rugged mountains of desolate appearance. Lead and copper mines are worked near Towyn at the mouth of the Disynwy, and copper-mines in the neighbourhood of Barmouth. Slates are quarried in the Berwyn Mountains, and at Festiniog.

Hydrography and Communications.—The principal rivers belonging to the county are the Dee, the Maw, and the Dovey, with their respective affluents. The *Maw*, otherwise called *Mawddach*, rises near the centre of the county, and has a southern course of 8 miles to its junction with the Llynauddon, which lies more to the westward, and is of about equal length. From the junction of the Llynauddon the Mawddach flows south-south-west 4 miles to the junction of the Wnion (12 miles long), which rises close to the source of the Dee, and flows along the same valley, but in an opposite direction. For the remainder of its course, which is about 8 miles south-west, the Maw is a tide river; expanding into an estuary in some places a mile wide, and in great part dry at low water. The *Dovey*, or *Dyfi*, rises just within the border of the county, east of the mountain Arran Mowddy, in the Berwyn chain. From its source it flows south-west nearly 30 miles through a winding vale into the Bay of Cardigan; receives a number of small mountain streams, of which the Tafalag, the Afon, the Dulas, and the Cwmcelli are the principal. A part of the course of the Dovey itself and of the Tafalag, and the whole course of the Afon and the Dulas, belong to Montgomeryshire. The lower part of the course of the Dovey is on the border of Merionethshire, which it separates first from Montgomeryshire, and then from Cardiganshire. Near the mouth it expands into a wide estuary, the greater part of which is dry at low water. The Dovey is navigable up to Machynlleth, 12 miles from its mouth. The *Disynwy* rises in the Berwyn Mountains, a little north-east of Cader Idris, and flows south-west 16 miles into the sea between the Maw and the Dovey. About 3 miles from its source it expands into a small lake, called Llyn-y-Myngil, which in width nearly fills the valley of Tal-y-Llyn, leaving only a narrow road on one side, and extends in length about a mile. The Disynwy above its mouth expands into an estuary of about a mile wide, but just at the mouth is contracted into a very narrow channel. The largest of the numerous lakes in the county is Llyn-Tegid, or Bala Lake. [BALA.]

The principal roads are those from London by Shrewsbury to Corwen and Bangor, to Bala and Caernarvon, and to Dolgelley and Barmouth, with branches to Towyn. There is no railway in the county.

Divisions, Towns, &c.—This county, called by the Welsh Meirionnydd, or Meirionnydd, is the only one in Wales that, with the addition merely of the word 'shire,' retains its ancient designation. Writers are not agreed as to the ancient division of the county; the present divisions, with their relative situations, are as follows:—Ardwdwy, or Arduddwy, north-west; Edermion, or Edeyrnion, north-east; Estimrder, or Estu-maner, south; Penllyn, north and north-east; Talybont, or Tal-y-bont, and Mowddy, south and south-east.

There are five ancient market-towns, namely, BALA and DOLGELLEY, the assize towns; HARLECH, CORWEN, and Dinas-y-Mowddy; and two, where markets have been established of late years, namely, Towyn and BARMOUTH. The places printed in small capitals are described under their respective titles, the others we notice here:—

Dinas-y-Mowddy, in the parish of Mallwydd, 10 miles E. from Dolgelley, population of the parish 1201 in 1851, is situated on a shelf of rock at the junction of the Cerris with the Dovey. It consists of a few mean cottages. Mallwydd parish church is a spacious edifice; there are Dissenting chapels and a Free school. Flannel is made in the neighbourhood. The scenery about Mallwydd is very fine; and many anglers resort here in the season.

Harlech, is in the parish of Llandandwg, near the shore of Cardigan Bay, 22 miles N.W. from Dolgelley. The population of the parish in 1851 was 749. A British fortress, called originally Twr Brouwen, and at an after period, Caer Collwyn, occupied the site of the present castle erected by Edward I. In the civil war of Charles I. the castle changed masters once or twice, but was finally taken by the Parliamentarians under General Mytton, March 1647. Harlech is now little more than a village. The ruins of the castle are situated on a lofty and precipitous rock facing the bay, and rising above an extensive marsh once occupied by the sea. Its walls are tolerably perfect; they form a square of about 70 yards each way, with a round tower at each

corner, and on each side of the entrance. The church is modern. The market has almost fallen into disuse; there are several fairs, chiefly for live stock. The county election is held here.

Towyn, is pleasantly situated near the coast, between the estuaries of the Disynwy and Dovey, 16 miles S.S.W. from Dolgelley. The population was 2769 in 1851. The houses are built chiefly of a coarse gray stone quarried in the neighbourhood. The town is frequented in summer for bathing. The church contains some venerable monuments; in the churchyard are two rude pillars, one of them 7 feet high, adorned with a cross, and bearing an inscription in commemoration of St. Cadvan. There are a dissenting chapel, and a school partly endowed. In a field near the church a medicinal spring has been inclosed, and two baths have been formed. Some flannels are manufactured. Races are held near the town. There is a yearly fair. The bathing village and port of *Aberdovey* on the estuary of the Dovey, is in Towyn parish. There are a chapel of ease and Dissenting chapels here. Slate-quarries are worked near Aberdovey, and a considerable share of the coasting trade is carried on at the port, which is a member of Aberystwith.

The only other places that require notice are Maentwrog and Trawsfynydd. *Maentwrog* is pleasantly situated near the foot of the Vale of Festiniog, 17 miles N. by W. from Dolgelley. The population in 1851 was 894. The village contains a neat church, a Methodist chapel, and Free schools. During the season the place is much resorted to by tourists. Tan-y-Bwlch a very celebrated tourists' hotel is near Maentwrog. In the neighbourhood are extensive slate-quarries. Many excellent residences are in the vicinity. *Trawsfynydd* is on the road from Festiniog to Dolgelley: population, 1498 in 1851. The village consists of neat houses, a church, and a chapel. The mountain scenery around is very fine.

Divisions for Ecclesiastical and Legal Purposes.—The county of Merioneth is partly in the archdeaconry of Merioneth and diocese of Bangor, and partly in the archdeaconry and diocese of St. Asaph. By the Poor-Law Commissioners the county is divided into 4 Unions—Bala, Corwen, Dolgelley, and Festiniog, containing 48 parishes and townships, with a population in 1851 of 51,211. The county is in the North Wales circuit; the Lent assizes and the Epiphany and Midsummer quarter sessions are held at Bala; the Midsummer assizes and the Easter and Michaelmas quarter sessions at Dolgelley, where is the county jail. County courts are held at Bala, Corwen, and Dolgelley. The county returns one member to the Imperial Parliament.

History, Antiquities, &c.—In the earliest period of the authentic history of the island, Merionethshire was included in the territory of the Ordovices. [BRITANNIA.] In the Roman division of the island it was included in the province of Britannia Secunda. There are several traces of Roman works in this county. There are remains of camps near BALA. Tommen-y-Mŵr, 'the mount within the wall,' a station, of which the ditch and bank, with vestiges of a wall, remain, near Festiniog, is supposed to be the Heiri Mons of Richard of Cirencester, though Stukeley places it near Bala. Castell Prysor, a hilly fort about 3 miles E. from Trawsfynydd, is considered by Pennant to have been originally Roman. The Dovey River is believed to be the Stucia of Ptolemaeus. A Roman road from Maridunum, or Muridunum (Caer-marthen), to Segontium (Caer Seiont, near Caernarvon) led through the county. It may be traced in the neighbourhood of Trawsfynydd through Tommen-y-Mŵr, where it is called Sarn-Helen, a name which is interpreted by some 'the road or causeway of Helen,' the wife of the usurper Maximus, who assumed the purple (A.D. 381) in the time of the emperors Gratian and Theodosius; and by others 'the road of the legion.' The Sarn-Helen is now entirely covered with turf, and is to be distinguished only by its elevation above the rest of the surface; but on digging, the layers of stone of which it was made are discoverable throughout its course: the aggregate breadth of these layers is about 24 feet. There are several tumuli or barrows near the road. There is a group of other monuments, probably sepulchral, near Rhyd-ar-Helen, a quarter of a mile from the Sarn-Helen, of considerable antiquity. In the neighbourhood of Rhiw Goch, not far from Trawsfynydd, is a grave, called the Grave of Porus, covered with an inscribed stone, evidently Roman; and near it is a great upright monumental or banta stone, of a kind frequent in Wales and in northern Europe. Roman coins, sepulchral urns, and other antiquities have been dug up in various places.

A stone inclosure, or fort, and several other British antiquities are near Llanddewi, between Barmouth and Harlech; and in the same neighbourhood are earnedds, cromlechs, and other primeval remains.

During the Saxon period and the reigns of the earlier English kings of the Norman dynasty, Merionethshire does not appear to have been the scene of events of historical interest. In proportion however as the consolidation of the Anglo-Norman power enabled the English to press the Welsh more closely, these previously unassailed fastnesses became the scene of contest. The invasion of Henry II., and the stop put to his progress by the Welsh, under Owen Gwynedd (1165), are noticed under CORWEN.

The county was probably conquered by Edward I., a little before the final conquest of Wales, as Harlech Castle was completed before 1283. Merionethshire was the scene of the rebellion of Owen Glyndwr. Harlech Castle was one of his conquests.

In the war of the Roses Harlech was held for the Lancastrians, but taken by Sir Richard Herbert. After the war was concluded the county became and long continued to be the scene of great confusion. A multitude of outlaws and felons established themselves near Dinas-y-Mowddy, and perpetrated a variety of crimes. To quell these outrages a commission was granted by Queen Mary to two gentlemen of the county—one of them Lewis Owen, vice-chamberlain and baron of the exchequer of North Wales. In pursuance of this commission 80 of the band were seized and punished. To revenge this severity Mr. Owen was waylaid and murdered in 1555, at a place since called Llydiart-y-Barwn, 'the baron's gate.' The vigorous measures to which this outrage gave rise led to the extirpation of the banditti, some of whom were executed, and the rest fled. In the civil war of Charles I. Harlech Castle was the object of contention. The repeated captures of this place, and a skirmish near Dolgelley, were however the only incidents of the contest which occurred within the county.

The principal remains of the middle ages are Harlech Castle, already described, and the ruins of Cymmer Abbey, near Dolgelley, with two or three smaller castellated buildings. Llys-Bradwen, between Dolgelley and Towyn, is the ruin of a rude edifice, the house of an ancient Welsh chieftain; and near Llanfihangel-y-Pennant are the remains of a castle supposed to be the castle of Bere, belonging to the last Llewellyn, prince of North Wales, and taken from him by William de Valence, earl of Pembroke, a short time previous to the final conquest of Wales.

Religious Worship, Education, &c.—According to the Returns of the Census in 1851, the Calvinistic Methodists appear to have the largest number of adherents of any of the religious bodies in the county; Wesleyan Methodists, Episcopalians, Independents, and Baptists have also numerous places of worship and Sunday schools. In 1851 there were 4 literary institutions in the county, with 187 members, and 357 volumes in their libraries. In 1853 the county possessed two savings banks, at Bala and Dolgelley; the amount owing to depositors on November 20th 1853 was \$1,366. 18s. 3d.

MEROE. [ETHIOPIA.]

MERSEBURG, one of the three governments into which the Prussian province of Saxony is divided, has an area of 3994 square miles, with a population of 742,644 at the end of 1849. The eastern and larger part of the government is flat, with gentle eminences, but no mountains; the western portion is more mountainous than level, being partly occupied by branches of the Harz and the Thüringerwald: this portion however contains extensive and fertile levels; and the whole of the government, though the soil is unequal, may be called fertile. The principal rivers are—the Elbe and its tributaries, the Schwarze Elster, on the right bank; the Mulde and the Saale on the left bank. The Saale receives the White Elster and the Unstrutt. The government is traversed by the Magdeburg-Leipzig and Thüringian railways, which meet at Halle.

Merseburg, the chief town of the government, is situated on the Saale, 10 miles by railway S. by W. from Halle, and has about 10,500 inhabitants. It is an old irregularly built town, with narrow crooked streets, consisting of the town itself, the Close, and the two suburbs Altenburg and Neumarkt, the latter lying on the opposite bank of the Saale, over which there is a large stone bridge. The town is surrounded with walls, and has four gates. The most remarkable buildings are—a fine palace, now used for the government offices; the cathedral, which has one of the largest organs in Germany; the cathedral school; the monastery of St. Peter, in the suburb of Altenburg; the palace of Count Zechi; the military hospital; and the new town-hall. There are manufactories of linen- and woollen-cloths, paper, tobacco, and vinegar, and extensive breweries and distilleries. The trade of Merseburg is considerable.

Dürrenberg, a small village between Merseburg and Lützen, has important salt-works, which produce about 40,000 tons of salt yearly.

Eilenburg, a town of about 9000 inhabitants, stands N.E. of Merseburg, on an island in the Mulde, which is reached by two bridges. The town, which is surrounded by walls and ditches, has manufactures of printed cotton, vinegar, starch, brandy, woollen-yarn, &c.

Eisleben, the birthplace of Luther, is situated 16 miles N.W. from Halle, on a hill above the Böse, and contains 4 churches, a gymnasium, several schools, 2 hospitals, and 7528 inhabitants, who are engaged in a brisk inland trade, in the manufacture of potashes and tobacco, and in the copper-mines and smelting-works of the neighbourhood.

Halle forms the subject of a separate article. [HALLE.]

Lützen, a village S. by E. of Merseburg, on the high road from Leipzig to Weissenfels, has given name to two celebrated battles, the first fought in 1632, in which the Imperialists were defeated by the Swedes under Gustav-Adolf, who lost his life on the field; the second in 1813, in which the French under the Emperor Napoleon I. defeated the combined armies of Prussia and Russia.

Naumburg, a station on the Thuringian railway, 28 miles from Halle, near the right bank of the Saale, a little above the point where that river is joined by the Unstrutt, is a well-built town, surrounded by walls which separate it from several suburbs. The chief buildings are the church of St. Wendel, the court-house, the town-hall, and the gymnasium. This town is the seat of the court of appeal for the governments of Merseburg and Erfurt. It has about 18,000 inhabitants, who manufacture broadcloth, linen, stockings, gloves, leather,

starch, soap, vinegar, beer, brandy, and chemical products. Two great annual fairs are held here, one in June, the other in December, for the sale of all kinds of industrial produce; besides these three other annual fairs are held for the sale of horses and cattle.

Sangerhausen, a well-built walled town, situated at the foot of the Harz Mountains, 31 miles N.W. from Merseburg, has 6000 inhabitants, many of whom are engaged in the copper mines and works near the town.

Torgau is a strongly fortified town, situated in a low marshy country on the left bank of the Elbe, which is here spanned by a bridge partly of wood and partly of stone. The population is about 7000; they manufacture woollen-cloth, linen, leather, and soap, and trade in corn, timber, and lime.

Weissenfels, a town of 8500 inhabitants, 11 miles by railway N.E. from Naumburg, stands on the right bank of the Saale, which here becomes navigable, and is crossed by a wooden bridge. It is a walled town, entered by four gates, which lead to as many suburbs. On a rock outside the town stands an old castle, now used as barracks. A training house for schoolmasters, a gymnasium, an asylum for deaf mutes, two hospitals, and an almshouse, are the principal institutions of the town. Jewellery, porcelain, leather, and merino, are the chief manufactures. The remains of Gustav Adolf, king of Sweden, who fell at the battle of Lützen, are buried in the convent church now no longer used.

Wittenberg, a fortified town N.N.W. of Torgau, situated on the Elbe, which is here crossed by a wooden bridge 1000 feet long, is celebrated for its university now suppressed, in which Luther was a professor in 1508. A colossal statue of Luther was erected in the market-place in 1817, and the university church contains the tombs of him and Melancthon. The town has a theological seminary, a gymnasium, several woollen and linen factories, breweries, distilleries, dye-houses, and 8500 inhabitants, who are also engaged in gardening and in the Elbe fisheries. The university of Wittenberg was incorporated with that of Halle in 1817.

Zetta, a walled town entered by six gates, built on the slope of a steep hill, on the right bank of the Elster, 18 miles S.E. from Naumburg, contains a fine old castle, called Moritzburg. four churches, a gymnasium, a library of 12,000 volumes, several schools, and about 10,000 inhabitants, who manufacture calico, broadcloth, leather, starch, beer, spirits, pottery, gloves, ribands, &c.

MERSEY ISLAND. [ESSEX.]

MERSEY RIVER. [CHESHIRE; LANCASHIRE.]

MERTHYR TYDVIL, or TYDFIL, Glamorganhire, a parliamentary borough and the seat of a Poor-Law Union, in the parish of Merthyr Tydvil, is situated in a valley near the north-eastern corner of the county, in 51° 45' N. lat., 3° 11' W. long, distant 21 miles N. by W. from Cardiff, and 171 miles W. by N. from London. The population of the borough, in which is included the adjoining town of Dowlais, in 1851 was 68,080. The living is a rectory in the archdeaconry and diocese of Llandaff. The borough returns one member to the Imperial Parliament. Merthyr Tydvil Poor-Law Union contains 9 parishes, with an area of 118,716 acres, and a population in 1851 of 76,813. Dowlais is noticed under GLAMORGANSHIRE.

Merthyr Tydvil is the principal seat of the iron district of South Wales. The town, which is situated in the valley of the Taff, consists mainly of workmen's houses, and is irregularly built. Previous to the appointment of the Local Board of Health in 1851, the town was entirely without drainage, and the water supply was miserably bad. Such was the filthy state of the place, that cholera found its victims ready for its approach, and many lives were sacrificed. The town has been somewhat improved in its condition, but much yet remains to be done.

According to the Returns of the Census in 1851, there were then 84 places of worship in Merthyr Tydvil, of which 20 belonged to Independents, 19 to Particular Baptists, 10 each to the Church of England, Wesleyan Methodists, and Welsh Calvinistic Methodists, and 6 to Mormons. The number of Sunday schools was 68, with 13,395 scholars. Of day schools there were 59, of which 16 were public schools with 2544 scholars, and 43 private schools with 1185 scholars. A library and reading-room has upwards of 1800 volumes; the number of subscribers in 1851 was 138.

Merthyr Tydvil was not represented in Parliament till the passing of the Reform Act. The mining operations of this place were comparatively unimportant prior to the year 1755. There are now four great iron-works, the largest in the empire. Some coal is exported. Communication between Merthyr Tydvil and the sea at Cardiff is maintained by the Cardiff Canal. Merthyr has communication with Cardiff by the Taff Vale railway, and with Swansea and Llanelli by the Vale of Neath railway. There are two market-houses. The market-day is Saturday, and fairs are held on May 14th and the first Mondays in July and August. A county court is held.

MERTOLA. [ALENTRO.]

MERTON. [SURREY.]

MERVILLE. [NORF.]

MERY-SUR-SEINE. [AUBE.]

MESOLONGHI, in Ætolia, a small town in Greece, is situated in a marshy plain on the northern side of the Gulf of Patras, near its entrance, and right opposite Cape Kologria or Papas in the Morea.

It became remarkable during the last Greek insurrection against the Turks, in consequence of its siege and the heroic resistance of the Greek garrison.

Mesolonghi is built on the edge of a marshy plain, bounded N. by the high ridge of Zygos, the ancient Aracynthus, and is protected towards the sea by a lagune extending about 10 miles along the coast and 5 miles in width; and hence perhaps the name of the town, which seems to be a contraction of the Italian words 'mezzo' and 'laguna.' With the exception of a few very tortuous channels, the lagune is impassable for any craft drawing more water than the 'monoxyla,' or small boats of the inhabitants. The main channel in the south is commanded by the mud-bank of Vassiladi, on which the Greeks had built a small fort; and the main channel in the north, by the islets of Poros and Anatoliko. At the time of the outbreak of the Greek revolution the town contained several thousand inhabitants, who derived wealth from their extensive fisheries. The fortifications were in such a neglected state that Lord Byron advised the Greeks to strengthen the place by additional works; but the Turks left them only time to add a rampart of earth faced with stones, and a ditch, which surrounded the town on the land side. After the progress of Reshid Pasha, the Turkish commander in Northern Greece, in the beginning of 1825, many Greek palikars and others flocked to Mesolonghi with their families, so that the garrison was increased to about 5000 fighting men. The chief was the veteran Nothi-Bozzaris; the body of officers was increased by many foreign volunteers, mostly German noblemen and gentlemen. On the 25th of April, 1825, Reshid Pasha appeared in sight of the town, with an army of 20,000 men and a numerous battering train, to which the besiegers could only oppose 48 bad iron guns of calibre varying from 4- to 48-pounders, two brass 10-inch mortars, one howitzer of 5 inches, and one mountain howitzer of 4½ inches. The Turks made the first trench on the 5th of May, and on the night of the 11th a terrible bombardment began. Bombardments and stormings now succeeded each other during two months, but the fire was well answered from the rampart, and the Greeks made frequent sallies, in which the besiegers were almost always defeated with great loss, especially on the 2nd of July. The Hydriotic fleet being stationed at the entrance of the lagune, there was no lack of ammunition and provisions in the town, till, on the 10th of the same month, the great Ottoman fleet appeared off the place, and, after having obliged the Hydriotic to avoid a certain defeat by a hasty retreat, landed a strong body of Turks, under Hussein Bei. On the 28th of July, the 2nd of August, and in the night of the 3rd, the fortress was furiously assaulted, and a terrible cannonade carried destruction among the houses and their inhabitants; but the Greeks stood their ground, and were excited to hopes of certain victory when, a few days afterwards, the great Greek fleet under Miaulis and Sakhtouri came in sight, and after a severe conflict defeated and dispersed the Turkish fleet. The maritime blockade was now at an end, and in the beginning of September the garrison was still 4000 strong, with an additional population of 10,000 women, children, and aged or infirm men. By orders of Sultan Mahmud, Ibráhim Pasha, who commanded in the Morea, then took the chief command, with Reshid Pasha as his first lieutenant.

Towards the end of November the combined fleet of Turkey, Egypt, and Barbary, drove the Greek fleet from the lagune, and kept a strict watch over its entrance. In the first week of January 1826 Ibráhim Pasha appeared in the Turkish camp with 14,000 Egyptians, and an ample supply of provisions and ammunition. Although the inhabitants were on the verge of starvation they would not capitulate, and continued their deadly sorties, when at last, Ibráhim, after having taken the islands of Poros and Anatoliko, made the town a heap of ruins by an uninterrupted bombardment from the 25th to the 27th of January, and after that continued his terrible assaults. On the 6th of April however his forces were driven back with immense slaughter, and had the Greeks availed themselves of the confusion in the Egyptian camp, they might have escaped with their families. Their ammunition and food being completely exhausted, so that even cats and rats were devoured with avidity, the garrison resolved to cut its way through the Egyptian camp. Three thousand fighting men were to rush headlong upon the besiegers on the 22nd of April, and cut a way for 5000 women and children, while the retreat was to be covered by a thousand men, and the fortress guarded by a few devoted warriors who were ready to sacrifice their lives for the safety of their brethren. But the plan was betrayed to Ibráhim Pasha, and when the heroes of Mesolonghi appeared outside their shattered stronghold, they were suddenly surrounded by the main body of the Egyptians. A dreadful conflict ensued. Five hundred men were cut down by the infuriated besiegers; 1800 persons, of whom 200 were females, escaped; of these, however, 600 were starved to death in the mountains; and Ibráhim boasted of having taken prisoners 3000 soldiers, and from 3000 to 4000 women and children.

Thus fell Mesolonghi after a siege of twelve months, and after 100,000 shot and shells had been exchanged between the besieged and the besiegers. Its melancholy fate excited the sympathy of all Europe, and there is scarcely a modern language in which poems were not written on the heroes of Mesolonghi. Lord Byron died at Mesolonghi April 19, 1824.

(Gordon, *History of the Greek Revolution.*)

MESOPOTAMIA (from the Greek μέσος, middle, and ποταμός, river), 'the country between the rivers,' is a term which was used by the Greek and Roman geographers (Strabo and others) to comprehend all the countries which lie between the rivers Euphrates and Tigris, and it is still in use. The Arabs and Turks call this country, by the corresponding name of Al Jezirah, or 'the island.' Mesopotamia was called in the Old Testament Aram-Naharaim, that is, 'Aram,' or 'Syria between the two rivers.' By ancient geographers it was considered to be bounded N. by Mount Masius (Karajah-Dagh), a branch of Mount Taurus, and S. by the Median Wall and the canals which connected the Tigris and Euphrates, by which it was separated from Babylonia. The name did not come into use till after the time of the Macedonian conquest of Asia. The southern part of Mesopotamia Xenophon calls Arabia ('Anab.,' i. 5, sec. 1); and other writers included it, especially the northern part, under the general name of Syria. (Strabo, p. 737.) It was considered by the Romans a division of Syria. (Mela, i. 11; Pliny, v. 13.) The northern part of Mesopotamia, as thus restricted, was in ancient times divided into two parts by the river Aborras or Chaboras (Khabour), called Araxes by Xenophon ('Anab.,' i. 4, sec. 19), which rises in Mount Masius, and receiving the Mygdonius (Jakhjakhah) on the east, flows into the Euphrates at Circesium, the Carchemiah of the Old Testament. Of these divisions the western was called Oaroen, and the eastern Mygdonia.

The name Mesopotamia, taken in its proper sense, ought to include all the country that is inclosed, or nearly so, between the two rivers; but from the boundaries ascribed to Mesopotamia by Strabo and others it is clear that the upper plain of the Tigris was not comprised in this designation. This plain, lying between the Kharzan-Dagh or Mush-Dagh, the ancient Niphates, on the north, and the Karajah-Dagh (Mons Masius) and Jebel-Mardin on the south, has been already partially described in the article ARMENIA (vol. i., 514-517). We shall here add some further particulars concerning it, and then notice successively the great southern plain of Mesopotamia, which embraces all the countries between the two rivers, from 36° 30' N. lat. to the Chalu or Median Wall, which begins on the banks of the Tigris, near 34° N. lat., and terminates on the Euphrates, near 33° 30' N. lat.; and, lastly, the plain of Babylonia (Irak-Arabi), which extends southward from the Median Wall to the confluence of the two rivers.

The upper Plain of the Tigris is included in the hilly region of Mesopotamia, which extends south from the Kharzan-Tagh to the great caravan-road that runs from Bir-eh-jik, on the Euphrates, to Mosul on the Tigris, through Urfah or Orfah, Mardin, and Nisabiu. This region lies between 38° 30' and 37° N. lat., and between 38° and 43° E. long., and extends about 100 miles from north to south, and 250 miles from east to west, so that its area may be roughly estimated at 25,000 square miles.

This country may be considered as a lower terrace of the table-land of Armenia. The northern districts are about 2500 feet above the sea-level, from which elevation it gradually descends to about 1000 feet, or somewhat more, where it is contiguous to the southern plain of Mesopotamia along the caravan-road. Only the most eastern part of this road between Tel-Rumaláh and Mosul is at a lower level, and runs through the Great Desert Plain.

The highest part of this region is that which on the west borders on the banks of the Euphrates between Izoglu and Gerger, where the river forms its 300 cataracts; and on the east on the upper course of the Tigris between its source and the town of Diarbekr, which is nearly 2500 feet above the sea: the source of the Tigris is nearly 5000 feet. The level of the surface of the Euphrates near the confluence of the Kara-Su and Murad is upwards of 2500 feet, and at Gerger probably less than 1800 feet. But the rocky mountain masses which rise abruptly from the water's edge, at many places perpendicularly, generally attain near the river an elevation of between 2000 and 3000 feet, and a greater height at some distance from it. The highest portion of this tract must therefore be more than 5000 feet, and it may be 6000 feet. In the depressions are small villages surrounded by walnut-trees and a little cultivation, but the inhabitants derive their subsistence chiefly from their cattle and sheep.

East of this mountain tract lies the Plain of Diarbekr, or of the Upper Tigris, which extends from some miles west of the town of Diarbekr to some distance east of the town of Sert, about 120 miles in length, and from the Kharzan Mountains on the north to the Karajah-Dagh on the south, from 40 to 50 miles; on the east it is shut up by the mountains of Kurdistan. The southern slope of Kharzan, or Mush-Dagh, is in many places interrupted by terraces from two to three miles in width. These terraces are generally used as pasture-grounds; they are cut by wide valleys, which descend from the summit of the range to the plain below, and are drained by feeders of the Tigris, already noticed in the article ARMENIA. Rich crops of wheat and barley are obtained everywhere, and in some places, where irrigation can be practised, rice is grown. The sides of the hills which inclose the valleys, and the valleys themselves, are partly covered with orchards and plantations, consisting of walnuts, figs, vines, pomegranates, mulberries, and the fruit-trees of Northern Europe. In some places cotton, melons, and plantains are grown to some extent. The steeper portions of the mountains are chiefly covered with woods, in which the manna and gall oaks abound. In some parts the steep

declivities of the hills have been transformed into terraces, which are planted with fruit-trees and irrigated.

The Plain of Diarbekr itself is arid, much less fertile, and not cultivated with such care as these valleys. Its surface may at the lower part be about 1700 to 1800 feet above the sea-level. There are many tracts which are quite level, and others have an undulating surface; a few are hilly. The rivers, especially the Tigris, run in beds deeply depressed below the general level of the country, which renders it difficult and expensive to use the waters for irrigation; and as the summers are hot and dry, only those tracts can be cultivated which have a better soil. The others are only used as pasture-ground during the wet season, and until the grass is dried up by the heat. In some parts the surface is bare of mould, and consists of naked rocks. There are no trees on this plain except mulberries and poplars, which are planted in some places. Corn and barley are grown, and some cotton, and also maize. In the vicinity of the town of Diarbekr cultivation is carried on with more vigour: flax is also grown.

A few miles from the right bank of the Tigris, where the river runs from west to east, the plain is bordered by rocky masses, which rise with rather a steep ascent to 2000 feet above the general level of the plain. Though they appear to form a range, these masses constitute only the outer border of a table-land which occupies the whole country between the Euphrates and Tigris, north of 37° N. lat., and compels the Tigris to run eastward and the Euphrates west, near 38° N. lat. These two rivers are hardly 30 miles apart; but 60 miles farther south, between Rumkalah on the Euphrates and Jezirah Ibn Omar on the Tigris, they are more than 220 miles from each other. The highest part of this table-land runs from north-west to south-east, forming the Karajah-Dagh, which with its continuation the Jebel Mardin, is described in the article ARMENIA, vol. i, col. 516.

Near the banks of the Euphrates where the mountain masses have sunk down to 1200 or even 800 feet above the level of the river, the edge of the masses is split and indented, and numerous small valleys are found between the high ridges. In these valleys some corn is cultivated, but the largest part of them is covered with orchards, consisting of olives, pomegranates, mulberries, pears, peaches, and quinces; all of them have also excellent vine plantations. In some parts cotton is cultivated.

The country through which the caravan road between Bir-eh-jik and Mosul runs, has great variety of surface and soil. Between Bir-eh-jik and Urfah it is hilly, and contains many cultivated tracts. Farther east, as far as Mardin, cultivated and wooded tracts, mostly situated in depressions, or valleys alternate with plains, which in some cases afford pasture, and in others are quite sterile. This tract is very uneven, and the ridges running south and north rise to high hills, generally of a conical shape. These ridges continue to Nisibin, but are less frequent. Between them run some watercourses, which are used for irrigation, and soon lost in the desert country that lies farther south. East of Nisibin cultivation ceases; but as in this part there are numerous watercourses, the adjacent country has pasture even during the summer months.

The climate of this region is much colder than that of Europe in the same parallel. In January and February a great quantity of snow falls. The spring hardly exceeds six weeks, and in May the dry season begins, in which hardly any rain falls to the end of October or the commencement of November. The thermometer rises to 90°, and all grass and minor vegetation dries up. Pasture is then only found in the vicinity of the pools and cisterns, which are common in many parts of the table-land. Nature becomes reanimated in the month of November, when very heavy rains fall. Among the products of this region are wheat, beans, barley, rice, lentiles, durrha; cucumbers, melons, pumpkins; mulberries, pomegranates, walnuts, figs, cherries, plums, apples, pears, quinces, almonds, chestnuts, filberts, &c.; tobacco, sesamum, castor-oil; hemp, flax, safflower, cotton; capers, mustard, liquorice, and asparagus. The four last grow wild.

Sheep, cattle, and goats, constitute the wealth of the nomadic tribes. There are two kinds of sheep, the Tartarian, with the fat tail, which often weighs 15 lbs., and the Arabian, whose tail is not much thicker than that of our sheep. Horses are numerous; asses are also kept in great numbers. Camels are used on the caravan road.

The most common wild animals are wild boars, deer of two or three different kinds, wolves, foxes, hyenas, jackals, bears, polecats, martens, marmots, hamsters (*Cricetus vulgaris*), squirrels, porcupines, and hares. There are several kinds of vultures, falcons, and owls; ravens, crows, jackdaws, thrushes, beccaficos, and other smaller birds. Fish abound in both rivers, the Euphrates and the Tigris, and in several of their confluent. There are also several kinds of turtles, snakes, and lizards.

The hilly region of Mesopotamia constitutes the pashalik of Diarbekr; but the most south-eastern districts of it are sometimes placed under the pasha of Mosul. The most remarkable places are situated either in the plain of Diarbekr or along the caravan road between Bir-eh-jik and Mosul. In the plain of Diarbekr are—

Diarbekr. [DIARBEKR.] North of Diarbekr, on the southern declivity of the Kharzan-Tagh, are rich copper mines of Arghana Masden. [ARMENIA.] The towns of *Ilijeh* and *Khimi* are noticed under ARMENIA.

Along the caravan road are the towns of Urfah, or Orfah, Mardin,

and Nisibin. *Urfah* (*Orfa*, the ancient *Edessa*), the most western, is at the base of a hill, and is a well-built large place, which is frequently compared with Damascus. It is surrounded by high and strong walls 7 miles in circuit, and has between 40,000 and 50,000 inhabitants. The most remarkable of its numerous mosques is the grand mosque, which in its exterior and interior exhibits a considerable degree of magnificence. With this building are united several medreses, where young men are instructed in the Koran, divinity, and the law. Edessa was the chief town of Osroene. It was also called Antiochia and Callirrhoe (Plin., v. 21), and is supposed to be the Erech of the Old Testament. (Gen., x. 10.) Edessa suffered greatly by an earthquake in the time of Justinian, who rebuilt a considerable part of the town, and gave it the name of Justinopolis. Orfa was plundered by the army of Timur in 1393, but it soon recovered its former importance. South of Orfa was the ancient town of *Charra*, the *Haran* of the Scriptures, where Abraham's family dwelt after they had left Ur of the Chaldees. In the time of Hezekiah, Haran had been conquered by the Assyrians. It is mentioned by Ezekiel as a place of commercial importance. *Charra* is memorable in Roman history for the defeat of Crassus, (Dion. Cassius, xl. 25; Pliny, v. 21).

Mardin is noticed in a separate article. [MARDIN.]

Nisibin (the ancient *Nisibis*), farther east, had sunk down to the condition of a miserable village, but in modern times the Turks have partially rebuilt it. Nisibis, the chief town of Mygdonia, also called Antiochia Mygdonica, was situated on the river Mygdonius, in the midst of a fertile plain at the foot of Mount Masius. It was surrounded by three brick walls, and was very strongly fortified. Sapor was repulsed in three separate attacks upon the town, but it was ceded to him by treaty in A.D. 363. The Zoba of the Old Testament (1 Sam., xiv. 47; 2 Sam., viii. 3) is supposed to be the same town as Nisibis, since the Syriac writers frequently mention Nisibis under the former name. To the north of Nisibis was *Daras* (*Dara*), which was fortified by Anastasius I. (A.D. 506), who gave to it the name of Anastasiopolis. (Procop., 'Pers.,' i. 10.) There are considerable ruins both of Nisibis and Daras.

The town of *Suverek*, or *Severek*, lies on the direct road between Urfah and Diarbekr, in a depression in the midst of the table-land. In the surrounding country wheat is raised to a considerable extent, and orchards are numerous. The place contains 2000 families.

The only place, except Diarbekr, built on the banks of the Tigris which requires notice is Jezirah-Ibn-Omar (the Island of the son of Omar), which was built on an island in the river. It was long the seat of a rebellious chief of the Kurds, and contains a population of about 1000.

The Great Southern Plain, sometimes called the Desert of Mesopotamia, extends from the great caravan-road leading from Bir-eh-jik to Mosul to the Median Wall, or from 37° N. lat. to 33° 30' N. lat., and between 38° and 44° E. long. At its northern extremity it is nearly 300 miles wide; but as the Euphrates and Tigris approach nearer to one another in their course to the south, the country grows narrower, and at its southern extremity it is hardly 50 miles wide. The length from north-west to south-east may be about 250 miles, and the average width about 150 miles. This gives an area of 37,500 square miles.

The level of this region at its northern extremity and in the vicinity of Mardin, is between 1300 and 1400 feet above the sea, but it decreases as it approaches the rivers; Mosul on the Tigris is only about 400 feet, and Bir-eh-jik on the Euphrates 650 feet above the sea-level. The course of the rivers and streams shows that it descends towards the south. At its southern extremity near the Median Wall it probably does not exceed 200 feet above the sea.

The country is a plain, but there are a few isolated ridges of high hills, which however do not cover a great extent of country. The best known of these ridges are the Jebel-Makhul on the banks of the Tigris, between 35° 30' and 35° N. lat.; the Sinjar Hills, south of Nisibin, north of 36° N. lat., and between 41° and 42° E. long.; and the Abd-al-aziz Hills, near 36° 30' N. lat., and between 39° and 40° E. long.

The most fertile portion of this region is in the north-western corner, between the Abd-al-aziz Hills and the Euphrates; it is drained by the river Belik, which runs about a hundred miles, and falls into the Euphrates at Racca. This region comprehends the districts which are known by the names of Saruj and Harran. In Saruj alone it is stated that there are more than forty large villages, inhabited by agriculturists, and that twenty of them cultivated rice. The country is considered as the granary of Syria, and no part of the last-mentioned province can vie with it in fertility and agricultural productions. *Harran*, which lies to the east of Saruj, is stated to contain a large portion of alluvial land, and to be equally fertile.

The country between the caravan-road and the Sinjar Hills is nearly a level plain, which even at the end of the dry season is mostly covered with coarse grass and prickly plants. In some places there are tracts of marshy ground, with long reeds, and interspersed with many large pools of sweet water; at a few places the soft soil is impregnated with salt. There are in this part many Tells or mounds of conical shape from 80 to 150 feet in height; they appear to be artificial, and some of them mark the sites of ancient towns. The portion of this tract which is under cultivation is small.

The *Sinjar Hills* run east and west with a slight inclination to the

south. They extend in length about 50 miles, and in breadth from 7 to 9 miles. The highest part of the hills is near the eastern extremity, where they rise about 1500 feet above the plain. This is an agricultural district. Considerable quantities of wheat, barley, and cotton are raised in the lower and more level parts, and the sides of the hills are covered with plantations of fig-trees and vines, which yield articles of export. A portion of the hills is covered with oak-trees, the acorns of which afford a plentiful supply of food to the numerous wild boars that frequent the hills. The number of the inhabitants, who are Yezidis, is stated to exceed 6000.

The plain between the Sinjar Hills and the Tigris has an undulating surface, and is for the most part barren, and covered with coarse scanty grass and thorny shrubs; there are large tracts of barren marshy soil, strongly impregnated with saline matter. The most common vegetable production is an oat-grass, which at many places covers tracts of several miles in extent, to the exclusion of all other plants except a few flowers. Cultivation is only carried on in some of the beds of temporary watercourses, and between some low ridges of rocks, where wheat and barley are cultivated. Some tracts are covered with wormwood. In the vicinity of the Tigris the cultivated tracts are more extensive. This river flows here in a valley from 8 to 10 miles wide: the projecting headlands of the higher country form large embayments, which have a fertile alluvial soil, overgrown in their natural state with grass and small tamarisks, but where cultivated giving abundant crops of grain or rice. In proceeding from Mosul southward the cultivated tracts decrease in number, as the agricultural inhabitants are too much exposed to the predatory incursions of the Shammar Arabs, who are in possession of the uncultivated interior of this part of Mesopotamia.

The Jebel-Makbul extends about 40 miles along the Tigris, and at a very short distance from the banks. It must be considered as the continuation of the Jebel-Hamri, which near 35° comes close up to the left bank of the Tigris from the south-east. The Jebel-Makbul may rise about 600 feet above the level of this river: it consists mostly of two ridges, and is composed of transparent gypsum. In its present state it is a waste. At its western base is a large tract of country with a sandy soil, which contains a great number of bitter wells that are frequently visited by the nomadic tribes of the Arabs. The banks of the Tigris between the Jebel-Makbul and the town of Tekrit are uninhabited on account of the neighbourhood of these tribes. Between Tekrit and the Median Wall the alluvial tract on the banks of the Tigris grows much wider, and appears to have been formerly a well-cultivated country, which was irrigated from a large canal that still exists under the name of Ishaki, and extends from the town of Tekrit to Baghdad; a great number of smaller canals for irrigation are connected with it. But at present the canal rarely contains water, as the whole work has gone to decay from want of attention; and this tract, which has an exceedingly fertile soil, is without inhabitants, and almost without cultivation, except a few isolated spots.

The higher ground west of this alluvial tract, as far as the river Tharthar, is described in article BAGHDAD, Pashalic of. On the left bank of the Tharthar are the extensive ruins of Al-Hadhr (the ancient Hatra). The Tharthar falls into a salt-lake called El-Milh, or Ashlik.

The country contiguous to the banks of the Euphrates is much better cultivated than that which skirts the Tigris. Between Bir-el-Jik and Balis the Euphrates runs in a narrow bed between very high rocks; there is no bottom along the banks of the river, and the adjacent country is sterile and uncultivated. But between Balis and Raeca the high grounds present themselves as low and rounded hills, and they are from one to six miles distant from the banks of the river. The bottom in these parts is an alluvium. On the banks of the river are tamarisk-bushes. A great part of the low plain is occupied by swamps, and the more elevated tracts between the swamps are either overgrown with tamarisk-bushes or used as pasture-ground. There is hardly any cultivation. In these parts the bed of the river is wider, and there are several islands in it. A few date-trees are planted.

At the mouth of the Khabur are some extensive woods, composed of high trees, especially tamarisks and poplars. Lower down the low and level flats increase in extent, and here also cultivation is much more attended to; but still by far the greater part of the bottom is swampy or only used as pasture. The number of islands increases as we proceed farther south; they are partly bare and partly well wooded with tamarisks. Before reaching Annah the cultivation begins to be more general. Round this place a large tract is well cultivated; corn, cotton, French beans, and sesamum are raised to a great extent; the plantations of dates are extensive, and the numerous orchards yield oranges, lemons, pomegranates, figs, and olives. The olive-tree is not met with farther south; but the other trees and branches of agriculture are greatly attended to in the bottom of the Euphrates as far down as Hit. The banks of the river present a continual plantation of date-trees; and between them and the low rounded gently-sloping hills at the back the bottom is, with the exception of some swampy ground, in a high state of cultivation and full of villages. The great fertility of this tract is mainly to be ascribed to the system of irrigation which has been introduced. A great number of canals traverse the river bottom in its width, extending from 200 to 2000 yards from the banks, and the water, raised by machines, is distributed over the

GEOG. DIV. VOL. III.

adjacent lands. The numerous islands which occur in this part of the course of the Euphrates are mostly cultivated, and on some of them towns are built.

Opposite the town of Hit the bottom is only a mile wide, and nearly without vegetation, as the surface is mostly composed of gravel, intermixed with flint and pieces of chalk. There are only a few date-trees, poplars, and tamarisks; and at a few places are isolated fields of wheat, barley, or sesamum. Below this place the high grounds disappear entirely, and the whole country is very little elevated above the level of the river. The soil of this tract is extremely soft, and as the banks of the Euphrates are very low, it is annually subject to inundations, which leave behind them large pools and lagunes, the water of which is generally salt. The whole tract is in possession of nomadic tribes, who find here during the dry season abundant pasture for their buffaloes and horses. The number of islands in the river decreases, and they are no longer cultivable; their soft soil consists of sand and mud. Such is the country between Hit and the Median Wall, which is noticed in the article BAGHDAD, vol. i., col. 820.

This region is divided between the pashalics of Mosul and Baghdad. No remarkable places are found, except the towns built on the banks of the two rivers which inclose the region. On those of the Tigris are MOSUL and Tekrit. Tekrit is built on a cliff, and occupies the eastern part of the site of an ancient town, the ruins of which are very extensive. [BAGHDAD, Pashalic of, vol. i., col. 819.]

Circesium (*Kerkeraiah*), at the union of the Khabur with the Euphrates, was a very ancient town: it is called Carchemish in the Old Testament. It was the most advanced fort held by the Romans in this direction, and was strongly fortified by Diocletian. The Khabur is the Kebar of the Old Testament.

The largest towns on the Euphrates are the following:—*Annah* (the ancient Anatho), which is partly built on the western bank, and partly on an island of the Euphrates, contains 1800 houses, and is considered the capital of the Arab tribes inhabiting the country west of the river. Farther down lies *Hedisah*, on an island in the river, in the midst of date plantations, and contains more than 400 houses. *El-Uz* is also a considerable place, and like Annah partly built on an island. *Jibbah*, another town built on an island, contains 500 houses, and is a thriving place. *Hit* (the Is of Herodotus) contains bitumen springs, which are mentioned by Herodotus (i. 179). It is built round a hill, and has good houses of stone. In the vicinity there is very little cultivation, and the inhabitants derive their subsistence from making salt, preparing bitumen, manufacturing woollen-stuffs, and building boats. The number of bitumen springs in the neighbourhood of this place is very great, and the produce of a single spring is sufficient to meet the demand, though it is used in these parts as fuel. A great number of river-boats of different sizes and forms are made here. They consist of wicker-work, made of branches from an inch and a half to two inches in thickness. The interstices are filled up with bark or straw, and then the whole is caulked with bitumen. In such boats the bitumen, salt, and prepared lime are taken to Hillah, Bassora, and Baghdad.

The plain of Babylonia, or Irak Arabi, extends from the Median Wall (34° N. lat.) to the confluence of the Euphrates and Tigris at Kornah (31° N. lat.), and between 44° and 47° E. long. In length it does not much exceed 200 miles, and in breadth it varies considerably. Between Felujah and Baghdad it is not more than 40 miles wide, but lower down it widens to 100 miles: 80 miles may be the average width. This gives an area of 16,000 square miles to the region, which is noticed under BABYLONIA; see also BAGHDAD, Pashalic of.

The banks of the Euphrates, from the place where the Saklawiyeh Canal (the most northern of the canals from the Euphrates to the Tigris) branches off, to the ruins of Babylon and the town of Hillah, are of moderate height. The country adjacent to them is of indifferent fertility, and is mostly overgrown with grass, thistles, and mimosa. Cultivation is limited to a few spots, and as the pasture-grounds are also indifferent, the number of cattle, sheep, and goats is not great. It appears to be little inhabited, and only from time to time a grove of date-trees is seen. Below Hillah the country improves greatly; a large portion of it is under cultivation, and the plantations of dates are more numerous. It is a populous country: between Hillah and Diwaniyeh a number of large villages are observed.

A short distance below Diwaniyeh begin the marshes of the Euphrates, which lower down are called the marshes of Lemlun or Lamlun. They extend from Diwaniyeh to El Karayin, a distance of upwards of 80 miles in a straight line, and they vary in width from 6 to 20 miles. This tract is the most productive and most populous on the banks of the Euphrates, and is inhabited by an Arab tribe called the Kasahel, who are estimated at half a million, which however is probably an exaggeration. The river runs between low banks, from which the country on both sides rises imperceptibly towards the interior, where it extends in level flats, between which are many extensive depressions which are swampy all the year round. The soil of this tract consists of a firm tenacious clay of a dark-blue colour, in which numerous shells are imbedded. The soil is very fertile when irrigated, and the means of irrigation are abundant. The Euphrates divides into numerous branches, so as to convert a large tract of the marshes into islands. The marshes are also traversed by two large canals,

8 D

ons on each side of the river. That on the Mesopotamian side is called the canal of Yusuf. It begins about half an hour above Diwaniyeh and terminates at El Karayin. The canal of the Arabian side is called the canal of Old Lamlun. It branches off from the Euphrates about 19 miles below Diwaniyeh, and rejoins it a short distance above the mouth of the Yusuf Canal. The two canals are connected with the Euphrates by numerous other canals of smaller dimensions, and other canals again carry the means of irrigation to those parts of the marshes which are more distant from the river. Great quantities of rice are grown in this marshy region; buffaloes abound; plantations of dates cover the banks of all the canals. There are also a few plantations of fig-trees. During the inundations the whole surface of these marshes is under water, with the exception of those places which are inclosed by embankments, and some more elevated tracts on which the villages are built. The villages also are frequently inundated, and when this happens the inhabitants convert the roofs of their reed-built huts into boats, or place their families on buffaloes, and in this way reach a more elevated spot. As it is very difficult to enter their country with any force, they are nearly independent. The Euphrates in their country contracts very much in width, so as to be at some places not 200 feet across, and the Kasahel Arabs levy a very arbitrary toll on all the river boats which navigate between the lower and middle course of the river.

The marshy swamps terminate at El Karayin, and with them the large canals for irrigation: farther downward only short narrow cuts are met with, which serve to irrigate the tracts adjacent to the banks of the river, and do not advance far inland. The banks are much more elevated, though not high, and in most places overgrown with bushes. This country inhabited by the Montefik Arabs, exhibits a mixture of cultivation and pastoral occupation. As the country is rather fertile, it is well inhabited, but not so populous as the marshes of Lamlun. The date plantations are as numerous and extensive as at any place higher up the river, but less care is bestowed upon them and on the cultivation of rice and wheat. Those inhabitants who still adhere to a nomadic life have large herds and flocks of horses, camels, buffaloes, sheep, and goats. The tract of ground between the mouth of the two canals, Shat-el-Kar and Shat-el-Hiyeh is swampy and well wooded, but little inhabited. But below the last-mentioned water-course the country rather improves; the banks of the river present almost a continuous forest of date-trees, between which the villages and hamlets are so numerous that they almost touch one another; on approaching the place where the two rivers unite, the banks of the rivers sink lower, and large tracts are only swamps overgrown with reeds, but in many places extensive fields still occur, on which wheat, rice, and barley are grown. The uncultivated grounds are used as pastures for the numerous herds of buffaloes. From 10 to 12 miles from the confluence of the rivers, the waters of the Tigris are so abundant that the country is converted into a swamp, which during part of the year is covered with water many feet deep, and in the dry season it is cut up by numerous watercourses. From neglect of the embankments the marshes are greatly on the increase in Lower Mesopotamia. [BAGHDAD, vol. i., cols. 819, 820.]

The Euphrates fertilises the low country which extends on both of its banks below the town of Diwaniyeh. The detritus brought down by the river is formed by the abrasion of chalk, lime, and gypsum, which form a rather hard clay, not fertile itself, but becoming so when irrigated. The water in the Euphrates is lowest from the middle of November to the end of the year. It then begins to rise slowly, and continues to rise to the middle of January, in consequence of the great rains in central Armenia at the beginning of winter. No difference in the level of the water is observed between the middle of January and the vernal equinox, when the great rise begins (consequent on the melting of the snow on the Armenian highlands), and continues to the end of May. It is then found that opposite the town of Annah it is from 11 to 12 feet above the lowest level, and farther down to the marshes of Lamlun from 15 to 18 feet. Were this great volume of water permitted to rush down on the low country, it would entirely submerge it, and convert it into an immense swamp. To prevent this the great canals of Babylonia were made, as they all occur above Hillah, or the place where the Euphrates enters the low country. The canals carried the superabundant water into the Tigris, and also gave to the adjacent country the means of irrigation. They appear still in some small degree to serve these purposes, but for the most part they are out of repair, all of them, even the Saklawiyeh, are either dry or nearly so during three or four months. As these canals at present are not kept in good order, they cannot carry away the great volume of water, and a larger quantity descends to the low country, destroys the embankments, and converts a great part of the marshes of Lamlun and of the low country farther down into swamps. From the end of May to November the waters of the Euphrates are continually but slowly on the decrease.

The Tigris also inundates the adjacent countries; but its inundations are more destructive than useful, on account of the great irregularity with which the inundations occur, and their difference in different years. This irregularity in the inundations of the Tigris is chiefly to be ascribed to the numerous large rivers which originate in the mountains of Kurdistan, and join the Tigris in its middle course; while the Euphrates, after the junction of its two principal

branches, the Kara-su and Murad, is not joined by any river of consequence. The affluents of the Tigris rise in the mountains of Kurdistan, which for many months being covered with deep snow, bring down an immense volume of water when the snow melts. The Zab Ala, or Greater Zab, at that time brings down a volume superior to that of the Tigris above the point of union. The other affluents, the Zab Asfal, or Lesser Zab, the Adhem, and the Diyalah, are also large rivers. [BAGHDAD, Pashalic of.] The Tigris begins to rise in November, owing to the great rains which then fall in its upper basin. It rises and falls at intervals until the supply of water from the mountainous countries is stopped by the frost. In the middle of March begins the great rise, which continues to the end of May. After that period its waters alternately rise and fall during June, when they begin to decrease quickly, owing to the great rapidity of the current. Between August and November the volume of water has decreased so much that only vessels drawing four feet can navigate the river, and even such vessels encounter great difficulties. The Tigris and its great affluents flow in beds which consist of hard rocks, and a small quantity of detritus is brought down by them. It does not raise its bed by a deposit, but, on the contrary, scours it out deeper. This is probably the reason why the canals for irrigation are at present without water during the greater part of the year. Even the Shat Eidha, an ancient bed of the Tigris in the plain of Baghdad, has very little water in it.

The country along the banks of the Tigris, from the northern extremity of the Median Wall to its confluence with the Euphrates, is nearly a desert, except in the immediate neighbourhood of Baghdad, which is not supplied with provisions from the lands in its vicinity, but from the country which lies farther north. Baghdad is indeed surrounded with extensive gardens and some fields, but they extend only a few miles from the walls, and are surrounded by an uncultivated country. North of the town the plain is traversed by the great canal called the Ishahi, which extends from the neighbourhood of Tekrit to the Saklawiyeh Canal, but is without water. There are also many other canals of smaller dimensions in the same state. The remainder of this tract is pasture-ground for the herds of the nomadic tribes during the summer. South of Baghdad there is still less cultivation. The country is quite flat, and in most parts a grassy prairie, well watered; in others, covered with extensive swamps. A few small cultivated spots appear at great intervals. Herds of buffaloes, however, and the black tents of the nomadic Arabs, are common. There are hardly two or three villages which have a permanent population. As we approach the confluence of the Tigris and Euphrates, nothing is seen but stagnant water, swamps, and morasses, in which single families have settled, who live on the milk of their buffaloes and the little rice that they can raise.

Numerous high mounds are seen in several parts of Babylonia and of the great plain of Mesopotamia, marking the sites of ancient cities; some of these are enumerated in the articles BABYLON and BABYLONIA. [See also ASSYRIA; BAGHDAD, Pashalic of.] The climate and products of this part of Mesopotamia will be found noticed under BAGHDAD. [BAGHDAD, Pashalic of; BABYLONIA.] Besides the town of Baghdad, a few places occur on the banks of the Euphrates which require notice.

Hillah is a fortified place with about 25,000 inhabitants, Arabs, Persians, Turks, Jews, Armenians, and Indians, in the midst of a number of canals, which are partly filled up. It carries on a considerable commerce with all the towns on the Euphrates, mostly in river-barges of 50 to 80 tons. The imports consist especially of rice, dates, fish, oil, coffee, cotton-stuffs, and Indian goods, part of which are re-exported to Hit and Annah.

Diwaniyeh, lower down, a considerable place, with 1500 houses, is inclosed by a wall. Numerous river-barges are employed in carrying the produce of the rich country in its vicinity to other places.

Suk el Sheykh, the capital of the Montefik Arabs, contains from 6000 to 7000 families, whose habitations are dispersed among the large plantations of dates which cover the country. It is the principal if not the only market which is visited by the nomadic tribes of Nejd in Arabia. They bring to this place cattle, horses, wool, and gum; and take in return lead, fire-arms, ores of different kinds, and culinary utensils. From this place the British settlements in Hindustan obtain horses.

From the sway of the kings of Assyria Mesopotamia passed successively to that of the Babylonians and Medians, and then it was subjected by the Persian Cyrus. After the battle of Issus it fell into the power of the Macedonians, and after the death of Alexander his generals Antigonus and Seleucus successively got possession of it. Seleucus founded the kingdom of Syria, of which Mesopotamia formed a portion, until the countries belonging to the Syrian kingdom were divided between the Romans and Parthians. During many centuries Mesopotamia was the theatre of the wars in which these two nations contended for superiority, until the Parthians were supplanted by the Persian dynasty of the Sassanides, when Mesopotamia was disputed between them and the Greek emperor of Constantinople. But at last the Arabians appeared, and their kalifs established the seat of their wide-spreading empire in Mesopotamia. After these princes had lost their power, Mesopotamia fell into the hands of the Turkish princes, the Seljuks and Atabecks. The Mongols overran the country, and

then Mesopotamia again returned to a distracted state, until the Osmanlis, who had got a firm footing in Asia Minor, began to extend their conquests over this part of Asia. Their progress was for a time interrupted by the famous Timur, but after his death the Osmanlis again acquired the ascendancy, and subjected the whole of Mesopotamia to their dominion in the beginning of the 16th century.

MESSENE. [MESSENA.]

MESSENA, a country of ancient Greece, was bounded E. by Laconia, N. by Elis and Arcadia, and S. and W. by the sea. It was separated from Laconia by the mountain chain of Taygetus; and from Elis and Arcadia by the river Neda and the high land which runs between the bed of the Neda and the sources of the Pamisus. Its area is calculated by Mr. Clinton at 1162 square miles ('Fasti Hell.', ii. p. 385). It forms a nome in the modern kingdom of Greece, and had 98,805 inhabitants in 1852.

Messenia is described by Pausanias as the most fertile province in Peloponnesus (iv. 15, § 3); and Euripides, in a passage quoted by Strabo (viii. p. 366), speaks of it as a land well watered, very fertile, with beautiful pastures for cattle, and possessing a climate neither too cold in winter nor too hot in summer. The western part of Messenia is drained by the river Pamisus (now Pynratza), which rises in the mountains between Arcadia and Messenia, and flows southward into the Messenian bay (Gulf of Koroni). The basin of the Pamisus is divided into two distinct parts, which are separated from each other on the east by high land that stretches from Taygetus to the Pamisus, and on the western side of the river by Mount Ithome. The upper part, usually called the plain of Stenyklerus, is of small extent and moderate fertility; but the lower part south of Ithome is an extensive plain, celebrated in ancient times for its great fertility, whence it was frequently called Macaria, or the 'blessed.' Leake describes it as covered with plantations of the vine, the fig, and the mulberry, and "as rich in cultivation as can well be imagined." The western part of Messenia is diversified by hills and valleys, but contains no high mountains.

Messenia, called by Homer Messene, is said by Pausanias to have derived its name from Messena, the wife of Polycaon, the first king of the country, who is described as the younger son of Lelex, king of Laconia (iv. 1, § 1, 2). After the lapse of five generations, the sovereignty is said to have passed into the hands of Perieres, the son of Æolus. At the time of the Trojan war Messenia appears to have been subject to Menelaus, with the exception of Pylus and probably part of the western coast, which was under the dominion of Nestor. After the death of Menelaus, the Neleid princes of Pylus are said by Strabo (viii. p. 359) to have obtained the whole of the country. On the division of the Peloponnesus, after the Dorian conquest under the Heraclids, Messenia fell to the share of Cresphontes, who fixed his capital in Stenyklerus, and divided the country into five districts. (Strabo, p. 361.) Pylus however appears to have retained its independence till a much later date.

In the middle of the 8th century before the Christian era, a series of disputes and skirmishes arose on the borders of Messenia and Laconia, which gave rise to a confirmed hatred between the two nations. Prompted by this feeling, the Spartans are said to have bound themselves by an oath never to return home till Messenia was subdued; and they commenced the contest by a midnight attack on Amphibia, a frontier town, which they took, and put the inhabitants to the sword. This was the commencement of what is called the first Messenian war, the date of which is usually given, though it cannot be fixed with certainty, as B.C. 743. After a contest of twenty years, during which the Messenian king Aristodemus distinguished himself by deeds of heroic valour, the Messenians were subdued and reduced to the condition of the Laconian helots. They bore the yoke for 39 years, and then took up arms against their oppressors (B.C. 685) under the conduct of Aristomenes, a noble youth of the royal blood. The Messenians however were again subdued B.C. 668; and those who remained in their native country were treated with the greatest rigour. The majority of freemen however withdrew from Messenia, and a considerable number, under the two sons of Aristomenes, sailed to Italy, and settled at Rhegium. They afterwards obtained possession of Zancle, on the opposite coast of Sicily, and called it Messene, which has retained the same name (Messina) to the present day.

The Messenians again revolted in B.C. 464. This war, usually called the third Messenian war, lasted ten years, at the end of which time the Messenians, who had occupied the strongly-fortified mountain of Ithome, surrendered on condition of being allowed to retire from the Peloponnesus. The Athenians, who were not at that time on good terms with Sparta, gladly allowed them to settle at Naupestum, a town at the entrance of the Corinthian Gulf, which they had lately taken from the Locri Ozolæ. (Thucyd. i. 101, 103; Paus. iv. 24, sec. 2;

Diod., xi. 70.) This place however the Messenians were obliged to quit, when, at the end of the Peloponnesian war, the Spartans became masters of Greece; but after the supremacy of Sparta had been overthrown at the battle of Leuctra, Epaminondas formed the design of restoring the independence of Messenia, and accordingly sent messengers to Italy, Sicily, and all parts of Greece, to invite the long-exiled Messenians to return to their native country. Numbers obeyed the summons; and in B.C. 369 a town was built at the foot of Ithome, which they called Messene. The independence of the Messenians was guaranteed by the peace concluded B.C. 361; and Messenia continued to remain an independent state till the dissolution of the Achaean confederacy. In the Messenian state, as restored by Epaminondas, the ancient national manners are said to have been retained; and the dialect remained, up to the time of Pausanias, the purest Doric that was spoken in the Peloponnesus (iv. 27, sec. 5; Müller, 'Dorians.')

The chief towns on the western coast were Pylus and Methone, or Methone. The Bay of Pylus (Navarino), which is protected from the swell of the sea by the island of Sphacteria (Sphagia), is the best harbour in the Peloponnesus. Pylus was situated at the foot of Mount Ægaleus, according to Strabo, and must not be confounded with the fortress which was erected by the Athenians in the Peloponnesian war at the northern entrance of the bay, on the spot called Coryphasium by the Lacedæmonians. (Thucyd. iv. 108, 104.) Methone, or Methone (Modon), is said by Pausanias (iv. 35, sec. 1) to have been anciently called Pedasus, a town mentioned by Homer; it appears to have been a place of some importance in the time of Pausanias. Passing the promontory Acritas (Cape Gallo) we enter upon the Messenian Gulf, at present called Koroni: forty stadia north of Acritas was Asine (Paus. iv. 34, sec. 7), originally inhabited by the Dryopes. Following the coast we come to Colonides, 40 stadia N. from Asine; and afterwards to Æpea, which was called Corone after the restoration of the Messenians. At the head of the gulf, and east of the river Nedon, was Phæra, or Phara, which was annexed to Laconia by Augustus (Paus. iv. 30, sec. 2); and on the eastern coast of the gulf were Abia, which is mentioned by Homer, according to Pausanias (iv. 30, sec. 1) under the name of Ira, and Leuctrum, or Leuctra, which belonged at one time to Laconia. (Strabo, p. 361; Tac., 'Ann.,' iv. 43.) It is difficult to determine the boundaries of Laconia and Messenia, as they differed at various times. In the time of Pausanias the boundary was a woody hollow called Chœrius, 20 stadia S. from Abia (iv. 30, sec. 1). Strabo blames Euripides for making the river Pamisus the boundary (p. 366); but perhaps Euripides referred to a small river of the same name, which Strabo himself tells us was in the vicinity of Leuctrum (p. 361).

The only town inland of any importance was Messene, situated, as already mentioned, at the foot of Mount Ithome, on the summit of which was the citadel. Strabo speaks of this citadel and of Acrocorinthus as the two strongest places in the Peloponnesus (p. 361); and the account of Pausanias, who praises the strong fortifications of the town, is confirmed by the solid and beautiful masonry which remains to the present day.

MESSINA, a province of Sicily, comprehends the north-east extremity of the island, and is bounded W. by the province of Palermo, S. by that of Catania, N. by the Mediterranean, and E. by the Faro or Strait of Messina, which divides it from Calabria. The greatest length of the province is 60 miles, and its breadth is 30 miles. The population in 1851 amounted to 349,484. A continuation of the mountainous ridge which runs across Sicily from west to east, known to the ancients under the various names of Nebrodes, Herai, Pelorias, &c., covers the greater part of the interior of the province, and terminates at Cape Pelorum. A number of torrents during the rainy season descend from both sides of the ridge, but they are nearly dry in summer. On the south-west the province of Messina skirts the base of Ætna, the mass of which belongs to the province of Catania. It has no great plains, but it contains many valleys. Its chief products are wine, oil, and fruit of every sort. The province is divided into 4 distretti and 116 communes. The towns of the province are:—MESSINA. *Melazzo*, the ancient Myles, a sea-port town on a promontory of the northern coast facing the Lipari islands, 15 miles W. from Messina, with a castle and 7000 inhabitants, many of whom are employed as sailors and fishermen. It exports much wine from the neighbouring districts, and also oil. The red Faro wine, which is made nearer to Messina, is better than that of the district of Melazzo. *Patti*, on the same coast, 15 miles S.W. from Melazzo, and not far from the ruins of the ancient Tyndaris, has several churches and convents, and between 4000 and 5000 inhabitants. *Taormina*, the ancient *Tauromenium*, on the east coast of the island, and at the north-east base of the group of Ætna, an old-looking town with about 4000 inhabitants, is built upon a steep cliff towering above the sea; its ancient remains comprise a vast theatre capable of accommodating 40,000 persons, a ruined aqueduct and reservoir, sepulchres, and other ruins scattered around. *Castro Reale*, in a valley rich in oil and wine, has about 12,000 inhabitants in the commune. *Randazzo*, at the north base of Ætna, in a very fertile district, has 5000 inhabitants.

The islands of Lipari are included in the administrative province of Messina. [LIPARI ISLANDS.]

MESSINA, the Town of, lies on the north-east coast of Sicily opposite the Calabrian coast, from which it is separated by the Strait

of Faro, here about four miles wide. The town of Messina is built partly on the slope of a steep hill, and partly along the sea-shore at the foot of the hill. The port is formed by a strip of sandy beach projecting into the sea at the south side of the city, and sweeping round in the form of a semicircle. From the sickle-like form of this strip of land the town received from its first Greek inhabitants the name of Zankle, or Dankle, which in the Sicilian dialect meant a scythe. The name, as stated in the article MESSENIA, was afterwards changed into Messene. On this narrow tract of land are the citadel, the lazaretto, the lighthouse, and the castle of Salvatore at the entrance of the harbour, which faces the north. The harbour, which is more than two miles in circumference, is one of the best in the Mediterranean. The lighthouse at the entrance of the harbour of Messina stands in 38° 11' 10" N. lat., 15° 34' 7" E. long. The larger part of the town rises in the form of a crescent on the west side of the harbour, along which is a handsome quay backed by a row of fine buildings called La Palazzata: this quay constitutes the fashionable promenade of the town.

Messina has many remarkable buildings; the cathedral, the church of La Candelara, and that of the Capuchins, contain some fine paintings. The royal palace, the archiepiscopal palace, that of the senate, the seminary, the great hospital, the arsenal, the loggia or exchange, the granaries, the royal college, the bank, and the two theatres, are all worthy of notice. The public library, founded by Constantine Lascaris, is rich in Greek manuscripts. Messina is an archbishop's see, has a court of appeal for the province, a commercial tribunal, a royal college called Accademia Carolina for the study of law and medicine, and about 60,000 inhabitants.

Messina is the most trading town of Sicily; large vessels load and discharge close to the quays. It exports oil, currants, oranges, raisins, wine, brandy, almonds, lemons, sumach, lamb-skins and kid-skins, liquorice, silk, linseed, salt-fish, and other produce of the island. The imports comprise cotton and woollen manufactures, coffee, sugar, and other colonial produce, hardware, &c. The spinning and weaving of silk, and the manufacture of damask and satin, employ several thousand hands. The tunny and other fisheries are actively plied. Messina took part in the abortive attempt made by the Sicilians in 1848 to shake off the yoke of Naples; and it was the first place upon which retribution fell, being taken by General Filangieri, in September of that year, after an obstinate resistance, during which the town suffered severely.

The Faro, or Strait of Messina, which here separates Sicily from Italy, is about 22 miles long from north to south; its breadth varies from 10 miles to about 2½ miles at its northern extremity between the Faro tower and the rock of Scylla. The whirlpool of Charybdis, so celebrated in ancient times, is fixed by some opposite to Scylla, by others opposite the harbour of Messina. [CALABRIA.] The depth of the strait is very great, and a strong current runs through it.

Coin of Zankle (Messina). British Museum.

MESSINGHAM. [LINCOLNSHIRE.]
MESURADO, CAPE. [LIBERIA.]
METHERINGHAM. [LINCOLNSHIRE.]
METHWOLD. [NOFOLK.]
METHYMNA. [LESBOS.]

METZ, capital of the French department of Moselle, is built on the Moselle at the point where that river is joined by the Seille, in 49° 7' 14" N. lat., 6° 10' 46" E. long., 580 feet above the level of the sea, 170 miles in a straight line, 245 miles by railway through Nancy, E. by N. from Paris, and has 43,484 inhabitants in the commune, besides the garrison, which numbers 10,000 men. The town is washed on the west by the Moselle, which makes a bend and traverses the town; the Seille enters the city on the south, dividing into two branches, one of which flows between the ramparts, the other runs through the town and drives several mills: these two rivers are crossed by 17 bridges. Metz is, after Strasbourg, the strongest fortress in France. It is girt by a regular system of fortifications, and entered by nine gates furnished with drawbridges. The defences were constructed by Marshals Vauban and Belle-Isle; amongst the most important of the works erected by them are—the fort of Belle-Croix, which is built on a hill, and commands all the east of the town from the gate Des-Allemands to the Moselle; and the fort of La-Double-Couronne, which defends the southern part of the city.

This city existed in the time of the Romans, to whom it was known by the name *Divodurum*, which was the chief town of the *Mediomatrici*. At a later date it took the name of the nation, *Mediomatrici*, for which, early in the 5th century, was substituted the shorter designation of *Mettis*, or *Metis*, whence the modern Metz. In the civil dissensions which followed the death of Nero, A.D. 70, *Divodurum* was nearly destroyed by a sudden outbreak of the troops of Vitellius.

(Tacitus, 'Histor.' i. 63.) *Divodurum* was ruined in the invasion of the Huns under Attila, 452; but afterwards became the capital of Austrasia, which was sometimes termed the kingdom of Metz. In the division of the Carolingian empire, Metz was comprehended in the kingdom of Lotharingia, or Lorraine.

Metz is in general a well-built town; the houses are mostly of cut stone; the quarter that lies on the right bank of the Moselle stands high, and contains many steep streets; on the left bank the site is level. The streets however are in most instances narrow, crooked, and ill laid out; many of the houses are adorned with bas-reliefs. In the centre of the town is the esplanade, which stands on high ground, and is one of the finest promenades in Europe, formed by numerous avenues of trees, and commanding a fine view over the rich valley of the Moselle; near it is a vast space on which the troops in garrison are exercised. Amongst the many remarkable structures of Metz must be mentioned—the arsenal, which is of vast extent, and amongst other stores contains 80,000 muskets; the cathedral, founded in 1014, but not finished till 1546; the elegance, delicacy, and boldness of this structure have been always much admired; of its lightness some idea may be formed from the circumstance that the total area of its windows (many of them of the best age of glass-painting) amounts to no less than 4869 square yards; the church of Notre-Dame-de-la-Ronde and that of the abbey of St. Vincent, both of which are ancient and remarkable structures; the college buildings, formerly the abbey of St. Vincent; the military hospital, a vast building contiguous to the barracks and close to the Moselle; and the palais-de-justice, in which the courts are held and the public library of 30,000 volumes is kept. Next to these the prefect's residence, the town-house, the mint, the churches of St. Martin, St. Nicolas, and Sainte-Segolène, and another library of 10,000 volumes of select works, and rich in manuscripts by Vauban, Monge, and other writers on fortification and the art of war, are the most notable objects in the town.

Metz gives title to a bishop, whose see is the department of Moselle; it is the seat of a high court of justice for the department of Ardennes and Moselle. Besides a tribunal of first instance, a tribunal and chamber of commerce, the city possesses an exchange, an artillery and engineering school, an endowed college, several literary and scientific societies, a diocesan school, an ecclesiastical college, and several other schools, in which lectures are delivered gratuitously on midwifery, botany, drawing, painting, and music.

Amongst the industrial products of the town are broad-cloth, flannel, and other woollen stuffs, hosiery, plush, small wares, muslin embroidery, room-paper, glue, ground chicory, cotton-twist, excellent beer, nails, tiles, and leather. The commerce is composed of these articles, and of wine, brandy, confectionery, groceries, furniture, hides, iron, &c. A railroad, 25 miles in length, joins Metz to Nancy on the Paris-Strasbourg line, and is continued eastward to the Russian frontier at Forbach, whence it runs to Mannheim and Spire on the Rhine. The Calvinists have a consistorial church at Metz, the Jews a consistorial synagogue and a central rabbinical school.

(*Dictionnaire de la France.*)

MEUDON. [SEINE-ET-OISE.]

MEULAN. [SEINE-ET-OISE.]

MEUNY. [LOIRET.]

MEURTHE, a department in the north-east of France, bounded N. by that of Moselle, E. by that of Bas-Rhin, S. by that of Vosges, and W. by that of Meuse. It lies between 48° 22' and 49° 2' N. lat., 5° 42' and 7° 16' E. long. Its form is compact; the greatest length from east to west is 70 miles; its greatest breadth, at right angles to the length, is 46 miles. The area is 2353 square miles. The population in 1841 was 444,603; in 1851 it amounted to 450,423, giving 191.42 inhabitants to the square mile, or 16.84 above the average per square mile for the whole of France. The department is formed out of the old duchies of Lorraine and Bar, and a part of the territory called the *Trois-Evêchés*. This last comprised the territories of the three cities of Metz, Toul, and Verdun, which for a long time were imperial towns, and as such subject to the bishops who resided in them. In 1552 these districts were united to France by Henri II.

The department is remarkable for the beauty of its scenery, the fertility of its soil, and the variety of its productions. The principal chain of the Vosges Mountains runs along the eastern boundary, reaching in one of its summits to the height of 1148 feet above the plain. The rest of the department presents a pleasing variety of hills, dales, and well-watered valleys—the hills, which branch off from the Vosges, nowhere exceeding 650 feet in height, and nearly all running in a north-western direction. The hill slopes and a considerable portion of the plains are covered with dense forests.

The department takes its name from the river *Meurthe*, which rises in the E. of the department of Vosges, and running first north and then north-west, past St. Dié and Raon-l'Étape, enters the department of Meurthe, below this last town: here it flows through a fine valley, fertilised by the deposits of its frequent inundations, in a general north-west direction past Lunéville, Rosières, and Nancy, a little below which last-named city it falls into the Moselle, on the right bank, after a course of 100 miles. Great quantities of fir planks for Holland, rough timber, and fire-wood, are floated down this river, which is navigable for only 6 miles above its junction with the Moselle. Its principal feeders on the right bank are—the *Plaine*, which forms part

of the southern boundary of the department; the *Vézouse*, which joins the Meurthe at Lunéville; and the *Saron*, which flows westward from one of the numerous tarns on the western side of the Vosges Mountains, and enters the Meurthe a few miles east-south-east of Nancy. On its left bank the Meurthe receives the *Mortagne* a few miles south of Lunéville. The west of the department is drained by the *Moselle*, which here receives the *Madon* on its left bank. The *Seille*, which springs from one of the lakes in the east of the department, flows through a very fertile valley, first west and then north, falling into the *Moselle* at Metz, in the department of Moselle. The *Sarre* rises on the western side of the main chain of the Vosges Mountains, in the south-east of the department, and flows generally north as far as Sarreguemine, in the department of Moselle. Below this town it enters the Prussian Rhein-Province, through which it runs north-west to its junction with the *Moselle* a few miles above Trèves. The department is traversed by 8 state, 15 departmental, and a great number of parish roads. The Paris-Strasbourg railway crosses the department, passing through Nancy, whence a branch runs north to Metz and Forbach, and is continued to Mannheim on the Rhine. The canal Des-Salines, which runs from Deuze to Sarrealbe in Moselle, unites the Seille with the Sarre.

The plains and valleys of the department are very fertile in wheat, barley, and oats. About 400,000 quarters of wheat are grown annually, of which a large portion is sold in the markets of the department of Vosges for the supply of some of the more southern departments. From the time that the old ordinance of the dukes of Lorraine against planting the vine in soils fit to yield wheat fell into disregard, a large breadth of the best lands was laid out in vineyards; and in favourable years, which however are few, owing to the frequency of late frosts in the spring, a very large quantity of wine is made; in ordinary years the produce is 20,064,000 gallons. The surplus over the home consumption is sold into Alsace and the department of Vosges. In the arrondissement of Sarrebourg, where the climate, owing to the proximity of the Vosges Mountains, is colder than in the rest of the department, the vine is not cultivated at all. Rapes is extensively grown, both for green food and for making oil. Hay is abundantly produced along all the river bottoms. Potatoes, potherbs of all kinds, and fruits are largely cultivated. Horses, which are small, are used for draught and in the plough, except on the slopes of Vosges, where the ox is more frequently seen at farm labour. Cows also are small; they are however of a tolerable breed and good milkers. Hogs are numerous; pork is a staple article of the food and consequently of the commerce of the people. The forests still contain the deer, the roebuck, and the wild boar; wolves, foxes, and weasels are common enough.

The Vosges Mountains in this department are composed chiefly of the new red-sandstone and the subjacent secondary rocks; the rest of the department is occupied by the rocks that intervene between the chalk and the red-sandstone. Iron ore is found, but too poor to be worth digging for. Building stone, marble, and limestone are quarried; lithographic stone, red and gray granite, grindstone-grit, glass-sand, potters'-clay, &c., are found. A mine of salt-rock at Vic, and several salt-springs, are the most valuable mineral treasures of the department.

The industrial activity of the department has been greatly developed within the last few years, and is exerted on a great variety of products, among which are—woollen-cloth, calico, canvass, embroidered muslins and cambrics, playing-cards, room-paper, cut- and plate-glass, tobacco-pipes, oil, mineral acids, cotton-twist, gloves, beet-root sugar, candles, basket and wood-work, &c. There are also some iron- and bell-foundries, numerous glass-works, tan-yards, paper-mills, dye-houses, and potteries. Of the articles just enumerated or indicated and of its agricultural produce the commerce of the department is composed. About 100 fairs are held in the course of the year.

The inhabitants are a mingled German and French race; the German language is still spoken in the east of the department. They are in general a grave people—deficient in the usual vivacity of Frenchmen; but they are among the most industrious and orderly of the inhabitants of France. The department is distinguished for the number of successful candidates it sends to the entrance examinations of the École Polytechnique in Paris.

The department contains 1,505,929 acres. Of this area 750,328 acres are under tillage; 452,862 acres are forest and wood land; 177,554 acres are grass land; 40,455 acres are under vine culture; 15,736 acres are laid out in gardens, orchards, and nurseries; 15,250 acres are covered with heaths and moors; and 21,685 acres are occupied by rivers, lakes, and canals.

The department is divided into five arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Nancy	8	121	147,978
2. Château-Salins	5	150	68,634
3. Lunéville	6	201	88,978
4. Sarrebourg	5	118	76,667
5. Toul	5	127	68,166
Total	29	717	450,423

1. Of the first arrondissement and of the whole department the chief town is NANCY. *St-Nicolas-du-Port*, 5 miles E. by S. from Nancy, has a handsome gothic church, and 3178 inhabitants, who manufacture linen, brandy, cotton and woollen yarn, leather, and beer. *Pont-à-Mousson*, a station on the railway to Metz, 16 miles N. from Nancy, takes its name from the bridge here thrown across the *Moselle*, and from the old fortress of *Mousson*, which is built on a hill east of the town. It is surrounded by ramparts. The most remarkable objects in the town are—a gothic church built about the end of the 13th century; the town-hall; the large cavalry barracks; the hospital; and a square, surrounded by arcades. *Pont-à-Mousson* has ecclesiastical and communal colleges and 8010 inhabitants. The manufactures consist of coarse woollens, pottery, tobacco-pipes, beet-root sugar, beer, leather, and tiles. *Rosières-aux-Salines*, a station on the Strasbourg railway, 10 miles S.E. from Nancy, is built at the foot of a vine-clad hill above the Meurthe, and has 2332 inhabitants. It was formerly fortified, and flourished on account of its brine-springs; these however have not been worked since 1760.

2. In the second arrondissement the chief town *Château-Salins*, stands 17 miles N.E. from Nancy, in a pretty valley watered by a feeder of the Seille, and has a tribunal of first instance, glass-works, tan-yards, and a population of 2394. *Dieuse*, or *Duze*, famous for its salt-springs, stands on the right bank of the Seille, 10 miles E. of *Château-Salins*, and has a college and 3964 inhabitants. In Roman times the town bore the name *Decam Pagi*, and was considered an important post on the military road from Metz to Strasbourg. *Vic*, S. of *Château-Salins*, in a narrow valley drained by the Seille, has salt-springs, a tribunal of first instance, and 3277 inhabitants.

3. In the third arrondissement the chief town is LUNÉVILLE. *Baccarat*, situated on the Meurthe, which is here crossed by a bridge of nine arches, is famous for its manufacture of cut glass, and has 3216 inhabitants, who manufacture also common glass, calico, iron-mongery, chemical products, leather, &c. *Blamont*, a well-built town, situated in a fine corn and grass country E. of Lunéville on the *Vézouse*, has a population of 2577. *Gerbeviller*, formerly a fortified town, stands in a plain on the left bank of the *Mortagne*, and has 2208 inhabitants.

4. Of the fourth arrondissement the chief town, *Sarrebourg* is situated in a fertile country on the right bank of the *Sarre*, 48 miles by the Paris-Strasbourg railway E. from Nancy, and has a tribunal of first instance and 2493 inhabitants in the commune, who manufacture cotton-cloth, flax, scythes, saws, tin-ware, and chemical products. The position of the town at the opening of an important pass in the Vosges Mountains, makes it a place of importance in a military point of view. *Phalbourg*, 9 miles N.E. of Sarrebourg, at the entrance of the defiles of the Vosges, and near the Paris-Strasbourg railroad, is a well-built and strongly fortified town, with a population of 4947. The most remarkable structures are—a large church, built in the reign of Louis XIV.; the college buildings; the barracks; the arsenal; the town-hall; and the market-house.

5. The fifth arrondissement is named from its chief town, *Toul*, which stands at the foot of vine-clad hills, in a fertile plain on the *Moselle*, here crossed by a stone bridge of seven arches, at a distance of 21 miles by railway W. from Nancy, and has a tribunal of first instance, a college, and 8937 inhabitants. The town is irregularly built, but contains some good structures. Among the objects deserving of notice are—the cathedral, which contains some fine sculptures; the church of *St-Gengoult*; the town-hall; the two hospitals; the barracks; the corn-market; and the ramparts, which are flanked with nine bastions. This town is noted for its embroidery; pottery, beer, and leather are made.

The department forms the see of the Bishop of Nancy, is included in the jurisdiction of the High Court and within the limits of the University-Academy of Nancy, and belongs to the 5th Military Division, of which Metz is head-quarters. It returns three members to the Legislative Body of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1858.*)

MEUSE, the ancient *Mosa*, and the Dutch *Maas*, a river which rises in the plateau of Langres, in the department of Haute-Marne, and flows first in a general northern direction and then west into the German Ocean, having drained portions of France, Belgium, and Holland. Its upper current is formed by two small streams that unite at *Fort-Fillières*; but it is only after passing the village and the ruined castle of Meuse that the name of Meuse is applied to the river. Having traversed in a direction of north by east the eastern part of Haute-Marne, the Meuse enters the department of Vosges, where, flowing under ground for four miles, it reappears a little south-west of *Neufchâteau*, not far north of which it crosses the boundary of the department of Meuse. Through the whole length of this department it flows north by west in a narrow valley past Commercy, Verdun (where it becomes navigable), and Stenay. On entering the department of Ardennes it has a very winding course, first north-west past Sedan, Mézières, and Charleville, and then north by east past Fumay and the fortress of Givet, just below which it enters the kingdom of Belgium. Here it traverses the province of Namur in the direction of north by west, as far as the town of Namur, whence it flows north-east to Liège, and then turning north by east it forms the boundary between Dutch and Belgian Limburg; and continuing in the same

direction to a few miles below Venloo, it turns nearly north-west as far as Grave. From the neighbourhood of Grave it flows west, and separates North Brabant from Guelderland and Holland. Below Gorcum it divides into two arms: of these, the northern one, flowing through the province of Holland, takes the name of Merwe, as far as Dort, where it subdivides into two branches, the northern one called the Maas, the southern one the Oude Maas, which inclose between them the island of Ysselmonde; these branches, uniting on the eastern side of the Isle of Rosenburg, form a wide current, which enters the North Sea to the north-west of the island of Voorn. The southern arm, having passed through the Biesbosch, takes the name of Hollands-Diep as far as Willemstad, below which it also subdivides into two branches: one of these, first called Haring-Vliet, and more to westward Flakke, enters the North Sea by a wide estuary between the islands of Voorn and Over-Flakkee; the other flows into the North Sea between the islands of Over-Flakkee and Schouwen, having first sent part of its waters to the eastward of Schouwen Island into the Ooster Schelde. The whole course of this river is 552 miles in length, 256 miles of which are in France; it is navigable from Verdun to its mouth, a distance of 430 miles—133 miles of these are in France. The principal feeders of the Meuse in France are the Mouzon, the Vair, the Chiers, and the Semoy on the right bank, and the Bar on the left; in Belgium the Lesse and the Ourthe on the right, and the Sambre on the left bank; in Holland, the Roer, the Niers, the Linge, the three branches of the Rhine known as the Waal, the Leek, and the Yssel, on the right bank, and the Dommel and the Merk on the left. Many of these rivers are navigable; those that are not so are available for floating timber. Down the Meuse itself the chief articles of transport are marble, slates, iron, timber, and corn.

The basin of the Meuse is for the most part very narrow, the French part of it being a mere strip of a few miles in width, hemmed in between high hills; lower down, where it includes the valleys of the Sambre and the Ourthe, it attains its greatest width, which is about 90 miles. North of Liège the basin again becomes narrow, and so continues to the final bend of the river westward, where in some places the width of the basin is between 30 and 40 miles. The lower part of the basin of Meuse includes a good deal of fertile flat land, with not a few marshes and peat bogs; the upper part of it is in general fertile, and presents some pretty and some bold scenery. The basin of the Meuse communicates with those of the Rhine, the Seine, and the Schelde by means of canals.

MEUSE, a department in the north-east of France, is bounded N. by the duchy of Luxembourg and the department of Ardennes, E. by the departments of Moselle and Meurthe, S. by those of Vosges and Haute-Marne, and W. by the departments of Marne and Ardennes. Its form approximates to that of an oval; its greatest length from north to south is 80 miles; its greatest breadth is 46 miles, but the average width does not exceed 33 miles. The area is 2405.9 square miles. The population in 1841 was 326,872; in 1851 it amounted to 328,657, giving 137.6 inhabitants to a square mile, or 37.98 below the average per square mile for all France. The department was formed chiefly out of the duchy of Lorraine and Bar; and the rest of it out of a part of the Trois-Évêchés and portions of the counties of Champagne and Clermont.

The Faucilles Mountains, which, running through the department of Haute-Marne and Vosges, connect the plateau of Langres with the principal chain of the Vosges Mountains, send out two ranges of hills that inclose the narrow valley of the Meuse, and traverse the department of Meuse from south-south-east to north-north-west, terminating northward in the wooded heights of the Ardennes. From these two ranges, which nowhere exceed the height of 1600 feet, numerous lateral offshoots spring, so that the surface presents a great variety of hill and dale, and plain and valley. The more western of the two ranges is often designated by the name of the Argonne Hills; it forms the watershed between the Meuse and the Seine. The eastern range, which in general is more properly described as a high table-land, divides the feeders of the Meuse from those of the Moselle. These heights, which consist of fossiliferous rocks, are in many places covered with extensive forests, in others with pastures, whereon great numbers of cattle are fed. The lower slopes are laid out in vineyards, which yield ordinary white and red wines of the first class. The soil of the plains is in general shallow and unproductive; but the river valleys, especially those of the Meuse and the Orain, are of the greatest fertility, and cultivated with the utmost care.

The chief river is the MEUSE, which gives name to the department, and is navigable from Verdun to its mouth. The west and south-west of the department are drained by the AISNE and its feeder the Aire; and by the Orain and the Saulx, which unite their waters, and, swelled by the Chee, flow into the Marne a little below Vitry-sur-Marne, in the department of Marne. The Madine and the Ornes flow north-east into the Moselle. The Oison and the Othain drain the northern district, and flow north-west into the Chiers, a feeder of the Meuse. The department is crossed by 9 state, 12 departmental, and a great number of cross roads. The Paris-Strasbourg railroad traverses the department, passing through Bar-le-Duc and Commercy. The climate is mild in the valleys, but harsh and cold on the hills and on the high table-land east of the Meuse.

Of the usual bread-stuffs more than is enough for the consumption

is raised. Hemp, flax, and oleaginous seeds are cultivated. Cattle, swine, and goats are numerous; horses are small. Gooseberries and strawberries are grown in very large quantities in the neighbourhood of Bar-le-Duc and Ligny, whence they are largely exported in the preserved state. Gruyère and cream cheese are made in the arrondissement of Commercy. About 22,000,000 gallons of wine are made annually, two-thirds of which are consumed on the spot, and the remainder is exported to Belgium.

The department is occupied by the rocks that intervene between the chalk and the new red-sandstone. Several iron-mines are worked; good building-stone, marl, potters'-clay, and slates are found. Fossils of great variety, and some of large dimensions, are met with.

The chief manufactures are—iron, made in 40 forges and furnaces, cotton cloth and twist, hosiery, oil, glass, paper, pottery, beer, leather, brandy, &c. The commerce of the department is fed by the articles already enumerated, and by timber, oak-staves, clover-seed, butter, fat pork, hides, wool, confectionary, &c. Above 100 fairs are held in the course of the year.

The department of Meuse contains 1,539,794 acres. Of the whole area 328,302 acres are under cultivation; 442,920 acres are covered with woods and forests; 34,349 acres are under vine culture; 122,252 acres are meadow and grass land; 18,254 acres are laid out in gardens, orchards, and plantations of various kinds; 29,634 acres consist of barren moorland; 15,294 acres are covered with rivers, ponds, marshes, or canals; and 35,649 acres are occupied as roads, streets, and squares.

The department is divided into four arrondissements, which, with their subdivisions and populations, are as follows:—

Arrondissements,	Cantons.	Communes.	Population in 1851.
1. Bar-le-Duc . . .	8	128	86,353
2. Commercy . . .	7	181	87,664
3. Montmédy . . .	6	132	69,096
4. Verdun . . .	7	150	85,539
Total . . .	28	591	328,657

1. Of the first arrondissement the chief town is BAR-LE-DUC, which is also the capital of the department. *Ancerville*, a small place S. of Bar-le-Duc, has 2181 inhabitants. *Ligny*, a well-built town, prettily situated on the left bank of the Orain, has several iron-forges and smelting furnaces, a cotton-spinning factory, tanyards, and a population of 3147. The town is noted for its manufacture of anvils.

2. In the second arrondissement the chief town, *Commercy*, stands on the left bank of the Meuse, in 48° 45' 54" N. lat., 5° 35' 41" E. long., 20 miles in a straight line, 25 miles by railway, E. from Bar-le-Duc, and has a tribunal of first instance, a college, and 3735 inhabitants in the commune. The town is well built, and has several pretty promenades. The barracks, riding-school, town-hall, and corn-market are the most remarkable buildings. In the environs, which are very beautiful, there are several iron-forges and smelting-furnaces. The manufactures of Commercy are calico, cutlery, beer, and leather. *St-Mihiel*, a pretty well-built town, with a college and 6462 inhabitants, is situated on the right bank of the Meuse, which here flows through a narrow valley shut in by high hills. The church of *St-Étienne* contains a fine sculptured representation of the Entombment of Christ. Cotton cloth and yarn, iron, carpenter's tools, and leather, are the chief industrial products. *Vaucouleurs*, a town of 2500 inhabitants, stands on the slopes of a hill above the left bank of the Meuse, 12 miles S. from Commercy, and has manufactures of cotton cloth, cotton hosiery, and leather.

3. In the third arrondissement the chief town, *Montmédy*, is situated at the foot and on the slope of a hill above the Chiers, a feeder of the Meuse, in 49° 31' 6" N. lat., 5° 21' 55" E. long., 964 feet above the level of the sea, and has a college, a tribunal of first instance, and 2132 inhabitants in the commune. It is an ill-built place, with narrow crooked streets and badly constructed houses. This town, being situated on the frontier of France, is regularly fortified: its defences have been repaired and strengthened within a few years. It has hydraulic saw-mills, tanyards, oil-mills, and some hosiery manufactures. *Stenay*, a well-built town, 8 miles W. from Montmédy, is situated in a fertile spot on the right bank of the Meuse, which forms several islands and drives the machinery of several iron forges below the town. The inhabitants, who number 3775, manufacture beet-root sugar, wine-casks, beer, leather, iron, and bricks.

4. In the fourth arrondissement the chief town, *Verdun*, stands on the Meuse, which here begins to be navigable, in 49° 9' 20" N. lat., 5° 19' 52" E. long., 1030 feet above the level of the sea, at a distance of 145 miles E. from Paris; and has tribunals of first instance and of commerce, a diocesan school, communal and ecclesiastical colleges, and 13,649 inhabitants in the commune exclusive of the garrison. The town is defended by a citadel constructed by Vauban, and by ten detached redoubts. The Meuse flows through the town in five branches, which unite outside the fortifications. Verdun is in general well built; but the streets, some of which are steep, are badly paved. An esplanade, planted with trees, divides the citadel from the town. The residence of the bishop of Verdun, the public library, which contains

14,000 volumes, the cavalry barracks, the military stores, the promenades, and the great sluices, by means of which the environs can be inundated, are the principal objects of notice. Verdun is famous for its sugar-plums and liquors. Cotton- and woollen-yarn, beer, and leather are also manufactured. *Clermont-en-Argonne*, a small town of about 1500 inhabitants, 14 miles W. from Verdun, on the slope of a high hill, in the vicinity of extensive forests, was formerly fortified, and the capital of a county to which it gave name. After the incorporation of Lorraine with France its fortifications were demolished. Clermont is well fortified; it stands on the high road from Paris to Metz. *Etain*, a well-built town, 12 miles E. from Verdun, stands on the left bank of the Orne, a feeder of the Moselle, and has a college, and 2961 inhabitants, who manufacture cloth, hats, cotton cloth and yarn, leather, and lina. *Varennes-en-Argonne*, a small place of 1600 inhabitants, on the left bank of the Aire, a feeder of the Aisne, 15 miles W. from Verdun, deserves notice as being the place where Louis XVI., his queen, and two children, in their flight from Paris, were arrested, on the night of the 21st of June, 1791.

The department forms the sea of the Bishop of Verdun, is included in the jurisdiction of the High Court and within the limits of the University-Academy of Nancy, and belongs to the 5th Military Division, of which Metz is head-quarters. It returns two members to the Legislative Assembly of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Official Papers.*)

MEVAGISSY. [CORNWALL.]

MEWAR. [HINDUSTAN.]

MEXICO, Republic of, occupies the north-western portion of the isthmus which connects North and South America, and the south-western extremity of North America, and lies between 15° and 33° N. lat., and 87° and 117° W. long. It is bounded E. by the Gulf of Mexico; S.E. by the British colony of Belize or British Honduras, and the republic of Guatemala; S.W. and W. by the Pacific Ocean, which here forms the long Gulf of California, the whole of which is included within the limits of Mexico; and N. by the United States of North America, the state of California being on the north-west, that of New Mexico north, and Texas north-east. By a recent treaty (known as the Gadsden Treaty) Mexico transferred a large portion of her northern territory to the United States on condition of receiving the sum of 10,000,000 dollars. The boundary line between Mexico and the United States as defined by this treaty, is formed on the north-east by the Rio Grande del Norte from its mouth up to a league above the town of El Paso del Norte (about 31° 30' N. lat.), thence south-west one league south of Lake Guzman to 31° N. lat.; along which parallel it is carried westward to 111° W. long., whence it ascends north-west to the confluence of the Rio Gila with the Colorado; it then descends the Colorado to 32° N. lat., along which parallel it is carried to the Pacific. The area of Mexico is about 1,000,000 square miles; the population within the present limits probably does not exceed 6,000,000.

Surface; Soil; Climate; Rivers.—Mexico is divided by nature into three regions, each of which is marked by different features. The first comprehends the countries lying to the east of the isthmus of Tehuantepec, which is crossed by the meridian of 95° W. long.: we shall call it the Eastern Region. The second extends from the meridian of 95° N. lat. in a curved line to the mouth of the Rio del Norte on the east (26° N. lat.), and to the confluence of the Gila with the Colorado (32° 45' N. lat.) on the west: it comprises the Central and Northern Region, or Anahuac. The third or Lower California comprehends the peninsula of that name on the west of the Gulf of California.

The Eastern Region comprehends the peninsula of Yucatan, the western declivity of the table-land of Guatemala, the plain of Tabasco, and the isthmus of Tehuantepec. Along the northern and western shores of the peninsula of Yucatan, there are no harbours, but only roadsteads, which during the northern gales are very unsafe; but along the eastern shores there are several harbours. The shores are sandy and flat. The level country extends to a considerable distance inland, whilst the centre of the peninsula is occupied by a long and comparatively narrow table-land inclosed by two ranges of low hills. The country along the Bay of Honduras is well watered, and exhibits a vigorous vegetation, both in its trees, which are of heavy growth, and in the great variety of its plants; but the soil is nearly uncultivated, the scanty population being chiefly employed in cutting mahogany, with fustic and several other dye-woods. The hilly district in the interior, as well as the flat country on the northern coast, has a sandy soil, and spring-water is everywhere extremely scarce. The vegetation is scanty; the trees are stunted, and the plants of a languid growth, except during the rainy season (from May to September); but as the climate, though exceedingly hot, is healthy, it is much better inhabited and cultivated than the eastern shores. The hills in the interior grow higher towards the point where the peninsula is connected with the table-land of Guatemala, the larger and higher portion of which belongs to the state of GUATEMALA. From the ridge which traverses this table-land the country descends rather rapidly to the west, until it meets the plain of Tabasco, north of 17° N. lat. Its surface being furrowed by numerous watercourses it is rather a succession of ridges of hills and valleys than an inclined plane. The climate is in general healthy; and according to the different elevations of the

surface, either the productions of the West Indies, or wheat and European plants are grown.

The plain of Tabasco begins on the east, at some distance east of the lagune of Terminos, and extends westward to Partida Rock, a moderately elevated cape, in which a range of hills, including the volcano of Tuxla, terminates (96° W. long.) on the shores of the Gulf of Mexico. This plain is more than 250 miles long, and extends inland from 50 to 120 miles. Its surface is level, and the soil alluvial. Being very fertile, it is covered with a thick forest of heavy growth but is little cultivated, being generally under water for several months during the rainy season, and consequently very unhealthy. Besides maize, plantains, and manioc, it produces a large quantity of coconuts and some coffee. Vanilla and indigo are stated to be common in the woods. The coast is generally low; but between the lagune of Terminos and the mouth of Tabasco River are the heights of San Gabriel, a range of hills running east and west about 30 miles, at a short distance from the shore; and where the plain terminates on the west is Cape Partida Rock, the extremity of a somewhat elevated and rocky shore, which extends about 30 miles. The Laguna de Terminos is about 60 miles long from north-north-east to south-south-west, and 30 miles wide on an average; but in many places it has hardly 4 feet of water, and the three or four channels by which it is connected with the gulf are hardly passable for large boats. The plain of Tabasco is watered by a considerable river, the Rio de Tabasco, and its two branches the Usumasinta and the Grijalva. The Rio de Tabasco rises in two branches on the eastern corner of the table-land of Guatemala, and flowing in a direction generally north by west, forms a considerable cataract south of 17° N. lat., where it descends from the table-land. Above this waterfall it is navigable for canoes, and below it for larger boats. This is also the case with its tributary, Chacamas, which rises in the most northern offsets of the table-land of Guatemala. The Usumasinta joins the Rio de Tabasco a few miles above its mouth, after a course of more than 300 miles. The Grijalva rises in the range of high hills in Guatemala, between the towns of Totonicapán and Gueguetenágo, and runs with many bends in a north-west direction, in a wide valley, until it issues from it near the isthmus of Tehuantepec, where it turns to the north-east by a bold sweep, and receives the name of Rio de Tabasco. It is navigable for vessels of moderate size as far as Villa Hermosa. After having joined the Usumasinta, it falls into the Gulf of Mexico at Port Victoria, after a course of about 350 miles.

The plain of Tabasco occupies the northern portion and about one half of the isthmus of Tehuantepec. The southern half comprehends a mountain ridge and a smaller plain. The most western declivity of the table-land of Guatemala assumes the form of several nearly parallel ridges at about 94° W. long., which running due east and west connect the last-mentioned table-land with the elevated plains of Anahuac. These ridges occupy between 35 and 40 miles of the isthmus. They are called Cerro Pelado, and probably do not rise above 2000 feet. Being entirely covered with trees of heavy growth, the district is also known as the Forest of Tarifa. The southern plain, or that of Tehuantepec, is about 25 miles wide, and extends along the Pacific from the boundary of Guatemala to some distance west of the town of Tehuantepec. It has a very hot but rather dry climate, and the soil, though not distinguished by fertility, is capable of producing several tropical plants. It is traversed by the river Chimalapa, which descends from the Cerro Pelado, and is navigable to San Miguel de Chimalapa, a distance of about 30 miles. On the same Cerro, but within the northern ridges, rises the Rio Huasacualco, which breaking through some of the ridges, is joined by numerous small rivers, which descend from the western declivity of the table-land of Mixtecapán, and soon becomes a powerful river, though it is not navigable on account of rapids or cataracts. As soon as it enters the plain of Tabasco its course is gentle, and there is no further obstruction to the navigation; but its mouth, which is situated in the south-western recess of the Gulf of Mexico, is choked by a bar and shoals.

The Central and Northern Region of the Mexican States may be called Anahuac, though this name was used before the Spanish conquest to designate only the country as far north as 21°. In its natural features it exhibits great variety. The eastern coast is low and sandy from the Punta de Rocca Partida (18° 40' N. lat.) to the mouth of the Rio del Norte, about 25° 45' N. lat. It runs on in a continuous line, without being broken by inlets or bays; and consequently contains no harbours except those formed by the mouths of the rivers; and even these are only unsafe roadsteads, as the rivers of this coast (between 18° 40' and 22° N. lat.), with the exception of the Rio Alvarado, have little water except in the rainy season. North of 22° N. lat., several rivers of considerable size fall into the sea, but except at their mouths the coast cannot be approached by vessels, as it is lined by long, low, and narrow sand-banks, which lie parallel to, and from two to six miles from it. The country adjacent to the shores, and from three to ten miles inland, is very low, but is defended from the sea by sand-hills rising from 50 to 200 feet high. The soil is sandy and almost destitute of vegetation. At the back of this low sandy tract the country rises gradually to the foot of an extremely steep ascent, which constitutes the eastern edge of the extensive table-land farther west. The country which lies between the shores and the steep ascent is only about 60 miles wide south of 22° N. lat.;

farther north it widens to about 150 miles; as it approaches the northern limit of the Republic the land rises rapidly, towards the interior attaining an elevation of 2500 or 3000 feet at a distance of only 50 miles from the sea.

This tract is comprehended in the Tierras Calientes, or 'Hot Countries.' The seasons are divided into the winter, or the season of the north winds; and the summer, or season of the breezes. The winter lasts from October to April, during which time the north winds (los nortes) are prevalent, and frequently blow with the force of a hurricane, sometimes for days together. They are the terror of navigators on these shores. During this period the coast is healthy, and the vomito-prieto, or yellow fever, ceases. The mean heat of this season is 71° of Fahrenheit, but during the north winds the thermometer sometimes descends to 60°. Rain is not rare during this season, but the showers are only of short duration. During the summer the heat is great: the mean temperature is about 81°, and in July and August it is about 82°. The rains are not heavy before June, but in that month they descend in torrents nearly every day for several hours. Towards the end of the summer, in September and October, the vomito prieto is prevalent in the lower part of the country, and very destructive among the white inhabitants. The mean annual heat of this tract is 77°. It is well adapted for the cultivation of all tropical products, and as its soil, with the exception of the sandy shores, is possessed of a considerable degree of fertility, it produces rich crops of maize and rice where it can be irrigated. Bananas, pine-apples, oranges, and manioc are also cultivated. The products adapted for exportation are chiefly coffee, sugar, and cocoa, and a small quantity of cotton; vanilla and jalap are collected in the woods, with which a great part of this region, especially that near the steep ascent, is thickly covered.

The steep ascent which bounds this tract on the west rises in some places in terraces which lie between the declivities, and in such places the ascent occupies a considerable space; but in other parts it rises from 5000 to 6000 feet in a distance generally not exceeding 10 miles in width, and frequently much less. The acclivity is so steep that on the whole line, nearly 600 miles, there are only two places where it is practicable for carriages, namely, at Xalapa, near Vera Cruz (19° N. lat.), and at Santillo, west of Monterey (26° N. lat.). The rocks are generally too steep to maintain any vegetation beyond a few plants, but in the narrow ravines which intersect the acclivity a vigorous vegetation is found; in the lower part there are many oak-trees, and in the higher large pines.

The steep ascent just described constitutes the outer edge of the elevated plains of Anahuac, which extend westward to a great distance. The edge itself is lined by a continuous series of hills rising in general only to a moderate elevation above the table-lands, but some of them attain a great height, as the Cofre de Perote, near the road leading from Vera Cruz to Mexico, which is 13,415 feet above the sea-level, and 5723 feet above its base; and the peak of Orizáva, which attains a height of 17,373 feet. The heights which line the margin of the table-land do not form a continuous chain, but appear rather isolated in the southern districts.

The elevated plains of Anahuac are divided into two parts by a range of mountains which traverses them in a general eastern and western direction, and is called Sierra Madre. This chain begins not far from the eastern edge, near 21° N. lat., west of Tlacolula, with the mountains of La Encarnación, whence it continues in a west-by-north direction to San Felipe (21° 40' N. lat.), which town is situated in a comparatively small plain inclosed by two branches of the range. Here an elevated and wide offset branches off to the southward, and stretches over the plain for about 50 miles, terminating with the group in which the mines of Guanajuato are situated.

West of San Felipe the range declines to the north-north-west, and its continuity is broken into isolated ridges, as the Sierra de Altamira, about 20 miles east of Aguas Calientes, and the group of mountains which contain the mines of Zacatecas. But at no great distance west of Zacatecas the Sierra Madre re-appears as a mountain range, and occupies a width of 100 miles from east to west. The mountains of La Encarnación rise more than 10,000 feet above the sea, and about 4000 feet above their base; those inclosing the plain of San Felipe are probably as high.

The elevated plains which spread out west of the steep ascent occupy the greatest part of the surface of Mexico. They are widest between 19° and 20° N. lat., where they occupy 360 miles from east to west. This extensive tract of country however is not one plain, but divided into four plains unequal in extent, and separated from each other by ranges of hills which rise from 500 to 2000 feet above their base. The most eastern plain has the town of Tlascala nearly in its centre. Its surface, which is pretty level, is from 7000 to 7500 feet above the sea; and it occupies the space between 97° and 98° 30' W. long., 18° 30' and 20° N. lat. Two lofty, but isolated peaks, the Cerro de Pizarro and Mount Malinche, are near the road which leads from the sea to Mexico. The parts of this plain which are contiguous to the eastern edge of the table-land are very sterile, the ground being covered with lava, and producing only a coarse grass, on which sheep pasture. This sterile tract, known as 'El Mal Pais,' occupies about one-third of the plain. Farther west the soil improves, and in many places the ground is covered with maize, wheat, and barley, or laid out in plantations of American aloes. The chain of hills which divides the

plain of Tlascala from that of Tenochtitlan contains the peak of Istaccihuatl (15,704 feet above the sea), and the volcano of Popocatepetl (17,884 feet), which last is the highest mountain in Mexico. The plain of Tenochtitlan, lying west of that of Tlascala, is between 19° and 20° N. lat., 98° 30' and 99° 30' W. long., and about 7480 feet above the sea. Farther west is the plain of Toluca, which extends to 100° W. long., and is somewhat smaller in extent than that of Tenochtitlan, but likewise surrounded by chains of hills. In the southern chain is the Nevado de Toluca, which is 15,160 feet above the sea, and through the northern chain the Rio de Lerma forces its course. The surface of this plain is in many places uneven and broken, but it contains also extensive levels. As it is nearly 9000 feet above the sea-level it is too cold to produce wheat, and it serves chiefly as pasture-ground. The most western of these extensive plains is that of Michoacan, which between 19° and 20° N. lat. extends from 100° to 104° W. long., and approaches the Pacific within about 30 miles. Its surface in the eastern districts is about 6500 feet high, but towards the west it sinks down to 5500 feet. This plain exhibits several broken and high ridges of hills, which inclose valleys of moderate width and great fertility. The mountains are covered with a fine growth of timber. The level country is fertile, and produces abundantly every kind of grain; but its elevation above the sea is too great to admit the cultivation of tropical products. Nearly in the centre of this plain is the Lake of Patzcuaro, famous in the history of the ancient kingdom of Michoacan, whose capital, Tzintzontzan, was built on its banks. Towards the western extremity of the plain is the lofty peak of Tancitaro.

From the western edge of the table-land of Michoacan, on which the small town of Zapotlan is built, the country declines rapidly to the plain of Colima, which seems to resemble in most respects the low tract along the Gulf of Mexico. On this plain the isolated volcano of Colima rises to a great height. This country is fertile, and is capable of producing all the tropical plants; but it is badly cultivated.

On the north the table-lands just mentioned border on others of a similar description. On the south the country descends rapidly and with a very irregular surface, except where it borders on the plain of Tlascala. This plain is joined on the south by that of Mixtecapan, which stretches from about 18° 30' N. lat. southward to the very shores of the Pacific, where it terminates with high mountains, leaving only a narrow tract between them and the sea, from the plain of Tehuantepec on the east to the mouth of the Rio Yopez on the west, a space of 300 miles. This whole region, with the exception of a few depressions and the low tract on the coast, forms a broken table-land about 5000 feet above the sea. Maize and other grains are grown in abundance, and a great quantity of cochineal is collected.

The table-land of Mixtecapan, stretching south and north, and extending westward to 98° 30' W. long., forms nearly a right angle with the table-land which stretches east and west over the Mexican isthmus, between 19° and 20° N. lat. The countries which fill up this angle are covered with numerous narrow ridges running generally east and west, with intervening valleys sometimes wide enough to be called plains. Both the ranges and the valleys grow lower as they approach the shores of the Pacific. Sugar plantations occur at Istla (3100 feet) and at Cuantla y Amilpas, not more than 30 or 40 miles south of the table-land of Tenochtitlan. Farther south the descent is less rapid, as the valleys, which are only 30 or 40 miles from the Pacific, are still about 2000 feet above it. The descent again becomes more rapid near the shores, on the margin of which is a narrow level tract intersected with salt lagoons. This region is traversed from east to west by a river of considerable magnitude, but too rapid to be navigable, the Rio de Zacatula, whose course exceeds 200 miles, its source being near the western edge of the plain of Mixtecapan. Towards the northern margin of this region is the volcano of Jorullo, which stands in the middle of a plain 2890 feet above the sea, the volcano itself being 4114 feet above the sea. This volcano was formed on the 29th of September, 1759, in a violent eruption, by which a surface of between 24 and 30 square miles was raised several feet above the level of the plain. The volcano is surrounded by numerous conical hills of moderate elevation, from which smoke is continually issuing. From the mouth of the Rio de Zacatula westward a low level extends along the Pacific, which joins that of Colima, and spreads about 30 or 40 miles inland. It is a tierra caliente resembling in climate, fertility, and productions the low coast along the Gulf of Mexico, and, like the latter, it is very unhealthy; but the yellow fever, or vomito prieto, does not visit the shores of the Pacific. The mean annual temperature of these shores is considerably higher than that of the shores of the Gulf of Mexico, the thermometer even during the cold season hardly descending below 82°, and nearly all the year round maintaining itself in the day-time between 86° and 95°. The gales by which it is visited rather resemble hurricanes, and blow during the months of July and August from the south-west: sometimes they occur as late as September and October. From October to May the air is in general calm, and the sky cloudless; but the sun is nearly invisible on account of a fog, of an olive colour, which covers the whole sky in its upper regions, and does not affect the hygrometer.

North of 20° N. lat. is the table-land of Queretaro, which extends to the ridge of the Sierra Madre, on the east to about 21° N. lat., but

on the west to 21° 30'. That portion of it which lies east of 100° W. long. is in general about 6500 feet above the sea-level. Its surface is broken by single groups or short ranges of hills, which rise from 1000 to 1500 feet above the plain; but still there occur many level tracts of considerable extent and great fertility. This region contains numerous productive mines. The western and greater portion of the table-land (between 100° and 102° W. long.) is nearly a plain, rarely interrupted by hills. The central part of it is occupied by one of the richest agricultural districts on the Mexican isthmus, known under the name of Baxio. It is 100 miles long and 30 miles wide, and covered with corn-fields, which, being irrigated by canals, yield rich crops of maize and wheat. In the other districts many sterile tracts occur, which are either covered with stones, and then called 'pedregal,' or with lava, when they always receive in Mexico the name of 'mal país.' The remainder is rather fertile, but by far the greater part of it cannot be irrigated, and is used only as pasture-ground. On this table-land there are many 'barrancas,' or depressions in the level country, having a steep declivity, and descending frequently 1000 feet below the general surface of the country. These depressions are sometimes 3 or 4 miles wide, and still longer: they are covered with trees of a vigorous growth, which form a striking contrast with the bare surface of the table-land. Their climate is considerably milder than that of the country about them, and approaches in some cases to that of the *tierras calientes*. Vegetation follows the course of a small stream which runs in the centre of the barranca. Several small towns are built in these depressions of the table-land.

The plain of Queretaro descends very gradually to the west, but with a broken surface, so as to present a succession of hills and valleys with some intervening plains, usually of no great extent; the plains in some places occupy the summit of the higher country, and are called 'mesa' (table-land). The descent terminates about the meridian of Zapotlan, or Zapotlanéjo (102° 30'), where the productions of the *tierras calientes* appear, and the general level of the country extending to the shores of the Pacific may be estimated at about 4000 feet above the sea. This region, called the Plain of Xalisco, has a very uneven surface, being in many places intersected with hills, which frequently rise to a great height, with a steep ascent; though extended flat tracts are numerous, among which that about the town of Guadalajara is distinguished by fertility. Maize and wheat constitute the principal articles of agriculture. In this country is the lake of Chapála, which is about 90 miles long and from 12 to 18 miles broad: the surrounding hills rise to a considerable elevation, and descend rapidly to the water's edge. The lake contains the island of Mescála, on which a number of Indians resisted the arms of the Spaniards from 1811 to 1814.

The Rio Santiago, or Rio Grande, the largest of the rivers of the Mexican isthmus, principally traverses the regions just mentioned, having its mouth at S. Blas (21° 32' N. lat., 105° 18' W. long.). This river rises in a lake situated at the base of the range which divides the table-land of Toluca from that of Tenochtitlan, and in an extensive morass surrounding the small town of Lerma, whence it is called, in the upper part of its course, Rio de Lerma. Its course is rather gentle, until it breaks through the range of hills which separates the table-land of Toluca from that of Queretaro. It flows through the Baxio, and its waters are abundantly used for irrigation. Where it leaves the plain of Queretaro it is closely hemmed in by precipitous mountains, full of rapids and bars, and runs quickly over a stony bed. On approaching the lake of Chapála its course again becomes gentle, and before it enters the lake it passes through an extensive level tract, which is inundated by the river during the rains, and is swampy all the year round. It issues from the lake on the north side not far from the town of Ocotlan, where it is 200 yards wide, and flows with an even and uninterrupted course to the Puente del Rio Grande, near Guadalajara, where there occur in the space of less than three miles between 50 and 60 falls. Farther down, though less obstructed, it is still very rapid, and is not used for navigation. Its entire course considerably exceeds 400 miles.

The eastern part of the table-lands is drained by the river Panuoc, which rises in the Lake of Zumpango, on the table-land of Tenochtitlan. The waters of this lake are carried by the canal called the Desague de Huehuetoca to the Rio de Tula, or Mootezuma, which runs in a northern direction, inclining a little to the east, to Tamasinchali, where it is called the Rio de San Juan. From this place it passes in the same direction to Miraflores, San Juan, and Tanquichi. In this latter part of its course the river, which near its source is extremely rapid, becomes more gentle, and canoes may ascend it to San Juan; but above Tanquichi the rapids are numerous and violent. Five miles above Panuoc a ledge of rocks runs across the river, which, except in the rainy season, has only four feet of water on it, and thus prevents large vessels from ascending it farther. Schooners sail up to Panuoc, which is 80 miles by water and about 40 miles by land from the sea. The course of the river below Panuoc is exceedingly winding. It traverses a low and frequently swampy tract, covered with extensive forests, in which mahogany and different kinds of dye-wood are cut. At its mouth the river forms the harbour of Tampico.

The climate of these table-lands varies in proportion to their elevation above the sea. In those of Tenochtitlan and Tlascala, which are nearly equal in this respect, the mean annual temperature is 62°. In

winter the thermometer generally ranges between 45° and 47°, and sometimes, though rarely, descends below 32°. In summer it never exceeds 75° in the shade. On the table-land of Toluca, which is the most elevated, the air is so cold during the greatest part of the day that the thermometer generally varies between 42° and 46°. On the table-land of Valladolid, Mixtecapan, and Michoacan, which are considerably lower than Tenochtitlan, the mean annual temperature probably varies between 66° and 68°. All these countries, being more than 5000 feet above the sea-level, are called by the inhabitants *Tierras Frias* (Cold Countries). The seasons on the table-lands are only two, that of the rains (*estacion de las aguas*) and the dry season, or summer (*el estio*). The rains commence in June or July, and terminate in September or October; the rainy season consequently lasts only four months. The rains occur earlier in the countries approaching the eastern shores, and extend afterwards farther west. They are accompanied by thunderstorms, which are experienced successively at Mexico, Guadalajara, and on the western shores. Though the rains are much less abundant on the table-lands than on the coast, they would be sufficient to maintain a vigorous vegetation but for the rapid evaporation, and the peculiar nature of the soil, which covers rocks of a porous nature. Consequently all these table-lands have rather an arid soil, which can only be employed in the cultivation of grain where it can be watered; and even many of the rivers disappear in fissures of the rocks. The plains are entirely destitute of trees, but are covered with several kinds of cactus. For want of the means of irrigation, perhaps nine-tenths of the table-lands are only used as pasture; and the grass is sufficient for that purpose to the months of March and April, when the south-east wind, called *Viento de la Mistica*, begins to prevail, which, being very dry and hot, withers the smaller plants and grass. The elevated table-lands of Mexico, like those of Tibet and Central Asia, which are still more arid, have also a large portion of their surface covered with muriate of soda and other saline substances in the dry season, like a hoar-frost, which considerably diminish the productive powers of the soil. The countries which are elevated from 2500 to 4000 feet above the sea, such as the broken region lying between the table-lands of Tenochtitlan, and Toluca and Michoacan on one side, and between the table-land of Mixtecapan on the other, and the uneven plain of Xalisco, are called *Tierras Templadas*. Their mean annual temperature amounts to between 75° and 78°, and they enjoy nearly a continual spring, as the difference of the temperature in the colder and hotter season does not exceed 8°, or at the utmost 10°. These tracts produce the tropical fruits and the sugar-cane in abundance, and, as well as the table-lands themselves, enjoy a very healthy climate all the year round, whilst the inhabitants of the low tracts along the coast are subject to dangerous diseases.

We pass to the countries lying to the north and east of the Sierra Madre. The country, which is bordered by this range on the south and west, is a plain nearly 700 miles long, and from 100 to 300 miles wide, terminating on the north-east on the banks of the Rio del Norte, and at the Sierra de las Espuelas, the most northern offset of the Sierra Madre. Of the southern portion some districts, being possessed of the means of irrigating the land, are distinguished by fertility, as the country about San Luis de Potosi, and the Valle del Maiz, which lies on the banks of the Rio Tamoin, a tributary of the Rio Panuoc. A great portion of the country serves as pasture-ground for numerous herds of cattle, sheep, and goats. The rains are less abundant than farther south, and fall mostly in October and November; the heat in summer is less and the cold in winter greater than on the table-land of Queretaro.

The northern portion of the plain is still less favoured by nature. It suffers greatly from the scarcity of rain, which in the southern districts is far from being abundant, and north of 27° N. lat. is very rare. It is consequently badly supplied with water, the springs being few in number, and the water of a very disagreeable taste, owing to the soil containing a great portion of carbonate of soda. The plain contains numerous dry salt-lakes, whence large quantities of carbonate of soda are collected and taken to different parts of the republic for the manufacture of soap. All the rivers which water this plain rise along the eastern declivity of the Sierra Madre, and, running northward, are lost in some lake having no communication with the sea, with the exception of the Rio Conchos, which rises with several branches between 26° and 28° N. lat., and falls into the Rio del Norte near 31° N. lat. In the southern districts are the Rio Grande de las Nieves, which runs about 800 miles, and loses itself in the Lake of Parras; and the Rio Nassa, which after a course of about 200 miles enters the Lake of Mapimi. In the northern districts are the Rio de San Buenaventura, and the Rio de las Casas Grandes, which run hardly more than 100 miles, and fall into the lakes of Santa Maria and of Guzman. The cultivable land of this plain is limited to the river-bottoms, which extend from two to four miles along the banks, and produce maize and other grain. In the valley of the Rio Nassa cotton is grown, and in the neighbourhood of the Lake of Parras are extensive vineyards, from which a good wine is obtained. All the extensive tracts which separate the river-bottoms from one another are level, and consist mostly of a firm soil, the sandy or stony tract being rare and of comparatively small extent; but they are quite destitute of wood or even shrubs, and in certain seasons even dry grass is rare. Gales

of wind are very frequent, and from whatever point of the compass they blow they are very cold, and raise immense clouds of dust filled with saline particles. Within this plain is situated a mountainous region, called the Bolson di Mapimi, which occupies the tract of land extending from the northern shores of the Lake of Mapimi to the banks of the great southern bend of the Rio del Norte: it is said to contain an abundance of metals.

The Sierra Madre, which extends along the western side of this plain in a north-western direction, descends towards it in terraces, separated from each other by abrupt declivities, and traversed by deep and steep transverse valleys. The crest of the chain is situated towards its western declivity, and between the ridges which compose the mountain region are longitudinal valleys, narrow, but of considerable extent, which contain rich mines. Towards the plains which lie along the Pacific the descent is very rapid, and only furrowed by ravines.

The country between the Sierra Madre and the Pacific is naturally divided into two different regions—the plains of Cinaloa and the hilly region of Sonora. The former extends between 24° and 28° N. lat., and the latter between 28° and 32° N. lat. The plains are perfectly level, and only hills of moderate elevation divide them from the Sierra Madre. Their soil consists of a sandy clay, almost without a pebble. The rains set in regularly on the 24th of June, and last about two months. The greatest heat is experienced before the rains, from the month of March, when the country is parched up and resembles a desert. The rivers running across the plain flow in beds considerably below its surface, and it does not appear that even after the most abundant rains they rise high enough to water the adjacent tracts. The most considerable of these rivers are the Rio de Culiacan, the Rio del Fuerte, and the Rio Mayo, each of which may run upwards of 100 miles in a wide and deep bed.

Sonora, which begins at some distance north of the Rio Mayo, has likewise a tract of level and low land along the sea, but it soon rises to some elevation, and then extends nearly on a level many miles inland. This part of the country is rather sterile from want of moisture. The hilly country begins from 30 to 40 miles from the shore, and is traversed by several ridges running south and north, parallel to the Sierra Madre. In some places the hills rise to the height of mountains. Between these hills run rivers in valleys, generally several miles wide, and possessed of a considerable degree of fertility. The largest is the Yaqui, which is formed by two branches—the Rio Babispe, 200 miles long, flowing along the base of the Sierra Madre southward, and the Rio Oposura, 120 miles long, which runs parallel to it farther west. After their junction they take the name of Rio Yaqui, and flow about 150 miles more, until they fall into the Gulf of California, south of 28° N. lat. The central districts of Sonora are also traversed from north to south by the rivers Arispe and Dolores, which flow parallel to each other until they unite a few miles above the town of Pitic at San Jaunita; a few miles below Pitic the united river enters a lake of some extent, which has no communication with the sea. In the north-western corner of Sonora the Rio de San Ignacio enters from New Mexico, runs more than 100 miles, and is likewise lost in a lake. None of these rivers are navigated, but they are used to irrigate the valleys, in which maize and wheat are grown to a considerable extent. As this part of Mexico is situated within the temperate zone, it partakes of the great changes in temperature which commonly occur in these countries. The thermometer ranges during the year between 30° and 95°. During the northern and north-eastern winds, which blow from the Rocky Mountains, it sometimes freezes every night for several weeks at Pitic (29° N. lat.), and the thermometer then sinks as low as 18° in the night-time; but the summer is excessively hot, and the hot weather continues for several months. The rains take place much later here than farther south.

The third division, or Lower California, is described under CALIFORNIA (vol. ii, col. 243). The Gulf of California, which lies between the west coast of the district just described and Lower California, and belongs wholly to Mexico, is also noticed in a separate article. [CALIFORNIA, GULF OF.]

The Rio del Norte, also called in its lower course Rio Grande, and often incorrectly Rio Bravo, forms in its lower course the boundary between Mexico and the United States. Including its windings, its course is nearly 1800 miles. It rises in the most northern angle of the Vale of New Mexico, near 40° N. lat., not far from the sources of the Arkansas, a tributary of the Mississippi, and of the Rio Colorado, which falls into the most northern recess of the Gulf of California. The Rio del Norte runs southward from 40° to 29° N. lat., and belongs wholly to the United States to a league above the town of El Paso del Norte, 31° 40' N. lat. It here is of great service for irrigating the fertile district which surrounds the Paso del Norte, and its water is considerably diminished. Afterwards it receives a small supply of water by the Rio Conchos; and after having changed its course by a great bend to the east and north-east, it receives a larger supply by the Rio Puerco, which runs in a longitudinal valley east of the Sierra de Sacramento; but as its course lies through an arid plain, which is rarely refreshed by abundant rains, the volume of its waters is too small even for small craft, until it has changed its course to the south-east, and has arrived at the Presidio de Rio Grande, nearly 800 miles from its mouth. In this neighbourhood the river leaves the elevated

plain and descends into the lower country which extends along the shores of the Gulf of Mexico. From Loredo downward it may be navigated by steamboats of light draught. Small sailing-vessels ascend to Matamoros, 60 miles above the mouth; but larger ones cannot enter the river on account of its bar and numerous shoals.

Productions.—As there is so great a difference in the climate of the different regions of Mexico, there must be a corresponding variety in their productions. Humboldt asserts that within these states almost all the vegetable productions may be grown which are found between the equator and the polar circle. The agricultural productions which actually are grown prove the justice of this observation. On the highest of the table-lands, that of Toluca (9000 feet), wheat does not succeed, nor does it succeed in Europe beyond 60° N. lat. On this table-land agriculture is limited to the cultivation of barley and the plantations of the American aloe, which may be considered as the vineyards of Mexico, the juice of this plant being converted into a kind of wine called 'pulque.' Most of the table-lands however are from 6000 to 7500 feet above the sea; and as their climate may be compared with that of the southern countries of Europe, we find that they produce all the *Cerealia* of Europe with the exception of oats, which are not used, as horses in Mexico are fed on barley. The wheat is of large size and excellent quality. The fruits also are those of Europe, as cherries, peaches, plums, apricots, apples, pears, figs, and pomegranates. The vegetables too are those of Europe, among which capsicum, called 'chile,' is most abundantly grown, as it is used all over the country nearly as salt is in Europe. The plantations of American aloes on these table-lands are also very extensive. The difference between the agricultural productions of the Tierras Templadas and Calientes is not well established. Maize is grown everywhere, and constitutes the principal food of the lower classes. It is the only grain which is cultivated for food, rice being only grown to a small extent in the wet countries along the Rio Huasacualco; but the plantations of plantains and those of manioc are extensive, and *Oxalis tuberosa*, *Dioscorea alata*, and *Batatas* are also cultivated on a large scale. Oranges and lemons, which do not succeed on the table-land, are abundant in the Tierras Templadas; olives and grapes succeed well; and besides these many fruits of hot countries, especially pine-apples, guavas, and others.

The agriculture of the table-lands does not supply any article for exportation. Cotton is grown along the shores of the Pacific, and coffee on the eastern coast, west of the town of Vera Cruz; sugar is cultivated in many places, but to a much less extent than formerly; cocoa is collected in the low country along the river Huasacualco; and indigo along the southern coast, but only for home consumption. Tobacco, which in many parts succeeds very well, is only permitted by the government to be grown in certain places. Three valuable plants grow wild in the forests, at the base of the steep ascent which divides the low eastern coast from the table-lands, and supply articles of export—the jalapa, sarsaparilla, and the vanilla.

All the domestic animals, which have been brought over from Europe by the Spaniards, have multiplied greatly in Mexico, owing to the wide tracts which are not or cannot be cultivated, and which afford pasture-ground for nine or ten months of the year. Cattle are abundant, both on the table-lands and the lower tracts; among the latter, especially on the wet plain of Tabasco and the arid plain of Yucatan. Jerked beef and horns are exported. Sheep are numerous on the table-lands, and wool is an article of exportation. Horses abound generally; and both horses and mules are exported in great numbers to the United States. In winter American buffaloes pasture on the plains along the lower course of the Rio del Norte. Carnivorous wild animals are not numerous. Gams is abundant, especially deer and hares. Among the birds are various kinds of parrots, mackaws, and humming-birds. The lakes abound in fish. The cochineal insect is reared with great care on the table-land of Mixtecapan, whence by far the greatest part is brought to the market of the world. In the Gulf of California pearl-shells are found, and formerly many pearls were collected.

Mexico is noted for its mines of gold and silver. The gold-mines occur chiefly on the western side of the Sierra Madre, north of 24° N. lat.: the silver-mines are richest on the mountains which rise on the table-lands, and in those which border their margin. It is said that quite recently gold has been found in large quantities in Lower California by some Indians. The working of the mines has been very imperfectly carried on, owing in a great measure to the disturbed state of the country, and the difficulty of procuring competent directors and industrious miners. Besides the precious metals, Mexico has abundance of copper, iron, lead, and quicksilver, which are worked. Tin, antimony, and zinc have also been found. Carbonate of soda, which is necessary for the smelting of the silver-ore, is collected in several lakes, where it is found crystallised on the surface in great abundance, and it is also common in the upper layers of the soil in most parts of the table-land.

Manufactures and Commerce.—Before the Revolution (1810) there were many flourishing manufactures, the annual produce of which amounted to from eight to ten millions of Spanish dollars, or about two millions of English money. The most considerable were those of cotton and wool in the towns of Puebla, Cholula, Tlascala, Queretaro, Lagos, Guadalajara, and Tezcoco. The manufactures of soap,

leather, and saddlery were also considerable. The manufacturers owed their prosperity to the high price at which, under a system of monopoly, European goods were sold in that country. After the harbours were thrown open to a free-trade (in 1820) they began to decline. The manufactures of cotton and wool are now of little importance. Cigars, hats, soap, leather, saddlery, glass, earthenware, and other articles of ordinary use are made in large quantities, but the factories are ill-conducted.

The commercial intercourse between the coast and the table-lands is difficult on account of the steep ascent to the table-lands from the coast. On the east there are only two carriage-roads, as has been already observed, which lead to the table-land; and on the western coast the communication between Acapulco and Mexico, and between San Blas and Guadalajara, is carried on by roads which are only passable to mules and horses. No such obstacle exists between the harbours of Mazatlan and Guaymas on the western coast, and the country farther back, but no road leads from them over the Sierra Madre, by which the goods landed at these places could be carried to Durango or the towns of the northern plain. Even in those parts where there is no obstacle to the use of carriages, the goods are commonly carried by mules, on account of the great number of these animals, and the low price at which they are bought.

The maritime commerce is considerable. In the beginning of the present century the exports, according to Humboldt, amounted to twenty-two millions of Spanish dollars, and the imports to fifteen millions of dollars. After the declaration of independence they greatly declined, and have never since nearly equalled that amount. At the present time however they are probably not much under twenty millions of dollars. The exports consist chiefly of gold and silver, which amount in value to nearly seven-eighths of the whole, of cochineal, sugar, indigo, salt meat, hides, sarsaparilla, vanilla, jalap, soap, campeachy wood, fustic, Tabascan pepper, and coffee. Little, if any, commercial intercourse exists between Central America and Mexico, but a considerable number of mules and horses, and some wool, are exported to the United States of North America.

The imports amount in value to somewhat over 15,000,000 dollars. The value of goods sent from the United Kingdom to Mexico in 1858 was 791,940*l.*, being more than double that of 1852 (366,020*l.*). The imports from Great Britain consist principally of cotton, linen, and woollen goods, hardware and cutlery, machinery, &c. From British colonies Mexico receives large quantities of quicksilver, cinnamon, cocoa, and raw silks. The imports next in amount to those of Great Britain are those from France, Germany, and the United States. The commerce is mostly carried on in foreign vessels. The vessels of the United States of America almost exclusively visit the smaller ports; the larger British vessels are chiefly confined to the harbours of Vera Cruz, Tampico, and Tamaulipas; next in number are the vessels of France, from Bordeaux and Havre, and lastly those of the free German towns of Hamburg and Bremen.

Inhabitants.—The population of Mexico is composed of creoles or descendants of Europeans, of Indians or natives, and of those of mixed blood. The number of Europeans, who are called Gachupines, and formerly amounted to 80,000 individuals, has been much reduced by the expulsion of the natives of Spain; and though many individuals of other nations have settled in these states during the last thirty years, it is not likely that the whole number of Europeans now amounts to more than 30,000. Probably nearly half of the population still consists of the descendants of those nations which inhabited the country at the time of the Spanish invasion.

The natives who have submitted to the dominion of foreigners have attained different degrees of civilisation. Those who inhabit the country between 18° and 23° N. lat. were, on the arrival of the Spaniards, subjects to the kings of Tenochtitlan and Michoacan, or united in the republics of Tlaxcallan (Tlascala), Huexochingo, and Cholollan, and had then attained a considerable degree of civilisation, as is proved by the ruins of their religious buildings, or 'teocalis,' their causeways and dykes, their hieroglyphics, paintings, and sculptures; and though the objects of their agriculture were only few in number, their cultivation was extensive, and carried on with considerable care. [ASTRECS.] Their present condition is not worse than that of the lower classes who cultivate the ground in most parts of the European continent, but they appear to have fewer wants, and accordingly indulge more in indolence. Among them are some very rich families, but they are not distinguished by their mode of life or their dwellings from the other members of their tribe. In most places they live mixed with the whites and Metis; in others they occupy large tracts, to the exclusion of all foreigners. The countries north of 24° N. lat. were inhabited at the time of the conquest by tribes resembling those of the United States of North America. They were few in number, had no fixed dwellings, and lived mostly on the produce of the chase; and they speedily retired from the plains, which they had until then occupied, to the mountain tract called the Bolson de Mapimi, where they still continue their savage life. But in the hilly tract north of the Rio Mayo the natives resisted the invasion of the Spaniards, and were only subjected by the Jesuit missionaries. The padres accustomed them to a civilised life, and taught them the principal mechanical arts. Though these Indians inhabit the same country with the numerous white families which have spread among

them, they live in separate places, and no close intercourse exists between them, except for the purposes of trade.

The mixed race is mostly composed of the descendants of Europeans and the aboriginal tribes: these are called Metis, or Mestizos, and constitute more than one-fourth of the population. The descendants of Africans and Indians, and of Africans and Europeans, are much fewer. The former are called Zamboas, and the latter Mulattos. In the neighbourhood of Acapulco there are a few Chinese and Malays, who have emigrated from Asia. There are very few negroes in this country.

Political Divisions and Towns.—Mexico is divided into the following provinces or departments—the former states of the federal republic:—

1. Chiapa, called also Las Chiapas, comprehends the whole of the western declivity of the table-land of Guatemala, as far as it belongs to Mexico, and a portion of the plain of Tabasco. The soil is in general fertile, and the climate favourable to the growth of tropical productions; but almost the only article of commerce is logwood, which is floated down the rivers Usumasinta and Tabasco to Villa Hermosa. Near the banks of the Rio Chacamas, a tributary of the Usumasinta, are the extensive ruins of Palenque, in a country which at present is a desert overgrown with trees. *Ciudad de las Casas*, formerly Ciudad Real, the capital of Chiapa, stands near the centre of the province, in a very fertile country, and has about 4000 inhabitants. It has a college; and a monument was erected here in 1826 to Las Casas, the protector of the Indians, who was bishop of this province, and died in 1566. Some other towns are still more considerable—as *Chamula*, with 6000 inhabitants; *San Bartolomeo de las Llanos*, with 7500 inhabitants; *Comitan*, with 6000 inhabitants; and *Tuxtla*, with 4500 inhabitants.

2. Yucatan comprehends the peninsula of that name as far south as 18° N. lat. It exports much campeachy-wood and fustic, which grow mostly on the eastern coast, and on the western, south of 20° 30' N. lat., and also a considerable quantity of bees-wax. The rivers Champoton and Pacaitun are navigable, for small craft, for many miles inland. The capital is *Merida*, population 28,000, situated on an arid plain about 25 miles from the sea. It carries on a considerable commerce by means of the harbour of Sisal, which is properly only a roadstead formed by a sand-bank called Bajo Sisal, 12 miles long. Farther east is *Valladolid*, population 3000, in a district in which much cotton is grown. On the eastern coast is *Salamanca de Bacalar*, population 2000, whence much mahogany and fustic are shipped to Belize. On the western coast is CAMPEACHY, with a number of populous villages inhabited by Indians.

3. Tabasco extends over the greater part of the low plain, from the lake of Terminos on the east, to the Rio de Huasacualco on the west. It is traversed by the Rio de Tabasco. It exports cocoa, coffee, Tabasco pepper, indigo, and vanilla. The capital is *Villa Hermosa*, also called San Juan Bautista, population 8000, on the river Tabasco, about 50 miles from the sea, to which place vessels of moderate size may ascend the river.

4. Oaxaca extends over the whole of the table-land of Mixtecapan, and is rich in agricultural products: the industrious inhabitants rear the cochineal-insect and the silkworm, and apply themselves to the cultivation of indigo. It has some mines of gold and silver. Several antiquities occur on the table-land, among which are the ruins of the palace at Mitla, which differ from the ruins of the edifices erected by the Aztecs, and approach in style nearer to those of Greece. The capital, *Oaxaca*, population 40,000, is built in a depression of the table-land, 4800 feet above the sea-level. It has fine houses, squares, and aqueducts, and contains some manufactures of sugar, chocolate, and silk. *Tehuantepec*, population 7000, is situated about 10 miles from the sea, on a plain on which indigo and cocoa are grown; and salt is collected in the lagunes which skirt the sea. It carries on some commerce by the harbour called Ventosa, or Tehuantepec Road.

5. Vera Cruz comprehends the whole coast of the Gulf of Mexico, from the river Huasacualco on the south-east, to that of Panuco on the north-west, and, in some parts, extends over the mountains which border the table-lands on that side. Accordingly it exhibits a great variety in climate and vegetation: its most elevated parts are covered with pine forests. Within its boundary-line are situated the Peak of Orizava, the Coffre de Perote, and the small volcano of Tuxtla. Its commercial products are sugar, coffee, jalap, sarsaparilla, and vanilla. Tobacco is extensively grown. In the northern districts of this state, in a forest near the village of Papantla, is a pyramid built of hewn blocks of porphyry, which are worked with great care and skill. The capital is *Xalapa* (or Jalapa), built on a level spot, situated on the steep ascent, 4335 feet above the sea, in a very beautiful country: population, 13,000. To this place the merchants of Vera Cruz retire when the vomito prieto is raging along the coast. VERA CRUZ, the chief commercial town of Mexico, is noticed in a separate article. The roadstead is formed by several shoals, on the largest of which, called La Gallega, is built the fortress of San Juan de Ulloa. *Alvarado*, about 3 miles from the mouth of the Rio Alvarado, is a small town, which however carries on some commerce, having a good wide port. At the most northern extremity of the province is the town of *Tampico*, or rather Pueblo Viejo de Tampico, population 4000, built on the border of a large shallow lake, the Laguna de Tamiagua, which communicates with the Rio Panuco near its mouth. It carries on a

considerable commerce, which however has decreased since the new town, called Pueblo Nuevo de las Tumulipas, has been founded on the left bank of the river, about 3 miles from it. In the interior are the towns of *Cordova* and *Orizava*, built near the base of the steep ascent, each containing about 3000 inhabitants; in their neighbourhood much tobacco and coffee are grown.

6. Puebla comprehends by far the greater portion of the table-land of Tlascala, and also a considerable portion of the lower but very hilly country, which extends to the Pacific, between the table-lands of Mixtecapan, Tenochtitlan, and Michoacan. It contains the elevated peaks of the Popocatepetl and Istaccihuatl. The western and southern districts are fertile and well cultivated. In the country about the capital great quantities of carbonate of soda are collected. *Puebla*, the capital, formerly called *Puebla de los Angeles*, population 50,000, is built in a well-cultivated plain, on the south side of a hill which is wooded to its summit. The houses are of stone, large, and commodious. The churches and convents are very numerous, and generally well-built. The cathedral is considered the finest and most magnificent edifice in the whole republic. The town has some manufactures of cotton, wool, and earthenware, and a considerable trade. South-east of it is the town of *Tehuacan*; population, 10,000. CHOLULA is noticed in a separate article.

7. Tlascala lies between Puebla and Vera Cruz, and is chiefly occupied by Indians, whose former privileges have been confirmed by the republic. The capital, *Tlascala*, still surrounded by its ancient walls, is some 30 miles N. of Puebla, and has about 4000 inhabitants.

8. Mexico comprehends the two table-lands of Tenochtitlan and Toluca, the north-western part of the table-land of Tlascala, and a considerable part of the lower but much more hilly country, which lies to the south of the two first-mentioned table-lands, and extends from them to the Pacific. Nearly all the productions of the tropics, together with those of the temperate zone, might be grown in the different regions belonging to this province; the sugar cultivated in the plain of Cuantla y Amilpas, south of the table-land of Tenochtitlan, and in some other places, to a considerable extent, is consumed in the country. It contains several rich mines of silver, among others those of Real del Monte, Actopan, and Zimapan. There are also some mines of lead and iron. Carbonate of soda is collected in the districts surrounding the lakes of Tezcuco and San Christoval. In the vale of Tenochtitlan are several antiquities. Near the town of Tezcuco are two large Mexican pyramids, or teocallis; and about 20 miles farther north, near the small town of Teotihuacan, is a group of nearly 200 of such pyramids, two of which, erected in honour of the sun and moon respectively, are of great dimensions. On the mountainous descent by which the road leads from Tenochtitlan to the Pacific, near the town of Cuernavaca, are some remarkable ruins, which seem to have been a fortress; they are called the fortress of Xochialco. For the description of the capital of the republic, see MEXICO. The capital of the province is *Tezcuco*, situated on the eastern border of the lake of that name, whose waters formerly approached the town, but are now about 3 miles from it: population, 5000. *Chalco*, population 3000, lies at the eastern extremity of the lake of Chalco. *Toluca*, population 12,000, about 10 miles north of the Nevado de Toluca, has a fine cathedral, and is well-built. *Zimapan*, population 9000, is situated in the centre of the northern mining district. This state has two harbours on the Pacific, *Acapulco* and *Zacatula*, at the mouth of the Rio de Zacatula; but they are little frequented.

9. Michoacan extends over the whole of the table-land of Michoacan and the low country lying between it and the Pacific, and a portion of the hilly country south of these districts. The river Santiago traverses its north-eastern districts, and within its territories are the lake of Patzcuaro, the peak of Tancitaro, and the volcano of Xorullo. Its productions are various, but no article of export is supplied, except from the mines, which are situated along the eastern border of the province, in the mountain range which runs between the table-lands of Toluca and Michoacan. In the districts along the northern boundary-line carbonate of soda is collected. The capital is *Valladolid*, or *Morelia*, a large town, with 25,000 inhabitants. It contains a rich cathedral; and is well supplied with water by an aqueduct, erected at the expense of the bishops, who resided here. *Patzcuaro*, population 6000, is built near the lake of that name, at whose northern extremity is the town of *Tzintzoncan*, population 2500, formerly the capital of the kingdom of Michoacan. In the northern districts are *Zamora*, population 6000, and *Owisco*, a considerable place, on the banks of an extensive lake. *Tlalpujahua*, in the principal mining district, has 9000 inhabitants.

10. Xalisco, or Jalisco, comprehends the whole of the hilly region of Xalisco, and the lower country between it and the Pacific; its eastern districts extend over the hills which form the ascent to the table-land of Queretaro, and comprise also a small portion of that plain. Within its territories are the lake of Chapala, and the lower course of the Rio Santiago. The productions are as various as in all those states which are so diversified in climate; but it supplies for exportation only a small quantity of cotton and some cochineal. The mines are not very important. Carbonate of soda is collected on the eastern border, and salt is made along the coast. The capital is GUADALAJARA. The second place in importance is *Lagos*, near the eastern boundary, on the table-land of Queretaro, which

contains 15,000 inhabitants, and is well-built. Farther west is *San Juan de los Lagos*, nearly as large a town, built in a deep barranca, and noted for its annual fair, which is held in the month of December. *Tepic*, population 7000, is situated in a small plain, surrounded by volcanic hills, and considerably elevated above the Rio Santiago, which flows at some distance north of it. Between it and the town of Guadaluajara is a difficult mountain-pass, through the barranca of Michetiltic, and the populous town of *Tequila*. *San Blas*, the principal port of the state, is on the top of a rock 150 feet high, which is precipitous on three sides, and very steep on the fourth: it rises out of a low swampy plain, which in the rainy season is completely under water. At this season the place is unhealthy; and the inhabitants, amounting to 3000, remove to Tepic. The rocky islands called *Tres Marias* lie off this harbour. South of Cape Corrientes are the two small harbours of Navidad and Guatlan, which are little frequented.

11. Colima comprises the low country surrounding the Volcano de Colima. Much cotton is grown in this district. *Colima*, the capital, is built at the foot of the volcano of the same name. *Purificacion*, population 3000, is in the neighbourhood of some gold-mines.

12. Guanajuato comprehends the western districts of the table-land of Queretaro, a part of the Sierra Madre, and a tract north of that range. The widest and most fertile part of the Baxio lies within this territory, which exports great quantities of wheat and Indian corn. Rich mines surround the town of Guanajuato. Besides the capital [GUANAJUATO], it contains several populous places. In the Baxio are—*Zelaya*, with 10,000 inhabitants, and a fine cathedral; *Salamanca*, population 15,000; *Irapuato*, with 16,000 inhabitants, and manufactures of cotton; and *Villa de Leon*, population, 25,000. *San Felipe*, in a wide valley between two branches of the Sierra Madre, was formerly a considerable town, but is now in ruins. *San Miguel el Grande* has 16,000 inhabitants, and manufactures of cotton and iron.

13. Queretaro extends over the eastern portion of the table-land of Queretaro. It contains numerous and extensive fertile tracts, and a portion of the Baxio. It has some productive silver-mines, the most famous of which is El Doctor; and north of it is the quicksilver-mine of San Onofre. There are also some lead-mines. The capital is *Queretaro*, population 30,000, a well-built place, 6362 feet above the sea. It contains several large churches and other fine buildings; carries on some manufactures of cotton and woollen stuffs, and has a considerable trade. *Cadereita*, in the mining district, is a considerable place. *San Juan del Rio*, population 8000, is a mining town, 30 miles S.E. from Queretaro.

14. San Luis de Potosi comprehends by far the larger part of the southern portion of the great northern plain, and is traversed from west to east by the river Tamoin, an affluent of the Panuco. It is only rich in cattle. The mines are not numerous, but among them is the rich mine of Catorce. There are also some mines of copper. The capital, *San Luis de Potosi*, is a large town, containing, with the adjoining villages, 50,000 inhabitants. It has many large and substantial buildings, and numerous churches. The Palacio occupies one side of the Piazza de las Armas; and on the opposite side stands the cathedral.

15. Zacatecas extends on both sides of the Sierra Madre. The southern portion is productive in grain, and the northern arid plains contain abundance of cattle. Of the numerous mines, all of which are situated in the Sierra Madre, the most celebrated are those of Zacatecas and Sombrerete. The territory has nine lakes, from which carbonate of soda is collected in a crystallised state. Not far from the western boundary, an extensive tract is covered with immense ruins, called Los Edificios, which seem to mark one of the resting-places which the Aztecs erected on their emigration towards the south. Zacatecas contains several populous towns. Sombrerete, Fresnillo, Ierez, Pinos, and Nochistlan have each a population varying from 14,000 to 18,000: they are all situated near the mines. The capital, *Zacatecas*, with the adjacent village of Veta Grande, contains 28,000 inhabitants, and is built in a ravine between high hills. The streets are narrow and crooked, but the churches are very large buildings of stone: the most remarkable is La Búfa, which stands on a high eminence, and looks like a fortification. *Aguas Calientes*, situated towards the southern extremity of the state, in a richly cultivated country, has 35,000 inhabitants, and manufactures of cloth. Its cathedral has the appearance of a Moorish mosque.

16. Durango includes the Sierra Madre from 24° to 27° N. lat., and comprehends also an extensive tract of level country skirting the range on the east, and belonging to the great northern plain. The terraces by which the mountains descend on the east are rich in agricultural products, the plain itself in cattle, and the Sierra Madre in metals. The richest mines are near Guarisamey, San Dimas, and Gavilanes, situated in narrow valleys in the Sierra Madre, at an elevation of more than 9000 feet above the sea. There are also mines of lead and abundance of iron-ore. Between the town of Durango and that of Nombre de Dios is a sterile plain, called Brea, covered with basalt, about 30 miles long and 15 miles wide. It contains an extinct crater, more than 100 yards in circumference, and 30 yards deep. The capital is *Durango*, or *La Ciudad de Victoria*, population 22,000, a well-built place, with wide streets and several fine buildings. *Nombre de Dios* has 7000 inhabitants. *Papasquiaro*, in a valley of the Sierra Madre, near the rich mines, has a population of 6000. In the plain

are San Juan de Rio, with 10,000 inhabitants, and Villa de los Cinco Señores, on the Rio Naas, along the banks of which cotton is grown.

17. Cinaloa comprehends the low tract extending along the Pacific from 23° to 27° N. lat. The soil is sandy but yields good crops of maize and wheat where it admits of irrigation. There are several important mines of gold, silver, and copper. *Villa del Fuerte*, on the left bank of the Rio del Fuerte, population 8000, is the capital. *Rosario*, near the southern border of Cinaloa, population 6000, is the centre of a mining district, and has some commerce by means of the harbour of Mazatlan, 60 miles distant; at the entrance of which is the town of *Cosalá*, with a population of 5000. *Culiacan*, population 10,000, on the left bank of the river of the same name, just above the confluence of the Rio Mayo, and *Cinaloa* at the head of the Rio Cinaloa, population 9000, are the only other towns of any importance.

18. Sonora comprehends the hilly country north of Cinaloa: these two divisions formed the federal state of Occidente. There is a good deal of fertile soil, but agriculture is in a very backward state. The mountains have little timber, being mostly covered with stunted trees and bushes. Mines of gold and silver are worked in several places. The north-western parts are said to be rich in gold and other metals. The principal towns are *Los Alamos*, on the south, population 6000, a well-built place, having, as the centre of a silver mining district, a considerable trade; *Santa Cruz*, near the mouth of the Rio Mayo, population 10,000, the chief town of the Mayo Indians; *Guaymas*, population 3000, the best port of Mexico, lies on the Pacific, and has a considerable trade; *Pitic*, on the Rio Pitic, population 8000, carries on a good trade; *Arispe*, population 3000, is the most northern town of any importance, and an important military station: the hilly country which lies to the west of Arispe, called Pimeria Alta, contains valuable gold- and copper-mines.

19. Chihuahua comprehends that portion of the northern plain which lies between the northern part of the Sierra Madre and the middle course of the Rio del Norte, together with the mountain region of the Bolson de Mapimi, and a tract of country south of it. The soil is in general very dry, and unfit for agricultural purposes; cultivation is limited to the river bottoms and a narrow strip of country along the declivity of the Sierra Madre; but the province has many herds of cattle, horses, and sheep. The mines are numerous. Near the base of the Sierra Madre, and not far from the Sonora boundary-line, are ruins of great extent, called Casas Grandes, considered to be one of the stations of the Aztecs in their emigrations. The capital, *Chihuahua*, population 12,000, is a well-built town, with regular streets and many large houses. Its cathedral is an extensive building; and the town is well watered by means of an aqueduct. *San Bartolomeo*, situated towards the boundary of Durango, population 20,000, is badly built, and the streets are narrow, but it carries on a considerable commerce with the agricultural produce of the fertile district in which it is situated. Not far from it to the west is El Parral, which contained 50,000 inhabitants when the mines were productive, but now only 7000. *El Paso del Norte*, at the north-eastern angle of Mexico, has about 4000 inhabitants.

20. Coahuila, or Cohahuila, extends over the north-eastern portion of the northern plain, over that which lies between the Bolson de Mapimi on the west, and the lower course of the Rio del Norte on the east. The most sterile portion of the northern plain is included in this province, and lies along the boundary of Zacatecas. Farther north, between 27° and 29° N. lat., are several watercourses with fertile bottoms, and considerable tracts of cultivable ground. Cattle, and particularly mules and horses, constitute the commercial wealth of this province. The capital *Saltillo*, population 12,000, being on the only road by which the steep declivity with which the table-lands of Mexico terminate towards the east can be passed by heavily laden carriages, carries on considerable commerce. In this town a fair is held, which is much frequented by merchants from the adjacent provinces. *Montelopez*, or *Cohahuila*, farther north, population 3000; *Santa Rosa*, N.W. of Montelopez, population 4000; and *El Presidio del Rio Grande*, population 2500, at the head of the boat navigation of the Rio del Norte; and *Monclova*, farther down, are places with some trade.

21. Nuevo Leon lies between Cohahuila and Tamaulipas. That part of it which lies south of the Rio del Tigre is undulating, but north of the river are mountains probably more than 10,000 feet above the sea, and in which some rich mines are found near Pesqueria and Salinas. The lower parts of the country are very fertile, but only cultivated in isolated places. Though the climate is hot, it is healthy. *Monterey*, the capital, contains 15,000 inhabitants, and its commerce is considerable on account of the rich mines in the vicinity. *Linares* has 4000 inhabitants, and the neighbourhood abounds in cattle.

22. Tamaulipas extends along the Gulf of Mexico from the mouth of the river Panuco to that of the Rio del Norte. It is a low unhealthy country, in which only a few hills occur. Though very fertile, except along the sandy sea-shore, it is badly cultivated and thinly inhabited. Its commercial wealth consists in its forests, in which fustic and logwood are cut to a great extent. The capital is *Pueblo Nuevo de Tamaulipas*, situated at the southern extremity of the province, on the left bank of the Panuco, about six miles from its mouth. The harbour is good and safe, and the bar at its entrance has generally 12 feet of water, but the navigable channel is narrow.

Its commerce is considerable, as most of the European goods which are consumed on the northern plain are landed here. Sotto la Marina is a small harbour, not much frequented, near the mouth of a little river, the Rio de Santandero, on the banks of which is the small town of Santandero, formerly the capital. *Matamoros*, on the Rio del Norte, about 60 miles from its mouth, population 3000; vessels not drawing more than 8 or 9 feet of water may ascend the river to this place.

23. Lower California. [CALIFORNIA.]

History, &c.—Though Columbus in his last voyage approached the peninsula of Yucatan, he did not come in sight of it. Thirteen years later (1517) the peninsula was discovered by Francisco Hernandez Cordova, who sailed along the coast from Cape Catoche to Campeachy Bay. The following year, Juan de Grijalva continued the discoveries along the same coast northward to the mouth of the Rio Panuco; he visited the islands of Sacrificios and San Juan de Ulua, opposite the present town of Vera Cruz, and gave them the names which they still preserve. His account of the wealth of the country excited the desire of conquest. In 1519 Hernan Cortes landed at the place where Vera Cruz now stands, but the town which he founded and called Villarica was some miles farther to the north, near a small harbour named Chihauitsia. With his little army he soon ascended the table-land, numerous inhabitants of which he found united under a powerful sovereign, the King of the Aztecs, Montezuma, or Mootezuma. Within the limits of this empire there were some small republics, of which that of Tlascala united with Cortes. Cholula was also a republic, and the name of a third is preserved, that of Huajocingo; all three were situated within the territories of the present state of Puebla. The empire of the Aztecs did not extend over all the table-lands; the table-land of Michoacan constituted a separate and independent kingdom. The very remarkable architectural and other antiquities of this period of Mexican history are noticed under AMERICA, vol. i, cols. 307-9, and AZTECS.

After two years of continuous and laborious warfare, Cortes succeeded in overturning the empire of the Aztecs, and the smaller states were subjected to the Spaniards almost without a struggle; and from that time until 1820 Mexico remained a Spanish colony. As the number of the conquistadores, or companions of Cortes, was very small, in comparison with the native population, they were anxious to bring over more of their countrymen. A considerable number of Spaniards accordingly annually emigrated to Mexico, and there acquired great wealth, as officers of government, merchants, and adventurers in mining. Their descendants the Creoles settled in Mexico, and their numbers were continually increasing; but the Spanish government forming an incorrect idea of their condition among the natives, thought that the government of the colony could only be intrusted to persons who considered Spain as their native country; it therefore excluded the Creoles from all offices of government, and even from commissions in the army. Such exclusion excited in them a considerable degree of ill-will against Spain and the Spaniards, which would probably have manifested itself in resistance and rebellion, if they had not feared that the native population, with the illegitimate descendants of the Spaniards and native women, a numerous race called Metis, or Mestizos, would take advantage of such a circumstance to effect their own destruction. The opposite interests of these different races served to maintain a state of internal quiet in Mexico down to the commencement of the present century, notwithstanding the United States of North America had obtained their independence, and the Mexicans were well acquainted with the advantages which their neighbours had obtained. It is even possible that the political condition of Mexico would not have undergone any change for a long time, but for the events in Europe and in Spain in 1808. By the intrigues of Bonaparte the royal family were compelled to abdicate the throne of Spain, and he conferred the whole Spanish monarchy on his brother Joseph, then king of Naples. The Spaniards in Mexico and the Creoles were unanimous in declaring their resistance to the government established by the French. The viceroy could no longer receive orders from Spain, and it was necessary to organise a government which should act independently under a certain sanction, and with authority. But as to this point they disagreed. The Creoles wished to establish a national representation; the Spaniards opposed and prevented the measure. The Creoles submitted: but the public mind had been agitated by the discussions which had taken place, and soon afterwards, in 1810, the natives and the Mestizos, headed by Don Miguel Hidalgo y Castilla, the cura or parish priest of Dolores, rose against the government. The Creoles sided with the Spanish government. Hidalgo, who had soon an immense force with him, took Guanaxuato by storm, and occupied Valladolid, whence he advanced over the table-land of Toluca to that of Tenochtitlan; but some time after he was defeated, taken prisoner, and shot. In the meantime the whole country had risen in insurrection, and many leaders began to act separately. The most remarkable among them was Don Jose Maria Morelos, cura of Nocupetaro, who maintained the southern provinces in rebellion against the governor, and formed in 1811 a 'junta,' or central government. Morelos succeeded, amid varying fortunes, in keeping together an army for some years. The junta, increased by new members, assumed the title of the National Assembly and declared the independence of Mexico, on the 13th of November,

1813. But after that event Morelos had less success in his daring enterprises; and in November, 1815, he was taken prisoner, conducted to Mexico, and shot. Other chiefs sprung up, but the viceroy Venegas, supported by the gallantry and skill of Calleja, destroyed successively their armies, so that when Don Xavier Mina, the famous Spanish guerilla chief, landed in Mexico in 1817, the fortune of the insurgents was at so low an ebb, that he was unable to restore their cause, and he perished in the attempt.

The country now gradually became more tranquil; but the events which occurred in Spain in the beginning of 1820 suddenly changed the aspect of affairs, and deprived Spain of the most valuable of her possessions in America, which it had regained at the cost of much blood and money. The Spaniards and the Creoles, who had formerly made common cause, were now divided into two parties, royalists and constitutionalists, and Don Augustin de Iturbide, commander of a force of 800 men, issued a proclamation (February 24th, 1821), since known as the Plan of Iguala, which, professedly in order to conciliate all parties, and at the same time to establish the independence of Mexico and yet preserve its union with Spain, proposed to offer the crown of Mexico to the King of Spain, and in case of his refusal to one of his brothers, provided they would consent to reside in the country. The Spaniards of the capital opposed the plan, but Iturbide succeeded in gaining for it the support of the country generally, and even in inducing the new Spanish Viceroy O'Donoju to accept it conditionally on its approval by the Spanish Government. Iturbide was thus enabled to obtain possession of the capital, where a junta was formed, which declared the convention with the viceroy to be illegal. A congress was convened, and Iturbide soon after (May 18th, 1822) procured himself to be proclaimed Emperor of Mexico under the title of Augustine I. His sovereignty was however of short duration. He first quarrelled with the congress, but this he dissolved, and formed a new legislative assembly. When however the army declared against him, he lost heart, and in March, 1823, abdicated, and retired to Europe. In 1824 he ventured to return to Mexico, but upon landing at Padilla in Tamaulipas, he was arrested and shot. On the abdication of Iturbide, Mexico was declared to be a federal republic, and a constitution modelled on that of the United States of North America was adopted. The new state of affairs had been brought about mainly by the army, and, as was to be expected, the jealousies and ambition of different generals soon led to new insurrections and disturbances. It is neither possible nor desirable to give an account of these in the present work. It must suffice to say that down to the present time Mexico has witnessed a succession of insurrections and revolutions, and at the present moment (December, 1854) one is raging the issue of which is far from certain. During nearly the whole of this period moreover, and at the present time, the Indians and whites have been in a state of hostility. Among the leaders of the various revolutionary movements the present ruler of Mexico, Santa Anna, has acquired the pre-eminence. From 1832 among many changes, at one moment the supreme chief, the next an exile, he has continued to be the leading character in Mexican affairs. By the last grand movement commenced in September, 1852, he was recalled and placed at the head of the state; by a general vote (February 7th, 1853) the nation adopted his scheme of government; and in the following December he was elected president for life, with the title of most serene highness, and full dictatorial powers. In the place of the chambers elected by popular vote, there is now to be a council of state composed of 21 members, but the authority of the president is practically unlimited.

The most important event in the external history of the republic is the war with the United States. In 1835, Texas, the most north-eastern of the Mexican states, which had long been in a very disturbed condition, broke out into open revolt against the central government. The government troops were unable to put down the insurgents; and in 1836 the American settlers, who were very numerous in Texas, succeeded in inducing the state to declare itself independent. On this Santa Anna marched into Texas, but was defeated, wounded, and taken prisoner. In order to obtain his liberty he consented to acknowledge the independence of Texas. His agreement was not ratified by the Mexican legislature, but no effort was made to reconquer Texas, and the "independent republic," having applied for admission into the North American Union, was, in 1845, formally recognised by the Congress as one of the United States. This step was understood by both republics to be equivalent to a declaration of war. Mexico was however in a thoroughly disorganised condition, and the arms of the United States were everywhere successful. Peace was ratified in February, 1848. The result of the war was the loss to Mexico of the whole of the northern provinces, comprising the vast and most valuable tract of country now forming the North American States of Texas and California, and the territories of Utah and New Mexico, an area of upwards of 900,000 square miles.

The revenue of the republic in 1849 was under 2,000,000*l.*, the expenditure was 3,300,000*l.* The foreign debt amounted in 1850 to 10,241,750*l.*; the internal debt to above 6,000,000*l.*; but the finances of the republic are altogether in the utmost disorder. The army is fixed at 26,553 men; the civic guard at 64,946 men. [See SUPP.]

MEXICO, or MEJICO, the capital of the republic of Mexico, is situated in 19° 25' N. lat., 99° 5' W. long., 7468 feet above the level

of the sea. The population is said to amount to 150,000. It stands nearly in the centre of an extensive oblong plain, which, from being surrounded by high hills or mountains, is commonly called the Vale of Tenochtitlan, which was the name given to the town before the year 1530. The circuit of this vale, measured along the crest of the ranges which inclose it, is nearly 205 miles, and its area is 1710 square miles; but about one-tenth of its surface, or 164 square miles, is occupied by four lakes. The largest of these lakes, that of Tezcuco, which covers a surface of 77 square miles, occupies the centre of the vale, and is only about three feet and a half lower than the great square of the city, which stands on its western shores, on a swampy ground. The surface of the other lakes is above the level of the city; and as during the rainy season the water, descending abundantly from the ranges which inclose the vale, is poured into these lakes, which have no outlet, it frequently happened that in very wet seasons the water which accumulated in the lakes inundated the lower portion of the vale, and rose several feet in the streets of Mexico. To prevent such an occurrence the Spanish government caused a canal to be made through the mountains of Nochistongo, which lie north-west of the lake of Zumpango, by which the superabundant water from the lake is carried off. This stupendous work, known by the name of the Desague of Hueshuetoca, is above 12 miles long, and for more than 1000 yards is cut through rocks from 60 to 75 feet high. It is justly considered one of the most remarkable hydraulic works in existence.

Mexico is one of the finest cities in the world. In the dry season it is at some distance from the lake of Tezcuco, whose waters in the rainy season are sometimes driven by easterly winds to the eastern border of the city, which is protected against inundations by dykes. The streets are very wide, intersect each other at right angles, and are well paved. The private houses, though spacious, are rather low, seldom exceeding one story; but being constructed either of amygdaloid or porphyry, they have an air of solidity and even of magnificence. The moderate height of the public as well as private buildings is owing partly to the difficulty of laying a good foundation, as water is uniformly found at a very few feet from the surface, and partly to the frequency of earthquakes. In consequence of the water all the larger buildings are raised upon piles. The houses are all squares, inclosing open courts, which are surrounded by corridors, and have flat roofs; and all the windows are ornamented with balconies.

The squares are spacious and generally surrounded by buildings of hewn stone in a good style of architecture. The principal square is the Plaza Mayor, which on two sides is surrounded by the cathedral and the palace, and on the two other sides by shops and dwelling-houses, with the exception of the Casa del Estado, or the Palace of Cortes. In the centre of the square was formerly a bronze equestrian statue of Charles IV. of Spain, which has been removed since the revolution to the court-yard of the university. This square is the market for vegetables and fruits. Manufactured goods are sold in the Portales, or covered colonnades, of which there are several on a large scale. The Parian, or bazaar, is a square building, divided into uniform compartments by two principal cross streets, and others subdividing it. The palace, in which the viceroy formerly was lodged, and which now serves as the residence of the president, and also contains the senate-house, mint, and all the principal public offices, is a building of great extent, including a number of squares and inner courts with separate staircases and suites of apartments. One of these courts contains the botanic garden, which however has long been much neglected. The Minería, or School of Mines, is a large modern edifice, already in a very dilapidated condition: it contains a rich collection of minerals. The Acoardada, or great prison, is a substantial and large building, which will contain above 1200 prisoners. The hospital, now converted into artillery barracks, occupies a large site, and is well built. The university building contains a collection of Mexican antiquities, among which is the celebrated stone of sacrifice. The academy of arts, which is a fine building, but in a very neglected state, contains a great collection of models and casts, and a school for drawing.

The numerous churches and convents, with their cupolas and steeples, give the town a magnificent appearance. The cathedral stands on the ruins of the great teocalli, or temple, of the god Mixitli. The interior is lofty and imposing. In the outer wall of this church is fixed the 'kellenda,' a circular stone, covered with hieroglyphic figures, by which the Aztecs used to designate the months of the year. [AZTECS.] Among the numerous convents that of San Francisco is distinguished by its extent, architectural beauty, and wealth. The Alameda, or public walk, laid out like a park, is at the western extremity of the town. There is a large Plaza de Toros, or theatre for bull-fights. As the ground on which the city stands is low, all the roads leading to it are raised six or eight feet above its level; they are broad, paved in the middle, and planted on both sides with double rows of trees. These roads, called pascos, afford delightful rides.

The city is supplied with drinkable water by two aqueducts, which bring it down from sources situated in the mountains west of the vale. The larger aqueduct, leading from Santa Fé to the Alameda, and thence to the lake, is 11,155 yards long, and in one-third of its course is supported by arches of stone and brick. Its water, which is very pure, is distributed through the city. The other aqueduct, that of Chapultepec, which supplies the southern suburbs, is 3608 yards long. The city is partly supplied with provisions and vegetables by small

boats, which bring them over the lake of Tezcuco; but it depends, especially for vegetables, of which vast quantities are consumed, on the supply by the canal of Iztapalapan, which leads from the lake of Xochimilco to the town. This canal is narrow, but always covered with small canoes loaded with fruits and vegetables: it passes through the 'chinampas,' or floating gardens, which in their present state are long narrow strips of well-cultivated ground, redeemed from the surrounding swamp, and intersected by small canals. It is stated that they originally consisted of wooden rafts, covered with earth, and floated about in the lake when it was full of water, whence their name is derived. At present they are all stationary, but there are still some floating gardens in the lake of Xochimilco.

The manufactures are not important, except those of plate and tobacco, which latter is carried on for the benefit of the government, as in every part of the republic. Gold lace is also made. There are also a few manufactories of soap, cotton and woollen cloths, coaches, and hats; but by far the greater part of the manufactured goods for the consumption of the inhabitants is imported from Europe; silk stuffs, and especially stockings, are brought from China. The commerce of Mexico is limited to the importation of these foreign goods, and to the exportation of the produce of the mines. The city owes its present importance to the circumstance of being the seat of government, and the residence of the president of Mexico and of a great number of very wealthy individuals.

The most remarkable object in the environs of Mexico is the palace of Chapultepec, which is built on a rock, to the foot of which the water of the lake of Tezcuco extended at the time of the conquest by Cortes (1521). The palace, which was built by one of the viceroys of Mexico, is properly a fortress; but it is now in a very dilapidated state.

MEXICO, GULF OF, is a mediterranean sea, united by numerous straits with the Atlantic, from which it is separated by a row of islands and widely extended banks. The long chain of the Antilles forms its eastern boundary between 10° and 20° N. lat., and several small banks, with the Great and Little Bahama Bank, extend along it from 20° to 26° N. lat. It is divided from the Pacific Ocean by the Mexican isthmus, which unites the two Americas. The length of the whole sea, from east-south-east to west-north-west, is not much short of 3000 miles. It is divided into two portions by the island of Cuba, which lies across the sea from east to west. Of these portions the southern in modern times has obtained the name of the Caribbean Sea, whilst that of the Gulf of Mexico has been limited to the northern portion.

The Caribbean Sea, which extends from east to west nearly 2000 miles, or the distance from the British Islands across the Atlantic to Newfoundland, with an average breadth of less than 500 miles, is free from rocks and dangers to navigation between the Lesser Antilles and 80° W. long, except along the coast of Venezuela, where there are numerous steep rocks and islands which extend westward to 70° West of 80°, and indeed from the innermost recess of the Gulf of Darien, the coast is lined by numerous reefs and low wooded islands, called 'keys,' which in the Mosquito Gulf and the Bay of Honduras increase in number, and render navigation more intricate and dangerous.

The Gulf of Mexico, or the northern portion of the mediterranean, is united to the Caribbean Sea by a strait about 120 miles wide, which is formed by Cape San Antonio, the most western extremity of the island of Cuba, and Cape Catoche, the most northern point of the peninsula of Yucatan. The length of the Gulf, from Cape Sable in Florida to the eastern coast of Mexico, is more than 1000 miles, and its breadth towards the west more than 700 miles; but between Yucatan and Cuba, on the south, and the shores of Louisiana and Alabama, on the north, it does not exceed 550 miles. Shoals and small islands are rare within the body of the sea, and occur only along the northern coast of the island of Cuba and along the peninsula of Yucatan. Along the coast of Mexico the soundings are very regular, beginning at a distance of about 30 miles with 100 fathoms, and decreasing gradually as we approach the shores. At the eastern extremity, where the gulf terminates in the old Bahama Channel and Florida Strait, the navigation is rendered very intricate by the Florida Reef, the Key Sal Bank, the Great Bahama Bank, and the numerous keys, shoals, and islets which surround the northern coast of Cuba.

The eastern trade-winds prevail in this sea during the summer from May to November, and on its eastern border along the islands all the year round. But along the coast of Venezuela and the shores of the Mexican isthmus the winds are subject to a regular change from November to April. In the Caribbean Sea calms and light winds succeed the trade-winds in November until the month of December, when the wind settles in the north-west, and varies only to the north up to the month of April. This wind blows in violent gusts and is attended with rain, but does not appear to extend beyond 12° 30' N. lat., to the north of which parallel the trade-wind always blows. Calms and light airs in April indicate the change of the wind, which soon settles in north-east and east. In the Gulf of Mexico the *Nortes*, or northern gales, are much dreaded by navigators. They begin in September or October, and become prevalent in November: they blow with the greatest force in March, and sometimes last to the month of April.

The currents in this sea are mostly independent of this change of winds. A strong current sets into the Caribbean Sea from the Atlantic; and one still stronger is met with along the coasts of Venezuela and New Granada: it runs westward the whole year round as far as the Gulf of Venezuela, but west of that bay only from May to November. When the easterly wind ceases in November the currents begin to run to the westward some days before the north-west winds come on, and continue to flow in that direction to the month of April. But in the Gulf of Darien, the most southern corner of the Caribbean Sea, the order of the currents is inverted; they run westward from December to April, and eastward from May to November. These currents extend only about 24 or 30 miles from the shores, and in the body of the sea they are always westerly, and commonly weak, except in January and February, when they run with great force. Along the shores of Mexico, and at a considerable distance from them, no current is met with, except when the northerly blow, when a strong southerly current runs along the shores; and to this circumstance is ascribed the formation of the numerous long-extended islands which line these shores, as also the bars which lie before the embouchures of the rivers. Near the mouth of the Mississippi River the northern current turns eastward, and afterwards to the south-east. At the western extremity of Florida Reef the current divides: the greater portion of the water, turning eastward, forms the Gulf Stream; while the remainder, running westward along the reefs called the Colorados, winds about Cape San Antonio and Cape Corrientes, and returns to the Caribbean Sea. The Gulf Stream carries the water back to the Atlantic. [ATLANTIC OCEAN.]

The Mexican Gulf may be entered by vessels through all the straits which divide the Lesser Antilles from one another; but navigators prefer the straits between Trinidad and Grenada, and between San Vincent and Santa Lucia, when they sail to the northern coast of South America.

The Gulf of Mexico is remarkable for the high temperature of its waters. It raises the thermometer to 86°, while in the Atlantic, between the same parallels, the water does not exceed 77° or 78°. In the centre of this sea, between the northern coast of Yucatan and the shores of Louisiana, great quantities of *Fucus natans*, or gulf-weed, are met with, extending in parallel lines from south-south-east to north-north-west.

MICHAEL'S, ST. [AZORES; MARAZION.]

MICHIGAN, one of the most northern of the United States of North America, extends between 41° 50' and 48° N. lat.; 82° 25' and 90° 34' W. long. It is bounded E., N.E., and N. by Canada, from which it is separated by lakes Erie, Huron, and Superior, with their connecting channels; N.W. by the territory of Minnesota, from which it is divided by the Montreal and Mononomie rivers; W. by the state of Wisconsin; S.W. by that of Illinois, from which it is separated by Lake Michigan; and S. by the states of Indiana and Ohio. The area is 56,243 square miles, or about 2000 square miles less than that of England and Wales. The population in 1850 was 397,654 (of whom 2583 were free-coloured persons), or 7.07 to the square mile. The inhabitants being all free the federal representative population is the same as the entire population in 1850; this, according to the present ratio of representation, entitles the state to send four representatives to Congress. To the Senate, like each of the other states, Michigan sends two members.

Surface, Hydrography, &c.—The surface of the state consists of two peninsulas—a southern and larger one—forming Michigan proper, which lies between lakes Michigan, Huron, and a small portion of Erie; and a northern one, lying between lakes Michigan and Superior, and forming what is generally known as Northern Michigan. The lake coast-line is said to be upwards of 1400 miles in length.

The southern peninsula, or Michigan proper, has not a very diversified surface. The eastern side is level. The western coast exhibits some bold cliffs. The interior forms a plain generally level, but in some districts undulating or intersected with low hills. This tract is probably about 200 feet above the lakes, and the surface of the lakes is nearly 600 feet above the sea-level. The highest land traverses the peninsula towards its southern extremity in a south-west and north-east direction, and terminates on the east of Saginaw Bay with the smaller peninsula of Sanilac. The surface of this part is more undulating than other parts, and intersected by a great number of small lakes. The slope of this high land towards the lakes Erie and St. Clair, and the straits of Detroit and St. Clair, is long and hardly perceptible. This is probably the most fertile district of the country; it contains little prairie land, except on the alluvial tracts near the mouths of the rivers and along the lakes, which are in some parts marshy but fertile. Nearly the whole of the remainder of the country is covered with trees of a heavy growth; but the peninsula of Salinae has a poor soil and is mostly sandy. The northern part of the penin-

sula, between Lake Huron and Lake Michigan, slopes from the higher central tract with a very gradual descent to the west, but more rapidly towards Lake Huron. On the coast of Lake Michigan the cliffs, or bluffs, are frequently 100 and occasionally 200 to 250 feet high. A great portion of the northern part of this peninsula is prairie-land. The shores of both the great lakes are poor and sandy, and along the shore of Lake Michigan there are sandy eminences, formed near the mouths of the numerous small rivers which join the lake by the action of their current against the swell of the lake.

The northern peninsula is more varied in aspect and grander in its picturesque features. On the eastern side it rises in low hills from the lakes to a more elevated table-land. Westward the country is broken by high hills with intervening plains, and is in part occupied by a portion of the Porcupine Mountains, which form the dividing range of the waters which fall into lakes Superior and Michigan. The highest summits of this range are said to attain an elevation of nearly 2000 feet. Along the northern coast, from the Pictured Rocks westward, there are bare bold rocks and sandy plains; and the country for some distance inland being wild and dreary, it has been called the Siberia of Michigan. By far the larger remaining part of the peninsula consists of vast forests of white and yellow pines, birch, oak, aspen, hemlock, and spruce trees, with ash and elm along the rivers, and the sugar-maple in the southern parts. There are however also wide and bare sandy plains.

As the rivers of both peninsulas descend from the table-land to the great lakes, they have but a short course. The principal rivers of the southern peninsula are the Detroit, St. Clair, Grand, and Saginaw, which flow into Lake Huron; and the St. Joseph's, Grand Maskegon, and Kalamazoo, which flow into Lake Michigan. On the table-land they run slowly, but on the declivity their course is accelerated and interrupted by rapids. The most important are St. Joseph's River and Saginaw. St. Joseph's falls into Lake Michigan, not far from its southern extremity, after a winding course of about 250 miles. It has a sand-bar at its mouth; but is navigable for keel-boats to Lockport, 150 miles. The Saginaw is formed by a great number of branches, which descend from the table-land to the depression in which it flows, and which may be considered as a prolongation of Saginaw Bay. Some of these branches flow 50 miles before they unite. After their union the river takes the name of Saginaw, and is navigable for boats to its mouth, a distance of 80 miles. The rivers St. Clair and Detroit, as well as the lakes of Superior, Michigan, Huron, St. Clair, and Erie, are noticed under CANADA. The chief rivers of the northern peninsula are the Montreal, Great Iron, Ontonagon, Huron, and St. John's, which fall into Lake Superior; and the Manistee and Monomomie, which flow into Lake Michigan; but there are also numerous smaller rapid streams, which are of great value for agricultural and mechanical purposes. Besides the great lakes, which almost surround the state, the whole interior of both peninsulas contains a very large number of small lakes, varying in size up to 1000 acres, generally of considerable depth, and abounding in fish, while their shores and surface are the resort of numerous water-fowl.

There is no canal in the state, but one or two of considerable importance have been for some time projected.

In 1854 the total length of completed railways in Michigan exceeded 500 miles. The main lines are two very important transverse roads—one, called the Central, extending from Detroit, by New Buffalo, to Chicago, in Illinois; the other, called the Southern Michigan, extending from Monroe to Chicago: both belong to the southern portion of the southern peninsula. These lines have an immense traffic, as they form the readiest communication between the Northern Atlantic states and the Mississippi, and are in connection by means of branch-lines and lake-steamers with the neighbouring states and Canada. There are several short lines in operation in the state, and others are commenced or projected.

Geology, Mineralogy, &c.—The rocks of Michigan belong principally to the primitive and palaeozoic formations. Of the northern peninsula, the middle and south-western portions are occupied almost entirely by eruptive and metamorphic rocks, and they occur through the centre of the eastern district. Granite rocks occur widely; and in proximity with them are hornblend, felspars, talcoes and chloritic schists, and other metamorphic rocks. Granite boulders, often of immense size, are met with in many parts of the state. South of the granite and trappean beds is a series of Lower Silurian rocks, consisting of Potsdam sandstone, what is termed by American geologists the lower sandstone, and blue limestones, well marked by the characteristic fossils. The Lower Silurian is skirted southward by a narrow belt of Upper Silurian strata, consisting of the gray or cliff limestone and sandstone. The northern part of this peninsula, bordering Lake Superior, is occupied by rocks of the New Red-Sandstone formation, or, as some geologists assert, of Potsdam, or Old Red-Sandstone. The strata consist of beds of red-coloured sandstone, with their intervening beds of clays, resting on thick beds of conglomerates, occasionally capped with masses of basaltic trap; and everywhere in conjunction with or intersected by rich veins and dykes of copper-trap, silver, fibrous gypsum, &c. The oldest rocks noticed in the southern peninsula are of the Devonian formation, which occupies a wide area in the extreme north, and small spaces in the south, south-east, and south-west. It is composed of "one group of strata, containing very fossiliferous limestone beds of a

light-gray colour, often whitish." The remainder, forming the main portion of this peninsula, consists of Carboniferous strata; the Lower Carboniferous, or mountain limestone rocks, occupying, except where they bear upon the Devonian, the outer area; and the Upper Carboniferous, or coal-measures, the entire centre of the peninsula.

Michigan is extremely rich in minerals, though in this respect her resources have scarcely begun to be developed. According to the United States Geologists, who were especially deputed by the federal government to examine these districts, the beds of iron in the northern peninsula "are on a scale of such magnitude, and the ore is of such purity . . . and there are such immense forests covering the surface suitable for charcoal . . . that this iron region may be pronounced the most valuable and extensive in the world, for the manufacturing of the finer varieties of wrought-iron and steel . . . The iron-ore occurs in a metamorphic formation bounded by two granite beds, one on the north and the other on the south, and it is prolonged westerly beyond the Michigan River. This formation consists of hornblend, talcoes and chlorite slates, with associated beds of hornblend and felspar rocks, evidently trappean in their origin. The ore consists mainly of the specular or peroxide of iron, with an admixture of the fine-grained magnetic. In some instances the whole ridge, or knob, appears to consist of one mass of pure ore. . . . In others the ore is mixed with seams of quartz or jasper, which renders it less valuable." Copper-ore is also found in extraordinary extent and richness. Point Kewenaw is the centre of the copper region, which is said to extend for 135 miles with a width of from 1 to 6 miles. Both iron- and copper-mines are being worked, but, owing to the thinness of the population and the want of shipping on Lake Superior, only very imperfectly. Veins of silver occur on Point Kewenaw. Indications of both bituminous and anthracitic coal are found in the carboniferous region of the southern peninsula. Barytes, strontium, and gypsum occur in the great mineral region of the northern peninsula. There are in various parts both saline and sulphureous springs. Granite and various kinds of limestones and sandstones, affording excellent building stones, abound; and numerous quarries are in full work. Limestone and marl for burning abound, as do also beds of marly clay suitable for the manufacture of pottery, and fine sands for the manufacture of glass and porcelain.

Climate, Soil, Productions.—The climate of this country is severe in both peninsulas, though most so in the northern. The winter generally begins in the middle of November, and lasts to the middle of March. The ice on the rivers and borders of the lakes is strong enough to admit travelling on sledges. The summers are never hot, but subject to considerable changes. In the hottest days the thermometer rises to 70°, but in the evening and morning it is as low as 46°. The climate is rather dry, and the quantity of snow which falls not considerable.

A very large portion of the northern peninsula appears to be ill adapted for agricultural operations. Besides the extensive sandy plains, there are immense forests, covering by far the larger part of the peninsula. Millions of acres are at present covered with pines. The southern side of this peninsula is however more genial in climate, and better fitted for the farmer. Much of it appears to be available for the growth of wheat, oats, the grasses, and esculent plants; though not for maize. Vast tracts in this part are covered with the sugar-maple, and more thinly with white and red oak, beech, and spruce. The soil of the southern peninsula is considerably varied, but much more fitted for agricultural purposes, and appropriate manures are readily obtainable. It is pretty extensively and carefully cultivated. Both maize and wheat flourish here; and the other grains, especially oats, fruit, potatoes, and other vegetables, are also largely grown and succeed well. The country along the Strait of Detroit is famous for its orchards, which the French settlers planted, and which are extensive and well managed. A great quantity of cider is made, and much of it is exported. Some flax, hops, and tobacco are grown. Maple sugar is very largely prepared. Around the lakes of the table-land, and near the mouths of some rivers, large tracts are covered with wild rice (*Zizania aquatica*), on which immense flocks of water-fowl, of various species, feed. We have already spoken of the almost unbounded resources which the forests afford for the development of the lumber trade.

Domestic animals are rapidly increasing in numbers in the state. Horses, cattle, sheep, and swine are numerous, and wool is becoming an important article of trade. The lakes and rivers abound in fish, and the lake fisheries promise to become a very considerable branch of the industry of the state.

Michigan has as yet scarcely any manufactures. Of 108,978 males above the age of 16 in the state in 1850, there were 65,815 returned as employed in agriculture, and 22,375 in commerce, trade manufactures, mechanic arts, and mining. The principal manufacturing establishments are iron-works; there are also woollen-factories, tanneries, and numerous flour and saw-mills. The copper-mines in 1850 employed 706 hands.

The state has little direct foreign commerce, and that is with the adjoining British provinces, but the lake commerce is very large and constantly increasing; in 1850 the commerce on Lake Michigan amounted to nearly twenty-five million dollars.

Divisions, Towns, &c.—Michigan is divided into 43 counties, but

there are besides "21 unorganised counties." Lansing is the capital, but DETROIT is the centre of commercial operations, and by far the largest town in the state. Lansing and the other more important towns we notice here: the population is that of 1850:—

Lansing, the capital, stands on the right bank of the Grand River, at the confluence of the Cedar River, 42° 43' N. lat., 84° 29' W. long., 483 miles N.W. from Washington: population, 1229. Lansing is regularly built, having been laid out as the capital of the state on a site reclaimed from the wilderness in 1847. The state house is large and handsome, and other public buildings are neat structures.

Adrian, at the junction of Beaver Creek with Raisin River, 86 miles S.E. from Lansing, population 3006, is a busy village, having some mills and factories. *Ann Arbor*, the capital of Washtenaw county, on the Huron River, 51 miles E.S.E. from Lansing, is the centre of an important internal trade, and the seat of the university of Michigan. *Grand Rapids*, by the rapids so called, at the head of the steam navigation of Grand River, 60 miles W.S.W. from Lansing, population 2636, is becoming one of the leading commercial depôts of the state. In the town are numerous public buildings, warehouses, and mills; in the vicinity are quarries of excellent building stones. On the opposite side of the river is an extensive ancient Indian burying place. *Jackson*, on the upper branch of Grand River, 32 miles S. by E. from Lansing, population 2363, stands in the centre of a good grass and grain district; possesses great water-power for manufacturing purposes; and building stone and coal are obtained in abundance in the vicinity. The manufactures are of iron-ware, machinery, and leather; there are several flour-mills; and a large trade is carried on with the interior. *Kalamazoo*, on the river of the same name, 51 miles W.S.W. from Lansing, population 2507, is a thriving manufacturing and trading town, and is the centre of a rich agricultural district. *Monroe City*, on the right bank of Raisin River, 2½ miles from its outlet in Lake Erie: population, 2813. Monroe as the terminus of the Michigan Southern railway, and the depôt of the commerce of Lake Erie, is a place of considerable and growing commercial importance, and has some manufactures. It contains several handsome public buildings. *Ypsilanti*, on the Huron River, and the Michigan Central railway, 60 miles S.E. from Lansing, population 3051, contains five churches, a branch of the state university, and a state normal school; and has numerous mills and manufactories.

Government, &c.—The present form of constitution was framed and adopted in 1850: every sixteenth year the question of the revision of the constitution is to be submitted to the popular vote. The right of voting in all state elections is vested in every white male citizen, and every civilised male Indian not a member of a tribe. The legislative body, elected biennially, consists of a Senate of 32 members, and a House of Representatives of not less than 64, nor more than 100 (at present 66) members. The acknowledged debt of the state, November 1852 was 2,307,850 dollars, but Michigan is one of the repudiating states, and omits all reference to the repudiated debt.

Early in the 17th century the French penetrated into this country from Quebec. In 1670 they founded Detroit. In 1783 Michigan was included in the limits of the United States, but not actually given up by the British until 1796. In 1805 it was formed into a territory; and in 1837 it was admitted into the Union as an independent state.

MIDDELBURG. [ZEELAND.]

MIDDLEFAHRT. [FÜNEN.]

MIDDLEHAM. [YORKSHIRE.]

MIDDLESEX, the metropolitan county of England, is bounded N. by Hertfordshire; E. by Essex, from which it is separated by the river Lea; S.E. by Kent; S. by Surrey, from both of which it is separated by the river Thames; and W. by Buckinghamshire, from which it is separated by the river Colne. Its greatest length is, from north-east to south-west, from the Lea near Waltham Abbey to the Thames opposite Chertsey, 28 miles; its greatest breadth, at right angles to the length, is, from near South Mimms on the great north road to Limehouse, 17 miles. Its area is estimated at 282 square miles. The population in 1841 was 1,576,636; in 1851 it was 1,886,576. It is the smallest of the English counties, except Rutland.

Surface; Geological Character.—The surface of the county consists for the most part of gentle undulations, affording a sufficient slope for the purposes of drainage. A range of hills extends along the Hertfordshire border by Barnet, Elstree, Stanmore, and Pinner, averaging 400 feet in height above the level of the Thames. Another range of hills skirts the northern side of the metropolis by Hornsey, Highgate, and Hampstead; Harrow occupies an insulated eminence between these two ranges. That portion of the county which lies south-west of a line drawn from Brentford to Uxbridge is an almost unbroken flat, scarcely rising more than 20 feet above the level of the Thames.

The county is chiefly occupied by the London clay. Enfield Chase, the most northern portion, and a strip along the western boundary by Harefield and Uxbridge, are occupied by the plastic clay, which here crops out. The high ground about Hampstead, Highgate, and Hornsey consists of Bagshot sand. The thickness of the London clay varies from 45 to 240 feet. The thickness of the plastic clay appears to be from 100 to 120 feet.

The county belongs entirely to the basin of the THAMES, which forms its southern boundary. The Thames first touches the border just above Staines, at the junction of one of the arms of the Colne.

GEOG. DIV. VOL. III.

The river is navigable throughout its course along Middlesex for laden barges; but locks are required in the upper part to keep up the water. The lowest of these locks is at Teddington, between Kingston and Richmond bridges. Up to London Bridge the Thames is navigable for sea-borne vessels, and the space between that bridge and the junction of the Lea forms the port of London. The banks of the Thames are for the most part low and flat, and in some places marshy.

The Lea forms the eastern boundary of the county, which it touches below Waltham Abbey. Its waters are, at the point of junction, divided between two or three channels, which re-unite very soon after. Its course is southward through a belt of low marsh-land, 8 miles to the foot of Stamford Hill, and thence south-east 6 miles by Lea Bridge, Old Ford, Bow, and Bromley, into the Thames. Between Lea Bridge and Old Ford, the navigation is carried on by an artificial channel. A navigable cut opens a communication between the Lea at Bromley and the Thames at Limehouse. On the channels of the Lea which are not used for navigation are several mills.

The Colne forms the western boundary of the county. It first touches the border below Rickmansworth, and its waters, like those of the Lea, frequently flow in several channels, which inclose a number of islands. It flows southward past Uxbridge, and Colnbrook (Bucks), to its junction with the Thames above Staines. Its whole length on the border of this county is about 18 miles; it is not navigable, but is useful in turning a number of mills.

The Brent rises just within the northern border of the county, and, after crossing a corner of Hertfordshire north of Totteridge, flows by Finchley, Hanwell, and Brentford, into the Thames. Its course, which is very circuitous, is about 18 or 20 miles; in its lower course it forms part of the line of the Grand Junction Canal. The Cran rises between Harrow and Pinner, and after a circuitous course of 20 miles past or near Ickenham, Cranford, and the powder-mills at Hounslow, joins the Thames at Isleworth.

The principal canal is the Grand Junction, which enters the county near Harefield, in the north-west corner, and runs southward along the valley of the Colne by Uxbridge to West Drayton; from this place it runs eastward across the Cran to the Brent near Hanwell; it then follows the valley of the Brent, and for the most part coincides with the channel of that river, till it joins the Thames near Brentford. About 18 miles of its course are in this county. A branch from this canal near Cranford runs north-east to Northolt, and from thence east-south-east by Twyford to Paddington, a distance of 12 or 14 miles. The Regent's Canal commences in the Paddington branch of the Grand Junction Canal, and passes along the north and east sides of the metropolis by the Regent's Park, Islington, Hackney, Mile End, and the Commercial Road, into the Thames near Limehouse, 8½ miles. It has one or two short branch cuts or basins in its course. The New River, an artificial cut designed to supply the metropolis with water, enters the county on the north side between Enfield and Cheshunt, and is conveyed in a very winding channel to a reservoir at Pertonville, on the north side of London.

The south-western road (to Salisbury, Exeter, &c.) leaves London by Hyde-park Corner, and runs by Brentford and Hounslow to Staines, where it crosses the Thames into Surrey. The Portsmouth road, branching from this near Hyde-park corner, crosses the Thames at Putney Bridge; and the western (Bath and Bristol) road, branching from it at Hounslow, crosses the Colne at Colnbrook. The Oxford and Birmingham road leaves Oxford-street at Hyde-park Corner, and passes through Acton and Uxbridge, beyond which it crosses the Colne into Buckinghamshire. The Great North road leaves London by Islington, and passes through Highgate and Barnet to South Mimms. Of the Norfolk and Suffolk roads, one leaves London by Shoreditch church, passing through Hackney and crossing the Lea at Lea Bridge into Essex; another leaves by Whitechapel church, and crosses by Bow Bridge into Essex. Edgware Road leads from Hyde-park Corner by Paddington and Edgware into Hertfordshire, joining the north road at St. Alban's; another road passes by Harrow to Rickmansworth; a third, called 'the Green Lanes,' leads by Stoke Newington and Winchmore Hill to Enfield.

The North-Western railway has its London terminus at Euston-square, on the north side of the metropolis, and runs past Harrow, beyond which it leaves the county. The Great Western railway has its London terminus at Paddington, and runs by Ealing and Southall to West Drayton. The Great Northern railway has its terminus at King's Cross, and runs by Hornsey to Barnet. The Eastern Counties railway commences at Shoreditch, and runs by Bow, across the Lea into Essex. The Cambridge branch, however, re-enters the county near Tottenham, and continues just within its boundary to Waltham. A short branch is carried from it near Edmonton to Enfield. The Blackwall railway runs from Fenchurch-street by Limehouse and the West India Docks, to Blackwall. A branch from it quits the main line at Stepney, and runs by Bow, Hackney, &c. to the North-Western line at Camden station, whence it is carried by a short junction-line to unite with the Windsor branch of the South-Western railway. There are other short connecting lines and extensions belonging to the North-Western and the Blackwall companies, chiefly for the transmission of goods into the centre of London.

Soil and Agriculture.—The soil of this county is of three distinct

qualities: poor sand and gravel on the tops of some of the hills and in various spots in the plain; a heavy poor clay in the north and north-west portion, which is chiefly covered with permanent grass, enriched by repeated application of manure; and a good fertile loam over a bed of gravel, and sometimes of peat, along the plain in which the Thames flows. To these must be added some rich deposits from the Thames, of a lighter and more muddy nature, which are admirably adapted for garden ground, and have been almost entirely converted into a rich black vegetable mould, by an abundant application of dung, from time immemorial.

The surface, with the exception of a few hills on the northern side of London, none of which rise more than 400 feet above the Thames, may be described as a plain, almost perfectly level as it approaches the Thames, but with a sufficient fall for the waters to prevent it being marshy. The Thames has been long kept within its present channel by artificial embankments, wherever these were necessary. Nearly the whole of the county lies over the blue clay, which is known by the name of the London clay: and the hills which rise above it are formed of a basis of clay covered by a poor ferruginous sand and gravel. The stiff clay is altogether unfit for arable cultivation until its nature is altered and corrected by the addition of chalk, lime, and ashes; most of it therefore remains undisturbed by the plough. Most of the commons have been inclosed, and yield grass in sufficient abundance to make hay, of which two good crops are generally produced every year. The value of hay so near the metropolis, and the abundant supply of labourers, enable the occupiers of grass-land to take advantage of a few days of fine weather to secure their hay. Some inclosures of pasture-land are made profitable by taking in horses to graze when they require rest and green food after having been overworked.

The arable portion of the county lies chiefly towards Buckinghamshire, and between the Great Western railway and the Thames. Some extremely good loams of considerable depth on a bed of flinty gravel, well adapted to every kind of agricultural produce, occur in several places. The lighter portions are mostly laid out in orchards, market-gardens, and nursery-grounds. Almost the whole of the land in the parishes of Chelsea, Hammersmith, Chiswick, Isleworth, and Brentford is taken up by such gardens. Here the spade is the principal instrument of cultivation. Beyond Hounslow, including what was formerly Hounslow Heath, the land is cultivated more extensively, by farmers properly so called; and some of these occupy from 200 to 1500 acres. Here every improvement in the management of the soil is readily adopted, and the best implements are in use. The system of cultivation is greatly modified by the short distance from an inexhaustible source of manure.

Every breed of animal is to be met with in Middlesex. Horses and milch cows are the most common, as the most useful. The cart-horses are generally fine and strong. Some large horses, a little too heavy for a carriage and too slow for stage-coaches, but which make excellent cart-horses, are brought to London by dealers, who collect them in the northern and midland counties. The dairy cows are chiefly of the large Holderness breed or the short-horn.

Divisions, Towns, &c.—Middlesex is divided into six hundreds, as follows:—Edmonton, north-east; Gore, north; Elthorne, north-west; Isleworth, south-west; Spelthorne, south-west; Osulston, south-east, including the Finsbury, Holborn, Kensington, Tower, and Westminster divisions; and the City of London. The suburbs of London form the parliamentary boroughs of Marylebone, Finsbury, and the Tower Hamlets. LONDON, the capital of the county, and the metropolis of the British empire, is described in a separate article. Middlesex possesses three market-towns—BRENTFORD, STAINES, and UXBRIDGE; besides Edgware, Enfield, and HOUNSLOW, the markets of which have been discontinued. The places printed in small capitals, as well as Chelsea, Edmonton, Fulham, Hackney, Hampstead, Hendon, and Kensington are noticed under their respective titles. The other small towns and more important villages we notice here; the populations are those of the respective parishes in 1851:—

Acton, 8 miles W. from the General Post-Office, population 2582, is a station on the Great Western railway. The church, a handsome edifice, has been repaired at an expense of about 3000*l.* Independents and Roman Catholics have places of worship, and there are National and Infant schools. *Bayswater*, in Paddington parish, about 4 miles W. from the Post-Office, is a suburb of the metropolis. Within the last few years it has much increased; a handsome church, an elegant Independent chapel, and many streets and squares of good houses have been built. There are National and Infant schools, and a Female Orphan school. *Bow*, nearly 4 miles E. from the Post-Office, population 6989, is situated on the right bank of the river Lea, which is crossed at Stratford-le-Bow by a handsome stone bridge, erected in 1830. The church, which stands in the middle of the public road, is chiefly of early English date. The Independents have a neat chapel. Coborn's Free school for 30 boys and 20 girls, the Merchant Seamen's Orphan Asylum, the Sailmakers' almshouses, and the Hamlet almshouses, are among the benevolent institutions. There is an extensive brewery at Bow. A county court is held. *Bromley St. Leonard's*, about 4 miles E. from the Post-Office: population, 11,789. Distilling, malting, brewing, and the manufacture of starch are carried on. Many of the inhabitants are employed in the East and West

India Docks, and in the ship-building yards in Poplar and Limehouse. There are numerous market-gardens. The church is a neat brick edifice, erected in 1843. The Wesleyan Methodists have a chapel, and there are National and Infant schools. A new Union workhouse for the city of London accommodates about 800 persons. *Brompton*, about 3 miles W. by S. from the Post-Office, population 14,870, adjoins CHELSEA. There are here a chapel of ease, Holy Trinity church, St. Mary's church, a chapel for Independents, National, British, and Infant schools, and the recently founded Hospital for Consumption. *Camden Town*, about 3 miles N.W. from the Post-Office, is a rapidly increasing and well-built suburb of the metropolis. There are here a district church, chapels for Independents and Wesleyan Methodists, National and British schools, and a Veterinary college. *Chiswick*, about 9 miles W. by S. from the Post-Office, population 6303, on the left bank of the Thames, has a parish church with an ancient tower; a chapel of ease, a chapel for Independents, and National, British, and Infant schools. Brewing is carried on. At Chiswick are the gardens of the Horticultural Society. *Chiswick House*, a seat of the Duke of Devonshire, is surrounded by extensive and finely-planned grounds. *Turnham Green*, a hamlet of Chiswick, has a fine gothic church, erected in 1843, and many good private residences. *Clapton* [HACKNEY]. *Colney Hatch*, population 974, is in the parish of Friern Barnet, on the east side of Finchley Common. Here is the Middlesex County Lunatic Asylum, completed in 1852 at a cost of about 300,000*l.* It is of vast extent, affording ample accommodation for 1300 patients. The extreme length of the building is 1883 feet. The architect was Mr. S. W. Dawkes. *Dalston*, [HACKNEY]. *Ealing*, 9 miles W. from the Post-Office, population exclusive of Old Brentford chapelry, 3771. In the neighbourhood are many fine seats, especially Ealing Park, and Gunnersbury, the seat of Baron Rothschild. Besides the parish church, there are a district church, a chapel for Independents, a National school, an Infant school, and Lady Byron's School of Industry. *Edgware*, about 12 miles N.W. from the Post-Office, on the road to Watford and Aylesbury, population 765, consists chiefly of a long straggling street. The church, which is of brick, was rebuilt in 1760; the tower is ancient. Near this place is Canons, a neat villa, erected on the site and from the materials of a stately mansion built by the Duke of Chandos. The church of Stanmore Parva, close to the park of Canons, was decorated by the duke. The Independents have a place of worship, and there are National schools. *Enfield*, about 11 miles N. from the Post-Office: population, 9453. Enfield manor-house was the residence of Elizabeth (afterwards queen) for a short time, during the reign of her brother Edward VI. One room on the ground-floor remains as in her time. Many of the houses in the town are well-built. The town is lighted with gas. In the market-place is a cross erected by subscription in 1826. The church is an ancient structure. There are a chapel of ease, two district churches, chapels for Wesleyan Methodists, Independents, and the Countess of Huntingdon's connexion; a Free Grammar school, National and British schools, a girls' school, establishments for the children from Shoreditch workhouse, and for the children from Edmonton Union, a literary and scientific institution, and a savings bank. There are two yearly fairs. Petty sessions and a Court of Requests are held. *Finchley*, 8 miles N.W. from the Post-Office, population 4120, situated near the left bank of the river Brent, has a parish church, erected in the 15th century, and chapels for Wesleyan Methodists and Independents, with National, Infant, and Free schools. *Hammersmith*, 6 miles W. by S. from the Post-Office, population 17,760, has many fine residences. In the parish are extensive market-gardens and nurseries. Coach-making and hat-making are carried on. There are the parish church, a spacious brick building erected in 1631, a new district church, chapels for Wesleyan Methodists, Baptists, Quakers, and Roman Catholics, National, British, Infant, Industrial, Ragged, and Roman Catholic schools, a savings bank, almshouses, and two Roman Catholic convents. With the convent of the Good Shepherd is connected an asylum for penitent women. An elegant suspension-bridge crosses the Thames at Hammersmith. *Hampton*, on the left bank of the Thames, about 12 miles S.W. from London: population, 4802. The chief object of interest is the royal palace of Hampton Court, the site of which was once the possession of the Knights Hospitallers. Cardinal Wolsey took a lease of the manor from the prior of St. John's before the dissolution, which lease he surrendered to Henry VIII, who formed a royal park or chace. This chace was in the succeeding reign broken up on the remonstrance of the parishes affected by it, but the crown has since retained paramount authority over all game within its limits. While Wolsey held the lease of the manor he pulled down a mansion which stood here, and erected in its place a sumptuous palace, which Henry VIII. subsequently enlarged. Here was born Edward VI., and here his mother queen Jane Seymour died. Charles I. resided here during part of his confinement, and Cromwell, Charles II., and James II. made it their occasional residence. William III. rebuilt a considerable part of the palace, and laid out the gardens and park in their present form. It is now usually occupied by persons of rank, reduced in circumstances, who have obtained grants of residence from the Lord Chamberlain. The palace consists of three principal quadrangles, with some smaller courts. The interior of the great hall, and the exterior of the older parts of the building generally, have been restored within the last 15

years. The great eastern and southern fronts were erected by Sir Christopher Wren. The palace contains a number of historical portraits, the Beauties of the Court of Charles II., painted by Lely, and many pictures by the old masters, but the Cartoons of Raffaele constitute its chief treasure. The gardens are laid out in the formal taste of the reign of William III. Bushey Park and lodge form an appendage of Hampton Court Palace. Hampton races are held on Moulsey Hurst, on the opposite side of the Thames. In the village of Hampton are the parish church and a chapel for Independents. The Free Grammar school, which has an endowment of 367*l.* a year, consists of an upper and lower school at Hampton, and a branch school at Hampton Wick. At Hampton are a Charity school, a school of Industry, and an Infant school; and at Hampton Wick is a Free school for girls. *Hanwell*, about 12 miles W. from the Post-Office, population 1547, is pleasantly situated on the left bank of the river Brent. The parish church, erected in 1841, is in the early English style. The Independents have a chapel, and there is a National school. The County Lunatic Asylum, opened in 1841, affords accommodation for about 1000 patients. The cost of erection was upwards of 180,000*l.* *Harefield*, on the border of the county, and on the left bank of the river Colne, 5 miles N. from Uxbridge: population, 1498. Besides the parish church there is a National school. The extensive works of the Mines Royal Copper Company are in the vicinity. By the Grand Junction Canal there is water communication with Uxbridge and West Drayton. At Harefield was the residence of the Lord Keeper Egerton, where Shakspeare's Othello was played for the first time before Queen Elizabeth, and where about thirty years later Milton's Arcades formed the poetic part of an entertainment presented before the Countess Dowager of Derby, the then proprietor of Harefield. The mansion was burnt down in 1660. *Harrow-on-the-Hill*, about 12 miles N.W. from the Post-Office, population 4951, derives its celebrity and chief support from its Grammar school, which was founded, under letters patent of Queen Elizabeth, by John Lyon, a wealthy yeoman of this parish, in 1571. The school-buildings are situated near the parish church. Harrow school is free to all boys of the parish of Harrow, but the scholars are chiefly the sons of the nobility and gentry. Among persons who have been educated at Harrow may be named Sir William Jones, Richard Brinsley Sheridan, Lord Byron, and the late Sir Robert Peel. The number of scholars in 1853 was about 390. There are several exhibitions for Oxford and Cambridge. The village is irregularly laid out. The parish church is a spacious structure on the summit of the hill; at the west end is a lofty tower, with a spire. The church was thoroughly repaired a few years back. The Baptists have a place of worship. There are a savings bank and a literary institute. A fair is held annually on the first Monday of August. *Highgate* is situated on an eminence on the great north road, 5½ miles N.N.W. from the Post-Office: population of the ecclesiastical district, 4502. The village comprises many good houses. The church, recently built in the gothic style, is a handsome edifice, with a fine spire. The Baptists and Independents have places of worship. The Endowed Grammar school, founded by Chief Justice Cholmeley in the reign of Elizabeth, has an income from endowment of 777*l.* a year. It is free to 40 boys, nominated by the governors from the neighbourhood. The number of scholars in 1853 was 112. There are National and Infant schools, a literary and scientific institution, a dispensary, and a savings bank. Park House, on the north road, is occupied as the Asylum for Idiots, established in 1847. A road crosses the north road at Highgate over an archway of brick and stone. The North London Cemetery is on the slope of the hill just below Highgate church. *Hornsey*, about 7 miles N. by W. from the Post-Office: population of the parish 7135, of whom 3260 are in the chapelry of Highgate. The church, which is of stone, has been rebuilt all but the tower, which is ancient. There are National and Infant schools at Hornsey. The bishops of London had formerly a palace here. *Isleworth* is on the bank of the Thames, 11 miles W.S.W. from the Post-Office, population 7007, of whom 1864 are in the chapelry of Hounslow. At Sion, or Syon, in this parish, was formerly a monastery of Bridgettine priests and nuns, founded in 1414 by Henry V., and originally settled at Twickenham. The site was granted by Edward VI. to the Protector Somerset, who commenced the present mansion of Sion House, which has received great additions and alterations from the dukes of Northumberland, the subsequent proprietors. The village of Isleworth contains several substantial villas and residences. The church, on the bank of the Thames, is of brick, and was rebuilt in 1706; the tower, more ancient, is of stone. The Wesleyan Methodists, Independents, Quakers, and Roman Catholics, have places of worship. There are Blue Coat, Green Coat, British, and Infant schools, and three ranges of almshouses. The chief occupation is gardening; great quantities of raspberries and strawberries are grown for the London market. There are extensive flour-mills and a brewery. *Islington*, about 2 miles N. from the Post-Office, population 55,690 in 1841 and 95,329 in 1851, forms part of the metropolis. The principal street, under the designation of High-street, Upper-street, and Holloway, runs for some miles along the north road to the foot of Highgate Hill. The Regent's Canal is carried by a tunnel under the New River and under the High-street, which is on an eminence. Many of the inhabitants are cow-keepers, who supply the metropolis with milk. There are some nursery-grounds, and a few manufactories,

together with lime and coal wharfs, adjacent to the Regent's Canal. The parish church (St. Mary's, Islington), situated between Upper and Lower streets, is of brick, with a tower of the same material, surmounted by a stone spire of good design. There is a chapel of ease at Lower Holloway, a plain and rather heavy brick building erected in 1814; and there are numerous district churches in the parish. Wesleyan Methodists, Independents, English Presbyterians, Baptists, Irvingites, Roman Catholics, and others have chapels. There are also National, British, and Infant schools; two literary institutions; a savings bank; and a proprietary school, established in 1830, in connection with King's College, which had 113 scholars in 1853. At Islington is a college founded in 1827, by the Church Missionary Society, for the education of young men designed for foreign missions, which had 31 students in 1853; and at Highbury Park is the Church of England Metropolitan Institution, for training masters for National, Parochial, and other juvenile schools; it had 43 students in July, 1852. The Caledonian Asylum, a handsome building in the Caledonian Road, is for the education and clothing of children of Scotch parentage. The Model Prison, Pentonville, is in Caledonian Road. The new City Prison, at Holloway, is a castellated structure of great extent. At Upper Holloway are the Small-Pox Hospital, and Whittington College, an asylum for 28 females, supported by the Mercers' Company. The Metropolitan Benefit Societies' Asylum at Ball's Pond, built in 1836, accommodates 50 inmates. Canonbury Tower, a heavy square brick building, is a relic of Canonbury House, the former mansion of the priors of St. Bartholomew's Monastery in Smithfield. *Kentish Town*, a suburban village in the north-west of London, contains two district churches, two chapels for Independents, chapels for Wesleyan Methodists, Baptists, Roman Catholics, and Unitarians; National, British, and Infant schools; and the Asylum for Decayed Governesses. *Kilburn*, anciently *Cuneburn*, on the Edgware Road, about 6 miles N.W. from the Post-Office. There is here a chapel of ease to Willesden parish. Kensal Green Cemetery is a short distance east of Kilburn. *South Mimms* is pleasantly situated about 4 miles N. by W. from Barnet: population, 2825. Besides the parish church there are National schools. The population is agricultural. *Southall*, population of the chapelry 325, about 13 miles W. from the Post-Office, has a large cattle-market, held weekly on Wednesday, for which facilities are afforded by the Great Western railway. There are a chapel of ease and a National school, both built by Mr. Henry Dobba. *Southgate*, about 10 miles N. from the Post-Office, has a district church, a chapel for Independents, and National and Infant schools. The vicinity is attractive in its scenery. *Great Stanmore*, 14 miles N.W. from the Post-Office, population 1180, situated on rising ground, consists chiefly of one long street. There are a new church, opened in 1850, and National and Infant schools. The old church was erected in 1632. Bentley Priory, the seat of the Marquis of Abercorn, occupies the site of a priory formerly existing here. *Teddington*, about 14 miles S.W. from the Post-Office, population 1146, is on the left bank of the Thames; the first lock on the river is at this place. The church is of brick, with a low square tower, and contains several interesting tablets and monuments. In this church John Walter, Esq., the late chief proprietor of the 'Times' newspaper was interred. There are at Teddington a Free school and an Infant school. *Tottenham*, 6 miles N. by E. from the Post-Office, population 9120, is a favourite place of residence for London merchants and persons of independent means. The main street is formed of good houses irregularly ranged along the road. In this street is a cross, erected in 1600 in place of a former wooden one. The church is an ancient building, with a square embattled tower covered with ivy. There are also a district church; chapels for Wesleyan Methodists, Baptists, Quakers, Plymouth Brethren, and Roman Catholics; a Free Grammar school, which had 80 scholars in 1853; a Blue-Coat school for girls; National, British, and Infant schools, and a school of Industry for girls; a Proprietary school; a literary and scientific institution; and a savings bank. The Fishmongers' and Poulterers' Company have an asylum, and there are Printers' Almshouses. The Roman Catholics have a convent. Bruce Castle, now occupied as a school, is a brick mansion, rebuilt in the latter part of the 17th century. The edifice takes its name from a castellated mansion the residence of Robert Bruce the elder, father of the king of Scotland of that name, which formerly occupied the site. *Twickenham*, on the left bank of the Thames, about 12 miles S.W. from the Post-Office, population 6254, has derived celebrity from its being the residence of Alexander Pope, and several other eminent persons. The village is irregularly laid out, but contains a number of genteel residences. The church is near the river, and is a plain brick structure, built in the early part of the last century, with an ancient embattled tower. It contains monuments erected by Pope to the memory of his parents, and by Bishop Warburton to Pope himself. Besides the parish church there are Trinity church and schools, chapels for Wesleyan Methodists and Independents, Archdeacon Cambridge's National school, and Lady Shaw's Infant school. Among the private residences are Strawberry Hill, and a strange-looking modern house termed 'Pope's' Villa, because it occupies the site of the poet's residence. Strawberry Hill was in great part erected by Horace Walpole, and is a medley of castellated and ecclesiastical gothic architecture. There are a powder- and oil-mills in the parish. Twickenham Ait is a small island in the

Thames, comprising a few acres, chiefly laid out in pleasure grounds. Near the village of Whitton, in Twickenham parish, is Kneller Hall, a government institution for the education of masters for schools of Parochial Unions, or other schools connected with the civil government. It is under the care of a Principal, a Vice-Principal, a mathematical master, and an English master; accommodation is provided for 90 students; the number resident in July 1852 was 33. Whitton Place, a mansion with extensive grounds attached, built by the third duke of Argyll, and afterwards in the possession of Sir William Chambers, contains an extensive collection of pictures, marbles, &c.

Divisions for Ecclesiastical and Legal Purposes.—This county is included in the diocese of London, and is divided between the archdeacons of London and Middlesex. By the Poor-Law Commissioners Middlesex is divided into 32 Poor-Law Unions:—Bethnal Green; Brentford; Chelsea; St. James, Clerkenwell; Edmonton; Fulham; St. George, Hanover Square; St. George in the East; St. Giles in the Fields, and St. George, Bloomsbury; Hackney; Hampstead; Hendon; Holborn; St. Mary, Islington; St. James, Westminster; Kensington; City of London; East London; West London; St. Luke, Middlesex; St. Margaret and St. John, Westminster; St. Martin in the Fields; St. Marylebone; Paddington; St. Pancras; Poplar; St. Leonard, Shoreditch; Staines; Stepney; The Strand; Uxbridge; and Whitechapel. These Unions contained in 1851 a population of 1,875,608.

The county is, in civil suits, within the immediate jurisdiction of the superior courts sitting in the metropolis. In criminal cases of the more important class it is within the jurisdiction of the Central Criminal Court, held twelve times a year, in the Old Bailey in London. Sessions, at which lighter criminal offences are tried, are held at the Sessions-House, Clerkenwell, twenty-four times in the year, and by adjournment at the Broad Sanctuary, Westminster. Sessions are also held at Guildhall, for the City of London, four times in the year; and at the Sessions-House, Wellesole Square, for the Tower Liberty, eight times a year. County courts are held at Bloomsbury, Bow, Brentford, Brompton, Clerkenwell, Edmonton, Marylebone, Shoreditch, Uxbridge, Westminster, and Whitechapel. The City is under the police jurisdiction of its own aldermen; and other parts immediately round London have police-offices with stipendiary magistrates. The parts more distant from London are under the county magistrates. The shrievalty of Middlesex is united with that of London. Two sheriffs are annually chosen by the Livery of London in common hall. London has a body of police of its own; the suburbs are watched by the metropolitan police, a numerous body of men under the direction of two commissioners.

Fourteen members of Parliament are returned from Middlesex—2 for the county, 4 for the city of London, 2 for the city of Westminster, and 2 each for Marylebone, Finsbury, and the Tower Hamlets.

History and Antiquities.—In the earliest period of authentic history, this part of our island was comprehended in the domains of the Trinobantes, who occupied Essex. It was traversed by Cæsar in his second expedition into Britain (B.C. 54) after his successful attempt to cross the Thames. [BRITANNIA.] It fell under the Roman dominion in the time of Claudius, but was overrun by the Britons in the general revolt under Boadicea. Londinium (London) was already a place of considerable trade, and the residence of many Romans. In the Roman division of the island the county was included in the province of Flavia Cæsariensis, and contained the stations of Londinium, Pontes (according to some), and Sulloniaca. Pontes has been variously fixed, at Colnbrook in Bucks, at Old Windsor in Berks, and at Longford and Staines in Middlesex. Sulloniaca was at Brockley Hill, between Edgware and Elstree. Roman camps have been traced at Stanmore, in the fields near Islington, and at Shepperton, near the place where Cæsar crossed the Thames. The Roman Watling-street from Londinium ran through Sulloniaca to Verulamium (near St. Alban's). Ermine-street ran from Londinium northward by Stoke Newington to Enfield, and other roads led from Londinium by Pontes and across the Thames to the south-west parts of England, and across the Lea into Essex. Roman antiquities have been found at Hampstead, Shepperton, Turnham Green, and other parts of the county. At Bentley, near Stanmore, 50 gold coins and several of silver and copper were found, with two gold rings, and a gold bracelet.

In the Saxon division of the island this county is generally considered to have been a part of the kingdom of the East Saxons; but we think this may be questioned. [ENGLAND.] It may have been governed occasionally by the kings of Essex—it is known that these at least possessed many extensive rights in the city of London; but Essex was itself little more than a dependency of Kent, and probably never enjoyed political independence. In the division of England under Alfred, while the county of Essex and part of Hertfordshire were included in the Danelagh, or Danish territory, London and the rest of Middlesex were, according to the best authorities, placed under the alderman of Mercia. (Sir F. Palgrave, 'Life and Progress of the English Commonwealth.')

In the wars which the West Saxon princes sustained with the Danes, London was repeatedly taken by that people. In the great struggle between Alfred and the Danish chieftain Hasting, the citizens bore a distinguished part. In the reign of Athelstan, London became the occasional residence of the king. In the reign of Edmund II., Ironside, London was twice besieged by the Danish king Canute, without

success. The death of Edmund however brought the whole island under the sway of Canute. London became under the later Saxon princes or under the Norman dynasty, the seat of government, and has continued to be so ever since. The city, consequently, and the metropolitan county, have been the scene of many important events, which properly belong to the general history of the country.

Religious Worship and Education.—According to the Returns of the Census of 1851, it appears that in March of that year, there were in the county, 962 places of worship, of which 419 belonged to the Church of England, 155 to Independents, 119 to six sections of Methodists, 102 to five sections of Baptists, 32 to Roman Catholics, 19 to Presbyterians, 16 to Mormons, 10 to Quakers, 8 to Lady Huntingdon's Connexion, 9 to Jews, 7 to Unitarians, 6 to Lutherans, 6 to Irvingites, 5 to Plymouth Brethren, 2 to Moravians, and 2 to the Greek Church. The total number of sittings provided was 572,338. There were 589 Sunday schools, of which 227 belonged to the Church of England, 132 to Independents, 96 to Methodists, 65 to Baptists, 11 to Presbyterians, and 5 to Roman Catholics. Of Day schools there were 3427, of which 772 were Public schools, with 138,108 scholars, and 2655 were Private schools, with 62,149 scholars. Of Evening schools for adults there were 76, with 1733 scholars. Of literary and scientific institutes there were 77, with 34,766 members, and libraries containing about 333,500 volumes.

Savings Banks.—In 1853 there were 37 savings banks in the county, at Bath-place, Bishopsgate, Bloomsbury, Brentford, Camden Town, Chelsea, Covent Garden, Edmonton, Enfield, Farringdon-street, Finsbury, Fulham, Hackney, Haggerstone, Hammersmith, Hampstead, Harrow, Highgate, Hornsey, Hoxton, Islington, Kensington, Kingsland Road, Limehouse, Marylebone, Paddington, Poplar, St. Martin's-place, St. Clement Danes, St. Giles (Cripplegate), Stoke Newington, Staines, Stepney, Tottenham, Tufton-street, Uxbridge, and Whitechapel. The amount due to depositors on November 20th 1853 was 5,349,188*l.* 2*s.* 4*d.*

MIDDLETON, Lancashire, a town in the parish of Middleton, is situated on the right bank of the river Irk, a feeder of the Irwell, in 53° 34' N. lat., 2° 12' W. long., distant 6 miles N. by E. from Manchester, 192 miles N.W. by N. from London by road, and 193½ miles by the North-Western and Lancashire and Yorkshire railways. The population of the town in 1851 was 5740. The living is a rectory in the archdeaconry and diocese of Manchester.

Middleton is dependent on the cotton and silk manufactures. A market formerly held in the town has been discontinued. Messrs. Peto and Betts, the eminent contractors, have within the last few years purchased the property of the town from Lord Suffield. The town is lighted with gas, and is well supplied with water. The parish church was erected at the beginning of the 16th century: of an older church some Norman portions remain. There are chapels for Methodists, Independents, and Swedenborgians; National and Infant schools, a Grammar school, founded in 1570, which had 130 scholars in 1851, a mechanics institute and reading-room, and a branch of the Manchester savings bank. Mills for spinning cotton-thread and for manufacturing cotton-cloth, dye-works, print-works, and silk-weaving establishments supply the chief occupations of the inhabitants. Many of the brocaded fabrics which are sold in London as Spitalfields goods are produced in Middleton.

MIDDLETON. [DERBYSHIRE; DURHAM.]

MIDDLETOWN. [CONNECTICUT.]

MIDDLEWICH, Cheshire, a market-town in the parish of Middlewich, is situated near the confluence of the rivers Dane and Croke, in 53° 12' N. lat., 2° 25' W. long., distant about 20 miles E. from Chester, and 167 miles N.W. from London. The population of the township of Middlewich in 1851 was 1235. The living is a vicarage in the archdeaconry and diocese of Chester.

The town of Middlewich contains many good houses, a commodious parish church, places of worship for Wesleyan and Association Methodists and Quakers, a Free Grammar school, National, British, and Infant schools, and a town library and news-room. Salt is made to a very great extent; and there are breweries, brick-fields, boat-building yards, a silk factory, and some lime-works. The Grand Trunk Canal, in its course to the Mersey, passes through Middlewich.

MIDHURST, Sussex, a market-town, parliamentary borough, and the seat of a Poor-Law Union, is pleasantly situated on a gentle eminence on the right bank of the Rother, in 50° 49' N. lat., 0° 44' W. long., distant 12 miles N. from Chichester, and 50 miles S.W. by S. from London. The population of the parliamentary borough in 1851 was 7021. The borough returns one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry and diocese of Chichester. Midhurst Poor-Law Union contains 26 parishes and townships, with an area of 64,068 acres, and a population in 1851 of 13,373.

On a mound near the Rother are the ruins of a castle long occupied by the Bohuns, lords of Midhurst. The parish church has lately been much enlarged. The Independents and Baptists have places of worship. The Free Grammar school, founded in 1672, had 7 free scholars and 15 boarders in 1852. There are a National school, a literary and scientific institution, and a savings bank. A county court is held in the town. There is a neat town-hall. A corn-market

is held every Thursday. Fairs are held on April 6th, Whit-Tuesday, and October 29th. Midhurst is a borough by prescription, and previous to 1832 returned two members to Parliament. About a quarter of a mile east of Midhurst, stood Cowdry House, the princely seat of the Montagues, built in the reign of Henry VIII, and, except the gate-house, destroyed by fire in 1793.

MIDDLETON, county of Cork, Ireland, a post- and market-town, and the seat of a Poor-Law Union, is situated near the head of the north-eastern branch of Cork Harbour, in 51° 55' N. lat., 8° 10' W. long., 13½ miles E. from Cork by road, and 17¾ miles S.W. by S. from Dublin. The population in 1851 was 3676, besides 2334 inmates of the workhouse. Middleton Poor-Law Union comprises 19 electoral divisions, with an area of 109,286 acres, and a population in 1851 of 44,059.

Middleton consists mainly of a spacious and well-built street between the Avonachora and Roxborough rivers, terminating at each end in a bridge. In the town are a neat parish church, a Roman Catholic chapel and nunnery, a Free school, or college, founded in 1696, which had 30 scholars in 1852, two National schools, a court-house, a market-house, a bridewell, a fever hospital, and a district dispensary. There are also distilleries, breweries, corn-stores, and flour-mills. Vessels of 300 tons ascend to Baillick, within half a mile of Middleton; and at the port of Ballincurra, about a mile below the town, large shipments are made of corn and other provisions. Quarter and petty sessions are held in Middleton. Fairs are held on May 14th, July 5th, October 10th, and November 22nd. The town and neighbourhood are the property of Viscount Middleton.

MIHIEL, ST. [MUSEE.]

MILAN, a province of Austrian Italy, is bounded N. by the province of Como, E. by that of Bergamo (from which it is divided by the Adda), S. by the provinces of Lodi and Pavia, and W. by the Ticino, which separates it from the Sardinian territory. The province of Milan is entirely in the great plain of Lombardy, and is watered by the Lambro, the Olona, and other affluents of the Po. Numerous canals, some for irrigation and others for navigation, communicate with these various rivers. The soil is in most parts fertile, and the country is well cultivated, full of large villages, farm-houses, and country-houses; and the appearance of prosperity is general. The chief products are corn, rice, fruit, pasture, and silk. The area of the province is 746 square miles; the population according to the official return of 1850-1 was 604,512. The province is divided into 15 districts. The only town, besides Milan, is Monza, 10 miles N.E. from Milan, on the Lambro, with about 16,000 inhabitants, and a fine old cathedral founded by the Longobard queen Theodelinda: it contains several good paintings, and the portraits of all the sovereigns who have worn the iron crown of Lombardy, from Agilulphus, the husband of Theodelinda, to Charles V. The iron crown, so called because it contains an iron rim which is said to be made of one of the nails from our Saviour's cross, is kept in the cathedral of Monza. The archives contain many valuable old documents, and some fine manuscripts of the time of Pope Gregory the Great. Monza has also a handsome royal palace, with a vast park and gardens: it was the capital of the Lombard kingdom. The neighbourhood of Milan contains many fine country residences belonging to the Milanese nobility and landed gentry. One of them, Montebello, is memorable from having been the head-quarters of Bonaparte after the campaign of 1797, and during the negotiations which preceded the peace of Campoformio. It was at Montebello that he decreed the destruction of the republic of Venice. The roads in the province of Milan are numerous, wide, and kept in excellent repair. The province is traversed by railroads from Milan to Venice, and from Milan to Como; the latter line passes through Monza.

MILAN, the capital of the Austrian crownland of Lombardy, and of the province of Milan, is situated in 45° 28' 2" N. lat., 9° 11' 39" E. long., 160 miles by railway W. from Venice, 80 miles E. by N. in a straight line from Turin, and had 161,962 inhabitants in 1851. The city is built in the midst of a vast plain, between the rivers Olona and Lambro, with which it communicates by a canal called Naviglio Grande, which flows all round the original old town. This canal, and the Martesana and Pavia canals, put Milan in communication with the Lago Maggiore and the Lake of Como on one side, and with the Po on the other. The suburbs, which have been gradually built outside of this boundary, and which occupy more space than the original city, are inclosed and surrounded by a line of ramparts, which is planted with trees, and serves as a promenade. This external circuit of the town is nearly 10 miles. Much of the space however between the Naviglio and the ramparts is not built upon, and is occupied by gardens and fields. The widest and finest streets of Milan are in the external part of the town, or suburbs: those which lead to the principal gates are called Corso, and serve as fashionable promenades. The Corso di Porta Orientale, which leads to the Bergamo road, is the most frequented. The streets of the old town are mostly narrow and irregular. The duomo, or cathedral, stands nearly in the centre of the town, and its lofty spire, which is seen from almost every part of it, serves as a directing point to strangers. This magnificent building, all of white stone, and dedicated to the Virgin Mary, was begun by Giovanni Galeazzo Visconti, duke of Milan, in March, 1386. The exterior, with its 100 spires and its

3000 statues of various sizes, looks like a forest of marble. The style of architecture is a kind of florid gothic; the front is of a mixed style. The interior is vast and imposing, and not loaded with ornaments. There are 520 steps to ascend, in order to reach a gallery which runs round the principal spire, from which there is a most splendid view of the whole Lombard plain, and of the chain of the Alps which borders it in the form of a crescent on the north side. The churches of Milan abound with fine paintings: the famous Last Supper, by Leonardo da Vinci, in the refectory of the former convent of Santa Maria delle Grazie, though sadly injured, is not yet quite obliterated.

Milan is a gay, thriving, modern city: its markets are abundantly supplied with every luxury, and the citizens are generally fond of good living. Numerous coffee-houses, splendid hotels, abundance of handsome carriages, elegantly dressed pedestrians, several theatres well supplied with actors and singers,—all attest the habits of a luxurious capital. Milan has been styled "the little Paris;" and the appellation is appropriate, for it resembles that capital rather than the other Italian cities. But Milan is also a centre of learning: it is the place of residence of several of the best Italian writers, and more books are published yearly at Milan than in all the rest of Italy. The fine arts are successfully cultivated at Milan, as the annual exhibition of the works of living artists prove. The museum of Brera contains several excellent paintings of the great masters; among others the Agar of Guercino, the Marriage of the Virgin by Raphael, and St. Peter and St. Paul by Guido. The Ambrosian library is well known for its numerous and valuable manuscripts, and especially for its palimpsests, derived from the monastery of Bobbio, and among which Mai discovered the treatise 'De Republica' of Cicero, fragments of several of his lost orations, the letters of Marcus Aurelius and Fronto, and other valuable remains of ancient literature. The library of Brera contains 100,000 volumes, and is open to the public. Among the private libraries, that of the marquis Trivulzio contains 30,000 printed volumes and 2000 manuscripts.

Milan abounds with charitable institutions. The great hospital, one of the finest and largest in the world, has been richly endowed by numerous benefactors, whose portraits are preserved within it. Four houses of refuge for poor children are supported by public contributions. There are two large workhouses for the unemployed poor, and a house of correction for criminals, who are employed in useful labour. Milan has a savings bank, an insurance company, a military college, a veterinary school, a conservatorio or school of music, and a school of the fine arts. For general education, there are two Lyceæ, three gymnasia, a clerical seminary, and three colleges for higher female education. The elementary schools are numerous. [LOMBARDO-VENETIAN KINGDOM.] The Society of Arts and Sciences bestows annual prizes for inventions relating to agriculture and manufactures. The manufactures of Milan are of some importance: they consist chiefly of silks, printed cottons, plate-glass, jewellery, artificial flowers, braid, soap, and leather.

Milan is an archbishop's see. It has a court of appeal, tribunals of first instance, and of commerce. The fortifications were greatly strengthened, and 14 detached forts erected round the town in 1850.

The public gardens, the ramparts, the great parade, which occupies the site of the old citadel, and the several avenues planted with trees which lead from the gates in various directions, afford pleasant walks and rides. The climate of Milan is hot in summer, but occasionally cold and foggy in winter: it is however considered healthy.

The Circo, or modern amphitheatre, built in the time of the French dominion, for the exhibition of chariot and horse races, bull-fights, and other games, is of an oval form. The arena, which is about 800 feet in length, can be filled with water and transformed into a naumachia for boat-races.

Amongst the palaces, some of which are of striking elegance and grandeur, may be named—the Palazzo Arcivescovile ('archiepiscopal palace'), with its façade of simple grandeur; the Palazzo Visconti, remarkable for the series of large busts on the pediments of the principal floor windows; the Palazzo Annona, by Fiancesco Richini, in a rather peculiar yet majestic style; the Palazzo Marini, or Di Finanza, the work of Galeazzo Alessio, which, although impure in taste and too much crowded, is an exceedingly rich and picturesque as well as extensive pile of buildings, whose principal façade exhibits three orders, a Doric, an Ionic (in pilasters), and one consisting of fluted termini, surmounted by masks or busts for their capitals. Among the more recent structures of this class is the Palazzo Belgioioso, by Giuseppe Piermarini, the architect of the Della Scala theatre, the Monte, or public bank, and various other edifices; the Villa Belgioioso, by the architect Leopoldo Pollak; and the Palazzo Belloni, the work of the celebrated Cagnola, who likewise erected the magnificent marble triumphal arch called the Arco della Pace. Somewhat akin to this last-mentioned structure are several of the arches, or gateways, forming the entrances into the city. Among these the most remarkable in point of design is the Porta Ticinense, or Di Marengo, a classical propylæum of the Ionic order, presenting a double distyle in antis, that is, one in each front, connected by lateral walls, each pierced by a single plain arch. This also was designed by Cagnola. The Porta Nuova, by the architect Zanoia, is a very tasteful design, and one that shows considerable originality. The Porta Orientale again, with

the adjoining buildings, by Vantini, makes a rich architectural display.

The Arco della Pace, the principal work of its architect, the Marchese Luigi Cagnola, was commenced in 1807, and carried on until his death, August 10, 1833, after which it was continued by Carlo Londinio, and finally completed in 1837. It stands on the north-west side of the city, where it forms the entrance from the road of the Simplon into the spacious Piazza d'Armi, and is not only completely insulated, but so situated as to be seen to the utmost advantage from every point of view, particularly as regards its two principal fronts, one of which faces the noble avenue above mentioned, and the other, or that towards the city, is viewed between two elegant Doric marble buildings (serving as guard- and toll-houses), which are placed a little in advance of it, and are about three times the breadth of its front apart from each other. The arch, which is entirely faced with marble, and highly enriched in every part with reliefs and sculptures, besides statues both upon and in front of the attic, forms an architectural mass whose general dimensions are—72½ feet English by 42½ feet in depth, and 74 feet in height, or, including the sestiga and statue on its summit, the extreme height is 98 feet. Each of the principal fronts exhibits four fluted Corinthian columns, with half-columns behind them; and between them a centre arch (24 feet wide and 48 feet high) and a smaller one (10 feet 9 inches wide and 28 feet high) on each side of it. The entablature (the frieze of which is enriched throughout with figures of genii holding festoons) forms only a single projecting break on each side of the centre, whereby the inconvenience is avoided of such a mass of stone being suspended over the wider centre intercolumn. A single recumbent figure is placed on these projecting entablatures. Those on the side towards the city represent the rivers Ticino and Po, on the other the Adige and Tagliamento; the two former of which were executed by Cacciatori, and the latter by Pompeo Marchesi.

There is no transverse passage through the Arco della Pace from end to end, but merely an opening through the piers separating the larger arch from the one on each side of it, owing to which the external sides or ends of the structure have the expression of greater solidity. At each angle of the attic is a bronze equestrian statue of Victory, about 13 feet high; and on the side towards the city the centre is crowned by a colossal figure of Peace (modelled by Sangiorgio, and cast in bronze by Luigi and Antonio Manfredini) in a car with six horses. Of the various other sculptures and reliefs that adorn this magnificent work, no enumeration can be here given.

Milan, under the name of Mediolanum, was a town of the Cisalpine Gauls. (Livy, v. 34; Polybius, b. xi.) It was taken by the consuls M. Marcellus and C. Cornelius Scipio, B.C. 221. Little is said in history of Milan afterwards until the end of the 3rd century of the Christian era, when Maximianus, the colleague of Diocletian, fixed his residence at Milan, and surrounded it with walls, which were two miles in circumference, and which continued to inclose the area of the town till the time of Frederick I., in the 12th century. Valentinian II., Theodosius I., Honorius, and other emperors of the 4th and 5th centuries, resided occasionally at Milan. At the fall of the Western empire, Milan was twice devastated, once by Attila, and afterwards by the Goths under Vitiges, A.D. 539, and it did not recover from their ravages for several centuries after. In the latter part of the 9th century the archbishop Anspertus restored the walls built by Maximianus, and thus gave security to the inhabitants. From that time Milan recovered, and grew in population and wealth, and became gradually the principal city of Lombardy. [LOMBARDO-VEGETIAN KINGDOM.] The present city of Milan has no claims to classical antiquity, the only remains of Roman construction being 16 handsome fluted pillars near the church of San Lorenzo.

An insurrection against the Austrians broke out in Milan in March, 1848, in consequence of which Field-Marshal Radetzky, at the head of the Austrian garrison, retreated eastward, gathering all the garrisons in his march to the line of the Mincio. Charles Albert, king of Sardinia, advanced to Lombardy at the head of his army to support the insurgents, and accompanied rather than aided by a rabble of Italian republicans, pursued the Austrians. Engagements on the whole favourable to the Italian cause, as it was called, took place at Goito and Sonna Compagna, and Peschiera capitulated to the Sardinians (May 30th), but they failed in their attack upon Verona. Meanwhile the question of a prompt union of Lombardy with Sardinia was put to the vote in all the communes of Lombardy by the provisional government of Milan, and carried by 561,002 votes, only 681 voting for delay. Charles Albert, at his head-quarters in Garda, on the lake of that name, signed the act of union, which was ratified by the Sardinian parliament by 127 voices against 7. On the 23rd of July, the Field-Marshal having put down the insurrection in the Venetian provinces, and gathered his reinforcements, advanced from the Adige to Vallegio, and the heights of Custozza on the Mincio, where a decisive battle fought next day resulted in the defeat of the Piedmontese army, and their retreat to Goito on the right bank of the Mincio. In vain the provisional government at the instigation of Mazzini, appointed a committee of defence to organise a 'levy-en-masse' against the Austrians; the latter advanced, receiving the submission of Cremona, Pizzighetton, and other towns on their march. Pursuers and pursued reached the neighbourhood of Milan together, where, after a short

engagement, the Sardinians took refuge in the town, and next day, August 5th, capitulated to Field-Marshal Radetzky. [See SUPP.]

MILBORNE. [SOMERSETSHIRE.]

MILDENHALL, Suffolk, a market-town, and the seat of a Poor-Law Union, in the parish of Mildenhall, is situated in 52° 20' N. lat., 0° 31' W. long., 12 miles N.W. by W. from Bury St. Edmunds, and 70 miles N. by E. from London. The population of the parish in 1851 was 4374. The living is a vicarage in the archdeaconry of Sudbury and diocese of Ely. Mildenhall Poor-Law Union contains 13 parishes and townships, with an area of 63,629 acres, and a population in 1851 of 10,351.

Mildenhall stands on the border of the fen country, a little to the left of the road from London to Norwich. It is irregularly laid out; the streets are lighted with gas; the houses are for the most part well built. The church, a large handsome edifice, in the perpendicular style, with a tower 120 feet high, has lately undergone extensive alterations and repairs. The roof is of wood, handsomely carved. There are chapels for Baptists and Calvinistic and Wesleyan Methodists, a National school, and a mechanics institute. The market is on Friday, and there is a considerable fair in the beginning of October. The river Lark, which passes the town, facilitates the export of corn and agricultural produce.

MILFORD. [DERBYSHIRE; HAMPSHIRE.]

MILFORD, Pembrokeshire, a market-town, borough, and sea-port, partly in the parish of Steynton, and partly in that of Hubberston, is situated on the north shore of Milford Haven, in 51° 41' N. lat., 5° 1' W. long., 12 miles W.N.W. from Pembroke, and 253 miles W. by N. from London. The population of the borough of Milford in 1851 was 2837.

Milford rose into importance about the commencement of the present century, when it was made a station for the mail packets communicating with the south of Ireland, and docks and quays were erected at the port. A royal dockyard, and slips for building ships of war were constructed, and an arsenal was established. In 1814 the dockyards at Pater or Pembroke on the opposite side of the Haven were erected, and the naval establishments were removed from Milford. Some years later the station of the mail steamers for Waterford was removed to Hobb's Point at Pater. After these events the prosperity of Milford declined. The construction of new docks is expected to benefit the town. From the salubrity of the climate, and its convenience for sea-bathing, Milford is much resorted to by invalids. There are in Milford a handsome church, erected in 1806, places of worship for Wesleyan Methodists, Independents, Baptists, and Quakers; an Endowed National school, a British school, a mechanics institute, and a reading-room. There is a neat market-house, and markets are held on Tuesday and Saturday.

The number of vessels registered as belonging to the port of Milford, on the 31st December, 1853, was:—Under 50 tons 73, tonnage 1979; above 50 tons 70, tonnage 8494; with one steam-vessel of 48 tons. During 1853 there entered the port 739 sailing-vessels, of 33,002 tons, and 161 steam-vessels of 38,539 tons; and there cleared 1307 sailing-vessels of 44,899 tons, and 49 steam-vessels of 12,485 tons. Milford Haven is spacious, safe, and easily accessible in all weathers; large numbers of vessels are frequently protected in the Haven. On St. Ann's Point, at the western extremity of the Haven, are two light-houses, erected in 1800. Some small forts called blockhouses still remain, which were erected by Henry VIII.

MILFORD, county of Donegal, Ireland, a small post-town, and the seat of a Poor-Law Union, is situated about half a mile S. from Mulroy Bay, in 55° 5' N. lat., 7° 42' W. long., 27 miles N.N.W. from Lifford, and 156 miles N.N.W. from Dublin by road. The population in 1851 was 437. Milford Poor-Law Union comprises 12 electoral divisions, with an area of 111,336 acres, and a population in 1851 of 31,552. The town contains a few shops, some good houses, and the Union workhouse. Petty sessions are held on the second Thursday of every month. A market or fair is held on the 23rd of every month.

MILHAU. [AVEYRON.]

MILITARY FRONTIER. This is the name given to a tract of country which extends from the Adriatic Sea to the Bukovina, between the frontiers of Illyria, Croatia, Slavonia, Hungary, Transylvania, and those of Turkey. Its length is about 1000 miles, from the Adriatic, near 16° 48' E. long., to the defile of Ostocz, in 26° 25' E. long., and it lies between 44° 7' and 47° 36' N. lat.; its breadth varies in different parts. The area is about 13,000 square miles. The whole of this tract comprises—1, the western or Croatian Military Frontier; 2, the Slavonian Military Frontier; 3, the Hungarian or Banat Military Frontier; 4, the Transylvanian Military Frontier. The Military Frontier now forms one of the crownlands of the Austrian empire, and is divided into two military commanderies, the area and military population of which, according to the official returns of 1850-1, are as follows:—

Commanderies.	Area in Square Miles.	Population in 1851.
Croatia and Slavonia . . .	7,500	670,655
Banat and Servia . . .	5,398	338,454
Total . . .	12,898	1,009,109

This tract is distinguished from the rest of the Austrian monarchy by having its own purely military government. All the peasants are soldiers, of whom, in time of peace, 45,000 men are constantly under arms; but in 1815, before the peace, there were 62,000. This force was originally intended as a barrier against the inroads of the Turks. By this tenure the peasants hold from the state the hereditary usufruct of their lands. This singular institution secures to the state the services of a great military force (there being above 100,000 men capable of bearing arms), which in time of peace costs the state nothing. These well-trained and disciplined soldiers defend their own frontier both against hostile attacks and the plague without pay, and in time of war serve the state in the same manner as the rest of the army, and receive the usual pay. They are divided into eighteen regiments, the whole numbering 46,842 in time of peace, and 84,720 in time of war. There is besides a battalion of *csalkists*, or boatmen, numbering 1297 in peace, and 2049 in time of war, who cruise on the Danube, the Save, and the Theiss, in small galleys carrying howitzers. Each regiment consists (in time of peace) of two battalions or twelve companies, which serve in turn, has its own staff, and is commanded by a colonel, who exercises both the civil and military authority. Two regiments make a brigade. The military authority is divided among what are called two general commanderies, the seats of which are at Agram for the Croatian and Slavonian frontier, and at Temesvar for the Banat and Servian frontier. The whole is under the supreme direction of the Aulic Council of War at Vienna. According to the military constitution, the generals superintend the civil affairs and the administration of justice. Under the general are the regimental commanders, who are in the place of district authorities; in short, all civil officers hold military rank.

A great part of the country is mountainous, the western part being traversed by the Julian Alps, and the eastern by branches of the Carpathians. Many fine valleys, some of them rich in picturesque beauty, lie between the branches of the mountains; the remainder of the country is pretty flat. The western part of the Banat is a sandy plain covered with sand-hills from 60 to 180 feet high. On the banks of the Danube, the Theiss, and the Temes, there are extensive marshes. In the mountainous parts the temperature is that of more northern countries; whereas the lower central parts enjoy a climate resembling that of Italy. The soil is on the whole very fruitful, especially in the plains, and in several valleys of the Banat. For the natural productions see CROATIA, and HUNGARY.

There are no manufactures of any importance. The women, as well as the men, show great skill and ingenuity in manufacturing almost every article for their own consumption. There is a very great export trade in the productions of the country. The extensive forests supply great quantities of excellent timber.

The population above given comprises only the military colonists of these frontiers; in the towns, and at various points along this territory, are besides numbers of people engaged in trade and commerce, who swell the total population to 1,226,408. Of this number 514,545 are Catholics, 62,743 United Greeks or Greek Catholics, 598,603 Non-United Greeks, 14,536 Protestants of the Augsburg Confession, 31,053 Calvinists, 4341 Unitarians, and 537 Jews. The population is of many different races, two-thirds however being of Slavonian origin, namely, Croats, in the Croatian Military Frontier, and the Slavonians and Servians in Slavonia and the Banat. The three other less numerous nations are the Wallachians in the Transylvanian and Banat Military Frontier, and the Hungarians and Szeklers in Transylvania. Besides these there are Magyars, Germans, Greeks, Jews, and Gipsies. The Clementines are of Albanian origin, so called from their leader Clement. They are not above 2000; they inhabit two villages in the district of Peterwardein, and have retained their manners and language.

The great variety of costume appears surprising to a stranger; each nation and tribe has its own costume. The people are described as possessed of great natural talents, acute, docile, very patriotic, devotedly attached to the Imperial house, hospitable, fond of music and poetry, and possessing a great degree of national pride. All the branches of a family (called a house communion) live together, and several generations are found at the same time in one house. The head of the family, called the *Gospodar* (House-father), exercises a kind of patriarchal authority, which all the members are bound to respect and obey. The mother, who is called *Gospodarizza*, presides over the internal affairs, and superintends the female members of the family. The property of the family is in common, and no one is exempt from the duty of working. Each person who works has an equal share in the produce, but the *Gospodar* and his wife have each a double portion. No member is allowed to have land or cattle of his own; but he may possess money and furniture. He who leaves the house without the consent of the elders and the regiment is reputed a deserter. Daughters who marry into another house have a smaller portion. Such a family often consists of 30, 40, and even 80 members.

The territory, now called the Military Frontier, has been subjected to its peculiar organisation only since the 16th century. Before that period long wars, pestilence, and famine had rendered this vast sweep of country almost a desert waste. Even in time of peace the Turks used to dash across the frontier in savage quest after Christian heads and ears, for which they received a fixed sum from their pashas. The

emperor Ferdinand I. in order to check this inhuman barbarity, partitioned out a part of Croatia among military colonists, who were to cultivate the hitherto neglected soil, and to repel the inroads of the Turks. The system has been since gradually perfected and extended all along the Turkish border of Austria; and a chain of watch-posts stretches all along the frontier. The system of outposts has not only served to protect the empire from Turkish invasion and from the inroads of the plague (for it was a highly efficient sanitary cordon), but it is equally useful as a preventive service to check smuggling. Guard-houses constructed of wood or stone, sometimes merely of boughs, at intervals of about two miles, stretch away over mountains, through valleys, and along the swampy banks of the rivers. In each are 6 or 8 men, one of whom is constantly on the look-out in each by day, and at night constant communication is kept up by patrols. By means of beacon-fires, shots, and bells, the whole force of the military frontier can be alarmed and assembled at the head-quarters of the regiments in 12 hours.

Of these frontier colonists (*Grünzer*) every male from 18 to 60 years of age is at his own disposal. Every border family according to its numbers has its *fief* (about 50 acres), half-*fief*, or quarter-*fief*, which is cultivated in the intervals of duty, the emperor (who, in consequence of the destruction of the original landowners by the Turks, is proprietor of nearly the whole frontiers), receiving so many days of military service instead of rent. Each *fief* is bound to maintain a certain number of soldiers. To every company in a regiment an agricultural officer is attached, in order to promote the cultivation of the land; nevertheless so much of the men's time is occupied with military duty that agriculture is in a very backward state. Education is much more widely diffused among them than in the neighbouring parts of Hungary; two-thirds at least of all the children are taught in the public schools. (*Oester-reichische National Encyclopedie.*)

MILLBROOK. [BEDFORDSHIRE; CORNWALL; DERBYSHIRE; DURHAM; HAMPSHIRE.]

MILLEDGEVILLE. [GEORGIA, U. S.]

MILLOM. [CUMBERLAND.]

MILLEORT. [CUMBRAE.]

MILLSTREET, county of Cork, Ireland, a post- and market-town and the seat of a Poor-Law Union, is picturesquely situated in a valley on the Finow, a tributary of the Blackwater, and on the road from Dublin by Mallow to Killarney, in 52° 3' N. lat., 9° 4' W. long., distant 37½ miles W.N.W. from Cork, and 190¾ miles S.W. from Dublin. The population in 1851 was 1504, besides 2191 in the workhouse. Millstreet Poor-Law Union comprises 12 electoral divisions, with an area of 74,905 acres, and a population in 1851 of 17,261. The town contains a church, a Roman Catholic chapel, National schools, a brickwell, a district dispensary, and infantry barracks. Petty sessions are held monthly, and fairs on the 1st of March, June, September, and December. In the neighbourhood is Drishane Castle, erected in 1436.

MILLTOWN. [CLARE; KERRY.]

MILNTHORP. [WESTMORELAND.]

MILO, MELOS, one of the larger Cyclades in the Ægean Sea, about 70 miles N. of the coast of Crete, and 65 miles E. of the coast of the Peloponnesus. It is 14 miles long from east to west, and its breadth is about 8 miles. Its northern coast is indented by a deep bay, which forms a natural harbour, one of the best and safest in the Levant. The surface of the island is mountainous, and of volcanic formation; it has hot mineral springs, and mines of sulphur, vitriol, and alum. The soil is fertile, and produces abundance of fruit, wine, oil, and pasture for cattle. The population, which was above 20,000 in the time of Tournefort, is now stated to be only about 4000.

The chief town, also called Milo, is in the east part of the island, near the port, where are extensive remains of the ancient capital of the island. The lower grounds near the sea are marshy, and are said to render the air unwholesome in summer.

Melos is said to have been colonised first by the Phœnicians, and afterwards by the Lacedæmonians. During the Peloponnesian war the Athenians sent an armament to reduce it, but the attempt failed. Some years later the Athenians, after a siege of several months, took the town of Melos, and put to death all the adult males, and carried away the women and children as slaves, after which a colony of Athenians was sent to occupy the place. (Thucyd., iii. 91; v. 84, &c.) Melos, like the other Greek islands, became subject successively to Rome, the Byzantine emperors, the Venetians, and the Turks. It now forms part of the new kingdom of Greece, and is included in the nome of the Cyclades, of which Syra is the capital.

North of Milo is the rocky island of *Cimolus*, now called *Cimoli* by the Greeks, and by the Italians ARGENTIERA, from a silver-mine which was formerly worked on the island. The channel between Milo and Argentiera is only half a mile wide, and very dangerous in stormy weather. Off the entrance of the strait to the east, and about five miles from the eastern coast of Milo, is the little desert island of *Anti-Milo*, the highest point of which is in 36° 47' 42" N. lat., 24° 14' 41" E. long.

MILTON, sometimes distinguished as Milton-next-Sittingbourne, Kent, a small market-town, and the seat of a Poor-Law Union, in the parish of Milton, is situated on the side of a hill sloping down to a creek or arm of the river Swale, in 51° 21' N. lat., 0° 43' E. long., 11

miles N.E. from Maidstone, and 39½ miles E.S.E. from London. The population of the parish in 1851 was 2407. The living is a vicarage in the archdeaconry of Maidstone and diocese of Canterbury. Milton Poor-Law Union contains 18 parishes and townships, with an area of 32,598 acres, and a population in 1851 of 11,992.

Milton was a place of some importance in the time of the Saxons. It contains many good houses and cottages of recent construction, a large and handsome church, chapels for Baptists and Independents, and National schools. There is a good oyster-fishery; and the port forms the point of communication with London for the district in which Milton is situated. Saturday is the market-day; a fair is held yearly. Paper-making, brick-making, tanning, and other occupations are carried on. In the centre of the town is an ancient court-house, with the town-jail in the lower part of the building.

MILTON ABBAS. [DORSETSHIRE.]

MILVERTON. [SOMERSETSHIRE.]

MINAS GERAES. [BRAZIL.]

MINCHINHAMPTON, Gloucestershire, a market-town in the parish of Minchinhampton, is situated in 51° 42' N. lat., 2° 11' W. long., distant 14 miles S. by E. from Gloucester, and 98 miles W. by N. from London. The population of the parish in 1851 was 4469. The living is a rectory in the archdeaconry of Gloucester and diocese of Gloucester and Bristol.

Minchinhampton is an irregularly-built market-town, pleasantly situated on a gentle declivity. It is in the clothing district of which Stroud may be considered the centre. There are three market-houses, two of which were erected in 1700 by Mr. P. Sheppard, with the design of establishing a wool-market, but the attempt was unsuccessful. The cloth manufacture is carried on along the banks of the numerous brooks and rivulets in the vicinity. The church, which is cruciform, was founded about the reign of Henry III. by the nuns of Caen: it was rebuilt in 1842. There are chapels for Wesleyan Methodists, Association Methodists, and Baptists, a Free school, a National school, and a dispensary. The market-day is Tuesday: fairs are held on Trinity Monday and October 27th. Amberley, a tract of common land on the west side of the town, is the site of a remarkable encampment, supposed to have been made by the Danes during their occupation of Cirencester in 879. The encampment extends about three miles.

MINCIO. [AUSTRIA; PO.]

MINDANAO. [PHILIPPINE ISLANDS.]

MINDEN, the most eastern of the three governments into which the Prussian province of Westphalia is divided, has an area of 2024 square miles; the population in 1847 was 459,833. The soil is of unequal quality. There are some barren spots, but the greater part is fertile in corn; hemp and flax also are generally cultivated, linen and thread being the chief industrial products. The pastures are good, and cattle abound. Iron, lead, and salt are the most important mineral products. The Weser is the principal river, and the trade on its banks is very considerable. The Lippe drains the southern part of the government. [WESTPHALIA.]

Minden, the capital of the government and a strongly fortified town, is situated 37 miles by railway W. from Hanover, 230 miles from Berlin, and 161 from Cologne, in 52° 18' N. lat., 8° 53' E. long., on the left bank of the Weser, here crossed by an old bridge 600 feet long. It is one of the oldest towns in Germany. The streets are narrow and irregular; the old-fashioned houses are in general built of stone or brick. The Domplatz, or cathedral-close, is a handsome square, planted with trees. Among the public buildings, the largest and handsomest is the Roman Catholic cathedral, which was completed in 1072; it is built in the lower part of the town, on a foundation made with piles. Besides the gymnasium (which had 15 teachers and 243 pupils in 1850) and a seminary for schoolmasters, there are several public schools, the Westphalian museum, and other useful institutions. The manufactures are woollen stuffs, linen, leather, tobacco, sugar, vinegar, beer, and brandy. In the vicinity there are oil- and saw-mills. The population of the town exceeds 9000. The French were defeated near Minden on the 1st of August, 1759, by an Anglo-Hanoverian force under Prince Ferdinand.

Paderborn, the capital of the old principality of Paderborn, now included in this government, is an ancient gloomy town with about 9000 inhabitants, situated about 40 miles S. from Minden, on the Westphalian railroad from Hamm to Warburg, which joins the Cologne-Minden line to the Thuringian railway through Cassel, Gotha, and Leipzig to Dresden. The town, which is built at the source of the Pader, a feeder of the Lippe, is surrounded by a wall pierced with five gates. The cathedral is the principal building; the former university is now a Roman Catholic theological college. Paderborn gives title to a Roman Catholic bishop; the see was founded in the time of Charlemagne. The town was a member of the Hanseatic League. The Catholic gymnasium of Paderborn had 22 teachers and 506 pupils in 1850.

Herford, 15 miles S.W. by railway from Minden, on the Werra, a feeder of the Weser, is a walled town, and has 6000 inhabitants, who manufacture cotton-twist, calico, linen, tobacco, and leather. It has a large prison, an arsenal, a gymnasium, a museum, and six churches.

Bielefeld is described in a separate article. [BIELEFELD.]

MINDORO. [PHILIPPINE ISLANDS.]

MINEHEAD. [SOMERSETSHIRE.]

MINERVINO. [BARI, TERRA DL.]

MINGRELIA. [GEORGIA.]

MINHO, RIVER. [PORTUGAL.]

MINNESOTA, a territory of the United States of North America, lies between 43° 30' and 49° 22' N. lat., 90° 0' and 102° 30' W. long. It is bounded E. by the state of Wisconsin, N.E. by Lake Superior, N. by British North America, W. by the territory of Nebraska, and S. by the state of Iowa. The area is estimated at 141,839 square miles; the population in 1850 was 6077, or 0.04 to the square mile: but this does not include the native Indians living in tribes.

The surface of this territory has generally the character of an immense high 'rolling prairie land,' but there are considerable exceptions. Towards the eastern side it runs into a ridge of lofty hills, which traverses a large portion of it in a north-east and south-west direction. From a short distance above the Falls of St. Anthony, on the Mississippi, there extends southward a vast forest region for 120 miles, with a breadth ranging from 15 to 40 miles. The northern and north-eastern portion of the territory is sometimes termed the 'region of lakes,' from the great number of lakes of various sizes which here lie along the upper course of the Mississippi and its tributaries; and for some distance below this region the Mississippi traverses a swampy country.

The territory is in every part abundantly watered. The Mississippi rises within its boundaries, in Lake Itasca; and belongs wholly to it down to the confluence of the St.-Croix, after which to the southern boundary of the territory, it belongs equally to Minnesota and Wisconsin. This part of its course is described under MISSISSIPPI RIVER. The principal tributaries which join it in this territory are the St.-Croix, which separates Minnesota from Wisconsin, and the Minnesota, a large and broad stream, which rises near the centre of the territory, flows through Big Stone Lake, and after a course including its windings of some 500 miles, first south-east, then south, and finally north-east, falls into the Mississippi at Fort Snelling. The Mississippi is navigable in Minnesota by steam-boats during seven months of the year: the other five months it is, with its tributaries, closed by ice. The Missouri, with its tributary the White Earth River, forms the western boundary of Minnesota: it is navigable by steam-boats throughout Minnesota. It is joined by several small feeders, but by none of any consequence in this territory. The Red River, which flows northward to Winnipeg Lake in British America, has its source in, and belongs for a very considerable distance to Minnesota, and has numerous tributaries in this part of its course. The Big Sioux and several other rivers have also their upper courses in this territory. The Mississippi, Missouri, Minnesota, and St.-Croix rivers, with Lake Superior, afford great commercial facilities: while the numerous smaller streams and lakes afford like facilities for agricultural and manufacturing operations. The principal lakes are the Itasca, Cass, Red, Leech, Devil, Ottortail, Big Stone, and Pepin lakes, which range from about 5 to 20 miles long.

As regards its geological character, the larger half of the country, including the centre and north-eastern portions, appears to belong to the igneous and metamorphic formations. In the northern and south-eastern districts are extensive tracts of Lower Silurian rocks. Extending from the centre eastward to Lake Superior is a narrow band of New Red-Sandstone, with dykes of copper trap. The Missouri through its whole course in Minnesota appears to flow through cretaceous rocks, which are bordered on the east by tertiary formations. Copper- and lead-ores are said to have been found.

The climate, though severe, is not subject to rapid or extreme variations. The winters are long, but owing to the stillness of the air during winter, the coldest weather is endurable. A great quantity of snow falls in the winter, but generally there is not much moisture. The soil over a country so vast in extent, and having such different lithological features, is of course greatly varied; but in the settled parts it is found to be remarkably fertile, and the mould is of unusual depth. Most of the cereals appear to flourish: maize, oats, and wheat are the crops most cultivated, but rye, barley, and buckwheat are also grown. Potatoes, peas, and beans are raised to some extent. The broad prairies appear well adapted for raising stock. There are at present no manufactures in the territory. The chief occupation is the cutting and preparing of pine lumber, much of which is retained for home consumption, but the larger portion is sent to St. Louis.

At the census of 1850 Minnesota was divided into 9 counties. The political capital is St. Paul, the only place which can as yet fairly take rank as a town; but Pembina, on the right bank of the Red River, at the northern boundary of the territory—Fort Snelling, at the confluence of the Minnesota with the Mississippi—and Stillwater, on the west side of St. Croix Lake, are places of growing local importance.

St. Paul, the capital, occupies a commanding position on the left bank of the Mississippi, 15 miles below the Falls of St. Anthony, in 44° 52' N. lat., 93° 4' W. long. The first trading house was built here in 1842, it having previously been merely the station of a Roman Catholic mission. It now contains a state-house 139 feet long, a court-house, jail, nine churches, schools, numerous hotels, stores, an iron-foundry, agricultural implement factories, flour-mills, &c. The streets are traversed by coaches and omnibuses; and, whilst the river is free

from ice, steam-vessels arrive and sail daily, although the vicinity of the town is still a wilderness. In 1850 St. Paul had 1135 inhabitants; in the spring of 1853 it is said to have had above 2500.

Minnesota has a legislature, consisting of a Council and House of Representatives. By the constitution, as framed by the territorial legislature, citizenship is not limited to whites, but extended to "all persons of a mixture of white and Indian blood who shall have adopted the habits and customs of civilised men." Minnesota was erected into a territory by Act of Congress in March 1849; that portion of it west of the Mississippi having previously formed a part of the territory of Iowa, and that part east of the Mississippi having belonged to the territory of Wisconsin.

(*Statistical Gazetteer of the United States; Seventh Census of the United States; American Almanac, 1854; Owen, Report of a Geological Survey of Wisconsin, Iowa, and Minnesota; Marcou, &c.*)

MINNHIVE. [DUMFRIESSHIRE.]

MINORCA. [MENORCA.]

MINSK, a government of European Russia, in the division called West Russia (formerly Lithuania), lies between 51° 12' and 55° 50' N. lat., 25° 18' and 30° 50' E. long. It is bounded N. by Witepsk, E. by Mohilev, S.E. by Tschernigov, S. by Kiev and Volhynia, and W. by Grodno and Wilna. Its area is 34,830 square miles, and the population in 1846 amounted to 1,046,400. The face of the country is one vast plain, broken only here and there by a hill or by the high banks of the rivers. In the north and east there are large forests, and on the south and south-west extensive marshes. There is a great diversity of soil. In the north it is dry, and in some parts extremely fertile, but traversed by heaths and barren sandy tracts: in the south it is generally wet and marshy, yet it contains large tracts which are very fertile; the marshes also are rendered productive with little labour, and even the heaths yield to the efforts of cultivation.

The principal rivers are the DÜNA and the DNIEPER, both of which however only touch the frontier; the former flows for a short space between this province and Wilna, and the latter on the south-east divides it from Tschernigov. Among the rivers that flow into the Düna are—the Desna, which comes from Wilna, and joins it at the town of the same name; and the Ulla, which feeds the Beresina Canal, which unites the Beresina, the Düna, and the Dnieper. The NERMEN, and its feeder the Vilia, both rise in the government of Minsk. The Dnieper receives from this province two of its most important tributaries—the Pripetz, which comes from Grodno, and the Beresina, which rises in the circle of Desna, and having received several minor streams falls into the Dnieper on the frontier of this province. There are many other rivers of less note. The province has no great lakes.

The climate in winter is so severe that the rivers are every year frozen over for some time; in spring there are frequently hard frosts at night; the summer is hot, and drier in the north than in the south; in autumn the weather is agreeable and not variable, but the night-frosts return in September, and winter begins at the end of October. The disease called 'Plica Polonica' is common.

Agriculture is the chief occupation of the inhabitants, but it is in a most backward state. The grain generally cultivated is rye, of which there is a considerable surplus for exportation. The peasants grow also some barley and oats, and the nobles and great landowners grow wheat. Buckwheat is grown on the heaths. Flax and hemp of excellent quality are important products. There are extensive forests of fine trees, especially fir, which supply good timber for building, planks, and masts, and yield likewise much resin, pitch, and potash. All kinds of game abound in the forests, which contain deer, wolves, bears, lynxes, foxes, beavers, otters, gluttons, ermines, martens, and wild boars. The horses are of the Polish breed, and are very spirited and hardy, but neither handsome nor large. The aurochs, or wild bull, is sometimes met with in the deepest recesses of the forests. Cattle and sheep are bred in great numbers; in general the sheep are of inferior breed, and yield coarse wool. Goats, swine, and bees are kept everywhere. Though the rivers abound in fish, they do not yield enough for the consumption, and great quantities of fish are brought from the interior of Russia and from the Baltic. Polish cochineal is collected, especially in the south, in great quantities, and manna is found in all the fields and meadows. The minerals are lime, marl, and stone for building, but there is no metal except bog-iron.

The domestic industry of the country-people consists in spinning and weaving flax, hemp, and wool, of which they make linen; sail-cloth, and coarse woollen-cloth for the peasantry, but their dwellings are so small that they have scarcely room for a loom. They distil brandy enough for their own consumption. The manufactories are very few in number, and inconsiderable. The chief articles of exportation are square timber for ship-building, masts, spars, planks, pipe-staves, and potash; besides flax, hemp, tow, linseed, corn, honey, wax, cochineal, and cattle. The greater part of the inhabitants are of the Greek Church; but the Catholics are very numerous; and there are also some Protestants. The Tartars have their mosques, and the Jews synagogues. This is one of the most miserable of the former Polish provinces; the towns and villages are in general wretched, chiefly occupied by Jews, who are almost exclusively the shopkeepers, publicans, distillers, and even butchers. The petty nobility are scarcely above the peasants, of whom only the Tartars are reckoned

GEOG. DIV. VOL. III.

free, while the Russniaks, Lithuanians, and gipsies are in the most degraded state of vassalage, which is greatly aggravated by the non-residence of the great landowners.

Minsk, the chief town, in 53° 40' N. lat., 27° 40' E. long., is situated on the river Switocz, one of the tributaries of the Beresina. Like all old Polish towns it is irregularly built, with narrow crooked streets. It has a fine cathedral, a handsome theatre, a gymnasium, and an abbey of the Greek Church. Minsk is the seat of a Greek archbishop and of a Roman Catholic bishop, as well as of the government of the province. There is some trade, manufactures of cloth and leather, and a much frequented fair. The inhabitants number about 24,000.

The other towns are:—*Bobrouisk*, a fortress on the Beresina, with 4700 inhabitants; *Sluzk*, with 5000 inhabitants; *Dawidow*, on the Horyn, with 3500 inhabitants; *Pinsk*, which is surrounded with extensive marshes, and has considerable manufactories of Russian leather, with 4500 inhabitants; and *Borissow*, on the Beresina: population, 3000.

MISSISSIPPI (or the "Great Water," as the term signifies in the native language), one of the largest rivers on the globe, which drains, with its numerous branches, a surface of about 1,300,000 square miles, and probably not less than one-fifth of the North American continent.

Its basin extends from 29° to 50° N. lat., and from 77° to 112° W. long. It is widest on the west, averaging from north to south, and west of 90° W. long., about 1200 miles, whilst its average width east of 90° W. long. does not exceed 560 miles. The greatest length of the basin from east to west is near 42° N. lat., where it measures nearly 1500 miles. Its basin comprehends, besides the immense tract of country along its western and north-western border, still in possession of the aboriginal tribes, the territory of Minnesota, which contains its source and head streams; and that of Nebraska; the states of Iowa, Missouri, Arkansas, and Louisiana, on the west; and those of Wisconsin, Illinois, Indiana, Ohio, Kentucky, and Tennessee, on the east of the river. It also contains the larger portion of the state of Mississippi, and parts of Alabama, Georgia, North Carolina, Virginia, Pennsylvania, and New York. The country comprising this basin is described under these several states and territories: in the following article we notice more particularly the valley of the river. The remarkable fortifications and other antiquities found in the valley of the Mississippi are noticed under AMERICA, and will not be further alluded to here: for a full account of them see the large and elaborate work 'Ancient Monuments of the Mississippi Valley,' by E. G. Squier.

The source of this river is a small lake, situated in 47° 10' N. lat., and 94° 54' W. long., called Lake Itasca, about 8 miles long, and about 1500 feet above the level of the sea. From it a stream 10 feet wide and from 12 to 18 inches deep issues in a northern direction, which unites after a circuitous course of 50 or 60 miles with a similar stream from Lake Usawa, some distance west of Lake Itasca. The united stream falls into Lake Travers, which is about 12 miles long from north to south, and 6 miles broad, and is the most northern point attained by the river. Issuing from the eastern side of this lake, the river flows south-eastward to Lake Cass. Lake Cass is 16 miles long, 3000 miles from the Gulf of Mexico, 1330 feet above the sea, and 182 miles from Lake Itasca. From Lake Cass it still runs in an eastern direction to Little Winnipeg Lake, issuing from which it takes a south-eastern course, which it maintains for a considerable distance. Down to the Falls of St. Anthony its course lies through a country studded with lakes, and united with each other by channels full of rapids and small cataracts. The surrounding country consists of an alternation of small eminences and swampy ground. The elevations or ridges are composed of diluvial sand, on which large granite boulders are scattered, and are overgrown with pine-trees. In the swampy ground other trees grow, especially hemlock, elm, and ash, which are covered with moss. In some parts small prairies occur. In other places the river is skirted by narrow strips of alluvial soil, subject to inundation, and in others its bed is already wide enough to form islands, especially above the Big Falls, where twenty islands called the Beaver Islands occur in the space of four miles. Nine miles above the place where the Mississippi is joined by its first great affluent, the Minnesota, or St. Peter's River, which falls into it from the west, occur the largest cataracts in the river, called St. Anthony's Falls. The Mississippi, though considerably narrowed by the rocks, is about 640 yards wide at this point. In the middle is an island about 100 yards wide, and covered with trees. The fall on the eastern side is 230 yards and that on the western 310 yards

wide; and the perpendicular height is 25 feet. Below the falls the river is narrowed to about 200 yards. There is a considerable rapid both above and below the falls, making a total descent of more than 40 feet in three-fourths of a mile. There is a portage around the falls. Boats of 40 tons burden ascend to these falls, more than 2000 miles from the mouth of the river. The Falls of St. Antony may be considered as the point where the Mississippi terminates its upper course.

From the falls to Lake Pepin the river winds through a country of prairies, whose surface is rather undulating than hilly, the elevations being of moderate height, and seldom attaining 200 feet above the level of the water. The river itself is intersected with several small islands; its channel is also impeded by sand-bars, and the current is rapid. At Lake Pepin commence the bluffs, or wall-like high grounds, which generally run parallel to the course of the river, and at some distance from it. Lake Pepin, in most parts, nearly fills up the whole space between the bluffs, which rise about 450 feet above its level. The lake is about 24 miles long, and from 2 to 4 miles wide. The country at the back of the bluffs is rather undulating, and assumes the character of a prairie land, being only wooded in isolated spots. Below Lake Pepin the vale of the Mississippi varies from 3 to 10 or 12 miles in width, except at Rock Island and Des Moines Rapids, where it is only wide enough to receive the volume of the river. At both of these rapids the bed of the Mississippi is contracted to 800 or 1000 yards; while in many places the river occupies half the vale, spreading out to the width of 5 or 6 miles, and appearing to lose itself among numberless islands, between which it runs in narrow channels. Between Lake Pepin and the mouth of the Missouri not less than 640 islands of considerable size have been enumerated, which are formed of the alluvium brought down by the stream, and are chiefly sandy; many of them are covered with a vigorous vegetation. The vale of the river is bounded by bluffs, from 100 to 800 feet high, which are generally abrupt, and often precipitous. These bluffs are intersected by numerous deep ravines and watercourses, which give the country a hilly and broken aspect. On the western side of the river, above the mouth of the Wisconsin, forests cover the high grounds to the distance of 6 or 8 miles from the river: behind them is a prairie region of great extent. The vale itself has a level surface; but in some places, and especially in the vicinity of Lake Pepin, isolated knobs and hills of considerable magnitude frequently occur. The level is covered with an alternation of prairies and forests. The prairies are generally elevated a little above the floods, and richly carpeted with herbage and flowers: the woodlands are subject to inundation, and sustain a dense and heavy growth of trees. Between the Falls of St. Antony and the mouth of the Missouri River the principal affluents of the Mississippi from the west, are the Minnesota, Chippeway, Wapispinicon, Iowa, and Des Moines rivers; from the east it is joined by the St. Croix, Wisconsin, Rock, and Illinois rivers. At the mouth of the Missouri the middle course of the Mississippi terminates.

Below the mouth of the Missouri, the river and the vale through which it flows present different features. The river, though less in width, has a more imposing aspect, flowing with a comparatively gentle course, in one sheet of water, rarely interrupted by islands. The only serious obstruction to navigation occurs about 30 miles above the mouth of the Ohio, where two bars of limestone, called the Big and the Little Chain, which in the low state of the river have little water on them, extend across the bed of the river. The vale widens more and more as it proceeds southward. It consists of an alternation of high lands with an undulating surface, and of low bottoms partly covered with swamps. Both are of great extent, and are generally opposite to each other, so that when the high ground approaches the banks of the river on one side, extensive bottoms skirt them on the other side.

The most northern of these bottoms, called the American Bottom, begins 4 miles above the mouth of the Missouri; it is noticed under ILLINOIS. Opposite to it, on the west side of the Mississippi, the high lands approach the river, presenting abrupt declivities, prominent points, and in many places perpendicular precipices from 100 to 200 feet high. The country at the back is partly wooded and partly prairie. These high lands continue along the right bank of the Mississippi somewhat farther than Cape Girardeau, north of which place they attain their greatest elevation, which is 350 feet. Between the mouth of the Kaakaakia River and that of the Ohio are also high lands of inferior elevation; but about 30 miles above the mouth of the Ohio the banks begin to be low, and continue so to its very mouth. The soil consists of recent alluvium, and is covered with dense forests: the width is about 10 miles.

This low alluvial tract continues south of the mouth of the Ohio for about 17 miles, where the river runs at the base of the Iron Banks, which rise nearly perpendicularly about 180 feet above the level of the river, and are annually wearing away by the action of the water, which sets strongly against them. From the Iron Banks southward, bluffs less than 200 feet high skirt the banks of the river as far south as 35° N. lat., with the exception of a swampy bottom-ground about 30 miles long and from 3 to 4 miles wide; it is covered with high trees, and hence called Wood Swamp. South of it some bluffs attain an elevation of 200 or 300 feet, especially the four hills called the Chickasaw Bluffs. The country opposite to this high bank, on the

west side of the river is low. It begins on the north, about 13 miles below Cape Girardeau, with the Tywapatia Bottom, a fine tract of wooded country, and extends to the mouth of the St. Francis River, a distance of more than 160 miles in a straight line. Its width is more than 50 miles, and its western side is skirted by bluffs of moderate elevation, which, for a considerable distance, run along the western banks of the Black and White rivers, nearly parallel to the Mississippi. This extensive tract is traversed in all its length by the St. Francis River, which is joined not far from its source by an offset of the Mississippi, by which, during the time of the freshets, a great volume of water is poured towards the middle of the plain, so that the greatest part of it is inundated, and a considerable extent is a swamp all the year round. This swampy tract, extending on both sides of the St. Francis River, is called the Great Swamp. The country is unhealthy, and covered with a continuous forest.

On the south, this low region borders on another, which is not much more elevated, but is less subject to inundations. The whole tract extending from the mouth of the St. Francis River to 33° N. lat., is quite level, without any elevations, and does not form bluffs along the banks of the Mississippi. It is covered with recent alluvium, and mostly wooded. Its width is above 30 miles; and on the west it borders on a more elevated hilly region covered with pine-forests. Opposite to this region, on the left bank of the Mississippi, is an immense swamp, known as the Mississippi or Yazoo Swamp, which extends from opposite the mouth of the St. Francis River to that of the Yazoo River, a distance of nearly 170 miles, with a width of about 50 miles in the middle, where it is widest, and an average breadth of about 30 miles. This low region is generally swampy and impassable, and it is only along the watercourses which flow through it that the banks are dry for several months in the year. During the floods it is described as assuming the appearance of a 'marine forest.' On the east it is bordered by a much more elevated tract, which is generally wooded on its margin, but farther inland extends in wide and open prairies.

South of the mouth of the Yazoo River, the bluffs on the eastern bank of the Mississippi re-appear, and extend south of Baton Rouge (about 30° 30' N. lat.). In some places very narrow tracts of low inundated ground separate the bluffs from the bed of the river, but their base is generally washed by its waters. As in the other bluff region, the surface of this tract is intersected by numerous watercourses, which give to it the aspect of a hilly country; but at the distance of about 10 miles from the river it extends in an undulating plain. The bluffs themselves rise rather steeply from 100 to 200 feet above the bed of the river. Opposite to this bluff region is another low and generally swampy tract, which is traversed by the Texas River, another outlet for the superabundant waters of the Mississippi during the floods. It is from 20 to 30 miles wide, beginning north of 33° N. lat., and extending southward to the mouth of the Red River and the efflux of the Atchafalaya branch of the Mississippi, where it is connected with the extensive low regions of the delta. This region, as well as the delta itself, which constitutes the most southern portion of the vale of the Mississippi, is more particularly described under LOUISIANA. The low and swamp lands of the lower course of the Mississippi are estimated to cover an area of 40,000 square miles. About 16,000,000 acres of land are now annually overflowed, which, if the overflows could be prevented, might be converted into excellent cotton and sugar plantations. By an Act of Congress, the swamp-lands along the Mississippi have been ceded to the respective legislatures of the states within which they lie, in order to make grants to parties willing and able to reclaim them; and the state legislatures have passed acts, varying in their provisions, but all having this object in view.

The Mississippi falls into the Gulf of Mexico by six mouths, after a course of about 3200 miles; but if we consider the Missouri as the principal river, the whole course is 4349 miles. Through the delta the Mississippi varies in width from 2200 to 5900 feet; the average width is about 3200 feet. The depth varies from 66 to 135 feet. There is no tide in the Mississippi. During high floods the surface of the river is, according to Mr. Ellet, from 18 to 20 feet higher than a great part of the actual delta.

Under LOUISIANA we have noticed the steady though gradual extension of the delta of the Mississippi from the enormous quantity of solid matter brought down and held in deposit in its waters. From this cause the channels by which it enters the Gulf of Mexico are continually shifting their position, and the bars at their mouths are also constantly changing. In the report of Mr. Ellet, who was directed by the central government to survey the delta of the Mississippi, it is stated that the South Pass, which had 10 feet over its bar in 1772, has at the present time its entrance almost closed up by a spit of sand. The North-East Pass, which in 1772 had a depth of 14 feet of water, has now only 8 feet, while the bar itself has advanced about 6 miles. On the other hand the Pass à l'Outre, a subdivision of the North-East Pass, which in 1838 had a depth varying from 6 to 8 feet on the bar, has since been increasing in depth, and has now a minimum of 10 feet on its bar. "This Pass has accordingly taken the place of the ancient favourite entrance to the Mississippi for all inward and outward bound vessels of less than 18 feet draught, when the wind favours that route, and steam can be obtained to help them through." The main entrance

to the Mississippi however, Mr. Ellet says, is now the South-West Pass, which has an actual depth of 15 feet on its bar, and is the channel used by all the ships of heavy draught which ascend to New Orleans. Occasionally vessels drawing 18 feet of water, and in rare instances 19 feet, pass to and from the sea by this channel. This pass has also much increased in depth, and the channel has shifted considerably, within the last few years.

Rivers draining the Basin of the Mississippi.—The rivers which fall into the Mississippi from the east drain a country which is cultivable to a great extent. The most northern on this side is the St. Croix River, which joins the Mississippi between the mouth of the Minnesota and Lake Pepin. It rises in Upper St. Croix Lake, near the head-waters of Bois-Brulé River, which falls into Lake Superior, and there is a portage of two miles between the streams. It flows in a general southern direction, receives numerous tributaries, and about 40 miles from its source enters the Lower Lake St. Croix, which is 30 miles long, and from one to three miles wide. The river is navigable for steam-boats about 80 miles, and for row-boats nearly 200 miles.

The Wisconsin or Ouisconsin River rises in Vieux Desert Lake, near the north-eastern boundary of the state of Wisconsin, and flows thence through the mountain region called the Wisconsin Hills, in a general south direction for about 250 miles to Portage, where it turns to the south-west and afterwards west, and falls into the Mississippi near the Prairie du Chien, after a further course of 110 miles. Its banks present much very striking scenery; and when the projected improvements in its navigation are carried out, it appears likely to form an important channel of communication.

The Rock, Illinois, and Kaskasia, the next in succession of the more important tributaries which join the Mississippi from the east, are noticed under ILLINOIS.

The Ohio, the largest and most important of the eastern affluents of the Mississippi, is formed by the confluence of two rivers, the Alleghany and Monongahela. The Alleghany rises in several branches on the west side of the Alleghany Mountains, south of the eastern extremity of Lake Erie, at an average elevation of 1300 feet above the sea, and 700 feet above the lake. The general direction of its course is first south-west and then south, and after a course of about 300 miles (for 250 miles of which it is navigable by boats of 100 tons), it unites with the Monongahela, the sources of which river are nearly 300 miles south of those of the Alleghany. The Monongahela rises in Virginia, in the Laurel ridge of the Appalachian Mountains, and runs northward: its course is about 280 miles; and it is navigable at full water by large boats for 100 miles. These two rivers, uniting at Pittsburg, form the Ohio, whose course from this place to its junction with the Mississippi, in a direct line, is 600 miles, but measured along its windings 959 miles. At Pittsburg its mean level is 700 feet above the tides of the Atlantic Ocean, and at its junction with the Mississippi about 275 feet. Except in high floods the current of the Ohio is gentle and nearly uniform. About 300 miles from its mouth, near the town of Louisville in Kentucky, are some rapids, where the river falls 22 feet in two miles. During high water boats pass over these rapids; but a canal is carried round them which admits the passage of the largest steam-boats. About 15 miles from the mouth of the Ohio a limestone bar extends across the river, called the Grand Chain. This place is impassable for boats of considerable burden in the lowest state of the water. With the exception of these two places, the Ohio has sufficient water during a part of the year to float vessels of 300 tons burden as far as Cincinnati, and boats may ascend it to Pittsburg, and also both of its upper branches for a considerable distance above their confluence. The Ohio runs in a valley, inclosed on both sides by ranges of hills, called River Mountains, which vary considerably in height, but are generally between 300 and 500 feet; their ascent is sometimes rocky and abrupt, but often sufficiently gradual to admit cultivation to the summit. The hills diminish in altitude as they approach the rapids of Louisville, where they rise again to a height nearly equal to what they attain at the head of the river; and from thence they gradually lower, until they disappear a little above the confluence of the Ohio and Green rivers. At this point a low country commences, which extends to the mouth of the Ohio, a distance of more than 150 miles: the river also increases in width and diminishes in velocity. The low country on its banks is thickly wooded, and its soil is a deep alluvium. The low hills which bound the alluvial district are at some distance from the stream. As the country is higher along the banks of the river than at the base of these hills, the inundations to which this district is subject leave extensive pools of stagnant water, which during the summer send forth noxious exhalations. The whole vale of the Ohio is well wooded.

The rivers which fall into the Ohio from the north, as the Big Beaver, the Muskingum, Sciota, Miami, and Wabash are navigable in the greatest part of their course. The Muskingum and the Sciota have acquired great importance, owing to the Erie and Ohio Canal, which runs chiefly along their courses, beginning on the Ohio at Portsmouth and terminating on the southern shores of Lake Erie at Cleveland. The largest of these affluents is the Wabash, which has a course of above 500 miles, and is navigable for more than 400 miles, though it is obstructed by some rapids about 70 miles from its junction with

the White River. It also connects the Ohio with Lake Erie by means of the Wabash and Erie Canal.

The rivers which join the Ohio from the south, especially the Kenhawa, Big Sandy, Licking, Kentucky, Green, Cumberland, and Tennessee are mostly navigable for steam-boats, to a great distance from their mouth from February to June. During the remainder of the year it is only the lower parts of these rivers that are navigable for boats of moderate burden. Of these rivers the Tennessee is noticed under TENNESSEE, and all the others under KENTUCKY.

South of the mouth of the Ohio no considerable river joins the Mississippi from the east, except the Yazoo, which falls into it five degrees of latitude farther south. Its course is about 160 miles, and it is navigable for boats in the spring season for 50 miles from its mouth.

The rivers which join the Mississippi from the west have a much longer course, as most of them rise on the declivity or near the base of the Rocky Mountains, but the country through which they flow is very thinly inhabited. The most northern is the Minnesota, or St. Peter's River, which rises on the northern border of the basin of the Mississippi, in Big Stone Lake, and runs in a very winding course about 300 miles south-east and 200 miles north-east, though its whole course in a straight line does not exceed 275 miles. During the vernal floods it is navigable for boats to Big Stone Lake, there being but two obstructions that are impassable on such occasions, namely, at Patterson's Fall, nearly 300 miles, and at Great Portage, about 400 miles from its mouth; at both of which places there are portages. The Iowa and the Des Moines are noticed under Iowa.

The largest of the affluents of the Mississippi is the Missouri; and as the sources of the Ohio drain the most north-eastern corner of the basin of the Mississippi, so those of the Missouri drain its most north-western angle. It rises in three branches, called the Jefferson, Gallatin, and Madison, in which all the waters descending from the eastern declivity of the Rocky Mountains between 42° and 49° N. lat. unite. From their junction in 45° 10' N. lat. 100° W. long., the stream is known as the Missouri. Its course is first north and then east, and after a course of 400 miles it meets the Yellow Stone River, which rises between 43° and 44° N. lat.; but its southern affluents rise as far south as 42° N. lat. The course of the Yellow Stone is first north-north-east and then east, approaching gradually to the Missouri, which it joins after a course of 300 miles. The Yellow Stone joins the Missouri about 1200 miles from the source of the latter river, and 1880 miles from its mouth: steam-boats ascend to the confluence of these rivers. These two rivers at their junction may each be compared with the Rhine in length and volume of water: the Yellow Stone River is 300 yards wide near the junction. But though the numerous affluents which the Missouri receives in its upper course bring down a large body of water from the Rocky Mountains (portions of which are covered with snow, if not all the year round, at least for the greater part of it), the Missouri loses much of this water during its long course through a sandy desert; and though it is joined in the lower part of its course by some large rivers, it is stated that the volume of water which it pours into the Mississippi is not greater than what it contains immediately after its junction with the Yellow Stone. From their junction the Missouri continues its eastern course, declining however a little to the south, until it reaches the Mandan villages, where it is deflected by the Coteau des Prairies to a southern course for above 400 miles, until it unites with the White River. In this course it is joined by several affluents from the west; but though some of them flow from 200 to 300 miles, none of them increases the volume of its water to any amount, as their course lies through the sandy desert. From its junction with the White River the Missouri again flows eastward for 200 miles, and then to the east-south-east for 300 miles, to the mouth of the Kansas River, which is its largest tributary, with the exception of the Platte, or Nebraska, River, which joins it about 180 miles farther up. [KANSAS.] After the junction with the Kansas River it runs still 250 miles, turning a little to the south of east, and joins the Mississippi near Belle Fontaine, after a course of about 3098 miles. The Missouri is a very rapid river in the whole of its course, but it contains no falls except about 520 miles from its source, in the vicinity of the Rocky Mountains, where it flows over several ledges of rocks for above 16 miles, in the course of which distance it descends 357 feet. The falls, known as the Grand Falls, are said to be next in grandeur of appearance among American cataracts to those of Niagara. The lowest and principal fall has a perpendicular descent of 87 feet. In the lower part of the course the vale of the Missouri is wide and very fertile, and it is generally covered with a deep and heavy growth of timber and underwood for about 350 miles from its mouth. There are however prairies of considerable extent, even in this part of its course. Higher up the prairies within its vale become more numerous and extensive, till at length all woodlands disappear, except the small tracts at the points formed by the windings of the river.

The tributaries of the Missouri generally have their mouths blocked up with mud, which arises from the floods of these rivers taking place earlier in the season than those of the principal river, whose course is much farther north. The flood of the tributaries carries off the mud which is deposited at their mouth; but on the rising of the Missouri, which is caused by the melting of the snow, its floods back

up the waters of the tributaries, which are loaded with mud, to considerable distances up these rivers, and in this stagnant state of the waters the mud at their mouth is deposited. It is only in spring-time and before the time of flood in the principal river that these tributaries have any considerable depth of water at their mouths.

Below the mouth of the Missouri the Mississippi is joined by no considerable river from the west for about 400 miles, until south of 35° N. lat. it receives the St. Francis River. The White River follows next, but after a considerable interval. Both of these rivers are noticed under ARKANSAS STATE. The Arkansas River joins the Mississippi a little farther south: the vale traversed by it, and its great tributary the Canadian River, are noticed under ARKANSAS RIVER. The last considerable river which falls into the Mississippi from the west is the Red River, which is noticed under LOUISIANA.

The Mississippi is at its lowest level in autumn and winter, from October to January. It begins to swell in February, when the freshets come down the Red River. These freshets last for two or three months; but in March and April they are increased by the floods of the Arkansas, and nearly at the same time by those of the Ohio. Before they subside, in May, the great floods of the Missouri and Upper Mississippi commence, and continue to maintain the high level of the water to the middle of July, or even to the end of that month. From the middle of August to October the river is low. In the month of October its level is somewhat increased by the autumnal freshet of the Ohio, but it soon subsides again.

The inundations extend only over the wide bottoms adjacent to the banks of the Mississippi, and differ in all of them, both as to time and duration. The American Bottom, and the somewhat elevated country between the mouth of St. Francis River and 33° N. lat. are inundated only for a few weeks in April and May, and the water rises only a few feet. These tracts are accordingly cultivable. But a large proportion of the other bottoms is inundated for several weeks, and the low country of the delta even for six months, and exactly at the season which alone is favourable to cultivation, from March to August. These extensive tracts are therefore swampy. The water rises on them from 8 to 20 feet. As noticed above, the central and state legislatures hold out great inducements to private individuals to attempt their reclamation. The banks, or levées, which are constructed along the Mississippi for the purpose of restraining the overflow of the river, are said by Mr. Ellet to extend at the present time along both sides of the river from below New Orleans to the mouth of the Arkansas, a distance of nearly 700 miles.

We have already spoken of the depth of water over the bars at the mouths of the Mississippi, and along the delta. As far as the town of Natchez, in Mississippi, few obstructions to navigation occur, the river being so deep that sunken trees and sand-bars are too far below its level to cause any danger to the vessels. From Natchez upwards the depth of water lessens considerably to the confluence of the Missouri, and the impediments become more numerous and difficult. Still the main channel, though intricate in many places, has always a sufficient depth of water for boats of 5 or 6 feet draught to ascend to the mouth of the Ohio. Between the mouth of the Ohio and that of the Missouri, during the low state of the water, the navigation is obstructed by shoals and the two ledges of rocks called the Big and Little Chain, and only vessels drawing about three feet of water can be used. Between New Orleans and the mouth of the Missouri the average velocity of the current is only 4 miles per hour, in a moderate state of the water; but when the river is high its velocity is considerably increased. Above the mouth of the Missouri the Mississippi is generally much less rapid, and does not exceed 2 or 2½ miles per hour; but its navigation is more intricate and difficult on account of the numerous islands and shoals. This upper part of the river is also generally blocked up with ice during the winter season. The navigation of the Missouri is much more difficult and intricate, on account of its numerous sand-bars and islands, and more dangerous on account of the frequency of sunken trees and rafts, locally known as 'snags and sawyers.' During the high floods (from March to July) there is a sufficient depth to admit boats of almost any burden; but during the remainder of the year it can hardly be called navigable, except for boats drawing no more than two or three feet. The average velocity of its current, in a middling state of water, may be estimated at 4½ miles per hour, which in time of freshets is accelerated to 5 or 5½ miles per hour. The river is usually blocked up with ice during the winter.

The Ohio has a much more gentle current. Its average velocity, in a moderate state of the water, may be estimated at 2½ miles per hour, and in a high state at 3 miles per hour. The obstructions to its navigation are sand-bars, some few sunken trees, and rapids, to which we must add the intricacy of its channel in several places. During a middle and high state of water these obstructions entirely disappear, and an accelerated current is the only difficulty to be encountered. There are large masses of floating ice during part of the winter. The season in which the navigation of this river can be depended upon commences between the middle of February and the 1st of March, and continues to the latter end of June. An autumnal freshet usually takes place in October or November, and the river is again navigable for a few weeks. During the remainder of the year only boats from 50 to 75 tons burden can be used, and they meet with numerous obstructions in their progress from the lowness of the water.

The city of New Orleans carries on an extremely active trade with the countries which skirt the lower course of the Mississippi, and particularly with those on both sides of its great tributary, the Ohio, and its numerous affluents, as well as a very extensive foreign commerce. As the goods are exclusively conveyed by water, the number of steam and other vessels which navigate the Lower Mississippi and Ohio is very considerable. For ascending the river steam-boats have nearly superseded all other vessels: but for descending it large flat-bottomed boats termed 'arks,' which are not intended to return, are extensively used. There are said to be at the present time considerably over 300 steam-vessels, many of them of heavy burden. The Mississippi is navigable by steam-boats for 2000 miles from its mouth; the Missouri 1500 miles; the Ohio 1000 miles; the Arkansas 600 miles; the White River 500 miles; and the other larger tributaries for distances varying from 60 to 300 miles from their confluence with the Mississippi.

(Lewis and Clarke, *Travels to the Source of the Missouri*; Pike, *Exploratory Travels through the Western Territories of North America*; James, *Account of Major Long's Expedition from Pittsburg to the Rocky Mountains*; Keating, *Narrative of Major Long's Expedition to the Sources of St. Peter's River*; Schoolcraft, *Narrative of an Expedition through the Upper Mississippi to Itasca Lake*; *Statistical Gazetteer of the United States*; Ellet, *The Mississippi and Ohio Rivers*.)

MISSISSIPPI, one of the United States of North America, lies between 30° 13' and 35° N. lat., 88° 10' and 91° 36' W. long. It is bounded E. by the state of Alabama, N. by that of Tennessee, N.W. by Arkansas, from which it is divided by the Mississippi River, S.W. by Louisiana, and S. by Louisiana and the Gulf of Mexico. The area is 47,151 square miles. The population in 1850 was 606,526, of whom 930 were free-coloured persons, and 309,878 slaves: being 12'86 inhabitants to the square mile. The federal representative population according to the Census of 1850 was 482,574, in which number three-fifths of the slaves are included. This, according to the present ratio of representation, entitles the state to send five representatives to Congress. To the Senate, like each of the other United States, Mississippi sends two members.

Surface, &c.—The surface of this state is for the most part low, with a general slope towards the south and south-west. The coast, which extends for 60 miles along the Gulf of Mexico, has no harbours which admit vessels of large size: the only harbours of any consequence are those of Mississippi City and Shieldsborough. About 6 or 8 miles from the shore is a chain of low sandy islands, which form the Bay of St. Louis on the west and Pascagoula Sound on the east. These islands produce nothing but pines and coarse grass, and are of little value: one or two of them are however said to be eligible stations for ocean steamers.

The shores near the mouths of the Pascagoula and Pearl rivers are low and sandy, and in many places interrupted by swamps; these tracts are therefore unhealthy. In the space between the two rivers there is a higher and more healthy tract of land, extending for a distance of nearly 24 miles, which is resorted to by the inhabitants of New Orleans and Lower Louisiana generally during the sickly season. The country which stretches northward from this coast to 31° N. lat. is low, but undulating, and the soil is uniformly sandy and covered with extensive pine-forests, which on the Pearl River contain many large trees. The country between 31° and 32° N. lat. includes by far the best portion of the state. The tract contiguous to the Mississippi River consists of numerous hills, very irregularly scattered over the surface, and rising from 50 to 150 feet above the narrow low tract which in some places lines the course of the river. The hills, the base of which is washed by the Mississippi, are called Bluffs, and this region is generally called by that name. It extends from 10 to 25 miles inland, and is of great fertility, being covered with forests of oak, sweet gum, poplar, tulip-tree, ash, maple, and hickory, with a few pine-trees. Farther east the country rises imperceptibly higher, and extends in wide plains. The numerous watercourses which occur on these plains have furrowed their outer edges along the Mississippi, and imparted to them a hilly aspect, together with a great degree of fertility. The surface of the plains themselves generally consists of an unproductive sand, and is covered with the long-leaved pine; but the continuity of the level ground is interrupted by the bottoms, which extend along the numerous affluents of the Mississippi, Pearl, and Pascagoula rivers, are several feet lower than the surface of the plains, and from half a mile to three miles wide. These bottoms have a rich and productive soil, covered with a fine growth of trees, such as gum, laurel, oak, and cotton-tree, intermixed in the more elevated parts with lofty canes; the lower parts are mostly cypress swamps. The Bluff region continues northward to the mouth of the Yazoo River. The plains which are covered with pine-forests and furrowed by streams, extend somewhat farther north, where they begin to be intersected by rolling prairies, which increase in number and extent as we proceed farther north, and occupy the greatest portion of the country lying north of 33° N. lat. These prairies are covered with grass during the greatest part of the year, though the country is dry, and suffers from want of water. East of this prairie region extends a level but very fertile tract on the upper course of the Tombigbee, which resembles the bottoms in fertility, but is more extensive. In the northern districts is a range of hills of moderate elevation, well

wooded, but devoid of undergrowth, terminating on the Mississippi River with what is called the Fourth Chickasaw Bluff, which extends 10 miles along the river, is from 60 to 100 feet above its bank, and is stated to be fertile to a considerable distance from the river. Between these hills and the Walnut Hills, with which the southern bluffs terminate in about 32° 20' N. lat., a distance of more than 170 miles, the country is occupied by an immense swamp, produced and fed by the inundations of the Mississippi. Some parts of this low region become dry towards the end of the year, but the others are a perpetual swamp. This tract extends to the banks of the Yazoo River, and is in the widest part (near 84° N. lat.) above 50 miles wide. Much of this swampy tract has been within the last 16 years taken into cultivation with remarkable success.

Hydrography and Communications.—Nearly every part of Mississippi is amply provided with running streams. The Mississippi forms its western boundary for 530 miles, following the windings of the river. [MISSISSIPPI RIVER.] For more than three-fourths of this distance, from the northern boundary of the state to Vicksburg, the configuration of its banks admits of no port along this river, and below that the only one of much value is Natchez.

Several of the secondary and smaller affluents of the Mississippi rise and terminate in this state. The most important are the Homochitto, the Big Black, and the Yazoo rivers. The *Homochitto* runs about 70 miles, and is navigable to some distance from its mouth for small craft. The *Big Black River* rises near the north-eastern end of the state, flows about 200 miles, mostly in a south-western direction, and is navigable by steam-boats for 50 miles from its mouth. The *Yazoo River* rises in three branches in the range of hills which traverses the northern part of the state, flows mostly with a south-south-western course for more than 200 miles, of which 50 miles are navigable by large steam-boats, and falls into the Mississippi 12 miles above Vicksburg. Not far from its mouth it unites with *Falser River*, that branch of the Mississippi which leaves the great river south of the Fourth Chickasaw Bluff, and traverses the swampy region. The *Bayou Pierre* is another of the affluents of the Mississippi which belong to this state. The *Pearl River* rises near the centre of the state, and runs first south-west, and afterwards south-south-east for about 250 miles. It falls by several branches into the Rigolets, or straits which unite Lake Pontchartrain with Lake Borgne. It is navigable for boats for nearly 150 miles, but its entrance does not admit vessels which draw more than 5 feet: below 31° N. lat., the Pearl River divides this state from Louisiana. The *Pascagoula*, which waters the south-eastern part of the state, is formed by the junction of the Chickasaw and the Leaf rivers, and flows south by east for 60 miles into Pascagoula Sound, opposite Cuerno or Horn Island. Near its outlet it is joined by a considerable tributary, the Dog River, which runs parallel to it. The *Pascagoula* is navigable by vessels drawing 6 feet of water to a distance of 50 miles from its mouth, but the estuary into which it falls only admits vessels drawing 4 feet of water. In the north-eastern districts are a part of the Tombigbee [ALABAMA] and the Tennessee rivers. [TENNESSEE.]

Mississippi is tolerably well provided with carriage roads; but is behind most of the states in respect to railways. At the present time the completed lines in the state do not amount to 100 miles in length. The chief completed line is one from Vicksburg past the capital to Brandon, 60 miles, with a short branch to Raymond. There are other lines projected and in progress, which will ultimately traverse the state north, south, east, and west, and place it in connection with the railways and ports of the neighbouring states; but the only portion in actual operation is the West Feliciana, which unites the south-western angle of Mississippi with Louisiana.

Geology, &c.—With the exception of a small space in its north-eastern corner, the state belongs entirely to the Cretaceous and Tertiary systems. The banks of the Mississippi are throughout formed of the more recent tertiary deposits, consisting of sandy and clayey strata, containing enormous quantities of various fresh-water shells, and rising at times into cliffs, or bluffs, 100 and 200 feet high. These strata are celebrated also for the numerous bones of the mastodon, megatherium, elephant, and other gigantic fossil animals, which are found in them. On the east these later deposits are throughout the state bounded by a band of earlier tertiary strata, chiefly greensands and marls of the eocene period, which enlarges as it proceeds southward, the southern portion of the state being wholly occupied by it. This again is bounded on the north-east by the greensands and chalky marls of the Cretaceous system, which occupy almost the whole of the remainder of the state, except, as above-mentioned, on the north-eastern boundary, where occur small portions of the Devonian and Carboniferous basins of Tennessee.

Climate, Soil, Productions.—Along the southern coast the winters are mild, frost being of rare occurrence, and owing to the prevalence of the sea breeze from the Gulf of Mexico, the heat of the summer is less oppressive than in many of the states farther north. The Bluff region along the Mississippi River differs considerably in climate. The summer is in general very hot and the heat oppressive, whilst the winters are colder than might be expected. Every year the thermometer sinks to about 25°, and occasionally so low as 18°; and rises to 94° Fabr., and occasionally much higher. North of 31° N. lat. the climate is less mild, and the sugar-cane is no longer cultivable.

As will be readily understood from our notice of the surface and geology of the state, there is an extensive prevalence of sandy and dry marly soil in the upper parts of the state. The valleys or bottoms however, even in these parts, have generally a deep rich soil, though they suffer from the vast quantities of sand brought down from the uplands during floods. The banks of the Mississippi and the southern bottoms are very rich, and the extensive swamps are remarkably fertile. Cotton is the staple product; the quantity annually raised being about equal to that of Georgia, and only exceeded by that of Alabama. Maize is also grown in very large quantities: oats, rye, and wheat are cultivated, but to a much less extent, especially the two last. Rice is cultivated somewhat largely in some of the swampy districts. Tobacco is grown, but now only to a comparatively small extent. The culture of the sugar-cane has been revived within the last ten or twelve years, and sugar again figures among the more important products of the state. The principal vegetable is the sweet-potato; but the common potato, peas, and beans, and most of the vegetables of Europe are also grown. The fruit of both the south and north of Europe ripen here. Plums, peaches, and figs are abundant; oranges ripen only in the southern districts.

The prairies, especially in the Tombigbee district, form an excellent pastoral country. Cattle are very numerous, though generally of a small size. The horses are also of a small breed. Sheep are much more numerous than formerly, and wool is becoming an important article of commerce. Swine are raised in great numbers. Wild animals, such as pumas, wolves, bears, and wild cats still abound. Alligators occur in the Mississippi as far north as the mouth of the Arkansas River, and in some of the smaller rivers. Most of the rivers abound in edible fish. Parroquets are seen as far north as Natchez; wild turkeys and pigeons abound.

Mississippi is essentially an agricultural state, and the manufactures are confined to the requirements of an agricultural state. Grist- and saw-mills, tanneries, &c., are numerous. The state has no direct foreign commerce. Its products are carried by river to New Orleans and Mobile for exportation to foreign countries, and its imports are received through the same channels. The shipping employed in this river-trade mostly belongs to Alabama and Louisiana, the entire tonnage belonging to Mississippi not exceeding 2000 tons.

Divisions, Towns, &c.—Mississippi is divided into 59 counties—36 in Southern and 23 in Northern Mississippi. Jackson is the capital, but Natchez is much the largest and most populous town in the state; indeed all the others are comparatively small places.

Jackson, the capital, on the right bank of the Pearl River, 32° 23' N. lat., 90° 8' W. long., 1035 miles S.W. from Washington: population, 1881. The town is regularly laid out, contains a handsome state-house, governor's house, and other state buildings, churches, &c.; but is a place of little trade.

Natchez, on the Mississippi, 87 miles S.W. from Jackson, population 5239, is the chief port and trading depôt in the state. The commercial part of the city is built on the margin of the river, but the remaining and larger portion occupies the summits of the bluffs, about half a mile from its bank. The upper part of the city has broad streets, and some well-built houses. It contains a court-house, jail, churches, &c. The manufacture of oil from cotton seeds is carried on. Cotton is forwarded from this port in very large quantities.

Vicksburg, on the Mississippi, 41 miles W. by N. from Jackson, population 3678, is the next most important port in the state. Like Natchez the commercial part of the city is built close to the river, and the other part on the bluffs above it. There is an excellent harbour for steam-boats with a good pier; and the Vicksburg, Jackson, and Brandon railway affords considerable facilities for the transit of goods from the interior. Very large quantities of cotton are sent from Vicksburg to New Orleans. *Grand Gulf*, 55 miles W.S.W. from Jackson, population 613, is the only other port-town on the Mississippi belonging to this state.

The only other places which call for mention are—*Columbus*, on the left bank and at the head of steam-boat navigation on the Tombigbee, population 2611, the largest town in Northern Mississippi, and the centre of a good cotton district; *Port Gibson*, population 1037, a place of some trade on the Bayou Pierre, 62 miles W.S.W. from Jackson; and *Woodville*, the capital of Wilkinson county, 105 miles S.W. by S. from Jackson: population, about 900.

History and Constitution.—Mississippi was discovered in 1542 by De Soto; but the first settlements were formed in the neighbourhood of Natchez by some Frenchmen about 1700, but they did not thrive. When the country was ceded to the British in 1763, some respectable settlements were founded. In 1800 all that is now comprised in Mississippi and Alabama was formed into a territory by the name of Mississippi Territory. In 1817 this territory was divided into two portions:—the western was admitted as a member of the Union, and the present constitution was formed. The legislative body consists of a Senate consisting of 32 members, elected for four years; and a House of Representatives, consisting of not less than 36 nor more than 100 (at present 92) members, elected for two years. The right of voting is vested in every free white male citizen of the United States 21 years of age. The revenue for 1851 was 221,200 dollars; the expenditure for the same period 223,637 dollars. The acknowledged

debt of the state (Mississippi being one of the repudiating states) is 7,971,707 dollars.

MISSOURI. [MISSOURI.]

MISSOURI, one of the United States of North America, lies between 36° 30' and 40° 30' N. lat., 88° 55' and 95° 38' W. long. It is bounded E. by the states of Kentucky and Illinois, from which it is divided by the Mississippi River; N. by Iowa; W. by the Nebraska and Indian territories; and S. by the state of Arkansas. The area is 65,037 square miles, or nearly 7000 square miles larger than England and Wales. The population in 1850 was 682,044, of whom 2618 were free-coloured persons, and 87,422 slaves; being 10.49 inhabitants to a square mile. The federal representative population, according to the Census of 1850, was 647,075, in which number three-fifths of the slaves are included. This, according to the present ratio of representation, entitles the state to send seven representatives to Congress. To the Senate, like each of the other United States, Missouri sends two members.

Surface; Hydrography; Communications.—The state is divided by the river Missouri into two parts, having marked differences of surface and general character. The southern part consists of an undulating country rising into mountains as it approaches the Ozark range. That portion of the state north of the Missouri is a rolling prairie or level country. Looking at these districts more in detail, and beginning with the extreme south-east, we find that an extensive bottom-land extends along the Mississippi, commencing on the north at Cape Girardeau, north of the mouth of the Ohio River, and extending southward to that of the Arkansas. It includes many large swamps, which are rendered almost impenetrable by a dense growth of trees, mostly cypress. The most extensive of these swamps, called the Great Swamp, commences a few miles south of Cape Girardeau, and passes southward to the mouth of the river St. Francis, penetrating far into the state of Arkansas. Of this swamp above 100 miles belong to Missouri. Within the bottom are numerous lakes, lagoons, and marshes; but it contains also many isolated tracts of considerable extent, which are elevated above the range of the highest floods. The bottom, almost throughout its whole extent, supports a dense and heavy growth of timber of excellent quality, but little use is made of it. Since the earthquakes of 1811-12 this tract has been inundated and uncultivated; but it is capable of being reclaimed, and has a very fertile soil.

The high grounds along the Mississippi begin a few miles below Cape Girardeau, and extend up to the mouth of the Missouri River. The highest part lies between St. Genevieve and the mouth of the river Maramec, where the banks of the Mississippi, composed of solid masses of limestone, rise in some places 360 feet above the water. This undulating country extends westward to the river Gasconade, occupying the basin of the Maramec River as far south as the lead-mining district. It is diversified with prairies and forests, the lower lands being well wooded, but the high grounds very thinly; scarcely a shrub is seen on the natural meadows. This is the most populous section of the state.

Between the rivers Gasconade and Osage, both of which are affluents of the Missouri River, a range of low hills approaches the Missouri, rising from 150 to 200 feet above the level of its water. They are thinly wooded, and constitute the most northern offset of the Ozark Mountains, a region of which the undulating country between Cape Girardeau and the river Gasconade may be considered as the most northern and lowest portion. This elevated tract covers more than half of the state south of the Missouri River. The surface is extremely broken and mountainous. The hills and mountains, which rise from 500 to more than 1000 feet above their bases, are exceedingly numerous, but do not form continuous ranges, being divided into knobs and peaks with rounded summits, and presenting perpendicular cliffs and abrupt precipices of sandstone. They are covered with a poor soil, which is generally shallow, and overgrown almost exclusively with pitch-pine, cedar, and bramble. Along the numerous rivers which originate in this mountain tract are bottoms of moderate extent and tolerable fertility, but they are subject to excessive floods. The country west of this mountain region, especially the basin of the Osage River, is chiefly a rolling prairie, diversified with forests, which however are only of moderate extent, and produce little or nothing but stunted timber. North of this region, along both sides of the Missouri, extends a rich alluvial bottom, which is probably more fertile, and better settled than any other part of Missouri, with the exception of the country near the confluence of the Missouri and Mississippi; but a large part of it is still in a natural state, and covered with a deep and heavy growth of timber.

In the country north of the Missouri, which comprehends about one-third of the state, the surface is generally undulating or level. The bottoms along the Missouri and Mississippi are remarkably fertile, especially those of the Missouri. The country between these two large rivers is diversified by the broad valleys of rivers and creeks, and intervening tracts of undulating upland, which are united with the valleys by gentle slopes. The woodlands occur only upon the margins of the watercourses, and the uplands are extensive prairies completely destitute of a timber growth. These prairies occupy at least nineteen-twentieths of the whole region, and comprehend some of the best land in the state.

The Mississippi washes the eastern boundary for 470 miles, and the Missouri traverses the state from west to east, with a winding course of above 400 miles. [MISSISSIPPI.] Some of their affluents require notice. White River and Francis River are described in ARKANSAS, State of. *Maramec River*, which enters the Mississippi about 20 miles below St. Louis, has a course not exceeding 180 miles; but it is important as flowing from the lead district and affording navigable channels to a fertile and improving tract of country: steam-boats ascend it for 60 miles. *Salt River*, which joins the Mississippi about 60 miles above the mouth of the Missouri, runs more than 200 miles with rather a gentle course, and through a tolerably fertile bottom. *Cuivre*, or *Copper River*, joins the Mississippi about 40 miles above the Missouri. Of the rivers which join the Missouri, the Gasconade and Osage are the principal. The *Gasconade* is rather small, and runs about 120 miles; but derives importance from the supplies of timber and planks it furnishes to the country below. The *Osage* rises in the plains between the Arkansas and Kansas rivers, and flows in a general direction east-north-east about 400 miles, joining the Missouri near the centre of the state. About the head-waters is some of the best cotton land in the state; and on its northern bank is a tolerably wide bottom with an alluvial soil of considerable fertility. It is 375 yards wide at its mouth, and navigable by steam-boats of light draught for 200 miles. The Grand Chariton and Nodaway rivers are affluents of the upper course of the Missouri; all of them are navigable for some distance.

Missouri is very badly provided with means of internal communication. Good carriage-roads even are few in number, and not well maintained; and in railways Missouri is one of the worst furnished of the United States. The only line in operation is one from St. Louis to Franklin, a distance of 37 miles; but two or three important trunk lines, with short subsidiary lines, have been authorised by, and received grants of land and credit from the state legislature. These projected lines are in all about 1200 miles in length. One of these, called the St. Louis and Pacific, of which the line in operation is a portion, is to proceed from St. Louis westward to the western boundary of the state, about 300 miles, whence it is to be continued ultimately to San Francisco in California. Another about 280 miles long is called the Hannibal and St. Joseph line, and is to connect the Mississippi and Missouri rivers from the places so named. The others are short lines.

Geology, Mineralogy, &c.—Eruptive and Metamorphic rocks occupy the central portion of the mountainous country south of the Missouri; and surrounding them is a broad band of Lower Silurian strata, consisting of various sandstones, and limestones. Skirting the Silurian rocks on the east is a narrower belt of light gray and very fossiliferous limestones, bearing much resemblance to the Silurian limestones, but belonging to the Devonian formation. Lower Carboniferous, or mountain limestone strata, occur along the banks of the Mississippi and Missouri throughout the state. Upper Carboniferous strata, or coal-measures, forming a portion of the great coal basin of Illinois, Missouri, Michigan, and Arkansas, occupy a large part of the northern half of Missouri. In the south-eastern corner of the state, are some cretaceous rocks; and recent deposits occur along the Mississippi from about the mouth of the Ohio downwards.

Missouri is extremely rich in minerals. The broken and mountainous country described under Southern Missouri, the igneous and palaeozoic district just noticed, is the great metal region of Missouri: it is said to occupy an area of 18,000,000 acres. The most valuable of the metals of Missouri perhaps is iron, which occurs in various forms and almost unlimited quantities. The ore occurs most frequently as hematite, and micaceous ochre and red oxides. Two mountain peaks, the Iron Mountain and Pilot Knob, which are about 6 miles apart, and form the eastern extremities of the Ozark Mountains, are said to contain an almost inexhaustible amount of micaceous ore, which yields 60 per cent. of pig iron. Lead is also found over a large portion of the metal region; the carbonate is said to yield 72 per cent., and the sulphuret from 66 to 80 per cent. of lead, and to contain 6 per cent. of silver. The lead-mines have been long worked, but during the last few years less than formerly, owing to the migration of the miners to California and Australia. Copper is found in the south and west of this region. The ore occurs most commonly in the form of pyrites; but oxides and carbonates are also met with. It is found in combination with lead, iron, nickel, cobalt, and manganese. Zinc, antimony, and tin are also found.

The coal-measures, as above indicated, occupy a very large area, mostly north of the metal region, but intruding into it. The coal is chiefly bituminous, but cannel coal is found in a few places. The coal-field of Missouri has been as yet but little worked; but, taken in connection with the immense iron-beds just noticed, its value may be said to be almost inappreciable.

Building stones of various kinds abound. Porphyries and sienites well fitted for ornamental and architectural purposes, are numerous in the mountain districts. Marbles of various kinds are plentiful. Limestones of excellent texture are quarried in many places. Sandstones are very common, but generally of a coarse and friable kind. Sands of excellent qualities for glass-making; kaolin or porcelain clay; pipe-clay; clays suitable for earthenware and pottery; and brick-earth are abundant. Gypsum is found in some places. Saltpetre occurs

in caverns near the Maramec, Gasconade, and one or two other rivers in vast quantities.

Climate, Soil, and Productions.—The climate of Missouri is cold and very variable. The winters are severe and long. The Mississippi can in some years be crossed on the ice at St. Louis, and sometimes it is frozen for two months and more. The summers are often hot, but sudden and frequent changes of temperature occur during the north-western winds, whose chilling blasts are experienced over all the countries west of the Alleghany Mountains, but in this state are felt in all their force. They are however dry and bracing.

The soil in most of the uplands is formed by the disintegration of sandstones and limestones; and the richer bottom lands suffer from the sand washed down by the floods. A good deal of the sandy land is mainly adapted for the growth of the yellow pine, of which it supports a vast quantity of great value for lumber. The arenaceous soils in the rolling prairies of the north are often very fertile; and so are the soils formed from the decomposition of the carboniferous limestones, especially in the vicinity of streams. In the southern districts along the river bottoms where clay abounds, an excellent soil is found.

Maize, wheat, oats, and tobacco appear at the present time to form the staple productions of Missouri. Rye, barley, and buckwheat are raised, but not very largely. Cotton was formerly grown in three or four places, but its culture appears to have been nearly abandoned. Hemp and flax are cultivated successfully. A little rice is grown. Both common and sweet potatoes are grown in considerable quantities. The peach, nectarine, apple, pear, and most of the other fruits of England ripen well; and orchard products generally are raised extensively. Nearly all the ordinary vegetables likewise flourish. The wild grape abounds in parts. Some wine, and a considerable quantity of maple sugar are made. The river bottoms are heavily timbered; oak, ash, elm, hickory, white and black walnut, and cotton wood being the most abundant. On the barrens are extensive forests of yellow pine.

The prairies form excellent pasture-grounds, and cattle abound where the bottoms and prairies are near one another. In summer the cattle feed on the grass of the prairies, and in winter on the cane and rushes of the alluvial soil. Horses are numerous. Sheep have largely increased in number during the last few years; and a great deal of attention is now given to the preparation of wool, which has come to be regarded as one of the staples of the agriculturists of Missouri. Swine are very numerous, being readily raised in the forests. A very large quantity of bees-wax and honey is annually obtained. Wild animals still abound. Buffaloes, elk, and deer are met with in large herds on the prairies east and west of the Ozark Mountains. The animals which are killed for their skins only are beavers, otters, bears, foxes, cats, racoons, martens, and lynxes: but the fur trade has decreased of late years.

The manufactures of Missouri are at present very limited. There are only three or four cotton- and woollen-factories, and those not on a large scale in the state. Iron-works are increasing in number and importance. Grist- and saw-mills, tanneries, and the establishments connected with an agricultural and pastoral country are numerous. The manufactures are chiefly concentrated around St. Louis. The mining capabilities of the state are only beginning to be developed; and their progress will probably for some time be slow.

Commerce is almost limited to the export of maize, tobacco, and live stock, with hemp and flax in a moderate quantity; and lead and copper. Furs still form an article of export. The imports chiefly consist of manufactured goods, with some colonial goods and wine. In 1852 they amounted in value to 914,826 dollars. The shipping owned in the state amounts to about 25,000 tons, all employed in the river trade, and nearly all propelled by steam. Ship-building is carried on to a small extent.

Divisions, Towns, &c.—Missouri is divided into 100 counties. Jefferson City is the capital of the state; but St. Louis is the commercial centre, and by far the most populous city in the state. Few other towns are of much extent; the following are the more important: the population is that of 1850:—

Jefferson City, the capital, is built on elevated ground on the right bank of the Missouri, 137 miles from its mouth, in 38° 36' N. lat., 92° 8' W. long., 980 miles W. from Washington: population about 2500. Some of the state buildings are handsome, and the little city has a pleasing appearance. It is a place of inconsiderable trade.

St. Louis, a city, port of entry, and the commercial and manufacturing centre of Missouri, stands on the Mississippi, 20 miles below the mouth of the Missouri, and 157 miles W. from Jefferson. The rise of this city in population has been remarkably rapid. It contained only 1600 inhabitants in 1810; 16,469 in 1840; and 77,860, of whom 40,114 were natives of foreign countries, in 1850, when it had risen to be the eighth city in the Union in regard to population. By a state census, taken in 1852, the population was found to be 94,819. It is now the principal port on the Mississippi after New Orleans, and the commercial depôt of the Upper Mississippi, Missouri, and Ohio rivers with their tributaries. As a manufacturing town it possesses extraordinary advantages, lying as it does in close contiguity to unbounded supplies of coal and iron, and of scarcely inferior supplies of lead, copper, and other metals. The city, which stretches for two miles

along the Mississippi, reaches back nearly three miles, and is built on uneven ground, rising in terraces from the river. In the older part the streets are narrow; but in the newer portion they are wide, regularly laid out, and lined with numerous handsome public, commercial, and private edifices. Besides the county buildings, court-house, jails, market-houses, &c., there are a large and costly Roman Catholic cathedral, and fifty other churches; numerous academies and schools; literary institutions; hospitals, orphan asylums, and other charitable institutions; a United States arsenal, barracks, land-office, &c.; several very large commercial and trading establishments; and numerous hotels on a scale of great magnificence. The St. Louis University, which in 1854 had 10 professors, 225 students, a library of 15,000 volumes, a museum, &c., is situated about 3 miles from the city. Twenty-four daily and weekly newspapers, of which three are in German, are published in the city. Iron-foundries, machine tool, and agricultural implement factories, ship-yards, glass-works, cigar and tobacco factories, distilleries, and numerous other large manufacturing establishments are carried on. The amount of tonnage which entered in 1852 was 681,252 tons; the value of goods imported was 954,946 dollars. St. Louis is the starting point for the extensive system of railways projected and commenced in the state.

Boonville, on the right bank of the Missouri, 52 miles N.W. from Jefferson, population 2326, is a regular station for steam-boats, and a place of considerable business. *Hannibal*, on the Mississippi, 90 miles N.E. from Jefferson, population 2557, is one of the chief of the rising commercial towns of the state. *Herculaneum*, on the Mississippi, 102 miles E. by S. from Jefferson, population about 800, is the chief port-town of the lead-mining district. Several lead- and shot-factories are in the vicinity. *Independence*, about 4 miles S. from the Missouri River, and 129 miles W. by N. from Jefferson, population about 1000, is noteworthy as a great station for the overland emigration to the Pacific, and consequently a place of considerable local consequence. *Potosi*, the capital of Washington county, 80 miles S.E. from Jefferson, population about 1000, is the chief town of the lead- and iron-mining district, though at present an inconsiderable place. *Saint Charles*, on the left bank of the Missouri, 87 miles N. by E. from Jefferson city, population about 2000, lies on the line of route from St. Louis to the northern part of the state, and is a place of much business. It contains several churches, academies, and schools, a convent, St. Charles's Methodist College, and numerous mills and factories.

Government, &c.—The constitution is framed on that adopted on the admission of the state into the Union. By it the right of voting is vested in every free white male citizen of the United States 21 years of age. No law can be passed for the emancipation of slaves without the consent of their owners; or to prevent the importation of slaves with their owners, or otherwise than as merchandise. Free negroes and mulattoes are not to be permitted to come into the state. The legislature, styled the General Assembly, consists of a Senate of not less than 14 nor more than 33 (at present 18) members, elected for four years; and a House of Representatives, consisting of not more than 100 (at present 49) members, elected for two years. The governor is elected for four years. The annual revenue of the state is about 325,000 dollars; the ordinary expenditure is under 200,000 dollars; but the legislature of 1852-3 authorised an extraordinary expenditure of 107,000 dollars. The state debt is 802,000 dollars.

History.—Although this country for more than a century had been visited by the French from Canada, no settlement was formed before 1763. In that year St. Genevieve was founded, and in 1764 St. Louis. But these and a few other places remained in a backward state up to 1803, when the United States got possession of the country, which was then comprehended in LOUISIANA. The following year the state now called Louisiana was separated from it, and the present state became the territory of Missouri. In 1821 it was admitted into the Union, as an independent state.

MISTLEY. [ESSEX.]

MITAU, or MITTAU. [COURLAND.]

MITCHAM. [SURREY.]

MITCHELDEAN. [GLOUCESTERSHIRE.]

MITCHELDEVER. [HAMPSHIRE.]

MITCHELSTOWN, county of Cork, Ireland, a market- and port-town, and the seat of a Poor-Law Union, is pleasantly situated near the river Funcheon on a small tributary, in 52° 17' N. lat., 8° 17' W. long., 30 miles N.N.E. from Cork, 129 miles S.W. by S. from Dublin. The population in 1851 was 3091. Mitchelstown Poor-Law Union comprises 18 electoral divisions, with an area of 86,957 acres, and a population in 1851 of 27,269. The town consists of an extensive square, containing some well-built houses, and of two principal streets with several smaller streets intersecting these at right angles. It contains the parish church—a handsome building, enlarged in 1830, a spacious Roman Catholic chapel, a National school, and a town library. There are also a court-house, fever hospital, dispensary, bridewell, and Union workhouse. Mitchelstown College, a group of neat buildings

with a chapel attached, was founded by the Earl of Kingstown for the support of 12 males and 16 females of his decayed Protestant tenantry. Each receives 40*l.* a year, besides a house and garden. On one side of the square is the gateway to the extensive demesne of Mitchelstown, the seat of the Earl of Kingstown, proprietor of the town. The mansion with its towers and battlements forms a striking object. It was erected in 1823 and is the largest and finest of the modern castles in Ireland. Petty sessions are held monthly. Fairs are held January 10, March 25, May 23, July 30, November 12, and December 2.

Mitchelstown and Kingstown caves are two series of beautiful stalactite caverns under small limestone hills about 8 miles from Mitchelstown on the Dublin road. One series discovered in 1833, is 870 feet in extreme length by 572 feet in breadth.

MITFORD, a hundred in Norfolk, which, with the adjoining hundred of Launditch, has been constituted a Poor-Law Union. Launditch hundred is bounded N. by the hundred of Gallow, E. by the hundred of Eynsford, W. by the hundred of Fræbridge Lynn, and S.W. by South Greenhoe hundred. Mitford hundred is bounded W. and S. by Forehoe hundred, S.E. by the hundred of Wayland, and N.E. by that of Launditch. The two hundreds include 53 parishes, with an area of 90,213 acres, and a population in 1851 of 25,701. Mitford and Launditch Poor-Law Union comprises 60 parishes and townships, with an area of 102,352 acres, and a population in 1851 of 29,383.

MITYLENE. [LEBOS.]

MOBILE. [ALABAMA.]

MOCHA, or MOKHA, the chief port of Yemen in Arabia, on the shores of the Red Sea, a little north of the straits of Bab-el-Mandeb. It is a walled but mean and dirty town of about 10,000 inhabitants.

MODBURY. [DEVONSHIRE.]

MODENA, DUCHY OF, a state of North Italy, extending north and south of the central ridge of the Apennines, is bounded N. by the Po and a part of the duchy of Mantua, which lies on the south bank of the Po; W. by the duchy of Parma; S. by Tuscany; and E. by the Papal States. This, which is the duchy of Modena proper, must be distinguished from the states belonging to the Duke of Modena, which include several districts and principalities south of the Apennines, and extending to the coast of the Mediterranean, namely, Garfagnana Estense, Lunigiana Estense, and the duchy of Massa and Carrara.

The territories of the Duke of Modena comprise seven provinces, which, with their respective areas and populations, are as follows:—

Provinces.	Area in Square Miles.	Population in 1850.
Modena	612	204,491
Reggio	732	161,646
Guastalla	122	50,859
Frignano	406	57,450
Garfagnana	209	37,897
Massa-Carrara	245	56,867
Lunigiana		17,248
Total	2,326	586,458

Lunigiana is part of the valley of the Magra, which was called in the middle ages *Lunigiana*, from the ancient town of *Luna*, an Etrurian city on the left bank and near the mouth of the Magra, which continued to exist throughout the empire, and was famous for its quarries of white marble. The Normans plundered it in 857. In the time of Dante, who calls it *Luni*, it had fallen into complete decay. The ruins that still remain on the site are of Roman buildings. The port of *Luna* was still more celebrated than the town; it is now called the *Bay of Spezia*. The *Gulf of Spezia* is about 7 miles in depth and 3 miles in width; it contains several minor ports, among which *Porto Venero* and *Lerici* are respectively the ancient *Portus Veneris* and *Portus Eriæ*. The gulf however belongs to *Sardinia*. The bishops of *Luna* had feudal jurisdiction over part of this mountainous and sequestered region, and the marquises *Malaspina* over the other. It is now divided between the states of *Modena*, *Sardinia*, and *Tuscany*. The part belonging to *Modena*, called *Lunigiana Estense*, consists of 10 communes. *Fosdinovo*, a small place near the *Magra*, is its capital. *Carrara* and *Massa* are noticed in separate articles. [CARRARA; MASSA.]

A large portion of the territory belonging to the Duke of Modena is covered by the chain of the Apennines and its offsets, which slope gradually towards the north; about one-third of it forms part of the great plain of *Lombardy*, and is very fertile; and a small strip extends along the shores of the Mediterranean. Of the mountainous part some valleys are tolerably fertile, but the greater part is either rocky or covered with oak- and chestnut-trees. The highest summits of the Apennines are—*Monte Cimone* (7000 feet) and *Camporaghena* (6500 feet). The snow generally leaves these summits in the month of April. The principal rivers of the Modenese territory, which have their sources in the Apennines and run into the Po, are:—1. The *Secchia*, which rises in the Apennines of *Camporaghena*, and flowing through the whole length of the province of *Modena*, passes near the capital, receives many affluents, supplies numerous canals for irri-

gation, and, after a winding course of nearly 100 miles, enters the Po within the borders of *Mantua*. 2. The *Panaro* rises at the foot of *Mount Cimone*, and running in a parallel direction to the *Secchia*, waters the eastern part of the duchy, and then enters the territory of *Ferrara*, where it falls into the Po. Both these rivers are navigable for boats from the neighbourhood of *Modena* to the Po. 3. The *Crosetolo* rises in one of the lower ridges of the Apennines, passes near *Reggio* and by *Guastalla*, below which it enters the Po. The *Tassoni Canal*, which communicates with the *Crosetolo*, is about 14 miles long. In the plain of *Modena*, Artesian wells have been in use from time immemorial; many of them are of very considerable depth, and the supply of water is abundant. South of the Apennines the *Magra*, which rises in the Apennines north of *Pontremoli*, crosses the Modenese territory of *Lunigiana*, and enters the sea west of *Carrara*. Two smaller streams, the *Avenza* and the *Frigido*, water the territory of *Massa* and *Carrara*. The *Serchio* is the river of *Garfagnana*. Two roads cross the central Apennines, and make a communication between the northern and southern divisions of the Modenese states; one road leads from *Reggio* to *Fivizzano* and *Aulla* in the valley of the *Magra*; another from *Modena* to *Castelnuovo* in *Garfagnana*, and from thence to *Massa*. A railway has been projected from *Bologna* to *Piacenza*, through *Modena*, *Reggio*, and *Parma*, with a branch from *Reggio* to *Mantua*, which is already connected by railroads with *Venice* and *Milan*.

The chief products of the country are wheat, maize, rice, pulse, hemp, oil, wine, silk, and fruita. *Polenta*, or pudding of Indian corn, flour, beans, and chestnuts in the mountain districts south of the Apennines, are the principal articles of food for the peasantry. Horned cattle and swine are exported in considerable numbers. The other articles of exportation are fruit, silk, corn, marble, brandy, wine, and vinegar. The manufactures of the duchy consist of woollens, silks, gauzes, paper, straw-hats, glass, and pottery. There are abundant sources of petroleum in several parts of the duchy.

The government of *Modena* is the most absolute in Italy, there being no provincial states of any kind. The duke is assisted in the administration by a council of state, consisting of 14 members. The revenue in 1851 amounted to 8,418,622 francs, the expenditure to 8,728,133 francs. The judicial establishment consists of two supreme courts, one at *Modena*, and the other at *Massa*; and two secondary courts, one at *Modena*, and the other at *Reggio*. There are also justices of the peace in every canton or district, each of which embraces several communes. For municipal matters, each commune has its *podestà*, or *sindaco*, and a municipal council. For religious purposes the Modenese possessions are divided into five bishoprics—*Carpi*, *Guastalla*, *Massa-Carrara*, *Modena*, and *Reggio*. The military force numbers 3500 men, or including three regiments of reserve 14,656 men. These corps are recruited by voluntary enlistment with bounty money. There are two urban battalions, which act as a kind of civic guard, one at *Reggio* and the other at *Modena*, besides a *guardia nobile*, or body guards, who attend the sovereign and his family. There is a military academy at *Modena*.

The establishments for public instruction consist of a lyceum at *Modena*; colleges for the study of law and medicine at *Modena*, *Reggio*, and *Mirandola*; schools of philosophy, at *Carpi*, *Correggio*, and *Castelnuovo*, the chief town of *Garfagnana*; besides several colleges for boarders kept by the *Jesuits* and other religious orders.

The principal town is *Modena*, the Roman *Mutina*, which is situated on the ancient *Æmilian* road, 59 miles N. by W. from *Florence*, 21 miles W. from *Bologna*, in 44° 37' N. lat., 10° 57' E. long., in the centre of a wide plain between the *Panaro* and the *Secchia*, and has about 27,000 inhabitants. The town is well and regularly built, and has several handsome churches and palaces. Most of the streets have arcades on each side. The ducal palace is a magnificent princely residence; it contains a fine gallery of paintings by the great masters, and a valuable library of 90,000 printed volumes and 3000 manuscripts. The cathedral, a gothic building of the 11th century, is remarkable chiefly for its lofty square marble tower. In this tower is kept the *Bucket* taken from the *Bolognese* by the Modenese in 1325, and which forms the title of *Tassoni's* '*Secchia Rapita*' (*Rape of the Bucket*). The other remarkable buildings are, the theatre, the college, the barracks, the hospital, and the old citadel, which, with its *Place d'Armes*, covers nearly one-third of the site of the city. *Modena* is surrounded by fortifications of no great strength, but forming fine walks and affording peculiarly beautiful views of the Apennines. A canal uniting the *Secchia* with the *Panaro* affords a line of boat navigation between *Modena* and the Po. The manufactures comprise broadcloth, sail-cloth, silks, hats, leather, and glass.

Reggio, the *Rhegium Lepidi* of the Romans, a walled town in the midst of a fine and fertile plain, 15 miles W. from *Modena*, is well-built; it has a fine cathedral, several handsome churches, a lyceum, a theatre, an old castle, in which *Ariosto* was born, some manufactories of linen and silks, and nearly 20,000 inhabitants. There is a public library of 30,000 volumes and a museum in the town. Among the industrial products are silks, canvass, articles of horn, wood, and ivory. The trade of *Reggio* in agricultural produce and cattle is very considerable. A fair is held during the whole month of May. *Mirandola*, an old looking walled town, in a low unhealthy flat in which

rice is grown, has several churches, and about 4600 inhabitants. *Finale*, near the borders of Ferrara, has 6000 inhabitants. *Correggio*, the birthplace of the great painter Antonio Allegri: population, 3500. *Concordia*, a walled town on the right bank of the Secchia, has 3500 inhabitants. *Carpi*, on the high road from Modena to Mantua, has 5000 inhabitants, a magnificent cathedral, an old castle, and some silk factories.

The territory of the Guastalla originally belonged to the dukes of Mantua. On the death of the last duke in 1746 it came into the hands of the emperor who gave it to the Duke of Parma in 1748. Napoleon I. gave it to his sister Pauline, and subsequently incorporated it with the so-called kingdom of Italy. On the downfall of Napoleon in 1815 Guastalla was annexed to Parma, and given together with this duchy to the ex-empress Maria Louisa. The ex-empress died in 1847, when the duchy of Guastalla with certain districts on the right bank of the Enza, came into the possession of the Duke of Modena by virtue of a convention with the Duke of Parma, who received certain other territories in exchange. The city of *Guastalla*, an episcopal and walled town, is situated near the right bank of the Po, in 44° 54' 57" N. lat., 10° 39' 54" E. long., 16 miles N. from Reggio, and has about 10,000 inhabitants. The town is well-built; it has a citadel, a cathedral, a public library of 12,000 volumes, and several churches. The chief manufactures are silk goods and flannel. The French defeated the Imperialists under the walls of Guastalla in 1734. The Austrian general Brown took the city from the Spaniards in 1748.

In consequence of a revolt of his subjects (March 23, 1848) the Duke of Modena withdrew from his states. A provisional government was appointed, and a Sardinian force calling itself a 'liberating army' occupied the country, for the purpose of annexing it to Piedmont. After the capitulation of Milan to the Austrians [MILAN], the Sardinians evacuated the Modenese territories. An Austrian force then entered and restored the duke to his states.

MÖDLING. [ENS, LOWER.]

MÖERIS, LAKE. [EGYPT.]

MŒSIA, the name of a province of the Roman empire, extending north of the range of Mount Hæmus, the modern Balkan, as far as the Danube, and eastward to the Euxine, and corresponding to the present provinces of Servia and Bulgaria. Its boundaries to the west were the rivers Drinus and Savus, which divided it from Pannonia and Illyricum. Strabo (vii. 295) says that the old inhabitants of the country were called Mysi, and were a tribe of Thracians, and that they were the ancestors of the Mysi of Asia Minor. The Romans first invaded the country under Augustus (Dion, cap. 51), and it was afterwards made into a Roman province, and divided into Mœsia Superior, to the west, between the Drinus and the Cæsus, or modern Iaker, and Mœsia Inferior, extending from the Cæsus to the Euxine. Being a frontier province of the empire, it was strengthened by a line of stations and fortresses along the south bank of the Danube, of which the most important were Axiopolis (Rassova), Durostorum, Nicopolis ad Istrum, Viminacium, and Singidunum. In the interior of the country were the towns of Naisus (the modern Nissa), Sardica, and Marcianopolis; and on the coast of the Euxine, Odessus, or Odysus, near the modern Varna, Dionysopolis, and Tomi, the place of Ovid's exile and death. A Roman wall was built from the Danube to the Euxine, from Axiopolis to Tomi, as a security against the incursions of the Scythians and Sarmatians, who inhabited the delta of the Danube.

The conquest of Dacia by Trajan removed the frontiers of the empire farther north, beyond Mœsia; but after the loss of that province, about A.D. 250, Mœsia became again a border province, and, as such, exposed to the irruption of the Goths, who, after several attempts, crossed the Danube and occupied Mœsia in the reign of the emperor Valens. The Moso-Goths, for whom Ulphilas translated the Scriptures, were a branch of Goths settled in Mœsia. Some centuries later the Bulgarians and Slavonians occupied the country of Mœsia, and formed the kingdoms of Bulgaria and Servia.

MOFFAT. [DUMFRIESHIRE.]

MOGADORE. [MAROCCO.]

MOGULBUNDY. [CUTTACK.]

MOHACS. [HUNGARY.]

MOHILEV, a government of European Russia (in the division called West Russia), lies between 53° 5' and 55° 10' N. lat., 28° 50' and 32° 40' E. long. It is bounded N. by Vitepsk, E. and S. by Smolensk and Tchernigov, and W. by Minsk. The area is 18,724 square miles, and the population in 1846 was stated to be 931,300. The surface is level, yet there are fewer lakes, marshes, and fens than in most of the adjoining provinces; the soil is generally fertile. The principal river is the DNIÉPER, which enters the government on the north-eastern boundary and runs west as far as Orscha, whence it flows south to its junction with the Beresina; from this point it forms the south-western boundary of the government. Of the feeders of the Dnieper the principal are, on the left bank, the Swinaja, the Bolotinka, and the Sodscha; on the right the Druéz. Most of the lakes are in the north-west part.

The climate is drier and milder than in Vitepsk; and apples and pears, which there thrive only in sheltered spots, succeed here without any particular care.

The chief occupations of the inhabitants are agriculture and the

breeding of cattle. The soil is equally favourable to both, and if the higher lands produce the finest corn, the low grounds on the banks of the rivers have the most nutritious pastures; but both these branches of rural economy are in a very backward state. About 4,000,000 chetwerts of corn are grown annually, a quantity which allows of a large surplus for exportation. Rye, barley, oats, some wheat, and buckwheat in the most sandy soils are the chief bread-stuffs grown. Hemp and flax are staple articles and cultivated for exportation. Peas and beans are cultivated almost exclusively on the lands of the nobles. Almost all the landowners have kitchen-gardens and orchards; in the latter all kinds of fruit are cultivated, chiefly however apples and cherries. Hops and poppies are grown in the gardens. The fescue grass (*Festuca ovina*, Linn.), here called manna, is found in the fields and in some parts is gathered. In the forests and low grounds there are prodigious quantities of bilberries. The forests are a great source of wealth to the province; in particular the banks of the Sodscha and the Druéz, and the whole circle of Tsoherikof, are covered with the finest fir, which are partly felled for the Black Sea fleet, and floated down the Dnieper. The pastures are very good. The horses and cattle are of inferior breed. The sheep have been improved by crossing the Saxon sheep. Deer and other large game are rather scarce; hares and feathered game of all kinds abound. The fisheries are productive; the Dnieper and Sodscha yield annually above 40,000 poods (a pood is 36 lbs.) of sturgeon and shad, the whole of which is consumed in the province. The chief mineral is bog-iron. The industrial establishments are chiefly tanneries, distilleries, glass and iron-works, and paper-mills. The trade consists in the exportation of corn, flour, flax, hemp, linseed, timber, cattle, honey, wax, wool, tallow, hides, and some manufactures. The principal trading towns are Mohilev and Matislawl. The inhabitants are for the most part Russniaks or Little Russians, who speak a dialect which is a mixture of Polish and Russian. Jews and Gipsies are pretty numerous. The religion of the majority of the inhabitants is that of the Greek Church. The Greek churches have an archbishop, to whose diocese Vitepsk also belongs, and who resides at Mohilev; the Roman Catholics are also numerous, and have an archbishop resident at Mohilev. The Jews have synagogues and schools in almost all the towns, and have got into their hands almost all the retail business, the sale of brandy, and some of the trades or professions.

Mohilev, the capital of the province, is a considerable town, situated in 53° 50' N. lat., 30° 25' E. long., in a pleasant well-cultivated country on the left bank of the Dnieper, and has 21,080 inhabitants. It is the residence of the civil and military governors, of a Greek archbishop, and of the Catholic primate of Russia and Poland. The city is surrounded by a decayed rampart, and is divided into four quarters. Many of the streets are broad and paved, and in the centre of the city there is a large square. The public edifices are numerous, and some of them rather splendid, as the church of St. Joseph. The town has a theological college, a gymnasium, and an infirmary; some manufactories of ironware and leather; and a considerable trade in corn with Odessa by the Dnieper.

The other principal towns are *Matislawl*, 5000 inhabitants; *Dubrowna*, 4000 inhabitants; *Skiof*, a fortified place, 2500 inhabitants; and *Orscha*, 4000 inhabitants.

MOHILL, Leitrim, Ireland, a market and post-town and the seat of a Poor-Law Union, is situated in 53° 58' N. lat., 7° 50' W. long., distant 9½ miles E. by S. from Carrick-on-Shannon, and 92½ miles N.W. by W. from Dublin. The population in 1851 was 1223. Mohill Poor-Law Union comprises 23 electoral divisions, with an area of 92,956 acres, and a population in 1851 of 31,724. The parish church stands on the site of an abbey said to have been founded in 608. In the town are a Roman Catholic chapel, a Methodist chapel, a fever hospital, dispensary, and Union workhouse. Petty sessions are held monthly, and fairs 15 times a year. About a mile south of the town is Lough Rynn, on the shore of which is a lodge of the Earl of Leitrim.

MOHILLA. [COMORO ISLES.]

MOIRA. [DOWN.]

MOISDON. [LOIRE-INFÉRIEURE.]

MOISSAC. [TARN-ET-GARONNE.]

MOKSOBO. [BIRMA.]

MOLA. [BARI, TERRA DI.]

MOLD, the county town of Flintshire, a market-town, and municipal and parliamentary borough, in the parish of Mold, is pleasantly situated on the right bank of the river Alen, in 53° 10' N. lat., 3° 7' W. long., 191 miles S.W. from London. The population of the borough of Mold in 1851 was 3432. It contributes to the Flint district in returning one member to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of St. Asaph.

Mold is called in Welsh 'Yr Wyddgrug,' a lofty hill, which designation it owes to the Bailey Hill, an eminence partly natural and partly artificial, on which formerly stood an ancient castle. In the time of William Rufus the castle was in the possession of the English. In 1144 this castle was stormed by the Welsh under their prince, Owen Gwynedd, and razed. It was afterwards rebuilt, and repeatedly taken in the contests between the English and the Welsh. Of the castle no part remains; but the moats which encompassed it may still be traced. The town contains some good houses. The church is of

the perpendicular style, and is a handsome edifice. It contains some good monuments, and in the churchyard is the grave of the painter Wilson. Methodists, Independents, Baptists, and other Dissenters have places of worship. There are National schools and a savings bank. A county hall, in which the assizes are held, has been recently erected. A county court is held in the town. A large market-house has been lately built; the market-days are Wednesday and Saturday. There are four annual fairs. A branch of the Chester and Holyhead railway to Mold, 18 miles long, quits the main line not far from Chester.

MOLDAU. [AUSTRIA; BOHEMIA.]

MOLDAVIA, one of the two Danubian principalities under the sovereignty of Turkey and the protectorate of Russia, is situated between 45° 25' and 48° 18' N. lat., 25° 10' and 28° 30' E. long. It is bounded E. by the Russian province of Bessarabia, from which it is separated by the river Pruth; S. by the Danube and Wallachia; W. by Transylvania; and N. by the Austrian crownlands of Bukovina and Galicia. Its greatest length from south to north, between the Pruth and the Danube, is about 200 miles; its general breadth between the Pruth and the crest of the Carpathians is about 90 miles, but to the north of 47° 30' the width hardly exceeds 50 miles. The area is about 17,000 square miles; and the population is stated at 1,254,447.

The Danube, which touches only a small part of Moldavia, receives within the limits of the principality the rivers Sereth and Pruth. The *Sereth* rises in the Bukovina, to the south-east of Czarnowicz, and runs first eastward, then to the south, entering Moldavia on the north-west in the district of Suchava. Thence the course of the river is towards the south, first between ridges of mountains and hills, and then for several miles above its mouth in the Danube, through wide marshy plains, into which many lateral valleys, some of them of considerable extent, open. The Sereth receives the drainage of all the west and centre of the principality. Its principal feeders are the Suchava, the Moldava (from which the province is named), the Bistriz, the Trotus, the Milkov (which flows past Fokshani, and separates Moldavia from Wallachia), the Busco (which rises in the Busa Pass of the Carpathians, and flows entirely within Wallachia, first towards the south-east, then to the north-east to its junction with the Sereth), and the Birlat, which carries into the Sereth the drainage of a long central valley that commences to the west of Jassy. The length of the Sereth is about 200 miles. It is navigable for boats. Its valley is the best corn district in Moldavia. A long wooded offshoot of the Carpathians, called the Strunga Mountains (the ancient Bastarnic Alps), extends all through the principality, first south-eastward, and then southward, terminating in the plain above the junction of the Birlat with the Sereth, and forming the watershed between the Sereth and the Pruth. This latter river forms part of the northern and the whole of the eastern boundary of Moldavia; its basin comprises only a narrow strip of land in Moldavia south of 47° N. lat., but to the north of that parallel, from the neighbourhood of Jassy, the level land and the slope of the Carpathians drained by the Pruth is of considerable extent. A few miles above its junction with the Danube the Pruth sends off an arm into Moldavia which forms the lake Pralitz. Between this lake and the Danube the town of Galatz is situated. The Pruth is navigable; its banks are in parts marshy and unhealthy. The Danube touches Moldavia only on the southern frontier for about 12 miles, between the mouth of the Sereth and the Bessarabian town of Reni.

The Carpathians extend along the western frontier of Moldavia, and separate the principality from Transylvania. These mountains send out offsets into the interior of Moldavia, which decline in height as they advance to the banks of the Sereth and Pruth, where they terminate in hills covered with vineyards. Moldavia is divided into Upper Moldavia, or *Tzara-de-Susa*, which is subdivided into 6 districts, and Lower Moldavia, or *Tzara-de-Shoes*, which is subdivided into 7 districts. Each district is governed by an officer called *Ispravniks*. The districts, with their chief towns and population in 1850, are given in the following table:—

	Districts.	Chief Towns.	Population in 1850.
Upper Moldavia.	Neamtz	Piatra	99,210
	Dorohoi	Mihailia	99,222
	Suculava	Falticeni	71,044
	Roman	Roman	80,677
	Botoshani	Botoshani	146,361
	Jassy	Jassy	128,566
Lower Moldavia.	Bakeou	Bakeou	132,244
	Putna	Fokshani	124,217
	Cocarien	Galatz	67,293
	Tacutzi	Tacutzi	86,505
	Vaslui	Vaslui	84,708
	Tulova	Berlatu	83,674
	Falsii	Us	78,722
Total		1,254,447	

The climate of Moldavia is much colder in winter than might be expected in a latitude corresponding with the north of Italy: the

ivers are generally frozen, and the ground covered with snow for a considerable time. The summers are exceedingly hot. The country is subject to earthquakes, but they are not very violent. It possesses much mineral wealth, of which however little advantage has been taken, in consequence of the long unsettled state of the country. There is an abundance of rock-salt in the vicinity of the Carpathian Mountains; there are also some mineral-springs; asphaltum of two kinds, red and black, is found in several parts; a great quantity of saltpetre is also produced, chiefly in the northern part of the principality. The sand of the river Bistriz contains gold, but not in a large quantity. The soil is generally exceedingly fertile, and, notwithstanding a very inferior state of agriculture, produces every kind of grain and vegetable in the greatest abundance. A great number of horses, cattle, and sheep is fed on the rich meadows which Moldavia contains, and the vast forests produce every kind of timber.

Jassy, the capital of Moldavia, is situated on the Bachel, or Baglui, a small muddy stream which flows into the Pruth, in 47° 9' N. lat., 27° 30' E. long., and has about 60,000 inhabitants. It is the residence of the Hospodar of Moldavia, of the principal authorities of the principality, and of a Greek archbishop. The Hospodar's palace is on an eminence on the southern side of the town, and is surrounded by a wall. This wall is all that remains of the strong fortifications of the town, which were destroyed by the Russians in 1788. *Jassy* occupies a large space of ground, most of the houses being separated from each other by courts and gardens and plantations of trees. It was almost entirely destroyed by fire in 1827. The modern part of the town is tolerably well built; but the older part consists chiefly of wooden buildings one story high, with wide spaces between vacant or filled with ruins. The principal street, which is very broad, is furnished with shops on each side; the other streets are narrow and crooked; most of them are laid with rough planks of oak; in the rainy season they are covered with wet mud, and in summer with a thick layer of black dust, which the slightest wind raises in clouds. The number of churches is about 40: the most remarkable of these is the church of the Three Saints, a richly ornamental Byzantine structure. The town has also a Catholic and a Lutheran church, a great number of monasteries, an hospital, a bazaar, public baths, a college, and several printing-offices. There are not many manufactures, but a considerable commerce is carried on in agricultural produce, especially during the fairs which are held here.

Galatz, or *Galatz*, in 45° 23' N. lat., 28° 5' E. long., is situated on the left bank of the Danube, about 3 miles E. from the mouth of the Sereth and 10 miles W. from the junction of the Pruth with the Danube. Galatz is the only port of Moldavia, so that it is the place of export and import for the whole province. It has been a free port since 1834, and steamers ply regularly to Vienna and Constantinople. Galatz is for the most part better built than the other towns of Moldavia, having numerous houses of stone, several Greek churches, a convent, an hospital, and a large bazaar always well filled with merchandise, together with a great number of warehouses for grain and other produce; the streets however are narrow and dirty. Vessels of 300 tons burden can come close up to the town. There is a large export trade in corn and in preserved meats for ships. In 1847 there were exported from the ports of Galatz and Ibrail 1,836,647 quarters of corn (wheat, maize, and barley); in 1849, an ordinary year, the quantity shipped at the two ports was 1,005,240 imperial quarters. Other exports are tallow, timber, wool, hides, and skins. The chief imports are British and Austrian manufactures, colonial products, olive-oil, hardware, &c. The population is about 30,000. A British vice-consul resides at Galatz, and several Greek and British commercial houses are established there.

Fokszani, or *Fokshani*, is built on the Milkov, in 45° 41' N. lat., 27° 10' E. long., partly in Moldavia, partly in Wallachia, and has about 25,000 inhabitants. It was almost destroyed in 1784, during the war between the Russians and the Turks, but has been since rebuilt. It has a tolerable trade in hardware. It contains several Greek churches and a curious old convent. Fokszani is about 45 miles W. from Galatz. Among the other towns may be mentioned *Bakeou*, on the right bank of the Sereth, about 100 miles N.N.W. from Galatz, and 60 S.W. from Jassy: population, 12,000. At *Bakeou*, Stanislas Leczynski, king of Poland, was taken prisoner by Nicholas Mavrocoordato, prince of Moldavia. *Roman*, higher up the Sereth, here crossed by a wooden bridge, stands in a fine corn country, and has about 8000 inhabitants.

A good Macadamised road runs up the valley of the Sereth to the Bukovina. Another road runs from Fokshani up the valley of the Birlat to Jassy, whence it runs along the eastern base of the Strunga Mountains, and joins the former road in the north of Moldavia. There is a road from the valley of the Sereth to Jassy and the north-east of the principality, which crosses the Strunga Mountains at the town of Turgu-Formos (6000 inhabitants).

Among the population of Moldavia are many Wallachians, Armenians, Greeks, Jews, Gipsies, and Hungarians. The mass of the people profess the religion of the Russo-Greek Church; but the Hungarian part of the population is Catholic. The revenue of Moldavia is stated to be about 9,370,000 piastres.

Moldavia has been subjected to great devastations by the several hordes which invaded the Byzantine empire, and a great number of its inhabitants, descended from the Roman settlers, retired to the west

of the Carpathian Mountains. About the middle of the 13th century a colony of the same inhabitants re-occupied the country, under a chieftain called Bogdan, whence it is called by the Turks and the natives *Bogdania*. The language of the inhabitants, who call themselves *Roomoon*, consists of Latin with an admixture of Slavonic. Divine service is performed in the Slavonic tongue.

From that time the rulers of Moldavia, called 'voivodes' (a Slavonic term which signifies military leader), were often subject to the kings of Hungary, but also frequently asserted their independence, until they submitted to the protection of the Turks in 1536, under the voivode Roydan. The sultan granted to Moldavia his protection, for which an annual tribute was paid. The voivodes were to be elected by the principal clergy and the boyars, or nobles, and their election was to be confirmed by the sultan, who was not to interfere in the local administration of the principality, neither were Turks permitted to settle there. The voivodes had the power of life and death over their own subjects, and even the right to make peace and war, without being accountable to the Sublime Porte. No inhabitant of Moldavia was to be summoned by the Turkish government to Constantinople or any part of the Turkish dominions on any pretext whatever.

Moldavia was exposed to several wars which were carried on between Turkey and Poland, as the latter country had an old claim on the principality, which was finally abandoned by the peace of 1621.

In 1711 the Turks abolished the privilege of electing the voivodes, and nominated to that dignity the Greek princes of the Fanar (the name of the Greek quarter of Constantinople). The princes, called also 'hospodars,' governed with the assistance of a council, composed of 12 members appointed by the prince every year, with the exception of the metropolitan, whose ecclesiastical dignity entitles him to a permanent seat. The laws were administered according to a code framed after that of Justinian. There were a great many offices, several of which were copied from those of the Greek empire. The national army was composed of about 6000 men.

The tribute paid to the Porte was not so oppressive as the monopoly of trade: several articles, as wheat, timber, and cattle were exported to Constantinople, and bought from the inhabitants at a fixed price, which amounted to about one-fourth of the current market-price. As the hospodars were obliged to give considerable presents to the Turkish officers, and as they also sought to enrich themselves, the country was ground down by a most oppressive taxation.

Peter the Great in 1710 made an unsuccessful campaign, for the purpose of gaining possession of Moldavia. Moldavia was occupied by the Russians in 1739, but was evacuated by the peace of Belgrade. By the 10th article of the treaty of Kutchuk Kainarji, in 1774, Russia obtained the right to intercede with the Porte in favour of the above-mentioned principalities. The 4th article of the treaty of Jassy, January 9, 1792, confirms all the privileges of the two principalities, and exempts the inhabitants from the payment to the Sultan of tribute for two years. By the treaty of Bucharest (1812) the eastern part of Moldavia, situated on the left bank of the Pruth, was ceded to Russia, the rights and privileges of the two principalities were confirmed, and a release from tribute again granted for two years.

The events of the Greek revolution had a fatal influence on Moldavia, which was entered by Prince Ipsilanti at the head of a troop of the Heterists, or Greek patriots; he was defeated and obliged to escape to the Austrian territory, but the Turkish troops, which occupied both the principalities, committed great excesses. This led to many demands on the part of Russia, which were temporarily adjusted by the treaty of Akerman in 1826. At the peace of Adrianople in 1829 it was stipulated "that the hospodars should, instead of for seven years, as had hitherto been the case, be invested with their dignity for life;" that the hospodars should administer the internal government of their provinces, with the assistance of their divan, according to their own pleasure, but without any infraction of the rights guaranteed to the two countries by treaties or hattisherifs (ordinances of the sultan), nor shall their administration be disturbed by any command tending to the violation of those rights; that the Turks should evacuate all the fortified points and cities on the left bank of the Danube; that no Turks should be permitted to settle in the principalities; that the principalities should be relieved from all those contributions of corn, provisions, cattle, and timber, which they were formerly bound to furnish for the supply of Constantinople and the victualling of the fortresses on the Danube; and that forced service from labourers should be abolished. In order to indemnify the Turks for the renunciation of those rights, the principalities are bound, independently of the annual tribute formerly paid, to pay yearly a pecuniary compensation. Moreover, upon every fresh nomination of the hospodar, the principality where that event occurs shall be bound to pay to the Sublime Porte a sum equal to the annual tribute of the province. A Russian general, Kisseleff, administered the provinces from 1832 to 1834, when Michel Sturdza was elected Hospodar of Moldavia. He governed tranquilly till April, 1848. At this date the revolutionary movement which originated in France reached Jassy, whose inhabitants demanded a new constitution. The hospodar put down the movement, but nevertheless resigned his power. In June 1849 Gregory Ghika, a native boyard, was elected hospodar, not however for life, but for a term of seven years, according to an article of the convention of Balta Liman, concluded between Russia and Turkey, May 1, 1849.

At the outbreak of hostilities between Russia and Turkey in 1853 a Russian army occupied Moldavia and Wallachia, and advanced to the Danube for the purpose of invading Bulgaria and marching upon Constantinople. Repulsed from the Danube in Little Wallachia, and unable, in consequence of the bravery of the Turks and the vigilance of their general, Omer Pasha, to effect a passage of the river from Wallachia, they crossed the Danube near Galatz in the spring of 1854, and after seizing the fortresses of the Dobruzscha advanced to attack Silistria, which they bombarded for forty days. On the arrival of French and English troops at Varna for the support of the sultan, the Russians, after losing vast numbers of men, raised the siege of Silistria, recrossed the Danube, and in the latter end of autumn evacuated the principalities, which were immediately occupied by an Austrian army. During the Russian occupation the hospodars retired from their states, but returned with the Austrians. [WALLACHIA.]

MOLFETTA. [BARI, TERRA DL.]

MOLINA. [CASTILLA LA NUEVA.]

MOLITERNO. [BASILICATA.]

MÖLLEN. [LAUBENBURG.]

MOLOSSI, a people of ancient Epirus, who occupied the southern part of that country along the banks of the river Arachtus, and extended to the shores of the Ambracian Gulf. Their principal town was Ambracia. [EPIRUS.]

MOLSHEIM. [RHIN, BAR.]

MOLTON, SOUTH. [SOUTH MOLTON.]

MOLUCCAS, or SPICE ISLANDS, a group of the Indian Archipelago, which extends from the eastern coast of Celebes to the western coast of Papua or New Guinea, and includes the islands from which spices are obtained, and several others. The principal of them are Amboyna, Banda, Ceram, Gilolo, Booro, Waigiou, Zula, Mangola, Ooby, Batchian. Several of these islands are noticed in separate articles in this work, AMBOYNA, BANDA, BOORO, CERAM, &c. The present article presents a general view of the group.

Surface, Soil, &c.—Nearly all the Moluccas are mountainous, and some of them contain peaks which rise to the height of 7000 or 8000 feet. The rocks of which they are composed seem to be mostly of a volcanic nature, and there are at least eight volcanoes still in action. These volcanoes seem to be the southern extremity of that extensive series which commences on the north in the peninsula of Kamtchatka, and continues southward through the Kuriles, Japan, and the Philippines, inlosing the eastern shores of Asia, as it were, with a volcanic barrier. On the other hand, it may be said that the most southern of these volcanoes constitute the eastern extremity of another volcanic barrier, which skirts Eastern Asia on the south, and proceeds from the Moluccas westward through the Lesser Sunda Islands and Java, where it terminates. Like other volcanic countries, the surface of all these islands is very rugged and broken, but their lower parts possess a great degree of fertility; and the coast, which in many parts rises from the water's edge to a considerable elevation with a very steep acclivity, contains a great number of harbours for every kind of vessels. Except where the declivity is too steep, the mountains are covered with forests, containing a great variety of trees, valuable as timber or for cabinet-work.

Climate.—As none of these islands is more than 9 degrees from the equator, the climate is hot all the year round, but the heat is not excessive, on account of their comparatively small size and the uninterrupted continuance of the monsoons for at least ten months of the year. The seasons are dependent on these periodical winds. The rainy season begins in October or November, with the north-westerly monsoon; for while the north-east monsoon and fair weather prevail in the Chinese Sea and in the sea between Sumatra and the eastern coasts of Africa, the wind blows from north-west and west in the sea surrounding the Moluccas. During this wind the rains fall in torrents, but seldom continue above two or three hours at a time. The rainy season is also the hot season, and the mid-day heat during that time varies between 89° and 95°; the extremes are 77° and 100°, or somewhat more. The rains cease in the end of April or in May, when the wind settles in the south-east, and the weather becomes more temperate. Rains however occur from time to time, and the atmosphere contains considerable moisture. The mid-day heat is a few degrees lower than it is during the rains, and the difference between it and the temperature of the cool nights is greater, but hardly exceeds 12 degrees.

Productions.—The agricultural productions do not differ from those of Java, with the exception of rice, which is not cultivated, but imported, though not in great quantities. The common food of the people is derived from the sago-palm, which grows wild in the forests and also in plantations. Fish, wild deer, and hogs are also articles of food. The productions raised for exportation to Europe are cloves and nutmegs; edible birds'-nests, sea-slugs (trepang), and shark-fins are sent to China. A small quantity of gold is also exported, as well as birds of paradise, which visit these islands from New Guinea and the Arroo Islands, where they breed. The fertility of the soil and the climate favours the growth of all tropical products; turtle-shells, mother-of-pearl, honey, bees'-wax, ambergris, sandal-wood, and various kinds of beautiful wood for cabinet furniture are to be had, but the jealous spirit of the Dutch has hitherto excluded all European vessels but their own from the islands, and consequently the articles

named and many others are neglected. When the English were in possession of the Moluccas, they obtained from them cordage, cables, and timber.

Inhabitants.—These islands are inhabited by two races, the Malays and the Papuas. The Malays are in possession of the coasts, where they cultivate the ground or gain their subsistence by fishing. They are Mohammedans. Their language contains a great number of foreign words, and Dr. Leyden is of opinion that the Ternate or Molucca language has been an original tongue. The Papuas have been extirpated on the smaller islands, but they still maintain their ground in the mountainous districts of the larger islands. They seem to belong to the same race which inhabits the continent of Australia. They are described as an inoffensive race who cultivate the ground.

Division.—The number of islands probably amounts to some hundreds, of which however many are small and uninhabited. They may be divided into three groups: the Gilolo Group, or Moluccas proper; the Ceram Group; and the Timor Laut Group. The *Gilolo Group* is the most northern, and extends from 2° S. lat., to 3° N. lat., and contains the islands of Gilolo, Morty, Mandioly, Batchian, Ooby, and Mysole, with numerous smaller islands lying between and about them, among which the islands of Ternate and Tidore are the most important. In figure *Gilolo* bears a remarkable resemblance to CELEBES, being composed of four long peninsulas, which radiate from a common centre near 1° N. lat. Its greatest length from south to north may be 220 or 230 miles, and its surface, on a rough estimate, about 3000 miles. The northern and north-eastern peninsulas rise into high mountains, and are densely wooded; the southern attain only a moderate elevation. The chief products are sago, cocoa-nuts, spices, fruits, edible birds'-nests, pearls, gold-dust. Horses, horned cattle, and sheep are reared. Manufactured goods, opium, china, and iron are imported by the Dutch. The island is divided into several petty states; the chief town is Gilolo, or Jilolo, at the head of a bay on the west side of the island to the north-east of Ternate. The sea between Gilolo and Celebes is called the *Molucca Passage*. *Morty* rises with a gentle ascent to a considerable height, and is said to have good harbours. *Mandioly*, *Batchian*, and *Tawaly* are separated from one another by narrow straits which afford good anchorage. They are of moderate elevation, and are governed by their own sovereign, to whom also the island of *Ooby*, or *Paulo Oby*, belongs. The last-mentioned island is very little known. The islands of Ternate and Tidore are small, being only from 20 to 30 miles in circuit, but the soil is fertile, and they are very populous. Their sultans possess the greater part of Gilolo, and also several districts on the eastern coast of Celebes. The island of *Waygiou*, off the north-west coast of Papua, or New Guinea, is sometimes reckoned among the Moluccas. It lies a little south of the equator, and is crossed by the meridian of 131° E. long. The island is stated to be fertile and populous and to have good harbours. It extends east and west with two deep indentations on its northern and southern shores near the centre of the island; the northern inlet forms the bay of Offak (0° 1' 3" S. lat., 130° 43' E. long.). Farther east, but on the north shore also, is another harbour, *Port Boni*, sheltered by an island. *Waygiou* is mountainous in the centre, the shores and some other parts are marshy.

To the Gilolo group belong two smaller groups lying farther north-west. The eastern group, called the *Salibabo Islands*, consists of three islands of some extent, Tulour, Salibabo, and Kabruang, and several smaller ones. The island of Salibabo has a good harbour at Leron, in the narrow strait which divides that island from Kabruang. The western group, called the *Sangir Islands*, consists of a larger island and numerous smaller islands. Sangir Island is about 70 miles long; through its central part runs a ridge of high mountains, which terminates on the north in an active volcano.

The Ceram group occupies the middle, between 3° and 5° S. lat., and comprehends the two large islands of CERAM and BOORO, and among the smaller ones, which lie to the south of them are AMBOYNA and BANDA islands.

The *Timor Laut* group is the most southern and least known. It consists of the large island of Timor Laut and the KNY, or KI, ISLANDS, noticed in a separate article. Timor Laut is about 70 miles long and 25 miles wide, mountainous and wooded. The centre of the island is nearly in 7° 50' S. lat., 131° 20' E. long. Timor Laut must not be confounded with the large island of Timor, which lies considerably to the west and is one of the lesser SUNDA ISLANDS. The island of Arroo [ARROO], lying farther east, is also sometimes considered as belonging to the Moluccas.

History.—The Portuguese arrived at the Moluccas in 1510, and had hardly begun to form settlements when the vessels of Magalhaens arrived from the east, and a dispute arose between the Portuguese and Spaniards respecting the possession of the islands, which lasted for several years. The Dutch took the Moluccas from the Portuguese about 100 years afterwards, and, in order to secure to themselves the exclusive trade in nutmegs, maces, and cloves, they formed numerous small settlements on nearly all of them, by which they kept the petty sovereigns in subjection, and, with their assistance, were enabled to extirpate all the spice-trees in the islands, except Amboyna and Banda, which they subjected entirely to their sway. In 1796 the British took possession of the Moluccas, and kept them to the peace of Amiens, when they were restored to the Dutch. The British again

took possession of them in 1810, and again gave them up to Holland at the treaty of Paris in 1814. Since that time the Dutch have abandoned a few of the smaller establishments, but they still maintain their hold more or less upon all these islands. In June 1853 a bill was brought into the Dutch chambers by the government for opening the trade in spices; and making four free ports—Ternate, Amboyna, Banda, and Kajelie. At the last-named place British vessels trading to China call for water and provisions, and it lies on the track to Australia. That the bill was made law we are unable to say.

(Forest, *Voyage to New Guinea*; Stavroinus, *Voyages*; Delano, *Voyages and Travels*; Crawford, *History of the Indian Archipelago*; Hogendorp, *Coup d'Œil sur Java, &c.*)

MOMBAS is a sea-port town situated on that part of the eastern coast of Africa which is called the coast of Zanguebar, in 4° 4' S. lat., 39° 38' E. long. It is built on the eastern side of Mombas Island, which occupies the greater portion of a bay, about 5 miles long and 3 miles wide. The island is 3 miles long by 2 miles broad; the two straits which divide it from the continent are hardly half a mile across. The eastern strait constitutes the harbour of the town, which is one of the most perfect in the world. The castle, built by the Portuguese in 1635 on a rock of moderate elevation, lies to the south of the town. The town is not large; it consists of the city and the Black Town, which occupies the most northern portion of it. The former, which was once inhabited by the Portuguese, is now inhabited by the Arabs. Some free coloured people and slaves constitute the population of the Black Town. The population probably does not exceed 3000 or 4000, and the town, it is said, has fallen into decay.

Vasco de Gama visited this port in 1498, and was well received, but nearly fell a sacrifice to the treachery of the inhabitants. It was afterwards taken and burnt by Francisco de Almeida in 1505. Twenty-three years later it was taken by Nunho da Cunha after a stout resistance from the inhabitants, and was again reduced to ashes. The Portuguese remained in possession of it till 1631, when the king of the country retook it, and put all the Christians to death. Since then European vessels seldom visit this part of the coast, the government of Mombas having more than once seized such vessels when they put into the harbour for provisions. In 1720 Mombas was in possession of the Imam of Muskat, who lost it afterwards by a rebellion of its inhabitants. In 1824 the Imam sent a force against the town, which then placed itself under British protection, in order to preserve its independence. It is governed by an Arab sheikh.

MOMPOX. [NEW GRANADA.]

MONA. [ANGLESEY; MAN, ISLE OF.]

MONACO, the Principality of, a small state in the Western Riviera of Genoa. It consists of the small towns of Monaco and Mentone, and the village of Rocca-bruna, with a small territory about five miles in length along the coast, between Nizza and Ventimiglia, and extends inland about three miles. The country is rocky, but produces oranges, citrons, lemons, and other fruits, and oil. The town of Monaco is built on a steep naked rock rising above the sea-coast, is fortified, and has about 2000 inhabitants, and a harbour for small vessels. Mentone, farther to the east, lies on the sea-shore in a narrow strip of fertile land sheltered by mountains from the north winds, and planted with olive- and lemon-trees: it has a warm southern climate, and carries on some trade by sea. Mentone has about 4000 inhabitants, and a handsome church.

Since the 14th century the principality of Monaco has been in possession of the Genoese family of Grimaldi, under the protection of France and of the Genoese republic. It is now under the protection of the king of Sardinia. The prince resides half the year in Paris and the other half in Monaco. He has a palace at Monaco and a handsome villa near Mentone. The Sardinian troops took military possession of Monaco and Mentone during the revolutionary troubles of 1848-9, and we believe that the principality has been since purchased by the government of Sardinia. The name of Monaco is derived from a temple dedicated to Hercules Monoecus ('solitary'), which stood on the rock where the town now stands. [See SUPPLEMENT.]

MONAGHAN, an inland county in the province of Ulster, Ireland, is bounded N. by county Tyrone, E. by Armagh and Louth, S. by Meath and Cavan, and W. by Fermanagh. It lies between 53° 54' and 54° 25' N. lat., 6° 33' and 7° 20' W. long. Its greatest length from north to south is 37 miles; from east to west it is 23 miles. The area is 500 square miles, or 319,757 acres, of which 285,885 acres are arable, 21,585 acres uncultivated, 5816 acres in plantations, 304 acres in towns, and 6167 acres under water. The population in 1841 was 200,442; in 1851 it was 141,813.

Surface, Hydrography, and Communications.—The northern part of the county belongs to the basin of the Blackwater, the southern part to the basins of the Fane and the Glyde, and the western part to the basin of the Erne. The general surface is hilly, the hills being for the most part detached and scattered in an irregular manner. The Slieve Beagh range, of which the chief summit is 1254 feet high, extends along the north-west boundary into the county of Fermanagh. The portion of the county lying south-east of that range is a comparatively level tract, and forms the northern limit of the great plain of Ireland. This district is bounded on the south by a series of heights lying east and west, and connected with the Fewa Mountains of Armagh. Mullash, on the border, is 1034 feet high. The division

of the county south of these heights, sloping on the west towards Lough Erne, and on the east towards the Irish Sea, is divided by several eminences, of which the principal is Crieve Hill, 886 feet in height. Patches of bog occur in all parts of the county.

There are no navigable rivers in the county. The Blackwater has about 10 or 12 miles of its course along the north-eastern boundary, partly upon and partly within the border, for about 12 miles, before it enters the county of Louth, through which it flows into the Irish Sea. The Glyde rises in the south part of the county, and has a course parallel to the Fane; the Lagan, a feeder of the Glyde, and a much more considerable stream, has about 13 miles of its course along the southern boundary. The Finn is the most important of the streams which flow into the Erne; it rises in the Slieve Beagh Mountains, and has about 20 miles of its course within the county. The Ulster Canal, which unites Lough Neagh with Lough Erne, crosses the county in a south-west direction near Monaghan and Clones. Its length within the county is about 20 miles.

The loughs are numerous, but all of them are small. Muckno or Barrac Lough, near Castle Blayney, is the largest. It is of very irregular form, about 3 miles long, and in some parts about a mile wide: it contains a number of small islands. The river Fane runs through it. Lough Inner, on the south-west border near Rockcorry, is about 3 miles long, exceedingly narrow, and of very irregular form. Lough Emy, near Emyvale, and Glas Lough, near the town of Glaslough, in the northern part of the county; Lough Leesborough, between Rockcorry and Newbliss, and Lough Long, near the village of Drum, in the western parts; the White Lough and Corin Lough, near Ballybay, in the central parts; Lough Egish, or Eglis, Lough Avaghon, and Lough Bawn, near Ballytrain, in the southern part; Lough Ballyhoe (through which the Lagan runs), on the southern border of the county, and Lough Ross, on the eastern border, are next in size to Muckno and Inner.

There are numerous good roads in the county. The principal line is that from Dublin to Londonderry, Carrickmacross, Castleblayney, and Monaghan. A branch road runs from Carrickmacross to Monaghan by Ballybay. Other roads lead from Carrickmacross to Dundalk, from Castleblayney to Newry and to Armagh, from Monaghan to Armagh, and from Monaghan by Clones to Cavan. A road from Dublin by Cootehill (Cavan) passes through Clones, and joins the Londonderry mail-road at Omagh in Tyrone.

Geology, Mineralogy, &c.—The carboniferous limestone of the great central field of Ireland occupies that part of the county which lies north-west of a line drawn through Monaghan and Clones. The Slieve-Beagh Mountains are composed of the rocks belonging to the calp series of this formation. The rest of the county, with the exception of a small tract on the southern border, belongs to the transition formation, which occupies an extensive district in the east of Ulster and north of Leinster. The rocks consist of grauwacke slate, fissile clay-slate, flint-slate, and chlorite slate, with hornblende slate, schistose porphyry, and other metamorphic rocks. On the southern border is a small coal-field, not wrought, resting on a tract of carboniferous limestone, and flanked on the west by a patch of new red-sandstone, which contains a valuable deposit of gypsum. Escarpments, or low steep ridges of alluvial matter, usually composed of clay and limestone gravel, are found in several parts of the county. Those near Tyhallon, not far from Monaghan, are composed entirely of jasper, quartz, agates, and argillaceous sand. Limestone of great variety and excellent quality is quarried; also fine marble, and valuable freestone for building. A fine white sandstone, dug in the Slieve-Beagh Mountains, is extensively used for architectural purposes. Ironstone is found, but of inferior quality, and several quarries of slates or flagstones are worked. Lead-ore has been found to a small extent. Some potters'-clay is found, and brick earth in nearly all parts of the county.

Climate, Soil, and Produce.—North-west winds prevail during the greater part of the year. These bring frequent rains from the Atlantic up the valley of the Erne, rendering the climate exceedingly moist. The evil however is to a great extent counteracted by the ventilation and drainage of numerous valleys. The soil of the county varies much, but is mostly a strong deep loam resting on a firm subsoil of clay, mixed with lime, gravel, or sand. In the elevated parts the soil is moory or peaty. The lowlands are generally wet and moory, especially in the north-west, near the Slieve-Beagh Mountains. The western side of the county has a soil naturally wet, but capable of great improvement. The southern extremity consists of rich and productive land. The most fertile part of the county is the central, including the baronies of Monaghan, Cremorne, and Dartree. The barony of Monaghan is altogether a tillage district, except some 'rough grazing' in the mountains, on which some young cattle are kept: there is no grazing-land in the district capable of fattening cattle. The occupations are almost wholly agricultural. Spade husbandry is much practised. Flax, from its improved culture, is increasing greatly in quantity and value. The culture of wheat and of green crops is extending. The manufacture of linen is reviving.

In 1853 there were 152,404 acres under crop; of which 2519 acres grew wheat; 78,537 acres oats; 4962 acres barley, bere, rye, peas, and

beans; 23,926 acres potatoes; 8305 acres turnips; 2664 acres mangold-wurzel, carrots, vetoches, and other green crops; 17,392 acres flax; and 14,099 acres were in meadow and clover. In 1841 the plantations covered 8007 acres, yielding oak, ash, elm, beech, fir, mixed timber, and fruit. In 1852, on 19,338 holdings, there were 10,258 horses, 5110 mules and asses, 64,621 cattle, 9830 sheep, 18,716 pigs, 10,072 goats, and 263,099 head of poultry. The estimated value of the live stock here enumerated was 553,938*l.*

Divisions and Towns.—The county is in the diocese of Clogher in the united sees of Armagh and Clogher. It is divided into five baronies—Cremorne, central and east; Dartree, central and west; Farney, south; Monaghan, central; and Trough, north. The principal towns are MONAGHAN, CLONES, CASTLEBLAYNEY, and CARRICKMACROSS, which are noticed under their respective titles. The following are some of the other towns and more important villages, with the population of each in 1851:—

Ballybay, or Ballibay, population 1617, a well-built town, 9 miles S. from Monaghan and 86 miles N.N.W. from Dublin, contains a neat parish church, a Roman Catholic chapel, two Presbyterian meeting-houses, several endowed schools, a public library, a market-house, and district dispensary. The linen manufacture is carried on; in the neighbourhood are extensive bleach-fields. Petty sessions are held here. Fairs for cattle, horses, and pigs are held on the third Saturday of every month. There is a weekly market on Saturday. *Emyvale*, a small post-town situated on the left bank of an affluent of the Blackwater, 8 miles N. from Monaghan, is a neat clean place consisting chiefly of one street. The general employment is weaving. There is a large flour-mill on the stream, as also a mill for working iron, principally in the manufacture of spades and shovels. A cattle fair is held monthly. *Glaslough*, a neat and thriving market-town, 6 miles N.E. by N. from Monaghan, on the margin of a beautiful lake called Glas Lough, or Green Lake. The town contains the parish church of Donagh, and a district dispensary. Flax-spinning and weaving are carried on. Gray marble is quarried in the neighbourhood. There is a market every Friday for corn and flax. Fairs are held on the third Friday of every month except February. *Newbliss*, population 481, a small market-town 9 miles S.W. from Monaghan and 71½ miles N.W. from Dublin by road, consists of a single street of good width, containing houses of respectable appearance. The church is a handsome building recently erected. There are a Presbyterian meeting-house, a neat market-house, a dispensary, and a school of the London Hibernian Society. Petty sessions are held monthly. There is a well-attended market on Saturday, chiefly for pigs and flax. Fairs are held on the last Saturday of every month. *Rockcorry*, population 316, a small market-town 9 miles S. by W. from Monaghan, contains a Presbyterian and a Methodist meeting-house, a neat market-house, and a dispensary. Petty sessions are held monthly. Fairs are held on the last Wednesday of every month. The town belongs to Baron Cremorne, by whom the neighbourhood has been much improved. *Scots-house*, in the barony of Dartree, 14 miles S.W. from Monaghan, contains a parish church and a Roman Catholic chapel. In the neighbourhood are the remains of an ancient embankment called Worm Ditch, which has been traced several miles from this point.

The county of Monaghan returns two members to the Imperial Parliament. The assizes are held in Monaghan, and quarter-sessions there, and at Carrickmacross, Castleblayney, and Clones. Petty sessions are held in eight places. The county court-house and jail are in Monaghan, and there are bridewells at Carrickmacross, Castleblayney, and Clones. The county infirmary is in Monaghan. There are fever hospitals at Carrickmacross, Clones, Monaghan, Rockcorry, and Trough; and dispensaries in fourteen places. A savings bank is established in Monaghan; the amount owing to depositors on November 20th, 1853, was 18,128*l.* 13*s.* 11*d.* The constabulary force consisting of 208 men and officers, has its head-quarters at Monaghan. The county is divided into 4 police districts comprising 24 stations. In September 1852 there were 141 National schools in operation, attended by 7014 male, and 5862 female children.

History and Antiquities.—In the invasion of Ireland by the Anglo-Normans, Henry II., having bestowed all Ulster on John de Coursey, that chieftain overran various parts of the province in 1177, and built castles to secure his conquests. Among others he built two in the district of Farney in this county, and gave them in charge to MacMahon, an Irish chieftain, who had gained his confidence. MacMahon subsequently demolished the castles, and set himself in opposition to De Coursey. In the reign of Henry V. the MacMahons seem to have risen in arms, for they are noticed among the septa whom Talbot, lord Furnival, the lord-lieutenant, brought into the king's peace. In the reign of Elizabeth, Monaghan was constituted a shire by the Irish Parliament which assembled at Dublin in 1568. The country however still remained in an unsettled state in consequence of the turbulent spirit of the MacMahons. In the troubles excited by the Earl of Tyrone, the county was the scene of hostilities, and some of the MacMahons appear to have joined the earl. In the rebellion of 1641 Monaghan came early into the power of the insurgents, but in the course of the subsequent struggle, no events of particular interest occurred in it. In the war of the Revolution a sharp conflict took place at Glaslough, in which the Protestants were victorious.

There are no feudal remains of importance in the county. The

chief ecclesiastical antiquity is the ruin of the abbey of Clones, which is said to have been founded in the 6th century. At Clones there is a round tower still entire, and at Inniskean, near the eastern border, there is one less perfect in its form, but remarkable for having the door on a level with the ground. Rath and other earth-works appear in various parts of the county. A singular structure consisting of several apartments, arched with flat stones nicely fitted together, and inclosed within a wall of similar materials, was a few years since discovered at a depth of several feet under a hillock, about 3 miles from Monaghan. It is supposed to have been the abode of ancient hunters, and to have been covered for concealment with the earth which had been removed to make way for its erection.

MONAGHAN, Ireland, the chief town of the county of Monaghan, and the seat of a Poor-Law Union, is situated on the road from Dublin to Londonderry, in 54° 15' N. lat., 6° 58' W. long., distant by road 76 miles N.N.W. from Dublin. The town is governed by a provost, 12 free burgesses, and a body of freemen. The population in 1851 was 3484, besides 640 inmates of the workhouse. Monaghan Poor-Law Union comprises 21 electoral divisions, with an area of 112,789 acres, and a population in 1851 of 49,032.

The three principal streets of the town meet in a central square called the Diamond. The town is lighted, and the streets are paved and well kept. The parish church is a large modern gothic structure. There are a Roman Catholic chapel, two Presbyterian, and two Methodist meeting-houses. On the west side of the town is a Diocesan school, founded in the reign of Elizabeth; the number of scholars in 1851 was 34. There are several National and Endowed schools. The county court-house is a handsome modern building in the centre of the town. The county infirmary occupies an elevated site on the east side of the town. The county jail is on the north side. A well-built market-house stands in the principal square. There are also a linen-hall, an infantry barrack, a fever hospital, a dispensary, and a savings bank. The manufacture of linen is carried on. The Ulster Canal connecting Lough Erne with Lough Neagh, passes near the town, and facilitates its trade with Belfast. The assizes and quarter and petty sessions are held in the town. Fairs are held on the 1st Monday of every month. The principal market-day is Monday; markets for agricultural produce are held on Tuesday, Wednesday, and Saturday. Monaghan obtained a charter from James I. The borough returned two members to the Irish Parliament, but was disfranchised at the Union.

MONFERRATO, the name of a district in Piedmont, which comprises the country drained by the Tanaro, and extends from the right bank of the Po to the Ligurian Apennines. Many parallel offsets branch off in a northern direction, from the Ligurian Apennines to the southern bank of the Tanaro; and the intervening valleys are watered by numerous streams, the Stura, the Gesso, the Borbio, the Pesio, the Ellero, the Tanaro, the Belbo, the two Bormide, the Erro, and the Orba, all of which join the Tanaro above Alessandria, below which town the Tanaro enters the Po. North of the Tanaro another range of hills, parallel with the course of the Po, runs from the mount of Superga, opposite to Turin, to the town of Casale, and divides the valley of the Upper Po from that of the Tanaro. The greater part of this hilly region, on both sides of the Tanaro, went by the name of Monferrato, and was divided into High Monferrato, south of the Tanaro, and Lower Monferrato, between the Tanaro and the Po. The principal towns of Lower Monferrato were Alessandria, Asti, Casale, and Valenza; those of Upper Monferrato were Mondovi, Acqui, and Alba. It is a favoured region, rich in corn, wine, fruit, silk, and cattle. The wines of Monferrato are the best in northern Italy; the muscat of Asti is particularly esteemed.

Monferrato gave the title of Marquis to an ancient family, descended from the imperial house of Saxony, from the 11th century till the time of Charles V., when, the male line becoming extinct, the marquises fell to the Gonzaga of Mantua. On the death of Francesco Gonzaga in 1612, without male issue, the Duke of Savoy claimed the inheritance; this led to a war between the dukes of Savoy and Mantua, in which Spain and France took part, and which was not concluded till the peace of Cherasco in 1630, when the territory in dispute was divided between the dukes of Mantua and Savoy. During the war of the Spanish succession the Duke of Savoy obtained the whole of Monferrato. This territory is now divided among the provinces of Acqui, ALBA, ALESSANDRIA, ASTI, CASALE, and MONDOVI.

MONGHIR. [HINDUSTAN.]

MONGOLIA (*Mongolistan*), 'the Country of the Mongols,' comprehends a vast extent of country in the interior of Asia, between 38° and 68° N. lat., 84° and 124° E. long. Its length from east to west exceeds

1700 miles, and its width, from north to south, between 100° and 110° E. long., 1000 miles; but towards both extremities of its length it narrows to 600 miles. Its area may amount to between 1,200,000 and 1,300,000 square miles. It is bounded N. by Siberia, E. by Mandshooria, S. by China proper, and W. by the Chinese province of Kansu and the Chinese government of Thianshan Pelu.

The middle portion of Mongolia is occupied by the Great Gobi (Ta-Gobi), which stretches across the country south-west and north-east from the boundary-line of the province of Kansu to the Dalai Nor, near the boundary of Da-uria, with an average width of about 200 miles. The Gobi is the worst part of the country, the surface being covered with sand or small stones, and the vegetation being very scanty and occurring only in single spots. Vast tracts of it are level, but at great distances from one another there are hills of moderate elevation. The whole region is destitute of trees, and the water, which is only found at some distance below the surface is brackish. South-east of the Gobi extends a more elevated and uneven country, which terminates in a mountain-range of considerable elevation.

This range begins on the south, near the most southern point of Mongolia, not far from the banks of the river Hoang-ho, about 38° N. lat., and extends northward along that river for nearly 400 miles. It is covered with wood, and called Alashan, or Ho-lang Shan. Near 42° N. lat. it turns abruptly to the east, forming nearly a right angle, and it is then called Inshan by the Chinese, and Onglian Oöla by the Mongols. In this direction the chain continues, between 41° and 42° N. lat., about 600 miles, when it again turns north, though less abruptly, and proceeds in a north-by-east direction from 42° to 55° N. lat. under the name of Khing-khan Oöla. The highest portion of this mountain range seems to be at the point where it turns northward, and where a peak, called Petaha, rises far above the snow-line, and is supposed to attain a height of more than 15,000 feet above the sea. The country which skirts this range along its western and northern base, and extends from it to a distance of between 50 and 100 miles, has a broken surface, the hills rising to some height above the valleys and small plains. It is not deficient in water, but trees occur only in isolated tracts. As its elevation above the Gobi is considerable, and probably not less than 5000 feet above the sea-level, and as it is also much exposed to the cold winds which blow with great force over the desert, it is nearly unfit for agriculture, and only used as pasture-ground for horses, cattle, and sheep.

South of the Inshan Mountains the country exhibits fertile valleys and mountains, partly wooded, as far west as the place where the Hoang-ho River turns southward: this fertile tract is included in the Chinese provinces of Pe-tche-li and Shan-si. But the tract farther west, which is surrounded by the great northern bend of the Hoang-ho, partakes strongly of the features of the Gobi, and forms part of Mongolia: it is called the country of the Ordes, taking its name from a Mongolian tribe which belongs to the great division of the Tabakhar Mongols. This whole tract is covered with hills composed of loose sand, mostly without water, and entirely destitute of trees. But the numerous depressions contain extensive meadows, with rich grass and bushes. The attempts to cultivate some parts of it have not proved successful, and accordingly it is abandoned to the Mongols and their herds; but in order to prevent them from plundering the adjacent agricultural districts of the neighbouring provinces of Shan-si and Kan-si, the great Chinese wall was built across the peninsula from east to west from Pao-tsheou to Ning-gia.

That part of Mongolia which is to the east of the Khing-khan Oöla, and extends nearly to the shores of Hoang-Hai, or the Yellow Sea, from which it is only divided by a narrow fertile tract belonging to the province of Leao-tong, is called Kortahin. This name is properly only applied to the tract north of the river Sira Muren, or Leao-ho, which resembles the country of the Ordes, except that it is less intersected by sand-hills. A great portion of it seems to be of inferior fertility; but south of the Sira Muren the country contains numerous meadows clothed with rich grass, and agriculture has been introduced here by the Chinese, who send to this country their criminals who are condemned to transportation. A great part of it serves only as pasture-ground. Great quantities of grain, especially wheat, are exported from the province of Leao-tong to Peking and Shanghai. The most southern district of this country is traversed by an offset of the Khing-khan Mountains, which branches off from the principal range near the peak of Petaha, and extends in a south-eastern direction to the Hoang-hai, where it forms the high, rocky, and mountainous shores along the western side of the Gulf of Leao-tong north of the mouth of the river Lan-ho. The declivities of this range are abundantly watered, but the northern side is bare and destitute of wood; whilst the southern is overgrown with pine, fir, oak, lime, walnut, and other trees, and is the haunt of numerous wild animals, among which are tigers and leopards. It constitutes the most extensive hunting-ground of the Chinese emperor, and contains the royal palace of Ichol, which was visited by Lord Macartney and described by Sir George Staunton. The tract on both sides of the Lan-ho is an agricultural country of great fertility and well cultivated. Though included within the boundary of Mongolia, it is inhabited by Chinese, and is very populous. Besides several small towns, it contains the large town of Quan-tsing.

The country which extends along the north-western side of the Ta-Gobi is nearly unknown, with the exception of the eastern part,

which is traversed by the caravan road from Kiachta in Siberia to Khalgan in China. Here too the surface of the country is frequently broken by hills and isolated ridges; but the intervening level tracts contain rich pasture-ground. It is mostly well watered, but wood is scarce. In advancing northward the hills grow higher, and the valleys or intervening level tracts become narrower, till near the boundary-line between Mongolia and Siberia the country rises into mountains, which run in a continuous chain, and are that portion of the Altai Mountains which is known under the name of Khing-khan Oöla. [ALTAI MOUNTAINS.] The width of this mountainous and uneven country, which lies between Siberia and the Ta-Gobi, seems on an average to be about 150 miles. In it originate the river Selenga and its numerous upper branches. Here also rise the Kerlon and the Onon, two large rivers, which by their union form the Amur. [AMUR.] This country, which is rich, when compared with other portions of Mongolia, belongs to the high-priest of the Buddhists, who resides in the neighbourhood of the town of Urga, and is called Kootookhtu. It forms a separate government of the Chinese empire, and its general governor, called 'vang,' or 'kiun-vang,' as well as the lieutenant, called 'amban,' resides in the town of Urga, or Oergo. This town is built in a small plain; but though sheltered by mountains against the northern winds, the climate is too cold to permit the most common vegetables to be raised, which are accordingly brought to it from Mai-mat-shin, a place two degrees farther north. Its population does not exceed 7000, of which 5000 are said to be lamas, or persons belonging to the ecclesiastical establishment of the Kootookhtu; but it is a place of considerable traffic, being a depôt for the goods intended for the trade with Siberia, and also for those Chinese productions and manufactures which are consumed in the parts of Mongolia farther to the west. Many of the Mongolian princes, whose tribes wander about in the Ta-Gobi and the adjacent countries, are obliged to reside in this town, in order that their views may be known to the Chinese governor, who is a Mandshoo, and commonly a relation of the emperor. Here also is the supreme court, called Yamoun, for the administration of justice in that part of Mongolia which is inhabited by the Khalkas. This place may in fact be called the capital of Eastern Mongolia. The small town of Mai-mat-shin is on the very boundary-line of Siberia, and less than a mile from Kiachta. [KIACHTA.]

Of the western portion of Mongolia, extending from 84° to 96° E. long., between Siberia and the most western extremity of the province of Kan-su, all our knowledge is derived from the geography of the Chinese empire, the Tay-tsing-hoei-tien, and the maps annexed to it. Its western part is traversed by a mountain range, which near its western extremity is connected with the Altai Mountains, not far from the eastern bank of the Irtysh. This range, the Ektag Oöla, is commonly called on our maps the Great Altai. It seems to rise to a considerable elevation, but to disappear about 94° E. long.; for farther east only isolated mountain masses or short ranges occur in the desert. That portion of Mongolia which lies south of this range seems to partake largely of the nature of the Gobi, extending mostly in extensive sterile plains. The great number of rivers which, descending from the southern declivity of the Ektag Oöla, join the Irtysh before it reaches the lake of Zaizan, seems to indicate that a tract of fertile country extends along the northern banks of that river. The Irtysh is the largest river in this country, and probably runs 160 miles before it falls into Lake Zaizan. Another large river, the Ooroongoo, falls into Lake Kialibash, which has no outlet. The country between the Ektag Oöla and the principal chain of the Altai Mountains appears to be traversed by several subordinate ridges running east and west. Though it is much better watered than any other part of Mongolia, the greatest part of it is a desert, especially towards the east, but towards the west the tracts of pasture are more extensive and less interrupted by sandy districts. In this part there are several extensive lakes, all of which receive considerable rivers without having any outlet. The most northern is the Upsa Nor, which receives from the east a considerable river, the Tes, besides several smaller ones. The Yeke Aral Nor, to the south-south-west of the Upsa Nor, is the receptacle of the Djabekan, a river whose course can hardly be less than 500 miles. In this part Mongolia extends to the north of the Altai Mountains, comprehending the country in which the upper branches of the Yenesei have their origin and course. The mountain range which divides the last-mentioned tract from the lake Upsa Nor and the river Tes is called the Tangnoo Oöla.

This part of Mongolia is divided into two governments, the government of Kobdo and that of Uliassutai, the boundary-line between them running near 92° E. long. The capital of the former is Kobdo, not far from the northern extremity of Lake Yeke Aral Nor: the capital of the latter is Uliassutai, situated on the river Iro, an affluent of the Djabekan. The latter place is stated to contain 2800 houses, and to be regularly built. Caravans pass from it to Urga and to China, and its commerce seems to be considerable. Nothing is known of Kobdo. A general, appointed by the Chinese emperor, resides in each town, a Mandshoo by birth, who has under his inspection the Mongol inhabitants of the country; he unites in his person the military and civil authority.

As the whole surface of Mongolia, with the exception of the deep depression of the Ta-Gobi, is more than 3000 feet elevated above the sea-level, and as it stretches out in vast plains, to which the compara-

tively low ranges of mountains along its northern border cannot afford shelter against the northern and north-eastern winds, the climate is much colder than in that part of Siberia which extends along the base of the Altai range west of Lake Baikal. No month in the year is free from snow, and even frost, though the heat in summer is nearly insupportable, on account of the want of trees and the sandy surface of the country. Sudden and great changes in the temperature are of frequent occurrence. It is however remarkable that the numerous herds which pasture on this plain find subsistence all the year round: even after a fall of snow the grass is seen above it, and serves to nourish the animals. This evidently shows that the quantity of snow which falls is comparatively small, and much less than that which annually covers the northern countries of Europe or of North America. This fact is a proof of the great dryness of the air; and to this want of moisture the unfitness of the soil for agricultural purposes, even where it is not composed of sand or stones, is mainly to be attributed. A little millet is grown in a few sheltered places between high hills, which attract the moisture. Rain is rare, except near the great ranges of mountains, especially about Urga. Gales of wind are frequent, and, especially in the Gobi, blow with great force, and frequently for many days together.

The wealth of the Mongols consists in their numerous herds of camels, horses, and sheep. Cattle are only numerous on the more hilly tracts, especially towards the boundary of China; there are none in the Gobi. Asses and mules are only found in the vicinity of China. Wild animals are numerous, especially hares, antelopes, dahiggetais, or wild asses, deer, foxes, sables, squirrels, and marmots. Water-fowl are plentiful on the numerous lakes and swampy tracts. In some places the desert is covered with small stones, among which several kinds of precious stones occur, as chalcedony, agate, onyx, jade, carnelian, &c., which are collected by the Chinese.

Inhabitants.—The inhabitants are called Mongols, and constitute the principal stock of a nation which is widely diffused over the extensive table-lands of Central Asia.

This nation is divided into two great divisions, the Eastern or Proper Mongols, and the Western Mongols, or Kalmucks. All the tribes belonging to this nation have, from time immemorial, led a nomadic life, and subsisted on the produce of their herds, without attempting to cultivate the ground; a circumstance which must be attributed to the countries they inhabit being entirely unfit for agriculture, with the exception of very small tracts.

The Proper Mongols inhabit that portion of Central Asia which is bounded by a line drawn from the northern extremity of Lake Baikal to the northern extremity of Lake Balcash, thence to the Hoang-ho, where the range of the Alashan rises near the town of Ninghia; from this place it follows the Great Wall, from the eastern extremity of which it runs to the junction of the rivers Nonni and Songari in Mandshooria, whence it returns to the northern extremity of Lake Baikal. The whole country encompassed by this line is in possession of the Proper Mongols, with the exception of some plains between the Ektag Altai and Lake Balcash, which are occupied by Kalmuck tribes. There are however Mongols also in other parts of Asia, especially in the country about the sources of the Hoang-ho, and about Lake Kookoonor, and in the western parts of Tibet, where they are called Khor-Katsai Mongols. All the Mongols speak the same language, and admit that they all belong to the same nation, and have a common origin.

The Proper Mongols are divided into three great nations, the Tshakhar, Khalkhas, and Sunnit. The Tshakhar inhabit the best part of Mongolia, being in possession of the tract which skirts the great Chinese Wall on the north, and extends to the Ta-Gobi, a distance of from 150 to 200 miles from the wall. They obtained the full confidence of the court of Peking by yielding to the sway of the Mandshoo, before they had made any considerable progress in the conquest of China. The Khalkha, or Khalkhas Mongols, occupy the northern part of Mongolia, along the southern boundary of Siberia. They voluntarily submitted to the Chinese emperor to avoid destruction in their unsuccessful war with the Oelöth Kalmucks in 1683. The Sunnit occupy the country between the Tshakhar and Khalkhas, or that part of Mongolia through which the Ta-Gobi extends. They are less numerous and powerful than their neighbours, and less esteemed by the Chinese. They submitted to the Mandshoo when the Tshakhar joined them in 1634.

The Mongols however have a literature, which they owe to the Chinese, and which consists chiefly of translations of Chinese books, and a few original historical works, especially the history of their great hero, Gengis Khan.

The whole nation is divided into 26 tribes, called 'aimak.' Each of these divisions has an hereditary prince, except the Khalkhas, who constitute one aimak, but are governed by four hereditary princes, called 'khan.' All four claim a descent from Gengis Khan. Each aimak has its territory, in which it wanders about with its herds. The order of society resembles the feudal system, and the noblemen are called 'taidahis.' The Mandshoo have introduced among them a military division, according to which the whole nation forms 135 banners, each of which is subdivided into regiments and companies. Each Mongol is bound to serve as a horseman from his 18th to his 60th year. The Mongols are governed by the decrees of the Li-fan-yuen, or Tribunal of Foreign Affairs, which has instituted for them a

civil government, resident at Urga, and two military governments, at Uliassutai and Kobdo. All their princes are obliged to pay a fixed tribute as a token of their dependency, but it is small, and they receive ten times its amount back in presents, given to them as a remuneration for their services and fidelity. A few receive even a fixed salary. Some of their princes also are always married to a princess of the imperial blood, and thus are more closely attached to the interests of the emperor. By these means the court of Peking keeps the unruly and warlike temper of this nation in subjection, in which it is powerfully supported by the indelible hatred which the Mongols bear to the Chinese.

According to a rough estimate, it is thought that this nation, after having lived in peace for more than a century, can bring to the field 500,000 warriors; and, as each male is a warrior, it is presumed that the whole population does not much exceed two millions.

The Mongols have been sometimes strangely confounded with the Tartars, and Mongolia is called Tartary on many old maps. No two nations could physically be more distinct, though both are addicted to the same nomadic mode of life. The Tartars belong to the Turki race, from whom the European Turks are descended. Personally they are a noble and intrepid race (though animated by fierce passions and addicted to plunder and robbery), observant of the duties of hospitality, and all believers in Mohammed. They are all distinguished by the same striking features of the finely-formed and light-coloured Caucasian family to which they belong. The Mongols, on the other hand, are characterised by a short stature, dark yellow colour, flat nose, strong cheek-bones, large and prominent ears, and by the almost complete absence of beard. The Mongol race, which is far more numerous than the Tartar, is dispersed over almost all the eastern countries of Asia; but it is to the restless hordes of middle Asia, and to the Buriates, Bashkirs, Kalmucks, and other roving tribes that the name of Mongols is chiefly restricted. Addicted to the same nomadic manner of life, and equally fond of horse and cattle breeding with the Tartars, they wander in quest of pasturage over their boundless plains, carrying with them their whole stock of property, and even their houses, which are placed upon wheels and drawn by oxen. Thus they leave scarcely a trace of their former residence in the places which they abandon. Contending for temporary pasture-grounds, or propelled by urgent necessity, those innumerable crowds of Mongols, though naturally fainthearted and cowardly, have often invaded the neighbouring countries.

The distinctive names of Mongols and Tartars did not become known until after the conquests of Gengis Khan, who honoured his Mongols with the pompous title of 'Koekae Monghoel,' or Celestial People; whereas the conquered Turki hordes were called Tributaries, or Tatars, as the word should be more correctly written. Gengis Khan, born in 1163, became the chief of a petty Mongol clan in the 18th year of his age, and having first overcome the neighbouring hordes, he soon united the numerous wandering tribes into a conquering nation, and successively subdued the greatest part of Asia. His son Oktai followed him, under the title of Great Khan, and was equally successful. In their expeditions to the west, the Mongol armies advanced even to Hungary and Silesia; so that after the dreadful battle of Wahlstadt (1241) the Mongol empire extended from the northern provinces of China to the frontiers of Poland and Germany. The Mongols (Khalkhas), under their khan Kublai, conquered all China, and remained in possession of that country for a century. In the course of the thirteenth century this vast empire gradually split into several independent sovereignties, till it was once more united, and even considerably enlarged in the direction of Hindustan, by the famous Tamerlane, after whose brilliant career (1335-1405) the Mongol empire slowly dissolved. In the year 1519 a lineal descendant of Timur, Zehireddin Mohammed Baber, founded a new monarchy in Hindustan, erroneously called the Mogul empire. Being himself of Turki origin, Baber not only wrote his interesting 'Memoirs' in the purest Turki dialect, but often censures in the strongest terms the depravity, perfidy, venal character, and cowardice of the Mongols.

(Timkowsky; Pallas; Klaproth; Staunton, *Account of an Embassy to China*; M'Leod, *Narrative of a Voyage to the Yellow Sea*; Ritter, *Erkunde von Asien*; Abulghasi Behadurkhan, *Historia Mongolorum et Tatarorum*; Hüllmann, *Geschichte der Mongolen*.)

MONISTROL. [LOIRE, HAUTE.]

MONMOUTH, the capital town of Monmouthshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated at the confluence of the rivers Wye and Munnow, in 51° 48' N. lat., 2° 42' W. long., distant 129 miles W. by N. from London. The population of the borough in 1851 was 5710. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and, in conjunction with the boroughs of Newport and Usk, returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry of Monmouth and diocese of Llandaff. Monmouth Poor-Law Union contains 33 parishes and townships, with an area of 92,427 acres, and a population in 1851 of 27,348.

Monmouth appears to be the Blestium of the Roman Itineraries. It was in early times occupied by the Saxons, who fortified it to maintain their conquests between the Severn and the Wye, and to prevent the incursions of the Welsh. The town was at one period

surrounded by walls and by a moat on the sides which are not protected by the river: one gate still remains, but the walls have been demolished. A remnant only is left of the castle. Monmouth Castle was the favourite residence of John of Gaunt, of his son Henry Bolingbroke, afterwards Henry IV.; and the birth-place of Henry V., who was thence called Harry of Monmouth. Charters were granted to the borough by Edward VI., and by subsequent sovereigns. The town is lighted with gas and well supplied with water. The parish church of St. Mary has a tower which dates from about the 14th century, and is surmounted with a beautiful spire. The body of the church was rebuilt about the beginning of the 18th century. A district church has been opened, which is a restoration of a curious edifice of early Norman date. Wesleyan Methodists, Independents, and Roman Catholics have places of worship; and there are National and Infant schools, and Jones's Charity school and almshouses. The Haberdashers' Company of London are trustees for Jones's charity. The town possesses a dispensary and a savings bank. A county court is held here. Markets are held on Wednesday and Saturday; and on the first Wednesday in each month there is a great market or fair for cattle. Three fairs are held annually. There is a considerable trade in timber and iron. Fishing is carried on in the Wye with coracles. Monmouth is much resorted to in the summer by tourists. The neighbourhood of Monmouth abounds with old castles, abbeys, and other memorials of the olden time, and the scenery of the Wye is here very beautiful.

MONMOUTHSHIRE, a maritime English county, lying between 51° 29' and 51° 59' N. lat., 2° 39' and 3° 17' W. long., is bounded W. and N.W. by the Welsh counties of Glamorgan and Brecknock, N. and N.E. by Herefordshire, E. by Gloucestershire, and S. by the Bristol Channel and the estuary of the Severn. Its greatest length, from a point in the Black Mountains on the north, to the Goldcliff Headland on the south coast is 31 miles: its greatest breadth from the point where the Wye enters the county on the east to a little west of Tredegar, is 28 miles. The area is 576 square miles, or 363,399 statute acres. In 1841 the population was 134,368; in 1851 it amounted to 157,418.

Coast-line and Surface.—The coast-line extends 22 miles along the estuary of the Severn, and a part of the Bristol Channel, between the mouths of the Wye and the Rumney. The only indentation within this distance is that formed by the estuary of the Usk, which is navigable for vessels of the largest size, up to the town of Newport. The coast is exposed to the high spring-tides which rush up the Severn from the Bristol Channel, rising at Newport to 40 feet, and at Chepstow sometimes to 60 feet, the highest tidal altitude reached in Great Britain. The southern part of the county east and west of the Usk, consists of two extensive levels, called respectively the Caldecot and Wentloog Levels, which are protected from the wash of the sea by vast sea-walls and earth-works, and are under the control of a Court of Sewers. The Caldecot Level is diversified by the hill and headland of Goldcliff.

The district north of the Caldecot Level, and between the Usk, the Wye, and the Munnow, is in parts undulating, but generally presents an irregular hilly surface, rising here and there into bold bluffs, and diversified by wooded knolls and deep shady dells. This part of the county is famous for its scenery, which is greatly set off by a background of misty mountains on the north and west, by numerous primitive churches, half concealed by clustering ivy or the shade of aged yews, by the picturesque ruins of feudal strongholds and grand ecclesiastical structures, and on the eastern boundary by the graceful windings of the Munnow and the Wye. The most northern part of the county consists of a long narrow projection, formed by offshoots from the Black Mountains of Brecknockshire, inclosing between their dark and lofty ridges two wild and secluded glens, one of which, watered by the Grunty Vawr, forms the chief portion of a detached part of Herefordshire, called the Ffwddog; the more eastern glen called the Vale of Ewias, and celebrated for its romantic mountain scenery, is watered by the Honddu.

South of the glen of the Grunty Vawr, and about 4 miles N.W. from Abergavenny, is a remarkable peaked mountain 1856 feet high, called the Pen-y-Val, or Sugar-Loaf. At a distance of 3 or 4 miles E. from the Sugar-Loaf, is a much more wild and rugged height, called Scyrryd Vawr, or Holy Mountain, 1498 feet high, on the north-eastern point of which formerly stood the ancient chapel of the Archangel Michael. North-east of the Holy Mountain, and commanding the finest scenery of the Munnow, is Graig Hill.

From the west side of the Vale of Crickhowell, in Brecknockshire, and at a little distance from the left bank of the Usk, a high range of hills enters the county west of Abergavenny, and after running for a few miles south-south-east, sweeps gradually round to the south-west, terminating on the left bank of the Rumney, a little west of Newport. In the northern part of the chain, is the Blawrenge Mountain, 1720 feet high. This ridge lies on the eastern edge of the South Wales mineral field, and between it and the Rumney, on the western boundary of the county, are several lower chains of hills, inclosing vales watered by small rivers, which converge upon the Usk, near Newport. All this western district is dotted with iron and coal works.

Hydrography and Communications.—The principal rivers of Mon-

monmouthshire are the Wye, the Usk, the Rumney, the Ebbw, the Sirhowy, the Avon-Llwyd, and the Munnaw.

The *Wye* first enters Monmouthshire at a detached portion, the parish of Welsh Bicknor, of which it forms the western and southern boundary; thence it flows between the counties of Hereford and Gloucester, until it reaches Hadnock Wood, in the parish of English Newton, where for a short distance it divides Herefordshire from Monmouthshire: it then enters Monmouthshire, and flowing past the town of Monmouth, it again at Redbrook becomes the boundary of the county, and continues so to its mouth in the estuary of the Severn. Sea-going vessels work up to Chepstow bridge. The tide ascends the river as far as Tintern, 5 or 6 miles higher up. Above Chepstow the Wye is navigated by trows or heavy barges which are dragged by gangs of men over the weirs and rapids that occur in the river above the tide-way. It is the portion of this river bordering Monmouthshire that is most frequently visited by tourists; and the whole extent from Monmouth to Chepstow is of remarkable beauty. From Tintern to Chepstow the river flows between high and steep banks crowned with woods, and on approaching the Windcliff, a bold cliff, 800 feet high, it sweeps past a fine range of rocks called the Bannagar Crags. Tintern Abbey, one of the finest ecclesiastical ruins in Europe, on one of the loveliest spots in England, is the gem of the scenery of the Wye. The *Usk* enters Monmouthshire about 3 miles west of Abergavenny, flows near that town, and through the middle of the county past the towns of Usk, Caerleon, and Newport, into the Bristol Channel. The *Rumney* first reaches Monmouthshire at its most western point, and flowing in a south-south-east direction, divides it from Glamorganshire, until it falls into the Bristol Channel. The *Ebbw* is formed by the Ebbw-Vach and the Ebbw-Vawr, two small streams that rise within the Brecknockshire border, and flowing south-south-east unite their waters a short distance above Crumlin. From this point the Ebbw flows south past Crumlin and Newbridge, to its junction with the Sirhowy, on the right bank, whence it runs south-east past Bassaleg, entering the Wentloog Level, through which it flows by a very winding channel into the estuary of the Usk. The *Sirhowy* also rises in Brecknockshire; it enters Monmouthshire, a short distance above the Tredegar iron-works, and flows through a long vale west of the Ebbw, in a general south-south-east direction to within about a mile of its junction with the Ebbw: through this distance its course is eastward. The *Avon-Llwyd* rises on the western side of the Blawrenge Mountain, and flows south-south-east through a vale studded with iron-works and intersected by tramways and inclined planes, to Pontypool; hence its course is due south to Llantarnam Abbey, when it turns eastward, and joins the Usk on the left bank at Caerleon. The *Munnaw* rises on the eastern slope of the Hatterel Hills, in Herefordshire, near the village of Dorston. After a south-south-east course of about 15 miles, it reaches the boundary of this county about a mile south of the village of Clodock, in Herefordshire, and after separating the two counties for a considerable distance, it enters Monmouthshire about 3 miles north-north-west of Monmouth, passes that borough, and falls into the Wye. There is good fishing in all these streams. The Wye and the Usk are both famous for their salmon. A canal runs from Newport to the neighbourhood of Pontypool, thence to the west of Abergavenny and up the Vale of Usk to Brecknock. The Crumlin Canal branches from the former between Newport and Malpas, and runs along the left bank of the Ebbw to the village of Crumlin. In connection with these canals are many tramroads and railways, having several inclined planes and tunnels of great length, on which iron and coal are conveyed from the various works.

The county is well provided with common roads. The principal are the following—the road from Chepstow by Caerwent to Newport, and thence to Cardiff; that from Chepstow to Monmouth and Hereford; and that from Ross through Monmouth and Abergavenny to Brecon and Caermarthen. The South Wales railway from Swansea to Gloucester enters Monmouthshire a little east of Cardiff, and passes through Newport and Chepstow, where it crosses the Wye by a bridge of peculiar construction. [CHEPSTOW.] Its length in the county is about 28 miles. The Western Valleys railway, formerly a tramroad belonging to the Monmouthshire Canal company, was adapted in 1850 to passenger traffic; it passes through Risca, Abergarn, Newbridge, and Crumlin, to the vicinity of the Nant-y-glo iron-works near Blaina; and has a branch to Ebbw Vale. The Newport and Pontypool railway forms part of a continuous line from Newport to Hereford, Shrewsbury, and Chester. Numerous tramways from the coal-mines and iron-works converge upon Newport, and the quays, wharfs, and staiths on the left bank of the Usk, to the south of that town.

Soil, Climate, &c.—In the vales of Wye and Usk, and in many of the southern parishes, the crops are much earlier than in the northern and western portions of the county, where the narrow valleys are swept by the winds, and are subject to frequent rain. In the mountainous portion on the north-west, little wheat is grown; oats and barley form the principal grain crops. In the fertile Vale of Usk, the Vale of Wye, and the northern and eastern districts generally, wheat is the principal crop. Orchards are seen in favourable situations; the hills are also frequently covered with oak-coppice. The levels bordering the Bristol Channel consist partly of a black and

sterile peat, but chiefly of an alluvial loam, which is productive either as pasture or meadow, or under tillage.

Geology and Mineralogy.—That part of Monmouthshire which lies east of a line drawn from Abergavenny to Newport, and prolonged thence to the Bristol Channel, is composed of the old red-sandstone formation. At Chepstow, a tongue of carboniferous limestone, from the coal-basin of the forest of Dean, runs into Monmouthshire, and is bordered on the south by a strip of new red-sandstone, which forms the shore of the Severn. Close to Usk the strata of the old red-sandstone have been pierced by the underlying rocks which form an oblong district in the midst of the old red-sandstone formation. The district to the west of the supposed line consists of the coal-measures of the South Welsh coal-field, skirted by a narrow band of carboniferous limestone. The important minerals in this county are coal, limestone, and ironstone. There are 12 beds of coal, varying from 3 to 9 feet thick, and having an aggregate thickness of about 95 feet. The principal strata lie at a considerable depth; so much so, that some of them cannot be profitably worked, but as the district is intersected by deep valleys, the expense of sinking shafts is avoided, levels for ingress and egress to the mine being driven into the side of the hills. Limestone is burnt extensively for building purposes and manure, and is used in large quantities in the manufacture of iron. It is reckoned that about a ton of limestone is required for the manufacture of every ton of iron. The ironstone of this district is an argillaceous ore, occurring sometimes in strata, sometimes in detached lumps or balls; the proportion of iron contained in it varies from 18 to 55 per cent. The principal iron-works of Monmouthshire are the Rumney, Tredegar, Sirhowy, Ebbw Vale, Victoria, the British, Pentwyn, Beaufort, Blaen-Afon, Coalbrooke Vale, Blaina, Bute, Nant-y-Glo, the Varteg, Abersyochan, and Pontypool, which terminates the mineral range in that direction. The products of the iron-works and the collieries in Monmouthshire are shipped almost entirely at Newport. The area of the Monmouthshire mineral district is estimated at 89,000 acres.

Divisions, Towns, &c.—Monmouthshire is divided into 6 hundreds:—Abergavenny, north-west; Caldecot, south-east; Raglan, central and east; Skenfrith, north-east; Usk, central; and Wentloog, west. It contains 8 market-towns—ABERGAVENNY, CAERLEON, CHEPSTOW, MONMOUTH, NEWPORT, PONTYPOOL, which will be found under their respective titles, and Tredegar and Usk, which we notice here.

Tredegar, population 8505 in 1851, about 12 miles W. by S. from Abergavenny, and about 1 mile from the Brecknockshire border, has risen up around the extensive Tredegar iron-works. The market is held on Saturday. There are here a district church, and chapels for Wesleyan Methodists and Baptists; also schools supported by the iron-works company. The Ebbw Vale branch of the Western Valleys railway has its terminus near Tredegar.

Usk, a small neat and clean town of considerable antiquity, is situated at the junction of the Olwy and the Usk, 12 miles S.W. from Monmouth, population of the borough 1479 in 1851. Usk unites with Monmouth and Newport in the return of a member to the Imperial Parliament. The borough is governed by a portreeve, two bailiffs, and burgesses. On an eminence above the town are considerable remains of the castle. Several ancient encampments are near the town.

The following are the only other places that require notice: the populations are those of 1851:—

Caerwent, population of the parish 420, the Roman military station, *Venta Silurum*, and afterwards a town of considerable importance, is now a poor village. It is situated in the south of the county, at a short distance from Caldecot Castle. The church is partly Norman, with a lofty embattled tower. The chief objects of interest are the Roman fortifications, which remain in a very perfect state. Roman coins of the reign of Severus, tessellated pavements, and fragments of sculpture, have been discovered on the site. About 4 miles N. from Caerwent is the only cromlech in Monmouthshire. *Newbridge*, situated in the Ebbw Vale, 11½ miles from Newport by the Western Valleys railway, is a considerable town of only a few years growth. Higher up the vale, on the left bank of the Ebbw, is *Crumlin*, also a rising place, 12 miles by railway from Newport, with which it is also connected by canal. In the valley of the Wye, between Chepstow and Monmouth, are—*Brookweir*, a busy village, in which ship-building is carried on to some extent: *Llandogo*, a picturesque village of white cottages straggling up the sides of a hill on the right bank, amongst noble trees; near it is a small waterfall called the Cleidan Shoots: and *Tintern*, celebrated for its ancient abbey.

By the Poor-Law Commissioners the county is divided into 6 Poor-Law Unions—Abergavenny, Bedwelty, Chepstow, Monmouth, Newport, and Pontypool. These Unions comprise 161 parishes and townships, with an area of 354,006 acres, and a population in 1851 of 177,020. The county, with the exception of 4 parishes, is in the diocese of Llandaff and archdeaconry of Monmouth. Two members of Parliament are returned for the county, and one for Monmouth and the boroughs connected with it. The county is in the Oxford circuit; the assizes are held at Monmouth. Quarter-sessions are held alternately at Monmouth and at Usk. County courts are held in Abergavenny, Chepstow, Monmouth, Newport, Pontypool, Tredegar, and Usk.

History and Antiquities.—Monmouthshire at the time of the Roman invasion was occupied by the Silures, whose capital was Caerwent. The Silures were reduced by Julius Frontinus in the reign of Vespasian;

from this time the Romans occupied their country until A.D. 408, a period of 330 years. During the Heptarchy the Saxons and the Welsh princes were continually at war; the Saxons drove back their adversaries, and compelled them to pay tribute. Wales was now divided into three principalities—Gwynedd, Powisland, and Deheubarth. Monmouthshire, once within the limits of Deheubarth, afterwards formed at some times a separate district under the name of Gwent, at others was comprehended in Morganwg, or the kingdom of Glamorgan. Canute entered Gwent in 1034, and defeated the prince of South Wales, and the English occupied the castles of Monmouth, Chepstow, and Caerleon before the Norman Conquest. The Norman barons made incursions at their own expense, and were rewarded with the gift of the lands which they subdued. The barons held these lands by feudal tenure under the crown, and built castles and towns. Henry VIII, in the 27th year of his reign, abolished the government of the lords of the marches, divided Wales into 12 shires, and annexed Monmouthshire to England.

Two Roman roads traversed this county: the Via Julia, extending from the mouth of the Severn to Caerwent, Caerleon, and onwards to Neath; and Akeman-street, running eastward from Caerwent over the rivers Wye and Severn to Cirencester. The stations which antiquaries have acknowledged to be Roman are—Isca Silurum (Caerleon), Venta Silurum (Caerwent), and Gobannium (Abergavenny). The county contains many Roman encampments (called caers or gaers), and numerous druidical remains. Of this last class of antiquities the three stone pillars on the summit of a hill near Trelech church, a short distance from Llandogo, are the most famous.

In no part of England are to be found remains of so many feudal castles as are met with in that part of Monmouthshire east of the Uk. Those connected with the chief towns are noticed in the articles before referred to. In Wentwood Forest or Chase, a wooded tract of 2200 acres belonging to the Duke of Beaufort, are ruins of no less than five castles, and there were originally six. But the grandest remains of this kind in the county are Raglan Castle, Caldecot Castle, and White Castle. The ruins of Raglan Castle, the ancestral seat of the Duke of Beaufort, are situated near the village of Raglan, on a gentle elevation to the right of the road leading from Chepstow to Abergavenny. The different parts of the building present specimens of the styles that prevailed from the time of Henry V. to the early part of the 17th century. After the battle of Naseby, in 1645, Charles I. took refuge in Raglan Castle for two months; and this was the last castle in England that defied the power of Cromwell. The Marquis of Worcester, its owner, then eighty-five years old, defended it against Fairfax from June 3rd to August 19th, when a capitulation was effected on honourable terms. The farmers of the neighbourhood for a century afterwards used this noble structure as a quarry. Enough however still remains to convey an idea of its olden grandeur. Caldecot Castle, partly of Norman erection, is situated near Caerwent, and a little to the left of New Passage. It was long held by the Bohuns, earls of Hereford; it now belongs to the duchy of Lancaster. The plan is rectangular, with round towers at the corners. The principal parts remaining are the grand entrance gateway, the hall, and the keep. White Castle, a gigantic moated ruin, on a high ridge five miles east from Abergavenny, is a place of immense strength. Part of it dates from before the Norman Conquest. Its massive walls, flanked by huge round towers, with the extensive barbican, remain entire.

The principal ecclesiastical antiquities of this county are Tintern and Llanthony abbeys. The well-known ruins of Tintern Abbey are situated on the right bank of the Wye, about nine miles below Monmouth. The roof and tower of the building have fallen, but the greater part of the rest of the abbey remains in tolerable preservation. It is a singularly beautiful example of the transition style from early English to decorated. The abbey was founded in 1131 for Cistercian monks by Walter de Clare, and dedicated to St. Mary. The abbots and monks first celebrated mass within the church in 1263. The whole is now the property of the Duke of Beaufort. Llanthony Abbey stands at the foot of the Black Mountain, in the Vale of Ewias. The abbey was cruciform, and, though of small dimensions, well proportioned. The building is of the 12th century, and in a style of transition from Norman to early English architecture.

Religious Worship and Education.—According to the Returns of the Census for 1851 it appears that in March of that year there were 434 places of worship in the county, of which 159 belonged to the Church of England, 126 to five classes of Methodists, 79 to Baptists, 51 to Independents, 8 to Roman Catholics, and 6 to Mormons. The total number of sittings provided was 105,201. The number of day schools was 295, of which 118 were public schools with 10,120 scholars, and 177 were private schools with 4096 scholars. The number of Sunday schools was 278, with 26,622 scholars. Of literary and scientific institutions the county contained 6, with 744 members, and 1784 volumes in the libraries belonging to them.

Savings Banks.—In 1853 Monmouthshire possessed 5 savings banks, at Abergavenny, Chepstow, Monmouth, Newport, and Pontypool. The total amount owing to depositors on November 20th 1853 was 123,376*l.* 12*s.* 10*d.*

MONS (*Berghen*), the capital of the province of Hainault, is situated in 50° 27' N. lat., 3° 59' E. long., on the river Trouille (by which the city is divided into two parts), 38 miles by railway S. from Brussels, 20 miles E.N.E. from Valenciennes, and has 25,000 inhabitants. It is surrounded by strong fortifications in form of a polygon flanked with 14 bastions. It is supposed that Mons occupies the site of the Roman station which was so bravely defended by Quintus Cicero, brother of the orator, against the attacks of the Eburones, Nervii, and other tribes ('De Bell. Gall.' v. 39-52). About A.D. 653 a hermitage, and then a chapel, dedicated to St. Peter, were built on the spot; and some time after Alberic, count of Hainault, made it his place of residence, a circumstance which attracted many other inhabitants. The town from this time went on increasing, and in 804 Charlemagne made it the capital of Hainault. Towards the end of the 10th century Mons sustained a siege against Hugh Capet, and about 50 years later was again invested by Baldwin of Flanders. In 1290 the city was enlarged, and new walls, inclosing a greater area, were built. In the war which Jacqueline of Bavaria, countess of Hainault, sustained with the duke of Burgundy, Mons, after an obstinate resistance, fell into his hands in 1436. Under the reign of Charles V. Mons attained the highest degree of prosperity; and such was the extent of the woollen manufacture carried on, that at the hour when the workmen left their labour the streets were too narrow for the traffic, and the passing of carriages through them was forbidden. Manufactures of hardware were also pursued, and there were several streets wholly inhabited by goldsmiths. This state of prosperity was cut short by the exactions of the Duke of Alva in 1569, which caused the inhabitants to revolt. After some resistance they capitulated, and many were driven from the city, others executed. Mons was quiet under the rule of the arch-dukes of Austria, but its prosperity had passed away. In 1678 Mons was invested by the French under Marshal Luxembourg, but the siege was raised in consequence of the treaty of Nimeguen. In 1691 the city was again assailed by Louis XIV., and was defended with the greatest bravery until the walls were altogether destroyed, and nearly all the houses were in ruins. Mons remained in possession of the French until the peace of Ryswick. They occupied it again in 1701, and were besieged in 1709 by Prince Eugene and the Duke of Marlborough, to whom the town capitulated 24 days after the opening of the trenches. By the treaty of Utrecht, Mons was restored to Austria: it was taken again by the French in 1746, and reverted to Austria once more in 1748. It was taken by the French under Dumourier in 1792. In 1794 it was declared part of France, and was the capital of the department of Jemappe until 1814. The fortifications were greatly strengthened in 1818. The east side of the town is protected by two large ponds, and the whole neighbourhood can be inundated by means of the Trouille.

Mons is entered by 5 gates. It contains 76 streets, besides a great number of lanes. The former are for the most part wide, clean, and well paved. There are 3684 houses, with a population of 23,231.

The church of St. Waudru, which is built on the site of the hermitage already mentioned, is a remarkable specimen of Gothic architecture, and one of the finest ornaments of the city. The present building, the first stone of which was laid in 1460, was not finished until 1589. There are several other churches in Mons, of which St. Elizabeth's is surmounted by a rich cupola. The other buildings of note in the city are:—the town-hall, built in 1440; the tower of the castle, built on the site of Cæsar's Castrum in 1662; the Palace of Justice; the college; the military hospital; the arsenal; and the theatre.

Mons has several sugar and salt refineries, soap- and starch-works, oil-crushing-mills, saw-mills, and flour-mills. Woollen and cotton manufactures, cutlery, pins, gloves, and small wares are also manufactured. It derives great advantages from the numerous productive coal-fields by which it is surrounded. Steam-engines are employed for draining the mines and for lifting the coal, which is largely exported by railway and canal to France. There are about 400 pits in the coal-field of Mons, in which over 26,000 persons are employed. There are extensive bleaching-grounds in the vicinity of Mons. The town is the residence of many rich proprietors, and is the centre of a very active trade in coals, flax, hemp, grain of various kinds, mill-stones, horses, and cattle.

Mons has tribunals of first instance and of commerce, and is the residence of the governor of Hainault. It has communication by railway with all parts of Belgium and France. A canal, fed by the Haine, which passes close to the town, runs from Mons to the Schelde at Condé, in the French department of Nord; it was cut by the French between 1807 and 1814 for the more ready conveyance of coal. A new branch has been recently cut from this canal to enter the Schelde lower down, where both banks of that river belong to Belgium. About 10 miles south from Mons is Malplaquet, where the Duke of Marlborough and Prince Eugene defeated the French in 1709, but with a loss of 20,000 men.

MONTAUBAN, a town in the south of France, capital of the department of Tarn-et-Garonne, is situated on the Tarn, in 44° 1' 6" N. lat., 1° 21' 17" E. long., at an elevation of 318 feet above the surface of the sea; 32 miles N. from Toulouse, and has 23,314 inhabitants in the commune.

The town was founded in 1144 by Count Alphonse of Toulouse. In the religious contests of the 16th century it was fortified by the Huguenot party, and resisted the attack of the Catholics, who besieged it under Monluc in 1580. In the following century, being still in the hands of the same party, it resisted the attack of Louis XIII. in 1621, and did not submit until after the siege and capture of Rochelle in 1629. Its fortifications were soon after destroyed.

The gates of the town, the only remains of its old fortifications, are of elegant architecture; the streets are well laid out and clean, and the houses, which are of brick, are in general well built. There is a handsome square in the centre of the town. The town walks, from which there is a fine view of the distant Pyrenees, are very attractive. The public buildings most worthy of notice are—the fine old cathedral, the town-hall, and the bishop's palace. The manufactures are woollen-cloth, kerseymere, serge, silk-stockings and broad silks, starch, and cards for dressing woollen goods; there are also soap-houses, potteries, brandy distilleries, tan-yards, and dye-houses. The town has a good corn-market, and there are five fairs in the year. The navigation of the Tarn and the Garonne affords ready communication with Bordeaux. The town has a theatre and a public library of 11,000 volumes. Montauban is the seat of a bishop; it has theological and communal colleges, a Calvinist theological seminary, a tribunal of first instance, and a consultative chamber of manufactures.

MONTENEGRO (*Czerna Gora*, Black Mountain, so called from the dark forests that clothe its mountain sides), is a high rugged district, forming a small independent state, nominally under the protection of Austria, and situated on the borders of Albania, Herzegovina, and the Austrian territory of Cattaro. The country is described as a succession of high rugged limestone ridges diversified here and there by lofty peaks, and in some parts looking 'like a sea of immense waves turned into stone.' The highest summits of the region are between 5000 and 6000 feet high. The mountain sides are generally clothed with timber. Between the ridges high valleys slope down to the south-east drained by two streams, the Schiniza and the Rivoernovich, both affluents of the Lake of Scutari. The area of this mountainous district is stated to be 1481 square miles. It is said to contain about 120,000 inhabitants, a fierce Slavish race, which has always maintained its independence against the Turks. They are described as hospitable to strangers, but their habits of savage warfare in their constant border forays with the Turks, in which heads are cut off and exhibited as trophies, prove them to be little less than barbarians. The men are idle and gossiping, except when on their plundering excursions. The women, coarse, muscular, and strong, in consequence of their unfeminine occupations, are the 'beasts of burden' in Montenegro. The Montenegrins belong to the Greek Church; they were, till the accession of the present ruler, governed by a 'vladika,' or prince, who was at once a bishop, a judge, a legislator, and commander-in-chief. The office was hereditary in the family of Petrovich; but as every vladika was consecrated bishop, and could not marry, the succession always fell to a nephew or some other member of the family. The present ruler of Montenegro, Prince Danieli, on his accession refused to be consecrated bishop, with the view of founding a princely house for his own descendants. He rules his country with almost absolute sway, assisted by a senate of twelve members.

The following are the principal valleys of Montenegro:—1. Katunzka Nahia, the widest and most central, is watered by the Rivoernovich, and contains the capital, Cettigne, with a convent, the residence of the

Greek bishop, and the villages of Gnegnai, Xagneudo, and others. Mount Bukovizza rises above this valley in the centre of Montenegro. 2. Licsanska Nahia, which runs north of and parallel to the preceding, contains the village of Dobro and some hamlets. 3. Czarniska Nahia, the southernmost district of Montenegro, a long narrow valley between the Austrian territory on the west (from which it is divided by mounts Giurgevo, Ortich, and Resevich), and Turkish Albania on the east (from which it is separated by another ridge), contains several villages, Ocinichi, Optocichi, Dobraceli, &c.

In the wars of Venice with the Turks the Montenegrins acted as auxiliaries of the former power. After the fall of Venice in 1797 Cattaro was given up to Austria. By the treaty of Presburg in 1805 it was ceded to France; but before the French garrison could reach that district the natives, joined to the Montenegrins, rose in arms and occupied Cattaro, Castelnuovo, and the other towns. This served to the French as a pretext for taking forcible possession of the neighbouring republic of Ragusa; but the Montenegrins came down from the mountains and besieged General Lauriston within the town of Ragusa. A desperate war ensued between the Montenegrins and the French commanded by Marmont, Lauriston, and Molitor, in which no quarter was given; until the French at last took possession of Cattaro, and drove the Montenegrins back to their mountains.

Since 1814 the Montenegrins are nominally under the protection of Austria, to whom they are occasionally a source of trouble, on account of their incursions into the Turkish territory, and the consequent complaints of the Turkish authorities. In November 1852, Prince Danieli, at the head of a body of Montenegrins, captured the fortified Turkish fort of Zabljak, at the northern extremity of the Lake of Scutari, the fisheries of which are much coveted by the Montenegrins. In some petty engagements that followed the Montenegrins were victorious, until, in consequence of their outrages, the Turks blockaded all the coast approaches to their country; and on the land-side Omer Pasha, at the head of an army of 20,000 men, stormed the village of Grahovo, and occupied all the accessible parts of the country, confining the inhabitants to their mountain fastnesses, not however before they had given many proofs of fearless bravery. The pasha was preparing to complete the conquest of this troublesome district when Austria, alarmed at seeing so near her frontier a large Turkish force, which contained many of her own exiled subjects, interposed, and obtained the withdrawal of the Turks at the end of February 1853, and the restoration of the *status quo*.

The soil of the valleys of Montenegro is not very fertile; it produces fruits, some wine, maize, potatoes, tobacco, and vegetables, and has good pasturage and abundance of timber. The inhabitants live in 300 villages scattered among the valleys. Cettigne is the capital. The climate is healthy. The houses are built of stone and covered with shingle. Every village has its church. Cattle, sheep, goats, and pigs are numerously reared; mules and asses are used as beasts of burden; articles are transferred from one place to another on the backs of these animals, carriages being unknown. Fish are abundant. [See SUPP.]

MONTEVIDEO, or SAN FELIPE DE MONTEVIDEO, the capital of the republic of Uruguay, in South America, is situated in 34° 58' S. lat., 56° 16' W. long., and built on a small promontory, which forms the eastern shore of its harbour, the western consisting of another projecting point connected with a hill, from which the town has received its name. It is 130 miles from Cape Santa Mary, which forms the northern point of the entrance of the La Plata River, and opposite the town the river is still 70 miles wide. Its harbour is more than 4 miles long, and more than 2 miles wide, but too shallow for large vessels; it is also exposed to the pamperos, or south-western winds, which blow over the pampas with exceedingly great force. With all these disadvantages it is the best harbour on the broad estuary of the La Plata River. The town is in general well built, the streets being wide, straight, and intersecting each other at right angles; they are paved, and have narrow footways. The houses are built with taste, and have flat roofs and parapets. The cathedral, dedicated to the apostles San Felipe and San Jago, is not distinguished by its architecture, nor are there any other public buildings of note. Montevideo is a very healthy place, but suffers from want of wood and water. The inhabitants use rain-water, which is collected in cisterns placed in the court-yard of each house; but there are also some wells dug near the sea-shore, from which water is brought in carts for the supply of the town. The population, which before 1810 is stated to have amounted to 36,000 souls, was reduced by war and a siege, which the town had to sustain against the Brazilians, to 15,000 souls. During the sway of General Rosas in Buenos Ayres it suffered greatly in its commerce and otherwise by the long irregular siege it sustained, and which terminated only on the downfall of Rosas. The population now perhaps does not exceed 12,000. Its commerce has recently been increasing; but the unsettled state of the republic of the Argentine Confederation, and the jealousy of Buenos Ayres,

prevent it from attaining any continuous prosperity. The principal articles of export are the produce of the numerous herds of the country, as hides, salted and jerked beef, butter, tallow, hair, and horns, to a very considerable amount—between 5 and 6 millions of dollars. The imports consist chiefly of British manufactures, hardware, flour, wine, colonial produce, salt, &c.

MONTFAUCON. [LOIRE, HAUTE.]

MONTFERRAND. [CLERMONT.]

MONTFORT. [ILLE-ET-VILAINE; SEINE-ET-OISE.]

MONTGOMERY, the capital of Montgomeryshire, North Wales, a municipal and parliamentary borough, and conjointly with Pool, or Welshpool, the seat of a Poor-Law Union, in the parish of Montgomery, is situated on the eastern border of the county, in 52° 34' N. lat., 3° 8' W. long., distant 168 miles N.W. by N. from London. The population of the borough in 1851 was 1248. In conjunction with five other boroughs Montgomery returns one member to the Imperial Parliament. The living is a rectory in the archdeaconry of Salop and diocese of Hereford. Montgomery and Pool Poor-Law Union contains 18 parishes and townships, with an area of 68,322 acres, and a population in 1851 of 16,561.

The town stands partly on the slope and partly on the summit of a hill. The four principal streets meet in the market-place in the centre of the town. The houses are well built, and the town has a respectable appearance. The church is an ancient cruciform building, in the early English style, with a tower of recent erection. There are in the town a chapel for Calvinistic Methodists, a Free school for 20 boys, and another school with a small endowment. The town-hall is a brick building, with a market-house underneath; the county jail is on the road to Shrewsbury. A market for corn and provisions is held on Thursday. There are four yearly fairs. The borough has returned a member to Parliament from the reign of Henry VIII.

Baldwin or Baldwin, who had been appointed lieutenant of the Marches by William the Conqueror, built a castle or fortress here, and laid the foundations of the town in 1092. Both were almost immediately captured by the Welsh, from whom they were taken in 1093 by Roger de Montgomery, earl of Arundel and Shrewsbury. In the civil war of Charles I., the castle was given up by the governor, Lord Herbert of Chisbury, to the Parliamentarians. It was afterwards dismantled by the order of the House of Commons. The castle stood on a steep eminence on the north of the town. The remains consist of part of a tower at the south-west angle, and some portions of the walls. A few fragments of the town wall remain. At the foot of the castle-hill are traces of a small fort; and on a neighbouring hill are the remains of an extensive British camp.

MONTGOMERY. [ALABAMA.]

MONTGOMERYSHIRE, a county of North Wales, lying between 52° 20' and 52° 51' N. lat., 2° 59' and 3° 55' W. long., is bounded N. by Denbighshire, E. and S.E. by Shropshire, S. by Radnorshire, S.W. by Cardiganshire, and W. and N.W. by Merionethshire. The area of the county is 755 square miles, or 483,323 statute acres. The population in 1841 was 69,607; and 67,335 in 1851. More than half of the population speak only Welsh.

Surface and Geology.—Montgomeryshire is an inland county, and belongs wholly to the mountainous tract of Wales. A large portion of it consists of wide, bleak, and lofty moorlands, where human habitations are wide apart; the river valleys, especially towards England, are low and warm, and clothed in many places with luxuriant timber. It belongs entirely to the basin of the Severn, with the exception of a small tract in the extreme west, on the confines of Cardiganshire and Merionethshire, which is drained by the Dovey and slopes towards the south-west. The edge of this part of the basin of the Severn is formed by an offshoot from Plinlimmon, which joins a branch of the Berwyn Mountains that screens the vale of the Dovey towards the south-east, and by the crest of the Berwyn range, which forms the northern boundary and separates the feeders of the Severn from those of the Dee. From the Breiddin Hills, which form the most eastern part of the county, and are partly in Shropshire, an irregular line of heights runs westward past Welshpool and Llanfair, near which it turns to the south-west and joins the branch of the Berwyn Mountains before mentioned. This range forms the watershed between the Severn and its feeder the Vyrnwy. The Breiddin Hills are distinguished by three peaks, on one of which, called Craig-y-Breiddin, is an obelisk in memory of Lord Rodney.

The south-eastern border is occupied by the heights which extend from the neighbourhood of Shrewsbury across Clun Forest to Rhayader in Radnorshire. The Berwyn Chain rises to the height of 2014 feet at the head of the Tanat on the northern boundary; but its culminating point, Cader Berwyn, farther east, reaches the altitude of 2563 feet. The Breiddin Hills are about 1200 feet high. Kerry Hill and Llandinam Mountain, in the chain that skirts the Shropshire and Radnorshire border, are 1895 feet high. Plinlimmon is partly in this county, but its summit (2463 feet) is just within the border of Cardiganshire.

The county is almost entirely occupied by the slate rocks which overspread so large a portion of Wales. The principal exceptions are the Breiddin Hills, which are composed of granite, greenstone, and conglomerate; and a small tract near the junction of the Severn and the Vyrnwy, where the new red-sandstone, or red marl of Cheshire

and Shropshire, is found. The mineral treasures are not very abundant. Lead and zinc are procured from mines near Llangynnog in the hills that bound the valley of the Tanat; lead in the Berwyn Mountains, copper in Plinlimmon, and copper and zinc between Llanfyllin and Oswestry, on the Shropshire border. Millstones are quarried in the Breiddin Hills; stones for other purposes in the neighbourhood of Plinlimmon; slates of rather inferior quality at Llangynnog in the vale of the Tanat, at Llanwddyn in the vale of the Vyrnwy, in the hills near Llanidloes, and at Machynlleth; and a little coal and limestone near the border of Shropshire. In the Plinlimmon Mountains, and several other parts of the county, are wide tracts of bog, from which peat is dug for fuel.

Hydrography, Communications, &c.—The Severn is the principal river of the county; it rises on the eastern side of Plinlimmon, and flows east about 12 miles to Llanidloes, receiving at that town the Glywedog and a number of small brooks. From Llanidloes the Severn flows north-east in a winding channel about 38 miles, past Newtown and Welshpool, to the junction of the Vyrnwy, a little below which point it enters Shropshire. That part of the course of the Severn which lies in Montgomeryshire or on the border may be estimated at 51 miles.

The Vyrnwy (spreading river) rises on the north-west border near Bwlch-y-Pawl, and receiving a number of small streams, flows south-east in a winding channel 22 miles to its junction at Mathrafel with the Einion, which is called the Banw above Llanfair. From Mathrafel the Vyrnwy flows 9 miles till it receives the Cain, 11 or 12 miles long, from above Llanfyllin; and about a mile lower down the Tanat. The vale of the Tanat is admired for its scenery. From the junction of the Tanat the Vyrnwy flows about 9 miles further to its junction with the Severn. Its whole course is about 50 miles. The Vyrnwy and its feeders are among the best angling streams in Wales; trout, salmon, grayling, and other fish abound. Most of the rivers in the county are well stocked with fish.

The south-western angle of the county is drained by the Wye, which rises on the south-east side of Plinlimmon near the source of the Severn, and flows south-east 13 miles into Radnorshire, receiving by the way the Tarrenig, the Bidno, and the Nant-y-Durrel.

The Dovey chiefly belongs to Merionethshire. It enters Montgomeryshire about 4 miles below Dinas-y-Mowddy, and flows about 10 miles to the neighbourhood of Machynlleth, where it again touches Merionethshire. Its remaining course is between Merionethshire on the north-west, and Montgomeryshire and Cardiganshire on the south-east. Its chief tributaries in this county are the Twymynd and the Dulais, which flow northward from the range connecting Plinlimmon with the Berwyn Mountains. The Twymynd forms a magnificent cataract at Frwd Vawr, not far from its source; after heavy rains the fall is very grand, with a perpendicular descent of 130 feet. The Llyfnant, another feeder of the Dovey, separates Montgomeryshire from Cardiganshire. The glen of the Llyfnant is one of the finest examples of Welsh river scenery; the river makes a fine fall over immense rocks called Pystyll-y-Llyn. The Dulais has its source in two small lakes, the Glas Llyn and Beigus Llyn.

Of the rivers only the Severn and the Dovey are navigable in this county. The navigation of the Severn begins at Welshpool; that of the Dovey in the neighbourhood of Machynlleth. The only navigable canal is the Montgomeryshire Canal, which commences in the Severn at Newtown, and runs along the valley of that river past Welshpool, about 4 miles below which it turns northward to Llanymynech in Shropshire, in which county it joins a branch of the Ellesmere Canal. It has a short branch below Welshpool to Guilsfield.

The principal roads which pass through Montgomeryshire are those from London by Shrewsbury to Caernarvon, Barmouth, Towyn, and Aberystwith. The road to Caernarvon crosses the north-eastern side of the county near the Denbighshire border. The Barmouth road passes through the centre of the county by Welshpool and Llanfair to Dinas-y-Mowddy in Merionethshire. The road across the Berwyn Mountains east of Mallwyd is one of the bleakest in Great Britain; but it commands views of Plinlimmon and Cader-Idris. The road to Towyn branches from the Barmouth road between Welshpool and Llanfair. The Aberystwith road passes through Montgomery and along the valley of the Severn by Newtown and Llanidloes to Llangerrig, and thence by the valley of the Wye into Cardiganshire.

Soil and Produce.—The soil in the mountainous uplands of the county is generally thin, cold, and moory; chiefly fitted for mountain pasture, but in some spots yielding oats, rye, and potatoes. In the valleys, especially towards England, the soil is good, and here wheat, barley, and flax are raised. Great numbers of small cattle, sheep, and ponies are bred. There were formerly vast forests in this county, of which there are some remains on the hills near Carno.

Divisions, Towns, &c.—Montgomeryshire takes its names from the town and castle of Montgomery, founded by Baldwin, lieutenant of the Marches to William the Conqueror and William Rufus, and recaptured, probably from the Welsh, by Roger de Montgomery, earl of Shrewsbury, who gave both to town and castle his own name. The Welsh call the town, from the name of its original founder, Tre Faldwyn, and the county Sir Tre Faldwyn. The county was formed in the reign of Henry VIII. It is divided into 9 hundreds:—Llanfyllin, north; Deythur, north-east; Pool, north-east; Cawrae, east; Mathrafel, central

and north-west; Machynlleth, west; Llanidloes, south; Montgomery, south-east; Newtown, central. The county is divided into four Poor-Law Unions:—Llanfyllin, Machynlleth, Montgomery and Pool, and Newtown and Llanidloes. These Unions include 69 parishes and townships, with a population in 1851 of 73,238. County courts are held in Machynlleth, Llanfyllin, Llanidloes, Newtown, and Welshpool. The principal towns, LLANFYLLIN, LLANIDLOES, MACHYNLLETH, MONTGOMERY, NEWTOWN, and POOL or Welshpool, are described in separate articles.

Llanfair, or *Llanfair Caer Binion*, population of the parish 2727 in 1851, is about 11 miles N.W. from Montgomery, on the right bank of the Vyrnwy. It is neatly built and of pleasing appearance; the two principal streets intersect nearly at right angles. The town-hall is neat and commodious, with a market-house underneath. The church is an ancient building. There are several Dissenting places of worship. Flannel is manufactured to a small extent. There is a market on Saturday, and several yearly fairs are held. Roman antiquities have been dug up in the neighbourhood.

Llanbrynmair, population 1982, on the road between Llanfair and Machynlleth, is surrounded by fine scenery. The church is an ancient structure, adorned with some fine specimens of carved oak. In the neighbourhood are two stone circles. *Llangynog*, population 568, is on the road from Llanfyllin to Bala, in Merionethshire, in a pleasant but narrow vale, watered by the Tanat, and inclosed by lofty and steep mountains. There are many detached farm-houses in the valley. The church is a small ancient building. Many of the inhabitants are employed in slate-quarries and lead-mines.

Of smaller places the following may be noticed; the population when given is that of 1851:—

Caer-Sws, a village at the junction of the Carno with the Severn. A Roman entrenched camp of square form and covering four acres is close to the village: it commanded all the passes round, and was connected with 5 Roman roads. A farm-house now stands in the centre of the area of the camp. *Cemmes*, a small village 7 miles N.E. from Machynlleth on the left bank of the Dovey, has some curious old houses and remains of a rude amphitheatre. In the parish of *Llanwrin*, population 768, which comprises a portion of the county on the right bank of the Dovey, is *Mathavarn*, where Henry VII. slept on his way from Milford Haven to Bosworth. The parish church of Llanwrin is four miles from Machynlleth, and is 163 feet long. *Meifod*, a well-built thriving little place two miles farther east on the left bank of the Vyrnwy, is supposed to occupy the site of the Roman station *Mediolanum*. It has a commodious Norman church and a very large church-yard. Several encampments are seen in the neighbourhood.

The county is chiefly in the diocese of St. Asaph. Nearly the whole of the hundred of Montgomery is in the diocese of Hereford. The hundred of Llanidloes is a peculiar of the bishop of Bangor. Montgomeryshire is included in the North Wales circuit. The assizes are held at Welshpool. The county jail and house of correction are at Montgomery, where the quarter-sessions are held. The county returns one member to Parliament, and Montgomery with its contributory boroughs returns one member.

History and Antiquities.—Montgomeryshire was, with the neighbouring counties, included in the territory of the Ordovices, and on the reduction of the island under the Roman power, in the province of Britannia Secunda. Various Roman antiquities have been found near Machynlleth. The site of a Roman camp is traceable at Caer Sws, about 5 miles west of Newtown. There are other marks of intrenchments near it, and traces of a Roman road called 'Sarn Swsan.' Ancient camps, cairns, and tumuli abound.

This county was the scene of hostility between the Welsh and the Mercians under Offa. The celebrated 'dyke' made by Offa traverses the county from north to south, passing a little to the east of Welshpool and Montgomery, and including the eastern part of the county in the Saxon territory. The rest of the county was included in Powys or Powysland, a designation which had previously been given to this part of Wales. In the latter part of the 9th century Powys became a separate principality, under chieftains who had their residence at Mathrafel, near the banks of the Vyrnwy, above Meifod. There are some earthworks and other traces of the castle of the princes of Powys at Mathrafel.

In 894, in the reign of Alfred, the Danes entered the county. After the Conquest, Powys became the continual object of attack by the Norman lords of the marches or frontiers. These hostilities led to the erection of the castles of Montgomery by the Normans, and Powys, near Welshpool, by the Welsh, and to a continued and severe struggle for the possession of these strongholds. In the latter part of the 11th century a desperate engagement was fought on the hills of Carno, between the forces of Gryffydd ap Cynan, lawful claimant of the throne of Gwynedd, or North Wales, assisted by Rhys ap Tewdwr, prince of South Wales, against those of Trahaiarn ap Caradog, his usurping competitor. The engagement was the most bloody of any recorded in the Welsh annals, and ended in the death of Trahaiarn and the entire defeat of his army.

The independence of Powys was overthrown before the final subjugation of North Wales: it became an English lordship, which remained for many years in the posterity of John de Charlton, who, in the time of Edward II., married the heiress of the Welsh chief-

tain. The barony and title passed to the Greys, a Northumberland family, until it became extinct in the reign of Henry VIII. The only remaining castles or ruins of castles worth mentioning, are those of Montgomery and Powys, which are noticed under MONTGOMERY and POOL respectively. There are no monastic ruins in the county of importance.

Statistics.—The registration county (which included a population in 1851 of 9807 more than the county proper) contained in March 1851, when the Census was taken, 846 places of worship, of which 89 belonged to Calvinistic Methodists, 78 to Wesleyan Methodists, 66 to the Church of England, 53 to Independents, 26 to Baptists, and 23 to Primitive Methodists. The total number of sittings provided was 62,886. The number of day schools was 127, of which 72 were public schools with 4854 scholars, and 55 were private schools with 1340 scholars. Of Sunday schools there were 312 with 23,001 scholars; and of evening schools for adults there were 6 with 130 pupils. There were three literary societies with 271 members—one of these societies possessed 300 volumes in its library. In 1853 there were two savings banks in the county, at Machynlleth and Welshpool. The amount owing to depositors on November 20th 1853 was 64,903*l.* 0*s.* 5*d.*

MONTPELLIER, a city in the south of France, capital of the department of Hérault, is situated on a hill near the Lez, in 43° 36' 44" N. lat., 3° 52' 57" E. long., at an elevation of 145 feet above the level of the sea, 30 miles by railway S.W. from Nîmes, 20 miles N.W. from Cette its port, and has a population of 40,222 in the commune. The town was built in the 10th century to replace the episcopal town of Mauguellonne, which stood on an island in a neighbouring lake, and had been destroyed by order of Charles Martel for favouring the Saracens. The town had at an early period lords of its own, who distinguished themselves in the crusades and other wars against the Mohammedans in the 11th and 12th centuries. Benjamin of Tudela describes the town as one of the chief commercial stations of France and of the world.

The lordship of Montpellier was at this time in the hands of the kings, first of Aragon, and subsequently of Majorca, a younger branch of the same house. These princes held their lordship immediately of the bishops of Mauguellonne, who divided with them the jurisdiction of the city, under the suzerainty of the kings of France. The portions both of the bishop and the king were united to the French crown by purchase in the 13th and 14th centuries respectively. The lordship was subsequently conferred on Charles le Mauvais, king of Navarre (1371), in exchange for certain lordships ceded by him to the King of France; but on the forfeiture of that king's domains for treason (1378), it was re-united to the French crown. In 1538 the bishopric of Mauguellonne was transferred to Montpellier. Montpellier came into the hands of the Huguenots in the reign of Henri III. After enduring a long siege it surrendered to Louis XIII. (1622), who ordered the construction of a citadel to retain the place in subjection.

Montpellier is situated on an eminence, from which there is an extensive view over the Mediterranean and the adjacent coasts. Except some of the gates and the citadel, there are few remains of the old fortifications. The citadel is of little strength; it is however well kept up, and has a good parade. The streets are narrow, crooked, and steep; but the houses, which are almost all of stone, are substantially built. Most of the squares are small and of irregular form; the public fountains are numerous. There are two town-walks, the esplanade between the town and the citadel, and the Peyrou, a terrace-walk planted with trees and covered with turf. On the upper part of the terrace there is a hexagonal tower adorned with columns, and inclosing a reservoir, which is supplied with water by an aqueduct about 5 miles long. The water from this reservoir falls in a cascade over artificial rocks, and supplies the various fountains of the city. The cathedral presents little that is worthy of notice. The former amphitheatre of St.-Côme, now the exchange, is adorned with a handsome Corinthian portico, and is perhaps the handsomest building in the city. The modern anatomical theatre is a fine building, and the gate of Peyrou, a triumphal arch opening on the promenade of Peyrou, is also handsome; but the former episcopal palace, now occupied as a medical school, the court-house, the prefect's house, &c., are of ordinary appearance.

The manufactures of Montpellier are considerable, and trade is prosecuted on a large scale. There are several banking-houses. Liqueurs, perfumery, preserves, dried fruits, verdigris, alum, cream of tartar, vitriol and aquafortis, woollen-cloth, muslins, printed cottons,

named and many others are neglected. When the English were in possession of the Moluccas, they obtained from them cordage, cables, and timber.

Inhabitants.—These islands are inhabited by two races, the Malays and the Papuas. The Malays are in possession of the coasts, where they cultivate the ground or gain their subsistence by fishing. They are Mohammedans. Their language contains a great number of foreign words, and Dr. Leyden is of opinion that the Ternate or Molucca language has been an original tongue. The Papuas have been extirpated on the smaller islands, but they still maintain their ground in the mountainous districts of the larger islands. They seem to belong to the same race which inhabits the continent of Australia. They are described as an inoffensive race who cultivate the ground.

Division.—The number of islands probably amounts to some hundreds, of which however many are small and uninhabited. They may be divided into three groups: the Gilolo Group, or Moluccas proper; the Ceram Group; and the Timor Laut Group. The *Gilolo Group* is the most northern, and extends from 2° S. lat., to 3° N. lat., and contains the islands of Gilolo, Morty, Mandioly, Batchian, Ooby, and Mysole, with numerous smaller islands lying between and about them, among which the islands of Ternate and Tidor are the most important. In figure *Gilolo* bears a remarkable resemblance to CELEBES, being composed of four long peninsulas, which radiate from a common centre near 1° N. lat. Its greatest length from south to north may be 220 or 230 miles, and its surface, on a rough estimate, about 8000 miles. The northern and north-eastern peninsulas rise into high mountains, and are densely wooded; the southern attain only a moderate elevation. The chief products are sago, cocoa-nuts, spices, fruits, edible birds'-nests, pearls, gold-dust. Horses, horned cattle, and sheep are reared. Manufactured goods, opium, china, and iron are imported by the Dutch. The island is divided into several petty states; the chief town is Gilolo, or Jilolo, at the head of a bay on the west side of the island to the north-east of Ternate. The sea between Gilolo and Celebes is called the *Molucca Passage*. *Morty* rises with a gentle ascent to a considerable height, and is said to have good harbours. *Mandioly*, *Batchian*, and *Tawaly* are separated from one another by narrow straits which afford good anchorage. They are of moderate elevation, and are governed by their own sovereign, to whom also the island of *Ooby*, or *Paulo Oby*, belongs. The last-mentioned island is very little known. The islands of Ternate and Tidor are small, being only from 20 to 30 miles in circuit, but the soil is fertile, and they are very populous. Their sultans possess the greater part of Gilolo, and also several districts on the eastern coast of Celebes. The island of *Waygiou*, off the north-west coast of Papua, or New Guinea, is sometimes reckoned among the Moluccas. It lies a little south of the equator, and is crossed by the meridian of 131° E. long. The island is stated to be fertile and populous and to have good harbours. It extends east and west with two deep indentations on its northern and southern shores near the centre of the island; the northern inlet forms the bay of Offak (0° 1' 8" S. lat., 130° 43' E. long.). Farther east, but on the north shore also, is another harbour, *Port Bons*, sheltered by an island. *Waygiou* is mountainous in the centre, the shores and some other parts are marshy.

To the Gilolo group belong two smaller groups lying farther north-west. The eastern group, called the *Salibabo Islands*, consists of three islands of some extent, Tulour, Salibabo, and Kabruang, and several smaller ones. The island of Salibabo has a good harbour at Leron, in the narrow strait which divides that island from Kabruang. The western group, called the *Sangir Islands*, consists of a larger island and numerous smaller islands. Sangir Island is about 70 miles long; through its central part runs a ridge of high mountains, which terminates on the north in an active volcano.

The Ceram group occupies the middle, between 3° and 5° S. lat., and comprehends the two large islands of CERAM and BOORO, and among the smaller ones, which lie to the south of them are AMBOYNA and BANDA islands.

The *Timor Laut* group is the most southern and least known. It consists of the large island of Timor Laut and the KEY, or KI, ISLANDS, noticed in a separate article. Timor Laut is about 70 miles long and 25 miles wide, mountainous and wooded. The centre of the island is nearly in 7° 50' S. lat., 131° 20' E. long. Timor Laut must not be confounded with the large island of Timor, which lies considerably to the west and is one of the lesser SUNDA ISLANDS. The island of Arroo [ARROO], lying farther east, is also sometimes considered as belonging to the Moluccas.

History.—The Portuguese arrived at the Moluccas in 1510, and had hardly begun to form settlements when the vessels of Magalhaens arrived from the east, and a dispute arose between the Portuguese and Spaniards respecting the possession of the islands, which lasted for several years. The Dutch took the Moluccas from the Portuguese about 100 years afterwards, and, in order to secure to themselves the exclusive trade in nutmegs, maces, and cloves, they formed numerous small settlements on nearly all of them, by which they kept the petty sovereigns in subjection, and, with their assistance, were enabled to extirpate all the spice-trees in the islands, except Amboyna and Banda, which they subjected entirely to their sway. In 1796 the British took possession of the Moluccas, and kept them to the peace of Amiens, when they were restored to the Dutch. The British again

took possession of them in 1810, and again gave them up to Holland at the treaty of Paris in 1814. Since that time the Dutch have abandoned a few of the smaller establishments, but they still maintain their hold more or less upon all these islands. In June 1853 a bill was brought into the Dutch chambers by the government for opening the trade in spices; and making four free ports—Ternate, Amboyna, Banda, and Kajelia. At the last-named place British vessels trading to China call for water and provisions, and it lies on the track to Australia. That the bill was made law we are unable to say.

(Forest, *Voyage to New Guinea*; Stavorinus, *Voyages*; Delano, *Voyages and Travels*; Crawford, *History of the Indian Archipelago*; Hogendorp, *Coup d'Œil sur Java*, &c.)

MOMBAS is a sea-port town situated on that part of the eastern coast of Africa which is called the coast of Zanguebar, in 4° 4' S. lat., 39° 38' E. long. It is built on the eastern side of Mombas Island, which occupies the greater portion of a bay, about 5 miles long and 3 miles wide. The island is 3 miles long by 2 miles broad; the two straits which divide it from the continent are hardly half a mile across. The eastern strait constitutes the harbour of the town, which is one of the most perfect in the world. The castle, built by the Portuguese in 1635 on a rock of moderate elevation, lies to the south of the town. The town is not large; it consists of the city and the Black Town, which occupies the most northern portion of it. The former, which was once inhabited by the Portuguese, is now inhabited by the Arabs. Some free coloured people and slaves constitute the population of the Black Town. The population probably does not exceed 3000 or 4000, and the town, it is said, has fallen into decay.

Vasco de Gama visited this port in 1498, and was well received, but nearly fell a sacrifice to the treachery of the inhabitants. It was afterwards taken and burnt by Francisco de Almeida in 1505. Twenty-three years later it was taken by Nunho da Cunha after a stout resistance from the inhabitants, and was again reduced to ashes. The Portuguese remained in possession of it till 1631, when the king of the country retook it, and put all the Christians to death. Since then European vessels seldom visit this part of the coast, the government of Mombas having more than once seized such vessels when they put into the harbour for provisions. In 1720 Mombas was in possession of the Imam of Muskat, who lost it afterwards by a rebellion of its inhabitants. In 1824 the Imam sent a force against the town, which then placed itself under British protection, in order to preserve its independence. It is governed by an Arab sheikh.

MOMPOX. [NEW GRANADA.]

MONA. [ANGLESEY; MAN, ISLE OF.]

MONACO, the Principality of, a small state in the Western Riviera of Genoa. It consists of the small towns of Monaco and Mentone, and the village of Roocabruna, with a small territory about five miles in length along the coast, between Nizza and Ventimiglia, and extends inland about three miles. The country is rocky, but produces oranges, citrons, lemons, and other fruits, and oil. The town of Monaco is built on a steep naked rock rising above the sea-coast, is fortified, and has about 2000 inhabitants, and a harbour for small vessels. *Mentone*, farther to the east, lies on the sea-shore in a narrow strip of fertile land sheltered by mountains from the north winds, and planted with olive- and lemon-trees: it has a warm southern climate, and carries on some trade by sea. Mentone has about 4000 inhabitants, and a handsome church.

Since the 14th century the principality of Monaco has been in possession of the Genoese family of Grimaldi, under the protection of France and of the Genoese republic. It is now under the protection of the king of Sardinia. The prince resides half the year in Paris and the other half in Monaco. He has a palace at Monaco and a handsome villa near Mentone. The Sardinian troops took military possession of Monaco and Mentone during the revolutionary troubles of 1848-9, and we believe that the principality has been since purchased by the government of Sardinia. The name of Monaco is derived from a temple dedicated to Hercules Monoecus ('solitary'), which stood on the rock where the town now stands. [See SUPPLEMENT.]

MONAGHAN, an inland county in the province of Ulster, Ireland, is bounded N. by county Tyrone, E. by Armagh and Louth, S. by Meath and Cavan, and W. by Fermanagh. It lies between 53° 54' and 54° 25' N. lat., 6° 33' and 7° 20' W. long. Its greatest length from north to south is 37 miles; from east to west it is 23 miles. The area is 500 square miles, or 319,757 acres, of which 285,885 acres are arable, 21,585 acres uncultivated, 5816 acres in plantations, 304 acres in towns, and 6167 acres under water. The population in 1841 was 200,442; in 1851 it was 141,813.

Surface, Hydrography, and Communications.—The northern part of the county belongs to the basin of the Blackwater, the southern part to the basins of the Fane and the Glyde, and the western part to the basin of the Erne. The general surface is hilly, the hills being for the most part detached and scattered in an irregular manner. The Slieve Beagh range, of which the chief summit is 1254 feet high, extends along the north-west boundary into the county of Fermanagh. The portion of the county lying south-east of that range is a comparatively level tract, and forms the northern limit of the great plain of Ireland. This district is bounded on the south by a series of heights lying east and west, and connected with the Fewa Mountains of Armagh. Mullyash, on the border, is 1034 feet high. The division

of the county south of these heights, sloping on the west towards Lough Erne, and on the east towards the Irish Sea, is divided by several eminences, of which the principal is Crieve Hill, 886 feet in height. Patches of bog occur in all parts of the county.

There are no navigable rivers in the county. The Blackwater has about 10 or 12 miles of its course along the north-eastern boundary, where it receives several streams from the Slieve Beagh Mountains. The Fane rises not far from Castle Blayney, and flows south-east, partly upon and partly within the border, for about 12 miles, before it enters the county of Louth, through which it flows into the Irish Sea. The Glyde rises in the south part of the county, and has a course parallel to the Fane; the Lagan, a feeder of the Glyde, and a much more considerable stream, has about 13 miles of its course along the southern boundary. The Finn is the most important of the streams which flow into the Erne; it rises in the Slieve Beagh Mountains, and has about 20 miles of its course within the county. The Ulster Canal, which unites Lough Neagh with Lough Erne, crosses the county in a south-west direction near Monaghan and Clones. Its length within the county is about 20 miles.

The loughs are numerous, but all of them are small. Muckno or Barrac Lough, near Castle Blayney, is the largest. It is of very irregular form, about 3 miles long, and in some parts about a mile wide: it contains a number of small islands. The river Fane runs through it. Lough Inner, on the south-west border near Rockcorry, is about 3 miles long, exceedingly narrow, and of very irregular form. Lough Emy, near Emyvale, and Glas Lough, near the town of Glaslough, in the northern part of the county; Lough Leesborough, between Rockcorry and Newbliss, and Lough Long, near the village of Drum, in the western parts; the White Lough and Corfin Lough, near Ballybay, in the central parts; Lough Eglis, or Eglis, Lough Avagham, and Lough Bawn, near Ballytrain, in the southern part; Lough Ballyhoe (through which the Lagan runs), on the southern border of the county, and Lough Ross, on the eastern border, are next in size to Muckno and Inner.

There are numerous good roads in the county. The principal line is that from Dublin to Londonderry, Carrickmacross, Castleblayney, and Monaghan. A branch road runs from Carrickmacross to Monaghan by Ballybay. Other roads lead from Carrickmacross to Dundalk, from Castleblayney to Newry and to Armagh, from Monaghan to Armagh, and from Monaghan by Clones to Cavan. A road from Dublin by Cootehill (Cavan) passes through Clones, and joins the Londonderry mail-road at Omagh in Tyrone.

Geology, Mineralogy, &c.—The carboniferous limestone of the great central field of Ireland occupies that part of the county which lies north-west of a line drawn through Monaghan and Clones. The Slieve-Beagh Mountains are composed of the rocks belonging to the calp series of this formation. The rest of the county, with the exception of a small tract on the southern border, belongs to the transition formation, which occupies an extensive district in the east of Ulster and north of Leinster. The rocks consist of grauwacke slate, fissile clay-slate, flint-slate, and chlorite slate, with hornblende slate, schistose porphyry, and other metamorphic rocks. On the southern border is a small coal-field, not wrought, resting on a tract of carboniferous limestone, and flanked on the west by a patch of new red-sandstone, which contains a valuable deposit of gypsum. Escars, or low steep ridges of alluvial matter, usually composed of clay and limestone gravel, are found in several parts of the county. Those near Tyballon, not far from Monaghan, are composed entirely of jasper, quartz, agates, and argillaceous sand. Limestone of great variety and excellent quality is quarried; also fine marble, and valuable freestone for building. A fine white sandstone, dug in the Slieve-Beagh Mountains, is extensively used for architectural purposes. Ironstone is found, but of inferior quality, and several quarries of slates or flagstones are worked. Lead-ore has been found to a small extent. Some potter's-clay is found, and brick earth in nearly all parts of the county.

Climate, Soil, and Produce.—North-west winds prevail during the greater part of the year. These bring frequent rains from the Atlantic up the valley of the Erne, rendering the climate exceedingly moist. The evil however is to a great extent counteracted by the ventilation and drainage of numerous valleys. The soil of the county varies much, but is mostly a strong deep loam resting on a firm subsoil of clay, mixed with lime, gravel, or sand. In the elevated parts the soil is moory or peaty. The lowlands are generally wet and moory, especially in the north-west, near the Slieve-Beagh Mountains. The western side of the county has a soil naturally wet, but capable of great improvement. The southern extremity consists of rich and productive land. The most fertile part of the county is the central, including the baronies of Monaghan, Cremorne, and Dartree. The barony of Monaghan is altogether a tillage district, except some 'rough grazing' in the mountains, on which some young cattle are kept: there is no grazing-land in the district capable of fattening cattle. The occupations are almost wholly agricultural. Spade husbandry is much practised. Flax, from its improved culture, is increasing greatly in quantity and value. The culture of wheat and of green crops is extending. The manufacture of linen is reviving.

In 1853 there were 152,404 acres under crop; of which 2519 acres grew wheat; 78,537 acres oats; 4962 acres barley, bere, rye, peas, and

beans; 23,926 acres potatoes; 8305 acres turnips; 2664 acres mangold-wurzel, carrots, vetches, and other green crops; 17,392 acres flax; and 14,099 acres were in meadow and clover. In 1841 the plantations covered 8007 acres, yielding oak, ash, elm, beech, fir, mixed timber, and fruit. In 1852, on 19,338 holdings, there were 10,268 horses, 6110 mules and asses, 64,621 cattle, 9830 sheep, 18,716 pigs, 10,072 goats, and 263,099 head of poultry. The estimated value of the live stock here enumerated was 553,938*l.*

Divisions and Towns.—The county is in the diocese of Clogher in the united sees of Armagh and Clogher. It is divided into five baronies—Cremorne, central and east; Dartree, central and west; Farney, south; Monaghan, central; and Trough, north. The principal towns are MONAGHAN, CLONES, CASTLEBLAYNEY, and CARRICKMACROSS, which are noticed under their respective titles. The following are some of the other towns and more important villages, with the population of each in 1851:—

Ballybay, or Ballibay, population 1617, a well-built town, 9 miles S. from Monaghan and 86 miles N.N.W. from Dublin, contains a neat parish church, a Roman Catholic chapel, two Presbyterian meeting-houses, several endowed schools, a public library, a market-house, and district dispensary. The linen manufacture is carried on; in the neighbourhood are extensive bleach-fields. Petty sessions are held here. Fairs for cattle, horses, and pigs are held on the third Saturday of every month. There is a weekly market on Saturday. *Emyvale*, a small post-town situated on the left bank of an affluent of the Blackwater, 8 miles N. from Monaghan, is a neat clean place consisting chiefly of one street. The general employment is weaving. There is a large flour-mill on the stream, as also a mill for working iron, principally in the manufacture of spades and shovels. A cattle fair is held monthly. *Glaslough*, a neat and thriving market-town, 6 miles N.E. by N. from Monaghan, on the margin of a beautiful lake called Glas Lough, or Green Lake. The town contains the parish church of Donagh, and a district dispensary. Flax-spinning and weaving are carried on. Gray marble is quarried in the neighbourhood. There is a market every Friday for corn and flax. Fairs are held on the third Friday of every month except February. *Newbliss*, population 481, a small market-town 9 miles S.W. from Monaghan and 71½ miles N.W. from Dublin by road, consists of a single street of good width, containing houses of respectable appearance. The church is a handsome building recently erected. There are a Presbyterian meeting-house, a neat market-house, a dispensary, and a school of the London Hibernian Society. Petty sessions are held monthly. There is a well-attended market on Saturday, chiefly for pigs and flax. Fairs are held on the last Saturday of every month. *Rockcorry*, population 316, a small market-town 9 miles S. by W. from Monaghan, contains a Presbyterian and a Methodist meeting-house, a neat market-house, and a dispensary. Petty sessions are held monthly. Fairs are held on the last Wednesday of every month. The town belongs to Baron Cremorne, by whom the neighbourhood has been much improved. *Scotshouse*, in the barony of Dartree, 14 miles S.W. from Monaghan, contains a parish church and a Roman Catholic chapel. In the neighbourhood are the remains of an ancient embankment called Worm Ditch, which has been traced several miles from this point.

The county of Monaghan returns two members to the Imperial Parliament. The assizes are held in Monaghan, and quarter-sessions there, and at Carrickmacross, Castleblayney, and Clones. Petty sessions are held in eight places. The county court-house and jail are in Monaghan, and there are bridewells at Carrickmacross, Castleblayney, and Clones. The county infirmary is in Monaghan. There are fever hospitals at Carrickmacross, Clones, Monaghan, Rockcorry, and Trough; and dispensaries in fourteen places. A savings bank is established in Monaghan; the amount owing to depositors on November 20th, 1853, was 18,128*l.* 13*s.* 11*d.* The constabulary force consisting of 208 men and officers, has its head-quarters at Monaghan. The county is divided into 4 police districts comprising 24 stations. In September 1852 there were 141 National schools in operation, attended by 7014 male, and 5862 female children.

History and Antiquities.—In the invasion of Ireland by the Anglo-Normans, Henry II., having bestowed all Ulster on John de Courcey, that chieftain overran various parts of the province in 1177, and built castles to secure his conquests. Among others he built two in the district of Farney in this county, and gave them in charge to MacMahon, an Irish chieftain, who had gained his confidence. MacMahon subsequently demolished the castles, and set himself in opposition to De Courcey. In the reign of Henry V. the MacMahons seem to have risen in arms, for they are noticed among the sept whom Talbot, lord Furnival, the lord-lieutenant, brought into the king's peace. In the reign of Elizabeth, Monaghan was constituted a shire by the Irish Parliament which assembled at Dublin in 1568. The country however still remained in an unsettled state in consequence of the turbulent spirit of the MacMahons. In the troubles excited by the Earl of Tyrone, the county was the scene of hostilities, and some of the MacMahons appear to have joined the earl. In the rebellion of 1641 Monaghan came early into the power of the insurgents, but in the course of the subsequent struggle, no events of particular interest occurred in it. In the war of the Revolution a sharp conflict took place at Glaslough, in which the Protestants were victorious.

There are no feudal remains of importance in the county. The

chief ecclesiastical antiquity is the ruin of the abbey of Clones, which is said to have been founded in the 6th century. At Clones there is a round tower still entire, and at Inniskean, near the eastern border, there is one less perfect in its form, but remarkable for having the door on a level with the ground. Baths and other earth-works appear in various parts of the county. A singular structure consisting of several apartments, arched with flat stones nicely fitted together, and inclosed within a wall of similar materials, was a few years since discovered at a depth of several feet under a hillock, about 3 miles from Monaghan. It is supposed to have been the abode of ancient hunters, and to have been covered for concealment with the earth which had been removed to make way for its erection.

MONAGHAN, Ireland, the chief town of the county of Monaghan, and the seat of a Poor-Law Union, is situated on the road from Dublin to Londonderry, in 54° 15' N. lat., 6° 58' W. long., distant by road 76 miles N.N.W. from Dublin. The town is governed by a provost, 12 free burgesses, and a body of freemen. The population in 1851 was 3484, besides 640 inmates of the workhouse. Monaghan Poor-Law Union comprises 21 electoral divisions, with an area of 112,789 acres, and a population in 1851 of 49,032.

The three principal streets of the town meet in a central square called the Diamond. The town is lighted, and the streets are paved and well kept. The parish church is a large modern gothic structure. There are a Roman Catholic chapel, two Presbyterian, and two Methodist meeting-houses. On the west side of the town is a Diocesan school, founded in the reign of Elizabeth; the number of scholars in 1851 was 84. There are several National and Endowed schools. The county court-house is a handsome modern building in the centre of the town. The county infirmary occupies an elevated site on the east side of the town. The county jail is on the north side. A well-built market-house stands in the principal square. There are also a linen-hall, an infantry barrack, a fever hospital, a dispensary, and a savings bank. The manufacture of linen is carried on. The Ulster Canal connecting Lough Erne with Lough Neagh, passes near the town, and facilitates its trade with Belfast. The assizes and quarter and petty sessions are held in the town. Fairs are held on the 1st Monday of every month. The principal market-day is Monday; markets for agricultural produce are held on Tuesday, Wednesday, and Saturday. Monaghan obtained a charter from James I. The borough returned two members to the Irish Parliament, but was disfranchised at the Union.

MONFERRATO, the name of a district in Piedmont, which comprises the country drained by the Tanaro, and extends from the right bank of the Po to the Ligurian Apennines. Many parallel offsets branch off in a northern direction, from the Ligurian Apennines to the southern bank of the Tanaro; and the intervening valleys are watered by numerous streams, the Stura, the Geaso, the Borbio, the Peato, the Ellero, the Tanaro, the Belbo, the two Bormide, the Erro, and the Orba, all of which join the Tanaro above Alessandria, below which town the Tanaro enters the Po. North of the Tanaro another range of hills, parallel with the course of the Po, runs from the mount of Superga, opposite to Turin, to the town of Casale, and divides the valley of the Upper Po from that of the Tanaro. The greater part of this hilly region, on both sides of the Tanaro, went by the name of Monferrato, and was divided into High Monferrato, south of the Tanaro, and Lower Monferrato, between the Tanaro and the Po. The principal towns of Lower Monferrato were Alessandria, Asti, Casale, and Valenza; those of Upper Monferrato were Mondovi, Acqui, and Alba. It is a favoured region, rich in corn, wine, fruit, silk, and cattle. The wines of Monferrato are the best in northern Italy; the muscat of Asti is particularly esteemed.

Monferrato gave the title of Marquis to an ancient family, descended from the imperial house of Saxony, from the 11th century till the time of Charles V., when, the male line becoming extinct, the marquise fell to the Gonzaga of Mantua. On the death of Francesco Gonzaga in 1612, without male issue, the Duke of Savoy claimed the inheritance; this led to a war between the dukes of Savoy and Mantua, in which Spain and France took part, and which was not concluded till the peace of Cherasco in 1696, when the territory in dispute was divided between the dukes of Mantua and Savoy. During the war of the Spanish succession the Duke of Savoy obtained the whole of Monferrato. This territory is now divided among the provinces of ACQUI, ALBA, ALESSANDRIA, ASTI, CASALE, and MONDOVI.

MONGHIR. [HINDUSTAN.]

MONGOLIA (*Mongolistan*), 'the Country of the Mongols,' comprehends a vast extent of country in the interior of Asia, between 38° and 63° N. lat., 84° and 124° E. long. Its length from east to west exceeds

1700 miles, and its width, from north to south, between 100° and 110° E. long., 1000 miles; but towards both extremities of its length it narrows to 600 miles. Its area may amount to between 1,200,000 and 1,300,000 square miles. It is bounded N. by Siberia, E. by Mandshooria, S. by China proper, and W. by the Chinese province of Kansu and the Chinese government of Thianshan Pelu.

The middle portion of Mongolia is occupied by the Great Gobi (Ta-Gobi), which stretches across the country south-west and north-east from the boundary-line of the province of Kansu to the Dalai Nor, near the boundary of Da-uria, with an average width of about 200 miles. The Gobi is the worst part of the country, the surface being covered with sand or small stones, and the vegetation being very scanty and occurring only in single spots. Vast tracts of it are level, but at great distances from one another there are hills of moderate elevation. The whole region is destitute of trees, and the water, which is only found at some distance below the surface is brackish. South-east of the Gobi extends a more elevated and uneven country, which terminates in a mountain-range of considerable elevation.

This range begins on the south, near the most southern point of Mongolia, not far from the banks of the river Hoang-ho, about 38° N. lat., and extends northward along that river for nearly 400 miles. It is covered with wood, and called Alashan, or Ho-lang Shan. Near 42° N. lat. it turns abruptly to the east, forming nearly a right angle, and it is then called Inshan by the Chinese, and Oghian Oöla by the Mongols. In this direction the chain continues, between 41° and 42° N. lat., about 600 miles, when it again turns north, though less abruptly, and proceeds in a north-by-east direction from 42° to 55° N. lat. under the name of Khing-khan Oöla. The highest portion of this mountain range seems to be at the point where it turns northward, and where a peak, called Petsha, rises far above the snow-line, and is supposed to attain a height of more than 15,000 feet above the sea. The country which skirts this range along its western and northern base, and extends from it to a distance of between 50 and 100 miles, has a broken surface, the hills rising to some height above the valleys and small plains. It is not deficient in water, but trees occur only in isolated tracts. As its elevation above the Gobi is considerable, and probably not less than 5000 feet above the sea-level, and as it is also much exposed to the cold winds which blow with great force over the desert, it is nearly unfit for agriculture, and only used as pasture-ground for horses, cattle, and sheep.

South of the Inshan Mountains the country exhibits fertile valleys and mountains, partly wooded, as far west as the place where the Hoang-ho River turns southward: this fertile tract is included in the Chinese provinces of Pe-tche-li and Shan-si. But the tract farther west, which is surrounded by the great northern bend of the Hoang-ho, partakes strongly of the features of the Gobi, and forms part of Mongolia: it is called the country of the Ordes, taking its name from a Mongolian tribe which belongs to the great division of the Tabakhar Mongols. This whole tract is covered with hills composed of loose sand, mostly without water, and entirely destitute of trees. But the numerous depressions contain extensive meadows, with rich grass and bushes. The attempts to cultivate some parts of it have not proved successful, and accordingly it is abandoned to the Mongols and their herds; but in order to prevent them from plundering the adjacent agricultural districts of the neighbouring provinces of Shen-si and Kan-si, the great Chinese wall was built across the peninsula from east to west from Pao-tsheou to Ning-hia.

That part of Mongolia which is to the east of the Khing-khan Oöla, and extends nearly to the shores of Hoang-Hai, or the Yellow Sea, from which it is only divided by a narrow fertile tract belonging to the province of Leao-tong, is called Kortahin. This name is properly only applied to the tract north of the river Sira Muren, or Leao-ho, which resembles the country of the Ordes, except that it is less intersected by sand-hills. A great portion of it seems to be of inferior fertility; but south of the Sira Muren the country contains numerous meadows clothed with rich grass, and agriculture has been introduced here by the Chinese, who send to this country their criminals who are condemned to transportation. A great part of it serves only as pasture-ground. Great quantities of grain, especially wheat, are exported from the province of Leao-tong to Peking and Shanghai. The most southern district of this country is traversed by an offset of the Khing-khan Mountains, which branches off from the principal range near the peak of Petsha, and extends in a south-eastern direction to the Hoang-hai, where it forms the high, rocky, and mountainous shores along the western side of the Gulf of Leao-tong north of the mouth of the river Lan-ho. The declivities of this range are abundantly watered, but the northern side is bare and destitute of wood; whilst the southern is overgrown with pine, fir, oak, lime, walnut, and other trees, and is the haunt of numerous wild animals, among which are tigers and leopards. It constitutes the most extensive hunting-ground of the Chinese emperor, and contains the royal palace of Iohol, which was visited by Lord Macartney and described by Sir George Staunton. The tract on both sides of the Lan-ho is an agricultural country of great fertility and well cultivated. Though included within the boundary of Mongolia, it is inhabited by Chinese, and is very populous. Besides several small towns, it contains the large town of Quan-tshing.

The country which extends along the north-western side of the Ta-Gobi is nearly unknown, with the exception of the eastern part,

which is traversed by the caravan road from Kiachta in Siberia to Khalgan in China. Here too the surface of the country is frequently broken by hills and isolated ridges; but the intervening level tracts contain rich pasture-ground. It is mostly well watered, but wood is scarce. In advancing northward the hills grow higher, and the valleys or intervening level tracts become narrower, till near the boundary-line between Mongolia and Siberia the country rises into mountains, which run in a continuous chain, and are that portion of the Altai Mountains which is known under the name of Khing-khan Oöla. [ALTAI MOUNTAINS.] The width of this mountainous and uneven country, which lies between Siberia and the Ta-Gobi, seems on an average to be about 150 miles. In it originate the river Selenga and its numerous upper branches. Here also rise the Kerlon and the Onon, two large rivers, which by their union form the Amur. [AMUR.] This country, which is rich, when compared with other portions of Mongolia, belongs to the high-priest of the Buddhists, who resides in the neighbourhood of the town of Urga, and is called Kootookhtu. It forms a separate government of the Chinese empire, and its general governor, called 'vang,' or 'kiun-vang,' as well as the lieutenant, called 'amban,' resides in the town of Urga, or *Ceryo*. This town is built in a small plain; but though sheltered by mountains against the northern winds, the climate is too cold to permit the most common vegetables to be raised, which are accordingly brought to it from Mai-mat-shin, a place two degrees farther north. Its population does not exceed 7000, of which 5000 are said to be lamas, or persons belonging to the ecclesiastical establishment of the Kootookhtu; but it is a place of considerable traffic, being a depôt for the goods intended for the trade with Siberia, and also for those Chinese productions and manufactures which are consumed in the parts of Mongolia farther to the west. Many of the Mongolian princes, whose tribes wander about in the Ta-Gobi and the adjacent countries, are obliged to reside in this town, in order that their views may be known to the Chinese governor, who is a Mandshoo, and commonly a relation of the emperor. Here also is the supreme court, called Yamoun, for the administration of justice in that part of Mongolia which is inhabited by the Khalkas. This place may in fact be called the capital of Eastern Mongolia. The small town of Mai-mat-shin is on the very boundary-line of Siberia, and less than a mile from Kiachta. [KIACHTA.]

Of the western portion of Mongolia, extending from 84° to 96° E. long., between Siberia and the most western extremity of the provinces of Kan-su, all our knowledge is derived from the geography of the Chinese empire, the Tay-tsing-hoei-tien, and the maps annexed to it. Its western part is traversed by a mountain range, which near its western extremity is connected with the Altai Mountains, not far from the eastern bank of the Irtysh. This range, the Ektag Oöla, is commonly called on our maps the Great Altai. It seems to rise to a considerable elevation, but to disappear about 94° E. long.; for farther east only isolated mountain masses or short ranges occur in the desert. That portion of Mongolia which lies south of this range seems to partake largely of the nature of the Gobi, extending mostly in extensive sterile plains. The great number of rivers which, descending from the southern declivity of the Ektag Oöla, join the Irtysh before it reaches the lake of Zaizan, seems to indicate that a tract of fertile country extends along the northern banks of that river. The Irtysh is the largest river in this country, and probably runs 160 miles before it falls into Lake Zaizan. Another large river, the Ooroongoo, falls into Lake Kisilbash, which has no outlet. The country between the Ektag Oöla and the principal chain of the Altai Mountains appears to be traversed by several subordinate ridges running east and west. Though it is much better watered than any other part of Mongolia, the greatest part of it is a desert, especially towards the east, but towards the west the tracts of pasture are more extensive and less interrupted by sandy districts. In this part there are several extensive lakes, all of which receive considerable rivers without having any outlet. The most northern is the Upsa Nor, which receives from the east a considerable river, the Tea, besides several smaller ones. The Yeke Aral Nor, to the south-south-west of the Upsa Nor, is the receptacle of the Djabekan, a river whose course can hardly be less than 500 miles. In this part Mongolia extends to the north of the Altai Mountains, comprehending the country in which the upper branches of the Yenesei have their origin and course. The mountain range which divides the last-mentioned tract from the lake Upsa Nor and the river Tea is called the Tangnoo Oöla.

This part of Mongolia is divided into two governments, the government of Kobdo and that of Uliassutai, the boundary-line between them running near 92° E. long. The capital of the former is Kobdo, not far from the northern extremity of Lake Yeke Aral Nor: the capital of the latter is Uliassutai, situated on the river Iro, an affluent of the Djabekan. The latter place is stated to contain 2900 houses, and to be regularly built. Caravans pass from it to Urga and to China, and its commerce seems to be considerable. Nothing is known of Kobdo. A general, appointed by the Chinese emperor, resides in each town, a Mandshoo by birth, who has under his inspection the Mongol inhabitants of the country; he unites in his person the military and civil authority.

As the whole surface of Mongolia, with the exception of the deep depression of the Ta-Gobi, is more than 3000 feet elevated above the sea-level, and as it stretches out in vast plains, to which the compara-

tively low ranges of mountains along its northern border cannot afford shelter against the northern and north-eastern winds, the climate is much colder than in that part of Siberia which extends along the base of the Altai range west of Lake Baikal. No month in the year is free from snow, and even frost, though the heat in summer is nearly insupportable, on account of the want of trees and the sandy surface of the country. Sudden and great changes in the temperature are of frequent occurrence. It is however remarkable that the numerous herds which pasture on this plain find subsistence all the year round; even after a fall of snow the grass is seen above it, and serves to nourish the animals. This evidently shows that the quantity of snow which falls is comparatively small, and much less than that which annually covers the northern countries of Europe or of North America. This fact is a proof of the great dryness of the air; and to this want of moisture the unfitness of the soil for agricultural purposes, even where it is not composed of sand or stones, is mainly to be attributed. A little millet is grown in a few sheltered places between high hills, which attract the moisture. Rain is rare, except near the great ranges of mountains, especially about Urga. Gales of wind are frequent, and, especially in the Gobi, blow with great force, and frequently for many days together.

The wealth of the Mongols consists in their numerous herds of camels, horses, and sheep. Cattle are only numerous on the more hilly tracts, especially towards the boundary of China; there are none in the Gobi. Asses and mules are only found in the vicinity of China. Wild animals are numerous, especially hares, antelopes, dahiggetais, or wild asses, deer, foxes, sables, squirrels, and marmots. Water-fowl are plentiful on the numerous lakes and swampy tracts. In some places the desert is covered with small stones, among which several kinds of precious stones occur, as chalcedony, agate, onyx, jade, carnelian, &c., which are collected by the Chinese.

Inhabitants.—The inhabitants are called Mongols, and constitute the principal stock of a nation which is widely diffused over the extensive table-lands of Central Asia.

This nation is divided into two great divisions, the Eastern or Proper Mongols, and the Western Mongols, or Kalmucks. All the tribes belonging to this nation have, from time immemorial, led a nomadic life, and subsisted on the produce of their herds, without attempting to cultivate the ground; a circumstance which must be attributed to the countries they inhabit being entirely unfit for agriculture, with the exception of very small tracts.

The Proper Mongols inhabit that portion of Central Asia which is bounded by a line drawn from the northern extremity of Lake Baikal to the northern extremity of Lake Balcah, thence to the Hoang-ho, where the range of the Alashan rises near the town of Ninghia; from this place it follows the Great Wall, from the eastern extremity of which it runs to the junction of the rivers Nonni and Songari in Mandshooria, whence it returns to the northern extremity of Lake Baikal. The whole country encompassed by this line is in possession of the Proper Mongols, with the exception of some plains between the Ektag Altai and Lake Balcah, which are occupied by Kalmuck tribes. There are however Mongols also in other parts of Asia, especially in the country about the sources of the Hoang-ho, and about Lake Kookoonor, and in the western parts of Tibet, where they are called Khor-Katshi Mongols. All the Mongols speak the same language, and admit that they all belong to the same nation, and have a common origin.

The Proper Mongols are divided into three great nations, the Tahakhar, Khalkhas, and Sunnit. The Tahakhar inhabit the best part of Mongolia, being in possession of the tract which skirts the great Chinese Wall on the north, and extends to the Ta-Gobi, a distance of from 150 to 200 miles from the wall. They obtained the full confidence of the court of Peking by yielding to the sway of the Mandshoo, before they had made any considerable progress in the conquest of China. The Khalkha, or Khalkhas Mongols, occupy the northern part of Mongolia, along the southern boundary of Siberia. They voluntarily submitted to the Chinese emperor to avoid destruction in their unsuccessful war with the Oelöth Kalmucks in 1683. The Sunnit occupy the country between the Tahakhar and Khalkhas, or that part of Mongolia through which the Ta-Gobi extends. They are less numerous and powerful than their neighbours, and less esteemed by the Chinese. They submitted to the Mandshoo when the Tahakhar joined them in 1634.

The Mongols however have a literature, which they owe to the Chinese, and which consists chiefly of translations of Chinese books, and a few original historical works, especially the history of their great hero, Gengis Khan.

The whole nation is divided into 26 tribes, called 'aimak.' Each of these divisions has an hereditary prince, except the Khalkhas, who constitute one aimak, but are governed by four hereditary princes, called 'khan.' All four claim a descent from Gengis Khan. Each aimak has its territory, in which it wanders about with its herds. The order of society resembles the feudal system, and the noblemen are called 'taidshia.' The Mandshoo have introduced among them a military division, according to which the whole nation forms 135 banners, each of which is subdivided into regiments and companies. Each Mongol is bound to serve as a horseman from his 18th to his 60th year. The Mongols are governed by the decrees of the Li-fan-yuen, or Tribunal of Foreign Affairs, which has instituted for them a

It afterwards belonged to the Eastern, or Byzantine, emperors till the beginning of the 13th century, when the Franks having conquered Constantinople, the Venetians obtained for their share several islands of Greece and a considerable part of the Peloponnesus, with the towns of Coron, Modon, Argos, Nauplia, Corinth, &c. It was then that they gave the peninsula the name of Morea, from the quantity of mulberries ('more' in Italian) which it produced.

Towards the end of the 15th century the Morea was conquered by the Turks, and the Venetians were expelled from it. In 1684 war having broken out between Venice and the Porte, the Venetians sent an armament, which conquered the peninsula, to which they gave the name of a kingdom, subject to Venice, and its flag was hoisted on the square of St. Mark. In 1715 the Turks, after an arduous struggle, reconquered the Morea. In 1770 an insurrection broke out amongst the Greek inhabitants, but the Porte marched into it a large body of Albanians, who devastated and reduced the country. In 1820-21 the Moreotes joined in the general revolt of the Greeks, and after a long struggle the battle of Navarino (1829) at last delivered the Morea from the Turkish yoke. The Morea forms now an essential part of the kingdom of Greece.

(Coronelli; Leake; Sir William Gell, *Morea*.)

MOROCCO. [MAROCCO.]

MORPETH, Northumberland, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Morpeth, is situated in 55° 10' N. lat., 1° 40' W. long., distant 15 miles N. by W. from Newcastle, 289 miles N.N.W. from London by road, and 320 miles by the Great Northern, and York, Newcastle, and Berwick railways. The population of the municipal borough of Morpeth in 1851 was 4096; that of the parliamentary borough was 10,012. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. For sanitary purposes Morpeth is under the management of a Local Board of Health. The living is a rectory in the archdeaconry of Lindisfarne and diocese of Durham. Morpeth Poor-Law Union contains 72 parishes and townships, with an area of 93,798 acres, and a population in 1851 of 18,126.

The town stands on a sort of peninsula formed by the windings of the Wansbeck. The road from Newcastle enters the town from the south by an elegant bridge of three arches over the river, designed by Telford, and there is a suspension-bridge on the west side. The streets, which are irregularly laid out, are lighted by gas. The church, built in the 14th century, is nearly half a mile from the town, on the side of the river; it consists of a nave and chancel, with a western tower. In the churchyard is an ancient octagonal cross. The Wesleyan Methodists, Presbyterians, Independents, and Roman Catholics have places of worship. The Free Grammar School of Edward VI., founded in 1552, had 80 scholars in 1853. The income from endowment, which was 224*l.* in 1830, is expected to be more than doubled, owing to the termination of the Chancery suit, 'The Attorney-General v. Trevelyan,' which commenced about 150 years ago. There are also National and Infant schools, a mechanics institute and library, a savings bank, and a dispensary. The county jail and house of correction was erected about 30 years since, at a cost of 70,000*l.* The gateway is an imposing mass of building, and contains the chapel, the sessions-house or hall for county business, in which the Easter sessions for the county are held, and other apartments. Near the jail are the remains of Morpeth Castle, a rude and strong building, of which the gate-house and the outer wall, now much shattered, are still standing. The town-hall was erected by Sir John Vanburgh. Morpeth has a good weekly market for live stock on Wednesday. Five fairs are held in the year. Some flannel is made in the town; brewing, malting, tanning, and hat-making are carried on, and there are iron-foundries and corn-mills. Races are held yearly in the first week of September.

MORVAN, LE, the name of a hilly region in the centre of France, which forms part of the watershed between the Loire and the Seine. It now forms the south-west of the department of Côte-d'Or, the north-west of Saône-et-Loire, and the east of the department of Nièvre. The Morvan Hills are an offshoot from the Côte-d'Or Mountains; they extend first in a direction of west-north-west from the sources of the Arroux and the Armançon, tributaries respectively of the Loire and the Seine, to beyond the town of Saulieu, and the south-west to the sources of the Yonne and the Vendesne. The heights that form the edge of the two basins to the west of the Yonne are a

continuation of the Morvan Hills, but they are known by no particular name; they run across the department of Nièvre and the south-west of that of Yonne, beyond which they unite with the hills of the Forest of Orleans. The Morvan Hills are of inconsiderable height; they consist for the most part of a table-land of granite or other primitive rocks, traversed by narrow valleys and watered by numerous streams. The region affords in some parts good pasturage; other parts are clothed with wood; the rest is naked and bare: buckwheat, oats, and rye are the only grains raised.

MORWINSTOW. [CORNWALL.]

MOSAISK. [MOSCOW, Government of.]

MOSAMBIQUE. [MOZAMBIQUE.]

MOSCOW (*Moskwa*), one of the eight governments of Great Russia, is situated nearly in the centre of European Russia, between 54° 40' and 56° 30' N. lat., 35° 10' and 38° 40' E. long. It is bounded N.W. by Twer, N.E. by Wladimir, S.E. by Riäsan, S. by Tula, S.W. by Kaluga, and W. by Smolensk. Its area is 12,469 square miles. The population in 1846 was 1,374,700. It is divided into 13 circles.

The face of the country is an undulating plain, here and there broken by groups of low hills, but nowhere presenting any grand scenery: only the environs of the capital have any attractive spots, most of which however owe their beauties to art. The soil is for the most part loam and sand, with some heath and marsh; and on the whole the land is but moderately fertile. Boulders of granite and other kinds of rock are met with in more or less abundance on the surface, or in the beds of clay and sand.

This government is most amply provided with water, there being 109 lakes, none of which however are of any great extent, and 2610 rivers and streams. The principal rivers are—the Wolga, which indeed only just touches the province for a short distance in the north, where it receives the Lama and the Sestria on the right bank; the Oka, which forms the southern boundary; the Moskwa, which gives its name to the government and to the capital; and the Voria and the Khazma in the east, which unite to form a great tributary of the Oka, which it joins on the western border of the government of Niahnei-Novgorod. The Moskwa rises in the east of the government of Smolensk, near 55° 30' N. lat., 35° 15' E. long., and flowing eastward soon enters the government to which it gives name. Hence it pursues the same easterly course past Mosjaik and Zvenigorod to the city of Moscow; on entering which it takes a general south-east course to its junction with the Oka on the southern border of the government of Moscow. The whole length of the Moskwa is about 200 miles. Its principal feeders are the Iskwa, the Buzs, and the Istra on the left, and the Paktera on the right. The river is navigable in the open season, but the navigation is interrupted by a rapid under the bridge of Moscow. By its upper course timber, firewood, &c., are brought down to the capital, to which provisions, &c., are brought up the river from the Volga and the Oka. Moscow has communication with the upper Volga also by means of a canal that unites the Istra to the Sestria. The rivers are in general frozen about the middle of November, and thaw by the end of March. The whole length of the winter, including the less genial days of the autumn and the spring, is reckoned to be five months.

Agriculture is the chief occupation of the inhabitants, and Moscow is one of the best cultivated as well as one of the most populous provinces of the whole empire. As the soil is but moderately fertile, and the capital consumes a vast quantity of corn, the crop is never sufficient, even in good years, for the supply of the inhabitants, and large quantities are therefore imported. Flax, hemp, and hops are cultivated by the farmers for their own use, but the manufacturers must obtain their supplies elsewhere. Horticulture is carried on to a great extent, and the produce is nearly adequate to the consumption; most vegetables flourish, especially those which the Russians prefer, such as turnips, carrots, onions, garlic, cabbages, cucumbers, and gourds; other kinds of garden vegetables are cultivated in the environs of Moscow—the asparagus is celebrated all over the empire for its size and fine flavour. Fruit is scarce, and though apples, pears, and cherries thrive, in fact only apples are attended to. The best sort of apple is of Chinese origin; it is called Naliwy; is transparent, juicy, and pretty well flavoured. There are likewise many plums.

In general there is no want of wood for timber or fuel. The number of cattle is not sufficient for the supply of the province, which requires a great importation, not only of cattle, but of wool, tallow, &c. What the inhabitants chiefly attend to are domestic poultry and calves, for which they are sure of obtaining a good price in the capital. Some attempts have been made of late years to improve the breed of sheep. More attention has been paid to the breed of horses, and there are several considerable studs, some of which belong to the crown. Game is not abundant. Bears and wolves have not yet been quite extirpated in the great forests. Most of the rivers and lakes abound in fish, but are far from yielding sufficient for the consumption of the people. The minerals are freestone, potters'-clay, brick-clay, lime, gypsum, alabaster, and bog-iron.

Manufactures of various kinds are carried on to a great extent, both by the country-people for their own supply as well as for sale, and also in the villages and towns, and especially in the capital. The number of manufactories has increased rapidly in recent times. The

manufactures comprise woollen-cloth, hats, silk, leather, obints and calico, linen, cotton, paper, china, earthenware, &c.; steam-engines and steam-machinery are used to a great extent in the cloth, cotton, and silk factories. There are many distilleries and breweries, and numerous small manufactories; in fact almost every family in the country has some kind of manufacture.

The province has a very extensive inland trade; Moscow, from its wealth and industry, being necessarily one of the greatest emporia in the interior of Russia. Moscow may indeed be called the centre of the internal trade of Russia, as St. Petersburg is of its maritime commerce.

Other towns of this province, are—*Kolomena*, at the junction of the river Kolomenka with the Moskwa, and a little above the junction of the latter with the Oka. The town, which is divided by the Kolomenka into two parts, contains 17 churches, an ecclesiastical seminary, and a population of 10,200 inhabitants, who have manufactures of silk, cotton, linen, woollen-cloths, and leather. There are several tanneries, and malt and brick kilns; above 400,000 poods (36 lbs. each) of tallow are annually melted here. The inhabitants have a very extensive trade in tallow, hides, leather, corn, hemp, oil, hops, and fruits from the Ukraine, all of which find their way to Moscow; and they supply the neighbouring country with colonial produce, wines, and manufactures. The fairs are much frequented.

Serpuchov, on the rivers Nara and Oka, over the latter of which there is a bridge of boats. The citadel, on an eminence, is surrounded by a high wall, now fallen into decay; the town has 16 churches, a lazaretto, and other public buildings, and 6000 inhabitants, who have manufactures of sailcloth, woollens, leather, and paper. They have a good trade in corn, cattle, tallow, hemp, linen, and timber, which go partly to St. Petersburg and partly to Moscow. There are two fairs.

Wereja, on both sides of the Protwa, a feeder of the Oka, which crosses the south-west of the government. The Protwa is crossed by a wooden bridge. The inhabitants of the town, 6000 in number, have a brisk export trade with Moscow, St. Petersburg, Riga, and Königsberg.

Mosatsk, near the right bank of the Moskwa, in the west of the government, and a little east of the village of Borodino, has 4000 inhabitants. The bloody victories obtained by Napoleon I. over the Russians on September 5th and 7th, and called respectively by the French the victories of Borodino and the Moskwa, were fought near this town. After the terrible battle of the 7th, Marshal Ney was saluted by Napoleon—Prince de la Moskwa, and the French marched straight to the city of Moscow.

Dmitrov, in the north-east of the government, on the Sestria, has 3000 inhabitants.

The common roads are excellent. A railway from Moscow to St. Petersburg unites the two capitals of the empire. The navigation of the Oka and the Moskwa is a great advantage to this province.

The inhabitants are all of Russian origin; in the city of Moscow itself indeed there are not only persons from all parts of the Russian empire, but strangers from the remotest countries of Asia and Europe. The Russians are of the Greek religion, of which there are in this province above 1800 churches, under the archbishop of Moscow. The Roman Catholics, Lutherans, and Calvinists have churches in Moscow.

MOSCOW (in Russian, *Moskwa*), formerly the capital of the Russian empire, till Peter the Great in 1703 made St. Petersburg the seat of government, seems to have been founded about A.D. 1147, by the Grand-duke Yury II., or George, surnamed Dolgorucky, or Long-Hand. It was taken and plundered by Tamerlane in the reign of Basil II., and subsequently it was sacked by the Tartars. In 1536 it was nearly destroyed by a fire; again in 1571 the Tartars fired the suburbs, the conflagration spread to the city, a great part of which was reduced to ashes, and about 100,000 persons perished by fire or sword. In 1611 it was taken by the Poles, and a great part of it was destroyed by fire. Lastly in 1812 the inhabitants set fire to their city, after it had been entered by the French under Napoleon I. It has been since rebuilt with little change, except that individual houses are in better taste than in the old city, and gardens are more frequent.

Moscow is situated in 55° 45' 45" N. lat., 37° 33' 8" E. long., in a fertile and richly cultivated country on the banks of the river Moskwa (pronounced Moskva) and of the rivulets Jausa and Neglina (or Neglinnaya), the latter of which is in fact only a brook. The form of the city is a sort of irregular rhomboid, and its girding rampart is about 25½ miles long. In the inclosed space however there is a great number of gardens, besides many fields or parks which are used for promenades, for holding festivals, and for exercising troops; there are likewise 253 ponds or small lakes, on the banks of some of which there are public walks and fine gardens laid out with much taste, and inclosed by walls.

The central part of Moscow, containing the Kremlin and its gardens, east of which is the cathedral of St. Basil and the Kitai-Gorod, or Chinese Town, lies north of the Moskwa, and is surrounded by the Beloi-Gorod, or White Town. Round the Beloi-Gorod runs the inner boulevard, nearly circular in shape, with its two ends resting on the river and with a radius of about a mile. The Zemlianoi-Gorod incloses the preceding parts on the north side of the river, but extends to the

south side, so as to fill up the circle, and is inclosed by a wide circular boulevard concentric with the one just mentioned. Between this exterior boulevard and the ramparts of the city are the Slobodi, or suburbs, which are 85 in number. The finest of the gates of Moscow is the St. Petersburg Gate at the north-west angle of the city, consisting of three arches—a central one of large dimensions spanning the wide carriage-road, and two smaller ones over the footway. The panels are adorned with only a few imperial eagles in bas-relief; on the summit is a colossal figure of Victory in a car drawn by eight furious coursers.

The Moskwa crosses the line of the western wall of the city a little north of the Warsaw Road in an eastern direction, and immediately turning first south and then south-west, again crosses the rampart near the Devitchei Convent. After winding round to the south and east along the base of the Sparrow Hills to the south-west of the city (whence the French obtained their first view of Moscow), the river again enters within the ramparts at the south-western angle near the Kaluga Road, and flowing north-east between the Empress's villa and gardens on the east, the Devitchei Convent and vast barracks on the west, it crosses the exterior boulevards which separate the city from the suburbs. From one extremity of the interior boulevard to the other the river flows eastward along the southern base of the hill on which the Kremlin is built, and then turning nearly south it crosses the ramparts for the last time at the south-eastern angle; the convent of St. Saviour's, the vast powder magazine, and the Semionovskoi Convent lying between its left bank and the eastern wall. The small river Jausa enters the city on the north-east, and joins the Moskwa at the eastern extremity of the inner boulevard after passing the hospital of St. Catharine, the palace of the Empress Elizabeth, the Imperial Palace, the summer gardens, the new and old military hospitals, and the military school.

The view of Moscow at a distance has excited the admiration of all travellers. The countless number of towers, some with cupolas either gilt or painted green, and others rising in the form of minarets, and the many gardens and trees intermixed with the houses, give the city quite an oriental appearance. The number of towers in Moscow is very great, nearly every church having several besides the steeple. The churches have in general a peculiar appearance, being surmounted by several cupolas or small domes, which are painted or gilt and bespangled with stars; on the top is a crescent, with the cross above it. With a general similarity of appearance, the forms of the towers vary considerably, striking the eye by the irregularity of their forms and their gay diversity of colours. It is to those towers in particular that Moscow owes its remarkable appearance. They are all of stone, and most of them situated in open squares, in consequence of which they escaped the fire of 1812. Hence Moscow has lost little or nothing of its original aspect by that fire, especially as the part of the Kremlin which was blown up by order of Napoleon has been rebuilt in the same style. The roofs of the houses are composed of iron plates, painted dark green, so that at a distance they are lost among the tall groups of trees which rise from the gardens. The gilded cupolas are in general relieved by the green background. The best view of the city is from the Ivan Veliki, or great tower of Ivan in the Kremlin, which is in the centre of the city. The extraordinary mixture and contrast of magnificent palaces and petty huts, though still occurring in a few places, no longer strikes the eye as Moscow previous to the fire of 1812; the city is daily losing its Asiatic features, and assuming the appearance of the capitals of Western Europe. Happily for the lover of venerable antiquity, the Kremlin, which suffered comparatively little, notwithstanding the attempts of the French to blow it up, retains unimpaired its ancient irregularity and grandeur.

Moscow contained in 1835 above 10,000 houses, of which more than 2000 were of stone, 7 cathedrals, 21 monasteries, 245 Greek, 2 Roman Catholic, and 3 Protestant, besides 2 English churches, 8 Armenian chapels, and a Turkish mosque.

1. *The Kremlin*.—The Kremlin, which was first built of stone in 1367, in a commanding situation on the left or north bank of the Moskwa, taken as a whole, is a most singular, beautiful, and magnificent object. It is surrounded with walls from 12 to 16 feet thick, and of different heights, 28, 30, 35, 45, and 50 feet, with battlements, embrasures, numerous towers, and five gates. The most important of these gates is the Holy Gate, Spass Vorata, or Gate of the Redeemer, so called from a picture of our Saviour which hangs over it. This gateway is under a tower, and about 20 paces in length. Every one from the emperor to the meanest serf must take off his hat till he has passed through it. The most important parts remaining of the ancient palace of the czars are the Terema, which contains below the throne and audience chambers of the old czars, and above the apartments of the Czarovinas (princesses) and imperial children; and the Granovitaya Palata, a quadrangular building, the second story of which contains the coronation hall of the emperors of Russia. On the ground occupied by the main body of the old Tartar palace stands the Balshoi-Dvorets, or Large Palace, a lofty and imposing structure, erected and inhabited by the emperor Alexander. Adjoining the Granovitaya Palata is Maloi-Dvorets, or Little Palace, erected by the present emperor; it is a neat building, simple in style and interior arrangement. The Kremlin contains many magnificent churches.

The cathedral of the Assumption, founded in 1326, is deemed the most splendid in Moscow. It is by no means a large edifice compared with the cathedrals of other countries, but the interior is adorned with extraordinary profusion and splendour. Many highly venerated relics are preserved in this cathedral. The Russian sovereigns are here crowned and anointed. The cathedral of St.-Michael contains the tombs of the Russian sovereigns, the grand-dukes and czars, from the time that Moscow became the capital till the death of Peter the Great, and, besides those of many male members of the imperial family (the females are deposited elsewhere), that of Peter II. The cathedral of the Annunciation is smaller than the preceding, but built in better taste, and being splendidly ornamented, is a pleasing and magnificent object, forming as it were a wing to the palace. The floor is paved with jaspers, agates, and carnelians of different sizes and shapes. The cathedral of the Transfiguration is a very plain and nearly square edifice, founded in 1328, and rebuilt in 1527. Including the cathedrals, there are 32 churches in the Kremlin.

After the cathedrals, the Ivanovskaya Belfry claims attention for its size, its elegance, and magnificent appearance. The belfry has been entirely rebuilt since 1812 nearly in the same style as before, but it is now more beautiful and splendid. The tower is 269½ feet high to the top of the cross, which is 18 feet 8 inches. Besides many other bells, there is in this belfry the celebrated bell said to be the largest in the world. It was cast in 1736, but fell in consequence of a fire in 1737, and lay sunk by its weight to some depth in the ground till 1837, when the emperor Nicholas had it raised and placed on a pedestal; a piece broken off by the fall is also placed on the pedestal. It weighs 10,000 poods, or 360,000 lbs. English. The bell in the first story of the tower weighs 64 tons, and requires the united strength of three men to toll it. The view from the summit of this tower of Ivan Veliki over the city and its environs is surpassingly fine. The Kremlin contains likewise the imperial museum, the arsenal (which contains a vast collection of French cannon taken on the retreat of Napoleon I. in 1812), the treasury, the immense pile of buildings called the senate, the palace of the patriarchs of Moscow, now called the Synodalni Dom, or House of the Holy Synod, and the Vosnesenskoi nunnery, in the cathedral belonging to which a great number of grand-duchesses and empresses are interred. The Treasury contains the crowns, sceptres, thrones, arms, and drinking-vessels, apparel, and other memorials of the grand-dukes and czars, forming a collection of vast intrinsic value. Outside the Holy Gate of the Kremlin in the Krasnoi-Plotchad (Red Place), between the walls of the Kremlin and those of the Kitai-Gorod, is the cathedral of St.-Basil, a grotesque building, erected by an Italian architect for Ivan the Terrible, and surmounted by above 20 towers and domes of different shapes and sizes, and painted of various colours.

2. The *Kitai-Gorod*, surrounded by a wall with 12 towers and 5 gates, is properly the city. The houses, which are mostly of stone or brick, are built close to each other, contrary to the usual mode. It is the centre of the trade of Moscow; and contains the bazaars, the magazines, and the richest shops. Among the public buildings are the following:—The Pokrovskoi cathedral, built in 1554, was originally so constructed as to have 9 separate churches or chapels, to which 11 more have since been added, so that there are now 21 places of worship joined together, in which divine service may be performed at the same time. The house of the town council, a handsome edifice, was formerly the university. The printing-office of the Holy Synod is a very fine building, in which there are 30 presses for printing ecclesiastical books in Slavonian, and books in Greek, Latin, French, and German, for the spiritual schools under the synod. In the Krasnoi-Plotchad is a splendid monument erected by the emperor Alexander in honour of Minin and Pojaraki, who delivered the country from usurpers and foreign invaders in the 17th century, and placed on the throne Michael Romanof, the first sovereign of the reigning family. This monument consists of colossal bronze statues of the two heroes, 14 feet high, on a pedestal of a single block of red granite, adorned with bas-reliefs. In the Kitai-Gorod, to the north of the cathedral of St.-Basil, are the Gostinnoi-Dvor, or Great Bazaar, and the Riadi. The former is a colossal building three stories high, and three rows of pillars and shops stand one above another, connected by numerous passages and steps. Upwards of 1000 wholesale merchants trade here in the produce of the Baltic, the Black Sea, the Levant, western Europe, Siberia, China, Tartary, &c.; there seems a continual fair all through the year. The Riadi is an open space of ground laid out in narrow streets of shops or booths; the traders are grouped according to their respective callings. It is the noisiest and most bustling place in Moscow. The secondhand markets are numerous; the largest is held along the wall of the Kitai-Gorod. During what is called the winter market, which is held immediately after the frost has set in, vast quantities of perishable provisions—fish from the White Sea and the great northern lakes, frozen oxen and sheep from the Crimea and the shores of the Caspian, deer from Siberia, &c.—are piled in huge heaps in the streets, and a vast traffic is carried on in fresh provisions, for the winter supply of the city itself, and many other towns.

3. The *Beloi-Gorod*, or White Town, the third grand division of the city, forms above two-thirds of a circle, inclosing the Kremlin and

Kitai-Gorod on the north side of the Moakwa River, which forms the southern boundary of these divisions. Besides many fine palaces of the nobility, the Beloi-Gorod contains several remarkable edifices, such as the University, the Medico-Chirurgical Academy, the Foundling Hospital, the Post-Office, College of Foreign Affairs, the residence of the governor-general, the Riding School, the assembly-rooms of the nobility, three monasteries, three nunneries, and numerous churches. The palace of the governor stands in a fine elevated situation, and is a princely edifice of three immense stories, besides the basement, in a simple style of architecture. The internal arrangement, the size and elegance of the apartments, as well as the rich furniture and decorations, correspond with the external magnificence of the building. The University, founded in 1705, suffered severely in consequence of the French invasion, before which it was very flourishing. The fine library and valuable collections of all kinds fell a prey to the flames. The building has since been repaired. The number of professors and teachers in 1846 exceeded 100, and the students numbered above 1000. The university possesses valuable mineralogical, anatomical, and other collections.

The Riding School, or Exercise House, an enormous edifice to the north-west of the Kremlin, was built in 1817. In Russia, where the cold in winter is so severe, and the heat in summer frequently so intense, the inconvenience, and sometimes the impossibility, of training and exercising troops out of doors render such buildings as this absolutely necessary. The government has therefore provided both the capitals, and some of the chief towns, with these edifices. This at Moscow is, we believe, the largest in Russia. It has two fronts, precisely similar, and two similar ends. The length of each front is 560 feet, and the breadth of each end 168 feet; the height is 43 feet. Each front has 32 and each end 8 plain Ionic columns, with fine arched windows between, the frames of which, and the doors of oak, not painted, make an agreeable contrast with the white walls. In this building 2000 infantry and 1000 cavalry may be exercised at the same time. The weight of the roof rests on the walls without horizontal pressure. The Beloi-Gorod contains the only two theatres in Moscow—the French theatre, a small building, and the Imperial theatre, a showy building, with a large and handsomely fitted-up interior. They stand near each other, to the north of the Kotai-Gorod. Nearer the boulevard is the bank. The Foundling Hospital, founded in 1763, is an immense quadrangle four stories high, besides the basement. It is situated on the north bank of the Moakwa, between the east wall of the Kitai-Gorod, and the mouth of the Jausa. It is a simple and uniform edifice of vast extent. The upper part of the building is appropriated to infants and wet-nurses, of each of which there are always 600. The next suite of rooms is occupied by children from 4 to 7 years old. Other floors contain chapels, school-rooms, dining-rooms, kitchen, &c. Besides the children in the house, many others are given out to peasants' wives to nurse. Every child brought to the institution is received; its name, number, and date of admission are entered on the books, a corresponding ticket is tied round the child's neck, and a duplicate is given to the mother, who on presenting it may again receive her child. A small deposit left with the child ensures its being brought up in the house; boys left without a deposit are brought up for the army. All who give proof of good abilities are carefully educated, both boys and girls, for engineers and governesses respectively. Some of the boys are sent to the university. Besides a good education in the Russian language, the girls are taught manual labour, part of the proceeds being applied to the support of the institution, and the remainder laid up for a marriage portion. The main expenses of the establishment are defrayed by a tax on all places of amusement, and the interest of sums borrowed from a bank attached to the hospital. The entire number of children belonging to the house, in and out, amounted to about 25,000 in 1848. Persons of both sexes may return to the hospital should they fall into distress.

The assembly house of the nobility is a large pile of building. The interior is fitted up with great splendour. The grand hall is large enough to contain 2000 persons. It was burnt in 1812, and has since been rebuilt. Several of the private palaces in this part of the town are of vast extent, and a few of them are good specimens of architecture. The College of Mines, the College of Foreign Affairs, containing an immense mass of valuable state papers, and the Post-Office, are more remarkable for their use than for their style of architecture. Several of the churches and monasteries are worthy of notice.

4. The *Zemlianoi-Gorod*, or Earthen Town, was so called from the earthen rampart which formerly surrounded it, and which is now replaced by the boulevard, forming a noble promenade planted with trees. In this division are the depôt of the commissariat, a handsome building, consisting of a large central structure three stories high, adorned with Doric columns, with a balcony at their base, and two wings. The depôt for spirits, which occupies an immense space forming two squares, is chiefly remarkable for its length and its use, it being the depôt for the spirits made at the distilleries belonging to the crown, and from which all Moscow and the neighbourhood are supplied. The Imperial Philanthropic Society, and the Moscow Commercial School (an excellent institution), are plain edifices; the Medico-Chirurgical Academy is a large building three stories high, with a portico of six Doric columns, and has two detached advanced

wings. It possesses a very respectable anatomical museum, and a fine collection of specimens from the three kingdoms of nature. The Zatchateisk Monastery is a great ornament to this part of the city. This monastery derives its name from the church dedicated to the Zatchatiyé, or Conception of St. Ann, a handsome building in the gothic style, the interior of which is very elegant and splendid.

5. The *Slobodi*, or Suburbs, 35 in number, form an irregular polygon, completely surrounding the Zemlianoi-Gorod. Part of the suburbs, like the Zemlianoi-Gorod, consists of a mixture of stone and wooden houses, intermixed with superb mansions and mean hovels; but many of them are like villages, with much uninclosed pasture and waste land. Many of the monasteries and churches in the suburbs are worthy the attention of visitors. A Russian monastery occupies a large piece of ground, surrounded with high walls, which inclose besides the monastery, a principal central church, and three, four, five, six, or even more churches. Galitzin Hospital, to the east of the Empress's villa and gardens, is a very fine building, and a noble institution, founded at the end of the 18th century by Prince Galitzin. Sheremetof's Hospital is an extensive, noble, and magnificent edifice, resembling a fine Grecian temple. The establishment is not merely for the relief of the sick—a large annual sum is assigned for other charitable purposes, such as giving portions to 25 female orphans, allowing pensions to 50 indigent females, &c. In the northern suburbs are the Alexander Hospital, the St. Catharine's Hospital and Institution, the Botanical Garden, and the Sokolniki Field, a vast inclosed space behind the palace of the empress Elizabeth. In the eastern suburbs are the Hospital of St. Catharine, the Imperial Palace, and other buildings mentioned before as lying along the banks of the Jousa and the southern bend of the Moskwa. In the southern suburbs, between the right bank of the Moskwa and the Empress's villa, are the hospital of St. Paul, the great provision stores, the race-course, and the convent of the Donskoi. This convent, like some others in Moscow, is of vast extent, surrounded by walls, which are painted white and red, and surmounted by battlements resembling those of the Kremlin. Within the walls are six churches and chapels, numerous buildings for the monks, gardens, cloisters, courts, groves, and the whole crowned by numerous towers, looks like a little fortress. The Seminoff Monastery, opposite to that of the Donskoi, also resembles a fortress, and its ramparts are really mounted with small guns. From the principal tower of this convent, or from the terrace of its principal church, a very fine view of the Kremlin is obtained. The Devitchei Convent, near the south-east angle of the rampart of the city, is another of these vast structures; its walls are strengthened by 16 towers. The principal church has five smaller ones near it, besides chapels; the churchyard in the inner court of the cloisters is laid out with shrubs and flowers. In the principal church are the tombs of many czarinas and princesses. Some of these monasteries contain good libraries. The Devitchei-Foll, or Maiden's Field, a vast meadow between the convent and the outer boulevard, is the spot on which the czars of Russia entertain their subjects on their coronation: no less than 50,000 persons dined in this field at the coronation of the emperor Nicholas in 1826. In the western suburbs are the Widows' Hospital, in front of which is the Prensenskia Lake, a fine sheet of water; and the great prison, not far from the St. Petersburg Gate. At some short distance outside this gate, on the north-east side of the road to St. Petersburg, are the Petrofakoi Palace and gardens, the great resort of the fashionable world of Moscow in summer. To this palace Napoleon I. retired when Moscow was in a blaze; and here he dictated the bulletin that announced that terrible catastrophe to France. The gardens and grounds of the palace are beautifully laid out, and open to all the public; even the trades-people come here on their holidays, and under the thick shade of trees imbibe vast quantities of tea, the favourite beverage of all true Moscovians. On the Sparrow Hills a large building has been erected as a dépôt for prisoners sentenced to Siberia.

Moscow is the residence of two archbishops, and contains, besides the several government offices and public institutions specified in this article, the most important manufactories in the empire. It is the centre of the whole internal trade, and is the depository of immense quantities of merchandise of every description. The industrial products comprise woollen cloths, cotton manufactures, silks, carpets, jewellery, paper, &c. Steam-engines are used in the factories. Its vast trade is facilitated by water communication along rivers and canals with all the ports and cities of the empire, and by the railway to St. Petersburg. Moscow is also the residence of the great Russian nobles, who live here, especially in the winter. On the whole, Moscow is one of the richest and most magnificent cities in the world, and that in which the national manners and the character of the people have been least changed. The population in winter amounts to 400,000, including about 25,000 soldiers; in summer the number is diminished to about 360,000. [See SUPPLEMENT.]

(Lyll, *History of Moscow*; Hassel; Hörschelmann; Humboldt, Ehrenberg, and Rose; *Handbook for Northern Europe*.)

MOSELLE, RIVER. [MOSELLE, Department of.]

MOSELLE, a department of France, on the north-eastern frontier, lying between 48° 54' and 49° 34' N. lat., 5° 25' and 7° 40' E. long., is bounded N. by Belgium, the grand-duchy of Luxembourg and the Rhenish province of Prussia, E. by Bavaria and the department of

Bas-Rhin, S. by the department of Meurthe, and W. by that of Meuse. Its greatest length from west to east is 102 miles. Its breadth is very irregular, not more than 5 miles a little east of Sarreguemines, 41 miles near the meridian of Sierck; the average is about 25 miles. The area is 2078·3 square miles; the population in 1841 was 440,312; in 1851 it amounted to 459,684, giving 221·71 inhabitants to a square mile, or 47·13 above the average per square mile for the whole of France. The department is formed out of the old district of Measin, French Luxembourg, and a part of Lorraine. It is named from its principal river the Moselle, which crosses it from south to north.

The surface is in general uneven. The hills, which in the east of the department are offshoots from the Vosges Mountains, and in the west from the Ardennes, are of gentle slope, and nowhere exceed 650 feet in height. Their summits are covered with forests containing good ship-timber, and their sides are planted with fruit trees, or laid out in vineyards. There are no plains properly so called in the department, unless that term be applied to the plateaus formed by the upper surface of some of the highlands. The river valleys are all narrow; the finest of them is that watered by the Moselle, which for beauty of scenery and richness of soil is seldom paralleled, especially that part of it that extends from Metz, where the inclosing hills take a wider sweep from the river bank, to Sierck, where they again mutually approach.

The principal river is the *Moselle*, which rises in the south-eastern angle of the department of Vosges, and running nearly north-west, passes Remiremont, Épinal, and Charmes. A few miles below this last town it enters the department of Meurthe, which it traverses in the same direction as far as Toul, whence it flows north-east to its junction with the Meurthe, about 8 miles north of Nancy; from this point its course is nearly due north past Pont-à-Mousson, below which it enters the department of Moselle, where it passes Metz, Thionville, and Sierck, near the Prussian frontier. The Moselle, on passing out of France, forms for above 20 miles the boundary between Rhenish Prussia and Dutch-Luxembourg, then taking a decided north-eastern course through Rhenish Prussia, it passes Trèves, and after many windings through vine-clad hills enters the Rhine at Coblenz. The Moselle has a length of 320 miles, of which 182 are in France; it is available for floating timber almost from its source to its junction with the Meurthe, whence to its mouth, a distance of 210 miles, it is navigable; 72 miles of this navigation are in France. Steamers ply up and down the stream between Metz and Trèves, Trèves and Coblenz: the up-navigation is very tedious, owing to the rapidity of the current. The basin of this river is, with the exception mentioned in the last paragraph, very narrow; and the scenery is very beautiful. The river is subject to inundations, which sometimes cause great ravages. Timber, building-stone, iron, firewood, coal, slates, corn, wine, oak-staves, planks, charcoal, &c., are the articles chiefly carried on its waters. The principal feeders of the Moselle on the right bank are—the Valogne, the Meurthe, the Seille, and the Sarre; on the left bank the Madon, the Math, the Orne, the Sure, the Kill, and the Elz. The north-west of the department is drained by the Chiers, a feeder of the Meuse. The eastern districts are drained by the Sarre (which crosses the narrowest portion of the department) and by the Nied, a feeder of the Sarre, which is formed by the junction near Boulay of the Nied-Française and the Nied-Allemanda. All these rivers occasionally overflow their banks.

The valleys and hill-sides of the department are covered in general with a rich soil, and are carefully cultivated so as to yield great quantities of wheat, rye, and oats, of which a considerable surplus over the home consumption is sold for exportation in the great corn-market of Metz. Other crops raised are vetches, millet, peas, beans, and lentils. Improved methods and implements of agriculture are being adopted, but slowly. The vine is cultivated; but, with the exception of the white wines made near Metz, which are of good quality, the wines of the department are not so good as they might be. Wine merchants, settled at Metz, purchase Moselle wine, and manufacture from it what they call champagne wine for the German and Russian markets. Gardening is carried on extensively, and brought to considerable perfection; melons are abundant; pears, peaches, and other fruits are grown in large quantities, and exported in the form of dry, liquid, and crystallised conserves from Metz, where preserved fruits form an important article of commerce. Flax is extensively grown both for the sake of the fibre and of the seed, which is pressed for oil; rape and turnips are also grown. The forests consist of oak, beech, hazel, &c.; they abound in game, including in this term, roebucks, wild boars, wolves, foxes, and wild cats. Bees are very numerous, and much honey is gathered. Horses are of inferior breed; oxen and cows are lean; butter is scarce; cheese bad; sheep are small in size and coarse of fleece. The common fresh-water fish abound in the Moselle and the Sarre.

A portion of the department which projects eastward of Sarreguemines to the Bavarian frontier, forms an exception to the general fertility of the soil. Here the potato is almost the only plant that succeeds; the natural pastures are good, but these are frequently covered with sand and stones, swept down by torrents from the mountain sides.

The department is traversed by 12 state, 12 departmental, and 45 parish roads. A railway, which leaves the Paris-Strasbourg line at

Nancy, runs up the valley of the Moselle to Metz, and then crossing the department to Forbach, where it passes the frontier, crosses part of the Prussian and Bavarian territories to Spire, Mannheim, and Mayence on the Rhine.

The climate of the department is on the whole mild; in the north-western and the eastern districts however, which are respectively connected with the Ardennes Hills and the Vosges Mountains, the air is sharp, and the winters sometimes long and rigorous.

The offshoots of the Vosges in this department consist of the formations which overlie the primitive rocks to the new red-sandstone inclusive. The rest of the department is occupied by the formations which intervene between the red-sandstone and the chalk. Several iron-mines are worked, and the ore is smelted and made into malleable iron in 19 furnaces and forges. Lead and copper are found, but no mines are worked. Building-stone, quartz, gypsum, crucible and potters' earth are quarried. Marl is found in great masses in the north and north-west of the department, and is extensively used in manure. Plaster-of-Paris is also much used as a top-dressing for meadow-land. Fossils abound in the strata of the hills, which are generally calcareous, except in the vicinity of the Vosges; among other fossils, bones of the elephant and rhinoceros have been found.

The industrial products consist of sheet- and bar-iron, block-tin, nails, glass, unbleached- and table-linen, embroidered muslin, canvass, paper, beer, tobacco, oil, starch, room-paper, beet-root sugar, tiles, pipes, pottery, leather, hosiery, and common woollen and cotton stuffs. These articles, together with timber and the products previously mentioned, support an active commerce. About 90 fairs are held during the year.

The department contains 1,326,927 acres. Of the whole area 751,012 acres are under the plough; 112,677 acres are grass-land; 851,216 acres are covered with woods and forests; 29,456 acres are laid out in gardens, orchards, and plantations; 16,287 acres consist of heath and moor-land; 30,227 acres are occupied as roads, streets, squares, &c.; and 7759 acres with rivers, canals, and ponds.

The department is divided into 4 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Metz	9	210	169,472
2. Thionville	5	118	91,708
3. Briey	5	120	67,481
4. Sarreguemines	8	128	131,023
Total	27	571	459,684

1. Of the first arrondissement and of the whole department the chief town is Metz. *Boulay*, a well-built little town, with a handsome square and a large richly-decorated church, is situated on the slope and at the foot of a hill between the Nied and the Katsbach, feeders of the Sarre, and has 2670 inhabitants, who manufacture broadcloth, blankets, glue, ivory black, saddle-trees, hardware, foil blades, cotton-twist, and leather.

2. In the second arrondissement the chief town, *Thionville*, surrounded with ramparts and entered by three gates, stands 17 miles N. from Metz on the Moselle (which is here crossed by a covered bridge), and has a tribunal of first instance, a college, and 5500 inhabitants in the commune. The town stands on a level ground, and has wide but irregular streets, with solidly built houses, some of which date from the 16th century. The *Place-d'Armes*, or drilling-ground, is a handsome square, surrounded on three sides by barracks, and on the fourth by a large riding-school. Among the most remarkable buildings are—the parish church, the corn-market, the theatre, the hospital, and the town-house, near which there is a good botanical garden. Hosiery is the chief manufacture of the town; in the environs there are numerous spirit-distilleries, iron-foundries, glass-works, tan-yards, and breweries; there is also a good trade in corn, hemp, and flax. *Bousonville*, very prettily situated E. of Thionville, on the Nied, has a population of 2160. *Sierck*, a walled town, defended by a castle, is situated at the foot and on the slope of a steep hill, on the right bank of the Moselle, near the Dutch and Prussian frontiers, and has 2189 inhabitants, who manufacture eau-de-cologne, glue, and leather, and have a good trade in wine, timber, hides, ribands, and hardware.

3. In the third arrondissement the chief town, *Briey*, a small place of about 2000 inhabitants, and the seat of a tribunal of first instance, is situated in the west of the department, on a small stream that runs into the Orne. *Longuey*, in the north of the department near the Belgian frontier, 22 miles N. from Briey, is a fortified town, built on a hill, not far from the left bank of the Chiers, and has a population of 4197, who manufacture calico, table-covers, lace, pottery, beer, and leather. The upper town, which is the fortified part, is well-built, and contains a good town-house, a handsome church, an hospital, and several deep wells, which supply it with water. The lower town is built below the southern escarpment, and contains several old monasterial buildings, the dark appearance of which forms a striking contrast with the handsome country houses that stud both banks of the Chiers.

4. In the fourth arrondissement the chief town *Sarreguemines*, or

Saar-Guemend, is built in a pretty situation at the confluence of the Saare and the Bèlise, 42 miles E. from Metz, near the Bavarian frontier, and has a tribunal of first instance, a college, a custom-house, and 4917 inhabitants. The most notable buildings are—the old capuchin convent, which now serves as a residence for the sub-prefect, as a court-house, and college lecture-rooms; and a prison. This town is the centre of a great tobacco manufacture, which is carried on in the adjacent villages; other industrial products are earthenware, glue, silk, velvet, and plush. The trade in corn, canvass, fruits, timber, &c., is considerable. *St-Avoid*, a station on the railway to Metz, 20 miles W. from Sarreguemines, stands in a hilly country on the Roselle, and has 3408 inhabitants. It is a pretty little town, and has dyehouses, tile-works, tan-yards, and manufactures of swanakin and Prussian blue. *Bitche*, a small fortified town, which commands the defile of the Vosges Mountains between Weissenbourg and Sarreguemines, stands 16 miles E. from Sarreguemines, and has 3911 inhabitants. The town is well-built in shape of a half-moon. The citadel, built on an isolated rock near the centre of the town, is considered a masterpiece in the art of fortification. In the environs of Bitche there are glass-works, the products of which are in great request. *Forbach*, 12 miles N.W. from Sarreguemines, 43 miles by railway E. by N. from Metz, stands in a hilly and woody country, near the Prussian frontier, and has 4288 inhabitants, who manufacture pipes, iron chains, soap, leather, and glass. The town, which was formerly defended by a strong castle, now in ruins, is ill-built, with narrow, crooked, and steep streets. It has a custom-house, and is one of the principal outlets between France and Germany in this part. *Sarreguibe*, situated in a fine grazing country, 10 miles S. by W. from Sarreguemines, at the confluence of the Sarre and the Albe, has 3434 inhabitants, who manufacture household linen, straw-hats, tobacco, and steel.

The department forms the see of the Bishop of Metz; is included in the jurisdiction of the High Court of Metz, and within the limits of the University-Academy of Nancy, and belongs to the 5th Military Division, of which Metz is head-quarters. It returns 3 members to the Legislative Assembly of the French empire. Besides the colleges in the four chief towns of arrondissements there are at Metz a school of artillery, an endowed college, a normal school, an ecclesiastical seminary, and a preparatory ecclesiastical college. The Calvinists have a consistorial church at Metz, and three meeting-houses elsewhere in the department. The Jews also have a consistorial synagogue at Metz, and a central rabbinical school.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Official Papers.*)

MOSQUITO KINGDOM, Central America, an independent Indian kingdom, which occupies the tract of country known as the Mosquito Coast, extending along the shore of the Caribbean Sea from the mouth of the river San Juan de Nicaragua, 10° 55' N. lat., 83° 47' W. long., to Cape Camaron, 15° 57' N. lat., 85° W. long. It is bounded N. and E. by the Caribbean Sea, S. by the republic of Costa Rica, W. by that of Nicaragua, and N.W. by that of Honduras. The boundaries between this kingdom and the neighbouring republics are not very clearly defined; but the area is roughly estimated at 20,000 square miles: the population is said not to exceed 6000 or 7000.

The northern extremity of the coast is hilly. Mount Poyas, the termination of the mountain chain which stretches through Honduras, at the boundary of the two states, is above 3000 feet high; but from this point the land rapidly descends to the south, and the remainder of the shore is low. Along the northern part of this low line of coast, from Governor's Point to the Patook River, is a series of cays, from 10 to 35 miles from the shore, known as the Mosquito Cays; and along the southern part of the coast are numerous other cays, lying closer to the shore. They are dangerous to inexperienced navigators, but shelter that narrow part of the sea which lies between them and the mainland from the oceanic swell. Along the low coast the country is a level plain, slightly elevated above the sea, but on proceeding farther inland it rises in terraces, and here the plain is frequently interrupted by depressions and by elevated tracts which are connected with the mountain ranges. The terraces are furrowed by valleys scooped out by the currents of the rivers. The lower portions of the country are savannahs, without trees and frequently without bushes, but where the country rises and forms hills it is overgrown with trees. In the vicinity of the sea the soil of the savannahs is light. The whole country, as far as it is known, presents a continual alternation of wooded lands and prairies.

The Mosquito coast is drained by numerous rivers. Many of them are navigable to a considerable distance from their mouths, but the navigation is frequently impeded by the trees which are brought down during the rains. Most of the embouchures of the rivers form harbours, which however are only accessible to small vessels. The Rio Escondido, or Blewfields River, rises in Nicaragua and falls into Blewfields Lagune (12° N. lat.) after a course of considerably more than 100 miles. Wanks, or Segovia, River also rises in Nicaragua, where it passes near the town of Matagalpa and Segovia, and falls into the sea near the Bay of Cape Gracias a Dios after a course of 250 miles. It is navigable for boats throughout Mosquito. The San Juan issues from the Lake of Nicaragua, and at its mouth is Greytown: it is navigable throughout. [NICARAGUA.] The Patook and the Pinto, in the northern part of the state, are both of considerable size and

length, and, though obstructed by rapids, they are navigable by barges. There are several other rivers in the kingdom, but none of much consequence.

The lagunes are a peculiar feature of this country. They are not shallow and stagnant collections of water, but deep lakes, connected with the sea by one or more straits, by which the tide enters them. They generally receive one stream, frequently several, and always have therefore a current. Near the entrance of the lagunes the water is brackish, but in the interior it is quite sweet. The most extensive, from south to north, are—Blewfields Lagune, into which the Blewfields River falls, 25 miles long, and Pearl Key Lagune, which is 20 miles long; and, beyond Cape Gracias a Dios, Carataaka Lagune, which is much the largest, being 50 miles long and nearly 20 miles across.

The climate somewhat resembles that of Jamaica. The wet seasons extend from November to February, and from the middle of June to the end of July, the dry seasons being the intermediate periods. On the coast the rains are heavy, but very short; they are however attended with heavy thunder-storms. In the coldest months (from September to February) the temperature varies between 66° and 70°, but descends occasionally to 62°, and even to 60°. In summer the thermometer ranges between 75° and 84°, sometimes rising to 86°. The country is said to be healthy.

Vegetation is as vigorous as in any country between the tropics. The natural productions, vegetable and animal, are similar to those of other parts of Central America. Maize, sugar, cotton, cacao, indigo, and other tropical productions, are capable of being grown with great success. In the interior are immense forests of fine timber, but log-wood and sarsaparilla are the chief articles brought down to the coast. Tortoiseshell of fine quality is obtained along the coast.

The majority of the inhabitants do not materially differ from the other savage tribes of America. All the tribes, though they speak different dialects, distinguish themselves from other nations by the name of Miskitos, which the Europeans have changed into Mosquitos. The power of the king is absolute.

The commerce of the Mosquito coast is carried on by a few English and American families which are settled there. There are several Indian villages, at some of which are European residents; but the only towns are—Blewfields, the capital, on the west bank of Blewfields Lagune; and Greytown, the chief or only trading town of the state, situated at the mouth of the San Juan, and formerly known as San Juan di Nicaragua. Greytown, as noticed below, was destroyed, July 12, 1854, by an American sloop-of-war; it has since been to a great extent rebuilt, but it will probably be some time before it recovers its former prosperity.

The first settlement of Englishmen on this coast dates from 1730, when some families settled at Cape Gracias a Dios on Black River and at the mouth of Blewfield's River. In 1813, when the States of Central America acquired their independence, that of Nicaragua claimed the Mosquito coast as a portion of its territories, but these claims were rejected by England, and the King of the Mosquitos, an Indian prince, was guaranteed by Great Britain the sovereignty of the Mosquito coast. This English protectorate was protested against by the United States, who refused to acknowledge the sovereignty of the King of Mosquito, and in 1850 a treaty was concluded between England and the United States, by which the British protectorate was abandoned, the King of Mosquito being thrown on his own resources; while the two powers agreed to co-operate in the construction of a neutral and secure line of communication by way of the San Juan River and Lake Nicaragua between the Atlantic and Pacific Oceans, open on equal terms to all countries, and in establishing a free port for all nations at each extremity of the line. An American company was formed for constructing a canal and working the line by steam-boats; and a body of mercantile men, chiefly Americans with some British, settled in the old Spanish town of San Juan de Nicaragua at the mouth of the San Juan River, which they declared a free port under the title of Greytown. This town was within the Mosquito kingdom, and the merchants acknowledged themselves subject to the king; but as Nicaragua also claimed the town, and there was no attempt at the exercise of real sovereignty by either power, the inhabitants organised a local government, and the town appeared to be steadily growing in size and prosperity. In the beginning of 1854 the town was the chief commercial port on the new route, and contained under 1000 inhabitants, who are rather curiously described in the message of the President of the United States, as "a heterogeneous assemblage gathered from various countries, and composed for the most part of blacks and persons of mixed blood, and of mischievous and dangerous propensities." Unfortunately differences sprung up between the authorities of the town and the Transit Company. The American Consul to Central America supported the company, and when the 'mayor' of Greytown attempted to arrest the captain of one of the company's steamboats who had murdered a townsman, the consul interfered to rescue him. In doing so he received a blow from one of the crowd; and for this insult the American government sent a vessel of war to demand an apology and reparation. The commander of the Cyane, the ship sent on this mission, gave notice that unless ample apology was offered and the sum of 24,000 dollars immediately paid, he should at once bombard the town. The commander of an English war schooner protested against the bombard-

ment; and the European and American inhabitants took refuge on board the British schooner, while the Negroes and Indians fled into the interior. The bombardment then proceeded, and every house and warehouse in the town with their contents were entirely destroyed, a body of men having been landed to burn such as had escaped the cannonade. This proceeding excited great indignation in the United States as well as in Europe, and was formally complained of by some of the European powers; but the American government have accepted the responsibility of it, and justified the conduct of Captain Hollins, who had been supposed to have exceeded his instructions.

MOSS. [AGGERHUUZ.]

MOSTAH. [BOSNIA.]

MOSUL, a town of Mesopotamia, capital of a pashalic, is situated on the right bank of the Tigris, opposite the ruins of Nineveh, at a distance of about 220 miles N.N.W. from Baghdad, and has about 40,000 inhabitants, chiefly Arabs, Turks, and Kurds, with a considerable number also of Catholic, Syrian, Chaldean, and Nestorian Christians and Jews. Caravans trade between Mosul and Diarbekr, Baghdad and Aleppo. Indian goods are forwarded to Tocat in Asia Minor, whence copper is received in return. The chief manufacture is that of coarse cotton-cloths, dyed blue, and used by the lower order of people. According to Marco Polo, the muslins took their name from Mosul, where they were first manufactured. Gall-nuts from Kurdistan and copper are exported to Baghdad in return for Indian goods, which are sent to Syria, Kurdistan, Armenia, and Asia Minor. The Catholic or Latin bishop of Diarbekr (or of Chaldea), resides here. The town is surrounded by a wall, and is further defended by a castle built on an island in the river; the streets are narrow and unpaved. There are several bazaars, numerous coffee-houses and baths, 10 or 12 Christian churches, and about 30 mosques. A bridge of boats connects Mosul with the eastern bank of the Tigris.

MOTALA, RIVER. [SWEDEN.]

MOTCOMBE. [DORSETSHIRE.]

MOTRICO. [BASQUE PROVINCES.]

MOTRIL. [GRANADA.]

MOTTE-DU-CAIRE, LA. [ALPES, BASSES.]

MOULINS, a town in France, capital of the department of Allier; the seat of tribunals of first instance and of commerce, of a primary normal school, an endowed college, and a gratuitous school of design; is situated on the right bank of the Allier, here traversed by a handsome stone bridge of thirteen arches, 160 miles in a straight line, 213 miles by railway through Orleans and Vierzon, S.S.E. from Paris, in 46° 33' 59" N. lat., 3° 20' 9" E. long., at an elevation of 744 feet above the level of the sea; and had 15,398 inhabitants in the commune at the census of 1851. It is said to have derived its name from the number of mills driven by the Allier at this point. It existed in the 13th century. Archambaud VIII. exempted the townsmen from a certain tax in consideration of an annual rent of 200 livres. Robert, son of St. Louis, founded an hospital in Moulins in 1269. Its prosperity dates from 1363, the year in which the Duke of Bourbon returned from England, and built on the north side of the town the castle of Moulins, in which he took up his residence. The town was then small and surrounded with ditches, the sites of which are now occupied by the Cours, or interior promenades of the town. From this time till the flight of the constable of Bourbon in the early part of the 16th century, Moulins was the chief town of Bourbonnaise, and its castle the residence of Bourbon princes. The marriage of Antoine de Bourbon with Jeanne d'Albret was celebrated in the castle of Moulins, October 20th, 1548. The castle was destroyed by fire in 1755; the only part of it now remaining is a square tower (called Mal-Coiffée, erected in 1327) which is used as a prison, and a small wing occupied by the gendarmerie.

Moulins stands in a fertile plain in a well wooded and very delightful country. It is a neat and well-built town; the streets, clean and well paved, are not remarkable for great width or regularity. The houses are constructed with brick. The squares, of which the finest are the Place d'Allier and the Place de la Bibliothèque, are adorned with fountains. Besides the Cours already mentioned there are several handsome public walks; the principal one is the Allée de Bercé, which is perfectly level, 1100 yards long, and shaded by lofty trees. The chief buildings are the town-hall, the court-house, both of which are modern, and the church of the Convent of Visitation, which contains the tomb of Henri de Montmorency, who was beheaded under Louis XIII. at Toulouse; the convent itself is now occupied as a college. Under the choir of the church of Notre-Dame (which dates from 1336) are buried several members of the house of Bourbon. In the interior of the church is a stone monument, on which a dead body is sculptured with remarkable truth and effect. The clock-tower is ancient and of great height, the hours are struck by colossal figures moved by machinery. The barracks, at the end of the bridge in the suburbs of La Madeleine, the public library of 16,000 volumes and some valuable manuscripts, the general hospital, and the waterworks deserve mention. The industrial products of Moulins comprise oatmeal, silk and cotton hosiery, blankets, coverlets, cotton and woollen yarn, marquetry, leather, and ropes. There is a considerable trade in corn, wine, iron, wood, coals, salt, cattle, and pigs. Ten yearly fairs are held. Moulins gives title to a bishop, whose see is the department of Allier. Marshal de Villars (1653) and Fitz-James, duke of Berwick

(1670), were born here. Sterne has immortalised Moulins by his story of Marin. The Loire steamers ascend the Allier as far as Moulins.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

MOULMEIN (*Maulmain*, or *Moelmyn*), a town and port in the Tenasserim Provinces, which form a part of the British possessions on the eastern side of the Bay of Bengal. Moulmein is situated near the Gulf of Martaban, at the confluence of the rivers Saluen, Attayen, and Gyeng, in 16° 30' N. lat., 97° 44' E. long.: the three rivers when united are called the Moulmein River. It is 10 miles S. by E. from Martaban, and 30 miles N. by E. from Amherst. [AMHERST.] Moulmein has a good harbour, which admits vessels of 600 or 800 tons. Being favourably situated for commerce, and free from duties of import and export, it has drawn away much of the commerce which belonged to Martaban, and has in a great measure superseded Amherst. The population is estimated at upwards of 10,000. The exports are teak-timber, rice, tobacco, ivory, stick-lac, cocoa-nuts, and live stock. The imports are cotton goods and other manufactures.

MOULTAN. [HINDUSTAN.]

MOULTON. [LINCOLNSHIRE.]

MOUNT-BELLEW, Galway, Ireland, a small market-town, the seat of a Poor-Law Union, is situated in 53° 27' N. lat., 8° 23' W. long., 15½ miles E.S.E. from Tuam by road, and 109½ miles from Dublin. The population in 1851 was 329. Mount-Bellew Poor-Law Union comprises 14 electoral divisions, with an area of 102,383 acres, and a population in 1851 of 22,790. The town contains a monastery with a chapel attached, an Endowed school, and a school conducted by the monks. Petty sessions are held monthly, and fairs four times a year. A market is held every Tuesday.

MOUNT CARMEL. [CARMEL; ILLINOIS.]

MOUNT CHARLES. [DONEGAL.]

MOUNT SORREL. [LEICESTERSHIRE.]

MOUNTMELLICK, Queen's County, Ireland, a market and post-town, and the seat of a Poor-Law Union, is situated on the Oweness, a tributary of the Barrow, in 53° 7' N. lat., 7° 20' W. long., distant by road 6 miles N. by W. from Maryborough, and 52½ miles W.S.W. from Dublin. The population in 1851 was 3657, besides 1600 in the workhouse. Mountmellick Poor-Law Union comprises 43 electoral divisions, with an area of 200,633 acres, and a population in 1851 of 50,185. In the town are places of worship for Episcopalians, Roman Catholics, Presbyterians, Wesleyan Methodists, and Quakers; two National schools, and a Free school supported by the Quakers. There are also a court-house, a fever hospital, dispensary, and Union workhouse. A branch of the Grand Canal terminates at the town. Tanning and soap-making are carried on. There are a woollen factory, a foundry, and a machine manufactory in the place. The Irish Beet-Sugar Company have works for making sugar. Quarter and petty sessions are held in the town. There are two weekly markets and fairs eight times a year.

MOUNTNESSING. [ESSEX.]

MOUNT'S BAY [CORNWALL.]

MOUSTIERS. [ALPES, BASSES.]

MOVILLE. [DONEGAL.]

MOY. [AISNE.]

MOZAMBIQUE CHANNEL divides the island of Madagascar from the continent of Africa, washing the western shores of the island and the coast of Mozambique. Opposite the town its width is 250 miles. The length of the channel, between 12° and 25° 45' S. lat., may be about 1000 miles. Towards its northern extremity are the Comoro Islands. Along the coast of Mozambique are extensive shoals with several low coral islands, and along the Madagascar shore several rocky islands, but only a few small islands occur in the middle of the channel. The shores of the Mozambique coast are all low. The depth of water is very considerable. This channel to the south of Sofala is under the dominion of the south-eastern trade-wind; to the north it is subject to the monsoons. According to the monsoons (south-east from April to November, north-east for the rest of the year), vessels going to and coming from India frequently pass through the Mozambique Channel. The black whale, which yields the spermaceti, is very abundant in these seas. Water-spouts are of frequent occurrence.

MOZAMBIQUE COAST, a portion of the eastern coast of Africa which is situated between Cape Delgado (10° 41' S. lat., 40° 34' E. long.), and the northern mouth of the river Zambesi (17° 30' S. lat., 33° E. long.) The Portuguese have had settlements on this coast for more than three centuries, yet the country is very little known, with the exception of the coast-line. The Portuguese have several forts along the coast, but their authority extends only a short way inland. The interior is inhabited by a powerful and brave nation, the Makawas, who maintain commercial intercourse with the Portuguese.

The low narrow beach is generally lined by a sandy shore from 12 to 15 feet high, and covered with bushes. This strip of elevated ground seems to be of moderate width, and behind it extends a plain dotted with clumps of trees on some elevated mounds. This plain is a morass of great extent and considerable depth, and is impassable, being covered with grass nearly 6 feet above the water. Between it and the sand-hills is a narrow strip of dry land covered with jungle,

the haunt of elephants, hippopotami, deer, lions, and tigers. Along the course of the numerous rivers the country is higher and drier; it is also generally covered with forests, whilst along the sea-shore trees are scarce. About 30 miles from the coast the banks of the rivers are high and the country cultivated, though still intersected with extensive swamps. The mountains and hills which constitute the eastern border of the table-land of southern Africa occur on the banks of the Zambesi River, about 180 miles from the sea.

The sea along the shores of this country is considered very dangerous to navigators, and many vessels are lost. For a space of 10 to 20 miles it is lined by shoals, on which rise several small coral islands, some bare, others well-wooded. The channel between these islands and the continent has generally deep water. The sea east of the shoals is nearly everywhere unfathomable. The most remarkable of these islands are Fogo, Mafamede, and St. Antony, all of which are situated south of Mozambique: they are uninhabited. Towards Cape Delgado are the *Querimba Islands*, which are of various sizes, but all low and formed of coral, with long flat reefs extending seaward, and rising abruptly from an immense depth. Between these islands there is good and secure anchoring ground. The islands are inhabited by Portuguese settlers who have slaves to till the ground. The largest of the islands is called Querimba; it stands in about 12° 20' S. lat., 40° 58' E. long., and is about 5 miles long. There are several well-built farmhouses on it, and a church near the centre of the island.

The year is divided into the rainy and dry seasons. The rains commence in November and continue to the end of March. The country along the rivers is then overflowed to a distance of several miles. The heat in summer being very great, the numerous swamps render nearly the whole coast unhealthy. The country is rich in productions. The grains which are cultivated are rice, millet, maize, and wheat; the most common vegetables are cabbage, lettuce, spinach, peas and beans of different kinds, tomatoes, pumpkins, and cucumbers. The fruits are cocoa-nuts, mangoes, oranges, limes, acajoa-apples, custard-apples, pineapples, guavas, bananas, and plantains. Different kinds of pimento are also cultivated. Fish and turtle abound on all the coral-banks and islands. Cattle, sheep, and especially goats, are numerous. The exports are ivory, the tusks of the hippopotamus, gold-dust, columbo-root, gums, and some amber. Formerly a great number of slaves were exported.

The settlements which the Portuguese still maintain on the eastern coast of Africa do not extend so far as Cape Delgado. The river Mozimba separates them in this direction from the territories partially subject to the Imam of Muscat. The most northern is *Ibo* (12° 20' S. lat., 40° 30' E. long.), the harbour of which is formed by Querimba Island. It is strongly fortified, but does not appear to be a place of trade. Farther south is *Pomba*, which has one of the finest harbours on the coast, the entrance being a channel between two rocky points, one mile and three-quarters across; but the basin into which it opens is 9 miles long by 6 miles broad, and has sufficient water for the largest ships. This place has some trade. Near 15° S. lat. are three excellent and spacious harbours—Port Conducia, Port Mozambique, and Port Mokamba, but only the second is used for commercial purposes.

The most southern Portuguese settlement on this coast is *Quilimane*, built on the northern bank of the northern, or Quilimane arm of the Zambesi, in 17° 51' 8" S. lat., 37° 1' E. long. It is about 12 miles from the sea. The river at its entrance is a mile broad, and immediately increases in width considerably. The place contains only a few brick houses for the Europeans and their descendants, and a great number of huts for the slaves. The trade in slaves was considerable till very recently. Besides rice, it exports ivory and some gold and silver. There are extensive coal-fields in the captaincy of Quilimane, but no mines are worked. The principal Portuguese settlement on the Zambesi is *Sena*, or *Senna* (near 17° S. lat., 37° E. long.), to which place goods are sent up the river in boats from Quilimane, bringing down gold dust, elephants' teeth, wax, hides, rhinoceroses, horses, &c., to be shipped to Mozambique. The African tribes of the interior trade with Sena. Sena is 110 miles W. from Quilimane, like which town it is the head of a captaincy, and consists of a few brick houses and churches, a redoubt, and a large number of huts. About 100 miles N.W. from Sena and also on the Zambesi is *Tette*, a large well-built town, which stands on a healthy site on the right bank of the river. Tette gives name to one of the captaincies into which the Portuguese government of Mozambique is divided, but it is very questionable whether the Portuguese have any authority so far inland.

Two decrees were issued by the Portuguese government in June 1854, ordering the establishment of custom-houses and fiscal ports at Mozambique, and some other settlements along this coast.

MOZAMBIQUE, a fortified sea-port on the east coast of Africa, is the capital of the Portuguese territories along that coast. It is situated in 15° 2' S. lat., 40° 43' E. long., on a deep inlet of the sea, 5 miles broad and 6 miles long, which receives the waters of three considerable rivers. At the entrance of the harbour are three small islands, which render the anchorage perfectly safe. Of these islands that of Mozambique, on which the city stands, is formed of coral, is very low and narrow, and scarcely one mile and a half long. It is situated nearly in the centre of the entrance of the inlet. The other two islands, San George to the northward and Sant' Iago to the

southward, lie opposite to one another, nearly 3 miles outside that of Mozambique; they are of coral, covered with vegetation, but without inhabitants.

The north-eastern extremity of the island is occupied by the strong fort of San Sebastião. There are also two other small forts. The streets of the city are narrow, but the houses are generally lofty and well constructed. Nearly in the middle of the city is a large square, at the eastern extremity of which is a long and commodious stone wharf, built on arches, stretching out from the shore almost to low-water mark, and affording at all times an excellent landing for boats. On the three other sides of the square are the palace of the governor, the custom-house, and the main-guard. The city covers half the island; to the south of it is the Black Town, composed of small bamboo-huts, and inhabited by coloured people.

The population, amounting to about 6000, consists of Portuguese, Canareans, or Creoles, Banyans from Hindustan, free-coloured people, and slaves. The commerce of Mozambique has greatly decreased: it formerly traded largely with India, and was notorious as a slave-port. In addition to slaves, only a small quantity of ivory, gold-dust, and a few articles of smaller value were sent abroad. Rice and other provisions are imported from Madagascar and the neighbouring Arab settlements. The Portuguese have gardens for growing vegetables on the mainland. Good drinking-water is scarce; there is only one well on the island.

Mozambique was first visited by Vasco de Gama in 1498. It was taken in 1506 by Tristan da Cunha and Albuquerque, and became the centre of the Portuguese possessions, and the seat of a viceroy. Whilst the Portuguese remained in possession of their extensive conquests in India, Mozambique and the other settlements on this coast were in a flourishing state, but they began to decline in the 17th century, and have continued to decline ever since. The governor of Mozambique has still the supreme authority over all the Portuguese settlements from Cape Delgado to Dalagoa Bay.

MUGRON. [LANDES.]

MÜHLHAUSEN. [ERFURT.]

MÜHLHEIM. [DUSSELDORF.]

MUIRKIRK. [AYRSHIRE.]

MULA. [MURCIA.]

MÜLHAUSEN, a large manufacturing town in the French department of Haut-Rhin, which, with the communes of Illzach and Modentheim, though entirely surrounded by France, was a member of the Swiss Confederation till 1793, when it voted its annexation to France, with which it was incorporated by treaty in 1798. The town is situated on the Ill, a feeder of the Rhine, in 47° 45' N. lat., 7° 21' E. long., at a distance by railway of 27 miles S. from Colmar, 18 miles N.W. from Basel; and has a tribunal of commerce, a bank, a council of Prud'Hommes, a college, and 20,587 inhabitants. Mühlhausen is built on an island formed by the Ill, which is here crossed by several bridges. The town forms an irregular oval; the streets are tolerably broad and well paved, and the houses well built. There are a Catholic and a Protestant church, a town-hall, a synagogue, an hospital, several squares, and a college. Mühlhausen has obtained deserved celebrity for its printed cottons, for the manufacture of which there are several important establishments. The other manufactures are cotton and woollen-yarn, muslin, silk, woollen-cloth, hosiery, straw-hats, morocco leather, soap, damask, linen thread, &c. There are dye-houses, tanneries, metal-foundries, and large establishments for the manufacture of steam-machinery, which is extensively used in the great industrial establishments of the town. There is also a considerable commerce in corn, wine, brandy, groceries, hardware, iron, &c. The canal which unites the Rhône to the Rhine passes by the town. A railroad, 13 miles in length, runs westward from Mühlhausen to the busy little manufacturing town of Thann. [RHIN, HAUT.]

MULL. [ARGYLSHIRE.]

MULLINGAR, Ireland, the chief town of the county of Westmeath and the seat of a Poor-Law Union, is situated on the Royal Canal, in 53° 32' N. lat., 7° 18' W. long., distant 50 miles W.N.W. from Dublin by road, and by the Midland Great Western railway. The population in 1851 was 4789, besides 2023 in the workhouse, infirmary, and jail. Mullingar Poor-Law Union comprises 48 electoral divisions, with an area of 208,401 acres, and a population in 1841 of 62,094; in 1851 of 51,221. The town obtained certain privileges by royal letter from Elizabeth. In the war of the revolution Mullingar was fortified and made a principal rendezvous of the army of King William. It is watered by the Brosna, a tributary of the Shannon. The parish church, erected in 1813, is a handsome building with a tower and spire. The Roman Catholic chapel is the cathedral for the diocese of Meath. There are a small Presbyterian meeting-house, a Wesleyan chapel, a Diocesan school, National schools, and a nunnery which was built about 40 years since on the site of an ancient Dominican friary. In Mullingar are the county court-house and jail, the county infirmary, the Union workhouse, and a large infantry barrack. The assizes for the county are held in Mullingar, also quarter and petty sessions. Thursday is the market-day. Fairs are held on April 6th, July 4th, August 29th, and November 11th and 12th.

MULWIA. [MABOCOO.]

MÜNDEEN. [HILDESHHEIM.]

MUNDLESIR. [HINDUSTAN.]

GEOG. DIV. VOL. III.

MUNEEPOOR, a principality of India east of the Ganges, is bounded E. by Birma, and W. by the British province of Cachar. The boundaries N. and S. are mountainous regions, and imperfectly defined. The territory is comprehended between 24° and 25° 15' N. lat., 93° and 95° E. long. The greatest length west to east is 130 miles, the greatest breadth north to south is 85 miles. The area is 7584 square miles. The population, according to the latest estimate, is 75,840.

The valley of Muneepoor, which constitutes the principal and by far the most important part of the principality, is 2500 feet above the level of the sea. It consists of a fertile tract on either side of the Imphan Toorel River. An extensive and elevated range of mountains bounds the valley on the west side. On the east it is bounded by the Muring range. On the north and south boundaries of the valley are the projecting ends of numerous ridges which issue from two extensive mountain tracts. The principal river of the vale of Muneepoor is the Imphan Toorel, which rises with two principal branches in the mountain region lying north of the vale; the eastern is called the Eeril River, and the western the Khongba Rivér. The two join about 24° 40' N. lat., and the united river afterwards receives the Thobal, the Myetha, and the Korotub. The Imphan Toorel, after a course of 300 miles, interrupted by many falls and rapids, joins the Ningtha, a tributary of the Irawaddy.

The Barak, or Soormah River, traverses the mountainous district west of the vale of Muneepoor, and has a course of more than 180 miles through Muneepoor, but its stream is too rapid for navigation. At the mouth of the Jeere River it becomes navigable for boats of moderate burden. The Barak joins the Brahmaputra near the village of Sunerampoor, in Bengal. The climate of the vale of Muneepoor is modified by its elevation above the sea, and by the mountains which surround it. In December and January the thermometer at noon varies between 56° and 58° Fahr. In June it generally attains a height of from 80° to 85°. The agricultural produce consists chiefly of rice, which forms the staple article of food, and the crops are everywhere very abundant. Tobacco, sugar-cane, indigo, mustard, different kinds of sesamum, and opium are also cultivated, and cotton in the valleys of the mountainous districts. European vegetables are now much cultivated. There are extensive forests in the mountainous districts. Cedar of gigantic size, fir, and pine, occupy the highest portions of the range; oak of every size occurs on the several hills and mountains, and is employed as fuel and building material.

The animals employed in agriculture are buffaloes and cattle, more especially the former. The cattle are superior to those of Bengal. The horses are small in size, rarely exceeding 13 hands high, but they are hardy, vigorous, and highly valued. Goats and sheep are only reared on the slopes of the mountains. Elephants, deer, wild hogs, wild dogs, and tigers are met with. There are many varieties of birds. Iron is common in many parts of Muneepoor, especially in the hills near Langthabal. There are many rich salt-springs.

Muneepoor valley contains many villages, which are mostly on the banks of the tributaries of the Imphan Toorel. The city of Muneepoor is situated a short distance from the western bank of the Khongba, in 24° 48' N. lat., 94° 7' E. long. It was destroyed in the war with the Birmanese, previously to 1826, and has not, as far as we know, been rebuilt. The Raja fixed his residence in the village of Langthabal.

The Muneepoorers, or inhabitants of the valley, appear to be the descendants of a Mongol colony, which in ancient times penetrated into this country: they rather resemble the Chinese and Birmanese than the inhabitants of Bengal, being taller, stronger, and possessing more vigour of mind than the latter. They have made considerable progress in the arts of civilisation. They make several kinds of cotton-cloth and muslins, and their silk fabrics are remarkable for strength and the brilliancy of their colours, especially a kind of large scarfs, which sometimes are very richly embroidered, and then exported to Ava. The language of the Muneepoorers is very different from that of Bengal, but the Bengalee is generally understood. Brahmanism seems to be the prevailing religion.

The principality of Muneepoor has been under the protection of the British since the peace of Yandaboo with the Birmanese in 1826. A British political agent resides at the place where the Raja holds his court. Gambhir Sing, the raja who first placed himself under the protection of the British, died in 1832, and was succeeded by his son.

MUNICH (*München*), the capital of the kingdom of Bavaria, and perhaps the handsomest city in Germany, is situated on the left bank of the Isar, in 48° 8' 19" N. lat., 11° 35' 15" E. long., at an elevation of about 1700 feet above the sea, and had, with its suburbs, a population of 127,385 in December 1852; in 1815 the population, including the suburbs, was only 60,215. Of the population the great majority are Catholics. The city stands in a plain bounded to the eastward by low hills; portions of it still bear traces of antiquity; but its extent has been nearly doubled in the present century by the erection of new quarters and suburbs. It has several broad straight streets, with lofty houses, in a good style, and some very handsome squares. The Max-Joseph Platz is adorned with a colossal bronze statue of King Maximilian. In the centre of the old town is the Haupt-Platz, on which the numerous streets abut, several of which contain a great number of fine buildings. The Au suburb lies to the eastward of the Isar, and is connected with the old city by two bridges. A railway 40 miles in length connects the city with Augsburg, and opens

to it the railway systems of west and north Germany. The terminus is outside the Karls-Thor, on the west of the city, near the botanic garden. A railway is in course of construction in an east-south-east direction from Munich to Salzburg. The city is connected by electro-telegraphic wires with all the chief towns in Europe.

Munich, till the end of the 18th century, was merely a second-rate German capital. It was surrounded with ramparts and a ditch, which were removed in 1791; but several of the old castellated gate-entrances have been preserved. The houses in the old town are built in a quaint picturesque style, irregular in size and form, crowded with windows, and ornamented with scroll-work or rude frescoes. The roofs are high, and perforated with three or four tiers of lights. In the great market-place called Schrammen-Platz the characteristics of the house architecture of old Munich may still be seen in all their perfection. The new parts of the city extend round the old town in all directions.

Munich has numerous scientific and literary institutions, most of which were improved or founded by Maximilian Joseph I. and the ex-king Ludwig; to the latter it is chiefly indebted for its magnificent buildings and inestimable treasures of ancient and modern art. The Royal Academy of Sciences was founded in 1759 by the elector Maximilian Joseph III.; in 1807 it received from King Maximilian I. a new constitution and ample endowment, and was reorganised in 1827. A general conservator has under his care the public library of 400,000 volumes and 22,000 manuscripts, the museum of natural history, the Brazilian Museum (composed of the collections formed by Spix and Martius), the scientific collections, the botanic garden, the cabinet of medals, the cabinet of antiquities, the chemical laboratory, the observatory at Bogenhausen, &c. There are three gymnasia for the higher branches of education, a royal academy of arts, a military academy, veterinary and medico-clinical schools, a training school, a central polytechnic school, and many others. The University, founded in 1472 at Ingolstadt, was transferred in 1800 to Landsbut, and in 1827 to Munich. It has 58 ordinary and 10 extraordinary professors, and in 1850 there were 1884 students. The university is well furnished with all the necessary requisites, and has a library of 150,000 volumes. The charitable institutions are numerous—the general hospital, for 600 patients; St. Joseph's hospital, for 260 patients; the asylum for the blind and for deaf mutes; the military lazaretto; the poorhouse; the lunatic asylum; the lying-in hospital; and many others. The house of correction is considered as a model of its kind. It contains a manufactory of woollen-cloths.

The manufactures of Munich comprise linen, woollen-cloth, calicoes, damask, silk, ribands, household furniture, piano-fortes, playing-cards, articles of gold and silver, bronze- and iron-works, coaches, and mathematical, surgical, optical, and astronomical instruments. Fraunhofer's manufactory of astronomical and optical instruments has become celebrated throughout Europe. There are likewise manufactories of leather, snuff, and paper (the latter, established in 1347, is probably the oldest in Germany), extensive breweries, sugar-refineries, and distilleries. The presence of the numerous public establishments and government offices, the expenditure of the court, and of the numerous land-owners who reside in the capital, contribute still more to its prosperity than its manufactures. Lithography was invented at Munich by Sennefelder.

The environs of the city are very pleasant, and contain numerous places of public resort and amusement, which are very much frequented: some of them are noticed below. In the vicinity are the royal country-seats of Nymphenburg and Schleissheim, both of which contain fine picture-galleries. The inhabitants of Munich are very fond of amusement: in the summer they enjoy the open air in the country, and in the winter, besides the carnival, frequent concerts and balls. There are likewise three theatres. Though Munich is so far south the climate is by no means mild, in consequence of its elevation and the vicinity of the mountains of the Tyrol. The changes of temperature are frequently sudden.

For its celebrity as a seat of the fine arts Munich is mainly indebted to the ex-king Ludwig I. The number of public buildings erected in his reign is astonishing, when the limited resources of such a small kingdom as Bavaria are taken into the account. Neither is it merely as buildings—as works of architecture alone—that these additions to the capital are worthy monuments of art; for painting and sculpture, fresco, and in some instances polychromy also, have been unsparingly employed to embellish them. Very little more than a mere enumeration of the chief edifices of Munich can be here given: to describe them would require a volume. To begin with the older ecclesiastical structures, the most ancient is St. Peter's, which dates from the 13th century, and contains a gothic altar-piece of carved stone in three compartments, the uppermost representing Christ in Majesty, the middle the Last Judgment, and the lowest the Crucifixion. The Cathedral, or Frauen-kirche, which was begun by Duke Sigmund in 1468, and completed 20 years afterwards, is in the gothic style, constructed of red brick. The towers are capped with small domes, and are 386 feet in height. The length of the edifice is 321 feet, the breadth 122 feet, and the height to the summit of the vaulting of the nave 110 feet. The choir contains a mausoleum to the memory of the emperor Louis IV., a splendid work of art, which has hardly any superior of its kind throughout Europe. It is of black marble and bronze, and was executed from the designs of Candido, who also

Painted the principal altar-piece. The next building in point of antiquity is St. Salvator's, now the Greek church, erected in 1494; after which, according to the succession of dates, comes St. Michael's, or the Jesuits church, which dates from 1583, and is built in the Italian style. It is cruciform, and 280 feet in length. The interior is very handsome and remarkable for its width of roof unsupported by pillars. The church of St. Cajetan, a work of the 17th century, and of the Italian style also, is 220 feet in length, by 120 feet in its greatest width, being in the form of a cross, and it has a central dome raised on Corinthian columns. The beautiful façade is of later date than the rest (1767): it was executed after the designs of Couvillers, a Frenchman. The interior resembles St. Peter's at Rome in miniature. The burial vaults of the royal family of Bavaria are under this church. The interior contains Thorwaldsen's magnificent monument to Eugene Beauharnais, in which, besides a colossal figure of the ex-viceroy of Italy, there are two beautiful geni, and a female representing the Muse of History, while a portal of Grecian design forms a rich architectural background to the whole composition. Trinity church, formerly that of the Carmelite nuns, was begun in 1704, and is a rotunda with a cupola on 18 Corinthian columns. The façade is of the Ionic order.

Of the modern churches the Ludwigs-Kirche, the Pfarr-Kirche, the Basilica of St. Bonifacius, and the Allerheiligen-Kapelle are pre-eminently deserving of notice.

The Ludwigs-Kirche, which is in the round-arch style, is no less remarkable for the beauty of its execution than the richness of its design. The front, somewhat more than 100 feet to the summit of the gable, has two towers 220 feet high, which give the façade five compartments, the centre one, or that corresponding with the nave within, being an open vestibule, with arches resting upon delicately sculptured columns. Immediately over this porch are five niches with colossal statues of Christ and the four Evangelists, and crowned with arches decorated with arabesques. Above these is a large rose window, and then the gable ornamented with foliage and open work, with a cross on its summit, and colossal statues of St. Peter and St. Paul at its angles, which, as well as those in the niches, were modelled by Schwanthaler. The nave is 246 feet long by 43 feet wide, and upwards of 80 feet high. The tribunal at the end of the choir and the extremities of the transept are decorated with noble frescoes. The subject in the tribunal is the Last Judgment by Cornelius, allowed to be one of the greatest efforts of art in the present century. This fresco is 64 feet high.

The Pfarr-Kirche, or parish church of St. Maria Hilf, in the Au suburb, the first stone of which was laid Nov. 28, 1831, is a noble architectural work in the pointed gothic style with high lancet windows. The building, which is quite insulated, has three portals in its west front, and above the middle one a large rose window. The tower is upwards of 250 feet high, and the upper part of it consists of ornamental open work. Within it is divided into a nave and aisles, the former of which is 80 feet high. Independently of its architecture, this church deserves notice on account of its 19 splendid painted windows, representing incidents in the life of the Blessed Virgin, designed by first-rate artists, and executed in the Royal Porcelain manufactory of Munich. Ohlmüller was the architect of the building.

The Basilica of St. Bonifacius attached to the Benedictine convent, was commenced in 1835, and completed in 10 years. It is in the Byzantine style, 250 feet long and 120 feet wide. The walls are of red brick. The interior is divided within into a nave and double aisles on each side by 72 monolithic columns of Tyrolese marble disposed in four rows. Of the nave, the width is 51 feet and the height 70 feet; of the aisles, the width 15 feet and the height 40 feet. The pavement is of marble mosaic, and the roof of open timber work, the beams of which are not only carved, but richly decorated with painting and gilding, and the ceiling between them azure, with gold stars. The walls of the interior are decorated with magnificent frescoes, the upper series between the round-headed windows representing scenes in the lives of German saints and martyrs, the lower series subjects from the history of St. Bonifacius, designed and painted by Heas and his pupils. In the rear of this magnificent church (the front of which, towards the Karls-Strasse, has a portico of eight Corinthian columns with three bronze doors) is a theological seminary, directly facing the Glyptothek, to which it forms a corresponding piece of architecture, on the south side of the Königs-Platz. The Allerheiligen-Kapelle is noticed farther on.

The Alte-Residenz, or Old Palace, is a vast pile, said to have been erected from the designs of Vasari, by Maximilian I., at the close of the 16th century. The west front is about 550 feet in length, and has two noble Doric portals, ornamented with bronze statues. Within are four courts, adorned with rich fountains and bronze figures. The most remarkable part of the Old Palace is the Reiche-Kapelle (Rich Chapel), the floor of which is of jasper, porphyry, and amethyst; the walls of Italian mosaic, and the altar of solid silver: in short, such is its marvellous gorgeousness that this single apartment is said to have cost Maximilian I. several millions of florins. In this chapel is preserved the portable altar at which Mary Queen of Scots prayed before her execution. In an apartment of the old palace called the Schatz-Kammer, or Treasury, the regalia and royal jewels of Bavaria are kept.

Vast as the Old Palace was left by Maximilian, it has been greatly

extended by two others, namely, the Neue-Residenz (New Palace), or Königsbau, and the Festbau, which may be considered as forming together with it one enormous mass of building, extending from the façade of the post-office on the south side of the Max-Joseph's Platz, to the old picture-gallery on the north side of the Hof-Garten and the end of Ludwig-Strasse.

The Königsbau begun in 1826, from the designs of Von Klenze, adjoins the Old Palace on the south, and forms the north side of the Max-Joseph's Platz, the east and south sides of which are occupied by the theatre and post-office respectively; while the centre is adorned with the splendid bronze monument of King Maximilian Joseph, a sitting colossal figure (modelled by Rauch) on a double pedestal, whose sides are covered with reliefs, and the lower one has the figure of a lion partly projecting from it at each angle. The façade of the Königsbau is 406 feet in length. In style and design the building presents a copy of the Pitti Palace at Florence. The ground-floor and that above it have each 28 arches in one continued line, of which the centre ones below are larger than the others, and form open entrances to the loggia or carriage vestibule. The third story rises above the rest of the elevation, it being only 11 windows in length, and has a balustraded terrace on each side of it, forming the flat roof above the remainder of the façade. If it be said in depreciation of this noble and imposing structure that the plan is not original, it may be safely affirmed that the interior is unequalled in its magnificent decorations; the refined taste of King Ludwig, and the frescoes, paintings, and sculptures of Schnorr, Zimmermann, Kaulbach, Schwanthaler, and other artists have contributed an ensemble of internal ornamentation unsurpassed out of the Vatican. The ground-floor contains the state apartments, the walls of which are covered with frescoes by Schnorr, the subjects being taken from the *Nibelungenlied*. The apartments on the first floor are occupied by the king and queen. The king's rooms are painted (both ceilings and walls) in encaustic, with subjects taken from the Greek poets, the friezes by Schwanthaler, representing scenes portrayed by Pindar. The subjects represented in the Queen's rooms are taken from the German poets. The floors all through the palace are formed with different coloured woods laid in patterns. The apartments on the second floor are used for court entertainments, among which is a ball-room, 62 feet long by 37 feet wide, and 27 feet high, with semi-circular ends, and adjoining it a Blumensaal, or Hall of Flowers, 68 feet long by 36 feet wide, opening to the terrace over the east end of the building.

The Festbau, also by Von Klenze, incloses the Old Palace on the north, as the Königsbau does on the south. It has a façade towards the Hofgarten (along the south side of which it extends about 800 feet in length) in the Roman style, with an Ionic colonnade in the centre, upon which are a series of allegorical figures by Schwanthaler. It contains state drawing-rooms, throne-room, banquetting-room, ball-room, several halls and apartments for the crown princes of Bavaria. The throne-room is adorned with colossal statues of electors and princes of Bavaria in bronze gilt. The ball-room is decorated with reliefs and paintings, representing Greek dances; the banquetting-room with battle scenes by Hess and Adam; the Hall of Beauties with statues of modern female beauties; and the three halls that precede the throne-room with large pictures descriptive of events in the lives of Charlemagne, Barbarossa, and Rudolf of Hapsburg, by Schnorr.

The Hofgarten is a planted square of about 1100 feet from east to west, and 700 feet from north to south. On the west side of it is the bazaar; on the east side a barrack; and on the north the old picture-gallery. The west side of the Hofgarten is lined throughout its whole extent by arcades, beneath which are cafés, shops, &c.; while the rest of the arcade which surrounds the square is decorated with a series of frescoes representing events in the annals of Bavaria, and with landscapes of remarkable places in Greece, Italy, Sicily, &c. These last are illustrated by verses ascribed to the pen of King Ludwig. The principal front of the bazaar, another of Von Klenze's productions, faces the Odeon-Platz, of which it forms the east side. It is in a simple but tasteful style of Italian architecture, with enriched panels between the larger arches of the ground-floor, and grouped windows above, consisting of lesser arches, whose archivolts rest upon Corinthian pilasters.

Along the north side of the Hofgarten extends the old Picture Gallery, arranged in a suite of rooms over another lengthened arcade. It is now appropriated to extensive collections of carvings in ivory, &c. All the choicest pictures are deposited in the Pinakothek, as also are the last of those from Schleissheim and the other royal collections, the total number of which is not less than 9000. The abundance of works of art in Munich is quite prodigious, and that not in painting alone, but in sculpture, as is testified by the collections in the Glyptothek.

The Glyptothek, or Sculpture Gallery, was erected by Von Klenze for King Ludwig. It is in the Greek style of architecture. The building is beautiful, standing with its south or principal front towards a large open space called the Königs-Platz, near the Basilica of St. Bonifacius in the north-west of the city. It is not more than about 220 feet square in plan, with a court in the centre. The façade has an Ionic portico, raised on three very deep gradini, or flights of steps, continued as a base along the whole front, like those in some of the ancient Greek temples. Eight columns are placed in front and the others

behind, in such manner as to form a second range of four columns and four antæ. It may be described technically therefore as consisting of an Ionic octastyle projecting before a tetrastyle in antis. The pediment is not filled with sculpture in relief, but recessed or hollowed so as to admit detached figures or statues (as in the temple of Ægina), exhibiting the various operations of the plastic arts, modelling, sculpture, carving, &c. The figures were executed by Schwanthaler, Haller, and others, but the composition was designed by Wagner. The interior is divided into a series of rooms, of which the two rotundas at the angles of the Königs-Platz are lighted from above, through lanterns and domes; the others by large semicircular or lunette windows, above their cornices, and towards the inner court. The first rooms, beginning with those on the left hand, or west side of the vestibule, are appropriated to Egyptian antiquities and other works of early art; to these succeed the Ægineten-Saal, or Hall of Ægina Marbles, the Apollo-Saal, the Bacchiden-Saal, and the Niobiden-Saal, which last is at the west angle of the north front, and is lighted by one of the two windows on that side of the building. The space between that and the corresponding angle is occupied by what are called the Fest-Saale, two large apartments whose walls are entirely covered with frescoes by Cornelius and his pupils. At the north-east is the Heroen-Saal, from which there is a descent into the Roman hall or gallery, the most spacious of all, and which exceeds the other sculpture-rooms in the splendour of its architecture. An ascent of steps at the farther end leads up into the Saal der Farbigen Bildwerke, or Hall of Coloured Sculptures, the rotunda at the south-east angle of the front, adjoining which is the hall of modern sculpture, containing Canova's Paris and Venus, and Thorwaldsen's Adonis. Near the Glyptothek is a temple used for the exhibition of modern works of art: it is proposed to unite the two structures by a propylæum.

The Pinakothek, another, and in some respects the best, of Von Klenze's works, is a much more extensive edifice than the Glyptothek. It stands in an open situation at no very great distance north-east from the Glyptothek, and in the immediate vicinity of the spacious infantry barracks. The first stone was laid April 7 (Raphael's birthday), 1826, by King Ludwig, and the building was completed in about ten years. Although each side of the building (which in plan resembles two Ts [—] joined), presents an architectural façade of uniform character, that facing the south may be considered the principal one. The lower portion consists of a very lofty ground-floor, with a series of arched windows within square-headed framings, surmounted by cornices, and resting upon a podium, formed by two courses of large rustics. In the centre of that side are eleven such windows on each side of the entrance porch, which consists of four Ionic columns, whose entablature supports a balcony in front of the three central arcades or windows of the loggia above. Along the upper floor the same order is continued throughout in half-columns against the piers of the arches between them, forming a long arcade or corridor, divided into 25 loggie or compartments. This order is crowned by a bold cantilever cornice and antefixe, terminating the elevation; for the attic does not rise immediately over the order, but is set back as far as the hinder wall of the loggia. On the lower floor, at the west end of the building, are a library, and rooms for collections of prints and drawings. The rest consists of rooms required for officers of the establishment. The larger rooms or halls in the centre are lighted from above; the height to the top of their lanterns is rather more than 50 feet. This height contributes greatly to architectural importance, and affords ample space for decoration above the cornice of the rooms, it also causes the light to fall upon the upper part of the walls themselves, so that the tops of the pictures have the light full upon them. Not only the ceiling but all the decorations of the rooms may be pronounced magnificent, and both the floors and the lower parts of the walls, are of Bavarian marble. The number of paintings is limited to 1500, consisting of the choicest works of the great masters, taken from all the collections belonging to the royal galleries of Bavaria. They are arranged in schools—Italian, French and Spanish, Dutch, Flemish, and German—in the large central halls before described, and in 25 adjoining small cabinets on the first floor. The halls communicate on one side with these cabinets and on the other with the loggie which anywhere else would be considered a museum and gallery of itself, forming a line of 400 feet in extent, decorated throughout with arabesques on its walls, with historical frescoes in the lunettes facing the arches, and with subjects in each of the small cupolas covering the 25 compartments of this long corridor. These frescoes, which have all some reference to the history of art, were designed by Cornelius and executed by Zimmermann and others. The north and south façades of the Pinakothek are also externally adorned with frescoes illustrative of the progress of art in Bavaria: between each window are colossal full-length portraits of Thorwaldsen, Von Klenze, Cornelius, Ohmüller, Hess, Gärtner, Schnorr, H. Hess, Rottmann, Ziebland, Schwanthaler, Schorn, Kaulbach, and Schrandolph.

The Allerheiligen-Kapelle (All Saints' Chapel), on the east side of the Residenz, another work of Von Klenze, was also begun in 1826. In its architectural character it does not resemble any other portion of the palace, being in the Byzantine or Lombardic style. It may be described as about 70 feet wide and as many high, exclusive of the lower portion on each side, covered with a half-gable, and whereby the entire width is increased to about 100 feet. Slender pilaster shaft

whose carved caps do not reach quite up to the corbelling of the gable, divide the façade into three compartments, the middle and widest of which contains a rich portal, with receding columns and arches, with a bas-relief in the lunette over the square-headed door, and a statue on each side of the canopy which crowns this entrance. Above it is a large rose window; and in each of the other compartments are two round-headed windows, one above the other. The body of the chapel is 105 feet in length within, exclusive of the apsis at its western extremity, which is elevated about 3 feet above the rest of the pavement, and gives about 20 feet more. This space consists of two square compartments of 30 feet, covered each by pendentives and a dome, and united by an intermediate narrower space. On each side these compartments have below three circular-headed arches on columns, opening into side aisles; and above as many windows of the same form, not immediately over the arches, but at the back of the upper recesses that cover the aisles below. Consequently the width in the upper part of the building is, in appearance at least, greatly extended. It is difficult to convey a distinct notion of the profuse and gorgeous yet solemn decorations of the whole interior: the pavements, walls, arches, pendentives, domes—all is embellishment; and all that is not marble or mosaic is painting and gold. The columns are of red Salzburg marble, with white bases and gilded capitals; the soles, or bottom of the walls, is also of red marble throughout; and the upper part to the height of the upper aisles is encrusted with different coloured marbles or scagliola. All the rest is entirely covered with fresco painting, upon a gold ground. The subjects were designed, and executed by Hess and his pupils; those of the first compartment and its cupola are symbolical of the events of the Old Testament; those of the other, of the New, while those introduced in the large intervening arch refer to the connection between the two. Many of the figures are colossal; those for instance, of the Redeemer and of the Deity behind the principal altar, which may be considered as the focus where the power of art is concentrated, the subjects here being illustrations of the Seven Sacraments. The building was consecrated and opened for service November 1, 1837.

On the south side of this magnificent chapel is what was formerly the Hof, or Court Theatre, but it is not now made use of as such, the larger and adjoining building on the south being now the principal theatre. This structure, which has a fine octastyle Corinthian portico painted in polychrome towards the Max-Joseph's Platz, was originally erected by Karl Fischer, and rebuilt according to the first design, after being burnt down in 1823. On the south side of the same square is the new façade of what was formerly the Döring Palace, but is now converted into the post-office. The length is 290 feet, the whole of which, exclusive of 32 feet at each side, is occupied by an open loggia of 13 arches, resting upon Doric columns, with as many windows above them, besides two in each of the end compartments, that is, one on the ground-floor and one above it. The whole is crowned by a cornice, with an enriched band or narrow frieze beneath it, the pattern of which is white upon a red ground; for this building also exhibits, to a certain extent, the application of polychromy. On the west side of the Odeon-Platz are the Odeon and Leuchtenberg Palace, whose opposite fronts towards the street that runs between them present two handsome and uniform façades in the Italian style, of two stories above the ground-floor, of 11 windows in each, and with a small Doric portico, or entrance porch, of 4 columns. The large concert- or ball-room, on the principal floor of the Odeon, is 124 feet by 71 feet, and 50 feet high. West of the Odeon is the Wittelsbacher-Platz, in which is a bronze statue of the elector Maximilian I., cast from the Turkish cannon taken in the Greek war, after a model by Thorwaldsen.

Northward from the Odeon-Platz runs the Ludwigs-Strasse, by far the handsomest and most regular street in Munich, having on its east side the Kriegs-Ministerium, the public library, and Ludwigs-Kirche; on its western side the Maximilian Palace, Blind Institute, &c.; it widens out at its northern end in a spacious quadrangle, on one side of which stretches the solemn white mass of the university buildings; on the other the pale stone-coloured, severe-looking Jesuits College; and terminates in the magnificent triumphal arch of the Sieges-Thor. The Maximilian Palace is a large insulated structure in the Italian style, of about 200 by 300 feet. The façade towards the Ludwigs-Strasse (206 feet) has three large arched doors in the centre, between four insulated Doric columns supporting a balcony, in front of the three centre windows above. On each side of this portal are five windows, which are round-headed within square dressings. Those of both the upper floors are square-headed, the first with pediments, the second without.

The next building, almost immediately opposite the preceding, is the Kriegs-Ministerium, or war-office, and is the work of the same architect (Von Klenze). The façade, 248 feet in length, is also in the Florentine style, and consists of a centre having seven large arcades, filled-in with door and windows on the ground-floor, and two stories above it, with two wings or lateral divisions, five windows in width, and a story lower. The spandrels of the seven arcades of the ground-floor are filled up with military trophies and armour, which mass of sculpture gives unusual richness and character to the whole. The building stands at the angle of the Schonfelds-Strasse, towards which street its south side presents a far more extensive and varied façade

(363 feet), uniform as to general style, but different as to composition, it being divided into a centre and two advanced wings, connected on each side by four arcades with windows in them, similar to those of the other front.

Immediately to the north of the Kriegs-Ministerium is the new public library and archive, whose lofty façade (495 feet in length) is a compound of the Florentine and Lombardic styles. The lower floor forms a massive rusticated basement, 44 feet high, with three portals in its centre. Each of the upper floors has 25 arched windows, and the whole is crowned with a cornice of very peculiar design. The library is capable of containing 2,000,000 of volumes; the number at present in it is variously estimated at 400,000 and 540,000 volumes; the number of manuscripts amounts to 22,000.

Nearly opposite the Ludwigs-Kirche are the Blind Institute and what is called the Damenstift (Ladies' College), two more of those extensive masses of building which give so much grandeur to this street. The former of these is upwards of 220 feet and the other 400 feet in length; both are by Gärtner, and both somewhat similar in style to the Public Library. The same may be said of the university buildings, at the northern extremity of this noble street, where they form a large quadrangle, into which the street itself runs. The Sieges-Thor (Gate of Victory), at the north end of the Ludwigs-Strasse, is a triumphal arch designed by Gärtner in imitation of the Arch of Constantine in Rome, and dedicated to the Bavarian army. It is built of Regensburg stone, and embellished with medallions and bas-reliefs executed in Carrara marble. The masonry for solidity and beauty is unsurpassed in Europe. The six medallions are symbolical of the Bavarian provinces; the bas-reliefs represent battles, sieges, and the passage of a river. Four Winged Victories in Carrara marble, and of the noblest forms and proportions, rise on either side of the gate before the pediment, which is supported by four Corinthian pilasters. Two Flying Victories, with wreaths and palms, are sculptured over the central arch. The whole is surmounted by a figure of Bavaria seated in a triumphal car drawn by four lions. This gate was opened on October 15, 1850.

The Isar-Thor, one of the old gate-entrances of the city, has been restored and decorated with a fine fresco, representing the return of Lewis the Bavarian after his victory at Mühlhof. In the Schranren-Platz, in the old town, stands a pillar to commemorate the victory of the Bavarians and Austrians over the Elector Palatine, near Prag. A bronze obelisk, 100 feet high, is erected in the circus called Carolinen-Platz, between the Botanic Garden and the Pinakothek, in memory of the 30,000 Bavarians who fell in the Russian campaign of 1812.

Among the other public buildings of Munich must be mentioned—the General Hospital (Krankenhaus), which stands in extensive grounds to the south-west of the town, outside the Sendlinger Gate; the Isar Bridge; the Synagogue; the General Prison, in the Au suburb; the Riding School, cavalry and infantry barracks; the Royal Porcelain manufactory, in the Kaufinger-Gasse, where the painting of glass is carried on extensively, &c. &c.

It remains to mention the spacious Friedhof, or public cemetery, which lies a little east of the Krankenhaus; the Theresien-Wiese, to the south-west of the town, and the beautiful park to the north-east of the city, and called the English Garden. The English Garden, situated to the north-east of the city, is laid out with plantations, intersected by streams of water, and embellished with statues and various ornamental buildings, the most remarkable of which is the circular monopteros of twelve Ionic columns, erected in 1833, as a monumental temple in honour of the elector Karl Theodore, the founder of the garden; it is remarkable as exhibiting the first modern application of polychromy, the capitals of the columns and the mouldings of the entablature being enriched with various colours painted in encaustic. The Friedhof has at its southern extremity an extensive range of building, consisting of a chapel and range of arcades, disposed in the form of a crescent about 550 feet in diameter. In the Theresien-Wiese (Theresian Meadow) a kind of people's festival is held, commencing on the first Sunday in October. There is a cattle show; and there are pony races, athletic games, and rifle-shooting matches; the king attends and gives prizes to the successful competitors. A high sloping natural bank, which runs along one side of the meadow, is cut into steps like a Roman amphitheatre, for the convenience of spectators, and commands the whole varied scene, to which the villages far and near send bands of peasants in native costume and headed by their respective banners.

On the natural terrace just mentioned, which rises above the plain on which the city stands, is the Ruhmes-Halle (Hall of Fame), a beautiful doric structure of white marble, adorned with emblematic friezes by Schwanthaler. It was designed by Von Klenze; busts of all the great men that Bavaria has produced are to be arranged along its walls. Right in front of this beautiful temple, and dwarfing it into insignificance by her gigantic proportions, rises Schwanthaler's colossal statue of Bavaria, with a majestic lion by her side, and holding out the wreath, or crown, of reward to any who may be worthy to enter the temple. The statue, which represents a Titanic virgin of calm majestic beauty, is 54 feet high, and stands on a granite pedestal 30 feet high. It is cast from Turkish cannon sunk at the battle of Navarino, and brought up by Greek divers. A winding staircase ascends the interior to a chamber in the head, large enough to contain

28 persons. In the bust of the figure are 20 tons of bronze. The statue was cast at the bronze foundry of Stiglmayer in the Nymphenburg road, about a mile from the city, between 1844 and 1848, by Ferdinand Miller, Stiglmayer's nephew. The statue was unveiled during the people's festival of October 1850, in the presence of the ex-king Ludwig, his two sons, the kings of Bavaria and Greece, the king of Saxony, and a vast concourse of people.

MUNSTER, one of the four provinces into which Ireland is divided. It comprehends the southern part of the island, and is bounded N. by the province of Connaught, E. by the province of Leinster, S. and W. by the Atlantic Ocean. It lies between 51° 25' and 53° 12' N. lat., and 6° 56' and 10° 32' W. long.

The general character of the surface is mountainous. Along the coast are the excellent harbours of Waterford, Dungarvan, Youghal, Cork, Kinsale, and Tralee, which are generally formed by the estuaries of rivers. Next to the Shannon the chief rivers are the Suir, the Blackwater, the Lee, and the Bandon, all of which, except the Suir, in the upper part of its course, have a general direction from west to east. The principal lakes are those of Killarney, which are much resorted to for the picturesque beauties of the surrounding scenery. The bogs are neither so numerous nor so extensive as in most other parts of Ireland. The province is divided into the six counties of CLARE, CORK, KERRY, LIMERICK, TIPPERARY, and WATERFORD, to the separate articles on which we refer for further information. For ecclesiastical purposes Munster is nearly coincident with the archiepiscopal province of Cashel, which by the Act 3 and 4 Wil IV. cap. 37, was united to that of Dublin. It contains the united dioceses of Cashel, Emly, Waterford, and Lismore; Cork and Ross; Cloyne, Limerick, Ardfer, and Aghadoe; with Killaloe and Kilfenora of the united dioceses of Killaloe, Kilfenora, Clonfert, and Kilmacduagh.

The chief Anglo-Norman families who settled in Munster were the Fitz-Thomases, earls of Desmond; the Butlers, earls of Ormond; the Geraldines, Barrys, Roches, and Cogan. South Munster was divided into counties in the reign of Henry VIII. Thomond (Clare County) was made shire-ground with Connaught in the 11th year of Elizabeth's reign. It was added to Munster in 1601, but continued till 1792 in the Connaught circuit. During the rebellions of the time of Elizabeth, Munster was governed by a President under the Lord Deputy of Ireland.

The population of the counties and cities in Munster province at the four decennial periods of 1821, 1831, 1841, and 1851, with the area of each, will be found in the article IRELAND.

MUNSTER, NEW. [ZEALAND, NEW.]

MUNSTER, the most north-western of the three governments into which the Prussian province of Westphalia is divided, is bounded N. by Hanover, E. by Minden, S. by Arensburg and the Rhein-provins, and W. by the Netherlands. Its area is 2797 square miles, and the population in 1846 was 421,044, about 9-10ths of whom are Catholics. The government presents a surface diversified by mountains, hills, and plains; the northern part is drained by the Ems, and the southern districts by the Lippe, a feeder of the Rhine. The Teutoburgerwald range runs north-west across the territory of Münster, forming part of the watershed between the Ems and the Weser. The country is not very productive in corn; flax and hemp are the chief products. Linen is the staple manufacture. Swine are very numerous. This government comprises a large portion of the former prince-bishopric of Münster, of which Hanover and Oldenburg got the rest. A railway runs south from the city of Münster, and joins the Cologne-Minden line at Hamm.

Münster, the capital of Westphalia, and of the government of Münster, situated on the river Ahe, in 51° 58' N. lat., 7° 36' E. long., in a flat country, about 200 feet above the level of the sea, is a tolerably well built commercial and manufacturing town, with about 21,000 inhabitants. The streets are broad; the houses lofty, but neither uniformly nor regularly built. The fortifications were dismantled in 1765 but the ramparts remain, which are planted with lime-trees and form a fine promenade round the town. Of the public buildings the most worthy of notice are—the cathedral, which contains the tomb of Bishop Galen who recovered the city from the Anabaptists; the church of St. Lambert, built in the finest gothic style; the palace of the bishop, which occupies the site of the old citadel; the senate-house; and the mansions of several of the nobility. John of Leyden with a few adherents threw himself, in 1536, into Münster, which he resolutely defended against the bishop. The town however was taken by storm and John and two of his followers were put to a violent death, and their remains were exposed on the tower of St. Lambert's church in iron baskets which still hang there. The town has a Catholic ecclesiastical college, which has faculties of theology and philosophy; a Catholic gymnasium with 21 professors and 625 pupils (in 1850), and a library of about 80,000 volumes; surgical and veterinary schools, a botanical garden, a school for deaf-mutes; and manufactures of woollen-cloths, leather, starch, &c. The city is the seat of all the great offices of the province of Westphalia. The trade in linens, woollens, yarn, Rhenish wine, hams, &c., is very considerable. Münster is celebrated on account of the peace concluded in it October 24, 1648, which put an end to the Thirty Years War. It was founded at the end of the 6th century and called Meiland and about a century after Miningerode. In 972 it was taken by Charle-

magne, in whose time the bishopric was founded and a monastery built, whence the name of Münster is derived. A navigable canal connects Münster with the Ems; and a railroad 21 miles in length unites it to the Hamm station on the Köln-Minden line.

Bocholt, on the Aa, about 45 miles W. from Münster, has a castle, belonging to the princes of Salm-Salm, manufactures of woollens, cotton, silk, hosiery, spirits, soap, and a population of 4800. There are extensive iron-works in the vicinity of the town. At Anholt, a small town near Bocholt, is the principal residence of the prince of Salm-Salm. [ANHOLT.] Borcken, S.W. of Münster, on the Aa, has 3000 inhabitants, who manufacture linen, broadcloth, serge, and chicory. Kösfeld, 20 miles W. from Münster, on the Berkel, is surrounded by old fortifications, and defended by a castle; the manufactures are linen and woollen cloth. It has a population of 3500, and a Catholic gymnasium with 12 teachers and 150 scholars (in 1850). Kösfeld is the residence of the Horstmar branch of the house of Salm. Recklinghausen, formerly the capital of a circle, is situated on the Lippe, about 30 miles S.W. from Münster, on the slope of the Hard Mountain, and has an old ducal residence, two churches, an asylum for females of noble birth, some linen manufactures, steel-works, and about 3000 inhabitants. There is a Catholic gymnasium in the town, which had 10 teachers and 130 students in 1850. Recklinghausen was formerly the capital of a small sovereign county, 301 square miles in extent, which belonged to the Duke of Arenberg; the duke is still the proprietor but the sovereignty vests in the king of Prussia. Steinfurt, N.W. of Münster, a residence of the princes of Bentheim, has a population of 2700, who manufacture linen and leather. Warendorf, E. of Münster, on the Ems, has a gymnasium, a mad-house, several bleach-works, an important linen market, and 4200 inhabitants, who manufacture linen and broadcloth.

MUNONIO-ELF. [BOTENIA.]

MUR. [CÔTES-DU-NORD.]

MUR-DE-BARREZ. [AVEYRON.]

MURAT. [CANTAL.]

MURCIA, an ancient province of Spain, formerly a kingdom, is bounded S. by the Mediterranean Sea and the province of Granada, N. and N.W. by Castilla la Nueva, E. and N.E. by the Mediterranean Sea and the province of Valencia, W. by the province of Jaen, and S.W. by the province of Granada. It is situated between 37° 23' and 39° 16' N. lat., 40' and 3° 8' W. long. The greatest length from north to south is about 130 miles, the greatest width from east to west is about 110 miles. The area is 7877 square miles. The population in 1849 was 595,531. It is divided into the two following modern provinces:—

Provinces.	Area in Square Miles.	Population in 1849.
Murcia	7,877	400,000
Albacete		195,531
Total	7,877	595,531

Surface.—The form of Murcia is very irregular, and the boundaries are for the most part conventional. Only at the extreme western angle the Rio Guadarmena forms a natural line of separation between Murcia and the provinces of La Mancha and Jaen. The modern province of Albacete comprises the interior or north-western part of the old province; the modern province of Murcia comprises the south-eastern portion, or that next the coast, the line of division between the two being formed by the summit level of the Sierra de Sagra extended along the line of the sierras of Jumella, Yecla, and Villena.

The coast from the boundary of Granada as far as Cartagena presents a series of steep and elevated cliffs; eastward from that part to the Cabo de Palos the coast is low and sandy, the cape itself being the termination of a ridge of hills from the interior; northward of the Cabo de Palos is a shallow land-locked sea-lagune called the Encañizada de Murcia. The Sierra de Sagra, interrupted by the valley of the Rio Mundo, may be said to extend under different names from south-west to north-east through the centre of the province, forming a natural line of division between the two modern provinces. The Sierra de Alcaraz crosses the western corner of the province, extends through a part of La Mancha, and again enters Murcia near Chinchilla, filling up the north-western angle. The Sierra de Segura crosses the province between the Sierra de Alcaraz and the Sierra de Sagra; all these mountain ridges being in fact offsets from the eastern end of the great chain of the Sierra Morena. Another series of mountains extends from the province of Granada, south of the town of Lorca, to Cartagena, and this series includes the great mining district of Murcia. Other mountain groups cross the province in various directions, separated from each other by extensive valleys and a few level tracts. The only plain of considerable extent lies between Cartagena and Orihuela, and this plain is divided into two portions by a chain of sandstone hills on the southern side of the Sangonera. The Sierra de Segura is a mass of gray and white limestone, and most of the other mountain ranges belong to the same formation. Trachyte and other volcanic rocks occur at Almazarron; and here and in the mountains south of Lorca the mining operations are chiefly carried on. Porphyry, greenstone, primary slates, fine

whose carved caps do not reach quite up to the corbelling of the gable, divide the façade into three compartments, the middle and widest of which contains a rich portal, with receding columns and arches, with a bas-relief in the lunette over the square-headed door, and a statue on each side of the canopy which crowns this entrance. Above it is a large rose window; and in each of the other compartments are two round-headed windows, one above the other. The body of the chapel is 105 feet in length within, exclusive of the apsis at its western extremity, which is elevated about 3 feet above the rest of the pavement, and gives about 20 feet more. This space consists of two square compartments of 30 feet, covered each by pendentives and a dome, and united by an intermediate narrower space. On each side these compartments have below three circular-headed arches on columns, opening into side aisles; and above as many windows of the same form, not immediately over the arches, but at the back of the upper recesses that cover the aisles below. Consequently the width in the upper part of the building is, in appearance at least, greatly extended. It is difficult to convey a distinct notion of the profuse and gorgeous yet solemn decorations of the whole interior: the pavements, walls, arches, pendentives, domes—all is embellishment; and all that is not marble or mosaic is painting and gold. The columns are of red Salzburg marble, with white bases and gilded capitals; the soles, or bottom of the walls, is also of red marble throughout; and the upper part to the height of the upper aisles is encrusted with different coloured marbles or scagliola. All the rest is entirely covered with fresco painting, upon a gold ground. The subjects were designed, and executed by Hess and his pupils; those of the first compartment and its cupola are symbolical of the events of the Old Testament; those of the other, of the New, while those introduced in the large intervening arch refer to the connection between the two. Many of the figures are colossal; those for instance, of the Redeemer and of the Deity behind the principal altar, which may be considered as the focus where the power of art is concentrated, the subjects here being illustrations of the Seven Sacraments. The building was consecrated and opened for service November 1, 1837.

On the south side of this magnificent chapel is what was formerly the Hof, or Court Theatre, but it is not now made use of as such, the larger and adjoining building on the south being now the principal theatre. This structure, which has a fine octastyle Corinthian portico painted in polychrome towards the Max-Joseph's Platz, was originally erected by Karl Fischer, and rebuilt according to the first design, after being burnt down in 1823. On the south side of the same square is the new façade of what was formerly the Döring Palace, but is now converted into the post-office. The length is 290 feet, the whole of which, exclusive of 32 feet at each side, is occupied by an open loggia of 13 arches, resting upon Doric columns, with as many windows above them, besides two in each of the end compartments, that is, one on the ground-floor and one above it. The whole is crowned by a cornice, with an enriched band or narrow frieze beneath it, the pattern of which is white upon a red ground; for this building also exhibits, to a certain extent, the application of polychromy. On the west side of the Odeon-Platz are the Odeon and Leuchtenberg Palace, whose opposite fronts towards the street that runs between them present two handsome and uniform façades in the Italian style, of two stories above the ground-floor, of 11 windows in each, and with a small Doric portico, or entrance porch, of 4 columns. The large concert- or ball-room, on the principal floor of the Odeon, is 124 feet by 71 feet, and 50 feet high. West of the Odeon is the Wittelsbacher-Platz, in which is a bronze statue of the elector Maximilian I., cast from the Turkish cannon taken in the Greek war, after a model by Thorwaldsen.

Northward from the Odeon-Platz runs the Ludwigs-Strasse, by far the handsomest and most regular street in Munich, having on its east side the Kriegs-Ministerium, the public library, and Ludwigs-Kirche; on its western side the Maximilian Palace, Blind Institute, &c.; it widens out at its northern end in a spacious quadrangle, on one side of which stretches the solemn white mass of the university buildings; on the other the pale stone-coloured, severe-looking Jesuits College; and terminates in the magnificent triumphal arch of the Sieges-Thor. The Maximilian Palace is a large insulated structure in the Italian style, of about 200 by 300 feet. The façade towards the Ludwigs-Strasse (208 feet) has three large arched doors in the centre, between four insulated Doric columns supporting a balcony, in front of the three centre windows above. On each side of this portal are five windows, which are round-headed within square dressings. Those of both the upper floors are square-headed, the first with pediments, the second without.

The next building, almost immediately opposite the preceding, is the Kriegs-Ministerium, or war-office, and is the work of the same architect (Von Klense). The façade, 248 feet in length, is also in the Florentine style, and consists of a centre having seven large arcades, filled-in with door and windows on the ground-floor, and two stories above it, with two wings or lateral divisions, five windows in width, and a story lower. The spandrels of the seven arcades of the ground-floor are filled up with military trophies and armour, which mass of sculpture gives unusual richness and character to the whole. The building stands at the angle of the Schonfelds-Strasse, towards which street its south side presents a far more extensive and varied façade

(363 feet), uniform as to general style, but different as to composition, it being divided into a centre and two advanced wings, connected on each side by four arcades with windows in them, similar to those of the other front.

Immediately to the north of the Kriegs-Ministerium is the new public library and archive, whose lofty façade (495 feet in length) is a compound of the Florentine and Lombardic styles. The lower floor forms a massive rusticated basement, 44 feet high, with three portals in its centre. Each of the upper floors has 25 arched windows, and the whole is crowned with a cornice of very peculiar design. The library is capable of containing 2,000,000 of volumes; the number at present in it is variously estimated at 400,000 and 540,000 volumes; the number of manuscripts amounts to 22,000.

Nearly opposite the Ludwigs-Kirche are the Blind Institute and what is called the Damenstift (Ladies' College), two more of those extensive masses of building which give so much grandeur to this street. The former of these is upwards of 220 feet and the other 400 feet in length; both are by Gärtner, and both somewhat similar in style to the Public Library. The same may be said of the university buildings, at the northern extremity of this noble street, where they form a large quadrangle, into which the street itself runs. The Sieges-Thor (Gate of Victory), at the north end of the Ludwigs-Strasse, is a triumphal arch designed by Gärtner in imitation of the Arch of Constantine in Rome, and dedicated to the Bavarian army. It is built of Regensburg stone, and embellished with medallions and bas-reliefs executed in Carrara marble. The masonry for solidity and beauty is unsurpassed in Europe. The six medallions are symbolical of the Bavarian provinces; the bas-reliefs represent battles, sieges, and the passage of a river. Four Winged Victories in Carrara marble, and of the noblest forms and proportions, rise on either side of the gate before the pediment, which is supported by four Corinthian pilasters. Two Flying Victories, with wreaths and palms, are sculptured over the central arch. The whole is surmounted by a figure of Bavaria seated in a triumphal car drawn by four lions. This gate was opened on October 15, 1850.

The Isar-Thor, one of the old gate-entrances of the city, has been restored and decorated with a fine fresco, representing the return of Lewis the Bavarian after his victory at Mühlthorf. In the Schranzen-Platz, in the old town, stands a pillar to commemorate the victory of the Bavarians and Austrians over the Elector Palatine, near Prag. A bronze obelisk, 100 feet high, is erected in the circus called Carolinen-Platz, between the Botanic Garden and the Pinakothek, in memory of the 30,000 Bavarians who fell in the Russian campaign of 1812.

Among the other public buildings of Munich must be mentioned—the General Hospital (Krankenhaus), which stands in extensive grounds to the south-west of the town, outside the Sendlinger Gate; the Isar Bridge; the Synagogue; the General Prison, in the Au suburb; the Riding School, cavalry and infantry barracks; the Royal Porcelain manufactory, in the Kaufinger-Gasse, where the painting of glass is carried on extensively, &c. &c.

It remains to mention the spacious Friedhof, or public cemetery, which lies a little east of the Krankenhaus; the Theresien-Wiese, to the south-west of the town, and the beautiful park to the north-east of the city, and called the English Garden. The English Garden, situated to the north-east of the city, is laid out with plantations, intersected by streams of water, and embellished with statues and various ornamental buildings, the most remarkable of which is the circular monoperos of twelve Ionic columns, erected in 1833, as a monumental temple in honour of the elector Karl Theodore, the founder of the garden; it is remarkable as exhibiting the first modern application of polychromy, the capitals of the columns and the mouldings of the entablature being enriched with various colours painted in encaustic. The Friedhof has at its southern extremity an extensive range of building, consisting of a chapel and range of arcades, disposed in the form of a crescent about 550 feet in diameter. In the Theresien-Wiese (Theresian Meadow) a kind of people's festival is held, commencing on the first Sunday in October. There is a cattle show; and there are pony races, athletic games, and rifle-shooting matches; the king attends and gives prizes to the successful competitors. A high sloping natural bank, which runs along one side of the meadow, is cut into steps like a Roman amphitheatre, for the convenience of spectators, and commands the whole varied scene, to which the villages far and near send bands of peasants in native costume and headed by their respective banners.

On the natural terrace just mentioned, which rises above the plain on which the city stands, is the Ruhmes-Halle (Hall of Fame), a beautiful doric structure of white marble, adorned with emblematic friezes by Schwanthaler. It was designed by Von Klense; busts of all the great men that Bavaria has produced are to be arranged along its walls. Right in front of this beautiful temple, and dwarfing it into insignificance by her gigantic proportions, rises Schwanthaler's colossal statue of Bavaria, with a majestic lion by her side, and holding out the wreath, or crown, of reward to any who may be worthy to enter the temple. The statue, which represents a Titanic virgin of calm majestic beauty, is 54 feet high, and stands on a granite pedestal 30 feet high. It is cast from Turkish cannon sunk at the battle of Navarino, and brought up by Greek divers. A winding staircase ascends the interior to a chamber in the head, large enough to contain

28 persons. In the bust of the figure are 20 tons of bronze. The statue was cast at the bronze foundry of Stiglmayer in the Nymphenburg road, about a mile from the city, between 1844 and 1848, by Ferdinand Miller, Stiglmayer's nephew. The statue was unveiled during the people's festival of October 1850, in the presence of the ex-king Ludwig, his two sons, the kings of Bavaria and Greece, the king of Saxony, and a vast concourse of people.

MUNSTER, one of the four provinces into which Ireland is divided. It comprehends the southern part of the island, and is bounded N. by the province of Connaught, E. by the province of Leinster, S. and W. by the Atlantic Ocean. It lies between 51° 25' and 53° 12' N. lat., and 6° 56' and 10° 32' W. long.

The general character of the surface is mountainous. Along the coast are the excellent harbours of Waterford, Dungarvan, Youghal, Cork, Kinsale, and Tralee, which are generally formed by the estuaries of rivers. Next to the Shannon the chief rivers are the Suir, the Blackwater, the Lee, and the Bandon, all of which, except the Suir, in the upper part of its course, have a general direction from west to east. The principal lakes are those of Killarney, which are much resorted to for the picturesque beauties of the surrounding scenery. The bogs are neither so numerous nor so extensive as in most other parts of Ireland. The province is divided into the six counties of CLARE, CORK, KERRY, LIMERICK, TIPPERARY, and WATERFORD, to the separate articles on which we refer for further information. For ecclesiastical purposes Munster is nearly coincident with the archiepiscopal province of Cashel, which by the Act 3 and 4 Wil. IV. cap. 37, was united to that of Dublin. It contains the united dioceses of Cashel, Emly, Waterford, and Lismore; Cork and Ross; Cloyne, Limerick, Ardfer, and Aghadoe; with Killaloe and Kilfenora of the united dioceses of Killaloe, Kilfenora, Clonfert, and Kilmacduagh.

The chief Anglo-Norman families who settled in Munster were the Fitz-Thomases, earls of Desmond; the Butlers, earls of Ormond; the Geraldines, Barrys, Roches, and Crogans. South Munster was divided into counties in the reign of Henry VIII. Thomond (Clare County) was made shire-ground with Connaught in the 11th year of Elizabeth's reign. It was added to Munster in 1601, but continued till 1792 in the Connaught circuit. During the rebellions of the time of Elizabeth, Munster was governed by a President under the Lord Deputy of Ireland.

The population of the counties and cities in Munster province at the four decennial periods of 1821, 1831, 1841, and 1851, with the area of each, will be found in the article IRELAND.

MUNSTER, NEW. [ZEALAND, NEW.]

MUNSTER, the most north-western of the three governments into which the Prussian province of Westphalia is divided, is bounded N. by Hanover, E. by Minden, S. by Arensburg and the Rhein-province, and W. by the Netherlands. Its area is 2797 square miles, and the population in 1846 was 421,044, about 9-10ths of whom are Catholics. The government presents a surface diversified by mountains, hills, and plains; the northern part is drained by the Ems, and the southern districts by the Lippe, a feeder of the Rhine. The Teutoburgerwald range runs north-west across the territory of Münster, forming part of the watershed between the Ems and the Weser. The country is not very productive in corn; flax and hemp are the chief products. Linen is the staple manufacture. Swine are very numerous. This government comprises a large portion of the former prince-bishopric of Münster, of which Hanover and Oldenburg got the rest. A railway runs south from the city of Münster, and joins the Cologne-Minden line at Hamm.

Münster, the capital of Westphalia, and of the government of Münster, situated on the river Ahe, in 51° 58' N. lat., 7° 36' E. long., in a flat country, about 200 feet above the level of the sea, is a tolerably well built commercial and manufacturing town, with about 21,000 inhabitants. The streets are broad; the houses lofty, but neither uniformly nor regularly built. The fortifications were dismantled in 1765 but the ramparts remain, which are planted with lime-trees and form a fine promenade round the town. Of the public buildings the most worthy of notice are—the cathedral, which contains the tomb of Bishop Galen who recovered the city from the Anabaptists; the church of St. Lambert, built in the finest gothic style; the palace of the bishop, which occupies the site of the old citadel; the senate-house; and the mansions of several of the nobility. John of Leyden with a few adherents threw himself, in 1536, into Münster, which he resolutely defended against the bishop. The town however was taken by storm and John and two of his followers were put to a violent death, and their remains were exposed on the tower of St. Lambert's church in iron baskets which still hang there. The town has a Catholic ecclesiastical college, which has faculties of theology and philosophy; a Catholic gymnasium with 21 professors and 625 pupils (in 1850), and a library of about 30,000 volumes; surgical and veterinary schools, a botanical garden, a school for deaf-mutes; and manufactures of woollen-cloths, leather, starch, &c. The city is the seat of all the great offices of the province of Westphalia. The trade in linens, woollens, yarn, Rhenish wine, hams, &c., is very considerable. Münster is celebrated on account of the peace concluded in it October 24, 1648, which put an end to the Thirty Years War. It was founded at the end of the 6th century and called Meiland and about a century after Miningerode. In 972 it was taken by Charle-

magne, in whose time the bishopric was founded and a monastery built, whence the name of Münster is derived. A navigable canal connects Münster with the Ems; and a railroad 21 miles in length unites it to the Hamm station on the Köln-Minden line.

Bocholt, on the Aa, about 45 miles W. from Münster, has a castle, belonging to the princes of Salm-Salm, manufactures of woollens, cotton, silk, hosiery, spirits, soap, and a population of 4800. There are extensive iron-works in the vicinity of the town. At Anholt, a small town near Bocholt, is the principal residence of the prince of Salm-Salm. [ANHOLT.] Borcken, S.W. of Münster, on the Aa, has 3000 inhabitants, who manufacture linen, broadcloth, serge, and chicory. Kösfeld, 20 miles W. from Münster, on the Berkel, is surrounded by old fortifications, and defended by a castle; the manufactures are linen and woollen cloth. It has a population of 3500, and a Catholic gymnasium with 12 teachers and 150 scholars (in 1850). Kösfeld is the residence of the Horstmar branch of the house of Salm. Recklinghausen, formerly the capital of a circle, is situated on a circle, about 30 miles S.W. from Münster, on the slope of the Hard Mountain, and has an old ducal residence, two churches, an asylum for females of noble birth, some linen manufactures, steel-works, and about 3000 inhabitants. There is a Catholic gymnasium in the town, which had 10 teachers and 130 students in 1850. Recklinghausen was formerly the capital of a small sovereign county, 301 square miles in extent, which belonged to the Duke of Arenberg; the duke is still the proprietor but the sovereignty vests in the king of Prussia. Steinfurt, N.W. of Münster, a residence of the princes of Bentheim, has a population of 2700, who manufacture linen and leather. Warendorf, E. of Münster, on the Ems, has a gymnasium, a mad-house, several bleach-works, an important linen market, and 4200 inhabitants, who manufacture linen and broadcloth.

MUONIO-ELF. [BOTHNIA.]

MUR. [CÔTES-DU-NORD.]

MUR-DE-BARREZ. [AVEYRON.]

MURAT. [CANTAL.]

MURCIA, an ancient province of Spain, formerly a kingdom, is bounded S. by the Mediterranean Sea and the province of Granada, N. and N.W. by Castilla la Nueva, E. and N.E. by the Mediterranean Sea and the province of Valencia, W. by the province of Jaen, and S.W. by the province of Granada. It is situated between 37° 23' and 39° 16' N. lat., 40' and 3° 8' W. long. The greatest length from north to south is about 130 miles, the greatest width from east to west is about 110 miles. The area is 7877 square miles. The population in 1849 was 595,531. It is divided into the two following modern provinces:—

Provinces.	Area in Square Miles.	Population in 1849.
Murcia	7,877	400,000
Albacete		185,531
Total	7,877	595,531

Surface.—The form of Murcia is very irregular, and the boundaries are for the most part conventional. Only at the extreme western angle the Rio Guadarmena forms a natural line of separation between Murcia and the provinces of La Mancha and Jaen. The modern province of Albacete comprises the interior or north-western part of the old province; the modern province of Murcia comprises the south-eastern portion, or that next the coast, the line of division between the two being formed by the summit level of the Sierra de Sagra extended along the line of the sierras of Jumella, Yecla, and Villena.

The coast from the boundary of Granada as far as Cartagena presents a series of steep and elevated cliffs; eastward from that port to the Cabo de Palos the coast is low and sandy, the cape itself being the termination of a ridge of hills from the interior; northward of the Cabo de Palos is a shallow land-locked sea-lagune called the Encañizada de Murcia. The Sierra de Sagra, interrupted by the valley of the Rio Mundo, may be said to extend under different names from south-west to north-east through the centre of the province, forming a natural line of division between the two modern provinces. The Sierra de Alcaraz crosses the western corner of the province, extends through a part of La Mancha, and again enters Murcia near Chinchilla, filling up the north-western angle. The Sierra de Segura crosses the province between the Sierra de Alcaraz and the Sierra de Sagra; all these mountain ridges being in fact offsets from the eastern end of the great chain of the Sierra Morena. Another series of mountains extends from the province of Granada, south of the town of Lorca, to Cartagena, and this series includes the great mining district of Murcia. Other mountain groups cross the province in various directions, separated from each other by extensive valleys and a few level tracts. The only plain of considerable extent lies between Cartagena and Orihuela, and this plain is divided into two portions by a chain of sandstone hills on the southern side of the Sangonera. The Sierra de Segura is a mass of gray and white limestone, and most of the other mountain ranges belong to the same formation. Trachyte and other volcanic rocks occur at Almazarron; and here and in the mountains south of Lorca the mining operations are chiefly carried on. Porphyry, greenstone, primary alates, fine

whose carved caps do not reach quite up to the corbelling of the gable, divide the façade into three compartments, the middle and widest of which contains a rich portal, with receding columns and arches, with a bas-relief in the lunette over the square-headed door, and a statue on each side of the canopy which crowns this entrance. Above it is a large rose window; and in each of the other compartments are two round-headed windows, one above the other. The body of the chapel is 105 feet in length within, exclusive of the apsis at its western extremity, which is elevated about 3 feet above the rest of the pavement, and gives about 20 feet more. This space consists of two square compartments of 30 feet, covered each by pendentives and a dome, and united by an intermediate narrower space. On each side these compartments have below three circular-headed arches on columns, opening into side aisles; and above as many windows of the same form, not immediately over the arches, but at the back of the upper recesses that cover the aisles below. Consequently the width in the upper part of the building is, in appearance at least, greatly extended. It is difficult to convey a distinct notion of the profuse and gorgeous yet solemn decorations of the whole interior: the pavements, walls, arches, pendentives, domes—all is embellishment; and all that is not marble or mosaic is painting and gold. The columns are of red Salzburg marble, with white bases and gilded capitals; the soles, or bottom of the walls, is also of red marble throughout; and the upper part to the height of the upper aisles is encrusted with different coloured marbles or scagliola. All the rest is entirely covered with fresco painting, upon a gold ground. The subjects were designed, and executed by Hess and his pupils; those of the first compartment and its cupola are symbolical of the events of the Old Testament; those of the other, of the New, while those introduced in the large intervening arch refer to the connection between the two. Many of the figures are colossal; those for instance, of the Redeemer and of the Deity behind the principal altar, which may be considered as the focus where the power of art is concentrated, the subjects here being illustrations of the Seven Sacraments. The building was consecrated and opened for service November 1, 1837.

On the south side of this magnificent chapel is what was formerly the Hof, or Court Theatre, but it is not now made use of as such, the larger and adjoining building on the south being now the principal theatre. This structure, which has a fine octastyle Corinthian portico painted in polychrome towards the Max-Joseph's Platz, was originally erected by Karl Fischer, and rebuilt according to the first design, after being burnt down in 1823. On the south side of the same square is the new façade of what was formerly the Döring Palace, but is now converted into the post-office. The length is 290 feet, the whole of which, exclusive of 32 feet at each side, is occupied by an open loggia of 13 arches, resting upon Doric columns, with as many windows above them, besides two in each of the end compartments, that is, one on the ground-floor and one above it. The whole is crowned by a cornice, with an enriched band or narrow frieze beneath it, the pattern of which is white upon a red ground; for this building also exhibits, to a certain extent, the application of polychromy. On the west side of the Odeon-Platz are the Odeon and Leuchtenberg Palace, whose opposite fronts towards the street that runs between them present two handsome and uniform façades in the Italian style, of two stories above the ground-floor, of 11 windows in each, and with a small Doric portico, or entrance porch, of 4 columns. The large concert- or ball-room, on the principal floor of the Odeon, is 124 feet by 71 feet, and 50 feet high. West of the Odeon is the Wittelsbacher-Platz, in which is a bronze statue of the elector Maximilian I., cast from the Turkish cannon taken in the Greek war, after a model by Thorwaldsen.

Northward from the Odeon-Platz runs the Ludwigs-Strasse, by far the handsomest and most regular street in Munich, having on its east side the Kriegs-Ministerium, the public library, and Ludwigs-Kirche; on its western side the Maximilian Palace, Blind Institute, &c.; it widens out at its northern end in a spacious quadrangle, on one side of which stretches the solemn white mass of the university buildings; on the other the pale stone-coloured, severe-looking Jesuits College; and terminates in the magnificent triumphal arch of the Sieges-Thor. The Maximilian Palace is a large insulated structure in the Italian style, of about 200 by 300 feet. The façade towards the Ludwigs-Strasse (206 feet) has three large arched doors in the centre, between four insulated Doric columns supporting a balcony, in front of the three centre windows above. On each side of this portal are five windows, which are round-headed within square dressings. Those of both the upper floors are square-headed, the first with pediments, the second without.

The next building, almost immediately opposite the preceding, is the Kriegs-Ministerium, or war-office, and is the work of the same architect (Von Klense). The façade, 248 feet in length, is also in the Florentine style, and consists of a centre having seven large arcades, filled-in with door and windows on the ground-floor, and two stories above it, with two wings or lateral divisions, five windows in width, and a story lower. The spandrels of the seven arcades of the ground-floor are filled up with military trophies and armour, which mass of sculpture gives unusual richness and character to the whole. The building stands at the angle of the Schonfelds-Strasse, towards which street its south side presents a far more extensive and varied façade

(363 feet), uniform as to general style, but different as to composition, it being divided into a centre and two advanced wings, connected on each side by four arcades with windows in them, similar to those of the other front.

Immediately to the north of the Kriegs-Ministerium is the new public library and archive, whose lofty façade (495 feet in length) is a compound of the Florentine and Lombardic styles. The lower floor forms a massive rusticated basement, 44 feet high, with three portals in its centre. Each of the upper floors has 25 arched windows, and the whole is crowned with a cornice of very peculiar design. The library is capable of containing 2,000,000 of volumes; the number at present in it is variously estimated at 400,000 and 540,000 volumes; the number of manuscripts amounts to 22,000.

Nearly opposite the Ludwigs-Kirche are the Blind Institute and what is called the Damenstift (Ladies' College), two more of those extensive masses of building which give so much grandeur to this street. The former of these is upwards of 220 feet and the other 400 feet in length; both are by Gärtner, and both somewhat similar in style to the Public Library. The same may be said of the university buildings, at the northern extremity of this noble street, where they form a large quadrangle, into which the street itself runs. The Sieges-Thor (Gate of Victory), at the north end of the Ludwigs-Strasse, is a triumphal arch designed by Gärtner in imitation of the Arch of Constantine in Rome, and dedicated to the Bavarian army. It is built of Regensburg stone, and embellished with medallions and bas-reliefs executed in Carrara marble. The masonry for solidity and beauty is unsurpassed in Europe. The six medallions are symbolical of the Bavarian provinces; the bas-reliefs represent battles, sieges, and the passage of a river. Four Winged Victories in Carrara marble, and of the noblest forms and proportions, rise on either side of the gate before the pediment, which is supported by four Corinthian pilasters. Two Flying Victories, with wreaths and palms, are sculptured over the central arch. The whole is surmounted by a figure of Bavaria seated in a triumphal car drawn by four lions. This gate was opened on October 15, 1850.

The Isar-Thor, one of the old gate-entrances of the city, has been restored and decorated with a fine fresco, representing the return of Lewis the Bavarian after his victory at Mühlhof. In the Schranren-Platz, in the old town, stands a pillar to commemorate the victory of the Bavarians and Austrians over the Elector Palatine, near Prag. A bronze obelisk, 100 feet high, is erected in the circus called Carolinen-Platz, between the Botanic Garden and the Pinakothek, in memory of the 30,000 Bavarians who fell in the Russian campaign of 1812.

Among the other public buildings of Munich must be mentioned—the General Hospital (Krankenhaus), which stands in extensive grounds to the south-west of the town, outside the Sendlinger Gate; the Isar Bridge; the Synagogue; the General Prison, in the Au suburb; the Riding School, cavalry and infantry barracks; the Royal Porcelain manufactory, in the Kaufinger-Gasse, where the painting of glass is carried on extensively, &c. &c.

It remains to mention the spacious Friedhof, or public cemetery, which lies a little east of the Krankenhaus; the Theresien-Wiese, to the south-west of the town, and the beautiful park to the north-east of the city, and called the English Garden. The English Garden, situated to the north-east of the city, is laid out with plantations, intersected by streams of water, and embellished with statues and various ornamental buildings, the most remarkable of which is the circular monoperos of twelve Ionic columns, erected in 1833, as a monumental temple in honour of the elector Karl Theodore, the founder of the garden; it is remarkable as exhibiting the first modern application of polychromy, the capitals of the columns and the mouldings of the entablature being enriched with various colours painted in encaustic. The Friedhof has at its southern extremity an extensive range of building, consisting of a chapel and range of arcades, disposed in the form of a crescent about 550 feet in diameter. In the Theresien-Wiese (Theresian Meadow) a kind of people's festival is held, commencing on the first Sunday in October. There is a cattle show, and there are pony races, athletic games, and rifle-shooting matches; the king attends and gives prizes to the successful competitors. A high sloping natural bank, which runs along one side of the meadow, is cut into steps like a Roman amphitheatre, for the convenience of spectators, and commands the whole varied scene, to which the villages far and near send bands of peasants in native costume and headed by their respective banners.

On the natural terrace just mentioned, which rises above the plain on which the city stands, is the Ruhmes-Halle (Hall of Fame), a beautiful doric structure of white marble, adorned with emblematic friezes by Schwanthaler. It was designed by Von Klense; busts of all the great men that Bavaria has produced are to be arranged along its walls. Right in front of this beautiful temple, and dwarfing it into insignificance by her gigantic proportions, rises Schwanthaler's colossal statue of Bavaria, with a majestic lion by her side, and holding out the wreath, or crown, of reward to any who may be worthy to enter the temple. The statue, which represents a Titanio virgin of calm majestic beauty, is 54 feet high, and stands on a granite pedestal 30 feet high. It is cast from Turkish cannon sunk at the battle of Navarino, and brought up by Greek divers. A winding staircase ascends the interior to a chamber in the head, large enough to contain

23 persons. In the bust of the figure are 20 tons of bronze. The statue was cast at the bronze foundry of Stiglmayer in the Nymphenburg road, about a mile from the city, between 1844 and 1848, by Ferdinand Miller, Stiglmayer's nephew. The statue was unveiled during the people's festival of October 1850, in the presence of the ex-king Ludwig, his two sons, the kings of Bavaria and Greece, the king of Saxony, and a vast concourse of people.

MUNSTER, one of the four provinces into which Ireland is divided. It comprehends the southern part of the island, and is bounded N. by the province of Connaught, E. by the province of Leinster, S. and W. by the Atlantic Ocean. It lies between 51° 25' and 53° 12' N. lat., and 6° 56' and 10° 32' W. long.

The general character of the surface is mountainous. Along the coast are the excellent harbours of Waterford, Dungarvan, Youghal, Cork, Kinsale, and Tralee, which are generally formed by the estuaries of rivers. Next to the Shannon the chief rivers are the Suir, the Blackwater, the Lee, and the Bandon, all of which, except the Suir, in the upper part of its course, have a general direction from west to east. The principal lakes are those of Killarney, which are much resorted to for the picturesque beauties of the surrounding scenery. The bogs are neither so numerous nor so extensive as in most other parts of Ireland. The province is divided into the six counties of CLARE, CORK, KERRY, LIMERICK, TIPPERRARY, and WATERFORD, to the separate articles on which we refer for further information. For ecclesiastical purposes Munster is nearly coincident with the archiepiscopal province of Cashel, which by the Act 3 and 4 Wil. IV. cap. 37, was united to that of Dublin. It contains the united dioceses of Cashel, Emlly, Waterford, and Lisimore; Cork and Ross; Cloyne, Limerick, Ardferit, and Aghadoc; with Killaloe and Kilfenora of the united dioceses of Killaloe, Kilfenora, Clonfert, and Kilmaeduaugh.

The chief Anglo-Norman families who settled in Munster were the Fitz-Thomases, earls of Desmond; the Butlers, earls of Ormond; the Geraldines, Barrys, Roches, and Crogans. South Munster was divided into counties in the reign of Henry VIII. Thomond (Clare County) was made shire-ground with Connaught in the 11th year of Elizabeth's reign. It was added to Munster in 1601, but continued till 1792 in the Connaught circuit. During the rebellions of the time of Elizabeth, Munster was governed by a President under the Lord Deputy of Ireland.

The population of the counties and cities in Munster province at the four decennial periods of 1821, 1831, 1841, and 1851, with the area of each, will be found in the article IRELAND.

MUNSTER, NEW. [ZEALAND, NEW.]

MUNSTER, the most north-western of the three governments into which the Prussian province of Westphalia is divided, is bounded N. by Hanover, E. by Minden, S. by Arensburg and the Rhein-provins, and W. by the Netherlands. Its area is 2797 square miles, and the population in 1846 was 421,044, about 9-10ths of whom are Catholics. The government presents a surface diversified by mountains, hills, and plains; the northern part is drained by the Ems, and the southern districts by the Lippe, a feeder of the Rhine. The Teutoburgerwald range runs north-west across the territory of Münster, forming part of the watershed between the Ems and the Weser. The country is not very productive in corn; flax and hemp are the chief products. Linen is the staple manufacture. Swine are very numerous. This government comprises a large portion of the former prince-bishopric of Münster, of which Hanover and Oldenburg got the rest. A railway runs south from the city of Münster, and joins the Cologne-Minden line at Hamm.

Münster, the capital of Westphalia, and of the government of Münster, situated on the river Ahe, in 51° 53' N. lat., 7° 36' E. long., in a flat country, about 200 feet above the level of the sea, is a tolerably well built commercial and manufacturing town, with about 21,000 inhabitants. The streets are broad; the houses lofty, but neither uniformly nor regularly built. The fortifications were dismantled in 1765 but the ramparts remain, which are planted with lime-trees and form a fine promenade round the town. Of the public buildings the most worthy of notice are—the cathedral, which contains the tomb of Bishop Galen who recovered the city from the Anabaptists; the church of St.-Lambert, built in the finest gothic style; the palace of the bishop, which occupies the site of the old citadel; the senate-house; and the mansions of several of the nobility. John of Leyden with a few adherents threw himself, in 1536, into Münster, which he resolutely defended against the bishop. The town however was taken by storm and John and two of his followers were put to a violent death, and their remains were exposed on the tower of St.-Lambert's church in iron baskets which still hang there. The town has a Catholic ecclesiastical college, which has faculties of theology and philosophy; a Catholic gymnasium with 21 professors and 625 pupils (in 1850), and a library of about 30,000 volumes; surgical and veterinary schools, a botanical garden, a school for deaf-mutes; and manufactures of woollen-cloths, leather, starch, &c. The city is the seat of all the great offices of the province of Westphalia. The trade in linens, woollens, yarn, Rhenish wine, hams, &c., is very considerable. Münster is celebrated on account of the peace concluded in it October 24, 1648, which put an end to the Thirty Years War. It was founded at the end of the 6th century and called Meiland and about a century after Miningerode. In 972 it was taken by Charle-

magne, in whose time the bishopric was founded and a monastery built, whence the name of Münster is derived. A navigable canal connects Münster with the Ems; and a railroad 21 miles in length unites it to the Hamm station on the Köln-Minden line.

Bocholt, on the Aa, about 45 miles W. from Münster, has a castle, belonging to the princes of Salm-Salm, manufactures of woollens, cotton, silk, hosiery, spirits, soap, and a population of 4300. There are extensive iron-works in the vicinity of the town. At Anholt, a small town near Bocholt, is the principal residence of the prince of Salm-Salm. [ANHOLT.] Borcken, S.W. of Münster, on the Aa, has 3000 inhabitants, who manufacture linen, broadcloth, serge, and chicory. The Sierra de Segura is a mass of gray and white limestone, and most of the other mountain ranges belong to the same formation. Trachyte and other volcanic rocks occur at Almazarron; and here and in the mountains south of Lorca the mining operations are chiefly carried on. Porphyry, greenstone, primary alates, fine

whose carved caps do not reach quite up to the corbelling of the gable, divide the façade into three compartments, the middle and widest of which contains a rich portal, with receding columns and arches, with a bas-relief in the lunette over the square-headed door, and a statue on each side of the canopy which crowns this entrance. Above it is a large rose window; and in each of the other compartments are two round-headed windows, one above the other. The body of the chapel is 105 feet in length within, exclusive of the apsis at its western extremity, which is elevated about 3 feet above the rest of the pavement, and gives about 20 feet more. This space consists of two square compartments of 30 feet, covered each by pendentives and a dome, and united by an intermediate narrower space. On each side these compartments have below three circular-headed arches on columns, opening into side aisles; and above as many windows of the same form, not immediately over the arches, but at the back of the upper recesses that cover the aisles below. Consequently the width in the upper part of the building is, in appearance at least, greatly extended. It is difficult to convey a distinct notion of the profuse and gorgeous yet solemn decorations of the whole interior: the pavements, walls, arches, pendentives, domes—all is embellishment; and all that is not marble or mosaic is painting and gold. The columns are of red Salzburg marble, with white bases and gilded capitals; the soles, or bottom of the walls, is also of red marble throughout; and the upper part to the height of the upper aisles is encrusted with different coloured marbles or scagliola. All the rest is entirely covered with fresco painting, upon a gold ground. The subjects were designed, and executed by Hess and his pupils; those of the first compartment and its cupola are symbolical of the events of the Old Testament; those of the other, of the New, while those introduced in the large intervening arch refer to the connection between the two. Many of the figures are colossal; those for instance, of the Redeemer and of the Deity behind the principal altar, which may be considered as the focus where the power of art is concentrated, the subjects here being illustrations of the Seven Sacraments. The building was consecrated and opened for service November 1, 1837.

On the south side of this magnificent chapel is what was formerly the Hof, or Court Theatre, but it is not now made use of as such, the larger and adjoining building on the south being now the principal theatre. This structure, which has a fine octastyle Corinthian portico painted in polychrome towards the Max-Joseph's Platz, was originally erected by Karl Fischer, and rebuilt according to the first design, after being burnt down in 1823. On the south side of the same square is the new façade of what was formerly the Döring Palace, but is now converted into the post-office. The length is 290 feet, the whole of which, exclusive of 32 feet at each side, is occupied by an open loggia of 13 arches, resting upon Doric columns, with as many windows above them, besides two in each of the end compartments, that is, one on the ground-floor and one above it. The whole is crowned by a cornice, with an enriched band or narrow frieze beneath it, the pattern of which is white upon a red ground; for this building also exhibits, to a certain extent, the application of polychromy. On the west side of the Odeon-Platz are the Odeon and Leuchtenberg Palace, whose opposite fronts towards the street that runs between them present two handsome and uniform façades in the Italian style, of two stories above the ground-floor, of 11 windows in each, and with a small Doric portico, or entrance porch, of 4 columns. The large concert- or ball-room, on the principal floor of the Odeon, is 124 feet by 71 feet, and 50 feet high. West of the Odeon is the Wittelsbacher-Platz, in which is a bronze statue of the elector Maximilian I., cast from the Turkish cannon taken in the Greek war, after a model by Thorwaldsen.

Northward from the Odeon-Platz runs the Ludwigs-Strasse, by far the handsomest and most regular street in Munich, having on its east side the Kriegs-Ministerium, the public library, and Ludwigs-Kirche; on its western side the Maximilian Palace, Blind Institute, &c.; it widens out at its northern end in a spacious quadrangle, on one side of which stretches the solemn white mass of the university buildings; on the other the pale stone-coloured, severe-looking Jesuits College; and terminates in the magnificent triumphal arch of the Sieges-Thor. The Maximilian Palace is a large insulated structure in the Italian style, of about 200 by 300 feet. The façade towards the Ludwigs-Strasse (206 feet) has three large arched doors in the centre, between four insulated Doric columns supporting a balcony, in front of the three centre windows above. On each side of this portal are five windows, which are round-headed within square dressings. Those of both the upper floors are square-headed, the first with pediments, the second without.

The next building, almost immediately opposite the preceding, is the Kriegs-Ministerium, or war-office, and is the work of the same architect (Von Klenze). The façade, 248 feet in length, is also in the Florentine style, and consists of a centre having seven large arcades, filled-in with door and windows on the ground-floor, and two stories above it, with two wings or lateral divisions, five windows in width, and a story lower. The spandrels of the seven arcades of the ground-floor are filled up with military trophies and armour, which mass of sculpture gives unusual richness and character to the whole. The building stands at the angle of the Schonfelds-Strasse, towards which street its south side presents a far more extensive and varied façade

(363 feet), uniform as to general style, but different as to composition, it being divided into a centre and two advanced wings, connected on each side by four arcades with windows in them, similar to those of the other front.

Immediately to the north of the Kriegs-Ministerium is the new public library and archive, whose lofty façade (495 feet in length) is a compound of the Florentine and Lombardic styles. The lower floor forms a massive rusticated basement, 44 feet high, with three portals in its centre. Each of the upper floors has 25 arched windows, and the whole is crowned with a cornice of very peculiar design. The library is capable of containing 2,000,000 of volumes; the number at present in it is variously estimated at 400,000 and 540,000 volumes; the number of manuscripts amounts to 22,000.

Nearly opposite the Ludwigs-Kirche are the Blind Institute and what is called the Damenstift (Ladies' College), two more of those extensive masses of building which give so much grandeur to this street. The former of these is upwards of 220 feet and the other 400 feet in length; both are by Gärtner, and both somewhat similar in style to the Public Library. The same may be said of the university buildings, at the northern extremity of this noble street, where they form a large quadrangle, into which the street itself runs. The Sieges-Thor (Gate of Victory), at the north end of the Ludwigs-Strasse, is a triumphal arch designed by Gärtner in imitation of the Arch of Constantine in Rome, and dedicated to the Bavarian army. It is built of Regensburg stone, and embellished with medallions and bas-reliefs executed in Carrara marble. The masonry for solidity and beauty is unsurpassed in Europe. The six medallions are symbolical of the Bavarian provinces; the bas-reliefs represent battles, sieges, and the passage of a river. Four Winged Victories in Carrara marble, and of the noblest forms and proportions, rise on either side of the gate before the pediment, which is supported by four Corinthian pilasters. Two Flying Victories, with wreaths and palms, are sculptured over the central arch. The whole is surmounted by a figure of Bavaria seated in a triumphal car drawn by four lions. This gate was opened on October 15, 1850.

The Isar-Thor, one of the old gate-entrances of the city, has been restored and decorated with a fine fresco, representing the return of Lewis the Bavarian after his victory at Mühlhof. In the Schranzen-Platz, in the old town, stands a pillar to commemorate the victory of the Bavarians and Austrians over the Elector Palatine, near Prag. A bronze obelisk, 100 feet high, is erected in the circus called Carolinen-Platz, between the Botanic Garden and the Pinakothek, in memory of the 30,000 Bavarians who fell in the Russian campaign of 1812.

Among the other public buildings of Munich must be mentioned—the General Hospital (Krankenhaus), which stands in extensive grounds to the south-west of the town, outside the Sendlinger Gate; the Isar Bridge; the Synagogue; the General Prison, in the Au suburb; the Riding School, cavalry and infantry barracks; the Royal Porcelain manufactory, in the Kaufinger-Gasse, where the painting of glass is carried on extensively, &c. &c.

It remains to mention the spacious Friedhof, or public cemetery, which lies a little east of the Krankenhaus; the Theresien-Wiese, to the south-west of the town, and the beautiful park to the north-east of the city, and called the English Garden. The English Garden, situated to the north-east of the city, is laid out with plantations, intersected by streams of water, and embellished with statues and various ornamental buildings, the most remarkable of which is the circular monopteros of twelve Ionic columns, erected in 1833, as a monumental temple in honour of the elector Karl Theodore, the founder of the garden; it is remarkable as exhibiting the first modern application of polychromy, the capitals of the columns and the mouldings of the entablature being enriched with various colours painted in encaustic. The Friedhof has at its southern extremity an extensive range of building, consisting of a chapel and range of arcades, disposed in the form of a crescent about 550 feet in diameter. In the Theresien-Wiese (Theresian Meadow) a kind of people's festival is held, commencing on the first Sunday in October. There is a cattle show, and there are pony races, athletic games, and rifle-shooting matches; the king attends and gives prizes to the successful competitors. A high sloping natural bank, which runs along one side of the meadow, is cut into steps like a Roman amphitheatre, for the convenience of spectators, and commands the whole varied scene, to which the villages far and near send bands of peasants in native costume and headed by their respective banners.

On the natural terrace just mentioned, which rises above the plain on which the city stands, is the Ruhmes-Halle (Hall of Fame), a beautiful doric structure of white marble, adorned with emblematic friezes by Schwanthaler. It was designed by Von Klenze; busts of all the great men that Bavaria has produced are to be arranged along its walls. Right in front of this beautiful temple, and dwarfing it into insignificance by her gigantic proportions, rises Schwanthaler's colossal statue of Bavaria, with a majestic lion by her side, and holding out the wreath, or crown, of reward to any who may be worthy to enter the temple. The statue, which represents a Titanic virgin of calm majestic beauty, is 54 feet high, and stands on a granite pedestal 30 feet high. It is cast from Turkish cannon sunk at the battle of Navarino, and brought up by Greek divers. A winding staircase ascends the interior to a chamber in the head, large enough to contain

28 persons. In the bust of the figure are 20 tons of bronze. The statue was cast at the bronze foundry of Stiglmayer in the Nymphenburg road, about a mile from the city, between 1844 and 1848, by Ferdinand Miller, Stiglmayer's nephew. The statue was unveiled during the people's festival of October 1850, in the presence of the ex-king Ludwig, his two sons, the kings of Bavaria and Greece, the king of Saxony, and a vast concourse of people.

MUNSTER, one of the four provinces into which Ireland is divided. It comprehends the southern part of the island, and is bounded N. by the province of Connaught, E. by the province of Leinster, S. and W. by the Atlantic Ocean. It lies between 51° 25' and 53° 12' N. lat., and 6° 56' and 10° 32' W. long.

The general character of the surface is mountainous. Along the coast are the excellent harbours of Waterford, Dungarvan, Youghal, Cork, Kinsale, and Tralee, which are generally formed by the estuaries of rivers. Next to the Shannon the chief rivers are the Suir, the Blackwater, the Lee, and the Bandon, all of which, except the Suir, in the upper part of its course, have a general direction from west to east. The principal lakes are those of Killarney, which are much resorted to for the picturesque beauties of the surrounding scenery. The bogs are neither so numerous nor so extensive as in most other parts of Ireland. The province is divided into the six counties of CLARE, CORK, KERRY, LIMERICK, TIPPERRARY, and WATERFORD, to the separate articles on which we refer for further information. For ecclesiastical purposes Munster is nearly coincident with the archiepiscopal province of Cashel, which by the Act 3 and 4 Wil. IV. cap. 37, was united to that of Dublin. It contains the united dioceses of Cashel, Emlly, Waterford, and Lisimore; Cork and Ross; Cloyne, Limerick, Ardferit, and Aghadoe; with Killaloe and Kilfenora of the united dioceses of Killaloe, Kilfenora, Clonfert, and Kilmaeduaigh.

The chief Anglo-Norman families who settled in Munster were the Fitz-Thomases, earls of Desmond; the Butlers, earls of Ormond; the Geraldines, Barrys, Roches, and Cogan. South Munster was divided into counties in the reign of Henry VIII. Thomond (Clare County) was made shire-ground with Connaught in the 11th year of Elizabeth's reign. It was added to Munster in 1601, but continued till 1792 in the Connaught circuit. During the rebellions of the time of Elizabeth, Munster was governed by a President under the Lord Deputy of Ireland.

The population of the counties and cities in Munster province at the four decennial periods of 1821, 1831, 1841, and 1851, with the area of each, will be found in the article IRELAND.

MUNSTER, NEW. [ZEALAND, NEW.]

MUNSTER, the most north-western of the three governments into which the Prussian province of Westphalia is divided, is bounded N. by Hanover, E. by Minden, S. by Arensburg and the Rhein-provins, and W. by the Netherlands. Its area is 2797 square miles, and the population in 1846 was 421,044, about 9-10ths of whom are Catholics. The government presents a surface diversified by mountains, hills, and plains; the northern part is drained by the Ems, and the southern districts by the Lippe, a feeder of the Rhine. The Teutoburgerwald range runs north-west across the territory of Münster, forming part of the watershed between the Ems and the Weser. The country is not very productive in corn; flax and hemp are the chief products. Linen is the staple manufacture. Swine are very numerous. This government comprises a large portion of the former prince-bishopric of Münster, of which Hanover and Oldenburg got the rest. A railway runs south from the city of Münster, and joins the Cologne-Minden line at Hamm.

Münster, the capital of Westphalia, and of the government of Münster, situated on the river Ahe, in 51° 58' N. lat., 7° 36' E. long., in a flat country, about 200 feet above the level of the sea, is a tolerably well built commercial and manufacturing town, with about 21,000 inhabitants. The streets are broad; the houses lofty, but neither uniformly nor regularly built. The fortifications were dismantled in 1765 but the ramparts remain, which are planted with lime-trees and form a fine promenade round the town. Of the public buildings the most worthy of notice are—the cathedral, which contains the tomb of Bishop Galen who recovered the city from the Anabaptists; the church of St. Lambert, built in the finest gothic style; the palace of the bishop, which occupies the site of the old citadel; the senate-house; and the mansions of several of the nobility. John of Leyden with a few adherents threw himself, in 1536, into Münster, which he resolutely defended against the bishop. The town however was taken by storm and John and two of his followers were put to a violent death, and their remains were exposed on the tower of St. Lambert's church in iron baskets which still hang there. The town has a Catholic ecclesiastical college, which has faculties of theology and philosophy; a Catholic gymnasium with 21 professors and 625 pupils (in 1850), and a library of about 30,000 volumes; surgical and veterinary schools, a botanical garden, a school for deaf-mutes; and manufactures of woollen-cloths, leather, starch, &c. The city is the seat of all the great offices of the province of Westphalia. The trade in linens, woollens, yarn, Rhenish wine, hams, &c., is very considerable. Münster is celebrated on account of the peace concluded in it October 24, 1648, which put an end to the Thirty Years War. It was founded at the end of the 6th century and called Meiland and about a century after Miningerode. In 972 it was taken by Charle-

magne, in whose time the bishopric was founded and a monastery built, whence the name of Münster is derived. A navigable canal connects Münster with the Ems; and a railroad 21 miles in length unites it to the Hamm station on the Köln-Minden line.

Bocholt, on the Aa, about 45 miles W. from Münster, has a castle, belonging to the princes of Salm-Salm, manufactures of woollens, cotton, silk, hosiery, spirits, soap, and a population of 4800. There are extensive iron-works in the vicinity of the town. At Anholt, a small town near Bocholt, is the principal residence of the prince of Salm-Salm. [ANHOLT.] Borken, S.W. of Münster, on the Aa, has 3000 inhabitants, who manufacture linen, broadcloth, serge, and chicory. Kösfeld, 20 miles W. from Münster, on the Berkel, is surrounded by old fortifications, and defended by a castle; the manufactures are linen and woollen cloth. It has a population of 3500, and a Catholic gymnasium with 12 teachers and 150 scholars (in 1850). Kösfeld is the residence of the Horstmar branch of the house of Salm. Recklinghausen, formerly the capital of a circle, is situated on the Lippe, about 30 miles S.W. from Münster, on the slope of the Hard Mountain, and has an old ducal residence, two churches, an asylum for females of noble birth, some linen manufactures, steel-works, and about 3000 inhabitants. There is a Catholic gymnasium in the town, which had 10 teachers and 130 students in 1850. Recklinghausen was formerly the capital of a small sovereign county, 301 square miles in extent, which belonged to the Duke of Arenberg; the duke is still the proprietor but the sovereignty vests in the king of Prussia. Steinfurt, N.W. of Münster, a residence of the princes of Bentheim, has a population of 2700, who manufacture linen and leather. Warendorf, E. of Münster, on the Ems, has a gymnasium, a mad-house, several bleach-works, an important linen market, and 4200 inhabitants, who manufacture linen and broadcloth.

MUONIO-ELF. [BOHNSIA.]

MUR. [CÔTES-DU-NORD.]

MUR-DE-BARREZ. [AVEYRON.]

MURAT. [CANTAL.]

MURCIA, an ancient province of Spain, formerly a kingdom, is bounded S. by the Mediterranean Sea and the province of Granada, N. and N.W. by Castilla la Nueva, E. and N.E. by the Mediterranean Sea and the province of Valencia, W. by the province of Jaen, and S.W. by the province of Granada. It is situated between 37° 23' and 39° 16' N. lat., 40' and 3° 8' W. long. The greatest length from north to south is about 130 miles, the greatest width from east to west is about 110 miles. The area is 7877 square miles. The population in 1849 was 595,531. It is divided into the two following modern provinces:—

Provinces.	Area in Square Miles.	Population in 1849.
Murcia	7,877	400,000
Albacete		195,531
Total	7,877	595,531

Surface.—The form of Murcia is very irregular, and the boundaries are for the most part conventional. Only at the extreme western angle the Rio Guadarmena forms a natural line of separation between Murcia and the provinces of La Mancha and Jaen. The modern province of Albacete comprises the interior or north-western part of the old province; the modern province of Murcia comprises the south-eastern portion, or that next the coast, the line of division between the two being formed by the summit level of the Sierra de Sagra extended along the line of the sierras of Jumella, Yecla, and Villena.

The coast from the boundary of Granada as far as Cartagena presents a series of steep and elevated cliffs; eastward from that port to the Cabo de Palos the coast is low and sandy, the cape itself being the termination of a ridge of hills from the interior; northward of the Cabo de Palos is a shallow land-locked sea-lagune called the Encañizada de Murcia. The Sierra de Sagra, interrupted by the valley of the Rio Mundo, may be said to extend under different names from south-west to north-east through the centre of the province, forming a natural line of division between the two modern provinces. The Sierra de Alcaraz crosses the western corner of the province, extends through a part of La Mancha, and again enters Murcia near Chinchilla, filling up the north-western angle. The Sierra de Segura crosses the province between the Sierra de Alcaraz and the Sierra de Sagra; all these mountain ridges being in fact offsets from the eastern end of the great chain of the Sierra Morena. Another series of mountains extends from the province of Granada, south of the town of Lorca, to Cartagena, and this series includes the great mining district of Murcia. Other mountain groups cross the province in various directions, separated from each other by extensive valleys and a few level tracts. The only plain of considerable extent lies between Cartagena and Orihuela, and this plain is divided into two portions by a chain of sandstone hills on the southern side of the Sangonera. The Sierra de Segura is a mass of gray and white limestone, and most of the other mountain ranges belong to the same formation. Trachyte and other volcanic rocks occur at Almazarron; and here and in the mountains south of Lorca the mining operations are chiefly carried on. Porphyry, greenstone, primary slates, fine

marbles, rock-crystal, and gypsum, are found in various parts of the province.

Rivers.—There is only one river-system in Murcia, that of the Río Segura and its affluents. The Segura rises at the southern end of the Sierra de Segura, and has a northern course for about 50 miles, and in this part of its course receives the Taivilla on the eastern bank. It then turns to the east, and having received the Mundo from La Mancha, takes a southern course, receiving on its western bank the Moratara, the Caravara, and the Quipar. It then takes an eastern course, passes by the city of Murcia, below which it receives the Sangonera from the south, and soon afterwards enters the province of Valencia, where it falls into the sea below the Albufera de Elche.

Climate, Soil, and Productions.—The climate of Murcia is varied. Storms are not unfrequent in the spring; the summers are temperate on the sea-coast and among the mountains, but intensely hot in the plains, the mercury often rising above 100° Fahr. in the shade; the autumns are delightful, and the winters are so mild that ice and snow are almost unknown. Clouds and fogs are rare, and the sky is almost always blue and bright; but on the other hand rain very seldom falls.

Except in the vicinity of the Río Segura and its tributaries, the soil is generally parched for want of water, and in many parts is almost a desert; but in the river-valleys and wherever irrigation can be abundantly supplied, the fertility is excessive, especially of those districts which are called Huertas, or gardens. A large portion of the vale of Murcia is of this character. This portion is about 16 miles long, extending south-west and north-east from the city of Murcia, and 7 or 8 miles wide, is watered by the Sangonera and the Segura, and bounded by mountain ranges on both sides. It is divided into fields by embankments about two feet high, to assist the process of irrigation, and by rows of mulberry-trees and various kinds of shrubs. The whole of the vale may be seen from the top of the tower of the cathedral of Murcia, whence it presents the appearance of a garden extending as far as the eye can reach, luxuriantly green even in winter, and producing wheat, flax, pulse, and vegetables, interspersed with fig-trees, orange-trees, and stately palms. The vale of Lorca is comparatively small, but is rendered very fertile by an artificial system of irrigation supplied from a vast reservoir of water called the Pantano de Lorca. This reservoir was formed by damming back a stream which ran through a narrow gorge between mountains, and afterwards fall into the Sangonera. A dyke of stone was constructed of enormous height and thickness, and thus a deep lake was formed. The dyke was finished in 1789. It was quite filled with water in February 1802, but on the 2nd of April it gave way, doing a vast amount of damage throughout the whole extent of the vales of Lorca and Murcia. It has since been repaired, and the water is distributed in such quantities as are required.

The vegetable productions are wheat, barley, rye, rice, maize, flax, vegetables, and fruit of superior quality, particularly oranges, lemons, melons, and pomegranates. The most common trees are the mulberry, the olive, and the carob; evergreen and other oaks are in some parts numerous. The pines on the Sierra de Segura form the largest forest in the south of Spain. The oleander, cistus, and other odoriferous shrubs, grow wild, and the prickly pear and American aloe flourish luxuriantly. Barilla is made on the sea-coast. Rich wines, oil, and silk are produced in considerable quantities. The esparto-rush grows spontaneously in the uncultivated districts, and is worked up into baskets, mats, ropes, and other useful articles. The farming stock are principally sheep and goats, horned cattle being rare. The pigs are very large and well fattened; they are fed on the acorn of the ilex-oak and other produce of the forests. Game is abundant. Wolves, foxes, and wild boars inhabit the mountains.

The minerals are lead, silver, sulphur, and nitre. The lead and silver-mines are mostly near the coast, between Cartagena and the province of Granada.

The articles exported from the province of Murcia mostly pass through the port of Cartagena. They consist of wheat, barley, maize, oil, barilla, red pepper, esparto-rush, and raw and manufactured silk. The imports are salt-fish, sugar, cocoa, coffee, rice, iron, and contraband articles of hardware, linens, woollens, earthenware, and tobacco.

Of manufactures there are very few, and of none enough to supply the consumption of the province. The silk-manufacture, once large, has now almost ceased. It is chiefly the product of hand-labour, and cannot compete with the silk goods of Valencia, which are mostly produced by machinery. Good wines are made; but the manufactures of brandy, coarse linen, hemp, flax, cutlery, and gunpowder, are inferior in quality and not considerable in quantity.

Towns.—The city of Murcia is the capital of the ancient province as well as of the modern. [MURCIA.] *Albacete*, 85 miles N.N.W. from Murcia, is the capital of the modern province of Albacete. From its central position, whence roads branch to Murcia, Valencia, and Madrid, it is a place of great traffic. It stands in an extensive plain, which is irrigated by a canal, and produces large quantities of corn and saffron. The town is famous for its cutlery, coarse indeed, but such as satisfies the Spaniard, especially the long pointed two-edged púñal, or dagger-knife. The population is about 13,000. *Alhama*, 23 miles S.W. from Murcia, is frequented for its warm baths. There is a Moorish castle in ruins. The population is about 7000. *Almanza*, 38 miles E. by S.

from Albacete, is a well-built and tolerably flourishing town. The vega, or plain, is irrigated by means of the Pantano of Alfera, a fine reservoir of water, and the produce is abundant. The population is about 7000. *Caravaca*, 45 miles W. by N. from Murcia, is a considerable town at the base of the south-eastern side of the Sierra de Segura, and on the northern bank of the Río Caravaca. It contains a ruined Moorish castle, a college, and some conventual buildings. The population is about 10,000. *Cartagena* is the chief port of the province. [CARTAGENA.] *Chinchilla*, 11 miles S.E. from Albacete, is surrounded by ancient walls, and has an old castle. There are manufactures of coarse cloth. The population in 1845 was 12,609. *Cieza* (*Zieza*), 27 miles N.W. from Murcia, is situated near the north bank of the Segura. It has manufactures of coarse cloth, and in 1845 contained a population of 6917. *Hellin*, 52 miles N.W. from Murcia, is situated in a hilly district not far from the eastern bank of the Mundo. It is tolerably well built; most of the houses are painted, and the streets are well paved. It contains a fine old parish church, and there are remains of a Roman fortress. The population in 1845 was 9814. *Jumilla*, 40 miles N.N.W. from Murcia, stands at the foot of a hill which is crowned by an old fortress. It is a bishop's see, is tolerably well built, and has manufactures of fire-arms, earthenware, and tiles. The population in 1845 was 7862. *Lorca*, 45 miles S.W. from Murcia, is situated on the south bank of the Sangonera, in a beautiful and highly-cultivated vale, with mountains on both sides. The streets of the old part of the town are irregular, steep, and narrow, but clean; the new part has wider streets more regularly laid out. The castle on the Monte de Oro was formerly very strong, and is still a fine specimen of a fortress of the middle ages. The long lines of walls are the work of the Moors. The town contains a collegiate church, a gothic church, a bishop's palace, a college, and two hospitals. There are manufactures of linen-cloth, saltpetre, and thread. The population in 1845 was 40,469. *Mula*, 25 miles W. from Murcia, is resorted to for the warm mineral baths in the neighbourhood. It has some manufactures of pottery, and contains a population of about 6500. *Segura de la Sierra*, 95 miles W.N.W. from Murcia, is situated between the Río Guadalimar and the Sierra de Segura. The population is about 2500, who are mostly employed in the lead-silver- and copper-mines in the vicinity. *Totana*, 30 miles S.W. from Murcia, is one of the head-quarters of the gipsies of Murcia. It contains a fine fountain supplied by an aqueduct, and has some manufactures of linen, earthenware, brandy, and saltpetre. The population in 1845 was 8500. *Villena*, 50 miles N.N.E. from Murcia, stands near the foot of Monte San Cristoval, which is crowned with a castle now in ruins. It contains a town-hall, palace, hospital, barracks, and brandy distilleries. The streets of the town are narrow and winding, but it has an extensive modern suburb of better architecture. The population in 1845 was 8224. *Yecla*, 48 miles N. from Murcia, stands at the foot of the Cerro de Calvario, which is crowned by a ruined Moorish castle. It has distilleries of brandy, and contains a population of 9400.

History.—Murcia was the part of Spain first colonised by the Carthaginians, who, about B.C. 202, founded New Carthage, now Cartagena. [CARTAGENA.] It passed, with the rest of the peninsula, under the dominion of the Romans and Goths. From the Goths it was conquered in 552 by Justinian, emperor of the East, and it remained in the hands of the Greeks till 624, when it was recovered by the Gothic king Suintilla. In 712 it was conquered by Abdalaziz, son of Musa, the Arab invader of Spain. It continued subject to the khalifs of Cordova till 1144, when, after the breaking up of that khalifate, it fell under the dominion of the kings of Granada; but in 1221 was re-annexed to Cordova. In 1239 it was raised into a distinct kingdom by Hudiel, who the following year submitted to Ferdinand the Saint, king of Castilla, consenting to pay tribute on condition of being allowed to retain the crown for life. In 1264 he endeavoured to regain his independence, but was conquered and dethroned in 1266 by Alonso X. of Castilla and James I. of Aragon. Murcia ever afterwards continued in the possession of the Christians.

(Mados, *Diccionario Geografico de España*; Laborde, *Itinéraire Descriptif de l'Espagne*; Townsend, *Journey through Spain*; Cook, *Sketches in Spain*; Ford, *Handbook of Spain*; Inglis, *Spain in 1830*; Hoskins, *Spain as it is*, 1851; Mariana, *Historia General de España*; Conde, *Los Arabes en España*.)

MURCIA, a city of Spain, capital of the ancient kingdom and province of Murcia, and of the modern province of the same name, is situated in 38° 2' N. lat., 1° 14' W. long., 230 miles S.E. from Madrid. The population in 1845 was 48,488. It stands on the northern or left bank of the Segura, a little above the junction of the Sangonera. The beautiful garden-like vale is described under the province. The approach to the city from Lorca is by a wide avenue four miles long, bordered with trees, and terminated by two lofty towers of one of the churches. A fine bridge, built in 1720, crosses the Segura, and connects the city with a suburb on the right bank of the river.

Murcia is the see of a bishop, suffragan to the archbishop of Toledo. The city was built by the Moors out of materials of the Roman Murcia. It was formerly walled, but is now open. The streets are generally narrow, but clean, and here and there small squares and gardens filled with palms, cypresses, and orange- and lemon-trees, promote the ventilation and gratify the eye. The houses also, being painted in various colours, mostly blue, pink, and yellow, add to the picturesque effect.

The houses are generally low and flat-roofed; those of the principal square, or plaza, have highly-wrought-iron balconies, and in this plaza is the episcopal palace, also painted. The cathedral was begun in 1353, and received additions and alterations in 1521 and subsequently. The architecture is consequently of mixed styles of gothic. The belfry-tower was begun in 1522 and completed in 1766. It is of a square form, rises in diminishing stages, and is crowned by a dome. It is 10 feet higher than the tower of the cathedral of Sevilla; and, like that tower, is ascended by an inclined plane 320 paces in length and gradually increasing in steepness as far as the top of the first stage, where there is a gallery with a balustrade. A narrow staircase of 40 steps conducts thence to the belfry, and there are 70 steps more to the highest gallery, whence the view is truly magnificent, embracing not only the Huerta of Murcia, but the whole extent of the vale, a distance of about 30 miles. The interior of the cathedral contains some gothic chapels of delicate workmanship. There are no pictures; they were carried off by the French. There are ten other churches, several colleges, a town-hall, a plaza de toros, an hospital, a botanic garden, and two or three public libraries. It had upwards of 20 conventual buildings, which since the suppression have been taken down or converted to secular uses. The promenades are the Alameda del Carmen and the Arsenal.

The trade and manufactures of the city are inconsiderable. There are oil-mills, white-lead works, potteries, and tanneries. The government manufactories of nitre and gunpowder are nearly inactive. The esparto-rush is wrought into baskets, mats, cordage, and sandals. Some silk thread is spun, and small quantities of silk fabrics woven. There are also a few establishments for the manufacture of coarse linen-cloth. Fruits are exported.

(Ford, *Handbook of Spain*; Inglis, *Spain in 1830*; Hoskins, *Spain as it is*, 1851.)

MUSCAT, or MASCATE, a sea-port town on the east coast of Arabia, in the province of Oman, is situated on a peninsula which is joined to the island of Muscat by a reef of rocks, in 23° 48' N. lat., 58° 40' E. long., and has about 60,000 inhabitants. High lands to the south and west, and the island towards the east shelter the harbour, the entrance to which is from the northward, and protected by forts on each side; within there is room enough for a large fleet to moor in 4 or 5 fathoms water. A fort close to the town, and two other forts on the western side of the harbour command the whole of the port. The town is surrounded with walls and otherwise strongly fortified. The houses are only one story high, with the exception of some handsome stone buildings erected by the Portuguese. There are also some houses built in the Persian style, and an aqueduct.

Muscat is a great commercial entrepôt, and has a very active trade. A large number of ships belong to it, and trade to British India, Sumatra, the Malay Peninsula, the Red Sea, and eastern coast of Africa, the Comoro Isles, and Madagascar. Indeed wherever Arab traders are met with, between Africa and China, they may be set down as belonging to Muscat. The port is resorted to by ships from every part of Persia and Arabia. British and French merchantmen trading to the Persian Gulf stop at Muscat to sell and purchase goods. Besides its maritime commerce, Muscat carries on an extensive trade with the Arab tribes of the interior. The principal articles of the commerce of Muscat are—asafoetida, almonds, raisins, pistachio nuts, combrine aloes, gum ammoniac, sulphur, gum copal, and saltpetre. Other articles are frankincense, pearls, gall-nuts, coffee, cocoa-nut-oil, galbanum, hides, cotton-wool, mother-of-pearl, gum, bees'-wax, raw-silk, indigo, tortoise-shell, rhinoceros-horns, pepper, cochineal, cinnamon, sugar, rice, sandal-wood, dates, saffron, wheat, horses, salt, dried-fish, &c. Most of these articles are imported in Arab vessels from Persia, Zanzibar, Africa, and Western Arabia, and are exported to India, the Mauritius, Bourbon, Calcutta, Bombay, America, France, Zanzibar, &c. The tissues imported at Muscat are British and American long-cloths, British calico-prints, India shawls, Chinese silks, &c. The country near the town is barren, but provisions, fruits, vegetables, and fresh-fish are abundant in the markets. Bullocks, sheep, and fowls are to be had at a reasonable price. The annual imports into Muscat are probably under-estimated at a million sterling. Imports pay a duty of 5 per cent. if coming from Arabia, America, or Great Britain; 4 per cent. if coming from Bourbon. No duties are charged on exports. There is a large town called *Muttra*, 8 miles to the westward, nearly as large as Muscat. There is a good road between the two places. At *Muttra* vessels can be hauled ashore. In the interior there is another large town called *Rostak*.

Muscat was a place of considerable trade before the arrival of the Portuguese in the Indian Ocean, and it was then subject to Ormuz. Albuquerque took it in 1507, but had immediately to put down a bloody insurrection of the Arabs. On the destruction of Ormuz Muscat became the principal centre of trade in this part of the East, and yielded enormous profits to the Portuguese, who held the town till 1648. During this interval they built the fortifications and greatly improved the city, having erected a handsome church, a college,

and many other public structures, besides many superb stone houses. After being gorged with wealth the Portuguese treated the natives so badly and put so many restrictions on their commerce, that they took up arms and drove the Portuguese to their ships. Many unsuccessful attempts were made by the Portuguese to recover the town.

Left to themselves, the Arabs of Muscat—expert seamen, skilled in the use of fire-arms—soon raised a maritime force which overawed not only the neighbouring coasts, but also the European powers in India. By 1694 they had made themselves masters of several places in the Persian Gulf, and were threatening Gombroon; and the British government, acting upon the report of their resident at that place, proposed to send out an armament to clear the Indian seas, and “to root out that nest of pirates the Mascate Arabs.” In 1707 the Arabs obtained permission to build ships at the ports of Pegu from the king of that country; and their fleets, comprising ships of from 30 to 50 guns, annoyed trade in the Indian Ocean, and frequently made descents on the towns along the Malabar coast. With the Persians they were almost continually at war, although Persian traders were always permitted to trade at Muscat or any of its dependencies; all Persian ships of war were considered fair game. Since the beginning of the present century they have laid aside their piratical practices, and have confined themselves principally to commerce; and during the rule of the present Imam the territorial dominions, naval power, and commercial importance of Muscat have increased so vastly as to entitle him to be numbered among the great powers of the world. He has commercial treaties with Great Britain and the United States, and has opened intercourse with several European powers.

The Imam of Muscat claims as his possessions in Asia all the south-east coast of Arabia from the frontier of the British settlement of Aden to Ras-el-Had; all the territory of Oman along the east coast of Arabia, the sea-coast and islands in the Persian Gulf, including the Bahrein Islands and the pearl-fishery contiguous to them; and the coast of the Mukran. In Africa he claims sovereignty over all the coast from Cape Delgado to Cape Gardafui, including the ports of Mungallow, Lindi, Quiloah, Melinda, Lamoo, Brava, Magadoxa, &c.; and the valuable islands of Mafca, Zanzibar, Remba, Socotra, &c. Only a small part of this immense territory is garrisoned by his troops, but all, or nearly all, of it is tributary to him. He rules with patriarchal and despotic sway, but it is said in a just and liberal spirit. His government is strict and to Europeans courteous. A foreigner may walk the streets of Muscat at any hour of the night unmolested. Goods are piled up in the streets exposed night and day, and pilfering is never attempted.

The Imam derives his revenue, which is more than adequate to his expenditure, chiefly from commerce, in which he employs a great number of merchant vessels; from import dues on foreign merchandise; and from tribute money or the equivalent presents made him by princes under his sway. His naval force, more efficient than that of all the native emperors and princes from the Cape of Good Hope to Japan, numbered in 1837 15 vessels, carrying from 6 to 74 guns; 50 baghelas (one-masted vessels of 200 to 300 tons), carrying 8 to 18 guns; and 10 halits (one-masted vessels of 100 to 200 tons) carrying 4 to 6 guns. The number of vessels belonging to the port of Muscat at the same time, was estimated at 2000 of all sizes, a very large proportion of these being small craft. He has intelligent officers and abundance of sailors; but he keeps only a small number of regular troops as he can have any number of Bedouins, whenever he wants them, merely for the clothing and maintenance. His naval force however is sufficient to enable him to maintain his power against all native pretensions over all the territories he claims as his own. [See SUPPLEMENT.]

MUTFORD and LOTHINGLAND, a hundred in the county of Suffolk which has been constituted a Poor-Law Union. It is bounded N. and W. by Norfolk, E. by the North Sea, and S. by the hundreds of Blything and Wangford, and comprises 26 parishes and hamlets, with an area of 83,315 acres, and a population in 1851 of 16,164. Mutford and Lothingland Poor-Law Union comprises 24 parishes and townships, with an area of 32,732 acres, and a population in 1851 of 19,854.

MUTTRA. [HINDUSTAN; MUSCAT.]

MYCENÆ, an ancient town and state in the north of the Peloponnesus, founded, it is said, by Perseus, and which in the time of its king Agamemnon was the most powerful state of Greece, ruling over the greater part of the Peloponnesus, and many islands. The small kingdom of Argos was then subject to Mycenæ. But after the death of Agamemnon and the extinction of the dynasty of Atreus, Argos gained the ascendancy over Mycenæ, which however protected by Sparta still maintained a sort of independence. During the Persian war, Argos did not send any assistance to the Northern Greeks, but the contingent from Mycenæ was present at Thermopylæ. This added to the grudge which Argos bore against Mycenæ for its pride of

antiquity and independence, and after the end of the Persian campaign, while Sparta was distracted by intestine commotion and afflicted by the consequences of an earthquake, the Argives, being joined by the people of Tegea and Cleonæ, attacked Mycenæ, which they took after a stout resistance, and razed to the ground, B.C. 468. Part of the inhabitants were made slaves; the rest emigrated to Ceryneia, Cleonæ, and some even to Macedonia. (Diodorus, xi.; Herodotus; Pausanias.) Mycenæ never rose from its ruins, but these ruins still are of considerable magnitude, and very remarkable. In the time of Pausanias (ii. ch. 15, 16) they consisted of a great part of the walls, with the gate of the Lions, said to be the work of the Cyclopes; the fountain called Perseis; and the subterraneous buildings of Atreus and his sons, in which their treasures were deposited. There were likewise to be seen the tombs of Atreus, Agamemnon, of his charioteer Eurymedon, of Electra, and others. "But Clytemnestra and Ægisthus," adds Pausanias, "were interred at a little distance from the walls, being thought unworthy of burial where Agamemnon lay and those who were slain together with him."

According to Leake, Mycenæ was built upon a rugged height in a recess between two commanding summits of the range of mountains which border the eastern side of the Argolic plain, about 7 miles N. by E. from Argos. The Acropolis, the entire circuit of which is still seen, the ruined walls being in some places from 15 to 20 feet high, resembled many other fortresses in Greece, being built on the summit of a steep hill between two torrents. Its length is about 400 yards, and its breadth about 200 yards. The ground rises considerably within the inclosure; on the summit are the openings of subterraneous cisterns or granaries built of large irregular stones lined with plaster. It has a great gate at the north-west angle, and a postern towards the north-east. The door-case is formed of two massive upright blocks of stone, covered with another which is 15 feet long, 4 feet wide, and 6 feet 7 inches high. Upon this stands a triangular stone of green basalt 12 feet long, 10 feet high, and 2 feet thick, upon the face of which are represented in bas-relief two lions standing on their hind legs, one on each side of a round pillar or altar, upon which they rest their fore paws. Below the Acropolis, in the direction of the modern village of Kharvati, are the Spiliæ, or subterraneous chambers, known in the time of Pausanias by the name of the Treasury of Atreus. The largest of these chambers, which is of a conical form, is about 50 feet in diameter at the base. The door-ways are ornamented with half-columns of a style resembling the Tuscan. With the exception of some later reparations, easily distinguished from the oldest part, which is of the kind called Cyclopean, everything left at Mycenæ dates from the heroic

ages. Notwithstanding this remote antiquity, Mycenæ has undergone less change than any place in Greece since the time of Pausanias.

(Leake, *Travels in the Morea*.)

MY'CONOS, MICONI, one of the Cyclades, is situated east of Delos, from which it is separated by a narrow channel. It is about 10 miles in length, and 6 miles in its greatest breadth. The island is mountainous, and not very fertile: it produces some corn, wine, and cotton, but is deficient in wood. It exports wine, figs, and hides. The population is about 6000. On the west side of the island is the chief town, also called Mycone, which has a harbour and about 5000 inhabitants, who are by repute good sailors. The island belongs to the kingdom of Greece, and is included with the other Cyclades in the name of Syra. Myconos and Tinos form the see of a Roman Catholic bishop.

MYGDONIA. [MACEDONIA.]

MYRTOAN SEA. [ÆGEAN SEA.]

MYSIA, an ancient province in the north-west of Asia Minor, was bounded N. by the Propontis, W. by the Hellespont and the Ægean Sea, S. by Lydia, from which it was divided by the mountains which separate the valley of the Caicus from that of the Hermus, and E. by the Rhyndacus, which divided it from Bithynia. On the south-east the high land forming the interior of Mysia joins the central table-land of Phrygia towards the town of Azani. Herodotus (vii. 74-75) says that the Mysians were a Lydian colony. Strabo (xii.) says that "the Mysians of Asia were considered to be Lydians by some, and Thracians by others." This may mean that Thracian immigrations became mixed with the previous inhabitants of Lydian race. Repeated Thracian immigrations are mentioned as having taken place before and after the Trojan war. Then came the Æolians, who occupied the maritime coast from the Hermus to the Æsepus, and built their cities there. Geographers distinguished Æolia and Troas from Mysia. [TROAS; ÆOLIANS.]

Mysia became subject to the Lydian monarchy, after the fall of which it formed part of one of the satrapies of the Persian empire that included also Lydia. It was afterwards in succession under the Macedonians, the kings of Pergamus, and the Romans. Under the Romans it formed part of the province of Asia. Its principal towns were ABYDOS, CYZICUS, PERGAMUS, LAMPACUS, ADAMYTTIUM, and MILETOPOLIS, near the lake of the same name. The principal rivers of Mysia were the Caicus in the south and the Æsepus in the north; the smaller ones were the Evenus and the Granicus. [ANATOLIA.]

N

NAARDEN. [HOLLAND.]

NAAS, Kildare county, Ireland, a market and assize town, and the seat of a Poor-Law Union, is situated on the Dublin and Limerick road, in 53° 13' N. lat., 6° 40' W. long., distant 20½ miles S.W. from Dublin by road. The population in 1851 was 3132. Naas Poor-Law Union comprises 38 electoral divisions, with an area of 216,622 acres, and a population in 1851 of 44,863.

Naas was in early times a seat of the kings of Leinster. In 1419 a parliament was held in it. The town obtained charters from Henry V., Elizabeth, and James I. It returned two members to the Irish Parliament, but was disfranchised at the Union. Naas is pleasantly situated in a fertile and improved district. It consists of a street extending along the Dublin road, with several branches on each side. In the main street is the parish church, an old building in the early English style, enlarged in 1822, and again a few years back. There are a large Roman Catholic chapel, with a nunnery adjacent; an Independent chapel; a diocesan school; and several schools partially endowed. The town also contains a market-house, a county court-house and jail, a large infantry barrack, a fever hospital, dispensary, and Union work-house. There are the remains of an Augustinian monastery in the town; and a rath or high conical mound on which the states of Leinster are said to have held their assemblies. A branch of the Grand Canal passes near the town. Quarter and petty sessions are held. The market-days are Monday, Thursday, and Saturday. Fairs are held 12 times a year.

NAGASAKI. [JAPAN.]

NAGORE. [CARNATIC.]

NAGPOOR. [HINDUSTAN.]

NAILSWORTH. [GLOUCESTERSHIRE.]

NAIRN, the county town of Nairnshire, Scotland, a royal and parliamentary burgh and market-town, is situated on the left bank of the river Nairn, near its confluence with the Moray Frith, in 57° 35' N. lat., 3° 52' W. long., distant 15½ miles N.E. from Inverness, 198 miles N. from Edinburgh, and 86 miles N.W. from Aberdeen. The population of the parliamentary burgh in 1851 was 2977; that of the royal burgh was 3401. The town is governed by a provost, 3 bailies, and 13 councillors; and, with Inverness, Forres, and Fortrose, returns one member to the Imperial Parliament. The town is lighted

with gas and paved. By means of a breakwater recently erected the harbour has a depth of water of about 12 feet at high tide. Belonging to the port are 13 vessels, of an aggregate burden of about 1000 tons. There are about 70 herring boats, giving employment to many of the inhabitants. The public buildings consist of the town- and court-house and the jail; the hospital is a neat building of Italian design. Besides the Established church, there are a Free church, and chapels for Episcopalians, United Presbyterians and Independents. Rose's Academical Institution was endowed by a townsman, the late Captain Rose, R.N. There are also several other schools, and a savings bank. A corn-market is held every alternate Thursday. On the south side of the town, on the bank of the river, in the Constabulary Garden, are a few remains of Cawdor Castle, of which the Thanes of Cawdor were hereditary constables till 1747.

NAIRNSHIRE, a small maritime county in the north-east of Scotland, bounded N. by the Moray Frith, E. and S. by Elginshire, and W. by Inverness-shire, lies between 57° 20' and 57° 40' N. lat., 3° 40' and 4° 6' W. long., and extends from north to south about 22 miles, and from east to west about 10 miles. Its area is 215 square miles, or 137,500 acres, of which little more than one-fourth part is in cultivation: the rest consisting principally of waste, moor ground, wood, lake, and moss. The population in 1851 was 9956. The county unites with Elginshire in returning one member to the Imperial Parliament.

Coast-line, Surface, Hydrography, Communications.—The line of sea-coast extends about 10 miles. To the eastward are the Mavistoe sand-hills, whence it is supposed the great sand floods were blown which buried a great portion of the land to the eastward about two centuries ago. The westward part of the sea-shore is low and bare; near the coast runs a raised beach or terrace bank, composed of sand, gravel, and boulders, with shells occasionally mixed. The surface is of a varied character. The upper districts are hilly, the lower an undulating plain, from 1 to 5 miles broad, and characterised by a light and gravelly soil, with some deposits of clay and protruding rock. This portion is occupied by cultivated fields of wheat and the usual cereals; grains; potatoes are grown plentifully. The upper parts of the county abound with thriving plantations of Scotch fir, larch, and hardwood. The Nairn and Findhorn are the only rivers belonging in part to this county. The Nairn rises in Strathnairn, in Inverness-shire; in Nairnshire it is joined by the picturesque burn of Cawdor. Its course

is in a north-easterly direction, through the richest part of the county; from its source to its fall into the Moray Frith is only 35 miles; trout and salmon are taken in it. The Findhorn is described in ELGINSHIRE. The lochs of Bellivat, in the parish of Ardsalach, and Loch Lee, in Auldearn, are the resort of wild fowl.

The leading lines of turnpike-road are those from Nairn to Forres, to Inverness, to Fort George, Campbeltown, and The Ferry; and to Grantown. Within the last 25 years good cross roads have been constructed in every direction over the county, and there is now constant steam communication between Nairn and Edinburgh, Aberdeen, Cromarty, and Inverness.

Geology, &c.—Nairnshire may be divided into the hilly regions of primitive rock, comprehending granite, gneiss, mica-slate, primary limestone, hornblende, quartz, &c., and the low undulating country comprehending old red-sandstone rocks. There are several quarries of freestone; the stones obtained from a quarry in the estate of Boath are much sought after for ornamental building.

Climate, Soil, and Agriculture.—The early part of spring is generally severe from snow showers, biting winds, and frost; in the early and later part of summer north-easterly winds are frequent. Along the coast the snow disappears much sooner than in the interior of the county. The general character of the soil is light and sandy, but in many parts the surface soil is a deep loam. In the upper districts, from the abundance of vegetable matter, &c., in the fields, lime has stimulated the soil to great productiveness. Over the county oats and barley are the staple, though wheat is also grown to a great extent. There is much improvement in the breeding of cattle, sheep, swine, and horses; and the agricultural implements employed are generally good. The universal term of lease is 19 years. The farms vary in size from 30 to 200 acres each of arable land.

Divisions, Towns, &c.—Nairnshire contains four entire parishes, and portions of five others belonging to the surrounding counties. The sheriff of Elginshire is also sheriff of Nairn. The only town is NAIRN. Only two agricultural villages are worthy of mention—*Auldearn* and *Cawdor*.

History, Antiquities, &c.—Near to the village of Auldearn, Montrose obtained a great victory over the Covenanters in 1645. About a mile west from Nairn the Duke of Cumberland's army encamped in 1746, prior to the battle of Culloden. The greater part of Cawdor Castle was built in 1454; though the popular tradition makes this the castle in which king Duncan was murdered by Macbeth. Kilravock Castle dates from 1460. Of ecclesiastical antiquities the most interesting are the ruins of the chapel of the Virgin at Geddes, and of the kirk of Barivan in Cawdor parish. The vitrified fort of Dun Evan is situated on the summit of a hill in the parish of Cawdor; that of Castle Finlay, in the parish of Nairn, unlike similar vitrified forts, is in a hollow part of the hill of Urchanly. Scattered over the country are many stone circles and cairns.

Religious Worship, Education, &c.—According to the Returns of the Census for 1851, there were then in the county 10 places of worship, of which 4 belonged to the Free Church, 3 to the Established Church, 2 to the United Presbyterians, and 1 to the Independents. The total number of sittings provided was 4948. The number of Sabbath-schools was 14, of which 8 belonged to the Free Church, and 2 each to the Established Church and the United Presbyterian Church; the total number of Sabbath scholars was 994. The number of day-schools was 21, of which 14 were public schools with 798 scholars, and 7 were private schools with 260 scholars. In 1853 there was one savings bank in the county, at Nairn. The amount owing to depositors on November 20th, 1853, was 3523*l.* 6*s.* 1*d.*

NAJAC. [AVNYRON.]

NAKHICHEVAN. [GEORGIA.]

NAKITSHEVAN. [EKATARINOSLAV.]

NAMUR (*Namen*), a province of Belgium, is bounded N. by Brabant, N.E. and E. by Liège, S.E. by Luxembourg, S. by France, and W. by Hainault. Its greatest length from north to south is 55 miles, from east to west 45 miles; its area is 1411 square miles, and the population in 1849 was 268,143. The province is watered by the Meuse, the Sambre, the Lesse, and several small streams. [MEUSE.] The south of the province is divided in two parts by a long projection of the French territory which terminates near the strong fortresses of Givet and Charlemont, on the Meuse. The soil of the province is generally fertile, consisting for the most part of an unctuous marl, but without any great depth. The valley of the Meuse between Namur and Liège is exceedingly beautiful. Of the three arrondissements into which the province is divided, namely, Namur, Dinant, and Philippeville, that of Namur is the most productive, the other two being more stony. The principal agricultural products are wheat, rye, oats, barley, hemp, flax, and chicory. The grain harvests do not more than suffice for the consumption of the province. There are few natural meadows in the district of Namur, but in the other parts of the province the meadows are the most profitable of the lands. Artificial grasses are also much cultivated. Wood grows abundantly in the province. The trees are principally oak, beech, ash, hornbeam, birch, and hazel. The breeding of draught horses forms an important branch of rural occupation; they are strong and active, and the farmers are careful to preserve the breed unmixed. Great numbers of swine are bred.

GEOG. DIV. VOL. III.

The iron-mines of this province, which lie between the Sambre and the Meuse, are very productive, and give employment to a large portion of the population. Lead-mines are worked near the city of Namur. A great number of coal-mines are worked. Marble is quarried in different parts of the province; it is of various colours, red, gray, blue, and black; the greatest portion of what is raised is exported to France. Pottery-clay is found. The department is crossed by the Liège-Namur railroad, and by the Sambre and Meuse line from Charleroi to Mariembourg and Couvin in the valuable iron and coal district in the west of the province.

Namur, the capital, situated in 50° 28' N. lat., 4° 48' E. long., 67 miles by railway S.E. from Brussels, at the confluence of the Sambre and the Meuse, has 20,471 inhabitants. It is strongly fortified, entered by 11 gates, and commanded by a strong citadel, built on high ground, from which there is a beautiful view of the town and the two rivers. The streets are wide and clean; the houses are mostly built of a bluish stone, and are slated. There are several squares; two bridges, one over the Meuse, the other over the Sambre; and six churches, one of which is a cathedral, dedicated to St. Aubin. This is a fine building of modern architecture; the front is ornamented with 20 Corinthian columns, sustaining a cornice which bears several statues of white marble. On either side of the great altar are fine statues in Carrara marble, representing St. Peter and St. Paul. The new pulpit in this cathedral is considered a masterpiece of oak carving. The situation of Namur, at the confluence of two navigable rivers, is favourable to commerce. The chief manufactures are—superior cutlery, surgical instruments, tin and brass ware, copper utensils, tools of all kinds, agricultural instruments, ironmongery, and leather. The iron, lead, and coal mines and marble quarries of the neighbourhood, give employment to a large portion of the population. Steamboats ply between Namur and Liège. *Andenne*, situated on the right bank of the Meuse, near to the border of Liège, has a population of 5000. *Dinant*, likewise situated on the Meuse, has a cathedral, two hospitals, a population of 6500, who manufacture woollen cloths, hardware, paper, and hats. *Fosse*, a small town about 9 miles S.W. from Namur, has about 8000 inhabitants, who are chiefly employed in the coal-mines and marble-quarries of the vicinity. *Philippeville*, built on an eminence 17 miles W. by S. from Dinant, and fortified, is composed of wide well-paved streets, and has about 1200 inhabitants. Near it is Walcourt on the Heure, a walled town, with about 1500 inhabitants, tanyards, iron-works, and iron-mines. It is situated on the Sambre and Meuse railway. *Mariembourg*, a small fortified town with about 800 inhabitants; and *Couvin*, with about 3000 inhabitants, lie on the same line of railway nearer the French frontier, and both have important iron-works. Near *Sombreffe*, a small place in the north-west of the province, was fought the battle of Fleurus, in which the Austrians were defeated by the French in 1794. In this same vicinity is *Ligny*, a small village which gives name to the victory of the French over the Prussians, commanded by Blücher, June 16th, 1815.

NANCY, once the capital of Lorraine, now of the French department of Meurthe, is situated on the left bank of the Meurthe, 220 miles E. from Paris on the Paris-Strasbourg railway, in 48° 41' 31" N. lat., 6° 11' 22" E. long., 655 feet above the level of the sea, and had 40,289 inhabitants in the commune at the census of 1851. It is built in a beautiful and fertile plain at the foot of wooded and vine-covered hills, and consists of two parts, the old town on the north and the new town on the south. The old town is irregularly built. The new town has wide and straight streets, lined with good houses.

The stateliness of its public buildings, and the extent and beauty of its squares and public walks, render Nancy one of the handsomest of the departmental chief towns of France. The Place-Royale is the finest of the squares: one side is formed by the town-hall, containing a gallery of pictures; two other sides are occupied by the episcopal palace, the custom-house, the theatre, and some private houses. In the angles of the square are four beautiful fountains, in the centre a statue of Stanislas Leszinsky, ex-king of Poland and duke of Lorraine, and at one end a triumphal arch. The Place d'Alliance is adorned with a beautiful sculptured fountain and a fine alley of lime-trees. In the old town are the Place St-Epore, so called from the ancient church of St-Epore which is surmounted by a square tower, and is adorned in the interior with several good paintings, a fresco by Leonardo da Vinci, and a beautiful bas-relief of the Last Supper: the Place des Dames, a rectangular square surrounded by large hotels; the Place de Grève, in the centre of which are the water-works which supply the different quarters of the town; the Cours d'Orléans, which is a continuation of the preceding, is planted with trees, and terminated by a handsome triumphal arch of the Porte-Neuve, by which the city is entered from the side of Metz; and the Place Carrière, which, like the Place de Grève, is a long rectangle, and is separated from the Place Royale by a triumphal arch. At the north end of this square is a fine palace occupied by the prefect of the department; it is united by a lofty gallery to the two pavilions which form the angles of the square towards the north. The two buildings at the southern angles of the Place Carrière are occupied by the high court of justice and the tribunal of commerce. Two streets run in a direct line from the Place Royale to two of the town-gates, which are built like triumphal arches. The town possesses several richly ornamented churches, the

3 X

most remarkable of which are the church of St. Epore already mentioned, the cathedral, and the church of the Cordeliers.

The cathedral, a modern structure in the new town, has a handsome façade richly decorated with sculptures and open stone work, and flanked with two lofty towers capped with domes and lanterns 256 feet high. The interior presents handsome proportions and is neatly decorated; the space between nave and choir is covered with a dome of cut stone 130 feet in diameter, painted in imitation of the open sky. The choir, which is shut off by an iron screen, is paved with black and white marble, and contains a beautiful high altar, constructed of many coloured marbles, and a great number of carved stalls. The gates of the town are imposing structures of their kind; most of them are adorned with graceful and appropriate bas-reliefs. The principal are St. John's, Stanislas, Notre-Dame, and St. Catherine's gates. A little way outside St. John's Gate is the cross which marks the spot whereon the body of Charles the Rash was found after the battle mentioned below. The central house of the order of Sisters Hospitaliers, who devote themselves to tend the sick poor, is at Nancy; they have houses in many other departments of France, and in parts of Germany. The city possesses an institution for deaf-mutes from the departments of Meurthe, Moselle, Meuse, Ardennes, and Vosges. The little church of Bon-Secours, in the suburb of St. Pierre, built by René II. to commemorate his victory over Charles the Rash, the last duke of Bourgogne, Jan. 5th, 1476, is adorned by the monuments of Stanislas Lecsinaky and his wife.

In the old town is the ancient gothic castle, the former residence of the dukes of Lorraine; and adjacent to it is the small church of the Cordeliers, built in the Renaissance style of architecture. This church was the burial-place of the ducal family. The tomb of René II. and some others are in the church itself; others are in the ducal chapel attached to the choir. At the commencement of the first French revolution the tombs in this beautiful church were demolished, the remains of the princes of Lorraine, which were deposited in leaden coffins in the vaults, were dragged out and interred in the cemetery of the town. After the restoration, Louis XVIII. had the remains replaced in their original resting place. The Emperor of Austria still maintains a chaplain to say mass in the church of the Cordeliers for the souls of his ancestors, the dukes of Lorraine. The other important structures are—the university buildings, in which is the public library of 23,000 volumes; the college buildings; the infantry and cavalry barracks; the theological college; five hospitals, one of which is for foundlings; and the public baths. Nancy is connected by a branch from the Paris-Strasbourg railway with Metz, Forbach, and Mannheim on the Rhine; from Metz this line is continued northward down the valley of the Moselle to Thionville.

The inhabitants manufacture hosiery, embroidered muslin, cotton-yarn, woollen-cloth, calico, lace, oil, chemical products, liqueurs, and leather. Trade is carried on in the various articles just named, and in corn, wine, brandy, hides, wool, and iron. There are two yearly fairs, one of which lasts 20 days.

Nancy is the seat of a bishop, whose see is the department of Meurthe; of a High Court, which has jurisdiction over the departments of Meurthe, Meuse and Vosges; and of a university-academy, the limits of which comprise the departments of Meurthe, Meuse, Moselle, and Vosges. It has tribunals of first instance and of commerce, a chamber of commerce, a college, a museum, a medical school, a botanic garden; a scientific, literary, and artistic society; and several charitable institutions.

Nancy existed in the 11th century, and perhaps much earlier. From the 13th century it became the capital of Lorraine, whose dukes had here a vast fortified palace. The town was enlarged and the palace rebuilt by Duke Ferry III.; it was further enlarged by the dukes Jean and Charles II. The suburbs were demolished on the approach of the Burgundians under Charles the Rash, and the ramparts erected on their sites, which enabled the brave Lorrainers to resist his furious assaults. Charles had taken the town in 1475, but it was retaken by the nobles of Lorraine the following year. Charles then besieged the city, and it was suffering terribly from famine, when it was relieved by René II.; in the battle that took place under the walls Charles lost his life. The French occupied Nancy from 1633 to the treaty of Vincennes (1661), according to which the fortifications were ordered to be demolished. This was executed in part, but Louis XIV., having again taken the town in 1670, rebuilt the defences. These were finally destroyed after the treaty of Ryswyk, with the exception of the citadel and the gates. Nancy is indebted for its chief beauties as a city to Stanislas Lecsinaki, ex-king of Poland and duke of Lorraine, who made it his residence. [LORRRAINE.]

NANKING, a town in China, the capital of the province of Kiang-su, on the south bank of the river Yang-tse-kiang, near 32° N. lat., 118° E. long, and about 120 miles from the mouth of the river. This town was the capital of the empire to the end of the 13th century, and at that time the largest town on the globe. The Jesuits, when surveying the town for the purpose of making a plan of it, found that the circuit of the exterior walls was 37 lies, or nearly 20 miles; and this agrees with the description given by Sir J. F. Davis ('Sketches of China'), who says that the walls are 20 miles in circuit, and that the area reminded him of Rome, though the walls are higher, as the present town occupies less than half the ancient

site, the remainder being either waste or laid out in gardens, with the remains of paved roads and scattered cultivation; but Nanking has no antiquities. Chinese architecture, except their walls, is not very enduring, and the Tartars destroyed palaces, temples, and sepulchres. The town began to decrease when Kublai-khan removed the Imperial residence to Peking, and still more rapidly when the six great tribunals, which for some time were kept at Peking and Nanking, were attached to the court at Peking. When this took place the name of the town Nanking (the Southern Court) was changed into that of Kianning-foo, as it is now always called in public documents, though the people continue to call it Nanking.

The present town, which is about 3 or 4 miles from the river, consists of four principal streets, running parallel to one another, and intersected at right angles by smaller ones. Through one of the larger streets a narrow channel flows, which is crossed at intervals by bridges of a single arch. The streets are not spacious, but have the appearance of unusual cleanliness. The population, which is said to have been once four millions, was lately estimated at 300,000. It was the residence of the first viceroy of the empire, was celebrated as a principal seat of Chinese learning, furnishing more members to the imperial college at Peking than any other city; it carried on a considerable trade, by means of the canal which connects it with the river, with the ports of Su-tcheou-foo and Shang-hai; it was famed for its manufactures of crapes, books, and paper, and it exported much tea and silk. But in the civil war, which broke out in 1851, the rebels advanced to Nanking, and in March 1852 captured it. This has interrupted the trade, but as little opposition was made, the town probably suffered but little.

None of the buildings of Nanking are distinguished by their architecture, except some of the gates, two temples noticed by Sir John Davis, and the famous Porcelain Tower, which is attached to one of the pagodas, or temples. This building is octagonal, and of considerable height in proportion to its base, the height being more than 200 feet, while each side of the base measures only 40 feet. It consists of nine stories, all of equal height, except the ground-floor, which is somewhat higher than the rest. Each story consists of one saloon, with painted ceilings; inside along the walls statues are placed. Nearly the whole of the interior is gilded. The material of the wall seems to be a highly-polished stone; but probably it is composed of bricks made of a fine clay, susceptible of impressions, as the figures show which appear on them. On the outer side of the wall they are white, and, according to Ellis, are merely the white bricks frequently used in China. At the termination of every story a roof, built in the Chinese fashion, projects some feet on the outside, and under it is a passage round the tower. At the projecting corners of these roofs small bells are fastened, which sound with the slightest breeze. On the summit of the tower is an ornament in the form of the cone of a fir-tree: it is said to be of gold, but probably is only gilt; it rests immediately upon a pinnacle, with several rings round it. This tower is said to have been 19 years in building, and to have cost 400,000 taels.

NANT. [AVEYRON.]

NAN-TCHANG-FOO. [CHINA.]

NANTES, a large sea-port town, the capital of the French department of Loire-Inférieure, stands on the right bank and about 30 miles from the mouth of the Loire, in 47° 13' 8" N. lat., 1° 32' 55" W. long. at a distance of 270 miles by railway S.W. from Paris, and had 91,303 inhabitants in the commune at the census of 1851. The ground on which the cathedral stands is 62 feet above the sea-level, but some parts of the town are only about 40 feet above that line. The city is admirably situated for commerce, having communication with the interior by railway, and by steam-boats up the Loire, which forms the harbour of Nantes, and admits at high water large vessels up to the quays which line its banks. Formerly only vessels of 200 tons could make their way up to the city, whilst vessels of larger size were obliged to unload at Paimboeuf, but by means of steam-tugs and dredgers large vessels are brought up to the quays. [LOIRE-INFÉRIEURE.] The Erdre, which enters the Loire from the north, and the Sèvre-Nantaise, which empties its waters into the Loire just below the town, are both navigable streams. Besides these facilities for traffic, Nantes has communication by canal with Brest. The town is wall-built, very clean, and well laid-out, especially in the more modern part, which is remarkable for the regularity and elegance of its squares and public places; the Isle Feydeau (which is surrounded by fine quays, and joined to the town by a handsome bridge), the Graalin quarter, and the Place-Royale, will bear comparison with the finest parts of Paris. Indeed the quays, which extend 2 miles along the Loire and along both banks of the Erdre, the magnificent river covered with craft of various sizes, the islands, the meadows that stretch along the river bank opposite the town, the bridges across the Erdre and the arms of the Loire, and the harbour of Lafosse, form a very striking picture. The quays, planted with trees, and backed by large warehouses and other buildings, form very handsome promenades. But the most delightful of the public walks is that formed by the Cours St.-Pierre and St.-André, which run from the Loire to the Erdre, passing the old castle of the dukes of Bretagne: it is formed by four rows of trees, separated by a wide carriage-way, and backed by lines of handsome houses; statues of the Duchess Anne, Du Guesclin, and other

distinguished Bretons, are erected along this walk. The picturesque gable-fronted houses which in the older parts of the town overhang the dark narrow streets, are fast disappearing under modern improvements. In the new parts the streets are wide and well-paved; the houses are built of stone and roofed with slates.

The most remarkable objects in Nantes are—the ancient castle, the birthplace of the Duchess Anne, which stands on the banks of the Loire; its chapel is now a powder magazine: the castle of Bouffay, which is now used as a prison: the cathedral of St. Pierre, the nave and south transept of which alone is finished; the portal entrance, the wood carving, and the stone tracery of the organ loft in the nave, are greatly admired; in the south transept is the splendid mausoleum erected by the Duchess Anne to Francis II., the last duke of Bretagne, and his wife Margaret of Foix: the prefect's residence, the finest modern structure in Nantes; the exchange, which is adorned with several statues; the theatre, which stands in the Place Graalin; the museum of natural history; the picture gallery, which contains several paintings by the great masters; and the public library, which is on the quay Brancas, and contains 30,000 volumes, besides several valuable manuscripts. A lighthouse was erected in 1851 for the benefit of the commercial harbour. A new court-house (Palais de Justice) built in a handsome palazzo style, consisting of a basement and two stories with attics several windows' length on the sides, was opened in 1852. This building contains several courts, reception halls, and depositories for the archives of the department. The Duc de Feltre's gallery of pictures recently presented to the town is placed in a building adjoining the museum.

Nantes contains 33 squares, 450 streets, and 16 bridges. The Place-Royale, which presents a figure of nine sides, is formed by as many masses of buildings constructed on a symmetrical plan; the ground-floors are occupied as shops, which for elegance and splendour are not inferior to those of Paris or London. The Place Graalin is smaller than the preceding; but it is magnificently built, and contains several fine hotels. Suburbs are built on several of the islands and connected by bridges; and at the mouth of the Sèvre is the suburb of Madeleine, on the south side of the Loire, through which the Bordeaux road runs.

The industrial products of Nantes are, white and printed cottons, cotton-twist, refined sugar, ship cordage, glue, chemical products, blankets, serge, flannel, ship biscuits, &c. There are several ship-building yards, copper foundries, tan-yards, brandy distilleries, bleach-mills, and dye-houses. Vessels are fitted out for the whale and cod fisheries. The foreign and coasting trade is active. The chief articles of export are wine, brandy, woollen-cloths, silk, paper, linen, gold and silver lace, hardware, prepared meats, provisions, furniture, small wares, books, &c.; the imports are composed of ship-timber, planks, hemp, pitch and tar, steel, copper, lead, wool, raw cotton, oil, Spanish wine, cochineal, dye-stuffs, gum, ivory, perfumes, and colonial produce. Other articles of commerce are salt, butter, coal, building stone, hoops, flour, vinegar, and agricultural implements. The total number of vessels that entered and cleared out of the harbour in 1852 amounted to 14,935 ships and steamers of all sizes, with 580,843 tons burden, and 61,573 men.

Nantes gives title to a bishop, whose see is the department of Loire-Inférieure. It is the head-quarters of the 15th Military Division, and contains tribunals of first instance and of commerce, an exchange, a council of prud'-hommes, a bank, several insurance offices, a custom-house, a mint, a school of hydrography, a college, an ecclesiastical college, a school of medicine, and several literary and benevolent institutions. Foreign consuls reside in Nantes.

Nantes takes its name from the ancient Namnetes, whose capital it was. Among the important events in its more modern history are—the marriage of the Duchess Anne to Louis XII. in 1499, which united Bretagne to France; the issuing of the edict of Henry IV., April 30, 1598, by which the Calvinists were guaranteed the free exercise of their religion; the revocation of this edict by Louis XIV. in 1685; the fierce but unsuccessful attack which the town sustained (June 29, 1793) from the Vendéans under Cathelineau; the unparalleled butcheries committed soon after by Carrier and other republican agents; and the arrest of the Duchess de Berry, January 7, 1832.

NANTUA. [AIN.]

NANTUCKET. [MASSACHUSETTS.]

NANTWICH, or NAMPTWICH, Cheshire, a market-town and the seat of a Poor-Law Union, in the parish of Nantwich, is situated on the river Weaver, in 53° 4' N. lat., 2° 30' W. long., distant 20 miles S.E. by E. from Chester, and 164 miles N.E. from London by road. The population of the town in 1851 was 5426. The living is a rectory in the archdeaconry and diocese of Chester. Nantwich Poor-Law Union contains 84 parishes and townships, with an area of 104,315 acres, and a population in 1851 of 35,948.

Nantwich is mentioned in the Domesday Survey by the simple designation Wick, and the salt-works, to which the town for so long a period owed its prosperity, are noticed. The town is in a low flat situation, chiefly on the right bank of the Weaver, and is irregularly laid out. It consists of three principal streets, which unite near the church, and of some others. The houses are commonly old, built of timber and plaster, with large bay windows and projecting upper stories. The church is cruciform, and is chiefly of the decorated style.

It has an octagonal tower 110 feet high, rising from the intersection of the nave and transepts. Wesleyan, Primitive, and Association Methodists, Independents, Quakers, and Unitarians have places of worship. There are a Free Grammar school, founded in 1561, which had 85 scholars in 1853; a Blue-Cap school; National, British, and Infant schools; a mechanics institute; and a savings bank.

The brine-springs and salt-works of Nantwich were of great celebrity and antiquity, but only one spring is now worked. The chief manufactures are of shoes, gloves, and cotton goods. There are some malting establishments. Several canals unite in the neighbourhood of the town. The weekly market is on Saturday; a large market for cattle is held once a fortnight, on Saturday, in February and March. There are four yearly fairs. A county court is held in the town.

NAPERVILLE. [ILLINOIS.]

NAPLES, KINGDOM OF, is the name commonly given to the continental part of the Kingdom of the Two Sicilies. In the administrative language of the country it is styled Sicilia Citeriore, 'Hither Sicily,' or *Dominj di quà dal Faro*, 'Territories on this side of the Straits of Messina.' It comprises the southern half of Italy, being bounded N.W. by the Papal States, and on every other side by the sea. The frontier line between the kingdom of Naples and the Papal States begins on the coast of the Mediterranean, at the tower Dei Confini, which is a mile or two S.E. from Terracina. Then follows an offset of the Lepini Mountains as far as the valley of the river Sacco. Crossing that valley, the line proceeds first in a northern and afterwards in a north-north-western direction along several ramifications of the Apennines, which divide the waters of the Liri from those of the Anio; then ascending the loftier group to the west of the Lake Fucino, it descends the Salto into the valley of the Velino, crosses that river a little to the east of Rieti, and then crosses the central ridge of the Apennines between the sources of the Nera and those of the Tronto. Descending along the eastern slope of the central ridge, the line follows an offset which skirts the right bank of the Tronto, and afterwards, below Ascoli, the river itself forms the boundary down to the Adriatic. The whole of this tortuous boundary-line (which in all the vicissitudes of the country, for eight centuries, has never varied) is about 150 miles; but the direct distance, from the Mediterranean to the Adriatic coast is not quite 120 miles. Four roads, which are ultimately reduced to two, lead into the kingdom; one by Terracina to Fondi, along the coast of the Mediterranean; the second from Rome, by Palestrina and the valley of the Sacco, into the valley of the Liris, and thence into the valley of the Volturno, where it joins the former; the third, by Rieti, Civita Ducale, and Antrodoto, to Aquila and the valley of the Pescara; and the fourth by Ascoli to Teramo, and along the coast of the Adriatic to the banks of the Pescara likewise.

The greatest length of the kingdom of Naples, from the Tronto to Capo Spartivento, at the southern extremity of Calabria, is about 350 miles, in a line running through the centre of the peninsula. The breadth varies; in the northern part, between the mouths of the Garigliano and Pescara, it is about 85 miles wide; between Cape Misenum and the mouth of the Fortore it is 100 miles; and from Naples to Vietri, on the promontory of Mount Gargano, it is 125 miles. From Naples to Manfredonia it is about 100 miles. South of Naples, the Gulf of Salerno on one side, and that of Manfredonia on the other, reduce the breadth to 83 miles; but farther south it again widens from the point of Licosa, near Paestum, to Moli di Bari, on the Adriatic, a distance of 130 miles, which is the utmost breadth that the kingdom of Naples attains. The Iapygian peninsula projects in an oblique direction to the line of breadth for about 90 miles, with a mean breadth of 30 miles.

The breadth of the kingdom again becomes contracted between the Gulf of Taranto on the east and the Gulf of Policastro on the west, it being about 65 miles from the mouth of the Bradano to that of the Trecchina. It becomes still narrower to the southward: it is 45 miles between the Gulf of Lao and the Gulf of Taranto; and 35 miles from the mouth of the Cratis to Cape Cetraro, after which it widens again to near 60 miles for a length of about 50 miles. South of the Cape delle Colonne the land becomes contracted into a narrow isthmus about 14 miles across, between the gulfs of Squillace and Sant' Eufemia, and beyond this it spreads again to a breadth of 25 to 35 miles throughout the length of the province of Calabria Ultra. The population of the continental dominions numbered in 1825, 5,456,664; in 1832, 5,809,000; in 1837, 6,021,284; and in 1851, 6,612,892. Of the population about two-thirds live by agriculture, about half a million by manufactures and other mechanical labour, another half million by trade, including sailors and fishermen; the priests, monks, and nuns amount to about 50,000; lawyers, 8000; medical men about 9000; and persons employed under government 30,000.

The provinces of the kingdom are noticed under their proper heads, and to these the reader of this work is referred for a more particular description of the surface, and for the topography of the towns, &c. In the present article only a brief general survey of the country, its resources, and productions can be given. [APULLA; BARI, TERRA DI; CAPITANATA; &c.]

The Apennines, which run through the centre of the kingdom, form in several parts large masses and high table-lands, which, with their numerous offsets, occupy, especially in the southern part, almost the

whole breadth of the peninsula. [APENNINES.] Two extensive plains, Apulia and Campania, spring out, the former to the east and the other to the west of the Apennines, forming the province of Terra di Lavoro. [LAVORO.] Numerous valleys lie between the offsets of the Apennines, of which those on the side of the Adriatic are mostly transverse, while on the side of the Mediterranean the valleys of the Volturno, and its affluents the Calore, Sabato, and Tamaro, and the valley of the Tanagro, an affluent of the Sele, and some others, are longitudinal, running between ridges parallel to the central chain. In addition to the general features of the country, there is a strip of low land along the coast between the base of the mountains and the sea, varying in width from ten miles to one mile, and in some places even less, especially in eastern Calabria and some parts of Abruzzo, where the mountains advance close upon the sea. This low region is hot and naturally fertile, but unwholesome in parts, and exposed to inundations from the mountain torrents.

Among the river-basins is that of the Liris, or Garigliano, which is about 60 miles long, not reckoning the windings of the river, from its source at Mount Camicciola, in the Abruzzo, to its estuary near the site of ancient Minturnæ. [LAVORO.] The breadth of the basin in the upper course of the river is much contracted between the central Apennines to the east and the Sabine Mountains to the west, which latter divide it from the basin of the Anio; but after passing Sora it spreads to about 20 miles in breadth, including the courses of the Fibreno, Melfa, Rapido, Frigido, and other affluents. It also drains part of the Campagna-di-Roma through the channel of the river Sacco. The Garigliano is a deep river, always full of water, and is navigable for boats in the lower part of its course. West of the basin of the Garigliano, and separated from it by the mountains of Itri, is the small basin of Fondi, containing a low plain of about 50 square miles in extent, and drained by the small river Vetera. The basin of the Volturno is the largest and most important in the kingdom. The Volturno drains the greater part of the province of Terra-di-Lavoro, and its affluent the Calore is the drain of Principato Ultra, making in all an area of nearly 3000 square miles. The Volturno has a tortuous course of nearly 100 miles, and the Calore runs for about 60 miles before its junction with the Volturno. The fertile plain east of Mount Vesuvius, and between it and the Apennines, forms a small basin which is drained by the river Sarno. The basin of the Sele and its affluent the Tanagro includes the greater part of the province of Principato Citra, and a part of that of Basilicata which lies west of the central ridge. The Sele has a course of about 60 miles altogether, and the Tanagro a course of about 35 miles above its junction. South of the basin of the Sele the peninsula becomes narrow, the Apennines come close upon the sea, and the course of the rivers towards both coasts is very short. Calabria has only numerous mountain torrents, each of which drains its narrow valley. The basin of the Crati however forms an exception. This river which drains the fine valley of Cosenza, and enters the Gulf of Taranto, has a course of about 60 miles, and is the largest river of Calabria. [CALABRIA.] The basin of Basilicata, with its four parallel rivers, the Agri, Sinnò, Bradano, and Basiento, is described in the article BASILICATA. East of Basilicata, the narrow Iapygian peninsula, which is intersected in its length by a low barren ridge, has no water-course of any importance; and this is also the case with the province of Terra di Bari. [OTRANTO; BARI, TERRA DI.] The Ofanto, one of the principal rivers of the kingdom, rises in the Apennines of Conza, within the boundaries of Principato Ultra; it drains the part of that province which lies east of the Apennines, and also the northern part of Basilicata, as well as a part of Capitanata and Terra di Bari, and after a course of above 70 miles enters the Adriatic. [BASILICATA.] The great plain of Apulia is drained by the Carapella, Cervaro, and Candelaro, the courses of which are nearly parallel, and run from the central Apennines to the sea. The Candelaro has several affluents, and drains a considerable tract of country between the group of Monte Gargano and the Apennines of Lucera and San Severo. [CAPITANATA.] The Abruzzi contain numerous and rapid streams, which run direct to the sea along deep valleys between lofty parallel ridges; but there are no extensive basins, with the exception of that of the Pescara, which has a course of above 80 miles, and receives on one side the waters of the central chain of the Apennines, including Monte Velino, which runs north of Lake Fucino, and on the other those of the lofty mass of Monte Corno, which projects eastward towards the Adriatic coast, and has snow on its summit almost the whole year. [APENNINES.] The Pescara above the middle of its course passes through a narrow defile near the town of Popoli, and turns eastward towards the Adriatic, receiving from the south the waters of another great outlying group of Apennines, called Monte Majella, in the province of Abruzzo. [ABRUZZO.] The basin of Lake Fucino, or Celano, in the centre of the peninsula, is surrounded by mountains on every side. The lake, which is described under CELANO, receives the waters of high lands covered with snow for a great part of the year. It has naturally no visible outlet. The bottom of the lake is much higher than the neighbouring valleys of the Liris and the upper Pescara. On the side of the Liris the intervening ridge about Capistrello is much depressed, and there a tunnel was made in the time of the emperor Claudius. The Liris runs in a deep narrow valley about three miles from the lake. Works are now (Jan., 1855) in progress for draining the lake by enlarging and completing the tunnel of Claudius, and for

forming a channel of communication with the Liris by which all future accumulations of water may be carried off. By this important public work not less than 33,000 acres of the richest soil will be reclaimed.

The kingdom of Naples has a coast-line of about 1500 miles in length, two-fifths of which lie on the west or Mediterranean Sea, and the rest on the Ionian and Adriatic seas. The Ionian Sea extends from the Strait of Messina to Cape Leuca, at the extremity of the Iapygian peninsula. Unfortunately this very extensive line of coast has few harbours. The deficiency of tides in the Mediterranean renders the estuaries of rivers useless for the purposes of navigation. The principal harbours on the Mediterranean coasts are those of Gaëta and Naples; Baia, in the Gulf of Pozzuoli, and Castellamare; but they are either artificial ports or mere roadsteads. South of Castellamare, as far as the Strait of Messina, there is no harbour. The artificial port of Salerno is filled up with sand, which has been the fate of most harbours on the coast of the kingdom wherever a mole has been constructed. To prevent this evil the practice now is as at Nisita to raise, instead of continuous moles, piers made of arches, as the ancients did at Puteoli. On the Ionian Sea are the ports of Taranto and Gallipoli; the last has merely a roadstead. On the Adriatic are Otranto, Brindisi, Trani, and Barletta, all filled up, or nearly so, by accumulations of sand; but Manfredonia has a very good roadstead. Bari has a tolerable harbour for vessels of small draught. On all the coast of Abruzzo there is no harbour; the mouth of the Pescara and the mole of Ortona afford shelter only for small craft.

Statistica.—The continental territories of the kingdom of the Two Sicilies are divided into 15 provinces, the area, subdivisions, and population of which are given in the subjoined table. The provinces beyond the Faro are given under SICILY.

Provinces.	Area in Square Miles.	Districts.	Communes.	Population in 1851.
Napoli	381	4	65	822,142
Terra-di-Lavoro	2,493	5	230	752,012
Principato Citra	2,262	4	158	558,809
Principato Ultra	1,407	3	132	383,414
Basilicata	4,145	4	121	501,222
Capitanata	2,916	3	62	318,415
Terra di Bari	2,358	3	53	497,423
Terra d'Otranto	2,371	4	180	409,000
Calabria Citra	2,619	4	146	435,811
Calabria Ultra (II.)	2,063	4	151	381,147
Calabria Ultra (I.)	2,194	3	104	319,662
Molise or Sannio	1,777	3	135	360,549
Abruzzo Citra	1,243	3	121	312,399
Abruzzo Ultra (II.)	2,519	3	110	329,131
Abruzzo Ultra (I.)	1,227	2	72	231,747
Total	32,475	52	1840	6,612,892
Population of Sicily at the Census of 1851				2,091,580
Total population of the kingdom of the Two Sicilies				8,704,472

Agriculture and Products.—Agriculture is generally speaking in a backward state, although the climate is singularly genial, and the soil, except in the mountains, extremely fertile. The long-continued abuses of the feudal system, with its endless oppressions and restrictions, both as regarded person and property, rendered the pursuit of agriculture as a science impossible. Whatever crop could be raised with least labour, expense, and risk, without regard to the capabilities of the soil, became the object of the farmer's attention. Hence the cultivation of the vine spread over the best lands in the kingdom; with time the people became wedded to the system; and vast districts peculiarly fitted for the production of corn, oil, and silk, are rendered comparatively valueless, because no such crops have been raised upon them before, and because a system sanctioned by long custom cannot be readily relinquished. Next to the vine comes the olive as a staple production, and then maize and beans, preparations of which form the chief food of the mass of the people, and the cultivation of which requires but little skill. Cattle are generally stall-fed on straw and green food, which is raised without effort on the richer soils. The chief food of horses is lupins mixed with straw; hay and corn are luxuries known only to the horses of the nobility. Meadows are generally unknown. In many of the corn districts (with the exception of those near the metropolis) manuring and artificial grasses are disregarded, the system pursued being an unvarying round of corn and fallow. It is true many able works on agriculture have issued from the press of Naples, and many elaborate reports from societies have seen the light, but the instruction which these contain has rarely been reduced to practice, and has not yet reached the local worker. In the cultivated uplands, which embrace by far the largest portion of the kingdom, not including the higher ranges of the mountains, farms vary in extent from two to seven acres. Here after a fallow the rotation is maize or potatoes, next wheat, then rye or beans, and finally barley. In the Terra di Lavoro and the province of Naples, which comprise the ancient Campania Felix, farms are larger; and the land consisting of a light and rich volcanic soil, warmed in many parts by subterranean heat,

requires a different treatment. Here the system of fallowing is unknown: by tillage and manure the ground is kept in a high state of production, and irrigation is very generally practised, especially in raising garden stuffs. But the great characteristic of the Campanian system is the growth of corn under the shade of trees which protects the crop from the sun's rays: thus arable husbandry is combined with the cultivation of the vine, the mulberry, the orange, and the pine. The vine is trained to elms or poplars planted in rows; the other trees named are planted in rows from thirty to forty feet apart, leaving ample room for a crop of corn or green food between. The rotation in these farms is generally carried out with great skill, and the variety of the produce, comprising corn, wine, silk, olives, flax, pulse, and artificial grasses, is proof that no little industry is required to carry out the system. The great pasturage system of Apulia is sufficiently noticed in the article *CAPITANATA*.

The productions of the soil are various. The staple products are—corn, wine, fruits, oil, wool, and silk. The plains of Apulia produce vast quantities of corn for exportation. The average annual yield of the kingdom in corn is estimated at 10,000,000 quarters. A quantity of wool is exported from Apulia, where about 2,500,000 sheep are fed. [*CAPITANATA*.] Olive-oil of the best quality is exported in large quantities. Gallipoli is the great oil-mart. The mulberry is extensively planted for the growth of silk, the produce of which was formerly checked by heavy duties. Cotton is produced in the provinces of Bari, Terra di Lavoro, Napoli, Otranto, Basilicata, and Calabria. Wine is made all over the kingdom, and in great abundance and variety, but most of it is consumed in the country and within the year; and although some of the wine, especially that of Calabria, is as full-bodied and generous as any Portuguese and Spanish wine, yet little of it is kept or sent to the northern parts of Europe. Naples however exports wine to Rome, Genoa, and other parts of Italy. Some brandy is made and exported to America. Some of the wines made in the neighbourhood of Naples, at the foot of Mount Vesuvius (the latter is known by the name of 'Lachryma Christi'), and in the ancient Falernian district [*LAVORO*], are very fine and well flavoured. The country produces most kinds of fruit, such as figs, chestnuts, filberts, almonds, oranges, lemons, pomegranates, melons, peaches, and apricots. The date-palm produces fruit, which however ripens only in favourable situations. Raisins are abundant. Currants are grown in Calabria and the Terra di Bari; the best are produced in the little islands of Dino and Cirrella in the Gulf of Policastro. The carob is extensively grown. Tobacco is cultivated chiefly near Lecce, in the Terra d'Otranto; saffron in Abruzzo; and the sugar-cane in Calabria. Saffron grows wild about Aquila, Taranto, and Cosenza. The caper grows wild also in the stony parts of the Abruzzi, in Apulia, the Terra d'Otranto, and in the island of Ischia. Manna is produced abundantly in the Calabrias, and on a part of the Monte Gargano. In the marshy districts of the Salerno, and in the Adriatic provinces, rice is grown. Liquorice is a general and profitable crop in Basilicata and Calabria. Flax and hemp are also raised in considerable quantity. Maize is also much cultivated. Cheese is made chiefly in Abruzzo and Apulia.

There is a rich iron-mine near Stilo in the farthest Calabria, which is worked for the government. Coal is found also in Calabria near Briatico. Rock-salt is also found in Calabria, but it is not worked. Among other known mineral treasures are alum, sulphur, saltpetre, marble, basalt (which is quarried for building and paving), and pozzolan, or ground lava, used for subaqueous cement.

The forests with which the Apennines were once clothed have in great part disappeared. This is a very serious evil, for not only fuel and timber have become scarce, but the destruction of the forests has caused the springs to be dried up and occasioned summer droughts in the subjacent lands, whilst the winter rains have washed away the vegetable earth from the mountain sides and exposed the bare rock, and the torrents carrying down alluvial matter into the valleys and plains have damaged whole tracts of country, choked up the beds of rivers, and occasioned the formation of pestilential marshes. An attempt has been recently made to arrest the progress of the evil by the enactment of forest laws. [*CALABRIA*.]

The strip of maritime low land which skirts the sea-coast is in many places marshy and covered with underwood. Herds of black cattle, buffaloes, and pigs live in that unwholesome region. Something has been done of late years towards draining the marshes, especially between the mouth of the Volturno and Cuma, and on the opposite coast of Apulia. The number of live stock in the kingdom, according to a recent report, is estimated as follows:—4,000,000 sheep; 600,000 goats; 600,000 mules and asses; 300,000 oxen and cows; 60,000 horses, and 40,000 buffaloes. Pigs are almost entirely of the black breed; their number is not stated. The greater number of the sheep are fed on the Tavoliere of Apulia; the system of pasture is detailed under *CAPITANATA* (vol. ii., cols. 318, 319). The wool, which is fine, is mostly exported raw. Buffaloes are used for draught in Campania and Apulia. From a mixture of sheeps' and goats' milk a great quantity of cheese is made, which is much esteemed by the peasantry. Cheese made of cows' milk is greasy; that made from buffaloes' milk is rank. Butter is made from cows' milk in the neighbourhood of the capital only; olive-oil is the general substitute for butter, and the milk is used for making cheese.

Roads.—At the beginning of the present century there was no good carriage-road through the kingdom, with the exception of the high road from Rome to Naples, and this was broken at the Garigliano by a ferry, for which a fine suspension-bridge was substituted in 1832. The French, during their occupation of the country, made some roads for military purposes. But since the accession of the present king, Ferdinand II., there is scarcely a town in the remotest provinces which has not been connected with the capital by a good highway. There are two classes of roads, *Cammini Consolari*, Consular or main-roads, and *Cammini Traversi*, secondary, or cross-roads. Of the main-roads there are four—1, Naples to Rome (Roman road), through Capua, Mola, Fondi, and Terracina; 2, Naples to Reggio (Calabrian road), through Salerno, Cosenza, and Monteleone; 3, Naples to Otranto (Apulian road), through Avellino, Foggia, Bari, and Lecce; and 4, Naples to Aquila (Abruzzi road), through Capua, Venafrò, Isernia, and Sulmona. The cross-roads are arranged in four groups—9 connected with the Roman road; 26 with the Calabrian road; 13 with the Apulian road; and 11 with the Abruzzi road. There is besides a fifth class of secondary roads, called *Cammini de' Siti Reali*, from their connecting the capital with the royal residences. All these roads are admirably constructed; difficulties of the ground are overcome by high engineering skill, and the viaducts, bridges, and obstructions rank among the first works of their class in Italy. They are kept in good repair, and there is not a turnpike on any of them. The roads, canals, drainage works, rivers, forests, and fisheries of the kingdom are managed by a board, the members of which are architects and civil engineers.

There are two lines of railway open, one from Naples to Nocera, through Portici, Torre dell' Annunziata (whence there is a branch to Castellammare), Angri, and Pagani; the other from Naples to Capua, through Casalnuovo, Cancello (branch to Nola), Maddaloni, and Caserta. It is proposed to extend the former line through the valleys of the Sarno and the Sabato to Foggia and Manfredonia, and thence along the coast to Bari, Brindisi, and Otranto. Another extension southward has been projected through Salerno, Castrovillari, Cosenza, and Mileto to Reggio. The second line will be ultimately extended to the frontier of the States of the Church, either by way of Mola, Itri, Fonda, and Terracina, or by the valley of the Garigliano, through Pontecorvo, Aquino, to Ceprano. Other projected lines are the following:—From Naples to Termoli through Nola, Benevento, and Volturara, with a branch to Aquila through Popoli; and from Popoli another branch to Pescara, and thence along the Adriatic to Ascoli: from the proposed line to Reggio a branch to Melfi, Gravina, and Taranto, with a secondary branch from Gravina to Potenza.

Government.—The government of the kingdom of the Two Sicilies is an absolute hereditary monarchy. The king is assisted in the administration by a council of state, a council of ministers, and two Consulte, one for the continental dominions and one for Sicily. The council of state consists of an indefinite number of members appointed by the king from the nobility or the great officers of state. The superior judges and the heads of some of the principal departments of government are extraordinary members and have the right to vote; and a councillor is appointed for each province who has the privilege of being present at all discussions relating to his province. The king presides; in his absence the heir apparent, or a secretary of state, named for the purpose by the king. The council of state gives an opinion on projects of law, decrees, and acts of the government; the opinions of the members are entered in a minute book and submitted to the king, who adopts or rejects them at pleasure. The council of ministers is composed of eight secretaries of state and a president, who is also a member of the council of state. The decisions of this council have no force unless sanctioned by the king. The two Consulte have, as the name implies, merely to give their opinions on matters laid before them; they can originate nothing. The Consulta for the continental dominions numbers 16 members, for Sicily 8 members: each has its own president. The king takes their opinion on financial matters, treaties, tariffs, &c. In matters that concern the whole kingdom of the Two Sicilies the two Consulte deliberate together under the presidency of one of the ministers.

The provinces are arranged in three classes:—1, Naples, Terra di Lavoro, and Principato Citra; 2, Principato Ultra, Basilicata, Capitanata, Terra di Bari, Terra d'Otranto, Calabria Citra, and Calabria Ultra ii.; 3, Calabria Ultra i., Molise, and the Abruzzi. Each province is governed by an Intendente, or governor, appointed by the king and changed every three years. The powers of the Intendente comprise the civil, financial, and military administration of his province. He is assisted by a secretary and a council, which in provinces of the first class numbers 5 members, in those of the second class 4 members, and in those of the third class 3 members. In each province there is also a provincial council, which in provinces of the first and second classes numbers 20 members, in those of the third class 15 members. The members are appointed in the following manner. The communal councils in each province select among the land-owners, persons whom they approve of for members; the lists are submitted to the king who chooses as he thinks fit. The provincial council holds a session, not exceeding 20 days, once a year, to examine the accounts of the province, to recommend improvements, &c.; and at the close of its labours it names from the principal proprietors three persons from whom the king appoints one to be councillor of state for the province.

Each province is divided into districts (*distretti*) and these again into communes (*comuni*). There are 38 districts in the kingdom, and these are also arranged into three classes according to their wealth and population. The district is governed by a *Sottintendente*, or lieutenant-governor, who resides in the chief town of his district, his duty being to execute the orders of the *Intendente* and to report on matters laid before him by the communes. Each district has its council, consisting of a president and 10 members. The president is nominated by the minister of the interior and appointed by the king; the members are chosen by the king from a list of local proprietors filled up by the communal councils. The district council meets once a year for not more than 15 days, to examine and report to the provincial council on matters concerning the district. The districts are sub-divided for police purposes into circles (*circondarii*), of which there are 525 in the kingdom.

Finally, the communes also are arranged in three classes according to population and revenue. Each commune is governed by a *Sindaco*, or mayor, assisted by two *Eletti*, or aldermen, and a *Decurionato*, or communal council. The inhabitants at large are eligible to be members of this council, provided they possess a certain trifling qualification or practise a liberal profession. The names of persons thus qualified are elected by ballot; from the lists the king nominates the members of the councils for the first and second classes of communes, and the *Intendente* for the third class. In communes of the first class the council numbers not more than 30 members, 3 being appointed for every 1000 inhabitants; in the smaller communes the councils are composed of 8 or 10 members. The *Sindaco*, or one of the *Eletti*, presides at the meetings, which are held once a month. The communal council fixes the local rates, elects the *Sindaco*, and other municipal officers, administers the local revenues, and nominates to the king proprietors eligible to be appointed members of the provincial and district councils. The *Sindaco* has the management of the minor affairs of the commune, looks after the public establishments, the registration of births, deaths, and marriages, and is responsible for the commissariat of troops quartered in the commune. If there is no justice of the peace (*Regio Giudice*) in the commune, the *Sindaco* also has local jurisdiction in civil and criminal matters of minor importance. The *Eletti* act as deputies of the *Sindaco* and also as commissioners of police. This communal corporation, the basis of the whole system, has existed from time immemorial, having survived all the dynastic and constitutional changes, all the wars and conquests that have affected the country since the time of the Romans, of whose municipal system it is no doubt a remnant.

The judicial department consists of four '*gran corti civili*,' which sit at Naples, Aquila, Trani, and Catanzaro; a criminal court and a civil court in every head town of a province; a public prosecutor ('*giudice d'istruzione*') in every district, and a '*giudice di circondario*,' or police magistrate, in every circle. A supreme court of appeal, with jurisdiction in both civil and criminal matters ('*corte suprema di giustizia*') sits at Naples. Special courts, for the trial of offences against the state, are appointed by commission; from these there is no appeal. Finally, each commune has a magistrate called '*conciliatore*,' who holds courts of arbitration to prevent people from going to law for trifling causes: he has jurisdiction in minor disputes, and in actions involving not a greater amount than 6 ducats (a pound sterling), without appeal. The conciliator is elected by the communal council, but obtains his appointment (for three years) directly from the king, as do all the other judges named; he is eligible to re-election. Trials are public in the kingdom of Naples, as in France. The French civil and commercial codes, with some modifications, have been retained.

Education.—For the purposes of public instruction there is an elementary school in every commune; but these schools, established under French domination, are in many instances neglected, and the quality of education afforded by the best of them is very inferior: the result is that the great bulk of the population is illiterate. For the middle classes there are 38 grammar schools and 12 royal colleges; 5 lycées, at Naples, Salerno, Aquila, Bari, and Catanzaro, in which academical instruction and minor degrees may be obtained; and, lastly, the University of Naples, which has faculties of Catholic theology, law, philosophy, physical science, and medicine; 54 professors; and, on the average, about 1500 students. There are also special colleges at Naples for the army and the navy; the college of San Sebastian, directed by the Jesuit Fathers for the education of the children of the nobility; the Chinese College, for theological students natives of the celestial empire; and two ladies' colleges. To most of the monasteries also schools are attached, which are directed by the monks. Students for the church study at Naples and in the several diocesan seminaries.

The ecclesiastical establishment consists of 19 archbishops and 64 bishops, 72 clerical seminaries, 3 abbeys, and 3746 rectors of parishes. The ecclesiastical jurisdiction and discipline were defined by a concordat in March 1818. The Roman Catholic is the exclusive religion of the country. A Protestant chapel is tolerated in the capital for the accommodation of foreigners.

Army and Navy, &c.—The peace establishment of the army in 1854 comprised 34 regiments, numbering altogether 56,043 men, besides a few veteran battalions for garrison duty. The fleet numbers 2 vessels of the line, 5 frigates, 2 corvettes, 5 brigs, and 12 steam frigates of 300 to 450 horse-power, and 14 small steam-boats. The revenue of

the state averages about 4½ millions sterling, of which the island of Sicily contributes about one-ninth. The debt is about 15 millions sterling. The average value of the exports is about 1,800,000*l.*; of the imports 2,400,000*l.* The exports are chiefly olive-oil, silk, corn, liquorice, brandy, argol, nitre, sulphur, &c. The imports comprise British and other manufactured goods, colonial produce, fish, and metallic wares. The aggregate number of shipping is about 5000, measuring 132,000 tons only. Manufactures which have considerably increased in the reign of Ferdinand II. are not confined to one or two centres, but are diffused through the provinces, in the articles on which the most important are noticed.

The inhabitants of the countries composing the kingdom of Naples are derived from various and mixed races. The descendants of the ancient Samnites, Peligni, Marsi, Frentani, Lucanians, and other people of old Italian origin; the Etruscan Campanians, the Brutii, the Greek population of the coasts became mixed with numerous Roman and Latin colonies. The ancient Oscan and Samnite languages were gradually lost, but the Greek still remained a spoken language over a great part of the maritime districts. At the fall of the empire the country was overrun, rather than occupied, by the northern tribes, but afterwards returned to the allegiance of the Byzantine emperors, when it received a fresh admixture of Greek blood, Greek language, and Greek usages. In the 6th century the Longobards took possession of Beneventum, and founded there a powerful duchy, which survived the fall of their power in north Italy. In the 11th century the Normans came, who conquered both the Longobards and the Greeks, and founded the monarchy of the Two Sicilies upon the base of feudal institutions. Then came in succession the Suabians, the French or Provençals, the Aragonese, and the Spaniards. All these nations have left traces of their residence. Considerable shades of variety are observable among the inhabitants of different parts of the kingdom, whilst the capital contains specimens of them all; but notwithstanding these varieties, the long habits of amalgamation produced by a central administration and a large capital during eight centuries have created a lasting feeling of common nationality, which is perhaps stronger in the kingdom of Naples than in any other Italian state. Neapolitan, not Italian, is the national appellation. Generally speaking the Neapolitan is quick, shrewd, humorous, fond of music and dancing, rather inclined to bombast and hyperbole, fiery but changeable, inclined to pleasure and ease, hospitable, susceptible of generous feelings, and also of a high social polish.

NAPLES (*Napoli*), the metropolitan province of the kingdom of the Two Sicilies, is bounded N. and E. by the Terra-di-Lavoro, S.E. by the Principato Citra, and S. and W. by the sea. The coast-line runs first nearly south from the Lake of Patria, past Cuma, to the promontory of Misenum, which, with the islands of Procida and Ischia, forms the northern boundary of the Bay of Naples. From Misenum the coast curves round to north and east, forming the bays of Baia and Pozzuoli, the latter separated from the harbour of Naples by the hill of Posilippo. Almost every inch of this coast—from the hill of Posilippo, with its tomb of Virgil, its ancient tunnel through which the suns of October and February shine, to Cuma, where the Prince of Syracuse has lately disinterred such interesting remains of ancient times—is hallowed ground to the antiquary and the scholar. The hills that rise above this part of the plain of Campania (the ancient Phlegrean Fields) are all of volcanic origin: the Hill of Posilippo, the Solfatara, still only half extinct; the barren trachytic mass of Olibano, the Monte Nuovo thrown up in 1588, which half filled up the Lucrine Lake and the channel cut by Agrippa to join it to the Lake of Avernus in forming the Portus Julius; and the Monte Barbaro. The Lake Avernus, on the west side of the Monte Nuovo, is a beautiful bright piece of water about a mile and a half round placed in the crater of an ancient volcano, the lips of which, now clothed with vineyards, chestnut-woods, and plantations of orange-trees, inclose it on all sides except the south, where it opens to the Lucrine. A tunnel cut through a hill of tufa from the lake to the Lucrine is shown as the Sybil's Grotto described by Virgil. Another great ancient tunnel deserving of mention is that called Grotta-di-Sillaro, and cut by Lucullus through the promontory which is still crowned with the magnificent ruins of his villa. This tunnel, 2755 feet long, was restored by the emperor Honorius, and cleared out by the present king, Ferdinand II. Lucullus attached the volcanic island of Nisita with the villa by a bridge, on the piers of which the arches of one of the moles erected in the reign of the present king to form a harbour here are supported.

From the point of Posilippo the coast curves round in a north-east direction, its line being broken however by the rocky promontory called Castell del Ovo, the long mole of the military harbour, and the great and little moles, which form respectively the great and small commercial harbours of the city of Naples. At the eastern extremity of the city the little river Seleto empties itself into the bay. From this point the coast trends south-eastward, past Portici, Torre del Greco, near the western base of Mount Vesuvius, and the towns Annunziata and Castellamare. Between the last two towns it sweeps round to the southward, and below Castellamare to the south-south-west, terminating in the point Campanella, the extremity of an offset of the Apennines, which, with the island of Capri, lying off it to the south-west, forms

the southern boundary of the Bay of Naples. Along the crest of this ridge, called Monte Sant' Angelo, the boundary runs to a few miles east of Castellamare, whence the line runs up the plain east of Vesuvius to the sluggish stream of the Clanius (Regi Lagni), which it strikes a little south of Acerra. The banks of this river are unhealthy from malaria, and from the maceration of flax in its sluggish stream. A mile or two N.W. from Acerra, near 41° N. lat., the boundary runs first south and then west (leaving Aversa on the north), to the northern extremity of the Lago di Patria, the ancient Literna Palus, which is fed by the Clanius, and is now a mere marsh abounding with wild-fowl. This lake was the harbour of the ancient Liternum, the retreat and death-place of the great Scipio. It was joined to the sea by a canal. A tower marks the spot where Scipio was interred. Patria, the representative of Liternum, is a mere fishing village.

The only rivers are the Clanius, the Sebeto, and the Sarno, which last crosses the narrowest part of the province from the neighbourhood of Pompeii, and enters the sea midway between Annunziata and Castellamare. Among the lakes which have not been already mentioned are the Lago-di-Licola, north of Cumæ, supposed to be part of the canal begun by Nero to connect the Avernus with the Tiber; and the Lake of AGNANO; and the Lake of Fusaro, the Acherusius of the Latin poets, which communicates with the sea by a Roman canal now called Foce-di-Fusaro; this lake is famous for its oysters. The Mare-Morto also, once the harbour of Misenum, east of Mount Procida, deserves mention though not quite a lake. Of the ancient craters the most remarkable are those that lie between Monte Rosso, near Cumæ, and the hill of Posilippo, namely, Monte Barbaro, Monte Cigliano, Monte Campana, Astroni, Monte Nuovo, and some others already mentioned. The Astroni is the most perfect of all; its rim, 4 miles in circuit, is crowned by a wall, and unbroken, except by an artificial entrance to the crater, which is clothed with magnificent trees, and has been long used as a royal preserve for wild boars and deer.

The great feature of the province to the south-east of the city of Naples is Mount Vesuvius, which forms the subject of a separate article. [VESUVIUS.] The beautiful range of Monte Sant' Angelo, with its three lofty peaks, running through the peninsula of Sorrento, forms a grand feature in the scenery beyond Castellamare. Mount Cepparica, an offshoot of the range, runs west by north from the three peaks to the sea, between Vico Equense and Castellamare, and sends out northward a beautiful spur called Quisisana, which is covered with magnificent villas. The province is traversed by railways to Nocera and Capua, which start from a common terminus in the east of the city of Naples; the former running south-east along the coast to Annunziata, near which the main line takes an eastern direction, whilst a branch continues along the coast to Castellamare; the latter runs first north-east and then north-west up the plain of Campania.

The province is divided into four districts:—1, Naples; 2, Pozzuoli, which includes the whole western division and the islands Ischia and Procida; 3, Castellamare, which comprises the territory at the base of Mount Vesuvius and the coast opposite Naples as far as Sorrento; 4, Casoria, which comprehends a tract of the Campanian plain stretching north of the range of hills behind the city of Naples.

The principal towns of the province of Naples, exclusive of the capital, are:—*Pozzuoli*, the ancient *Puteoli*, situated on the east side of the gulf of the same name, and opposite to Baia, originally a colony of Cumæ, called *Dicaearchia*, founded in the 6th century before Christ, and now a bishop's see with 10,000 inhabitants. The whole surrounding country is of a volcanic character. The hill called *Solfatara*, which is the crater of a volcano not yet extinct, rises to the east above the town. *Afragola*, a town of 15,000 inhabitants, N.E. of Naples in the Campanian plain, has some hat manufactories. *Fratia*, near the ancient *Atella*, is famous for its strawberry-beds, which supply the markets of Naples: population, 10,000. *Somma*, at the north base of Mount Vesuvius, has 7000 inhabitants. *Sant' Anastasia*, near *Somma*, has 6000 inhabitants. The whole neighbourhood produces the luscious wine known by the name of 'Lachryma Christi.' *Portici* and *Resina*, two adjoining towns built on the south-west slope of Vesuvius, on the site of *Herculaneum*, contain respectively 6000 and 11,000 inhabitants. Visitors who ascend Mount Vesuvius pass through *Resina*. *Portici* has a royal palace: its museum of antiquities, obtained from *Herculaneum* and *Pompeii*, has been lately removed to the Museo Borbonico at Naples. East of *Resina* is another pretty royal villa called *La Favorita*, in a lovely situation near the sea-shore. *Torre del Greco*, about 2 miles S.E. from *Portici*, at the foot of Vesuvius, a town of 17,000 inhabitants, has been repeatedly destroyed by the lava and earthquakes, but rebuilt over and over again. The inhabitants are mostly addicted to a sea-faring life. *Annunziata*, or *Torre dell' Annunziata*, about 4 miles S.E. from *Torre del Greco*, and near the site of *Pompeii*, has 12,000 inhabitants, a manufactory of muskets for the royal service, and a large gunpowder magazine. It is also known for its great manufactory of 'maccaroni,' which is the best in Naples, and known by the name of 'Maccaroni della Costa.' North of *Torre dell' Annunziata* is the large village of *Bosco tre Case*, and farther north, on the east slope of Vesuvius, is the town of *Ottajano*, with 15,000 inhabitants. CASTELLAMARE. *Vico Equense* (*Vicus Equanus*), a small town perched upon the cliffs above the coast, about 4 miles S.W.

from Castellamare, was the birthplace of the metaphysician and historian Gianbattista di Vico: population of the town and neighbourhood about 10,000. *Sorrento* is in a delightful valley surrounded by hills, which is a complete grove of orange and mulberry trees, and contains several villages and numerous country houses. The town of Sorrento has 6000 inhabitants, is a bishop's see, and the birth-place of Tasso. The plain of Sorrento is much frequented by the wealthy Neapolitans during summer. There are boats which cross daily from Naples to Sorrento, and return loaded with oranges and other fruit. Silk is also produced here. *Casoria*, in the plain north of Naples, on the road to Afragola, is the head town of a district, and has 8000 inhabitants. East of *Casoria*, on the railway to Capua, is the long straggling village of *Casalnuovo*. West of it are the villages of *Arzana* and *Melito*. Farther west is *Giugliano*, which with two dependent hamlets has about 10,000 inhabitants. South of *Giugliano* is *Mugnano*: population, 4000. A little south-west of *Mugnano* is *Marano*, the chief town of a circle, with a population of about 8000. At *Marano* terminates the semicircular ridge of hills which bounds the Phlegrean Fields on the north, stretching across to the Lake of Licola, near the sea-shore. This ridge is probably a portion of the lip of a gigantic crater that may have once inclosed the whole volcanic region of the Phlegrean plain.

NAPLES (*Napoli*), the capital of the kingdom of the Two Sicilies, is situated in 40° 52' N. lat., 14° 15' E. long., on the northern coast of the fine Bay of Naples, partly at the foot and partly on the slope of a range of hills which runs obliquely to the shore. The population in 1851 was 450,000. The city is 4 miles long from the Maddalena bridge over the Sebeto on the east to the suburb of Mergillina on the west; its breadth from the Capodimonte to the Castel dell' Ovo is 2½ miles; and its circumference is about 10 miles.

Seen from the sea Naples appears in the form of two crescents, of very unequal depth, one on the east, and the other on the west, divided by the point of Castel dell' Ovo and the hill of Pizzofalcone, which is behind it. The eastern crescent, which includes the great bulk of the city, faces the south-east, and is bounded by the hill of Capodimonte to the north, and Sant' Elmo to the west, crowned by the castle of that name, which commands the town. Between these two hills is a considerable depression, on which the suburbs of La Sanità and L'Infrascata are built. The slope of the hill of Capodimonte is likewise covered with houses, forming the suburbs called Dei Miracoli and Le Vergini. To the eastward the town is open to the plain of Campania. From the barrier of Capo di Chino, at the entrance from Rome, a succession of fine streets run through the body of the town to the sea, the principal of which, called *Strada di Toledo*, about a mile in length, runs due south, and divides the old city, which is east of it, from the new districts. The street of Toledo terminates southward in the Piazza before the royal palace. Of the old city part of the walls, towers, and ditches still remain, and several of the gates are standing, namely, *Porta Nolana*, on the road to Nola, *Porta Capuana*, on the road to Apulia, and *Porta S. Gennaro*, and *Porta S. Maria di Constantinopoli*, towards the north. Between the gates of Nola and Carmine on the eastern side of the city is the common terminus of the railroads to Nocera and Capua. The old part of the town, which is in a plain, has narrow streets and lofty massive houses, many of them six or seven stories high; it is very thickly inhabited, and contains more than one half of the whole population of the capital. West of the *Strada di Toledo* numerous streets run up the hill of Sant' Elmo, which is covered with houses for two-thirds of its height. South of the hill of Sant' Elmo, and between it and the point of Pizzofalcone, is another depression, which affords a carriage communication between the *Strada di Toledo* and the western crescent, or new part of the town, which is called by the general name of Chiaja, 'the quay.' This part, which is much contracted between the hills and the sea, extends in length about a mile and a half between the hill of Pizzofalcone to the east and that of Posilippo to the west. A fine road runs all this length, parallel to the sea-shore, and between the public gardens of *Villa Reale* on one side and a row of fine houses on the other; it then turns along the base of Mount Posilippo, and gradually ascending it, leads to the other side of it towards Pozzuoli. There is another and straighter road to Pozzuoli by the tunnel called *Grotta di Posilippo* mentioned in the preceding article.

Naples is an open city like London, but it has barriers or custom-house posts at the principal avenues leading into the town, for the purpose of collecting the 'gaballa,' or duty on provisions. The most remarkable buildings are:—

1. The royal palace, 'La Reggia,' a large mass of buildings, constructed at two different times, first by the Spanish viceroy Pedro de Toledo, which part goes by the name of Palazzo Vecchio; and the second, after the design of the architect Fontana, under the Spanish viceroy Count de Lemos, in the 17th century. This new palace has a front of nearly 400 feet in length, with three orders of pillars, one above the other, Doric, Ionic, and Corinthian. The great court has two rows of arcades, one above the other, supported by granite columns; the grand staircase is ample and commodious. The apartments are adorned with valuable paintings of the old Italian masters. The great gallery contains the portraits of all the Spanish viceroys who presided over Naples for more than two centuries. At the back of the palace, along the first floor, facing the sea, is a handsome terrace

paved with marble and shaded with trees, from which there is a delightful view of the bay. Facing the palace is a semicircular colonnade, with a pantheon-shaped church in the centre, raised by the late king Ferdinand I.

Adjoining the palace, and between it and the sea, are the arsenal, the cannon-foundry, and basin or wet-dock for the king's barges or yachts. From the south-eastern part of the dockyard a broad massive mole, begun in 1826, runs in a south-east direction 1200 feet, and is to terminate in an arm bending to the north-east, in order to shelter the new naval harbour, which extends between this mole and the mole of the Porto Grande, and has a depth of about five fathoms. On the eastern side the palace adjoins the theatre of San Carlo, which is one of the remarkable structures of Naples. It was rebuilt after the fire of 1815, and is one of the largest theatres in Europe; it has six tiers of boxes, each box capable of containing from ten to twelve persons. Farther on, the old palace adjoins the Castel Nuovo, a massive and extensive castle, with towers and a ditch around, begun in the 13th century by Charles of Anjou, and successively increased. Fronting the castle is the finest square in Naples, called Largo del Castello. East of Castel Nuovo is the mole, or Molo Grande, which shelters the commercial harbour. It is fortified, and has two lighthouses; the depth in the harbour does not exceed four fathoms. The mole affords a promenade which is much frequented by the citizens. The Porto Piccolo, or small harbour, to the north of the preceding, is little more than a wet dock; but it is very interesting as being all that remains of the ancient harbour, which existed here probably before the Greek colonisation of Neapolis. This port evidently extended some way into the city. It is separated from the Porto Grande by a small mole.

2. The palace, museum, and library, called 'Degli Studj,' are in the northern part of the town, at the foot of the hill of Capodimonte. The museum, styled 'Museo Borbonico,' is one of the richest in Europe. Among the numerous master-pieces of ancient sculpture which it contains, are the Hercules Farnese, the Venus Callipyge, the Apollo Citharoedus, the Bacchus, and the statue of an orator called Aristides. The museum is also rich in ancient bronzes. The collection of ancient instruments, utensils, female ornaments, and other household articles found at Herculaneum and Pompeii, is unique. It contains also a vast number of articles of glass, mostly Egyptian. The collection of Campanian, Greek, and Sicilian vases, as well as the numismatic cabinet, is also very rich. That of ancient paintings is very remarkable. There are also some fine ancient mosaics. The tables found at Heracles, in Magna Græcia, are valuable as specimens of Greek palmography.

The Gallery of Modern Paintings contains many good works of the Neapolitan, Flemish, Venetian, and Bolognese schools. The royal library, in the Museo Borbonico, contains 200,000 printed volumes, and about 3000 manuscripts. Among the latter is the book called the Office of the Blessed Virgin, illustrated by Giulio Clovio, and the gem of illuminated works. Besides this library, which is open to the public, there are the Brancacciana library of 70,000 books and 7000 manuscripts attached to the church of St. Angelo à Nilo, the library of San Filippo Neri in the magnificent monastery of the Oratorians with 18,000 volumes and 60 manuscripts, and the university library of 25,000 volumes.

3. The churches of Naples amount to 257. The cathedral, begun by Masuccio, a Neapolitan architect and sculptor of the 13th century, has been since repeatedly altered. The interior is rich in ancient columns of valuable marbles; it also contains a splendid mausoleum of Charles I. of Anjou, the conqueror of Naples. The adjoining chapel of San Gennaro is rich in paintings: the ceremony of the liquefaction of the blood of St. Januarius is performed there annually. The front of the church of San Paolo, built on the site of a temple of Castor and Pollux, contains some fluted columns of marble, the remains of the ancient structure.

The church of San Lorenzo, founded by Charles of Anjou, on the site of the town-house, where the municipal council of the city formerly used to assemble, contains several royal tombs and some good paintings. The church of San Filippo Neri is built in better taste than most of the churches of Naples; it is rich in paintings. The church, sacristy, and convent of San Domenico constitute a real museum of the middle ages, on account of the numerous monuments of kings, literary men, and other distinguished personages of the times of the Anjou and Aragonese; and for the cell, lecture-room, and chair of Thomas Aquinas, who resided, wrote, and taught in this convent. The interior of Santa Chiara is elegant and rich; it contains the monuments of Robert of Anjou; of his son, the duke of Calabria; and of Joanna I. The neighbouring church of Gesù Nuovo, or Trinità Maggiore, the façade of which has been compared to that of a prison, has in the interior the appearance of a splendid ball-room. It belongs to the Jesuits. In one of the chapels is Guercino's celebrated picture of the Trinity. The church of Monte Oliveto is rich in sculptures by Giovanni di Nola, Donatello, Benedetto da Majano, and other celebrated artists. The vast adjoining convent, which once afforded an asylum to Tasso, has been suppressed, and is now occupied by several offices of the municipal administration. San Giacomo dei Spagnoli contains the magnificent tomb of Don Pedro de Toledo, one of the best Spanish viceroys of Naples. The small neglected church of San Giovanni à Carbonara is remarkable for the

monuments of King Ladislaus and his sister Joanna II., and in the chapel behind the altar, that of her favourite, Ser Gianni Caracciolo, who was murdered at last through a court intrigue. The church Del Carmine, with its lofty steeple, is chiefly noticed for its neighbourhood to the great market, the scene of Masaniello's insurrection, and also of the desperate defence of the populace against the French in 1799; and likewise for the modest tomb of the unfortunate Corradino and his cousin Frederick of Austria, who were beheaded near this spot by order of Charles of Anjou. The church of L'Annunziata, by the architect Vanvitelli, is one of the best churches of Naples: adjoining to it is a foundling hospital and a Magdalen. The church of San Martino, near the castle of Sant' Elmo, from which there is a most magnificent view of Naples and the bay, is richly painted by Lanfranco, Spagnoletto, and D'Arpino. The church of Santa Maria del Parto, founded by Sannazaro, in a delightful spot, near the shore of Mergellina, has a fine mausoleum of the poet. San Gennaro dei Poveri is remarkable for its vast catacombs, which extend under the hill of Capodimonte.

4. The royal palace of Capodimonte is a heavy structure, but is remarkable for its fine situation, the excellent road leading to it, constructed by the French, its extensive park and hunting grounds, and the adjoining observatory along the southern part of the road, forming the new street of Capodimonte, which may be considered a continuation of the fine Strada di Toledo. On the slope of the hill is the Chinese college, for the education of young Chinese, who, after taking holy orders, return to their country as missionaries. On the hill of Miradois to the south of the hill of Capodimonte is the observatory and the botanical garden. Not far from thence, in a secluded valley at the foot of the hill, are the remains of an aqueduct constructed by Augustus, which is called Ponti Rossi, 'red bridges or arches,' from the colour of the brick.

Naples has many charitable institutions, such as the great hospital Degli Incurabili, the foundling hospital already mentioned, the school of the deaf and dumb, the asylum for the blind; the Reclusorio, or general workhouse for able-bodied poor, near the botanic garden, with a school annexed to it, and which contains about 3000 poor; San Gennaro dei Poveri, for the poor who are unable to work, San Francesco di Sales, and several other minor hospitals and houses of refuge. Mendicity is forbidden by law; but the law is often evaded. There are no poor-rates at Naples.

The university is well provided with professors. It has a good library and a cabinet of natural history annexed to it. This institution is noticed in a preceding article on the kingdom of NAPLES. Among the special schools are a medical college, a veterinary college, two military schools, a college of pilots, and the 'Conservatorio,' or school of music, which has produced many illustrious composers. Besides San Carlo, Naples has half a dozen minor theatres, Il Fondo, I Fiorentini, Teatro Nuovo, La Fenice, San Carlino, &c. In the last two, plays are performed in the Neapolitan dialect, which is full of humour and naive expression, a mixture of Italian and Spanish, but different from both.

The chief manufactures of Naples are silks, embroideries, broad-cloth, flannel, carpets, chemicals, and macaroni; soaps, perfumes, gloves, artificial flowers, corals, china, hats, carriages, &c. There are royal type-foundries, iron and glass works. The chief exports are agricultural products, oil, raw silk, liquors, corn, brandy, &c.: the imports are manufactured goods, colonial produce, fish, iron and tin ware, hardware, &c. French, Sardinian, Neapolitan, Tuscan, and Austrian companies' steamers ply between Naples, Leghorn, Marseille, Sicily, and various towns in the Mediterranean. Small passenger steamers ply between the city and towns along the coast daily. The tunny and anchovy fisheries are actively plying. Ship-building is carried on.

The town is divided into twelve 'quartieri,' or districts, of which five and the most populous are in the old or eastern part of the town, namely, Mercato, Pendino, Porto, San Lorenzo, and Vicaria; one in the middle, San Ferdinando, in the neighbourhood of the royal palace; two at the west end, Chiaja and San Giuseppe; one, San Carlo all' Arena, at the north end towards the road to Rome; and three, Stella, Avvocata, and Monte Calvario include the upper part of the town, which is built on the hills of Capodimonte and San Elmo. Every district has a commissary of police, whose office is open at all hours of the day. There are 66 military posts in the whole town, 4 castles—San Elmo, Castel Nuovo, Castel dell' Ovo, and Castello del Carmine, besides extensive barracks both for infantry and cavalry. The town has six prisons, one of which is for debtors. The vast and massive structure called 'La Vicaria,' at the east end of Naples near the Porta Capuana, which was once a castle and the residence of the Norman kings, now contains various courts of justice (hence it is named I Tribunali), and also the archives of the kingdom, an immense collection of documents, divided into four sections, historical, financial, judicial, and communal. The acts, edicts, &c. of the sovereigns of the Anjou dynasty alone fill 300 thick folio volumes. The 'Constitutiones' of Frederick II., the oldest code of the kingdom, written by his chancellor Pietro delle Vigne, are also there.

The Lazzaroni, so often mentioned by travellers, and so confusedly described, included the lowest orders of the inhabitants or populace, the porters, the hawkers of fish vegetables, and other eatables, the

boatmen, journeymen out of place, and numerous vagrants, and other low and loose characters. Many of these classes in former times had no regular domicile, and lived chiefly in the open air, or were huddled together at night under some porch or vestibule, in narrow alleys, in their boats, and wherever they could find shelter. To these were added indiscriminately the numerous class of fishermen, an industrious race, whose habits have always been more domestic and orderly than those of the common *lazzaroni*. All these people were vaguely reckoned, with probably some exaggeration, at 40,000 individuals, a muscular, brawny, and erect set of men, but totally uneducated and little civilised, very abstemious and frugal in their habits, mostly barefooted, living from day to day on their casual earnings, their dress consisting merely of a shirt and a pair of loose trousers; very good-tempered in quiet times, but apt to run riot on the first political excitement or tumult. As a peculiar class, the *lazzaroni* may be said to be now extinct: the lower orders live like those of other cities; they are all duly registered in their respective parishes, they have all a domicile of some sort, and police regulations have produced a material alteration in their habits, though the every-day clothing of many of them continues to be the same as before.

The nobility at Naples are very numerous, but, excepting their titles, they enjoy no privilege or influence above the rest of their countrymen. The palaces of the nobility are spacious and massive. The most remarkable are the palazzo Gravina, or Orsini, the palace Maddaloni, that of Sansevero, remarkable for its chapel, adorned with some good statues, that of Della Rocca, those of Francavilla, Stigliano, Berio, &c. The building which has been raised between the streets Toledo and S. Giacomo, for the offices of the financial department and for the bank of the Two Sicilies, is one of the finest structures in Naples.

Naples is not so well supplied with water as Rome, and has not such handsome fountains; those of Fontana Medina and Monte Oliveto are the best. Several aqueducts from the neighbouring mountains supply the water, besides which most houses have cisterns. There is a sulphureous spring of water on the shore of Santa Lucia, which is much drunk by the inhabitants in the spring. Another spring, called Acqua del Leone, in the suburb of Mergellina, is the purest fresh-water. Of mineral waters there is an abundant supply.

The neighbourhood of Naples abounds in delightful walks. The public gardens, or Villa Reale, extending along the shore of the Chiaja for nearly a mile, enjoy the advantages of the sea-breeze, and of a view unrivalled in the world. The new road over the hill of Posilipo is a beautiful drive. The hills of Capodimonte and Scuttilo, and the suburbs of Infrascata and Arenella, at the back of Sant' Elmo, abound with pleasant walks and a variety of scenery. These, as well as the other neighbouring hills of Vomero, Posilipo, &c., are covered with country-houses and gardens of all sizes.

Naples is an archbishop's see, and is divided into 50 parishes, including the neighbouring villages.

The town is abundantly supplied with provisions of every kind; fish and shell-fish are plentiful, as well as vegetables and fruits. Snow, of which a great quantity is used, especially in summer, for cooling the drink and for ices, is brought from the mountain of Castellamare, where it is kept in large reservoirs. The city is lighted with gas since 1840. Omnibuses ply to all parts of the town, and steam-boats to all the towns on the bay.

The great street of Toledo is thronged with people and carriages at all times of the day, and until very late at night, or rather until two or three o'clock in the morning, when fashionable people retire to rest. It is decidedly the noisiest street in Europe, as the people are in the habit of vociferating at the top of their voices; and others must do the same in order to be heard. The motley groups which are seen mixing pell-mell in the street, the crowded balconies above, the numerous vendors of provisions, the *acquaiuoli*, or sellers of ice-water, at the corners of the bye-streets, the life out of doors, which is a general habit in this country, all render the streets of Naples, and especially that of the Toledo, most curious to a foreigner.

Naples, or Neapolis, that is, 'New City,' was a Greek colony from Cumæ; the date of its origin is not known. The story of its first foundation, under the name of Parthenope, is a mythic tradition. Livy (b. viii. 22) says that there were once two towns near each other, Palæapolis and Neapolis, the inhabitants of both being from Cumæ, but Palæapolis had, long before Livy's time, merged into the new town, or Neapolis. Some modern writers think that the original foundation on the site was made by the Phœnicians, and that their town was distinguished by the Greeks from their own new city (Neapolis) by the designation Palæapolis, or old city.

Neapolis, after its first foundation by the Cumæans, received colonists from Chalcis, Pithecusa, and Athens; and subsequently admitted some Campanians also among the body of citizens. (Strabo, p. 246. Casaub.) It became allied to the Samnites, but after their subjugation by Rome it maintained its independence as a republic, and during the second Punic war sent ambassadors to Rome to propose an alliance against Hannibal, and with it a rich present in golden vases, which the people took from their temples to defray the expenses of the war. (Livy, xxii. 32.) It continued afterwards an ally to Rome and became a municipium. After the fall of the empire Neapolis was taken by the Goths, retaken by Belisarius, and lastly

GEOG. DIV. VOL. III.

destroyed by Totila in 543. It was afterwards rebuilt and annexed to the Longobard duchy of Beneventum, but after the decline of the Longobard power, when the Byzantine emperors asserted a kind of supremacy over southern Italy, Naples had its dukes, who were chosen by the inhabitants. In the 9th century the dukes of Beneventum obliged it to pay tribute. When the duchy of Beneventum was split into three principalities, Benevento, Capua, and Salerno, Landulf, count of Capua, in order to maintain its independence of the other two, called in the Saracens, who devastated the shores of Campania. The Norman adventurers lent their assistance to the prince of Salerno against these piratical hordes, and afterwards by degrees established their own power in Apulia and Sicily. Naples was one of the last towns which submitted to the Normans; it acknowledged king Roger I., of Sicily, as its sovereign, about 1137. The Norman dynasty becoming extinct at the death of the emperor Henry VI., Naples then became subject to the house of Suabia from 1198 to 1268, when that line ceased at the death of the ill-fated Conradin. Next came the Angevine dynasty, founded by Charles of Anjou, who removed the seat of government from Palermo to Naples, which continued under the house of Anjou till 1442, when Alfonso of Aragon took the city from king René, the last of the Angevine kings. Under the Aragonese and Spanish kings the country was ruled by viceroys till 1700, when it became subject to German princes of the house of Austria. Don Carlos, son of Philip IV. of Spain, made himself master of the city and the kingdom, and founded the dynasty that still occupies the throne.

NAPOLI DI MALVASIA (*Monembasia*) is a town built on the small island of Monembasia, on the east coast of Laconia, and connected with the mainland by a bridge. About four miles north of the bridge are the ruins of Epidaurus Liméra. As Epidaurus fell into decay the town on the island grew into importance, and it then probably assumed the name of Neapolis. It was a place of some consequence under the Byzantine emperors, and Andronicus Comnenus in the 12th century founded here a monastery, which still exists. The town, which is a poor place with narrow steep streets, and about 400 houses, including those on the summit of the hill near the castle, gives title to a Greek archbishop. The country in the neighbouring district formerly produced a luscious wine, to which the English gave the name of Malmsey.

NAPOLI DI ROMANIA (*Nauplia, Anapli*), a town of the Morea, built on a rocky promontory at the north-east extremity of the Argolis Gulf. The harbour between this promontory and the north coast is large and tolerably safe, but too shallow to admit large ships. The town stands on the north-east slope of the hill facing the mainland, and is fortified: the hill has a tabular summit, which is unoccupied with houses, and from which abrupt cliffs descend to the open sea at the back of the promontory. A steep and rocky mountain rises above it to the south-east, called Palamedis; on this cliff is a strong castle. Nauplia was once the port and arsenal of Argos, but in the time of Pausanias it was deserted. It was occupied by the Venetians in the 13th century, and became their chief settlement in the Morea, until it was taken from them by Sultan Solyman in 1537. After the Greek insurrection it remained for several years the head town of Greece, until it was superseded by Athens. Its population, which had risen to about 12,000, has recently declined. The streets are irregular and dirty, but some improvements have been recently made: the air is not wholesome. The Greek bishop is styled Bishop of Argos and Anapli. An aqueduct of good water from the rocky ridge near Tiryns supplies the town.

NARBERTH, Pembrokeshire, South Wales, a market-town, parliamentary borough, and the seat of a Poor-Law Union in the parish of Narberth, is situated on elevated ground near the left bank of the East Cleddau River, in 51° 47' N. lat., 4° 44' W. long., distant 13 miles N.N.E. from Pembroke, and 240 miles W. by N. from London. The population of the borough in 1851 was 1392. The living is a rectory in the archdeaconry and diocese of St. David's. Narberth Poor-Law Union comprises 51 parishes and townships, with an area of 55,996 acres, and a population in 1851 of 22,120. The town is the centre of a considerable agricultural district. A new market-house has been erected, and other improvements have been made. The market-day is Thursday: eight fairs are held in the year.

NARBONNE, a city in the French department of Aude, stands

3 M

near the coast of the Mediterranean, in $43^{\circ} 18' 8''$ N. lat., $3^{\circ} 0' 23''$ E. long., 54 miles S.W. from Montpellier, and had 11,855 inhabitants in the commune at the census of 1851. Narbonne is one of the oldest cities of France. It is the *Narbo-Martius* of the Romans, who planted here their first colony west of the Alps in B.C. 112. The city became the capital of Roman Gaul until the rise of Vienna on the Rhône; and on the death of Constantine it again became the capital of Gallia Narbonensis. In the reign of Antoninus it was destroyed by fire, but was soon after rebuilt. In A.D. 414 Narbonne witnessed the marriage of Placidia, sister of the emperor Honorius, to Ataulphus, brother-in-law of Alaric. In 462 it was ceded to the Visigoths as the price of their alliance with Rome. During the Roman domination Narbonne had a capitol, many temples, and other public buildings, and it was celebrated for its schools. After the capture of Toulouse by Clovis, Narbonne became the capital of the Visigoths, who held it till the death of king Roderic in Spain. The Visigothic kings made the Roman capitol their palace. The Burgundiones pillaged the city in 508; in 681 it was taken by the Franks; and in 719 by the Saracens, who planted a Mussulman colony in the city. The Saracens held the city against Charles Martel, who laid siege to it from 738 to 737. Again for five years after 750 did Saracen skill defend the town against the assaults of Pepin and his Franks till betrayed by the Christian portion of the inhabitants, who massacred the Saracen garrison and opened the gates to the Franks. In 859 the Northmen plundered the town, and the Saracens unsuccessfully besieged it in 1018. In the 11th and 12th centuries the city, which retained still the form and spirit of its Roman municipal institutions, flourished by its manufactures and wealth, and was distinguished by the spirit of liberty that animated its inhabitants. It afterwards fell into comparative obscurity. But in vain is any monument of its ancient splendour sought for. Time, ignorance, and war have swept away every trace of its Roman structures, with the exception of a few fragments of capitals and marble slabs with inscriptions.

The town is situated upon the Robine Canal, a branch of the Canal-du-Midi, by which a portion of the waters of the Aude flow into the Mediterranean. It is surrounded by an old wall pierced by four gates, and defended by several bastions and towers. The canal divides it into two parts, between which there is communication by three bridges. Along the bank of the canal is a public walk planted with trees. The cathedral of St. Just, founded in 1272, and finished only recently, is a handsome gothic church; it has a splendid nave and choir, which are richly ornamented with good sculptures, and contain several marble monuments. Philippe III. of France was buried in the choir, but his monument has now disappeared. The other principal structures of Narbonne are—the church of St. Paul, the archbishop's palace, the barracks, and three hospitals. The city has tribunals of first instance and of commerce, a custom-house, an ecclesiastical college, a theatre, and a school of hydrography. The chief industrial products are—brandy, verdigris, bricks, tiles, pottery, linen, leather, and paper. The inhabitants trade in corn, wine, brandy, oil, salt, soda, wax, and excellent honey. [AUDE.] Narbonne has given title to an archbishop since 419; the see however is now united to that of Toulouse, the prelate being styled Archbishop of Toulouse and Narbonne. The church of Narbonne has seen two of its prelates raised to the Papal chair, Clement IV. and Clement VII. The archbishop of Narbonne was styled Primate, and was *ex-officio* president of the states of Languedoc, which held their sessions at Montpellier down to the time of the first French revolution. The projected railway from Bordeaux to Cette is to pass through Narbonne.

NASEBY. [NORTHAMPTONSHIRE.]

NASSAU, a small German duchy, is comprised between $49^{\circ} 55'$ and $50^{\circ} 50'$ N. lat., $7^{\circ} 31'$ and $8^{\circ} 45'$ E. long., and is bounded by the Prussian-Rhenish provinces and by the different states of Hesse. The duchy is divided into 11 circles. The country is generally mountainous or hilly, and there is no part that can be called plain. The Westerwald in the north and the Taunus Mountains in the south cover nearly the whole surface. The mountains follow the Rhine and the Lahn in their whole course through the duchy, and form delightful valleys, which are among the most romantic parts of Germany; the most picturesque is the Rheingau from Biberich to Lorchhausen, celebrated for its fine wines. Of the rivers the chief is the Rhine, which bounds the duchy on the south and west, and at Lahnstein receives the Lahn, which is navigable 14 leagues from its junction with the Rhine to Weilburg. The Main forms the boundary to the south-east. There are several smaller rivers and mountain streams, such as the Embs, Aar, Sieg, Wiedbach, Weilbach, and Niestar. There are no canals and no lakes. On the other hand the country has numerous Spas and mineral springs, which are among the most celebrated in Germany; as Ems, Wiesbaden, Langenschwalbach, Selters, Faehingen, and Geilenau. The natural productions various and valuable. But the boast of Nassau is its wine, of which that produced about Hochheim is well known by the name of 'König'; there are likewise the wines of Marcobrunn, Asmannshausen,

Rüdesheim, and Johannisberg. The vineyard of Johannisberg was originally formed by the monks of the monastery of St. John, the site of which is now occupied by the castle of Johannisberg, the property of Prince Metternich, and well known to all tourists on the right bank of the Rhine. The breeding of cattle is a chief source of wealth. The minerals are silver, lead, iron, copper, marble, freestone, limestone, slate, fullers' earth; and potters', pipe, and porcelain clay. There are also some salt-springs. The forests, which abound in game, supply quantities of timber and fire-wood. The smelting and manufacturing of metals are carried on to a considerable extent; there are also paper-mills, tanneries, distilleries, tobacco, vinegar, and potash-works, and some woollen, leather, and linen manufactures, but on a small scale. The trade is almost wholly limited to the exportation of the produce of the country. The area of the duchy is 268 square miles. The population in 1852 amounted to 429,341, of whom 224,103 were Protestants, 197,892 Catholics, 6741 Jews, and the rest Mennonites, Lutherans, and German Catholics.

The duke was formerly an absolute sovereign, but in 1817 a representative constitution was introduced. Otho, brother of king Conrad I., in the 10th century, is considered as the founder of the Nassau family, which after the death of Henry II. was divided into two branches, of which his sons, Wabram and Otho, were the heads. The dukes of Nassau are descended from the elder, and the house of Orange-Nassau (Dutch royal family) from the younger branch. The duke is assisted in the administration by a ministry of state. The people elect deputies who discuss the budget. The supreme court of appeal is at Wiesbaden, the Catholics of the duchy are subject to the Bishop of Limburg, the Protestants to the Bishop of Wiesbaden. The revenue amounts to about 4 millions of florins annually. The expenses in 1854 were estimated at 3,989,203 florins. The state debt in 1850 was 10,200,000 florins. The total military force numbers 6285 men. The circles of the duchy of Nassau, with the population in 1852, are as follows:—Hachenburg, 38,395; Hadamar, 54,871; Herborn, 47,077; Höchst, 49,879; Idstein, 40,456; Langenschwalbach, 33,686; Limburg, 48,305; Nassau, 43,820; Reichelsheim, 1578; Rudesheim, 37,365; and Wiesbaden, 33,903. The Taunus railway connects Wiesbaden with Frankfort. There are many remains of ancient ramparts and hill forts in the country.

The chief town, Wiesbaden, is situated in a small and pleasant valley on the southern declivity of Mount Taunus. In the immediate vicinity of the town there are productive gardens and orchards, and on every side neat farmhouses and villages. Wiesbaden is an open and constantly improving town, and has broad and well-paved streets. This place owes its prosperity and its name, 'Baden,' to the celebrated hot springs, which are 16 in number. The visitors to these springs are very numerous. The chief buildings in Wiesbaden are—the palace, the town-hall, the Kur-Saal, several splendid hotels, nearly 30 bathing-houses, the barracks, schools, a theatre, &c. The Kur-Saal has banqueting-rooms, ball-rooms, assembly-rooms, and gaming-rooms. It is the chief centre of attraction and gaiety, and on Sundays especially the rooms are very numerously attended. The town has one Lutheran, one Calvinist, and one Roman Catholic church. The fixed population of Wiesbaden is about 13,000; from June to September the number of visitors to the springs and gaming-tables doubles the number of inhabitants. [See SUPPLEMENT.]

NASSAU, or POGGY ISLANDS, THE, form a part of a chain of islands which lie off the whole length of the west coast of Sumatra, at a distance of 60 or 80 miles. There are two islands which bear this name: they lie between $2^{\circ} 30'$ and $3^{\circ} 16'$ S. lat., and are separated from each other by a strait, which forms an excellent harbour for ships of any size. It is surrounded by mountains, so that the water is literally as smooth as in a pond; and there are 25 fathoms of water close in-shore, and 45 fathoms in the mid-channel.

The surface of the islands is rough and irregular, consisting of high hills or mountains of sudden and steep ascents. The mountains are covered to their summits with trees, many of which supply excellent timber. The sago-tree grows in abundance, and affords the chief article of food to the inhabitants, who cultivate no rice. The coconut tree and the bamboo also abound. The fruits common in the islands of the Indian archipelago, such as mangosteens, plantains, &c., are numerous. The woods in their natural condition are impervious to man, and harbour various wild animals, as deer, hogs, and several kinds of monkeys. Fowl and pigs are raised, and fish are plentiful.

The inhabitants of these islands are few in number: the population amounted in 1792 to about 1400 individuals. In colour and stature they resemble the Malays, but they speak a language quite different from those used on the coast of Sumatra.

NASSAU. [BAHAMAS.]

NATAL, a British colony on the south-east coast of Africa, is bounded S.W. by the river Umtacoune (about 30 miles W. from the Umzincla, the previous boundary), N.E. by the river Tugala, N.W. by the Drachenberg or Quathlamba Mountains, and S.E. by the Indian Ocean. The colony lies between $29^{\circ} 20'$ and $30^{\circ} 50'$ S. lat., $29^{\circ} 40'$ and $31^{\circ} 25'$ E. long. The area is about 20,000 square miles. The white population in 1850 was estimated at 16,000, the native population at 100,000.

The Drachenberg or Quathlamba Mountains form a broad range which runs nearly parallel with the coast, at a distance varying from

60 to 90 miles from the shore. The average height of the range may be estimated at 8000 or 9000 feet above the sea, and the summits are covered with snow at least four months in the year. On the north-west, or interior side, a table-land slopes gradually down almost from the summits of the mountains, exhibiting extensive plains, diversified by a few isolated mountain-groups and low ranges of hills. There is no pass in the whole range between 28° 30' and 31° S. lat. practicable for horses or wheel carriages, and there are very few for pedestrians. Coal occurs not far from the sources of the Tugala, and ironstone is frequently found. Copper has been discovered within 20 miles of Pietermaritzburg. In Natal the country gradually rises from the sea to the foot of the mountains. A few mountain groups occur, which are offsets from the Drachenberg range. The country is diversified with hill and dale.

The rivers are very numerous, and all flow eastward to the sea. Two of the largest are the Tugala and the Umzincula; they both rise in the Drachenberg Mountains. The Tugala receives several tributaries, of which the principal are the Buffalo River, which forms a portion of the boundary to the north, and the Bushman River; and it reaches the sea in 29° 15' S. lat., 31° 25' E. long. It has a bar at the mouth, and is not navigable. The Umzincula flows through a rugged and almost inaccessible country, and falls into the sea in 30° 50' S. lat., 29° 20' E. long.

Along the coast, in summer, the average temperature is about 74° Fahr.; in winter about 63°. Nearer the mountains the climate becomes colder. The rains generally commence in March, and end in September. Thunder-storms are of frequent occurrence, and are very violent. The climate, on the whole, is pleasant and healthy.

The climate and soil have been found suitable for the cotton-plant, but it is doubtful if it can be cultivated profitably. Indigo, sugar, and coffee are cultivated, and it is expected that sugar and coffee will become articles of export. Tobacco, maize, sweet potatoes, oranges, pine-apples, and pumpkins are raised in abundance. Cattle thrive well; but the climate does not appear to be suitable to the growth of wool. Horses are liable to sickness in the spring months, and many die. The soil is generally more fertile than in the Cape Colony, nor does it appear to suffer so much from droughts.

The elephant, which was formerly common in the colony, is now nearly driven away. The lion and leopard are still met with along the mountain ranges. Hyenas, jackals, wild dogs, ant-bears, and porcupines are numerous. The hippopotamus abounds in several of the rivers, and in the Tugala are numbers of small crocodiles. The larger antelopes are becoming scarce, but there are still many of the smaller ones. The vulture, rock-eagle, and Kaffir crane are common. Several valuable timber-trees grow on the declivities of the mountains and in the mountain valleys.

The colony of Natal is divided into the districts of Pietermaritzburg, D'Urban, Umvoti, Impafane, Tugala, and Umsinyate, and a tract in the south-west part of the territory. The principal town in the colony is Pietermaritzburg, founded by the Dutch boers in 1840, and containing about 3000 inhabitants. It is situated on an offset of the Drachenberg Mountains, in 29° 30' S. lat., 30° 2' E. long., about 50 miles W.N.W. from Port Natal. It contains a barrack, ordnance stores, and Dutch, Episcopal, and Methodist places of worship. It is well supplied with water. D'Urban, the only port of the colony, is situated on the east side of the inlet called Port Natal, which is a bay completely landlocked, and affording good anchorage. The entrance is narrow, and is impeded by a bar, on which there is sometimes not more than two fathoms of water. The cape at the entrance of Port Natal is in 29° 53' S. lat., 31° 2' E. long. Verulam, Windsor, and Western are the largest of the villages.

The white population of the colony is mostly composed of the original Dutch settlers who remained after the dispersion of the boers in 1842, and of the immigrants who have since arrived chiefly from Great Britain. The native population, consisting mostly of Zooloos, are an intelligent and docile people, and make excellent servants. They are scattered in kraals along the banks of the rivers, and round the mission stations along the coast and western boundary. The British commissioner manages the affairs of the aborigines, and is regarded as their protector and chief. British, American, and Norwegian missionary societies have mission stations in the colony.

Natal has a lieutenant-governor, who is assisted by an attorney-general and an auditor-general, a collector of customs, a surveyor-general, a crown prosecutor, and a government secretary, who form a legislative and executive council. The revenue is derived from a customs duty of 5 per cent. on all British goods, and of 12 per cent. on all foreign goods imported, sale of lands, a capitation tax on the aborigines, and a few other sources. A bishopric of Natal was created in 1858. There are episcopal ministers at Pietermaritzburg and D'Urban.

The colony of Natal owes its origin to the Dutch boers (farmers), who in the year 1836 emigrated northward beyond the boundaries of the Cape Colony, and established themselves in small communities, with their families and cattle, in different parts of the unoccupied territory. These emigrants in 1838 employed their commandant, Pieter Retief, to enter into a treaty with Dingaan, the chief of the Zooloos. Retief crossed the Drachenberg Mountains, accompanied by 70 or 80 farmers, and their families and attendants, who visited Dingaan at his place of residence, preparatory to forming their intended

establishment in the vicinity of Port Natal. They were received by the Zooloo chief and his warriors with every demonstration of kindness, but were treacherously surrounded and slain in the midst of professedly friendly festivities. The farmers scattered over the territory were next attacked successively, and upwards of 600 men, women, and children were killed, besides those who had been previously massacred at Dingaan's residence. The great body of emigrants, who still remained behind the Drachenberg Mountains, sent off expedition after expedition against Dingaan, and at length, in February 1839, succeeded in putting him to flight. The greater part of the Dutch farmers then removed to Port Natal, where, in December 1839, they hoisted the tricolor flag, and proclaimed an independent republic, with Andries Wilhelm Pretorius for president. The British government refused to acknowledge their independence, and Sir George Napier, then governor of the Cape Colony, sent some troops to take possession of Port Natal. They entrenched themselves, and maintained their position till the arrival of reinforcements by sea, in June 1842, when the Dutch were compelled to submit. By a proclamation dated Aug. 21, 1845, the colony of Natal was established by the British Government. [See SUPP.]

NAVAN, county Meath, Ireland, a market-town and the seat of a Poor-Law Union, is situated at the junction of the rivers Boyne and Blackwater, in 43° 39' N. lat., 6° 38' W. long., 8 miles N.N.W. from Trim, 28 miles N.W. by N. from Dublin by road, 49½ miles by the Dublin and Drogheda and the Navan branch railways. The population in 1851 was 4016, besides 803 inmates of the workhouse. Navan Poor-Law Union comprises 12 electoral divisions, with an area of 94,466 acres, and a population in 1851 of 27,657. Navan was the first borough established by the English in this part of the country. It returned two members to the Irish Parliament, but was disfranchised at the Union. The town lies mainly between the two rivers, and consists of four streets, meeting in a central triangular area. A bridge over the Boyne leads to the small suburb of Athlumney. A bridge over the Blackwater leads to a larger suburb called Donaghmore. The parish church is a neat building, erected in 1818. The Roman Catholic chapel is a spacious Grecian structure. There are four National schools, an Endowed school, a Roman Catholic diocesan seminary, and a savings bank. The town also contains a court-house and market-house, the county infirmary, a fever hospital, dispensary, bridewell, and union workhouse. An infantry barrack on the right bank of the Blackwater occupies the site of an abbey founded in the 12th century. The town is connected with the Boyne navigation by a canal. It also communicates with Drogheda, by the Navan branch railway. Fringe and sacking are manufactured. There are a flax-spinning mill, two paper-mills, and several flour-mills; a tannery, a brewery, and two distilleries. Quarter and petty sessions are held. Fairs are held seven times a year. The market-days are Wednesday and Saturday.

NAVARINO, called *Neocastro* by the Greeks, a small town and fortress of the Morea, built on the south coast of the bay of the same name, about 5 miles N. from Modon, and about 3 miles measured across the bay from old Navarino, which is a ruined town with an old fort of the middle ages, built on a steep hill on the northern coast of the bay, near the site of the ancient Messenian Pylos, which, according to Pausanias, was situated on the promontory Coryphasium. The island of Sphacteria, or Sphagia, lies across the entrance of the bay, and adds to its security, rendering it one of the best harbours in the Levant. Sphacteria is known in ancient history for the defeat and capture of the Lacedaemonians by the Athenians, in the seventh year of the Peloponnesian war. (Thucyd., iv. 39.) In modern times the Bay of Navarino has become memorable for the naval battle which took place on the 20th October, 1827, between the French, English, and Russian combined fleet on one side, and the Turco-Egyptian fleet which was anchored in the bay on the other. The object was to oblige Ibrahim Pasha to evacuate the Morea. After a warm resistance, the Turco-Egyptians were completely defeated, with the loss of 8 ships of the line, 4 frigates, and about 40 or 50 smaller vessels. The rest surrendered, and a convention followed by which Ibrahim evacuated the Morea, and the Greek prisoners whom he had sent to Egypt were restored to their country. The Egyptian ships which had not been destroyed were returned to the Pasha of Egypt. The battle of Navarino decided the independence of Greece.

NAVARRA, a province of Spain, formerly a kingdom, is bounded N. by France, S. by the province of Soria in Castilla la Vieja, E. by Aragon, and W. by the Basque Provinces. It is situated between 41° 57' and 43° 18' N. lat., 0° 45' and 2° 27' W. long. The greatest length from north to south is about 100 miles; the greatest width from east to west is about 70 miles. The area is 2450 square miles. The population in 1849 was 280,000. It is divided into the five merindades, or districts, of Pamplona (north), Tudela (south), Sanguesa (east), Estella (west), and Olite (central).

Surface.—The great mountain chain of the Pyrenees entering from Aragon runs along the northern border of Navarra, the irregular line of the summit-level forming the boundary between this province and France as far as the pass of Lanz, which is about 10 miles W. from the pass of Roncesvalles. From this point the main ridge continues its course westward, whilst an offset of less elevation runs first northward in the direction of Bayonne, and then westward towards the mouth of the Bidassoa, where it terminates. This offset incloses the whole course of the Bidassoa except about six miles at the mouth of the river, and thus includes, at the north-west angle of Navarra and on the northern or French side of the summit-ridge of the Pyrenees, a beautiful and fertile series of valleys, the principal of which are those of Bastan, San Esteban, and the Cinco Villas, the last receiving its name from the five hamlets of Echalar, Sumbilla, Lesaca, Vera, and Aranax. The summit-level of the Pyrenean chain is of less elevation in Navarra than it is in Aragon, the highest summit in Navarra being only 5400 feet above the level of the sea.

Navarra south of the summit-level of the Pyrenees consists mostly of a series of offset-ridges, which gradually decrease in height as they extend southward towards the valley of the Ebro, which river bounds the whole of the province on the south, with the exception of the merindad of Tudela at the south-eastern corner. Several of the offsets from the Pyrenean chain extend far into the central and southern parts of Navarra; they have some large valleys between them, and several smaller ones, and leave a considerable extent of fertile plains on the northern side of the Ebro.

Navarra, from its mountainous character, is almost isolated from the countries around it. Across the Pyrenees there are ten passes; the five principal are those of Vera, Lanz (or Mays), Roncesvalles, Ochagavia, and Ibañeta. On the sides of Biscaya and Aragon the approaches are more difficult; and on the side of Castilla the deep and rapid Ebro forms a barrier passable only by the three bridges of Logroño, Lodosa, and Tudela.

Of the geology of Navarra little is known. The mountains are mostly of transition and secondary rocks. Jasper and marbles occur in some places, and there are many mines of iron.

Rivers.—All the rivers which descend on the southern side of the Pyrenean chain fall into the Ebro. [Ebro.] The river Aragon enters Navarra from the province of Aragon. It soon afterwards receives the Salazar, the Irati, and some smaller rivers, passes southward by Sangüesa, and after flowing in this direction about 20 miles takes a western course, during which it receives the Cidacos on the north bank. It afterwards receives the Arga, and then turning southward soon reaches the Ebro. The Arga rises above Pamplona, among the ridges of the Pyrenees, and receives the Araquil from the west, below Pamplona, and many other smaller affluents on both banks. The only other river of importance on the south side of the Pyrenees is the Ega, which has an eastern course past Estella, and then flows south-east and south till it enters the Ebro about 12 miles above the mouth of the Aragon. On the northern side of the Pyrenees the Bidassoa is the only river of importance in Navarra. It arises from two head-streams, and has at first a southern course, but afterwards turns westward, and flows to San Esteban de Lerin, whence it pursues a northern course, forming by itself and its numerous small affluents the beautiful series of valleys before mentioned. The valley of Bastan extends about twenty-three miles from north to south, and has a varying width of from two to three miles. The river in this the upper part of its course is called Bastan-Zubi, and does not receive its name of Bidassoa till after it turns and enters the valley of San Esteban. It afterwards commences its course northward, and passes through the valley of the Cinco Villas. The total length of the Bidassoa is about 45 miles.

Climate, Soil, and Productions.—The climate of the northern districts is exceedingly cold in winter, and rarely subject to excessive heat in summer; in the south it is far more genial, and highly delightful and salubrious. The soil in the low grounds is very rich, and susceptible of a high degree of cultivation; there is also much fine pasture-land.

Forests of pines (*Pinus sylvestris*) cover the slopes of the Pyrenees, and much wood is cut, and sent down by the mountain-streams to the Ebro, by which it is floated onward to Aragon and Cataluña. The other principal forest-trees are the oak, evergreen and deciduous, the olive, the chestnut, and the beech. The forests are not extensive, yet Navarra yields more valuable timber than any other province of Spain. Heaths, ferns, and broom, with many aromatic plants, grow on the sides of the mountains. Of grain Navarra yields annually about 4,000,000 bushels, consisting of wheat, maize, barley, oats, rye, and spelt-wheat. Other vegetable productions are chestnuts, broad beans, kidney-beans, hemp, and flax. Of olive-oil about 150,000 gallons are produced, and of wines, which are excellent and of various descriptions, about 10,000,000 gallons. After an abundant vintage people are invited by the public crier to take the old wine away from particular vaults gratis, in order to make room for the new. A small quantity of cider is also produced in the valleys of the Bastan and Cinco Villas.

There are in Navarra about 40,000 head of horned cattle, 700,000 sheep, 70,000 goats, 40,000 pigs, and 30,000 mules. The annual produce of wool amounts to 1,500,000 lbs. The mountains abound

in game and the rivers in fish. The wild animals are wolves, foxes, and wild boars.

The manufactures of Navarra are inconsiderable. There are several manufactories of coarse linen and woollen-cloth, and some of leather, soap, and iron. The quantity of brandy annually distilled averages about 2,000,000 gallons. Besides these are some potteries and some manufactories of Spanish liquors.

The greater part of the produce, natural and manufactured, is consumed in the province, but some grain, a little oil, half the wine, the greater portion of the wool, and two-thirds of the iron annually remain unconsumed, and are exported, which however fall very far short in amount of the cottons and silks, cutlery, tobacco, sugar, spices, and other luxuries, imported, principally from France.

Towns.—The city of Pamplona is the capital of Navarra. It is situated on the western or left bank of the Arga, in 42° 48' N. lat., 1° 40' W. long. The river here makes a bend northward, and flows through the beautiful plain called La Cuenca, which is about 30 miles in circumference, and is full of beautiful gardens and verdant meadows. Pamplona was anciently the court of the kings of Navarra, and has since been the residence of the viceroys of the province, is now the seat of the captain-general and the local government, and is the see of a bishop, suffragan of the archbishop of Burgos. The population in 1845 was 11,000. The city is built on an eminence, and is defended by a citadel, which overlooks the river by two of its bastions, and commands the level plain with the others, and is not commanded itself: it is a regular pentagon of 1000 feet each side, and is connected with the city by an esplanade, or glacis. The river is crossed by several bridges, and has a suburb called La Rochapea. The city itself is well built, well paved, and well cleansed. The fountains are abundantly supplied from a noble aqueduct constructed by Ventura Rodrigues with Roman solidity, and which brings the water from the hills of Subisa, 12 miles distant: one portion of it, 2300 feet long, is supported on 97 arches of 35 feet span and 65 feet high. The cathedral is small, and the exterior is disfigured by a Corinthian façade constructed in 1783, but the interior is of a good light gothic. The city contains also four parish churches, an episcopal palace, a town-hall, a university, a casa de espositos (foundling hospital), a theatre, and a plaza de toros, or bull arena. The Plaza del Castillo, which is the principal square, is also, on great festivals, converted into a plaza de toros. There are public walks on the roads leading to Madrid, to France, and La Rioja, but the alameda in the city, called La Taconera, is the most admired and most frequented. The manufactures and trade are of small importance. Pamplona is called Pompelon by Strabo (161, Casaub.), who adds, "as if it might be Pompeiopolis," that is, the City of Pompey. The people are called Pompelonenses by Pliny (iii. 3). The name of the city was corrupted by the Arabs, who took it in the beginning of the 8th century, into Bamblona. In 1808 it was seized by the French, who had been allowed to enter as friends; it was held by them till 1813, when it capitulated to the allies under the Duke of Wellington, after the battle of Vitoria.

Cascaste, 58 miles S. from Pamplona, overhangs the small river Queyles, an affluent of the Ebro flowing from the south. There are two bridges over the Queyles. The town contains two churches, in one of which is a very fine retablo, or carved altar-piece, executed in 1596. The population is about 3000. **Corella**, 45 miles S. by W. from Pamplona, stands in a fertile plain, on the west bank of the Albama, a small affluent of the Ebro from the south. It has several distilleries of brandy, some oil-mills, and some liquors-factories. The population in 1845 was 4648. **Estella**, 27 miles S.W. from Pamplona, is an ancient city, now the chief town of the merindad of Estella. It is situated on the river Ega, which is here joined by the Amescua. It has a ruined alcazar on an eminence, and contains two old churches, an hospital, and a college, and has some manufactures of woollens. The population in 1845 was 6192. **Olite**, 28 miles S. from Pamplona, is the chief town of the merindad of Olite. It is situated on the west bank of the Cidacos, and contains remains of old walls and of an old royal palace, once a residence of the kings of Navarra. The population in 1845 was 2748. **Sangüesa**, 25 miles S.E. from Pamplona, the chief town of the merindad of Sangüesa, is situated on the west bank of the river Aragon, which is here crossed by a stone bridge. The town is inclosed by walls except on the side next the river, where there are embankments as a defence against inundations of the river. The streets are wide and well paved, and the houses tolerably well built. It contains four parish churches, and has some brandy-distilleries. The population is about 3500. **Tafalla**, 23 miles S. from Pamplona, is built on the west bank of the Cidacos, about 5 miles above Olite. It is surrounded by old walls, and contains the ruins of a royal palace. It has brandy-distilleries and tanneries. The population in 1845 was 2912. This town and Olite were favourite places of residence of the kings of Navarra. **Tudela**, 52 miles S. from Pamplona, the chief town of the merindad of Tudela, is situated a little above the mouth of the Queyles, on the south bank of the Ebro, in the angle formed by the junction of the two rivers. The Ebro is here crossed by a substantial stone bridge of 17 arches, and 1200 feet in length. The town is the see of a bishop, the collegiate church having been raised to the rank of a cathedral in 1788, when the bishopric was established. This cathedral is an ancient gothic structure, and contains the tomb of Blanche of Castilla,

queen of Pedro the Cruel. The houses are solidly built and lofty; the streets are narrow, but well cleansed. The town contains several churches, some conventual buildings now converted to secular uses, a workhouse, a prison, and three or four hospitals. There are manufactures of woollen-cloth, soap, bricks, and earthenware. The population in 1845 was 6790. *Viana*, 50 miles S.W. from Pamplona, is an ancient city in a rich corn country, with the Ebro flowing at a short distance on the south. It is a pleasant town, with a good plaza, and a fine church dedicated to La Santa Maria. The population in 1845 was 3146.

History.—The earliest inhabitants of Navarra were called Vascones by the Romans. In 470 they were subdued by the Goths. Early in the 8th century Navarra was conquered by the Arabs; but the Christian inhabitants, who had fled to the recesses of the Pyrenees, resolving to expel the invaders, chose a noble knight, Garci Ximenez, for their chief or king; and thus was founded the monarchy of Navarra. His family became extinct in the middle of the 9th century, and the Navarrese then elected Ifigo Sanchez, count of Bigorre, in the hands of whose descendants the sceptre of Navarra remained for five centuries. In 1512 Fernando the Catholic obtained possession of that part of the ancient kingdom of Navarra which forms the present province, and annexed it to the Spanish dominions, leaving unconquered a portion on the northern side of the Pyrenees, which was afterwards united by Henri IV. to the crown of France, and is now known as the department of Basses Pyrenées; but this, as will be seen from our description, does not include the valley of the Bidasoa.

NAVENBY. [LINCOLNSHIRE.]

NAVIA. [ASTURIAS.]

NAVIGATOR ISLANDS, a group of islands situated in the Pacific, between 10° and 15° S. lat., 169° and 173° E. long., consists of nine islands, of which the largest, called Pola, or Savan, is the most western. It is about 50 miles long and 30 miles wide, and the mountains rise to the height of 1000 feet. Eastward of Pola is Ojalava, which is hardly inferior in size. Maouna, also east of Pola, is much smaller, and the other six are smaller still. They are all volcanic; the rocks of the beach, upon which the sea breaks with so much force as to throw the water more than 50 feet high, are only pieces of lava, rounded basalts, or coral, by which the islands are wholly surrounded. In the coral-reefs are narrow passages for boats. Along the beach are level tracts, but at some distance the country rises into hills and mountains. The islands are clothed even to the very summits of the hills with trees loaded with fruit. They abound in pigs, dogs, fowls, birds, and fish; and the lower parts are covered with extensive plantations of guavas, bananas, and other fruits. The sugar-cane grows spontaneously on the banks of the rivers. The inhabitants are numerous; they belong to the Malay race, and speak a language which is a dialect of that used in the Friendly Islands.

NAVY BAY, a natural harbour lying between the Atlantic coast of New Granada and the island of Manzanilla. The island, which is a mile and a quarter long, a mile broad, and covered with luxuriant trees and shrubs, is separated from the mainland at its southern extremity by a channel of about 60 feet wide and about 10 feet in depth. A projecting reef stretching out from the mainland at the north-eastern extremity of the bay forms a natural breakwater. The harbour thus formed is accessible at all seasons: it is secure in every wind, with a depth of 6 to 7 fathoms in the middle and 3 to 4 fathoms within 60 feet of the shore, and capable of containing 300 sail. Navy Bay is the Atlantic terminus of the Panama railway, which from hence to Gatun (7 miles) is carried over a swamp supported on piles. A lighthouse has been erected at the western point of the island.

Aspinwall city, founded in 1851, is situated on the island, the terminus of the railway, and is now the depôt of the eastern side of the isthmus, instead of Chagres, from which it is distant 7 miles, and which has been since nearly altogether abandoned.

NAXOS, NAXIA, one of the larger Cyclades, lies between 36° 45' and 37° 15' N. lat., 25° 20' and 25° 35' E. long., to the east of Paros, from which it is separated by a channel 6 miles wide. It is situated in the middle of the archipelago, about half-way between the coasts of Greece and Asia Minor. It was anciently called Strongyle (Round) on account of its shape; and also Dia, in honour of Jupiter; and Dionysias, from the worship of Dionysus, who, according to the mythi, was brought up on this island. Its first inhabitants were said to have been Thracians. According to Herodotus, the Greek inhabitants of Naxos were Ionians from Athens (viii. 46). The island was taken by the Athenians in the time of Pisistratus. It was captured and ravaged by the Persians under Datis and Artaphernes (B.C. 490). After the defeat of Xerxes at Salamis (B.C. 480) the Naxians recovered their independence. After the battle of Mycale it became one of the confederate states, at the head of which was Athens; and it was the first of those states that fell under political subjection to Athens.

In modern times Naxos, after the conquest of Constantinople by the Latins, became the seat of a dukedom founded by the Venetians, which embraced most of the other Cyclades. It was taken possession

of by the Turks in the 16th century, and it now forms part of the new kingdom of Greece.

Naxos is the most fertile of the Cyclades, and its wine is much esteemed. It produces corn, oil, cotton, silk, most kinds of fruits, and abounds with game. The plains and valleys are well supplied with springs, and all travellers describe Naxos as a very pleasant country. The chief town, called *Naxia*, is on the western coast of the island, and near it is the harbour, called Porto Saline, on account of the sea-salt which is collected there. The castle of Naxia, on the hill above the town, was built by the Venetians, and was the residence of the dukes. According to Thevenot, the plant (*Cistus*) which produces ladanum grows here, and in his time the substance was collected from the beards of the goats which fed on the plant, in the manner mentioned by Herodotus (iii. 112). There are about 40 villages and many country-houses scattered about the island, the population of which is reckoned at 20,000. There is a Greek and a Latin bishop, with convents of both churches. The northern part of the island contains some mountains, from which came a kind of marble called by the Greeks ophites, on account of its being spotted like a serpent's skin, and which was much valued. Emery is also found there, which is considered of the best kind, and constitutes an article of export.

There was an ancient city of Sicily called *Naxos*, north of Catania, and near the site of Taormina, which was founded by some Chalcidians from Euboea. (Strabo, p. 267.)

NAZARETH. [SYRIA.]

NAZING. [ESSEX.]

NEAGH, LOUGH, Ireland, a lake in the province of Ulster, is bounded N. by the county of Antrim, E. by Antrim and a small part of Down, S. by Armagh, and W. by Tyrone. Its greatest length from north to south is 18 miles; from east to west, 11 miles. It covers 98,255 acres, or 154 square miles. The surface of the lake is 48 feet above the level of the sea at low water, and its greatest depth is about 102 feet. It is the largest lake in the British Islands.

The principal bays are Antrim Bay, Sandy Bay, and Bartin's Bay on the east side, and Washing Bay in the south-west. In the lough are several very small islands; on Rams Island, in Sandy Bay, there is an ancient round tower. Lough Neagh receives the Blackwater, the Upper Ban, the Six-Mile-Water, the Main, and the Moyola. The only outlet is the Lower Ban, which quits the lake at the north-western angle, and, passing through Lough Beg, enters the ocean below Coleraine. The shores of the lake are low and flat, and in some parts marshy and frequently flooded. The water possesses in several parts a petrifying quality. The petrified wood is manufactured into hones; and the pebbles found in the white sand of the shores, chiefly chalcodony, are polished and wrought into seals and necklaces. The char, the pullan (or fresh-water herring), the dollaghern (a species of trout), and other fish are taken in the lough; and the swan, the heron, the bittern, the teal, and the widgeon frequent the shores.

Lough Neagh possesses several good landing-places and ports, and is navigated by small vessels. It communicates by one canal with Lisburn and Belfast, by another with Newry, and by the river Blackwater and the Tyrone and Ulster canals with the Tyrone coal-field, Monaghan, Clones, and Lough Erne. A steam-boat is employed on it in towing vessels.

NEAPOLIS. [ISTRIA; NAPLES.]

NEATH, Glamorganshire, South Wales, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union in the parish of Neath, is pleasantly situated on the left bank of the river Neath, in 51° 40' N. lat., 3° 49' W. long., distant 35 miles W.N.W. from Cardiff, 193 miles W. by N. from London by road, and 203 miles by the Great Western and South Wales railways. The population of the borough in 1851 was 5841. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor, and is contributory to Swansea in returning one member to the Imperial Parliament. The living is a rectory in the archdeaconry and diocese of Llandaff. Neath Poor-Law Union contains 30 parishes and townships, with an area of 162,817 acres, and a population in 1851 of 46,471.

Neath occupies the site of the Roman station Nidum. The river Neath is crossed at the town by a bridge. The streets are lighted with gas and paved. There is a commodious market-house, erected in 1837. The church has a square embattled tower. The Wesleyan Methodists, Independents, and Baptists, have places of worship; and there are schools partially endowed, a philosophical society, museum,

library, and mechanics institute. Of the castle, part of the walls and a gateway, flanked by two towers, are yet standing. The exports are coal, copper, iron, fire-bricks, oak, timber, &c.; the imports are copper and iron-ore, corn, flour, foreign timber, &c. There are large copper, iron-, and tin-plate-works. Machinery for smelting and mining operations is extensively made. The market is held on Wednesday, and there are three fairs in the year. About a mile from Neath are the ruins of Neath Abbey, founded in the 12th century.

NEBRASKA, a territory of the United States of North America, established by Act of Congress 1854, occupies the tract of unreclaimed country north of the Nebraska River up to 42° N. lat. It is bounded E. by the state of Iowa, from which it is divided by the Missouri River; N. by the North-West territory; W. by the Rocky Mountains, which divides it from the Oregon and Utah territories; and S. by the territory of Kansas. No definite statement of its limits has been published; but the area of Kansas and Nebraska together is estimated by the United States land-office at 136,700 square miles. No census has been taken of the population: the civilised inhabitants are very few in number.

This country and Kansas have hitherto been usually spoken of together [KANSAS], and the descriptions published have included both. Like Kansas, Nebraska has on the east, extending down to the valley of the Missouri, extensive tracts of prairie lands; on the west a broken and hilly country, rising into the mountainous tract of the Rocky Mountain range; while the centre is occupied by a broad apparently irreclaimable waste, forming the northern part of the Great American Desert, and the home of numerous wandering tribes of Indians. But Nebraska has a larger share than Kansas of this desert land, and in other parts it is believed a less fertile soil.

The Missouri, as we have said forms its eastern boundary, and the only actual settlements, so far as we know, yet made in this territory are on its banks. The chief river belonging to the territory, and that which gives it its name, is the Nebraska, which is formed by the union, in 41° 5' N. lat., 101° 21' W. long., of two branches from the Rocky Mountains. The united stream flows in a generally eastern direction to the Missouri into which it falls about 50 miles below Council Bluffs, and about 600 miles above the confluence of the Missouri with the Mississippi. It is a very rapid shallow stream, fordable, except during floods, in almost every part; and full of islands covered with cotton wood, willows, and shrubs, and of shifting sandy shoals: it is thought to be unavailable for navigation by steam-boats of light draught for more than 40 miles. At its confluence with the Missouri it is 600 yards wide. One of the two main routes for emigrants to Oregon and the Pacific lies along this river quite up to the Rocky Mountains. The chief affluents of the Nebraska belonging to this territory are the Loup Fork, Elkhorn, and Wood rivers.

The chief settlement yet formed is Council Bluffs on the Missouri, which is within this territory, though previous to its organisation assigned to IOWA, under which state it will be found noticed. It is of considerable local importance as the last civilised resting place of the emigrant to the 'far west,' who here makes his final arrangements and purchases, previous to entering upon what has hitherto been commonly known as the Indian country. Council Bluffs was established as a government Indian agency station. Bellevue, a little lower down the Missouri, is the only other civilised settlement in the Nebraska territory, with the exception of a military station for the surveillance of the Indians. The chief tribes of Indians in Nebraska are the Pawnees, Poncahs, Omahas, Otoes, &c., but we have no account of their numbers or condition.

The Act of Congress which erected Nebraska into a territory, leaves it open to settlement by citizens of the United States, and to aliens who make the usual declaration of their intention to become citizens; and defers to the inhabitants themselves the power to determine whether slavery shall be permitted to exist within the territory.

NECKAR-KREIS (circle of the Neckar), a province in the north-west of the kingdom of Würtemberg, is bounded N. and W. by the grand-duchy of Baden, E. by the circles of Jaxt and Danube, and S. by that of Schwarzwald. Its length from north to south is 55 miles; its breadth is about 36 miles; its area is 1278 square miles; and its population in 1852 was 501,034. The province is traversed by several ranges of moderately high forest-clad hills, which run in a western or north-western direction from the Rauhe Alb, or Alps of Suabia, in the east of the kingdom. It takes its name from the river Neckar, which, rising on the Baden frontier in the south of the Schwarzwald, runs in a general north-eastern direction to the centre of the kingdom of Würtemberg, whence it flows northerly past Heilbronn, below which it turns to the north-west, crosses the territory of Baden till it reaches that of Hesse-Darmstadt; of this it forms the boundary to its entrance into the Rhine at Mannheim, after a course of about 170 miles. The Neckar receives in this province the Enz, the Kocher, the Jaxt, and a great number of small streams. It is navigable for small craft from Cannstadt. There are several lakes and mineral springs in the province. The soil of the valley of the Neckar and of the other rivers is exceedingly rich and fertile. The chief products are wheat, hemp, wine, silk, and wood. Horned cattle, sheep, and horses of good breed are numerous. Railroads run from Stuttgart to Heilbronn, and from Stuttgart to Ulm and Frederikshaf on the Lake of Constance (from Ulm a line runs east to Augsburg). From the former line a

branch is constructed to join the great trunk line along the right bank of the Rhine at the Bruchsal station, between Karlsruhe and Heidelberg. [WÜRTEMBERG.]

Towns.—STUTTGARDT. CANNSTADT. ESSLINGEN. Heilbronn, 28 miles N. by railway from Stuttgart, is situated on the right bank of the Neckar, which is here crossed by a wooden bridge. It is surrounded with high walls and a deep ditch, and contains some good buildings, the most interesting of which are the church of St-Kilian, the town-hall, and the house of the Teutonic Knights, now used as barracks. Heilbronn has a gymnasium, a public library, and about 10,000 inhabitants, who are actively engaged in trade, and in the manufacture of silver ware, carpets, tobacco, white lead, chemical products, gunshot, paper, &c. The navigation of the Neckar below this town is much facilitated by the Wilhelm's Canal. Ludwigsburg, N. of Cannstadt, a mile from the left bank of the Neckar, is a well-built town, with 6208 inhabitants, exclusive of the garrison. The town, which, for its size, is one of the prettiest in Germany, has long wide streets, mostly lined with trees. The principal building is the former royal palace, one of the largest in Germany; it contains a great number of pictures of the old German and Flemish schools. The other remarkable objects are the military college, the lyceum, and the arsenal. Woollen cloth, linen, calico, jewellery, leather, nails, and cannon, are among its industrial products.

NENAGH, Tipperary county, Ireland, a market- and post-town, and the seat of a Poor-Law Union, is situated on the Dublin and Limerick road, in 52° 52' N. lat., 8° 11' W. long., distant by road 24 miles N.E. from Limerick, and 95 miles S.W. from Dublin. The population in 1851 was 7349, besides 1943 inmates of the workhouse. Nenagh Poor-Law Union comprises 28 electoral divisions, with an area of 183,088 acres, and a population in 1841 of 72,045; in 1851 of 50,492. The town consists of four streets which contain some well built houses, and the place has a neat and pleasant appearance. The parish church is a plain building, erected in 1810. There are chapels for Roman Catholics and Methodists, a parochial Free school, three National schools, the court-house and jail for the North Riding, a dispensary, and Union workhouse, and an infantry barracks. There is a weekly market for corn and cattle. The market-day is Thursday. Nenagh Round, a lofty and massive keep, forms a conspicuous object in the town.

NENTHEAD. [CUMBERLAND.]

NEOT'S, ST., Huntingdonshire, a market-town, and the seat of a Poor-Law Union, in the parish of St. Neot's, is situated on the right bank of the river Ouse, in 52° 14' N. lat., 0° 17' W. long., distant 9 miles S. by W. from Huntingdon, 56 miles N. by W. from London by road, and 51½ miles by the Great Northern railway. The population of the town in 1851 was 2951. The living is a vicarage in the archdeaconry of Huntingdon and diocese of Ely. St. Neot's Poor-Law Union contains 30 parishes and townships, with an area of 65,256 acres, and a population in 1851 of 18,825.

At this place, anciently called Ainulphabury, a Benedictine monastery was early established, to which the remains of Neot, a Saxon saint, were transferred from Neotstock, in Cornwall. The town consists of several streets, and has a commodious market-place. The lowness of its site exposes the town to inundations of the Ouse, which is here crossed by a bridge of five arches, with six additional arches over the low ground on the banks. The parish church is considered the finest church in the county. It consists of a nave, aisles, and chancel, with a tower 150 feet high at the west end. The interior has been well restored. The Baptists and Wesleyan Methodists have chapels, and there are Free, National, and Infant schools. A paper manufactory employs some of the inhabitants. The market is held on Thursday, and there are three yearly fairs.

NEOT'S, ST. [CORNWALL.]

NEPACTOS. [LEPANTO, GULF OF.]

NEPAUL, or NEPAL, a principality situated within the range of the Himalaya Mountains, lies between 26° 20' and 30° 40' N. lat., 80° 5' and 88° 20' E. long. It has Tibet on the N., the plains of Hindustan on the S., Kumaon on the W., and Sikkim on the E. The length east to west is about 450 miles, the breadth north to south, on an average, is about 100 miles. The area is 54,000 square miles. The population is estimated at 1,940,000.

Nepaul forms a long and elevated valley, inclosed by the Himalaya Mountains on the north, and by the Lama Dangra Mountains on the south. Some of the summits of the Himalaya Mountains bordering upon Nepal are the highest of the range, one of them, the Dhawalaghiri, or White Mountain, attaining an elevation of 28,000 feet above

the sea, and two others to 25,000 and 23,000 feet respectively. The Lama Dangra Mountains have a general elevation of 6000 or 7000 feet above the sea. The valley of Nepal itself is 3000 or 4000 feet high. The surface is very uneven and broken, and the general width of the cultivated part is not more than 30 or 40 miles. It includes at the east end a portion of the plain of the Ganges, which is a part of the Tarai, or swamp, but is of a much better kind than that which is south of Bootan, and belongs to Bengal: the products are timber, of which a great quantity is sent to Calcutta, and elephants. The principal object of cultivation in Nepal is rice, but maize, wheat, barley, sugar-cane, cotton, madder, and legumes, are also grown.

The streams in Nepal are very numerous. The principal rivers are—the Coosy in the east, which reaches the Ganges about 20 miles below Boglipoor; the Gunduck in the centre, which falls into the Ganges nearly opposite to Patna, and the upper course of the Gogra in the west. The tributaries of the Coosy and Gunduck are numerous, and some of them large.

Nepal contains several considerable towns, which owe their origin or prosperity to the country being the thoroughfare between the table-land of Tibet and the plains of the Ganges. Other towns owe their prosperity to the fertility of the district in which they are situated. This is particularly the case with the capital, *Khatmandu*, which stands in a plain about 20 miles long by 16 miles wide, environed by mountains which rise from 3000 to 4000 feet above it. The town is surrounded by a wall. The streets are long, narrow, well drained, and tolerably clean. The same plain contains two other large towns, Lalita Patan and Bhatgong, which are Newar towns, and are falling into decay. Khatmandu has a population of about 50,000, and contains many temples. *Neacote*, another large town, about 20 miles N.W. from Khatmandu, stands on a high hill, on one of the most frequented of the roads into Tibet, along the course of an affluent of the Trisul Ganga, and over the pass of Kheru.

The population of Nepal consists of several tribes, some of whom are Buddhists, and appear to be of Mongol origin; others seem to be of Hindoo origin, and adhere to Brahmanism. The ruling tribe are Ghorkas, and belong to the latter class; the next most important are Newars, who, until 1716, supplied the sovereigns of the state until subdued by the Ghorkas. The Newar tribe now presents the best artisans and cultivators, while the Ghorkas form the soldiery. In 1814 the Nepaulesse commenced a war with the English, which was terminated in 1816, when all the countries between the Sutlej and Kali rivers were ceded by them to the British, and the territories of the raja of Sikkim, which they had occupied, were evacuated. In 1850 the raja of Nepal sent his prime-minister as ambassador extraordinary to the government of Great Britain; he landed at Southampton May 25, and left London on his return August 20. In 1854 another expedition was preparing against Tibet.

Nepal is not under British protection, but the raja is united by treaty to the British government, whose decisions he is bound to follow in certain cases.

NETHERBURY. [DORSETSHIRE.]

NETHERLANDS, a kingdom in the north-west of the continent of Europe, consists of the territory of the republic of the Seven United Provinces, the duchy of Limburg, and the grand-duchy of Luxemburg, which the king of the Netherlands possesses, with the title of grand-duke, as a part of the German Confederation. It is situated between 50° 44' and 53° 34' N. lat., 3° 30' and 7° 10' E. long., and is bounded E. by Germany, N. and W. by the North Sea, and S. by Belgium. The area of the kingdom is 12,567 square miles. The population, on the 1st of January 1839 was 2,583,271; on the 31st of December 1853 it amounted to 3,203,232. The area and population are distributed over 11 provinces as follows:—

Provinces.	Area in Square Miles.	Population.
North Brabant	1976.2	405,525
Guelderland	1962.0	387,423
North Holland	955.0	514,755
South Holland	1169.6	591,493
Zealand	670.4	165,075
Utrecht	534.2	155,324
Friesland	1260.9	259,508
Overijssel	1280.8	227,683
Groningen	882.5	197,101
Drenthe	1027.0	87,944
Limburg	848.5	211,401
Total	12,567.1	3,203,232

If to these numbers be added respectively 986 square miles and 194,619 inhabitants, for the grand-duchy of Luxemburg, the total extent of the European territory subject to the king of the Netherlands is 13,553 square miles, and the total population 3,397,851. Of the number about 60,000 are Jews; about 50 Greeks and Armenians; and the rest Protestants and Catholics, in the ratio of 11 to 7.

Face of the Country; Soil; Climate.—The Netherlands are part of the great plain of Northern Europe, and are not separated from Germany on the north-east by any natural boundaries. The provinces about the mouths of the Schelde and the Rhine, and the country to the north of them, Zealand, North and South Holland, Friesland, Groningen, Drenthe, and Overijssel, are indeed most appropriately called the Netherlands, that is, the Lowlands. They form one unbroken flat without a hill or rock, without forests or running waters, they lie in part even below the level of the sea, against the inroads of which they are protected partly by immense dykes, and partly by sandhills, or 'dunes,' from 80 to 180 feet high, which have been cast up by the ocean, and, running parallel with the coast, protect it against the element to which they owe their origin. Nothing can be more dreary than this ocean of sand; it is a perfect image of aridity and barrenness; some broom scarcely green, some stunted shrubs growing at intervals in the hollows, where they are protected from the wind, alone interrupt this dreary solitude. From the Helder to the mouth of the Maas, a distance of 75 miles, these gloomy though protecting deserts everywhere extend between the cultivated country and the sea. The land thus rescued from the sea, consisting of moor and mud, is traversed by numberless canals, which are absolutely necessary to drain it and render it fit for cultivation. The labour is simply rewarded, for the land is extremely fertile and covered with the richest pastures. The lowest parts are called polders. When a marsh is to be drained, it is first inclosed with a rampart, or dyke, to prevent any water from flowing into it. Windmills are then erected on the edge of the dyke, each of which works a pump. As the mills raise the water it is discharged into a canal, which conveys it to the sea or to some inland piece of water. But in general the operation cannot be performed at once; where the marshes are too deep below the surrounding country, two or three dikes and as many canals are made at different levels, rising by degrees to the upper canal, in which the whole terminates. All the polders have an extremely rich alimy soil, which is generally used for pasturage, but in some places produces rich crops of corn. The eastern provinces nearest to Germany contain many meres and marshes, and especially the great series of turf moors which extend from the mouth of the Schelde eastward to the Maas, and there join the great morass called the Peel, on the east frontier of North Brabant, which is 10 leagues long and from 1 to 3 leagues broad.

This marshy country, which is so wholly artificial that it has justly been said 'the Dutch built Holland,' is one of the best cultivated, the most wealthy, and the most populous in Europe; and it would be difficult to find elsewhere, in so small a compass, such a number of large and well-built villages, towns, and cities. The atmosphere in these low tracts is for the most part damp, thick, and heavy; fogs and storms are very frequent; but both the heat and the cold are more moderate than in Northern Germany. The climate is unhealthy, especially for foreigners. The want of good spring water is very sensibly felt. The climate is more healthy in the eastern provinces, which are rather more elevated, and contain some small hills, which the inhabitants dignify with the name of mountains.

Bays, Rivers, Canals, and Lakes.—The whole coast, which is much broken and indented with considerable bays, large inlets of the sea, and the mouths of great rivers, would measure near 500 miles. The North Sea, which borders Belgium and the Netherlands from the frontier of France to the mouth of the Ems, has produced in the lapse of ages great physical revolutions in the maritime provinces. The most remarkable of these revolutions have been the retreat and encroachment of the sea, and the changes in the course of the Rhine. The whole country probably once belonged to the ocean, but the oldest accounts that we possess represent the land as more extensive than at present. The Yssel, it appears, ran into an inland lake called Flevo, from which a river pursued its course for 50 miles to the sea. That lake, with the adjacent continent, has been covered for many centuries by the Zuyder-Zee, the only remains of the continent being the islands of Texel, Vlieland, Schelling, and Ameland, which lie in a curved line, convex towards the ocean, in front of and protecting the entrance of the Zuyder-Zee. This inland sea, which is inclosed by the islands and the provinces of Holland, Utrecht, Guelderland, Overijssel, and Friesland, resembles a great lake: it is 80 miles long from north to south, and its breadth varies from 20 to 30 and 40 miles. On account of its great extent, the navigation is dangerous in stormy weather for small vessels, which however cross it from South Holland to Friesland rather than go all round the coast. The entrances between the islands being much obstructed by sand-banks, the trade of Amsterdam derives infinite benefits from that noble work the Helder, or North Holland Canal. The Lauwer-Zee, between Friesland and Groningen, and the Dollart, between Groningen and the German province of East Friesland, were formed by similar irruptions of the sea in the 13th century; and so late as the 15th century a great salt-

water lake, called the Bies-Bosch, was suddenly formed to the south-east of Dort, by the sea bursting through a dam and overwhelming 72 villages, with 100,000 inhabitants. [BIESBOSCH.]

The principal river is the RHINE, which, coming from Germany, enters the Netherlands at Lobith, where it is 2300 feet broad; but in traversing this country it is divided into three arms, and before it reaches the sea even loses its venerable name. Soon after crossing the frontier it divides into two branches, the larger and left arm forming the Waal. The right or northern arm flows to Arnheim, where it again divides into two branches; one, called the Yssel, flows northward to the Zuyder-Zee; the other runs to Wijk, where it again divides into two streams, the larger, called the Leek, joining the Waal above Rotterdam, and the smaller, now reduced to an insignificant river, passing by Utrecht to Leyden and the sea. Till the beginning of the 19th century, this branch was lost in the sand, the mouth being completely choked up since A.D. 840; works were commenced by Louis Bonaparte to re-open this mouth of the river near Katwyk, and the operation was happily completed in 1807. The other principal rivers are—the Maas, or MEUSE, which comes from Belgium and joins the Waal at the fort of St.-Andries; and the SCHelde, which, likewise coming from Belgium, enters Holland below Antwerp, and divides into two arms, the East and the West Schelde; the West Schelde falls into the ocean at Flushing, and the East Schelde between the Zealand Islands of Schouwen and North Beveland. Of the canals the most important is the North or Heider Canal. [HOLLAND, North.] The greatest lake, that of Haarlem, has been recently drained by the action of steam-engines, and its area converted into polders. [HAARLEM.]

The railway system of the Netherlands comprises a line running from Rotterdam through the Hague, Leyden, and Haarlem to Amsterdam; a second line joining Amsterdam to Utrecht, and continued eastward to Arnheim near the Prussian frontier; and a line connecting Rotterdam with Antwerp, thus uniting the great Dutch commercial cities with the general railway system of Europe. Electro-telegraphic wires are laid along all these lines.

Natural Productions.—The horses are a large strong breed, well adapted for draught and for heavy cavalry, but like all horses bred in a damp soft soil, they have tender feet. The horned-cattle are mostly remarkable for their size and beauty, and amount to about a million. Vast numbers of lean cattle from Denmark and Germany are fattened in the rich pastures of North Holland. There are about 700,000 sheep. The swine are of the German breed, and are most numerous in the provinces next to Germany. The only kind of game is the hare, and even that is rare; wild-rabbits however are very numerous among the sand-hills. Domestic poultry is plentiful. There are wild geese and ducks, snipes, woodcocks, and plovers. This is the paradise of storks, it being considered a great offence to kill one. Accordingly they build their nests on the house-tops, and walk about unmolested and unconcerned. Fish is abundant on the coasts and in the rivers; the cod fishery on the Doggerbank and the Greenland whale fishery are very productive. But the herring fishery on the coast of the Shetland Islands, formerly a chief source of the wealth of the Dutch, has greatly declined. In 1601 there were 1500 vessels employed in the herring fishery; in the years from 1795 to 1807 and 1808 there were only 30 vessels; but the number has since greatly increased. In 1842 the Dutch fisheries employed 1603 vessels, worked by 8350 men. The average annual produce then amounted to 40,000 tons of salt-herrings; 10,000,000 herrings for smoking or drying; and 10,000 tons of salt-fish. The gross value of the produce was estimated at 4,000,000 florins, or 333,333*l.*, a sum, which, taking into account the capital employed in the ships, &c. amounting to 354,410*l.*, and to the yearly expenditure of about 314,416*l.*, leaves but a small margin for profit. The Dutch carry on a large trade in eels with London; the eels are kept alive in wells on board the schuyts (as the vessels are called). The vessels generally remain at Erith, and the fish are sent up by lighters in eel-boxes.

Sufficient corn for home consumption is not raised; hemp and flax are grown in great abundance.

There are no minerals, except a little bog-iron in Overijssel and Guelderland: there are brick-earth and potters'-clay in most of the provinces. Fullers'-earth (but mixed with too much sand) is got in pretty considerable quantities about Tilburg; and immense quantities of turf are dug in Holland and Friesland: some sea-salt, but in small quantities, is made on the coasts of Holland and Friesland.

Trade.—The history of the commerce of the Netherlands, properly begins with Bruges in Flanders, in the 14th century. From Bruges the trade was for the most part transferred at the end of the 15th century to Antwerp, which became the greatest emporium in the world. But the ravages of the war with Spain and the capture of the city after the memorable siege in 1585 drove the wealthiest inhabitants to the northern provinces, especially to Amsterdam. The new republic of the 'Seven United Provinces,' founded on principles of civil and religious liberty, became a sure asylum for the oppressed, while religious dissensions and persecutions prevailed in many other parts of Europe. Poor as the country then was in natural resources, it was necessary to find for the rapidly increasing population employment beyond the seas. The republicans, who were at first driven by necessity to become bold corsairs against the Spanish squadrons, soon

became excellent and intrepid seamen, and enterprising indefatigable merchants. The commerce of Antwerp, Cadix, and Lisbon fell into their hands, and thus, in the middle of the 17th century, the United Provinces became the first commercial state and the greatest maritime power in the world, and the trade of Amsterdam acquired an unparalleled degree of prosperity. The East India Company, founded in 1602, with a capital of only 6,500,000 florins, conquered kingdoms and islands in Asia. With 200 ships it traded with China and Japan; it alone furnished Europe with the costly productions of the Spice Islands; the gold, the pearls, and the diamonds of the East passed only through its hands. The prosperity of Amsterdam remained almost unimpaired till towards the latter end of the 18th century, when the French revolution in 1795 gave it a fatal blow, and its rival, London, became the commercial capital of the world. Reduced to the condition of a vassal and afterwards of a province of France, and consequently engaged in a constant war with England, Holland lost its ships, its colonies, its commerce, and its public credit. After recovering its independence on the expulsion of the French in 1813, the commerce of Holland revived in a remarkable manner, but is still below its former magnitude. During the union of the northern and southern provinces, under the name of the kingdom of the Netherlands, both Holland and Belgium flourished. Holland indeed lost the colonies of Berbice, Demerara, and Essequibo, with the Cape of Good Hope and Ceylon. The very profitable contraband trade formerly carried on with Spanish America has also been destroyed, since those colonies declared themselves independent. The trade with India has undergone a great change, not only by the loss of the Cape and Ceylon, but by the fall of the East India company and the throwing open of the East India trade to all the subjects of the Netherlands, excepting that to the Moluccas and to Japan. On the other hand the improved administration of Java has led to a vast increase of the productions of that fine colony, and new and profitable channels have been opened to Dutch commerce in Brasil, Cuba, and Haiti. The revolt of the southern provinces in 1830 was a great check to the progress of commerce; yet it continued to improve even during that period, and has again become very flourishing. In recent times, especially since 1840, the city of Rotterdam has obtained a preponderating share in the shipping and foreign commerce of the Netherlands; before that date Amsterdam was the leading commercial city as it still is in all banking and exchange transactions.

Commerce.—The Dutch import from and export to all the great producing countries of the world. The total value of the imports according to official returns in 1851 and 1852 respectively, was 303,993,224 and 322,719,559 Dutch florins. The total value of the exports in the same years amounted to 242,744,806 and 272,484,555 florins respectively. The following table shows the countries most weightily concerned in Dutch commerce, the numbers expressing the official value (in florins) of the imports from, and the exports to, each country in 1852:—

Countries.	Imports.	Exports.
Belgium	16,517,060	24,565,335
France	12,800,992	10,311,122
Great Britain	83,408,545	61,022,444
Java	76,316,357	18,833,592
United States	9,335,773	5,393,474
Norway	4,543,059	737,224
Austria	1,618,803	3,731,987
Russia	18,367,788	5,182,174
Sardinia	240,046	3,291,697
Surinam	4,872,358	1,467,113
German Zollverein	53,502,643	111,743,569
Turkey and Greece	2,723,111	3,659,274
Denmark	2,212,018	1,276,097
China	3,603,234	4,371
Hamburg	3,214,861	7,580,473
Hanover and Oldenburg	3,100,244	2,314,792
Canaries	5,938,917	216,769
Naples	1,433,975	3,673,613
Cuba	1,943,665	217,915

The exports consist of colonial produce from the East and West Indies, coffee, sugar, spices, tea, silks, and other articles from China and Japan; the productions of the home country, butter, cheese, flax, hemp, and corn; tobacco, madder, flower-roots, cattle, and horses; the produce of their fisheries, especially herrings, and of their distilleries and manufactories. The chief articles of importation are corn, salt, wine, timber in very large quantities, partly from Norway and partly from Germany, whence it is floated down the Rhine; stone, such as blocks of granite from Norway for the dykes, and freestone for building; marble; and various manufactured goods: besides colonial produce of every kind from Asia, Africa, and the West Indies.

Manufactures.—The principal manufactures are linen, wool, silks, leather, refined sugar, tobacco-pipes, gin or hollandia (distilled in vast quantities at Schiedam and Delft), cotton manufactures, jewelry, and numerous other articles, which will be found enumerated in the articles on the chief towns and on the provinces.

Religion.—The established religion is Calvinian; but other religious

are tolerated. The Calvinist and Lutheran Churches have each their own synod. The Protestant clergy have a support from the state: the amount allotted to them in the budget of 1854 amounted to 1,677,906 florins. The Catholics, perhaps the largest united religious body in the state, received in the same year for the support of their worship 573,329 florins. A bull of the Pope, dated March 4th 1853, established a hierarchy in the kingdom of the Netherlands, consisting of an archbishop (Utrecht), and four suffragans (Haerlem, Bois-le-Duc, Breda, and Ruremonde).

Education is very generally diffused throughout the kingdom. Besides the pariah schools, under the protection of the government, private boarding-schools are numerous. For the higher branches there are seminaries called royal schools, where the ancient and modern languages, mathematics, rhetoric, and drawing are taught: of these there is one in every large town. The universities are those of Leyden, Utrecht, and Groningen, the first of which was formerly one of the most illustrious in Europe. There are likewise schools for particular branches of education, such as military and naval schools.

Constitution.—According to the constitution, which was promulgated by a royal ordinance August 24, 1815, the crown is hereditary in the male line, and in default of male descendants in the female line. The executive power is in the hands of the king, whose person is inviolable, his ministers being responsible. The legislative power is in the king and the states-general, consisting of two chambers: the members of the first chamber are appointed by the king for life; the second chamber is elected by the provincial assemblies, and one-third of the members go out annually by rotation, but they may be re-elected. All new laws are proposed by the king to the second chamber. The sittings of the second chamber are open to the public; those of the first are not. Each province has its own provincial assembly, which has various important local duties, such as the superintendence of religious worship and charitable institutions, the care of the roads and bridges, and the election of the deputies to the second chamber.

Finances.—In the budget of 1854 the revenue is estimated at 71,833,752 florins; the expenditure at 70,703,711 florins. The total amount of the public debt in 1854 was 1,200,988,330 florins, the interest payable on which within the year was 35,123,122 florins. The receipts from the East India possessions, including the proceeds of the sale of colonial produce, was estimated at 69,942,791 florins in 1852; the whole of this sum, it is stated, would be absorbed by the colonial administration and expenses in the mother country. The revenue of Dutch Guyana amounted to 1,006,150 florins, and the expenses to the same sum. The revenue obtained from the West India Islands and the coast of Guinea does not pay the expenditure required for the maintenance of those colonies.

Army and Navy.—The army in 1854 consisted of 8 regiments of the line; 1 regiment of grenadiers and chasseurs; 4 regiments of dragoons, and 1 of mounted chasseurs; 1 regiment of field artillery, 3 of garrison artillery, and 1 regiment of horse artillery; with a corps of pontooners and a battalion of sappers and miners; the whole force numbering 57,959, including 1869 officers.

The navy in July 1854 comprised 2 ships of eighty-four guns; 3 seventy-fours; 5 first-class frigates (one of them a screw), with fifty-four to sixty guns each; 8 second-class frigates, of thirty-eight to forty-four guns; 12 corvettes (two propelled by screw); 20 sloops (one of them a screw); 21 war steamers; 2 frigates and 1 corvette for port duty, carrying together one hundred guns; 2 armed transports; and 49 gun-boats: all manned by 6760 men (580 of whom are East Indians), and carrying altogether 2174 guns.

Colonies.—The colonial possessions of the Dutch in the East Indies comprise the islands of Java and Madura, the west coast of Sumatra, the west, south, and east coasts of Borneo; Celebes, the Moluccas, Banca, Billiton, Menado, Ternate, Amboyna, Banda, Timor, &c., with an aggregate area of 612,000 square miles, and 12,006,700 inhabitants.

The West India colonies comprise Dutch Guyana, Curaçao, Bonaire, Aruba, St. Eustache, St. Martin, and Saba, with a total area of 59,880 square miles, and a population of 76,500.

The Dutch possessions in Africa are estimated at 10,500 square miles, with a population of about 100,000.

History.—Julius Cæsar, in prosecuting his conquests in Northern Gaul, advanced as far as the Rhine. The inhabitants of the north bank of the Rhine were called Batavi, and considered as belonging to Germany. They were engaged in many wars, either with the Romans or as their allies. We afterwards find them partly as trading, partly as seafaring people, and as pirates, who were in the end subdued by the Romans. In the 5th century the Batavians, and in the 6th century the Belgæ, were conquered by the Franks, but the Frieslanders not till the 7th century. At the peace of Verdun, in 843, Batavia and Friesland were incorporated with the newly-created kingdom of Germany, of which Ludwig (that is, Lewis), surnamed the German, was the first king, and were under governors, who afterwards made themselves independent. From the year 1000 to the end of the 11th century the country was divided into duchies, counties, and imperial cities. Utrecht became a bishopric, and extended its temporal power over Groningen and Overysel. Of all these princes the counts of Flanders were the most powerful, and their country having become subject in 1383 to the still more powerful house of Burgundy, the

latter made itself master of almost the whole of the Netherlands. Charles the Bold, the last duke of Burgundy, fell in a battle with the Swiss; and his only daughter and heiress Maria marrying Maximilian, son of Frederick III., duke of Austria and emperor of Germany, the Netherlands came under the dominion of the house of Austria. Maximilian's grandson, Charles V., by the Pragmatic Sanction in 1548, united all the seventeen provinces with Spain; they however retained the name of the Circle of Burgundy, and were attached to the German empire. During the reign of Charles V. the Protestant religion began to spread in these provinces, though grievously oppressed, for the number of persons in the seventeen provinces put to death in his reign as heretics is estimated at several thousands. His son and successor Philip II. introduced the inquisition, and carried on religious persecution with a cruelty before unknown. The patience of the people was exhausted, and they rose in open rebellion, which the atrocities of the bloodthirsty Alba could not quell. Most of the other provinces concluded with Holland and Zealand the Convention of Ghent in 1576, and formed a still closer alliance in the following year by the Union of Brussels. But the consummate abilities of the Prince of Parma succeeded in bringing all the southern provinces under the authority of Spain. In 1579 the five provinces of Holland, Zealand, Utrecht, Guelderland, and Friesland concluded the celebrated Union of Utrecht, in which they declared themselves independent of Spain. They were joined in 1580 by Overysel. On the 26th of July 1581 they renounced their allegiance to Philip, and being joined in 1594 by Groningen, formed the celebrated republic of the Seven United Provinces, which was afterwards generally called Holland, from that province, which exceeded the others in extent, population, wealth, and influence. Though Philip III. was obliged to conclude in 1609 a thirteen years' truce, called the Peace of Antwerp, and the independence of the provinces was recognised by all the European powers except Spain, it was not fully secured till the peace of Münster, at the close of the thirty years' war, in 1648. Towards the end of the 17th century they were engaged in war with France and England, and at the beginning of the 18th century in the war of the Spanish succession. Holland was weakened by these efforts, while republican jealousy of the attempts of the house of Orange to increase its authority sowed the seeds of party rage and civil war. In 1747 the house of Orange triumphed, and William IV. obtained the hereditary dignity of stadtholder in all the seven provinces. In 1786 the republicans again raised their heads, but the wife of the stadtholder William V., who was sister to Frederick William II., king of Prussia, having been insulted by some violent patriots, applied to her brother, who sent a Prussian army of 25,000 men to avenge the indignity she had received, and secure the rights of her husband. The patriots resisted in vain; the rights of the house of Orange were confirmed and enlarged, and a close alliance concluded between the republic and Great Britain and Prussia. In 1794 the republican or anti-Orange party, encouraged by the approach of the victorious armies of France, again rose. Pichegru easily conquered Holland, being favoured by the severe winter and by the popular party; and the stadtholder, with his family, was obliged to fly to England. The provinces were now organised under the title of the Batavian Republic. A necessary consequence of this change was war with England, which led to the capture of their fleets, the destruction of their trade, and the loss of their colonies, to all which evils were added the exorbitant demands of their French allies, who also changed several times the constitution of the republic. In 1806 it was formed by Napoleon into a kingdom, and given to his brother Louis, who studied the welfare of his subjects, but lost the friendship of his brother by his too great liberality, and unexpectedly resigned the crown in favour of his eldest son, a minor, on the 1st of July, 1810. Napoleon however refused to recognise his brother's arrangement, and incorporated the kingdom with the French empire, with which it remained united till November, 1813, when the people, encouraged by the disasters of the French, rose and expelled them from the country, and recalled the Orange family. The Prince of Orange governed the country by the title of 'Sovereign Prince' till 1815, when the seven northern and the ten southern provinces, after a separation of 200 years, were again united by the name of the kingdom of the Netherlands. This union continued for fifteen years. In 1830 the Belgians revolted from their allegiance, and became an independent state. [BELGIUM.] [See SUPPLEMENT.]

NEU-BRANDENBURG. [MECKLENBURG STRELITZ.]

NEUBOURG. [EURE.]

NEUBURG, a well-built town in the Bavarian circle of Suabia, is agreeably situated on an eminence on the right bank of the Danube, 33 miles N.N.E. from Augsburg, and opposite to an island which is connected with both banks by bridges. Among the public buildings are a large handsome palace, which contains the great hall, with a collection of ancient armour; a college, formerly belonging to the Jesuits; a rich library, a collection of antiquities, a gymnasium, extensive barracks, the church of St. Peter, two other churches, an hospital, and an orphan asylum. Neuburg is the seat of a court of appeal, and of the courts of justice of the circle and the town. The inhabitants, who are about 7000 in number, have considerable breweries and distilleries, a manufactory of earthenware, and a flourishing trade. In the neighbourhood are the royal country-seats of Grunau and Petzelheim, the royal stud at Rothanfeld, and, near the village of

Unterhausen, the monument erected in honour of Latour d'Auvergne, "the first grenadier of the French army," who was killed here by an Austrian lancer on the 27th of June 1800. Neuburg was formerly the residence of the palgrave, and the capital of the ancient principality of Neuburg.

NEUFCHATEAU. [VOSGES.]

NEUFCHÂTEL. [AISNE; SEINE INFÉRIEURE.]

NEUFCHÂTEL (generally written *Neuchâtel*, but called *Neuenburg* by the Germans), a canton of Switzerland, situated in the Jura Mountains, which here form several parallel narrow ridges running in the direction of north-east to south-west, and separated by elevated longitudinal valleys. The greatest length of the canton is about 31 miles; the greatest breadth 13 miles. The area is 250 square miles. It is bounded W. by France, S. by the Canton de Vaud, E. by the Lake of Neuchâtel, and N. by the Canton of Bern. The canton is naturally divided into three regions:—1, the 'Vignobles,' being the banks of the lake, the level of which is 1400 feet above the sea, and the lower hills which rise immediately above, and are planted chiefly with vines; 2, the 'Vallon,' or the two valleys, Val de Travers and Val de Ruz, which run between two parallel ridges of the Jura, and rise from 2000 to 2400 feet above the sea; they produce corn, hay, pulse, and fruits; 3, the 'Montagnes,' or highlands of the Jura, nearer to France, consisting of some naked and some wooded ridges, with high bleak valleys intervening, which are known by the names of La Chaux de Fond, Locle, Chaux du Milieu, La Brevine, and La Sagne. The canton does not produce corn sufficient for its population; the deficiency is made up by importations from Bern and Basle. The products are chiefly cheese, wine, cattle, barley, and timber.

The population of the canton in March 1850 was 70,753, of whom 5570 were Catholics, and the rest Protestants of different sects. Of the population about 18,000 are employed in watchmaking in the towns and country districts; watches are exported in large numbers to all parts of Europe and America. Other manufactures are cotton fabrics for export, hosiery, cutlery, and hardware. The women, especially in the Val de Travers, are employed in the manufacture of lace. The language of the inhabitants is French.

Neuchâtel, the capital, is built partly on the bank of the lake and partly on two hills divided by the river Seyon, which comes from the Val de Ruz. It contained 12,846 inhabitants in 1850. On one of the two hills is the castle, which was built in the 13th century, and near it the cathedral, which dates from the 10th century, and contains the tombs of the ancient counts of Neuchâtel. In the lower town are the town-hall, the burgesses' hospital, the orphan asylum, the Pourtales hospital, and a fine college, which contains a public library and a cabinet of natural history. The lower town, generally speaking, is well built, and has a fine appearance when seen from the lake.

Among the other places the following are worthy of notice:—*Chaux-de-Fonds*, a large scattered town resembling an assemblage of villages and hamlets, is 10 miles N. from Neuchâtel, and at the census of 1850 had 12,688 inhabitants. It stands in a bare bleak valley more than 3000 feet above the sea. The inhabitants live chiefly by the manufacture of watch- and clock-works, which is carried on, not in factories, but in the dwellings of the workmen, each of whom devotes himself to making one particular piece of the machinery. *Locle*, about 10 miles W. by N. from Neuchâtel, is another scattered village nearly as populous as Chaux-de-Fonds. The men are almost all watchmakers and the women lacemakers. A tunnel through the limestone rock forms a channel for the little river Bied which traverses the valley and which formerly inundated the plain. A short distance from the town, and below its exit from the tunnel, the Bied, on its way to join the Doubs, disappears down a chasm 100 feet deep, and the fall is made available to turn the machinery of three or four mills, one above the other, each receiving in succession the water-power that turns its wheels. There are two similar subterranean mills in Chaux-de-Fonds. *Vallengin*, the chief place in Val de Ruz, has an old castle which dates from the 12th century and is now used as a prison, and about 6000 inhabitants comprising the neighbouring district. At *Motiers*, a village in the Val de Travers, Rousseau resided for a while after his banishment from Geneva, and here he wrote his 'Lettres de la Montagne.' The mountains in this neighbourhood and generally throughout the canton present many frightful chasms and crater-like cavities in the limestone rock. One of these cavities, a few miles below Motiers, is seen on the summit of the mountains called *Croix-de-Vent*, which is 4300 feet above the sea, and is hollowed out from the summit to a depth of 500 feet.

The county of Neuchâtel was a fief of the old kingdom of Burgundy, and it had its line of counts until A.D. 1283, when it passed into the house of Châlons, from which it came into that of Longueville. In 1707 the ownership was obtained by Prussia. Bonaparte obliged the King of Prussia to surrender Neuchâtel in 1806, and he gave it to General Berthier, but in 1814 the county returned to the allegiance of the house of Brandenburg, and it was at the same time received as a canton into the Swiss confederation, of which it had already been for a long time an ally.

Neuchâtel continued to be a principality of which the King of Prussia was the sovereign prince, till the Swiss revolution of 1847, when it became a democratic member of the Swiss confederation. It

returns 4 members to the National Council of the republic. The canton has a representative assembly, and a constitutional code.

The *Lake of Neuchâtel*, called also the *Lake of Yverdon*, is 25 miles long by 5 miles broad. Its greatest depth towards the middle is about 400 feet. Its feeders are the rivers Orbe, Brole, Reuse, and Seyon. The outlet is the Thiele at the north-east extremity, which carries its waters into the neighbouring lake of Bièvre, whence there is an outlet into the river Aar. The basin of the Lake of Neuchâtel belongs to the water-system of the Rhine. The level of the lake is nearly 200 feet above that of the Lake of Geneva. Steamers ply on the lake between Neuchâtel and Yverdon. The projected railway from Geneva to Bern skirts the east shore of this lake.

NEUHAUS, a well-built town in Bohemia, 68 miles S.S.E. from Prague, has about 8000 inhabitants. It is the chief place of a lordship belonging to Count Czerny, whose palace is a very magnificent edifice. It has one of the finest churches in Bohemia; a gymnasium, which formerly belonged to the Jesuits; and extensive manufactories of woollens, linen, paper, and playing-cards. A great part of the town was destroyed by fire in 1801. Fine topazes are found in the vicinity.

NEUHAUSEL. [HUNGARY.]

NEUILLY. [SEINE.]

NEUILLY LE RÉAL. [ALLIER.] and ST. FRONT. [AISNE.]

NEUSATZ. [HUNGARY.]

NEUSOHL. [HUNGARY.]

NEUSS. [DÜSSELDORF, Government of.]

NEUSTADT, or WIENER-NEUSTADT. [ENGL.]

NEUSTETTIN. [POMERANIA.]

NEUVIC. [CORRÈZE; DORDOGNE.]

NEUVY ST. SEPULCHRE. [INDRE.]

NEUWIED, a town in the Prussian government of Coblenz, is situated in 50° 25' N. lat., 7° 30' E. long., on the right bank of the Rhine, was formerly the capital of the small principality of Wied, which retained its independence till 1806, when it was mediatised, and assigned to Nassau, but in 1814 it was transferred to Prussia. It is a very regular well-built town with broad straight streets, and houses all of equal height. It contains about 6000 inhabitants, consisting of Roman Catholics, Lutherans, Calvinists, Anabaptists, Moravians, Mennonites, Quakers, and Jews: all these sects have their own places of worship. Neuwied is the residence of the Prince of Wied-Neuwied, who has a very fine palace with extensive gardens. The palace contains a good library, and an interesting collection of Roman coins, statues, &c. found in the neighbourhood, this having been the site of the standing Roman frontier camp against the Germans. There is likewise the collection of natural history made in Brazil and North America by Prince Maximilian of Wied. Among the public institutions there are a training school, a school for mechanics, several infirmaries, a Moravian school, a synagogue, and many manufactories. It is the seat of the government of the principality and of many public offices. The inhabitants are very active and industrious, and have a large slaughtering establishment, manufactures of silk, cotton, wool, lace, thread, hats, carpets, leather, tobacco, stockings, and tape; a considerable manufactory of tin culinary utensils, stoves, and also a manufactory of musical clocks. There are breweries, distilleries, and vinegar manufactories. The inhabitants carry on a profitable trade in their own manufactures, and in the products of the country, such as pipe-clay, timber, potash, iron, lead, corn, and wine.

NEVA, RIVER. [PETERSBURG.]

NEVADA, SIERRA. [ANDALUCIA.]

NEVERS (the *Noviodunum Aduorum* of Julius Cæsar), the capital of the French department of Nièvre, stands on the right bank of the Loire, at the junction of the river Nièvre, in 46° 59' 15" N. lat., 3° 9' 37" E. long., 188 miles by railway through Orléans and Bourges, S. by E. from Paris, and had 16,113 inhabitants in the commune in 1851. The town is built on the slope of a hill above the Loire, and presents a pretty aspect when seen from the left bank of the river. The streets however are narrow, steep, and irregularly built. Some remains of the old turreted walls of the town still exist. The entrance to Nevers from Paris is by the triumphal arch erected on the occasion of the victory of Fontenoy in 1746. The chief public buildings are—the cathedral, the pavement of which is 658 feet above the sea-level; the churches of St.-Etienne and St.-Sauveur; the old castle, which forms one side of the principal square in the town; the barracks, the arsenal, the bridge over the Loire, which has 20 arches, and the residence of the prefect of the department. Nevers gives title to a bishop, whose see is the department of Nièvre. It has tribunals of first instance and of commerce, ecclesiastical and communal colleges, and an agricultural society. The inhabitants manufacture iron-ware of massive character, cannon and shot, chain-cables, anchors, chains for suspension-bridges, steam-machinery and millwork, &c. Agricultural implements, files, and other tools, earthenware, porcelain, enamel, cordage, violin-strings, glue, vinegar, candles, beer, leather, coarse woollens, and glass are also manufactured. There is a commodious port for river craft at the mouth of the Nièvre, and considerable trade is carried on in iron and steel, wood, coal, wine, leather, cattle, and manufactured goods. A short branch railway joins Nevers to the continuation of the Vierzon-Bourges line southward.

Noviodunum seems early to have acquired the name of *Nivernis*, from the river Niveris (Nièvre), on which it is situated. It was of

little importance until the reign of Clovis, in whose time it belonged to the Burgundians. It afterwards came into the hands of the Franks, and was taken and burnt by Hugues, count of Paris, in 972. It suffered much in the wars of the English under Henry V. and VI., and in the disputes of the dukes of Bourgogne with the kings of France. In the middle ages it was the capital of the county of Nevers, which was raised by François I. to the rank of a duchy (1539). The duchy was sold by Charles III. de Gonzague (Gonzaga), the last duke, to Cardinal Mazarin, and was (1665) united to the crown of France. It constituted the province of Nivernais.

NEVIN. [CAMBRIDGESHIRE.]

NEVIS, one of the Leeward Islands, in the West Indies, belonging to the group called the Lesser Antilles, is situated in 17° 14' N. lat., 63° 3' W. long. Nevis is about 2 miles S.E. from St. Christopher's, from which it is separated by a channel called the Narrows. The island is about 24 miles in circumference. The area is 20 square miles. The population in 1853 was estimated at 10,200, of whom a very small number were whites. Of the white population there were only 64 adult males. Nevis consists of a single conical mountain, of volcanic origin, which reaches an elevation of 2500 feet. The sides of the mountains are covered with plantations, and the soil is a fertile marl; the higher parts are rocky and sterile. A forest of evergreen-trees grows like a collar round the neck of the highland where cultivation ceases. The summit is constantly covered with clouds. The exportable produce of the island consists almost wholly of sugar, molasses, and rum. The exports amounted in 1850 to 17,197*l.*; in 1851 to 30,284*l.*; the imports were 16,474*l.* in 1850; 16,483*l.* in 1851. *Charlestown*, the seat of government, stands near the south-west end of the island, and has a tolerable roadstead, but is somewhat difficult of approach on account of a shoal which extends from the shore to the distance of half a mile. There are here a court-house and a jail. Nevis was first colonised by the English in 1628.

NEVIS, BEN. [INVERNESSSHIRE.]

NEW ALBANY. [INDIANA.]

NEW AMSTERDAM. [BERBICE.]

NEW BEDFORD. [MASSACHUSETTS.]

NEW BRITAIN is a large island in the Pacific, situated between 5° and 7° 30' S. lat., 148° and 153° E. long. It is separated from New Guinea by Dampier's Strait (discovered by Dampier in 1700), about 40 miles wide; and from New Ireland by St. George's Channel. New Britain is of a very irregular figure, and its southern shores have a coast-line of more than 350 miles. The surface is estimated at 24,000 square miles, or nearly half the extent of England. The interior of the island contains mountains of great elevation, as may be inferred from their being seen from sea at a great distance. Carteret observed smoke to rise from the highest summit. In several places the mountains come close to the sea, as at Cape Gloucester. Along the shores there are some good harbours. The declivities of the mountains are generally covered with trees. The island is fertile, and produces the cocoa-nut, sago, and other kinds of palms; also bananas, yams, ginger, sugar-cane, the bread-tree, bamboo, and many other plants and trees. Dogs, pigs, turtles, and fish abound. The inhabitants, who appear to be rather numerous, belong to the race of the Australian negroes; they are stout and well made, of a very dark colour, with curly hair, and go naked.

NEW BRITAIN. [CONNECTICUT.]

NEW BRUNSWICK, a British colony in North America, lies between 45° and 48° 5' N. lat., 68° 48' and 67° 53' W. long. It is bounded N. by Canada, from which it is separated by the Ristigouche River and the Bay of Chaleurs; E. by the Gulf of St. Lawrence, and by Northumberland Strait, which divides it from Prince Edward Island; S. by Nova Scotia, the Bay of Fundy, and the State of Maine; W. by the State of Maine and Canada East, the boundary line, except a small part in the southern extremity, lying along the meridian of 67° 53' W. long. The greatest length of the province, from north to south, is 180 miles, from east to west, 150 miles. Its area is 27,704 square miles, or 17,730,560 acres. The population in 1834 was 119,457, in 1853 it was 211,473.

Surface and Soil.—New Brunswick may be divided into three regions, the Southern, Central, and Northern. The Southern Region comprehends the country along the Bay of Fundy, and from 40 to 50 miles inland. It is divided into two unequal portions by the St. John River. The western section contains the greatest part of Passamaquoddy Bay, an extensive sheet of water, branching out into several inlets, and forming harbours for vessels of considerable size. It receives many rivers, of which the St. Croix is the most important, being navigable for large vessels to St. Stephen's, above which place it is interrupted by falls, yet timber is floated down. Passamaquoddy Bay contains several islands: Campobello, 10 miles long and 2 miles wide, is separated by a narrow deep channel from Maine; and Deer Island is nearly 7 miles long and 3 miles broad in the widest part. Before the bay lies Grand Manan Island, about 14 miles long and 6 or 7 miles wide. The coast of this section is rocky. The surface is much broken, but as the rocks are generally covered with a deep layer of earth, it is clothed with high forest trees, and when cultivated yields good crops of grain. The most elevated part of this tract is intersected by several lakes. That part of the Southern Region which lies east of the St. John River is rather rocky and sterile. The

rocky and elevated coast runs off in an almost continuous line, so that the inlets along it may rather be called coves than harbours. At the back of this iron-bound coast the country rises with a rather steep ascent, and then extends in an uneven and broken plain. The soil of this tract is very stony, and generally shallow. When cultivated it produces moderate crops of rye, barley, oats, and potatoes, but not wheat. There are however several fine valleys, in which the rivers flow, mostly to the St. John. The lower part of the valleys is occupied by lakes, as Kenebekasis, Belleisle, and Washademoak. These valleys are covered with large timber-trees, and when cultivated produce excellent crops of grain. In climate this tract is somewhat less cold than the country farther northward, but much more humid, and exposed to thick and frequent fogs when the winds blow from the Atlantic.

The Central Region is divided from the Northern by a line beginning on the west, on the banks of the St. John River at Presqueisle, and running thence in a north-eastern direction to the mouth of the Little Nipisighet River in the Bay of Chaleurs. The shores of this region are low, and the rivers have sand-bars across their entrance, though there is usually a considerable depth of water on them. There are no deep harbours except at the mouths of the rivers. The country begins to rise at from 12 to 20 miles from the shores, and continues to rise till about 60 miles, where it begins to descend rather rapidly towards the St. John River at a distance of about 30 miles from its banks. Low hills with gentle slopes occur in several places. Their whole surface is covered with a continuous forest of heavy timber. Along the banks of the St. John extends a flat country, which on the east begins at the mouth of the Washademoak, and extends west to Meductic, and thence north to Presqueisle. The eastern portion is nearly a level, and contains the most fertile and best settled part of the colony.

The Northern Region is very hilly, and even mountainous, especially on the banks of the river Ristigouche, and in that tract where the rivers Tobique and Nipisighet originate. This tract forms an elevated table-land, exceeding 2000 feet in height, and thickly studded with lakes. The interior of this region is little known, except the country along the river Tobique, which is covered with fine forest red pine. There is a settlement on the Bay of Chaleurs, the estuary of the Ristigouche, where the inhabitants live to a great extent on the produce of their fishing.

Rivers.—The largest river is the Looshtook, or St. John River, which rises far in the west, and flows for above 200 miles through the State of Maine, and along the boundary between it and Canada. It enters New Brunswick near 47° N. lat., and soon afterwards forms the Great Falls. By the most northern fall the river descends a perpendicular height of 58 feet. This is followed by some smaller falls, so that in about three-quarters of a mile the water descends 116 feet. Up to the foot of these falls the river is ascended by flat-bottomed boats of 20 tons burden. Below the falls the river often runs between abrupt banks, and its rugged bed renders navigation dangerous in many places. Several rapids occur, of which the most difficult are those called Meductic Falls, situated where the river begins to run eastward. The last of the rapids occurs 6 or 7 miles above Fredericton, at Saraye Islands. Where the river bends again to the south it is connected by narrow channels with several lakes, among which the largest is Grand Lake, whose channel joins it opposite Gagetown. This lake is 30 miles long and about 8 miles wide. The other lakes, Washademoak, Belleisle, and Kenebekasis, are somewhat smaller. All of them, as well as the rivers which fall into them, are navigable for sloops. Sloops can ascend the St. John River to Fredericton. About a mile above the town of St. John are the Rugged Narrows, where the river is interrupted by huge rocks, over and among which the waters roll and foam, and which render the navigation, except for four short diurnal periods, impracticable. The great rise of tide, which here attains from 25 to 30 feet, so far overflows these rapids that when the flood rises 12 feet at the foot of the town, sloops and schooners pass in safety for about 20 minutes, and for the same time when the tide ebbs to 12 feet. The whole course of the St. John River exceeds 400 miles, of which 220 lie within this colony. It receives many rivers from Maine. The most important is the Aroostook, which joins the St. John a little above the confluence of the Tobique. In the seasons of flood the Aroostook has a river and lake navigation of 400 miles.

The Petitcodiac, which falls into Shepody Bay, the western branch of Chignecto Bay, is about 70 miles long, and the tide flows up 40 miles. The Miramichi, the most important river next to the St. John, has two main branches, the North-West and the South-West Miramichi, which, with their numerous head streams, drain the middle of the Central Region. The Miramichi falls into the Gulf of St. Lawrence, after a course of more than 100 miles, and is navigable for large ships for about 40 miles. There is a sand-bar across its entrance, but the channel over it is broad, and has water for ships of from 600 to 700 tons. The Nipisighet River, which drains the Northern Region, and runs nearly 100 miles, is much broken by falls and rapids, and does not appear to be navigable to any extent. The Ristigouche has its source in the Canadian and New Brunswick highlands, and runs along the northern boundary of the province. On approaching the Bay of Chaleurs it widens into a spacious harbour, 24 miles long by

2 miles broad, which is navigable for the largest ships to the head of tide-water within 2 miles of its upper extremity. Ristigouche harbour opens into Ristigouche Bay, the head of the Bay of Chaleurs, which is a magnificent inlet 80 miles long and from 16 to 30 miles broad.

Steamers ply daily in summer between the city of St. John and Fredericton. During the floods of spring and autumn small steamers ascend to Woodstock, which is 62 miles above Fredericton. During the summer months steamers run between St. John and the Bend of Petitcodiac, Annapolis in Nova Scotia, and Eastpool in Maine. Much attention is paid to the formation of roads and bridges in the settled parts of the province. In addition to local assessments large yearly grants are made for the purpose. The province possesses more than 2000 miles of excellent roads. Settlements are formed by government, in which three-fourths of the price of the land are received in labour for the construction of new lines of communication.

Geology, &c.—Metamorphic slates occupy the higher parts of the province, and extend from the upper parts of the shore of the Bay of Chaleurs to the St. John, crossing that river some miles west from Fredericton. These slates are intersected by a broad belt of granite, running in the same direction and crossing the St. John into Maine, about 12 miles east from Woodstock. In the valley of the Tobique the slate rocks are interrupted by a bed of red-sandstone, which extends 80 miles up the river, and presents about midway interstratified cliffs of gypsum. The lower parts of the province consist of the Carboniferous and New Red-Sandstone Systems, including large deposits of red marl and gypsum, and extensive beds of coal. Coal abounds on the banks of the Grand Lake and the Salmon River, where it is worked. Anthracite coal is worked near Shepody Bay, and a large vein of very pure bitumen has been discovered in that neighbourhood, and is exported for making gas.

Iron-ore, of the hematite variety, is abundant near Woodstock, where extensive hot-blast smelting-works have been erected. Copper, plumbago, and manganese have been found. Marble abounds on the banks of the lake Kenebekasis. Gypsum occurs in large beds along the shores of the Bay of Fundy, and is exported to the United States, as are also grindstones, which are quarried in the vicinity of Shepody Bay. Salt-springs, capable of yielding the finest salt, are numerous, and sulphureous springs are met with. Specimens of amethyst, carnelian, and jasper have been found in several places.

Climate, Soil, Agriculture.—The heat is greater and the cold more intense than under the same latitudes in Europe. The thermometer however rarely rises above 90° of Fahrenheit in July, and rarely sinks below 10° in January. Spring lasts from the middle of April to the middle of May, and is accompanied by cold winds and rain. During summer, which extends to the beginning or middle of September, rain seldom falls, except in thunder-storms, which are frequent. In September and October the weather is pleasant, but in the two following months it is cold, with frequent rains. The frost, previously felt at intervals, becomes continuous about the end of December, and the winter lasts till the end of March or the middle of April, about which time the ice on the rivers generally breaks up. The average length of the agricultural year is 6 months and 22 days. The average period between the sowing and reaping of grain crops is 3 months and 17 days, leaving an open period of about 3 months for labouring on the land. The climate is remarkably healthy. Epidemics are unknown; ague is seldom met with; rheumatism, low typhus, and consumption are the only diseases that prevail to any extent.

The most valuable soils of the province are those formed from the extensive marsh-lands that occur at the mouths of the rivers, and at the heads of bays and inlets. Large tracts of this description, called 'dyked' lands, have been reclaimed from the muddy deposits of Shepody Bay and Cumberland Basin. The soils next to these in fertility are those called 'intervale' lands, or river terraces, spacious alluvial tracts, a succession of which in many places appears along all the larger rivers.

The forests, which still cover nearly the whole surface of the province, consist of pine, fir, spruce, hemlock, birch, beech, maple, ash, elm, and poplar. Oak is not common. Pine has the chief commercial value. The lumbering trade, or the preparation of timber, has hitherto been the engrossing pursuit, to the neglect of agriculture, so that the province has imported yearly from the United States bread-stuffs to the value of more than 200,000*l*. Greater attention is now given to the cultivation of the land. Agricultural associations have been formed in the several counties, which are encouraged by grants from government. Improved methods are introduced, and efforts are made to raise from the soil of the province the requisite supplies of grain. An almost unbroken line of settlements extends up the valley of the St. John on both sides of the river. Up the valley of the Miramichi the land is extensively cleared. New settlements have been formed along the estuary of the Ristigouche. On the shores of the Bay of Chaleurs and of Fundy Bay every year is adding to the openings in the forest. The crops raised are wheat, rye, oats, barley, beans, peas, buck-wheat, and flax. In the southern districts maize is extensively cultivated. Potatoes are raised in large quantities. The turnip culture is extending. Red and white clover are the grasses most cultivated. It is estimated that there are in the province 150,000 horses and cattle and 250,000 sheep and pigs. Apples, plums, and cherries grow well, but not the other fruit-trees of England.

The number of wild animals is rapidly diminishing. More than

300 bears are destroyed annually under the operation of a government bounty. There is a like premium for the destruction of wolves, which first entered the province in 1818 along with the fallow-deer. Foxes, racoons, minks, squirrels, and beavers are in considerable numbers. The moose-deer is nearly extinct. Wild geese, ducks, partridges, and pigeons are the most common game. The rivers abound with salmon, eel, trout, and perch, and the sea near the shores with cod, haddock, shad, mackerel, and herrings. At the mouth of the St. John River, and along the shores of the Bay of Fundy, great quantities of salmon, herrings, and shad are taken; and on the shores of the Gulf and of the Bay of Chaleurs there are extensive fisheries of herrings, mackerel, and cod. The cod is sent to the Mediterranean. Considerable exports of fish are made to the United States and to the West India. A profitable whale fishery has been carried on for some years.

There are two settlements of Indians in the province, one of the Micmacs, on the Miramichi, the other of the Mellicetes, near the Grand Falls on the St. John. They do not cultivate the land, but live chiefly by hunting and fishing. They profess the Roman Catholic religion, and are strict in the observance of its forms. Their whole number is about 1400, and they hold 63,000 acres of land, reserved for them by government. There are extensive settlements of French, descendants of the old Acadians, on the shores of Northumberland Strait and of the Bay of Chaleurs. The great proportion of the population of the colony consists of emigrants and the descendants of emigrants from the British Isles.

The province is divided into 12 counties:—Ristigouche and Gloucester in the north; Northumberland, Kent, and Westmoreland in the east; Albert and St. John's in the south; York and Carleton in the west; and King's, Queen's, and Sunbury, which are intersected by the St. John River, and extend inland north-west from the county of St. John.

Fredericton, or *Fredericton*, the capital of the province, on the bank of the St. John River, 85 miles from its mouth, is built on a flat, bounded on two sides by the stream, and consists chiefly of handsome wooden houses, in regular streets. It contains a cathedral, five or six churches, the government house, the legislative halls, King's college, a Baptist college, a grammar school, a normal school, a court-house, and barracks. Vessels of 50 tons burden ascend to the town. The population is about 6000.

St. John, the principal trading place, and an incorporated town, is situated on a rocky peninsula, and on adjoining crags and hollows, near the mouth of the St. John River. The city is lighted with gas. It contains an excellent court-house, church, and bank of stone. In the neighbourhood are the lunatic asylum and the provincial penitentiary. The population is about 12,000.

St. Andrews, a thriving town, with some handsome buildings, and about 3000 inhabitants, stands at the mouth of the St. Croix River, in Passamaquoddy Bay. *Woodstock*, a town of 3000 inhabitants, is advantageously situated on the road into Maine, at the mouth of the Meduxnukik River, and on the right bank of the St. John. It contains four churches and a grammar school. *Newcastle*, on the banks of the Miramichi, about 20 miles from its mouth, is a small place, well situated for the exportation of timber. *Douglstown* and *Chatham* are improving towns some miles farther down, on opposite sides of the river. *Bathurst* is a well-built town, with about 1000 inhabitants, on an inlet of the Bay of Chaleurs. It contains an Episcopal, a Roman Catholic, and a Presbyterian church. It is chiefly dependent on ship-building. *Dalhousie*, at the mouth of Ristigouche Harbour, and *Campbelltown*, 16 miles higher, are thriving towns of about 1000 inhabitants each.

The affairs of the province are administered by a governor and an executive council, a legislative council, and a house of assembly of 26 members. The laws are administered by a supreme court and minor tribunals. The supreme court has a chief justice and three puisne judges. There are chancery, vice-admiralty, and probate courts. Besides an armed force maintained by the British government, a native militia of 20,000 men is kept up. The revenue of the province for the half-year ending May 31st 1853 was 65,888*l*. During 1852 there entered at the port of St. John 1524 British vessels of 219,964 tons, and 216 foreign vessels of 114,303 tons; and there cleared 1532 British vessels of 245,453 tons, and 214 foreign vessels of 117,464 tons. The number and tonnage of new ships registered in 1852 were:—ships, 87; tons, 45,123. The value of the fish exported from the province in 1850 was 27,319*l*.; in 1851 it was 38,971*l*.; in 1852 it amounted to 46,059*l*. The greater part of this increase is probably owing to the increased quantities of salmon sent to the United States.

The governor and executive council constitute a board of education for the province, and considerable attention is given to the establishment and support of common schools, normal schools, and county grammar schools. The University of King's College at Fredericton was built at the public expense, chartered as an Episcopalian institution, and endowed with 6000 acres of land and 2000*l*. per annum in money. The charter has been changed so as to admit members of all persuasions into the governing council, of which the bishop is president. The system of instruction is formed after that of Oxford and Cambridge. Connected with the college, and supported out of its funds, is a grammar school. The Baptists have a college at Fredericton, and the Methodists have one at Sackville.

The religious denominations in the province are those of the Church of England, the Roman Catholics, Presbyterians, Independents, Methodists, and Baptists. No church is distinguished by law, but the bishop takes precedence after the governor and the commander of the forces.

Till the latter part of last century New Brunswick was regarded as a portion of Acadia, and was connected with Nova Scotia, along with which it was finally ceded to Great Britain by the treaty of Utrecht in 1713. In 1762 some families from New England settled about 50 miles up the St. John River. At the end of the American war several thousands of disbanded troops were settled at Fredericton. In 1785 the province received its present name and limits. The province rapidly advanced after 1809, when the duty on Baltic timber was increased, colonial timber being left free. In 1825 the country suffered from one of the greatest conflagrations that have occurred in the history of the world. A district extending above 100 miles along the course of the Miramichi, and spreading many miles on both sides of the river, was swept by the flames under the force of a hurricane; towns were entirely consumed; many lives were lost, and a vast amount of property was destroyed. [See SUPPLEMENT.]

NEW CALEDONIA, an extensive island in the Pacific, situated between 17° 57' and 23° S. lat., 163° and 168° E. long. This island extends from north-west to south-east more than 400 miles, but is of inconsiderable width. In the broadest part it is hardly 60 miles wide. On all sides it is inclosed by coral-reefs, which connect innumerable small sandy islands or cliffs. These reefs extend in some places more than 50 miles from the shores, but they generally occur at a distance of from 4 to 10 miles from the coast. There are only two harbours in which large vessels can anchor with security; on the north-eastern shores, Port Balade, and on the south-western, Port St. Vincent. One of them has been fortified by the French, who have taken possession of the island.

From the shores the country gradually rises inland to a mountain range which traverses the island in all its length, and rises in some parts to 2000 or 3000 feet above the sea. This island is less fertile than most other islands of the Pacific. The declivities of the hills are partly bare and partly covered with coarse grass and low trees. The inhabitants live mostly on yams and fish. The sugar-cane and banana are cultivated to some extent. Cacao-nut palms, bread-fruit-trees, and mango-trees abound on the shores. Among other minerals, a kind of steatite is found, which is eaten by the inhabitants, who belong to the race of the Austral negroes. They are stoutly made, have black and curly hair, and a very dark colour. [See SUPP.]

NEW ENGLAND STATES is the term applied to the north-eastern portion of the United States of America, which was originally colonised by the Puritans from England. The inhabitants are yet principally of English descent, and possess many characteristic differences from the inhabitants of the other states of the Union. There are six of the New England states—CONNECTICUT, MAINE, MASSACHUSETTS, NEW HAMPSHIRE, RHODE ISLAND, and VERMONT, all of which are fully described under their respective heads.

NEW GEORGIA ARCHIPELAGO, also called *Solomon's Islands*, constitutes one of the most extensive groups of islands in the Pacific. They extend from north-west to south-east, between 5° and 10° 50' S. lat., 154° 35' and 162° 25' E. long. They were discovered by the Spanish seaman Mendana, in 1567; visited for the second time by Carteret, and afterwards by several French and English navigators. The most northern island is Winchelsea or Anson, and the most southern Rennell. The largest islands from north to south are—Bougainville's Island, which is about 60 miles long; Choiseul, which is perhaps as long; Santa Isabella, perhaps the largest of the group; Georgia, which extends 40 miles from east to west; Guadalcanar, which is 70 miles long; and San Cristoval, which is about the same size. Besides these there are a great number of small islands. The shores are mostly very steep, and rise to a considerable height. The interior is rugged, and frequently mountainous. The hills and mountains are generally covered with lofty trees, and the valleys well cultivated and fertile. Bananas, yams, sugar-cane, and ginger are extensively cultivated. The most common fruit-trees are the bread-fruit, cacao-palms, cabbage-tree, a kind of almonds, and Indian kale (*Caladium esculentum*). The clove-tree is also found here. Fowls abound, as well as several wild birds.

NEW GRANADA, a republic of South America, extends from south to north between 0° and 12° 30' N. lat., and from east to west between 70° and 83° W. long. It is bounded E. by the republic of Venezuela; N. by the Caribbean Sea; W. by the republic of Costa Rica, and the Pacific Ocean; and S. by the republic of Ecuador. The area is about 380,000 square miles; the population in 1853 was estimated at 2,363,000.

Surface, Hydrography, &c.—The western part of New Granada is comprehended within the mountain district of the Western and Central Andes. The eastern part belongs to the great plains or llanos of the Orinoco River. The northern portion includes the low ground lying along the Gulf of Darien and the lower valley of the Magdalena; the Isthmus of Panama; and the eastern extremity of Central America bordering on Costa Rica and known as Veragua.

On the boundary-line between New Granada and Ecuador, is the mountain-knot De los Pastos, with its numerous volcanoes. North of

it extends a mountainous country, inclosing the valley of Almaguer, which is shut in on the east by that portion of the Andes which is called Paramo de Aporte and de Iscanse, but on the west by the range called Cordillera de la Costa, or Paramo de Momacondy. These two ranges are about 80 miles apart, and the mountain region between them contains the valley of Almaguer, which is about 6900 feet above the sea-level, and is drained by the Rio de las Patias, which breaks through the Cordillera de la Costa, and falls into the Pacific. About 2° 9' N. lat. both ranges are united by a transverse range, called the Sierra de Socoboni. On the north of this transverse range the great mass of the Andes separates into three great ranges, which running north and north-east, inclose the valleys of the rivers Magdalena and Cauca. They are called the Western, Central, and Eastern Cordillera of New Granada, and are described under ANDES [vol. I. col. 356].

The country west of the Western Andes and between them and the Pacific contains the basins of the rivers Atrato and San Juan, and a rather narrow tract along the sea-shore. [ATRATO.] The tract along the sea has a soft, alluvial, and very fertile soil, but being almost incessantly drenched by rains, it is nearly a continual swamp and extremely unhealthy, especially for Europeans. It has accordingly been abandoned to the native tribes and a few negroes, who are employed to wash the gold-sand which is found along the western declivity of the Andes in great abundance, and is at some places intermixed with platinum. Europeans make only hurried visits to it. That portion of New Granada which is included in the Isthmus of Panama with the contiguous district of Veragua is described under PANAMA.

The most southern of the table-lands which extend along the western declivity of the Eastern Andes, those of Bogotà [BOGOTÀ], and Tunja, are from 8000 to 10,000 feet above the sea, and on them the grains and fruits of Europe are cultivated, with the root called the araca. Those farther north are much lower, and adapted to the cultivation of tropical grains, roots, and fruits, as well as cotton, sugar, coffee, and tobacco. The low country which extends between the table-lands of Girona and Cucuta and the mountain-mass of Santa Marta is mostly covered with extensive forests, and nearly uninhabited on account of its unhealthiness, which is caused by numerous swamps, frequent inundations, and almost continual rains. It contains the extensive lake of Zapatos.

The Plains, or Llanos, of the river Orinoco comprehend the whole tract extending to the western banks of the Orinoco and to the Cassiquiare, between the Guainia, or Rio Negro, on the south, and the Apure River on the north. The northern part, as far south as the river Vichada, is a complete level, on an average 300 feet above the sea, near the mountains, and thence insensibly declining towards the Orinoco. It is quite destitute of trees, with the exception of a few palms, which occur at great intervals all over the plain. Along the river courses are some low bushy trees. The rainy season begins in April, and continues to the end of October. During this time the rain pours down in torrents, and is accompanied by violent thunderstorms, which generally occur two hours after noon. The dry season lasts from October to April, and during the months of December, January, and February, a cloud never crosses the sky. This extensive plain is quite unfit for cultivation, but innumerable herds of cattle and horses find here abundant pasture during the wet season, though they suffer much during the dry months. The mean temperature of the air is 80° Fahr.: the rainy season is seven or eight degrees hotter than the dry. That portion of the plain which is south of the river Vichada is somewhat hilly in several places, especially between the rivers Guaviare and Guainia, where steep rocks rise a few hundred feet above its level surface. It is covered with immense forests, haunted by numerous wild animals. It is two or three degrees hotter than the level plain farther north, and its air is never agitated by a breeze. Rain descends every day, except during the months of December and January, sometimes in torrents, sometimes like a dense mist, and the annual quantity is very great. The most south-eastern part of it, which is inclosed by the rivers Orinoco, Cassiquiare, Guainia, and Atabapo, is uninhabited, though covered with tall forest-trees. All this portion of the Llanos is extremely unhealthy, on account of the stagnant air and the vapours which continually rise from its rain-drenched surface. The rivers which drain the Llanos of Granada are noticed under ORINOCO. The remainder of the country is included in the valleys of the Magdalena and Cauca.

The *Rio Magdalena* rises where the two ranges of the Eastern and Central Andes begin, near 2° N. lat., and runs in a narrow valley with a rapid course as far as 3° 20' N. lat., where the valley enlarges to 40 or 50 miles in width. In this valley its course is gentle; but at 4° 40' N. lat., where the mountains approach the river on each side, and especially on the east, the current of the river becomes quicker. Below Honda eleven rapids occur, which render the navigation difficult and even dangerous, and only cease at Badillo (near 8° N. lat.). The river falls 670 feet in about 200 miles, and in this part the valley is rarely 10 miles wide, and sometimes not half so much. Below Badillo it widens to 60 miles and more, and the river divides into two branches, which inclose an island about 20 miles long and 10 miles wide. Both branches are navigable; the eastern runs with greater rapidity and is only used in descending, while the gentler current of the western branch is more favourable to ascending boats. The Rio Magdalena afterwards declines more to the north-west and meets the

Rio Cauca below Mompox; it then again turns to the north and runs through a wide plain, past Baranese, to the Caribbean Sea. About 60 miles from its mouth it divides into two branches, of which that which continues due north is the principal, and forms at its outlet the small harbour of Savanilla; but this branch is little navigated. The other branch, which turns to the north-east and is much more used, forms in its course several small lakes and terminates in the Ciénaga de Santa Marta, an extensive lagoon, or salt-water lake, with a mean depth of 6 or 7 feet, which communicates with the sea by a narrow canal some miles south-west of Santa Marta, but has a bar at its entrance. The whole course of the Magdalena River is about 1000 miles.

The valley of the Magdalena above Honda extends in a generally level plain, which has an elevation little short of 2000 feet above the sea. The river and its tributaries run in smaller valleys 3 or 4 miles wide and a few hundred feet depressed below the surface of the plain. At Passo de Guayacana, nearly due west of Bogotá, the surface of the Magdalena is still 1200 feet above the sea-level. The valleys along the rivers produce abundantly sugar, tobacco, cacao, and the common agricultural crops of the tropics, yams, mandioc, maize, batatas, and bananas. The upper plain is in some parts fertile; in others rather sterile, and covered with bushy trees. The seasons are regular. In June, July, and August not a drop of rain falls; between September and February showers are rather frequent. Heavy rains follow in February, March, and April, and the weather in May is variable. Every day a strong wind begins towards noon to blow from the south, and continues till sun-set; it causes great heat, but is regarded as healthy. The narrow part of the valley between Honda and Badillo and the wider one north of Badillo are very little elevated above the river, and therefore subject to frequent inundations. Though fertile and producing large crops, especially of rice, it is very little inhabited, on account of its unhealthiness, being subject to daily rains, and never enjoying the slightest breeze except when thunderstorms occur, which are common during the night. The vapours arising from the numerous swamps and pools render it extremely unhealthy.

The *Rio Cauca* rises in the Paramo de Guanacas, east of the volcano of Purace, and not far from the sources of the Magdalena. It runs nearly due west for about 60 miles in a narrow valley between high mountains, passing within a mile of Popayan. It then turns north, and, at the village of Quilachoa, enters a valley about 30 miles wide, and extending to the north of Cartago nearly 180 miles. The course of the river is gentle. About 30 miles north of Cartago it enters a narrow glen, formed by the high mountains on both sides; which does not contain level ground enough for a road. In this glen the river flows with astonishing rapidity, forming a succession of rapids and cataracts, from Salto de S. Antonio to Boca de Espiritu Santo about 120 miles, and within this distance falls probably not less than 2500 feet, its elevation at Cartago being about 3000 feet above the sea. Issuing from this glen it enters a wider valley, which grows still wider north of the town of Antioquia, where the river declines to the north-east and meets the Magdalena below Mompox. The whole course of the river is above 700 miles.

The wide valley of the Upper Cauca is from 3000 to 4000 feet above the sea-level, and has a healthy and not very hot climate and regular seasons. The two rainy seasons occur about the time of the equinoxes, with an interval of dry seasons between them. Along the river the plain is low and marshy, subject to periodical inundations and mostly overgrown with rushes and reeds, but at no great distance from its banks the country rises higher and extends partly in savannahs and partly in wooded plains. In many districts it is cultivated, and produces rice and maize in abundance, as well as sugar, cacao, coffee, and tobacco; but by far the greatest part serves as pasture-ground for numerous herds of cattle and horses. About Cartago the surface of the plain is undulating and less fertile. In the hills which skirt the Central Andes are thick layers of a reddish sand, which contains numerous particles of gold. In the lower part the valley of the Cauca resembles generally that of the Magdalena below Honda.

The geology of New Granada is noticed generally under **ANDES**. Its mineral riches are considerable, and mostly occur on the western declivity of the three chains of the Andes. They consist of gold, silver, platinum, mercury, copper, lead, iron, and rock-salt. Gold seems to occur along the whole western declivity of the Central and Western Andes, and is obtained by washing the sand of the rivers, or that on the foot and sides of some hills. In the Eastern Andes it is found on the table-lands of Girona and Cucuta. Silver occurs on the table-lands of Girona and Cucuta. There are also some rich mines in the mountain region north of 5° 30', between the Magdalena and Cauca. Platinum occurs on the western declivity of the Western Andes. Mercury is found in the valley of Santa Rosa, near Antioquia, and in the Central Andes near the mountain pass of Quindiu. Copper occurs in the Eastern Andes, north of Tunja and near Pamplona. Lead has been discovered in various parts of the Eastern Andes. Iron and coal are found in the mountains bordering on the table-land of Bogotá. Rock-salt in large masses occurs in some mountains north-east of Bogotá, and is worked by the government. Some salt-springs in these mountains also furnish a large quantity of salt.

Productions, Commerce, &c.—From the great diversity of surface,

soil, and climate in New Granada, the natural productions are extremely varied, including not only those of the West Indies, but also those of the temperate zone. These products are specified more particularly in noticing the several districts of the country. Here it will be sufficient to observe generally, that over the table-land of Bogotá, and the country north of it along the western declivities of the Eastern Cordillera, wheat and other European grains, potatoes, and the aracaoha-root, are the principal objects of culture; while in the valleys of the great rivers, and on the plains along the coast, maize is the chief grain raised for food, with rice, plantains, and sweet potatoes; and that cacao, cotton, tobacco, coffee, and some sugar and indigo are cultivated as articles of commerce. Many useful kinds of trees are found in the forests; but almost the only ones which are converted into articles of export are the Brazil, fustic, Nicaragua, and logwood, trees which grow most abundantly in the forests of the Sierra de Santa Marta. Cinchona is obtained in large quantities in the same region, and in various other places. Ipecacuanha is largely collected on the banks of the Rio Magdalena, and balsam of Tolu on the banks of the Rio Sinu. The llanos and plains support vast herds of cattle, which furnish tasajo, or jerked beef, and hides as articles of commerce. Horses, mules, and horned cattle are exported to the West Indies.

The manufacturing industry of New Granada is of little importance. It is limited to woollen and cotton stuffs of a coarse texture only adapted for the use of the lower classes, and mostly made by the consumers; and the commoner articles of every-day use.

The commerce of New Granada was much greater before its independence than it is now, a circumstance which is chiefly to be attributed to the effects of almost incessant internal war, and the unsettled state of its government; but the want of means of communication with the interior is a great hindrance to the commerce of the country. The greater part of the interior is in fact unable to export its produce for want of roads and other means of communication. The tracts which border on the sea being mostly covered with swamps and morasses, and consequently very unhealthy, endanger the life of those who venture to traverse them. Neither of the more healthy provinces of the republic can send its produce without great expense to any of its harbours except the valley of the Upper Magdalena. The most fertile tract is the valley of the Upper Cauca, but this is everywhere surrounded by high mountains; and as the river becomes unfit for navigation on issuing from the valley, this district is obliged to convey its produce over one of the two great ranges which inclose it. Both however are so exceedingly steep as not to admit the use of beasts of burden, and all merchandises is carried over on the backs of men. The entire imports of New Granada average in value less than 900,000*l.*; the exports, 600,000*l.* The imports from Great Britain, which usually amount to nearly three-fifths of the whole, were returned at 450,804*l.* in 1858.

Inhabitants.—The population of New Granada consists of the descendants of the Spaniards who have settled there during the three last centuries, of some native tribes, and a few negroes. The Africans and their descendants were much more numerous before the war of independence; but as they were the best soldiers that the country could furnish, the war has nearly annihilated that hardy race. The native tribes have attained very different degrees of civilisation. Those inhabiting the table-lands along the Eastern Andes had before the arrival of the Spaniards formed a political society, and made some progress in the arts of civilisation; they cultivated Indian corn and the aracaoha-root. They are still the best husbandmen of the republic; and the Indian families living in the valley of the Upper Magdalena resemble them. In the valley of the Cauca there are no Indians. In the country between the Western Andes and the Pacific the native tribes constitute nearly the whole of its scanty population. They have made only small progress in civilisation, and this little they owe to the Spanish clergy established among them. That portion of the llanos which is destitute of trees is inhabited only by the descendants of Europeans, who take care of the herds of cattle, mules, and horses. The southern wooded portion of the llanos is inhabited by different tribes of wandering Indians, still in the lowest stage of civilisation. Hubner estimates the numbers of the various races in New Granada as follows:—White Caucasians, 450,000; civilised native Americans, 301,000; Negroes, 80,000; Metis (or descendants of Spaniards and natives), nearly 1,000,000; Mulattoes, 283,000; Quadroones, 30,000; Samoyes, 120,000; Zambas (chiefly in Magdalena), 100,000.

Political Divisions, Towns, &c.—The republic of New Granada is divided into four departments—Cauca, Cundinamarca, Boyaca, and Magdalena. The population of the towns in the following notice must be taken as a rough estimate:—

1. *Cauca* extends over the Isthmus of Panama, with the contiguous province of Veragua [PANAMA], which formerly constituted the department of Istmo; the whole of the western coast from the Bay of Panama to Barbacoas, on the boundary of Ecuador; and the valleys of the rivers Atrato, San Juan, and the Upper Cauca. Its principal productions are gold and platinum, the produce of its herds in the valley of the Upper Cauca, and cacao along the coast of the Pacific. In this department is the canal of Raspadura, which unites the San Juan and Atrato rivers. [ATRATO.] The principal town is *Popayan*, population 20,000, situated not far from the sources of the Cauca River, 5000

feet above the sea, and near the two volcanoes of Purace and Sotara. It contains several superior buildings, the most remarkable being the bishop's palace and the Compañia, or College of Jesuits. Earthquakes are frequent. Farther north is *Cali*, in the vale of the Cauca, a clean and well-built town, from which the most frequented road over the Western Andes leads to Buenaventura on the Pacific. *Buenaventura* consists only of a few wretched huts built on posts, although it is the only port that supplies the valley of the Cauca and Popayan with merchandise, and has generally some foreign vessels besides coasters anchored there. On the shores of the Pacific are the small harbours of Atacames and Barbacons. In the Andes, near the boundary of Ecuador, is the town of *Pasta*, 8576 feet above the sea, on a fine plain, near the foot of a very active volcano. Population about 5000.

2. *Cundinamarca* (by which name the table-land of Bogotà was designated at the arrival of the Spaniards) contains the valley of the Lower Cauca, that of the Upper and Middle Magdalena, the table-land of Bogotà, and a small portion of the Llanos lying about the sources of the rivers Guaviare and Meta. All the vegetable productions of New Granada may be cultivated here at different places, and the declivities of the Andes are covered with extensive forests. Gold and silver are found in the Central Andes; copper, lead, coal, and rock-salt in the Eastern Andes. The river Bogotà, in its descent from the table-land, forms, at a distance of 18 miles S.W. from the town of Bogotà, the cataract of Tequendama, where the river, suddenly contracting from a breadth of 60 yards to less than 20 yards, is precipitated in an immense body of water down a fall of 650 feet. In the same part of the table-land are the natural bridges of Icononzo, or Pandi, which unite two rocks, between which a torrent roars. The uppermost consists of a rock 47 feet long and 6½ feet thick, and is more than 300 feet above the surface of the water; the lower bridge is nearly 70 feet under the first, and consists of three pieces of rock, which support one another. The capital of the department and of the whole republic is BOGOTÀ. *Honda*, population 5000, is on the left bank of the Magdalena; and at some distance N. from it is *Rio Negro*, with a population of 6000. West of Honda is *Mariquita*, a small town, near which are rich mines of gold. South of Honda is *Neyva*, with 4000 inhabitants; and still further, near the source of the Magdalena, *Timana*, with 2000 inhabitants: both places are noted for their plantations of cacao. Gold is washed near Timana. Between Neyva and Honda, but at the foot of the Central Andes, nearly 4900 feet above the sea, is *Ibague*, which has a college. In the valley of Cauca are *Antioquia*, with 4000 inhabitants; and *Medellin*, in a fine valley, containing 8000 inhabitants.

3. *Boyaca* obtained this name from the bridge of Boyaca, where Bolivar defeated the Spanish general Barreya in 1819, by which victory the independence of South America was established. It comprehends the northern table-lands of Tunja, Girona, and Cucuta, and nearly the whole of that part of the Llanos which belongs to New Granada. It has some mines of gold and copper in the table-lands, and in the northern part of the Eastern Andes. The capital is *Tunja*, on the hilly table-land of Tunja, near the Eastern Andes; population, 7000: it has some manufactures of woollen and cotton stuffs. *Socorro*, on the table-land of Bogamoso, has 12,000 inhabitants, and some manufactures of cotton and straw hats. On the table-land of Cucuta is *Rosario de Cucuta*, a considerable town, which carries on an active commerce in the products of the contiguous country, which is covered with plantations of cacao, sugar-cane, coffee, and cotton. *Pamplona*, which is in the mountains south of the table-land, has 4000 inhabitants, some good buildings, and several gold-mines in its neighbourhood.

4. *Magdalena* comprehends the whole country east of the Gulf of Darien, and extending east to the boundary of Venezuela, not far from the Lake of Maracaybo. With the exception of the mountain-mass of Santa Marta on the east, and the northern offsets of the Western Andes on the west, the whole of this department is rather level, and only contains some hilly tracts. Every kind of vegetable production peculiar to countries between the tropics is grown; but the heat and moisture of the climate, which favour vegetation in an astonishing degree, are very injurious to the health of its inhabitants; and the country is consequently thinly peopled. The capital is CARTAGENA. *Mompox*, population 10,000, a town on the left bank of the Magdalena, above its junction with the Cauca, carries on a considerable commerce, being the depôt for the produce of the table-land of Girona, and partly also of that of Cucuta. *Ocaña*, population 8000, lies E. of the Rio Magdalena, near the Sierra de Ocaña, at a considerable elevation above the level country along the river, and has a healthy climate. *Santa Marta*, E. of the Cienaga de Santa Marta, and not far from the Nevado of the same name, has a good harbour, with some commerce, and 3000 inhabitants. *Ciudad de la Hacha*, further to the east, has about 3000 inhabitants, and a small and ill-sheltered harbour. Along the coast west of this town pearls were formerly fished.

History, &c.—New Granada was discovered by Alonso de Ojeda in 1499. The first settlement was made at Santa Maria la Antigua, on the Gulf of Darien, in 1510. The interior of the country was only conquered towards the middle of the 16th century, by Benalcazar and Ximenes de Quesneda, who founded the town of Santa Fé de Bogotà in 1545. The Spaniards continued in possession of this country till

1811, when New Granada proclaimed its independence. The war, which was the consequence of this declaration, continued to devastate the different provinces of which New Granada consists to the year 1821. In 1819 New Granada and Venezuela being united into one republic, formed a constitution at the Congress of Rosario de Cuscuta in 1821, and received into the union Ecuador and Panama in 1823. This union was dissolved in 1831, and the republic of Colombia divided into the three republics of Venezuela, New Granada, and Ecuador. Like the other republics of South America, New Granada has been ever since the declaration of Independence in a very unsettled condition. At the date of the latest accounts (received in December 1854) New Granada was in a state of revolution. The government troops had been defeated; Bogotà, the capital, was in possession of the 'Constitutionalists'; and a project was to be brought before Congress for the formation of the Istmo (including Panama and Veragua) into an independent state.

(Juan and Antonio de Ulloa; Humboldt; Mollien; Hamilton; Hubner, &c.) [See SUPPLEMENT.]

NEW GUINEA. [PAPUA.]

NEW HAMPSHIRE, one of the United States of North America, lies between 42° 41' and 45° 11' N. lat., 70° 40' and 72° 28' W. long. It is bounded S.E. for about 18 miles by the Atlantic Ocean; E. by the state of Maine; N. by the British province of Lower Canada; W. by the state of Vermont, from which it is divided by the Connecticut River; and S. by the state of Massachusetts. The area is 8080 square miles, or 605 square miles larger than Wales. The population in 1850 was 317,976, or 89·6 to the square mile. The inhabitants being all free, the ratio of representation entitles the state to send three representatives to Congress. To the Senate, like each of the states of the Union, New Hampshire sends two members.

Coast-line, Surface, &c.—The coast is a low sandy beach, indented by several creeks and coves, which serve as harbours for vessels of light draft. The shore is bordered by salt-marshes, and the country, to the distance of 20 or 30 miles inland, rises imperceptibly, so as to arrest the tides within 20 miles from the sea, though they rise to about 18 feet. This flat tract has a sandy soil of inferior fertility. At the back of it the surface becomes broken and hilly; the hills gradually rising in height towards the interior, until, at a distance of about 10 miles from the banks of the Connecticut River, they constitute a continuous range, running nearly due south and north. Some of the summits attain a considerable elevation. Mount Monadnock, about 10 miles from the boundary of Massachusetts, rises to the height of 3254 feet, and Moosehillock, farther north, to 4636 feet. On approaching 44° N. lat. the chain expands into an extensive mountain-group, which projects considerably towards the east, and is known as the White Mountains. The highest summit of this group, Mount Washington, 6428 feet high, is the loftiest mountain in the United States east of the Rocky Mountains. Several other summits rise above 5000 feet: as Mount Adams, 5960 feet; Mount Jefferson, 5860 feet; Mount Madison, 5620 feet; Mount Franklin, 5050 feet; and Mount Monroe, 5510 feet. The loftier peaks of this range are covered with snow during three-quarters of the year—whence the name White Mountains. Round their bases are forests of heavy timber, which are succeeded by belts of stunted fir, above which are bushes, and then only a coating of mosses and lichens. The scenery of this mountain region is of a very grand character. From the northern side of the White Mountains the chain continues on both sides of the Androscoggin River, but it does not attain a great elevation. The country between this northern portion of the chain and the Connecticut River is hilly and rocky, and but thinly settled, on account of the severity of the climate owing to its elevation above the sea, and the barrenness of the soil. But south of the White Mountains the soil on the declivities of the lower hills and in the valleys between them is good, and that along the banks of the rivers, which is subject to be overflowed annually, is of excellent quality.

Hydrography; Communications.—The *Connecticut* rises near the northern border of the state, in Lower Canada, in several small branches, but soon begins to form the boundary-line between New Hampshire and Vermont. Though its current is considerably obstructed by falls, rapids, and shoals, the navigation has been so much improved by dams, locks, and short canals, that boats of considerable tonnage may ascend it for some distance above Haverhill, near 44° N. lat., a distance of nearly 200 miles from its mouth in a straight line. [MASSACHUSETTS.] The principal affluents of the Connecticut in New Hampshire are the Upper and Lower Ammonoosuc, the Ashuelot, and the Sugar rivers. The *Merrimac*, which rises in the White Mountains, and traverses the central districts of the state by a southern course, has also many falls and rapids, but the navigation of this river also has received great improvements, so that it is navigable from its mouth to Concord. [MASSACHUSETTS.] The *Piscataqua*, which for about 40 miles forms the boundary between this state and Maine, rises near the southern declivity of the White Mountains in a small lake, and runs south-south-east about 60 miles in a straight line. As a navigable river it is of small importance, as its course is very rapid, and the tide ascends it only a short distance from the sea; but it forms the fine harbour of Portsmouth. It only bears the name of Piscataqua from the point about 10 miles from its mouth, where several tributaries unite with the main stream. Several smaller

Rio Cauca below Mompox; it then again turns to the north and runs through a wide plain, past Baranacas, to the Caribbean Sea. About 60 miles from its mouth it divides into two branches, of which that which continues due north is the principal, and forms at its outlet the small harbour of Savanilla; but this branch is little navigated. The other branch, which turns to the north-east and is much more used, forms in its course several small lakes and terminates in the Ciénaga de Santa Marta, an extensive lagoon, or salt-water lake, with a mean depth of 6 or 7 feet, which communicates with the sea by a narrow canal some miles south-west of Santa Marta, but has a bar at its entrance. The whole course of the Magdalena River is about 1000 miles.

The valley of the Magdalena above Honda extends in a generally level plain, which has an elevation little short of 2000 feet above the sea. The river and its tributaries run in smaller valleys 3 or 4 miles wide and a few hundred feet depressed below the surface of the plain. At Paso de Guayacana, nearly due west of Bogotá, the surface of the Magdalena is still 1200 feet above the sea-level. The valleys along the rivers produce abundantly sugar, tobacco, cacao, and the common agricultural crops of the tropics, yams, mandioc, maize, batatas, and bananas. The upper plain is in some parts fertile; in others rather sterile, and covered with bushy trees. The seasons are regular. In June, July, and August not a drop of rain falls; between September and February showers are rather frequent. Heavy rains follow in February, March, and April, and the weather in May is variable. Every day a strong wind begins towards noon to blow from the south, and continues till sun-set; it causes great heat, but is regarded as healthy. The narrow part of the valley between Honda and Badillo and the wider one north of Badillo are very little elevated above the river, and therefore subject to frequent inundations. Though fertile and producing large crops, especially of rice, it is very little inhabited, on account of its unhealthiness, being subject to daily rains, and never enjoying the slightest breeze except when thunderstorms occur, which are common during the night. The vapours arising from the numerous swamps and pools render it extremely unhealthy.

The *Río Cauca* rises in the Paramo de Guanacas, east of the volcano of Purace, and not far from the sources of the Magdalena. It runs nearly due west for about 60 miles in a narrow valley between high mountains, passing within a mile of Popayan. It then turns north, and, at the village of Quilachoa, enters a valley about 30 miles wide, and extending to the north of Cartago nearly 180 miles. The course of the river is gentle. About 30 miles north of Cartago it enters a narrow glen, formed by the high mountains on both sides; which does not contain level ground enough for a road. In this glen the river flows with astonishing rapidity, forming a succession of rapids and cataracts, from Salto de S. Antonio to Boca de Espiritu Santo about 120 miles, and within this distance falls probably not less than 2500 feet, its elevation at Cartago being about 3000 feet above the sea. Issuing from this glen it enters a wider valley, which grows still wider north of the town of Antioquia, where the river declines to the north-east and meets the Magdalena below Mompox. The whole course of the river is above 700 miles.

The wide valley of the Upper Cauca is from 3000 to 4000 feet above the sea-level, and has a healthy and not very hot climate and regular seasons. The two rainy seasons occur about the time of the equinoxes, with an interval of dry seasons between them. Along the river the plain is low and marshy, subject to periodical inundations and mostly overgrown with rushes and reeds, but at no great distance from its banks the country rises higher and extends partly in savannahs and partly in wooded plains. In many districts it is cultivated, and produces rice and maize in abundance, as well as sugar, cacao, coffee, and tobacco; but by far the greatest part serves as pasture-ground for numerous herds of cattle and horses. About Cartago the surface of the plain is undulating and less fertile. In the hills which skirt the Central Andes are thick layers of a reddish sand, which contains numerous particles of gold. In the lower part the valley of the Cauca resembles generally that of the Magdalena below Honda.

The geology of New Granada is noticed generally under ANDES. Its mineral riches are considerable, and mostly occur on the western declivity of the three chains of the Andes. They consist of gold, silver, platinum, mercury, copper, lead, iron, and rock-salt. Gold seems to occur along the whole western declivity of the Central and Western Andes, and is obtained by washing the sand of the rivers, or that on the foot and sides of some hills. In the Eastern Andes it is found on the table-lands of Girona and Cucuta. Silver occurs on the table-lands of Girona and Cucuta. There are also some rich mines in the mountain region north of 5° 30', between the Magdalena and Cauca. Platinum occurs on the western declivity of the Western Andes. Mercury is found in the valley of Santa Rosa, near Antioquia, and in the Central Andes near the mountain pass of Quindiu. Copper occurs in the Eastern Andes, north of Tunja and near Pamplona. Lead has been discovered in various parts of the Eastern Andes. Iron and coal are found in the mountains bordering on the table-land of Bogotá. Rock-salt in large masses occurs in some mountains north-east of Bogotá, and is worked by the government. Some salt-springs in these mountains also furnish a large quantity of salt.

Productions, Commerce, &c.—From the great diversity of surface,

soil, and climate in New Granada, the natural productions are extremely varied, including not only those of the West India, but also those of the temperate zone. These products are specified more particularly in noticing the several districts of the country. Here it will be sufficient to observe generally, that over the table-land of Bogotá, and the country north of it along the western declivities of the Eastern Cordillera, wheat and other European grains, potatoes, and the araca-ha-root, are the principal objects of culture; while in the valleys of the great rivers, and on the plains along the coast, maize is the chief grain raised for food, with rice, plantains, and sweet potatoes; and that cacao, cotton, tobacco, coffee, and some sugar and indigo are cultivated as articles of commerce. Many useful kinds of trees are found in the forests; but almost the only ones which are converted into articles of export are the Brazil, fustic, Nicaragua, and logwood, trees which grow most abundantly in the forests of the Sierra de Santa Marta. Cinchona is obtained in large quantities in the same region, and in various other places. Ipecacuanha is largely collected on the banks of the Río Magdalena, and balsam of Tolu on the banks of the Río Sinu. The llanos and plains support vast herds of cattle, which furnish tasajo, or jerked beef, and hides as articles of commerce. Horses, mules, and horned cattle are exported to the West Indies.

The manufacturing industry of New Granada is of little importance. It is limited to woollen and cotton stuffs of a coarse texture only adapted for the use of the lower classes, and mostly made by the consumers; and the commoner articles of every-day use.

The commerce of New Granada was much greater before its independence than it is now, a circumstance which is chiefly to be attributed to the effects of almost incessant internal war, and the unsettled state of its government; but the want of means of communication with the interior is a great hindrance to the commerce of the country. The greater part of the interior is in fact unable to export its produce for want of roads and other means of communication. The tracts which border on the sea being mostly covered with swamps and morasses, and consequently very unhealthy, endanger the life of those who venture to traverse them. Neither of the more healthy provinces of the republic can send its produce without great expense to any of its harbours except the valley of the Upper Magdalena. The most fertile tract is the valley of the Upper Cauca, but this is everywhere surrounded by high mountains; and as the river becomes unfit for navigation on issuing from the valley, this district is obliged to convey its produce over one of the two great ranges which inclose it. Both however are so exceedingly steep as not to admit the use of beasts of burden, and all merchandise is carried over on the backs of men. The entire imports of New Granada average in value less than 900,000*l.*; the exports, 600,000*l.* The imports from Great Britain, which usually amount to nearly three-fifths of the whole, were returned at 450,804*l.* in 1858.

Inhabitants.—The population of New Granada consists of the descendants of the Spaniards who have settled there during the three last centuries, of some native tribes, and a few negroes. The Africans and their descendants were much more numerous before the war of independence; but as they were the best soldiers that the country could furnish, the war has nearly annihilated that hardy race. The native tribes have attained very different degrees of civilisation. Those inhabiting the table-lands along the Eastern Andes had before the arrival of the Spaniards formed a political society, and made some progress in the arts of civilisation; they cultivated Indian corn and the araca-ha-root. They are still the best husbandmen of the republic; and the Indian families living in the valley of the Upper Magdalena resemble them. In the valley of the Cauca there are no Indians. In the country between the Western Andes and the Pacific the native tribes constitute nearly the whole of its scanty population. They have made only small progress in civilisation, and this little they owe to the Spanish clergy established among them. That portion of the llanos which is destitute of trees is inhabited only by the descendants of Europeans, who take care of the herds of cattle, mules, and horses. The southern wooded portion of the llanos is inhabited by different tribes of wandering Indians, still in the lowest stage of civilisation. Hubner estimates the numbers of the various races in New Granada as follows:—White Caucaians, 450,000; civilised native Americans, 301,000; Negroes, 80,000; Metis (or descendants of Spaniards and natives), nearly 1,000,000; Mulattoes, 283,000; Quadroons, 30,000; Samoyes, 120,000; Zambes (chiefly in Magdalena), 100,000.

Political Divisions, Towns, &c.—The republic of New Granada is divided into four departments—Cauca, Cundinamarca, Boyaca, and Magdalena. The population of the towns in the following notice must be taken as a rough estimate:—

1. *Cauca* extends over the Isthmus of Panama, with the contiguous province of Veraguas [PANAMA], which formerly constituted the department of Istmo; the whole of the western coast from the Bay of Panama to Barbacona, on the boundary of Ecuador; and the valleys of the rivers Atrato, San Juan, and the Upper Cauca. Its principal productions are gold and platinum, the produce of its herds in the valley of the Upper Cauca, and cacao along the coast of the Pacific. In this department is the canal of Raspadura, which unites the San Juan and Atrato rivers. [ATRATO.] The principal town is Popayan, population 20,000, situated not far from the sources of the Cauca River, 5200

feet above the sea, and near the two volcanoes of Purace and Sotara. It contains several superior buildings, the most remarkable being the bishop's palace and the Compañia, or College of Jesuits. Earthquakes are frequent. Farther north is *Cali*, in the vale of the Cauca, a clean and well-built town, from which the most frequented road over the Western Andes leads to Buenaventura on the Pacific. *Buenaventura* consists only of a few wretched huts built on posts, although it is the only port that supplies the valley of the Cauca and Popayan with merchandise, and has generally some foreign vessels besides coasters anchored there. On the shores of the Pacific are the small harbours of Atacames and Barbacoas. In the Andes, near the boundary of Ecuador, is the town of *Pasta*, 8576 feet above the sea, on a fine plain, near the foot of a very active volcano. Population about 5000.

2. *Cundinamarca* (by which name the table-land of Bogotà was designated at the arrival of the Spaniards) contains the valley of the Lower Cauca, that of the Upper and Middle Magdalena, the table-land of Bogotà, and a small portion of the Llanos lying about the sources of the rivers Guaviare and Meta. All the vegetable productions of New Granada may be cultivated here at different places, and the declivities of the Andes are covered with extensive forests. Gold and silver are found in the Central Andes; copper, lead, coal, and rock-salt in the Eastern Andes. The river Bogotà, in its descent from the table-land, forms, at a distance of 18 miles S.W. from the town of Bogotà, the cataract of Tequendama, where the river, suddenly contracting from a breadth of 60 yards to less than 20 yards, is precipitated in an immense body of water down a fall of 650 feet. In the same part of the table-land are the natural bridges of Leonozzo, or Pandi, which unite two rocks, between which a torrent roars. The uppermost consists of a rock 47 feet long and 6½ feet thick, and is more than 300 feet above the surface of the water; the lower bridge is nearly 70 feet under the first, and consists of three pieces of rock, which support one another. The capital of the department and of the whole republic is BOGOTÀ. *Honda*, population 5000, is on the left bank of the Magdalena; and at some distance N. from it is *Rio Negro*, with a population of 6000. West of Honda is *Mariquita*, a small town, near which are rich mines of gold. South of Honda is *Neyva*, with 4000 inhabitants; and still further, near the source of the Magdalena, *Timana*, with 2000 inhabitants: both places are noted for their plantations of cacao. Gold is washed near Timana. Between Neyva and Honda, but at the foot of the Central Andes, nearly 4900 feet above the sea, is *Ibague*, which has a college. In the valley of Cauca are *Antioquia*, with 4000 inhabitants; and *Medellin*, in a fine valley, containing 9000 inhabitants.

3. *Boyaca* obtained this name from the bridge of Boyaca, where Bolivar defeated the Spanish general Barreya in 1819, by which victory the independence of South America was established. It comprehends the northern table-lands of Tunja, Girona, and Cucuta, and nearly the whole of that part of the Llanos which belongs to New Granada. It has some mines of gold and copper in the table-lands, and in the northern part of the Eastern Andes. The capital is *Tunja*, on the hilly table-land of Tunja, near the Eastern Andes; population, 7000: it has some manufactures of woollen and cotton stuffs. *Socorro*, on the table-land of Sogamoso, has 12,000 inhabitants, and some manufactures of cotton and straw hats. On the table-land of Cucuta is *Rosario de Cucuta*, a considerable town, which carries on an active commerce in the products of the contiguous country, which is covered with plantations of cacao, sugar-cane, coffee, and cotton. *Pamplona*, which is in the mountains south of the table-land, has 4000 inhabitants, some good buildings, and several gold-mines in its neighbourhood.

4. *Magdalena* comprehends the whole country east of the Gulf of Darien, and extending east to the boundary of Venezuela, not far from the Lake of Maracaibo. With the exception of the mountain-mass of Santa Marta on the east, and the northern offsets of the Western Andes on the west, the whole of this department is rather level, and only contains some hilly tracts. Every kind of vegetable production peculiar to countries between the tropics is grown; but the heat and moisture of the climate, which favour vegetation in an astonishing degree, are very injurious to the health of its inhabitants; and the country is consequently thinly peopled. The capital is CARTAGENA. *Mompox*, population 10,000, a town on the left bank of the Magdalena, above its junction with the Cauca, carries on a considerable commerce, being the depôt for the produce of the table-land of Girona, and partly also of that of Cucuta. *Ocaña*, population 8000, lies E. of the Rio Magdalena, near the Sierra de Ocaña, at a considerable elevation above the level country along the river, and has a healthy climate. *Santa Maria*, E. of the Ciénaga de Santa Marta, and not far from the Nevado of the same name, has a good harbour, with some commerce, and 3000 inhabitants. *Ciudad de la Hacha*, further to the east, has about 3000 inhabitants, and a small and ill-sheltered harbour. Along the coast west of this town pearls were formerly fished.

History, &c.—New Granada was discovered by Alonso de Ojeda in 1499. The first settlement was made at Santa Maria la Antigua, on the Gulf of Darien, in 1510. The interior of the country was only conquered towards the middle of the 16th century, by Benalcazar and Ximenes de Quesada, who founded the town of Santa Fé de Bogotà in 1545. The Spaniards continued in possession of this country till

1811, when New Granada proclaimed its independence. The war, which was the consequence of this declaration, continued to devastate the different provinces of which New Granada consists to the year 1821. In 1819 New Granada and Venezuela being united into one republic, formed a constitution at the Congress of Rosario de Cuenta in 1821, and received into the union Ecuador and Panama in 1823. This union was dissolved in 1831, and the republic of Colombia divided into the three republics of Venezuela, New Granada, and Ecuador. Like the other republics of South America, New Granada has been ever since the declaration of Independence in a very unsettled condition. At the date of the latest accounts (received in December 1854) New Granada was in a state of revolution. The government troops had been defeated; Bogotà, the capital, was in possession of the 'Constitutionalists'; and a project was to be brought before Congress for the formation of the Isthmo (including Panama and Veragua) into an independent state.

(Juan and Antonio de Ulloa; Humboldt; Mollien; Hamilton; Hubner, &c.) [See SUPPLEMENT.]

NEW GUINEA. [PAPUA.]

NEW HAMPSHIRE, one of the United States of North America, lies between 42° 41' and 45° 11' N. lat., 70° 40' and 72° 28' W. long. It is bounded S.E. for about 18 miles by the Atlantic Ocean; E. by the state of Maine; N. by the British province of Lower Canada; W. by the state of Vermont, from which it is divided by the Connecticut River; and S. by the state of Massachusetts. The area is 8086 square miles, or 605 square miles larger than Wales. The population in 1850 was 317,976, or 39·6 to the square mile. The inhabitants being all free, the ratio of representation entitles the state to send three representatives to Congress. To the Senate, like each of the states of the Union, New Hampshire sends two members.

Coast-line, Surface, &c.—The coast is a low sandy beach, indented by several creeks and coves, which serve as harbours for vessels of light draft. The shore is bordered by salt-marshes, and the country, to the distance of 20 or 30 miles inland, rises imperceptibly, so as to arrest the tides within 20 miles from the sea, though they rise to about 18 feet. This flat tract has a sandy soil of inferior fertility. At the back of it the surface becomes broken and hilly; the hills gradually rising in height towards the interior, until, at a distance of about 10 miles from the banks of the Connecticut River, they constitute a continuous range, running nearly due south and north. Some of the summits attain a considerable elevation. Mount Monadnock, about 10 miles from the boundary of Massachusetts, rises to the height of 3254 feet, and Moosehillock, farther north, to 4336 feet. On approaching 44° N. lat. the chain expands into an extensive mountain-group, which projects considerably towards the east, and is known as the White Mountains. The highest summit of this group, Mount Washington, 6428 feet high, is the loftiest mountain in the United States east of the Rocky Mountains. Several other summits rise above 5000 feet: as Mount Adams, 5960 feet; Mount Jefferson, 5860 feet; Mount Madison, 5620 feet; Mount Franklin, 5050 feet; and Mount Monroe, 5510 feet. The loftier peaks of this range are covered with snow during three-quarters of the year—whence the name White Mountains. Round their bases are forests of heavy timber, which are succeeded by belts of stunted fir, above which are bushes, and then only a coating of mosses and lichens. The scenery of this mountain region is of a very grand character. From the northern side of the White Mountains the chain continues on both sides of the Androscoggin River, but it does not attain a great elevation. The country between this northern portion of the chain and the Connecticut River is hilly and rocky, and but thinly settled, on account of the severity of the climate owing to its elevation above the sea, and the barrenness of the soil. But south of the White Mountains the soil on the declivities of the lower hills and in the valleys between them is good, and that along the banks of the rivers, which is subject to be overflowed annually, is of excellent quality.

Hydrography; Communications.—The *Connecticut* rises near the northern border of the state, in Lower Canada, in several small branches, but soon begins to form the boundary-line between New Hampshire and Vermont. Though its current is considerably obstructed by falls, rapids, and shoals, the navigation has been so much improved by dams, locks, and short canals, that boats of considerable tonnage may ascend it for some distance above Haverhill, near 44° N. lat., a distance of nearly 200 miles from its mouth in a straight line. [MASSACHUSETTS.] The principal affluents of the Connecticut in New Hampshire are the Upper and Lower Ammonoosuc, the Ashuelot, and the Sugar rivers. The *Merrimac*, which rises in the White Mountains, and traverses the central districts of the state by a southern course, has also many falls and rapids, but the navigation of this river also has received great improvements, so that it is navigable from its mouth to Concord. [MASSACHUSETTS.] The *Piscataqua*, which for about 40 miles forms the boundary between this state and Maine, rises near the southern declivity of the White Mountains in a small lake, and runs south-south-east about 60 miles in a straight line. As a navigable river it is of small importance, as its course is very rapid, and the tide ascends it only a short distance from the sea; but it forms the fine harbour of Portsmouth. It only bears the name of Piscataqua from the point about 10 miles from its mouth, where several tributaries unite with the main stream. Several smaller

streams, though not available for navigation, furnish valuable mill-power.

This state contains several lakes; the largest is Lake Winnipisseege, which is 23 miles long, and from 2 to 10 miles wide, and has scattered over it above 350 islands. Squam Lake, N.W. of the former, is 5 miles long and 4 miles wide. In the northern districts is Umbagog Lake, through which the boundary-line between New Hampshire and Maine passes. The lake scenery of New Hampshire is very beautiful; the noble mountains of the state forming with the various lakes and falls strikingly picturesque combinations.

New Hampshire is well provided with the ordinary carriage-roads. The principal lines of railway run in a north-west and south-east direction, or from the Atlantic at Portsmouth and Boston to the Connecticut River, where they unite with the railways of Vermont, which connect them with Lake Champlain and Canada. The Great Atlantic and St. Lawrence line traverses the northern section of the state. The southern lines diverge from Concord as a centre. At the close of 1854 there were 512 miles of railway in operation in the state, and 34 miles constructing.

Geology, Mineralogy, &c.—The rocks of New Hampshire are almost entirely of the Paleozoic, or non-fossiliferous, and nearly all of the so-called primary system. Igneous, or eruptive, and metamorphic rocks, including granite, gneiss, sienite, and porphyry, occupy the chief part of the state. Crystalline limestone has been found in one or two places; and the new red-sandstone of Massachusetts is prolonged for some distance into the western portion of New Hampshire. The state is believed to possess considerable mineral wealth, though it has as yet been but little developed. Iron is reported to exist in almost every county, and some really valuable beds are said to have been recently discovered. Hitherto it has been chiefly in the northern counties that the ore has been worked. Copper and zinc have been found and worked in Grafton county, near the centre of the state. A very rich vein of tin is said to have been discovered at the foot of the White Mountains, in Coos county. The granite is of the finest texture, and in much request for building purposes; it is obtainable in blocks of any size, and the quarries are said to be practically inexhaustible. Marble is also abundant.

Climate, Soil, Productions.—The climate of the lower districts may be compared with that of the countries along the eastern shores of the Baltic. The cold sets in about the middle, and slight frosts occur towards the end of September; but intense frost does not occur till November, from which time till early spring the rivers are frozen to their sources, and the ground is covered with snow. The snow falls to the depth of from two to four feet, and does not disappear before April. In winter the prevailing wind is from the north-west, which rarely blows in summer. The winter does not last longer in the hilly and mountainous districts, but it is more severe. At Keene, in the south-western part of the state, the thermometer has sunk to 24° below zero, Fahr. The heat in summer is great, the thermometer occasionally rising to 100° Fahr.

The soils in this state are described as being generally stubborn, but repaying careful culture by abundant harvests. The grain which is grown in the greatest abundance is maize, which is cultivated in almost every district. The low lands along the rivers yield rich crops of wheat, oats, and rye, also flax, hemp, and culinary plants. Barley, buckwheat, peas and beans, large quantities of potatoes, some tobacco and hops are also grown. The uplands produce only moderate crops. Each farmer has an orchard of apple and pear-trees, and good cider is made; maple sugar is prepared to a large amount. Horned cattle are tolerably abundant, and the dairies very good. The cattle are of a large size. Sheep are very numerous, and a considerable quantity of wool is sent to market. Swine are also common. Horses are not very numerous, and they are of a small size.

On the hills and mountains are still extensive forests, consisting of pine, fir, oak, cedar, hemlock, beech, sugar-maple, balsam, poplar, birch, hickory, spruce, chestnut, and larch. In the forests the black bear, the wolf, fox, wild cat, racoon, and gray, striped, and flying squirrel, are still common; but the moose-deer, the beaver, and black squirrel have become very rare. The bays and rivers abound with various kinds of fish; and wild fowl are plentiful.

Manufactures, Commerce, &c.—New Hampshire has extensive manufactures, especially of cotton and woollen goods, carpets, iron goods, &c. In the manufacture of cotton New Hampshire is second only to Massachusetts, and makes one-seventh of the entire quantity manufactured in the United States. Upwards of 12,000 persons are employed in the cotton and 2100 in the woollen manufactures. There are numerous tanneries, grist- and saw-mills, machine shops, hardware and outlery works, carriage factories, paper-mills, powder-mills, &c.

The foreign commerce of New Hampshire is concentrated at Portsmouth, the only port of entry in the state; but the direct imports and exports have both greatly fallen off of late years; the bulk of the produce of New Hampshire being now exported and the foreign supplies received through Boston. The total direct imports for the year ending January 30, 1852, were valued at 69,458 dollars; the exports at 82,819 dollars: while in 1823 the imports were 237,705 dollars, and the exports 571,770 dollars. The cod and mackerel fisheries are pursued to some extent. In 1852, 14 brigs and schooners of the aggregate burden of 9515 tons were built in this state.

Divisions, Towns, &c.—New Hampshire is divided into ten counties. Concord is the political capital, but Portsmouth is the commercial centre, and was until recently the most populous city in the state, but the manufacturing city of Manchester appears within the last few years to have outgrown it in population. The following are some of the more important places; the population is that of 1850, but the Census Report does not distinguish between the populations of the 'villages' or 'cities,' and the 'towns' (or as we should term them townships) in which they are situated—the number of inhabitants therefore is probably in most instances greater than that of the actual city or village:—

Concord, the capital, is built on the right bank of the Merrimac, in 43° 12' N. lat., 71° 29' W. long., 474 miles N.E. from Washington: population, 8576. Since the construction of the various state railways which centre in Concord, full advantage has been taken of the great amount of water-power furnished by the Merrimac, and the village has become one of the principal seats of the manufacturing industry of New England. In and around the village are several large cotton-factories, paper-mills, boot and shoe shops, potteries, fulling-mills, &c. The chief public buildings are the state-house, state-prison, court-house, churches, schools, &c.

Portsmouth, a city and port of entry, stands on rising ground where the Piscataqua River opens into Portsmouth harbour, about 3 miles from the sea, and 41 miles E.S.E. from Concord: population, 9738. As the only seaport town in the state, Portsmouth is a place of considerable commercial activity. Shipbuilding is somewhat extensively carried on, and the port owns about 23,000 tons of shipping. The harbour is commodious and safe, well protected by headlands, and has 40 feet of water at low tide. On an island opposite the river is a United States navy yard, containing a large and costly dry dock, and three immense ship-houses. The entrance to the harbour is defended by some forts. The principal public buildings in the city are six churches, an Athenæum, academy, several schools, and a United States lunatic asylum. There are extensive cotton and hosiery factories, machine-shops, iron-works, &c.

Dover, on the left bank of the Cochecho, a tributary of the Piscataqua, 33 miles E. from Concord: population, 3196. The village is built round the lowest falls of the Cochecho, which afford immense water-power, at the head of the navigation, about 12 miles from the sea. The village possesses some shipping, has extensive cotton manufactures, and contains some good buildings. *Exeter*, on the Squamscot or Exeter River, a tributary of the Piscataqua, 32 miles E.S.E. from Concord, population 3329, is another thriving manufacturing town, containing several good public buildings, and an important educational establishment called Phillips' Academy. *Hanover*, situated on a plain about half a mile from the Connecticut River, 52 miles N.W. from Concord, population 2352, is a pleasantly-situated village, with some manufacturing establishments, but chiefly noteworthy as the seat of Dartmouth college, one of the principal collegiate establishments in New England. In 1853 it had 10 professors, 237 students, and a library of 25,000 volumes: a medical school is attached to it. *Keene*, on the Ashuelot, 43 miles S.W. from Concord, population 3392, is a busy manufacturing and commercial village, and contains some good buildings. *Manchester*, a city built on elevated ground on the right bank of the Merrimac, is rapidly rising into importance as the centre of what is becoming one of the chief manufacturing districts in New England. The township (population 13,932) contains several very extensive cotton-mills belonging to three or four incorporated companies, print-works, machine-shops, foundries, &c. The city contains a lofty town-house, several churches, schools, and other public buildings, large business establishments, hotels, &c.; and has good railway accommodation. *Nashua*, at the confluence of the Nashua River with the Merrimac, 33 miles S. by E. from Concord, population 5820, is another of the rising manufacturing towns of the state. Besides the cotton factories, which are the chief source of employment, there are steam-engine and machine shops, and manufactories of guns, locks, tools, &c. Four railways connect Nashua with the other large manufacturing and commercial towns in this and the adjoining states.

Government, History, &c.—The original constitution as framed in 1784, and amended in 1792, is still the fundamental law of the state. A new constitution was framed in 1850, but rejected by a subsequent vote of the people. The right of voting is vested in all male citizens 21 years of age, paupers and persons excused from paying taxes excepted. The legislature, styled the General Court, consists of a Senate of 12 members, and a House of Representatives of which the number of members, at present 286, is regulated by the population: members of both houses, and the governor, are elected annually. By the terms of the constitution no person can hold any public office in this state who is not a Protestant. The public debt of the state in 1853 was 75,570 dollars. The total revenue of the state for the year ending June 1, 1853, was 164,416 dollars; and the expenditure for the same period 165,418 dollars. The state militia in 1853 was composed of 31,440 men, of whom 1309 were commissioned officers.

New Hampshire was first settled in 1623, and the progress of the colony in the beginning was very slow. It had to sustain many distressing wars with the natives who inhabited its present territory. From the middle of the last century its progress was more rapid. In 1775, before the declaration of independence, the provincial convention

declared the royal government dissolved, with the view of separating entirely from Great Britain. In 1776 the first provincial congress was established, under the name of a House of Representatives. In 1784 New Hampshire assisted in establishing the Federal Union, of which it formed one of the 13 original states, and the constitution of which it ratified June 21, 1788.

NEW HANOVER. [NEW IRELAND.]

NEW HARMONY. [INDIANA.]

NEW HEBRIDES is an extensive group of islands in the Pacific, situated (if Banks's Islands are included among them) between 13° 15' and 20° 5' S. lat., 166° 40' and 170° E. long. Banks's Islands, the most northern group of the New Hebrides, were discovered by Captain Bligh in 1789; they consist of five small islands and one larger island which is more than 20 miles in circumference. South-west of these islands is the largest of the whole group, Tierra del Espiritu Santo, 70 miles long from north-north-west to south-south-east, with an average width of 25 miles, which was discovered by Quiros in 1605, and contains a wide bay with good anchorage on its eastern side. Farther south is Mallicolo, more than 60 miles long, and about 28 miles wide, which has a good harbour called Port Sandwich, on the east side near its southern extremity. The islands l'Isle des Lepreux, Aurora, Pentecôte, Ambrym, Paocom, and Apee, which are situated east of Tierra del Espiritu Santo and Mallicolo, are not so large. Farther south is the large island Erromango, 80 miles in circumference, and the smaller island of Tanna, about 20 miles long. Besides these larger islands there is a considerable number of smaller ones, which lie dispersed between and about them. These islands, or at least some of them, are of volcanic origin. An active volcano exists on the island of Tanna. These islands consist mostly of hills of moderate elevation, which however in some of them rise to the height of mountains. The valleys between these hills and also the level tracts along the coasts are very fertile. The uncultivated declivities of the hills are covered with trees. These islands are very rich in vegetable productions. The banana, sugar-cane, yam, arum, batata, and curcuma are grown in regularly divided fields, and with great care. The cocconut, bread-fruit, the cabbage-tree, a kind of figs, almonds, and oranges are common. Bamboos, pepper, and mastic are abundant, and the nutmeg-tree occurs likewise. The domestic animals are hogs, pigs, and fowls. The inhabitants eat their enemies who fall in battle. They belong to the race of Australian negroes, but have made greater advances in civilisation than most of the other tribes of that race, as the state of their agriculture evinces. Tanna is the best known, since Cook remained there some time, when he discovered most of these islands in 1774.

NEW HOLLAND. [AUSTRALIA; LINCOLNSHIRE.]

NEW IRELAND, an island in the Pacific, situated between 2° 40' and 4° 52' S. lat., 150° 30' and 152° 50' E. long., is more than 170 miles long from south-east to north-west, but on an average not much more than 12 miles wide. It is separated from New Britain by St. George's Channel, discovered by Carteret in 1767, who also discovered and named Byron's Strait, which divides it from the small island of New Hanover. Near the southern extremity of New Ireland, Cape St. George, there is a good harbour, called Port Praslin. The island has a hilly surface, and some summits rise into mountains, but all of them are covered with wood. The lower tracts produce bananas, sugar-cane, batatas, ginger, yams, bread-fruit, cocos-nuts, sago, figs, bamboos, and many other plants and trees. Dogs, pigs, and turtles are abundant. The inhabitants belong to the race of Australian negroes, and resemble in every respect their neighbours the inhabitants of New Britain. New Hanover is situated farther west, and is about 30 miles long from east to west; it is likewise very hilly, and even mountainous, but contains many cultivated tracts.

NEW JERSEY, one of the United States of North America, lies between 38° 58' and 41° 21' N. lat., 73° 58' and 75° 29' W. long. It is bounded E. by the Atlantic Ocean; N.E. and N. by the state of New York; W. by the river Delaware, which separates it from the states of Pennsylvania and Delaware; and S. by Delaware Bay. The area is 6851 square miles, or about 600 square miles less than Wales. The population in 1850 was 489,555, of whom 23,810 were free coloured persons, and 236 apprentices under the state Act for the abolition of slavery: being 71'46 inhabitants to a square mile. The federal representative population, in effect the same as the number of inhabitants, entitles the state to send five representatives to Congress. To the Senate, like each of the other United States, New Jersey sends two members.

Surface, Hydrography, and Communications.—The northern part of the state is hilly, being occupied by the extensions of several of the mountain ranges of Pennsylvania: the principal are the South Mountain and Kittatinny ridges, portions of the Appalachian chain. The remaining and larger part of the state, comprising the whole country south of a line from Staten Island to Trenton, consists of a great sandy plain, which is for the most part a dead level, the only place where it rises more than 60 feet above the sea being at the Navesink Hills, which form the southern side of Raritan Bay, and attain an altitude of 300 feet. The hills in the northern part of the state are nowhere very lofty, but some of the ranges present very picturesque features, and the beauty of the scenery and salubrity of the climate cause them to be much resorted to during summer:

GEOG. DIV. VOL. III.

Schooley's Mountain, where are some mineral springs, is one of the most favourite resorts. Between the ranges are broad, pleasant, and fertile valleys, containing some of the best land in the Union. The entire eastern coast, from Sandy Hook, a low sandy island 3 miles long, at the mouth of Raritan Bay, to Cape May, the southern extremity of the state, consists of a succession of sandy beaches, interrupted at intervals by inlets, and inclosing shallow lagoons. These inlets are constantly changing their position, from the extension or destruction of the sand-bars: since the settlement of the state several of the old inlets have been closed and new ones formed. From the nature of this coast and its exposure to the heavy surf of the Atlantic it is very dangerous to mariners. The most available inlets for navigation are the Barnegat, Great Egg Harbour, and Little Egg Harbour; but there are several others open to small craft. A low marshy tract extends for several miles inland from this coast. The south-western coast along Delaware Bay consists chiefly of a narrow tract of salt marsh, rising gradually into the sandy plain. Along it there are several coves and inlets, but none frequented by large vessels. Raritan Bay, between Sandy Hook and Staten Island, affords a ready inlet to Amboy, up to which it has 15 feet of water.

Besides the Hudson, which on the east divides this state from New York, and the Delaware, which on the west divides it from Delaware and Pennsylvania, and which are noticed elsewhere (the Hudson under NEW YORK, and the DELAWARE in a separate article), the state has no rivers which are navigable for vessels of large size. The *Hackensac* rises in New York, and has a course of about 45 miles to Newark Bay: it is a valuable mill-stream, and is navigable for sloops to the village of Hackensac, 15 miles from its mouth. The *Passaic*, which also falls into Newark Bay, has a course of about 70 miles; it is navigable by sloops for 12 miles. The chief feature of this river is the great fall near Paterson, where the river makes a perpendicular descent of 50 feet: it has been made largely serviceable for mechanical purposes. The Raritan River, which opens into Raritan Bay at Amboy, is formed by two branches which unite in Somerset county: it is navigable by vessels drawing 8 feet of water up to New Brunswick, 14 miles from its mouth; at which place the Delaware and Raritan Canal, which continues the navigation for vessels of 100 tons burden, locks into it. The principal rivers of the southern part of this state are the Little Egg River and the Great Egg River, which open into the inlets of the same names, and Maurice River which falls into Delaware Bay, all of which are navigable by sloops for about 20 miles from their outlets.

The canals of New Jersey are the Morris Canal, which traverses the northern part of the state and unites the rivers Delaware and Hudson; and the Delaware and Raritan Canal, which unites the rivers so named: both lines are of considerable commercial importance, especially as the channels by which the anthracite of Pennsylvania and the coal of Maryland are conveyed to New York.

Like the canals the railways of New Jersey have been chiefly constructed with a view to facilitate communication between Pennsylvania and New York. The Union, a feeder of the New York and Erie line is the only one which does not run in this direction. The total length of railway completed in the state in 1854 was 437 miles.

Geology, Mineralogy, &c.—The northern or hilly and mountainous part of the state is wholly occupied by igneous and palæozoic rocks. Eruptive and Metamorphic rocks, consisting of granite, gneiss, sienite, greenstone, mica-schist, &c., occupy the greater part of the north-west; the north-western angle however contains strata of the Lower Silurian formation, which form the loftiest summits in the state. On the south the eruptive and metamorphic rocks are bounded by strata of new red-sandstone, consisting of beds of red-sandstone with layers of red clay interposed, corresponding to the new red-sandstone of England, or according to M. Agassiz more exactly to the Keuper, or variegated marls, which form the upper part of the Trias of the continent of Europe. South of the new red-sandstone, and occupying the entire middle of the state, from Staten Island to Trenton on the north, and from south of Sandy Hook to the Delaware opposite Philadelphia on the south, are strata of the Cretaceous system. The lower of these strata are composed of green-sand and green-marl, very analogous to the upper green-sand and marly-chalk of England; while the upper part is composed in a great measure of soft and easily disintegrated straw-coloured limestone. The remainder of the state, south of the cretaceous rocks, consists wholly of tertiary rocks, of the miocene and later groups. Along the eastern coast from Sandy Hook to Cape May occur raised beaches and other post-pleiocene deposits. In the drift clays in the valley between the two principal ranges in the north-west of the state, have been found many remarkable remains of animals, &c.; the most remarkable discovery being made in 1845, when no less than six skeletons of the *Mastodon giganteus* were found about 6 feet below the surface, in the rich mud at the bottom of a small pond in Warren county.

New Jersey is on the whole rich in minerals. Iron in various forms is found in both the northern and southern sections of the state. Copper is obtained in various places, but does not appear to be at present much worked. A vein of silver-ore is said to have been discovered in a copper-mine near Belleville on the Passaic. Zinc-mines of great richness have been opened in Sussex county: at present the ore is chiefly manufactured into zinc paint. Graphite (black-lead)

is found in considerable quantities in the hilly districts. Enormous masses of the irreducible mineral first observed in this state, called franklinite, are found at Franklin, whence its name, and elsewhere. Granite, limestones, and sandstones adapted for building purposes are quarried; as are also marbles of various and some of very beautiful descriptions.

Climate, Soil, and Productions.—The northern part of the state is considerably cooler than the southern, and more salubrious. The southern part is influenced by the prevalent winds from the Atlantic. In the vicinity of the low swampy districts agues and malignant fevers prevail. Cape May however, the most southern point of the state, is resorted to by invalids and others during summer as a healthy watering-place.

The soils vary considerably according to the locality and the geological character of the substratum of rocks. The hilly districts are for the most part in their natural state, only a few farms having yet been established on the hill sides. The valleys however afford excellent soils; and while the hills are covered with forests of oak, pine, hickory, poplar, &c., the valleys are clad with crops of maize, wheat, and most of the ordinary agricultural products. The most productive part of New Jersey is the central section, where all the cereals flourish, and the orchards yield large profits; the apples and cider, and also the peaches of this part of the state find a ready sale in the markets of New York and Philadelphia. The southern districts have a dry sandy soil, but it is capable of being rendered fertile by the application of manures, which are readily obtained. Stunted oaks and other trees cover a considerable portion of this southern district.

The cereals most largely raised in New Jersey are maize, wheat, oats, rye, and buckwheat; very little barley is grown. Potatoes are grown in very large quantities; a considerable quantity of sweet potatoes is also raised. Orchard products, as already mentioned, form a staple of the middle district; and some wine is made. Vegetables also form an important item in the agricultural returns. No cotton is raised, and very little tobacco. Horses are not particularly numerous. In the hilly parts and along the coast a good many horned-cattle are reared, and the dairy products are important. Sheep are pretty numerous, and a good deal of attention is given to the wool. Swine are very plentiful. The wolf, bear, deer, and other wild animals still roam in the forests of the north.

Manufactures and Commerce.—New Jersey is generally regarded as an agricultural state, but it has an important and growing manufacturing interest. At the census of 1850, out of a total of 128,740 males above 15 years of age, 32,834 were returned as engaged in agriculture, and 46,544 in commerce, trade, manufactures, mechanic arts, and mining. The principal manufactures are of cotton and woollen goods; pig, cast, and wrought-iron; machinery, leather, glass, and earthenware; bricks, paper, jewellery, fire-arms, paint, spirits, boots and shoes, hats, &c.

The direct foreign commerce of the state is small, the exports being mostly forwarded, and the imports received through the ports of New York and Philadelphia. The total shipping owned by the state in 1850 amounted to 80,300 tons. In 1852 there were 38 vessels built in the state of the aggregate burden of 3953 tons.

Divisions, Towns, &c.—New Jersey is divided into 20 counties. Trenton is the political capital; but Newark is by far the most populous city in the state. These, with some of the other more important places, we notice below; the population is that of 1850:—

Trenton, the capital of New Jersey, stands at the confluence of the Assunpink Creek with the Delaware River, in 40° 14' N. lat., 74° 46' W. long., 166 miles N.E. from Washington, 30 miles from Philadelphia, and 59 miles from New York: population, 6461. The city is regularly laid out, and contains some good buildings. The state-house is a spacious structure; the other principal public buildings are the governor's-house, court-house, state lunatic asylum, and state prison; there are several churches, schools, &c. Trenton possesses great water-power, and is the seat of extensive manufactures of paper and leather, saw-mills, grist-mills, &c. The Delaware is navigable up to Trenton by sloops and steam-boats; and the sloop navigation is continued by the Raritan Canal which here joins the Delaware. Several railways unite at Trenton. The Delaware River is here crossed by a covered bridge of five arches, erected in 1806.

Newark, a port of entry, and the principal commercial and manufacturing city of the state, on the right bank of the Passaic, 3 miles above its outfall in Newark Bay, 47 miles N.E. from Trenton, and 9 miles W. from New York: population, 38,894. The city is regularly laid out; the streets are wide, straight, and in parts bordered by large and lofty elms; and the city is supplied with good water and lighted by gas. Some of the public buildings are handsome edifices. There are 30 churches, numerous schools, three literary, and various benevolent institutions. The manufactures are on an extensive scale, the principal being of machinery, railway-cars, carriages, and waggons, zinc-paint, leather, india-rubber, paper-hangings, cutlery, jewellery, &c. The commerce is chiefly connected with the coasting-trade, but a few foreign vessels annually enter the port. Regular communication is kept up by steam-boats with New York; and by railway with the chief towns in this and the neighbouring states. Three newspapers are published daily.

New Brunswick, a city and port of entry, and the capital of Middle-

sex county, on the right bank of the Raritan, 14 miles from its mouth, 26 miles N.E. from Trenton: population, 10,019. The river is navigable for vessels drawing 8 feet of water up to the town, and the navigation is continued by the Raritan and Delaware Canal, which here locks into the Raritan. The city is the centre of a fertile district, and has considerable trade and manufactures. The oldest part of the city consists of narrow and crooked streets, built by the river-side; but the new part stands on elevated ground, and consists of broad and straight streets, in which are some good buildings. On the highest ground is Rutgers' College, founded in 1770, which in 1853 had 7 professors, 85 students, and a library of 10,000 volumes; and in the vicinity is the theological seminary of the Dutch Reformed Church.

Paterson, on the Passaic, immediately below the great falls of that river, 58 miles N.E. from Trenton, population 11,334, is the centre of the cotton-trade of New Jersey. It contains 20 extensive cotton-mills, several large woollen-mills, fulling-mills, dyeing and printing-works, machine-shops, car and carriage-factories, iron and brass-foundries, gun and pistol factories, paper-mills, and numerous other works, for which the falls, as rendered available by extensive dams, afford ample water-power. The town is well built, contains many public buildings, hotels, and trading establishments of considerable architectural pretension; numerous churches, academies, schools, a philosophical society, mechanics institute, &c. On the opposite side of the Passaic, and united to it by two bridges, is the town of *New Manchester* (population 2788), similar in character to Paterson, and in effect a suburb of it.

Burlington City, population 4586, occupies a small island on the left side of the Delaware, 13 miles S. by W. from Trenton; carries on considerable trade and manufactures, and contains some good buildings. *Camden*, on the Delaware, opposite to Philadelphia, population 9479, is a place of considerable and growing trade. The city is well built, and contains numerous churches, schools, a court-house, and other public buildings. Ships of the largest size ascend to the lower part of the city; and there is ample railway accommodation. Three ferries unite Camden with Philadelphia. Some manufactures are carried on.

Elizabeth Town, on the left bank of Elizabeth Creek, about 2 miles above its entrance into Staten Island Sound, 40 miles N.E. from Trenton, population 5583, contains a court-house and other buildings, and has some trade and manufactures: the New Jersey, and New Jersey Central railways meet here. *Jersey City*, on the Hudson opposite to New York, with which city it is connected by steam ferries, population 6856, is a very busy manufacturing town, and has incorporated with it two or three manufacturing suburbs, which swell its population to upwards of 11,000. The Cunard steam-ship dock is situated here; there are also extensive wharfs, and the railways from New York westward commence here. The chief manufactures are of iron, glass, pottery, rope, starch, soap, &c. Ship-building is carried on.

Morristown, the capital of Morris county, stands on elevated ground about 42 miles N.N.E. from Trenton, population 4992; it is regularly laid out with wide straight streets, contains the county and several other public buildings, and has somewhat extensive iron-foundries, machine-shops, paper-mills, &c. *Perth Amboy*, population 1865, on the left bank, and at the mouth of the Raritan, and *South Amboy*, population 2266, on the right bank, nearly opposite to Perth Amboy, are places of considerable trade, owing to their position at the head of Raritan Bay, and their proximity to New York. Perth Amboy has some manufactures; South Amboy has some potteries, and is the terminus of the Amboy and Camden railway, which is connected with New York by steam-boats.

Salem, on the left bank of Salem Creek, 4 miles from its confluence with the Delaware, and 59 miles S.W. by S. from Trenton, population 3052, is the oldest town in New Jersey, having been founded in 1675. It contains a court-house and other public buildings, and has some trade: vessels of 50 tons ascend to the town. *Shrewsbury*, population 3182, on the Navesink inlet, 37 miles E.N.E. from Trenton, is a place of considerable business, and is much resorted to during summer as a bathing-place by the citizens of New York and Philadelphia.

Government, History, &c.—The present constitution was framed and adopted in 1844. By it the right of voting is vested in every white male citizen of the United States 21 years of age, who has resided in the state for a year. All elections are by ballot. The legislature consists of a Senate of 20 members, elected for three years, one-third being elected annually; and a General Assembly of 60 members, elected annually. The governor is elected for three years. The judges are appointed by the governor, with the consent of the senate, for seven years. The revenue for the year ending January 1, 1853, was 171,683 dollars; the expenditure for the same period was 165,533 dollars. The debt of the state, January 1, 1853, was 71,346 dollars. The state militia comprises 81,984 men.

New Jersey was originally settled by the Dutch in the early part of the 17th century; their settlements being chiefly along the Hudson. Some Swedish settlements were made soon after, but they were taken possession of by the Dutch. In 1664 Charles II. of England, without regarding the Dutch priority of claim, granted this territory, with New York, to his brother the Duke of York, afterwards James II., who sold his patent to Lord Berkeley and Sir George Carteret. The Dutch, about 1674, regained possession of this territory; but on the conclusion of peace soon after it was restored to England. Lord

Berkeley and Sir George Carteret, at subsequent periods, sold their claims to New Jersey to William Penn and some others, and the country received considerable colonies of Quaker settlers, and of Scotchmen, at the head of whom was the Earl of Perth. The first governor of New Jersey under 'the proprietors' was the celebrated Robert Barclay, author of the 'Apology for the Quakers.' In 1702 the proprietary was surrendered to Queen Anne; and in 1786 New Jersey was definitively separated from New York. In the struggle for independence New Jersey took an early and decided part, and was one of the 13 original states. It published its first constitution as a state July 2, 1776; and ratified the federal constitution December 18, 1787.

(*Statistical Gazetteer of the United States; Seventh Census of the United States, Official Report; American Almanac, 1854; Marcou, Geological Map of the United States; Rogers, Description of the Geology of the State of New Jersey.*)

NEW LONDON. [CONNECTICUT.]

NEW MEXICO, a territory of the United States of North America, lying between 31° and 38° N. lat., 103° and 117° W. long. It is bounded S.E. and E. by the state of Texas, from which it is divided on the S. by the parallel of 32° N. lat., and on the E. by the meridian of 103° W. long.; N. by the territory of Utah; W. by the state of California; and S. by the republic of Mexico, from which it is divided by the boundary line described under MEXICO. The area of New Mexico is estimated at 210,774 square miles, or about 4000 square miles larger than France. The white population was 61,525 in 1850; or 0.29 to the square mile. The Indian population was estimated by the Commissioner of Indian Affairs in 1858 at 45,000. The territory of New Mexico was formed in 1850 out of the country ceded by Mexico [MEXICO, vol. iii. col. 795], with the addition of a portion of that claimed by Texas.

Surface, Hydrography, &c.—The territory of New Mexico, as at present constituted, consists of two distinct sections, which will probably at some future day be separated into two distinct territories or states: the one comprising the country occupied by the two great ranges into which the Rocky Mountains are in this part separated; the other the country west of those mountains. The former, or New Mexico proper, is a rugged mountainous country, with a valley about 20 miles wide, formed by the Rio Grande del Norte, traversing it from north to south. The western range of the Rocky Mountains bears various names, as the Sierras de Anahuac, de los Mimbres, de los Grullas, Mogullon, Madre, &c.; but the name now most commonly given to the greater part of it is the Sierra Madre. Many of the most northern summits of this range are covered with perpetual snow, and may be from 9000 to 12,000 feet above the sea. The southern portion is probably from 6000 to 8000 feet above the sea. The eastern range which runs nearly parallel to the other is known in the northern part as the Sierra Obscura, and in the southern as the Sierra Sacramento, though the latter name is commonly applied to it throughout. These mountains rise very abruptly from the eastern plain into lofty peaks and knobs variously disposed, with fertile valleys between them. Some of the northern summits of this ridge are also covered with perpetual snow, and the altitude appears to be on the whole somewhat greater than that of the western ridge. Pines generally grow on the higher mountains, cedars and occasionally oaks on the lower ones. The narrow tract bordering the Sierra Sacramento on the east is very elevated, and forms the western boundary of the extensive plain north-west of Texas. The narrow valleys by which the mountain streams reach the plain are often heavily timbered, and the soil appears to be fertile; but the intervening spaces have an arid soil, which is only covered with vegetation in the early part of the year.

The great valley which lies between these mountain chains forms the district known as New Mexico while the country belonged to the Mexican republic. It is a very elevated tract, the northern part being more than 5000 feet, and the most southern, where it touches the Mexican boundary, 3800 feet above the sea. Through it as mentioned above flows the Rio Grande del Norte. The surface, especially in the upper part, is greatly broken, and the soil throughout is dry and sandy; but where irrigated is generally pretty fertile. Below Santa Fé about 36° 20' N. lat. is the most fertile part, and there two crops are often obtained annually. This is the most populous and the only civilized part of the country, a large portion of it being occupied by the farms of the old settlers.

The country west of the Sierra Madre, forming nearly two-fifths of the territory, is very much varied in surface. It is drained throughout by the Rio Colorado and its tributaries. The northern part is mountainous, and a large part of the eastern boundary is formed by rugged mountains. The interior is considerably diversified, well watered, and appears to be in many parts a fine agricultural country. The middle part is occupied by a great plain drained by the Rio Gila and its affluents, much of which is sandy and barren; but the land in the immediate vicinity of the streams is frequently fertile. The whole is occupied by Indian tribes: the Apaches inhabiting the east and south-east, the Navajoes the north-east, the Pah-Utahs the north-west, and the Pinos the west and south-west.

The Rio Grande del Norte, or, as it is more commonly called, the Rio Grande or Rio del Norte, rises in the Rocky Mountains, near 40° N. lat., not far from the sources of the Arkansas and Colorado. Its course before it reaches the boundary of New Mexico is generally

south-east, but throughout this territory it is nearly south. Its direct length from its source to its mouth in the Gulf of Mexico is about 1400 miles, but its course following its windings is full 2000 miles. Throughout New Mexico it is a rapid shallow stream, and has numerous shoals and sand-bars. It appears to be scarcely navigable even by canoes, and though it is well fitted to supply mill-power, it is at present scarcely used except for irrigation. Its lower course is noticed under MEXICO. The Rio Puerco is its only tributary of any consequence in this territory; but this stream, though it runs for a considerable distance through a longitudinal valley west of the Rio Sacramento, has, owing to the arid nature of the soil, but little water. The Rio Colorado, which drains the western part of the territory, runs south by west from its source near that of the Rio Grande till it enters New Mexico, when it bears more to the west, and so continues till it quits the territory and opens into the Gulf of California. The Colorado is believed to be navigable for a great distance, but the country through which it flows has as yet been but little explored. Several of its tributaries are also believed to be navigable for considerable distances. The most important tributary in New Mexico is the Rio Gila, which drains the great plain noticed above. It rises in the most southern extremity of the western range of the Rocky Mountains, and after descending into the plain, where it is joined by the San Francisco, an affluent which rises much farther north, it flows through the plain nearly west-south-west to its confluence with the Colorado, about 32° 45' N. lat. It receives several affluents on both its banks, but none appear to be of much consequence. The other more important tributaries of the Colorado in this state are the Nabajoes and the Yaquesila.

The mountains appear to be mainly composed of eruptive and metamorphic formations; the rocks enumerated consisting chiefly of granite, sienite, basalt, porphyry, &c., but Silurian and Carboniferous strata also seem to have been recognised. New Mexico appears to be rich in minerals, though its resources have been very imperfectly developed. Gold has been found in many places. In the Santa Fé district the peasantry have long been accustomed to employ a good deal of their time in washing the river-sands for gold, and some gold-mines are worked. The Spaniards wrought several silver-mines, but none are now in operation. Copper is said to abound throughout the mountain districts, though only one or two mines are now worked. Iron is also abundant. Coal is said to have been found near the village of James south-west of Santa Fé, and in other places. Gypsum occurs in various parts. On the high lands between the Rio Grande and Rio Pecos and in other places are extensive salt-lakes, or salinas, whence all the salt used in New Mexico is obtained.

The climate differs considerably, but is, on the whole temperate; its great characteristic is its dryness. There is a rainy season, from July to October; but the rains are seldom heavy, and never of long continuance. The winters are long, especially in the north; but below Santa Fé the Colorado is seldom frozen firm enough to admit the passage of carriages. In the lower part of the valley of the Colorado the summer temperature occasionally rises to 100° Fahr., but the nights are generally cool. Epidemics are scarcely known.

The grain products are mostly confined to maize and wheat; mezquite is raised in the central valley; peas and beans, onions, red pepper, some fruit, and tobacco are also grown. Agriculture is everywhere in a most primitive state. Even in the central valley the chief dependence is on the raising of stock. Large numbers of horses, mules, cattle, and sheep are reared, there being everywhere extensive pastures; but comparatively little attention has been yet paid to the improvement of the breeds, which are generally small and inferior.

Almost the only manufactures are those for which the natives have long been celebrated—namely, those of coarse and fancy blankets, in great request for the favourite national garment called the 'serape;' and the chequered woollen-stuff called 'gorra,' used for carpets, as well as for clothing. Most of the imported articles are received by the Missouri overland route by caravans, by way of Independence, to Santa Fé.

Of the 61,525 white inhabitants, above 58,000 are the descendants of the Spanish settlers, and all of them are Roman Catholics. The settlers from the older states and territories of the United States were only 761 in 1850. The natives appear to be an indolent but contented race, partaking more of the character of their Indian than their Spanish ancestors. The more laborious work is assigned to the females; not only the household work, and a good deal of the field labour, falls to their lot, but the spinning of the blankets and woollen wares is chiefly done by them. Of the ancient inhabitants of New Mexico the vestiges are still very numerous. They are chiefly what are called Aztec ruins, similar to those described under AMERICA and AZTECS. Several are found along the banks of the Colorado and the Grande rivers and their tributaries. The most celebrated are those known as Las Casas Grandes, on the Gilas, noticed under AMERICA, vol. i. col. 303. Some of equal extent, called La Gran Quiviri, occur near the Salinas, between the Rio Grande and the Pecos, about 100 miles S.E. from Santa Fé, where, among other extensive remains, are said to be portions of an aqueduct 10 miles long.

Divisions, Towns, &c.—New Mexico is divided into seven counties. Santa Fé is the political capital, and though there are several other towns, they have necessarily so small a population as to be of little other than local consequence. *Albuquerque*, on the left bank of the Rio Grande, 76 miles S. from Santa Fé, is the only one which requires

to be mentioned. It is said to have formerly contained 6000 inhabitants, but it has now little trade or population.

Santa Fé, the capital, is situated about 20 miles E. from the Rio Grande, in 35° 41' N. lat., 106° 1' W. long., on a wide plain surrounded by mountains, and at an elevation of 7047 feet above the level of the sea: population, 4846 in 1850. It is an old town, having been founded by the Spanish settlers in 1581, and consists of narrow irregular streets, with houses of a single story, built of adobe, square in form, and having a central area. It contains two Roman Catholic churches, but no other public buildings of any note. The inhabitants are still nearly all of Spanish and Indian descent, but there are a few Americans, who have established two newspapers, one published three times a week and the other weekly. *Santa Fé* is a place of great trade, being the centre and depôt of the overland route by way of Missouri. The climate is serene and little variable, and the town is said to be very healthy.

The government of New Mexico is based upon the Act of Congress of September 9th, 1850, which established the territory, and provided that every free white male inhabitant then residing in New Mexico, and all free white citizens of the United States who should subsequently qualify by residence, should be entitled to vote in all elections. The legislative assembly consists of a Council of 13 members, elected for two years, and a House of Representatives of 26 members, elected annually. The governor, as in all the territories, is appointed by the president of the United States. A delegate to Congress is elected by the citizens.

(*Statistical Gazetteer of the United States; American Almanac, 1854; Seventh Census of the United States; Official Report; Humboldt, Essai Politique sur la Nouvelle Espagne; Pike, Exploratory Travels; Poinsett; Lyon, &c.*)

NEW MILLS. [DERBYSHIRE.]

NEW ORLEANS, the principal city and port of Louisiana, United States of North America, is situated on the left bank of the Mississippi, 105 miles above its mouth, in 29° 57' N. lat., 90° W. long., 1203 miles S.W. from Washington. New Orleans was founded by the French in 1717. It was ceded to Spain, with the rest of Louisiana, in 1763; but was restored to France in 1801, and purchased by the United States in 1803. [LOUISIANA.] Its growth has been very remarkable. It contained 17,242 inhabitants in 1810; 46,310 in 1830; 102,193 in 1840; and 116,376 in 1850, or 130,565 including Lafayette, which in 1852 was incorporated with it as a part of the city, and the whole placed under one administration. The inhabitants are of very inter-mixed races. The wealthier classes are chiefly Americans, French, and Spanish, with a few English and Germans; and English, French, and Spanish are the prevalent languages. Large numbers of Irish are among the labouring population. A large portion of the population consists of free coloured persons and slaves.

The city is built on a declivity which slopes gently from the river towards the marshy land in the rear. Being from three to nine feet below high-water mark, the city is defended from the overflow of the Mississippi by an embankment, called a levée, which forms a continuous quay, or landing-wharf, 4 miles long, and of an average width of 100 feet. The Mississippi is here half a mile wide, and from 100 to 160 feet deep, a depth which it retains to the bar at its mouth. [MISSISSIPPI.] The river here makes a broad sweep, and the city extending around the outer line for about five miles, forms a crescent of very striking appearance, whence it is generally known as 'the Crescent City.' The old city is built in the form of a parallelogram; the streets are narrow, and the houses generally of brick with a picturesque continental appearance; but the new city, which consists of the suburbs or 'faubourgs' of St. Mary's, Annunciation, and La Course, and the city of La Fayette above the old city, the faubourgs of Mangney, Dournois, and Declouet below, and Tremé and St. John behind it, is built more in the American style, with broad straight streets, and contains many spacious and costly edifices. During the summer months the city is exceedingly unhealthy, and many of the wealthier inhabitants leave it at that season; of those who remain a large proportion are carried off yearly by yellow fever: the cholera has also on several occasions made fearful ravages. The climate is however in general far more fatal to Europeans who are new comers than to natives. The extreme unhealthiness is mainly attributable to the exhalations with which the air is consequently loaded, caused by the marshy nature of the soil in which the town stands, and the heat of the temperature. Efforts have been made to remedy the evil, but owing to the low site of the city it is hardly probable that they will be more than partially successful.

The public buildings are numerous, and several of the more recent ones have considerable architectural pretensions. The most marked of the older buildings is the cathedral, a large and massive edifice with four towers, and having on its walls numerous figures of saints in niches. There are besides 18 other Roman Catholic churches, and many belonging to the Methodists (one of which is described as "a splendid copy of the temple of Theseus with a steeple 170 feet in height"), Presbyterians, Episcopalians, &c. The educational establishments are on a large scale. The principal is the University, founded in 1849, the building of which is 100 feet long and 104 feet deep, with two detached wings. It has 7 professors in the department of arts, 3 of law, and 7 of medicine. There are also colleges, academies,

numerous primary schools, and several literary institutions. Of the many benevolent institutions the principal is the Charity Hospital, one of the largest and perhaps the most important of its kind in the United States: it is noticed under LOUISIANA. There are 9 cemeteries, in all of which (except that called the Potter's Field, appropriated to coloured persons and friendless strangers) the coffins are placed above ground in tombs from one to three stories high; a mode of burial adopted in consequence of the soil being everywhere saturated with water.

The municipal buildings are close to the cathedral, and are handsome structures of the Tuscan and Doric orders. The buildings used for the sittings of the General Assembly and other state purposes while New Orleans was the political capital of Louisiana, are now variously employed. A branch of the United States mint is established here for coining gold and silver. The main building is 282 feet long, 108 feet deep, and three stories high; and has two large wings: the money coined here in 1851 amounted to above ten millions of dollars. There is also a United States land-office; but the chief federal structure is the Customs House, one of the most magnificent public buildings in the Union: it is nearly equal in size to the Capitol at Washington, and has been constructed in the most costly manner. The market-houses are very extensive and substantial structures. New Orleans is supplied with water from the Mississippi, by a company which has constructed a very large reservoir for the collecting and purifying of the water previous to its distribution through the city by pipes. There is also an aqueduct built by the municipal authorities for conveying water, especially for cleansing the streets, &c.

The hotels and theatres form characteristic features of the civic architecture. Several of the hotels are on a scale of magnitude and costliness equal to any in America: more than one has cost upwards of half a million dollars to erect. There are three large theatres, besides an arena for bull-fights, which are commonly held on Sundays, a circumstance noteworthy as marking the foreign character of the place. Gaming-houses and other places of amusement or dissipation are also numerous; New Orleans being in fact generally regarded as the most luxurious and dissolute city in the Union.

The city is in the most favourable situation for the prosecution of the trade of one of the most important parts of the North American Union, being near the mouth of the great outlet to the valley of the Mississippi. It is the emporium of the vast region which is drained by that river, the Missouri, the Red River, and their tributaries, and already one of the greatest, it appears destined to become the chief commercial city of the west. There is indeed no place in Europe or America which has equal natural facilities of internal navigation; it is said that nearly 20,000 miles of inland navigation are tributary to it. The annual value of domestic merchandise exported from New Orleans now averages more than 50,000,000 dollars; of which about two-thirds are conveyed in American vessels. In the year ending June 1851 the clearances were 645 American vessels of the aggregate burden of 292,958 tons, and 325 foreign vessels of the aggregate burden of 128,949 tons. The entrances were 643 American vessels of 195,136 tons burden, and 333 foreign vessels of 137,000 tons burden. The total entrances in the coast trade were 1227 vessels of the aggregate burden of 353,175 tons; clearances 1178 vessels of the aggregate burden of 435,892 tons. The principal exports are cotton, tobacco, flour, sugar, pork, lard, beef, and corn to foreign markets; with a large number of other articles sent coast-wise. [LOUISIANA.] The arrivals of steam-boats from the interior are about 3000 annually.

New Orleans has not attained eminence as a manufacturing city. The principal establishments are iron-works, machine-shops, sugar refineries, distilleries, tobacco factories, steam saw-mills, lumber-yards, and cotton-presses, which are on a scale of unequalled magnitude. There are some large banks possessing about 40,000,000 dollars of assets. The stores and retail trading establishments are said to surpass in style and costliness of stock those of almost every other American city. Nine newspapers are published here daily, and there are besides several weekly and monthly journals. Some of the newspapers are in the French language. Four canals and three or four railways connect New Orleans with Lake Portchartrain, and otherwise facilitate the communication with the interior; and other railways on a more extended scale and all converging to the city, are projected or in course of construction.

In the environs there are large plantations of sugar, cotton, indigo, and rice, which are cultivated in a very perfect manner. Many of the seats in the suburbs have extensive gardens filled with pomegranates, magnolias, myrtles, and orange groves, the fragrance of which when the trees are in blossom, is delicious.

On the opposite bank of the Mississippi and connected with New Orleans by a ferry is *Algiers*, 'the workshop of New Orleans,' in which are extensive yards for ship-building, and the other trades connected with the commerce of that city. Close to it is the United States Marine Hospital. *Belleville*, adjoining Algiers on the east, contains the residences of many of the wealthy inhabitants of New Orleans.

NEW PROVIDENCE. [BAHAMAS.]

NEW QUAY. [CARDIGANSHIRE.]

NEW ROSS, Ireland, a market-town and sea-port, a parliamentary borough, and the seat of a Poor-Law Union, partly in Kilkenny county, but chiefly in Wexford, is situated on the left bank of the estuary of

the Barrow, in 52° 24' N. lat., 6° 56' W. long., distant by road 24 miles W. by N. from Wexford, 84 miles S.S.W. from Dublin. The population in 1851 was 7941, besides 2028 inmates of the workhouse. The borough returns one member to the Imperial Parliament. The town is governed by 21 commissioners. New Ross Poor-Law Union comprises 39 electoral divisions, with an area of 117,570 acres, and a population in 1851 of 56,456. The town was surrounded with walls in 1269. In 1649 Cromwell, having obtained possession of the place, demolished the fortifications, of which however two gates and a small part of the wall still remain. The town was attacked by the insurgents in 1798; but, after a conflict of 10 hours' duration, they were defeated with great slaughter. New Ross obtained various charters from the reign of Henry III. till that of Charles II. It returned two members to the Irish Parliament. The older part of the town consists of a long street on the summit of the high bank of the river, and several steep streets descending from it. The modern part extends in regular and well-built streets along the level margin of the river. *Rosbercon*, a suburb on the Kilkenny side of the river, consisting principally of a single straggling street, is connected with the town by a wooden bridge 510 feet long, and a causeway of 150 feet. The town is lighted with gas, and supplied with water. The parish church, a neat edifice, occupies part of the site of an old abbey, of which some portions still exist. Rosbercon parish church is the restored chancel of a conventual church, of which the lofty tower and part of an aisle are also preserved. There are chapels for Roman Catholics, Methodists, Presbyterians, Independents, and Quakers. The other public buildings are the court-house, the market-house, the corn and fish markets, a small cavalry barrack, Trinity hospital, or almshouse, the fever hospital, lying-in hospital, dispensary, Union workhouse, and bridewell. Vessels of 200 tons discharge at the quays at all times of the tide, and those of 800 tons at spring tides. The quays are of considerable extent. Barges can ascend the river to Athy, where the Grand Canal continues the communication to Dublin on the one side, and to Limerick on the other. The number of vessels registered as belonging to the port on December 31st 1853 was 18, namely—2 of 69 tons aggregate burden, and 16 of 5756 tons. During 1853 there entered the port 236 vessels of 25,536 tons, and cleared 100 vessels of 14,880 tons. The principal exports are grain, flour, wool, butter, fowls, and bacon. A salmon fishery, above and below the town, employs 300 nets and 1200 men. There are tanyards, breweries, and a distillery. Quarter-sessions and petty-sessions are held. Fairs are held monthly, and markets on Wednesday and Saturday in each week.

NEW SOUTH SHETLAND is a group of islands situated about 600 miles S.S.E. from Cape Horn, between 61° and 63° 30' S. lat., 53° and 63° W. long. They extend from east-north-east to south-south-west over a space of nearly 300 miles, and consist of 12 islands of moderate extent, and a great number of rocks and cliffs. They were discovered in 1819 by Captain Smith, and have frequently been visited since that time for the purpose of taking fur-seals and sea-elephants, with which the shores abound. The largest of the islands from east to west are Clarence, Elephant, King George, Strachan, Mitchell, Sartorius, Livingston, Low, and Smith. The interior of these islands consists of high hills or mountains. A mountain on Smith's Island attains the height of 6600 feet above the sea. They are almost entirely covered with snow all the year round, and only after Midsummer (in January) a few tracts, which are free from snow, are overgrown with lichens and mosses, in some places intercepted with a sort of straggling grass. The only inhabitants of these cold regions are numerous sea-fowls, as the albatross, penguin, &c., and the animals above mentioned. The surrounding sea abounds in whales and fish. Most, if not all of these islands, are of volcanic origin. Port Foster, an excellent harbour in Deception Island, has doubtless been a crater. South of these islands is a wide strait, called Bransfield Strait: the coasts which constitute the southern shores of this strait appear to form an extensive country, of which portions have been named Trinity Land, Graham's Land, &c. [SOUTH POLAR COUNTRIES.] (Weddell, *Voyage*; Foster, *Voyage*).

NEW SOUTH WALES. [WALES, NEW SOUTH.]

NEW TITSCHHEIN. [MORAVIA.]

NEW YORK, the most populous and wealthy, and one of the largest of the United States of North America, is situated between 40° 45' and 45° N. lat., 71° 56' and 79° 55' W. long. It is bounded E. by the states of Connecticut, Massachusetts, and Vermont; N., N.W., and W. by the Canadas, from which it is separated by the parallel of 45° N. lat., known as the Canada line, the river St. Lawrence, Lake Ontario, Niagara River, and Lake Erie; S. by the states of Pennsylvania and New Jersey, and the Atlantic Ocean. The area is about 46,000 square miles, or about 12,000 square miles less than that of England and Wales. The population in 1850 was 3,097,394 (of whom 49,069 were free coloured persons), or 67.33 to the square mile. The inhabitants being all free the federal representative population is the same as the entire population in 1850; this, according to the present ratio of representation, entitles the state to send 33 representatives to Congress—being 8 more than any other state. To the Senate, like each of the other states, New York sends two representatives.

Surface and Soil.—The state presents a very great variety of surface, owing to its including portions of three distinct mountain ridges, all

of which however are portions of the great Alleghany or Appalachian system. These three mountain ridges are separated by wide valleys, mostly of a peculiar description, and from the lakes Erie and Ontario by a plain of considerable extent. Before they divide, near the southern border of the state, in 41° N. lat., these mountains are above 200 miles in width. The western ridges grow lower and less distinct as they approach 42° N. lat., and north of that parallel they are lost in an elevated plain or table-land, which has a hilly surface. The eastern ridges continue as distinct mountain masses eastward to 74° 40', about 30 miles from the banks of the river Hudson, where they unite with the northern extension of the Kittatinny Mountains of New Jersey; they are here known as the Catskill Mountains, or Kaatsberg. This range continues northward to 43° N. lat., where one branch turns westward nearly 50 miles, and terminates at the eastern extremity of the table-land on which the western ranges of the Alleghanies are lost. The other appears to be prolonged northward, though much broken, to the Adirondack Mountains, which inclose Lake George and extend along the western shores of Lake Champlain. West of them is an elevated table-land, which on the south terminates in the valley of the Mohawk River. The most eastern of the mountain chains of the Alleghanies, known in New Jersey under the name of the Blue Ridge, is divided from the range first noticed by the valley in which the Pawling and Wallkill rivers flow south-west and north-east. It forms on the west of the Hudson River the Mattewan Mountains or Highlands, and east of the Hudson the Fishkill Hills, which constitute the south-western extremity of the extensive mountain region which occupies a considerable portion of New England, and extends through Lower Canada to the mouth of the St. Lawrence River. The Fishkill Hills run from the banks of the Hudson north-east and north through New York until they arrive at its eastern boundary-line, where the states of Connecticut and Massachusetts meet, and where they take the name of the Taghkanic or Taconic range. From this point, continuing to the east of north, they constitute the boundary between Massachusetts and New York, until, by declining more to the east, they enter Massachusetts and proceed into Vermont, where they are called the Green Mountains. Between them and the ranges previously noticed extends the valley of the middle Hudson.

New York contains several regions, different in configuration of surface and in fertility, and to a considerable degree also in climate. The region of the Susquehanna and Delaware rivers comprises the country which is surrounded on the east and north by the Catskill range, and is drained by the upper branches of the Delaware and those of the eastern branch of the Susquehanna; it extends westward to about 76° W. long. The mountain range which surrounds it rises in its highest part to above 3000 feet, the loftiest summits being Round Top (3804 feet), High Peak (3718 feet), and Pine Orchard (3027 feet). The valleys which descend from this range, chiefly in a south-western direction, contain rather wide and extensive bottoms of great fertility, which in their natural state are overgrown with forests of sugar-maple, black walnut, elm, beech, and other trees, indicating a strong soil. The declivities of the mountains are rather steep, and their soil of inferior quality; they are mostly overgrown with pine, among which oak, chestnut, and hemlock are intermixed. When cultivated the valleys yield rich crops.

West of this region, along the boundary-line of Pennsylvania, lies the elevated table-land on which the western ridges of the Alleghanies terminate, and the western branch of the Susquehanna, the Alleghany River, an affluent of the Ohio, and the Genesee River originate. It is from 20 to 30 miles wide, has a very broken and hilly surface; is almost entirely covered with wood, mostly pine, and is but thinly settled. Some sheltered tracts between the hills exhibit a considerable degree of fertility.

From this table-land the country has a general but interrupted slope towards Lake Ontario, rising however again somewhat as it reaches the shores of the lake. The depression between the table-land and this rise, extending in the form of a trough east and west, is called the Lake Country. It contains numerous lakes, of which the most considerable are Canandaigua (685 feet above the level of the sea), Crooked Lake (700 feet), Seneca (440 feet), and Cayuga (400 feet). The surface of this depression is generally level or undulating, but the lakes lie in deep and wide chasms, and the beds of the rivers are likewise much depressed. In its natural state this country is covered with high forest-trees, and when cultivated yields most abundant crops, being indeed the most fertile portion of the state. The central portion of the Grand Canal passes through the depression, but the western part passes over the higher grounds which separate it from Lake Ontario.

The surface of the higher ground, which occurs north of this region, is uneven and broken, and the soil partly stoney and gravelly, and in general of indifferent quality. From this higher ground the country descends uniformly and gradually to Lake Ontario, except that, between Niagara and Genesee rivers, a distance of 80 miles, it is traversed in its whole length by an elevated tract of sand and gravel, known as the Ridge Road, or Alluvial Way, the former shore of the lake, but now raised 150 feet above it.

The northern region comprehends the country lying north of Lake Oneida and of the valley in which the Mohawk River flows, as far east as the mouth of the East Canada Creek. It is separated from Lake Champlain by the deep depression in which that lake lies. It

comprehends the Adirondack Mountains as well as an elevated and extensive table-land lying to the west of them, and includes about one-third of the surface of the state; a great portion of it is however uninhabited. The mountains occupy the eastern part of the region. The most elevated summit of the chain, called Mount Marcy, attains an elevation of 5467 feet. Mount MacIntyre, west-north-west of it, is 5183 feet high, Mount MacMartin 5022 feet, and several other peaks rise to between 4000 and 5000 feet. The snow does not disappear from the summit of Mount Marcy till after the middle of July. The valleys embosomed between these higher ranges are from 2000 to 3300 feet above the sea-level, and are of course uninhabitable. They are however covered with pine, spruce, and birch trees. Towards the summit of the mountains these trees become dwarfish, and are interwoven with each other by their numerous horizontal branches. On the highest summits however the trees disappear entirely, and are replaced by mosses, lichens, and small alpine plants. Much of the scenery of this mountain district is of a very grand character. The climate of this elevated region is so cold that ice is formed during the night in the beginning of August. Towards the south the valleys are much lower, and a few settlements have been made.

West of this mountain region lies a table-land of an uneven surface; a portion of it is covered with swamps, and a still greater part intersected with lakes. Numerous rivers originate on it, and descend by a succession of rapids and cataracts to the lower country. In the western declivity of this elevated region the settlements commence, about 20 or 30 miles from the shores of Lake Ontario and the St. Lawrence River. In the more sheltered valley of Black River they extend to a greater distance, but they are confined to the banks of the rivers, the remainder of the region being entirely covered with woods. The climate of these declivities is very severe, as they are exposed to the prevailing cold winds which blow from the north-west.

Lake Champlain lies along the eastern base of the Adirondack Mountains; and on the east of the lake, but at a much greater distance from it, are the Green Mountains of Vermont. The higher parts of both ranges are from 25 to 30 miles apart. The valleys and flats between the hills and on the borders of the lake are not distinguished by fertility, but give good crops when cultivated with care. From the southern extremity of Lake Champlain a glen extends between the hills which cover the country to the Hudson River below Glens Falls. The highest level of this Glen is only 140 feet above the tide-water in the Hudson River, and 50 feet above the level of Lake Champlain. Through this glen the Champlain Canal has been made, which unites the river to the lake. As the outlet of the lake, the river Chambly, falls into the St. Lawrence River, a water communication is thus opened between the St. Lawrence and the Hudson.

The vale of the Middle Hudson begins near 43° 20' N. lat., where the river, after issuing from the Adirondack Mountains, forms Glens Falls, and begins its southern course. It extends, with a width of from 60 to 80 miles, between the Tughkanic range on the east and the Catskill range on the west to where the river pierces through the Highlands near Fishkill. The slope on the east of the river is rapid but regular. The surface frequently rises into hills, but they do not attain a great elevation, and their declivities generally admit cultivation. The soil possesses a considerable degree of fertility, and to this circumstance, united to the advantages offered by a river navigable for large vessels, must be ascribed the fact that this portion of New York is one of the most populous and best cultivated. That portion of the vale which lies west of the river presents a greater variety in surface and fertility. It is traversed by the Catskill range; among the loftiest summits of which are the Round Top and other lofty mountains already noticed. On the western, as on the eastern side of the Hudson, only a few alluvial tracts occur on the banks of the river, and they are of very small extent. The country generally rises from the west banks with a rather rapid ascent to 200 feet and more, and then extends in a broken and hilly surface to the base of the mountains, though flat tracts occur in some places. The soil is in many places stoney, but it generally possesses a considerable degree of fertility, though it is somewhat inferior to that on the east side of the river. At the most south-western extremity of this region, in the valley of the Walkill, is a level marshy tract of exuberant fertility, called the Drowned Lands. Its southern extremity lies within New Jersey, but the greater portion is in Orange county, New York. It is from 35 to 40 miles in length and from 5 to 7 miles wide, and some small lakes are scattered over it. In spring it is subject to inundation.

The vale of the Lower Hudson extends from the Highlands at Newburg and Fishkill to the mouth of the river, a distance of about 60 miles. The Highlands rise to a considerable elevation, Beacon Hill attaining 1471 feet, and New Beacon, or Grand Sachem, 1685 feet above the sea-level. The Highlands, or Mattewan Mountains, west of the river, though high, do not attain so great an elevation. Both ridges terminate on the banks of the river in high and precipitous rocks, which extend on each side for about 20 miles. The prevailing character of the surface and soil of this region is rocky, especially on the west of the river. The higher lands recede to a distance from the river, and slope to the banks with a rather gentle declivity; but from Tappan to a distance of about 8 miles from the city of New York, the Palisades, as they are called, extend along the river: they consist of enormous masses of rocks, from 20 to 500

feet in height. In some places they rise almost perpendicularly from the shore, forming for many miles a solid wall of rock, diversified only by an occasional fishing-hut on the beach at their base, and sometimes by an interval of a few acres of arable land, affording an opening for a landing-place, and a steep road leading to their top. The whole tract south of the Highlands has a very rocky soil, and only a small portion of it is cultivable. The country east of the river also rises with a bold and broken shore, but it is lower and less precipitous, and the country farther back is varied by ascents and descents. It contains a much larger portion of cultivated land, but the soil is rocky and of inferior quality.

Long Island is 113 miles long from west to east, and on an average about 12 miles wide, though in some places it is 20 miles across. At the eastern extremity a shallow inlet, called Peconic Bay and Gardner's Bay, separates it into two peninsulas, of which the southern extends farthest east, and terminates with Montauk Point. A ridge of low hills extends along the northern shores of the island, and from their base to the southern shores there is an alluvial margin from 1 to 5 or 6 miles wide. Along the southern shores, and from 1 to 2 miles from it, extend long, narrow, low, and sandy islands. The intermediate space between these islands and the shores is occupied by shallow sounds. The soil is everywhere sandy and light, but within the hilly tract, especially at the western extremity, and from 20 to 30 miles eastward, it is of considerable fertility. The largest portion of the eastern districts is still covered with pine. The level tract along the southern shores is generally sterile, and in some parts not worth cultivation. The area of Long Island is about 1440 square miles. There are a few serviceable harbours along the shores of the island, but they are not much used by shipping.

Staten Island is separated from Long Island by the strait called the Narrows, which forms the entrance into New York Bay. Staten Island is about 14 miles long and from 2 to 8 miles wide, with an area of 77 square miles.

Long Island Sound, or the strait which divides Long Island from the continent, is about 100 miles long, with a varying width, increasing from about 8 miles at each end to about 20 miles in the middle. At its western extremity it contracts to between half a mile and 2 miles for a distance of 8 miles, until it joins East River. In this narrow western portion of the strait the channel is rocky and much interrupted by small islands and projecting points. Where most obstructed by projecting rocks it is known as Hell-Gate, a corruption of *Hord Gatt*, the Dutch for whirlpool; but in 1852 large portions of the rocks were removed by blasting, and the strait is now navigable by the largest vessels. Long Island Sound receives all the large rivers from Connecticut. The coasting vessels and steamers plying between New York and the New England ports generally take the Sound route.

The chief harbour of the state is that of New York, the chief commercial depôt of the state, and the finest harbour on the Atlantic sea-board: it is noticed more fully under New York City.

Hydrography and Communications.—On the elevated table-land which extends along the northern boundary of Pennsylvania all the large rivers rise which fall into the Atlantic west of the mouth of the Hudson and east of the innermost recess of Chesapeake Bay. This region contains the sources of the DELAWARE, the Susquehanna [PENNSYLVANIA], and the ALLEGHANY. On the same table-land between the upper branches of the Alleghany and Susquehanna, and within the limits of Pennsylvania, rises the *Genessee*, which runs in a general northern direction about 145 miles, of which about 125 miles belong to New York. In its middle course, which lies in the Lake Country, it traverses a deep and wide valley of great fertility, and forms at Rochester, 5 miles from its mouth, a cataract 95 feet high. But above this impediment the river is navigable about 20 miles for boats. The Genessee Valley Canal follows the course of the river, as does also a railway.

Not far from the eastern banks of the Genessee River commences that remarkable series of lakes, which extends nearly 100 miles farther eastward, and is from 20 to 30 miles distant from Lake Ontario. Lines drawn from the most northern extremity of these lakes in the direction of their length to Lake Ontario, cut the shores of that lake at right angles. The most considerable of these lakes from west to east are Lake Canandaigua, which is 14 miles long, and about 1 mile wide; Crooked Lake, 22 miles long, and about one mile and a half wide; Seneca Lake, 40 miles long, from 2 to 4 miles wide, and of great depth; Cayuga Lake, 40 miles long, and from 1 to 3½ miles wide; Skaneateles Lake, 15 miles long, and about 1 mile wide; and Oneida Lake, the most eastern, 22 miles long, and from 4 to 6 miles wide. Onondaga Lake, which lies between Skaneateles and Oneida lakes, is 8 miles long, and 2 to 4 miles wide, and remarkable for the copious and strong salt springs, which occur at a distance of a mile from its eastern banks. All these lakes, except the most western, that of Canandaigua, discharge their waters by one river, the *Seneca*. This river issues from the northern extremity of Lake Seneca, which receives the waters of Crooked Lake by a narrow channel, and winds with numerous bends through the Lake Country, running in a general north-eastern direction. Each lake discharges its waters by a separate channel into its bed. In approaching the western extremity of Oneida Lake it is met by the channel issuing

from that lake, and after their union the river is called the *Oswego River*. The united river flows for about 24 miles in a north-western direction to its outfall in Lake Ontario. Its navigation has been improved by locks and cuts, and its banks are lined with manufacturing establishments, to which its waters supply mill-power.

Black River rises on the western declivities of the Adirondack Mountains, and descends from the table-land of the northern region first by a south-western and afterwards by a north-western course. About 36 miles from its mouth it turns west, and discharges its waters into Black River Bay at the foot of Lake Ontario. This river runs about 110 miles, but in many parts of its course it consists of a series of cataracts and rapids. From the falls at Leyden the Black River Canal extends to Lake Erie. Between Leyden and Carthage it is navigable by boats.

The table-land west of the Adirondack Mountains contains many lakes, and some of considerable extent. The most eastern ridges of these mountains contain Lake George, or Lake Horicon, which extends from south-south-west to north-north-east 36 miles, with a width of from 2 to 5 miles. It is inclosed on all sides by high rocks, and contains many small rocky islands. It is 243 feet above the Hudson River; it discharges its water by a channel into Lake Champlain at Ticonderoga. Along its banks are several ruined forts. The beauty of its scenery makes it a favourite resort of tourists. Lake Champlain extends northward into Lower Canada. [CHAMPLAIN.]

The largest river of New York, and one of the most important rivers of the United States, is the *Hudson*. It is formed by two branches which rise in the mountains west of lakes Champlain and George, and unite about 40 miles from their respective sources near 43° 30' N. lat. As both branches descend from a very elevated region, their current is very rapid, and frequently interrupted by rapids and cataracts. The united river runs southward for some distance, and where it begins to turn to the east, it is precipitated over a ledge of rocks, and forms the Great Falls. Twenty miles lower down are Glens Falls, where the river turns again to the south, which direction it maintains with slight deviations to its mouth. Below Glens Falls the river becomes navigable, though the current continues to be rapid to the mouth of the Mohawk River. The tide ascends the river as far as the mouth of the Mohawk, and below this point the river has a mean breadth of nearly a mile. In some places it widens considerably and appears like a lake, as above Newburg, and still more above Tappan. About 30 miles from its mouth, which is between Sandy Hook in New Jersey and the western extremity of Long Island, the river divides into two arms, which inclose the island of Manhattan. The eastern and more narrow arm is called Haerlam River, and after it has united to Long Island Sound, East River. Where the river meets Long Island Sound is the strait already noticed called Hell-Gate. At the city of New York the East River again unites with the West River, or proper Hudson, and the spacious bay of New York is formed. But before the river enters the sea, it sends off another arm to the westward, which surrounds Staten Island, under the names of Newark Bay, the Kills, and Amboy Bay. The Hudson is navigable for large ships to Hudson, 118 miles from its mouth, and for sloops and large steamers to Albany, 145 miles from its mouth; smaller steamboats ascend to Troy, 6 miles farther. It may be ascended by boats to Glens Falls, but this navigation is now superseded by the Champlain Canal, which extends along its right bank. The Hudson railway runs for the most part along the left bank of the river, but in many places crosses it on embankments. By the Erie Canal it is connected with the great western lakes; and by the Delaware Canal with the Delaware River. The whole course of the river exceeds 300 miles. After issuing from the mountain region the Hudson is not joined by any considerable tributary, except the *Mohawk River*, which rises on the table-land west of the Essex range, near 75° 30' W. long., and runs southward. One of its upper branches, Utica Creek, forms 14 miles north of Utica, the Trenton Falls, by which the river descends 387 feet in a space of less than 5 miles. Below the village of Herkimer the Mohawk forms the Little Falls, by which the river descends more than 80 feet in the distance of a mile. About two miles above its mouth are the Cohoes Falls, 62 feet in perpendicular height. The tide ascends to the last-named falls. At Waterford the Mohawk joins the Hudson, after a course of about 120 miles. It is little used for navigation, the Erie Canal passing along its right bank.

The St. Lawrence and the Niagara rivers and lakes Ontario and Erie, which belong partly to this state and partly to Canada, are described generally under CANADA. The St. Lawrence is navigable for sloops to Odensburg, 60 miles from Lake Ontario, below which its course is so much interrupted by rapids as to render navigation difficult and dangerous. Of Lake Erie only about 60 miles of coast belongs to New York, but the commerce of this district is immense, and steadily increasing. Its harbours are Buffalo and Dunkirk, and the canals and railways which converge upon the lake afford the greatest facilities for the extension of commerce. Of Lake Ontario the whole southern coast belongs to New York, it has several good harbours, the most noted being Sacket's Harbour near the east end of the lake. It is connected with Lake Erie by the Welland Canal. The trade between the United States and Canada is chiefly carried on by Lake Ontario: it is of great and constantly growing extent.

New York has a more extensive and grander system of canals than

any other state. They extend from the Hudson to Lake Erie (by the Erie Canal, 364 miles long), with branches in all directions; from the Hudson to the Delaware (83 miles long); from Lake Champlain to Lake Ontario (64 miles) noticed under CHAMPLAIN LAKE, and towards all the other commercial centres: there are in all about 950 miles of canal belonging to this state.

The railways are still more extensive and important. On the 1st of January 1855, New York state possessed 32 lines of railway, of the aggregate length of 2625 miles; and 801 miles more were in course of construction. The total cost of these railways had been 111,882,500 dollars, or nearly twice as much as the railways of any other state of the Union. These railways traverse the state in the direction of every leading route of traffic. Plank roads, which are here greatly valued, are likewise laid down to almost every trading centre; and the ordinary carriage roads are ample in number and everywhere well kept.

Geology, Mineralogy, &c.—The rocks of New York are almost entirely igneous and palaeozoia. Eruptive and Metamorphic rocks occur in two great groups, and occupy together nearly one-third of the state. The larger group is nearly circular in form, and comprises the Adirondack Mountain district, in the northern part of the state. The second group occupies a smaller district in the south-eastern part of the state, including Putnam and Westchester counties, the larger part of New York, &c. The rocks include granite, serpentine, primary limestones, greenstone, trap, porphyry, sienite, gneiss, hornblende, mica-schist, talcose slate, steatite, &c. Silurian rocks also prevail over a wide area. Lower Silurian strata occur in the northern end of the state, from the head of Lake Champlain to the St. Lawrence, and form throughout the banks of this river. The head of Lake Ontario is also surrounded by Lower Silurian strata, which thence cross the state to the Hudson, with a mean breadth of about 20 miles. The banks of the Hudson, down to the Highlands, likewise belong to this formation. The strata consist in the ascending series of a hard brown sandstone, gray limestones, light green shales, a sandstone of very beautiful appearance and great durability, known as Potsdam Sandstone; then a calciferous sand rock; then hard and very fossiliferous limestones, but varying considerably in character in different localities, and thence known as Bird's-Eye, Chazy, Trenton, and other limestones, and surmounting all are various shales and roofing slates, known as Lorraine Shale, Utica Slate, &c. Upper Silurian strata occupy the entire southern side of Lake Erie, and thence follow on the south and west, in a narrow band, the course of the Lower Silurian rocks through the state. These rocks consist of gray-sandstones and conglomerates, above which are various sandstones and limestones, known as the soft green and variegated Medina sandstone, Oneida group, Water-lime group, pentamerus, encrinural green-shaly, and Oriskany limestones, with saliferous and gypseous rocks, known as the Onondaga salt group. The Devonian formation comprises the basin of Lake Erie, and so much of the state as lies between the Silurian rocks and Pennsylvania. It is composed of numerous and very deep strata, the whole formation here attaining, it is said, a depth of 14,000 feet. Very fossiliferous sandstones, known as the Oriskany sandstone, Schoharie grit, &c., form the lowest beds; then occur various limestones, known as the Helderberg, &c., with a great extent of marl and black schistose clay; the whole being crowned by a very deep red-sandstone, corresponding to the Old Red-Sandstone of Great Britain; this is the prevalent rock of the Catskill Mountains, or Kaatsberg, and hence has been denominated by the state geologists Kaatsberg sandstone. The Carboniferous basin of Pennsylvania does not appear to extend into New York; nor are there any of what are called Secondary strata. Long Island consists wholly of Tertiary and recent deposits; and raised beaches and recent deposits occur along the shores of the lakes and larger rivers. The most important of the raised beaches is a lofty bank of sand and gravel, known as the Ridge Road, which extends along the whole southern coast of Lake Ontario, at a distance of from 6 to 8 miles from it. It is from 100 to 150 feet high, and forms a natural highway. At one period it evidently formed the bank of the lake.

New York is rich in minerals. Iron abounds in various parts. In the primary rocks of the Adirondack Mountains it occurs in enormous quantities as a magnetic oxide. As a specular oxide it occurs largely in the north-western part of the state. As hematitic ore it is very widely spread through the middle and southern districts. Among the recent strata it occurs in considerable quantities in the form of argillaceous or bog ore. Graphite is found in the primary rocks both in the north and south. Lead occurs in enormous quantities in St. Lawrence county, in the north-west of the state; and is also found, though not so abundantly, in other parts. Copper, zinc, arsenic, barytes, and strontium are likewise obtained, though not largely. Alum is found in several places. Gypsum is obtained in the Onondaga group of Upper Silurian strata noticed above. Soapstone, talc, carbonate, hydrate, and sulphate of magnesia, asbestos, &c., with garnet, beryl, chrysoberyl, tourmaline, and various other minerals are found throughout the state. As will have been noticed in our sketch of the geology of the state, the most prevalent rocks are limestones and sandstones; and these, with the primary rocks, furnish a remarkably varied and almost inexhaustible supply of excellent building stone. Coal, as already mentioned, does not occur, except indeed some layers of

anthracite a few inches thick which are of no practical value. New York is dependent mainly upon Pennsylvania for its coal. Chalybeate springs occur at Saratoga; sulphur springs at Avon, Chittenango, and Rochester; and brine springs in several parts of the north-west. Oil springs occur in Cattaraugus and Alleghany counties; nitrogen springs at New Lebanon and Hoosic; and the village of Fredonia and the lighthouse of Barcelona, on the border of Lake Erie, are lighted by 'natural gas' from springs of carburetted hydrogen; similar springs occur in several other places.

Climate.—The mean annual temperature of the city of New York is between 52° and 53°, which is only 2 or 3 degrees higher than that of London, though it is more than 10 degrees nearer to the equator. But this city has a milder climate than any other part of the state, except Long Island. The mean average temperature of the whole state is 46° 49' Fahr. The vale of the Hudson River is much colder than any part of Great Britain. In December the cold increases gradually, and the winter lasts to the end of March. In January and February the thermometer sometimes sinks to 2° Fahr. Snow lies on the ground several feet deep, and the river is passed on the ice. The spring months are raw, chilly, and damp. In summer the thermometer ranges, in general, between 60° and 80°; it sometimes rises to 85°, and for a few days to 90°, but rarely higher. Night frosts begin to occur in October, and towards the end of November snow falls; but the temperature is subject to great and sudden variations, amounting to 20° and even 30° Fahr. in the same day. In the vicinity of the mouth of the Mohawk River the cold is much more severe, which is ascribed to the prevalence of the north-western winds, which blow with considerable force through the valley of the Mohawk. The Lake Country enjoys a milder climate, its temperature being generally at least 3 degrees higher than that of the valley of the Mohawk; but it is subject to dense fogs, and is considered the most unhealthy portion of the state. The northern region has very severe winters, so that during six months the country is covered with snow and the rivers are frozen. In the high valleys of the Adirondack Mountains it freezes even in August. The average annual quantity of rain for the whole state is about 49 inches.

Productions.—The cultivated cerealia are maize, wheat, rye, barley, oats, and buckwheat. About one-third of all the buckwheat, two-thirds of the barley, one-fourth of the rye, one-sixth of the oats, and one-eighth of the wheat grown in the United States are raised in New York. Artificial grasses are largely cultivated in some parts. Potatoes and turnips are generally cultivated. Immense quantities of melons are raised. Peas and beans succeed very well. Apples, peaches, and cherries are plentiful, but pears and plums are not so abundant. Currants and strawberries are cultivated near New York. In some parts flax and hemp are grown, but their culture is decreasing. Only a small quantity of tobacco is grown.

Forests of vast extent still occupy the uncultivated regions of the north and west. They consist chiefly of pines, of which the most numerous are pitch pine, white pine, hemlock, spruce, black spruce, white spruce, balsam fir, and tamarack, together with the red and white cedar, yew, and arbor vitae; white, black, scarlet, and numerous other oaks, yielding valuable timber; beeches, &c. Over the interior of the state the most abundant trees are the valuable sugar maple, from which sugar is made in immense quantities, cane sugar being now seldom used by the farmers of the interior; chestnut, hickory, ash, elm, walnut, &c. Medicinal plants abound.

All the domestic animals of Europe are reared; but less attention appears to be given to them than formerly. A great deal of wool is sent to market, and the dairy products are very valuable. Wild animals are still numerous. The panther is now rare, except in the Adirondack Mountains, which also contain the moose-deer. Deer are still frequent in the western and northern regions. Other wild animals are, black and gray wolves, black bears, gray and red foxes, woolverines, wild cats, racoons, skunks, opossums, weasels, pine martins, minks, beavers, otters, squirrels, musk-rats, marmots, rabbits, and hares. The wild turkey has become rare, even in the western districts, but prairie hens, partridges, grouse, with swans, wild geese, canvass-back and other ducks, and pigeons are abundant. The turkey buzzard, golden and bald eagle, various hawks, and other birds of prey are numerous. The sea and the lakes abound in fish. Turtle are taken on the coast.

Manufactures, Commerce, &c.—New York at the Census of 1850 was the first state in regard to both its manufacturing and agricultural population, having 312,697 persons returned as employed in commerce, trade, manufactures, mechanic arts, and mining, while Pennsylvania the next in rank had only 266,927 persons so employed. The persons employed in agriculture were still more numerous; being 313,980, or 43,618 more than Ohio, the next in numerical rank as to agriculture. The most numerous and important manufacturing establishments are cotton and woollen factories; iron-works; steam-engine and machine-shops; manufactories of fire-arms; distilleries and breweries; tanneries; sugar refineries; glass-houses and potteries; soap- and tallow-works; carriage- and waggon-factories; saw- and grist-mills; and manufactories of all the usual articles of domestic consumption and luxury.

The commerce of New York far exceeds that of any other state in the Union. In the year ending June 30, 1852, the exports amounted to 87,484,456 dollars, of which 74,042,581 dollars were of domestic

produce. The imports during the same period amounted to 132,329,306 dollars, or nearly 100,000,000 dollars above those of any other state. Of these, imports valued at 101,746,789 dollars, were carried in American, and 30,582,517 dollars in foreign vessels. The number of entrances of ships in the state in 1850 was 7969, of which 3165, of the aggregate burden of 1,145,835 tons, entered at Atlantic ports (almost wholly at that of New York), and 4804 vessels of 1,131,885 tons entered at Lake ports. The clearances during the same period numbered 7303, namely, at Atlantic ports 2612 vessels of 983,239 tons burden, and at Lake ports 4691 vessels of 1,165,807 tons burden. The shipping belonging to the state exceeds 1,000,000 tons. The inland and coasting trade is far greater than even the foreign commerce. As a ship-building state New York exceeds every other except Maine. The number of vessels built in the state in 1851-2 was 179, of the aggregate burden of 72,072 tons; of these 26 were ships, 56 schooners, and 45 steam-vessels.

Divisions, Towns, &c.—New York is divided into 59 counties, 45 in Northern and 14 in Southern New York. Albany is the political capital. Including the capital and New York, the great commercial centre of the Union, there are 12 incorporated cities in the state; of these ALBANY, NEW YORK, BROOKLYN, and BUFFALO form the subject of separate articles; the others, with some of the more important towns, or villages, as they are here termed, we notice below: the population is that of 1850:—

Hudson, on the left bank of Hudson River, and at the head of ship navigation, 30 miles S. from Albany, population 6286, is one of the oldest cities in the state, but its progress has been of late comparatively slow. It is regularly laid out, well built, contains a large and handsome court-house and other county buildings, several churches, a lunatic asylum, &c.; carries on a large whale-fishing and river-trade; and has considerable manufactures.

Oswego, on both sides of the Oswego River, at its outfall in Lake Ontario, 150 miles W.N.W. from Albany: population, 12,205. The river is not navigable, but its mouth, around which the city is built, forms one of the best harbours on the south side of the lake, and its capabilities have been much increased by the carrying out of piers. Oswego is the chief American depot for the Canadian trade passing by way of the Welland Canal, and it is connected by branch lines with the Central railway and the Erie Canal. The import and export trades are both very large and rapidly increasing. The chief articles received from Canada are lumber, wheat and flour, potatoes, and other provisions. The exports include all the leading articles of domestic and foreign produce. The two sides of the city are connected by a bridge 700 feet long. The city is regularly laid out with streets 100 feet wide, and contains a court-house, several churches (some of considerable architectural pretensions), schools, a large railway terminus; several hotels, commission houses, and warehouses of large size; and numerous extensive manufactories. The city is defended by a strong fort.

Rochester, on both sides of the Genesee River, 7 miles above its outfall in Lake Ontario, and 252 miles, by railway, W. from Albany, population 36,403 (20,191 in 1840). The city contains a large and handsome court-house, a post-office and public-hall or 'arcade,' built of marble, 30 churches, Rochester university, a Baptist theological college, an atheneum, numerous schools, an orphan asylum, and other benevolent institutions, and several spacious hotels and business establishments. The rapid rise of Rochester is mainly due to the immense supply of water-power here afforded by the falls of the Genesee, which within the city limits has a descent of 268 feet by three successive perpendicular falls, and 105 feet by two rapids. This vast power has been rendered available to the fullest extent for manufacturing purposes. The chief establishments are the flour-mills, at which three million bushels of flour are ground annually; there are also extensive iron-foundries, machine-shops, cotton- and woollen-factories, and large manufactories of cabinet-ware, &c. Rochester has ample canal and railway accommodation, and the river is navigable to Lake Ontario.

Schenectady, on the right bank of the Mohawk, and on the line of the Erie Canal, 17 miles N.W. from Albany, population 8921, is one of the oldest cities in the state; contains a city-hall, court-house, lyceum, several churches, a college, and other public buildings; and has some manufactures, especially of flour, paper, cotton goods, iron, and brooms.

Syracuse, on the Onondaga Creek, a short distance above its entrance into Onondaga Lake, 148 miles by railway W.N.W. from Albany: population, 22,271 (6500 in 1840). The city contains some large and handsome churches and public buildings; its hotels, Syracuse having become a great centre of railway traffic, are celebrated for their size and style. The chief manufactures are of salt, of which enormous quantities are prepared from springs in the immediate vicinity; flour; iron-castings, and machinery. The Erie and Oswego canals, and several lines of railway pass through or terminate in the city.

Troy, on the left bank of the Hudson, 6 miles N.E. by N. from Albany, population 28,785, is one of the chief business places of the state. The city is finely situated, well built, and has a more than usually pleasing appearance. Its chief public buildings are the court-house, a spacious marble edifice of the Doric order, several churches and educational institutions, a museum of natural history, &c. The

principal manufactures are of various branches of the iron trade, machinery, hardware, and cutlery; but there are also extensive cotton and woollen factories, railway-car works, paper-mills, tanneries, flour-mills, lumber-yards, &c. The shipping trade with New York is very large. Numerous railways, as well as the Erie and Champlain canals, connect Troy with all parts of the state and with Canada.

Utica, on the right bank of the Mohawk River and on the Erie Canal, 95 miles by railway W.N.W. from Albany: population, 17,565. The city stands on rising ground; is regularly laid out with streets 100 feet wide; contains 20 churches, several schools, two orphan asylums, the state lunatic asylum, a very large and handsome building with extensive grounds, and other public buildings; and has large manufactories of iron, machinery, carriages, leather, flour, &c.

Williamsbury, on the east bank of East River, Long Island Sound, nearly opposite to New York city, with which it is connected by a steam ferry, and of which it is in fact a suburb: population 30,780. The city, which was incorporated in 1852, stands on an elevated site, is regularly laid out, contains many fine buildings, including 30 churches, and numerous extensive manufacturing and business establishments, and resembles in character and general arrangements the parent city, with the fortunes of which it is closely united.

Auburn, at the outlet of Owasco Lake, 175 miles W. from Albany, population 9548, is a busy manufacturing village, and contains the state prison, a Presbyterian college, &c. *Canandaigua*, on the west side of Canandaigua Lake, 200 miles W. from Albany, population 6143, is a place of considerable business, and a station of three lines of railway. *Catskill*, on the right bank of the Hudson, at the confluence of Catskill Creek, population 5454, contains the county buildings, several churches, schools, hotels, &c.; possesses considerable manufactures; and has a large river trade. *Elmira*, at the confluence of Newton's Creek with Chemung River, 160 miles W. by S. from Albany, population 6212, has considerable manufactures, a large trade in lumber, and is amply provided with canal and railway facilities. *Flushing*, at the head of Flushing Bay, Long Island Sound, 125 miles S. from Albany, population about 2500, is a place of considerable resort in summer for bathing. In the village are several good churches, and near it is St. John's Episcopal College. Large quantities of vegetables are raised in the neighbourhood for the New York market. *Geneva*, at the north-western angle of Seneca Lake, 160 miles W.N.W. from Albany, population about 4500, is celebrated for the beauty of its site, and as the seat of Geneva College and Medical School. It contains several residences of a superior class, and carries on some manufactures. *Ithaca*, on both sides of Cayuga inlet, about a mile above its entrance into Cayuga Lake: population, 6909.

Canal boats ascend to the town, which possesses unusual water-power, which has been rendered largely available in working cotton, woollen, flour, paper, and plaster mills; there are also iron-works, machine-shops, &c. The village is regularly laid out, contains some good buildings, and has ample railway accommodation. *Lansingbury*, on the left bank of the Hudson, at the head of sloop navigation, 10 miles N.N.E. from Albany, population about 4500, is a busy and flourishing manufacturing and trading town, and contains several churches, schools, and public buildings. It is connected with Waterford, on the opposite bank, by a bridge, and with most of the leading towns in the state by railways. *Lockport*, on the Erie Canal, and on the Canandaigua and Niagara railway, 250 miles W. by N. from Albany, and 23 miles from the Falls of Niagara, population 12,323, is one of the most prosperous and rapidly-increasing villages in the western part of the state. It contains a court-house, jail, and other county buildings, 18 churches, several schools, &c.; and has extensive cotton and woollen factories, iron-furnaces, machine-shops, agricultural implement manufactories, flour, saw-, and plaster-mills, &c. *Newburg*, on the right bank of the Hudson, 55 miles S. by W. from Albany: population, 11,415. The village is finely situated on elevated ground, and contains the usual county buildings, churches, schools, &c., and a theological seminary. It has extensive manufactories of machinery, carriages, chairs, cordage, flour; with iron-foundries, tanneries, lumber- and stone-yards, &c. A large trade is carried on in forwarding by the river to New York vegetables and other agricultural produce received from the interior. *Niagara Falls*, population about 1000, is so called from the famous Falls of Niagara, close to which it is situated. It contains flour- and paper-mills, iron-furnaces, and several large hotels. *Plattsburgh*, at the head of Cumberland Bay, on the west bank of Lake Champlain, 150 miles N. from Albany: population of the township, 5618. The village contains some good buildings, has considerable trade and manufactures, and possesses good railway accommodation. *Poughkeepsie*, on the left bank of the Hudson, about midway between Albany and New York: population, 13,944. The town is large, regularly laid out, and contains many spacious and handsome public buildings; among them are the court-house, jail; 17 churches, a college, and numerous schools; a lyceum; two market-houses, &c. The manufacturing establishments are numerous, and some are on a very large scale: the principal are locomotive- and machine-shops, iron- and brass-works, carpet factories, cotton- and silk-mills, oil- and candle-works, breweries, tanneries, gunsmiths, &c. A large trade is carried on with the back country; and the river trade is very great. *Rome*, on the right bank of the Mohawk, 109 miles by railway W.N.W. from Albany, population of township 7918, contains a United States

arsenal and workshops, and has some manufactures. *Sackett's Harbour*, on Black River Bay, at the east end of Lake Ontario, is considered to be the best harbour on the south side of the lake; but though a good deal of trade is carried on the place has not advanced nearly so fast as some others in this part of the state. It contains a United States barrack for 2000 men, a ship-yard, and naval stores. The village has some manufactures. *Sag Harbour*, between Gardiner's and Great Peconic bays, Long Island, population 3650, is extensively engaged in the cod and whale fisheries, and the manufacture of salt. There is also a very large clock factory. Some ship-building is carried on. *Seneca Falls*, population 3045, is a busy manufacturing village, situated on Seneca River and Canal, and on the Rochester and Syracuse railway, 185 miles W. from Albany. *Watertown*, at the falls of the Black River, 145 miles W.N.W. from Albany, population of township 7201, has extensive cotton, woollen, paper, and flour mills, iron-works, &c., and is a place of considerable trade. *West Troy*, on the right bank of the Hudson, where the Erie Canal locks into it, 6 miles N. by E. from Albany, population 7564, has rapidly risen into importance as a trading and manufacturing town. The river and canal trade is very large; and, in addition to its private ship-yards and factories, West Troy is the seat of the largest arsenal of construction belonging to the United States. A bell-foundry here is the largest in the Union.

Government, &c.—The original constitution was framed in 1777; its present amended form was adopted in 1846. By it the right of voting is vested in every free white male citizen, 21 years of age, who shall have resided in the state for one year; but free coloured men must have been resident three years in the state, have possessed a freehold to the value of 250 dollars, free of all encumbrances, for one year, and have paid taxes thereon, before becoming entitled to vote. The legislature consists of a Senate of 32 members, elected for two years, and an Assembly of 128 members, elected annually. The total absolute and contingent debt of the state in 1852 was 24,323,838 dollars. The total receipts from all sources in the year ending September 30, 1852, was 6,818,947 dollars; and the total expenditure, 6,716,847 dollars. The General Fund revenue, 'on which are charged the ordinary expenses of government,' for the same period, was 1,153,477 dollars (including a surplus of 15,753 dollars from the previous year); and the expenditure, 1,841,821 dollars.

Great attention is paid to education in the state. Besides the primary schools established in every township, and the academies and upper schools, there are in the state 20 colleges, including theological, medical, and legal schools, with 185 professors and about 1500 students.

The original discovery of the Bay of New York is believed to have been made by Verrazano, a Florentine in the service of France, in 1524. But the discovery remained without fruits till 1609, when Hudson, an Englishman in the Dutch service, sailed up the river, which now bears his name, as far as the site of Albany. The Dutch continued for some time to send vessels to trade with the Indian possessors of the soil before founding any settlement—the earliest having been made in 1614. The number of settlements or trading stations rapidly increased, and armed forts were erected; and in 1621 the territory was transferred by charter to the Dutch West Indian Company. A few years later English traders settled in some places; and in 1627 the Plymouth Colony set up a claim to a portion of the territory. Disputes and enmity continued for years, the English continually increasing in numbers and strength, until in 1645 they wrested the colony from the Dutch and changed its name to New York, in honour of the Duke of York, afterwards James II., who had obtained from Charles II. a grant of the territory as governor. The colony was re-conquered by the Dutch in 1673, and its name changed to New Orange; but at the conclusion of peace in the following year it was ceded by treaty to England, and its former name was restored. In the war of independence New York played a prominent part; and it formed one of the 13 original states of the Union.

(O'Callaghan, *History of the State of New York*; *Statistical Gazetteer of the United States*; *Geology of New York*; *Reports of State Geologists*; *Marcou*; *Seventh Census of the United States*; *American Almanac*, &c.)

NEW YORK, City of, State of New York, the largest city and the commercial capital of the United States of North America, is situated on the southern end of Manhattan Island, at the head of New York Bay, and at the confluence of East Strait, or River, with Hudson River. The City Hall is in 40° 42' 45" N. lat., 74° 0' 3" W. long., 226 miles N.W. by W. from Washington. The population, which was only 60,489 in 1800, was 312,710 in 1840, and 515,547 in 1850. The government of the city is vested in a mayor, recorder, and a common council of 38 members, consisting of one alderman and one assistant-alderman elected by each of the 19 wards into which the city is divided.

The island upon which New York stands is 13½ miles long, and from 1 mile to 3 miles broad. The city extends along the Hudson above 2 miles, and along the East River, which divides it from Long Island, about 4 miles. The south-west part of the town, which was the earliest built, is ill arranged; but the more modern parts are regularly laid out in parallel avenues 100 feet wide, which are crossed by straight streets 80 feet wide; the whole is well paved and lighted. Broadway, the principal street, which runs through the centre of the town, is nearly 3 miles long and 80 feet wide. It contains several handsome churches, many of the principal hotels, and a great variety of elegant shops.

Wall-street, which branches off from Broadway, contains the Exchange, the Custom-house, and most of the city banks, as well as the greater part of the merchants' and brokers' counting-houses, and the insurance-offices. The city is deficient in public grounds. There are indeed 18 so-called parks, but they contain altogether only about 170 acres. The favourite as a resort is that called the Battery, at the southern end of the city. New York contains some magnificent and costly buildings. The City Hall, the front of which is of white marble, is 216 feet long, 106 feet wide, and 51 feet high; in it are offices and places of meeting for the municipal bodies. The building was begun in 1808, and finished in 1812, at the cost of 500,000 dollars. The New City Hall, erected in the rear of this, is occupied by the law courts and public offices. The Custom-house is constructed of white marble as a copy of the Parthenon; it is 200 feet long, 90 feet wide, and 80 feet high. It was finished in 1841, and cost 1,195,000 dollars. The Merchants' Exchange, erected in the place of one destroyed by the great fire of the 16th of December, 1835, is the most magnificent edifice in the city. Its front in Wall-street is 198 feet long, 77 feet high, and it is surmounted with a dome 124 feet high. It is constructed entirely of Quincy granite, and cost 1,800,000 dollars. The great portico has 18 columns, each 38 feet high and 4 feet 4 inches in diameter, and formed of a single block of granite 43 tons in weight. The Hall of Justice, a sombre pile, 253 feet long and 200 feet deep, is in the 'Egyptian style.' The City Penitentiary, the New State Arsenal, and the Post-office, are among the other larger civic edifices. The churches are above 250 in number, and some of them are among the most splendid buildings in the city. Trinity, Grace, St. George's, St. John's, St. Patrick's, and St. Peter's Episcopal and Roman Catholic churches, with one or two of the Presbyterian, Baptist, Dutch Reformed, and Unitarian churches, are of the greatest architectural celebrity. The educational establishments, which are extremely numerous, include Columbia Episcopal College, a spacious and very handsome edifice; New York University, one of the architectural ornaments of the city; the College of Physicians; University Medical College; New York Medical College; the General Theological Seminary, and the Union Theological Seminary; besides numerous academies and high schools. Among the chief literary institutions and libraries are—the New York Historical Society; the Geographical and Statistical Society; the New York Law Institute; the New York Society Library; the Mercantile Library Association; the Apprentices Library; the American Institute; the Typographical Library, free to printers; the New York Lyceum, and Lyceum of Natural History; and the noble Astor Library, founded by John Jacob Astor, at a cost of 400,000 dollars. The hospitals and asylums, and other religious and benevolent institutions, are exceedingly numerous, and some of their buildings are very spacious and handsome structures. There are 6 theatres, an opera house, a metropolitan hall capable of accommodating 4000 persons, and numerous other places of amusement; but none are of very high architectural rank.

New York is supplied with water by the Croton aqueduct, a vast work commenced in 1837 and completed in 1842 at a cost of 14,041,584 dollars. The water is brought from a lake or pond, 5 miles long, at Croton River in Westchester county, by a covered aqueduct 40 miles long, capable of discharging 60,000,000 gallons of water in 24 hours. Immense reservoirs within the limits of the city receive the water, which is distributed from them by means of iron pipes.

The situation of New York as a commercial port is admirable. New York Bay, which is completely landlocked, is about 8 miles long and from $1\frac{1}{2}$ to $5\frac{1}{2}$ miles wide, and affords a perfectly safe anchorage. It is easy of approach, and is very rarely closed by ice. The entrance between Long Island and Staten Island, by a channel called the Narrows, is protected by forts, while the approach to it is facilitated by lighthouses, one of which is placed on a long tongue of land on the New Jersey shore called Sandy Hook; two others are erected about 4 miles south from Sandy Hook, and their lights, being 250 feet above the level of the sea, can be seen in fair weather at 40 or 50 miles distant. A fourth lighthouse is placed on Staten Island, at the narrowest part of the entrance to the harbour. The bay contains several small islands, which have been surrendered to the general government as sites for fortifications. The wharfs and docks have an aggregate length of 7 miles. On each side there are about 60 piers averaging from 200 to 300 feet in length, and 50 to 60 feet in width; and at these there is sufficient depth of water, both in the Hudson and East rivers, for ships of large burden to load and unload. But the amount of shipping has so greatly increased that it has been found necessary to form docks for their accommodation, as well at Brooklyn and Jersey City as in New York itself. Besides the vast amount of tonnage engaged in the foreign trade, there are generally about 2000 coasting vessels lying in the harbour at the same time. The commercial intercourse with the interior and with the western states of the Union is secured by means of the Hudson river, and the very complete system of railways and canals. No less than 11 lines of railway diverge from New York, placing it in direct communication with all the more important trading centres of the Union. There are also 'avenue railways' running through all the principal thoroughfares of the city.

The commerce of New York has, with occasional fluctuations, been steadily progressive, and now ranks among the first in the world.

The imports from foreign countries in 1852 amounted in value to 117,739,457 dollars, the exports to 44,187,329 dollars. The disparity between the value of the imports and exports here exhibited is compensated by disparity in the opposite direction, in the commercial dealings of other parts of the American Union. A great part of the returns from foreign countries for the produce of Louisiana, Alabama, Georgia, Carolina, and Virginia, which is shipped direct from the ports of those states, is made through New York. The coasting and internal trade greatly surpasses that with foreign countries. Nearly half the value of the foreign imports consists of 'dry goods,' as woollens, cottons, silks, &c. The imports of bullion in 1852 amounted to 2,523,391 dollars, the exports to 37,273,703 dollars. The entrances to the port of New York in 1851 amounted to 1,148,768 tons, of which 953,879 tons were American; and the clearances to 1,230,082 tons, of which 793,229 tons were American. Of 3888 vessels which cleared, 2331 were American, 966 British, and 133 Bremen. The shipping owned by New York in 1851 amounted to 931,198 tons, of which 504,304 tons were registered. The vessels employed in the coasting-trade amounted to 426,747 tons; steam-vessels to 121,541 tons, but these have since largely increased. There were in 1853 in New York 16 ocean steam-ship companies, owning 76 steam-ships of the aggregate burden of 129,010 tons: these of course include the famous lines of New York and Liverpool steamers. Ship-building is largely carried on. In 1851, 208 vessels of the aggregate burden of 71,214 tons were built in the district of New York; of which 26 were ships, 56 schooners, and 47 steamers; the rest being chiefly sloops and canal-boats.

There are in the city 40 banks, with capitals amounting in the aggregate to 35,834,950 dollars. There are also 37 fire-insurance companies, with capitals amounting in the aggregate to 6,654,010 dollars, and 6 life-insurance companies, whose united capitals amount to 5,060,000 dollars. The total value of property in 1852 was returned at 351,706,796 dollars.

New York, though mainly distinguished by its vast commerce, is at the same time to be regarded as the greatest manufacturing city in the United States. At the Census of 1850 the persons employed in 'productive or manufacturing' establishments were nearly one-sixth of the entire population of the city: the number of establishments was 3387, the capital invested was returned at 34,332,822 dollars, and the number of persons employed was 83,620, of whom 29,917 were females. The larger establishments were iron-foundries and machine-shops, which are on a scale of great magnitude; breweries, distilleries, sugar-refineries, brass-foundries, carriage-factories, hardware-works, with manufactories of pianofortes, furniture, jewellery, and all the usual branches of useful and ornamental goods required for ordinary use or luxury in a wealthy metropolis.

The publishing trade of New York is also of very great importance. The wholesale stores and warehouses are very extensive establishments, and many of the retail shops rival those of Europe in appearance and costliness of stock. In connection with the trading establishments we ought not to overlook the hotels, which form so remarkable a feature in the civic architecture and economy. Many of the hotels of New York are on a scale of magnitude and costliness almost unequalled elsewhere; several of them contain from 300 to 400 rooms, and some are fitted up with remarkable splendour, and have cost from 300,000 to little short of 1,000,000 dollars.

Fourteen or fifteen daily, and about 60 weekly newspapers are published in New York: in all, including newspapers, magazines, and reviews, 125 periodicals are published here.

Two good-sized cities, Brooklyn and Williamsburg, lying within a short distance of New York, are so closely connected with it in business, &c. as to form in effect almost parts of it: they are noticed, BROOKLYN in a separate article, and Williamsburg under NEW YORK State. To these may be added Jersey City, on the opposite side of the Hudson, which is noticed under NEW JERSEY.

NEW ZEALAND. [ZEALAND, NEW.]

NEWARK-UPON-TRENT, Nottinghamshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on an arm of the Trent, in 53° 5' N. lat., 0° 49' W. long., distant 20 miles N.E. from Nottingham, 124 miles N.N.W. from London by road, and 147½ miles by the North-Western and Midland railways. The population of the borough in 1851 was 11,330. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns 2 members to the Imperial Parliament. For sanitary purposes it is under the management of a Local Board of Health. The living is a vicarage in the archdeaconry of Nottingham and diocese of Lincoln. Newark Poor-Law Union contains 49 parishes and townships, with an area of 93,834 acres, and a population in 1851 of 30,373.

Newark Castle, of which there are still some remains, was built or perhaps enlarged by Alexander, bishop of Lincoln, in the early part of the 12th century. The castle came into the possession of the crown, and in the reign of John was besieged by the barons. John, coming to its relief, died at Newark in 1216. The town was incorporated by Edward VI. In the civil war of Charles I. the townsmen zealously supported the king.

Newark is irregularly laid out, and consists of several streets, with a market-place near the centre of the town. It extends about a mile

along the bank of the river. It is well paved, lighted with gas, and is well supplied with water.

The parish church is one of the largest and, of its kind, most elegant in the kingdom. It was in great part rebuilt in the time of Henry VI. and Henry VII.; but there are in it some remains of a previous edifice of Norman character. It is cruciform, and consists of nave and chancel, with large aisles, transepts, and some chapels, with a tower at the west end, surmounted with an elegant spire 240 feet high. The Wesleyan Methodists and Baptists have places of worship. Magnus's Endowed Grammar school, founded in 1529, had 76 scholars in 1852. There are National and Infant schools, and a savings bank. There is a neat bridge over the river of seven semi-circular arches, built of brick and faced with stone. The approach to Newark from the north is by a causeway a mile and a half long, carried over the flat island formed by the main channel of the Trent and the Newark branch, and leading to the bridge: in this causeway are several bridges and arches, to give free passage to the waters when the floods are out. In the town are a court-house, where the quarter-sessions for the division are held; a handsome town-hall for the corporation business, the borough sessions, and assemblies; and St. Leonard's hospital or almshouses, built about the time of Charles I. The principal trade of Newark is in corn, malt, flour, coal, cattle, and wool. The market for corn and provisions is on Wednesday. There are six yearly cattle-fairs. A county court is held. Large quantities of gypsum and limestone are obtained in the neighbourhood. There are brick- and tile-works and large iron- and brass-foundries. The arm of the Trent which passes by Newark is navigable.

NEWBERRY. [CAROLINA, SOUTH.]

NEWBIGGIN. [NORTHUMBERLAND.]

NEWBLISS. [MONAGHAN.]

NEWBOROUGH. [ANGLESEY.]

NEWBRIDGE. [GLAMORGANSHIRE; KILDARE.]

NEWBURG. [NEW YORK.]

NEWBURGH. [ABERDEENSHIRE; FIFESHIRE.]

NEWBURY, Berkshire, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Newbury, is situated on the right bank of the river Kennet, in 51° 24' N. lat., 1° 19' W. long., distant 17 miles W.S.W. from Reading, 56 miles W. by S. from London by road, and 52½ miles by the Great Western railway. The population was 6574 in 1851. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor. The living is a rectory in the archdeaconry of Berks and diocese of Oxford. Newbury Poor-Law Union contains 18 parishes and townships, with an area of 42,956 acres, and a population in 1851 of 20,815. As early as the time of William the Conqueror the place, then called Newbir or Newbyrig, was granted by the Conqueror to Ernulph de Hesdin. The principal streets are broad and well paved, and the town is lighted with gas. The church is a plain stone building, erected in the reign of Henry VII. The Wesleyan Methodists, Independents, Baptists, and other dissenters, have places of worship. The Free Grammar school, which has an income of 100*l.* a year from endowment, had 50 scholars in 1851. In the town are a literary institute, a dispensary, and a savings bank. The weekly market is held on Thursday. Fairs are held six times in the year. The Kennet and Avon Canal passes through the town.

NEWBURYPORT. [MASSACHUSETTS.]

NEWCASTLE, Limerick county, Ireland, a post- and market-town, and the seat of a Poor-Law Union, is situated on the Arra, an affluent of the Deel, in 52° 28' N. lat., 9° 4' W. long., distant by road 25 miles S.W. from Limerick, 144 miles S.W. by W. from Dublin. The population in 1851 was 2518, besides 3297 inmates of the workhouse. Newcastle Poor-Law Union comprises 26 electoral divisions, with an area of 148,024 acres, and a population in 1851 of 36,267. The town has a neat rural appearance. It mainly consists of four principal streets and a spacious square, containing some well-built houses. The parish church is a handsome structure, built in 1777 by Viscount Courtenay. In the town are a Roman Catholic chapel, the Courtenay Free school, an ancient foundation, and a National school. A fever hospital and dispensary stand on an eminence near the town. There are a large town-hall, a neat market-house, an infantry barrack, and a Union workhouse. Some coarse cloths are manufactured. Quarter and petty sessions are held. Saturday is the market-day. The town took its name from a castle erected by a community of Knights Templars in 1184. The remains of the building have been in part fitted up as a residence by the Earl of Devon.

NEWCASTLE. [DELAWARE; NEW BRUNSWICK.]

NEWCASTLE EMLYN, Caermarthenshire, a market-town, and the seat of a Poor-Law Union, in the parish of Kenarth, is situated on the left bank of the river Teifi, in 52° 2' N. lat., 4° 28' W. long., distant 16 miles N.W. by N. from Caermarthen, and 229 miles W. by N. from London. The population of the hamlet of Newcastle-in-Emlyn was 1083 in 1851. For parliamentary purposes the town of Newcastle is united with Adpar on the opposite bank of the Teifi, in Cardiganshire; the united borough called Adpar, is contributory to Cardigan in returning one member to the Imperial Parliament, and had a population in 1851 of 1746. The living of Newcastle-Emlyn is a perpetual curacy in the archdeaconry of Cardigan and diocese of St. David's. Newcastle Poor-Law Union contains 22 parishes and

townships, with an area of 113,346 acres, and a population in 1851 of 20,178.

Newcastle was anciently called Dinas Emlyn (city of Emlyn), and took its name of Newcastle from its fortress being rebuilt by Sir Rhys ap Thomas, in the reign of Henry VII. The remains of this castle, on a sort of peninsula formed by a bend of the Teifi, present a very picturesque appearance. Newcastle Emlyn and Adpar are usually considered as one town, and both are commonly included under the name of Newcastle. The houses are in general well built. The parochial chapel at Newcastle is a neat modern building. There are chapels for Baptists and other Dissenters, a school with a small endowment, and a savings bank. The town forms a centre for the sale of cattle for the English market. There are 11 cattle fairs in the year. A county court is held.

NEWCASTLE-UNDER-LYME, Staffordshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 53° 1' N. lat., 2° 13' W. long., distant 16 miles N. by W. from Stafford, 150 miles N.W. from London by road, and 147 miles by the North-Western and North Staffordshire railways. The population of the borough in 1851 was 10,569. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a rectory in the archdeaconry of Stafford and diocese of Lichfield. Newcastle-under-Lyme Poor-Law Union contains nine parishes and townships, with an area of 26,718 acres, and a population in 1851 of 20,814.

Newcastle was a corporate town as early as the reign of Henry II. A castle was erected here by Edmund, earl of Lancaster, second son of Henry III.; the town has returned members to Parliament since the 27th Edward III. Newcastle is situated about 2 miles from the right bank and near the source of the Trent. It consists of several streets irregularly laid out, but well paved, and lighted with gas. There are a guildhall with a market-place beneath, a public office for the mayor and magistrates, two churches, of which one was rebuilt early in the last century, but has a lofty square tower of much greater antiquity, built of red-sandstone; chapels for Roman Catholics, Independents, Baptists, Unitarians, and several branches of Methodists; National and Infant schools, and an Endowed school. The Free Grammar school, founded in 1602, which has an income of 97*l.* 10*s.* a year, had 34 scholars in 1853. A range of almshouses for 20 poor females was founded by Christopher Monk, duke of Albemarle, son of the celebrated George Monk.

The chief manufacture in Newcastle-under-Lyme is that of hats, which are prepared here, and finished in London. There is also a considerable manufacture of shoes. There are silk-, cotton-, and paper-mills, and pottery-works. Markets are held on Monday and Saturday. Five fairs and five moveable cattle markets are held in the course of the year. A branch canal communicates with the Trent and Mersey Canal at Stoke; and a canal from the coal-mines at Apedale, about 3 miles N.W. from Newcastle, affords facilities for conveying a supply of coals to the town.

NEWCASTLE-UPON-TYNE, the chief town of Northumberland, a town and county of a town in itself, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated at the southern extremity of the county on the river Tyne, 8¼ miles from its confluence with the German Ocean, in 54° 59' N. lat., 1° 37' W. long., 15 miles N. from Durham, 117 miles S.E. from Edinburgh, and 273 miles N.N.W. from London by road, and 303¼ miles by railway. The population of the borough of Newcastle in 1851 was 87,784. The borough is governed by 14 aldermen and 42 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Northumberland and diocese of Durham. Newcastle Poor-Law Union contains 11 parishes and townships, with an area of 7102 acres, and a population in 1851 of 89,156.

Newcastle appears to have derived its origin from Pons Ælii, the second station from the eastern extremity of the Roman wall. Several Roman remains furnish evidence that it occupies the site of a station. Many coins were found in the piers of the old bridge thrown down by a flood in 1771, and the remains of a Roman well, two altars, fragments of walls, and large quantities of pottery, in digging the foundations of the county court-house in 1810. Previous to the Conquest the place went by the name of Monkchester, from the number of monastic institutions. The town was also the resort of numerous pilgrims who came to visit the holy well of Jesus' Mount, now Jesmond, a mile north-east of the town. One of the streets in Newcastle is still called Pilgrim-street. It was from a fortress built by Robert, eldest son of William the Conqueror, to which the name of the 'New Castle,' was given, that the town derived its present name. In the rebellion of Mowbray, earl of Northumberland, against William Rufus, this fortress was taken by the king. In the reign of Stephen it was held for a while by the Scots. In the reign of Edward I., John Baliol did homage at Newcastle for his crown of Scotland. The town had been early incorporated, probably by William Rufus, but the first mayor was appointed in the reign of Henry III., 1251. In the wars with Scotland, Newcastle was a frequent place of rendezvous to the English forces, and it was the scene of several diplomatic meetings. In 1636 above 5000 persons are said to have died of the plague at Newcastle, an indication of the extent and population of the town.

In the contest between Charles I. and the Parliament the town was finally taken by storm in 1644 by the Scots, who had come to the support of the Parliamentarians.

The town is situated on the summit and declivities of three lofty eminences, rising from the left bank of the Tyne. It extends about 2 miles along the bank of the river. The town of Gateshead, in the county of Durham, occupies the opposite bank, and may be regarded as a sort of suburb of Newcastle. [GATESHEAD.] Within the last 10 or 12 years the old part of the town has undergone a thorough change; new streets have been opened, and old ones widened, for which purpose all the gates of the old wall, with the greater part of the towers, as well as many curious old buildings, have been swept away. In the upper and more modern parts of the town are spacious streets and squares, with ranges of elegant buildings. The whole is well paved, and lighted with gas. The principal improvements have been on the northern side of the town, where the corporation have erected a new market-house, and entire streets have been built of shops and houses of a superior description. The additions to the town eastward, along the bank of the river, are chiefly for commercial or manufacturing purposes. For its improvements Newcastle is greatly indebted to the skill and enterprise of Mr. Grainger, a builder of Newcastle, who, in the space of five years, planned and constructed streets and buildings of an estimated rental of nearly 1,000,000*l*.

Newcastle is connected with Gateshead by a stone bridge of nine elliptic arches, erected in 1781, and widened in 1801. A short distance east of this bridge is the High-Level Bridge, one of the most remarkable features of Newcastle. This vast work was constructed in order to connect the railways on the opposite sides of the Tyne, and at the same time to form a roadway that should avoid the steep and dangerous approaches to the Tyne by Gateshead and Dean-street, which had so long been an obstruction to the free communication between the towns. The roadway is carried at a sufficient elevation above high-water level to admit of vessels passing beneath it. The bridge is supported by six massive stone piers, 125 feet apart, four rising 130 feet from the bed of the river, and one at each side. The bridge is a double one, carrying a road for foot passengers, horses, and ordinary carriages, and 25 feet above that a railway. The extreme length of the bridge is 1375 feet; the waterway is 512 feet. The height from high-water to the roadway is 86 feet; to the railway, 112 feet; to the parapet of the bridge, 132 feet. The cast and wrought iron employed in constructing the bridge weighed 5050 tons. The cost of construction was 234,450*l*.

The church of St. Nicholas, in the centre of the town, is a large and handsome cruciform church, 245 feet in length: it is chiefly of decorated English character, having been rebuilt in 1359. The steeple, which is at the west end, 193 feet high, is late perpendicular. At the corners of the tower are bold buttresses, crowned by octagonal turrets with crocketed pinnacles; from the base of these turrets spring four flying buttresses, crocketed and peculiarly graceful in their forms; and on the intersection of these is placed a lantern crowned with a crocketed spire, and four crocketed pinnacles at the corners. This steeple has been imitated in those of St. Giles at Edinburgh, and St. Dunstan's in the East, in London, and in other places; but the imitations fall far short of the original. In the interior are several interesting monuments; the east window has a painting of Christ bearing the cross; and there is an altar-piece by Tintoretto, representing Christ washing his disciples' feet. St. Andrew's church, on the north-west side of the town, is partly of Norman architecture. St. John's, near the Westgate, is a large cruciform church, chiefly of early English character, with a square embattled tower. All Saints' church, near the centre of the town, is of Grecian architecture, with a steeple 202 feet high. The interior is an ellipse 86 feet by 72 feet. The Roman Catholic church of St. Mary, erected in 1843, is a magnificent building, in the early English style. The Wesleyan, Primitive, New Connexion, and Reform Methodists; Independents; Baptists; English, Scotch, United, and Reformed Presbyterians; Swedenborgians; Unitarians; Quakers; Roman Catholics; and Jews, have each places of worship. In March 1851 the number of places of worship in Newcastle was 51, and the total number of sittings provided was 28,806. The Royal Grammar school, founded in 1599, had 120 scholars in 1853. The Newcastle Grammar school has had a rather unusual number of distinguished pupils. Among others are Bishop Ridley, Mark Akenaide, Sir Robert Chambers, lords Collingwood, Eldon, and Stowell. The Royal Jubilee school was established in 1810. There are numerous National, British, Ragged, and Infant schools. The total number of day schools in Newcastle in March 1851 was 115, of which 26 were public schools with 5328 scholars, and 89 were private, with 3761 scholars. The number of Sunday schools was 41, of which 15 were supported by Methodists, 8 by Episcopalian, 6 by Baptists, 5 by Presbyterians, 4 by Independents, 2 by Unitarians, and 1 by Quakers. The total number of Sunday scholars was 6821. There were 5 evening schools for adults, with 407 scholars. There is a savings bank. Two public baths have been formed on an extensive scale.

The Exchange buildings form a spacious Ionic structure of semi-circular form, and including the Guildhall, Exchange, and Merchants' Court. Among the other public buildings of note are the corn-exchange, theatre, lecture-rooms, assembly-rooms, literary and philosophical institution, branch bank of England, and the royal arcade.

The town and county jail is a massive stone building of modern erection. The moot-hall, or county court-house, erected in part of the precincts of the ancient castle, is a building of elegant proportions, adorned with a fine portico of six doric columns on the south front, and a similar portico of four columns on the north front. The other courts are the town-hall, burgess's court of record, non-burgess's court, new county-court, and court of guild.

The benevolent institutions comprise the infirmary, dispensary, a lying-in hospital, asylums for lunatics, for the deaf and dumb, and for the blind; an eye infirmary; the keelmen's hospital for poor keelmen; Jesus hospital for decayed freemen, their widows and children; the Trinity almshouses, and the Westgate hospital, founded in commemoration of the peace of 1814. The Literary and Philosophical Society, instituted in 1793, occupies a handsome building of Doric architecture, erected in 1825, comprehending a museum, a library, and other apartments. The library contains about 25,000 volumes. Adjoining the library of the Literary and Philosophical Society are the rooms and museums of the Natural History Society of Northumberland, Durham, and Newcastle. The Antiquarian Society of Newcastle, founded in 1813, holds its meetings in the keep of the old castle. The mechanics institute, in Blakett-street, has a library of 8500 volumes. The government school of design had 90 scholars in 1851. There are also a botanic and horticultural society, and a farmers' club in the town. Extensive barracks are on the north-west of the town. In the vicinity are several large cemeteries.

The commercial importance of Newcastle arises from its situation on a river navigable thus far by sea-borne vessels. The Tyne forms the haven, and is under the care of the corporation. The river side is lined with warehouses and extensive quays. The chief business has always been in the shipment of coals, the produce of the surrounding coal-pits. The coal-field is estimated to extend 44 miles in length, with an average width of 21 miles; and to lie at an average depth of 18 feet. Throughout the greater part of this coal-field, which consists of alternating beds of coal, sandstone, and clay-slate, the seams of coal number about 25; they are of varying thickness, lie at various depths, and are separated by more or less numerous earthy beds. The coals are brought down the river in broad vessels called keels. The boatmen are called keelmen. The imports are wine, spirituous liquors, and fruit from the south of Europe, with sulphur, and mundic-stone, now used by some of the chemical manufacturers as a substitute for sulphur; corn, timber, flax, tallow, hides, tobacco, and various other articles. The gross receipts at the custom-house, for the year ending January 5th 1851 were 331,961*l*.

The principal manufactures of Newcastle and the Tyne are the chemical, glass, iron, and lead. There are several iron-smelting furnaces in the neighbourhood, large iron-foundries, and very extensive steam-engine and locomotive manufactories. On the banks of the river are numerous chemical works. The preparations chiefly manufactured are alum, alkali, chloride of lime, sulphuric acid, &c. The lofty chimneys of these works, reaching to a height of from 150 feet to above 300 feet, form a striking feature of the town, and from the flatness of the surrounding country are seen at a great distance. Glass-works were established in Newcastle in 1619. The manufacture has ever since been carried on, but since the repeal of the duty on glass the trade has been greatly extended. Plate, crown, and flint-glass and bottles are chiefly made. There are several extensive potteries and lead-works. The lead-ore is smelted and wrought into sheet-lead, pipes, shot, red- and white-lead, &c. Many other branches of manufacture are carried on; soap-factories, oil-mills, works for painters' colours, roperies, both hemp and wire, tanneries, paper-mills, fire and common brick-works, and yards for ship-building both in wood and iron. The combustible character of some of the materials used in the manufactures of Newcastle and Gateshead occasioned a great destruction of life and property in both places, but chiefly in Gateshead, by an explosion which took place on October 6th, 1854.

The number and tonnage of vessels registered as belonging to the port of Newcastle on December 31st 1853 were:—Sailing-vessels under 50 tons 107, tonnage 8164; above 50 tons 695, tonnage 147,782; steam-vessels under 50 tons 89, tonnage 1624; above 50 tons 9, tonnage 2226. During 1853 there entered and cleared at the port, in the coasting-trade, sailing-vessels, inwards 2182, tonnage 163,440; outwards 11,172, tonnage 1,502,813; steam-vessels, inwards 399, tonnage 81,886; outwards 429, tonnage 97,154. In the colonial and foreign trade there entered 2555 sailing-vessels of 350,190 tons, and 70 steam-vessels of 17,248 tons; and there cleared 5396 sailing-vessels of 864,291 tons, and 70 steam-vessels of 17,248 tons.

The inland trade of the town is considerable. Markets are held on Tuesday, Thursday, and Saturday. The corn-market is important. The markets for meat, poultry, butter, vegetables, &c., are all held under one roof. The building is in form an oblong parallelogram, 340 feet long by 250 feet wide, and covers an area of nearly two acres; it is one of the finest as well as largest market-houses in the kingdom. At the cattle-market the amount of business done is very great. General fairs are held on the second Wednesday in August and the last Wednesday in October (and eight following days); horse and cattle fairs on March 26, and the last Wednesday in November; hirings for farm servants are held on the first Tuesday in May and November.

Until the construction of the High-Level Bridge the railway accommodation was very incomplete. When that was erected, and the various railways on both sides of the Tyne were connected with each other, the town was placed in direct communication with most of the ports and principal towns of England and Scotland. A central terminus for all the lines was at the same time built, on a magnificent scale, in a convenient part of the town. The building is a Roman Doric edifice of polished stone, having a principal front nearly 600 feet long, with a portico in the centre 200 feet long.

NEWCHURCH. [LANCASHIRE.]

NEWENT, Gloucestershire, a market-town, and the seat of a Poor-Law Union in the parish of Newent, is situated in 51° 55' N. lat., 2° 24' W. long., distant 8 miles N.W. from Gloucester, and 110 miles W. by N. from London. The population of the liberty of Newent town in 1851 was 1547. The living is a vicarage in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Newent Poor-Law Union contains 18 parishes and townships, with an area of 45,281 acres, and a population in 1851 of 12,575. The parish church is ancient, but has been much altered at various times. The Independents have a chapel, and there are National schools. Coal abounds in the vicinity. The Hereford and Gloucester Canal passes the town. The market is held on Friday: fairs are held on the Wednesday before Easter, Wednesday before Whitsuntide, and August 12th.

NEWFOUNDLAND, an island belonging to Great Britain, is situated in the Atlantic Ocean, between 46° 40' and 51° 37' N. lat., 52° 25' and 59° 15' W. long. It forms a sort of barrier across the greater part of the entrance to the Gulf of St. Lawrence. The northern extremity of the island is separated from Labrador by the Strait of Belle Isle, which is 60 miles long and 12 miles wide, and affords a deep and safe passage to and from the Gulf of St. Lawrence. Cape Rays, the south-western point of the island, is about 70 miles from the North Point, in Cape Breton, and the wide expanse of water between these two points forms the opening from the Gulf of St. Lawrence to the Atlantic on the south side of the island. The area is estimated at about 60,000 square miles. The population in 1853 was estimated at 106,000, all of whom with the exception of about 3000 are fishermen and fishing servants and labourers, with a small number of families engaged in agriculture. The population is composed in nearly equal proportions of Protestants and Roman Catholics.

The shores are rocky and high, and indented by broad and deep bays, which enter from 40 to 60 miles into the body of the island. The lands adjacent to the sea are rugged and bare, but at the heads of the bays and near the mouths of the rivers there are plains of some extent covered with trees. The interior of the island seems to contain many lakes, and to be full of swamps and bogs. The hills do not form ridges, but are isolated, and towards the eastern coast they are low, and covered with trees of small growth. The most elevated part is the northern peninsula which lies along the Strait of Belle Isle. The inhabitants are mostly established on the south-eastern coast, especially on the peninsula of Avalon, which is united to the main body of the island by a low isthmus little more than three miles wide. This isthmus separates Trinity Bay from the Bay of Placentia. The settlements on the other coasts are few and at a considerable distance from one another.

The climate of Newfoundland is much influenced by its geographical position, by its exposure to the atmosphere of the Atlantic, and by the large fields of ice which, during March, and the two succeeding months, are on their way from the polar regions towards the south, and cover the sea adjoining the island to a great extent. Great humidity prevails whenever the wind blows from the Atlantic. The cold in winter is great, but it is not quite so severe as it is on the opposite continent. During the summer months the days and nights are generally pleasant.

Considerable attention has of late years been paid to agriculture; wheat, oats, barley, potatoes, and turnips, have been produced of the best quality. Large supplies of seed (wheat, barley, and oats) have been imported by the local government, as well as vegetable and garden seeds, and have been distributed among the cultivators of the soil; prizes have also been given for the best crops and the best specimens of cattle. Roads are being constantly extended; 900*l.* having been spent on them in 1852, and a provincial act was passed in 1852 for the establishment of an electric telegraph company, the line to extend across the island from east to west, and to be connected by a submarine cable with the continent of America.

Deer and foxes are numerous, but beavers have become scarce. Fishing is almost the only occupation of the inhabitants. Seals are taken, for the sake of the skins and the oil produced from the fat, either by means of nets along the shores or by vessels proceeding to the floating fields of ice in the spring. About 360 vessels, of an aggregate tonnage of about 35,000 tons, and carrying about 18,000 men, are employed in catching the seals. A large number of other persons find employment in preparing the skins and extracting the oil. The estimated value of the seals caught in the spring of 1852 was about 250,000*l.* The cod fishery is prosecuted in the summer along the eastern and southern shores of the island, on the coasts of Labrador, and on the Great Bank. The cod-liver yields a large quantity of oil, which is extracted by merely putting the livers into casks, and when they are fully decayed drawing off the oil. The

shores of Newfoundland swarm with herrings from March to December, but the curing is not well attended to, and the fishery is in consequence of much less value than it might be. The salmon fishery is of considerable importance. A great number of the salmon are sold on the coasts of Labrador and parts of Newfoundland to American traders, the remainder are cured and packed in barrels for exportation.

The native tribes seem to have left the island, or have become extinct. The last was the Micmac tribe.

Newfoundland, together with the Bahamas, forms a Church of England bishopric. The Protestants on the island include Episcopalians, Wesleyan Methodists, Presbyterians, Independents, and some others. There is no state provision for the support of any particular religious denomination. For educational purposes a grant of 8400*l.* a year is made by the legislature, and is distributed, according to their numerical proportions, between Protestants and Roman Catholics.

St. John's, the capital of Newfoundland, is situated in a bay on the south-east side of the island, in 47° 33' N. lat., 52° 43' W. long. The entrance to the harbour is narrow, and has only 12 feet of water in mid-channel, but the harbour itself is spacious, is sheltered on all sides by high rocks, and is defended by several forts. The town suffered severely from a conflagration in June, 1846. The damage was estimated at 1,000,000*l.* sterling. A new custom-house, a building for the meetings of the legislature, and a Protestant cathedral have since been built; two large tanks have been constructed in the centre of the town, and rendered frost-proof, so as to afford at all times a supply of good fresh water; besides which a water company has been established, and also a gas company; and a cemetery has been formed outside the town. The population is about 27,000. The town next in importance to St. John's is *Harbour Grace*, on the west side of Conception Bay, 20 miles N.W. from St. John's, which has a well-sheltered harbour.

The Great Bank, on the south-east side of the island, is the most extensive submarine elevation known to exist in any ocean. It is 600 miles long, and in some places 200 miles wide. The whole appears to be a mass of rock, with abrupt edges, which deepen suddenly from 25 to 90 fathoms. There are about 4 fathoms of water on the shoalest parts. The principal fishing grounds are over the Bank, between 42° and 46° N. lat.

The affairs of the colony are administered by a governor, a legislative assembly, and an executive council. The total revenue in 1850 was 82,625*l.* 8*s.* 8*d.*; in 1852 it was 80,479*l.* 19*s.* 10*d.*, and the total expenditure 102,536*l.*, the customs duties having fallen off from a diminution of imports, and the expenditure having been increased by the necessity of affording extensive relief, in consequence of the failure of the cod-fishing and of the potato crop. The estimated value of the imports in 1850 was 867,316*l.*; in 1852 it was 795,758*l.* The imports consist chiefly of provisions, coals, woollen, cotton, linen, and silk manufactures, cordage, fishing-tackle, and various other necessary articles, from Great Britain, the British colonies in North America, and the United States. The estimated value of the exports in 1850 was 975,770*l.*, the exports from the fisheries alone amounting to 928,427*l.*, the remaining articles of export being chiefly molasses, sugar, and wine, which are imported for subsequent exportation to Great Britain and the British colonies in North America. In 1852 the exports were somewhat more than 980,000*l.* The number of ships inwards in 1850 was 1220 (138,628 tons); the number of ships outwards was 1102 (129,832 tons). The amount of the customs duties in 1850 was 64,524*l.* 7*s.*, but in 1852 there was a considerable decline.

Newfoundland was first discovered before the year 1000 by the Norwegians who sailed from Greenland on a voyage of discovery, and visited several parts of the coast of North America. It was again discovered June 24th 1497 by John Cabot, then in the service of England. The name Newfoundland was given by him to the whole of the territories which he discovered, but was subsequently restricted to the island to which it is now applied. After several attempts had been made to form settlements without success, Sir George Calvert, afterwards Lord Baltimore, in 1623 formed a colony on the south-eastern part of the island, which he called Avalon, and appointed his son governor. He and his followers were Roman Catholics. Other colonies were established in 1633 by Lord Falkland, and in 1654 by Sir David Kirk. In 1708 the French attacked and obtained possession of nearly all the colonies, but by the treaty of Utrecht the island was declared to belong wholly to Great Britain, the French being allowed a certain limited right of fishing.

NEWHAVEN, Sussex, a small sea-port town, and the seat of a Poor-Law Union, in the parish of Newhaven, is situated on the right bank of the navigable river Ouse, near its mouth, in 50° 47' N. lat., 0° 3' E. long., distant 8 miles S. from Lewes, 56 miles S. by E. from London by road, and 56½ miles by the Brighton and South Coast railway. The population of the parish of Newhaven in 1851 was 1358. The living is a rectory in the archdeaconry of Lewes and diocese of Chichester. Newhaven Poor-Law Union contains 16 parishes and townships, with an area of 28,462 acres, and a population in 1851 of 5248.

Newhaven was formerly called Meeching. The parish church stands on a hill to the west of the town: the nave is modern, but the chancel is of Norman date. There are a chapel for Baptists and a National school. The harbour is the best tidal harbour between Portsmouth and the Downs. It has been considerably improved of late years. The railway is carried down to the quay. Since

the opening of the railway to Newhaven the traffic of the place has steadily increased. The mouth of the river is protected by a battery on the heights near Castle Hill. The river is crossed by a drawbridge erected in 1784. There are a ship-building yard and large bonding warehouses. The chief imports consist of coals, timber, corn, wine, and spirits, and there is a good coasting-trade in flour and butter. The exports are limited, most of the vessels going out in ballast. The number of vessels registered as belonging to the port of Newhaven, on December 31st 1853 was 25, of an aggregate tonnage of 2621, of which 10, under 50 tons each, amounted to 216 tons. During 1853 there entered the port 301 sailing-vessels, of 33,310 tons, and 273 steam-vessels of 42,020 tons; and there cleared 61 sailing-vessels of 6116 tons, and 280 steam-vessels of 42,202 tons. Steam-vessels, in connection with the Brighton and South Coast railway, ply between Newhaven and Dieppe and the Channel Islands.

NEWHAVEN. [CONNECTICUT; EDINBURGSHIRE.]

NEWMARKET, partly in Cambridgeshire and partly in Suffolk, a market-town and the seat of a Poor-Law Union, is situated in 52° 14' N. lat., 0° 25' E. long., distant 13 miles E. by N. from Cambridge, 61 miles N. by E. from London by road, and 64 miles by the Eastern Counties railway. The town is under a Local Board of Health. The population of the town in 1851 was 3356. The livings are in the archdeaconry of Sudbury and diocese of Ely. Newmarket Poor-Law Union contains 29 parishes and townships, with an area of 97,373 acres, and a population in 1851 of 30,655. The town is built in the bottom and along the sides of a valley. The main street is three-quarters of a mile long, wide, and well lighted. There is a neat market-house. Besides the two parish churches there are chapels for Independents and Wesleyan Methodists, a National school, and a savings bank. The greater part of the town was destroyed by fire in 1623, and again in the early part of the last century. Horse-racing, now the principal source of prosperity, does not appear to have been introduced here till about the close of the 16th century. Soon after the accession of James I. to the English throne horse-racing became a fashionable diversion, and a house was erected at Newmarket for the accommodation of the king and his court. Adjoining the remaining portion of this house are the extensive stables formerly used for the royal stud. The building of the Jockey Club and other large mansions are close by. The race-course extends four miles in length, and is considered the finest in the world. The training-ground is on a gentle acclivity on the southern side of the town, and for its purpose is quite equal to the race-course. The races which take place during the year are seven in number, and never fail to attract a large number of visitors. The market-day is Tuesday. The fairs are held on Whit-Tuesday and on the 8th of November. Malting and brewing are carried on. A county court is held.

NEWMARKET. [CORK.]

NEWMILNS, Ayrshire, Scotland, a village and ancient burgh of barony in the parish of Loudoun, is situated on the right bank of the Irvine Water, in 55° 36' N. lat., 4° 20' W. long., distant 7 miles E. from Kilmarnock, 41 miles S. by W. from Glasgow by the South-Western railway, and 57 miles S.W. by W. from Edinburgh by road. The population of the burgh in 1851 was 2211. Many of the inhabitants are employed in hand-loom weaving. The village contains the parish church, a chapel for United Presbyterians, the parochial school, a school for girls, and a subscription library.

NEWNHAM. [GLOUCESTERSHIRE.]

NEWPORT, Monmouthshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of St. Woollos, is situated on the right bank of the river Usk, about 4 miles from its mouth, in 51° 55' N. lat., 2° 59' W. long., distant 24 miles S.W. by W. from Monmouth, 148 miles W. from London by road, and 158½ miles by the Great Western and South Wales railways. The population of the borough in 1851 was 19,323. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and, in conjunction with Monmouth and Usk, returns one member to the Imperial Parliament. The living is a vicarage in the archdeaconry of Monmouth and diocese of Llandaff. Newport Poor-Law Union contains 40 parishes and townships, with an area of 110,255 acres, and a population in 1851 of 43,472.

The town of Newport has much increased in importance of late years. Extensive iron-works have been established, and the docks, opened in 1842, have afforded increased accommodation for shipping. The town-hall and the post-office are modern erections. The parish church was originally of Norman architecture: the nave and a very fine western archway remain in good condition. There are also—St. Paul's church, built within the last 15 years; a new church in the suburb of Pillgwenly, adjacent to the docks; a large and handsome Roman Catholic chapel; chapels for Welsh and English congregations in connection with Wesleyan and Calvinistic Methodists, Independents, and Baptists; National, British, and Infant schools; an Athenæum; a mechanics institute; a working man's institute; a dispensary; and a savings bank. Nails and iron spikes are extensively manufactured. The exports of iron and coal from Newport are of large amount. Newport was anciently the port of the city of Caerleon, about 3½ miles farther up the river. The number of vessels registered as belonging to the port on December 31st 1853 was 78, namely:—Sailing-vessels, 19 under 50 tons, tonnage in all 562; and 59 above 50 tons, tonnage

11,378: steam-vessels 8, tonnage 119. During 1853 there entered the port 1967 sailing-vessels of 149,777 tons aggregate burden, and 31 steamers of 2366 tons; and there cleared 7660 sailing-vessels of 587,111 tons, and 24 steam-vessels of 1763 tons aggregate burden. The docks cover an area of 4½ acres. The dock-gates have a clear opening of 62 feet. The rise of spring tide is from 36 feet to 40 feet. The Usk is navigable for shipping up to the stone bridge. A short distance above the stone bridge the South Wales railway crosses the river on a bridge constructed of timber and iron. The Monmouthshire Canal communicates with Pontypool and Brecknock. The market-days are Wednesday and Saturday. Commodious barracks stand about a mile from the town. Newport Castle, of which the only remains are a square tower and a portion of the great hall, now used as a brewery, commanded the passage of the Usk. Newport was the scene of the Chartist outbreak in November, 1839.

NEWPORT, Shropshire, a market-town and borough, and the seat of a Poor-Law Union, in the parish of Newport, is situated in 52° 46' N. lat., 2° 28' W. long., distant 17 miles E.N.E. from Shrewsbury, 142 miles N.W. from London by road, and 144 miles by the North-Western and Shropshire Union railways. The population of the town in 1851 was 2906. The living is a perpetual curacy in the archdeaconry of Salop and diocese of Lichfield. Newport Poor-Law Union contains 16 parishes and townships, with an area of 47,477 acres, and a population in 1851 of 15,620.

The corporation of Newport existed in the reign of Henry III. A portion of the parish church appears to be of the 15th century, and the interior bears traces of great beauty; but the side-aisles having been rebuilt with brick, the building presents a most incongruous appearance. The Independents and Roman Catholics have places of worship. The Free Grammar school has three masters, and several exhibitions for Oxford University. The number of scholars in 1851 was 53. There are another Endowed school for boys, a National school for girls, and a savings bank. A county court is held. The market-day is Saturday. The manufacture of stockings furnishes some employment.

NEWPORT, Isle of Wight, Hampshire, the capital of the island, a market-town and municipal and parliamentary borough, in the parish of Newport, is situated in 50° 42' N. lat., 1° 17' W. long., distant 82 miles S.S.W. from London. The population of the borough in 1851 was 8047. The borough is governed by 6 aldermen and 18 councillors, and returns two members to the Imperial Parliament. The living is a curacy annexed to the vicarage of Carisbrooke, in the archdeaconry and diocese of Winchester.

Newport is situated in a valley near the centre of the island, on the left bank of the Medina River, which is navigable to Newport. Vessels of considerable burden can ascend to the quay with high tides. The town is built on an easy ascent, and is well paved, lighted with gas, and clean. The town-hall and market-house form a neat and commodious structure. There are a public library and reading-room, called the Isle of Wight Institution; a mechanics institute; a Free Grammar school, which had 42 scholars in 1852; a small theatre; and two assembly-rooms. The church was built in 1172, but has been frequently repaired and altered. There are chapels for Wesleyan Methodists, Independents, Baptists, and Roman Catholics; National and Infant schools; Blue-coat and Gray-coat schools for girls; and a savings bank. A county court is held. The House of Industry, in the vicinity of Newport, is a spacious building, with 80 acres of land attached to it, divided into fields and gardens, and cultivated by the inmates. The Albany barracks were built in 1798, and were much employed during the last war: they have a good military hospital, and grounds attached to them. Farkhurst prison, for juvenile convicts, is in the neighbourhood of Newport.

The market is on Saturday, and is much frequented, Newport being a central depot, from which corn and other agricultural produce are shipped, and which imports articles of manufacture, coals, provisions, &c., for the interior and south side of the island. The lace manufacture employs several hundred persons. An annual fair is held on Monday, Tuesday, and Wednesday in Whitsun week; at Michaelmas are three Bargain-Fair Saturdays, when the country men-servants and maid-servants meet at separate parts of the town to be hired, and this is the great season for rustic sports. There are some fine walks in the neighbourhood of Newport.

NEWPORT. [ESSEX; KENTUCKY; PEMBROKESHIRE; TIPPERARY.]

NEWPORT PAGNELL, Buckinghamshire, a market-town and the seat of a Poor-Law Union, in the parish of Newport Pagnell, is situated near the junction of the rivers Ouse and Ousel, in 52° 5' N. lat., 0° 43' W. long., 28 miles N. by E. from Aylesbury, 50 miles N.W. by N. from London by road. The population of the town in 1851 was 3812. The living is a vicarage in the archdeaconry of Buckingham and diocese of Oxford. Newport Pagnell Poor-Law Union contains 45 parishes and townships; with an area of 68,051 acres, and a population in 1851 of 28,093.

The town of Newport Pagnell is divided into two unequal parts by the river Ousel, over which there is an iron bridge, erected in 1610. The parish church is a spacious building of considerable antiquity, with a handsome square tower and pinnacles, and stands upon an eminence from which there is a fine view of the surrounding country. There are chapels for Independents, Baptists, and Wesleyan Methodists;

National, British, and Infant schools; a Charity school for 20 girls; a school for girls, supported by Mrs. Vanhagan; a literary and scientific institute; and a savings bank. There is here an academy for educating young men for the ministry, in connection with the Independents. The principal charities of the place are Revis's almshouses and Queen Ann's hospital, or almshouse—so called from Ann, consort of James I., by whom it was refounded. The manufacture of bone-lace is carried on to some extent. There is a good carrying trade in coal, and timber. The market is held on Saturday, and seven fairs, chiefly for cattle, are held in the year. A county court is held.

NEWPORT, or NEWPORT-PRATT, county Mayo, Ireland, a market-town and sea-port, and the seat of a Poor-Law Union, is situated at the head of Clew Bay, on the Newport River, in 53° 53' N. lat., 9° 31' W. long., distant by road 11 miles W.N.W. from Castlebar, 170 miles W.N.W. from Dublin. The population in 1851 was 934. Newport Poor-Law Union comprises 10 electoral divisions, with an area of 159,510 acres, and a population in 1851 of 15,879. The town contains a neat parish church, chapels for Roman Catholics and Methodists, and several National schools. There are also a court-house, some large storehouses recently erected, and a Union workhouse. The harbour admits to the quays vessels of 400 tons. The principal trade is the export of grain. Petty sessions are held monthly. Tuesday is the market-day. Fairs are held June 8th, August 1st, November 11th, and December 20th. The neighbourhood is strikingly diversified by the numerous islands around the head of Clew Bay, and the lofty mountains skirting it on either side, and those overhanging Newport Vale.

NEWRY, Ireland, a sea-port town, parliamentary borough, and the seat of a Poor-Law Union, partly in county Armagh, but chiefly in county Down, is situated on the Newry River, in 54° 10' N. lat., 6° 20' W. long., distant by road 88 miles S.S.W. from Belfast, 63 miles N. from Dublin by road, and 74 miles by the Dublin and Drogheda, and Dublin and Belfast Junction railways. The borough returns one member to the Imperial Parliament. Its population in 1851 was 13,191, besides 883 inmates of the workhouse. Newry Poor-Law Union comprises 23 electoral divisions, with an area of 187,785 acres, and a population in 1851 of 84,576.

The town grew up around a monastery, which was founded in 1158, and soon after a castle was built in the place, by John de Courcey, one of the Anglo-Norman conquerors of Ulster. The castle was destroyed by Edward Bruce, in his invasion of Ireland. Being rebuilt, it was again destroyed in the rebellion of Shane O'Neil; but was a second time restored by Bagnal Marshal, of Ulster, who also rebuilt the town, and re-peopled it with Protestant settlers. Newry suffered in the civil war of 1641, and was destroyed by the army of James II., in their retreat from the north in 1689, only the castle and six houses being left standing. The borough was incorporated by James I., and till the Union returned two members to the Irish Parliament. The corporation is extinct. The town is under the management of 21 commissioners. Four stone bridges over the river Newry connect the two parts of the town, and four drawbridges cross the canal, which runs along the right bank of the river. The town contains many handsome houses. It is lighted with gas, well-paved, and supplied with water.

The parish church, a handsome structure in the early English style, with a tower and spire 190 feet high, was erected in 1811. Of two chapels of ease, one, formerly the parish church, was built in 1678, and restored in 1680. There are two Roman Catholic chapels, one of them the diocesan chapel of the Bishop of Dromore; a nunnery; a school, preparatory to the college of Maynooth; chapels for Presbyterians, Independents, and Methodists; National schools; and a savings bank. Among the public buildings are the new court-house, the town-hall or market-house, a spacious assembly-room, a neat custom-house, a large infantry barrack, the fever-hospital, dispensary, Union workhouse, and two bridewells. Along the quay are large and well-built warehouses. The manufactures of the town are linen, cotton, glass, and cordage. There are also iron and brass foundries, coach and car manufactories, tan-yards, breweries, a distillery, and corn- and flour-mills. Newry communicates with Carlingford, 5 miles distant, by a ship canal and the Newry River; and with Lough Neagh, 32 miles distant, by a boat canal and the river Bann. Vessels drawing 15 feet water ascend to Albert Basin, at the town. The port of Newry, which extends to Carlingford Bay, admits vessels of 1000 tons to Warrenpoint, 6½ miles below the town. The principal exports are grain, provisions, cattle, eggs, and butter. Two steamers sail twice a week to Liverpool. There is a considerable trade with North America, the Baltic, and the Levant. On Dec. 31st 1853 there were registered as belonging to the port, 117 sailing-vessels, of 7694 aggregate tonnage, and three steamers, of 873 tons. During 1853 there entered the port 773 sailing-vessels of 55,873 tons, and 145 steam-vessels of 40,886 tons aggregate burden; and there cleared 224 sailing-vessels of 18,097 tons, and 135 steam-vessels of 38,266 tons aggregate burden. Quarter and petty sessions are held in the town. Fairs are held on the first Monday after Easter week, and on October 29th. In Ballybot, a part of the town within the county of Armagh, fairs are held on the Tuesdays after the 18th day of March, June, September, and November. The market-days are Tuesday, Thursday, and Saturday.

NEWTOWN-IN-THE-WILLOWS. [LANCASHIRE.]

NEWTOWN, or NEWTON ABBOT, Devonshire, a market-town, and the seat of a Poor-Law Union, is situated on the little river Lemon, at the head of the Teign estuary, in 50° 32' N. lat., 3° 38' W. long., distant 15 miles S. by W. from Exeter, 188 miles S.W. by W. from London by road, and 214 miles by the Great Western and Bristol and Exeter railways. The population of the town of Newton in 1851 was 3147. The livings are in the archdeaconry of Totnes and diocese of Exeter. Newton Abbot Poor-Law Union contains 89 parishes and townships, with an area of 117,896 acres, and a population in 1851 of 52,306.

Newton Abbot is finely situated on rising ground on the right bank of the Lemon. On the left bank is that part of the town called Newton Bushel. The town has been considerably improved of late years. The town-hall is a neat building. Besides the parochial chapel there are in Newton Abbot chapels for Independents and Baptists. The Wesleyan Methodists have a chapel in Newton Bushel, and there are National schools. The market-days are Wednesday and Saturday. Fairs are held on June 24th, September 11th, and November 6th. It was at Newton Abbot that William, prince of Orange, afterwards William III., made his first public declaration after landing at Torbay in 1688.

NEWTOWN. [GLAMORGANSHIRE.]

NEWTOWN STEWART. [TYRONE; WIGTONSHIRE.]

NEWTOWN-UPON-AYR. [AYR.]

NEWTOWN, Montgomeryshire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Newtown, is situated in a beautiful valley on the right bank of the Severn, in 52° 38' N. lat., 3° 8' W. long., distant 8 miles S.W. from Montgomery, and 175 miles W.N.W. from London. The population of the parliamentary borough of Newtown, which is contributory to Montgomery in returning a member to the Imperial Parliament, was 6371 in 1851. The living is a rectory in the archdeaconry of Montgomery and diocese of St. Asaph.

Newtown is the chief seat of the flannel manufacture in Montgomeryshire. A spacious flannel hall has been recently erected. The church is a new building; there are chapels for various bodies of Dissenters, a National school, and a mechanics institute, with a library of 300 volumes. A county court is held. There are several potteries, tan-yards, and malt-kilns. Machinery of various descriptions is manufactured. The Montgomery Canal commences at this town. Around the canal basin, or along the banks of the canal, are lime-kilns, and wharfs and yards for landing and storing coals, bricks, slates, timber, and other articles. Markets are held on Tuesday, Thursday, and Saturday. There are several yearly fairs, one of them a considerable fair for sheep and pigs.

NEWTOWN. [CONNECTICUT; WIGHT, ISLE OF.]

NEWTOWN-BARRY. [WEXFORD, County of.]

NEWTOWN-BUTLER. [FERMANAGH.]

NEWTOWN-FORBES. [LONGFORD, County of.]

NEWTOWN-LIMAVADY, county of Londonderry, Ireland, a market-town, and the seat of a Poor-Law Union, is situated on the right bank of the Roe, and on the Londonderry and Coleraine road, in 55° 3' N. lat., 6° 56' W. long., distant by road 15 miles E.N.E. from Londonderry, 148 miles N. by W. from Dublin. The population in 1851 was 3206, besides 408 inmates of the workhouse. Newtown-limavady Poor-Law Union comprises 19 electoral divisions, with an area of 152,392 acres, and a population in 1851 of 33,899. Newtown-limavady contains a large parish church; a Roman Catholic chapel; an Independent, a Methodist, and five Presbyterian chapels; a National school, an Infant school, and a savings bank. There are also a market-house, a dispensary, the Union workhouse, and bride-well. Large sales of flax and of general farm produce are made at the markets, which are held on Monday, Tuesday, and Friday. Quarter and petty sessions are held. Fairs are held March 28th, June 18th, and October 29th. Newtown-limavady, then named the Dog's Leap, was the ancient seat of the O'Callans. The town shared in most of the important warlike events of which Londonderry county was the scene in the period subsequent to the conquest. It was incorporated by James II. and returned two members to the Irish Parliament.

NEWTOWN-HAMILTON. [ARMAGH.]

NEWTOWARDS, County Down, Ireland, a market-town, and the seat of a Poor-Law Union, is situated near the head of Lough Strangford, on the Belfast and Donaghadee road, in 54° 36' N. lat., 5° 54' W. long., 12½ miles E. from Belfast by the Belfast and County Down railway, which is opened to the town. The population in 1851 was 9567, besides 508 inmates of the workhouse. Newtownards Poor-Law Union comprises 16 electoral divisions, with an area of 93,851 acres, and a population in 1851 of 56,861. The town, pleasantly situated in the midst of hills, is neat, regular, and well built. In the Market-square and principal street are many good houses. The parish church is a handsome building, erected in 1817. There are chapels for Roman Catholics, Presbyterians, and Methodists, and three National schools. The old parish church, erected in 1632, a large building with a handsome spire, is now used as a court-house. There are a market-house, a bride-well, and a Union workhouse. The weaving and embroidering of muslin afford a considerable amount of employment.

Quarter and petty sessions are held. Fairs are held on the second Saturday of every month, and on January 23rd, May 14th, and September 23rd. Near the centre of the town is an octagonal structure, with canopied niches, forming the pedestal of a cross, erected in 1636. Newtownards was incorporated by James II., and returned two members to the Irish Parliament.

NEWTYLE. [ENGLAND.]

NGAMI, LAKE. [AFRICA.]

NIAGARA. [CANADA.]

NICÆA (*Nicaia*), an ancient ruined city in Bithynia, in the north-west of Asia Minor, the site of which is marked by the Turkish village of Is-nik. It stood on the eastern shore of the Lake Ascania, and was built or restored by Antigonus, son of Philip, after whom it was called Antigonæa. The name was subsequently changed by Perdiccas in honour of his wife, Nicæa, daughter of Ptolomæus, king of Egypt. The city became early the seat of a Christian bishop. It was destroyed by an earthquake in the latter end of A.D. 325, but it was restored under the emperor Valens in 368. Aided by the Greek Nicephorus Melissenus, the Turks, under Solyman I., took the city (1080), which was made their head-quarters till 1097, when Godefroi de Bouillon, at the head of the Crusaders, took it after a siege of 35 days, and it was again united to the Greek empire. Two years after the establishment of the Latin empire in Constantinople (1204) Theodore Lascaris made Nicæa the Greek capital, which it continued to be till 1261, when, in the reign of Michael Palæologus (who was crowned at Nicæa the year before), Constantinople was recovered by the Greeks. In 1383, after an obstinate and bloody siege, the Turks, under Orkan, again took Nicæa, which they made their capital. After the battle of Angora (June 30, 1402) it was taken and pillaged by the followers of Tamerlane. In 1422 it joined in a conspiracy to put Mustapha on the throne of his brother, Amurath II., whereupon the latter reduced the city to obedience, and had his brother and the chief conspirators strangled in his presence.

Sir Charles Fellowes, who visited the site of Nicæa, says that the walls form a circuit of four miles. These walls are strengthened with towers. One part is built or repaired with materials of great elegance from an ancient temple; another part is built with Roman brick; a third with marbles of a late age, marked with the sign of the cross and ill-out inscriptions, shewing the repairs made in Christian times; the remaining parts are built of immense stones cut to fit into each other in the cyclopean style. Four large majestic gateways with arched entrances still exist in an almost perfect state, but the inscriptions that once covered them have been nearly altogether effaced. Among the existing remains are many inscribed stones, copies of which are given in Sir Charles Fellowes's 'Asia Minor'; ancient bas-reliefs; a few statues; and ruins of an early Greek theatre, "of extremely good workmanship, and colossal, the stones being some nine and others fourteen feet in length." Ruins of mosques, baths, and houses are seen among the gardens and corn-fields which cover a great space within the ancient walls. In the village of Is-nik, which stands in the centre of the ruins there is a small church, used by the Greeks for their worship, with mosaic floor and ceiling of the Byzantine age. Every fence, trough, or paving-stone in the village and its neighbourhood is derived from this quarry of art, and many fragments of good sculpture are built into the houses. A Roman aqueduct still conveys water to the town from the neighbouring mountains. In the lake, the waters of which are of transparent clearness, are the remains of an ancient landing-place.

In the history of the church Nicæa is memorable as the place in which the first and seventh œcumenical or general councils were held. The first, held in 325 (June 19 to August 25), in presence of the emperor Constantine, and presided over by Osius, representative of Pope Sylvester, condemned the doctrines of Arius, maintained the divinity of Christ, and declared the consubstantiality of the Son of God with his Father to be an article of faith. The creed founded upon these decrees was drawn up by Osius; it is the *Symbolum Nicænum*, that is, Nicæne or Nicæne Creed, still in use. This council also passed decrees for celebrating the festival of Easter on the same day throughout Christendom. A proposal forbidding priests who were married before receiving holy orders, to live with their wives, was rejected. The council was attended by 318 bishops from all parts of the Roman empire.

The seventh general council, held in 787 (September 24 to October 23), and attended by 377 bishops, condemned the Iconoclasts, and explained the worship of images.

(Fellowes, *Asia Minor*; *Art de Vérifier les Dates*.)

NICARAGUA, Republic of, Central America, occupies the hilly and volcanic region extending from Salinas Bay to the Bay of Conchagua on the Pacific, and back to the Mosquito territory. It may be taken generally as lying between 10° 45' and 14° 10' N. lat., 84° and 87° 40' W. long.; and as bounded E. by the Mosquito territory; N. by the republic of Honduras; N.W. by that of Salvador; W. by the Pacific Ocean; and S. by the republic of Costa-Rica: but the eastern boundary is really undefined, Nicaragua refusing to acknowledge the right of the King of Mosquito to the tract lying along the Caribbean Sea. The area consequently is not agreed upon: that really under the authority of the republic does not probably exceed 35,000 square miles, but that claimed is of course much greater. The population may be about

250,000: the chief part of whom are ladinos, or mulattoes, and native Indians.

The coast along the Pacific from Salinas Bay to the Gulf of Conchagua bears nearly north-west. It is throughout rocky and has some harbours of much value. That which may just now be regarded as the most important, from its being the Pacific port for the Nicaragua route connecting the Atlantic and Pacific Oceans, is San Juan del Sur, north of Salinas Bay, which is formed by two promontories between 400 and 500 feet high, having an entrance above 3000 feet across. The harbour is small, but well sheltered, and affords anchorage in from 2 to 10 fathoms water. About a mile from it is the nearly similar harbour of Nacascolo. Port Realejo, towards the northern end of the state, is also a very good and much larger harbour, and is that which prior to the opening of the Nicaragua transit route received most of the foreign vessels trading with the republic. There is a very narrow tract of tolerably level land along a good part of the coast.

Along the western side of the republic, at a few miles from the coast, extends a ridge of low volcanic mountains, highest at the southern end, and generally decreasing in altitude as we proceed northward: though one or two of the isolated peaks in the northern part are among the most elevated. Several of these volcanoes appear to stand alone or to have scarce any connection with the main ridge, though standing in its general line of direction. The highest summits appear to be Omotepec, which forms an island in Lake Nicaragua (5100 feet above the sea); Momotomba, at the northern extremity of Lake Managua, about the same height; Mombacho, between Lake Nicaragua and the Pacific (4500 feet); Nindirí, between Managua and Masaya; Felica; El Viejo, and one or two others. Several of these are active volcanoes. Another mountain tract, a part of the mountain system of Honduras, extends along the northern part of the country. This part of Nicaragua is traversed by several ridges, some of whose summits attain a considerable altitude. Between the ridges extend many good-sized valleys, the principal being those of the Rio de Segovia, and the Rio Escondido. The remainder of the state belongs to the plain of Nicaragua, of which however the larger portion forms the Mosquito territory. This plain is but little elevated above the level of the sea; the Lake of Nicaragua which occupies a large part of the Nicaragua section of it being only 122 feet above the Caribbean Sea. Along the rivers it is wooded; the rest of the plain forms extensive savannahs, covered with a rich verdure, and presenting occasionally a clump of high trees. The climate being excessively hot and moist the white races have not formed any settlements on this plain, and it is only inhabited by independent aboriginal tribes.

The few rivers which in Nicaragua fall into the Pacific are of short extent and of little consequence. Those falling into the Atlantic are longer and more important. Two considerable streams rise, as already mentioned, in the northern part of the republic, the Segovia and the Escondido; the sources of some of their upper branches are not very distant, but their outlets are far apart—that of the Escondido being near the southern, and that of the Segovia towards the northern end of the Mosquito coast. The Segovia flows past the town of the same name, but both rivers belong more to Mosquito than to Nicaragua. The most important river of this republic is the *San Juan*, which forms the boundary between Nicaragua and Costa-Rica, and falls into the Caribbean Sea, near 11° N. lat. It is by means of this river and the Lake of Nicaragua, that one of the two great lines of communication is proposed to be opened between the Atlantic and Pacific oceans. The river San Juan is the only channel by which the Lake of Nicaragua discharges its waters into the Atlantic. The Lake or Lagoon of Nicaragua is an inland sea, of a lengthened form, being about 100 miles long and 40 miles broad where widest, without narrowing much at either end. It is the reservoir of a great extent of mountainous country, and is deep enough to be navigated by vessels of considerable size, having about 100 yards from the beach generally a depth of about 2 fathoms; and at a greater distance from 5 to 15 fathoms of water along the southern and western banks. It is only very shallow along the north-east shore for a mile and upwards into the lake. It contains several islands, among which that of Omotepec, near the south-western bank between Granada and Nicaragua, is remarkable for a high volcano, and for its fertility and population, being inhabited by a numerous and industrious tribe of Indians, who have a small town, Moyagalpa, possess cattle, and raise maize, rice, &c. The river issues from the south-eastern extremity of the lake; its breadth varies from 100 to 400 yards. About the middle of its course the San Juan receives from the south the Rio San Carlos, and lower down the Serapiquí. About 25 miles from its mouth the river divides into two arms, of which the southern and wider is called Rio Colorado; the other enters the sea near the harbour of San Juan del Norte. [MOSQUITO KINGDOM.] The depth of water in the upper part of the course of the San Juan varies from 9 to 20 feet, but in some places it is so shallow that rapids are produced, and it contains numerous islands. The lower portion of the river, below its bifurcation, is generally shallow. The mouth of the San Juan has a bar with seldom four feet of water upon it. The winding course of the river is somewhat under 100 miles. On the Pacific side there are however greater obstacles to the communication between the two oceans than that presented by the channel of the San Juan. At the narrowest part the distance between the Lake and the Pacific is only about 15 miles, and on the coast

there is here the good harbour of San Juan del Sur, but the hills upon it rise to between 400 and 500 feet, presenting a formidable barrier to the construction of a canal, while the difference of level between the lake and the sea is 129 feet, and therefore locks would be necessary. The hills might perhaps be in a measure avoided, but the canal would of course be longer. Whether such a canal will ever be formed it would be hard to predicate; especially since the completion of the railway across the Isthmus of Panama has provided so much more rapid a route. But even in the absence of the canal this route has been largely adopted. As noticed under MOSQUITO KINGDOM the governments of England and the United States concluded a treaty in 1850 by which they agreed to co-operate in the establishment of a secure and neutral line of communication between the two seas by way of the San Juan River and Lake Nicaragua, to be open on equal terms to all nations, with a free port at each end of the line. A company as there mentioned was formed for constructing a canal, improving the navigation of the San Juan, and working the communication by steam-boats. The Nicaragua Transit Company have been unable even to attempt to carry out the first and most arduous part of their task, but they have established steam-boats of light draught to navigate the river, and organised a line of carriages to convey the passengers and goods from Nicaragua to San Juan del Sur on the Pacific. During 1854 a very large number of passengers to and from California adopted this route, and we find it asserted in some of the advertisements of the line published in New York, that not only is "the Nicaragua Transit route the shortest, safest, and by far the most comfortable and healthful," but that passengers by it "have to travel but 12 miles of land carriage over a good macadamised road." Long before the establishment of this route communication had been maintained between the Atlantic and the towns of Granada and Nicaragua, by the river San Juan and Lake Nicaragua, by means of flat-bottomed vessels called piraguas, of from 5 to 10 tons burden. The passage from Granada to San Juan, or Greytown, is usually made by the piraguas in about 8 days, whilst the return passage being against the stream, occupies from 12 to 15 days. It has been proposed by some as more advantageous to unite the Lake of Managua by a canal with the harbour of Realejo. The country between them is nearly level, and of a firm soil, without being rocky. Besides this, the canal would terminate in the port of Realejo, one of the best harbours on the west coast of America, while that near Nicaragua would end in the smaller harbour of San Juan del Sur. But this canal would be more than twice as long as the other; in addition to which, the Tepitapa, which unites the Lake of Nicaragua with that of Managua, must be rendered navigable. The Lake of Managua is 35 miles long, and 15 miles broad in its widest part. It is deep enough for vessels of considerable size; but the Rio Tepitapa, which brings down the water from the Lake of Nicaragua, and is about 25 miles long, has falls which, in the dry season, are from 6 to 8 feet high, and also several shoals. These obstacles could only be avoided by a canal cut through the level ground on the northern side of the Rio Tepitapa.

The climate of the Plain of Nicaragua, as stated above, is hot and moist, and so unhealthy as to have caused it to be left to the undisturbed occupation of the native races. The thickly-wooded banks of the San Juan River are no exception to this observation. The shores of the Pacific, where the population is densest, are also very hot and somewhat humid, but do not appear to be particularly unhealthy, except in the vicinity of the Bay of Conchagua, where however there are comparatively few inhabitants. The hilly districts between the coast and the western banks of the lakes are much milder and more salubrious, as is also the mountainous country of the north. There are regular dry and rainy seasons, as in other parts of Central America [COSTA-RICA, &c.], the only difference being that the rains last somewhat longer, and fall in larger quantities. In the hilly country west of the lakes occasional showers also occur out of the regular rainy season.

The soil throughout the occupied districts appears to be very fertile, but agriculture is in a rude state; the roads are almost everywhere insufficient, ill made, and ill kept, and oxen are almost the only animals of draught. Although therefore Nicaragua might with a peaceful and industrious people furnish vast quantities of agricultural produce for other countries as well as for the supply of a greatly increased population, it really affords little more than suffices for domestic consumption. Maize and frixoles are raised in considerable abundance, and form the staple food of the people. Some wheat is grown in the north, chiefly for use in the cities. Sugar, indigo, cotton, coffee, cocoa, and tobacco are all grown, but, except indigo, not to any great extent. A great variety of fruits, including several native kinds, with oranges, lemons, &c., ripen well; and garden vegetables flourish, but little attention is paid to them except by the Indians, who cultivate them for sale in the cities. Indigo, Nicaragua, and Brazil wood, and some other timber and dye-woods and hides, are at present the chief articles exported. Cattle are among the principal sources of wealth, very large numbers of them being kept on the plains along the eastern sides of the lakes. Fish are plentiful in the lakes, in which also crocodiles are common. Along the coast pearls used to be found. The mineral resources of Nicaragua have not been very diligently explored. Gold and silver have been found and worked, but not extensively; copper has also been found.

GEOL. DIV. VOL. III.

The manufactures are nearly confined to the coarser goods required for home consumption. The chief articles made are coarse cotton and woollen cloths; the cotton being dyed of a purple colour, obtained from a shell-fish caught in the vicinity of San Juan del Sur, is in great request among the Indians, who prefer it to any European dyed goods on account of the greater durability of the colour.

Nicaragua is divided into five departments, which are named after their respective capitals:—Segovia comprises the north-eastern part of the territory; Leon the north and north-western; Managua the district south of Leon; Granada that south of Managua; and Nicaragua the most southern part bordering on Costa-Rica. Leon is the political capital. The following are the principal towns; the populations are merely a loose approximation:—

Leon, the capital of Nicaragua, contained not many years ago a population of 32,000 inhabitants, but the civil contentions within the town have reduced it to half that number, and destroyed a large proportion of its best buildings. It is situated on the road which leads from the best cultivated districts of the state to the harbour of Realejo, in 12° 26' N. lat., 86° 52' W. long. The city occupies a considerable area, and contains a cathedral, several churches, a university, Tridentine college, &c., but all in a very neglected condition.

Granada, on the north-western bank of the Lake of Nicaragua, population about 12,000, carries on some trade with Jamaica by means of the river and harbour of San Juan; contains several churches and convents; but has no features requiring further notice.

Managua, on the south bank of Lake Managua, is a considerable place, containing 10,000 inhabitants. *Masaga*, some little distance S. of Managua, has a population nearly equal to it, but almost all Indians, who are engaged in commerce with the adjacent populous country, and in the manufacture of the various articles of domestic requirement in which they display much skill.

Nicaragua, about 2 miles from the west bank of Lake Nicaragua, contains, with the suburb of San George, some 15,000 inhabitants, and is surrounded by a district noted for its fertility, especially in cacao and grapes.

San Juan del Sur, on the Pacific, S.W. of the town of Nicaragua, contained but few inhabitants previous to its selection as the Pacific port for the Nicaragua line of communication between the two oceans. The harbour, as already mentioned, is small but convenient, and possesses good anchorage.

Segovia, on the Rio de Segovia, is a small place, whose only claim to notice is that of being the capital of the department of Segovia, the least populous section of the republic. The country around is fertile and healthy, and its mineral wealth is believed to be considerable.

Nicaragua is nominally a republic with a senate and a chamber of deputies, but the government is really vested in a dictator with the title of Supreme Director. After the declaration of independence, and the formation in 1842 of the republic of Central America [GUATEMALA; HONDURAS], Nicaragua formed one of the federal states until the dissolution of the union, when, like the other states, it became an independent republic; and, like them, all hopes of its progress have been since arrested by constant internal discord. [See SUPPLEMENT.]

NICASTRO. [CALABRIA.]

NICE, or NIZZA, an administrative division of the Sardinian States, bounded W. by France, from which it is separated by the Var, S. by the Mediterranean, E. by the division of Genoa, and N. by the main ridge of the Maritime Alps, which divide it from Piedmont, and send out numerous branches southward, that cover about two-thirds of the whole territory. The Col-di-Tenda, a high pass over these mountains, rises about 5900 feet above the sea, and is traversed by the main road from Nizza to Turin. The mountain slopes and high valleys afford good pasture, and the loftiest uplands are covered with forests. The soil in the mountains is ill-adapted for cultivation; but in the valleys and lower slopes of the south the soil is good and the vegetation luxuriant. Maize, barley, and a little wheat are the principal grain crops. Olives, figs, grapes, oranges, lemons, almonds, citrons, some dates, and various other fruits are abundantly produced. The palm, the aloe, rose-laurel, myrtle, and other odoriferous and tropical plants flourish throughout the year; and it is not uncommon at the end of December to see some trees in blossom and others covered with fruit. The forests afford good timber. The mulberry is extensively cultivated. Cattle are numerous, and bees are carefully tended. The fisheries along the coast are very productive. There is an argentiferous lead-mine near the town of Tenda. Spun silk, coarse woollens, soap, paper, and perfumes are the chief industrial products. These articles, together with oil, raw silk, wine, honey, timber, and the fruits before-named, are the principal exports. The chief rivers are the Var (which receives the Vesubia and the Tinea), the Paglion, the Roja, the Taggia, and the Impero. Sheltered by the Alps from the north winds, the division has a delicious but rather a dry climate; the sea breezes moderate the heat of summer; in spring and autumn however the sirocco and the mistral are sometimes felt. A good road, affording a series of the most delightful and magnificent views, runs along the coast from Nizza to Genoa.

The administrative division of Nizza lies between 45° 40' and 44° 20' N. lat., 6° 40' and 8° 8' E. long. Its length from north-east to south-west is about 75 miles; the mean breadth is about 23 miles.

3 R

The area is 1623 square miles, and the population in 1848 was 242,990. The language of the people is a mixture of old Provençal French and Italian.

The administrative division of Nizza, which consists of the former county of Nizza and the western portion of the old republic of Genoa, is now divided into 3 provinces, 28 mandamenti, and 194 comuni. The area and population of these provinces are as follows:—

Provinces.	Area in Square Miles.	Mandamenti.	Population in 1848.
Nizza . . .	1179	14	118,377
Oneglia . . .	174	6	60,072
San-Remo . . .	365	8	64,541
Total . . .	1618	28	242,990

The principal towns in the province of Nizza, are—*Nizza* [NICE]; *Sospello*, 17 miles N.E. from Nizza: population, 4394; *Scorgio*, on the left bank of the Roja: population, 2639; *Tenda*, at the foot of the Col-di-Tenda: population, 2441; *Villa-Franca*, 2 miles E. from Nizza, which has a good harbour, docks for the Sardinian navy, and a population of about 3000, who ply the tunny fishery along the coast, and trade in oranges, lemons, wine, silk, corn, and hemp; and *Briga*, 25 miles N.E. from Nizza: population, 3729. The province forms the see of the Bishop of Nizza.

Of the province of Oneglia, situated between that of Albenga on the east, and San Remo on the west, the chief town is *Oneglia*, which stands 45 miles E. from Nizza, on the sea-coast, at the mouth of the Impero, and has 5500 inhabitants. It has some fine churches, a college, and a small harbour, by which wine, fruits, and oil are exported. Oneglia is the birthplace of Andrea Doria. The other towns are—*Porto-Maurizio*, a well-built busy little sea-faring town, with a population of 6481 in the commune; and *Pieve*, N. by W. from Oneglia, in the valley of the Aroschia: population of the commune, 3093. The province of Oneglia is included in the see of Albenga.

The province of San-Remo, situated west of Oneglia, and east of the province of Nizza and the principality of Monaco already noticed [MONACO], has for its chief town *San-Remo*, which is built on the slope of a hill rising from the sea-shore, 30 miles E. from Nizza, and has 9854 inhabitants. It is sheltered from the north winds by a semicircular group of mountains, the lower slopes of which are planted with olive, lemon, orange, fig, almond, and pomegranate trees. The town, which is well built, has a handsome church, college; and a gallery of good paintings; it is supplied with water by an aqueduct of modern erection. The inhabitants trade with Marseille and Genoa in the produce of the country, and in dried fruit and salt provisions. The port of San-Remo admits small craft only. *Ventimiglia*, a well-built town at the mouth of the Roja, a few miles W. of San-Remo, has 5894 inhabitants. It gives title to a bishop, whose see is the province of San-Remo. The cathedral and the church of San-Michele are handsome structures, said to be constructed with the remains and on the sites of two Roman temples. There are several Roman inscriptions in this town. *Taggia*, situated in a rich wine district on the right bank of the Taggia, 5 miles N.E. from San-Remo, has a population of 3880. *Triora*, 10 miles N. from San-Remo, is situated among the mountains on the left bank of the Taggia, and has 4346 inhabitants in the commune.

NICE, or NIZZA, the ancient *Nikaia*, the capital of the Sardinian province and administrative division of Nizza, is situated on the Mediterranean coast, about 10 miles E. from the mouth of the Var, 96 miles S. by W. from Turin, in 43° 41' N. lat., 7° 16' E. long., and has 85,195 inhabitants, including the garrison and foreign visitors. It is pleasantly situated, being bounded on the north by the Maritime Alps, and open on the south to the sea. The citadel of Mont-Albano, on a high and pointed rock, overhangs the town, and the Paglion, a mountain torrent, passes it on the west side, separating it from the suburb called La-Croix-de-Marbre. In this suburb the houses are painted externally in fresco, and surrounded with gardens containing orange- and lemon-trees. The town itself is divided into two parts, distinguished respectively as the old and new towns. The streets of the former are narrow; the latter is better laid out, and the houses are painted in fresco. There are two handsome squares, one of them surrounded with porticoes. Adjacent to one of these is a raised terrace, which serves for a defence of the town against the sea and for a public walk. The ramparts of the town on the land side form another promenade. The cathedral of Santa-Reparata is the chief public building. The climate of Nice has been much celebrated for its mildness, but has been probably over-praised. The neighbourhood of the Alps, and the prevalence of the 'Vent de Bise,' a keen searching wind, render the air frequently very cold and even frosty in winter and spring; and the heat in summer is excessive. It is however much resorted to by invalids and other strangers, especially English. The walks and rides in the neighbourhood of the town are agreeable. The rocky eminence crowned by Fort Montalban, which divides the town from Villa-Franca, has a lighthouse at the extremity, and commands a very extensive view stretching from Antibes to Monaco, and

comprising in clear weather the island of Corsica, which is 90 miles distant. There are a theatre, baths, good inns, caffès, and a public library. The town has silk-, cotton-, and paper-mills, a great number of oil-mills, and a tobacco manufactory. Soap, liqueurs, essences, superior turnery, inlaid tables, boxes, trays, and perfumery are also made. The port, which is protected by a mole, is spacious and secure. Vessels of 300 tons can enter it. The chief trade is in silk, oranges, fruit, and the manufactures of the town. The roadstead would afford anchorage to 100 vessels of the line. The town gives title to a bishop, whose see is the province of Nizza. Foreign consuls reside in Nice. Steamers ply regularly between Marseille and Genoa.

Nikaia was founded by the Greeks of Massilia, and fortified by them to repress the neighbouring tribes and secure the navigation of the adjacent sea. It continued subject to the Massilians after the establishment of the Var as the boundary of Gaul and Italy. In the middle ages it was the capital of a county, and a strong fortress. It was besieged in 1543 by the French and Turks, taken and plundered, except the citadel, which held out. The town was again taken by the French in 1691, 1706, and 1744. It was seized by the French, without resistance, in 1791, and annexed to the republic, being made the capital of the department of Alpes Maritimes. In 1814 it reverted to Sardinia.

NICHOLAS, ST. [FLANDERS, EAST.]

NICOBAR ISLANDS, THE, are situated in the Indian Ocean, between 6° 50' and 9° 20' N. lat., 92° 50' and 94° 10' E. long. They consist of nine larger islands and some smaller ones. The two most southern are called Great and Little Nicobar. Great Nicobar is more than 20 miles long and 8 miles across in the widest part. Little Nicobar is not half as large. Farther north are six smaller islands. The best known are Noncowry and Camorta, or Nicovari, which are separated from one another by a strait, forming one of the safest harbours in India, in which ships of all sizes may ride with the greatest security; and as it is open at both the east and west, two ships may get in and out either with a north-east or south-west monsoon. The most northern island is much farther to the north, and is called Car Nicobar. The surface of these islands is hilly, and the hills in some places are rather high. They are in general covered with wood, and only a few tracts along the shores are cultivated. The dense forest with which the hills are covered are considered to be the cause of the great unhealthiness of these islands to Europeans. The soil is very fertile and capable of producing all the fruits and vegetables of inter-tropical countries. The islands abound in cocoa-nuts, papayas, bananas, limes, tamarinds, betel-nuts, and the mellori, a species of bread-fruit; yams and other roots are cultivated. The mangosteen-tree and the pine-apple grow wild in the woods. The animals are hogs, dogs, and fowls. The woods contain timber in plenty, and some of it supplies excellent materials for building or repairing ships. The sea abounds with exquisite fish, shell-fish, and turtle. Ambergris and the edible bird's-nest are common, and supply the only articles of exportation; the Chinese and Malays annually visit these islands to procure them. The inhabitants belong apparently to the Malay race, and probably do not exceed 3000 or 4000. In the interior of the island of Great Nicobar a tribe is said to exist which differs from the other inhabitants; they are probably the aborigines, and belong to the race of Australian negroes. The Danes twice tried to form a settlement in the harbour of Noncowry, in 1756 and 1768, but they abandoned it after a few years, on account of the unhealthiness of the climate. Some missionaries remained there till 1792, but as they did not succeed in the conversion of the natives they returned to Tranquebar. (Hamilton; Fontana; Colebrooke, in *Asiatic Researches*.)

NICOLSBURG. [MORAVIA.]

NICOMEDIA (*Nικουμήδεια*), a city of Bithynia, at the head of the Gulf Astacenus (Gulf of Ismid), was founded by Nicomedes I., B.C. 264. According to Pausanias this city was originally called Astacus (v. 12, § 5); but Strabo informs us that Astacus was another city on the same gulf, which was founded by the Megarians and Athenians, and afterwards destroyed by Lysimachus; on which occasion its inhabitants were removed to Nicomedia (xii. p. 563, Casaub.).

Under the Roman emperors Nicomedia became one of the chief cities of the empire. Pausanias speaks of it as the principal city in Bithynia (v. 12, § 5); but under Diocletian, who chiefly resided there, it increased greatly in extent and populousness, and became inferior only to Rome, Alexandria, and Antioch. (Liban., 'Orat.,' viii. p. 203; Lactant., 'De Morte Persec.,' c. 17.) It was almost entirely destroyed by an earthquake during the reign of the emperor Julian, but it was again rebuilt with great splendour and magnificence, and recovered nearly its former greatness. (Amian. Marcell., xxii. 9; xxii. 13; xvii. 7.) It is called at the present day *Is-nic-mid*, or more usually by abbreviation *Ismid*, and is still a town of considerable importance; but it contains few remains of antiquity. The ancient walls still exist in part; they inclose many a ruined heap, and a much larger space than the town of Ismid. One of the ruins is still recognisable as a Christian church. The persecution of the Christians under Diocletian commenced at Nicomedia. The modern town contains about 3000 houses, and is the residence of a pasha. Steamers ply regularly to Constantinople.

NICOPOLI, NIKOPOL, in Turkish *Tchingani-Kall*, the ancient *Nicopolis ad Istrum*, a city in Bulgaria, in European Turkey, and the

capital of a pashalic, is situated on the right bank of the Danube, 80 miles S.W. from Bukharest, 280 miles N.W. from Constantinople, and has about 10,000 inhabitants. The Osmas on the Bulgarian side, and the Aluta on the Wallachian, join the Danube just above the town. The city, which occupies one of the finest sites in the world, consists of two parts. The fortress and Musulman town, crowned by many shining minarets, stand on the summit of a lofty limestone cliff above the Danube, several hundred feet high, and surrounded by a ravine. It is a place however of little real importance as a fortress, for it is commanded by heights around it. On the opposite or eastern slope the houses of Bulgarians, Wallachs, and Jews rise in white clusters one above another like an amphitheatre. The Turkish town is defended on every side by batteries and by a stout parapetted rampart, for the protection of infantry; it is further defended by a castle or citadel. There are some large well-built houses, several mosques, and baths, but in general the town is ill built. The neighbourhood of Nicopoli, especially on the eastern side, towards Sistova, is very beautiful; much of the ground about the town is laid out in gardens. Nicopoli gives title to a Greek archbishop and a Catholic bishop. Its situation on the Danube makes it a place of some trade.

Nicopoli was founded by Trajan; several patches of the ancient walls still remain. The sultan, Bajazet I., at the head of the Janissaries, defeated the Hungarians, commanded by their king, Sigismund, and aided by the choicest troops in Europe, under the walls of Nicopoli, Sept. 28, 1396. Sigismund had besieged the town for six days before the arrival of the Turks. The town has often suffered from the Russians.

NICOSIA. [CATANIA; CYPRUS.]

NICOTERA. [CALABRIA.]

NIE'MEN is the Polish name of a river, which by the Germans is called *Memel*, and by the Lithuanians *Niémona*. It rises in the swampy region which, between 51° and 56° N. lat., forms the watershed between the rivers that run into the Baltic and Black seas. It originates between 58° and 54° N. lat., and near 27° E. long., and runs in its upper course about 180 miles westward. At the town of Grodno it suddenly turns to the north, and continues in that direction about 100 miles. It then turns again to the west, and soon afterwards is joined, at Kowno, by the Wilia, the largest of its affluents, which flows about 180 miles in a western direction. The remainder of its course is to the west. From Grodno to its entrance into Prussia it forms the boundary-line between Russia and Poland. Its course through Prussia amounts to about fifty miles. About eight miles below Tilsit the river divides into two arms, which branch off respectively to the north-west and south-west. The northern arm, called Russ, divides again, about two miles from its mouth, into two arms, the Atmat and Skirwieck. The southern arm is called the Ghilghe. Both arms empty themselves into the Curisches Hafl. The delta included between the Russ and Ghilghe, called the island of Kaukehnen, is alluvial and of great fertility, but it is swampy towards the lake. Though impeded by shoals at several places, the river is of great importance for the exportation of the produce of the adjacent countries. Large though clumsily-made river-barges, called 'wittinnes,' bring the produce of Lithuania (governments of Wilna and Grodno) and of a portion of Poland to Königsberg and Memel. These barges go up the Niemen to Grodno, and up the Wilia to Wilna. They bring down all kinds of oorn, hemp, flax, hides, bacon, and some minor articles. All the timber exported from Memel is floated down from the interior of Russia. As the wittinnes were formerly often lost owing to the westerly and north-westerly gales, which prevail on the Curisches Hafl, two canals have been made along the shores of that lake, by which the Ghilghe is united to the Deime, and thus to the Pregal river, on which the commercial town of Königsberg is built. The Oginsky Canal, cut in the middle of the 18th century, establishes a water-communication between the Niemen and the Dnieper, which runs into the Black Sea. This canal, 34 miles in length, unites the Szcza, a tributary of the Upper Niemen, and the Yasolda, an affluent of the Prypeck, a feeder of the Dnieper.

There is perhaps no river in Europe whose floods rise to such a height and whose inundations are so destructive as the Niemen. Snow to the depth of from four to six feet falls every winter on the country which is drained by it; and as the course of the river in general lies from east to west, this immense quantity of snow, being dissolved in so short a time as ten or fourteen days, causes the river to rise twenty or thirty feet above its general level; and as the fall of the river is in all its extent very inconsiderable, and its current slow, the water can only be carried off in a much longer time, and hence it accumulates in its bed and inundates the adjacent lands to a distance of several miles in many places, and causes great damage.

NIENBURG. [HANOVER.]

NIEUPORT. [FLANDERS, WEST.]

NIEVRE, a department in the centre of France, lies between 46° 40' and 47° 35' N. lat., 2° 50' and 4° 10' E. long., and is bounded N. by the department of Yonne, E. by Côte-d'Or and Saône-et-Loire, S. by the department of Allier, and W. by those of Cher and Loiret. The greatest length of the department, from north-west to south-east, is 79 miles; the greatest breadth, at right angles to the length, is 65 miles. The area is 2632 square miles. The population in 1841 was 305,246; in 1851 it was 327,161, giving 124.3 inhabitants to a square mile, or 50.28 below the average per square mile for the whole of

France. The department is formed from the old district of Nivernais, and is named from one of its rivers, the Nièvre.

The heights which separate the basin of the Loire from that of the Seine traverse the department from north-west to south-east; in the south-east part they are called the mountains of Morvan, being included in the district of that name, which comprehends the eastern side of the department. [MORVAN.] The east of the department is the more rugged portion, and consists chiefly or wholly of primitive rocks, granitic or schistose; the western part is covered by beds of the secondary strata, which intervene between the red marl and the chalk; the valleys of the Allier and the Loire, in the southern extremity of the department, and the valley of the Loire, in the north-western extremity, are occupied by the supracretaceous formations. The portion of the department that belongs to the basin of the Seine consists of hills separated by deep valleys; it is drained by the YONNE and its feeders, and has a general inclination towards the north. The larger division of the department lies on the south side of the watershed, and consists of extensive and sandy but tolerably fertile plains, sloping down to the the LOIRE, which crosses the south-western angle of the department, receiving the Aron and the Nièvre, a small stream that gives name to the department, on the right bank, and the ALLIER on the left. The western boundary of the department is formed by the Allier and the Loire. The Allier, the Loire, and the Yonne are navigable; the two last are joined by the Canal-du-Nivernais, which leaves the Loire at Decize, runs up the valley of the Aron, and, crossing the watershed between the Loire and the Seine, enters the Yonne 3 miles S. from Corbigny. There are about 400 ponds in the department, most of which become dry in summer. The department is traversed by 9 state and 12 departmental roads. The continuation of the Orléans-Bourges railway runs for a short distance along the left bank of the Allier, in the south-west of this department; a short branch connects the town of Nevers with this line.

Though the soil of the department is in general poor, yet corn more than enough for the home consumption is raised by careful husbandry. The mountains supply abundant pasture, and a large number of cattle is reared. In the arrondissement of Château-Chinon, in the east of the department, where the soil is decidedly bad, the only produce is rye, oats, or buckwheat. In the arrondissement of Clamecy, and in the districts that belong to the basin of the Loire, the produce includes wheat, wine, fruits, hemp, leguminous plants, &c. The arrondissement of Nevers, which occupies the south-west of the department, produces corn, wine, and pasture. The north-western districts, forming the arrondissement of Cosne, are fertile in corn and wine. The hilly country is in many parts covered with extensive forests of oak, maple, and beech trees. Timber forms one of the principal sources of wealth to the inhabitants, and is conveyed by water to Paris and other large towns. The quantity of wine produced in average years is about six millions of gallons, about one-third of which is exported, chiefly from Pouilly-sur-Loire. The climate is temperate and healthy, but rather damp. Several iron-mines are worked, and the ore is smelted and converted into malleable iron in a great number of iron-works, the most important of which are those of Pont-St.-Ours, Imphy, and Fourchambault. Coal-mines are worked near Decize. The iron, coal, and timber trades are important, and are continually improving in consequence of the great facilities for transit afforded by river and canal navigation and railways. The manufactures are—woollen-cloth, linen, hardware, inferior cutlery, fiddle strings, porcelain and pottery, paper, and glass. The chief articles of the commerce of the department are its agricultural and industrial products, hides, steel, copper, sheet-iron, tin-ware, oak-staves, wood charcoal, mill-stones, vine-poles, cattle, fire-wood, &c. About 370 fairs and markets are held in the year.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Nevers	8	108	105,484
2. Château-Chinon	5	55	69,083
3. Clamecy	6	97	77,038
4. Cosne	6	68	74,956
Total	25	326	327,161

1. Of the first arrondissement, and of the whole department, the capital is NEVERS. Decize, a town of 3358 inhabitants, is built on a rocky island in the Loire at the junction of the Aron with that river, and at the head of the Nivernais Canal. The only remarkable building is the old castle of the dukes of Nevers, which stands on the highest part of the island. The town communicates with both banks of the Loire by a good stone bridge and by a suspension-bridge. Iron is manufactured, and also tin; fuel-wood, charcoal, coal, oak-staves, vine-poles, hoops, &c., are the chief articles of trade. *St.-Pierre-le-Moutier*, a town of 2319 inhabitants, which owes its name and its origin to a suppressed Clunian monastery, stands near a small lake 15 miles S. from Nevers. A kind of sand in request for the manufacture of porcelain is found at this place, and exported to Paris and Rouen. *Pougues*, famous for its mineral spring, is a small village of

about 1200 inhabitants, a few miles N.N.W. from Nevers. *St.-Saulge*, situated N.E. of Nevers, in a valley between two wooded hills, has a population of 2147.

2. In the second arrondissement the chief town, *Château-Chinon*, is situated near the source of the Yonne, 37 miles S. from Nevers, on a high hill surrounded by still loftier heights which are covered with forests. It has a tribunal of first instance and 2925 inhabitants, who manufacture coarse woollens and leather, and trade in fuel-wood, charcoal, hides, wool, wheat, wine, and cattle. *Luzy*, on the Haine, a feeder of the Aron, is situated in the south-east of the department, and has a population of 2273, and some trade in wood, charcoal, pigs, and cattle. *Moulins-Engilbert*, at the foot of the Morvan Hills, a few miles S.W. from Château-Chinon, has an ecclesiastical school and 2867 inhabitants, who manufacture coarse woollens, serge, linen, and leather.

3. In the third arrondissement the chief town, *Clamecy*, stands at the junction of the Beuvron with the Yonne, and has 6002 inhabitants in the commune, who manufacture woollen-cloth, pottery, and leather, and trade largely in wood and charcoal. The town was formerly fortified and defended by an old castle. From 1168 to 1793 it was the residence of a bishop, who took his title from Bethlehem in Palestine, the original see having been suppressed by the Saracens. Clamecy has tribunals of first instance and of commerce, and a college. *Corbigny*, a town of 2124 inhabitants, situated in a well-wooded hilly country, 15 miles S. by E. from Clamecy, and near the confluence of the Anguisson with the Yonne, has cloth factories, tan-yards and a considerable trade in wood. *Lormes*, N.E. of Corbigny, formerly a fortified town defended by a strong castle still remaining, has a population of 3214. *Varsy*, 10 miles S.W. from Clamecy, is situated in a pretty valley at the foot of a high hill covered with vines, and has a population of 3132, who manufacture linen, leather, and pottery. In the neighbourhood there are several iron forges and furnaces. The town has a college, an hospital, and a town-house.

4. The fourth arrondissement takes its name from its chief town, *Cosne*, or *Cône*, the ancient *Condatis*, which stands on the right bank of the Loire, here crossed by a suspension-bridge, 32 miles N. by W. from Nevers, and has a tribunal of first instance, a college, and 6245 inhabitants. The little river Nohain, which here enters the Loire, drives the machinery of several iron-works and forges, in which anchors for the French navy are manufactured. The town is in general well built. It trades in corn, wine, nails, cutlery, timber, hemp, cattle, &c. *La-Charité*, 14 miles N. by W. from Nevers, prettily situated at the foot of vine-clad slopes on the right bank of the Loire, has a population of 6052, who manufacture cutlery, ironmongery, files, steel, bar-iron, and metal buttons. There are iron-forges, glass-works, and potteries in the neighbourhood. The town is clean, but on the whole an ill-built place. The bridge over the Loire is the most remarkable object. *Pouilly*, also situated on the banks of the Loire, a few miles below Cosne, in a rich wine district, has 3169 inhabitants. *Prémery*, N.E. of Nevers, on the Nièvre, has iron forges and foundries, tile and brick-works, and 2103 inhabitants. *Donsy*, E. of Cosne, on the Nohain, has a population of 3791, who manufacture bar- and sheet-iron, and trade in these products and in wood.

The department forms the see of the Bishop of Nevers, is included in the jurisdiction of the High Court of Bourges, within the limits of the University-Academy of Dijon, and belongs to the 19th Military Division, of which Bourges is head-quarters. It returns two members to the Legislative Assembly of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

NIGER, or QUORRA, a large river flowing through the interior of Central Africa, and entering the Gulf of Guinea by several mouths between the bights of Benin and Biafra. There seems no reason to doubt that the ancient Niger is identical with the Quorra. Herodotus (ii. 32) gives an interesting account of five young men of the Libyan tribe of Nasamonæ, which dwelt on the coast of the Greater Syrtis, who proceeded on a journey of discovery into the interior. After traversing in a southern direction the inhabited region, and next to it the country of the wild beasts, they crossed the great sandy desert in a western direction for many days, until they arrived at a country inhabited by men of low stature, who conducted them through extensive marshes to a city built on a great river which contained crocodiles and flowed towards the rising sun. This information Herodotus derived from the Greeks of Cyrene, who had it from Etearchus, king of the Ammonii, who said that the river in question was a branch of the Egyptian Nile, an opinion in which the historian acquiesced. Strabo seems to have known little of the interior of Africa and its rivers.

Pliny ('Hist. Nat.,' v. 1) gives an account of the expedition into Mauritania of the Roman commander Suetonius Paulinus, who (A.D. 41) led a Roman army across the Atlas, and, after passing a desert of black sand and burnt rocks, arrived at a river called Ger, in some manuscripts Niger. The Ger, or Niger, of Suetonius Paulinus was probably the Ghir which runs through Sejelmesa. But besides the Ger, or Niger, of Suetonius, Pliny in several places (v. 8, 9, and viii. 21) speaks of another apparently distinct river, the Nigris of Ethiopia, which he compares with the Nile, "swelling at the same seasons, having similar animals living in its waters, and, like the Nile, producing the calamus and the papyrus." In his extremely confused account, which he derived from the authority of king Juba II. of Mauritania, he

mixes up the Nigris and the Nile together with other rivers, as if all the waters of Central Africa formed but one water-course.

Throughout all these confused notions of the hydrography of interior Africa entertained by the ancients, one constant report or tradition is apparent, namely, that of the existence of a large river south of the great desert, and flowing towards the east. It is true that Herodotus, Strabo, Pliny, and their respective authorities thought that this river flowed into the Nile, but Mela, seems to have doubted this, for he says that when the river reached the middle of the continent, it was not known what became of it.

Ptolemy, who wrote later than the preceding geographers, and seems to have had better information concerning the interior of Africa, after stating the boundaries of Libya Interior, proceeds to enumerate various positions on the coast of the ocean, after which he mentions the chief mountains of Libya and the streams that flow from them to the sea. He then adds, "In the interior the two greatest rivers are the Geir and the Nigeir; the Geir unites Mount Usargula (which he places in 20° 20' N. lat., 38° E. long.) with the Garamantic pharanx (the name of a mountain which he has before stated to be in 10° N. lat., 50° E. long.). A river diverges from it at 42° E. long., 16° N. lat., and makes the Lake Chelonides, of which the middle is in 20° N. lat., 49° E. long. This river is said to be lost under ground and to reappear, forming another river, of which the western end is at 16° N. lat., 46° E. long. The eastern part of the river forms the Lake Nuba, the site of which is 15° N. lat., 50° E. long." The positions here assigned to the Geir and the direction of its main stream, from the Garamantic Mountain to Mount Usargula, being south-east and north-west, seem to point out for its representative either the Shary of Bornou and its supposed affluent the Bahr Kulla of Browns, or perhaps the Bahr Misselad of the same traveller, called Om Teyman by Burckhardt, who says that its indigenous appellation is Gr. a large stream coming from about 10° N. lat., and flowing north-west through Wadai, west of the borders of Dar-Fur. The Misselad is supposed to flow into Lake Fittre; we do not know whether any communication exists between Lake Fittre and the Tschad. From the exploration of Dr. Barth it appears that Lake Fittre is the bottom of a distinct basin, and that it is fed by the Batha, which he says receives all the smaller water-courses descending from the more elevated country at the western foot of Jebel Marah. Several streams, besides the Bahr Kulla and the Bahr Misselad, all coming from the south, flow in a north-west direction through the countries lying between Bornou and Dar-Fur, and the Geir of Ptolemy may have been the representative of any or all of them. Linant was informed by some Takrousi pilgrims from Dar-Sille that they travelled two months on the Bahr-al-Abiad before they arrived at Sennar; and that before arriving at the Abiad they followed the course of another river upwards; and that the Abiad had its rise in a country called Bahr-el-Lesse, from which some of the waters flow towards Marok, that is to say, to the north-west.

We now come to Ptolemy's Nigeir, which he makes quite a distinct river from the Geir, and places it to the westward. He says that it joins the mountain Mandrus, 19° N. lat., 14° E. long., with the mountain Thala, 10° N. lat., 38° E. long. Its course is thereby defined as much longer and in a less oblique line to the equator than the Geir. In fact it would correspond tolerably well with the actual direction of the course of the Joliba and that of the Rima or River of Sakkatoo, supposing that river to form a communication with Lake Tschad, as Ptolemy says that the Nigeir has a divergent to the Lake Libye, which he places in 16° 30' N. lat., 35° E. long.; and the words of the text seem to express that the water ran into the lake, so that the course of the Nigeir, according to Ptolemy, as well as his predecessors, was easterly, as the Joliba or Quorra actually runs for a great part of its course. "The Lake Libye," observes a distinguished geographer, "to which there was an easterly divergent, I strongly suspect to have been the Lake Tschad, notwithstanding that the position of Libye falls 300 geographical miles north-westward of this lake, for the name of Libye favours the presumption that it was the principal lake in the interior of Libya; it was very natural that Ptolemy, like many of the moderns, should have been misinformed as to the communication of the river with that lake, and that he should have mistaken two rivers flowing from the same ridge in opposite directions, one to the Quorra and the other to the Tschad (I allude to the Sakkatoo and the Yec rivers), for a single communication from the Quorra to the lake." (Leake in 'Royal Geographical Journal,' vol. ii.)

But Ptolemy, after all, may not have been so much misinformed with respect to a communication existing between the lake and his Nigeir, if, as is now strongly suspected, the communication really exists, though in an inverse direction from that which Ptolemy appears to have understood. Captain Allen ('London Geog. Journal,' vol. viii.) surmises that the river Tschadda, which at its junction with the Quorra, just above the beginning of the delta, is larger than the Quorra itself, receives an outlet from the lake somewhere about the town of Jacobah. The Arabian geographers of the middle ages, Edrizi, Abulfeda, and Leo Africanus, state that the Nil-el-Abid, or 'River of the Negroes,' flowed from east to west. The Tschadda then would be the river of the Arabian, and the Joliba, or Upper Quorra, that of the Greek and Roman geographers. Both were ignorant of the real termination of their respective streams. "It is nevertheless remarkable,"

says Leake, in the paper already quoted, "that the distance laid by Ptolemy between his source of the river and the western coast is the same as that given by modern observations; that Thamondocana, one of the towns on the Niger, is exactly coincident with Timbuktu, as recently laid down by M. Jomard from the itinerary of M. Caillié; that the length of the course resulting from Ptolemy's positions is nearly equal to that of the Quorra as far as the mountains of Kong, with the addition of the Tchadda or Shary of Funda, and that his position of Mount Thala, at the south-east extremity of the Niger, is very near that in which we may suppose the Tchadda to have its origin; so that it would seem as if Ptolemy, like Sultan Bello and other modern Africans, had considered the Tchadda as a continuation of the main river, though he knew the Egyptian Nile too well to fall into the modern error of supposing the Niger to be a branch of the Nile. The mountains of Kong, and the passage of the river through them at right angles to their direction, formed a natural termination to the extent of the geographer's knowledge."

Great light will be thrown on the geography of Central Africa by the publication of the explorations made since 1850 by Dr. Overweg, Barth, and Vogel. The determination by the latter of the elevation of Lake Tchad above the level of the sea—namely, 850 feet—puts an end to the theory that this lake was connected with either the Nile or the Quorra. In the account published by Mr. Petermann of the discoveries of Dr. Barth, the country to the south-east of Lake Tchad, comprising the basin of the Shary and others of its feeders for some 200 or 300 miles, presents a level plain almost imperceptibly inclined towards the lake; and the country west from the Shary to the Benueh, or Upper Tchadda, has in all probability a similar character of flatness. Dr. Barth, who in 1851 surveyed Lake Tchad and examined the countries forming its basin, mentions the Serbenel, a feeder of the Shary in the Mandara country south of Bornou, as a very considerable river. The Serbenel, which is called Loggene lower down, joins the Shary at a village named Sheggua, below Kusseru or Kusery. At Masafia, the capital of Baghirimi, the Shary, or Asu, runs due north 8 miles an hour, with a width of 600 yards; it subsequently falls into Lake Tchad. Dr. Barth calls it a magnificent river, and says that it extends to the basin of the Nile. The Serbenel and the Shary run nearly parallel above their junction, and are probably branches of the same river.

The Tchadda in its upper course is called the *Benueh*, and rivals if it does not surpass the Quorra in magnificence; and from the level nature of the country it is presumed that it presents no such obstacles to navigation as rapids or falls. The Benueh was crossed by Dr. Barth in his journey to Adamaoua, a very beautiful pastoral and agricultural country on the Upper Tchadda, at a part where it was half a mile wide and ten feet deep. Yola, the capital of Adamaoua, is placed by Dr. Barth in 8° 2' N. lat., 13° 5' E. long. A notion has lately gained ground that the Tchadda presents the most important and the readiest opening for the extension of European influence and civilisation into the interior of Africa. A flat-bottomed steamer, fitted up at the expense of Mr. McGregor Laird for the exploration of the river, left Birkenhead in 1854 so as to reach the mouth of the Niger by the 1st of July, from which time it was calculated that seventy-five days (during which its waters rise) would be sufficient to reach the head of the navigation of the Tchadda. This expedition returned to Fernando Po on Nov. 7, having spent 118 days on the Niger and the Tchadda without losing a single life. The Tchadda was ascended 350 miles, or 250 miles above Dagbeh, which had been reached in the expedition of 1852.

The *Quorra* rises in Mount Loma, a part of the Kong Mountains, which extend eastward from the coast of Sierra Leone, near 9° 25' N. lat., 9° 45' W. long. The French traveller Mollin says that the Quorra rises in 8° 20' N. lat., 9° 10' W. long. This difference may easily be accounted for by observing that many streams rise in a mountainous country which unite to form a great river, and that each of them may be considered as the source of such a river. The most western of these tributaries, that of which Major Laing got information as rising in Mount Loma, is properly considered the principal river. It runs near its source due north for about 70 miles, and is there called Timbia. It then turns to the north-east, and exchanges its name for that of *Baba*, and *Joli-Ba* (that is, large river), under which name its course as far as Timbuktoo is known, the name of Quorra being only applied to the lower portion of its course. Caillié crossed the Joliba at Curuassa, about 100 miles from its source, and found that it was navigated by large canoes. It flowed in a wide valley from south-south-west to north-north-east, which was surrounded by hills from 150 to 200 feet high. The soil of the valley was fertilised by the inundations of the river. The mountains in the neighbourhood are rich in iron-ore, and contain gold.

From Curuassa to Bammakoo, a distance exceeding 200 miles, the course of the river is unknown; but that portion of it which lies between Bammakoo (13° N. lat., 5° 20' W. long.) and Timbuktoo (18° N. lat., 3° 40' W. long.) has been laid down by Mungo Park and Caillié. Mungo Park, who was the first European traveller who reached the banks of that river, in his first journey travelled along the banks of the river from Bammakoo to Silla, a distance of about 160 miles. Between Bammakoo and Tabbec the river runs in a north-east direction, in a wide valley which produces good crops of rice, maize, and

vegetables, and has good pastures; it is pretty well inhabited, and there are several towns on the banks of the river. At Tabbec the Quorra enters the plain of Sídán, and it runs to the east as far as the town of Jennee. From Tabbec to Silla, the end of his travels, Mungo Park found the country on both sides of the river extremely fertile, well cultivated, and studded with towns of considerable size and many villages. In the rainy season the country to a considerable distance from the river is inundated. The current of the river is moderate, and offers no impediments to navigation; large river-boats are frequently seen both ascending and descending. In his second journey Mungo Park embarked at Segou, and descended the river more than 1000 miles to the town of Boussa (10° N. lat., 4° 40' E. long.), where his boat was wrecked and he was killed. Thus the information which he had obtained respecting this part of the course of the river and the countries adjacent to it was lost to the world. But Caillié has partly supplied the loss. He descended the river from Jennee to Timbuktoo, and found the banks in some places well cultivated and rather populous. The general course of the river was north as far as the Lake of Debo, and even to some distance farther; but afterwards it turned to the north-north-east, and continued so to the town of Timbuktoo, or rather to its port, Cabra. The river-barges which navigate this part of the river are from 60 to 80 tons burden, and take the produce of the country—rice, millet, corn, honey, butter of the shea-tree, &c.—to Timbuktoo and other large places. The crews consist of about 20 men: the boats use no sails. The Lake of Debo, through which the Quorra flows, south of 16° N. lat., is of considerable extent; it is perhaps 10 miles from south to north, but it occupies a much greater space from east to west. North of the lake, where the river flows to the north-east, cultivation is more general, and the number of villages is greater. Some of them carry on a considerable traffic with Timbuktoo. The winter at Timbuktoo, according to Dr. Barth, who visited it in 1853, is severely felt, coughs and colds being very prevalent, and the air relaxing, owing to the inundations of the river. In approaching Timbuktoo the Quorra separates into two branches, which appear to unite at no great distance farther down. On the smaller and more northern of these branches is Cabra, the port of Timbuktoo. From Timbuktoo the river seems to run in a general south-east direction to Yauri. It seems that the Quorra leaves the great plain of Sídán before it reaches the neighbourhood of Yauri. Above Yauri it flows through the interesting country of Dindina, a long narrow strip of land on both banks inhabited by a tribe of Tuaricks, who are distinguished for their industry and civilisation above the neighbouring tribes. The Rima or Sakatu River, also called Zirmi, joins the Quorra from the east to the south of the Dindina country; it flows past *Sakatu*, the best provided market and largest town in the Fellata country. This town is built in the form of a square; has 8 gates, according to Dr. Barth, and about 23,000 inhabitants. Sakatu is no longer the Fellata capital; *Wurao*, a town of 13,000 inhabitants, founded in 1831, and situated also on the Rima, 17 miles N.E. from Sakatu, now enjoying that distinction. Dr. Barth, the illustrious explorer of Central Africa, died at Menade on his return from Timbuktoo to Kuka, July 18th, 1854. Kashna, or Katsena, and Kano, are two very important places in the interior, between the Quorra and Lake Tchad. At Kano considerable quantities of British and American manufactures are sold: the former are sent across the desert from Tripoli and the Mediterranean coast; the latter, according to Dr. Barth, are sent up the Quorra in steamers by the Americans, who are extending their influence widely in these regions. A Fellata province near the Quorra called Kebbu (capital, Gando) is described by Dr. Barth as a most fertile, well-watered, and populous region, with "innumerable" large towns and villages.

From Yauri to its mouth, the river Niger has been navigated by the Landers. Between Yauri and Rabba (9° N. lat.) the river runs nearly south, and then it makes a great bend to the east; but before it arrives at 8° 24' lat., near which it is joined on the left bank by the Tchadda, it again runs south. That portion of its course which lies between Yauri and 7° N. lat. is only navigable during and after the rainy season; at the end of the dry season the bed of the river is full of rocks, sandbanks, and shoals. In these parts the river runs through a mountainous country, but the valley is low, and annually inundated; it is however very fertile, and villages and cultivation are common. The mountains by which this valley is inclosed rise to a considerable elevation, and with a gentle declivity. Between 8° and 7° N. lat. the lower offsets of the mountains on both banks of the river come close up to the water, and where they recede from it the interval is not very wide. The declivities of the mountains are covered with woods. This narrow valley does not contain so large a population as the wider one farther north. Near Abbasacca (about 6° N. lat.) the river leaves the mountain region, and enters a low alluvial plain, or delta, in which it divides into a great number of branches. The delta is mostly covered with swamps or jungle. Some parts of it are covered with high forests. The more elevated tracts of the delta are cultivated, and villages occur at distances of two or three miles, but most of them are surrounded by jungle, and not viable from the river. The river is frequently more than two miles wide, but in several places it contracts to a mile and even less, especially towards its mouth. The tide is perceptible to about 100 miles from its mouth. The principal arm or mouth of the river is that called the Nun.

The whole course of the Quorra probably exceeds 2500 miles. The Tchadda, which joins it near 8° N. lat., is not inferior in size to the Quorra; indeed some think the Tchadda to be the principal river. The volume of water brought down by the Tchadda evidently shows that it must have a long course; and this, with some other facts, induced Captain Allen to suppose that the Tchadda is the channel by which the Lake Tchad discharges its waters into the Quorra—a supposition which has hitherto received no confirmation. From the facts stated in a preceding part of this article it might be questioned whether Lake Tchad has any outlet at all.

Several expeditions have been undertaken to explore the Quorra, but generally speaking, they have failed to make us much better acquainted with the river. In the year 1832, Mr. McGregor Laird, and some other gentlemen of Liverpool, formed an association for the purpose of opening a direct communication with the interior of Africa by ascending the Quorra. Two steam-boats were fitted out for the expedition, and a sailing vessel was also equipped to carry out the goods with which it was proposed to trade with the natives. Richard Lander, already known by his African journeys, was engaged to take the direction of the expedition, which was also joined by Lieutenant Allen, for whom the Admiralty had requested a passage for the purpose of making a survey of the river. The expedition reached the mouth of the Quorra in safety, and the river was ascended to Rabba in 9° N. lat.; the Tchadda was also ascended to Dagbeh, in 8° N. lat., a distance of above 100 miles from its confluence with the Quorra. The results of the expedition were most disastrous. It was indeed shown that the Quorra is navigable in moderate-sized vessels from the sea to Bousa; but as a commercial speculation the expedition entirely failed, and it was attended with a melancholy loss of life caused by the climate. Only nine persons of those aboard the steamers survived; among these were Mr. McGregor Laird and Lieutenant Allen. Expeditions sent out by government in 1841 under Captain Allen, and others fitted out since, ended with similar results, the insalubrity of the climate being the main obstacle to the success of the different enterprises.

(Park; Mollie; Laing; Caillié; Clapperton; Lander, *Journal*, *London Geographical Journal*, vol. viii.; Laird and Oldfield, *Narrative of an Expedition into the Interior of Africa*; Petermann, *Account of the Progress of the Expedition to Central Africa in 1850-53*; *Athenæum* for 1852-54.)

NIGRITIA is a term, formerly applied by geographers to that part of Africa at present known by the name of Soudán. [SOUDÁN.]

NIKOLAJEFF. [CHERSON.]

NILE (*Nilus*, in Latin), the name of the great river of Eastern Africa, the various branches of which have their rise in the high lands north of the equator, and, flowing through Abyssinia and other regions to the westward of it, meet in the country of Sennar. The united stream flows northward through Nubia and Egypt, and after a course of more than two thousand miles from the farthest explored point of its principal branch, enters the Mediterranean by several mouths, which form the delta of Egypt. The word Nil seems to be an old indigenous appellation, meaning river, like that of Gir in Soudán and other countries south of the Atlas. The modern Egyptians call the river Bahr-Nil, or simply Bahr; in Nubia it is called by various names; in Sennar the central branch, or Blue River, is called Adit; and in Abyssinia, Abawi. The three principal branches of the Nile are:—1, the Bahr-el-Abiad, or White River, to the west, which is now ascertained to be the largest and longest; 2, the Bahr-el-Azrek, or Blue River, in the centre; 3, the Tacazze, or Atbara, which is the eastern branch. These three branches were known to Ptolemaeus, who seems to have considered the western as the true Nile, and to have called the others respectively Astapus and Astaboras, but his knowledge of them was very limited. The Bahr-el-Abiad was traced upwards by Linant in 1827 as far as Aleis, a direct distance of 132 geographical miles south of Khartum, which is in 15° 34' N. lat. and about 32° 30' E. long., and at the confluence of the Blue and White Rivers. In 1840, 1841, and 1842, expeditions were sent by the Pasha of Egypt to explore the course of the river to its sources, accompanied by some Europeans of scientific acquirements, among them Dr. Werne, a Prussian surgeon, who published an account of the second expedition. In the first the party marched upwards from Khartum for 35 days along the banks of the river, when they began to retrace their steps. At this point the river was shallow, full of islands, and six hours in breadth; and there were no mountains in sight. The latter part of the march appears to have been in a direction nearly west, and as the first island of the Shilluks, which they reached on the twelfth day, is not far from Aleis, according to Linant's statement, the extreme point attained was probably about 10° N. lat. and 29° E. long. By these expeditions it has been ascertained, that as far south as Aleis the Bahr-el-Abiad is in general from one to two miles wide, and runs in a bottom, which is generally four miles wide, but sometimes even six miles. Farther south the river is three miles wide, and contains a great number of low islands. Near 9° 11' N. lat. the Bahr-el-Abiad is joined from the east by a large tributary, the Sobat, which is supposed to rise in the mountains of Abyssinia, and brings down a volume of water nearly equal to that of the principal river. Above this point the Bahr-el-Abiad flows from west to east for about a hundred miles, and appears to traverse an

immense swamp interspersed with many smaller and larger lakes, one of which is stated to cover an area of 420 square miles. The river is completely navigable, without cataracts and even without rapids. At length the expeditions arrived in the country of a black nation called the Barrys, where their progress was stopped by a ledge of gneiss, which traversed the river in all its width. Here the current was estimated at six miles an hour, and mountains became visible, extending from east to west. This point, the farthest advance of Dr. Werne, was in 4° 42' N. lat., 30° 58' E. long. The natives stated to Dr. Werne that the sources of the river were much farther south.

About the end of 1845 M. Anthony d'Abbadie claims to have found the source of the White Nile in a stream called the Gibe, the source of which, in the mountains of Marya, he reckons to be in 7° 49' 45' N. lat., and in 36° 2' 39" E. long., thus making the river bend round to the north and east. But Dr. Beke and others still contend, founding their belief on information obtained from natives, from the mass of water brought down, and other reasons, that the Gibe of M. d'Abbadie is at most only an affluent, and that the true source is not yet discovered, though it probably lies in a range of mountains in about 2° S. lat. This theory he considers to be confirmed by the intelligence obtained by Dr. Krapf (one of the explorers of Africa from the eastern coast) in 1851, who heard of a river issuing from a large lake at the foot of the mountains of Kenia, flowing northward through another lake, and having an immense body of water.

Since Dr. Werne's visit the Pope's Vicar-General in Africa, Dr. Knoblecher, who has a missionary establishment at Khartum, has ascended the White Nile somewhat farther. He reached 4° 9' N. lat. in the country of the Barry negroes in 1850, twice ascended a mountain called Lognek, and saw the river trending away in a south-westerly direction, until it was lost between two mountains. He was also informed by the natives that beyond these mountains the river came straight from the south. The river was about 625 feet wide, and from 10 to 15 feet deep.

The Bahr-el-Azrek, or Blue River, which was long supposed to be the main branch of the Nile, has three sources in the high land of Gojam, near the village of Geesh, south-west of Lake Dembea, in 10° 59' 25" N. lat., 36° 55' 30" E. long., according to Bruce's observations. The Agows, who inhabit that district, worship the river. [ABYSSINIA.] The sources of the Azrek appear to have been visited by Father Pass, and perhaps by other missionaries, long before Bruce. After a north and north-west course of about 70 miles, the Azrek, or Abawi, as the Abyssinians call it, enters the Lake Dembea or Tsana on its south-western side. This fine lake is 65 miles in length from south-east to north-west, according to Bruce's map, and above 30 miles in its greatest breadth; its surface is more than twice that of the Lake of Geneva. It occupies the centre of an elevated table-land, surrounded by hills and mountain ranges, from which numerous streams fall into the lake. The Blue River, issuing from the lake at its south-east extremity, runs first to the south-east, forming a large cascade at Alata; after which it flows nearly due south, and then turns to the south-west, encompassing the provinces of Gojam and Damot, and leaving Amhara proper on its right or eastern bank. After receiving several affluents from the high lands of Shoa and Efa, it turns to the north-west, forming a curve which twice intersects the tenth degree of north latitude. The vast tract between this branch and that of the White Nile is yet unexplored; it is nominally dependant on Sennar, and is inhabited by the Denka, the Shilluks, the Bokki, and other negro tribes, who are pagans. Continuing its course in a north-north-west direction, towards the low country of Sennar, the Azrek, or Adit, as it is here called, passes by the town of Sennar, which is on its left bank, in about 13° 30' N. lat., 33° 45' E. long. Continuing to flow nearly in the same direction, it receives on its right bank the Dandar, Rahat, and other streams which flow from the outer or western side of the highlands which inclose the basin of Lake Dembea. At Khartum the White and Blue Rivers unite, the former being the wider. After passing Halfay the united stream of the Nile bends towards the north-east, passes by Shendy and the ruins of Meroe, and on entering the country of Berber it receives on its eastern bank the Tacazze or Atbara, the third great confluent of the Nile.

The Tacazze, perhaps the Astaboras of the ancients, rises in the high mountains of Lasta, in about 11° 40' N. lat., 39° 40' E. long. Its sources were known to the Jesuit missionaries in Abyssinia, and have been visited of late years by Pearce. It flows for a considerable distance in a northern direction between the range of the Samen Mountains on the west, and those of Lasta, Salowa, and Bora on the east. It receives on its right bank the Arequa from Antalo. On arriving at 18° 15' N. lat. the Tacazze turns to the north-west, forming the boundary between the kingdom of Amhara, on its left, and Tigre on its right bank. The river has numerous rapids, which render it fordable at most seasons of the year. Salt saw in it enormous crocodiles of a greenish colour and large hippopotami. Proceeding north-west through the lowlands of Waldhuba and Walkayt, about 14° 50' N. lat., 36° 40' E. long., it receives on its left bank the Angrab, which rises on the north slope of the highland of Dembea. It afterwards receives several other streams which come from the same direction and pass through the country of Ras-el-Feel. It then inclines more to the north; and between the parallels of 16° and 17° N. lat.

in the country of the Taka, it receives on its eastern bank the Mareb, a considerable stream which comes from Tigre. The Tacazze then passes Gous Radjib, and inclines again to the north-west, forming the boundary of the so-called island of Meroe and the Berber country; and after receiving the Mogren on its right bank, at last enters the Nile at 17° 45' N. lat., and about 34° 5' E. long.

The Nile, from the confluence of the Tacazze down to its entrance into the Mediterranean, a distance of 1200 geographical miles measured along the course of the river, receives no permanent streams; but in the season of rains it receives wadys, or torrents, from the mountains which lie between it and the Red Sea. After flowing through Berber in a north-north-western direction, a populous and fertile district, and full of villages, the Nile enters a barren and dreary country, where the desert sands come close to the river's edge. The rocks and stones of the desert are generally of black granite. No verdure is to be seen, except on the margin of the river. On arriving at about 19° N. lat. the Nile turns nearly direct west, and forms the large island of Mograt. The Nile below Mograt turns abruptly to the south-west. This is known as the great bend of the Nile. Arriving at the village of Korti, 18° N. lat., 31° 50' E. long., the river turns to the west; and after a course of about 30 miles in that direction, it resumes a northern course, flowing through the province of Dongola. The breadth of the cultivable land on each bank through the Dongola country, which is above 100 miles in length, varies from one to three miles, beyond which is the desert. The left or western bank is the more fertile, the eastern bank being in many places sandy and barren. North of Argo, in 19° 40' N. lat., the Nile enters the province of Dar Mahass, in Lower Nubia, where it forms a cataract, or rapid, commonly called the third cataract by those who ascend the river. After several windings the river inclines to the north-east; and near 22° N. lat. forms the second cataract, called Wady Halfa, after which it passes the splendid temple of Abusamboul, or Ipsamboul. Continuing its north-east course, the Nile passes by Derr, Dndour, and Kalabsheh; and at about 24° N. lat. forms the last cataract between granite rocks which cross the river near Essouan, or Assouan. Along this tract of Lower Nubia the valley of the Nile is very narrow; about Kalabsheh it rises between 30 and 40 feet perpendicularly during the inundation; and after it has subsided, in February, according to Sir J. G. Wilkinson, the stream runs at a rate of two or three nautical miles an hour.

After entering the boundaries of Egypt the Nile flows through the whole length of that country, which it waters and fertilises. Egypt owes to the Nile its very existence as a productive and habitable region, and accordingly, in olden times, the people worshipped the beneficent river as their tutelary god. [See SUPPLEMENT.]

NILGHERY MOUNTAINS, [HINDUSTAN.]

NIMEGUEN, [GUELDBRAND.]

NÎMES, or NISMES, capital of the French department of Gard, stands at a short distance from the right bank of the Gard, in 43° 50' 36" N. lat., 4° 21' 8" E. long., 30 miles by railway N.E. from Montpellier, and had 49,480 inhabitants in the commune in 1851. Nîmes, the ancient *Nemausus*, is a town of great antiquity. Strabo (p. 186, Casaub.) notices it as the capital of the Volcæ Ariscomisci. It submitted to Rome, B.C. 119, but retained its own laws and enjoyed the 'Jus Latii,' by virtue of which those elected to the ædileship or quæstorship in Nemausus acquired the rights of Roman citizens. It was fortified with walls and gates by the emperor Augustus, about 14 years before the Christian era. On the downfall of the Roman empire Nîmes fell into the hands of the Visigoths; it was taken in the beginning of the 8th century by the Moors, from whom it was wrested by Charles Martel, at whose hands the town suffered much. In the religious wars of the 16th century it was one of the strongholds of the Calvinists: it submitted to Louis XIII., who dismantled the fortifications. In the earlier periods of the French revolution (1791) and on the second restoration of the Bourbons (1815) it was the scene of serious intestine troubles, political and religious.

Of all the towns in France, Nîmes preserves the most striking memorials of its ancient grandeur. The ancient temple, now called Maison Carrée, which is considered to be a master-piece of architecture, is the best preserved Roman monument in the city. Its ground plan is a rectangle 84 feet long by 44 feet wide; the interior length is 52½ feet; the breadth and height are 39½ feet each. It is surrounded by 30 fluted Corinthian columns, so arranged as to present 11 on each side, 6 in the front, and as many at the back. The cornice and frieze which run all round the building, and the capitals of the columns, are regarded as models of architectural beauty. The only entrance to the building is by a door in the front under the portico, the ascent to which is by 15 stone steps. As there were originally no windows, it is conjectured that light was obtained by openings in the roof. There is reason to believe that this structure was only the sanctuary of a vast temple, the walls of which have been lately traced. The age of its erection is unknown, but from some traces of an inscription it is supposed to have been dedicated to Marcus Aurelius and Lucius Verus. In the middle ages it served as a town-hall: in the time of Louis XIV. the canons of St. Austin fitted it up as a church: it is now completely restored, and used as a museum of antiquities and a painting gallery.

The amphitheatre, which is near the Maison Carrée, is in form an ellipse, the major axis of which, extending from east to west, is

431½ feet in length and the minor axis 337½ feet, including the thickness of the walls. The inclosing structure consists of a lower and an upper story, each pierced by 60 arcades; the whole is surmounted by an attic, the summit of which is 70½ feet high. The lower or ground story is adorned with pilasters, and the upper with Tuscan columns. The attic shows the holes destined to receive the posts on which was stretched the awning that covered the amphitheatre. The rows of seats were 24 in number. There were four principal entrances, one facing each cardinal point. The amphitheatre was capable of holding 24,000 spectators. It was built with great solidity without cement. The stones were quarried in the neighbourhood, and some of them are of immense size. The building stands isolated in the midst of a wide open space, and with the exception of the seats may be said to be in almost a perfect state. The arena is now used for bull-coursing and for wrestling matches.

The edifice called Temple de Diane, but which was in reality a hydraulic edifice connected with the adjacent baths, is a mere ruin. The interior still exhibits some remains of a fine vaulted roof and of the niches and columns which once adorned it. The baths and the fountain which supplied them have disappeared, but their plan has been traced; a fountain erected under Louis XIV. disfigures the site. The waters of this fountain are conveyed by a canal round one of the public gardens of the town, and the place of the baths is occupied by statues and groups in marble, of modern date and inferior execution. A beautiful fountain was erected in June, 1851. In the centre of an octagonal basin on an 8-sided pedestal stands the personification of the city crowned with a temple, which seems to be a model of the Maison Carrée; on the four contreforts of the pedestal are four figures of river-gods. The sculptures are of Carrara marble; the basins and body of the fountain of stone. The basins are 8 feet high, and the diameter of the basin in which the whole stands is 38 feet.

The Tour-magne, supposed to be a Græco-Celtic mausoleum and the oldest monument of antiquity in Nîmes, is a tower which originally consisted of several stories diminishing in circumference and differing in form as they rose from the lowest. The ruin now presents a lower story of heptagonal form, 321 feet in circumference, and an upper story, which is octagonal. The original height of the structure was 124 feet, but what now remains of it is only 78½ feet high. It stands on an elevation, and is joined to the ancient walls of the town.

There are two Roman gates. One of them, called Porte d'Auguste, was discovered in 1791, on pulling down some ramparts erected in the 12th century. This gate is built of large blocks of freestone, and has two large arches in the middle, and two smaller arches, one on each side. It bears an inscription, showing that the gates and walls were the gift of Augustus Cæsar to the colony of Nemausus.

Besides these remains Nîmes has a vast number of inscriptions, monumental and other, and one or two fine mosaic pavements. In the neighbourhood there is a Roman bridge.

Nîmes is situated in a delightful plain at the foot of hills covered with vineyards and olive-gardens. The city, properly so called, has narrow, crooked, and ill-built streets; it is surrounded by boulevards, which occupy the site of the ancient ramparts, and separate it from its suburbs, which at least equal it in extent, and have straight, wide streets, but the houses are ill built. Of the public edifices the most remarkable are the court-house, the former citadel which is now used as a central prison, the hospital, the theatre, the cathedral, and the college church. The cathedral contains some interesting monuments, among others the tomb of Fléchier; its pavement is 159 feet above the level of the sea.

Bronze Coin of Nîmes, from the Museum of Avignon.

This coin is the celebrated 'Pied de Biche,' which is very rare. There is a similar coin which is so common that it is often found current with the copper money of France. The two heads are said to be those of Agrippa and the emperor Augustus; that on the right hand is Augustus, and that on the left is Agrippa. The inscription is read, "Imperator Divi Pilius Pater Patriæ." The crocodile chained to a palm-tree, surmounted by a streamer, is said to commemorate the victory of Actium and the subsequent reduction of Egypt, of which the crocodile is the symbol. The words 'Col. Nem.' (Colonia Nemausus) refer to the founding of the colony by Augustus. (Rasche, 'Lexicon Rei Numaricæ'.)

Nîmes has long been an important manufacturing town. Its importance has been lately on the increase in consequence of its being the centre from which the railways diverge that connect the town with Alais, Montpellier, Cette, Arles, Avignon, and Marseille. The principal manufactures are fancy silk goods, silk stockings and caps, hosiery of all kinds, velvet, small wares, printed cottons, shawls, handkerchiefs, chintzes, &c. There are several dye-houses, potteries, brandy-distilleries, vinegar-works, and tan-yards; and the town is the great mart for the raw silks of the surrounding district. Nîmes carries on considerable trade in these productions; and in wine, spices, drugs, oleaginous seeds, medicinal plants, and dye-stuffs.

Nîmes gives title to a bishop, whose see is the department of Gard. It has a High Court, which has jurisdiction over the departments of Ardèche, Gard, Lozère, and Vaucluse; there are also tribunals of first instance and of commerce, a chamber of commerce, and an exchange, a council of prud'hommes, a theological college, an endowed college, a school of design, a botanical garden, several cabinets of antiquities, and a public library of 30,000 volumes. By recent legislation of the French empire the University-Academy of Nîmes has with some others been suppressed, and the department of Gard is now placed within the limits of the University-Academy of Montpellier.

NINEVEH, called by the Greeks and Romans Ninus, the capital of the Assyrian empire, was situated in the plain of Aturia, on the left bank of the Tigris, opposite to the modern town of Mosul. The Hebrew and Greek writers concur in describing Nineveh as a very large and populous city. Jonah speaks of it as "an exceeding great city of three days' journey" (Jon., iii. 3), and states that there were more than 120,000 persons in it that knew not their right hand from their left (iv. 11). Rosenmüller and other commentators suppose this to be a proverbial expression to denote children under the age of three or five years, and accordingly estimate the entire population at two millions. Strabo says that it was larger than Babylon (xvi. 737); but if any dependence is to be placed on the account of Diodorus (ii. 3), who states that it was 480 stadia in circumference, it must have been about the same size as Babylon. (Herod., i. 178.) The walls of Nineveh are described by Diodorus as 100 feet high, and so broad that three chariots might be driven on them abreast. Upon the wall stood 1500 towers, each 200 feet in height, and the whole was so strong as to be deemed impregnable. (Diod., ii. 3; Nahum, chap. ii.)

According to the Greek writers, Ninus was founded by a king of the same name; but in the book of Genesis it is only stated to have been built by the Assyrians, which appears to be the meaning of the passage in Gen., x. 11. It was the residence of the Assyrian kings (2 Kings, xix. 36; Isaiah, xxxvii. 37; Strabo, ii., p. 84; xvi., p. 737), and is mentioned as a place of great commercial importance; whence Nahum speaks of its merchants as more than the stars of heaven (iii. 16). But as in the case of most large and wealthy cities, the greatest corruption and licentiousness prevailed, on account of which Nahum and Zephaniah (ii. 13) foretold its destruction.

On the dissolution of the great Assyrian monarchy, in the 8th century B.C., Nineveh was taken by the Medes under Arbaces, in consequence of the river demolishing part of the wall; when it is said to have been destroyed. (Diod., ii. 26-28.) But it appears to have still existed as the capital of an Assyrian kingdom till B.C. 625, when it was taken by the Medes under Cyaxares. (Herod., i. 106.) Strabo says that it fell into decay immediately after the dissolution of the Assyrian monarchy by the Medes (xvi., p. 737); and this account is confirmed by the fact that in the history of Alexander the Great the town is not mentioned, although in his march along the banks of the Tigris, previous to the battle of Gaugamela, he must have been very near the spot where it is supposed to have stood.

Until the recent discoveries of M. Botta and Dr. Layard the site of Nineveh was a matter of conjecture. According to Abulfaraj and the general testimony of Oriental tradition, most modern writers supposed it to have been situated on the left or east bank of the Tigris, opposite Mosul, and partly on the site of the modern village of Nunia, or Nebbi Yunus. At first sight the ruins of Nineveh present the appearance of a range of hills; but from all these hills large stones, frequently with bitumen adhering to them, are constantly dug out in great numbers. The bridge over the Tigris is said by Rich to have been entirely built of stones dug out of the ruins of Nineveh, which, he adds, is an inexhaustible resource. On the largest of these hills or mounds there is a mosque, which is supposed to cover the tomb of Jonah. The walls and ditches which surrounded part of the city may still be traced very clearly in many parts. It was also Rich's opinion that the part inclosed by these walls (four miles long by two miles broad) formed only "a part of a great city, probably either the citadel or royal precincts, or perhaps both, as the practice of fortifying the residence of the sovereign is of very ancient origin. There are very few traces of ruins outside these walls; but they may probably exist to a greater extent than has yet been supposed, since Rich relates that people digging for stones in a place outside the inclosure, found huge stones laid in layers of bitumen and lime mortar.

M. Botta, consul of France at Mosul, led the way to settling the question about the site of Nineveh by making excavations in 1843. He began with some operations in the inclosure on the river, just alluded to. He found only some bricks and fragments of no value. Meantime the inhabitants of the environs, seeing the consul engaged

in these researches, brought him bricks with inscriptions, and other remains of antiquities, which induced him to send his workmen to the village of Khorsabad, distant about five hours N.E. from Mosul, on the left bank of the Khauser. M. Botta's researches in this place proved more successful. Commencing his excavations in a small mound, his workmen soon came upon a building remarkable for the number and style of the sculptures with which it is adorned, and which appears to have been a royal palace. "The figures," says M. Botta, "though rather stiff, are well designed, the attitudes admirable, the muscles strongly marked, and the hands, feet, and ornaments very carefully executed. I have no doubt that the building has been destroyed by fire [the slabs had the appearance of gypsum, or alabaster]; on the ground were found a quantity of charcoal and some remains of burnt beams." Some of the slabs had on the back also cuneiform inscriptions.

Among the most interesting of M. Botta's discoveries were two colossal statues of bulls, 15 feet high, with human heads, and between them a passage 7½ feet wide, forming a portal of a striking character and of great magnificence. These bulls were winged; they are not properly statues, but in high relief. They have five legs, so contrived that from whatever side you look at them, one leg being hid by another, four legs are always to be seen. On each of the walls of the passage to which this is the entrance there is a figure with the head of a bird of prey; the hair is regularly braided; on the head is a sort of cup which comes down to the shoulder. The figure has a necklace, armlets, and bracelets, and wears a short tunic with a fringe girdle. On the opposite side of the chamber M. Botta afterwards found a similar portal. M. Botta resolved to send two of these bulls to Paris; but unfortunately the excavations made by the workmen deprived the calcined limestone of its only support, and very soon after their discovery these long buried architectural ornaments and historical records fell in pieces. Many sculptures however, and inscriptions, were sent to France, where they form an Assyrian museum. Drawings were made of most of the sculptures by M. Flandin, a French artist sent out for the purpose. In these drawings the manners and customs, the religion, the art of war, the costumes, and the instruments of the people who built the palace, are delineated in faithful copies of the bas-reliefs. The principal figure in most of them is a sovereign, king, or hero; on his head he wears the tiara, his forehead is low and prominent, his eyebrows thick; his hair and beard fall straight on the shoulders and breast, terminating in large ringlets. The dress, which appears to have been extremely magnificent, consists of a richly-embroidered tunic, and an upper garment resembling the surplice of a Roman Catholic priest. This figure appears, sometimes engaged in combat, driving his enemies before him; sometimes seated at an entertainment; and sometimes in a solemn procession, guiding a chariot with four horses abreast. Among the many figures of combatants there is frequently a shield-bearer, under whose protection another warrior draws his bow or poises his lance. M. Victor Place has continued the French researches on the site of Nineveh, and several antiquities, including the monumental gates of the city, four gigantic bulls, several bas-reliefs, many utensils of earthenware, copper, and iron, and a number of very ancient statues, are now (Feb. 1855) on their way to France.

Since M. Botta's first discoveries were made known to Europe still greater additions to our knowledge of Nineveh have been made by Dr. Layard, who spent much time in making excavations in the great inclosure near the Tigris, before mentioned. Here, in the Mound of Nimroud, he discovered the ancient palace of the great Assyrian monarchs; brought to light those colossal human-headed bulls, the kings, warriors, priests, and winged messengers, which form subjects of astonishment to visitors of the British Museum; and gave to learned eyes to read from long cuneiform inscriptions the pompous but interesting catalogue of Assyrian triumphs in war or in architecture. In a word, the discoveries of Dr. Layard, which form the interesting subject of the volumes quoted at the end of this article, have shed light upon one of the darkest periods of history, and laid bare before us the life, arts, and manners of a people of whom previously little more was known than the name. Colonel Rawlinson, Dr. Edward Hincks, and other distinguished British and continental scholars, have made great progress in interpreting the cuneiform inscriptions. An account of what they have done is given in the 'Journal of the Asiatic Society,' vols. xii., xiv., &c. Of the sculptures now in the British Museum a more particular account will be given in the ARTS AND SCIENCES DIVISION.

(*Lettres de M. Botta, sur les Découvertes à Khorsabad, Paris, 1845; Niebuhr, Travels; Rich, Narrative of a Residence in Koordistan; Layard, Discoveries in Nineveh and Babylon.*)

NINIAN, ST. [STRLINGSHER.]

NIO, IOS, one of the Cyclades, situated 5 miles S. by W. from Naxos, and 10 miles N. by W. from Thera or Santorini. It is about 9 miles in length, and 5 miles in its greatest breadth, which is towards the middle of the island. The surface is hilly, but not so rocky or barren as most of the smaller Cyclades. The island produces some corn (but not enough for the consumption), which is of good quality, cotton, oil, honey, and wine; but it is deficient in fruit and other trees. The population is about 3700. The town, called also Nio, is built on a hill on the western coast, above a bay in which there is

good anchorage and a fine spring of water issuing out close to the shore. On the eastern coast is another good harbour, called Manganuri.

Nio was called Ios by the ancient Greeks, in consequence, it is said, of having been colonised by the Ionians, before which, according to Pliny (iv. 12) and Stephanus of Byzantium, it was called Phœnicia, from the palm-trees which grew on the island, but which have long since disappeared, in the same manner as at Delos and other places, where the palm-tree was also found in ancient times. (Spon; Tavernier.)

Strabo, Pliny, and Pausanias speak of the tomb of Homer being at Ios, which was said to be the birthplace of his mother; and the author of the 'Life of Homer' (attributed to Herodotus) reports the epitaph of the poet. Ios now belongs to the kingdom of Greece, and is included in the nome of the Cyclades.

NION, or NYON. [VAUD, CANTON.]

NIONS, or NYONS. [DRÔME.]

NIORT, the capital of the French department of Deux-Sèvres, is situated on the Sèvre-Niortaise, in 46° 19' 23" N. lat., 0° 27' 49" W. long., at a distance of 225 miles S.W. from Paris, 96 feet above the level of the sea, and had 17,562 inhabitants in the commune in 1851. The town is situated in a delightful and well cultivated district, and is built on the slopes of two hills and on both sides of the river. It was formerly one of the most wretched-looking towns of the department, but it has been considerably improved of late years. The town-hall is a very ancient building, once the palace of Eleanor of Guienne, wife of Henry II. of England. There are two churches—one of them, called Notre-Dame, is an ancient gothic building, with a fine spire raised by the English, and 246 feet high; cavalry barracks; and an ancient castle, which is now used as a prison. The town has two good squares, and there is a pleasant promenade near the barracks. The chief manufactures are chamois and other leather, gloves, shoes, woollen- and cotton-yarn, druggets and other woollens, saddles, braces, horn combs, paper, saltpetre, and confection of angelica. Considerable trade is carried on in wine, staves, timber, corn, flour, wool, and hair. The navigation of the river Sèvre commences at Niort. There are in the town tribunals of first instance and of commerce, a council of prud'hommes, a college, two hospitals, a theatre, a public library of 20,000 volumes, and a botanic garden.

NIPON. [JAPAN.]

NISCHNEI- or NIJNI-NOVGOROD, or NISCHEGOROD (Lower Novgorod), a government of great Russia, is situated between 54° and 57° N. lat., 41° 45' and 46° 15' E. long. It is bounded N. by Kostroma, N.E. by Wiatka, E. by Casan, S.E. by Simbirsk, S. by Perm, S.W. by Tambov, and W. by Wladimir. The area is 18,557 square miles, and the population in 1846 amounted to 1,178,200.

The country is an undulating plain, diversified only by the high lands along the banks of the rivers and by small elevations. There is a considerable extent of forest, but only few swamps. The soil consists in a great measure of sand, with a mixture of good earth, and in many places it is covered with a thick layer of black mould; here and there clay is found, with portions of iron or ochre. The hills, none of which is more than from 400 to 500 feet above the level of the sea, generally consist of clay, gypsum, and limestone, and occasionally of sandstone: they are all covered with forests. The principal river is the Volga, which enters the government from Kostroma, and flows thence to Casan in a semicircular bend. This great river, in its course through the government, receives the following rivers:—The Oka, which, rising in Orel, flows through that government, and those of Tula, Kaluga, Riäsan, Moskwa, and Wladimir, and, after a course of 340 miles through the most fertile parts of Russia, falls into the Volga near the city of Nischnei-Novgorod; and then the Kulma, the Kirsenez, the Sura (a rapid river navigable only in the spring), the Werluga, and the Alatyr. There are few lakes, and none of them are large. The climate is milder than in Wladimir; there is not so much moisture, and spring and autumn are not so variable. The inhabitants are very long lived, and the number of births is often nearly double that of deaths.

Nischnei-Novgorod is one of the most fertile and best cultivated provinces of the empire. The inhabitants grow rye, buck-wheat, millet, peas and beans, large quantities of flax, hemp, and hops; and abundance of common vegetables and fruits. The forests are very productive; the banks of the streams and rivers are clothed with the finest timber, especially oak- and lime-trees. The pine, the fir, the beech, and the alder are found in all the forests. The oaks however have been very much thinned; and the great extent of the forests has led to the most extravagant waste. The undefined privileges of the distilleries, the potash manufactures, and the glass- and iron-works, are an obstacle to anything like system in the management of the forests. The breeding of cattle, though subservient to agriculture, is very carefully attended to. The best horses of the Russian breed are found in this province, where the government and many private persons have studs. The horned cattle are handsome and of a large size. Sheep and hogs are of the common breed. Some poultry, especially geese, abound; bees also are common. The principal fish in the rivers are the bleak, the isinglass-fish, and the caviare-sturgeon, of which there is a sufficient supply for home consumption.

Of all the governments of Russia, Moscow and Wladimir not excepted, Nischnei-Novgorod is that in which the inhabitants are the

OSCOG. DIV. VOL. III.

most generally engaged in manufactures of various kinds, though the province has comparatively few manufactories on an extensive scale. But most of the villages are full of artisans and little manufacturers of all descriptions, who, without belonging to a manufactory, yet make a great abundance and variety of articles. There are also in the country many who carry on some business on a large scale, though it is considered as only a secondary employment; so that weaving mats, making potashes, spinning yarn, weaving linen, and making earthenware, are common all over the country. The few large establishments manufacture woollen-cloth, leather of various kinds, linen, Russia-duck, cordage, soap, candles, iron, steel, and glass wares.

The exports of the province consist of corn, flour, hemp, flax, yarn, coarse linen, cordage, base-mats, leather, carved and turned wooden wares, oak-timber, potashes, cooper's work, iron-wire, hardware, glass, cloth, horses, and some other trifling articles, which amply suffice to counterbalance the imports, which are chiefly bar-iron, salt, brandy, wine, colonial produce, and manufactures.

The population consists of Russians, the most numerous race; Tschuvasches, Mordwins, Tschheremesses, and some Tartars. The Tschuvasches, Mordwins, and Tschheremesses are of Finnish origin. The Greek Church predominates, and is under the bishop of Nischnei-Novgorod. The Mordwins and Tschheremesses are most of them baptised, as well as many of the Tschuvasches, but a great portion of the latter are still heathens. They do not worship their gods in temples, but in consecrated places in the open air, which they call Keremet, or Irsan, and which are chiefly in groves and forests. They have a supreme god, whom they call Thor, and whom, as well as the inferior gods, they worship as an invisible being; they offer sacrifices to him, believe in a state of future rewards and punishments, and have priests and conjurers, whom they call Juma and Jömmé.

The capital of the government is also called *Nischnei-Novgorod*, which forms the subject of the next article. Among the other towns in this government are—*Arasmas*, 8500 inhabitants, with manufactures of silk, leather, silver, iron, and soap, and considerable trade in linen, sail-cloth, and shoes; *Podschinaki*, 5500 inhabitants, with an imperial stud; *Pawleno-Selo*, on the Oka, 6600 inhabitants; *Balachna*, 4500 inhabitants; *Muraschkina*, 7000 inhabitants; and several other thriving towns.

NISCHNEI-NOVGOROD, the capital of the government of Nischnei-Novgorod, is situated in 56° 19' 43" N. lat., 44° 0' 58" E. long., at the confluence of the Oka and the Volga, and has ordinarily only about 20,000 inhabitants, but at the time of its great fair this number is swelled to nearly 300,000. The city is built in the fork between the right banks of the Oka and the Volga, and consists of three parts:—1. The fortified part of the city is built on a hill, better than a mile in circumference, and surrounded with a wall which has five square and two round towers and two gates. It is chiefly composed of three handsome streets, which converge upon an open space in front of the Kremlin, or fortress, that crowns the hill and overhangs the Volga. In this fortress are the two cathedrals dedicated to St. Michael and to the Transfiguration, the palaces of the governors, and some other public buildings, and an obelisk of granite 46 feet high, in honour of Minin and Pojarsky. A beautiful terrace on the side towards the Volga affords a most extensive view of the noble rivers pursuing their course through a vast plain of corn and forest lands. 2. The city itself is situated on the declivity of the hill above the Volga, which is pretty well built in the Russian fashion: the streets indeed are narrow, but there is a large open market-place and a fine quay. 3. A large suburb is built along the face and at the foot of the high ground on the right bank of the Oka.

This city is the residence of the military governors of Perm and Nischnei-Novgorod, of the civil governor of the latter, the see of a bishop, and the seat of various public offices. The public buildings and institutions are:—42 churches, of which 30 are of stone, 3 convents, a seminary for schoolmasters, a gymnasium, several schools, and a very fine stone bazaar. Some of the churches are of great size and beauty. The domes and steeples of the numerous churches give it the appearance of a much more considerable town. The inhabitants carry on various manufactures of cordage, leather, coarse lace, cloth, copper and iron articles, soap, and candles, and there are many malt-kilns, breweries, and tanneries.

The great annual fair of this part of Russia was originally held in Kazan, the Tartar capital; it was transferred in 1648 to Makarieff, about 50 miles below Nijni, and its duration limited to five days. New regulations were promulgated in 1679, 1680, 1681, and 1691, by the last of which every facility was granted to foreigners. In 1750 the fair had become so considerable, that the government built a vast bazaar of wood, containing 800 shops; but the quantity of goods brought from Europe and Asia increased every year in such a degree, that the old bazaar could not contain half of them, and in 1809 the emperor Alexander ordered a new building to be erected, which contained 1400 shops. But even this bazaar was soon insufficient, and a great portion of the goods were placed under sheds, the number of which it was necessary to increase every year, till they at length amounted to 1800, the rent of which and that of the shops in the bazaar produced annually 120,000 rubles.

The government had devoted a sum of 600,000 rubles to the erection of this building, which was scarcely completed when it was totally

destroyed by a dreadful fire on the 18th of August 1816. The emperor Alexander transferred the fair in the following year to Nischnei-Novgorod, which is in the centre of that immense system of inland navigation which covers Russia as if with a net, and affords a communication from this point with the two capitals, with the White Sea, the Gulf of Finland, and the Caspian. A low flat peninsula, formed by the left banks of the Oka and the Volga, and Lake Mestcharskoe, which has a communication with the Volga a little farther to the north, was chosen for the site of the new bazaar. It was necessary first of all to raise the ground, which was inundated every spring by the Volga: to procure earth for this purpose, and likewise to facilitate the movement of the boats, a broad canal, in the form of a horse-shoe, was dug, the two extremities of which join the Oka, while on the other side it communicates by means of Lake Mestcharskoe with the Volga.

On the plateau inclosed by this canal there is now a whole town of stone magazines, built in the form of a large oblong parallelogram, surrounded with shops, before an edifice adorned with three rows of columns, which is the hotel of the governor, in which the local authorities reside during the fair: a long wide bridge of boats across the Oka joins the busy place to the city. Forty-eight blocks of buildings, separated by streets which intersect each other at right angles, extend behind this parallelogram. The number of the shops is about 2524, and over each there is a small apartment, in which the merchant may reside. All these buildings are roofed with iron, and the coverings of the open galleries which run along all the façades are likewise of iron, and supported by 8000 elegant cast-iron pillars. A very broad street, passing through the centre of this commercial town, terminates in a church built in a rich and noble style. A little before the church, in two transverse ranges on the right and left, are the Chinese shops, the fantastic architecture of which, their turned-up roofs, surmounted with flags and long streamers which are moved by every breath of air, give a variety to the appearance of these immense edifices. On the same line, beyond the canal, there is on the west an Armenian church, and on the east a mosque. The remainder of the peninsula beyond the canal round the above-mentioned mosque is occupied by a great number of wooden booths, in which are deposited goods less liable to spoil, such as iron, leather, cordage, &c. There too are the theatre and the numerous tents of the Tartar restaurateurs. An island in the Oka, between the town and the fair, is covered with similar booths. On each side of the bridge of boats across the Oka, which is as wide as the Thames at London, and along the Volga, at the mouth of the former river, the waters are covered for above a mile with boats and barges of all shapes and sizes used in conveying goods to the shops on the banks of the rivers and canals. Above 40,000 persons of various races and languages from the confines of Europe and Asia navigate these vessels, and altogether above 250,000 persons, mostly of the male sex, are here congregated for business.

All this vast, regular, and handsome town of warehouses, the erection of which cost 11,000,000 rubles, presents for ten months in the year the silence of a desert; but scarcely is the flag announcing the commencement of the fair hoisted on the 29th of June, when all the streets and warehouses are filled with a countless multitude who have flocked hither from the two Russian capitals, from the shores of the Baltic and the Caspian, from Bokhara, Khiva, Kokand and Tashkend, from Asia Minor, from the mountains of Turkistan and the frontiers of China, from western Europe, and even from America and Australia. All these magazines and booths are filled with the produce of the most diverse countries, and thousands of boats are employed in landing the goods, or in taking them on board to convey them to the seas which wash the northern and southern shores of the empire. Other goods, such as wooden wares, are piled up even in the open country, and farther on are long lines of carts with their horses, which serve both as magazines, and lodgings for the country-people.

The total values of the merchandises exposed for sale at this fair in 1837 amounted to 6,512,808*l.* sterling; in 1840 to 7,483,619*l.*; and in 1842 to 7,458,421*l.* The total value of the goods sold in 1840 was 6,794,897*l.*, including 4,248,945*l.* worth of Russian merchandise. In 1842 goods were sold for 6,087,379*l.*, of which 4,460,871*l.* worth was Russian manufacture and produce. The number of shops and magazines let in 1842 exceeded 4800.

The various products exposed for sale at the fair of Nischnei comprise cotton manufactures, woollen cloths; hempen and flaxen textures; silks; furs; leather and worked skins; washed rags; produce of the mines and foundries, iron, copper, and metal goods; porcelain, earthenware, mirrors, and glass; dried fish, caviare, train oil, and isinglass; corn and flour; Russian wines, brandy, mead, &c.; refined sugars from St. Petersburg and Archangel. Miscellaneous goods—such as potashes, soap, tobacco, paper, feathers, hogs' bristles, horses' tails, hides, skins, timber, Russian and Tartar horses, &c.; coffee, indigo, cochineal, other drugs and foreign wines. Of Asiatic produce the most important article is tea, imported from China by way of Kiachta, of which 46,000 chests were imported in 1842; 6000 boxes of tea pressed in cakes; Chinese silks, cottons, colours, playthings; Bokhara cotton, raw, spun, and woven; shawl-pieces, turquoises, furs, &c.; Cashmere wool, Persian carpets, raw silks, &c. Steamers ply on the Volga up to Tver and down to the Caspian Sea, and also up the Kama to the government of Perm, so that great facilities exist for

conveyance of goods to Nischnei over and above the common river and canal traffic in which it participates. Except during the times of the fair Nischnei is a dull uninteresting place.

NISHAPOOR. [PERSIA.]

NISIBIN, or NISIBIS. [MESOPOTAMIA.]

NISSA, or NISCH, a town in European Turkey, the residence of a pasha, is situated in a fine open plain on the Nissava, a feeder of the Morava, near the frontier of Servia, 60 miles S.S.W. from Widden, and contains about 10,000 inhabitants (4000 Mohammedans and 6000 Christians). Nissa occupies the site of Naissos, the birthplace of Constantine the Great; but nothing remains of its ancient glory. The town is modern, and by no means remarkable for its beauty; the principal building is the Konak, or palace of the pasha. The defensive works round the Turkish quarter on the right bank of the river consist of well-built ramparts of great extent, with wattled parapets and a dry ditch. The bazaar on the left bank of the Nissava is surrounded by a trench and palisades. The Christian quarter, which is the largest part of the town, lies beyond the bazaar, and is open to the plain. Nissa is now the chief town of the pashalic of Sophia; it is called Nisch by the Turks. It is the residence of a Greek bishop, and has famous thermal springs. As it is the key to military communications between Thrace, Bulgaria, and Servia, the fortifications of the town are mounted with a considerable number of guns of large calibre, and in good order. The plain of Nissa lying between wooded slopes of the Tesovitch and the little Balkan, two ramifications of the Hæmus, is one of the most beautiful, fertile, and well-tilled districts in Bulgaria. The town was taken by the Turks under the Sultan Amurath I. in 1389 on the march to the battle of Kosova. A couple of miles above Nissa on the road to Sophia, the site of an action between the Turks and Serbs in the same year is marked by a tower of skulls, which is more terrible in name than in reality. It was constructed of stone and lime, but externally heads were imbedded in the mortar. Very few skulls now remain, the Christians having in the course of time removed almost all of them for the purpose of interment, but their places are marked by rows of round holes. The tower is 10 feet square, 15 feet high, covered with a red-tiled roof, and has neither door nor window in it. The interior is said to be a favourite retreat of snakes and lizards. The Austrians took Nissa in 1737.

NITH, NITHSDALE. [DUMFRIESSHIRE.]

NIVELLE. [BRABANT, SOUTH.]

NIVERNAIS, one of the provinces into which France was divided before the first revolution. It was bounded N. by Orléanois and the district of Auxerrois in Bourgogne; E. by Bourgogne; S. by Bourbonnois; and W. by Berri.

It is almost entirely comprehended in the modern department of NIEVRE. In feudal times it constituted the county of Nevers.

NIZZA. [ACQUI, NICE.]

NOACOTE. [NEPAUL.]

NOBBER. [MEATH.]

NOCERA DEI PAGANI, a town on the south-eastern border of Campania, in the kingdom of the Two Sicilies, now belonging to the province of Principato Citra, is situated in a valley near the Sarno, at the foot of the Monte San Angelo ridge, which traverses the peninsula of Sorrento, and on the high road from Naples to Salerno. It is an open straggling town, with about 5000 inhabitants. It is a bishop's see, has several churches and convents, a clerical seminary, and fine barracks for cavalry. The walls and castle of the old town, which was deserted on account of the earthquakes, are on the hill above. About a mile from Nocera, on the road to La Cava, is a circular church, which has been mistaken by some for an ancient temple, but it evidently dates from the earlier ages of Christianity. A double row of marble columns, disposed in a circular range, support the roof upon arches. Nocera is joined to Naples by railway.

Nocera was destroyed by Hannibal (Livy, xxiii. 15), after whose departure for Lucania the dispersed inhabitants were settled by the Romans in Atella, the inhabitants of the latter town having been transferred to Calatia (xxviii. 3). The town of Nocera was however rebuilt and became a Roman colony. After several vicissitudes it was partly destroyed by earthquakes in the time of the early Norman kings, in the 11th century, when the inhabitants resorted to the present site. The adjunct 'Dei Pagani' which it bears has been variously accounted for: some derive it from the Saracens, called Pagani in the middle ages, who occupied the town for a considerable time in the 10th century; others from a powerful baronial family, Pagani by name, one of whom, Hugh de Payen, was Grand Master of the Templars in the time of the emperor Frederick I. (Lunadoro, 'Lettera intorno all' Origine di Nocera.')

NOCERA, NUCCERIA, a town of ancient Umbria, now belonging to that province of the Papal States called 'Delegazione di Perugia.' It is built on a steep hill on the western side of the central ridge of the Apennines, near the source of the river Topino, which is an affluent of the Tiber. Nocera lies on the high road from Rome to Pesaro and Rimini. Nuoceria was a city of the Umbri, and is mentioned by Livy (ix. 38) as having surrendered to the Romans, with other towns of Umbria, in 307 B.C. In the fall of the Western Empire, Nuoceria was repeatedly devastated by the Visigoths and other northern tribes. Under the Longobards it formed part of the duchy of Spoleto. In the year 1198 Innocent III. annexed it to the Papal territories. It

has given title to a bishop since A.D. 402; but the see has been united to Sassoferrato since A.D. 1027. The population is now only about 1200. The surrounding territory, which is hilly, produces wine, oil, and plenty of fruit.

NORD, a department in France, thus named from its being the most northern portion of that country, lies between 49° 58' and 51° 5' N. lat., 2° 7' and 4° 28' E. long., and is bounded E. by Belgium, S. by the department of Aisne, W. by those of Somme and Pas-de-Calais, and N. by the North Sea. Its length from Dunkerque to the south of Trélon, is about 124 miles; its breadth is very variable, being 39 miles at the widest part, but not quite 2½ miles near Armentières, where it is crossed by the Lys. The area is 2193.5 square miles; the population in 1841 was 1,085,298; in 1851 it amounted to 1,158,286, being 528.05 to the square mile, or 853.47 above the average per square mile for all France. With the exception of the metropolitan department of Seine, Nord is the most populous department in France.

The department is formed out of the old province of French Flanders, of nearly the whole of Hainaut-Français and Cambresis, and of small portions of Artois and Vermandois. It belongs almost entirely to the basin of the Escaut, and has a general inclination towards the north-east. The surface, except in the south of the department, is level. Some isolated hills spring up here and there, which seem to be higher than they really are in consequence of the general flatness of the country. Mont-Cassel, in the arrondissement of Hazebrouck, famous for the extensive view from its summit, is only 361 feet above the sea-level. The arrondissement of Avesnes, in the south of the department, is a hilly country; it is covered by the northern slopes of the Ardenne, many of which are covered with forests, while the narrow vales are furrowed by the Helpe-Majeure, the Helpe-Mineure, and a great number of smaller streams that flow into the Sambre, a feeder of the Meuse. The Ardenne Hills extend also into the arrondissement of Cambrai, and form the watershed between the Sambre and the Escaut. The hills of this arrondissement are all of gentle slope, and generally cultivated to their summits; the loftiest of them, Bonavis, the summit of which is the highest point in the department, is only 394 feet above the sea. In the arrondissement of Dunkerque, which extends about 25 miles along the sea-coast, a considerable portion of the surface is very little, if anything above the sea, and marshy, but maintained in a state fit for cultivation by a system of drainage called *Watteringues*. The *Watteringues* district, which contains an area of 95,927 acres, is divided into four sections, each under the care of commissioners appointed for the purpose of seeing the drainage works kept in repair. Between these lands and the sea extends a melancholy fringe of sand, bordered near the sea by sand-hills called 'dunes,' or downs. The canal from Bergues to Furnes, which forms one of the outlets for the waters raised from the *Watteringues* country, separates this from the district of the *Moères*, consisting of the basins of two lakes drained in a similar way by canals, windmills, and dykes; the *Moères* district is under a separate administration. The marsh-lands in the valleys of the Scarpe, the Escaut, the Sambre, and in various other districts, are each subjected to a system of drainage regulated by commissioners, who are appointed under the authority of the prefect of the department, by the proprietors interested in the reclamation of the lands.

The soil is in general good; but in such an extent of surface the variety of course is great, from the deep rich clay and marly soil of the arrondissement of Lille, to the barren sand-hills on the coast, and to the light gravelly soil of the southern districts. But everywhere the system of agriculture is good, and fine crops of great variety are gathered. Of the whole surface, which measures 1,403,824 acres, 1,175,224 acres are under cultivation, namely, 888,549 acres under plough-culture, 236,817 acres of meadow and grass-land, 40,372 acres of gardens, orchards, and nurseries, and 9486 acres under various culture. Of the remaining surface, 88,532 acres consist of forest land, a large portion of which lies in the arrondissement of Avesnes; 17,501 acres are barren bog and heath; 50,618 acres are covered with roads, streets, and buildings; and 57,470 acres of forest domain are the property of the state.

The crops grown for the sustenance of man and the domestic animals are—wheat, mixed grain, spelt and buckwheat, rye, barley, oats, peas, beans, and other leguminous seeds. The produce of these crops, taking one year with another, is now sufficient for the consumption; formerly this was not the case, though the population was then smaller. Of potatoes, the produce is not nearly equal to the consumption. Authority was given to plant 2498 acres with tobacco in 1849, calculated to furnish 63,070 cwt. of leaf. The other objects of the farmer's care are clover, lucern, oleaginous seeds, beet-root, turnips, colza, flax,

and hemp. The number of wind-, water-, and steam-mills for the manufacture of oil and flour, in 1848, was 1367. A good deal of the barley grown in the department is used for malting, beer being a common beverage; other grain and potatoes are used in the gin and other spirit distilleries. Apples, pears, nuts, and other common fruits are cultivated; flowers too are objects of especial attention; hops are grown.

The horses of the department are large, strong, and of good breed. A great number of horned-cattle are fed on the natural pastures and on the abundant green crops that are raised. The number of sheep reared to supply the markets with mutton and for the growth of wool is very considerable. Good butter and passable cheese are made. Pigs, poultry, and fish are abundant. Bees are kept chiefly in the south of the department. Coal is the common fuel, wood being scarce. Timber-trees are grown along the roads and in the hedgerows.

The principal rivers of the department are—the *Aa*, which runs along the western boundary, and enters the North Sea at Gravelines, where it forms a small harbour: the *Yser*, which receives the *Peene* below Wormhout, and runs north-east into Belgium: the *Lys*, a feeder of the Escaut, which is itself fed by the *Lave* and the *Deule*: the *Scarpe*, which, rising in Pas-de-Calais, runs east past Douai, and joins the Escaut at Mortagne, on the Belgian frontier: the *Escaut*, which, rising in the north of the department of Aisne, flows north to Cambrai, whence it runs north-east past Valenciennes and Condé, 7 miles north of which it enters Belgium, having received the *Seneffe* at Bouchain, the *Selles* and the *Escaillon* between Bouchain and Valenciennes, and the *Haine* at Condé: and the *Sambre*, which crosses the south of the department, passing Landrecies and Maubeuge, below which it enters Belgium on its way to join the Meuse. Most of these streams, and many smaller ones, have been rendered navigable; they, with the 25 canals that traverse the department in all directions, afford an internal navigation of 308 miles. Of these canals, particular mention must be made of the St.-Quentin Canal, which, running from Cambrai to St.-Quentin, unites the Escaut to the Somme, and completes the internal navigation of France between the North Sea, the Atlantic, and the Mediterranean.

Roadway accommodation is afforded by 15 state, 17 departmental, and 50 parish roads, to the extent of 1029 miles in length. Railroads traverse the department in several directions, uniting Valenciennes, Douai, Lille, Dunkerque, and the intermediate towns with Paris, Calais, Courtrai, Bruges, Mons, Antwerp, and Brussels. All these lines are connected with Paris by electro-telegraphic wires.

The mineral wealth of the department consists chiefly of its coal- and iron-mines; of the former, 19, all situated in the valley of the Escaut, were worked in 1848, and of the latter, three were worked in the arrondissement of Avesnes. A valuable coal-field was discovered near Douai in June 1858. Steam-engines are used for draining the mines. Marble, paving-stones, brick-earth, potters'-clay, peat, and fossil-ashes, which are used as manure, are found. There are mineral waters and baths at St.-Amand.

The industrial products of the department are of the most varied description, including all kinds of woollen, cotton, and linen manufactures, ticking, duck, velveteen, printed cottons, and handkerchiefs; woollen, flaxen, cotton, and hempen yarn; lace, tulle, cambrie, and lawn; soap, refined sugar, and salt; beer, oil, nails, glass, paper, tiles, bricks, earthenware, ropes, leather, toys, small wares, cannon, small arms, saltpetre, &c. These numerous products form the items of a large home and foreign commerce. The imports are chiefly raw cotton, wool, flax, colonial produce, wine, brandy, and timber. At the principal points on the Belgian frontier custom-house officers are stationed, who are under the direction of the custom-houses of Dunkerque and Valenciennes.

Among the principal educational, benevolent, and administrative institutions of the department are—at Douai a University-Academy, (which comprises within its limits the departments of Aisne, Ardennes, Nord, Pas-de-Calais, and Somme), and a Normal school; lycées at Douai and Lille, in which science and languages are taught; 15 communal colleges for pensioners, foundationers, and day students; societies of medicine and botanical gardens at Douai and Lille; public and lending libraries, and museums in all the principal towns; 47 hospitals, 5 of which are general, 7 for the sick, and the rest for special inmates; 2 institutions for deaf-mutes, one at Lille for girls, and one at Fives for boys; 3 lunatic asylums; 6 lying-in societies for the poor under the direction of ladies; a central prison at Loos, where the silent system is enforced, except among the junior convicts; and 8 common prisons. There is a branch of the Bank of France in Lille; 5 *monts-de-piété*, and 9 savings-banks in the large towns. In almost every commune there is a 'bureau de bienfaisance,' supported by charitable bequests, for the distribution of relief in food, clothes, child-bed linen, or money to poor householders. There are Protestant oratories at Lille, Quiévy, Walincourt, Inchy, and St.-Amand. The Jews have a synagogue at Lille. Besides these, there are numerous scientific and agricultural societies; special academies, in which painting, music, applied mathematics, hydrography, zoology, clinical medicine, chemistry, architecture, drawing, modelling, &c., are taught. The number of journals and periodicals published in the department is 32. In 140 communes there are societies of nuns and religious women, who attend the sick in the hospitals and at their

homes, and devote themselves to the consolation of the old and the education of the young.

The department is divided into seven arrondissements, which, with their subdivisions and population in 1851, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Lille	16	132	371,156
2. Douai	6	66	101,109
3. Dunkerque	7	59	105,441
4. Hazebrouck	7	53	104,515
5. Avesnes	10	153	145,040
6. Valenciennes	7	81	156,779
7. Cambrai	7	113	174,245
Total	60	662	1,158,285

1. Of the first arrondissement, and of the whole department, the capital is LILLE. *Armentières*, a clean well-built town on the *Lys*, 9 miles by railway N.W. from Lille, has a college and 7959 inhabitants. It is a busy manufacturing place; the chief products are beet-root sugar, table linen, ticking, hosiery, lace, printed calicoes, flaxen- and cotton-yarn, tulle, soap, grain spirits, bricks, &c.; there are also several bleach-works, dye-houses, and salt-refineries. The town has an active commerce in its industrial products, and in corn, wine, brandy, tobacco, iron, nails, sausages, &c. *Comines*, a pretty little town of 5225 inhabitants, situated on the frontier, 10 miles N. by E. from Lille, stands on the *Lys*, which divides it into two parts. The part on the right bank has belonged to France since the treaty of Utrecht in 1713; the part on the left bank is in the Belgian province of West Flanders. Tape, cotton stuffs, linen thread, beer, spirits, oil, flour, and leather are the chief industrial products. *Halluin*, 10 miles N.N.E. from Lille, on the right bank of the *Lys*, has a population of 4264, who manufacture calico, table linen, ticking, cotton-yarn, bricks, and oil. Near *Hautbourdin*, a small manufacturing town S.W. of Lille, is the village of *Loos*, on the Upper Deule, with a population of 3404. The buildings of the former abbey of Loos are converted into a central prison. *Le-Queunoy*, on the Lower Deule, a few miles N. from Lille, has 3551 inhabitants, who manufacture nails, anvils, chains, crucibles, iron, beer, coarse linen, &c. *Roubaix*, 6 miles by railway N.E. from Lille, one of the principal centres of the woollen trade in the north of France, is a well-built town, with a council of prud'-hommes, a commercial court, and 31,039 inhabitants. At the beginning of the present century the population was only 8000; in 1830 it was 13,132. Besides its elegant tissues of wool, the articles manufactured are table linen, furniture, cotton, nankeens, waistcoat pieces, woollen- and cotton-yarn, leather, gin, &c. These products, together with corn, wine, and colonial produce, form the items of a considerable commerce. *Sectin*, S. of Lille, a station on the Lille-Douai railroad, has a manufacturing population of 3240. *Tourcoing*, about 2 miles N. by railway from Roubaix, is an important manufacturing town, and has a college, a council of prud'-hommes, and 26,834 inhabitants. The town is well built, with wide straight streets and several good public buildings, the most remarkable of which are the town-hall and the churches of St-Christophe and St-Jacques. *Tourcoing* is a great mart for the sale of wool, which, after being washed and combed, is despatched to the manufacturers of Roubaix, Amiens, and St-Quentin. The principal manufactures are table linen, duck for trousers, swanakin, camlet, velveteens, cotton- and woollen-yarn, refined sugar, soap, grain, spirits, &c.

2. In the second arrondissement the chief town is DOUAI. Among the other towns are *Marchiennes*, an ill-built town on the Scarpe, E. of Douai, population 2965; and *Orchies*, N.E. of Douai, which is girt with a wall and fosse, and has 3568 inhabitants, who manufacture oil, soap, pottery, beer, gin, leather, and flaxen yarn.

3. In the third arrondissement the chief town is DUNKERQUE. *Bergues-St-Winoc*, 5 miles S. from Dunkerque, on the railway that joins the Lille-Calais line at Hazebrouck, stands at the junction of several canals, by one of which, communicating with the sea, vessels of 300 tons can reach the town. It is well built, with good brick houses, and has 6045 inhabitants. The town-house, the beffroi or clock-tower, and the two towers of the old abbey of St-Winoc, which serve as landmarks to sailors entering the harbour of Dunkerque, are the most noteworthy objects in the town. The manufactures consist of soap, hosiery, cotton-yarn, sugar, salt, distilled spirits, leather, &c.; boats are built; and there is a considerable trade in corn, cheese, butter, wine, and cattle. This town was strongly fortified by Vauban, and is considered a fortress of the first class. *Bourbourg*, in an unhealthy marshy situation near the right bank of the *Aa*, has oil-mills, breweries, salt-works, and 2603 inhabitants. *Gravelines*, a fortified sea-port town, 12 miles W. from Dunkerque, built in a marshy spot at the mouth of the *Aa*, has a lighthouse and 5582 inhabitants. The town is pretty well built; the arsenal is the most remarkable object. The fortifications constructed by Vauban render the town impregnable towards the sea; on the land side it may be surrounded with water at pleasure. The principal articles of trade are wine, brandy, gin, salt, timber, salt-fish, refined sugar, beer, &c. Vessels are fitted out for the herring, cod, and mackerel fisheries. *Hondschoote*, a few miles E. from Bergues, on the Bass-Colme Canal, has tan-yards, breweries, oil-mills, bleach-

works, and 3971 inhabitants. *Wormhoudt*, 11 miles S. from Dunkerque, situated on the *Yser*, is one of the cleanest and prettiest towns in French Flanders. It has 3828 inhabitants, several bleach-mills, breweries, brick-works, oil-mills, and tan-yards.

4. In the fourth arrondissement the chief town, *Hazebrouck*, is situated on the *Bourre*, a small feeder of the *Lys*, at the point where the railway from Lille diverges to Calais and Dunkerque, and has a tribunal of first instance, a college, and a population of 7589. The town, which is 25 miles distant from Lille and Dunkerque, is well built, and possesses several handsome public buildings, among which are the parish church, the town-house, the sub-prefect's residence, and the old Augustinian convent, the several parts of which are now used as college lecture-rooms, tobacco warehouse, hospital, corn-market, and a normal school. Among the industrial products of Hazebrouck are linen-cloth and twist, soap, leather, refined salt, beer, oil, and lime. A great linen-market is held every Saturday. *Bailleul*, 9 miles from Hazebrouck, on the railway to Lille, stands on high ground, and is in general a well-built town, with regular streets and tastefully-constructed houses. The sculptured decorations over the doors of the best mansions represent subjects taken from the Scriptures, and give an idea of the taste and of the religious feeling of the French Flemings. The most remarkable public structures are the church of St-Vaast and that which belonged to the former Jesuit college. The industrial products are linen of all kinds, tape, beet-root sugar, pottery, soap, refined salt, beer, oil, bricks, leather, and flour. There is considerable trade also in corn, beans, cheese, poultry, and cattle, of which great numbers are fed on the fine pastures round the town. *Bailleul* has 10,141 inhabitants. *Cassel*, said to be the *Castellum Menapiorum*, is built on an isolated conical hill, in the midst of a fertile and extensive plain, 6 miles by railway N. from Hazebrouck, and has a college and 4410 inhabitants. The town is neat, clean, and supplied with water from an abundant fountain. The summit of the hill on which the town is built is the highest point in French Flanders, and presents one of the finest views of the kind in Europe, comprehending the harbours of Dunkerque, Gravelines, and Calais, 32 towns, and above 100 church and clock towers, marking so many towns, villages, and hamlets, scattered over a varied and fertile plain. Lace, linen, hats, stockings, soap, coarse pottery, leather, and oil are the chief industrial products; there is also some trade in corn, butter, beans, poultry, and cattle. *Estaires*, 11 miles S.E. from Hazebrouck, formerly a fortified but now an open town, stands on the *Lys*, and has a college and 6390 inhabitants. The manufacture and bleaching of linen, the preparation and spinning of flax, nail-making, and boat-building are the leading occupations of its population. *Merville*, at the junction of the *Bourre* Canal, with the *Lys*, 8 miles S. from Hazebrouck, is a well-built town, with a population of 6079. It has important manufactures of damask and linen-cloth; and also salt-refineries, breweries, and brick-works. *Stenevoorde*, N. by E. of Hazebrouck, near the Belgian frontier, has a custom-house and 3363 inhabitants, who manufacture woollen stuffs, linen, pottery, beer, leather, and tiles. A great deal of hops are grown near this town.

5. The fifth arrondissement takes its name from *Avesnes*, a small well-built fortified town, situated on the *Helpe*, a feeder of the *Sambre*, in the former territory of Hainaut, 54 miles S.E. from Lille. It has a tribunal of first instance, a college, and 2946 inhabitants, who manufacture hosiery, gin, soap, leather, and bricks; there are also salt-refineries, marble-works, and, in the neighbourhood, iron-mines, iron-forges and smelting-furnaces, naileries, and glass-works. *Baray*, 15 miles N. from Avesnes, a small place of only 1700 inhabitants, marks the site of the Roman *Bajacum*. It contains several traces of its founders—among others, the ruins of a circus and an aqueduct. In the middle of the town a heptagonal column marks the point where seven Roman roads, called *Chaussées Brunehaut*, met. *Laudrecies*, a fortified town on the *Sambre*, 12 miles W. from Avesnes, has a handsome church, large barracks, and 3991 inhabitants. The *Sambre* is navigable at this place; and there is a good trade in corn, hops, flax, cheese, wood, charcoal, slates, cattle, and glass bottles. *Mauberge*, a well-built fortified town on the *Sambre*, by which it exports the coal, marble, and slates found in the neighbourhood, has 7328 inhabitants. The manufactures consist of ironmongery, tin-ware, nails, soap, and beet-root sugar; there are also marble-works, tan-yards, a salt-refinery, and a government manufactory of fire-arms. *Le-Queunoy*, another fortified town, 17 miles N.W. from Avesnes, is prettily situated on a hill above a fertile and extensive plain, fringed by the forest of Mormal, and has 3922 inhabitants, some cotton-spinning factories, tan-yards, and breweries. It is a pretty brick-built town, with a handsome town-house, an arsenal, and a remarkable church, founded in the 11th century. *Solre-le-Château*, situated on the *Solre*, 7 miles N.E. from Avesnes, has fulling-mills, marble-works, tan-yards, naileries, glass-works, and manufactures of lace, serge, blankets, and woollen-yarn; population, 2645. *Tyvelon*, 8 miles S.E. from Avesnes, has 2000 inhabitants, who manufacture hosiery, chemical products, iron, and lime.

6. Of the sixth arrondissement the chief town, *Valenciennes*, which is situated on the railway from Paris to Brussels, 22 miles S.E. from Douai, at the junction of the *Rhonelle* with the *Escout*, in 50° 21' 29" N. lat., 3° 31' 34" E. long., is 84 feet above the level of the sea, and has 22,625 inhabitants. The town, which is surrounded by fortifications and defended by a citadel constructed by Vauban, is

pretty well built, but the streets are narrow, crooked, and irregular. The town-hall, the theatre, the hospital, the church of St. Géry; the public library, which contains 18,000 volumes; and the academy of painting, sculpture, and architecture, are among the most remarkable buildings and establishments in the town. The beffroi, or clock-tower, which was erected in 1237, fell down April 7th 1843. Valenciennes has tribunals of first instance and of commerce, a college, a custom-house, an arsenal, large provision stores, and barracks. The principal manufactures are lawn, lace, hosiery, toys, nails, oil, soap, colours, pottery, &c.; there are also cotton-printing factories, oil-mills, beet-root sugar factories, dye-houses, bleach-works, tan-yards, and grain-distilleries. *St-AMAND-LES-EAUX*. *Ansis*, a village of about 5000 inhabitants, situated a mile N.W. from Valenciennes, of which it might be called a suburb, is the centre of one of the best coal-fields in France. Besides the works in the mines, there are at the surface several large establishments, such as foundries, saw-mills, rope-walks, forges, timber-yards, &c., for the construction of all the steam and other machinery required in the mines. There are also naileries, chicory-mills, cast-iron foundries, glass-works, salt-refineries, breweries, distilleries, and brick-works. *Bouchain* stands in a strong position on the Escaut, 11 miles S.W. from Valenciennes; it is fortified, and has 1400 inhabitants. *Condé-sur-l'Escaut*, 8 miles N.E. from Valenciennes, is situated on the Escaut, close upon the Belgian frontier, and has a population of 5103. It is a well-built fortified town, and possesses a handsome town-house and an arsenal. The defences were constructed by Vauban: by means of a sluice the town may be surrounded with water. Oil, salt, nails, ropes, and leather are the chief industrial products; boats are built; there are also chicory-mills, dye-houses, and bleach-works. *Denain*, situated 5 miles by railway W. from Valenciennes, in the centre of a rich coal-field, on the left bank of the Escaut, has a population of 5144. This town has sprung up almost entirely since 1826, when the population was only 900. The streets are straight and regular; here and there are iron-forges and smelting-furnaces, and shafts leading to the mines with short railroads, by which the coals are conveyed to the docks on the river bank. There is a good market in the town. Beet-root sugar is manufactured. Denain is celebrated for the defeat of the allies, under Lord Albemarle, by the French, under Marshal de Villars, July 23, 1712. A short way south of Condé is *Fresnes*, or *Fresnes-sur-l'Escaut*, which has glass-works, distilleries, breweries, steam flour-mills, and 4109 inhabitants, many of whom are employed in the several coal-mines of the neighbourhood.

7. The seventh arrondissement is named from its chief town, CAMBRAI. *Cateau-Cambresis*, 15 miles S.E. from Cambrai, on the right bank of the Selle, is a well-built town, with a college and 7686 inhabitants. The town, which is famous for the treaty signed in it between Philip II. of Spain and Henri II. of France in 1559, takes its name from the château (corruptly pronounced cateau) built for its protection, and from its position in the Cambresis or territory of Cambrai. The former archbishop's palace (now converted into a cotton factory), is the most imposing structure in the town. The manufactures are shawls, merinos, lawn, calico, soap, woollen- and cotton-yarn, beer, gin, leather, and salt. *Soldmes*, famous for its Benedictine abbey, still subsisting, stands 12 miles E. from Cambrai, and has 5295 inhabitants, who manufacture lawn, gauze, merino, cotton-stuffs, beer, leather, soap, &c. The parish church is a large handsome structure, surmounted by a spire above 200 feet high. *Crèvecoeur*, situated near the right bank of the Escaut, and famous for the defeat of Chilperic II. by Charles Martel, March 21, 717; and *Clary*, S. by E. of Cambrai, are small places of a little over 2000 inhabitants each.

The department forms the see of the Archbishop of Cambrai. It is included in the jurisdiction of the High Court and within the limits of the University-Academy of Douai; and belongs to the 8th Military Division, of which Lille is head-quarters. The department of Nord returns 8 members to the Legislative Body of the French empire.

NORE. [THAMES.]

NORFOLK, a maritime county of England, on the eastern coast, is bounded S. by Suffolk, from which it is separated by the Waveney and the Little Ouse; W. by Cambridgeshire; N.W. by Lincolnshire and the Wash; and on all other sides by the North Sea. Its greatest length from Yarmouth to the neighbourhood of Wisbeach is 67 miles, and its greatest breadth near 1° E. long. is 42 miles. The area is 2116 square miles, or 1,354,301 statute acres. The population in 1841 was 412,664; in 1851 it was 442,714. In area it is the fourth of English counties, being exceeded only by Yorkshire, Lincolnshire, and Devonshire.

Coast-line, &c.—The Norfolk coast, extending from the estuary of the Yare to that of the Nen in Cross-Keys Wash, is above 90 miles in length, and for the most part low, and liable to continual encroachments from the sea. Between Happisburgh and Weybourne, a dis-

tance of about 20 miles, are low cliffs called the Mud Cliffs, formed chiefly of clay and masses of imbedded chalk. From the mouth of the Yare to the commencement of the cliffs there is a low sandy coast skirted by sand-banks. The channel between these banks and the shore is known as Yarmouth Roads, and constitutes a safe anchorage, in 10 to 13 fathoms water. In time of war this roadstead has been the usual rendezvous of the North Sea fleet; and at all times it is frequented by the colliers in their way southward. West of the cliffs a low sandy or shingly coast succeeds, extending to St. Edmund's Point, at the entrance of the Wash. Along this coast is a line of sand-hills. The sands, by which Brancaster Bay in this part of the coast is defended to seaward, render it tolerably safe anchorage, with a depth in some parts of 16 or 18 fathoms. At Hunstanton, near St. Edmund's Point, are cliffs nearly 80 feet high. The Wash is an estuary, having extensive sand- and mud-banks dry at low water, with channels of deeper water between them. The Ouse and the Nen both flow into it. The deeper water off the Norfolk coast is known as Lynn Deep. A considerable breadth of very fertile land has been reclaimed from the sea by successive embankments in that part of Norfolk which lies west of Lynn. One of the embankments, which is most inland and no doubt very ancient, is called the Roman Bank; it is many miles in length, and extends a long way into the adjacent part of Lincolnshire. The works of the Norfolk Estuary Improvement Company, noticed under LYNN, add a considerable breadth of land to this district. The creeks and harbours on the Norfolk coast are—Yarmouth, Cley and Blakeney, Wells, Burnham, Brancaster, Thornham, Heacham, Snettisham, and Lynn. There are lighthouses at Winterton, 8 miles N. from Yarmouth; at Happisburgh, at Cromer, and at Hunstanton.

Surface and Geological Character.—Norfolk contains no hills. The rivers flow through valleys of varying breadth, skirted by low rising grounds. The highest ground in the county is probably on the north-west side, where the chalk downs appear, extending north and south from near St. Edmund's Point to Castle Acre, between Lynn and Swaffham, where they sink beneath the marshy valley of the Nar, whence they again emerge and extend to Downham. This high ground subsides gradually towards the east, where the chalk sinks under the beds of diluvium (or alluvium, for our authorities are not agreed) which overspread a large portion of this county and the adjacent county of Suffolk; but on the west, towards the shore of the Wash, the chalk has a steeper escarpment. On this side the chalk-marl and greensand crop out from beneath it; and beds of similar character to those of the Weald in the south-east part of England crop out from beneath these formations. The western part of the county is included in the great Fen district. The chalk has been found in many places, in the eastern part of the county, beneath the diluvial beds. Near Cromer large portions of it have been washed away by the sea, and the point of Foulness near that town has evidently been the site of a farther extension of the chalk towards the north-east; and some of the shoals which render the navigation of this coast so dangerous are formed of aggregated masses of ponderous chalk-flints. The diluvial beds vary in character. In the eastern part they are of gravel, sand, and clay, embodying in many places fragments of chalk, and containing a substratum of fossil shells, several feet in thickness, called 'crag-pit shells.' Beds of gravel are found on the sides of the valleys which intersect this district. At Norwich, and to the north and west of the city, thick beds of sand and gravel are found resting on the chalk, with patches of alluvial clay and brick-earth interspersed. In the western parts of the diluvial districts large blocks or boulders of gray or greenish sandstone, distinguished by its peculiar fossils, are found in pits of the clay or marl which rests upon the chalk. This side of the county is however chiefly distinguished by sandy beds.

Chalk is dug for lime in many places; excellent sand for glass-making is procured between Snettisham and Castle Rising; potters'-earth and good brick-earth are found; marl is dug in the valley of the Bure; and the Fen districts of the west furnish peat for fuel and manure.

Hydrography; Changes of the Coast.—The principal streams flow from the north-west part of the county. The Wensum rises at Wick-end, 7 miles W. from Fakenham, and, after making a circuit past that town, flows south-east in a winding channel 45 miles to Norwich, 2 miles below which it joins the Yare. The Yare rises at Shipdham, between Watton and East Dereham, and flows east to join the Wensum after a course of 25 miles. The stream formed by their united waters by some called Wensum, by others Yare, flows first south-east and then north-east through Reedham Marsh, till it expands into a large sheet of water called Breydon Water, 4 miles long and in some parts 1 mile broad, at the south-western extremity of which it receives the Waveney, and at the north-eastern the Bure; after receiving these it flows 3 miles southward into the German Ocean. From the source of the Wensum, the real head, to the outfall of the river, is 74 miles.

The Waveney rises at Lopham, between Thetford and Diss, and flows first east and then north-east past Dies, Bungay, and Beccles, to its junction with the Yare, nearly 60 miles. The Bure rises in the northern part of the county, at Melton Constable, between Foulsham and Holt, and flows south-east past Aylsham 50 miles to its junction with the Yare. These rivers receive several small tributary streams. In the lower part of their course the Yare, Waveney, and Bure flow

through flat marshy valleys in which are considerable pools of water, locally designated 'broads' and 'meers.'

The streams of the western side of the county belong chiefly to the system of the Ouse, which touches the border of the county a few miles below Ely, and flows northward 22 miles into the Wash below Lynn. The tide flows up to Denver near Downham, where it is arrested by sluices: it formerly flowed up much higher. This river receives the Little Ouse, the Wissey, and the Nar. The Little Ouse rises at Lopham, in the same tract of swampy ground as the Waveney. It joins the Greater Ouse in the marshes near the border of the county. The Wissey, or Stoke, is formed by the junction of two streams which unite at Buckenham Tofts, north by west of Thetford, and flow into the Ouse near Denver Sluice. The Nar, or Setch, rises at Litcham, in the neighbourhood of East Dereham, and flows into the Ouse above Lynn. One of the arms of the Nen forms for several miles the boundary of the county; and the Welney, a stream communicating between the Ouse and the Nen, skirts the border just above its junction with the Nen.

Few parts of England exhibit marks of more remarkable changes than this county. The valleys of the Waveney, Yare, and Bure were originally longitudinal basins of chalk; and it seems probable, from geological considerations, that the valley of the Bure as far as Burgh by Brampton, that of the Yare to above Norwich, and that of the Waveney to Bungay, were arms of the sea. The low flats north of Yarmouth, in which are so many 'broads,' were also parts of an estuary, which probably remained till the time of Alfred, but has since been left dry. There are local traditions of the sea having once reached Norwich on the Wensum, and Bungay Castle on the Waveney. The spot on which Yarmouth stands was not dry land till the 11th century.

Navigation and other Communications.—The Wensum and Yare are navigable to Norwich for sea-borne vessels. The southern entrance of the Yare, through Lake Lothing, was formerly much used by shipping; but a bar of shingle and sand accumulated at the mouth of it, and this was crowned in 1712 with an artificial bank to prevent the inundation of the marshes at high tides. The only navigable entrance to the Yare for centuries after the accumulation of the bar at Lake Lothing was by Yarmouth, where sea-borne vessels discharged their cargoes; and the communication with Norwich was carried on by river-craft. In 1827 an Act was obtained for making the Yare and Wensum navigable for vessels drawing 10 feet water, and for making a cut from the Yare to the Waveney, and from the Waveney, at Lowestoft, through Lake Lothing to the sea, thus restoring the ancient entrance, and making Norwich once more a port. The tide- or sea-lock of this navigation admits vessels 84 feet long and of 21 feet in the beam. The Waveney is now navigable to Beccles for small sea-borne vessels, and to Bungay, a few miles higher up, for river-craft. The Bure is navigable up to Aylsham, 40 miles from the sea at Yarmouth. The Greater Ouse and the Nen are navigable throughout that part of their course which is within this county. Some of the smaller rivers are likewise navigable for short distances from their respective outfalls.

The Norwich coach-road through Ipswich enters the county at Scole on the Waveney, and runs by Long Stratton to Norwich; that through Newmarket enters the county at Thetford, and runs by Attleburgh. The road to Lynn and Wells enters the county about 9 miles beyond Ely, and runs by Downham, Lynn, Snettisham, and Brandon. Another road to Wells enters the county just beyond Brandon in Suffolk, and runs by Swaffham, Fakenham, and Great Walsingham. The road to Cromer branches off from this beyond Brandon, and runs by Watton, East Dereham, and Reepham. One road to Yarmouth branches off from the Norwich and Ipswich road at Scole, and follows the valley of the Waveney; but the main road does not enter the county until it reaches Yarmouth.

The county is reached from London by the Eastern Counties railway through Colchester and Ipswich, and by the other great line belonging to the same company through Cambridge and Ely. From the Haughley station, midway between Ipswich and Bury St. Edmunds, a line runs northward into the county at Diss, and passes through Burston to Norwich. From Ely the Norfolk railway runs north-east, and entering this county at Brandon, passes Thetford and Wymondham to Norwich, and is continued eastward to Reedham, with branches thence to Yarmouth and Lowestoft. Another line, the East Anglian, runs from Ely northward down the valley of the Ouse through Downham Market to King's Lynn, where it turns eastward, and, passing Swaffham and East Dereham, joins the Norfolk railway at the Wyndham station. A branch from the East Anglian line running northward from East Dereham to Wells is completed as far as Fakenham. The extreme west of the county is crossed by a short line from the Watlington station on the East Anglian railway to Wisbeach, whence other cross lines run to Peterborough, connecting the railroads of this county with the Great Northern and other lines.

Climate, Soil, and Agriculture.—The climate is somewhat colder than that of the southern and western counties of England. The coast is exposed to the north-east winds. Except in a small portion of the county on its western boundary, and a strip along the southern part, which are marshy, the air is dry and healthy. The soil may be divided into three classes: light sands of various qualities, chiefly in

the north-west of the county; low alluvial clays and loams, on the borders of Lincolnshire and Cambridgeshire; and loams of various qualities, chiefly light, incumbent on a marly clay, in the centre and eastern part. There is a strip of peat and marsh along the courses of the Ouse and the Waveney on the southern boundary.

Much unproductive land in this county has been brought into cultivation and made equally productive with those which are naturally fertile. This has been effected chiefly by laying considerable portions of the marly clay, found a little below the surface, on the poorer soil which was at the surface, and by an excellent system of tile-draining where the subsoil is impervious to water. The crop which is raised in the greatest perfection in Norfolk is barley; but all the usual grains, with turnips, mangel-wurzel, potatoes, and the ordinary roots, are extensively cultivated. The principles of Norfolk agriculture generally are those of a judicious rotation of crops, known as the Norfolk system; the production, by rich manure, of a few inches of thoroughly good earth; a careful garden cultivation; and, to provide sufficient manure for the corn-crops, half the land is devoted to raise food for cattle.

On the light lands large flocks of sheep are kept. The old horned and black-legged breed, long peculiar to the county, are now in a great measure superseded by the Leicester and South Devon breeds. The Norfolk sheep are good, and their flesh superior to most other mutton, at a proper age, but they are great wanderers. The favourite oxen of the Norfolk farmer are the small Scotch breeds. Few large dairies are now found in the county. The cows kept for private use are mostly of the polled Suffolk breed. Many farmers in Norfolk breed horses from their working mares; and excellent hunters and coach-horses are sometimes produced by a cross with a good bony blood horse. Pigs are bred in great numbers. Great numbers of turkeys and geese are reared for the supply of the London market. Game is abundant, but less so than formerly.

Divisions, Towns, &c.—The county is divided into East Norfolk and West Norfolk, and into 33 hundreds, 13 of which are in the eastern division, and 15 in the western. The hundreds in the eastern division of the county are—Blofield, central; Clavering, south-east; Depwade, central; Diss, south; Earsham, south; North Erpingham, north-east; South Erpingham, central; Eynsford, central; East Flegg, east; West Flegg, east; Forehoe, central; Happing, east; Henstead, central; Humbleyard, central; Loddon, south-east; Taverham, central; Tunstead, north-east; and Walsham, east. In the western division are the hundreds—Brothercross, north; Clackclose, west; Freebridge Lynn, west; Freebridge Marshland, west; Gallow, central; North Greenhoe, north; South Greenhoe, central; Grimshoe, south-west; Guiltcross, south; Holt, north; Launditch, central; Mitford, central; Shropham, south; Smithdon, north-west; and Wayland, central. Besides these hundreds are the city and liberties of Norwich, constituting a county of a city, the boroughs of King's Lynn and Thetford, and part of the borough of Great Yarmouth. The county returns 12 members to the House of Commons, 2 for each division of the county, 2 for the city of Norwich, and 2 each for the parliamentary boroughs of Lynn, Thetford, and Yarmouth. Norfolk is in the diocese of Norwich, of which it forms the archdeaconries of Norwich and Norfolk. It is included in the Norfolk circuit. Assizes and quarter sessions are held in Norwich; county courts in Attleburgh, Aylsham, Downham Market, East Dereham, Holt, King's Lynn, Norwich, Swaffham, Thetford, North Walsham, Little Walsingham, Wymondham, and Great Yarmouth. The county jail and lunatic asylum are in Norwich; there are houses of correction at Swaffham, Little Walsingham, and Wymondham, and borough jails at Norwich, Yarmouth, King's Lynn, and Thetford. The maritime jurisdiction of the county is under the direction of the vice-admiral of Norfolk (generally the lord-lieutenant of the county), who is appointed under a commission from the lords of the admiralty, and is invested with power to hold a court of admiralty for the county, with judges, marshals, and other officers.

NORWICH, the capital of the county, is described in a separate article. Notices of ATTLEBURGH, AYLISHAM, BLOFIELD, EAST DEREHAM, DISS, DOWNHAM, LODDON, LYNN, SWAFFHAM, THETFORD, WALSHINGHAM, and YARMOUTH, will be found under their respective heads. Of the other towns the more important are given here; the population is that of 1851.

New Buckenham, population of the parish 766, is situated 15 miles S.W. from Norwich, near the source of the Tae. Old Buckenham had a castle at the time of the Conquest; but this castle was pulled down and an Augustinian priory built from its ruins, in the time of Stephen or Henry II. by William de Albini, who erected a new castle, round which grew up the town of New Buckenham. There are a National school and an almshouse for four persons. The church, dedicated to St. Martin, was partly rebuilt near the close of the 16th century. It has a richly-carved screen and some interesting monuments. Wesleyan and Primitive Methodists have chapels in the town. Fairs are held on the last Saturday in May and November 22nd.

Burnham, 32 miles N.W. from Norwich, is distinguished as Burnham Westgate from several neighbouring parishes with a similar designation. The population of the parish was 1241 in 1851. Burnham Ulph and Sutton and Burnham Norton are so close to Burnham Westgate as to form with it one town. The town is situated on the left

bank of a small stream, the Burn, at the mouth of which is a small tidal harbour, called Overy Staith. The church is a neat little building of stone and flint, with an embattled tower. There are chapels for Wesleyan and Primitive Methodists, and Independents. A considerable trade in corn, coal, and agricultural manures is carried on at the Staith, and two iron-foundries are in operation at Westgate. There are two yearly fairs. There are National, British, and Infant schools.

Cley, or Cley-next-the-Sea, population 995 in 1851, is 25 miles N. by W. from Norwich, on the right bank of a small river, the Glarm, and Blakeney on the left bank; the mouth of the river forms a harbour, called Cley and Blakeney Harbour. The river is navigable to Cley for vessels of 50 tons burden. There is a considerable importation of corn, coal, timber and deals, hemp, iron, tan, tallow, oil-cake, &c. The church is a large and beautiful edifice of early English architecture. The battlements, parapets, and tracery of the windows are remarkably rich and fine. An annual fair for horses is held in July. The Wesleyan Methodists have a chapel. Large quantities of the finest fruits and vegetables are raised by the inhabitants, and disposed of chiefly at Cromer. The population of *Blakeney* was 1108 in 1851. Blakeney church is a large old building of stone and flint, with a square embattled tower. Wesleyan and Primitive Methodists have chapels, and there are National and Infant schools. There are some remains of an ancient Carmelite monastery. About 50 vessels, mostly small, belong to Blakeney, some of which are employed in the oyster fishery.

Cromer is on the coast, 21 miles N. from Norwich: population of the parish 1366. There was anciently a town or village on this part of the coast called Shipden, which was destroyed by the sea about the commencement of the 15th century. The sea continues to gain on the land, and several houses in Cromer have been destroyed within the memory of those now living. The town is situated at the top of the cliffs. Many good houses have been built of late years, and the town has generally been much improved. It is frequented in summer as a watering-place. The Bay of Cromer is very dangerous. There is some trade in coals, timber, tiles, and oil-cake. The crab and lobster fishery is actively carried on. There is a yearly fair. The church is a building of great beauty, in the perpendicular style; the tower is nearly 160 feet high, and is remarkably fine. The Wesleyan Methodists have a chapel. The Free school, founded in 1505, had 80 scholars in 1850. There are a girls school and an Infant school.

Fakenham, 29 miles by railway, 25 miles by road N.W. from Norwich; population of the parish 2240, is situated on a pleasant declivity near the left bank of the Wensum. It is lighted with gas. The church, which dates from 1497, is handsome and commodious, with a lofty western tower. The Independents, Wesleyan and Primitive Methodists, and Baptists have chapels. There are National, British, and Infant schools; and a savings bank. There is an ancient market-cross. A large corn-market is held here on Thursday; fairs are held on Whit-Tuesday and November 22nd, and a hiring session for servants in October.

Foulsham is 16 miles N.W. from Norwich: population of the parish 1077. The town was burnt in 1770, and has been since rebuilt on a regular plan and in a respectable style. The church is a handsome building of flint and stone. There is a yearly fair. The Baptists have a chapel, and there is a National school.

Harleston, 16 miles S. from Norwich, population of the chapelry 1309, consists of a main street along the Yarmouth road, and has a convenient market-place on the south side. It is lighted with gas. The Independents, Wesleyan Methodists, and Baptists have places of worship. A small British school, two National schools, and a savings bank, are in the town. A neat corn-hall has been recently erected. There is a well-attended corn-market on Wednesday, and four fairs are held in the year.

East Harling is 20 miles S.W. from Norwich, on the Norfolk railway: population, 1198. An iron-foundry, a large flour-mill, lime-burning works, and a manufactory of agricultural implements, afford some employment. There is a weekly market on Tuesday for corn. Besides the church there are places of worship for Wesleyan and Primitive Methodists and Quakers; also National schools.

Hingham is 4 miles W. by N. from Wymondham: population, 1698. The town contains some good houses. The market-place is very neat. The church, which dates from the time of Edward III., is large and handsome, partly in the decorated, partly in the perpendicular style. The Independents and Mormons have chapels. The market is held on Tuesday, and there are three yearly fairs. There are an Endowed Grammar school for boys of the town, which had 36 scholars in 1852, and a National school.

Holt, 21 miles N. by W. from Norwich, population of the parish 1726, is irregularly laid out, but the houses are neatly built, and the streets are paved and lighted with gas. The town was nearly destroyed by a great fire in 1708, but it was much improved on being rebuilt. There are a neat sessions-house and a church, chapels for Wesleyan Methodists, Baptists, and Quakers, and an Endowed school for 50 boys, founded by Sir Thomas Gresham, and placed under the government of the Fishmongers' Company, London: it had 55 scholars in 1850. There are also National, British, and Infant schools. A market is held on Saturday. A county court is held. Brewing, brick-making, and rope- and twine-making are carried on.

Reepham is 12 miles N.N.W. from Norwich: population of the parish 409. The town was formerly remarkable for having three churches, those of Reepham, Hackford, and Whitwell, in one churchyard. Hackford church was burned in the reign of Henry VIII.; the two others, Reepham and Whitwell, yet remain. The market is on Wednesday for corn; and there is a yearly fair. Brewing, malting, and tanning are carried on.

Stoke Ferry is on the road from Thetford to Lynn, 33 miles W. by S. from Norwich: population of the parish 820. The church was restored and a new chancel built in 1848. The Wesleyan and Primitive Methodists have places of worship. There are a National school and an endowed Free school. The market is held on Friday, chiefly for corn, and a large cattle-fair on December 6th. There are extensive malting establishments, lime-burning works, and a steam flour-mill.

Swaffham is 34 miles by railway and 27 miles by road W. from Norwich; population of the town 3858. It is situated on an eminence, and contains numerous well-built houses, a neat theatre, an assize room, a house of correction, and a jail. The church, a large cruciform edifice, consists of a nave with two aisles, a chancel, and two transept-chapels. At the west end is an embattled tower with pinnacles. There are meeting-houses for Wesleyan and Primitive Methodists and Baptists, a Free school, National, British, and Infant schools, and a school of design. The market is held on Saturday, and there are three fairs in the year. Large quantities of butter are sold. The Mid-summer quarter-sessions for the county are held here. Races and coursing meetings are held on a heath near the town.

North Walsham, 14 miles N.N.E. from Norwich, population of the parish 2911, stands on a gentle eminence above the river Ant, a feeder of the Bure, and contains many good modern houses. The town was almost entirely burnt in the year 1600. A market-cross, erected in the time of Edward III., was repaired after the fire. The church is a fine specimen of the perpendicular style. Parts of the tower fell down in 1724 and in 1835. There are several chapels for Dissenters, schools, a literary and scientific institution, a savings bank, and a neat theatre. The silk manufacture is carried on. The market is held on Thursday; there are a cattle fair and two statute fairs in the year. A navigable canal opens a water communication between this town and Yarmouth.

Watton is a small town 20 miles W. by S. from Norwich, situated in the midst of a dairy country, from which butter is sent to London. Population of the parish 1353. The church, which is at some distance from the town, has a round tower with an octangular top; it was built in the reign of Henry II. There are chapels for Independents, and Wesleyan and Primitive Methodists, National and Infant schools, and a savings bank. Wednesday is the market-day; fairs are held in July, September, October, and November. Petty sessions are held monthly.

Wells, 29 miles N.N.W. from Norwich, population of the town 3633, stands on a slight elevation, above the marshy-flat which here lines the coast, and about half a mile from the sea, on a creek, the mouth of which forms the harbour. The shifting sands render this harbour difficult of access, but considerable improvements have been made; a new quay has been built, to which vessels of 200 tons can ascend. The town is partly lighted with gas, and possesses a custom-house and a theatre. Besides the parish church there are chapels for Wesleyan and Primitive Methodists, Independents, and Quakers, the Earl of Leicester's school for boys, girls, and infants, and two Free schools. Ship-building and rope-making are carried on. Corn and malt are shipped; and coals, timber, deals, bark, oil-cake, tar, and wine are imported. There is a yearly fair. Petty sessions are held every fortnight.

Wymondham, population of the town 2970, stands at the junction of the East Anglian and the Norfolk railways, 11 miles W.S.W. from Norwich. A Benedictine priory was established here before 1107, by William de Albini, chief butler to Henry I. Part of the conventual church is now used as the parish church. It is a spacious and remarkably fine edifice, having strong claims upon the attention of the antiquary. Wymondham has been much improved of late years; it is lighted with gas and paved. The Independents, Baptists, and Plymouth Brethren have each a place of worship; the Methodists have two chapels. The Free Grammar school, founded in the reign of Edward VI., had 25 scholars in 1853. There are also a Parochial and a British school. A market is held on Friday, and there are fairs on February 14th and May 17th, for horses and cattle, and a general fair on September 29th.

Of the places formerly of note, but now decayed, the following may be mentioned.—*North Elmham*, population 1211, situated 5 miles N. from East Dereham, was for four centuries (673-1075) the seat of a bishopric, formed originally by dismemberment from the still more ancient see of Dunwich, to which however it was reunited about 870. Some of the bishops had a castle here. The intrenchment which surrounded the castle still remains, and incloses about 5 acres of land. There are a few vestiges of the castle and some traces of the cathedral. The parish church is a handsome edifice, with a square tower. There are a chapel for Independents and a National school.

Castle Acre is 4 miles N. from Swaffham, on the right bank of the Nar, or Setch River, which joins the Ouse above King's Lynn: population 1567. Several coins and a tessellated pavement have been dug

up here. Of the castle erected by William, earl of Warren and Surrey, the earthworks remain, as well as fragments of the building. The principal street of the village passes through one of the main entrances of the castle; this entrance consists of an outer and inner gate, with a portcullis between them, and two circular bastions to defend the approach. Earl Warren founded here a priory of Cluniac monks, which existed till the dissolution. Of the priory buildings the remains are fine specimens of Norman architecture. The parish church is a handsome and commodious structure, with a lofty square tower. Wesleyan Methodists and Baptists have places of worship; there is a National school. Tanning and fellmongery are carried on, and there are flour-mills. Two yearly fairs are held.

Castle Rising is 5 miles N.W. of Lynn, on the left bank of the Rising, or Habingly River: population 392. William de Albi built a castle here before 1176. The trade of the place was considerable, and the town was incorporated; but the harbour becoming choked up, the place fell into decay. Of the castle the keep is standing. The general style of the building is Norman. Isabella of France, queen of Edward II., was kept in confinement in this castle by her son Edward III. from 1330 till her death in 1358. The church, which was built in the 11th century, was restored in 1844. Trinity hospital provides accommodation for twelve poor women and a governess.

Kenninghall, population 1048, about 3 miles E. from East Harling, on the Ikeneld-street, was once a residence of the princes of East Anglia. The site of the palace consists of an area of 4 acres, surrounded by a ditch, and having an artificial mound at each corner. The church has a south door of very singular Norman composition. There are chapels for Wesleyan Methodists and Baptists, and a Free school. Fairs are held on July 18th and September 30th.

Litcham is 7 miles N.W. from East Dereham: population 855. Although the market has been discontinued, the place continues to be the mart of the surrounding villages. Besides the parish church there are chapels for Wesleyan and Primitive Methodists. Pleasure fairs are held in May and November: races are held in July.

Methwold, between Brandon and Stoke Ferry, was formerly a market-town: population 1669. It has a handsome church with an embattled tower, surmounted with an octagonal spire. The Wesleyan Methodists have a chapel. A cattle fair is held on April 23rd.

Snettisham, 11 miles N. by E. from Lynn: population 1172. It has a church, Wesleyan and Primitive Methodist chapels, and a National school. Several brass 'celts' have been dug up in this neighbourhood. There are quarries of carstone and some chalk-pits.

Worstead is 12 miles N.N.E. from Norwich and 3 miles from North Walsham: population 827. It was formerly the seat of a considerable manufacture, introduced by the Flemings, of woollen twists and stuffs, called from it 'worsted goods;' but this manufacture was, in the reigns of Richard II. and Henry IV., removed to Norwich. The church is a fine building, chiefly of perpendicular character; the tower is of decorated character, and is of admirable arrangement and composition. There are a chapel for Baptists, National and British schools, and almshouses for six poor persons.

The following are among the more important villages: the populations are those of the parishes in 1851:—

Banham, population 1195, is 7 miles S. by E. from Attleburgh. The parish church is a handsome gothic structure: the altar-piece was brought here from Bristol cathedral in 1845. The Wesleyan and Primitive Methodists have chapels, and there is a Free school. In the neighbourhood are barracks. *Binham*, or *Binham Abbey*, 3 miles N.E. from New Walsingham, population 511, is a large village, which had a market and fair granted by Henry I. The fair only is now held. There are extensive ruins of a Benedictine priory. The nave of the priory chapel was converted into the parish church. There are a National and a Free school. *Blickling*, population 852, about a mile N. from Aylsham. The manor belonged to the father of Anne Boleyn; it was afterwards purchased by Lord Chief Justice Hobart, whose son built, in 1620, the mansion, Blickling Hall. The hall contains an extensive and valuable library, with numerous portraits and other paintings. A school for poor children is supported by Lady Suffield. *Briston*, population 996, about 5 miles S. by W. from Holt, near one of the heads of the river Bure, has a parish church, partly of decorated, and partly of later English character; chapels for Wesleyan and Primitive Methodists and Independents; and a National school. A stock market is held weekly on Tuesday, and a cattle fair on May 26th. *Caistor-next-Yarmouth*, population 1043, about 2½ miles N. from Great Yarmouth, formed at one time two parishes, but of one of the churches only a part of the tower remains. There are chapels for Wesleyan and Primitive Methodists, and National and Infant schools. Several persons are engaged in fishing. The coast-guard has a station here. West from the village are some remains of a round tower and of the walls of Caistor Castle. *Catton*, population 618, about 2 miles N. from Norwich, a neat village, containing many good houses and villas, chiefly the residences of Norwich merchants. The parish church is a neat building, with an octagonal tower; in the interior are some interesting monuments. There is here an Industrial school for girls. *Coltishall*, population 907, on the river Bure, 7 miles N. by E. from Norwich, occupies a pleasant situation, and has a considerable trade in corn, malt, coals, &c. The church has an embattled tower. The Wesleyan Methodists have a chapel,

and there is a National school. A fair is held on Whit-Monday. *Costessey*, or *Cossey*, population 1025, on the river Wensum, 4 miles N.E. from Norwich, consists chiefly of one long street. The church, a commodious structure, has a square tower, surmounted with a lofty wooden spire; the south porch is Norman. The Baptists have a place of worship. There are National, Roman Catholic, and Baptist schools. Near the village is the fine mansion and park of Costessey, the seat of Lord Stafford. Contiguous to the hall is a handsome Roman Catholic chapel. *Ditchingham*, population 1130, about 13 miles S.E. from Norwich, forms a suburb of Bungay, in Suffolk, from which it is separated by the river Waveney. The church, a handsome edifice, which contains some good specimens of stained glass, occupies an elevated site. There are National and Infant schools. A large silk manufactory here belongs to a Norwich firm. *Feltwell*, population 1675, about 7 miles S. by E. from Stoke Ferry, consists of several streets. St. Mary's Church is a handsome edifice, with a richly ornamented tower. St. Nicholas, a small plain building, has been in part rebuilt within the last few years. There are chapels for Wesleyan and Primitive Methodists, and a Free school. *Happisburgh*, or *Hasbro'*, population 621, on the coast, about 6 miles E. by N. from North Walsham. The parish church, a handsome building, with a lofty embattled tower, stands on an elevated site, and is a conspicuous land-mark. There is a National school. Some of the inhabitants are engaged in fishing. There is here a station of the coast-guard. The encroachments of the sea at this part have been considerable. Two lighthouses, respectively 80 feet and 100 feet high, stand a short distance south-east from the village. *Hickling*, population 812, about 15 miles N.E. from Norwich; the houses, being scattered, cover a considerable space. The ground in the neighbourhood is marshy. Hickling Broad, an extensive lake, communicates by the North River with the Bure, and small vessels are thus enabled to keep up commercial intercourse in the district. The church is an ancient edifice, with a tower. The Wesleyan and Primitive Methodists have chapels, and there is a National school. There are some remains of an Augustinian priory. *Hilgay*, 4 miles S. by E. from Downham, population 1710, has a large and handsome church; a fine avenue of trees forms an approach to the church. There are chapels for Wesleyan and Primitive Methodists, and a National school. The Wissey, or Stoke River, which is here crossed by an iron bridge, runs into the Ouse at Hilgay Creek, about two miles from the village. From Lynn, coal and other cargoes are brought by lighters to the quay at Hilgay, and corn and other products of the locality are taken back. *Holkham*, population 683, about 2 miles W. from Wells, and a mile from the coast, has a handsome church seated on elevated ground, with a lofty embattled tower, which forms a good land-mark: in the interior are some ancient monuments. There are a Free and an Infant school. *Holkham Hall*, the splendid seat of the Earl of Leicester, is situated in an extensive and well-wooded park. In the mansion are galleries of paintings and sculpture, and a noble library. Almshouses were erected in 1755, by the Countess Dowager of Leicester. In the 14th century the port of *Holkham* was of some importance. Much land has been reclaimed from the sea at this part of the coast by the efforts of the successive Earls of Leicester, particularly of the late earl (better known as Mr. Coke, the Norfolk agriculturist), who was created Earl of Leicester, of *Holkham*, in 1837, but who had succeeded to the estates sixty years before. In the course of the sixty-six years during which he held the estates of *Holkham* its rental was increased, chiefly owing to his princely improvements, from little more than 2000*l.* to above 20,000*l.* It was stated in the earl's will that he had "lately expended the sum of 500,000*l.* in the improvement of his estate." A column has been erected to his memory by subscription in the neighbourhood. It is 140 feet high, and in the Corinthian style. *Langley*, population 312, is about 10 miles S.E. from Norwich, near the right bank of the Yare. The church is a neat building, with a square tower. There is a National school. *Langley Hall*, a spacious mansion, stands in an extensive park on the west of the village. It contains numerous paintings and sculptures. About a mile north-east from the village are some remains of *Langley Abbey*, founded in 1198. *Marham*, population 1125, about 17 miles E.N.E. from Norwich, near the right bank of the river North, has a handsome gothic church, chapels for Wesleyan and Primitive Methodists and Baptists, and Free schools for boys and girls. A fair is held in July. *Mundsey*, population 451, about 20 miles N. by E. from Norwich, is a pleasant village on the coast, frequented in summer for bathing. In the absence of any harbour or pier, small vessels receive and discharge their cargoes on the beach. There is a coast-guard station at *Mundsey*. The church, which occupies an elevated site on the cliff, is partly dilapidated; service is performed in a portion of the nave. There are a chapel for Dissenters, and National, British, and Infant schools. *Northwold*, population 1397, about 4 miles E.S.E. from Stoke Ferry, is pleasantly situated on the left bank of the Wissey or Stoke River. The church is a handsome and commodious structure, with a tower of the 14th century, built chiefly of flint, and surmounted with 10 crocketed pinnacles. The Wesleyan Methodists have a chapel, and there is a Free school. *Great Ormsby*, or *Ormsby St. Margaret's*, population 707, about 5 miles N. by W. from Yarmouth, and a mile from the coast, has a parish church of ancient date, with a tower

surmounted by figures of four monks instead of pinnacles. The Wesleyan Methodists and Baptists have places of worship, and there is a National school. Near the village is Ormsby Hall, a handsome gothic mansion. *Oxborough*, or *Ozburgh*, population 293, about 7 miles S.S.E. from Swaffham, has a commodious gothic church, built of flint and stone, with a square tower and a spire of considerable height. The interior is neat; the roof is of carved oak: in the east window is some richly-stained glass. The Roman Catholics have a chapel. A fair for horses, cattle, toys, &c., is held on Easter Tuesday. *Oxborough Hall*, a castellated mansion of the 15th century, the seat of Sir H. R. P. Bedingfield, Bart., is in the neighbourhood. At Warren Hill are some ancient earth-works. *Pulham*, population 1414, pleasantly situated on an eminence 15 miles N. by W. from Norwich, has a handsome church, with a lofty embattled tower, and a porch of Norman character on the south-west side. The Baptists have a chapel, and there is a school with a small endowment. *Lower Sherringham*, population 1374, about 7 miles E.N.E. from Holt, is a fishing village of some importance; the fishery, chiefly of cod, lobsters, crabs, whittings, and skate, employing about 30 boats. There is here a station of the coast-guard. *Upper Sherringham*, about 1 mile S.W. from Lower Sherringham, has a handsome church of early English character, with some portions of later date; the church has a lofty embattled tower. *Shipdham*, 5 miles S. by W. from East Dereham, population 1769, has a handsome church, which was enlarged in 1845, and an Endowed school. The Wesleyan and Primitive Methodists and Independents have places of worship. A fair is held on the last two days of June. *Spronston*, population 1308, about 2 miles N.E. from Norwich, consists chiefly of one street about a mile long, containing many good dwelling-houses. The church is ancient, but it has been greatly altered by repairs. Brick-making and lime-burning are carried on. There are several corn-mills and saw-mills in the vicinity. *Stalham*, population 698, about 12 miles N.E. by N. from Norwich, has an ancient church, of which the tower was shattered by lightning some years since. The chancel was built in 1827. The Wesleyan Methodists have a chapel, and there is a National school. By Sutton Broad, or Lake, Barton Broad, and the river Bure, there is navigable communication with the sea at Yarmouth. *Terrington St. Clements*, population 2250, about 4 miles W. from Lynn, has a cruciform church, the tower of which stands apart from the body of the building. There are chapels for Wesleyan and Primitive Methodists, and a National school. Petty sessions are held fortnightly. *Lovell's Hall*, in the neighbourhood, is a stone mansion of the 16th century. *Thorpe*, population 3000, pleasantly situated on the left bank of the Yare, about 2 miles E. from Norwich, has a small church, a chapel for Independents, National and Free schools; also extensive iron-works. About a mile east from Thorpe is the County Lunatic Asylum, which in 1851 had 277 inmates. The Norwich Yacht Club has its head-quarters at Thorpe. The village is a favourite place of resort for the inhabitants of Norwich on holiday occasions. *Tullehall*, population 615, about 2 miles N. from Litcham, has a church of ancient date, in which are several interesting monuments, particularly one in black and white marble in memory of Lord Chief Justice Coke, with a full-length effigy. *Upwell*, population of the Norfolk part of the parish 3189, about 7 miles W. from Downham Market, on a branch of the river Nen, which here forms the boundary between the counties of Norfolk and Cambridge. The church is on the Norfolk side of the stream. There are in the village meeting-houses for Methodists and Baptists, and a Charity school. *Walpole St. Peter*, population 1361, about 7 miles W. by S. from Lynn, has a very handsome church in the perpendicular style, with a fine south porch and embattled tower. There is a Free school. The Roman embankment or sea-wall passes the village on the west. *Walsoken*, population 2740, about a mile N.E. from Wisbeach, is a favourite resort for the inhabitants of Wisbeach, there being pleasant walks round the village. *Walsoken*, like the neighbouring villages of Walton and Walpole, derives its name from its situation near the old Roman wall or embankment against the inundations of the sea. *Wilton*, population 1069, near the south border of the county, about 9 miles S. by E. from Stoke Ferry. The land in the neighbourhood is chiefly heath. The parish church is a modern structure of stone and flint, recently repaired. The Wesleyan and Primitive Methodists have chapels. In the centre of the village is an ancient stone cross 15 feet high on a circular brick pedestal 6 feet high. There is a Free school. *Winfarthing*, population 691, pleasantly situated about 18 miles S.S.W. from Norwich, is chiefly the property of the Earl of Albemarle. The church is ancient. The Wesleyan and Primitive Methodists have places of worship. *Winterton*, population 722, about 8 miles N. by W. from Yarmouth, is a fishing village, chiefly belonging to Joseph Hume, Esq., M.P., and the Earl of Winterton, who is lord of the manor. The church has a fine embattled tower 120 feet high. There is a National school. Many of the population are employed in the herring and mackerel fishing. There is a station of the coast-guard. *Winterton Lighthouse*, a hexagonal structure seated on a lofty eminence, is about 70 feet high.

History, Antiquities, &c.—Norfolk formed part of the territory of the Iceni. In the Roman division of Britain it was included in the province of Flavia Caesariensis. There were many British and Roman towns or posts in this county. *Venta Icenorum* was probably at Caistor St. Edmund's, about 3 miles S. from Norwich, and was the

chief town of the Iceni. *Branodunum* and *Gariannonum*, mentioned in the 'Notitia Imperii,' were probably in this county; the former at Brancaster, the latter on the estuary of the Waveney; and *Ad Taum*, mentioned in the Peutinger Table, was probably at Taesburgh, on a branch of the Yare. The mouth of the great estuary, where Yarmouth now stands, is mentioned by Ptolemaeus under the name *Garryenus*.

Of *Venta*, the principal Roman post on the east side of the island, there are some remains on the right bank of the Tase, which joins the Yare. It comprehended about 30 acres. Of a massive tower near the river, designed to guard the gate toward the water, there are considerable remains: it is still 30 feet high, and is composed of alternate layers of Roman bricks and of flint, imbedded in a strong cement. The parish church, which stands within the area, is partly built of Roman bricks.

There are traces in the county of Roman or other ancient roads. A road, nearly coinciding with the Norwich coach road, ran from the neighbourhood of Diss to *Venta Icenorum*. Another from *Ixworth* in Suffolk ran in nearly a direct line by *Castle Acre* to *Holme*, near *St. Edmund's Point*. A third road ran from *Venta*, or *Ad Taum*, across the valley or estuary of the Waveney at *Bungay*. The *Ikeneld-street* crossed the *Little Ouse* above *Thetford*, and ran in the direction of *Venta*. Several other roads traversed the county.

After the conquest of England by the Saxons, Norfolk formed part of the kingdom of East Anglia. In 823, Norfolk, with the rest of East Anglia, quietly submitted to the sovereignty of Egbert, king of Wessex; but continued for some time under the immediate government of the East-Anglian kings, and subsequently of ealdormen. In the Danish descent upon England, in 866, the inhabitants made common cause with the invaders, part of whom settled in the county. In 870 the Danes returned and established themselves at *Thetford*. *Edmund*, the East-Anglian king, in an attempt to expel them, was taken prisoner and beheaded, Nov. 20th, 870, and the dominion of the invaders became permanent. In the peace made between *Alfred* and *Guthrun* or *Godrun* (883), this county was included in the *Danelagh*, and, though subject to the supremacy of the Anglo-Saxon kings, became Danish in character. In 1004 *Sweyn*, king of Denmark, brought his fleet up to Norwich, which he plundered and burnt; but he was forced to retire by *Ulfketil*, or *Ulfkytill*, ealdorman of East Anglia, who was himself of Danish extraction. In the reign of *Edward the Confessor*, the earldom of East Anglia was held by *Harold*, afterwards king.

After the Conquest the earldom of Norfolk and Suffolk was bestowed on *Ralf de Guader*; but he, having rebelled, the earldom of Norfolk was bestowed on *Roger Bigod*, another of the companions of the Conqueror. On the death of *William*, *Roger* supported the claim of his eldest son, *Robert*, to the throne, which led to the devastation of the county. In the rebellion of the children of *Henry II.* against their father (1177) Norfolk was the scene of contest, *Hugh Bigod* being a supporter of the young princes: he died attainted of treason. His son *John* was one of the barons who extorted *Magna Charta* from *John*. In the subsequent war with the barons the king came into this county; and it was in crossing the *Wash* from *Lynn* into *Lincolnshire* that he lost his baggage. The forces of *Louis the Dauphin* and his confederates afterwards overran the county. In the great rebellion of the Commons under *Wat Tyler* (1381), the men of Norfolk took part under the command of *John the Litester* (or *Dyer*); but they were defeated at *North Walsham*, and the leaders were executed. At this time the manufacture of woollen-stuffs was flourishing in the county, and Norwich was a large and populous city. The earldom of Norfolk had before this period passed to the *Mowbrays*. *Thomas de Mowbray* was created Duke of Norfolk by *Richard II.* before 1380. In the time of *Edward IV.*, the direct male line of the *Mowbrays* having become extinct, the title of Duke of Norfolk came to *Edward's* son, after whose murder in the Tower the dukedom was conferred by *Richard III.* on *Sir John Howard*, in whose family it has ever since remained.

In the disturbances which arose out of the Reformation, Norfolk became the scene of tumult. A rising took place at *Attleburgh* in 1548, and it soon became serious. *Ket*, a tanner of *Wymondham*, was chosen leader of the rebels, who encamped on *Mousehold Heath*, near *Norwich*, to the number of 20,000. *Ket*, with two assessors from each hundred in the county, held a court of justice under an oak, since called 'the Oak of Reformation,' and issued edicts levying contributions for the support of his followers. The rebels were at length attacked by the Earl of *Warwick* with an army that had been collected to invade *Scotland*, and were totally defeated in a place called *Duffen Dale*, to which they had retired. *Ket* was hanged on *Norwich Castle*, and his brother on the tower of *Wymondham church*; and the rebellion, which had also broken out in other parts of England, was put down. In the struggle between *Charles I.* and the Parliament, Norfolk zealously supported the cause of the Parliament, and was one of the associated counties under the Earl of *Manchester*.

Of the edifices of the middle ages, monastic, ecclesiastical, or castellated, Norfolk has several remains. The principal castles are those at *Norwich*, *Castle Acre*, and *Castle Rising*, and *Caistor*, described elsewhere.

There are several ancient manor-houses. *Ozburgh Hall*, near *Stoke*

Ferry, on a stream that flows into the Wissey, was erected in 1481 by Sir Edmund Bedingfield. It is wholly constructed of brick, and originally inclosed a quadrangular court, 118 feet by 92 feet. The entrance is over a bridge (formerly a drawbridge) and through a gateway between two fine towers 80 feet high. The whole is surrounded by a moat 52 feet broad and 10 feet deep. Of East Basham House, near Fakenham, built in the reign of Henry VII. or Henry VIII., the walls of the porter's lodge and some of the apartments on the northern side of the court remain, and are appropriated as a farm-house. Winwal House, at Wareham, near Stoke Ferry, is perhaps the most ancient domestic edifice in England. It has Norman buttresses, and some portion of ornament in that style. It consists of two stories, each containing two apartments. The whole building is only 33 feet long by 27 feet deep, and scarcely 16 feet high. Oxmead Hall, and Blickling Hall, near Aylsham, belong to a later period—Oxmead to that of Elizabeth, and Blickling to that of James I. or Charles I.

A notice of the ancient buildings of Lynn, and of the abbey of Thetford, will be found under LYNN and THETFORD. The abbey or priories of Wymondham and Castle Acre have been already mentioned. Walsingham Abbey is noticed in the article WALSHINGHAM, LITTLE. Langley Abbey is on the verge of the marshes of the valley of the Yare, 2 or 3 miles N. from Loddon. It was founded in 1198 by Robert Fitz-Roger Helke, or De Claving, for Premonstratensian Canons. The remains of the Benedictine abbey of St. Bennet of Hulme, founded by Canute before 1020, are in the marshes near the junction of the Bure with the Thurn and the Ant. At West Dereham, between Stoke Ferry and Downham Market, are the remains of a Premonstratensian abbey, founded in 1188. The chapel and hospital (afterwards priory and abbey) of North Creak, 2 miles S. from Burnham Market, were founded by Sir Robert de Nerford in 1206. The priory and abbey belonged to the regular canons of St. Augustine. Of all these institutions there are ruins which contain some beautiful portions, chiefly in the early English style. Near the sea, on the road between Cromer and Cley, are some remains of Beeston Priory, founded for the canons of St. Augustine in the reign of John or of Henry III. There are a few remains of the once extensive priory of Flitcham, founded in the reign of Henry III., about 9 miles N.E. from Lynn: they are used for farm offices. Of Binham Priory, a Benedictine house, 5 miles S.E. from Wells, founded by a nephew of the Conqueror, the ruins are very considerable and interesting. The nave and north aisle, and a portion of the south aisle of the conventual church, with the chief part of the west front, and the ruins of the north transept remain. The west front is early English; the interior of the church is Norman. The nave and north aisle are at present used as the parish church. Of Broomholm Priory, near the sea, between Cromer and Yarmouth, founded in 1113 for Cluniac monks, there are some remains incorporated with a farm-house.

Several of the churches in the county have round towers, of no great dimensions, surmounted by an octagonal upper story; and many of them are partly of Norman architecture. Little Snoring church has a doorway exhibiting a curious mixture of Norman and early English. Northwold church has in the chancel against the north wall a lofty shrine, or Easter sepulchre, the upper part of which is composed of canopies over niches, while the lower part forms an altar tomb, on which are three figures of armed men in a posture of alarm, designed to represent the soldiers at the Resurrection of Our Lord. At Houghton, near Walsingham, is a small chapel, which is a beautiful specimen of decorated architecture.

Statistics; Religious Worship and Education.—According to the Returns of the Census in 1851 there were then in the county 1441 places of worship, of which 719 belonged to the Church of England, 516 to Wesleyan Methodists, 91 to Baptists, 49 to Independents, 15 to Quakers, 13 to Mormons, 7 to Unitarians, 6 to Roman Catholics, and 2 to Jews. The total number of sittings provided was 280,668. The number of day-schools in the county was 1861, of which 497 were public schools, with 34,961 scholars; and 864 were private schools, with 18,745 scholars. Of Sunday schools, there were 782 in the county, with 50,182 scholars, of which 481 schools, with 27,422 scholars, were under the superintendence of the Established Church. The number of evening schools for adults was 58, with 1033 pupils. There were 18 literary and scientific institutions in the county, with 2176 members, and 40,470 volumes in the libraries belonging to them.

Savings Banks.—In 1853 the county possessed 10 savings banks—at Aylsham, Downham Market, Fakenham, Harleston, King's Lynn, Norwich, North Walsham, Swaffham, Walton, and Great Yarmouth. The amount owing to depositors on November 20th 1853 was 595,823*l.* 3*s.* 3*d.*

NORFOLK, U. S. [VIRGINIA.]

NORFOLK ISLAND. The group of islands of which Norfolk Island is the largest, consists of Norfolk Island, Philip Island, Nepean Island, and several islets named the Bird Islands, which are little more than masses of rock scattered about near the shores of Norfolk Island. The sea surrounding the island has a rocky bottom, and there is no good anchorage. Norfolk Island is used by the British government as a penal settlement. It is situated in 29° 2' S. lat., 168° 2' E. long., 900 miles E.N.E. from Sydney, and about 400 miles N.N.W. from New Zealand. It is about 5 miles long, and the average width is about 2½ miles. The area is estimated at 14 square miles.

The substratum of the island is porphyry, but a very large number of boulders of greenstone are distributed over the surface, and appear to have been originally imbedded in the porphyry. The south-eastern part of the island, where the settlement is placed, is comparatively flat, and the beach is almost incessantly beaten by a violent surf. In this part the porphyry is overlaid by sandstone and limestone. The rest of the island rises from the sea with steep cliffs to the height of from 200 to 300 feet. The general elevation of the central part of the island is from 300 to 350 feet, but Mount Pitt rises to the height of 1050 feet. Numerous ravines radiate in all directions from Mount Pitt, most of which terminate in abrupt declivities from 30 to 40 feet above the sea, over which in winter fall several picturesque cascades. A landing-place on the north side of the island is close to one of these ravines, called Great Cascade. Springs of fresh water are abundant. The soil is rich, and the greatest part of the island is covered with timber-trees, among which are pines 200 feet in height and 5 feet in diameter. Maize, wheat, rye, barley, and oats, as well as vegetables and fruits are cultivated; but the difficulty of landing is unfavourable to colonisation. The island was discovered by Captain Cook in 1774. It was first occupied as a dependency of New South Wales, partly by criminals and partly by free settlers; but since 1825 it has been exclusively a penal settlement. The number of prisoners is from 600 to 700. *Philip Island*, about 6 miles S. from Norfolk Island, and unoccupied, is somewhat more than a mile long, and less than a mile wide. It is everywhere precipitous, and is furrowed into deep gullies. *Nepean Island* is smaller, and about 600 yards S. from Norfolk Island.

NORICUM, a province of the Roman empire, was bounded N. by the Danube, W. by Vindelicis and Rhætia, E. by Pannonia, and S. by Illyricum and Gallia Cisalpina. It was separated from Vindelicis by the Cenus (Inn), and from Gallia Cisalpina by the Alpes Carnicæ and Alpes Julis; but it is difficult to determine the boundaries between Noricum and Pannonia, as they differed at various times. Under the later times of the Roman empire, Mount Cæsius and part of the river Murus (Mur) appear to have formed the boundaries. Noricum would thus correspond to the modern Styria, Carinthia, and Salzburg, and to parts of Austria and Bavaria. Noricum is not mentioned by name in the division of the Roman empire, made by Augustus, but it may be included among the Eparchie. (Strabo, p. 840.)

Noricum was divided into two nearly equal parts by a branch of the Alps, which was called the Alpes Noricæ. These mountains appear to have been inhabited from the earliest times by various tribes of Celtic origin, of whom the most celebrated were the Norici (whence the country obtained its name), a remnant of the Taurisci. Noricum was conquered by Augustus, but it is uncertain whether he reduced it into the form of a province. It appears to have been a province in the time of Claudius, who founded the colony Sabaria, which was afterwards included in Pannonia. (Plin., iii. 27.) It was under the government of a procurator. (Tac., 'Hist.', i. 11.) From the 'Notitia Imperii' we learn that Noricum was subsequently divided into two provinces, Noricum Ripense and Noricum Mediterraneum, which were separated from each other by the Alpes Noricæ. In the former of these a strong military force was always stationed, under the command of a dux.

In addition to the Norici, Noricum was inhabited in the west by the Sevaes, Alauni, and Ambisontii, and in the east by the Ambidravi or Ambidrani; but of these tribes we know scarcely anything except the names. Of the towns of Noricum the best known was Noreia, the capital of the Taurisci or Norici, which was besieged in the time of Cæsar by the powerful nation of the Boii. (Cæsar, 'Bell. Gall.', i. 5.) It was subsequently destroyed by the Romans. (Plin., 'Hist. Nat.', iii. 23.) The only other towns worthy of mention were, Juvanum (Salzburg), in the western part of the province, Boiodurum (Innsbrück), at the junction of the Inn and Danube, and Ovilava, or Ovilaba, or Ovilava (Wels), south-east of Boiodurum, a Roman colony founded by Marcus Aurelius.

The iron of Noricum was in much request among the Romans (Pliny, 'Hist. Nat.', xxxiv. 41); and according to Polybius gold was formerly found in this province in great abundance (quoted by Strabo, iv. p. 208).

NORMA. [FROSINONE.]

NORMANDIE, one of the provinces into which France in ante-revolutionary times was divided, stretches along the English Channel from the mouth of the Bresle at Tréport to the mouth of the Couesnon, which river flows past Pontorson and enters the sea to the west of Mont-St.-Michel. It is bounded on the north and west by the sea. The eastern boundary dividing it from Picardie and Ile-de-France, ran along the Bresle and the Epte, to the mouth of the latter in the Seine; it then followed an irregular line to the Eure, which it struck opposite Ivry, whence the Eure completed the boundary to the mouth of the Avre. The provinces of Perche and Maine touched it on the south, the division being formed partly by the Avre, and partly by the crest of the high lands that form the watershed between the Channel and the Bay of Biscay, to about 1° W. long., whence it ran due west to the Couesnon. On the south-west it was bounded by Bretagne, the lower course of the Couesnon forming for a few miles the boundary between the two provinces.

Normandie was divided into Haute, or Upper Normandie, of which

the capital was Rouen; and Basse, or Lower Normandy, the chief town of which was Caen. Upper Normandy was subdivided into the following districts:—Caux, Bray, the Norman Vexin, Roumois, Auge, Ouche, and Lieuvin; Lower Normandy comprised the plains of Alençon, and Caen; together with the districts of Houlme, Bessin, Bocage, Cotentin, and Avranchin. Normandy now forms the departments of SEINE-INFÉRIEURE, EURE, CALVADOS, MANCHE, and of OISE, with the exception of the arrondissement of Mortagne.

Le-Vexin-Normand was so designated to distinguish it from that portion of Le-Vexin, which was in the early ages included in the domains of the crown and entitled Le-Vexin-Français.

The population of the five departments into which Normandy has been divided, with the exception of the arrondissement of Mortagne in the department of Orne (which comprehends a portion of the county of Perche), was, in 1851, 2,587,717. The length of the province, from east to west, is about 160 miles; the breadth varies from about 60 to 110 miles. The area is about 11,300 square miles.

A detailed description of the country is given under the names of the departments into which it is now divided. Normandy contains no great elevations, except in the south, where it is traversed by the eastern prolongation of the Armorican chain of hills, and in the west, where a branch of that chain extends into the Cotentin. It is watered on the east side by the Seine and its tributaries the Eure and the Rille; in the centre by the Orne, Dives, and Touques; and in the west by the Douve, Vire, Sée, and Celune. The climate is moist and temperate, and the soil produces abundantly all sorts of grain; apples and pears are grown in great quantity, from which are made cider and perry, the common drink of the peasantry. The meadow and grass lands are extensive and excellent, and afford pasturage to great numbers of cattle and horses. Normandy contains many important towns. Manufactures of cotton, linen, woollen stuffs, and lace are carried on in Rouen, Evreux, Caen, Lisieux, Bayeux, Vire, and other towns. Along the coast are the ports of Dieppe, Havre, Honfleur, Isigny, Cherbourg, and Granville.

The country was, in Roman times, inhabited by a number of Celtic nations, and was included in the Roman province of Lugdunensis Secunda. This part of Gaul was, on the downfall of the empire, conquered by Clovis (A.D. 497-500), and incorporated by him in the kingdom of the Franks. In the division of the Frankish territory among the sons of Clothaire I., it was included in the kingdom of Neustria. In the attacks of the Northmen on France, Neustria had its share of the general devastation. Among the most formidable of their chieftains was Rollo, who first attacked France in 876: he ravaged alternately the north and the south of France, the Low Countries, and England; and in 911 he led a numerous army from the last-mentioned country to the siege of Paris. He failed in his attempt upon Paris, but received, from the weakness or policy of Charles le Simple, the hand of his daughter Gisele in marriage, with the cession of an extensive province, to be held as a fief, on condition of his ceasing to ravage the rest of the kingdom and making profession of the Christian religion. The ceded province lying between the Seine, the Epte, and the sea, became the duchy of Normandy.

Rollo appears to have possessed qualifications far beyond those of an ordinary sea-king. He introduced the feudal system in its complete and regular form. The first fiefs granted by him were to some of the churches of his duchy, the rest of which he divided into counties and distributed among the chief officers of his army. The Normans applied themselves with energy to the cultivation of the ravaged lands; strangers from all parts were invited to settle within the duchy, and the laws were strictly administered for the protection of property. He rebuilt the ruined churches, and took every precaution for the defence of his territories against the attacks of other pirates, inclosing the towns with walls, securing the mouths of the rivers by barricades, and keeping up the valour and warlike skill of his subjects by hostilities along his frontier, especially against the Bretons, whom he partly reduced to subjection.

The warriors whom Rollo established in his new settlement adopted the language, the social and political institutions, and the religion of the nation which they had conquered; but they imparted to each that vigour which was the characteristic of their own nation. The rude dialect, formed by a corruption of the Latin language, which was then common in France, became a regular and a written language, embodied in their judicial code or in the poetry and romance which constituted their popular literature. The feudal system received from them a stability which rendered it an important instrument in the restoration of social order in Europe. Their attention to the sermons and the catechetical instructions of the clergy was marked by the same assiduity which characterised their other pursuits; although churches and priests had been, during their piratical career, the objects of their bitterest hostility.

Some years after the establishment of the duchy, a new invasion of France by the piratical Northmen took place (923-927), and the invaders, when defeated, found shelter and assistance among the subjects of Rollo, by whose support they were enabled to renew their ravages. The cession of Le-Bessin, or the territory of Bayeux, and of a portion of Maine, bought off the Duke of Normandy, and the pirates, left to their own resources, were almost entirely destroyed in a battle near Limoges. Rollo abdicated his duchy (927) in favour of his son.

Guillaume (William) I., called Longue-Epée (long-sword), was the successor of Rollo. He gained several advantages over the Breton chiefs who opposed him. He received from the King of France, the cession of Le-Cotentin and L'Avranchin, which he added to his dominions. He had a principal share in the restoration of Louis IV. to the throne of France. He afforded an asylum to Harald VII., king of Denmark, whom he restored by an armed force to his throne. Guillaume was assassinated by the attendants of Arnolphe, count of Flanders, at a conference which he held with that noble at Pecquigny on the Somme (942), just as he was on the point of abdicating his duchy to assume the habit and vows of a monk.

Guillaume left no legitimate offspring, but his natural son Richard I., afterwards called Sans-Peur (the Fearless), a boy of 10 years, was recognised as duke by the Normans, and placed by them under the care of three or four guardians, of whom two at least were recent emigrants from Denmark, and had not renounced paganism. Louis IV., king of France, hastened to Rouen (943) and secured the person of the young duke, whom he conveyed to Laon, that he might be there brought up in a manner befitting his rank and prospects. To put an end to the dissensions between Louis and Hugues, duke of France, the partition of Normandy was agreed upon; and these two, uniting their forces, attacked the duchy on one side, while it was assailed on the other by the Bretons, who gladly seized so favourable an opportunity of throwing off the Norman yoke. The address and perseverance of Bernard the Dane, regent of Normandy, triumphed over these difficulties. In this warfare Richard grew up, signalising his courage and obtaining thereby his distinguishing epithet of Sans-Peur. Louis (954) and Hugues (956) died leaving their children minors.

In the reign of Lothaire, son and successor of Louis IV., new attempts were made on the person and dominions of Richard (963), who resorted for assistance to the King of Denmark and obtained the support of an auxiliary force. By the ravages of this barbarous soldiery the king and his chief adviser, Thibaut, count of Chartres, were obliged to sue for peace. On the death of Louis V., successor of Lothaire, Richard was one of the most energetic and influential supporters of Hugues Capet, in his usurpation of the throne of France (987). Richard died at Fécamp (996), after a reign of 53 years.

The early part of the reign of Richard II., surnamed Le Bon, was distinguished by an attempt on the part of the peasantry of Normandy, who had been reduced to an inferior condition by the settlement of the Northmen under Rollo. Secret assemblies were held in each county of the duchy, and two deputies were appointed by each to meet in a general assembly in a central place, to maintain their pretensions to perfect equality with the dominant race. The plan was however discovered. A band of soldiers, despatched by the duke, surprised the general assembly at its sitting, seized the deputies and others of the peasantry, and causing them to be mutilated by cutting off their hands and feet, sent them home to strike general terror. The peasantry after this resigned themselves to a servitude against which they deemed it in vain to struggle (997).

A connection between the affairs of Normandy and England was first established by the marriage of Ethelred II. with Emma, the sister of Duke Richard (1002). In the following year hostilities appear to have broken out between the two powers, and a force, landed from an English fleet, was repulsed in an attempt to ravage the duchy. At a subsequent period Ethelred, when attacked by Sweyn, king of Denmark, and abandoned by his subjects, took refuge in Normandy (1013-14); until recalled by his subjects. On his death, Emma returned with her children to Normandy; but subsequently married Canute the Dane, the usurper of her children's inheritance.

Another remarkable event marked this reign. Rodolph, a Norman chieftain, who had some complaint against Richard, proceeded with many companions to Rome, in the double character of a pilgrim and an appellant to the authority or influence of the Pope (1016). By the advice of the pontiff he engaged in the service of the Lombard princes of Benevento, and attacked the Greeks of Apulia, which country was then subject to the emperors of Constantinople. Many young Normans, encouraged by Duke Richard, engaged in the service of Rodolph; and this expedition, in the course of a century, led to the establishment of a Norman dynasty on the throne of the two Sicilies. [SICILY, KINGDOM OF.]

On the death of Richard II. (1026 or 1027), his eldest son Richard III. succeeded to the throne. Soon after his accession he had a war with his brother Robert, whom he obliged to submit; but, immediately on his return to Rouen, he died under circumstances which led to a strong suspicion of poison; and the vacant duchy was seized by Robert, whose character and exploits obtained for him the twofold epithet of Le Magnifique (the Magnificent) and Le Diable (the Devil). He had to struggle against the rebellion of his vassals, but he triumphed over these opponents, and became the arbiter of the disputes among his neighbours, restoring Baldwin of Flanders to his country (1030), and enabling (1031) Henri I. to mount the throne of France. Henri, in return for his powerful support, ceded to him as a fief the district called Vexin-Français, between the Epte and the Oise. In 1034 Robert equipped a fleet for an expedition to England, in order to restore Alfred and Edward (afterwards the Confessor), the children of Ethelred II. by Emma, to the throne of their ancestors, then usurped and occupied by Canute the Dane. The fleet was however

driven back by a tempest, and Robert, changing the direction of the force he had gathered, sent it into Bretagne, and compelled Alain or Alan, who then held that duchy, to do homage to him. Robert shortly afterwards set out on a pilgrimage to the Holy Land, after having recommended his only son William the Bastard, a boy of eight years, to the fidelity of his nobles; and died at Nicaea, in Bithynia, in 1035.

Guillaume (William) II., surnamed first 'the Bastard,' afterwards 'the Conqueror,' had been, before his father's departure, taken to the court of Henri I. of France. On the death of Robert, Henri took his young ward to Rouen, and established him in possession of his father's dominions, except Le-Vexin-Français.

The tender age of the young duke, and the stain attaching to his birth, led to civil discord and bloody dissensions which caused terrible desolation, not only in Normandie, but in all parts of France. In this state of affairs the clergy attempted the establishment of 'the peace of God,' which would have caused the almost entire cessation of private war; but unable to suppress the evil, they set themselves to limit and regulate it, and under the title of 'the truce of God,' they secured certain periods of time, and portions of territory, and classes of persons, from the violence of warfare. The confusion and troubles of Normandie continued however during the minority of Guillaume, who, at last, by the victory obtained at Val des Dunes, between Caen and Argentan (1047), crushed his most formidable competitor, Guido of Macon, supported by nearly the whole body of Norman nobles. Henri I. of France was present at this battle, with an auxiliary force of 3000 men, on the side of Guillaume. Soon after, during the troubles of Anjou, the succession of which was disputed, and while Bretagne was torn by internal dissensions, Guillaume seized his opportunity, and wrested the suzerainty of Maine from the rival counts of Anjou. He also carried on war with the Bretons, over whom he gained some advantages (1065) a year before his expedition to England. He set sail for the conquest of England from St.-Valery-sur-Somme on Michaelmas-day in 1066. [ENGLAND.]

William, on setting out for the conquest of England, had engaged to Philippe, king of France, in order to obtain his consent to the enterprise, that he would, if successful, resign his continental dominions to his son Robert. ('L'Art de Vérifier les Dates.') After his success he not only refused to deliver up to Robert the government of the duchy, but withheld from him even the county of Maine, which had been granted to him as his wife's dowry. These and other wrongs, real or imagined, drove Robert into exile, and led him to make incursions into Normandie, which were repressed by Guillaume. In 1087 Guillaume demanded of Philippe I. of France the restitution of Le-Vexin-Français, which had been withheld from him by Henri I. Philippe refused; war ensued; and an accident which occurred in the course of it led to the death of Guillaume, after he had governed the duchy of Normandie 52 years.

On the death of Guillaume, Robert became Duke of Normandie; and, returning from exile, took possession of his inheritance. He made a vain attempt by means of his partisans to possess himself of England, which had fallen to his next brother, William the Red (1088). The misconduct of Robert, and the intrigues of his brothers, excited general discontent in Normandie, which continued to be the scene of confusion; until the duke, eager to engage in the first crusade, pledged his dominions to his brother the king of England for a sum of money, and embarked for the Holy Land (1096). Guillaume le Roux, thus possessor of the duchy, renewed the contest with Philippe for the possession of Le-Vexin-Français, and sought to recover Maine, but his projects were cut short by death (1100).

The death of William and the absence of Robert gave opportunity to Henry, the Conqueror's youngest son, to seize the throne of England. Normandie quietly submitted to Robert on his return (1101) from the crusade. Under his weak sway the country was again torn by anarchy and dissension, when in 1106 it was assailed by Henry with an army of Anglo-Normans. The discontent of Robert's subjects favoured his designs: he took Bayeux after a stout resistance and burned it, and Caen surrendered; but Falaise and Tinchebray resisted. The two brothers engaged in conflict under the walls of the last-named town; Robert was defeated and taken, and an English army conquered Normandie. Robert died, after a long captivity, in 1134.

Henry governed the country with vigour. He put a stop to internal warfare, resumed or compelled the restoration of many grants made by his brother, restored to the church the possessions that in a time of discord had been wrested from it, and regained possession of all that had belonged to his father. His attempts to possess himself of the person of Guillaume, son and heir of Robert, who took refuge in France, led to mutual jealousy, distrust, and war between him and Louis VI., Le Gros, king of France. Guillaume, the only legitimate son of Henry, was drowned in his passage from Normandie to England (1120). His daughter and heiress Maude had been married to the emperor of Germany, Henri V. (1114), after whose death (1125) her father married her (1129) to the son of the Count of Anjou, Geoffroy Plantagenet, who succeeded by the abdication of his father to the county of Anjou and its dependencies, in the same year in which the marriage was celebrated.

The death of Guillaume, son of Duke Robert, and claimant of Normandie, in 1128, seemed to secure for Henry's daughter the quiet succession to the kingdom of England and the duchy of Normandie;

but notwithstanding this favourable event his latter days were embittered by quarrels with Geoffroi of Anjou, and on his death (1135) the kingdom of England fell into the hands of his nephew Stephen, count of Boulogne. This usurpation led to civil war, and both England and Normandie suffered from a long series of hostilities, and from consequent social disorganisation. Stephen passed over from England to Normandie (1137), and did homage to Louis VI. for that duchy; but he too displeased his subjects and returned to England, and the duchy remained without a master until 1144, when it was conquered by Geoffroi, who in his turn did homage for it to the king of France, now Louis VII., and Maud exercised a government little more than nominal until 1151, when Geoffroi died, and was succeeded in his Anjevine and Norman states by his son Henri, afterwards Henry II. of England.

Henri had indeed been invested with the rights of his parents over Normandie before Geoffroi's death (1150), and the recognition of his investiture by the king of France had been purchased by the cession of Le-Vexin-Normand. In 1152 he married Eléonore, duchess of Aquitaine, from whom Louis VII. of France had just been divorced. This union, by uniting under one chieftain Normandie, Anjou, and Aquitaine, rendered his power superior to that of the king of France; and in 1164 he succeeded, on the death of Stephen, to the crown of England. His right to Anjou was disputed by his younger brother Geoffroi, on the ground that his father had bequeathed it to him. This was true; but the defrauded prince was obliged to content himself with lands unfortified and a pension from his brother (1156). The talent and ambition of Henry, his extensive plans of aggrandisement, his struggles with Louis VII. of France, the rebellion of his sons, and his memorable contest with the archbishop of Canterbury (Thomas a Becket), belong to the history of England. Henry died in 1189, worn out and broken-hearted by the ingratitude and perpetual rebellions of his children. His eldest and third sons, Henry and Geoffroi, had preceded him to the tomb.

Richard Cœur-de-Lion, or the Lion-hearted, succeeded his father in Normandie as well as in England. He had, before his father's death, and while in rebellion against him, done homage to Philippe Auguste, king of France, for the duchy and all the other fiefs possessed by his father in France. He was crowned as Duke of Normandie after his father's death, and before his own departure on the third crusade. During his captivity in Germany the duchy was attacked by the king of France, who took several towns, but failed in his attempt on Rouen (1193). The treachery of Prince John, Richard's brother, afforded him a fair prospect of wresting the duchy from its rightful owner; but the release of Richard and the double treachery of John frustrated his plans, and a petty yet destructive war followed, which, though interrupted by a short peace between the two kings, and by some subsequent temporary suspensions of arms, continued till the death of Richard (1199), an event which happened in the course of an obscure struggle, but which led to consequences of the most important character, especially to Normandie.

The dominions of Richard passed into the hands of John, his youngest brother; but his claim was disputed by Arthur, duke of Bretagne, son of Geoffroi, the third son of Henry II. Philippe Auguste however embraced the cause of Arthur; but the capture of Arthur (1202), and his subsequent assassination by John at Rouen (1203), put an end to the struggle. The crime however cost John his duchy; general indignation was excited by it: Philippe overran the duchy, and took the strongest fortresses. John fled to England, and his subjects, abandoned by their prince, hastened to submit to the invader. Rouen was the last town to capitulate, and Normandie passed finally into the hands of the French king. Philippe accused John before the peers of France of the murder of Arthur, and procured a sentence of forfeiture against him, by virtue of which the duchy was ever after united to the crown of France, though the legal act re-uniting it in perpetuity to that crown was not executed till the reign of Jean II. of France (1361).

In the wars of the English under Henry V. and VI. Normandie came again into their hands. They no longer however held it as a feudal duchy, but as a part of the kingdom of France to which they laid claim.

(Sismondi, *Histoire des Français*; Thierry, *Conquête d'Angleterre par les Normands*; *L'Art de Vérifier les Dates*, &c.)

NORMANTON, SOUTH. [DERBYSHIRE.]

NORRKÖPING, a sea-port town in Sweden, situated in 58° 36' N. lat., 16° 28' E. long., near the mouth of the Motala, which falls into an inlet of the Baltic called the Brävicken, a short distance below the town. This inlet is about 22 miles long, with a breadth varying between half a mile and two miles, and has depth enough for middle-sized vessels, which may sail up to the town. Norrköping is built on both sides of the river, which is crossed by several bridges. The streets are wide and generally straight, though the town stands on undulating ground; the houses, partly of wood and partly of stone, are only two stories high, but have a neat appearance. The manufactures are numerous, comprising woollen-cloth, brass and hardwares, stuff, paper, linen, cotton, gloves, starch, refined sugar, &c. There are oil-mills and ship-building docks. Iron is an important article of export, as all the iron worked in Eastern Götaland is exported from this town. Most of the grain grown in the plain of Linköping is also

shipped at this harbour. The town has a population of about 12,000. It has a grammar school, free schools for the poor and for orphans. The Jews are permitted to settle in this town, and have a synagogue. Norrköping is situated in the district (län) of Linköping, and is about 90 miles distant from Stockholm. [SWEDEN.]

NORRLAND. [SWEDEN.]

NORRSKA FIELLEN (the Norwegian Range), a mountain mass which occupies with its branches the southern portion of the Scandinavian peninsula. The southern portion of the Norrska Fiellen is sometimes called the Dovre Field, though this name properly belongs to the most northern portion of the mass. The range that lies north of the Norrska Fiellen is called Kiölen. The boundary-line between the Norrska Fiellen and the Kiölen lies between 63° 30' and 64° N. lat., east of the Vårdals Fiord, the eastern portion of the bay of Trondhjem, where the range is less than 12 miles across, and presents one of the most convenient roads for passing it.

The range of the Scandinavian mountains begins on the south with Lindesnaes, the most southern extremity of Norway (south of 58° N. lat.), and extends to Cape Nordkyn (71° N. lat.), and the Varanger Fiord, over a space exceeding 1000 miles in length. The Norrska Fiellen is only about 360 miles in length, but it considerably exceeds the Kiölen range in width and in elevation.

The Norrska Fiellen occupies more than three-fourths of the southern part of Norway. Its elevated, rocky masses approach close to the southern and western shores: on the east its boundary is determined by a line drawn from the shores of the Skagerrack at the Lange-sunda Fiord (9° 40' E. long.), to the town of Trondhjem, though some of its lower offsets advance considerably to the east of that line. In the whole country west of this line there is no low level, except in the narrow valleys; but on the summits of the rocky masses there are extensive plains.

South of 59° N. lat. the mountain masses do not attain a great elevation. They rise from the sea with a steep ascent to the height of 300 or 400 feet; but at the distance of about 20 miles from the coast they hardly exceed 1000 feet in elevation. Farther north they rise still higher in the Heck Field and in the Bygle Field, which attains an elevation of 2000 feet above the sea. In the latter the upper part of the mountains begins to extend into plains. South of it they are broken into narrow ridges running north and south, and separated from one another by deep narrow valleys. These valleys, though they contain only a small portion of low and level land fit for agricultural purposes, are fertile; and being sheltered against the western and northern winds, have a more temperate climate than any other part of the globe under the same parallel. The declivities of the ranges are covered nearly to their summits, except where they are very steep, with forests of pines, birches, and beeches. The coast is much broken, but none of the numerous inlets advance more than five miles within the mountain masses, and most of them not half that distance.

Bygle Field and the mountains south of it are only the southern slope of the whole mass. North of 59° N. lat., it attains, in the Yökle Field, an elevation of about 4500 feet, which may be considered as the general height of the Norrska Fiellen as far as the Dovre Field, whose branches extend to 63° N. lat. The highest part of the rocky masses is towards the western shores. These shores are cut up in a very remarkable manner by numerous inlets, which are generally only a few miles wide, but penetrate to a great distance inland, some of them 70 and 80 miles, between the huge mountain-masses that inclose them. Along the open sea and close to the water's edge the mountains are on an average between 600 and 1000 feet high, and they continue to rise as they proceed eastward; so that at the distance of 10 or 15 miles they attain the general level of about 4500 feet, which they preserve for more than 100 miles. They form indeed an elevated plain of uneven surface, on which are scattered bold peaks, rugged precipices, and extensive lakes. The general elevation of the plain does not rise above the line of perpetual congelation, which in 60° N. lat., in this country, is said to occur at an absolute height of 5600 feet, and in 62° N. lat., at 5100 feet; but it rises considerably above the line of trees, which cease to grow, even in a stunted state, below the height of 4000 feet. The surface of the plain consists either of barren naked rocks, or is covered with extensive morasses. In some places there are tracts on which heath and lichens are thinly scattered. These tracts are inhabited by the rein-deer and lemming. Here and there a few depressions occur in the plain, which in summer are covered with a scanty growth of grass, and are pastured for about two months; but they are from 50 to 60 miles distant from the nearest village. Along the western shores, owing to their steepness and to the western gales, the mountains are quite bare. But along the shores of the inlets there are level tracts of moderate extent, which are partly covered with tall pines, and are partly cultivated. The clear blue water of these inlets, the high mountains rising from their shores with a steep ascent, varied by the forests and cultivated spots, give to the whole a degree of beauty and sublimity which is hardly surpassed in any country on the globe. The scanty and scattered population find their subsistence mainly in the deep sea, which contains fish in abundance. The beauty of these inlets is sometimes much increased by the falls of water from the high rocks which surround them. Some of these falls pour down perpendicularly from a great height, as the Feigum Foss (or Fall), 700 feet, the Sevlø Foss,

1000 feet, and the Keel Foss, 2000 feet. These three cataracts occur on the shores of the Søgne Fiord. On the Hardanger Fiord are the Skyttie Foss and the Böring Foss, each 900 feet high. The eastern declivity of the Norrska Fiellen may be considered to commence about 100 miles from the western coast, near 8° E. long. This slope is much less rapid than the western, occupying about 50 miles in width, and descending in this space about 4500 feet. Its surface is exceedingly broken, consisting of precipitous ridges, which have flat and sometimes extensive plains at their tops, and of deep narrow valleys. Though a few of the ridges, as the Halling Skarven (5436 feet), the Gousta Field (5522 feet), rise above the line of trees, the valleys and a large portion of the declivities of the lower mountains are covered with extensive woods, and the largest and best portion of the timber exported from Norway comes from this region. But the valleys are generally too high for cultivation, though they supply good pasturage. Many of the valleys are occupied by deep and extensive lakes, especially near the beginning of the descent. Several of these lakes are from 1200 to 2000 feet above the sea-level.

The highest part of the Norrska Fiellen is situated at the innermost recess of the Søgne Fiord, and is known by the name of Hurungerne. Its surface is covered with snow nearly all the year round. The Skagstøls Tind is 8000 feet above the sea; farther east is the Ymes Fjeld (8400 feet), the highest summit in Norway. Contiguous to the Hurungerne, on the north-west, is the Søgne Field, which is somewhat lower; but west of the Søgne Field lie the Justadals, or Sneer Bräen, an immense sheet of perpetual snow and ice, covering a surface of more than 600 square miles. This is by far the largest mass of ice in Europe; the large snow-fields which surround the Finster Aarhorn and the Jungfrau do not occupy more than 200 square miles. The elevation of the Sneer Bräen is not known, but it is estimated that the more elevated portions are 7000 feet above the sea. From the sides of this mass descend glaciers, which terminate in several lakes at their base. The Folge Fonden is another remarkable and elevated mountain-mass; it is situated on the southern shores of the Hardanger Fiord, and partly occupies the peninsula formed by this long frith and one of its branches, the Sör Fiord. The masses of ice covering its summit extend 25 miles from north to south, and about 10 miles in average width. Its elevation is stated at 5380 feet; glaciers descend from the sides to a height of only 2000 feet above the sea-level; the summit rises above the snow-line, which here occurs at 4120 feet. (Forbes, 'Norway and its Glaciers'.)

The most northern portion of the Norrska Fiellen is the Dovre Field, in the southern and highest part of which is the Sneer-hätten, which rises to 7487 feet above the sea, and nearly 3000 feet above the mountain plain on which it stands. The northern and lower parts of the Dovre Field approach the entrance of the Trondhjem Fiord, or Bay of Trondhjem.

The mountain plains of the Norrska Fiellen terminate with the Dovre Field. East of 10° E. long., the rocky masses do not extend in plains, nor do they constitute a continuous range; still the country between 61° 30' and 63° N. lat., 10° and 11° 30' E. long., is a mountain region, its surface being in general more than 2000 feet above the sea-level, and there being only a few valleys which sink below that elevation. Its surface is exceedingly broken, and presents a continuous succession of ascents and descents. Neither the mountains nor the intervening valleys occupy a large space; mountains generally extend from north to south, in the direction of the whole system, but they rarely continue for a few miles without being broken by deep depressions. Still more rarely do their summits present a level surface. Many of the valleys are only ravines, which however widen towards the border of the mountain region so as to become narrow valleys, and to admit cultivation, which even extends on the declivities of the mountains to some elevation. The whole region is wooded, though the timber-trees are not so large as on the eastern declivity of the mountain plains. Several of the mountains rise above the line of trees, but only a few attain the snow-line. The Tron Fiellet (near 62° N. lat.) is 5593 feet, and the Sylfiellen (near 63° N. lat.) is 5747 feet high.

Only two roads fit for carriages traverse the Norrska Fiellen; one of these connects Christiania and Bergen. It runs from Christiania northward, skirting the eastern shores of the Rands Fiord Lake, at the northern extremity of which it turns west, and begins to ascend the eastern declivity of the mountain mass. It passes over the table-land in a depression lying near 61° N. lat., between the Hurungerne on the north and Mount Sule Tind on the south. The highest point of the road does not much exceed 3000 feet above the sea, from which elevation it descends in a narrow valley between high mountains to the Søgne Fiord, and then traverses a hilly and broken tract till it reaches the Södra Oester Fiord and Bergen. The second road leads from Christiania to Trondhjem. It runs from Christiania to the Lake of Miösen; along the eastern shore of that lake and up the valley of the Lougen, nearly to its northern extremity, and ascends the Dovre Field, passing near the base of the Sneer-hätten, where it attains an elevation of more than 4500 feet. As snow-storms are very frequent even in summer in this elevated region, and as travellers are exposed to great danger during these storms in an uninhabited region, four 'field-stuer,' or houses of refuge, have been erected ever since the 13th century; they occur in a space of about ten miles. The road

then descends in a northern direction to the valley of the Driv Elf, passes through a depression in the mountains into the valley of the Orkel Elf, and through another depression into that of the Guul Elf, which it follows to the vicinity of Trondhjem. A carriage-road leads from Trondhjem to Røraas, by which the produce of the copper-mines of the last-mentioned place is brought to the port to be shipped. This road follows the road to Christiania as far as it lies in the valley of the Guul Elf, and then runs along this river to its source, where it crosses a mountain-side, probably more than 3000 feet above the sea, west of the Lake of Oresund, whence it descends to Røraas, which is somewhat more than 2500 feet above the sea.

The most frequented road is that which lies in the deep depression of the mountains between 63° 45' and 64° N. lat., which divides the Norrska Fiellen from the Kiölen Mountains, and by which the western districts of Swedish Norrland bring their produce to the harbour of Trondhjem, in preference to taking it to the harbours on the Gulf of Bothnia. It runs from the town of Oresund in Oresunds Län, on the northern side of the Lake of Störsejon, and after passing along the southern base of Mount Areskutan, which is 4775 feet above the sea-level, it traverses the boundary-line between Sweden and Norway, and its highest level occurs west of Stalstugan, where it is little more than 2000 feet high. Hence it descends in the valley of the Suul Elf to the eastern extremity of the Trondhjem Fiord, along the shores of which it continues to the town of that name.

North of the depression in which this road lies begin the *Kiölen Mountains*, or the northern part of the Scandinavian range: they present the character of a nearly continuous ridge, which in general occupies a space of 25 miles in width. Between 64° and 68° N. lat. the range extends in a north-north-east direction, but farther north it runs north-east, and towards its northern extremity, north of 69° 30' N. lat., east-north-east. Between 64° and 65° N. lat. nearly the whole width of the mountain mass lies within the territories of Norway; but farther north, up to 69° N. lat., it is nearly equally divided between Norway and Sweden, the watershed constituting the boundary-line between these countries. Farther north the Kiölen Mountains belong to Norway, except a small tract along the upper course of the Muonio River, which is under the dominion of Russia.

South of 66° N. lat. the highest part of the range is in the middle. It does not generally rise to a great elevation, though always above the line of trees; a few isolated summits are always or nearly always covered with snow. The declivity towards the east is not very steep, descending, in a distance of about ten or twelve miles, about 2000 feet to the base of the mountains, which is about 2000 feet above the sea-level. The lower offsets of the range extend however farther eastward to a distance of about twenty miles; they are commonly below the line of trees, and the valleys embosomed by them are often from six to eight miles wide, and generally covered with woods. The western declivity is exceedingly steep and broken. It descends, in a space of ten or twelve miles, from an elevation of about 4000 feet to the level of the sea. Rugged and precipitous masses of rock inclose long and wide valleys; the rocks are usually bare, or covered with heath and lichens, and sometimes with brushwood, but the valleys contain forests of fine timber-trees, especially that of the Namsen Elf. The elevated rocky masses extend to the very shores of the sea, which consist of a succession of deep inlets and projecting headlands. The Földen Fiord penetrates seventy miles into the rocky masses.

North of 66° N. lat. the high mountain masses rise to a greater elevation, and occupy a much larger space. Numerous summits lie along the watershed, which are always covered with snow. The largest snow-field in this part of Norway is the Fondalen, which extends through 50' of latitude, between 66° and 67° N., with a breadth of 14 to 28 miles, and sends glaciers into the sea at Holands Fiord. The highest of the snow-capped summits is the Sulitelma, near 69° N. lat., which is 6200 feet above the sea. Here also the eastern declivity is not steep, but exactly resembles the descent farther south; towards the west however the high mountain masses preserve a great elevation to the very shores of the sea. Cape Kunnen, near 67° N. lat., consists of rocks which rise in perpendicular precipices to the height of 1000 feet, and at a distance of about four miles inland they attain an elevation of 4000 feet. The whole rock is covered with perpetual snow, the glaciers extending on the south side to the very edge of the sea. This shows that the snow-mass by which this glacier is fed must be very extensive. Other parts of the coast are less elevated, but in several places the mountains near the coast rise to 3000 feet.

The islands, which are numerous along the coast, must be considered as portions of the range, and the mountains of which they consist rise to a great elevation. The island of *Aloten*, which is of moderate extent, rises almost perpendicularly out of the sea, and the seven-pointed peaks with which it terminates ascend far beyond the region of snow, rising to more than 4500 feet, whilst the snow-line hardly exceeds 4000 feet. The mountains on the island of *Dunnö* are above 3000 feet high. The valleys, which are inclosed between the high masses of the continent, are deep and rather narrow; though in general well wooded, they do not contain timber-trees, and the soil is not adapted to agriculture, except in a few places.

The Sulitelma is the highest mountain in Europe north of the Polar circle. It has been examined by Wahlenberg, a Swede, who found that the snow-line on the Lapland, or eastern side occurs at

about 3520 feet, on the western declivity at 3410 feet. The vegetation on the two sides therefore differs considerably. In Sweden the fir-trees ascend the declivity of the Sulitelma to about 1200 feet, the pines to 1400 feet, and the birch to 2100 feet. A mountain on which the birch does not grow is called 'fiell.' Above 2100 feet only bushes are found, especially birches, and two kinds of willow (*glauca* and *hastata*), but they disappear at about 2800 feet. The mosses on which the rein-deer feed extend to 800 feet below the snow-line, and to this height the Laplanders advance with their herds in summer. *Ranunculus nivalis* and similar plants are found in the crevices of the bare rock, projecting out of the snow-masses 500 feet above the snow-line, and *Lichenes umbilicati* even 1500 feet higher in similar situations. Higher up all vegetation disappears, and no animal or bird is met with, except the *Emberiza nivalis*.

North of 68° N. lat. the mountains along the watershed of the rivers (which flow respectively into the Gulf of Bothnia and into the Atlantic), sink to a much lower level, none of their summits attain; the snow-line. The highest portion of the range lies along the West Fiorden, or the long strait which divides the Lofoden Islands from the continent, and on these islands themselves. In these parts numerous mountain masses rise above the snow-line. The Faxfield, an isolated mass (near 69° N. lat.), rises to 4260 feet; the mountains along the eastern shores of Lyngen Fiord rise almost perpendicularly above the region of snow to upwards of 4000 feet, and the glaciers descend to about one-fourth of this height. At 70° N. lat. is the Yökle Field, between Quinanger Fiord and Alten Fiord, which rises to 3500 feet, and is covered with extensive snow masses. It is the most northern snow-mountain of the Kiölen on the continent. In these parts all the mountain masses are isolated, being separated from one another by deep valleys with steep sides, exactly resembling the deep sounds between the islands lying along the shores. The mountains on the Lofoden Islands are hardly inferior in height. Snow-capped summits occur in East and West Vaage, and they rise in Hindoe and some smaller islands to 3200 feet above the sea. Farther north they are less elevated, but the last snow-mountains occur on the island of Seiland, where they may be considered as a continuation of the Yökle Field, which stands opposite the island, on the continent. The islands farther north up to Mageröe, which contains North Cape, are far less elevated. This is the most dreary part of the Kiölen range. The rocks are naked and the valleys narrow. They contain little wood, and that of a small size. In a few places at the innermost recesses of the firths some few spots occur where potatoes are cultivated. The sea supplies the scanty population with subsistence.

The Yökle or Jökuls Field may, in some measure, be considered as the termination of the high range. Rocky masses of considerable elevation separate indeed the great bays called Alten Fiord, Porsanger Fiord, Laxe Fiord, Tana Fiord, and Waranger Fiord, but they decrease in elevation as they proceed farther east. The highest portion of these rocky masses occurs at the extremity of the headlands, on the shores of the Icy Sea, but as they advance south they gradually decrease in height, until at the southern extremity of the fiords they unite in a table-land with an undulating surface, intersected by low long-backed hills of gentle ascent. This table-land descends gradually and continually towards the northern extremity of the Gulf of Bothnia; and it contains the last elevated summits of the Kiölen Mountains. The Vorio Duder, south of the innermost recess of the Porsanger Fiord, probably attains nearly 3620 feet; and Mount Rastekaise, south of the Laxe Fiord, 3200 feet. Between the Tana Elf and the Lake of Enars is Mount Peldoive, an isolated height, rising to 2130 feet, but not above the region of the birch. Farther east every trace of mountains disappears. This region is somewhat more favoured by nature than that south of Yökle Field. It is true that the Porsanger Fiord, and the bays east of it, being open to the northern and eastern gales, do not admit any kind of cultivation; but on the Alten Fiord, which is sheltered against these winds by the elevated islands lying before its entrance, barley and potatoes are successfully cultivated, and the birch-tree attains a considerable size, though this place is in 71° N. lat. It is the most northern place on the globe in which grain is grown.

The Scandinavian range consists mostly of primitive and transition rocks; secondary rocks occur very rarely. Gneiss constitutes by far the most prevalent component of this range. Granite is not frequent; it appears, like the other primitive rocks, in some degree subordinate to gneiss. The transition formation is mostly composed of grauwacke, alum-slate, clay-slate, and limestone; but it also contains sandstone and other rocks. The rocky sides of the mountains and fiords are almost everywhere scored by glacial action. The cliffs that screen the Sogne Fiord (which is 110 miles in its whole length) are remarkable for the grooves, flutings, and polished channels in the coarse conglomerates of which they are composed. Glacier markings indeed are observable throughout the whole range; and the glaciers themselves present the wrinkles, dirtbands, and moraines observable in the Alpine ice-fields.

The Scandinavian mountains are rich in metals. Iron occurs in immense layers on the eastern declivity near its extremities, in Norway, in the province of Christiansand, on the south; and, in Sweden, in Lulea Lappmark, on the north; in the latter, near the church of Gellivara, there are mountains many hundred feet high consisting entirely of iron-ore. But the rich iron-mines of Sweden are not

within the range; they are situated in the lower country which extends south-east of it. Silver occurs at Kongsberg and Iarsberg in Norway, and at the Nasafell in Pitea Lappmark; but it is worked only in the first-mentioned place. Copper is found in the Dovre Field, at Røraas, Medal, and Selby; the mines of Røraas are productive. Lead is also found in the southern district of Norway, and at the Nasafell. Cobalt occurs in several places on the eastern declivity of the Norraka Fiellen; zinc, marble, and slate also abound in several places.

NORTE. [LOIRE-INFÉRIEURE.]

NORTE, RIO DEL. [MEXICO.]

NORTH AUSTRALIA is at present the designation applied to all that part of Australia, comprising considerably more than one-half of the island, which lies north of the parallel of 26° S. lat. This parallel forms the northern boundary-line of the colonies of New South Wales and South Australia, that of Western Australia remaining unsettled. Coburg Peninsula projects west-north-west from the mainland, between Mount Norris Bay on the north-east and Van Diemen's Gulf on the south, and extends in that direction nearly 60 miles. The greatest breadth of the peninsula is 15 miles, and its narrowest part, where it is joined to the mainland by a neck of land of 5 miles in length, is 2½ miles. On the north side of Coburg Peninsula is the deep inlet named Port Essington, which lies between 11° 6' and 11° 25' S. lat., 132° 5' and 132° 18' E. long. The inlet, at its entrance, between Point Smith on the east and Vashon Head on the west, is 7 miles wide, and extends south by east about 18 miles; its average breadth is 5 miles. The depth of water varies between 5 and 12 fathoms, and at the southern end it forms three spacious harbours, each of which extends inward 3 miles, with a width of about 2 miles; the depth of water is 5 fathoms, with a bottom of stiff mud and sand. These harbours are sheltered from every wind, and afford excellent and secure anchorage. The port forms one of the finest natural harbours in the world; it may be entered with safety both by night and day. Being within the range of the regular monsoon it is accessible to the Malay and Bugia trading proas, and to the junks from China.

The soil of the peninsula is in general indifferent, but in many places it is good, principally on the low flats and hollows, and near tracts which are swampy in wet weather. The vegetation is luxuriant, but suffers much during the dry season. The north-west monsoon, which brings the rainy season, begins about November. The rain during this monsoon falls in torrents, but seldom continues above two or three hours at a time. The general range of the thermometer at this season is from 80° to 95° Fahr. in the shade. The termination of the monsoon is indicated by squalls, and usually a tempest in the early part of April. In May the thermometer ranges between 75° and 95°, the mid-day heat being 89°. The average heat of the whole year is 83°, or about that of the equator.

With the expectation that, if there were an establishment on the north coast of Australia, it would be resorted to by the traders of the eastern portion of the Indian Archipelago for the sale of their produce and the purchase of European and Indian commodities, a settlement was made in 1824 in Apsley Strait, and called Fort Dundas, and another in 1827 on the Coburg Peninsula, and named Fort Wellington, but both settlements were abandoned in 1828. In 1838 another attempt was made, and the town of Victoria was founded on the western shores of Port Essington. In 1846 the population was stated to be about 60. The Malays did settle there, as was expected: the climate is unsuitable to Europeans, and the settlement has been abandoned.

The coasts, inlets, and islands of North Australia have been surveyed and named, but of the interior hardly anything is yet known. Melville Island, on the northern coast, between 11° and 12° S. lat., 130° 20' and 131° 34' E. long., is one of the largest of the islands. The area is about 1800 square miles. It is separated from Bathurst Island, which lies west of it, by Apsley Strait, which is from 2 to 4 miles wide and 46 miles long. From Coburg Peninsula it is separated by Dundas Strait, which is 15 miles wide. The natives lead a wandering life, living in the dry season on kangaroos and other marsupial animals, and during the wet season on fish, turtles, crabs, and other shell-fish. Their vegetables are the cabbage-palm and the sago-palm.

NORTH AYLESFORD, Kent, a Poor-Law Union in the northern part of the lathe of Aylesford, of which the area is nearly continuous with the area of the hundreds of Shamwell and Toltingtrough. North Aylesford Poor-Law Union contains 15 parishes, with an area of 41,732 acres, and a population in 1851 of 16,569.

NORTH CAPE. [TRONDHEJEM.]

NORTH POLAR COUNTRIES. [NORTH-WEST PASSAGE.]

NORTH SEA, sometimes called the German Ocean, is separated from the Atlantic by the British Islands, which form its western limits, and on the opposite side by Norway and Denmark from the Baltic. To the southward it is bounded by the coasts of France, Belgium, the Netherlands, and Germany; and to the northward an open space between the Shetland Isles and the Norwegian province of Bergen unites it to the Polar Sea. With the Atlantic it is connected through the Strait of Dover by the English Channel; and with the Baltic by the Skagerrack, the Kattegat, the Sound, the Great Belt,

and the Little Belt. It extends across 10 degrees of latitude and 11 degrees of longitude; its greatest length is about 700 miles, its extreme breadth 400 miles, and its superficies about 140,000 square miles.

On its north-eastern side the bold rocky face of Norway, intersected by deep fiords, rises precipitously from its bosom; but the sea here receives few tributary streams from the interior mountains, and it preserves a depth of many hundred feet along the base of the cliffs. Its south-eastern and southern coasts are low; the Elbe, the Weser, the Rhine, and the Schelde pour out through those alluvial shores enormous quantities of sand, which have more or less filled up the southern portion of the basin. The east coast of England partakes of the same character, and is exposed to the same effects; the Thames, the Ouse, the Humber, the Tyne, the Forth, and the Tay, contributing their unceasing though comparatively trifling efforts to front the shore with similar shoals. All these shoals and banks obstruct the free navigation of the sea, and, combined with the stormy and foggy character of the climate, have led to the destruction of an immense number of vessels. There are other banks, which do not seem to be attached to the shores or to assume the same ridge-like form, but which have been equally the result of the same causes. Such are the long North Bank, the Dogger Bank, the Well Bank, the Broad Fourteens, and others which need not be enumerated. The deep holes which are found in this sea form another of its singular features. There are several of these holes, but it will be enough for our purpose to particularise the 'Little Silver Pit' off the coast of Holderness in Yorkshire. The northern end of this singular hole is in 53° 45' N. lat., 0° 47' E. long., whence it runs in rather an irregular form and nearly on the true meridian to 53° 20' N. lat., 0° 43' E. long., a length of 25 miles. Its breadth at the northern end is little more than half a mile, but towards the middle it is two miles, whence it narrows to one mile and a quarter, and again increases to two miles in breadth towards the southern end. The Little Silver Pit, so called in contradistinction to the Great Silver Pit (which is an extensive space of comparatively deep rocks between the Dogger and Well banks) is situated seven leagues eastward of the entrance of the river Humber. The depth of the water on its edges varies from 50 to 80 feet, and yet in this singular submarine ravine there is a depth of 330 feet, in 53° 31½' N. lat., 0° 41½' E. long. But the most surprising feature of the Little Silver Pit consists in the great steepness of its sides; and it would appear somewhat extraordinary, taking into consideration the sandy, gravelly, and loose nature of the surrounding ground, together with the action of the tides, which run at the springs with a velocity of more than three miles an hour in a diagonal direction across it, that the hole is not in course of gradual filling up. The Little Silver Pit is marked in charts of very ancient date. It is the resort of fish of various kinds peculiar to the North Sea, as ground-fish and soles of unusually large dimensions have been taken from it. The North-North-East Hole, so called from its position with respect to Cromer, is another of these remarkable places, and characterised nearly as the other is: it is situated 8 leagues to the eastward of the Little Silver Pit; its greatest depth yet discovered does not however exceed 265 feet.

One island only interrupts the uniformity of this sea, Helgoland Rock, which lies off the mouth of the Elbe, unless the Bell Rock and the May Rock, situated in the opening of the Frith of Forth, may be so called: on each of these three insulated spots lighthouses have been erected. Lighthouses have likewise been established on all the salient points of the coast, as well as at the entrance of all the principal ports; and floating-light vessels and buoys have also been moored on several of the detached banks. The North Sea carries the great staple commodities of the northern regions of Europe—their coals, the timber of their inexhaustible forests, their hemp, and their hides and tallow; and bears back in return the manufactures, the necessaries, and the luxuries of more favoured climates. It is the marine highway to the capitals of eight different states, and it may be asserted that no sea in the world of equal dimensions can boast of half such a commercial intercourse, either in the number of vessels which it employs or in the general value of their cargoes.

The profusion of fish in the German Ocean has in all ages been celebrated. The principal of these are—cod, hake, and ling, with turbot, soles, and other flat fish, lobsters, and vast swarms of mackerel and herrings which give active employment to thousands of men, women, and children.

To trace the course of the tides in the German Ocean would require a long article, so various are the phenomena, and so incongruous do they at first sight appear; the flood running to the northward along one part of our coast and to the southward in another; rising upwards of 20 feet in some of its estuaries, and elsewhere being scarcely perceptible; and though everywhere regulated by the phases of the moon, yet showing high-water at one place at the same moment that it is low-water in another. The great tidal wave which rolls up from the Atlantic Ocean splits at the south-western angle of Ireland into two streams, one of which pursues its straight course up the English Channel, though somewhat retarded in its progress by the converging shores; while the other passes to the northward, and bending round the north of Ireland and Scotland, pours through the Pentland Frith with a velocity of seven or eight miles per hour, or, sweeping round the Orkneys and Shetlands, turns to the southward along the coast of Great Britain, but spreading as it goes across the whole expanse of

the German Ocean. This circuitous course requires more time for the transmission of the northern wave than that which arrives through the Strait of Dover, and therefore when the two flood-tides meet, which takes place off the coast of Essex, the northern is half a day later than the other branch from which it was originally separated. On the coast of Holland this meeting occurs not far from the Texel. Besides the action of the lunar tides, the effects of distant currents are sometimes manifest in the northern part of this sea, produced by the melting of the polar ice, and, in an opposite direction, by the continuous movement of an offset from the Gulf Stream.

The icebergs which quit the arctic seas and melt in the vicinity of the German Ocean, the overflowing of the Baltic Sea, and the volume of fresh water constantly pouring into its confined space from the surrounding rivers, sufficiently prove, whatever may have been asserted to the contrary, that its water must contain considerably less salt than that of the Atlantic.

NORTH-WEST PASSAGE. The countries which are situated between 49° and 70° N. lat., 55° and 141° W. long., are described in the article HUDSON'S BAY TERRITORIES. Those regions which lie north of 70° N. lat., and within the above-mentioned degrees of west longitude, are noticed in the course of the present article, which is a brief narrative of the successive expeditions for the discovery of a passage by sea from the shores of Europe across the Atlantic Ocean into the Pacific Ocean, and also of the several voyages and overland journeys in search of the expedition under Sir John Franklin. The other countries which surround the north pole are described under their respective names. [GREENLAND, ICELAND, LAPLAND, NOVA ZEMBLA, SIBERIA, KAMTCHATKA, &c.]

A few years after the discovery of America, Vasco de Gama succeeded in reaching the shores of Malabar in Hindustan. He returned to Europe in 1499. On comparing the geographical position of the countries discovered by Columbus and Vasco de Gama, it was evident that an immense space lay between them. This space comprised the great kingdom of Cathay (China), which on the globes and maps made by the German geographers of that time, on the authority of Marco Polo, extends more than 20 degrees east of its true position. It was therefore concluded in Portugal, that Vasco de Gama had only sailed half-way to Cathay, and that the countries discovered by Columbus were much nearer to Cathay than the coast of Malabar was. It was supposed that if a vessel were to sail past the countries discovered by Columbus, either to the north or the south, it would reach Cathay. This consideration gave rise to the first attempt to make a North-West Passage. In 1500 Gaspar de Cortereal, a Portuguese nobleman, was sent out to make the North-West Passage. He discovered a large part of the north-eastern coast of Labrador. The following year he returned to the place to which his discoveries had extended, and came to a strait, which was called the Strait of Anian. It can hardly be doubted that this is the strait which is now called Hudson's Strait. Being entangled in the floating ice which encumbers that strait all the year round, his vessels were separated. The vessel of Gaspar de Cortereal was never heard of, but the two others returned to Lisbon. A brother of Cortereal sailed in 1502 in search of him, but he also never returned. After this the Portuguese abandoned the attempt.

John Cabot had previously (1497) discovered the island of Newfoundland, but evidently without any design of discovering a North-West Passage. His son, Sebastian Cabot, who had accompanied him on his voyages, sought for the passage in 1517, when he accompanied Sir Thomas Pert, but this voyage added nothing to what had been done before. For a long time no attempt was made, probably because Magalhaens had succeeded in entering the Pacific by the Strait of Magalhaens, at the southern extremity of America.

The spirit of maritime discovery was excited in England about the middle of the 16th century, and lasted more than fifty years. All the numerous attempts made in this period were at the expense of private persons, or rather companies of merchants. The attempts were first directed to the discovery of a North-East Passage, by which it was proposed to reach the Pacific by sailing from west to east along the northern shores of Asia, the real extent of the continent of Asia being then unknown. Three vessels sailed under the command of Sir Hugh Willoughby and Richard Chancellor in 1553. The vessels separated: Sir Hugh perished with his whole crew on the coast of Lapland, but Chancellor entered the White Sea. Chancellor's discovery was of importance: it led to the establishment of a trade between England and Archangel, and to the design of the English of carrying on commerce with India by means of the Volga and the Caspian Sea, which project so completely engrossed the attention of the merchants of London, that all further attempts at discovering the North-East Passage were abandoned. The Dutch merchants afterwards resolved to try if it was possible to reach the East Indies by a North-East Passage. William Barents made two voyages (1594-1596), but was unable to proceed east of Nova-Zembla and the Strait of Waygats, on account of the quantity of ice which covered the sea to the east of that island.

In the meantime the North-West Passage was lost sight of until the year 1576, when the attempt was again made by the English, who prosecuted this object with great ardour for forty years. The first English seaman who did anything decisive towards this object was Martin Frobisher, who made three voyages (1576, 1577, and 1578) to

the northern seas. In the second voyage he discovered Frobisher's Strait, 63° N. lat., and in the third he re-discovered the Strait of Anian, or Hudson's Strait. He was followed by John Davis, who likewise made three voyages (1585, 1586, and 1587). In the first voyage he discovered Davis's Strait, and sailed up it to Mount Raleigh, 66° N. lat., and also found the inlet now called Northumberland Strait, in 65° N. lat. In his third voyage he extended his discoveries along the western shores of Greenland as far as 72° N. lat., and afterwards in sailing southward he likewise found the entrance of Hudson's Strait, which had been seen before that time by Cortereal and Frobisher, but none of these three navigators seem to have advanced any great distance into it. Henry Hudson, after several unsuccessful voyages of discovery to the north-east and north, directed his last voyage to the north-west, and penetrated through Hudson's Strait into Hudson's Bay. He passed the winter on the shores of the bay, hoping to find a passage to the Pacific in the following year, but his crew, which had suffered great hardships during this voyage, mutinied, and abandoned him and some of his adherents in a boat in the middle of the bay. Hudson was never heard of afterwards. In 1612 Sir Thomas Button discovered the strait between Southampton Island and the continent; and Bylot in 1613 discovered Fox Channel between Cumberland Island and Southampton Island. Bylot and Baffin in 1614 penetrated through Davis's Strait and explored Baffin's Bay to its most northern extremity, called Sir Thomas Smith's Sound, 78° N. lat. In returning along the western shores of Baffin's Bay, they passed the wide opening of Lancaster Sound (between 73° and 75° N. lat.), but considered it a closed bay. As their researches had been made with great care, Baffin was of opinion that all attempts to find a North-West Passage in these parts were useless, and this opinion soon became so prevalent as to put a stop to all voyages of discovery in this direction. The voyages were now directed only to the exploration of Hudson's Bay, and were prosecuted with less ardour. In 1631 James discovered James's Bay, the most southern part of Hudson's Bay, and in 1741 Middleton explored Wager River and Repulse Bay on the Melville Peninsula.

While the English were pursuing their discoveries on the north-eastern shores of North America nearly without interruption, the Spaniards made some feeble attempts along the north-western coast with a view of finding a North-West Passage. Their voyages led to no important result, except that Juan de Fuca seems to have visited the coast, as the southern strait by which Vancouver Island is separated from the continent still bears the name of Fuca Strait.

The question as to the existence of a North-West Passage seemed now to have been considered as decided in the negative, when the whalers who annually visit the sea on both sides of Greenland reported that in the years 1816 and 1817 the arctic seas were much less encumbered with ice than had ever been observed. The British government now resolved to make an attempt to settle this question. In 1818 two vessels were despatched, under the command of Captain John Ross and Lieutenant Parry, to re-examine the shores of Baffin's Bay. All the bays and inlets which these navigators entered were closed by great masses of ice, and Captain Ross was also of opinion that this was the case with Lancaster Sound, and that a North-West Passage did not exist in these quarters. But Parry thought that Lancaster Sound, considering its great width, had not been examined with sufficient care. Parry was sent in the following year (1819), for the purpose of examining it more closely than had been done by Captain Ross. On entering the sound he sailed in a westerly direction 30 degrees of longitude, or 540 miles, having on the north a series of elevated tracts, broken apparently into islands by intervening channels. The larger of these islands were named by him respectively Cornwallis Island, Bathurst Island, and Melville Island. On the south side of the sound were two large islands, of which the eastern was called Cockburn Island; the western remained nameless, as it was supposed to form a part of the American continent. The channel which divides these two islands received the name of Regent's Inlet. West of 100° W. long. no land was in view on the south. Parry and his crews passed the winter on Melville Island, hoping in the following summer to reach the Pacific. He was unable however to advance west of Melville Island, the sea being covered with thick and impenetrable ice: but no land was in sight, except that at a great distance to the west-south-west there appeared a bold coast, to which Parry gave the name of Banks' Land.

All hope of reaching the Pacific by Lancaster Sound being frustrated, Parry proposed to try if the object could be effected by any of the inlets which open into Hudson's Bay, the northern portion of which had not been explored. In 1821 he entered that Bay, and passing between Cumberland Island and Southampton Island, he advanced to Repulse Bay, which he examined, and found to be completely inclosed, as Middleton had described it. He then explored a part of the contiguous coast to the northward, in which he found another large indentation, which he called Lyon's Inlet. His vessels were soon afterwards frozen up in the midst of the sea, near Winter Island, 65° N. lat. In the following summer he continued his voyage northward, and discovered the whole coast between 65° and 70° N. lat., in which no deep indentation occurred, with the exception of a wide sound between 69° and 70°, which he explored for more than 60 miles, when he found that it was closed by a barrier of ice, lying south and

north across the strait, but he ascertained that beyond this barrier there was an open sea, a circumstance which agreed with the information that he had obtained from the natives. This opening therefore was not a bay, but a strait, which he called, after the two vessels under his command, Fury and Hecla Strait. At the time of this discovery the season was far advanced, but he hoped to be able to reach the open sea west of the strait the following summer, and accordingly he passed the second winter on the island of Igloolik, at the eastern extremity of the strait. But though he waited to the middle of August in the following year, the strait continued to be covered with ice, and he was obliged to give up all hope of effecting his purpose.

The result of this attempt showed that Fury and Hecla Strait did not allow a navigable North-West Passage. Parry, whose success had deservedly secured the confidence of government, again obtained the same vessels for the purpose of trying whether Regent's Inlet might not allow a passage southward. On arriving at the entrance of Regent's Inlet, he found it much encumbered with ice, and was obliged to pass the winter from 1824 to 1825 in Port Bowen, on the western coast of Cockburn Island. In trying to sail southward the following July, one of the vessels (the Fury) was lost in the ice, and Parry returned home in the Hecla. Government did not think fit to continue these voyages, which led to no useful result; but as the last attempt of Parry had been merely interrupted by an accident, it seemed still probable that a navigable North-West Passage might exist through Regent's Inlet. A wealthy individual, Sir Felix Booth, furnished all the expenses for a new adventure, the direction of which was given to Captain John Ross, who, after passing through Lancaster Sound, entered Regent's Inlet in 1829, and sailed along the western shores of the Inlet as far south as Felix Harbour, 70° N. lat., where he passed the winter. The following seasons were unfavourable, the sea being constantly encumbered with heavy ice, and he was obliged to remain nearly on the same spot two more winters. This circumstance gave him an opportunity of examining the districts west of the position of his ships. To this tract of land he gave the name of Boothia Felix, and found it to be united on the south by a low isthmus to another tract which seems to be the northern part of Melville Peninsula. The shores of the continent itself, west of the isthmus, were examined to a distance of 70 miles, and the most western cape which was reached was called Victory Point, 69° 46' N. lat., 98° 33' W. long. In another excursion he reached what he considered to be the Magnetic Pole, 70° 0' 5" N. lat., 96° 46' 45" W. long. Not being able to extricate his vessels from the ice, Captain Ross and his crew returned in 1832 in boats to Hudson's Bay, where they were received on board of a whaler.

The whole line of the American coast from Behring's Strait to Melville Peninsula has now been traced. Between the discoveries of Captain Beechey, who advanced to Point Barrow, 71° 23' N. lat., 156° 10' W. long., and those of Sir John Franklin, who went as far as Point Beechy, 70° 30' N. lat., 150° W. long., only a coast-line of about 130 miles remained undiscovered, and this tract was explored in 1837 by Messrs. Dease and Simpson, agents of the Hudson's Bay Company. East of the Mackenzie River the coast-line as far as Point Turnagain, near 68° 30' N. lat., 109° W. long., was discovered by Sir John Franklin and Dr. Richardson. Dease and Simpson advanced to 106° W. long. in 1838. Captain Beck, in his expedition in search of Captain Ross, found a sea between 67° and 68° 30' N. lat., 95° and 96° W. long., which Dease and Simpson in 1839 found to be joined to the seas of the American coast by a strait since called Dease and Simpson Strait. These enterprising travellers in the same year followed the coast to 94° 35' W. long., and Dr. Rae has since traced its connection with Melville Peninsula.

In the year 1845 the British government sent out another expedition to the Arctic Seas for the purposes of discovery and survey, consisting of the Erebus and Terror, under the command of Sir John Franklin. They sailed from the Thames on the 23rd of May, and on the 26th of July were spoken by the Prince of Wales whaler at the entrance of Lancaster Sound. In consequence of the ships not having been afterwards seen or heard of, a series of searching expeditions were successively fitted out and sent to the Arctic Seas, all of which failed in the main object of finding the missing ships or their unfortunate crews, but one of which discovered the long-sought secret of a North-West Passage.

In 1848 the Enterprise and Investigator, under the command of Sir James Ross, were sent out, and reached Lancaster Sound on the 28th of August. They were not able to get farther west than Leopold Harbour, near the entrance of Prince Regent's Inlet, 73° 50' N. lat., 90° 12' W. long., where they wintered. After the ships were liberated from the ice, they were swept eastward by a mass of drift ice into Lancaster Sound, and Sir James Ross brought his ships back to England early in November 1849. In 1848 Sir John Richardson and Mr. Rae made a voyage in boats from the mouth of the Mackenzie River eastward, but without success.

Another searching expedition was fitted out by the British government at the end of 1849. Captain Collinson was appointed to the command of the Enterprise, and Captain M'Clure to that of the Investigator. The two ships left the Thames January 10, 1850, and sailed in company round Cape Horn. Captain M'Clure reached Point Barrow,

at the north-eastern extremity of Behring's Strait, August 5, 1850, and then bore to the east, just keeping clear of the American coast. Captain Collinson having failed to force his way through the pack-ice of Behring's Strait, sailed for Hong-Kong, where he wintered. Captain M'Clure reached Cape Parry on the 6th of September. From this point high land was observed to the east-north-east, and named Baring Island, and two days afterwards, still farther to the east-north-east, more land was observed, and named Prince Albert Land. This land is continuous with Wollaston Land and Victoria Land, and extends northward to 73° 21' N. lat. The Investigator was then navigated northward through a channel which separates Baring Island from Prince Albert Land, and which Captain M'Clure named Prince of Wales Strait. In sailing up this strait the Investigator several times narrowly escaped destruction, but on the 8th of October was firmly frozen in near the northern extremity of the strait, and remained there during the winter. Parties were sent out to explore, by whom it was ascertained that Prince of Wales Strait opens into Barrow Strait, and thus was made the first discovery of a North-West Passage.

On the 14th of July 1851 the Investigator was freed from the ice, when great exertions were made to pass out of Prince of Wales Strait into Barrow Strait, but on the 10th of August, being then in 73° 14' N. lat., 115° 32' W. long., strong winds from the N.E. drove the masses of ice against the ship, and Captain M'Clure, thus baffled, resolved to sail southward back again down Prince of Wales Strait. Having accomplished this, he sailed along the southern coast of Baring Island, and then northward along the western coast. At length, after incurring many risks and encountering difficulties which could only have been overcome by a rare combination of indomitable courage, admirable seamanship, and scientific resource, the Investigator, having rounded the whole island except the north shore, was got to the station which Captain M'Clure named Mercy Bay, Sept. 24, 1851. This station is at the north-west corner of Baring Island, in 74° 6' N. lat., 117° 54' W. long., on the south side of Barrow Strait. Here then was the discovery of a second North-West Passage; and had there been open water to the east the whole voyage into Baffin's Bay might have been easily accomplished, but unfortunately the Investigator was frozen up in Mercy Bay on the very day when it was entered. The north side of Baring Island was ascertained to be the Banks' Land which Captain Parry saw from Melville Island in 1819.

Melville Island is distant about 60 miles N.E. from Mercy Bay, and in April 1852 Captain M'Clure sent a travelling party across the ice to it, who deposited a document there, giving an account of the proceedings of the expedition, and of the position of the Investigator. In April 1853, only a few days before Captain M'Clure had made arrangements for deserting his frozen-up ship, the document was discovered by Captain Kellett's officers, and Lieut. Pim, with a party of sailors, carrying provisions, was sent from Melville Island to Mercy Bay. As nothing had been heard of the Investigator from the time of her rounding Barrow Point in August 1850, where Captain Kellett was then stationed with the Herald, and who made Captain M'Clure a signal of recall, till April 1853, when Captain Kellett sent this party to the relief of Captain M'Clure and his crew, the excitement of the meeting may be easily imagined. Captain M'Clure remained with his ship till the spring of 1854, when he and his crew were brought to England by the ships belonging to Sir Edward Belcher's expedition. The Investigator, as far as is known, still remains frozen-up in Mercy Bay.

Captain Collinson, after wintering at Hong Kong, passed through Behring's Strait in 1851, and followed very nearly the track of Captain M'Clure up Prince of Wales Strait, whence he also was obliged to return. He wintered in 1851-2 in 71° 35' N. lat., 117° 35' W. long. The winter of 1852-3 was passed in Cambridge Bay, Wollaston Land, 69° N. lat., 105° 30' W. long. Still struggling on, the winter of 1853-4 found the Enterprise in 70° 8' N. lat., 145° 30' W. long. On the 15th of July 1854 the Enterprise was released from the ice, when Captain Collinson commenced his return voyage. He reached Point Barrow on the 9th of August, and Point Clarence on the 21st.

The other searching expeditions may be more briefly noticed. In 1850 Captain Kellett with the Herald and Plover reached 72° 51' N. lat., 163° 48' W. long. In the same year the Advance and Rescue, two small brigs, were fitted out at the expense of Mr. Grinnell, an American merchant, and placed under the command of Lieutenant De Haven. In August, 1850, Captain Ommanney and Captain Penny conducted travelling parties by order of Captain Austin, who commanded an expedition sent out by the British government. Captain Penny discovered that Sir John Franklin's expedition had passed the winter of 1845-6 at the mouth of the Wellington Channel, in a bay between Cape Riley and Beechey Island. Captain Penny also explored the Wellington Channel to a distance of 80 miles from the mouth, and discovered a strait bearing to the north-west, which he named Victoria Channel. Dr. Rae and Commander Pullen also conducted expeditions in 1850.

In May, 1851, the Prince Albert, a small vessel, was equipped at the expense of Lady Franklin, and placed under the command of Mr. William Kennedy. The Prince Albert passed through Lancaster Sound, and wintered in Batty Bay in Regent's Inlet, on the east side of North Somerset. In March, 1852, Mr. Kennedy, with M. Bellot, an enterprising young French naval officer, and six seamen, travelled

southward along the east side of North Somerset till they reached Brentford Bay, which they ascertained to be a channel connecting Regent's Inlet with Victoria Strait, the northern part of which strait, called Peel Sound, enters Barrow Strait. They thus discovered a third North-West Passage, and proved that North Somerset is a large island, separated from Boothia Felix by the Brentford channel, which they named Bellot Strait, and found to be 15 miles long and 2 miles wide. They next travelled over the ice of Victoria Strait, then over Prince of Wales Land due west as far as 100° W. long., then northward to the south-east angle of Ommanney Bay, then eastward to Browne's Bay in Peel Sound, whence, following the coast-line northward they arrived at Cape Walker. They reached the Prince Albert in Batty Bay, May 30th, after an absence of 96 days, and having travelled on foot and with sledges 1100 miles.

Captain Inglefield, in the small screw-steamer Isabel, sailed from the Thames July 6th, 1852. He proceeded along the east side of Baffin's Bay, and entering Whale Sound found that it contained two large openings to the north-eastward. He entered Smith's Sound at the head of Baffin's Bay, and on the 27th of August attained 78° 35' N. lat., where he found himself in a great sea, only partially encumbered with ice. He was driven back by a violent gale, and afterwards entered Jones's Sound, which he penetrated to 84° W. long., the north coast there suddenly trending to the north-west, whilst the south shore continued its direction westward as far as the eye could reach. The Isabel returned to England in November, 1852.

A searching expedition under Sir Edward Belcher was sent out in 1852. He proceeded up the Wellington Channel, and wintered in 76° 52' N. lat., 97° W. long. While here explorations with boats and sledges led to the discovery of various coasts and lands. The eastern side of Wellington Channel was named North Devon; the western side is Cornwallis Land, which is separated by a strait from Bathurst Land still farther west. A group of islands in 78° 10' N. lat. was named Victoria Archipelago. On the 20th of May, 1853, Sir E. Belcher found the sea open in the latitude of Jones's Strait. His words are, "Polar Sea as far as the eye can reach." The gallant young Frenchman, Lieutenant Bellot, in attempting to convey the government despatches from Captain Inglefield to Sir E. Belcher, was blown from the top of a hummock of ice, and was drowned. Sir E. Belcher's ships were liberated from the ice July 14, 1853, and he returned to England the same year.

In October, 1854, Dr. Rae returned suddenly to England from the vicinity of Boothia Felix, for the purpose of announcing to the British government that he had obtained some relics which had belonged to Sir John Franklin's companions. He stated that he had met with some Esquimaux in Pelly Bay, who were in possession of watches, silver-spoons, telescopes, and other things, which had belonged to the officers and seamen of the Erebus and Terror. These he purchased, and brought with him to England; and he stated that the Esquimaux had informed him, that in the spring of 1850 about forty of the ships' crews were seen (but not by Dr. Rae's informants) near the north shore of King William's Land; that they were dragging a boat over the ice, looked worn and emaciated, and had purchased a seal of the natives. Later in the year, but before the ice had broken up, the Esquimaux had, it seems, fallen in with the spot where Franklin's party had been encamped, none of whom were living. Thirty bodies were found; some partly buried, some in a tent where they had died, and others under the boat, which they had overturned to form a shelter. They seemed to have perished from starvation. In consequence of this information, the Admiralty, in November 1854, resolved to send out two expeditions, one of which is to descend the Frobisher River (Back River), in order to search and make enquiries in the regions about Point Ogle and Montreal Island; the other to descend the Mackenzie River, and proceed eastward along the American coast.

The result of all these searching expeditions—of which we have only noticed the most important—has been the discovery of three or four passages by which the Pacific Ocean may be entered from the Atlantic, or the Atlantic Ocean from the Pacific, namely, by the west coast of Baring Island, by the east coast of the same island, through Prince of Wales Strait, by Regent Inlet through Bellot Strait into Victoria Strait, and probably also by Peel Strait into Victoria Strait. These passages, being all more or less encumbered with ice, may be of little or no commercial importance; but the long-sought North-West Passage has been discovered, many extensive lines of coast have also been traced, and large islands and countries have been found and partly examined. Besides the geographical discoveries which have been incidentally noticed in the course of this narrative, it has been ascertained, by the explorations of Dease and Simpson, Dr. Rae, and Captain McClure, that Wollaston Land and Victoria Land are continuous, forming the south coast of the largest of all the islands of the Arctic Seas, the western boundary being Prince of Wales Strait, the eastern boundary Victoria Strait with its continuation Peel Strait, and the northern boundary Barrow Strait. The northern coast of this large island is deeply indented near the eastern end by Ommanney Bay and Osborne Bay, so named from the explorers. North Somerset is also, as has been stated, a large island, separated from Boothia Felix by Bellot Strait, previously called Brentford Bay; whilst Boothia Felix seems to be united to the American continent by an isthmus.

In many parts of these cold regions there is an extraordinary

abundance of animal life, consisting of moose-deer, hares, ptarmigan, and other game. In 1851, Captain McClure says, "On the 1st of April we had 1000 lbs. of venison hanging at the yard-arms;" and, in 1853, he says, "A supply of game has been kept up during the winter which has enabled us to issue a meal twice weekly." It seems also to have been ascertained that north of Smith's Sound and the Wellington Channel there is an extensive Polar Sea, comparatively unencumbered with ice.

(Barrow, *Chronological History of Voyages into the Arctic Regions; Voyages of Ross and Parry; Franklin, Expeditions to the Polar Regions; London Geographical Journal*, vols. v., viii, ix., xxii, and xxiii; notices in the *Athenæum* and other journals.)

NORTH-WEST TERRITORY, was an unorganised territory of the United States of North America, lying between 43° and 49° N. lat., 99° and 112° W. long. In the statement of the area of the several states and territories, drawn up by the United States Land Office, for the Seventh Census of the United States, the area is given as 528,725 square miles, but it does not certainly exceed 225,000 square miles. No estimate has been made of the population. The North-West Territory formed a portion of the vast tract included within the Louisiana purchase. [LOUISIANA.] Up to the present time its only occupants have been the native Indians, who do not probably exceed 60,000, with a few trappers. No regular settlement has been made in any part of the territory.

This extensive tract is the country extending from that described under NEBRASKA territory, northward up to the British Hudson Bay territories; its western boundary being the Rocky Mountains, its eastern the Missouri River. When the territories of Kansas and Nebraska were about to be constituted, their limits were such as are given under those titles: but in the Act for their organisation, as it was actually passed by Congress, the territory of Nebraska was made to include the entire area between the Rocky Mountains and the Missouri River from 40° up to 49° N. lat., and consequently to embrace within its boundaries the whole of this North-West Territory, power being reserved to the United States Government to divide the new territory into two or more territories. The territory of Nebraska therefore, instead of being limited as described under Nebraska, must be understood to embrace also the country described in the present article. This extensive country has as yet been very imperfectly explored, and its surface and capabilities remain therefore comparatively unknown. It is described generally under AMERICA. A large portion of the surface is mountainous and hilly. The Rocky Mountains, which form an almost impassable barrier between it and Oregon, are of great altitude, many of the summits rising far above the line of perpetual snow. The Great South Pass, the only really practicable pass over this part of the Rocky Mountain range, is near its south-west corner; Fremont's Pass, 13,570 feet high, is some distance farther north. That part of the range on the south-west, known as the Wind-River Mountains, extends for some distance eastward, while the Black Hills stretch from them northward. Spurs extend everywhere from the Rocky Mountains into this territory. Between the several hill-ranges are numerous principal and lateral valleys. On the north-west is another divergent range of low mountains, dividing the waters of the Missouri from those of the Saskatchewan. From the Rocky range the country has a general slope towards the east, but the surface west of the Yellowstone River is considerably broken. The valley of the Missouri is generally level from the junction of the White Earth River. Along the lower part of its course there are extensive plains; in some parts are sandy deserts.

The territory lies almost wholly within the basin of the Missouri, the sources of which are within its boundaries. To the confluence of the White Earth River, a distance of 1250 miles, the Missouri belongs entirely, and its tributaries almost entirely, to this territory; from this point, for 700 miles more (in each case of course following the windings of the river) it belongs equally to this territory and to Minnesota. The Missouri is navigable for steam-boats for about 750 miles in this territory, or up to the Yellowstone, the principal tributary of its upper course. The Yellowstone rises in several branches in the south-western part of this territory, to which it wholly belongs: it is said to be navigable by steam for 300 miles. Both the Missouri and the Yellowstone, with the other more important feeders of the former river, are noticed under MISSISSIPPI RIVER.

The capabilities of the country seem to be very great. The mountain districts appear to belong chiefly to the primary formations, and it is believed that there exists considerable mineral wealth. Over a great part of the lower country cretaceous and tertiary rocks prevail. The soil of the valleys, judging from the heavy timber in many of them, is generally rich; and the broad plains, where not sandy, appear to be very fertile. The hilly slopes and adjoining plains are said to constitute a fine pasture country. Every part too, as above indicated, is well watered, and the larger rivers offer a remarkable extent of inland navigation. The climate is cold but healthy, and is said to be well adapted to the usual farming operations. Altogether it is a country of great promise; and it is scarcely probable that many years will elapse before some hardy settlers will pioneer the way for its permanent occupation by the white man.

NORTH-WESTERN PROVINCES. [HINDUSTAN.]

NORTH-WESTERN TERRITORY. [Hudson's Bay Territory.]

NORTH WITCHFORD, Cambridgeshire, a hundred in the Isle of Ely, which has been constituted a Poor-Law Union. North Witchford hundred, which is co-extensive with the Poor-Law Union, contains seven parishes and townships, with an area of 52,828 acres, and a population in 1851 of 18,243.

NORTHALLERTON, the capital of the North Riding of Yorkshire, a market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Northallerton, is situated on the Great North road, in 54° 20' N. lat., 1° 27' W. long., distant 33 miles N.N.W. from York, 225 miles N.N.W. from London by road, and 250½ miles by the Great Northern, North Midland, and York and Newcastle railways. The population of the borough in 1851 was 4995. The living is a vicarage in the archdeaconry of Cleveland and diocese of York. The borough returns one member to the Imperial Parliament. Northallerton Poor-Law Union contains 40 parishes and townships, with an area of 68,132 acres, and a population in 1851 of 12,424.

The town of Northallerton consists chiefly of one wide street, with numerous diverging lanes. The river Wiske passes near the town. The town is lighted with gas, and has a handsome modern sessions-house, to which is attached a house of correction. The church is a spacious cruciform edifice, erected near the end of the 14th century. There are chapels for Independents, Wesleyan and Primitive Methodists, Baptists, and Quakers. Besides the Free Grammar school, which is free to four boys, has a small endowment, and had 35 scholars in 1851, there are National, British, and Infant schools; Kaye's Charity; Widow Baine's Charity; Dr. Kettlewell's Charity; a savings bank, and the Maison Dieu, or hospital, founded in 1476, and subsequently rebuilt by the inhabitants. Quarter sessions and a county court are held in the town. In the vicinity are some flour-mills, including a steam-mill; linen and leather are made, and brick- and tile-making, malting, and brewing are carried on. Wednesday is the market-day, and there are five yearly fairs. Races are held annually in October. A castle, founded here by Hugh Pudsey, bishop of Durham, was raised to the ground by order of Henry II.

NORTHAMPTON, the county town of Northamptonshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the left bank of the river Nen, in 52° 14' N. lat., 0° 54' W. long., distant 66 miles N.W. from London by road and 67½ miles by the London and North-Western railway. The population of the borough in 1851 was 26,657. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Northampton and diocese of Peterborough. Northampton Poor-Law Union contains 17 parishes and townships, with an area of 20,453 acres, and a population in 1851 of 30,544.

Northampton is a very ancient town. Simon de St. Liz, on whom the Conqueror conferred the earldom of Northampton, built a castle here; and in the following reigns several ecclesiastical councils and parliaments were held in this town. In the civil wars of John, Northampton Castle was held for the king, and besieged in vain by the barons in 1215. In 1265 Northampton was taken by the barons, but recovered by the party attached to Henry III. In the commencement of the War of the Roses, a great battle was fought near the town on the 10th of July, 1460, in which the Lancastrians were defeated by the Earl of March (afterwards Edward IV.) and the Earl of Warwick. The king, Henry VI., was taken; and the queen and the young Prince of Wales escaped with difficulty. In the civil war of Charles I. Northampton was taken by Lord Brook, and fortified for the Parliament. In 1675 the town was nearly consumed by fire. In 1720 it was considerably damaged by a flood.

Northampton is pleasantly situated on a slope rising from the Nen, over two branches of which are three bridges. The houses are well built, chiefly of freestone, and the streets are well paved, and lighted with gas. The market-square is a large open area in the centre of the town. Among the principal edifices are the shire-hall, a spacious building of Grecian architecture; the county jail; the town-hall; the borough jail; the new corn-exchange; the temperance-hall and public-rooms; the theatre; the barracks; and the infirmary. All Saints church, in the centre of the town, at the intersection of the principal streets, was erected after the great fire of 1675: at the west end is the original embattled tower, which escaped the fire. St. Giles's church is a large cruciform building of early English character, with windows of the Norman, decorated, and perpendicular characters; a tower rises from the intersection of the nave and transepts. St. Peter's church, a remarkably fine and curious specimen of enriched Norman, has been recently restored. St. Sepulchre's was built probably about the beginning of the 12th century, and is one of the very few round churches. It has eight piers with Norman capitals, and plain pointed arches of later date; there is a chancel with a north and south aisle on the east side of the round part, and a good tower and spire of perpendicular character on the west side. There are several district churches. Among the numerous dissenting meeting-houses is the Castle Hill meeting, which contains a mural tablet to the memory of Dr. Doddridge, who exercised his ministry, and conducted an academy for the education of ministers in this town for more than 20 years. The Independents have two other chapels; the Baptists have five chapels; the Wesleyan Methodists two; and the Primitive and Aso-

ciation Methodists, Unitarians, Quakers, Roman Catholics, and Mormons, have one each. Of the religious houses which existed before the Reformation the hospitals of St. Thomas and St. John still remain. The Free Grammar school, founded in 1541, is free to 25 boys. There are a Blue-coat school for 25 boys; a Yellow school for 20 boys; a Blue-coat school for 30 girls; several Parochial, National, British, and Infant schools; and a school supported by the Wesleyan Methodists. There are also a mechanics institute, which in 1851 had 670 members, and a library containing 10,000 volumes, a natural history and an archaeological society, a savings bank, the general infirmary, the royal Victoria dispensary, and the general lunatic hospital and asylum. The architectural society of the archdeaconry of Northampton holds its meetings in the town.

The principal branch of trade carried on in Northampton is boot- and shoe-making, in which about 2500 persons are employed. The articles are sent to London and other parts of England, or are exported. Considerable business is done in currying leather; some stockings and lace are made. There are iron- and brass-foundries, corn-mills, breweries, and coach-works. Markets are held on Wednesday and Saturday, the principal, that held on Saturday, being a cattle-market. About 12 fairs are held in the course of the year; the one held on the 19th of September is called the cheese fair. There is also a wool fair. In the vicinity of the town are numerous market-gardens. The assizes for the county, quarter sessions, and a county court are held at Northampton. The Pythley Hunt races are held annually in March.

NORTHAMPTON. [Massachusetts.]

NORTHAMPTONSHIRE, an inland county of England, is bounded N. by the counties of Leicester, Rutland, and Lincoln; E. by those of Cambridge, Huntingdon, and Bedford; S. by those of Buckingham and Oxford; and W. by Warwickshire. It lies between 51° 59' and 52° 40' N. lat., 0° 8' and 1° 20' W. long. Its greatest length from north-east to south-west is 66 miles; its greatest breadth at right angles to the length is 26 miles, but the average width is hardly so much as 16 miles. Its area is 1016 square miles. The population in 1841 was 199,228; in 1851 it was 212,330.

Surface and Geology.—The surface of the county is undulating; the hills do not rise to a great height, but present gentle declivities, separated by intervening vales watered by rivulets and rivers. A nearly continuous range of heights runs just within the northern boundary, commencing near Duddington, and running in a south-western direction to the neighbourhood of Watford, where it turns more to the south, and meets at Woodford another range that crosses the southern division of the county to the north of Towcester. At a short distance east of Woodford a chain of hills runs nearly due south from the range north of Towcester to the most southern part of the county. The highest land is about Daventry, where Arbury Hill rises to the height of 804 feet above the level of the sea. The general elevation is about 300 feet above the sea level. The north-eastern extremity of the county, near Peterborough, belongs to the great fen district, and is only a few feet above the level of the sea.

The eastern border of the county, comprising the heights east of the valley of the Nen, adjacent to Huntingdonshire and Bedfordshire, is occupied by the Oxford clay, which forms the separation between the middle and lower divisions of the oolitic series. The north of the county, the central parts, and the south-eastern border are occupied by the oolites. At Collyweston and Easton, near the Welland, beds of forest marble are quarried for roofing-slates. On the slope of the hills on the right bank of the Nen, at Raunds and Stanwick, near Higham Ferrers, a shelly stone of a blue colour is quarried, sufficiently compact to take a tolerable polish. At the base of the oolitic formation, all along the line of railway from Peterborough to Towcester, an important bed of iron-stone has been recently discovered. The western border of the county and one or two valleys penetrating into the interior are occupied by the lia. Limestone is obtained in great plenty in almost all parts of the county. Good clay for making bricks and tiles is found in various places.

Hydrography and Communications.—The greater part of the county belongs to the basin of the Nen, which river is formed by the confluence of two streams which unite their waters near Northampton, where the Nen becomes navigable, and flows north-east through the county by Wellingborough, Higham Ferrers, Thrapston, and Oundle; below Oundle it reaches the border of the county, which it separates for some distance from Huntingdonshire. At Peterborough the navigable channel of the Nen leaves the county altogether; but the Catswater drain, which is an ancient channel or arm of the river, follows the border some miles farther, till it unites with an arm of the Welland from near Croyland. The length of the Nen in this county or on the border is about 60 miles; that of the Catswater drain about 8 miles. Its principal tributaries are the Ise (24 miles long), and the Harper's Brook and the Willow Brook (each about 15 miles long). These tributaries are not navigable. The Welland rises at Sibbertoft in this county, 5 miles south-west of Market Harborough, and flows to the border of the county, which it separates successively from Leicestershire, Rutlandshire, and Lincolnshire. That part of the course of the Welland which belongs to Northamptonshire is about 50 miles. The navigation commences at Stamford, from which town there is a navigable out to Deeping. The Avon rises at Naseby, and has the upper part of its course in this county, and the

Leam, a feeder of the Avon, rises in the hills west of Daventry. The Ouse rises near Brackley, and has part of its course on the southern border. The Tow rises in the neighbourhood of Sulgrave, and flows north-east to Towcester, whence its course is first east, and then south-south-east, to its junction with the Ouse, below Stony Stratford. The Cherwell, or Charwell, rises at Charwellton, 5 miles S.W. from Daventry, and, after crossing an angle of Oxfordshire, runs for some miles along the south-western boundary of the county past Banbury, on its way to join the Thames at Oxford.

The Grand Junction Canal enters the county near Stony Stratford, and runs north-west, passing between Northampton and Daventry, until it joins the Oxford Canal, near Braunston, just within the western boundary of the county. There is a navigable out from near Stony Stratford to Buckingham, the greater part of which is within this county. The Union Canal unites with the Grand Junction Canal, not far from the Braunston tunnel; and with the Leicester Canal at Foxton.

The principal roads that traverse the county are the road through Newport Pagnell, Northampton, and Market Harborough; the road through Higham Ferrers, Kettering, and Rockingham; the Great North road, which crosses the northern part of the county to Stamford in Lincolnshire; and the road which branches off from it at Norman Cross in Huntingdonshire, to Peterborough and Deeping. The London and North-Western railway crosses this county between Wolverton and Rugby. From the Blisworth station another line runs through Northampton, down the valley of the Nen, to Peterborough, where it meets the Great Northern, the Eastern Counties, and other lines. The Rugby and Stamford line joins the county on the north-west, near Market Harborough, and passing Rockingham, skirts the Welland as far as Stamford, where a branch of the Midland Counties connects it with Peterborough and Leicester. The southern part of the county is crossed by the Buckinghamshire railway, which, connecting Banbury and Buckingham, passes through Brackley.

Climate, Soil, &c.—The county of Northampton has many advantages in point of climate and soil, and has for a long time been comparatively well cultivated and productive. The soil is generally adapted to produce both corn and pasture of a superior quality. The climate is mild and healthy. Owing to its inland situation, and the absence of lofty hills, this county is not so subject to heavy and continued rains as the counties which lie farther west. The surface is pleasingly diversified by gentle swells and depressions, interspersed with woods and plantations.

The black mould of the fens, and the brown crumbling loam of the uplands, produce abundant crops of wheat, beans, barley, and oats; the upland soil is peculiarly adapted to turnips and green crops. The pastures are rich, and great numbers of cattle are fatted for the London market. The fattening of cattle is a principal object of the Northamptonshire farmers, some of whom are great cattle-breeders. But the majority of the farmers buy Scotch and Welsh cattle in autumn, turn them into the pastures to eat the coarse grass remaining after the fat beasts are sent to market during the winter, and finish them on grass in the following summer. Many Hereford long-horns and Durham short-horns are bought in spring, carried on at grass till near winter, and then finished with turnips, oil-cake, and chopped straw. The short-horned breed is a favourite stock. The breed of sheep most common in Northamptonshire is the improved Leicester. Some very fine flocks of breeding ewes are kept in the county.

Besides the natural woods, many plantations have been made in the neighbourhood of the numerous residences of the nobility and gentry. Rockingham Forest, formerly one of the largest in the kingdom, is now inclosed.

Divisions, Towns, &c.—The county of Northampton is divided, for parliamentary purposes, into two divisions—North and South. At the time of the Domesday survey it contained 30 hundreds. There are now only 20 hundreds, 10 in each division of the county. The hundreds in the Northern division, with their relative positions in the division, are as follows:—Corby, west; Hamfordahoe, south; Higham Ferrers, south-east; Huxloe, east; Navisford, central; Nassa-burgh, or Peterborough Liberty, north-east; Orlingbury, south, and central; Polebrook, east; Rothwell, south-west; Willybrook, north-west. The hundreds in the Southern division are—Chipping Ward, west; Cleley, south-east; Fawley, west; Greens Norton, central; Guilsborough, west; King's Sutton, south; Nobottle Grove, central; Spelhoe, north-east; Towcester, central, and south; and Wymersley, east. There are in the county, the county and market-town and borough of NORTHAMPTON; the city of PETERBOROUGH; the borough and market-towns of BRACKLEY and Higham Ferrers; and the market-towns of DAVENTRY, KETTERING, OUNDLE, THRASTON, TOWCESTER, and WELLINGBOROUGH. Kingsliffe and Rothwell formerly had markets. Those printed in small capitals are described under their respective titles; the others we notice here:—

Higham Ferrers, population 1140 in 1851, stands on a rocky eminence half a mile from the right bank of the Nen, 15 miles E.N.E. from Northampton. It has a large and curious church, partly of the decorated, and partly of the perpendicular style. The western entrance is much enriched with sculpture. The tower is surmounted with a crocketed octagonal spire. The Wesleyan Methodists and Baptists have places of worship. Near the church are a Grammar-school (a fine stone building), and an old bede-house or almshouse.

The town-hall is a neat building of modern erection. The shaft of the ancient market-cross, composed of one stone 16 feet high, stands in front of the town-hall. The principal business of the place is shoe-making. There are several yearly cattle fairs. The corporation consists of a mayor, 7 aldermen, and 18 burgesses.

Kingsliffe, population 1407 in 1851, is 12 miles W. by S. from Peterborough. The church, dedicated to All Saints, is built partly in the transition decorated style, and partly in the perpendicular style. There are National, British, and Endowed schools. The Independents, and Wesleyan and Calvinistic Methodists have chapels. The only industrial product of the town is wooden turnery. There is a yearly fair (October 29th) for cheese, linen, and turnery ware.

Rothwell, population 2278 in 1851, about 14 miles N. by E. from Northampton, is situated on the southern slope of a hill. The ruin of the market-house, begun by Sir Thomas Treaham in 1577, but never finished, consists of a square area surrounded by large pointed arches, designed for the market, and a suite of rooms above with wide square-headed windows; the whole is ornamented with Doric pilasters, shields with arms, &c. The building was repaired in 1827. The church, which is of great length, has an embattled tower and a fine doorway. The Wesleyan Methodists and Independents have places of worship, and there are National, British, and Free schools. An institution called Jesus Hospital, founded in 1590, provides rooms for 18 poor men, who have also a weekly allowance and other perquisites. There is a large yearly fair for live-stock, pedlery, and leather.

The following are some of the more important villages: the populations given are those of the parishes in 1851:—

Barnack, 8 miles N.W. from Peterborough, population 998, an ancient village, with a church, the tower of which is in part of Anglo-Saxon character. The neighbourhood suffered from the Danes in the beginning of the 11th century. Extensive quarries were formerly worked here. With the stone were built Peterborough, Crowland, Thorney, and Ramsey monasteries, and other ecclesiastical structures. *Blakesley*, population 798, is 4 miles W. by N. from Towcester, in the midst of a thickly-wooded district. The church is of late perpendicular character. The Free Grammar school, founded in 1669, has an endowment of about 80*l.* a year, and had 35 scholars in 1853. There are several parochial charities. Near the village is Blakesley House, which in the 14th century belonged to the Knights of St. John. *Blisworth*, population 951, about 4½ miles S.W. from Northampton. The North-Western railway has a station about a mile from the village. The Grand Junction Canal here passes through a tunnel one mile and three quarters long. The parish church is a handsome building, with nave, aisles, and an embattled tower. There is a chapel for Baptists. *Braunston*, population 1253, is situated near the union of the Grand Junction and Oxford canals, and about 3 miles N.W. from Daventry. The church is a large and handsome structure, in the decorated style, recently erected by subscription, at a cost of upwards of 6000*l.* The Wesleyan Methodists and Baptists have places of worship, and there is a National school. On the canal banks are extensive warehouses and wharfs. *Brigstock*, population 1231, about 20 miles N.N.E. from Northampton, had formerly a market. Three annual fairs are still held. An ancient market-cross is in the centre of the village. Besides the parish church, there are chapels for Independents and Primitive Methodists, and two charity schools. *Buckby, Long*, population 2341, distant 9 miles N.W. from Northampton. The church has undergone frequent repairs and alterations; the tower is early English. There are chapels for Independents and Baptists, a National school, and a branch of the Northampton savings bank. *Bugbrook*, population 860, about 6 miles W.S.W. from Northampton. The North-Western railway and the Grand Junction Canal pass to the west of the village. Besides the parish church, there are chapels for Wesleyan Methodists, Calvinistic Baptists, and Quakers. There is a National school. Soap-works, limekilns, and brick- and tile-works are in the neighbourhood. *Burton Latimer*, population 1007, pleasantly situated about 4 miles S.E. from Kettering, has a handsome church, with an embattled tower, surmounted with a spire; chapels for Wesleyan Methodists and Baptists; a Free school; an Infant school; and a Girls school. A large carpet-mill gives considerable employment. *Castor*, population 1396, near the left bank of the river Nen, consists chiefly of houses scattered along the high road, about 5 miles W. from Peterborough. The church has a large central tower, of early English style, surmounted with a pyramidal spire, resting upon four circular arches. There are a chapel for Independents, a National school, and a school with a small endowment. Fragments of pavements, baths, pottery, and other Roman remains have been found here. Castor is supposed to occupy the site of the Roman station Durnomagus. The ancient Ermine-street passed through the village. A convent existed here in the Saxon times. Milton Abbey, the magnificent seat of Earl Fitzwilliam, which stands in an extensive park to the north-east of Castor, was built in Henry VIII's reign. *Crick*, population 994, about 12 miles N.W. from Northampton, is situated near the Derby and Leicester Grand Union Canal. The church, originally early English, but considerably altered, has a tower surmounted with an octagonal spire of great beauty. There are chapels for Wesleyan Methodists and Independents; a National school; a Girls' and Infant school, chiefly supported by the rector; and some minor charities. Basket-making,

brick-making, and rope-making are carried on, and there are some corn-mills. *Desborough*, population 1350, situated about 6 miles N.W. from Kettering, had formerly a considerable manufacture of silk-plush for the covering of hats, but this branch of industry has somewhat declined. The parish church has a tower surmounted with a spire. There are chapels for Wesleyan Methodists, Calvinists, and Baptists; also National schools. *Earl's Barton*, population 1277, about 6 miles E.N.E. from Northampton, has a very ancient church. The tower is of Anglo-Saxon architecture, and very rude; the summit of the tower, which is embattled, is of late date. The southern doorway is of highly-enriched Norman workmanship. There are chapels for Wesleyan Methodists and Baptists, and National schools. *Finedon*, or *Thingdon*, population 1538, is about 6 miles S.E. from Kettering, in a retired situation. It possesses an elegant church, of the 14th century, with a beautiful tower and spire; in the parvise over the porch is a valuable library of theological works. There are in the village a chapel for Wesleyan Methodists, a Free Grammar school, and an Infant school. Malting, shoemaking, and the making of rush-mats give considerable employment. *Guisborough*, population 982, about 9 miles N.N.W. from Northampton. The church is ancient; at the west end is a tower in the early English style, surmounted with a spire of decorated character. The Baptists have a chapel. The affairs of the Free Grammar school, founded in 1668 for 50 children, have been in Chancery for more than 20 years; the endowment is 80*l.* a year, but the school is shut up. There is also a Writing school, founded in 1609, of which the endowment is about 73*l.* a year; in it about 30 children are taught reading, writing, and arithmetic without charge. At *Hollowell*, or *Holywell*, a hamlet in Guilsborough parish, is a neat chapel of ease, erected in 1840, in the early English style, at the expense of the vicar. On the summit of the Burroughs, or Borough Hill, between the sources of the Avon and the Nen, is the site of an extensive Roman encampment. *Haddon, West*, population 989, is about 10 miles N.W. from Northampton, on the road to Rugby. The church is an ancient edifice with a massive square tower. There are chapels for Wesleyan Methodists and Baptists, a National and a British school. **HARDINGSTON.** *Irthlingborough*, population 1577, is 2 miles N.W. from Higham Ferrers. The river Nen is here crossed by a stone bridge. Many of the inhabitants are employed in shoe-making. Brick-making is carried on. The church was formerly collegiate. There are places of worship for Wesleyan Methodists and Baptists, and an Endowed school. In the centre of the village is the shaft of an ancient cross. *Kingshorpe*, population 1586, is 2 miles N. by W. from Northampton. There is a town-hall in the village for the meeting of the trustees of the manor, which is a royal demesne, held in trust for the benefit of the townsmen. In the vicinity are stone-quarries, lime-works, and a brick-kiln. The church, partly Norman in style, is spacious. The Baptists have a chapel, and there are National and Infant schools. *Middleton Cheney*, population 1330, is 7 miles W.N.W. from Brackley. The church is a handsome gothic building, with a lofty spire. The Baptists have a neat chapel in the village, and there is a National school. On May 6th, 1643, the Earl of Northampton, at the head of a royalist force, defeated the Parliamentarians at Middleton Cheney. *Moulton*, population 1511, is a village a mile in length, on the left bank of the river Nen, 4½ miles N. by E. from Northampton. The church is partly of Norman architecture. The Wesleyan Methodists and Baptists have places of worship, and there is a National school. *Moulton Park*, which is extra-parochial, called in some early documents Northampton Park, was at one time a feudal appendage to the castle of Northampton. *Naseby*, population 848, about 12 miles N. by W. from Northampton, was formerly a market-town; the market-cross is still standing near the church. The village stands on very high ground. The houses are generally constructed of clay. The parish church, which is ancient, has a western embattled tower, with a crocketed spire, which being unfinished, the stone-work has been surmounted with a wooden framework 15 feet high, at the top of which is a large copper-ball. The Methodists have a chapel in Naseby, and there is a National school. On June 14th, 1645, the decisive battle of Naseby, in which Fairfax and Cromwell defeated Charles and his forces, was fought about a mile north from the village. The field of battle, then an open heath, is now inclosed and divided. A pyramidal monument has been placed near the spot. *Paulerspury*, population 1162, about 11 miles S. by W. from Northampton, consists of two portions, called Church End and Pury End, about a quarter of a mile apart, and extending in all about a mile in length. The parish church is placed between the two portions of the village. There are chapels for Independents and Methodists, and a National school. The population is chiefly agricultural. *Raunds*, population 1870, is a straggling village, 4 miles N. by E. from Higham Ferrers. The church has a remarkably fine and lofty tower and spire. There are chapels for Wesleyan Methodists and Baptists, and a National school. The manufacture of shoes is carried on. In the vicinity are some quarries of ragstone; this stone, used for chimney-pieces, window-slabs, &c., has been called Raunds Marble. *Rockingham*, population 261, about 10 miles S.W. from Stamford by railway, had formerly a market; an ancient castle, of which the grand entrance gateway remains, was fortified for Charles I., and besieged by Cromwell. *Rushden*, population 1460, a mile and a half from Higham Ferrers, has a large and handsome cruciform church, with a fine tower and spire

of perpendicular character: the piers and arches, the transepts and part of the chancel, are of decorated English character. The Baptists and Wesleyan Methodists have chapels. The making of boots and shoes employs many of the inhabitants. *Stamford Baron*, population 1778, on the border of the county, forms part of the parliamentary borough of STAMFORD, in Lincolnshire, the two counties being here separated by the river Welland. *Weedon-Beck*, population 2833 (of whom 837 were in Weedon barracks), 4 miles S.E. from Daventry, so named from a religious house established here as a cell to the abbey of Bec in Normandy. It is situated on the Watling-street. Wulfhere, king of Mercia, had a palace here. The church is an ancient building: the body of the church was rebuilt and enlarged in 1825 by the vicar. There are chapels for Wesleyan Methodists, Independents, and Roman Catholics; a Free and an Infant school. The Grand Junction Canal passes through the village, and near it the line of the North-Western railway is carried through a tunnel 400 yards long. The royal military dépôt at Weedon, which covers about 150 acres, contains extensive barracks; spacious storehouses for artillery, small-arms, and ammunition; an hospital, and workshops for artisans: it is one of the finest establishments of the kind in Europe. *Welford*, population 1153, about 12½ miles N.N.W. from Northampton, on the border of the county, is passed on the west by the Grand Union Canal, from which there is a short branch to the village. The church has portions of early English, decorated, and late perpendicular architecture. There are a chapel for Independents, a Free school, and a Girls school. The boot and shoe manufacture employs many of the inhabitants. *Yardley Hastings*, population 1210, about 7 miles E.S.E. from Northampton, near the border of the county, contains a considerable number of good houses. The church, which is ancient, has an embattled tower. There are chapels for Independents and Methodists, a National and two Infant schools. Lime-burning and brick-making are carried on. Nearly 2 miles S.W. from the village is Yardley Chase, which abounds with fine timber, and is stocked with deer. In this chase are some very large trees, including the Yardley oak, mentioned by the poet Cowper. An avenue three miles long extends from Yardley Hastings to Castle Ashby, the seat of the Marquis of Northampton. Castle Ashby is an extensive pile in the form of a square, erected in 1624.

Divisions for Ecclesiastical and Legal Purposes.—The county is almost entirely comprehended in the diocese of Peterborough and archdeaconry of Northampton. Northamptonshire is in the Midland circuit. The assizes are held at Northampton, quarter-sessions at Northampton and Peterborough; and county courts at Brackley, Kettering, Northampton, Oundle, Peterborough, Thrapston, Towcester, and Wellingborough. The county jail and house of correction is at Northampton. Borough jails are at Northampton and Peterborough. Nine members were returned to Parliament from this county before the passing of the Reform Act, namely, two knights of the shire, two members each for the city of Peterborough and the boroughs of Northampton and Brackley, and one member for the borough of Higham Ferrers. The county now returns eight members, Brackley and Higham Ferrers being disfranchised, and the county formed into two divisions, each returning two members.

History, Antiquities, &c.—In the Roman division of Britain, Northamptonshire was included in the province of Flavia Cesariensis. Watling-street crossed it in a north-west direction through or near Towcester and Daventry; the Via Devana crossed it near Oundle and Rockingham; the Ermine-street crossed the north-eastern extremity from Castor, on the Nen, to Stamford. Watling-street may be traced for many miles from the summit of Borough Hill near Daventry. On the London side of Weedon it is incorporated with the modern high road. Several Roman stations are usually considered to have been in the county—Tripontium, Bennavenna, Isanavatia, and Lactodorum of Antoninus; and the Brinava and Durnomagus of Richard of Cirencester. Bennavenna was probably on Borough Hill, a short distance east of Daventry, on which is one of the largest ancient camps existing in the island. The foundations of the prætorium were discovered in 1823; and walls, tessellated pavements, and utensils of various kinds were brought to light. Lactodorum is supposed to have stood on Berrymount Hill, an artificial mound on the north-east side of Towcester. The Brinava, or Brinavis, of Richard of Cirencester may be placed at Black Ground, near Chipping Warden, a village nine miles from Daventry on the road to Banbury, where Roman coins and a great quantity of pottery have been discovered. A rampart ran north and south near this station for some distance; it was probably designed for the defence of a frontier. Some small part of this bank is remaining near Warden, and is called Wallow Bank. Arbury Bank, not far off, is probably a part of it; and it is likely that this defence gave name to some neighbouring villages or hamlets, as Walton (Wall-town) near King's Sutton, Aston-in-the-Walls, &c. That a Roman town or station existed at Castor is evident, not only from the name, but from the Roman remains, ruined walls, tessellated pavements, urns and other vessels of pottery, and coins in great number, found there. Similar remains have been found at Chesterton, or rather at Water Newton in Huntingdonshire, just across the river: either Castor or Chesterton was probably the Roman Durobrivæ mentioned in the Itinerary of Antoninus, or the Durnomagus of Richard of Cirencester; perhaps the two may be identical. According to Tacitus, Ostorius Scapula, prætor of Britain under Claudius, fortified the line of the Nen by a

chain of posts; many Roman remains have been discovered along both banks of this river.

The county was included in the Anglo-Saxon kingdom of Mercia. In the invasion of that kingdom by the Danes, the monastery of Medeshamstede, now Peterborough, was destroyed; and, upon the extinction of the Mercian dynasty, the county was divided between the West Saxons and the Danes, the former having all to the south-west and the latter all to the north-east of Watling-street. Of the Anglo-Saxon period there are memorials in Brixworth, Barnack, and Earl's Barton churches. Simon de St. Liz built the castles of Northampton and Fotheringay. William the Conqueror is thought to have built Rockingham Castle. In the reign of William Rufus (1094) a great council or parliament was held at Rockingham to determine the dispute between the king and Anselm, archbishop of Canterbury, respecting the right of investiture. Both Henry III. and Edward I. frequently resided at Northampton, and in the reigns of Edward II., Edward III., and Richard II., several parliaments were held here: at the last of these was voted the poll-tax, which led to Wat Tyler's rebellion. The battle of Northampton in the civil war of the Roses is noticed under NORTHAMPTON. In 1469 a Royalist force, under William Herbert, earl of Pembroke, was defeated at Edgecot, on the border of the county towards Oxfordshire, by a body of insurgents headed by Robin of Redesdale.

Of ancient ecclesiastical or castellated architecture the county possesses several specimens. Brixworth church, 7 miles N. from Northampton, consists of a nave, south aisle, chancel, west tower, and staircase-turret, on the western side of the tower; but foundations of aisles and other parts prove that the original building was more extensive. Portions of Roman work are built up in the walls, and the whole has the appearance of having been constructed out of the materials of a more ancient structure. It is of rude character, apparently of the 11th century, but has been greatly altered at subsequent periods. Brigstock church, between Oundle and Rothwell, is another curious church, partly of Anglo-Saxon date, but the ancient work forms only a small proportion. The tower is of very rough masonry plastered, and has a roughly-built round staircase turret on the west side, like Brixworth. Earl Barton's church has a remarkable tower of Anglo-Saxon date. Barnack church, near Stamford, has a tower partly Anglo-Saxon. Castor church, near Peterborough, is a large and fine cruciform church, with a Norman tower at the intersection, which displays almost every variety of Anglo-Norman moulding and ornament. The two upper stories present a very enriched appearance, having open arches and continued arcades round. Both the parapet of the tower and the spire are of later date. St. Peter's church, Northampton, and Peterborough cathedral, have considerable portions of Norman architecture; and several of the parish churches have some Norman features. Of later date, Barnwell St. Andrew's, Aldwinkle All Saints, Canons Ashby, Easton, Finedon, Fotheringay (formerly collegiate), Lowick, Raunds, Rushden, St. Mary's church at Stamford Baron, Stanwick, King's Sutton, Titchmarsh, Warmington, Whiston, Wilby, and Woolston are perhaps most worthy of notice for their beauty or for the curious features they present. Of St. James's Abbey, Duston, near Northampton, founded by William Fevers, natural son of William the Conqueror, for Augustinian canons, and of Pipewell Cistercian abbey, Great Oakley, near Rockingham, only the foundations and traces of the walls are remaining. A portion of the chapel of Cateby Benedictine nunnery, near Daventry; a portion, supposed to be the refectory, of the Clunian priory at Daventry; the conventual church of the priory of Augustinian canons at Canons Ashby, between Northampton and Banbury; the kitchen and a few other vestiges of Sewardale Cistercian priory, near Towcester, are the principal monastic remains. Queen's Cross at Hardingstone has been already noticed. Geddington Cross, near Kettering, another of those erected by Edward I., is of triangular shape, elevated on eight steps, and divided into three compartments; it is richly adorned with statues and carvings.

The castellated ruins are few. These are, the earthworks of Northampton, Higham Ferrers, Brackley, Fotheringay, and perhaps one or two others, and the gateway of Rockingham. Fotheringay Castle was founded soon after the Conquest; Richard III. was born in it; Mary Queen of Scots was imprisoned in it by her cousin Queen Elizabeth, and here she was tried and executed February 8th 1587. This castle was demolished by Mary's son, James I., soon after he ascended the throne of England. Barnwell Castle is a fine and interesting ruin: it consists of four massy round towers, with their connecting walls inclosing a quadrangular court; the western wall is dilapidated. The grand gateway, which still remains, is flanked by two round towers.

There are a few ancient mansions. Drayton House, near Thrapston, is of the age of Henry VI.: it retains many of the features of an ancient castle. Fawsley House, 3 miles S. from Daventry, the ancient seat of the Knightly family, is an incongruous pile of various dates. Northborough manor-house, between Peterborough and Market Deeping, now a farm-house, is of decorated English character, and some of its portions and details are very beautiful. Burghley House, on the border of the county near Stamford, was built for the most part by the great Lord Burghley, though many additions and alterations have been made by subsequent possessors. It is a vast pile, displaying magnificence rather than taste. Kirby Hall, near Rocking-

ham, was built by Sir Christopher Hatton, lord-keeper: it has been materially altered since.

The battle of Naseby, which decided the great civil war, was fought in this county in 1645. After the Scotch had delivered the king to the Parliamentary Commissioners, he was brought to Holdenby House, about 6 miles N.W. from Northampton, whence he was carried off by Cornet Joyce. Holdenby House, which had been built by Sir Christopher Hatton, was demolished by order of the Parliament.

Statistics: Religious Worship and Education.—According to the Returns of the Census of 1851, there were then in the county 592 places of worship, of which 292 belonged to the Established Church, 118 to four sections of Methodists, 87 to Baptists, 56 to Independents, 6 to Quakers, 6 to Roman Catholics, 4 to the Countess of Huntingdon's Connexion, 4 to Mormons, and 3 to Moravians. The number of Sunday schools was 426, of which 257 were conducted by Episcopallians, 68 by Methodists, 52 by Baptists, and 39 by Independents. The number of Sunday scholars was 33,614. Of day-schools there were 687, of which 276 were public schools, with 18,969 scholars, and 411 were private schools, with 7555 scholars. Of evening schools for adults there were 15, with 305 pupils. There were 8 literary and scientific institutions, with 1451 members, and 14,324 volumes in the libraries belonging to them.

Savings Banks.—In 1853 the county possessed four savings banks— at Kettering, Northampton, Oundle, and Peterborough. The total amount due to depositors on November 20th 1853 was 288,335*l.* 8*s.*

NORTHERN SOVEREIGNTY. This name has been given, but perhaps not definitely, to an extensive tract of country which was annexed in 1848 to the British possessions in South Africa. It includes the whole of the territory west of the Drachenberg Mountains, between the two great branches of the Orange River, the Ky Gareep and the Nu Gareep, comprising a triangular area of about 50,000 square miles.

The Drachenberg Mountains, called also the Quathlamba Mountains, run parallel with the eastern coast of South Africa, at a distance varying from 60 to 90 miles from the shore. They rise to a height of from 6000 to 8000 feet, with towering peaks and rocky ridges, interrupted only by ravines and chasms, and thus form a barrier almost impassable between Kaffraria and Natal on the east, and the Northern Sovereignty on the west. A secondary range, called by the natives Malati, or the Peaks, runs parallel to the principal chain, at no great distance farther inland; and offsets, called the Wittebergen and Sneuwbergen, extend westward from the Drachenberg range, and close in the Northern Sovereignty on the south.

The country immediately west of the mountain ranges is from 5000 to 6000 feet above the level of the sea, and consists of a series of wide plateaus, which, sloping gradually downwards towards the lower course of the Vaal River, terminate in plains of vast extent, sometimes containing numerous isolated and rocky hills, but generally quite flat and without trees. These vast wastes are for the most part without a single human inhabitant, but afford abundant means of subsistence to countless herds of antelopes, quaggas, and other wild animals. All the rivers fall ultimately either into the Ky Gareep or the Nu Gareep. The Ky Gareep, or Vaal River, rises between 26° and 27° S. lat., 29° and 80° E. long., about 200 miles W. from Delagoa Bay, in an interior range of mountains bounding the great plains on the north, and flows west, south, and south-west till it meets the Nu Gareep. The Nu Gareep, or Cradock River, rises in the Drachenberg Mountains, about 29° S. lat., 30° E. long. It flows south-west, west, and afterwards north-west, till it joins the Ky Gareep. Its principal affluent from the north is the Caledon; from the south it receives the Stormberg River, the Oorlogs, the Zeekoe River, and others of less importance.

This portion of the continent, being remote from the sea-coast, receives its rain in thunder-storms, chiefly during the summer months, of which December and January are the hottest; and there being no rain during the rest of the year, the climate and soil are then characterised by great dryness, though copious dews fall at night. The smaller rivers are dried up, and the ponds and lagoons are converted into swamps.

The White-Faced Antelope (*Antelope albifrons*), the Spring-Bok (*A. exchore*), the Gnu (*A. Gnu*), and the Quagga (*Equus Quagga*) seem to be in the greatest abundance. They are often seen in countless herds covering an immense extent of the plains, mixed with other species of the antelope, which are less numerous, and with buffaloes. Hyenas are abundant. Lions are very common. The hippopotamus is very common in the larger rivers. Ostriches appear on the great plains in considerable numbers. Timber grows on the slopes of the mountains, but not in the plains. There are salt-lagoons and salt-marshes, and some of the plains are covered with an incrustation of salt.

The white population is estimated to be about 5000, who are chiefly the residue of the Dutch farmers who, in 1836 and following years, emigrated from the Cape Colony, and are settled in villages and in small groups near the rivers. The native population are supposed to amount to about 150,000, who mostly inhabit the Malati Mountains. The Bushmen live among the isolated hills of the interior. The Griquas, who are a mixed breed, arising from the intercourse of Europeans with the natives, are in considerable numbers. They are

mostly settled along the banks of the Nu Gareep and of the Orange rivers.

The colony has been distributed into four districts—Bloem Fontein, Caledon River, Winburg, and Vaal River. The principal town is *Bloem Fontein*, situated in 29° 8' S. lat., 26° E. long., on the high road from the Cape Colony to Natal. It is about 380 miles N. from Graham's Town. It contains about 1000 inhabitants, has an Episcopal church, a Wesleyan Methodist chapel, and barracks. Smithfield, Winburg, and one or two other villages, are inconsiderable places. There are three or four mission-stations belonging to the British, French, and Prussians.

The country appears to be well adapted for sheep pasturage and the production of wool. The climate seems to have a favourable influence on the fineness of the fleece. Small quantities of gold have been recently found in the neighbourhood of Smithfield.

When the Dutch inhabitants of the Cape Colony emigrated from it in 1836 and following years, they settled themselves at first in various parts of the territory which is now named the Northern Sovereignty. In 1838 a party of them went to Natal, where they were treacherously murdered by the warriors of the chief Dingaan. [NATAL.] When the Dutch, who had conquered the natives and declared a republic, were obliged in their turn to submit to the English in 1842, the greater part of them fled into the Northern Sovereignty, where they founded the village called Winburg, and proclaimed a new Dutch republic. Little notice was taken of their proceedings till they began to expel from their farms the Dutch farmers who continued to acknowledge the British supremacy, and in 1845, under their leader Pretorius, prepared a large expedition to attack Adam Kok, a Griqua chief in alliance with the British. The chief applied to the colonial government, and two regiments were immediately sent to his assistance, who repulsed the revolutionary Dutch boers. On the 1st of February 1848, Sir Harry Smith, with the assent of the well-affected boers, erected the whole of the territory inclosed by the Ky Gareep and the Nu Gareep into a British colony. This led to another contest, in which Sir Harry Smith defeated Pretorius and his adherents on the 29th of August, 1848. Pretorius fled beyond the Vaal River, and the majority of the boers laid down their arms and submitted to the British government.

NORTHFLEET. [KENT.]

NORTHLEACH, Gloucestershire, a market-town and the seat of a Poor-Law Union, in the parish of Northleach, is situated in a bottom among the Cotswold Hills, near the source of the Lech, in 51° 50' N. lat.; 1° 50' W. long., distant 20 miles E. by S. from Gloucester, and 82 miles W.N.W. from London. The population of the parish in 1851 was 1352. The living is a vicarage in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Northleach Poor-Law Union contains 30 parishes and townships, with an area of 67,647 acres, and a population in 1851 of 10,984. The church is a large handsome building, with an elegant south porch, and a lofty tower at the west end. In 1559 a Free Grammar school was founded here by Hugh Westwood; its income is about 600*l.* a year. There is also an Infant school.

NORTHOP. [FLINTSHIRE.]

NORTHUMBERLAND, a maritime county in the north of England, is bounded N. by the Tweed, which separates it for a few miles from the Scotch county of Berwick; E. by the North Sea; S. by Durham, from which it is divided in one part by the Derwent, and in another by the Tyne; and W. by Cumberland and the Scotch county of Roxburgh. By the Act 7 and 8 Vict., cap. 61, Northumberland, Islandshire (including Holy Island and the Farnes Islands), and Bedlingtonshire were transferred from the county of Durham to that of Northumberland. The county lies between 54° 48' and 55° 42' N. lat., 1° 22' and 2° 36' W. long. Its greatest length from north to south is 60 miles; from east to west, between Tynemouth and the point where the Irthing enters Cumberland, 54 miles. The most southern part of the county however, lying between the Tyne and the Derwent, is only 28 miles wide; and the greater part of the northern division hardly exceeds 24 miles in breadth. The area is 1952 square miles, or 1,249,299 acres. The population in 1841 was 266,020; in 1851 it was 303,568.

Surface and Geology.—Northumberland has a rugged surface and a naked aspect. The highest hills are the Cheviot, which in their northern part, near the Common Burn River, a little south-west of Wooler, reach the height of 2658 feet. At King's Seat, near the head of the Breamish, the true Cheviots are met by the Hedgehope and Standrop range (2347 feet), and by a lower range that runs north-west along the border to the Beaumont River. From King's Seat the ridge of the Cheviot Hills runs generally south-west round the sources of the Coquet, the Reed, and the North Tyne. These hills have in several instances a conical form, and some are nearly perfect cones; they are covered with a fine green turf, and afford excellent pasture for vast numbers of sheep peculiar to the district. Along the Cumberland border, and especially towards the south-west, the hills are extremely broken, dreary, and barren, but are valuable for their lead-mines. From these highlands numerous offshoots run, generally eastward, separated by fertile dales, and stretching out in the centre of the county into dreary wastes, on which arise a few rocky hills of no great elevation. The hills south of the Coquet form part of the extensive moorlands which occupy a third part of the county, and have an average elevation of from 500 to 1000 feet above the level of

the sea. South of the Tyne is a group of hills separating the valleys of the Tyne and the Wear. The valley of the Reed is wet, and in some parts so boggy as to be impassable. Woods are chiefly confined to the banks of the rivers.

The coast is low. It runs generally south by east from Warren Bay, opposite the Farnes Islands, to the mouth of the Tyne, and is marked by numerous headlands and bays. Coquet Island, lying off Hawksley Point, is nearly a mile long from north to south, and about half a mile broad. It contains some rich pasture, and abounds with rabbits. A lighthouse has been lately erected by the Trinity board, at a cost of 14,000*l.*, upon the island. Islandshire has no cliffs, neither has Bedlingtonshire. From Islandshire sand-banks (Fenham flats) run out and connect Holy Island with the main land, so as to render the island accessible at low-water to vehicles of all kinds; though the sands are dangerous to persons not acquainted with them. Holy Island is of an irregular form, nearly 4 miles long from east to west by north, and nearly 2 miles broad from north to south. The parish had in 1851 a population of 908 persons. This island was called by the Britons *Inis Medicante*, and was afterwards known by the name of *Lindisfarne*. It was the seat of a bishoprick, and had a monastery under the government of the bishops, which was subsequently reduced to be a cell of the Benedictine monastery of Durham. The church of the monastery is now in ruins. The soil of the island is rich. On the west side is a small village or town, formerly much more extensive: the inhabitants are chiefly engaged in fishing. There is a small harbour. An old castle, which during the last war was occupied by a garrison sent from Berwick, stands upon a lofty rock of whinstone in the south-east corner of the isle. On the north-east side of the island is a projecting tongue of land a mile long, and in some parts only 60 yards broad, occupied by rabbits; on one side of this tongue the tide may be seen ebbing while it is flowing on the other. The Farnes Islands lie to the south-east of Holy Island. The group consists of several small islets or rocks, some of which are visible only at low water. They produce kelp, and some of them a little grass. There are two lighthouses on two islets of the group. The population in 1851 was 20.

The south-eastern part of the county is included in the great coal-field of the counties of Northumberland and Durham. This coal-field is skirted on the north-west by a belt of land occupied by millstone-grit beyond which is a still narrower belt of land occupied by the carboniferous or mountain limestone. Nearly all the rest of the county is occupied by a series of formations comprising sandstones of various kinds. Trap rocks occur in connection with both coal formations. A small district along the Tweed is occupied by the new red-sandstone. The chief mineral products are coal and lead: most of the coal raised is sent coastwise to London and to various southern ports. The principal pits in the great coal-field are in the neighbourhood of the Tyne.

The most important lead-mines are in the south-west of the county, near Allendale. Some gypsum is obtained in the red-sandstone district, near the Tweed. Zinc-ore abounds in most of the veins producing lead. There is abundance of ironstone in the strata which occur in the coal-measures. Limestone and building-stone are quarried in different parts of the county.

Hydrography and Communications.—The rivers of Northumberland rise for the most part in the eastern slope of the hills on the western boundary, and flow, with the exception of the Till and its feeders, eastward across the county to the North Sea. The Tweed belongs chiefly to Scotland, but bounds the north-western angle of this county. The *Till* rises in the eastern slope of the border range, near the Hartside Hills, and, under the name of the Breamish, flows first east, then north; on reaching the neighbourhood of Belford it turns north-west, and, assuming the name of *Till*, flows into Northumberland, where it joins the Tweed on the right bank a little below Coldstream, after a course of about 40 miles. The Breamish, the Beaumont (which rises on the west side of the hills), and the *Till*, inclose the true Cheviot district. The *Aln* rises near Alnham, and flowing east 20 miles past Whittingham and Alnwick, falls into the sea at Alnmouth. The *Coquet* rises in the Cheviot Hills, and flowing first south-east, and then east past Rothbury, falls into the North Sea just below Warkworth, after a course of about 37 miles. The *Aln* and the *Coquet* are both navigable for a short distance, the former up to Alnwick. There is a salmon fishery at the mouth of these rivers, and the *Aln* abounds in trout. At the mouth of the *Coquet*, near the village of Ambleside, are a harbour and docks; the harbour is connected by a branch railway with the Newcastle and Berwick railway. The *Wansbeck* rises in a range of hills which runs through the centre of the county, forming the eastern side of the basin of the Reed, and flows east past Morpeth (where it becomes navigable) into the North Sea. Its whole length is 24 miles, the length of the navigation 6 miles. The *Blyth* rises a little south of the source of the *Wansbeck*; it has a course of above 20 miles nearly parallel to that river, and falls into the sea at the town of Blyth, of which it forms the harbour. The *North Tyne* rises from several springs on the border. After flowing southwards, under the name of the Kielder Burn, for 10 miles, it flows east 14 miles to its junction with the Reed below Bellingham; from this point the stream flows south-east 14 miles to the junction of the South Tyne, just

above Hexham. The *South Tyne* rises amid the hills south of Alston Moor in Cumberland, and after flowing 17 miles northward to Haltwhistle, turns east, and flows 16 miles to its junction with the North Tyne, receiving on its right bank above Haydon Bridge the Allen River. The *Derwent*, another feeder of the Tyne, is noticed under DURHAM. The *Tyne*, thus formed by the junction of the North Tyne and the South Tyne, flows eastward 30 miles, past Newcastle, into the sea between North and South Shields. Its whole length from the head of the North Tyne is about 70 miles. It is navigable for sea-borne vessels up to Newcastle, and for river craft a few miles higher. The spring-tides rise about 18 feet at the mouth of the river and about 11½ feet at Newcastle. From Newcastle to the sea the Tyne may be said to be one continued harbour, the river and the numerous docks adjacent to it being occupied with shipping, mostly colliers, and each bank being lined with wharfs, quays, staiths, and factories. The *Reed* rises on the northern slope of the Kielder Moors, and flows along the base of the Girdle Fell in a south-eastern direction past Otterburn, below which it runs nearly due south to its junction with the North Tyne. Its length is about 24 miles.

The Vale of the Coquet is noted for the excellence of its agriculture; the Vale of the Tyne exhibits great variety of scenery; above Newcastle it is rich and beautiful. There are medicinal springs at Eglingham, Snowhope, and Thurston, but none of them is much frequented.

The county is traversed by two important lines of railway connecting Newcastle with Berwick and Carlisle. The Newcastle and Carlisle railway runs westward up the valley of the Tyne, and passes Hexham and Haltwhistle. Its whole length in this county is 41 miles. The Newcastle and Berwick railway, forming part of the Great Northern railway from London to Edinburgh, runs northward at a little distance from the coast past Morpeth and Belford, sending out short branches to Alnwick and Warkworth. A railway, 7 miles in length, joins Newcastle to North Shields, whence there are short lines to Tynemouth and Blyth. On the south, Newcastle is connected by railway with Gateshead, South Shields, Durham, Hartlepool, and the numerous lines in connection with the Great Northern railway. The Berwick and Kelso railway, which runs up the right bank of the Tweed, is partly in the north-western angle of this county. The railways which converge on Newcastle meet at a central station within that town.

The Edinburgh coach-road enters the county at Newcastle, and runs northward through Morpeth, Alnwick, and Belford, to Berwick-upon-Tweed. Another road to Edinburgh branches off from this beyond Morpeth, and runs by Wooler to Coldstream. A third road to Edinburgh runs from Newcastle by the valley of the Reed to Jedburgh. The coach road from Newcastle to Carlisle runs by Hexham and Haltwhistle.

Climate, Soil, and Agriculture.—The climate is considerably colder and the harvest later than in the southern and midland counties. In that part of the county which skirts the sea-shore, although it is exposed to cold easterly winds, the air is much milder and more genial than in the western and mountainous part, which, although too high and bleak for cultivation beyond a certain elevation, produces sufficient herbage to maintain large flocks of hardy sheep, known by the appellation of the Cheviot breed.

Along the coast, and for some miles inland, the soil consists of a strong fertile clayey loam, well adapted to the growth of wheat, beans, and clover, and there are some excellent natural meadows and pastures. Along the banks of the Tyne and the Coquet, and along the Aln from Alnwick to the sea, the soil is chiefly a light gravel, sand, or dry loam, which is likewise the case to a great degree in the vales of the Breamish, Till, and Beaumont. In the middle and south-eastern parts of the county the soil is a moist loam on a cold impervious clay bottom. On the hills there is a mixture of peat-bogs, stony and gravelly heaths, and some good dry green pasture.

Northumberland has been one of the foremost of the English counties in adopting improved methods of agriculture. Wheat and barley are generally raised, and it is common for clover and grass-seeds to be sown amongst the grain. Turnips are extensively raised. On light gravelly soils, where the clover and grasses soon fall off, the turnips are fed off with sheep. There are some very heavy and wet soils in the county, which are fallowed once in six or seven years. In other respects they are cultivated in a similar manner with the good loams. The practice of thorough draining is spreading rapidly. Potatoes are grown in large quantities. The instruments of tillage are mostly of improved make. Threshing-machines, moved by water, wind, or horses, and seed-drills, are general on the larger farms.

The cattle in Northumberland are generally of good breeds, mostly short-horned. Those bought to fatten are chiefly Scotch. The cows kept for the dairy are almost invariably of the short-horned Durham breed; and many remarkably fine heifers are reared in the county. Great attention is paid to the breeding of bulls. Excellent farm-horses are bred. The sheep are chiefly of the native Cheviot breed, a useful hardy sheep with a small fleece. On highly-improved farms the Leicester and South-down breeds, and almost every other, may be found. The principal farms in Northumberland are let on lease for 21 years.

There are no very extensive old woods in the county, but many

thriving plantations; there is a constant demand for small timber for the use of the coal-mines, which makes it profitable to cut young saplings, and the trees are not often permitted to acquire the size of large timber. The larch is a profitable and favourite tree in all young plantations, and thrives well in most situations, from the sides of the rivers to near the tops of the highest hills.

The principal manufactures of Northumberland are those that depend chiefly on the collieries—namely, glass, pottery, and iron. Large quantities of dried and pickled salmon are exported.

Divisions, Towns, &c.—Northumberland is in the diocese of Durham, and constitutes the archdeaconry of Northumberland. It is in the northern circuit. The assizes are held at Newcastle; quarter-sessions at Newcastle, Morpeth, Hexham, and Alnwick alternately. County-courts are held in Alnwick, Belford, Bellingham, Haltwhistle, Hexham, Morpeth, Newcastle, North Shields, Rothbury, and Wooler. The county jail and house of correction is at Morpeth; there are houses of correction also at Tynemouth, Hexham, and Alnwick. Northumberland is divided into six wards—Bamborough, north-east; Castle, south-east; Coquetdale, central; Glendale, north-west; Morpeth, central; and Tindale, south-west. Besides these there is the county of the town of Newcastle. Before the Reform Act Northumberland returned six members to Parliament, two for the county, and two for each of the boroughs of Newcastle and Morpeth. By the Reform Act the county was formed into two divisions, each returning two members; Morpeth was reduced to one member, but the new borough of Tynemouth was created, returning one member, so that the number of borough members remained as before.

Northumberland contains the parliamentary borough and assize town of NEWCASTLE, the parliamentary boroughs of MORPETH, TYNEMOUTH, and NORTH SHIELDS, and the market-towns of ALLENDALE, ALNWK, BELFORD, BELLINGHAM, HALTWHISTLE, HEXHAM, ROTHBURY, and WOOLER. To these may be added, as places of some importance, though without markets, ALNMOOUTH, BAMBOROUGH, BLYTH, HARTLEY, SEATON, and WARKWORTH.

Wooler is an ancient market-town, in the east division of Glendale ward, 45 miles N.N.W. from Newcastle; population of the parish 1911 in 1851. The streets are lighted with gas and paved, and the houses are supplied with water. The parish church is a neat building, erected in 1765, and enlarged in 1835. The Baptists, English Presbyterians, United Presbyterians, and Roman Catholics have places of worship. A National school, a subscription library, and a dispensary are in the town. The market is on Thursday; there are two yearly fairs. There are several entrenchments near Wooler, the most remarkable of which is a circular entrenchment on a hill called Humbleton Hugh, about a mile from the town. In the plain beneath this hill is a stone pillar, commemorative of the victory gained here in 1402 by Percy, earl of Northumberland, over a Scotch army of 10,000 men under Earl Douglas. Another remarkable monument of British times exists near Wooler, on the flat top of a mountain called the Yevering Bell, which is 2000 feet above the plain at its base. It consists of a stone wall 8 feet thick, with an entrance on the south side, and inclosing a large cairn: on the sides of the hill are remains of circular buildings; there are also traces of a grove of oaks. *Alnmoouth*, 5 miles E. from Alnwick, at the mouth of the Aln: population of the township 488 in 1851. It may be considered as the port of Alnwick: there is a considerable export of corn and wool here; the fisheries too are valuable, and ship-building is carried on. The hill at the mouth of the Aln, on which the parish church of Alnmoouth stood, has for some time been completely insulated by the floods and tides; a portion of the ancient structure still remains on the hill. Alnmoouth is much resorted to for sea-bathing. *Hartley*, in Castle ward, 10 miles N.E. from Newcastle, population of the township 1627 in 1851, consists of one long street of mean houses, extending to the shore, where there is a small fishing harbour. Half a mile north from Hartley is *Seaton Sluice*, or *Seaton Delaval*, a harbour formed by Sir Ralph Delaval in the time of Charles II., at the mouth of the Seaton Burn. In order to prevent the harbour being filled up with mud and sand, he formed a sluice, with flood-gates, to scour the haven. This haven was improved by the late Lord Delaval, who made a new entrance from the North Sea by a cut through the solid rock, which is guarded by immense locks. This improvement has rendered the harbour accessible at all times, and in every state of the wind: 12 or 15 vessels of 300 tons can here ride in safety, and enter or leave the harbour fully laden. The principal trade of the place is in coals; there are besides extensive bottle-works. The English Presbyterians and Methodists have chapels. *Warkworth*, formerly a market-town, now a village, 14 miles N.N.E. from Morpeth, population of the township 834, is situated on the right bank of the Coquet, at a short distance from its mouth. The town contains several good modern houses, leading from the castle down a steep hill to the ancient cross, where the market was formerly held. A cattle fair is held on November 23rd. The parish church is a handsome building, with a tower and spire, above 100 feet high. There are places of worship for Methodists and Presbyterians. The town is governed by a borough-reeve and constables. On an eminence close to the town are the noble ruins of Warkworth Castle, one of the strongholds of the Percys. The keep is an octagon, surmounted with a tower. The building is very large, and comprehends many apartments. The great baronial hall is nearly 40 feet long by 24 feet wide,

and 20 feet high; and there is another state-room of rather smaller dimensions. Just within the entrance, on the ground-floor, are eight apartments with vaulted roofs of stone. The masonry of the castle is in excellent preservation, but the roof, windows, and floor are for the most part gone. A bridge of two spacious arches, which crosses the Coquet at the north side of the town, has a tower at the town end, with an archway through which the road passes; in the middle of the bridge is a stone pillar, with the Percy arms carved on it. In the perpendicular rocks which form the north bank of the Coquet, about a mile above the bridge, is an ancient hermitage, with a small neat chapel and two other apartments hewn out of the rock; the chapel contains an altar, and a monumental alab with a recumbent female figure. This retreat is celebrated in Dr. Percy's poem of the 'Hermit of Warkworth.'

Of villages the following may be mentioned; the populations given are those of 1851:—

Ambie, 2 miles S.S.E. from Warkworth, situated on an eminence on the right bank and near the mouth of the Coquet, population of the township 1040, is a neat well-built village, which has considerably increased of late years. The streets and shops are lighted with gas, and valuable coal-mines are worked in the neighbourhood. A branch line from the Newcastle and Berwick railway passes through the village to the harbour at the mouth of the Coquet. The Independents and Roman Catholics have chapels in Ambie. *Benwell*, 2 miles W. from Newcastle, population of the township 1272, is situated in an exceedingly fertile district, which abounds also with excellent seams of coal. At a short distance south of the village is Benwell House, surrounded by extensive plantations. *Blanchland*, situated on the Derwent, is famous for its lead-mines. Of its Premonstratensian Abbey, founded in 1175, some portions still remain. One of the abbey towers was converted into a chapel in 1752. There is an Endowed Free school here. The Abbot of Blanchland was elevated to the House of Peers by Edward I. *Corbridge*, a large village, population of the township 1363, is situated 4 miles E. from Hexham, on the left bank of the Tyne, over which there is a bridge of seven arches. There is a spacious market-place, which contains a cross and a fountain, erected in 1814 by the Duke of Newcastle. The parish church is a very ancient structure; and at the north-east corner of the market-place is an ancient tower, which formed part of the old town-jail. Corbridge was formerly a market-town, and had four parish churches, three of which have disappeared. There are traces of extensive buildings between this place and the neighbouring Roman station of Corstopitum. Two altars with Greek inscriptions have been dug up in the churchyard; one of them was dedicated to the Tyrian Hercules. The Independents and Wesleyan Methodists have chapels in Corbridge. Earthenware and fire-bricks are largely manufactured. Coal, lead, and limestone are raised in the parish. *Cowpen*, a village and township, about one mile W. from Blyth, is situated amidst extensive coal-mines: population of the township 4045. The Roman Catholics and Primitive Methodists have chapels. Several collieries have been recently opened. *Chirton*, a populous straggling village, one mile W. from North Shields, has a population of 3960, who mainly derive their support from the collieries. *Cullercoats*, population 695, about 2 miles N. from Tynemouth, is built close to the cliffs that here overhang the North Sea; it has a mineral spring, and is frequented in the season by sea-bathers. *Earsdon*, population of the township 551, is 4 miles N. from North Shields, situated on an eminence in a fertile country, abounding also with coal and stone. The parish church of St. Alban, a venerable structure, occupies the highest ground in the village, and commands extensive views of the coast and of the interior. *Elsdon*, 8 miles N.E. from Bellingham, on a small feeder of the Reed, population of the township 313, is supposed to have been a Roman town. *Elsdon Castle*, erected by David, king of Scotland, is a strong tower, the lower story of which is spanned by a single arch. The parish church is a large cruciform structure. Coal, limestone, and ironstone abound in the neighbourhood of Elsdon. *Ford*, near the Scottish border, on the right bank of the Till, about 9 miles N.N.W. from Wooler: population of the parish 2322. The village consists of one irregular street, on an eminence rising from the river, over which is a bridge. *Ford Castle*, on the north side of the village, originally built in the reign of Henry III., by Sir William Heron, was in great part rebuilt by the late Lord Delaval. Of the original structure only two towers on each flank of the present edifice remain. The castle was taken by James IV., in 1513, just before the battle of Flodden. Besides the parish church, there are two Dissenting places of worship. *Haydon Bridge*, formerly a market-town, is situated 6 miles W. from Hexham, on both banks of the South Tyne: population of the chapelry 2085. It contains Episcopal, Independent, and Wesleyan Methodist chapels. There are here a well Endowed Free school, and 20 almshouses. *Haydon Bridge* is the mid-station on the Newcastle and Carlisle railway, being about 29 miles distant from each of these towns. *Howden Pans*, 5 miles E. by N. from Newcastle, is situated in the parish of Wallsend, on the left bank of the Tyne: population of the township 1276. Wallsend coals are shipped from the staiths along the river here. There are large docks for ship-building, a rope-walk, a tar and varnish factory, and an extensive brewery. Wesleyan and New Connexion Methodists have chapels in Howden. The village got its distinctive

GEOG. DIV. VOL. III.

name from the numerous salt-pans that formerly existed here. *Jemond*, a township, with a population of 2089, situated in a vale about a mile and a half N.E. from Newcastle, is noteworthy for its extensive iron-works. Here was formerly an hospital dedicated to the Virgin Mary, the chapel of which was much resorted to by pilgrims. *Long Benton*, population of the township 2238. The village is 3 miles N.E. from Newcastle, and occupies a pleasant and healthy situation. The parish church is about a quarter of a mile from the village. Part of the parish skirts the left bank of the Tyne, which is lined with factories of different kinds, and with coal-wharfs. *Lowick*, a pretty village 8 miles N. from Wooler, population of the parish 1941, contains a parish church and a Presbyterian chapel. *Barmoor Castle* and grounds are close to the village. Coal and limestone are obtained in the neighbourhood. *Newbiggin*, a small bathing village about 4 miles N. from Blyth, population of the chapelry 717, contains some good houses. The chapel, an ancient structure, with a low spire, occupies a site near the shore. Some of the inhabitants are engaged in fishing. *North Sunderland*, a village 3 miles S.S.E. from Barmoor, population of the township 1208, has a small harbour, from which corn, fish, and lime are exported; many herrings are cured at this place. The church, a neat structure, was opened in 1833. The English and United Presbyterians have chapels. *Walker*, is situated on the left bank of the Tyne, 3 miles E. from Newcastle: population of the chapelry 3201. At the village is a station of the Newcastle and Tynemouth railway, and along the banks of the Tyne are iron-works, coal-staiths, iron shipbuilding-works, alkali- and copper-works, &c. *Wallend*, a flourishing village 3½ miles E. from Newcastle, on the road to North Shields, derives its name from its position at the extremity of the wall of Severus: population of the township 2161. The district is celebrated for its coal-mines; there are also large ship-building yards, extensive lime-works, copper-foundries, and potteries. The parish church is a neat building. The Wesleyan Methodists and United Presbyterians have chapels. *Wark*, an agricultural village 9 miles N.W. from Hexham, is situated on the road to Bellingham, and near the right bank of the North Tyne: population of the township 483. Besides the parish church, there are chapels for Presbyterians and Methodists. *Wylam*, is situated on the Tyne, 9 miles W. from Newcastle: population of the township 1091. The principal industrial establishments are an extensive colliery and pig-iron works. Near the colliery is Florist Hall, with extensive gardens. The land in the vicinity of Wylam is very fertile.

History, Antiquities, &c.—In the earliest period of the history of the island, the eastern side of the county and the adjacent parts of Scotland were inhabited by the Otadeni, and the western side by the Gadeni, who also occupied Cumberland and a part of Scotland. There are several remains of the primitive inhabitants of the country, consisting chiefly of rude hill-forts, cairns, stone circles, and similar monuments. The Romans do not appear to have attacked this part of the country until the time of Agricola, who, in the second year of his command (Tacit., 'Agric. Vita,' c. xx.), formed a line of forts extending from the mouth of the Tyne to the Solway Frith, nearly in a line with the great wall subsequently erected by Severus. Agricola pushed his conquest northward, and secured the newly-acquired territory by a second line of forts extending from the Forth to the Clyde. The northern conquests of the Romans were by no means permanent. Agricola was recalled, and the Roman power languished. The Caledonians continued hostilities, and several tribes, who had submitted, revolted; and the emperor Hadrian found it expedient to abandon all the country between the two lines of forts built by Agricola, and to defend the southern part of the island by a rampart of earth.

In the reign of Antoninus Pius, the district between the two lines of forts formed by Agricola was reconquered by Lollius Urbicus, lieutenant of the emperor, who raised a rampart of turf across the island in the direction of the northern line. In the following reigns Northumberland and the rest of the country between the two walls appear to have regained their independence. Severus engaged in active warfare against the natives (A.D. 207-10): he lost 50,000 men, but ultimately obliged them to submit. He built a strong wall across the island nearly in the line of Hadrian's rampart. Hostilities were soon renewed by the natives, and Severus died at York, in the midst of his preparations to extirpate them. The subsequent history of the county during the Roman period is obscure.

The most remarkable monument of the Roman dominion is the great line of defence formed and augmented by the successive labours of Agricola, Hadrian, and Severus; and sometimes called 'the Picts' Wall,' sometimes the 'Roman Wall.' Some account of these great works has been given under BRITANNIA. The principal Roman stations in the line of the wall along Northumberland were Segedunum, Wallsend; Pons Ælii, Newcastle; Condercum, Benwell Hill; Vindobola, Rudchester; Hunnum, Halton Chesters; Cilurnum, Walwick Chesters, on the right bank of the North Tyne; Procolitia near Carraw; Borcovicus, near House Steads, 6 miles N.E. from Haltwhistle; Vindolana, Little Chesters; Æsica, Great Chesters; and Magna near the Cumberland border, between the Toppald and the Irthing. Borcovicus is the most perfect station on the line; it is on high ground, with a precipitous descent towards the north: it covered an area of 15 acres, and had a large suburb on the south. A

3 x

great number of Roman remains have been found here. Besides these stations on the line of the wall there were several other places of note in the Roman times in this county. Of these we enumerate the following:—Bremenium, or Bramanium, at Rochester in Redesdale; Corstopitum, or Corstopium, at Corchester, near Corbridge; Ad Fines, at Chew Green, near the head of the Coquet. There are Roman camps in different parts of the county. Indeed, in the number of Roman remains existing or found in it, Northumberland surpasses any other English county. A great Roman road, the northern Watling-street, entered this county from Durham, and passing near Corbridge divided into two branches, one of which ran by Habitancum (near Bellingham), Bremenium, and Ad Fines into Scotland, the other ran to the west of Morpeth and Alnwick into Scotland by Berwick. Another Roman road, called the Maiden Way, entered the county from Alston in Cumberland, and ran to the station Magna on the great wall.

Upon the departure of the Romans in the 5th century, Northumberland became the prey of the Picts and other barbarians, who broke through the wall and ravaged the island. When the Saxons were invited to oppose these invaders, a body of them were posted with their ships at the east end of the Roman wall (about A.D. 454); but it was not till 547 that a serious attempt was made at the permanent conquest of this part of the country. The invaders were Angles; and their leader, Ida, though he experienced a stout resistance from the natives, laid the foundations of an Anglo-Saxon kingdom of Bryneich, or Bernicia, which extended from the Tyne to the Forth. He built a castle on the coast, to which he gave the name of Bebban Burgh, since better known as Bamborough. Ida died in 560. One of the succeeding chieftains, named Ella, separating himself from the other Angles of Bryneich, founded the kingdom of Deifyr or Deira, separated from Bryneich by a vast forest that occupied what is now the county of Durham. The two kingdoms of Bryneich and Deifyr, when united, constituted the kingdom of Northumbria, which extended along the eastern shore of the island from the Humber to the Forth, and was bounded on the west by the British kingdoms of Strathclyde, or Vale of Clyde, and Cumbria, which extended south to Lancashire.

In 844 and again in 867 the Danes attacked Northumberland. They made an entire conquest of the country, and settled in it. Halfdene became sovereign, and divided the kingdom among his followers. In the treaty which Alfred made with the Danes, Northumbria was included in the Danelagh, or Danish territory. Against the successors of Alfred the Northumbrian Danes carried on a succession of petty wars and anarchical struggles till the dissolution of the kingdom of Northumberland in 950. Northumbria was then divided into earldoms or counties; of these Bernicia, or Northumbria north of the Tyne, which was nearly coterminous with the county of Northumberland, was one, Deira (Yorkshire) another, and Lothian (south of Scotland) a third. The county of Northumberland, as well as Cumberland, Durham, and Westmoreland, is omitted in 'Domesday Book.'

As the Scottish princes augmented their territories and consolidated their power, and as the Anglo-Norman princes on the other hand grew in wealth and resources, Northumberland became subject to the evils and received the constitution of a border county. The earldom became merely titular, and the government of the county was given to the high-sheriff, who was intrusted with unusual powers. Excursions for plunder became the occupation of the borderers on both sides of the frontier, and they alternately inflicted and endured the miseries of a state of war. Agriculture was neglected, and cattle became the chief property of the landowner. Castles and towers were erected in almost every part, and every habitation was constructed with a view to defence as well as residence. Resistance to the plunderers led to scenes of blood, and bloodshed laid the foundations of deadly feuds. The fierce and unsettled habits caused by such a condition continued till modern times. The inhabitants of the eastern border, toward Berwick-upon-Tweed, were first brought into a more peaceful way of life; but amid the wastes and fastnesses of the western side of the county the borderers only at a comparatively late period became assimilated to the rest of their countrymen.

The most important occurrences connected with the stirring history of Northumberland, from the Conquest to the early part of the 16th century, are the following:—The defeat and death of Malcolm Canmore, king of Scotland, while besieging Alnwick Castle, 1093, by Robert de Moubay, earl of Northumberland; the capture of William the Lion, king of Scotland, under the walls of Alnwick Castle in 1174; the destructive incursions of the Scots, 1296 and 1297, in retaliation for the cruelties of Edward I. after the storming of Berwick-on-Tweed; another Scotch invasion in 1314, after the battle of Bannockburn; the victory of the Scotch at Otterburn in 1387, when Hotspur was taken prisoner, and Earl Douglas, the Scotch commander, slain (this battle is supposed to have furnished the subject of the old ballad of 'Chevy Chase'); the battle of Homildon, or Humbleton, near Wooler, in 1402, where the Earl of Northumberland, his son Hotspur, and the Scotch Earl of March, defeated about 10,000 Scots under the Earl Douglas, who was taken prisoner; the defeat of an English army, 4000 strong, under Hotspur's son, at Pepperden, in 1436, by Earl Douglas at the head of 4000 Scots (this battle, and not the fight of Otterburn, has furnished, according to

some, the origin of the ballad of 'Chevy Chase'); the capture of Alnwick in 1462, and of Bamborough Castle in 1464, by Margaret of Anjou, whose forces were soon after routed at Hedgley Moor near Alnwick, and at Hexham.

In the reign of Henry VIII. a large body of Scots, under Lord Hume, were cut off, on their return from a marauding incursion into the county, at Millfield, near the bank of the Till, and a little south of Ford Castle (1515). The king of Scotland, James IV., eager to revenge the defeat of his subjects, entered Northumberland the same year with 40,000 men, forced the garrison of Norham to surrender, and took and partly demolished Wark, Etal, and Ford castles. Meanwhile the Earl of Surrey advanced with an English army of about 30,000 men. The two armies met at Flodden, about two miles west of the spot where Hume, whose defeat the king desired to avenge, had been overthrown. The Scots were utterly defeated. James fell on the field, with the greater part of the brilliant train of nobles who had accompanied him, and probably about 15,000 men. Soon after the accession of James I. the office of lord warden of the marches fell into disuse, the garrison of Berwick was reduced, and the frontier lost its military character. It was long indeed before border feuds entirely died away; but they assumed the character of private quarrels or marauding expeditions. In the Great Civil War the inhabitants of the county generally joined the Royalist party.

Of the many centuries of strife and consequent misery this county contains many memorials. The ruins of Norham and Wark castles still overlook the Tweed, and those of Heton, Dudhowe, and Ford rise on the banks of the Till or its tributary streams. Norham is the most striking ruin: the walls of the keep are now reduced to a mere shell; the keep is a square tower of four stories above the vaults, built of red freestone very liable to decay. The outworks have been demolished, and part of the hill on which the castle stands has been washed away by the river. Two towers of Ford Castle remain incorporated in a more modern building.

Bamborough and Dunstanborough castles are on the coast. [BAMBOROUGH.] Dunstanborough Castle is protected by steep cliffs on the north and east sides; on the south and west sides it was defended by a wall and towers, which are for the most part yet standing. There are also remains of a chapel. The entrance gateway on the south side is yet standing.

In the interior of the county are ALN Wick and Warkworth castles, which have been described elsewhere. Of Callaley Castle, near Whittingham, the western tower is of great antiquity; the rest of the building is more modern. Bothall Castle on the Wensbeck, Mitford, Belsay, and Harnham castles, are all near Morpeth. The picturesque ruins of Bothall, which consist chiefly of the gateway, with its flanking towers, and the outer wall of the court in which the keep stood, are on an eminence on the bank of the river. There are considerable remains of Langley Castle near Hexham, and ruins of Blenkinsop, Bellester, Thirwall, and Featherstone castles, near Haltwhistle; of Staward Castle on the banks of the Allen; and of Prudhoe Castle, the ancient seat of the Umfravilles, on the south bank of the Tyne, between Newcastle and Hexham. This last is one of the finest ruins in the county; it stands on a precipitous bank of the river 60 feet high. The gateway, a lofty embattled square tower, the outer wall, and the keep, are yet standing; and there are ruins of the chapel and other buildings. The hostility to which the county was exposed rendered it necessary for the smaller proprietors to have their dwellings strongly built; their habitations were towers, with the basement vaulted to shelter the cattle of the neighbourhood. Whitton Tower, near Rothbury, now converted into a rectory-house, may be taken as a specimen of these fortified dwellings. The walls are 11 feet thick at the foundation, 9 feet in the kitchen, and 6 feet in the chambers over it. In the basement vaults is a deep well. Remains of similar towers occur in different parts of the county.

The chief ecclesiastical antiquities of the county are noticed under the towns before referred to. Of Hulne Abbey, for Carmelite friars, close to Alnwick, there are some remains. Of Brinkburn Augustinian Priory near Rothbury, the tower of the church, part of the side walls, and several pillars and arches, remain. They contain various examples of transition from the Norman to the early English styles. There are several ruined churches in different parts of the county.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851 there were then in the county 488 places of worship, of which 198 belonged to four sections of Methodists, 154 to the Established Church, 68 to Presbyterians, 20 to Roman Catholics, and 14 to Independents. The total number of sittings provided was 136,066. The number of Sunday schools was 359, of which 181 were conducted by Episcopalians, 115 by Methodists, 55 by Presbyterians, and 18 by Independents. The number of scholars was 29,657. Of day schools there were 642, of which 301 were public schools with 24,765 scholars, and 341 were private schools with 12,524 scholars. There were 22 evening schools for adults, with 629 scholars. Of literary and scientific institutions there were 40, with 3688 members, and 58,575 volumes in the libraries belonging to them.

Savings Banks.—In 1853 the county possessed seven savings banks, at Allendale, Alnwick, Berwick-upon-Tweed, Hexham, Morpeth, Newcastle-upon-Tyne, and Tyne-mouth. The total amount owing to depositors on November 20th 1853 was 669,975*l.* 1*9s.* 9*d.*

NORTHUMBERLAND STRAIT. [NORTH-WEST PASSAGE.]

NORTHWICH, Cheshire, a market-town and the seat of a Poor-Law Union, in the parish of Great Budworth, is situated on the banks of the Weaver, near the confluence of that river with the Dame, in 53° 16' N. lat., 2° 30' W. long., distant 17 miles E.N.E. from Chester, and 174 miles N.W. from London. The population of the township of Northwich in 1851 was 1377. The living is a perpetual curacy in the archdeaconry and diocese of Chester. Northwich Poor-Law Union comprises 60 parishes and townships, with an area of 65,445 acres, and a population in 1851 of 31,202. The high road from London to Liverpool passes through the town, and is there intersected by the road joining Manchester and Chester. Many of the houses in the town are of considerable antiquity. The church is large, and chiefly remarkable for its semicircular chancel. The Wesleyan and Primitive Methodists, Independents, and Baptists, have places of worship. There are a National school, a school with a small endowment, and a savings bank. A county court is held. Both the salt-mines and brine-springs are believed to have been wrought during the occupation of Britain by the Romans. At present these mines are exceedingly productive. The brine-springs are usually met with at from 90 to 120 feet beneath the surface. The salt is conveyed to Liverpool by the rivers Weaver and Mersey. The Grand Trunk Canal, uniting the rivers Trent and Mersey, passes the town on the north. Ship-building, rope- and sail-making, brick-making, iron and brass founding, and brewing, are the principal sources of employment. The market-day is Friday; fairs are held April 10th, August 2nd, and December 6th.

NORTON. [DURHAM.]**NORWALK.** [CONNECTICUT.]

NORWAY, a country in Europe which comprehends the western portion of the Scandinavian peninsula, extends from 58° to 71° N. lat. Its most southern point, Cape Lindesnaes, is in 57° 58' N. lat., and the most northern, Cape Nordkyn, in 71° 8' N. lat. It lies between 5° and 28° E. long. Its length is about 1100 miles, but its width varies: the width is greatest near 61° N. lat., where it is about 250 miles wide, and smallest between 67° and 68° N. lat., where the deep inlets of the sea terminate at a distance of less than twenty miles from the boundary of Sweden. Its area is 122,711 square miles, and its population at the end of 1845 was 1,328,471. On the north and west it is surrounded by the North Atlantic, and on the south by the North Sea and the Skagerack. East of it is Sweden, and towards the northern extremity Russia.

By far the greatest part of this extensive country is covered with mountains, which constitute an immense rocky mass, called in the southern part *Norraka Fiellen*, and in the northern *Kiölen*. [NORRKA FIELLEN.] From near *Trondhjem* (63° N. lat.) to the north cape the mountains generally cling to the coast, and form a ridge of comparatively narrow width; but southward from the *Trondhjem* Fiord they expand so as to cover by far the greater part of the breadth of Norway. The *Kiölen* Mountains form a range diminishing in height as it goes northward, broken by many depressions, but distinguished by summits of noble forms, though their absolute elevation is nowhere very great. The highest part of the range is the mass of *Sulitelma* (66° 1' N. lat.), the highest mountain in the Arctic circle. This range is 4906 feet high, but is surmounted by several summits, of which the highest towards the north is 6200 feet above the level of the sea, and the southern 5518 feet. It is covered with vast snow fields, from which descend glaciers of great width. [NORRKA FIELLEN.] On the eastern declivity of the *Kiölen* Mountains there is a remarkable chain of lakes, one or more of which occur upon almost every river that runs from it into the Gulf of *Bothnia*: they are nearly equidistant from the west coast, and occur at a pretty uniform level of 1200 to 1500 feet, showing a remarkable symmetry in the fall of the ground nearly through the whole peninsula.

In the southern division the mountains do not form a ridge, but consist of elevated barren table-lands of great breadth and almost perfectly level, generally more or less connected together, though occasionally separated by deep narrow valleys. These flat-topped mountains are called *Fjelds*, which in their highest and most expanded parts are distinguished by specific names. The chief of them proceeding from south to north are the *Hardanger-Fjeld*, the *Fille-Fjeld*, the *Sogne-Fjeld*, the *Horungerne*, the *Ymes-Fjeld*, the *Lange-Fjeld*, and the *Dovre-Fjeld*. The *Sneehättan*, the most elevated point of the *Dovre-Fjeld*, was formerly considered the highest hill in Norway (7487 feet), but it is exceeded by the *Skagtolstund* (8000 feet) and other summits of the *Horungerne*, and by the *Ymes-Fjeld*, which lies farther east, and rises to 8400 feet above the sea, being the highest known point in the Scandinavian peninsula. About 40 per cent. of the whole surface south of the *Trondhjem* Fiord exceeds 3000 feet above the sea. The average height of the mountain table-lands is about 4000 feet. The ratio of arable land to the whole area of Norway is not more than 1 to 10; and if we exclude the local enlargements of the places near *Christiania*, *Christiansund*, and *Trondhjem*, the ratio would not exceed 1 to 100. (Professor *Forbes*, 'Norway and its Glaciers.') About one-tenth of the surface rises to the height of 800 feet, and perhaps about one-thirtieth part is below 300 feet. The lowest tract, that which does not rise to 30 feet, is situated on both sides of the Bay of *Christiania*. The more elevated country, that which rises to between 300 and 800 feet, partly surrounds this low tract, and partly extends along the shores of the *Skagerack*, or incloses the Bay of *Trondhjem* on the south and east.

Cultivation is nearly limited to these two regions. In all the other parts of the country cultivation occurs only in the narrow valleys by which the rocky masses are indented. A large portion of the mountain masses is always covered with snow, and glaciers in many parts occupy the depressions in the high table-lands, and the heads of the valleys in which the numerous *Fjords* that indent the western coast terminate. The *Suphelle* glacier in the eastern valley at the head of the *Fjaerlands-Fjord* is the lowest in Norway proper, being only 105 feet above the sea, but the glaciers of the *Jökuls-Fjord* in *Finnmarkens* are much lower, in some instances reaching to the very shore. As to the nature of the lower country see *CHRISTIANIA*; *CHRISTIANSUND*; and *TRONDHEJEM*. A railway connects *Christiania* with *Lake Mjösen*; the lake itself is navigated by steamers.

As all the rivers of this country rise at a great elevation above the sea, and have a comparatively short course, they are not fit for navigation. Some of them however are used to float down timber, at least in a part of their course. The largest of these rivers is the *Glommen* Elf, which rises near 62° N. lat., on the declivities of the *Rute Fiell*, and after traversing the *Lake of Oresund*, which is nearly 15 miles long, about 3 miles wide, and 2400 feet above the sea, passes near the town of *Röraas*, and running in a south-south-western direction skirts the base of the high peak of the *Tron-Fiellet*, which is nearly 3600 feet high, and then turning nearly south it enters the cultivable region, in which it continues its southern course to *Kongsvinger*. At this place it turns abruptly to the west, but after running a few miles in that direction it again changes to the south-south-west, and passing through the *Lake of Oiern*, which is 15 miles long and about 3 miles wide, it enters the *Skagerack* near *Fredrickstadt*. The last of its numerous cataracts occurs near *Hafslund*, about 10 miles from its mouth; it is called the *Sarpe Foss*, and is 60 feet high. Below this place the river is navigable for large boats. It is remarkable that during the high floods, after the melting of the snow in spring, a part of the water of this river is discharged into *Lake Wenern* in Sweden, by the *Wrangs* Elf, at the sharp turning of the river near *Kongsvinger*. The whole course of the *Glommen* probably exceeds 400 miles. Below *Kongsvinger* it is joined by the *Wormen* Elf, the outlet of *Lake Mjösen*, which receives its waters from the mountain plain lying south-west of the *Sneehättan* by the river *Lougen*. This river originates in a series of small lakes, called *Lessöevarks Vand*, west-south-west of the *Sneehättan*, which are more than 2000 feet above the sea, and discharge their waters by two outlets, the *Romsdals* Elf, which runs north-west, and the *Lougen*, which flows south-east. After a course of nearly 150 miles the *Lougen* enters *Lake Mjösen*, which is nearly 60 miles long, and from one to more than five miles wide; it is more than 420 feet above the sea-level, and lies in the middle of the best cultivated portion of Norway. The *Wormen* Elf runs about 20 miles with a gentle current. The *Drammen* Elf originates on the eastern declivity of the *Norraka Fiellen* in two branches, the *Beina* Elf and the *Snarum* Elf. After a rapid course of more than one hundred miles the two branches unite about forty-five miles above their influx into the Gulf of *Christiania*, into which the *Drammen* Elf enters by a wide estuary called the *Drammen* Fiord. Much timber is floated down this river.

The other rivers remarkable for the length of their course are—the *Louvan* Elf, the *Skeem* Elf, and the *Otter*, or *Torrisdals* Elf, which run from 120 to 150 miles each; and, like the *Glommen* Elf and *Drammen* Elf, fall into the *Skagerack*. No considerable river falls into the Atlantic south of the *Namsen* Elf, which has its mouth between 64° and 65° N. lat., and runs nearly one hundred miles through a well-wooded valley. The *Alten* Elf falls into the *Alten* Fiord, near 70° N. lat. It runs northward about one hundred miles, first through an inclined plain, but against the declivity of the plain, so that its bed sinks lower and lower below the surface of the country as it proceeds farther north. In the lower part of its course it crosses the *Kiölen* Mountains by an exceedingly deep and narrow valley, which at last becomes a mere fissure, into which no person has yet been able to penetrate. It issues from this fissure by the cataract of *Pursorunka*, 15 miles from its mouth. [ALTEN.] The *Tana* Elf, which for the greatest part of its course forms the boundary-line between Norway and Russia, originates east of the source of the *Alten* Elf, and descends from a plain which declines towards the north-east, in which direction the river flows more than two hundred miles, until it approaches the *Varanger* Fiord, where it suddenly turns to the north and falls into the *Tana* Fiord, after a course of nearly three hundred miles. It is the least rapid of the rivers of Norway, but it flows through so sterile a region as to be entirely useless.

Norway, like a huge breakwater, defends Sweden from the tremendous force of the North Atlantic Ocean, and the state of its western coast with its rugged outline, the depth of its fjords, the boldness of its headlands, and the multitude of its islands, prove the long continuance of the struggle. Towards the north it has been observed that the sea sweeps along the very base of the mountains; but towards the south, where enduring crystalline rocks have borne the whole brunt of the wash of the sea, there is a considerable expansion of coast, though it is rent and torn by narrow bays of great length. These inlets of the sea; some of which in several places extend 70 or 80 miles inland, would be of great advantage if the adjacent country possessed only a moderate degree of fertility. But on the shores of these inlets, with

very few exceptions, high and bare rocks rise above a thousand feet; they are flanked however by the only habitable places along the western coast, and they abound in fish. The fiords of Christiania and Trondhjem are an exception, being surrounded by fertile tracts of considerable extent. The other inlets, which are remarkable for their extent, are the following, from south to north.

Bukke Fiord is wide at its entrance, and penetrates by two of its branches more than fifty miles inland. Hardanger Fiord is about seventy miles long; Søgne Fiord, which is narrow, and 120 miles long, reckoning to its extremity the Lyster Fiord, is surrounded by the highest region of the Norraka Fiellen. There is a great number of narrow deep fiords between Søgne Fiord and Trondhjem Fiord, and of bays farther north. The largest and widest occur at the northern extremity, where the Porsanger Fiord is above one hundred miles long and twenty miles wide on the average. The Laxe Fiord, Tana Fiord, and Varanger Fiord are considerable, but of less extent. The fiords, with their continuous screen of precipitous cliffs, the number and singular forms of the rocks and islands, the frequent appearance of perpetual snow, and the close approach of glaciers to the sea, superadded to noble cascades and luxuriance of vegetation, form the most distinguishing features of Norwegian scenery in summer. The deep valleys, which may be considered as a prolongation of the fiords, abound every where with running waters, formed by small streams that trickle or leap down from the edges of the fields or great table-like tops of the mountains. The most remarkable waterfalls are enumerated in the article NORRASKA FIELLEN.

Numerous lakes occur in the southern districts of Norway, on the eastern declivity of the Norraka Fiellen. Many of them are more than 2000 feet above the sea-level, and all of them are very deep. Lake Fämund, near the boundary of Sweden, is 2280 feet above the sea-level, and extends in length more than seventy miles, with an average width of more than three miles. From its southern extremity issues a river, which, under the name of Klar Elf, falls into Lake Wenern in Sweden.

The climate differs considerably in the different districts of a country which extends over 13 degrees of latitude, and on both sides of the polar circle, and also rises in the largest part of its surface to a mean elevation exceeding 2000 feet above the sea. Norway, says Professor Forbes, enjoys an average climate superior to that of any other continental country in the same latitude. The harbour of Bergen is not oftener frozen than the Seine at Paris, while the harbours of Lübeck and Copenhagen are frequently blocked up with ice. Drift ice, which is occasionally seen off the coast of North America in 41° N. lat., is unknown on any part of the Norwegian coast, though it extends to 71° N. lat. The influence of the sea and the Gulf Stream seem to cause this comparative moderation of the climate in the west of Norway. The eastern side of the Scandinavian peninsula has a continental and much colder climate. Between 60° and 62° N. lat. the snow line near the coast is about 4300 feet high; towards the centre of the country it rises to 5300 feet. In 67° N. lat. the line falls in the interior to 3700 feet, and on the coast to 2900 feet. On the west side of the Sulitelma the snow line is 3410 feet, and on the east or Lapland side 3520 feet high. The mean temperature of Christiania is 42° Fahr., or not quite 8 degrees less than that of London. It is probable that in the valleys near Cape Lindesnaes, where the beech grows to a stately tree, the mean temperature is higher. At Bergen it is 46° 7', and even at Trondhjem it is 40°. The difference in the mean temperature between Christiania and Bergen may be chiefly attributed to the difference of temperature of the winter, which is severe on the eastern declivity of the Norraka Fiellen and the adjacent countries, but very mild along the western coast, for the reason above given, and on account of the prevailing western winds and frequent fogs. This is evident from the following table:—

	In Winter.	Mean Temperature.		
		Spring.	Summer.	Autumn.
Christiania . . .	+ 25	+ 38	+ 60	+ 42
Bergen . . .	+ 36	+ 45	+ 58	+ 48
Trondhjem . . .	+ 24	+ 35	+ 61	+ 40
North Cape . . .	+ 24	+ 30	+ 42	+ 32

The mean temperature of North Cape is 32°, or the freezing point, but the winter is not more severe than at Trondhjem. The greatest cold at North Cape is felt when north-easterly winds blow, but the sea is always open, and the drift-ice from Spitzbergen does not approach the coast. The violence of the winds however renders this spot nearly uninhabitable. More than two-thirds of the year are boisterous, and in autumn and winter the storms are incessant, and rage with incredible fury. On the approach of winter the snow-storms frequently last for many days and weeks. They are preceded by heavy fogs, which advance from the ocean in immense masses, like impenetrable walls or moving bodies of water; but they occur only during westerly winds. The weather is fine and clear when the wind blows from the east. The longest day lasts from the 15th of May to the 29th of July, which is two months and a fortnight; the longest night, from the 19th of November to the 26th of January, which is two months and ten days. During the long nights the aurora borealis shines with uncommon brightness, so that the fishermen are enabled to carry on their ordinary occupation just as well as by daylight. (Von Buch.) Gales

are very frequent along the whole of the western coast. Thunder-storms are as common there in winter as in summer, but north of 66° thunder-storms do not occur. No traces of volcanic action are known to exist, except that lava occurs on an island not far from Bergen, and on a mountain in the Bukke Fiord fire is said to appear sometimes. Earthquakes occur, though rarely.

Productions.—The forests constitute the principal wealth of Norway. Beech occurs only south of 59½ N. lat.; oak, elm, and lime-trees as far north as 63°; apples, cherries, and prunes are found as far as 64°, but they do not ripen every year. Gooseberries and hazel-nuts extend to 65° N. lat., and so far oats, peas, beans, and flax are cultivated where the ground admits of it. Hemp and rye are grown to 66° N. lat., and the ash and spruce-fir reach this point. Pines grow as far as 67° N. lat., but north of 67° only birch and juniper grow, and only barley and potatoes are cultivated. Extensive forests of fir and pine cover the eastern declivity of the Norraka Fiellen, and a great part of the hilly and rocky country east of the range; and it is from these regions that the greatest part of the timber is brought to the sea. On the lower country along the Bay of Trondhjem, and in the valley of the river Namsen, there are also great forests of fir and pine. Though agriculture is not neglected, the produce of the crops is not sufficient for home consumption.

Cattle and goats are numerous, but sheep are rare. The horses are of a small size in the southern districts, but larger to the north of Trondhjem: they are strong and hardy. Bears, wolves, foxes, gluttons, ermines, as well as rein-deer, elks, deer and hares abound. The lemming exists in great numbers, and in its migrations destroys every plant in its way. Different kinds of sea-fowl abound along the northern coasts, and their eggs constitute the principal food of the inhabitants of some districts during a part of the year. In these parts the eider-duck is numerous, and the feathers are of great value for beds; a small quantity of them are exported. The sea furnishes the principal means of subsistence to the inhabitants of the western coasts; cod and herrings are most abundant, and this fishery gives occupation to many families. [BERGEN.] Salmon abounds, and is finer than in any other country in the world. Lobsters are found in the greatest abundance on both sides of Cape Lindesnaes. The geological structure and mineral productions are given under NORRASKA FIELLEN. Salt is made from sea-water at some places along the Skager-rack, but not in sufficient quantity for home consumption.

Inhabitants.—The Norwegians are of Teutonic origin, and speak a language which differs very little from the Swedish. In the most northern districts, north of 69° N. lat., there are many families of Finlanders and Laplanders: the former are here called Quäna, and the latter Finners. The Quäna cultivate barley and potatoes, and rear cattle. The Finners are mostly fishermen, except a certain number of families who live on their herds of rein-deer.

Political Division, Population, Manufactures, &c.—Norway was from an early period divided into four bishoprics—Christiania, Christiansand, Bergen, and Trondhjem. Under the Danish dominion a civil governor, called Stifthauptmann, was appointed for every bishopric. The bishopric of Trondhjem has been divided into two, Trondhjem and Nordland; but both continue to constitute one civil administration. Norway is subdivided into 17 districts, the area and population of which are as follows:—

Districts.	Area in Square Miles.	Population in 1845.
Smaalehønes . . .	1,663	73,622
Aggerhuus . . .	2,004	109,432
Hedemarkens . . .	10,303	87,118
Christians . . .	10,396	102,730
Buakeruds . . .	5,746	83,918
Jarlsberg and Laurvigs . . .	886	63,070
Bradsbergs . . .	5,383	72,891
Nedensæns . . .	4,603	53,932
Mandals . . .	2,056	61,918
Stavanger . . .	3,521	78,210
S. Bergenhuus . . .	5,781	116,989
N. Bergenhuus . . .	6,713	77,978
Romsdals . . .	6,001	81,214
S. Trondhjem . . .	7,159	89,329
N. Trondhjem . . .	8,769	66,570
Nordlands . . .	14,550	65,512
Finmarkens . . .	27,186	43,938
Total . . .	122,720	1,328,471

Less than half the population gain their subsistence by cultivating the ground; the remainder employ themselves chiefly in the fisheries, forests, and mines. Saw-mills, the erection of which is much facilitated by the rapid course of the various rivers, are very numerous. There are also several iron- and copper-works, potash-factories, glass-works, powder-mills, nail-forges, and salt-manufactories. Linens and coarse woollen-cloths are made by the country people for their own use. In Christiania and Trondhjem there are some manufactures of cloth, cotton stuffs, and tobacco; there are also a few sugar-refineries and tanyards. Ship-building is carried on in most of the towns along the coast.

The foreign commerce is considerable; the greatest part of the produce of the forests, the fisheries, and mines is exported to Great Britain, Spain, the Mediterranean, and partly to the Baltic. Iron is not exported, there being hardly sufficient for home consumption, but copper and cobalt are exported to Hamburg and Holland. The chief items of export are—planks, deals, masts, tar, fire-woods, salt-herrings, cod, and lobsters; the minor articles are—furs and eider-down. This commerce is almost entirely carried on in Norwegian vessels. The inhabitants are excellent seamen, a great number of them being occupied during the greatest part of the year, and during the coldest season, in fishing off the Lofoden Islands. A large number of Norwegian vessels are engaged in Swedish commerce.

History and Constitution.—The Norwegians first appear in history as pirates, who frequently visited and laid waste the countries bordering on the North Sea. Norway was then governed by a great number of small princes, whose ambition led them to continual wars. They discovered and settled Iceland. In the second half of the 9th century (875) the small kingdoms were united under king Harold Harfagra, and from that time they became still more troublesome to their neighbours, until Norway was connected with Denmark, and then the Norwegians accompanied Sven and Knut to the conquest of England. But the two kingdoms were soon separated again, and remained so till 1387, when Margaret became queen of Denmark and Norway. From that time till 1814 both countries remained united, and Norway was administered by a governor appointed by the king of Denmark. By the convention of Kiel, agreed to on the 14th of January, 1814, between Denmark and Sweden, Norway was ceded to the king of Sweden. A Danish prince, Christian Frederick, who was governor of Norway at that time, and had succeeded in gaining the affections of the nation, made an attempt to constitute Norway a separate kingdom; but the Swedes entered the country with an armed force, and the prince, who had assumed the title of king, was obliged to abdicate the royal dignity on the 7th of October. On the 20th of the same month the union of Norway and Sweden was determined in the Storting, and the constitution received its present form on the 4th of November, 1814. On the 31st of July, 1815, it was promulgated as the fundamental law of the country, and was assented to by the Swedish legislature on the 6th of August.

The legislative body, or Storting, is composed of the representatives of the people: they are not however elected immediately by the people, but by electors who are chosen by the citizens. In the cities 50 citizens, and in the country 100 citizens, elect one elector. The electors unite and choose the representatives either from among themselves or other persons. The number of the representatives must not be less than 75 nor above 100: two-thirds must be chosen by the electors of the country, and the remaining third by those of the cities. The king or his lieutenant opens the Storting, immediately after which it separates into two bodies, the Lagthing (or legislative body) and the Odelething (assembly of landed proprietors). The Lagthing consists of one-fourth of the members of the Storting chosen by the whole assembly. The Storting is empowered to abolish old and to enact new laws, to impose taxes or abolish or change them, to determine the civil list of the king and the salaries of the persons employed by government, &c. Every bill must originate in the Odelething; it may be proposed by a member or by one of the state councillors. When the bill has passed, it is brought into the Lagthing, which may adopt or reject it. When a bill has passed the legislative bodies it is sent to the king, whose signature (if he affix it, for he has the power of refusal), gives it the force of law. The king must sign a bill that passes three successive Storthings. The Storting meets once in three years, on the 1st of February, and the session cannot last more than three months. The members are only chosen for one Storting. The order of nobility was abolished in 1821, a bill having passed in three Storthings for the purpose.

The executive power is vested in the king. There is a Norwegian ministry composed of the governor of the kingdom, a minister, and councillors of state. When the king is not in Norway the minister and two of the councillors are with him, and the others, who remain in Norway, govern the country in conjunction with the governor, who must not be a Norwegian, but may be a royal prince, in which case he is called viceroy. All the other members of the ministry must be Norwegians. When the king has informed the Norwegian government of his intention to declare war he assembles the Norwegian and Swedish councillors of state, explains to them the motives which compel him to take such a step, and asks their opinion. The opinion of each member is taken down in writing, and the decision of the matter is left to the king.

The annual expenses, according to the budget for 1851-54, are fixed at 3,200,000 crowns of five francs each. The customs dues amount to about 2,000,000 crowns a year. The public debt in 1849 amounted to nearly 10,000,000 crowns. The army in time of peace numbers 23,484 men, including 9160 national guards. The fleet consists of 4 frigates, 4 corvettes (1 propelled by a screw), 1 brig, 5 schooners, 5 steamers, and 136 gun-boats.

(Von Buch, *Travels through Norway*; Everest, *Journey to Norway*; Laing, *Residence in Norway*; Schubert, *Reise durch Schweden, &c.*; Forbes, *Norway and its Glaciers.*)

NORWICH, a city and county of itself, and capital of the county

of Norfolk, a municipal and parliamentary borough, is situated in 52° 38' N. lat., 1° 17' E. long., distant 108 miles N.E. from London by road, and 126 miles by the Eastern Counties railway. The population of the city in 1851 was 68,195: it is governed by 16 aldermen and 48 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Norwich. For Poor-Law purposes the city of Norwich is managed under a local act; it contains 43 parishes, with an area of 4325 acres.

Norwich is not mentioned in history before the time of the earlier Danish invasions: It appears to have risen gradually from the decay of Caister, or Castor St. Edmund's, now an inconsiderable village about 3 miles S. from Norwich. Caister was first a British and then a Roman town under the name of Venta Icenorum. It is thought by some that during the time of the Romans the site of Norwich was covered by water, and that by the gradual accumulation of alluvial matter islands were formed. It is probable that even as late as the period of the Norman conquest what is now the lower part of the city consisted of such islands. During the existence of the separate kingdom of the East Anglians their kings had erected, upon what was then a promontory and is now the Castle Hill, a royal fortress; and merchants and fishermen sought the protection of the castle, and thus formed a town which, from its situation relative to their former town (Venta), obtained the name of North-wic, the northern station or town. Norwich became a place of some importance under the Anglo-Saxon princes, and had a mint. In the invasion of the Danes under Sweyn, in 1004, Norwich was taken and much injured by them. It was in the time of Edward the Confessor a flourishing town, having 1320 burgesses and 25 parish churches. In the Conqueror's time the constablership of the castle, with the earldom of Norfolk, was conferred on Roger Bigod, to whom the erection of the present keep has been ascribed. In 1094 the bishopric of the East Angles was removed from Thetford to Norwich, and the foundations of the cathedral were laid by Herbert Losinga, or Losinga, the bishop. Henry I. granted the citizens a charter in 1122, and soon after this the Flemings began to settle here, and introduced the worsted manufacture. In the time of John, Roger Bigod having joined the insurgent barons, Norwich Castle was seized by the king. In 1267 the barons took and plundered the place, and did great damage. The city was afterwards strongly fortified. The walls were embattled, and 12 gates and 40 towers were constructed in them. In the reign of Edward III. the Flemings settled here in considerable numbers. In the reign of Richard II., in 1381, the popular tumults which agitated nearly the whole country broke out in Norfolk, and the mob entering Norwich, and being headed by John the Lister, or Dyer, committed great outrages, until they retired to North Walsham, on the approach of Henry Spencer, the warlike bishop of Norwich. In 1403 Henry IV. separated the city of Norwich from the county of Norfolk, and made it a county of itself. In the reign of Edward VI., in 1549, the city suffered from the rebels under Ket, the tanner of Wymondham. In the earlier years of Elizabeth's reign about 4000 Flemings settled at Norwich, and much increased the prosperity of the town by the introduction of the bombazine manufacture.

The county of the city of Norwich extends about four miles from north to south, and as many from east to west; the town itself is in the north-east part of this district, and extends about a mile and a half in length from north-west to south-east, and about a mile and a quarter in breadth. The streets are narrow and winding; some of them follow the line of the ancient walls, which are partly standing. The houses are much intermixed with gardens, so that Norwich has been designated 'a city in an orchard.' The market-place is 600 feet long by 340 feet wide. There are many good houses and shops; the best are in the market-place and its vicinity; in the precincts of the cathedral are large and handsome private residences. Considerable increase has taken place in the town during the last few years. The river Wensum enters Norwich on the north-west side, and winds partly through, partly round the town, until it leaves it on the south-east side: it is crossed by ten bridges in the town or close to it.

The most interesting of the public buildings are the castle and the cathedral. The site of the castle is considerably elevated. The whole of the works originally comprehended an area of not less than 23 acres. The inner ditch and the bridge over it still remain. In the ditch, which is inclosed and planted, stands a newly-erected shire-hall, in the Tudor style. The bridge is 150 feet long, and has one arch of about 40 feet span, which is one of the largest and most perfect examples of an Anglo-Norman arch remaining. There are remains of two round towers, part of the original gateway, at the inner end of the bridge. The keep is a substantial quadrangular building 110 feet 3 inches from east to west, including a small tower, through which was the principal entrance; from north to south it is 92 feet 10 inches; its height to the battlements is 69 feet 6 inches. The interior has been so much altered, in order to adapt it to the purposes of a jail, to which it has been long applied, that the original arrangement of the apartments can scarcely be traced. The keep, the entrance tower, and the eastern front have been to some extent restored.

The foundation of the cathedral was laid in 1094 by Bishop Herbert Losinga; succeeding bishops added to the building; the spire was erected by Bishop Percy in 1361. Losinga laid the foundations of a

Benedictine monastery at the same time as those of the cathedral; the monastery, of which a few traces remain, was completed in 1101. The cathedral consists of a nave with side-aisles, two transepts without aisles or columns, a choir occupying part of the nave and the area under the tower, a chancel with side-aisles, several chapels, a tower and spire at the intersection of the transepts with the nave, and a cloister, nearly perfect, on the south side of the church. The length of the building from east to west is 407 feet; the breadth at the transepts is 178 feet; the breadth of the nave and side-aisles is 72 feet. The cloisters, with the included space, form a quadrangle with the sides not quite parallel, but averaging about 176 feet each. The height of the tower and spire, with the weathercock, is 315 feet. The plan is almost wholly Norman; the east end has a circular apsidal termination, and some of the chapels are circular. In various parts of the building there is much Norman work of excellent character. The architecture of the nave is very bold, and the arches of the triforium are very large. There are various insertions of later styles: the spire is of decorated English or early perpendicular; the cloisters present a series of work from early decorated to perpendicular; and a considerable portion of the west front is of perpendicular character.

On the north side of the cathedral is the episcopal palace, a large and irregular edifice, built by different prelates; there are in the garden some remains of the ancient hall of the palace, now in ruins. Near the west end of the cathedral is the free school (formerly the chancel-house), containing some good ancient work; and not far off are two ancient gates—St. Ethelbert's Gate, of decorated English character, and the Erpingham Gate, of late perpendicular; both valuable specimens of their respective styles.

There are 36 parish churches in Norwich. Some of them are valuable specimens of ancient architecture. Those of St. Bennet, St. Ethelred, and St. Julian have round towers; these towers are usually considered to be of early Norman date, but their original openings have been so disturbed by alteration that their period and style cannot be exactly ascertained. St. George's, Tombland, has a square tower, with pinnacles, 120 feet high, which was rebuilt in 1445. The church of St. Michael Coslany is of mixed character; part is early English, and part of perpendicular character; in the latter the tracery mouldings and other embellishments are carved in stone, and the interstices filled up with flints. The churches of St. Andrew, St. George Colegate, St. Giles, St. John Sepulchre, St. Lawrence, St. Michael at Plea, St. Saviour, and St. Stephen are all handsome churches, of perpendicular character, some of them with lofty and elegant flint and stone towers. But the most conspicuous church is that of St. Peter Mancroft, a large and fine perpendicular church, with a lofty tower and handsome windows. The nave of the church belonging to the monastery of the Dominican or Black Friars is now the common hall of the city, called St. Andrew's Hall; the choir, long used as the Dutch or Walloon church, with the convent kitchen, dormitory, infirmary, and other parts, were lately used as a workhouse. St. Giles' Hospital (popularly the Old Man's Hospital) comprehends portions of the ancient church of St. Helen's.

The total number of places of worship in Norwich in 1851 was 80, of which 41 belonged to the Church of England, 10 to three sections of Methodists, 8 to Baptists, 3 to Independents, and 1 each to the Countess of Huntingdon's Connexion, Quakers, Swedenborgians, Roman Catholics, Mormons, Unitarians, and Jews. The Free Grammar school was the first foundation of King Edward VI.; it was founded in 1547. The school has an income from endowment of about 2000*l.* a year; it is under the charge of a head master and a second master, assisted by five other teachers. The endowment yields in all about 8000*l.* a year, which is chiefly devoted to the support of St. Giles' Hospital for old people. The number of scholars in 1853 was 95. There are National, British, and Infant schools; Diocesan, Training, and Model schools; schools supported by Independents, Unitarians, and Roman Catholics; and several well-endowed Charity schools. There are several libraries, one of which, designated the Norwich Public Library, contains about 20,000 volumes; a museum; a school of design; and other educational institutions. The Norfolk and Norwich Literary Institution has a valuable library of about 15,000 volumes, for which a fine new building has been erected.

The Guildhall is a large old building, erected in the 15th or 16th century, but since repaired and altered; it includes courts for holding the city assizes and sessions, and contains some good paintings and other articles of interest. The new city jail is a massive and appropriate building; there is also a bridewell. The shire-hall, in the castle ditch, is a brick building in the Tudor style cased with cement. The new county jail, in connection with the castle, is a commodious building. There is a cavalry barrack.

The most important trade of the town consists of the manufacture of silk and worsted into shawls, crapes, bombazines, damasks, camlets, and imitations of the Irish and French stuffs. The manufacture of mousselines de laine, challis, and other light cotton fabrics is an important part of Norwich industry. Iron-founding, agricultural-implement making, tanning, dyeing, brewing, malting, coach-making, and boot- and shoe-making are carried on. There are several powerful corn-mills. Markets are held on Wednesday and Saturday; the Saturday market is a great market for corn and cattle. There are three yearly fairs. The corn-market is held in a large Grecian build-

ing, the Corn Exchange, 96 feet by 85 feet, and 27 feet high; and the cattle-market is in an open area adjacent to the castle. There are also a fish-market, a market for seeds and skins, and a hay-market. Trade in agricultural produce, coal, and other heavy goods is carried on by means of the river, chiefly in lighters or wherries of from 15 to 20 tons burden. An entrance from the sea into the navigable channel of the Waveney, by Lake Lothing, and a ship-canal from the Waveney to the Yare or Wensum, facilitate the approach of sea-borne vessels of small tonnage. There is another short canal near Norwich. These various cuts, with the river, are navigable for vessels not exceeding 10 feet draught of water. The harbour, lock, and sluice at the sea-entrance of this navigation are extensive works. The assizes and quarter-sessions for the county of Norfolk are held at Norwich. A county court is held in the city.

The benevolent institutions and charities are very numerous. The Norfolk and Norwich Hospital, a large building of red brick, erected in 1771, can receive above 100 patients. It is partly supported by a triennial musical festival in St. Andrew's Hall. The Norfolk and Norwich Lunatic Asylum is at Thorpe, about two miles from the city. There are a dispensary, an eye-infirmary, the Bethel hospital for poor lunatics, an asylum and school for the blind, and several hospitals or almshouses for the indigent—St. Giles' hospital, the Boys' and Girls' hospitals, and Doughty's hospital, are the chief of these. There is a savings bank.

The see of Norwich is in the province of Canterbury. The diocese includes Norfolk and parts of Suffolk, and comprises 911 benefices. It is divided into the archdeaconries of Norwich, Suffolk, and Norfolk. The chapter consists of the dean, 3 archdeacons, 4 canons, 14 honorary canons, 5 minor canons, and a chancellor. The income of the bishop is fixed at 4600*l.* a year.

NORWICH, U. S. [CONNECTICUT.]

NORWOOD. [SURREY.]

NOSSA SENHORA DE DESTERRO. [BRAZIL.]

NOTLEY, BLACK. [ESSEX.]

NOTTINGHAM, the county town of Nottinghamshire, a county in itself, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the left bank of the river Lene, about a mile N. from the Trent, in 52° 57' N. lat., 1° 8' W. long., distant 124 miles N.W. by N. from London by road, and 130½ miles by the North-Western and Midland railways via Rugby. The population of the borough in 1851 was 57,407. The borough is governed by 14 aldermen and 42 councillors, and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Nottingham and diocese of Lincoln. Nottingham Poor-Law Union contains the three parishes of the town, the area being 1870 acres.

Nottingham was included in the kingdom of Mercia. It was taken by the Danes, to whom it was confirmed by the treaty between Alfred and Guthrum about 880. William the Conqueror built a strong castle here. In the troubles of Stephen's reign the town was taken and burnt by the partisans of the empress Mand. In the troubles of the reign of Richard I. the castle was an object of contest: in those of the reign of John it was held throughout by the king. In 1330 Roger Mortimer, the favourite of Queen Isabella, was seized in Nottingham Castle. Charles I. set up his standard at Nottingham in August 1642; but the place came next year into the hands of the Parliament, who garrisoned the castle, of which Colonel Hutchinson (whom the 'Memoirs' of his lady have made so well known) was governor. During the Protectorate the castle was dismantled; and after the Restoration the old building was replaced by the present one, which has nothing of a castle but the name. It was built by the Duke of Newcastle, into whose possession the property had come by purchase, and it now belongs to the present duke. The only later occurrences of any importance have been the 'Luddite' disturbances in 1811-12, and the riot arising out of the political excitement of 1831, on which occasion the castle was burnt by the rioters.

The town is built on a slope which commands an extensive view of the Vale of Trent. The streets in the central and more ancient parts of the town are narrow and crooked; but considerable improvements have taken place of late years, and several spacious streets of good modern houses have been built. The market-place covers an area of about 5½ acres, and is surrounded with lofty buildings, under the first floor of which a piazza is formed. A handsome line of street, called Albert-street, leads from the market-place to the railway station. A large area, hitherto held as common ground, has been inclosed for building purposes. About 18 acres have been formed into an arboratum, and laid out and planted in an ornamental manner; the margin of the ground is to be occupied by terraces of handsome houses. The arboratum was opened May 11th 1852.

There are several bridges in the town over the arms of the Lene or over the Nottingham Canal; and about a mile S. from the town is Trent Bridge, of 19 arches, over the Trent, a very ancient structure. Connected with this bridge are a causeway over the meadows and an embankment to protect the lower part of the town in the time of floods. There are also railway bridges over the Trent, and a fine road bridge over the railway, and some adjacent meadow land. The Trent is here about 200 feet wide. The environs of Nottingham are very pleasant. Several caverns, or rooms, cut out of the rock on which Nottingham stands, have been converted into cellars and store-rooms.

Among the principal buildings are the New Exchange, at the east end of the market-place, a brick building erected early in the last century, and repaired in 1814. The lower part is appropriated to shops, behind which are the shambles; the upper part contains a suite of noble rooms for the transaction of public business or for assemblies. The County-Hall, rebuilt in 1770, is a commodious and handsome building, with two convenient courts and apartments for the judges, jury, &c. The Town-Hall is a spacious edifice, of which the town-jail forms the ground-floor. The House of Correction is built upon the site of a convent of Hospitallers of St. John of Jerusalem. There are a new post-office; a small theatre; a grand-stand on the race-course, which is to the north of the town; extensive cavalry barracks in the castle park; and a building erected as a riding-house for the yeomanry, and now used as a circus or for other public amusements.

St. Mary's church, a commodious edifice, stands on high ground in the central part of the town. It is a large cruciform church, with a fine tower at the intersection of the nave and transepts, rising two stages above the roof of the church, crowned with battlements and eight crocketed pinnacles. The number of places of worship in Nottingham in 1851 was 37, of which 8 belonged to the Established Church, 7 to Methodists, 7 to Baptists, 5 to Independents, 2 to Roman Catholics, and one each to Quakers, Moravians, Swedenborgians, Irvingites, Unitarians, Jews, and Mormons. The number of sittings provided in all was 11,484. The Roman Catholic chapel is a handsome stone building in the early English style, erected in 1841; it has a tower surmounted with a spire 164 feet high. The Free Grammar school, founded in 1513, which has an income from endowment of about 1000*l.* a year, had 93 scholars in 1851. There are several National, British, and Infant schools; schools supported by Roman Catholics and Unitarians, a government school of design, a Blue-Coat school, a Charity school for boys, a school of industry for girls, several libraries, a mechanics institute, a natural history society with a museum, and a savings bank. Plumtree Hospital for poor and aged widows, Collins's Hospital for 24 aged widowers or widows, Lambly Hospital for decayed burghesses or their widows, with several other hospitals or alms-houses, are among the charitable foundations of the town. The general hospital on Standard Hill, and the county lunatic asylum, are spacious buildings. There are also a general dispensary, the Midland Institution for the Blind, and public baths and wash-houses.

The principal manufactures carried on at Nottingham are those of bobbin-net and lace, and cotton and silk hosiery. There are several mills for spinning cotton- and woollen-yarn, and for throwing silk, and much cotton-yarn is obtained from the mills of Derbyshire. The machines for making bobbin-net and lace, which are very expensive, are let out at a weekly rent to the workmen by capitalists, who invest a considerable sum in this kind of property. Steam-power has been extensively introduced into this manufacture, and the number of factories has been increased, both in the lace and the hosiery departments. There are several dye-houses; also white-lead works and an iron-foundry. Wire-drawing, pin-making, and the manufacture of brass fenders are carried on to some extent. There are several breweries and malt-houses. The market-days are Wednesday and Saturday for corn, cattle, and general provisions; the Saturday market is one of the principal in the midland counties. There are several yearly fairs for cattle, cheese, and cloth: at one of these fairs, distinguished as 'goose fair,' a considerable number of geese are sold. The trade of the town is much promoted by its proximity to the Trent, which is navigable, and the communication thus afforded with the various canals connected with that river. The Nottingham Canal passes close to the town, and joins the Trent at Trent Bridge, a mile distant. The assizes and quarter-sessions for the county are held here; also quarter-sessions for the borough, and a county court.

NOTTINGHAMSHIRE, an inland county of England, is bounded N.E. and E. by Lincolnshire, S. by Leicestershire, W. by Derbyshire, N.W. and N. by Yorkshire. It lies between 52° 47' and 53° 30' N. lat., 0° 40' and 1° 20' W. long. Its greatest length from the junction of the three counties of York, Lincoln, and Nottingham, to the right bank of the Soar on the Leicestershire border, is 51 miles; the average breadth from east to west is about 20 miles. The area is 822 square miles, or 526,076 statute acres. The population in 1841 was 249,910; in 1851 it was 270,427.

Surface and Geology.—The surface of the county is undulating, except in the Vale of Trent and the Vale of Belvoir; but there are no very high hills. The northern boundary runs through the marshes that surround the Isle of Axholme. Beacon Hill rises to the east of Newark; and a ridge of upland skirts the immediate valley of the Trent, at a little distance from the right bank of that river, from the neighbourhood of Newark to Nottingham. The eastern side of this ridge has a very gradual slope towards the Vale of Belvoir, which is watered by the Deven and its tributary the Smite.

Quite in the south part of the county, and inclosed by the Soar and one of its feeders, the Trent, the Grantham Canal, the Smite, and a small portion of the Leicestershire border, are the Wolds, a region of upland moors and pastures, furrowed by many picturesque and fertile dales. To the south of the Fareham Brook lie the Leake Hills, the highest part of the Wolds.

On the west side of the Trent the ground rises gradually towards

the Idle in the north-west and the Erewash in the south-west. The western slope of the hills which skirt the valley of the Idle, and indeed of the Idle generally in this county, is steeper than the eastern. West of the Idle the ground rises again, but it is intersected by the valleys through which the tributaries of the Idle flow. Near the head of the Maun, one of these tributaries, are the high lands of Sherwood Forest, traditionally known as the principal haunt of Robin Hood. Sutton-in-Ashfield Hill, near Mansfield, is about 600 feet high.

The strata which occupy the surface of this county succeed each other in order from east to west. The eastern and southern districts of the county, including the Wold Hills, and the eastern side of the valleys of the Smite and the Deven, are chiefly occupied by the lias. The Vale of Trent and the uplands to the west of it are for the most part composed of new red-sandstone. In the northern part of the county these formations sink beneath the fens surrounding the Isle of Axholme, in which isle they emerge again. Among the beds of this formation is a sandstone so soft as to be easily excavated, and in the vicinity of Nottingham there are many caverns of artificial formation, some of them of great antiquity. Gypsum occurs plentifully in this formation, and is quarried in several places. The newer magnesian or conglomerate limestone underlies the red-sandstone; but in some parts these formations are separated by beds of quartzose gravel, extending to the depth of from 600 to 900 feet, and often consolidated into a soft pudding-stone, of which the Castle Hill at Nottingham is a specimen. This gravel is the prevailing stratum throughout Sherwood Forest.

The magnesian limestone occupies a tract varying from four to seven miles wide in the south-western part of the county, west of a line drawn from Mansfield to Nottingham. West of the magnesian limestone occurs the South Yorkshire coal-field, of which a small part is in this county. There are numerous coal-pits in the county, which yield abundance of coal. The seams of coal vary from one or two to five or six feet in thickness. The quality of the coal is good, but rather inferior to that of Newcastle. Blue limestone approaching to marble in texture, a good bluish stone, and a reddish stone sufficiently hard for building, and limestone for burning, are quarried in different parts of the county. Coarse paving-stone is quarried at Luby, a few miles south of Mansfield.

Hydrography, Communications, &c.—The whole county belongs to the basin of the Trent [TRENT and HUMBER], which river first touches the south-west border of the county at the junction of the Soar, flows along the border about 3 miles to the junction of the Erewash, and then entering the county flows through it 25 miles in a north-east direction to the neighbourhood of Newark, below which it turns to the north, and flowing first within and then upon the border of the county 25 miles farther, to below Gainsborough, finally quits the county and flows through the marshes of the Isle of Axholme to the Humber. It is a broad river, bordered by a belt of low lands, and navigable throughout the county for river craft, and up to Gainsborough, on the Lincolnshire border, for sea-borne vessels of 200 tons. The Maun rises near the village of Hardwick, to the south of Mansfield, and flows north-east 12 miles past Mansfield and through Clipstone Park, to Ollerton, where it receives the Rainworth, which rises in Sherwood Forest. From Ollerton the Maun flows 4 miles north by east, till it is joined on the left bank by the Meden, then flows north-east 4 miles to West Drayton, where it receives on the left bank the Poulter, forming by the junction the river Idle. From West Drayton the Idle flows northward in a winding course of 18 miles to Bawtry, receiving on the left bank, just above that town, the Ryton, and flows eastward 2 miles to the border of Lincolnshire, and 7 miles more along the border, or just within it, into the Trent at West Stockwith. The Idle is navigable from East Retford, 12 miles above Bawtry. None of its tributaries are navigable.

The Soar has about 8 miles of its course, navigable throughout, on the border of this county and Leicestershire. The Erewash rises in the county, very near the head of the Maun, and flows south-west to the border, and south-south-east along the border of this county and Derbyshire to its junction with the Trent. The Lene rises near the grounds of Newstead Abbey, 5 miles south of Mansfield, and flows southward into the Trent near Nottingham. The Dover Beck rises in Sherwood Forest, not far from the source of the Rainworth, and flows 10 miles south-east into the Trent, to the east of Thurgarton. The Deven rises in Leicestershire, and flows northward into the Trent, through the Vale of Belvoir. Of its whole course of more than 20 miles, 8 or 9 miles belong to this county. Its tributary, the Smite, 18 miles long, belongs chiefly to this county. The tongue of land at the junction of the Deven and the Trent is insulated by a navigable channel communicating between these two rivers.

By means of the Trent and the canals and navigable rivers connected with it, Nottinghamshire has water communication with almost all the principal towns in England. The Grantham Canal crosses the south of the county, and connects the Witham at Grantham, in Lincolnshire, with the Trent, near Nottingham. There is a branch from the Grantham Canal to Bingham, in this county. From the eastern border of the county, at a point nearly east of East Retford, the Fosse Dyke Canal joins the Trent again with the Witham, and so with the city of Lincoln and the Wash. The Chesterfield Canal crosses the north of the county, leaving the Trent near Stockwith,

and passing through East Retford and Worksop, whence it runs first north-west into an angle of Yorkshire, and then south-west into Derbyshire, where it terminates at Chesterfield. The Erewash Canal leaves the Trent opposite the mouth of the Soar, and runs up the valley of the Erewash, partly in this county, to Langley Bridge, where it is joined by the Cromford Canal. From Langley Bridge the Nottingham Canal runs direct, but by a very circuitous route, to the Trent, south of Nottingham. A cut which leaves this canal at Nottingham joins the Trent, 4 miles higher up. The Humber, into which the Trent runs, and the Trent and Mersey Canal, which joins the Trent in Derbyshire, just without the south-western boundary of this county, open to Nottinghamshire the whole system of the internal navigation of England.

The principal coach-roads are those through Newark, Ollerton, and Worksop, into Yorkshire; the branch road from Newark, through Tuxford, East Retford, and Bawtry; and the road through Nottingham and Mansfield into Derbyshire.

The Derby, Nottingham, and Lincoln branch of the Midland Counties railway has 30 miles of its length in this county, which it enters near the Long Eaton junction; it passes through Nottingham and Newark. A branch from this line leaves the Carlton station 3 miles east from Nottingham, and runs eastward across the county, through Bingham to Grantham. The Manchester, Sheffield, and Lincolnshire railway traverses the north of the county, passing through Worksop and East Retford, and on to Gainsborough and Great Grimaby, in Lincolnshire; from East Retford a branch from this line runs through Cottam and Tootsey to Lincoln. The southern branch of the Midland Counties railway runs up the valley of the Soar from Leicester, entering the county a little north of Loughborough, and joining the Derby, Nottingham, and Lincoln branch at the Long Eaton junction. From Nottingham a railway runs north to Mansfield, whence the Mansfield and Pinxton railway runs to the Cromford Canal at Pinxton Mills, near Alfreton in Derbyshire, with a branch to the Codnor Park iron-works. It is joined by the Erewash Valley line, which runs along the western boundary of the county, to the greater lines just mentioned at the Long Eaton junction. The Great Northern railway from London to York crosses this county, coming from Grantham, through Newark and East Retford, and passing through Bawtry northwards. Another line, intended to join the North Midland, has been constructed from Newark to Southwell.

Climate, Agriculture, &c.—The climate of this county is dry and healthy, and upon some of the light lands the harvest is as early as in many counties more to the south. The high hills of Derbyshire intercept the westerly winds, and cause the clouds to discharge their moisture before they reach Nottinghamshire; the heaviest rains are when the wind comes from the east.

The county may be divided into three districts with respect to soil. In the first, sand and gravel prevail. This extends along the Vale of Trent to the borders of Lincolnshire, and to the north of Nottingham along the ancient forest-land and border, in a strip of land about 30 miles long and from 7 to 10 miles broad. The next is the clay, which lies between the Trent land and the last-mentioned strip, and in a part of the southern extremity of the county towards Leicestershire. The third district is that where limestone and coal are found. This lies partly on the borders of Derbyshire, and partly on the south-east towards Leicestershire and Lincolnshire.

This county, of which a great portion was once forest-land, contains many fine parks and seats. The principal parks are those of Clumber, Thoresby, Worksop, and Welbeck Abbey, south of the town of Worksop; those of Newstead Abbey and Annesley, south of Mansfield; and Wollaston Hall, west of Nottingham. There are many fertile spots; but the land is in general not above mediocrity, and some of it is very poor. The farms are of moderate size, and the tenants are mostly at will. Improvements in agriculture are very generally followed. Turnips are cultivated to a great extent; other crops are wheat, beans, peas, oats, potatoes, &c. Along the river Trent are some good meadows and pastures, in which bullocks are grazed to advantage. The breeds which are preferred are the Hereford and the short-horn for the best pastures, and the small Scots for inferior. There are not many dairies, although some good cheese is made. The dairies are chiefly along the Soar. The sheep are mostly of the Leicester breed. There are many hop plantations in the county. In the neighbourhood of Newark, Nottingham, and other towns there are excellent market gardens, the sandy soil being very favourable to the cultivation of roots and vegetables. There are some good orchards on the heavier soils.

The remains of the old forest-trees are still to be met with in parks, where they have been preserved as ornaments. A better system of forest management has been introduced of late years, and considerable attention is now paid to the growth of navy timber. Many new woods and plantations have been made in those parts of the forests which have been granted to individuals or allotted on inclosures. Very extensive woods have been planted on the estates of the Dukes of Newcastle and Portland.

Divisions, Towns, &c.—Nottinghamshire is divided into six wapentakes—Bassetlaw, north; Bingham, south-east; Broxtow, west; Newark, east; Rushcliffe, south; and Thurgarton, central. Each wapentake consists of a north and south division, with the exception

of Bassetlaw and Thurgarton, which have each three divisions. Besides the divisions just enumerated, there is the county of the town of Nottingham.

The county town of NOTTINGHAM; the boroughs of NEWARK and EAST RETFORD; and the market-towns of BINGHAM, MANSFIELD, SOUTHWELL, and WORKSOP, are noticed under their respective heads. The only other market-towns in the county are Ollerton and Tuxford.

Ollerton, 19 miles N. by E. from Nottingham, population of the township 937, is situated on the Maun, and has a neat modern gothic chapel, a chapel for Wesleyan Methodists, a National and a Free school. The market is held on Friday; there is a hop-market every Tuesday in September, and a yearly cattle and sheep fair is held. The village of *Edwinstow*, which is on the Maun, above Ollerton, is extremely rural. The parish church of Edwinstow, a venerable gothic building, with a lofty spire, has been renewed and in part restored. At Clipstone, in the parish, are some ruins of a palace of King John.

Tuxford, about 28 miles N.N.E. from Nottingham: population of the parish, 1211. The town was rebuilt after a great fire in 1702. The church, which exhibits a mixture of various styles of architecture, was repaired in 1814. There are chapels for Wesleyan Methodists and Independents, a Free school, and an Infant school. The market is held on Monday; and there are two yearly fairs, one for live-stock, the other for hops.

The following are the more important villages, with the population of the parishes in 1851, and a few other particulars:—

Arnold, population 4704, is 4 miles N. from Nottingham, on the road to Mansfield. The village extends nearly a mile in length. The inhabitants are chiefly frame-work knitters. Besides the parish church, an old building, there are chapels for Wesleyan and Primitive Methodists and Baptists, an Endowed Free school, and an Infant school. *Basford*, population 10,093, is situated about 2½ miles N.N.W. from Nottingham, in the vale of the Lene. Besides the parish church, a commodious structure with a handsome tower, there are chapels for Wesleyan, Primitive, and New Connexion Methodists and Baptists, and National schools. The chief occupations are frame-work knitting, lace-making, and the manufacture of hosiery. *Beeston*, population 3016, is about 4 miles S.W. from Nottingham. The hosiery, silk, and lace manufactures are the principal occupations. There is a canal from the river Trent at Beeston to Nottingham. There are here a parish church, opened in 1844, of which the sittings are all free; chapels for Wesleyan and New Connexion Methodists and Baptists; National and Infant schools; and a library. *Blidworth*, population 1376, about 6 miles S.E. from Mansfield, occupies high ground in the neighbourhood of Sherwood Forest. The parish church, of Norman date, was repaired in 1839. The Wesleyan Methodists have a chapel, and there are National and Infant schools. *Blyth*, population 3982, about 7 miles N.W. from East Retford, on the right bank of the river Ryton, had once a market, which was removed to Bawtry, 4 miles from Blyth, when the Great Northern mail-road was opened. The church, which occupies an elevated site, is an embattled structure, partly of Norman date. The Wesleyan Methodists and Quakers have places of worship, and there is a National school. Cattle-fairs are held on Holy Thursday and on October 29th. *Bridgeford-on-the-Hill*, or *East Bridgeford*, population 1155, about 10 miles E.N.E. from Nottingham, on the right bank of the Trent, has a commodious church, rebuilt about 1780; chapels for Wesleyan and Primitive Methodists; and National schools. Here was the site of the Roman station Margidunum. Malting and brick-making are carried on. Gypsum is obtained in considerable quantity. *Bulwell*, population 3786, about 4 miles N.W. from Nottingham, in the valley of the Lene, has an ancient church with a tower, chapels for Wesleyan and Primitive Methodists and Baptists, and a Grammar school. Frame-work knitting and lace-making employ some of the inhabitants. Malting and lime-burning are carried on. *Calverton*, population 1427, about 7 miles N.N.E. from Nottingham, is situated on the Dover Beck. It has a parish church, chapels for Wesleyan and Primitive Methodists and Baptists, and a Free school. Frame-work knitting is the chief occupation. The Rev. William Lea, inventor of the stocking-frame, was a native of Calverton. *Carlton*, population of the township 2329, about 3 miles E. by N. from Nottingham, has chapels for Wesleyan and Association Methodists and Baptists, and an Infant school. The manufacture of lace and hosiery affords employment. Malting and brick-making are carried on. *Farnsfield*, population 1149, about 14 miles N.N.E. from Nottingham, has a neat and respectable appearance. The parish church is a plain stone building. There are a chapel for Wesleyan Methodists, a parochial school, and a school supported by the Wesleyan Methodists. An annual feast and a fair, chiefly for forest-sheep, are held at Michaelmas. Brick-making, rope-making, and malting are carried on. *Gotham*, population 792, is situated among the Leake Hills, near the border of the county. The church is a good stone edifice with a square tower. The Wesleyan and Primitive Methodists have chapels, and there are National and Infant schools supported by Earl Howe, who is lord of the manor. *Graby*, population 515, near the Leicestershire border, 4½ miles S.E. from Bingham, gives the title of Marquis to the Rutland family. The church is an ancient and commodious structure with a square tower; there are a Wesleyan chapel and an Endowed school. *Greasley*, population 5284, is 7 miles N.W. from Nottingham. The church is

handsome and spacious, with a lofty embattled tower. The inhabitants are chiefly employed in the manufacture of hosiery, lace, and lace machinery. The Nottingham Canal passes through the parish; there are several coal-wharfs on its line. *Hucknall Torkard*, population 2970, about 7 miles N.N.W. from Nottingham, is situated on a feeder of the Lene. Besides the parish church, there are chapels for Wesleyan, Primitive, and New Connexion Methodists and Baptists. The population is chiefly engaged in frame-work knitting. Brick-making and lime-burning are carried on. *Kimberley*, population of the ecclesiastical district 2392, about 6 miles N.W. from Nottingham, has a church, a chapel of ease, chapels for Wesleyan and Primitive Methodists, and an infant school. In the neighbourhood are an extensive corn-mill, collieries, and a brewery. *Kirkby*, population 2363, about 5 miles S.W. from Mansfield, has a parish church, chapels for Wesleyan Methodists and Baptists, and a Free school. The rivers Erewash, Lene, and Maun rise in the neighbourhood of Kirkby. There are several collieries, connected with which is the Mansfield and Buxton tramway. Frame-work knitting is the chief occupation. *East Leake*, population 1148, about 9 miles S.W. from Nottingham, has an ancient church, chapels for Methodists and Baptists, and an Endowed school. The inhabitants are chiefly stockingers. Three statute fairs for hiring servants are held in the year. *Lenton*, population 5589, about 2 miles W. from Nottingham, has a handsome gothic church, built of stone in 1842; chapels for Wesleyan Methodists, Independents, and Baptists; and National and Infant schools. Lace-factories, chemical-works, tanneries, agricultural-implement works, and machine- and starch-works employ many of the population. Two cattle-fairs are held, on Whit-Wednesday and November 11th. A priory of Cluniac monks formerly existed here. *Mansfield Woodhouse*, population 1972, nearly 2 miles N. from Mansfield, is a neat village, pleasantly situated near the western border of the county. The church, an early English edifice, has a tower surmounted with an octagonal spire. There are chapels for Wesleyan and Primitive Methodists and Independents, a Blue-Coat school, and National schools. Roman remains have been found in the vicinity. Frame-work knitting is the chief employment. Malting and lime-burning are carried on. *Misterton*, population 1743, in the north-eastern corner of the county, on the north side of the Chesterfield Canal, 9 miles E. by N. from Bawtry. The parish church, rebuilt in part in 1848, has a tower surmounted with a spire. The Wesleyan and Primitive Methodists have chapels, and there is an Endowed Free school. Malting is carried on. There is a considerable trade in cattle and pigs. *Radcliffe*, or *Radcliffe-on-Trent*, population 1273, is about 6 miles E. from Nottingham, on the right bank of the river Trent. The parish church, an old edifice, underwent thorough repair in 1829. There are a chapel for Wesleyan Methodists, and a Free school. On the Trent is a wharf for landing goods, and there is a good carrying-trade on the river. Malting is extensively carried on. Several families are employed in making skeen baskets. *Radford*, population 12,637, about a mile W. by N. from Nottingham, has a parish church, rebuilt in 1812; a church for New Radford district; chapels for Wesleyan, Primitive, and New Connexion Methodists, Independents, and Baptists; and National schools. Lace-making and the stocking manufacture are the chief occupations. There are several breweries, machine-making establishments, iron-foundries, and corn-mills. *Sneinton*, population 8440, a suburb of Nottingham, on the east side, contains many good houses, the residences of merchants and others connected with Nottingham. It has a recently-erected cruciform church, in the early English style, a chapel for Wesleyan Methodists, and National schools. The occupations generally are similar to those of the inhabitants of NOTTINGHAM. Brick-fields, Roman-cement works, and chemical-works are in the vicinity. *Stapleford*, population 1968, on the western border of the county, 6 miles W. by S. from Nottingham; the Erewash River forms here the boundary. The Nottingham Canal passes a short distance north of the village. Besides the church, which has a tower surmounted with a spire, there are chapels for Wesleyan and Primitive Methodists; National and Infant schools, built and endowed by the late Lady Warren; and a library. Lace-making, particularly the making of tatting lace, employs many of the inhabitants. At Stapleford are some primeval remains. *Sutton-in-Ashfield*, population 7692, about 8 miles S.W. from Mansfield, is situated on an eminence. The church is a fine gothic structure, with a tower and a lofty octagonal spire. The Baptists, Independents, and Wesleyan and Primitive Methodists have places of worship, and there is a National school. The population is chiefly employed in the manufacture of cotton-hosiery, lace, and lace machinery. There is a pottery for coarse red ware. A customary market for provisions is held weekly, on Saturday. Several fairs and an annual feast are held in the village. *Sutton-upon-Trent*, population 1262, about 8 miles N. from Newark, on the left bank of the Trent, has a handsome gothic church; chapels for Wesleyan Methodists, Baptists, and Independents; National schools partly endowed; and a Wesleyan school. Malting is carried on, and there are several corn-mills, a seed and bone-crushing mill, and patent oil-cake works. *Sutton Bonnington*, population 1220, about 10 miles S.W. by S. from Nottingham, near the right bank of the Soar, which here separates the county from Leicestershire, has a neat church with a lofty spire, and another church of small size, chapels for Wesleyan and Primitive Methodists and Baptists, a National and an Endowed

GEOG. DIV. VOL. III.

school. Frame-work knitting is the principal occupation. *Warsop*, population 1393, about 4½ miles N. by E. from Mansfield, formerly had a market. Two annual fairs are held. Rope-making and malting are carried on to a small extent. There are some corn-mills. The church is ancient; there are chapels for Wesleyan Methodists and Baptists, and a Parochial school.

Ecclesiastical and Legal Divisions, &c.—The county forms the arch-deaconry of Nottingham; it was formerly included in the diocese of York, but now forms part of the see of Lincoln. It is in the midland circuit. The assizes are held at Nottingham; quarter-sessions at Nottingham, Newark, and East Retford; county courts at Bingham, East Retford, Mansfield, Newark, Nottingham, and Worksop. The county jail is at Nottingham; the county house of correction at Southwell. The county returns four members to Parliament; two for the northern and two for the southern division. Nottingham and Newark return two members each.

History, Antiquities, &c.—In the division of Britain by the Romans this county was included in the province of Flavia Cæsariensis. The Roman stations Ad Pontem, Margidunum, and Verometum, were in the county. Of the Roman roads which connected these stations there are several traces. The Fosse Way may be traced from Verometum for several miles in the direction of Newark. Many Roman remains have been discovered in the neighbourhood of Newark, Mansfield Woodhouse, and in other parts of the county.

In the Saxon period it is likely that Nottinghamshire was possessed at first by the Northumbrian Angles. When the Mercians became independent of the kingdom of Northumbria (A.D. 626), this county appears to have been included in their dominion: it was divided between the northern and southern Mercians, who were separated from each other by the Trent. When the Danes, under the sons of Regnar Lodbrog, invaded England, they passed the winter (867-868) at Nottingham, which they had taken, and which became a Danish burgh. By the treaty with Alfred (878 or 880) they obtained possession of that part of Mercia which was north-east of Watling-street, including Nottinghamshire. After the Conquest, the greater part of the county, together with the castle of Nottingham, was bestowed by the Conqueror on his natural son, William Peverel. The principal events that took place in the county from the Conquest to the great civil war were—the capture of Nottingham Castle and town by the troops of the empress Maud; the death of king John at Newark, October 17th, 1216; the arrest of Mortimer in Nottingham Castle by Edward III.; and the defeat and capture of Lambert Simnel in 1487 by the royal army under Henry VII. at East Stoke, on the right bank of the Trent, 4 miles S.W. from Newark.

At the commencement of the civil war Charles I. set up his standard at Nottingham with great ceremony (1642). Shortly after this Nottingham came into the hands of the Parliament, and continued so to the end of the war. Newark, which was held by a body of Royalists under the command of Sir John Henderson, was besieged (1644) by a body of Parliamentary forces under Sir John Meldrum and Lord Willoughby of Parham, but was relieved by Prince Rupert, who drove part of the besieging forces over the Trent, and compelled another portion to capitulate, with all their artillery and ammunition. In the winter of 1644-45 it was again unsuccessfully besieged by the Parliamentarians. In May 1646 the king surrendered himself at Southwell to the Scotch commissioners, by whom he was conducted to the quarters of the Scotch troops then besieging Newark. The day after his arrival Newark was delivered up by his orders.

Of architectural antiquities Nottinghamshire is somewhat bare, and its ecclesiastical buildings are, with two or three exceptions, such as St. Mary's church at Nottingham and Southwell Collegiate church [NOTTINGHAM; SOUTHWELL], by no means remarkable for splendour. Balderton, Hovringham, and Mansfield churches have some Norman portions; Newark church has some slight Norman remains; the churches of Bingham, Coddington, Hawton near Newark, and Upton St. Peter near Southwell, have considerable portions of early English; Hawton is especially worthy of examination. Of the monastic ruins the most beautiful is Newstead Abbey, founded for Augustinian canons by Henry II. about 1170. The chief part of the abbey buildings were fitted up as a residence by Sir John Byron, to whom they were granted, but the chapel was allowed to go to decay. Its front is an exceedingly beautiful specimen of early English. Of Rufford Abbey, near Ollerton, there are some remains incorporated in a large mansion of later date, which retains the original designation. It was a Cistercian abbey, founded by Gilbert, earl of Lincoln, in 1148. Of Welbeck Abbey some slight remains are incorporated in the mansion of the Duke of Portland. Part of the cloisters, and some other portions of Mathersey Gilbertine Priory, near the Idle, yet remain. There are also some remains of Thurgarton Priory for Austin canons. At Newark is an ancient castle.

Statistics: Religious Worship and Education.—According to the Returns of the Census in 1851, it appears that there were then in the county 630 places of worship, of which 273 belonged to 6 sections of Methodists, 248 to the Established Church, 54 to Baptists, 21 to Independents, 11 to Mormons, 5 to Roman Catholics, 3 to Quakers, 2 to Unitarians, and 1 each to Irvingites, Swedenborgians, and Jews. The total number of sittings provided was 151,742. There were 428 Sunday schools with 43,938 scholars; of these, 183 schools with 17,785

3 T

scholars were under the superintendence of the Established Church. Of day schools there were 739, of which 231 were public schools with 18,286 scholars, and 508 were private schools with 12,892 scholars. Of evening schools for adults there were 32, with 983 scholars. The number of literary and scientific institutions was 10, with 1955 members, and 29,785 volumes in the libraries belonging to them.

Savings Banks.—In 1853 the county possessed 6 savings banks, at East Bedford, Mansfield, Newark-upon-Trent, Nottingham, Southwell, and Worksop. The total amount owing to depositors on November 20th 1853 was 517,624*l.* 12*s.* 1*d.*

NOUVION-EN-THIÉRACHE. [AMER.]

NOVA SCOTIA, a British colony in North America, situated between 43° 20' and 46° N. lat., 61° and 66° 20' W. long., is bounded N. by Northumberland Strait, which divides it from Prince Edward Island; E. by Cape Breton and the Atlantic; S. by the Atlantic; W. by the Bay of Fundy and New Brunswick. It forms a peninsula connected with the continent by Chignecto Isthmus, a neck of land about 10 miles broad at the south-east point of New Brunswick. Its greatest length from Cape Canso on the east to Cape St. Mary on the west is 230 miles; its breadth varies from 40 to 100 miles. The area is 15,607 square miles. The population in 1817 was 84,913; in 1827 it was 123,848; in 1851, excluding that of Cape Breton, it was 248,537.

Coast-line and Surface.—The Atlantic coast is rocky and rather elevated. It contains numerous creeks and inlets from 3 to 15 miles long, many of which form safe and convenient harbours. The shore is lined with numberless islets, within which small craft sail in smooth water while there is the heaviest sea outside. The chief inlets are—Sheet Harbour, eastward from Halifax; and, westward from it, Margaret's Bay, Mahone Bay, and Shelburne Harbour, all of them deep and spacious basins. Halifax Harbour is one of the finest roadsteads in the world. Mahone Bay contains above 200 islands. A similar coast extends along the south-western extremity of the province from Cape Sable to Cape St. Mary's. St. Mary's Bay, from 4 to 10 miles broad, stretches 35 miles parallel to the Bay of Fundy, from which it is separated by Briar Island, Long Island, and the peninsula of Digby Neck. Annapolis Basin, separated by a narrow isthmus from St. Mary's Bay, extends 10 miles in the same direction, with a breadth of from 1 to 4 miles. It forms an excellent harbour. Its entrance, the Gut of Digby, is the only inlet on the coast of the Bay of Fundy between St. Mary's Bay and the Bay of Mines. The shore is generally high and bold, but not so much broken as the Atlantic coast. The only refuge besides the Gut of Digby is at Black Point, where a pier has been erected for the accommodation of coasting vessels. The Bay of Mines is entered by a strait 8 miles wide between Cape Blowmedon on the south and Cape Parshoro on the north. It forms an extensive basin, stretching 50 miles inland to the head of Cobequid Bay, with an extreme breadth of 16 miles. Its shores are low and marshy. From the entrance of the bay to Cape Chignecto, and along the south shore of Chignecto Inlet, the coast is high and rocky. It changes into low and marshy lands along the banks of Cumberland Basin, which forms the upper extremity of the Bay of Fundy, and a narrow division between Nova Scotia and New Brunswick. The waters of Fundy Bay rush into its head branches with great impetuosity, rising in Mines Bay and Cumberland Basin from 50 to 60 feet, and advancing with a tide wave of 5 or 6 feet high. The shore of Northumberland Strait eastward to Pictou Harbour is low and either sandy or marshy, except in the vicinity of Pugwash Bay, where it is elevated. Beyond Pictou it rises to a considerable height, and at Cape St. George becomes rocky and bold. The Bay of St. George, which looks to the Gulf of St. Lawrence, is connected with Chedabucto Bay, which opens to the Atlantic, by the Gut of Canso, a strait running 21 miles between Cape Breton and Nova Scotia, with a breadth varying from a mile to a mile and a half. Chedabucto Bay, bounded on the south by Cape Canso and on the north by Cape Hogan on Madame Island, which belongs to Cape Breton, is free from cliffs and islands, and runs 25 miles inland, with a breadth of from 6 to 12 miles.

The country rises gradually from the Atlantic coast into an extended ridge seldom exceeding 300 feet in height. Other ridges traverse the peninsula in the same direction, separated in many places by deep valleys, and at times intersected by rivers and lakes, but forming towards the centre of the eastern and western divisions of the province an elevated table-land of a broken and irregular surface. Near the middle of the province a low tract of land, not rising more than 100 feet above the sea, stretches across the country from Halifax Harbour to Cobequid Bay. Along the northern shore of that bay, and the Bay of Mines, the Cobequid Hills rise to a height of from 800 to 1000 feet, and extend towards the shore of Northumberland Strait, with a nearly uniform breadth of 10 miles. Within 10 miles of the south shore of the Bay of Mines the central table-land is bounded by a group of hills, of which the principal heights are Horton Mountain and Ardole Mountain, the latter rising 810 feet, and forming the watershed of the rivers flowing to the Bay of Mines and to the Atlantic. Two extended ridges, called the North and the South Mountains, terminate the table-land westward, rising on opposite sides of the valley of the Annapolis. Along the shore of St. Mary's Bay the country rises into long ridges and detached hills, reaching its greatest elevation in the Blue Mountains, a little beyond the centre of this

part of the peninsula. The whole province is agreeably diversified by the succession of lofty ridges and less prominent undulations.

Hydrography and Communications.—About 3000 square miles of the surface are under water. In every part of the province the lakes and rivers are numerous, leaving few places far from convenient water-carriage, or without eligible sites for flour- and saw-mills. Between Halifax and St. Margaret's Bay, an extent of 20 miles, there are as many as 200 lakes. A series of lakes form a continued communication across the country from Liverpool Harbour on the Atlantic coast to Annapolis Basin. The most important rivers are the Annapolis and the Shubenacadie. A canal, supplied by the Shubenacadie River and the lakes from which it issues, forms a communication, for vessels drawing not more than 8 feet of water, between Halifax Harbour and Cobequid Bay. Good roads extend between Halifax and the towns of Windsor, Annapolis, and Pictou. Roads are carried round the peninsula, and one passing into New Brunswick is continued in the great road to Quebec. The forests are penetrated by roads wherever settlements have been formed. A railway has been formed for the conveyance of coal from the Pictou mines to the place of shipment. Steamers sail from Halifax, Annapolis, and Windsor to St. John's in New Brunswick, and in summer there is steam communication between Pictou and Prince Edward Island. Mail steamers leave Halifax weekly for England, the United States, Bermuda, Cape Breton, and Newfoundland. Halifax is connected by electric telegraph with the principal cities of Canada and the United States.

Geology.—The province comprises four geological divisions. Granite of several varieties, gneiss, and mica-slate form a narrow belt along the coast between Cape Canso and Cape Sable. Granite boulders are very numerous in many parts of this tract, especially in the vicinity of Halifax. A parallel section, reaching across the country to the Annapolis Valley, consists of metamorphic rocks. Grauwacke, grauwacke slate, and quartz rock prevail, with occasional masses of transition limestone. The coast of the Bay of Fundy, from Briar Island to the Basin of Mines, including the North Mountain and the islands along the shore, form a trap region, occupied by greenstone, amygdaloid, and tuffstone, containing gems and neolites. The new red-sandstone and carboniferous systems spread over the northern shore between the borders of New Brunswick and the Gut of Canso. The sandstone contains beds of gypsum and rock salt. The coal-measures include several valuable fields of coal, of which the most important are the Cumberland and Pictou fields. The Pictou field occupies an area of more than 100 square miles, and consists of seams from one foot to 50 feet thick. Iron-ore occurs in large quantities in combination with the coal. It is also found in other districts, and was worked for some time on the banks of the Moose River near Annapolis Basin. A large deposit of specular iron-ore of a very rich quality has been found on the south side of the Cobequid Hills. Copper-ore exists in several places, particularly at Cape d'Or, opposite the entrance to Mines Bay. Lead-ore in small quantities occurs among the limestone at Guy's River. Good mill-stones are obtained from the light gray granite near Cape Canso, and grindstones of the finest quality from the hard gray or bluish sandstone which occurs in various districts. On the south side of Mines Bay, at St. George's Bay, and the Gut of Canso, are extensive deposits of gypsum. Along the northern shore there is the finest freestone for building, and in the centre of the province abundance of excellent slate. Salt-springs of great strength are numerous between the Basin of Mines and Northumberland Strait.

Climate, Soil, and Productions.—The climate of Nova Scotia is very much modified by its nearly insular position. The winters vary considerably in length and severity. Sometimes there is a hard frost several weeks before Christmas; in other seasons the ground remains open till near the middle of January. On the Atlantic coast the influence of the Gulf Stream renders the harbours accessible all the year round, while the ports on the northern coast are frozen up for nearly four months. At no time is the cold oppressive, nor is the heat of summer, except occasionally and for brief periods, in excess.

The Atlantic shore is everywhere stony, and many of the headlands are bare of soil, but generally a stiff clay prevails, which, when the stones are removed, yields excellent crops. Improved tracts of this description appear all around Halifax. The heads of bays and banks of rivers along the coast present numerous patches of good alluvial land. The uplands, or hill-lands, as they are called in the province, are generally free from stones, and consist of a stiff clay, varied by a friable loam. They are commonly very productive, and the highest are the most fertile. The intervalles, or tracts of alluvial land formed by the deposit of the rivers, above the head of tide-water, are more in repute and produce excellent crops. The province however is still far from raising its own supplies, and large quantities of flour are yearly imported from the United States and Canada.

The most important crops are wheat, oats, and potatoes. Rye, barley, buckwheat, and maize are raised in large quantities, maize chiefly on the shores of the Bay of Fundy. Beans, peas, and turnips are extensively cultivated, and grasses obtain much attention. In 1851 Nova Scotia produced 297,157 bushels wheat, 67,438 bushels rye, 1,384,437 bushels oats, 170,301 bushels buckwheat, 196,097 bushels barley, and 1,986,789 bushels potatoes: of hay, 287,837 tons were raised. Of butter 3,613,890 lbs. were made, and of cheese 652,089 lbs. Large stocks of cattle, sheep, pigs, and poultry are kept,

especially on the northern shores and around the Bay of Mines. Cattle are exported to New Brunswick to form working teams for the lumbering trade. Newfoundland receives from Nova Scotia all its sheep and live stock. Beef and butter are exported. Nearly 9,000,000 acres are still covered with forests, which form a chief part of the wealth of the province. The most important trees are pine, birch, oak, hemlock, beech, ash, maple, and elm. Others of great beauty are of less commercial value. The wild animals which remain are the moose-deer, tiger-cat, beaver, bear, fox, marten, otter, mink, musk-rat, racoon, weasel, squirrel, and hare. The first four are nearly extinct. Nearly all the small lakes and streams contain trout and salmon. Cod and haddock are taken in great numbers along shore, and especially on banks about 10 miles off. Mackerel, going north in spring and returning in autumn, swarm in prodigious numbers in all the bays and inlets. In Mines Bay vast numbers of shad and bass are caught in weirs at the ebb and flow of the tide. Small herrings, taken in the same way in Annapolis Basin, are smoked for the foreign market. Halibut, sturgeon, sole, and other kinds of fish are found on the coast, which also abounds with lobsters, oysters, and other shell-fish.

The population of the province is of mixed origin. Of the aborigines there are a few hundreds belonging to the Miomac tribe. Free blacks, the descendants of slaves who entered the province at different periods, number some thousands. There are several settlements of Acadian French, of Germans, and of Swiss Protestants. The western and midland counties are chiefly inhabited by the offspring of loyalists from New England. The chief part of the population consists of the descendants of English, Scotch, and Irish immigrants. The Scotch are most numerous in the northern counties. The chief occupations are farming and fishing. A great part of the population engage in both, tilling their lands at the heads of the bays and near the river mouths, and sharing in the fisheries of the coast. Many take part in the more distant fisheries of the banks of Newfoundland and the coast of Labrador. In the midland counties the farmers and their sons are much engaged in ship-building, the ships being often manned by themselves and freighted with their own produce or with lumber. The manufactures, which are limited, are coarse cloths and flannels, bed-linen, blankets and carpets, hats, paper, tobacco, leather, ploughs and other agricultural implements, ropes, stoves for some of the colonies, and chain-cables for the United States. Near Halifax there are distilleries for the preparation of spirits from molasses. The exports of the province are timber of all sorts, planks, deals, spars, staves, and cordwood; fish, dry and pickled, smoked herrings, seal-skins, oil, coal, gypsum, grindstone, beef, pork, butter, live-stock, potatoes, and other vegetables. The imports are chiefly British manufactures, wines, spirits, wheat and flour, beef, pork, sugar, and tobacco. In 1852 the value of the exports was 970,781*l.*, that of the imports was 1,194,175*l.* The number of vessels belonging to the province in 1852 was 2943, with an aggregate tonnage of 189,083.

The province is divided into 10 counties, exclusive of CAPE BRETON, which is comprehended under the same government. These counties are subdivided into 43 townships, the inhabitants of which have the right of assembling to authorize assessments for local purposes.

The only incorporated city in the province is HALIFAX, which is noticed separately, as is also the town of ANNAPOLIS. The following towns may be noticed.—*Akwesht* is a thriving place, near the east shore of Cumberland Basin. *Chester* is favourably situated on the north side of Mahone Bay, and contains several fulling, grist, and saw-mills. It has a considerable lumber trade, and a number of its inhabitants are employed in the fisheries. *Dartmouth*, a small town opposite Halifax, on the eastern side of the harbour, was a place of importance during the war, but has been nearly stationary since. A steamer plies constantly between it and the city. *Dorchester* is a place of considerable trade, on the Antigonish River, a mile above the head of navigation. It contains a court-house, and a Baptist, a Presbyterian, and a Roman Catholic church. *Guyborough* is situated at the entrance to Milford Haven, near the head of Chedabucto Bay. It contains a court-house, and churches for Episcopalians, Roman Catholics, and Protestant Dissenters. *Liverpool*, the chief town of Queen's County, is a well-built place, situated on the west side of Liverpool harbour. Its inhabitants are chiefly employed in fishing and lumbering; and considerable quantities of timber and fish are exported to Europe and the West Indies. *Lunenburg*, situated at the head of Lunenburg Bay, is a regularly built town, containing several churches. It trades in lumber with the West Indies. *Pictou*, situated at the head of Pictou harbour, in Northumberland Strait, is a busy and improving town, with a population of several thousands. It contains a college, and Episcopal, Presbyterian, and Roman Catholic places of worship. Timber and coal are largely exported. The harbour has a bar at its mouth, but is capacious within, and has from five to nine fathoms depth of water. *Shelburne*, situated at the head of Shelburne harbour, was built by American loyalists after the war of independence. It had a population of 12,000 within a year after its rise, but it now contains only a few inhabitants, who are employed in ship-building and the fisheries. *Truro*, a town situated at the head of Cobequid Bay, is mostly built of wood. It contains a court-house and several places of worship. *Windsor*, a neat, clean, well-built town, on the estuary of the Avon River, and near the mouth of the St. Croix, distant about 40 miles N. from Halifax, contains King's College, an

academy, and places of worship for Episcopalians, Roman Catholics, and various other denominations. *Yarmouth*, an improving town, on the west coast of the province, consists of one street nearly two miles long, in which the houses are still considerably detached. It contains a court-house, an Episcopal church, and places of worship for Congregationalists, Baptists, and Methodists. It carries on an active trade with the West Indies. Many vessels belong to the place. From its local advantages and the enterprise of its inhabitants it is likely to become a town of great importance.

The affairs of the province are administered by a governor and executive council, a legislative council appointed by the governor, and a House of Assembly of 43 members, which meets at Halifax. The possession of a 40*s.* freehold forms the elective franchise, and qualifies for a seat in the House of Assembly. The laws are administered by a Court of Queen's Bench and district courts. They include the common and statute law of England, and the statute law of the province.

The religious denominations in the province are Episcopalians, Presbyterians, Roman Catholics, Methodists, Baptists, and some smaller sects. The members of the Church of England are under the direction of a bishop, an archdeacon, and 50 clergymen. The bishop and archdeacon are endowed by the home government, the clergy are supported by the Society for the Propagation of the Gospel. The Established Church of Scotland has 6 ministers in the province, the Free Church has 19 ministers, and from 20 to 30 ministers are connected with the United Presbyterian Church of Scotland. The number of churches in the province in 1851 was 520. Since 1826 a Common School Act has been in operation, which is every three or four years revised by the legislature. It divides the province into districts, in which the people appoint trustees, and maintain their schools on a popular basis, under the control of boards of commissioners appointed by the executive. In 1851 the number of common schools was 1026, with 29,175 children. A Grammar school is maintained in each county. There are several colleges in the province: King's College at Windsor, on the plan of Cambridge and Oxford; Dalhousie College at Halifax, on the model of Edinburgh College; a general institution at Pictou; a Baptist college at Horton; and Acadia College, a Roman Catholic seminary at Halifax. Attempts have been made to unite some of these institutions into one efficient university, but without success.

The revenue of the province is derived from a tax on imported goods, consisting chiefly of an ad valorem duty of 6½ per cent. The income in 1852 was 93,039*l.* 7*s.* 2*d.* The defence of the colony is provided for by two or three British regiments stationed in the garrison towns, and by the visits of the squadron in summer. An organised militia of 26 regiments, constituting a force of 26,248 men, exclusive of officers, is provided for by statute. For the construction and maintenance of lighthouses an annual rate is levied from coasting vessels, and a rate per ton from all other vessels entering and leaving the ports. Twenty-one lighthouses are in full operation around the coast.

Nova Scotia was discovered by the Cabots in 1497. In 1604 the French attempted to settle in it, but were expelled by the Virginian colonists, who claimed the country for Britain in right of previous discovery. Acadia, as the peninsula was called by the French, was granted under the name of Nova Scotia to Sir William Alexander in 1621. The French however retained their footing in it till 1654, when they were reduced by a strong force sent out by Cromwell. The colony was ceded to France by the treaty of Breda in 1667, but after various contests was finally secured to Britain in 1711. Certain designs of the French led the British Parliament in 1749 more actively to promote the settlement of the province. A large grant of public money was made for the purpose, 4000 adventurers embarked with their families for the colony, and the present capital was founded by them. The French, assisted by the Indians, made repeated attacks on the settlement till 1758, when they were finally expelled. In 1784 New Brunswick and Cape Breton were separated from the peninsula, and formed into distinct governments, but in 1818 Cape Breton became again, as it is now, a part of the province of Nova Scotia.

NOVA ZEMBLA, properly NOVAIA ZEMLIA, or 'New Land,' is the name of an island or rather of a chain of islands in the Arctic Sea, which curve round from south to east-north-east between 70° 30' and 76° 30' N. lat., 52° and 76° E. long. The convex or western side of Nova Zembla is washed by the Spitzbergen Sea, the eastern by the Kara Sea, and that part of the Arctic Ocean that lies opposite the mouths of the Obi and Yenisei. On the south it is separated from Waigatz Island by Kara Strait, also called Burrough's Strait. The total length of Nova Zembla is about 500 miles, and the average breadth is about 50 miles. At about 160 miles distant from Felsen Bay (an inlet of Kara Strait) a deep narrow sound called Matotshkin, or Matyushin Shar, connects the Sea of Spitzbergen with the Kara Sea, and cuts off the southern island, the proper Novaia Zemlia. About 40 miles farther north a similar but wider sound, the western part of which is called Cross Bay, cuts off another island. When about half-way through the island, Cross Bay divides into several arms inclosing several small islands. To the north of Cross Bay lie Lutke's Land, which extends to Cape Nassau, and Barentz Land, the most eastern part of Nova Zembla: these it is believed form one connected island. In a geographical point of view the island of Waigatz (50 miles long,

and 20 miles broad), lying south of Kara Strait, and separated from the continent of Russia by Yugoraky Shar, or Pett's Strait, form a part of the series of islands called Nova Zembla; and the whole may be considered as the prolongation of the Ural Mountains, the sounds mentioned merely filling up depressions in the chain.

The western side of the island is mountainous, rising from a steep and bold shore to the height of 1000 and 2000 feet. It is also indented with numerous bays formed by bold and lofty headlands which project from the mountains. A mountain east of Nameless Bay in Nova Zembla proper is 1842 feet high. A little farther north approaching the entrance to Matotahkin Shar is another peak 2547 feet high. Along the strait itself the mountains on the north side rise in three places to 3204 and 3156 feet high, and on the southern side there is a peak 3475 feet above the sea-level. All along Lutke's Land and Barentz Land the mountains run close along the shores. The mountains of Nova Zembla are chiefly composed of a very black clay-slate in the more southern portion; near the Kostin Shar on the south-west coast of Nova Zembla proper gray primitive limestone prevails, similar to that found in the Ural Chain. The eastern shores are comparatively level and barren. Though the heat in summer is very great, owing to the long continuance of the sun above the horizon (four months and a half at the northern extremity), the soil thaws only to the depth of between 6 inches and 2½ feet, and at that distance from the surface ground-ice is always found. The vegetation, which covers some parts of the surface, consists only of lichens and mosses. White bears, foxes, walruses or morsees, and seals abound, as well as reindeer and water-fowl. The islands are frequently visited by fishermen from Archangel and other places in order to take the walrus. Nova Zembla first became known by the voyage of Steven Burrough (1556), but had previously been visited by the Russians. The Dutchman, William Barentz, in 1596 sailed all along the west coast, doubled Cape Desire, the most eastern part of Barentz Land, and wintered from August 26, 1596, to June 14, 1597 in Icy Haven, on the eastern shore of the island. The Russian government in recent times has sent several expeditions to explore the islands. The western coast was explored and laid down by a Russian officer, Lieutenant Lutké. All the east coast of the southern island was explored by Pachtusoff in 1832-3. The Matotahkin Shar and the east coast between 73½° and 75° N. lat. was examined by Pachtusoff and Ziwoika in 1834-5. About 100 miles of the eastern coast remain still to be explored; this part, like all other parts of Nova Zembla, is often visited by whale and walrus hunters. The sea west of Nova Zembla is said to be open for four or five months in the year on an average; but the Kara Sea is almost always encumbered with fields and masses of ice.

(Barrow, *Chronological History of Voyages into the Arctic Regions*; *London Geographical Journal*, vol. viii. and xxiii.)

NOVARA, a division of the Sardinian states containing several provinces, is bounded E. by the Ticino and the Lago-Maggiore, which separate it from Lombardy, S. by the Po, W. by the provinces of Torino and Aosta, and N. by the Lepontian Alps and Switzerland. The portion of the division extending eastward from the spur of Monte-Rosa to the Swiss frontier, and including the Val-d'Ossola or upper part of the main valley of the Tosa, and various lateral valleys which open into it, forms the province of Ossola. This province is covered by the main ridge of the Alps which inclose the valley of the Toccia, or Tosa, which assumes different names at different points of its length. The southern part of the basin of the Tosa, and a fine strip of land between the lakes of Orta and Maggiore, form the province of Pallanza. Into the valley of the Tosa numerous lateral valleys open, each adding its tributary stream to the Toccia, to be by it conveyed into the Lago-Maggiore. The largest of these lateral valleys is the Val Macugnaga watered by the Anza, which flows eastward into the Toccia from Monte-Rosa. The Simplon road across the Alps enters Italy by that part of the valley of the Toccia called the Val-d'Ossola. The provinces of Pallanza and Ossola produce but little corn; the high valleys and lower slopes of the mountains afford pasture for great numbers of horned-cattle and numerous flocks of sheep and goats. In favourable situations and in the lower valleys the grape flourishes. Chestnuts and filberts are abundant. Some iron- and copper-mines are worked. The inhabitants are poor, and some of them annually emigrate to the neighbouring countries chiefly as stone-masons.

The province of Novara extends southward from that of Pallanza to a line running nearly east from the Sesia above Vercelli to the Ticino. It is hilly in the north about the Lake of Orta; but the central and southern portions are level, forming part of the great plain of the Po. The soil is rich and very productive in corn, rice, hemp, maize, pulse, and silk. Pasture is good, especially in the north. Pigs and poultry are very abundant. The pretty lake of Orta, which is partly in the province of Novara, is 10 miles long from north to south, and little more than one mile in breadth. Its southern extremity is about 20 miles north of the town of Novara. Its outlet is at the northern end, from which the waters flow into the Lago-Maggiore, which is 7 miles distant to the east. The banks of the Lake of Orta are hilly and pleasant, and covered with villages, hamlets, and handsome country-houses. In the middle of the lake is the little island of San-Giulio, with a very handsome church, a palace belonging to the Bishop of Novara, and some other buildings and gardens.

This island was once fortified, and is mentioned in the wars of the middle ages. The chief rivers are the Sesia and the Ticino, between which the province lies; the central part of the plain is drained by the Agogna and the Terdopio, which in their lower courses traverse the Lomellina, and ultimately enter the Po from the left bank. Numerous canals for irrigating the rice-grounds are derived from these rivers.

The *Lomellina*, or province of *Mortara*, lies south of the province of Novara, between the province of Valsesia, the Ticino, and the Po. The Ticino is navigable from the Lago-Maggiore to its entrance into the Po. The other streams are the Terdopio and the Agogna, which traverse it from north to south. The country is level; the productions similar to those of the preceding province.

The province of *Valsesia* forms the most western part of the division, and comprises the upper part of the basin of the Sesia to its junction with the Cervo. It is drained by the Sesia and partially by the Dora-Baltea, which is joined to the Sesia by a canal that runs by the town of Santhia. The Valsesia towards its northern part is covered by ramifications of the Alps. Except in the valleys, the climate, like that of Pallanza, is cold. Some rye, millet, a little maize, and chestnuts are the chief productions. In favourable situations however the vine and the mulberry are cultivated. The chief wealth of the country consists in its cattle, butter, and cheese. In the southern part the surface is mostly flat, productive in rice, wheat, maize, oats, hemp, wine, and silk. The rice-grounds, which are laid under water until the rice is ripe in September, both here and all through the valley of the Po, are very unhealthy; but the undulating and highlands to the northward are exceedingly salubrious, and the aspect of the country extremely varied and picturesque.

The area and population of the provinces of the division of Novara are as follows:—

Provinces.	Area in Square Miles.	Population in 1848.
Novara	533	178,069
Lomellina	480	139,849
Pallanza	312	64,030
Ossola	520	36,331
Valsesia	390	35,879
Total	2,135	453,958

Towns.—The province of Novara is named from its chief town *Novara*, an old, irregularly built, but strongly fortified town, which is situated 50 miles N.E. from Turin, and 10 miles from the left bank of the Ticino, on the high road from Milan to Turin, and has a population of about 20,000. It gives title to a bishop, and has an ecclesiastical college, a gymnasium, two hospitals, a public library, and a considerable trade in silk and agricultural produce. Some of the churches, convents, and the palaces of the nobility are handsome structures. The total defeat of the Sardinian army near this town by the Austrians under Marshal Radetzky (March 23, 1849) led to the abdication of the Sardinian King Carlo Alberto, and to the renunciation on the part of Sardinia of all claim to the sovereignty of Lombardy. [ARONA.] *Borgomanero*, 19 miles N. from Novara, on the left bank of the Agogna, is a well-built bustling town, with 7095 inhabitants. *Galliate*, situated near Novara, has 5858 inhabitants, including the commune. *Oleggio*, near the right bank of the Ticino, N. of Novara, has a population of 7420. *Treccate*, on the road from Novara to Vigevano, has a population of 5071.

In the Lomellina, the chief towns are—*Mortara*, the capital, which stands 46 miles S. by E. from Novara in an unhealthy situation among the irrigated rice-grounds; it is surrounded by walls, and has a population of 5316. *Gambold*, on the left bank of the Terdopio, 5 miles E. from Mortara: population, 5075. *Garlasco*, W.S.W. of Mortara: population, 5436. *Mede*, population 4415. *Sannazaro*, with 3980 inhabitants; and *Vigevano*, a large well-built walled town, which gives title to a bishop, and has 15,221 inhabitants, who trade in the produce of the country, and manufacture silk, soap, gauze, hats, and macaroni. Vigevano is 16 miles S.E. from Novara, about a mile and a half from the right bank of the Ticino, and on the southern road from Milan to Turin.

In the province of Pallanza the principal towns are—*Pallanza*, a small place of 2044 inhabitants on the shores of the Lago-Maggiore, with a college and the provincial courts. *Intra*, a little N.E. of Pallanza, which has 3743 inhabitants.

The chief town of the province of Ossola is *Cannobbio*, several miles higher up the lake: population, 2137. *Domo d'Ossola*, a well-built cheerful little town of 2025 inhabitants, situated in a beautiful part of the valley of the Toccia. At Domo-d'Ossola, the traveller who crosses the Alps from Switzerland by the Simplon road, first receives his impression of the Italian sky, scenery, and manners.

The province of Valsesia has for its capital *Varallo*, which is situated on the left bank of the Sesia, and has about 3000 inhabitants.

(*Nuova Circonoscione delle Provincie dei Regii Stati in Terraferma.*)

NOVGOROD SEVERSK. [CZERNIGOF.]

NOVL [GENOA, Province of.]

NOVO MOSKOPFSK. [EKATERINOSLAV.]

NOVOGOROD, one of the eight governments of Great Russia, extends from 57° 18' to 61° 8' N. lat., 30° 10' to 39° 40' E. long. It is bounded N. by the government of Olonetz, E. by Wologda and Jaroslaw, S. by Twer, and W. by Pskow and St. Petersburg. The area including the surface of the large lakes of Ilmen, Bjelo-Osero, and Wosché, is 46,833 square miles. It is divided into ten circles, and the population in 1846 was 907,900.

The face of the country is diversified with hills, rivers, high banks, plains, valleys, marshes, and lakes. The northern part is low and swampy, and for the most part covered only with peat. In the southern part the soil is clayey or sandy. There are fine pastures, and the agricultural produce amply repays the labour of the husbandman. The Waldai Hills, so called from the town of Waldai, traverse the south part of the government to the frontier of Twer, forming a line of detached hills about 100 miles long and not more than 300 feet high, which are close to each other, and almost all of them cultivated. In the narrow intervening valleys there is a pleasing mixture of wood and water scenery. The principal rivers are the Msta, which comes from Twer, and the Wolchow. The Msta has some falls at Borovitschi, but is navigable below them, and runs into Lake Ilmen. The Wolchow, which issues from Lake Ilmen, and flows into the Ladoga Canal, is from 600 to 1200 feet in width, and has sufficient depth of water for barks during the whole summer. These two rivers, which are connected by Lake Ilmen, complete the great water-communication between the Volga and the Neva. The other chief rivers are, the Lovat, the Pola, and the Schelen, all of which fall into the Ilmen; the Schekona and the Wologa, which join the Volga; and the Sias and the Buscha, which run into Lake Ladoga. The government contains 42 rivers, and 3 large and 55 smaller lakes. The Bjelo Osero, or White Lake, in the north-east of the government, is the largest of the lakes; it is above 26 miles in length and as many in breadth, and is connected by the Schekona with the Volga. It covers an area of 432 square miles. Lake Ilmen, which is in the west of the government, is 26 miles long and 16 miles wide, receives many large and small rivers, and is connected by the Wolchow with the Ladoga Canal; its area is 346 square miles. Lake Wosché is about 14 miles long, and has an area of 177 square miles. The Novogorod Canal, 5 miles long, connects the Msta directly with the Wolchow, so as to avoid Lake Ilmen, the navigation of which is often dangerous on account of the frequent storms.

The climate is cold; winter begins a fortnight sooner and lasts a fortnight longer in the northern than in the southern circles. All the rivers and lakes are frozen during the winter, which lasts from November to May. Agriculture is the chief occupation of the inhabitants. The chief products are rye, barley, oats, some buckwheat, and great quantities of peas. Flax and hemp are cultivated for home consumption and for exportation. A variety of common pot-herbs, potatoes, and other vegetables, with some apples, and cherries are grown. A great part of the country is covered with forests; the most common trees are pine, fir, birch, alder, and elm; there is much underwood. Timber is a staple article of the government, but many of the forests are inaccessible in summer on account of the swamps. The crown forests alone cover a fifth part of the whole surface. All the forests abound in berries of various kinds; they likewise contain deer, elks, bears, wolves, lynxes, badgers, martens, hares, and squirrels. Owing to the length of the winter, the breeding of cattle is limited to what is necessary for the purposes of agriculture. The horses, oxen, and sheep are of the common Russian breeds; few swine and goats are kept. The fisheries on the lakes and rivers are extremely productive; in some of the rivers pearls are found. The mineral products are iron, freestone, coal, slate, salt, clay, lime, and marl. The principal salt-springs are at Staraja-Russa, where salt is made for the supply of the provinces of Novogorod and Twer.

Manufactures and Trade.—The manufactures comprise coarse linen, soap, tallow candles, and great quantities of potash. The bog-iron found in the government is smelted and manufactured into small articles of iron-ware. There are some distilleries. Bells are made at Waldai. The export trade of the province is confined to its own productions, corn, hemp, flax, salt, some iron, a great quantity of timber, some furs, hides, leather, and forage, most of which goes to St. Petersburg. The principal place of trade is Novogorod, the capital. The exports are conveyed to the commercial towns in caravans of 50 to 100 carts, or in sledges drawn by one horse. Great numbers of geese are sent from this government to St. Petersburg.

Towns.—*Novogorod, Novgorod, or Novgorod Welike*, that is, the Great New City, is the capital of the government. It is situated in 58° 32' N. lat., 31° 20' E. long., 120 miles S.S.E. from St. Petersburg, in a fine country on the banks of the Wolchow, where it flows out of Lake Ilmen, and on the Novogorod Canal. The city consists of three parts: the Kremlin, or fortress, standing on a steep hill on the north side of the river, surrounded with thick walls and towers; and on the south of the river the commercial town and the Sophienstadt, which are connected with the fortress by a handsome stone bridge. This city is one of the most ancient in the Russian empire, having been founded in the 5th century. In the 9th century it had its own prince, and Ruric made it the seat of a government, but the court was soon afterwards removed to Kiev. Jaroslaw, his successor, gave the city considerable immunities in 1036. The governors however made them-

selves independent of the Russian grand-dukes. The citizens, having gradually acquired more extensive privileges, established a republic in the 12th century, under a chief magistrate, whose office was hereditary, but whose power was limited. In the 13th century the Hanseatic League established a factory here, which continued 200 years. The town it is said had in the 15th century 400,000 inhabitants, which gave rise to the saying, "Who can resist God and the Great Novogorod!" Jealous of its prosperity, Ivan Wassiliowitch I. completely reduced it under his power in 1477, and it soon after began to decline. The final blow was given to its prosperity by the foundation of St. Petersburg, which diverted the commerce of the Baltic into a new channel. Novogorod is now reduced to comparative insignificance. It consists principally of scattered groups of mean houses, separated by ruins or by fields formerly built upon, and its population does not exceed 7000. Yet, when viewed from a distance, it has a very striking appearance, owing to its fine situation and the gilded domes of its 63 churches, which remain as monuments of its ancient splendour. The principal church is the cathedral, dedicated to St. Sophia, which stands in the Kremlin, and contains the coffin of St. Ivan of Novogorod, and celebrated bronze doors, 11½ feet high and 3 feet wide, adorned with numerous figures and inscriptions. The other buildings are, three monasteries, of which that of St. Sergius is the principal, a fine bazaar, a new palace, a poor-house, and an orphan school. The city contains a considerable sail-cloth factory, tanneries and soap and candle manufactories.

Other towns are—*Staraja-Russa*, on the Polista, south of Lake Ilmen, with 5600 inhabitants, and considerable salt-works; *Waldai*, on the west shore of the Waldai Lake on the eastern declivity of the Waldai Hills, with 3200 inhabitants; *Tikhwin*, on the Tikhwina, in the north of the government, population 4100; *Kirilow*, in the east of the government, with 2500 inhabitants, remarkable for the new canal opened in 1827, which joins the Schekona with the Suchona; *Bjelo-Oserak* on the south shore of the Bjelo-Osero, population 3000; *Borovitschi* at the head of the navigation of the Msta, population 3000; and *Ustjushna*, or *Schelesopotskajo*, with 3000 inhabitants, who have considerable trade in iron and timber.

NOZAY. [LOIRE-INFÉRIEURE.]

NU GAREEP. [NORTHERN SOVEREIGNTY.]

NUBIA, a general and rather vague denomination which is often used to designate a vast extent of territory stretching along the banks of the Nile from the southern borders of Egypt to the frontiers of Abyssinia and Sennaar. The natives however apply the name of Noubas, or Wady-el-Nouba, to a comparatively small tract lying between Derr and the borders of Dongola. The extent of information possessed by the ancients concerning these regions, and especially concerning the kingdom of Meroe, will be found stated under ETHIOPIA.

The Nubas, or Nubats, are mentioned as a nation bordering on Egypt in the time of Diocletian, who gave up to them a strip of land seven days' march in length, above the first cataract, on condition of their preventing the Ethiopians and Blemmyes from attacking Egypt. In subsequent centuries however a kingdom of the Noubas was formed, which is mentioned by the Arabian geographers as a powerful Christian country at the time of the invasion of Egypt by the Moslems. Dongola was the residence of the king of the Noubas. The country appears to have continued to profess Christianity, and to have retained its independence till the 13th century of our era. Makrizi, an Arabian writer, says Nubia was inhabited by two different races—the Noubas and the Mokras—both of which came originally from Yemen; and Burckhardt remarks that at the present time two different languages are spoken, both differing from the Arabic, namely, the Noubas and the Kenous. Both races are black or nearly so, but have not the negro features nor woolly hair. Many of them have the peculiar style of countenance which is often seen in sculptures of the Egyptian temples.

Soon after the invasion of Egypt by the generals of the kalif Omar, a Saracen army advanced to Dongola, and obliged Koleydozo, the king of the Noubas, to agree to pay an annual bakt, or tribute, of 860 head of slaves. This agreement was maintained with little interruption for more than five centuries, when the Noubas having attacked and destroyed Assouan, Salah-ed-Deen, the famous sultan of Egypt, sent an army against them and defeated them. In the following century Dhaher Baybar, the Mameluke sultan of Egypt, sent an army into the Noubas country, which took Dongola, ruined most of the churches, taking away the golden crosses and silver vessels, and carried away a vast number of captives. For many years these contests between the kings of Noubas and the sultans of Egypt were renewed; the Egyptians being uniformly successful in their inroads, but unable apparently to retain possession of the country. In one instance it is related by Makrizi ('History of the Sultans of Egypt,' written in the 14th century), that in the expedition against Samamoun, king of Noubas, Dongola was taken, priests and nobles abandoned the king, a banquet was held in the temple of Yeous (Jesus), and a new king appointed, who agreed to pay tribute. No sooner had the army left Noubas, than Samamoun returned in disguise to Dongola, and knocked at the door of all his officers, who, when they came out and saw him,

kissed the ground in sign of allegiance. On the next morning he assembled the army and proceeded to the mansion of the new king, sent the Moslem guard back to Egypt, and seizing his rival, dressed him in an ox-skin and tied him to a post, where he was left till he died. Samamoun then wrote to the sultan of Egypt, asking his pardon, and promising to forward the bakt regularly, and in the meantime sent slaves and other presents, which were accepted.

These events happened in the early part of the 14th century. After that time little is known of the history of Nubia, but it seems that the power of the kings of Dongola being broken, the country became divided into various petty states, while fresh immigrations of Beduin Arabs took place, and Christianity became gradually extinct in all the countries between Egypt and Abyssinia. The old kingdom of Nubia ceased to exist, and instead of it rose various petty Mohammedan states, such as Sukkot, Mahass, Dongola, Berber, and others, each governed by a melek, or chief. In 1820, Mehemet Ali, the pasha of Egypt, directed an expedition against Upper Nubia, which overcame the opposition of the principal states, took possession of Kandy, and ever since Nubia has remained in at least nominal subjection to the rulers of Egypt.

The appearance of part of the country of Lower Nubia is described under *BATH-EL-HAJAR*. The districts of Sukkot and Dar-el-Mahass, which lie farther south, are more favoured by nature. The inhabitants of Mahass speak the Nouba language, but appear to be a distinct race from the Noubas, having more of the negro character, though they pretend to be descendants of the Koreysh Arabs.

Shendy is the principal place in the country of Atbara, the ancient island of Meroe, so called because it is in a manner inclosed between the Nile on the west, the Atbara or Tacazze on the north and east, and the Dandar, Rahat, and other streams coming from the mountains of Abyssinia on the south. The interior of this vast country is little known; it is nominally divided between the states of Shendy and Halfay, which is to the south of the former, the two meleks or chiefs of which are said to be able to bring into the field 30,000 well-mounted horsemen. The town of Shendy, the capital of the country, about half a mile from the east bank of the river, is large, and perhaps contains 5000 or 6000 inhabitants; the streets are wide and airy; the houses are low, but well built of clay; there are regular market-places, where, besides meat, fowls, liquid butter, grain, and vegetables, spices from Jidda, gum Arabic, beads and other ornaments for the women are sold. Great numbers of slaves from Abyssinia, Sennaar, and Dar-fur are purchased at a moderate price: a handsome Abyssinian girl sells for 40 or 50 dollars.

There is another town on the opposite or western bank of the Nile, called *Shendy-el-Gharb* (Shendy on the West), which is also large and well built, and contains about 6000 inhabitants. It has three market-places, where the people of the country exchange dourra and dollars for other provisions and goods. The people of Shendy have a bad character: they are said to be fraudulent, debauched, and treacherous.

Many Arab tribes inhabit the territory of Shendy, the great part of whom still lead the Beduin life. The merchants of the town, and especially the brokers, are mostly foreign settlers from Dongola, Sennaar, Dar-fur, and Kordofan. A succession of Arab meleks, or kings, of whom Caillaud gives the series, had ruled Shendy for nearly two centuries and a half. The habits of the people are nearly the same as at Berber, but there is more wealth, in consequence of the great trade, and more well-dressed persons are seen than in the latter country.

Not far from eastern Shendy, to the northward, near a village called *Assour*, or *Hatchour*, are a number of tarabyls, or pyramids, the largest of which is about 60 feet high. There are also extensive fragments of walls, columns, square pillars, and the remains of a small temple 60 feet in length, near the borders of the desert, and those of a larger one, with its propylæum. At another place called *Naga*, a little above Shendy, on the river side, are the remains of a Typhonium and other ruins; and farther south, at some distance from the Nile, are the remains of other temples, and of an avenue of sphinxes, and several sculptures executed in a rude and heavy style. About 12 miles nearly due N. from *Naga*, in a valley bordering on the desert, are the ruins of *El-Meçacourat*, which consist of several temples of small dimensions, connected by galleries and terraces, with a number of small chambers, the whole surrounded by a double inclosure. It is supposed that this retired spot may have been the Hieropolis, or sacred college, of the priests of Meroe, and that the city itself was near *Assour*.

Halfay, which lies south of Shendy, and between it and Sennaar, is a less important state. The head town, of the same name, lies above the confluence of the White and Blue rivers, and on the east bank of the latter, in about 15° 40' N. lat.

The monuments of Lower Nubia have been described by Gau, Burckhardt, Belzoni, and others. The most remarkable are the temples of *Abousambul*, *Dandour*, and *Soleb*; though the last, lying above the second cataract, is considered by some writers as in Upper Nubia. The monuments of Upper Nubia and of Meroe have been described by Waddington, Caillaud, and Rüppel.

NUBLE. [CHILI.]

NUMANTIA, a celebrated town of the Celtiberi in Spain, was situated on the river *Durius* (*Duero*), at no great distance from its source. It was built on a steep hill of moderate size. According to *Florus* (ii. 18), it possessed no walls, but it was surrounded on three

sides by very thick woods, and could only be approached on one side, which was defended by ditches and palisades. (*Appian*, vi. 76, 91.) It was 24 stadia in circumference. (*Appian*, vi. 90.) Its position has been a subject of considerable dispute; but it appears most probable that it was situated 3 or 4 miles N. from the town of *Storia*, in *Castilla la Vieja*.

Numantia is memorable in history for the war which it carried on against the Romans for the space of fourteen years. (*Florus*, ii. 18.) The Numantines were originally induced to engage in this war through the influence of *Viriathus*. They were first opposed by *Quintus Pompeius*, the consul (B.C. 141), who was defeated with great slaughter (*Oros.*, v. 4), and afterwards by several other Roman commanders, who were all defeated; till at length the Roman people appointed *Scipio Africanus* consul (B.C. 134,) for the express purpose of the conquest of *Numantia*. After levying a large army, he invested the town; and, having in vain endeavoured to take it by storm, he turned the siege into a blockade, and obtained possession of the place (B.C. 133) at the end of a year and three months from the time of his first attack. The Numantines displayed the greatest courage and heroism during the whole of the siege; and when their provisions had entirely failed they set fire to the city, and perished amidst the flames.

(*Appian*, *Rom. Hist.*, vi.; *Florus*, ii. 17, 18; *Livy*, *Epitomes*; *Plutarch*, *Life of Marius*; *Eutrop.*, iv. 17; *Vell. Pat.*, ii. 4.)

NUMIDIA was originally bounded E. by the dominions of Carthage, W. by the *Mulucha* or *Molocath* (the modern *Mulwia*), N. by the Mediterranean, and S. by the *Gætuli*. The Roman province of *Numidia* was of much smaller extent, being bounded W. by the *Ampsagas* (*Wadi-al-Kebir*), and E. by the *Tusca* (*Zain*), and thus corresponded to the eastern part of *Algiers*.

The Numidians were originally a nomadic people; they were called by the Greeks *Nomades*, and their country *Nomadia*. (*Polyb.*, xxxvii. 3; *Sallust*, 'Jug.' 18; *Pliny*, 'Nat. Hist.' v. 2.) When the Greek and Roman writers speak of the Numidians the term is usually limited to the two great tribes of the *Massasylii* and *Massylii*, the former of whom extended along the northern part of Africa from the *Mulucha* on the west to the *Ampsagas* on the east, and the latter from the *Ampsagas* to the territories of Carthage.

When the Romans first became acquainted with the Numidians, which was during the course of the second Punic war, *Syphax* was king of the *Massasylii*, and *Gala* king of the *Massylii*. *Gala* had a son of the name of *Masinissa*, who possessed extraordinary powers both of mind and body, and who served under *Scipio* in the African campaign before the close of the second Punic war, and in many engagements rendered essential service to the Roman arms. The great services of *Masinissa* did not pass unrewarded by the Romans. At the conclusion of the second Punic war he obtained all the dominions of *Syphax*, and a considerable part of the Carthaginian territory, so that his kingdom extended from the *Mulucha* on the west to *Cyrenaica* on the east, and completely surrounded the small district which was left to the Carthaginians on the coast. (*Appian*, viii. 106.) *Masinissa* laid the foundations of a great and powerful state in *Numidia*. He introduced the arts of agriculture and civilised life, amassed considerable wealth, and supported a well-appointed army. He died at the age of 90, B.C. 149.

Masinissa left three sons, *Micipsa*, *Mastanabal*, and *Gulussa*. The two latter died soon after the death of their father, but *Micipsa* lived to B.C. 118, and bequeathed the kingdom to his two sons *Adherbal* and *Hiempsal*, and to his nephew *Jugurtha*, who was an illegitimate son of *Mastanabal*. *Jugurtha* however, not content with a divided sovereignty, murdered *Hiempsal*, and obliged *Adherbal* to fly to Rome, where he appealed to the senate against the usurpation of his cousin. Many of the senators however were bribed by *Jugurtha*, and a commission was sent to Africa in order to divide *Numidia* between *Adherbal* and *Jugurtha*. The commissioners awarded the better part of the country to *Jugurtha*; but scarcely had they left Africa before he again attacked *Adherbal*, defeated him in battle, besieged him in *Cirta*, and, having obliged him to surrender, put him to a cruel death. When this news reached Rome war was declared against *Jugurtha*, which, after being carried on with various success, was at length terminated by the capture and death of *Jugurtha* B.C. 106.

After the death of *Jugurtha* the kingdom of *Numidia* appears to have been given to *Hiempsal II.* (*Hirtius*, 'Bell. Afr.' 56), who was probably the nephew of *Hiempsal I.* the son of *Micipsa*. *Hiempsal II.* was succeeded, about B.C. 50, by his son *Juba I.*, who took an active part in the civil wars against *Cæsar*. On the death of *Juba I.* (B.C. 46), *Numidia* was reduced to the form of a Roman province by *Cæsar*, who entrusted the government of it to the historian *Sallust*. (*Dion Cassius*, xliii. 2.) In the settlement of the empire after the death of *Anthony* (B.C. 30), the kingdom of *Numidia* was given to *Juba II.*, son of *Juba I.*, but he retained it only till B.C. 25, when he received *Mauritania* in exchange, and *Numidia* was finally reduced to a province.

The chief town in *Numidia* was *Cirta* (the modern *Constantina*, or *Constantineh*), which was the principal residence of *Syphax*, *Masinissa*, *Micipsa*, and *Juba*. *Hippo Regius*, the second town in the province, was situated near the coast, about a mile and a half S. from *Bona*. It was founded by the Phœnicians (*Sallust*, 'Jug.' 19), and is well known as the see of *St. Augustine*. It was called *Hippo Regius* to distinguish it from *Hippo Zarytus* in the province of *Africa*. It was a favourite

place of residence with the Numidian kings. (Sil. Italia, iii. 259.) At the mouth of the Tusca was the small town of Tabraca, the name of which is still retained in the island of Tabarkah at the mouth of the river. South of Tabraca, probably on the Tusca, was the important town of Vaga, or Vacca, which is described by Sallust as the chief commercial town in Numidia. (Sallust, 'Jug.,' 47.) South-west from Vacca was Tagaste, a free state according to Pliny (v. 4), and celebrated as the birthplace of St. Augustine.

The position of Zama, near which the memorable battle was fought between Scipio and Hannibal (B.C. 201, is uncertain. Some writers have considered it the same as the modern Zamora, which is situated south-west of Setif; but others, with more probability, identify it with the modern Zainah, south-east of Setif. Zama was strongly fortified, and was occasionally the residence of the Numidian kings. (Sallust, 'Jug.,' 56, 60, 61.) Juba fled to this town after he had been defeated by Caesar at Thapsus, but the inhabitants refused to admit him within the walls. (Hirtius, 'Bell. Afr.,' 91.) Zama is mentioned by Pliny (v. 4) as one of the free towns of the province; and the name of the bishop of Zama occurs in the councils of the African Church. [ALGERIE; MAURITANIA.]

NUN, CAPE. [MAROCCO.]

NUNEATON, Warwickshire, a market-town and the seat of a Poor-Law Union, in the parish of Nuneaton, is situated on the river Anker, in 52° 31' N. lat., 1° 28' W. long., distant 20 miles N. by E. from Warwick, 100 miles N.W. from London by road, and 96½ miles by the North-Western railway. The population of the town of Nuneaton in 1851 was 4859. The living is a vicarage in the archdeaconry of Coventry, and diocese of Worcester. Nuneaton Poor-Law Union contains 7 parishes and townships, with an area of 20,428 acres, and a population in 1851 of 13,532. The parish church is a small gothic building. The Independents, Baptists, and Roman Catholics have places of worship. The Free Grammar school, founded in 1553 by Edward VI., has an income from endowment of about 300*l.* a year, and had 56 scholars in 1851. There is also a National school. The Coventry Canal passes the town on the west. The chief branch of industry in the town and neighbourhood is the riband manufacture. The market is on Saturday; and there are three yearly cattle-fairs.

NÜRNBERG (incorrectly called *Nuremberg*), an ancient city of Bavaria, in the province of Franconia, and formerly a flourishing member of the Hanseatic League, is situated in 49° 27' N. lat., 11° 4' 15" E. long., 145 miles by railway N. by W. from Munich, and has 45,000 inhabitants, the great majority of whom are Lutherans. It stands in an extensive highly cultivated plain, 1008 feet above the level of the sea, on both banks of the river Pegnitz, which divides the city into two unequal parts: the northern is called the St. Sebaldus side, and the southern and larger the St. Lawrence side. The Pegnitz forms three islands within the walls, which are connected with each other and with the city by seven stone and nine wooden bridges, and one suspension-bridge.

Nürnberg is surrounded by an old wall, which has eight gates and a great number of round and square towers, and is strengthened at intervals by ramparts and small bastions. A moat, 100 feet broad, 50 feet deep, and lined throughout with masonry, incloses the whole. The four principal arched gateways are flanked by massive cylindrical watch-towers. The circuit within the walls is 3¼ miles, within which space there are many squares, or markets, and gardens. The streets are in general broad and well paved, but crooked and irregular. The houses are very old-fashioned, retaining externally, with little alteration, the old gothic style, and their internal arrangements recalling to mind the mode of private life of past ages. The fronts of the houses are often adorned with paintings: they are narrow, but often very deep, with a back front in a parallel street. One of the most remarkable ancient buildings is the old fortress called the Reichsfeste, which was probably erected in the 10th century under the emperor Conrad I. This fortress stands on a pretty steep eminence, and is an excellent specimen of the ancient style. It contains a gallery of pictures in 10 apartments, and many paintings on glass. The town-hall, one of the finest in Germany, is 275 feet wide, and contains among other curiosities a number of paintings by Albert Dürer, Hirschvogel, and others. Almost all the churches are worthy of observation for their architecture and the works of art which they contain. That of St. Sebaldus contains the tomb of the saint adorned with fine statues of the twelve apostles, a noble altar, the celebrated crucifix by Veit Stoss, and painted-glass windows of extraordinary beauty. The church of

St. Lawrence is a fine gothic edifice, extremely rich in old German paintings, but it is particularly celebrated for its tabernacle (Sacraments Hauslein), a tapering gothic spire of the most minute and graceful stonework, 64 feet high, supported by three kneeling figures, portraits of the artificers of the work, Adam Kraft and his two apprentices. To each of these churches a Latin school is attached. The church of St. Egidius, which was built in the Italian style at the beginning of the 18th century (1711-18), has a fine altar-piece by Vandyck. Near this church is the gymnasium, in front of which the city erected in 1826 the statue of Melancthon, by whom that institution was opened in 1526. The church of St. Clara has paintings on glass of the year 1278. In the chief market-place are the Frauen-Kirche, or Church of Our Lady, remarkable for its richly-carved decorations and sculptures by early German artists; and the Schöner Brunnen, or Beautiful Fountain, an elegant gothic spire of open stone-work, adorned with numerous statues of Christian, Heathen, and Jewish worthies. Both of these works date from about 1360. The former Dominican church contains the city library of 20,000 volumes, with a collection of the works of Melancthon and of works written at the time of the Reformation. Nürnberg has a gymnasium, a polytechnic institution, a great number of schools for all classes; several free schools; a seminary for teachers; a society for the promotion of manufactures, and a great many collections, both public and private, of works of art, antiquities, &c.

Before Vasco de Gama had doubled the Cape of Good Hope, Nürnberg was one of the most important commercial cities in Europe. It forwarded to the North the rich productions of India, which it received from Italy. The residence of the burgraves (from the year 1060) and occasionally that of the emperors was a great advantage, and above all its manufactures brought a great influx of wealth. Nürnberg was celebrated 400 years ago for working in brass, iron, and other metals, and for the manufacture of a long list of articles comprised under the general denomination of Nürnberg wares, musical and mathematical instruments, hardware, and toys of all kinds, both of metal and wood. The fine arts also flourished, especially painting and engraving. Its trade is still considerable in articles of its own manufacture in iron, steel, and brass; and in hardware of all kinds, turnery, looking-glasses, musical instruments, paper, engravings, painters' colours and pencils, glass, porcelain, watches, calicoes, carpets, toys, &c. There is an annual fair, at which a great deal of business is done. A branch railway 5 miles in length connects Nürnberg with Fürth, a manufacturing town of 15,000 inhabitants.

Nürnberg is first mentioned in history in 1050, and obtained its first charter in 1219. The city was governed by an oligarchy, like that of Venice. The emperor appointed the burgrave, who was generally regarded with little favour by the citizens. The ancestors of the royal family of Prussia first appear in history as burgraves of Nürnberg, and they were constantly at feud with the citizens until the burgrave Frederick IV. sold his castle and a portion of his rights to the town, in order to raise money to purchase the Mark of Brandenburg. No sooner had the citizens concluded the purchase than they levelled the castle to the ground. Nürnberg retained its freedom among all the changes made in Germany till 1803. It had a territory, for the most part well cultivated, nearly 500 square miles in extent, with 40,000 inhabitants, and a revenue of 800,000 florins; but the public debt amounting in 1797 to nine millions of florins, the revenue was not sufficient to pay the interest. The differences with the king of Prussia, who took possession of part of its territory, necessarily increased its difficulties, till the Act of the Confederation of the Rhine assigned over its territory to the king of Bavaria.

Albert Dürer was a native of Nürnberg, and also Melchior Pfünzing and Hans Sachs, the poets, and Martin Behem, who made the first serviceable terrestrial globe. Among the numerous inventions for which the world is indebted to Nürnberg are watches (first called Nürnberg eggs), the pedal, the air-gun, the clarinet, brass, the lock for fire-arms, and many others.

OADBY. [LEICESTERSHIRE.]

OAKHAM, or OKEHAM, Rutlandshire, a market-town, and the seat of a Poor-Law Union, in the parish of Oakham, is situated in the vale of Catnos, in 52° 40' N. lat., 0° 44' W. long., distant 95 miles N.N.W. from London by road, and 102½ miles by the Great Northern and the Leicester and Peterborough railways. The population of the town in 1851 was 2800. The living is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. Oakham Poor-Law

Union contains 80 parishes and townships, with an area of 55,080 acres, and a population in 1851 of 11,513.

Oakham had an ancient castle, of which the county-hall is a portion; the other parts are in ruins. The gate of the castle-yard and the interior of the county-hall are covered with horse-shoes; the lord of the manor being authorised by ancient grant or custom to demand of every peer, on first passing through the lordship, a shoe from one of his horses, or a sum of money to purchase one in lieu of it. The

town consists of neatly-built houses. The agricultural-hall, erected in the High-street in 1837, is a commodious building. The church is chiefly of perpendicular character. It has a fine tower and spire; the spire is said to have been erected by Roger Flore, who died in 1483. The Wesleyan Methodists, Independents, Baptists, and Quakers have chapels. The Free Grammar school, founded in 1581, had 81 scholars in 1853. There are also National schools, a clerical and general book club, and a dispensary. A county court is held. In an open spot near the castle is a jail and house of correction for the county.

The Oakham Canal affords facilities for supplying the town with coal, and for sending corn to the manufacturing districts. Malting is carried on. A market is held on Saturday for corn, and on Monday for butter. There are several cattle fairs in the course of the year. The assizes and quarter sessions are held in Oakham.

OAKHAMPTON. [OKEHAMPTON.]

OAKLEY, GREAT. [ESSEX.]

OAXACA. [MEXICO.]

OBAN, Argyleshire, Scotland, a parliamentary burgh and seaport, is situated on the west coast of Argyleshire, about 35 miles N.W. from Inverary, in 56° 27' N. lat., 5° 27' W. long. The population was 1742 in 1851. Oban unites with Ayr, Campbeltown, Inverary, and Irvine in returning one member to Parliament. Besides the parish church, there are chapels for the Free Church, the United Presbyterians, Independents, and Episcopalians. The harbour is completely sheltered by the island of Kerera. The port is frequented by numerous fishing-boats, a few sloops, and by several steamers in the summer, conveying tourists to Staffa, Iona, and the Caledonian Canal. In the neighbourhood are the ruins of Dunolly castle, the ancient seat of the Macdougalls of Lorn.

OBERSTEIN. [BIRKENFELD.]

OBIDOS. [ESTREMADURA, Portuguese.]

OBV, RIVER. [SIBERIA.]

OCANA, a town of Spain, in the ancient province of Castilla la Nueva, and modern province of Toledo, 35 miles S.E. from Madrid, and 30 miles E. from Toledo, is situated on the great road between Madrid and Andalucia, where another road branches off to the east, leading to Valencia. It is consequently a place of considerable traffic, and had in 1845 a population of 4789. It is surrounded by old walls, and contains four parish churches, an hospital, a cavalry barracks, and an aqueduct of Roman construction, which supplies the town with excellent water. It has some manufactures of coarse woollen and linen cloths, soap, and leather. The Spanish army of Andalucia under General Aricaza was here defeated by the French army under Marshal Soult, Nov. 19, 1809.

OCAÑA. [NEW GRANADA.]

OCEANIA, a name given by Balbi and other French geographers to a fifth division of the earth. They make it extend from about 98° E. to 105° W. long.; the northern boundary being the Indian Ocean, Malacca Strait, the Chinese Sea, and the Pacific along the parallel of 35° N.; the southern boundary being the 56th parallel of south latitude. The name is thus made to comprise the Andaman Isles, all the islands of the Indian Archipelago, Sumatra, Java, Borneo, Celebes, the Moluccas, the Philippines, Formosa, Australia, New Guinea, New Zealand, and the countless groups of islands in the Pacific within the limits above stated to the islets of Sala-y-Gomez, the most eastern of the whole.

OCHILL HILLS. [CLACKMANNANSHIRE; FIFESHIRE; KINROSS-SHIRE.]

OCKBROOK. [DERBYSHIRE.]

OCKENDON, SOUTH. [ESSEX.]

OCZAKOW, a town in the government of Kherson, in South Russia, is situated in about 46° 37' N. lat., 31° 30' E. long., on a small brook near the mouth of the river Dnieper, which is here about 4½ miles wide between Oczakow and Cape Kilborun. It was formerly one of the most important fortresses in this part of the country, and had a citadel, the walls of which were 25 feet high. The population was at that time 5000. It is chiefly remarkable for the importance that was attached to it in the wars between the Turks and the Russians in the last century, when it was frequently taken and occupied by both parties. After a six months' siege by the Russians under Suwarroff, it was taken by storm in 1788; and the Porte ceded the place, which was quite devastated, at the peace of 1791. The town has greatly declined since the rise of Odessa, and the population is now stated to be only about 3000.

ODENSE. [DENMARK.]

ODENWALD. [GERMANY.]

ODER. [AUSTRIA; BRANDENBURG.]

ODESSA, a seaport and important commercial town of South Russia, in the government of Kherson, stands in 46° 28' N. lat., 30° 44' E. long., at the north-western extremity of the Bay of Adschai, on the western shore of the Black Sea, and has a population of about 80,000, excluding the garrison. A miserable village called Kodschabeg, marked the site when the empress Catherine obtained possession of the country as far as the Dnieper in 1791. In 1794 the foundation of the town was laid, and public works were commenced. The site is well chosen. There is no river, but the bay has sufficient depth of water, almost to the shore, for the largest men-of-war. The bay is seldom frozen, and then only for a short time.

The emperor Alexander appointed the duke of Richelieu, a French emigrant nobleman, who had entered the Russian service, to the post of governor of the new town, and under his judicious administration its prosperity rapidly increased. In 1804 the population already amounted to 15,000. The town is regularly built in the form of an oblong parallelogram, on a limestone cliff sloping towards the sea. From the south-eastern extremity of the town runs a long fortified mole, called the Quarantine Mole, which terminates in a lighthouse, and shelters a great crowd of ships of all nations. The Imperial Mole at the northern extremity of the cliffs and of the town, is also fortified, and shelters the Russian ships, and large stores on the quays. The harbour is further defended by a battery at the foot of the cliffs, and nearly midway between the moles. The harbour, which is formed by these two large moles, and can contain some hundreds of ships, is defended by strong works. At the eastern extremity is the citadel, and at the other the lazaretto; on a projecting point of land on the south side of the bay there is a lighthouse. The roadstead is very spacious, and the anchorage safe, being protected against all winds except the south-east.

The town is well built; the streets, which are planted with acacia trees, are broad and straight, but only partially paved; in wet weather they are almost impassable for mud, in dry for dust. The houses are in general two stories high, and built of stone. There are many fine buildings; among them the church of St. Nicholas, which is the Russian cathedral, the Protestant church, the admiralty, the hospital, the custom-house, the exchange, and the theatre, where Russian pieces, Italian operas, and Greek tragedies are performed. There is a fine public garden in the middle of the town. Between the harbour and the town there is a line of barracks, consisting of sixteen detached edifices; there are in the town a very large number of corn-magazines, well built of stone, resembling palaces without windows; and a bazaar, which contains 550 shops. The shops are fine and well supplied with European goods. In the centre of the boulevard, which is the principal promenade, and which is connected with the quay by a magnificent staircase of 200 stone steps in ten flights, supported on arches, is a statue of the Duke of Richelieu. At each end of the boulevard is the exchange, and on the cliff at the other end stands the princely mansion of Count Woronzoff, and a majestic line of houses, built in the Grecian style, runs along the whole boulevard.

To the north of the town there are magazines of salt and meat, and to the west of them reservoirs of water. Odessa used often to suffer from want of water, but it is now supplied by means of an aqueduct. The chief establishment for education is the Richelieu lyceum; near it are the museum of antiquities, and the library. The museum contains remains from the site of ancient Greek colonies on the northern shores of the Black Sea. The town has also schools for jurisprudence, political economy and commerce, a training school, an academy of Oriental languages, several public baths, and a botanic garden. The inhabitants are composed of Russians, Jews, Poles, Greeks, Armenians, Germans, &c.

In the year 1817 Odessa was declared a free port for thirty years. The space allotted to the free port was inclosed with a circular wall to prevent smuggling into the interior. The most important exports are corn to Western Europe, and to the countries round the Mediterranean, including Constantinople; flax, timber, tallow, and hides. The imports are colonial produce, specie, and manufactures of all kinds. English, French, and Italian mercantile houses are established in the town; many Greeks, Jews, and Armenians are also largely engaged in trade. Odessa has considerable breweries and distilleries, and manufactories of woollens and silks, tobacco, soap, and candles. There are many gardens and large vineyards in the environs, beyond which the dreary steppe commences.

In 1845 Odessa exported 1,439,178 quarters of wheat: in 1847, a famine year in the west of Europe, the exports rose to 2,081,878 quarters; in 1852 the quantity exported was 1,464,818 quarters.

In 1846 the total value of the imports was 7,746,407 silver rubles; in 1847 11,113,298 silver rubles, including 4½ millions of specie. In 1849 the value of the goods imported rose to 10,373,360 silver rubles; this large increase in the imports was caused by merchants importing as largely as possible before the increased duties imposed in that year took effect.

The total value of the exports in 1846 amounted to 22,763,052 silver rubles; in 1847 to 34,764,962 silver rubles; and to 19,177,625 silver rubles in 1849.

In 1844 about 8½ per cent. of the wheat exported from Odessa went to Great Britain; 3½ per cent. to the north of Europe; and 88½ per cent. to the Mediterranean sea-board. In 1849 these ratios had changed as follows:—50 per cent. to Great Britain; 2½ per cent. to the north of Europe; and 47½ per cent. to countries round the Mediterranean.

The defences of Odessa were greatly injured in the attack of the French and English fleets upon the town, April 22, 1854.

ODIHAM, Hampshire, a market-town in the parish of Odiham, is pleasantly situated in 51° 15' N. lat., 0° 56' W. long., distant 25 miles N.E. from Winchester, and 40 miles S.W. by W. from London. The population of the parish of Odiham in 1851 was 2811. The living is a vicarage in the archdeaconry and diocese of Winchester.

Odiham was anciently a free borough, belonging to the bishop of Winchester. It possessed a royal residence and park; the remains of

the mansion have been converted into a farm-house. Besides the parish church there is a chapel for Independents. An Endowed school for boys, founded in 1750, has a yearly income from endowment of 38*l*., and had 43 scholars in 1852. There are also National schools. The Basingstoke Canal affords facilities for trade to the district. There are two tanneries and some extensive breweries in the town. The market-day is Tuesday. There are two yearly fairs. About a mile north-west from the town are the remains of an old castle, in which David Bruce, king of Scotland, was confined for eleven years after being taken at the battle of Neville's Cross.

OEDENBURG, the capital formerly of the palatinate, now of the district of Oedenburg in Hungary, is situated in a pleasant and fruitful country, amidst extensive vineyards and woods of chestnut-trees, about 2½ miles from the south-western part of the Neusiedler See, 57 miles by railway S.W. from Vienna, and has about 13,000 inhabitants, who have been celebrated from remote ages for the culture of the vine. The town is not large, but it is regular and well paved; the suburbs are extensive and well built. It has several fine churches and convents, a Calvinist church, a Catholic and a Protestant lyceum, a gymnasium, a military academy, and a theatre. The inhabitants manufacture considerable quantities of woollen cloths, calico, playing-cards, snuff and tobacco, potash, nitre, and sugar. Oedenburg is a great mart for the sale of cattle, pigs, and the agricultural produce of the surrounding country—wine, corn, wax, honey, and tobacco. In the vicinity there are very extensive coal-mines. Oedenburg was founded by the Romans, and was the station of the 15th legion, which was called *Sompronium*, whence *Soprony*, the Hungarian name of the town. Many Roman antiquities, inscriptions, coins, lamps, sarcophagi, &c., have been found in the neighbourhood.

OEHRINGEN. [JAXT.]

OELAND. [ALAND.]

OELS. [SILESIA.]

OESSEL, an island in the Baltic, situated between 58° and 58° 40' N. lat., 21° 40' and 23° 20' E. long., stretches across the entrance of the Gulf of Livonia, or Bay of Riga. It extends from south by west to north by east about 45 miles, with an average width of about 25 miles; a narrow peninsula extends from its south-western corner about 20 miles southward. The area of the island is about 1200 square miles. The surface is uneven and rocky, but it is covered with a layer of fertile vegetable mould. The winters are much less severe than on the adjacent continent. The island produces grain, of which a part is exported, flax, hemp, and a little tobacco. A considerable portion of the island is used as pasture-grounds. The fisheries round the coasts of the island afford occupation to many hands. The inhabitants amount to about 40,000. The island belongs to the government of Livonia, of which it constitutes the circle of Arensburg, so called from the principal town Arensburg. [LIVONIA.] Oesel was early taken possession of by the Danes, who ceded it to Sweden in 1645. In the beginning of the 18th century it was taken by Russia, to which power it was finally ceded in 1721, together with Livonia.

OETTINGEN, formerly an independent county in the north part of Suabia, now belongs partly to Bavaria and partly to Würtemberg. It is a very fertile country, watered by the rivers Wernitz and Eger, and produces corn, hemp, flax, and timber. It has a good breed of horned cattle and horses, and is particularly famous for its geese. It has likewise iron, saltpetre, and remarkably fine stone for building. The county is now divided between the two houses of Oettingen-Spielberg and Oettingen-Wallerstein. Oettingen-Spielberg is in Bavaria, and has an area of 84 square miles. The prince resides in the town of Oettingen on the Wernitz, in 48° 57' N. lat., 10° 38' E. long. It is a well-built town, with two palaces, a gymnasium, a Lutheran and a Roman Catholic church, some manufactures of cotton, linen, and worsted, and about 3500 inhabitants. Oettingen is a station on the railway from Augsburg to Nürnberg, and is 40 miles S. from the latter.

The prince of Oettingen-Wallerstein has a territory of 252 square miles, partly in Würtemberg and partly in Bavaria. *Wallerstein*, the capital and residence of the prince, is a well-built market-town, with 1500 inhabitants. The prince's palace is a handsome building, and contains a good library and a collection of paintings.

OFEN. [BUDA.]

OFFENBACH. [HESSE-DARMSTADT.]

OFFIDA. [FERMO.]

OGLIO, RIVER. [AUSTRIA.]

OHIO, one of the United States of North America, extends between 33° 24' and 42° N. lat., 80° 34' and 84° 42' W. long. It is bounded E. by the state of Pennsylvania; S.E. and S. by the Ohio River, which separates it from the states of Virginia and Kentucky; W. by Indiana; N.W. by Michigan; and N. by Lake Erie. The area is 39,964 square miles. The population (only 45,365 in 1800) in 1850 was 1,980,329 (of whom 25,279 were free-coloured persons), or 49.55 to a square mile. The inhabitants being all free, the federal representative population is the same as the total population in 1850; this, according to the present ratio of representation, entitles the state to send 21 representatives to Congress, being the largest number next to New York and Pennsylvania, and 8 more than Virginia, the state next in representative rank. To the Senate, like each of the other states, Ohio sends 2 representatives.

Surface and Soil.—The surface of this state may be divided into

two nearly equal portions, the Hilly and Prairie Regions; the Hilly Region comprehending the eastern and southern districts, the Prairie Region the northern and western districts.

The *Hilly Region* contains some level and low land extending about a mile and a half along the banks of the Ohio. It is very fertile, though in some parts swampy and subject to inundations. Behind this level tract the country rises suddenly into steep hills, called the River Mountains, which in general range between 300 and 500 feet above the level of the river. From these hills the country extends in an uneven hilly plain furrowed by valleys. Rocks rarely appear on the surface to any great extent. The general elevation of these uplands varies from 800 to 1000 feet above the sea-level. The bottoms along the principal rivers, which are frequently extensive, are exceedingly fertile, and produce very rich crops of grain. The declivities of the hills, when not too steep for cultivation, and the higher grounds between them, are less fertile, but by no means barren. The soil of both the bottoms and hills is almost uniformly an argillaceous loam: the soil of the valleys is very deep, and contains much lime and vegetable mould. In its natural state the whole region is covered with trees, but though timber is still abundant vast quantities have been cleared away. The uplands contain different kinds of oak, hickory, walnut, ash, poplar, dogwood, mulberry, sassafras, and some yellow pine. The levels along the Ohio and the other rivers were in their natural state overgrown with button-wood, white pine, hemlock, butternut, the tulip-tree, locust, honey-locust, black alder, beech, elm, cedar, and cypress. The maple-tree is common all over the state.

The *Prairie Region* is an extensive undulating plain, the general elevation of which hardly exceeds 1000 feet. A tract of slightly-elevated upland forms the watershed between the rivers which run southward to the Ohio and northward to Lake Erie. The surface of this plain presents an alternate succession of woodlands and prairies. In the eastern districts the woodlands prevail. The prairies are both wet and dry, but are all fit for cultivation. Along the south-western shores of Lake Erie is an extensive tract covered with a deep swamp called the Black Swamp, and swamps occur elsewhere also; but the whole extent of swamp-land in the state only amounts to 303,320 acres. A great part of the marshy and wet country is heavily wooded, especially with beech. The valleys by which this table-land is intersected, and in which the rivers flow, are less depressed below the surface of the plain than farther south; but they are broader and more regularly defined, being separated from the adjacent uplands by parallel ranges of bluffs, or mural banks. They are generally very fertile. Besides beech, which is most common on the swampy tracts, this region still contains large quantities of oak, ash, elm, hickory, sugar-maple, wild cherry, black walnut, poplar, and in some places cotton-wood and sycamore, most of which, especially the sycamore, attain a gigantic size.

Hydrography, Communications.—Ohio is in almost every part largely provided with rivers and smaller streams, furnishing considerable navigable facilities, and a vast amount of water-power for mechanical purposes. The Ohio River runs along the eastern and southern boundary-line of Ohio: it is described under *MISSISSIPPI RIVER*. The other rivers which drain this country, though comparatively small, are of great importance as affording the means of establishing a very extensive water-communication in the interior of the state, and between the countries bordering on Lake Erie and on both sides of the Ohio River. The most important of the rivers which fall into Lake Erie are—the Maumee, the Sandusky, and the Cuyahoga. The *Maumee* is formed by the union of the St. Mary's, the Little St. Joseph's, and the Auglaize rivers. The united river is about 100 miles long, and navigable for 18 miles, to Perrysburg, by steamers and schooners: in spring and fall it is navigable by river-boats to Fort Wayne in Indiana. It empties itself into the western corner of Lake Erie by a wide mouth called Maumee Bay. The *Sandusky* river originates in Richmond and Crawford counties, in two branches which flow westward, and after their union turn northward. Towards its mouth it declines to the north-east, and falls into Sandusky Bay, a shallow sheet of water united to Lake Erie by a narrow strait. Its length is about 100 miles, and it is navigable for small boats at high water. The *Cuyahoga* is the most important of the rivers which fall into Lake Erie, though its course does not exceed 60 miles. It rises west of 81° W. long., about 10 miles from the shores of Lake Erie. It flows first in a southern and south-western direction to 41° 8' N. lat., where it takes a north-north-western course to Lake Erie, where its mouth forms the harbour of Cleveland. In its natural state it was not navigable, but the waters are used to feed the Erie and Ohio Canal.

The most important rivers which fall into the Ohio are—the Muskingum, Scioto, and Miami rivers. The *Muskingum* rises near 41° N. lat., south of the southern bend of the Cuyahoga River, in two branches, of which the eastern is called Tuscarawas Creek and the western Chippewa Creek. By their union they form the Muskingum, which has a length of about 120 miles, and falls into the Ohio at Marietta. By means of locks and short cuttings it has been rendered navigable to Dresden, 96 miles. The *Scioto* River rises near 40° 30' N. lat., and flowing southward nearly through the middle of the state, falls into the Ohio at Portsmouth, after a course of about 250 miles. It is navigable for large boats nearly 200 miles upward. The *Miami* originates not far from the source of the Scioto River, and runs in a

general southern direction about 120 miles. It becomes navigable a few miles above Piqua for keel-boats during half the year. In the dry season it ceases to be navigable at Dayton, about 80 miles from its mouth. The navigation is always rendered difficult by numerous sand-bars.

Ohio in addition to its rivers possesses very extensive and complete artificial means of communication. Of canals there are about 830 miles in operation. The chief line is that known as the Ohio and Erie Canal, which commences at Cleveland, where the Cuyahoga falls into Lake Erie, and joins the Ohio at the mouth of the Muskingum River. The Ohio is here only 24 feet lower than the surface of Lake Erie, and the highest part of the intervening country is only 337 feet above Lake Erie. The canal which unites the Muskingum and Scioto rivers, was begun in 1825 and finished in 1832; it is 307 miles in length, and has several short branches. Other important canals are the Miami, 65 miles long, and the Miami Extension 131 miles long; the Muskingum Improvement, the Sandy and Beaver Canal, and various shorter but very valuable lines.

The ordinary carriage- and bye-roads are abundant, and in general well laid out and well kept. The railways of Ohio in length exceed those of any other state in the Union, and are among the first in completeness and value. The chief railway centres are Cincinnati on the Ohio; Cleveland and Sandusky on Lake Erie; and Columbus, Mansfield, Mount Vernon, Bellefontaine, Newark, Lanesville, Green-ville, Xenia, Sidney, Dayton, Hamilton, Springfield, and some other towns in the interior. In all, according to the 'American Railway Times,' there were in Ohio on the 1st of January, 1855, 47 lines of railway in operation, of the aggregate length of 2927 miles; and 1681 miles were in course of construction or projected.

Geology, Mineralogy, &c.—In no part of Ohio are there any eruptive or metamorphic rocks. The lithology of the state in fact belongs entirely to the Palæozoic series. Lower Silurian strata occupy a considerable area, of which Cincinnati is the centre; the rocks are mostly blue-limestone. Bounding the Lower Silurian on the north and east is a tolerably wide belt of Upper Silurian strata; chiefly consisting of what is here known as the cliff limestone. Outside these again occur strata of the Devonian system, comprising for the most part only a single group, which contains very fossiliferous limestone beds of a light gray, often whitish colour, and frequently much resembling the limestone of the Silurian series with which they are in connection. Devonian strata likewise occupy the whole northern border of the state, forming almost everywhere the shores of Lake Erie. Much of the centre of the state belongs to the Lower Carboniferous formation, which is throughout in contiguity with the Devonian. This formation is here represented by black argillaceous slate, very fine whitish sandstone, and limestone. The eastern side of the state is almost entirely occupied by Upper Carboniferous strata, or coal-measures, forming a part of the great coal-field of Ohio, Pennsylvania, and Virginia.

Ohio has very considerable mineral wealth, though it is as yet only partially developed. Iron-ore of much richness extends over an area above 100 miles long, and 10 or 12 miles wide; and for the most part in close connection with coal. The coal, which as mentioned above, prevails throughout the eastern side of the state, is bituminous, and of good quality: the coal-measures are said to be from 7000 to 8000 feet thick, the coal itself occurring in beds of from 3 to 30 feet in thickness. The number of mines is rapidly extending as wood increases in price, owing to the demolition of the forests. The principal coal-mining districts are Talmadge in Summit county, Pomeroy in Meigs county, and Nelsonville in Athens county; but mining is also carried on in the adjoining counties. Salt-springs of great value occur throughout the area occupied by the Lower Carboniferous strata; and rock-salt in the Devonian, at Athens, on the Muskingum, and elsewhere. Gypsum is found in many places. Limestone of various kinds, as seen above, forms the characteristic rock of most of the prevalent formations of Ohio. Much of it is valuable as a building stone, and much more for burning. Marble of good quality is obtained. At Yellow Springs, 64 miles N. from Cincinnati, are medicinal springs much resorted to by invalids. There are sulphur springs in Delaware county.

Climate.—The climate of Ohio is colder than that of England in winter, and warmer in summer. The mean annual temperature at Cincinnati on the Ohio, near the south-western corner of the state, which is sheltered on the north by high hills, is 53.56°, or about 8.86° higher than that of London. The mean temperature of the winter at Cincinnati is 36°; that of the summer at Cincinnati 72°. At Steubenville on the Ohio, near the centre of the eastern border of the state, the mean of the highest temperature during 21 years was 95°, of the lowest 12°. Vegetation does not begin before the first week of March. The first night-frosts occur at the end of September or beginning of October. Most of the rivers, including the Ohio, are covered with ice every winter. The south-west wind prevails for nine months in the year, from March to November included. In December, January, and February the wind generally blows from the north-west. The greatest quantity of rain falls in April and May; the mean annual quantity is nearly 40 inches.

Productions.—The wealth of Ohio chiefly consists in its agricultural productions. Maize is its staple, a larger quantity being grown than

in any other state, and about one-tenth of the entire crop raised in the Union. The wheat crop is about one-seventh of that raised in the Union, and greater than that of any other state except Pennsylvania. Rye, oats, barley, buckwheat, and tobacco are also extensively cultivated. Cotton arrives at maturity only in the districts along the Ohio River, and is liable to be injured by frost; but the cultivation of cotton, as well as of indigo, which was formerly grown to some extent, has been nearly or quite abandoned. Potatoes are raised in very large quantities; sweet potatoes and other vegetables are also largely grown. A good deal of attention is given to the cultivation of flax and hemp. Most of the fruit-trees of England succeed well, especially apples; and the orchard products form an important item in the agricultural returns. Maple-sugar is made in large quantities. The wild grape grows luxuriantly on the southern side of the hills; and vineyards have been very successfully planted—Ohio now ranking as the second wine-growing state of the Union. The cultivation of the grasses is not neglected.

Horned cattle are very abundant, a greater number being possessed by Ohio than any other state. Swine are also extremely numerous. Of both horses and sheep Ohio owns a greater number than any other state. The cattle and swine are driven in great numbers to the Atlantic states for sale, or sent down the Mississippi. Salt-pork also constitutes an important article of exportation. A larger quantity of wool is sent to market by Ohio than any other state. Butter and cheese are made very extensively.

Bears and deer are still found in the forests, and the flesh of both is dried and cured for sale. The woods abound with wild turkeys, geese, ducks, pheasants, and partridges. The rivers, especially the Ohio, are well stocked with fish, and some of them attain a great size. Turtles are also found in them.

Manufactures, Commerce, &c.—The manufactures of Ohio have not attained to very great importance. The total number of males above 15 years of age employed in commerce, trade, manufactures, mechanic arts, and mining, at the Census of 1850 was 142,687; the number employed in agriculture was 270,362. The principal manufacture is of iron, the various branches of which in 1850 employed nearly 6000 persons. There are very few cotton-mills; woollen-factories are more numerous, and the woollen manufacture appears to be growing in importance. Tanneries are also numerous. Distilleries are on an extensive scale, Ohio making a greater quantity of spirits than any other state. There are in the great towns large numbers of machine-shops, locomotive-works, railway-car and carriage factories, hardware and cutlery works, breweries; tobacco, oil, soap, and candle factories; glass-works, potteries; grist, flour, saw, and paper mills, &c.

The direct foreign commerce of Ohio is not very great, its exports and imports being chiefly made through New Orleans or one of the Atlantic ports. Almost the only direct foreign trade is that carried on with Canada by the ports of Lake Erie. The total value of the exports for the year ending June 30th 1853 was 158,418 dollars; of the imports, 847,760 dollars, of which goods to the value of 750,598 dollars were conveyed in American vessels. The domestic commerce has increased enormously during the last few years. In 1850 the exports from the lake ports alone amounted to 17,627,885 dollars, and the imports to 25,035,955 dollars; and both exports and imports have since much more than doubled—thus, the exports of Sandusky, which in 1850 amounted to about 3 million dollars, had increased in 1852 to above 20 million dollars, and the imports from 7 million to 45 million dollars, the other lake ports meanwhile increasing proportionably. The exports of Cincinnati are said to average 24 million dollars a year, and the imports 40 million dollars. The total shipping owned by the state in 1850 amounted to 64,463 tons, of which more than two-thirds belonged to the lake ports; 28,653 tons were propelled by steam-power. In 1863 there were 90 vessels built in the state, of which 4 were ships, 28 schooners, 28 sloops and canal-boats, and 35 steamers.

Divisions, Towns, &c.—Ohio is divided into 87 counties. Columbus is the political capital; but Cincinnati is the commercial centre, and by far the most populous city in the state. CINCINNATI is described in a separate article; the other more important towns we notice here; the population is that of 1850:—

Columbus, the capital, stands on rising ground on the left bank of the Scioto River, in 39° 57' N. lat., 83° 3' W. long., 896 miles W.N.W. from Washington: population, 17,882. The site of the city, when fixed on in 1812 as that of the future capital of the state, was in the wilderness. The city is regularly laid out, with broad streets crossing at right angles. The capitol, or state-house, is a costly new edifice, erected in place of a former one destroyed by fire in 1852: it is 304 feet long and 184 feet wide. The other principal public buildings are the state penitentiary; state asylums for the blind, deaf and dumb, and insane; and several churches, colleges, and schools. Since the formation of the extensive state railways, many of which centre in Columbus, the city has become a busy commercial and manufacturing place, and is rapidly growing in wealth and population.

Cleveland, a city and port of entry, on the right bank of the Cuyahoga River, at its outlet in Lake Erie, population 17,034, is the chief lake-port of the state, and the commercial capital of northern Ohio. Cleveland is the northern terminus of the Ohio and Erie Canal, and the centre of the lake, shore, and northern railways, which place it in communication with all the trading towns of this and the adjoining

states, while it has by the lake considerable commerce with Canada. The greater part of the city occupies a dry and healthy site. The streets are wide, and the houses generally well built. Besides the court-house, there are numerous churches and schools, a lyceum, three music-halls, &c. The harbour, which is one of the best in the West, has been improved by the carrying out of a pier on each side 425 yards into the lake, with a lighthouse at the head of each. There are extensive factories of locomotives, machinery, &c.; also flour-mills, &c. Ship-building is carried on to some extent. *Ohio City*, on the opposite bank of the Cuyahoga, population (including Brooklyn) 6375, though under a distinct incorporation, is really a suburb of Cleveland. The two places are connected by bridges.

Dayton, a city, and the capital of Montgomery county, on the Miami Canal, at the confluence of the Mad River, 66 miles W.S.W. from Columbus: population, 10,977. The city is regularly laid out, and neat in appearance. The court-house, which is built of white marble, is 127 feet long by 62 feet wide, and is described as in "style of architecture that of the Parthenon, with slight improvements." There are several churches and schools, a popular college, a literary association, three banks, two large market-houses, &c. Dayton possesses a vast amount of water-power, and is the principal manufacturing town in these parts. There are very extensive manufactories of railway-cars, stoves, hardware, paper, flour, linseed-oil, oil-cake, &c. The town is also a very important centre of canal and railway traffic.

Akron, at the junction of the Ohio and Pennsylvania and the Ohio and Erie canals, 125 miles N.E. from Columbus, population 3266, is a place of considerable trade, and has good railway accommodation. *Canton*, on the Ohio and Pennsylvania railway, 105 miles N.E. by E. from Columbus, population 2603, is one of the rising towns of the state. *Chillicothe*, on the right bank of the Scioto, 40 miles S. by E. from Columbus, population 7100, is a large and well-built place; contains a court-house, several churches, schools, market-houses, and other public buildings; holds a high rank as a commercial and manufacturing town; and possesses ample railway and canal communication. *Circleville* occupies the site of some ancient fortifications on the left bank of the Scioto, 28 miles S. by E. from Columbus: population, 3411. The town is laid out with great regularity; contains several good public buildings, and is rapidly growing in importance as a commercial and manufacturing village. *Hamilton*, on the left bank of the Miami River, 90 miles W.S.W. from Columbus, population 3210, is a leading centre of trade and commerce for the south western part of the state. The Miami Canal passes through the town, and several railways connect here. *Lancaster*, on the Hooking River and Canal, 27 miles S.E. from Columbus, population 3483, is a place of considerable trade, and has large flour-mills, machine-shops, &c. *Mansfield*, on the Sandusky, Mansfield, and Newark railway, 67 miles N. by E. from Columbus, is a busy town of 3557 inhabitants. *Marietta*, between the Great and Little Muskingum rivers, at their confluence with the Ohio, about 100 miles S.E. from Columbus, population 3175, is the oldest town in the state, having been founded in 1788. It is regularly laid out, contains the usual county buildings, churches, and schools, Marietta college (which has 6 professors and 68 students), possesses extensive iron-foundries, steam saw-mills, flour-mills, &c., and has regular communication by steam-boats with Cincinnati, Pittsburg, &c. *Massillon*, on the left bank of the Tuscarawas River, and on the Ohio Canal, 95 miles N.E. by E. from Columbus, population about 3500, is the capital of a rich agricultural district, and is locally known as 'the Wheat City,' from the great amount of business done in that grain. The town is pleasantly situated, well-built, contains several excellent public buildings, carries on a large trade, has considerable manufactures, abundant railway and canal accommodation, and is rapidly rising to be one of the leading towns of the interior. *West Massillon*, on the opposite side of the river, is partaking of its prosperity. *Newark*, at the junction of the upper branches of the Licking River, 83 miles E. by N. from Columbus, population 3654, is well situated for trade, being on the Ohio and Erie Canal, and the Central Ohio railway. *Piqua*, on the right bank of the Miami River and on the Miami Canal, 68 miles W. by N. from Columbus, population 3277, has considerable commerce, manufactures, and trade. *Portsmouth*, on the left bank of the Scioto, at its confluence with the Ohio, and at the southern termination of the Ohio and Erie Canal; 85 miles S. by E. from Columbus: population 4011. The town is regularly laid out, contains some handsome public buildings, and carries on a good trade. Coal and iron mines and stone quarries are worked in the vicinity. *Sandusky City*, a city and port of entry on the south side of Sandusky Bay, 3 miles from Lake Erie: population, 5087. The city is regularly laid out, and contains several handsome buildings. Sandusky is one of the chief lake ports. The wharfs and ship-yards are extensive and commodious, and their appearance, except during a short portion of winter, betokens an active commerce. The imports of Sandusky city in 1852 amounted to 40,396,085 dollars; the exports to 18,739,814 dollars. There are extensive manufactories of locomotives, &c. *Springfield*, on the left bank of the east-fork of Mad River, 45 miles W. by S. from Columbus, population 5103, is an important railway centre, and carries on extensive manufactures. Wittenberg college and theological seminary is situated here. *Stowenville*, on the Ohio, 125 miles E.N.E. from Columbus, population 6140, stands on rising ground, is regularly laid out, well-built, contains several good public buildings, and has exten-

sive woollen and cotton factories, machine-shops, iron- and brass-foundries, copper-works, rope-walks, boat-building yards, glass-works, &c., and is furnished with ample railway facilities. *Toledo*, a city and port of entry, on the right bank of the Maumee, 5 miles above its opening into Maumee Bay, Lake Erie; population, 3829. Toledo was founded in 1831 and is rapidly growing into importance owing to its convenient situation in connection with Lake Erie, the northern termination of the Wabash and Erie Canal, and the several lines of railway which now unite here. The imports at Toledo in 1852 amounted to 37,565,029 dollars; the exports to 19,738,923 dollars. Very large quantities of railway iron, grain, flour, and pork, with lard, &c., are brought here from the interior for exportation. *Xenia*, 48 miles W.S.W. from Columbus, population 3024, is a place of considerable trade, and the centre of an extensive railway traffic. *Zanesville*, on the left bank of the Muskingum, 50 miles E. from Columbus: population, 7929. The town is well-built, lighted with gas, and well supplied with water. It contains the county buildings, 14 churches, an atheneum, primary and high schools, &c. There is a great amount of water-power, which has been rendered largely available for manufacturing purposes, and bituminous coal is obtained in abundance in the vicinity. There is also ample canal and railway accommodation, and Zanesville is rapidly becoming one of the leading towns of the state. It is united by bridges with South Zanesville, West Zanesville, and Putnam, which are closely connected with it in business arrangements.

Government, History, &c.—The present constitution was framed and adopted in 1851. By it the right of voting is vested in every white male citizen of the United States, 21 years of age, who has resided in the state for one year. All elections are by ballot. The legislature, styled the General Assembly, is elected for two years, and consists of a Senate of 35 members, and a House of Representatives of 100 members. The governor is also elected for two years. The judges are elected by the people for 5 years. The revenue for the year ending November 15, 1853, was 2,865,907 dollars; the expenditure was 2,696,118 dollars. The debt of the state January 1, 1854, was 17,165,428 dollars. Great attention is paid to education in the state; there being several colleges, and numerous academies and upper schools, while the constitution provides that "there shall be a thorough and efficient system of common schools established throughout the state."

This country was first visited by the French from Canada in the 17th century, by the route of the lakes of Ontario and Erie, but no settlements were formed until the following century, when the British from Pennsylvania and Virginia began to occupy the country. The French tried to prevent this by establishing small forts from Presqu'île on Lake Erie to the Ohio along the channel of the Alleghany River. This however was considered by the British government as an encroachment, and it led to the war of 1755, by which the French lost Canada and were expelled from North America. Some settlements which were attempted after that time were destroyed by the Indian tribes then in possession of the country. Ohio was comprehended in the cession made by Virginia in the year 1787, after which the country, including the states of Michigan, Indiana, and Illinois, was formed into a territory. The first permanent settlement in Ohio was formed at Marietta about 1783, but its progress, as well as that of some others farther west, was slow, until the Indians, in 1795, ceded a great portion of country to the general government by the treaty of Greenville. The population now increased rapidly, and in 1803 Ohio was admitted into the Union as a sovereign state.

(*Statistical Gazetteer of the United States; Seventh Census of the United States; Official Report; American Almanac, 1855; Mather, Geological Survey of the State of Ohio; Marcou, Geological Map of the United States, &c.*)

OISE, a department in the north of France, lying between 49° 4' and 49° 46' N. lat., 1° 42' and 3° 8' E. long., is bounded N. by the department of Somme, E. by that of Aisne, S. by Seine-et-Marne and Siene-et-Oise, and W. by Eure and Seine-Inférieure. Its form approximates to that of a parallelogram, measuring about 65 miles from east to west, and 40 miles from north to south. The area of the department is 2260 square miles. The population in 1841 was 398,868; in 1851 it amounted to 403,857, which gives 178.68 inhabitants to a square mile, being 4.07 above the average population for the whole of France.

The department is formed out of part of the old province of Île-de-France, and a small portion of Picardie. It lies almost entirely in the basin of the Oise, which has a general inclination to the south-west, with the exception of a narrow zone along the northern boundary, which slopes northward towards the Somme. A broken hilly country, which forms the western part of the arrondissement of Beauvais, and separates the valley of the Thérain from the Norman district of Bray, is drained by the Epte, a feeder of the Eure. A small portion of the south-east of the department is traversed by the Ourcq. The general surface presents extensive plains, with here and there masses of isolated hills. Along the left bank of the Oise there is a chain of hills; and another runs close along the northern boundary, forming part of the watershed between the basins of the Somme and the Seine.

The department is named from its chief river—the Oise, the ancient *Isara*, which rises in the forest of Thierache, near Chimay, in the Belgian province of Hainault, within 3 miles of the French frontier. Having entered France, its general course is south-west across the

department of Aisne, wherein it becomes navigable at Chaunay; continuing in the same direction across the department of Oise, in which it passes Noyon, Compiègne, and Creil, it enters Seine-et-Oise, and throws itself into the Seine at Conflans-Sainte-Honorine, a few miles below Pontoise. Its whole course is 137 miles in length, 75 of which are navigable. The canals that unite the basins of the Somme and the Escaut with the basin of the Seine, enter the Oise. The principal feeders of the Oise from the left bank are—the Ton, the Serre, the Lette, the Aisne [AISNE], the Autonne, and the Nonette; from the right bank—the Noirieu, the Brèche, and the Thérain.

The soil of the plains is in general good, consisting of a strong calcareous clay, mixed in some places with flints and gravel. There is also a good deal of light sandy soil and some arid sandy flats, which are either totally barren, or covered with stunted underwood; the hills, on which the soil is thin and light, are in many parts overgrown with forest trees. There are extensive marshes and alluvial deposits in the valleys of the Oise and the Thérain. The formation of the department is calcareous.

The climate is healthy, but rather damp, the winters being commonly long and rainy; snow sometimes lies for a month in the north of the department.

The staple agricultural products are wheat, oats, and beetroot; mixed grain, rye, barley, pulse, potatoes, and some buckwheat are also grown. The system of cultivation consists of a plain fallow, or green crop, followed first by wheat and then by oats. The produce of wheat averages about 20 bushels, oats 40 bushels an acre. A surplus over the home consumption is exported. Other objects of culture are hemp, flax, chicory, onions, artichokes, turnips, carrots, and a vast quantity of other pot-herbs for the supply of Paris. Rape, poppy, and other oleaginous plants are grown. The vine is cultivated in several districts of the south and east; but the wine of the department is bad, and the breadth of land under vines is diminishing yearly. Cider and eating apples, and prodigious quantities of black and red cherries are grown. Apple-trees are planted in rows along all the highways, and in the fields they are often grown in quincunxes. Cider is the common beverage of the country people.

Saddle and draught horses are reared, being a cross between the native breed and English blood-horses or the Arab horse. Cattle are comparatively few in number; sheep are the principal stock. Indeed owing to the scarcity of water the country is ill adapted for cattle; the wells are in many instances 200 feet deep. A great number of calves however and some fat cattle are supplied to the Paris markets; in the hilly country west of the valley of the Thérain, cattle-feeding is the common occupation of the people, and a good deal of cheese and butter is made. The common breed of sheep is not good; but in some districts a cross with Spanish merinos has produced an improved stock, with a good carcass and a heavy fine fleece. They are always folded by night, and fed by day under the guardianship of shepherds and dogs; in winter they are housed, and fed on lucerne and sainfoin hay. Poultry is very abundant. The black eagle, a rare bird, inhabits the forests of Compiègne. Farms vary in size from 600 to 700 acres, except in the neighbourhood of towns, where subdivision of the land is carried to great extremes. The farm buildings are large, commodiously built of stone, and roofed with tiles or slates. At harvest time Belgian reapers assist in cutting the wheat, which is stacked on the land, and thrashed by a machine worked by horses. The farmers are generally wealthy, and many of them farm their own lands.

The manufactures of the department are various; the principal of them are broadcloth, tapestry, carpets, blankets, and other woollen textures for which Beauvais has been long famous. Linen, printed cottons, duck, lace, small wares, mirrors, spectacle glasses, toys, fancy cabinet work and turnery, porcelain, pottery, beet-root sugar (for the manufacture of which there are several factories in the department), paper, beer, ropes, tiles, bricks, leather, &c., are among the other industrial products. The various agricultural and industrial products of the department find ready outlets by the Oise, the Ourcq, and the canals connected with them. About 200 fairs are held in the year.

Building-stone, millstone-grit, paving-granite, chalk, marl, potter's and porcelain earths, and fossil marble are found.

The department is crossed by 13 state, 28 departmental, and 29 parish roads; and by the Paris-Amiens railroad, which traverses it from south to north, sending off a branch to the north-east from Creil up the valley of the Oise through Compiègne to St. Quentin.

The department is divided into 4 arrondissements, which with their subdivisions and population are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Beauvais . . .	12	244	101,983
2. Clermont . . .	8	178	90,515
3. Compiègne . . .	8	165	98,190
4. Senlis . . .	7	129	83,169
Total . . .	35	716	373,857

1. Of the first arrondissement and of the whole department the capital is BEAUVAIS. *Grandvilliers*, 17 miles N. by W. from Beauvais,

at the intersection of the great roads to Rouen, Calais, Amiens, and Paris, though a small place of only 2000 inhabitants, has important manufactures of woollen cloth, serge, hosiery, soap, oil, &c.; and a considerable trade in corn, brandy, cider, charcoal, horses, and cattle. *Mers*, 15 miles S. from Beauvais, is the centre of a large manufacture of fancy goods, such as fans, billiard-balls, pearl-buttons, dominoes, button-moulds, chessmen, fancy work-boxes, dice, metal-clasps, toys, &c.; it has 2237 inhabitants in the commune.

2. The second arrondissement is named from its chief town *Clermont*, or *Clermont-Oise*, which is prettily situated on the summit and slopes of a hill 16 miles E. by S. from Beauvais, 51 miles by railway from Paris, and has a population of 3271 in the commune. The site of the old fortifications is now covered with modern buildings and alleys of trees; of its defences there remains only the ancient castle of the Prince of Condé, which stands on the top of the hill and commands a magnificent view over one of the richest parts of Picardie. This castle has been since 1826 a central prison for female convicts. The town has a college, a tribunal of first instance, linen and cotton manufactures, saltpetre-works, breweries, tan-yards, bleach-works, besides a considerable trade in corn, fruit, and cattle. *Breteuil*, 18 miles by railway N. from Clermont, is an ill-built town, with 2399 inhabitants, who manufacture soldiers' shoes, shawls, serge, woollen-stockings, paper, leather, and pottery. The vast buildings of the abbey of Sainte-Marie, rebuilt in 1028 and still entire, form the only remarkable object in the town. A piece of ground, about half a mile south-east from Breteuil, on which the remains of ancient walls, besides Celtic and Roman coins, have been found, is said to be the site of the *Bratuspanium* of Julius Cæsar ("Bell. Gall." ii. 13). *Crévecoeur*, a few miles W. from Breteuil, is a small manufacturing town, with a population of 2394. *Mouy*, prettily situated between two hills in a valley watered by the Thérain, is a bustling little town with 2700 inhabitants, who manufacture woollen-cloth for soldiers' uniforms, serge, merinos, woollen-yarn, &c.

3. The third arrondissement takes its name from its chief town *COMPIÈGNE*. *Noyon*, said to be the ancient *Noviodunum*, and under the Roman empire *Noviomagus*, is a well-built town situated on the slope of a hill surrounded by gardens, and on the Vorse, a feeder of the Oise, 12 miles by railway N.E. from Compiègne, and has 5950 inhabitants. The town, which is entered by four principal gates, has a fine cathedral church, built by Pepin-le-Bref, and a large town-hall, which dates from 1499. It has some trade in corn, linen, canvass, and leather. Noyon is the birth-place of Calvin, and a station on the St. Quentin railway.

4. In the fourth arrondissement the chief town *Senlis* is situated on the slope of a hill, 29 miles S.E. from Beauvais, and has a tribunal of first instance and 5320 inhabitants. The town, which stands near the junction of the Nonette and the Aunette, two small streams that form a feeder of the Oise, consists of an ancient part or city and three suburbs. The city occupies the site, and contains some remains, of a Roman town, also a castle built in the time of St. Louis, and a handsome cathedral church. The houses of the town are well built, but the streets are mostly narrow and crooked. There are cotton-spinning factories, tan-yards, printing offices, linen-bleaching-works, and chicory-mills in the town. *Creil*, 6 miles N.W. from Senlis, at the junction of the railroads from St. Quentin and Amiens to Paris, stands on the left bank of the Oise, and has about 2000 inhabitants, many of whom are engaged at the extensive potteries and porcelain-works near the town. About 5 miles S. from Creil, and about a mile E. of the Paris-Amiens railroad is *Chantilly*, a pretty little town with 2446 inhabitants, situated on the Nonette, near an extensive forest, to which it gives name. Chantilly is one of the principal centres of the lace manufacture in France; both the common flaxen lace, and that made of silk, and called 'blonde,' are extensively manufactured. The royal park, palaces, and waterworks of Chantilly, were formerly famous all over Europe. During the first revolution the palace built by the great Condé was sold and demolished, its contents having been first removed to Paris. After the Restoration the ruins were concealed from view by plantations, the smaller palace repaired, and great improvements made; so that the palace, with the magnificent gardens, grounds, and sheets of water that surround it, still constitute a domain worthy of the admiration of foreigners. The hospital of Chantilly, founded by the princes of Condé, is a beautiful mass of building, and one of the best-regulated establishments of the kind in France. *Crépy*, or *Crépy-en-Valois*, 14 miles N.E. from Senlis, formerly the capital of Valois and a royal residence, is remarkable only for the ruins of its former structures and fortifications. It has 2873 inhabitants, who trade in corn, household linen, and thread. *Nanteuil-le-Haudouin*, a small town of about 1600 inhabitants, at the head of the valley of the Nanette, is the chief place of a canton. It had formerly a large castle, which was entirely destroyed in the first French revolution. In the canton of Nanteuil is the pretty village of *Ermenonville*, famous for its handsome church and castle. The castle and estates of Ermenonville were held by the Bouteiller family of Senlis, who were descended from Charlemagne, till 1350, when it was sold to the count of Lorris. In 1590 the property passed to the Devise, one of whom (archbishop of Auch) was buried in the church. The estate was again sold in 1754 to René Hatté, maternal uncle of the Marquis de Girardin, who became afterwards possessor of Ermenonville. The marquis, whose descendants

still hold the property, rebuilt the château and improved the grounds with admirable taste. Jean Jacques Rousseau died in the château of Ermenonville July 2, 1778, and was buried in the Île-des-Peupliers, in one of the pieces of water in the park, whence they were removed by decree of the National Convention to the Pantheon Oct. 11, 1794. *Pont-St-Maxence*, 7 miles N.E. from Creil, on the St-Quentin railroad, is a well-built market-town, with clean well-paved streets and 2455 inhabitants. It stands on the Oise, which is here crossed by a fine stone bridge.

The department forms the see of the Bishop of Beauvais: is included in the jurisdiction of the High Court of Amiens, within the limits of the University-Academy of Paris, and belongs to the 1st Military Division, of which Paris is head-quarters. It returns 3 members to the Legislative Assembly of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

OKEHAMPTON, or OAKHAMPTON, Devonshire, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Okehampton, is situated at the junction of the East and West Okement rivers, in 50° 44' N. lat., 4° 1' W. long., distant 22 miles W. from Exeter, and 195 miles W.S.W. from London. The population of the parish of Okehampton was 2165 in 1851; that of the borough was 1556. The borough is governed by a mayor, justice, and burgesses. The living is a vicarage in the archdeaconry of Totnes and diocese of Exeter. Okehampton Poor-Law Union contains 28 parishes and townships, with an area of 126,797 acres, and a population in 1851 of 20,401.

The town of Okehampton consists of several streets irregularly laid out. In the market-place is an old chapel of ease, which was originally founded as a chantry. The tower, of granite, is of perpendicular character. The parish church, which is situated on high ground, was rebuilt within the last twelve years. The Wesleyan Methodists and Independents have places of worship. There are National and Infant schools; a literary society, with a library; and a branch savings bank. The market-day is Saturday; cattle-fairs are held in March, May, July, and August. Okehampton formerly sent members to parliament, but was disfranchised by the Reform Act. In the river Okement small trout of excellent quality are taken. Okehampton Castle, formerly belonging to the Courtenays, is now a ruin.

OKHOTSK, a town on the northern shore of the Sea of Okhotsk, which separates the peninsula of Kamtchatka from the continent of Asia, is situated in 58° 40' N. lat., 148° 18' E. long. The town is built on a hill on the right bank of the Ochota, and about 3 miles from its mouth. It is small, consisting only of a few hundred houses, and the inhabitants, formerly about 2000, are now estimated at only 800. It was formerly, and perhaps still is, the port by which the Russian American Company brought their furs from America; they were then transported by land through Yakutsk to Irkutsk, and thence to Kiachta, to be exchanged for articles of Chinese production. The houses are built of wood; but there is a government-house, an hospital, and large storehouses in the town. The neighbouring country is barren, yielding nothing but furs. The mouth of the Ochota has only 9 feet of water, and is only accessible from June to September, being blocked up with ice and snow the remainder of the year. The Russian government some years ago resolved to select some other site with a better harbour whereon to build a new town; and the mouth of the river Uda, in the Sea of Okhotsk (55° N. lat., 136° E. long.), was favourably mentioned as having a fine harbour sheltered by the Shantar Islands. The nature of the country or district of Siberia named Okhotsk, after the town, is described in ALTAI MOUNTAINS, KAMTCHATKA, and SIBERIA.

OKHRIDA, a town of Albania, in European Turkey, situated on the north-eastern shore of the Lake of Okhrida, in about 41° 8' N. lat., 21° 5' E. long., is the see of a Greek bishop, and has about 6000 inhabitants. It is built on or near the site of the ancient Lynchidus, which in ancient times gave its name to the lake. The town lies at the foot of an eminence, the summit of which is crowned by a castle, in which the Turkish governor of the surrounding province resides. Silver-ore and sulphur are procured from mines near the town. The Lake of Okhrida is about 18 miles long, and is 8 miles across in the widest part. It is in the valley watered by the Black Drin, which flows through the lake. It abounds with fish. The pashalic or district of Okhrida is mountainous and well wooded; it is watered by the Black Drin and the Soombi. It is tolerably productive in corn, maize, rice, tobacco, cotton, hemp, fruit, and wine. Cattle and bees are reared, and game is tolerably abundant. The inhabitants are reputed to make the best soldiers among the Albanians.

OLD MELDRUM. [ABERDEENSHIRE.]

OLDBURY, Worcestershire, a town in the parish of Hales Owen, is situated near the junction of Staffordshire, Shropshire, and Worcestershire, in 52° 30' N. lat., 2° W. long., distant 29 miles N.N.E. from Worcester, and 120 miles N.W. from London. The population of the town of Oldbury is given in the Returns of the Census of 1851 as 5114, but this does not include the whole of the town. The entire population in 1851 was 11,641.

The town of Oldbury has very much increased of late years, owing to the extension of the iron trade. The parochial chapel of Christ-church is a commodious brick edifice with a square tower. There are chapels for Wesleyan, Primitive, and New Connexion Methodists, Baptists, Independents, Christian Brethren, Roman Catholics, and

Unitarians; and National, Free, and other schools. Besides numerous iron- and coal-mines in the vicinity, there are manufactures of iron and steel, of locomotive engines, malt-mills, edge-tools, hollow iron ware, bricks, earthen draining tubes, and of alkali. Boat-building is carried on, and there are corn-mills and breweries. Oldbury is nearly surrounded by the Birmingham Canal; the river Tame runs through the town, turning several mills in its course; and the Stour Valley railway passes close to it. A customary market is held weekly on Saturday. A county court is held in the town.

OLDBURY-ON-SEVERN. [GLOUCESTERSHIRE.]

OLDCASTLE, county Meath, Ireland, a market-town and the seat of a Poor-Law Union, is situated on the Dublin, Trim, and Enniskillen road, in 53° 46' N. lat., 7° 7' W. long., 24 miles N.W. from Trim, 51 miles N.W. from Dublin. The population in 1851 was 1072. Oldcastle Poor-Law Union comprises 15 electoral divisions, with an area of 85,912 acres, and a population in 1841 of 41,305; in 1851 of 29,282. The town contains a parish church, chapels for Roman Catholics and Methodists, a National school, and a Free school—a handsome edifice, capable of accommodating 1000 children, and supported by an endowment of 750*l.*, bequeathed by Lawrence Gibson, Esq. In the town are a neat market-place and court-house, and a dispensary and Union workhouse. Near the town are extensive corn-mills. The market is on Monday, for yarns and provisions. Petty sessions are held monthly.

OLDENBURG, a grand-duchy in the north of Germany, consists of three distinct portions. 1. The Duchy of Oldenburg, properly so called, which lies between 52° 54' and 53° 44' N. lat., 7° 40' and 8° 45' E. long., contains 2083 square miles. It is bounded N. by the North Sea; E. by the Hanoverian province of Bremen, the territory of the city of Bremen, and the Hanoverian province of Hoya; S. by Osnabrück; and W. by the Hanoverian province of Meppen and East Friesland. 2. The Principality of Lübeck, which is surrounded by the duchy of Holstein, contains 137 square miles. One large portion is compact and unbroken; the remainder is scattered on the banks of the Schwartau and the Trave. 3. The Principality of Birkenfeld (area, 194 square miles), which is noticed in a separate article. [BIRKENFELD.] These territories form the grand-duchy of Oldenburg, and together with the lordship of Knipphausen, which has peculiar relations with Oldenburg, have a total area of 2431 square miles, with a total population of 285,149, according to the census of 1852.

The duchy of Oldenburg proper is a part of the great plain of Northern Germany, without mountains or hills, and without forests. Heaths and moors alternate with cultivated spots. The most extensive of the moors is the Great Saterland Moor, which is traversed by the Söste and the Leda, or Saterems, and covers a large part of Oldenburg and Hanover, extending from the Hunte to the Ems. The coasts are low, and protected against the inroads of the sea partly by dunes and partly by dykes, like those in Holland. The mouths of the Weser and the Jahde are lined with dykes. The soil of the interior of the country is poor, but there is rich marsh-land on the banks of the Weser and at the mouth of the Jahde. The principal rivers are the Weser (which forms the boundary between Oldenburg and the province of Bremen), the Jahde (which enters and gives name to the large Bay of Jahde, an inlet of the North Sea), the Hunte (a feeder of the Weser), and the Hase and the Leda, tributaries of the Ems. There are no large lakes; the most considerable, the Zwischenahner Meer, is 6 miles in circumference, and its banks are surrounded by picturesque well-wooded eminences.

The Bay of Jahde is entered from the North Sea, to the south of Wangeroog Island (which belongs to Oldenburg), by a strait about 4 miles wide, which separates the territory of Knipphausen on the west from a projection of the duchy to the west of the mouth of the Weser. Inside this strait the bay widens out to about 12 miles from east to west, and about 10 miles in its greatest length from north to south. The depth of water in the bay (it is said) is nowhere less than 6 fathoms, and the river Jahde itself is deep enough for the largest merchant ships to enter. Prussia, with the view of forming a naval port and arsenal on the North Sea, purchased the sovereignty of the bay and 5000 morgen (3154 acres) of land, near the mouth of the river Jahde, in 1853, from the grand-duke of Oldenburg, and entered into possession of the territory thus ceded in December 1854.

The climate is damp and subject to frequent fogs. The natural productions are corn of all kinds, flax, hemp, some hops, culinary vegetables, timber for building, and wood for fuel. There are the usual domestic animals, especially very good horses, poultry, game, fish, and bees. Turf is dug for fuel; pipe- and brick-clay are found, and also building-stone. The principality of Lübeck is flat, and resembles Oldenburg in its soil and climate, but it contains some beautiful lakes, especially those of Ploen and Eutin. The Schwartau and the Trave are the chief rivers.

The chief occupations of the inhabitants are agriculture and the breeding of cattle. There are very few villages; the farm-houses lie quite isolated in the centre of the farms. There are no great manufactures; but the people make considerable quantities of coarse linen, worsted stockings, and thread. Oldenburg is extremely well situated for commerce, but the trade is chiefly a coasting-trade, which is carried on in vessels with one or two masts, from 20 to 40 tons burden, calculated for navigating the shallows ('watten') that occur between the Ems and the Eider. Ships are built at several places on the Weser

and along the coast. The exports include horses, oxen, linen, leather, raw hides, rags, &c., principally to Holland and the Hanseatic cities. The revenue, according to the budget for 1854, was, from the duchy of Oldenburg, 891,000 thalers; from the principality of Lübeck, 137,400 thalers; and from Birkenfeld, 116,700 thalers. The expenditure for these three divisions in the same year was estimated at 979,000, 148,800, and 127,800 thalers respectively. The public debt in 1853 amounted to 1,400,000 thalers. The armed force maintained amounts to 3673 men. Of the inhabitants, who are all Germans (with the exception of about 1500 Jews), 72,546 are Catholics, and all the rest Protestants, chiefly of the Lutheran Church. The Lutheran is the established religion.

With respect to education, Oldenburg is rather backward. The rarity of villages renders it difficult to establish schools. The various branches of a learned education are now taught in the Protestant gymnasium at Oldenburg, the Roman Catholic gymnasium at Veohtha, and the Latin schools at Jever and Eutin.

As a member of the German confederation, in conjunction with Anhalt and Schwarzburg, Oldenburg has the 15th place, or vote in the select council of the Diet, and one vote of its own in conjunction with Kniphausen in the full council. The contingent to the army of the confederation is 2207 men. The constitution is monarchical. The government is hereditary in the male line.

History.—The house of Oldenburg is one of the most illustrious in Europe; the emperor of Russia, the kings of Denmark, and the late royal family of Sweden are descended from it. Oldenburg is the original seat of the family. Christian I. founded the town of Oldenburg in 1155, and assumed the title of count. Joseph II. gave to the two counties, Oldenburg and Delmenhorst, the rank of a duchy in 1773, and assigned it to that family as an hereditary principality to the house of Holstein-Gottorp. In 1803 the duchy joined the Rhenish confederation; but Napoleon, in 1810, incorporated the duchy with the French empire. After the fall of Napoleon, the duke recovered his own dominions; the congress of Vienna also assigned to him the principality of Birkenfeld; he obtained from Russia the lordship of Jever, and likewise obtained some claim to the lordships of Varel and Kniphausen, which was disputed by Count Bentinck, the proprietor of both.

The lordship of *Kniphausen*, which lies between the lordship of Jever and the Jahde, was acknowledged an independent power by the Diet of the Germanic confederation in 1826. It is the smallest of the states of the confederation, its territory measuring only 17 square miles. The sovereignty vests in Count Bentinck, who has his own flag, and enjoys all the rights accorded to the state under the old German empire, but he furnishes his contingent to the army of the confederation indirectly through the grand-duke of Oldenburg. The capital of the state is *Kniphausen*, a small village with a fortified castle; the count resides chiefly at Varel.

Oldenburg, the capital, in 53° 20' N. lat., 8° 11' E. long., is a well-built town on the navigable river Huute; the ramparts have been converted into public walks and gardens. The population is 8000, including that of the two suburbs. The palace is a very handsome building with a fine park. There are some tanneries, distilleries, and soap manufactories in the town. The public institutions are—a gymnasium, a seminary for schoolmasters, a military school, an observatory, and a collection of antiquities. The grand ducal library contains 60,000 volumes.

Varel, on a canal which joins the Jahde, and forms a harbour which merchantmen can enter at high-water, has 3200 inhabitants. *Jever*, in a fertile country to the north of Kniphausen, on a navigable canal, is a walled town with 3400 inhabitants, who manufacture tobacco, leather, and spirits, and trade largely in cattle. *Eutin*, which is the only town in the principality of Lübeck, is on the bank of a lake, has a palace of the grand-duke with a beautiful park, and 2800 inhabitants.

OLDHAM, Lancashire a parliamentary borough, manufacturing

and market-town, and the seat of a Poor-Law Union, in the parish of Prestwich-cum-Oldham, is situated on an eminence near the right bank of the river Medlock, in 53° 33' N. lat., 2° 7' W. long., distant 50 miles S.E. by S. from Lancaster, 191 miles N.W. by N. from London by road, and 195½ miles by the North-Western and Lancashire railways. The population of the municipal borough in 1851 was 52,820; that of the parliamentary borough 72,367. The town is governed by commissioners appointed under the Police Act of 1828. The borough returns two members to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry and diocese of Manchester. Oldham Poor-Law Union contains seven townships and one chapelry, with an area of 16,872 acres, and a population in 1851 of 86,788.

The rapid rise of Oldham is mainly attributable to its situation near extensive coal-mines, which give employment to many of the population, and to the great increase of cotton manufactures. The number of steam-engines employed in the manufacture of fustians, cotton, and woollen and silk goods is said to be upwards of 100. Hat-making is a very important branch of the industry of Oldham. There are several extensive iron- and brass-foundries, machine-making factories, gas-meter manufactories, tanneries, rope-works, and other establishments. The town is well supplied with water, and is lighted with gas. The town-hall is a handsome structure, containing various rooms for public business. Besides the parish church, which was rebuilt about 1830, Oldham possesses a chapel of ease, chapels for Wesleyan, Primitive, New Connexion, and Association Methodists, Independents, Baptists, Unitarians, and Roman Catholics. The Blue-Coat school was founded at Oldham-Edge, from bequests of Thomas Henshaw, Esq., which, with interest, amounted in 1829 to more than 100,000*l.* The Grammar school, founded in 1611, has an income from endowment of 30*l.* a year, and had 54 scholars in 1853. There are also National, British, and Infant schools, and schools supported by the Primitive and the New Connexion Methodists; a lyceum, a subscription library, a working man's hall, and a savings bank. A county court is held. Saturday is the market-day. Fairs are held in February, May, July, and October.

OLEAROS. [ANTIPABOS.]

OLEGGIO. [NOVARA.]

OLÉRON. [CHARENTE-INFÉRIEURE.]

OLITE. [NAVARRA.]

OLIVENZA. [ESTREMADURA, Spanish.]

OLLERTON. [NOTTINGHAMSHIRE.]

OLMEDO, a town of Spain, in the ancient province of Leon and modern province of Valladolid, 28 miles S. from the city of Valladolid, is situated on an eminence in a fertile plain, between the Eresma and the Adaja, two small rivers, which afterwards unite, and enter the Duero by the southern bank. It is surrounded by ruined walls, and contains a population of 1860. It was formerly a place of importance and strength, but is now in a state of decay. Two great battles were fought here in 1445 and 1467, during the reigns of Juan II. and Enrique IV., kings of Castilla.

OLMÜTZ. [MORAVIA.]

OLNEY, Buckinghamshire, a market-town in the parish of Olney, is situated on the left bank of the river Ouse, in 52° 9' N. lat., 0° 41' W. long., distant 19 miles N.E. from Buckingham, and 55 miles N.N.W. from London. The population of the parish in 1851 was 2329. The living is a vicarage in the archdeaconry of Buckingham and diocese of Oxford. The church, an early English edifice, is a spacious building, with a tower and stone spire, 185 feet high. The Baptists and Independents have chapels. There are National, British, and Infant schools, and some almshouses. Over the Ouse is a bridge of four arches, with several small arches extending over the meadows, which in winter are frequently flooded. Lace-making is the chief employment. The market-day is Thursday; three fairs are held in the year. Olney was the residence of the poet Cowper, and the Rev. John Newton was curate here during the residence of Cowper.

END OF VOLUME III.
