VOLUME III.

GEORGIA.

GEORGIA, one of the most southern of the United States of North America, extends from north to south between 30° 22' and 35° N. lat., and from east to west between 80° 48' and 85° 40' W. long. Its greatest length is 322 miles, its greatest breadth 225 miles. It is bounded E. by the Atlantic; S. by Florida for 255 miles, the river St. Mary constituting the boundary-line for about 80 miles; W. by Alabama, with a boundary-line of 306 miles; N. by Tennessee and North Carolina; and N.E. by South Carolina. The Savannah River separates Georgia from South Carolina, and the Chattahoochee, a branch of the Appalachian, divides it for a considerable extent from Alabama. Its area is 58,000 square miles, or about 300 square miles more than the surface of England and Wales together. The following table shows the increase of the population, and the proportion of free coloured persons and slaves during the present century. The total population in

1800 was	162,101,	including	1019 free coloured persons,	and	59,404 slaves.
1810 "	252,433,	"	1801 "	"	105,218 "
1820 "	340,987,	"	1763 "	"	149,854 "
1830 "	516,823,	"	2486 "	"	217,531 "
1840 "	691,392,	"	2753 "	"	280,944 "
1850 "	906,185,	"	2932 "	"	381,682 "

The federal representative population in 1850 was 753,512, in which number three-fifths of the slaves are included. This entitles the state to send 8 representatives to Congress. To the Senate, like each of the other United States, Georgia sends two members.

Coast-line, Surface.—The line of coast, extending 105 miles in a straight line, runs from south-south-west to north-north-east, with a slight bend westward. Though generally uniform as to course from point to point, it is very irregularly indented, and is skirted by numerous low islands, which extend parallel to the shores. The principal of these islands from north to south are—Cabbage, Ossabaw, St. Catherine's, Sapello, St. Simons, Jekyll, and Cumberland. These islands, as well as some tracts on the adjacent shore, have a light sandy soil, well adapted for the culture of cotton. The cotton grown here is the long staple, or, as it is called from its place of growth, Sea-Island cotton, which fetches a higher price in the market than any other. The inlets and sounds which divide the islands from one another, and penetrate several miles inland, are generally navigable, but too shallow to admit vessels of more than 100 tons. Vessels of larger dimensions can enter only three harbours. The bar at the mouth of St. Mary's, at the most southern extremity of the state, has 13 feet of water on it; that at the mouth of the Altamaha, between St. Simons and Sapello, 14 feet; and the embouchure of the Savannah 17 feet of water: the last-mentioned river is navigable for large vessels to the city of Savannah.

The surface of Georgia is naturally divided into two regions, a plain and a hilly country. The boundary-line between them is indicated by the falls of the rivers which occur in the Savannah, near Augusta; in the Oconee, near Milledgeville; in the Ocmulgee, near Macon; in the Flint River, at Fort Lawrence, near Knoxville; and in the Chattahoochee, near Fort Mitchell. The plain which occupies the country south of this line extends in its western prolongation through the states of Alabama and Mississippi to the banks of the river Mississippi, and continues north-eastward through the states of South and North Carolina and Virginia to Chesapeake Bay. In Georgia it is a dead flat along the shores of the ocean, with a sandy soil, which produces no trees but the pine and palmetto. In many places it is intersected with swamps, which are however less numerous and less extensive

GEOG. DIV. VOL. III.

GEORGIA.

here than in the more northern states, but still occupy perhaps one-tenth of the whole tract. The largest of these swamps is the Okefinoke Swamp, near the boundary of and partly within Florida, which is about 50 miles in length and 30 miles in breadth. It is covered with a thick growth of bay-trees, vines, and underwood. In the rainy season, when the greater part of it is covered with water, it appears like an inland sea. Several streams are lost in the swamp, and several others which fall into the Atlantic and the Gulf of Mexico take their rise within its limits.

The swampy tract ceases about 50 or 60 miles from the sea, except the Okefinoke Swamp, which lies farther inland. West of the swampy tract the country is dry, and the soil consists of an infertile mixture of sand and loam. Only along the bottoms of the rivers there occur level tracts from a quarter to half a mile wide, which in their natural state are covered with reeds, and have an excellent soil, well adapted to the growth of most agricultural productions, particularly rice. The higher dry grounds are mostly covered with pine.

The hilly region, which occupies nearly the northern half of the state, contains a much greater portion of arable land. The best land is along the rivers, where the soil is a deep rich black mould, with a small portion of sand. The gentle declivities of the hills also contain large tracts of cultivable land, and it is only their dry and sandy summits which do not admit of cultivation, and are covered with pine. The productiveness of the country which till lately belonged to the Cherokees, and is now commonly known as Cherokee-Georgia, is very great; it is not so well adapted for cotton as the plain part of the state, but a large part of it is well suited to the growth of corn. The most southern ridges of the Appalachian Mountains occur along the northern boundary-line of Georgia, but they do not attain a great elevation.

Hydrography, Communications.—The rivers which drain Georgia fall partly into the Gulf of Mexico and partly into the Atlantic. The former traverse either Alabama or Florida before they reach the sea. The most western is the Etowah River, a branch of the Coosa, one of the principal branches of the Alabama. The Etowah drains the Cherokee country, and runs about 80 miles within Georgia. The most important river of Georgia which falls into the Gulf of Mexico is the Appalachian, or rather its two principal branches, the Chattahoochee and Flint rivers; for it is only at the extreme south-western angle of this state that these two rivers unite and take the name of Appalachian. The Chattahoochee rises between the most southern spurs of the Appalachian range, about 34° 40' N. lat., and not very far from the sources of the Savannah. It runs in a general south-western direction through the northern part of Georgia for about 200 miles, and in approaching 33° N. lat. it begins to turn gradually to the south until it flows due south, forming for about 190 miles the boundary between Georgia on one side and Alabama and Florida on the other. It runs above 400 miles before it joins the Flint River. The Flint rises in the western districts of the hilly region between 33° and 34° N. lat., and flows in a southern direction as far as 32° N. lat., whence it gradually declines towards the west, until, south of 31° N. lat., it turns nearly due west, and joins the Chattahoochee. Its whole course is above 250 miles, and it is navigable for 75 miles. The Ocklockonnee and Suwanee, two rivers of Florida, rise in the southern districts of Georgia, and the Ogeechee in the northern.

The most southern river that falls into the Atlantic is St. Mary's River, whose sources lie partly in Okefinoke Swamp and partly north of it. It flows with a very tortuous channel first south, then east,

GEORGIA.

GEORGIA, one of the most southern of the United States of North America, extends from north to south between 30° 22' and 35° N. lat., and from east to west between 80° 48' and 85° 40' W. long. Its greatest length is 322 miles, its greatest breadth 225 miles. It is bounded E. by the Atlantic; S. by Florida for 255 miles, the river St. Mary constituting the boundary-line for about 80 miles; W. by Alabama, with a boundary-line of 306 miles; N. by Tennessee and North Carolina; and N.E. by South Carolina. The Savannah River separates Georgia from South Carolina, and the Chattahoochee, a branch of the Appalachicola, divides it for a considerable extent from Alabama. Its area is 58,000 square miles, or about 300 square miles more than the surface of England and Wales together. The following table shows the increase of the population, and the proportion of free coloured persons and slaves during the present century. The total population in

1800	was 162,101, including 1019 free coloured persons, and 59,404 slaves.
1810	" 252,433, " 1801 " 105,218 "
1820	" 340,987, " 1763 " 149,654 "
1830	" 516,823, " 2486 " 217,531 "
1840	" 691,392, " 2753 " 280,944 "
1850	" 906,185, " 2932 " 381,682 "

The federal representative population in 1850 was 753,512, in which number three-fifths of the slaves are included. This entitles the state to send 8 representatives to Congress. To the Senate, like each of the other United States, Georgia sends two members.

Coast-line, Surface.—The line of coast, extending 105 miles in a straight line, runs from south-south-west to north-north-east, with a slight bend westward. Though generally uniform as to course from point to point, it is very irregularly indented, and is skirted by numerous low islands, which extend parallel to the shores. The principal of these islands from north to south are—Cabbage, Ossabaw, St. Catherine's, Sapello, St. Simons, Jekyll, and Cumberland. These islands, as well as some tracts on the adjacent shore, have a light sandy soil, well adapted for the culture of cotton. The cotton grown here is the long staple, or, as it is called from its place of growth, Sea-Island cotton, which fetches a higher price in the market than any other. The inlets and sounds which divide the islands from one another, and penetrate several miles inland, are generally navigable, but too shallow to admit vessels of more than 100 tons. Vessels of larger dimensions can enter only three harbours. The bar at the mouth of St. Mary's, at the most southern extremity of the state, has 13 feet of water on it; that at the mouth of the Alatamaha, between St. Simons and Sapello, 14 feet; and the embouchure of the Savannah 17 feet of water: the last-mentioned river is navigable for large vessels to the city of Savannah.

The surface of Georgia is naturally divided into two regions, a plain and a hilly country. The boundary-line between them is indicated by the falls of the rivers which occur in the Savannah, near Augusta; in the Oconee, near Milledgeville; in the Ocmulgee, near Macon; in the Flint River, at Fort Lawrence, near Knoxville; and in the Chattahoochee, near Fort Mitchell. The plain which occupies the country south of this line extends in its western prolongation through the states of Alabama and Mississippi to the banks of the river Mississippi, and continues north-eastward through the states of South and North Carolina and Virginia to Chesapeake Bay. In Georgia it is a dead flat along the shores of the ocean, with a sandy soil, which produces no trees but the pine and palmetto. In many places it is intersected with swamps, which are however less numerous and less extensive

GEORGIA.

here than in the more northern states, but still occupy perhaps one-tenth of the whole tract. The largest of these swamps is the Okefinoke Swamp, near the boundary of and partly within Florida, which is about 50 miles in length and 30 miles in breadth. It is covered with a thick growth of bay-trees, vines, and underwood. In the rainy season, when the greater part of it is covered with water, it appears like an inland sea. Several streams are lost in the swamp, and several others which fall into the Atlantic and the Gulf of Mexico take their rise within its limits.

The swampy tract ceases about 50 or 60 miles from the sea, except the Okefinoke Swamp, which lies farther inland. West of the swampy tract the country is dry, and the soil consists of an infertile mixture of sand and loam. Only along the bottoms of the rivers there occur level tracts from a quarter to half a mile wide, which in their natural state are covered with reeds, and have an excellent soil, well adapted to the growth of most agricultural productions, particularly rice. The higher dry grounds are mostly covered with pine.

The hilly region, which occupies nearly the northern half of the state, contains a much greater portion of arable land. The best land is along the rivers, where the soil is a deep rich black mould, with a small portion of sand. The gentle declivities of the hills also contain large tracts of cultivable land, and it is only their dry and sandy summits which do not admit of cultivation, and are covered with pine. The productiveness of the country which till lately belonged to the Cherokees, and is now commonly known as Cherokee-Georgia, is very great; it is not so well adapted for cotton as the plain part of the state, but a large part of it is well suited to the growth of corn. The most southern ridges of the Appalachian Mountains occur along the northern boundary-line of Georgia, but they do not attain a great elevation.

Hydrography, Communications.—The rivers which drain Georgia fall partly into the Gulf of Mexico and partly into the Atlantic. The former traverse either Alabama or Florida before they reach the sea. The most western is the Etowah River, a branch of the Coosa, one of the principal branches of the Alabama. The Etowah drains the Cherokee country, and runs about 80 miles within Georgia. The most important river of Georgia which falls into the Gulf of Mexico is the Appalachicola, or rather its two principal branches, the Chattahoochee and Flint rivers; for it is only at the extreme south-western angle of this state that these two rivers unite and take the name of Appalachicola. The Chattahoochee rises between the most southern spurs of the Appalachian range, about 34° 40' N. lat., and not very far from the sources of the Savannah. It runs in a general south-western direction through the northern part of Georgia for about 200 miles, and in approaching 33° N. lat. it begins to turn gradually to the south until it flows due south, forming for about 190 miles the boundary between Georgia on one side and Alabama and Florida on the other. It runs above 400 miles before it joins the Flint River. The Flint rises in the western districts of the hilly region between 33° and 34° N. lat., and flows in a southern direction as far as 32° N. lat., whence it gradually declines towards the west, until, south of 31° N. lat., it turns nearly due west, and joins the Chattahoochee. Its whole course is above 250 miles, and it is navigable for 75 miles. The Ocklockonnee and Suwanee, two rivers of Florida, rise in the southern districts of Georgia, and the Ogeechee in the northern.

The most southern river that falls into the Atlantic is St. Mary's River, whose sources lie partly in Okefinoke Swamp and partly north of it. It flows with a very tortuous channel first south, then east,

R

afterwards north, and again east, and enters the sea between Amelia and Cumberland islands, after a course of 110 miles. The Alatamaha runs through the central districts of Georgia; it is formed by the rivers Ocmulgee and Oconee, both of which rise towards the centre of the hilly region, near 34° N. lat., and run to the east of south for above 200 miles, nearly parallel to each other, at a mean distance of 40 miles. Having passed the parallel of 34° the Ocmulgee turns east, and joins the Oconee near 30° N. lat. The river thus formed, called Alatamaha, flows first east and afterwards bends to the south-east, until it empties itself in the ocean between St. Simons and Sapello islands. Its course is above 100 miles, and the whole length of the river upwards of 300 miles. Larger vessels can only ascend this river to Darien, but boats of 30 tons are navigated up the Oconee to Mill-edgeville, and an equal distance up the Ocmulgee. The Savannah, the chief river of the state, rises on the most southern declivity of the Appalachian range, and runs in all its course, including the windings, nearly 450 miles south-south-east, forming in all this distance the boundary between Georgia and South Carolina. It is navigable for large vessels to the city of Savannah, and for steamers of light draught to Augusta. There are numerous other streams of smaller size but of considerable importance as supplying ample water-power.

The only canals in the state are two short ones—the Brunswick Canal, 12 miles, running from Brunswick to the Alatamaha River; and the Savannah and Ogeechee Canal, 16 miles, which unites those rivers, but is not now used for purposes of navigation.

Besides the numerous good coach-roads which traverse the state, Georgia possesses a large number of excellent railways, the whole extent completed and in operation amounting to about 1000 miles, while charters have been obtained for about 700 miles more. The two great trunk-lines run from the ports of Savannah and Charleston inland to Chattanooga in Tennessee, where they unite and join the Tennessee system of railways. From these main trunks numerous branches diverge at various points. The following are the lines opened and at work in 1854:—Central (Savannah to Macon), 192 miles; Mill-edgeville and Gordon, 17 miles; Waynesborough and Augusta, 51 miles; Macon and Western (Macon to Atlanta), 101 miles; Georgia (Augusta to Atlanta), 171 miles, with Athens branch, 40 miles, and branch from Camak to Warrenton, 4 miles; Western and Atlantic (Atlantic to Chattanooga), 140 miles; Rome to Kingston, on the Western and Atlantic railway, 20 miles; Dalton to Knoxville (Eastern Tennessee and Georgia), 82 miles; South-Western (Macon to Oglethorpe), 71 miles; Muscogee (Columbus to Butler on the South-Western line), 50 miles; and Lagrange (Atlanta to West Point), 87 miles.

Geology, Mineralogy, &c.—The northern part of Georgia, occupied by members of the Blue-Ridge range of the Appalachian Mountains, is composed mainly of plutonic and metamorphic rocks. The primary formations, chiefly of the mica-schist system, cross the state in a north-west and south-east direction, having a breadth of 160 miles at the northern and 100 miles at the southern limit. They consist of gneiss, quartz, limestone, and carboniferous rocks, &c. Transition formations occupy the north-western angle of the state. South of the above formations, and extending into the middle of the state, occur chiefly rocks of the cretaceous series. The whole southern and eastern half of the state consists of tertiary deposits, comprising the extensive plain which rises very gradually from the Atlantic westward for some 100 to 150 miles.

Gold and iron are the most important minerals. The gold is found in the quartz rocks of the north-west. Iron-ore occurs in several varieties in different parts of the state. On both sides of the Etowah River, and extending south-west into Paulding county, and north-east through Cherokee county, are very extensive beds of good iron-ore, embracing, as far as yet known, a width of over 40 miles, along which numerous furnaces are in operation. Hematitic iron-ores also occur in the north-western part of the state of considerable extent; and in the gneiss formations are magnetic iron-ores of great purity. Specular ores are found in several places. Veins of sulphate of barytes occur of great extent. In the extreme north-western angle beds of coal are found. Limestone is worked largely, as are also gypsum and marl, for manure. Granite, marble, limestones, &c., are quarried to a great extent for building purposes. Millstones are obtained from the hills dividing the plain from the northern districts.

Climate, Soil, Productions.—The climate of a country extending over more than four degrees of latitude, and whose northern half is several hundred feet more elevated than its southern districts, must of course present great varieties. The hilly region is rather cold in winter. Frost is of common occurrence, and snow sometimes falls to the depth of five or six inches. But these districts are very healthy. The plain approaches in its climate the tropical regions of the globe. It is unhealthy on the bottoms of the rivers, and along the sea-coast in the vicinity of stagnant water. The heat in summer is very great, and the thermometer sometimes rises to 98° or even 102°: its common range is between 76° and 90° in this season. In winter the thermometer ranges between 60° and 40°, and sinks occasionally lower. The weather however is then dry and constant, and this is considered the most healthy and pleasant season of the year. The rains are most frequent in spring.

The great difference in the climate produces a corresponding differ-

ence in the productions. In the southern and south-western districts the temperature is suitable to the sugar-cane, orange, olive, fig, pomegranate, &c. Agriculture however is mostly limited to maize, sweet potatoes, cotton, rice, tobacco, and indigo. The swamp and tide lands produce vast crops of rice. Adjoining these lands are the oak-lands, on which black-seed cotton is largely raised. The hilly region resembles, in climate as well as in products, the countries of Middle Europe. The greatest part of the plain is covered with several kinds of the pine, a tree which extends also over the higher portion of the hilly region in vast quantities; and here tar, pitch, and turpentine are largely manufactured. The middle regions produce tobacco, cotton, and grain. In the northern parts, known as Cherokee-Georgia, the valleys are remarkably fertile; some cotton is grown, but this is peculiarly a grain district; the mountain slopes afford excellent grazing ground. Along the sea-coast as well as on the bottoms of the rivers, oak, hickory, ash, palmetto, and some other trees are common.

Bears and deer are numerous in the forests and near the swamps. Alligators frequent the Alatamaha and other rivers. Honey-bees are frequent in the swamps east of Flint River. The rivers abound with several kinds of fish.

The following are the principal results of the inquiries made respecting the agricultural statistics of the state at the last Census. The number of farms under cultivation in the state on the 1st of June 1850 was 51,759; the extent of improved land in farms was 6,378,479 acres, of unimproved 16,442,900 acres. The cash value of farms was returned at 95,753,445 dollars, of farming implements and machinery 5,894,150 dollars. The total produce of the principal crops in 1850 was as follows:—Wheat, 1,088,534 bushels; rye, 53,750 bushels; maize, 30,080,099 bushels; oats, 3,820,044 bushels; barley, 11,501 bushels; rice, 33,950,691 lbs.; potatoes, 227,379 bushels; sweet potatoes, 6,986,428 bushels; peas and beans, 1,142,011 bushels; tobacco, 423,924 lbs.; ginned cotton, 199,636,400 lbs.; wool, 990,019 lbs.; hay, 23,449 tons; cane sugar, 1,642,000 lbs.; molasses, 216,150 gallons. The value of orchard products was 92,776 dollars, and of market-garden products 76,500 dollars. Very little wine is made. Only a small quantity of hops and flax is grown.

The number of horses in the state in 1850 was 151,831; asses and mules, 57,379; milch cows, 334,223; working oxen, 78,286; other cattle, 690,019; sheep, 560,435; swine, 2,168,617. The value of live stock was 25,728,416 dollars; of animals slaughtered, 6,839,762 dollars. The products of animals were, butter, 4,640,559 lbs.; cheese, 46,976 lbs.; bees'-wax and honey, 782,514 lbs.; silk cocoons 813 lbs.

Manufactures, Commerce, &c.—Owing to the abundant supply of water-power furnished by the hill-streams in the northern part of the state, and especially in Cherokee-Georgia, manufactures have increased rapidly of late years. At the census of 1850 there were returned 28,715 free males above the age of 15 as employed in trade, commerce, and manufactures, and 83,362 employed in agriculture. The whole number of manufacturing establishments, producing to the value of 500 dollars and upwards, in 1850 was 1407. Of these 35 were cotton factories, employing a capital of 1,736,156 dollars, and an average of 873 male and 1399 female hands—but the number of cotton factories has since been much increased; 3 woollen factories; 140 tanneries; and 10 iron-works. The other principal establishments consist of flour-, saw-, and paper-mills, boot and shoe manufactories, agricultural implement-works, &c. The home-made manufactures of the year were valued at 1,838,968 dollars.

But a small portion of the produce of Georgia is exported directly to foreign countries. The great bulk of its produce is shipped coast-wise by vessels belonging to the northern states to northern ports, to be thence exported to foreign parts. The whole of the commerce of Georgia is centred in Savannah, but a large portion of the produce of Western Georgia is shipped at Apalachicola in Florida. The shipping owned by the state in 1850 was 21,690 tons, of which 10,487 tons were employed in the foreign trade; of the remainder, 6479 tons were navigated by steam-power. Only one vessel, of 822 tons burden, was built in the state in 1852. The value of the articles of domestic produce exported from Georgia in 1850 was 7,551,943 dollars, in 1852 it was 4,999,015 dollars; the imports in 1850 amounted to 686,964 dollars, in 1852 to 474,925 dollars. The total entries in 1850 were 118 of 57,017 tons burden, of which 71 of 45,184 tons were foreign. The clearances were 141 of 72,563 tons, of which 88 of 51,524 tons were foreign.

Divisions, Towns, &c.—Georgia is divided into 94 counties. Mill-edgeville is the political capital of the state, but Savannah is the most important town. Besides these there are few places of much consequence; the following are all which call for notice here: the population is that of 1850:—

Mill-edgeville, the capital, is situated on elevated ground at the head of the navigation of the Oconee River, in 33° 7' N. lat., 83° 19' W. long., 642 miles S.W. from Washington: population 2216, of whom 1020 were slaves. The city is laid out on a regular plan, the streets being at right angles to each other. Washington, the main avenue, is 120 feet wide; the others are each 100 feet wide; and there are three public squares, each of which has its sides 450 feet long. The principal building is the state-house, a handsome gothic edifice occupying a lofty site near the centre of the city. The other chief public buildings are—the governor's house, state arsenal and

magazine, penitentiary, market-house, five churches, &c. Milledgeville stands in the centre of a rich cotton district, and is a place of considerable business. It is well connected by railway with the other leading towns of the state and union. Five newspapers and journals are published here.

Savannah, the chief city and port of entry of Georgia, is built on the right bank of the Savannah, about 18 miles from its mouth. The population in 1850 was 15,312, of whom 6281 were slaves; according to a local census taken in 1852 the population in that year had increased to 18,301, of whom 5478 were slaves. The city is generally regarded as one of the finest and healthiest on the south coast. It is about a mile long by three-quarters of a mile wide, is laid out at right angles, and has several good public squares. Along the river are convenient wharfs and ranges of warehouses. The principal public buildings are—the custom-house, a fine new edifice 110 feet long and 52 feet deep; a court-house, jail, city-hall, exchange, arsenal, United States barracks, market-house, theatre, 15 churches, some of which are handsome structures; several asylums, hospitals, &c. Of the private houses a large number are built of wood, owing to which the city has several times suffered severely from fire. Savannah is one of the chief commercial cities of the south, and is especially eminent as a mart for cotton, rice, and lumber. From it in 1851-2 the quantity of bags of cotton exported was 353,068, of which 228,614 were sent coastwise and 124,454 to foreign ports, 109,378 of the last quantity being sent to English ports. Of rice 39,929 tierces were exported from Savannah in 1851-2, and of lumber 25,508,500 feet. The entire foreign commerce of the state centres in Savannah, and the city is consequently well provided with railway communication with every town and district of the state. The city maintains also regular communication by steamers with Florida, Charleston, New York, &c. Several newspapers are published here.

Athens, on the right bank of the Oconee, 57 miles N. from Milledgeville, has a population of 1661 free persons and an 'undefined' number of slaves. It is chiefly noticeable as the seat of the University of Georgia. Four newspapers are published here. *Atlanta*, at the junction of the Georgia, Western and Atlantic, and Macon and Western railways, is an important entrepôt of the internal commerce: population, 2572. *Augusta*, on the left bank of the Savannah, 90 miles E.N.E. from Milledgeville, is one of the most flourishing towns in the state, being the commercial centre of a fertile cotton and tobacco district; the population in 1850 is not given in the general census, but a local census taken in 1852 showed that the town had then 11,753 inhabitants, of whom 4718 were slaves. The town is regularly laid out, and contains several good public buildings; the chief are a city-hall, county court-house and jail; several churches, an arsenal, hospital, theatre, &c. Three newspapers and two monthly magazines are published here. *Columbus*, on the left bank of the Chattahoochee, at the head of steam navigation, and immediately below the falls of the river, population 5942, of whom 2258 were slaves. The town, which is regularly laid out, contains two streets, running parallel to the river, each 165 feet wide, and six streets of 182 feet wide, with 12 other streets intersecting them, each 99 feet wide. The public buildings are the court-house and other county buildings, several churches, a market-house, &c. The town is the centre of a rich cotton district, and contains several cotton and woollen factories, flour-mills, &c. Steam-boats drawing five feet of water ascend the river to Columbus at all seasons; and a large number of steam-vessels maintain constant communication with the sea-board, New Orleans, &c. Railways connect the town with all parts of the state. Three newspapers are published here. *Griffin*, on the Macon and Western railway, 63 miles W.N.W. from Milledgeville, population 2320, is an important railway centre, and rapidly growing in commercial consequence. *Macon*, on the right bank of the Ocmulgee, at the head of steam-boat navigation, 29 miles S.W. from Milledgeville, population 5720, of whom 2353 were slaves. A very large quantity of cotton is sent down the river in the steam-boats from this place, and the town is an important commercial depôt. Besides the usual county buildings, churches, and market-house, it contains the Wesleyan Female College; several extensive stores, lumber-yards, printing-offices, grist-mills, foreign commission houses, &c. Four newspapers are published here.

Government, Judicature, &c.—The right of voting appertains to every free male citizen 21 years of age, who has lived in the county six months, and paid all taxes demanded for 12 months. The legislative body, styled the general assembly, consists of a senate of 47 members, and a house of representatives, consisting of 130 members, who are elected biennially. The governor, who has a qualified veto on the acts of the general assembly, is also elected biennially; his salary is 3000 dollars. The public debt of the state, which is redeemable from 1863 to 1874, amounts to 2,801,972 dollars. The property of the state, consisting of shares in the Western and Atlantic railway, is valued at the cost price, 5,000,000 dollars. The total revenue for 1853 was 922,140 dollars, the expenditure 900,534 dollars. The state militia is composed of 78,699 men, of whom 5050 are commissioned officers.

The judicature consists of a supreme court, and superior and inferior courts. The judges of the supreme court are elected by the general assembly for a term of six years, and receive each a salary of 2500 dollars; the judges of the superior court are elected for four

years by the people of the district over which they preside. The judges of the inferior courts are also elected by the people for four years.

The state has made considerable provision for the education of the children of free citizens. In 1850 Georgia possessed 13 colleges, 219 academies or high schools, and 1251 common or primary schools. The total number of children attending school was 77,016, of whom 42,365 were boys. Among the attendants at school one free coloured boy is returned. The principal colleges are the Franklin, or Georgia University, at Athens, founded in 1785, which has 8 instructors, 182 students, and a library of 15,500 volumes; the Oglethorpe college near Milledgeville, founded in 1838, which has 5 tutors and 69 students; the Emory college at Oxford, which has 5 tutors and 115 students; and the Mercer (Baptist) University at Penfield, having 7 tutors and 127 students. Among religious sects by far the most numerous are the Baptists and Methodists. In 1850 the Baptists had 879 churches, affording accommodation for 319,293 persons; the Methodists had 795 churches, with accommodation for 237,318 persons. Next to these are the Presbyterians, who had 97 churches, with accommodation for 40,596 persons. Fifty-one newspapers and periodicals, circulating 4,070,866 copies annually, are published in the state.

History, &c.—The colony of Georgia was founded in 1732 by a private company, and received its name in honour of King George II. In 1733 General Oglethorpe founded the town of Savannah. In 1752 it became a royal government, and in 1755 a provincial legislature was established. The original limits of the state included also the territory which now forms the states of Mississippi and Alabama. It joined the other provinces in 1776 in declaring war against Great Britain; but in 1778 was occupied by a British force, and continued in such occupation till the peace of 1786. A new constitution was introduced in 1785, and afterwards was amended in 1798.

The whole population of Georgia is now composed of Europeans and Africans, or their descendants. Not a trace remains of the old Indian population. The Creeks, who up to 1826 inhabited the country between the Flint and Chattahoochee rivers, sold their lands in that year, and emigrated to the banks of the Arkansas. Up to 1835 the Cherokees were in possession of the north-western corner of the state, but in that year they were obliged to abandon it.

By the constitution the importation of slaves from Africa or any foreign state is prohibited: the legislature cannot liberate slaves without the owner's consent, or prevent immigrants bringing slaves into the state with them from any other state. The persons of slaves are protected equally with those of free people, and persons killing them are liable to punishment for murder, "unless their death should happen from accident in giving such slaves moderate correction."

(*Statistical Gazetteer of the United States, 1853; Seventh Census of the United States, Official Report, 1853; American Almanac, 1854.*)

GERA, a town in the principality of Reuss, in Germany, is situated in about 50° 52' N. lat., 12° 6' E. long., in a valley on the banks of the White Elster, and contains about 10,000 inhabitants. The streets are in general broad and at right angles to one another, and embellished with handsome houses. Gera has a fine town-hall; five churches; a gymnasium attended by between 600 and 700 pupils; a training school; a house of correction, to which an orphan asylum is attached; two hospitals; and a free school. Gera possesses numerous manufactures, particularly of fine woollens, mixed cotton and silk goods, woollen and cotton yarns, china, earthenware, printed cottons and woollens, oil-cloth, tobacco, carriages, chemical colours, hats, leather, musical instruments, soap, beer, &c. A canal from the Elster passes through the town. The china manufactory of Schloss Untermaus, and the princely residences of Osterstein, Köstritz, and Ronneburg are in the vicinity of the town, which is about 35 miles S.S.W. from Leipzig.

GERMAIN-EN-LAYE, ST., a town in France in the department of Seine-et-Oise, stands on the left bank of the Seine, 14 miles by railway W. by N. from Paris, and has about 14,000 inhabitants including the commune. It is situated on a height which commands a beautiful prospect of the valley of the Seine, with a distant view of Paris and its environs. The streets are wide, handsome, and well laid out; the houses lofty and well built. There are many mansions in the town in which formerly the grandees of the French court resided, before Louis XIV. forsook St-Germain for Versailles: and even to this day many of the old French noblesse continue to reside in this their ancient haunt. The town originated in a monastery founded about A.D. 1010 by King Robert, on the summit of the hill which was then surrounded by the forest of Lida (Laye). The same king or one of his immediate successors built a royal residence near the abbey. Louis Le-Gros (1124) occasionally resided here, and the palace of St-Germain was the residence of Baudouin, emperor of Constantinople, during his visit to France in the reign of St. Louis. The English plundered and burnt the town and the palace in A.D. 1346. They seized it again on account of its commanding military position in the invasion of Henry V., and held it from 1419 to 1435. The château, or palace, which replaced the more ancient royal residence and was erected by François I., is built chiefly of brick, surrounded by wide and deep ditches; the apartments are handsome. Henri II., his sisters Madeleine of France (queen of James V. of Scotland), and

Marguerite of Valois, Charles IX., and Louis XIV. were born at St. Germain, and Louis XIII. died there. Among its other historical associations must be mentioned that it was the residence of James II. of England, its last royal occupant. After his death in 1701 it was neglected till 1809, when Napoleon established in it a military school. In 1815 a body of 10,000 English soldiers were quartered in it. It afterwards served for a barrack for the royal guards. After the revolution of 1830 it was offered for sale, but found no bidder. It is now a military prison. The Château-Neuf, built by Henri IV. for his mistress Gabrielle d'Estrées, is now a heap of ruins. The forest or park of St. Germain, surrounded by walls and occupying more than 10,500 acres, is adorned by trees of immense size, and has numerous broad avenues. A noble terrace, of more than a mile and a quarter in length and nearly 100 feet wide, extends from the palace along the skirts of the forest, and affords to the townspeople an agreeable promenade. In the forest are several small edifices erected at different periods by the kings of France. The most remarkable of these is the structure called Les Loges, formerly a monastery, now an orphan school, in which 220 orphans, daughters of members of the Legion of Honour, are brought up. The town has a handsome parish church, in which is a monument erected at the expense of George IV. over part of the remains of James II., which were found in making some alterations in the church; a corn-market, a theatre, and three handsome squares, of which the one called Place-du-Château is the largest. The manufactures consist of cotton hosiery, crinoline, and leather. A yearly fair is held for business; and one a few days afterwards for pleasure: the latter, which is called the fair of Les Loges, is held in the forest for three days after the 30th of August, and is one of the gayest in France, attracting numerous visitors from Paris and the surrounding country. There are many schools in the town and neighbourhood. A weekly market is held every Monday chiefly for the sale of pigs, of which above 100,000 are annually sold in the town. St. Germain is considered a very healthy place. In the picturesque nomenclature of the French republicans it bore the name of *Montagne-du-Bon-Air*.

GERMAN BANAT. [SERVIA AND TEMESVAR BANAT.]

GERMANS, ST., Cornwall, a market-town, and the seat of a Poor-Law Union, in the parish of St. Germans, is situated on the small river Tidi, in 50° 24' N. lat., 4° 16' W. long., distant 22 miles E.S.E. from Bodmin, and 228 miles S.W. from London. The town is governed by a portreeve. The population of the town in 1851 was 2967. The living is a perpetual curacy in the archdeaconry of Cornwall and diocese of Exeter. St. Germans Poor-Law Union contains 13 parishes and one chapelry, with an area of 42,141 acres, and a population in 1851 of 16,542.

The town of St. Germans stands on the southern slope of a tolerably high hill, and consists chiefly of one street. It was once the seat of a bishop, afterwards united with the bishopric of Crediton, and from this union arose the see of Exeter. The parish church, which was once the church of a monastery of Augustinian priests, and is said to have been the cathedral church of the diocese, was formerly much more extensive. The ancient chancel fell to the ground in 1592: the church now consists of a nave and two aisles. The west front has two towers: the north tower is octagonal above and quadrangular below; the south tower is quadrangular throughout. Between the towers is the entrance, formed by a deep Norman arch with shafts and mouldings, and two small Norman windows above. The south aisle is pointed, of later erection; the pointed arch is found also in the west front, which has probably undergone partial alteration. The Methodists have three places of worship. In the town are an Endowed school for poor boys, National and Infant schools, and a parochial book-club. The seat of the Earl of St. Germans, called Port Eliot, occupies the site of the ancient priory; many of the apartments are convenient and spacious, and decorated with paintings.

The population is chiefly agricultural. There is a considerable fishery at the port. At St. Germans Quay coals are imported, and lead-ores from mines in the adjoining parish of Menheniot are shipped to Swansea for smelting. The market-day is Friday, and there are two cattle fairs in the year.

(Lysons, *Magna Britannia*; Wallis, *Cornwall Register*; *Communciation from St. Germans*.)

GERMAN OCEAN. [NORTH SEA.]

GERMANY extends from 45° 5' to 57° 50' N. lat., 6° 20' to 20° 10' E. long. It is bounded W. by the Netherlands, Belgium, and France; S. by Switzerland and the Austrian territories in Italy; E. by the kingdoms of Hungary, Galicia, Poland, and Prussia; and N. by the Baltic. Its area is estimated at 284,000 square miles, or about twice and a half the area of the British Islands.

The states included within Germany, and forming the Germanic Confederation, are as follows (their area and population will be found under EUROPE):—Austria, Prussia, Bavaria, Saxony, Hanover, Würtemberg, Baden, Hesse (electorate of), Hesse (grand duchy of), Holstein (duchy), Lauenburg (duchy), Luxemburg (duchy), Brunswick, Mecklenburg-Schwerin, Nassau, Saxe-Weimar, Saxe-Coburg and Gotha, Saxe-Meiningen-Hildburghausen, Saxe-Altenburg, Mecklenburg-Strelitz, Oldenburg, Anhalt-Dessau, Anhalt-Bernburg, Anhalt-Köthen, Schwarzburg-Sonderhausen, Schwarzburg-Rudolstadt, Lich-

tenstein, Waldeck, Reuss (principalities of), Schauenburg-Lippe, Lippe-Detmold, Hesse-Homburg, Lübeck, Frankfurt, Bremen, and Hamburg.

All these states being described under their several titles, and the more important mountain ranges, rivers, and other great physical features being also separately described, it would be superfluous to repeat such descriptions here. We therefore propose under the present heading merely to give such a general notice of the physical geography of Germany as may facilitate reference to particular articles, adding a brief sketch of its history, language, and literature.

Physical Geography.—The surface is divided into four distinctly-marked districts, two plains and two mountain regions. One of the plains is low, and rises only a little above the level of the sea; the other attains a considerable elevation. Between the two plains extends a mountain region, whose summits in no part attain the snow-line, which in this parallel is about 6000 feet above the sea-level. To the north of this region extends the low plain, and to the south of it the elevated plain, which on the east and west is inclosed by mountainous tracts belonging to that region. The southern boundary of the elevated plain is formed by the Alps, which constitute the fourth natural division of Germany.

The *low plain* is only a small section of the great plain which extends nearly over the whole northern part of the old continent. This section occupies the northern portion of Germany, which lies on the southern shores of the North and Baltic seas, and extends to the peninsula of Jutland. Its length, from the boundary of the Netherlands and the Rhine to the borders of Russia, including the kingdom of Prussia, is nearly 600 miles; but its width varies, being, on the west of the Elbe, on an average about 160 miles, and to the east of that river about 300 miles. There is probably no tract of country in Europe of equal extent which has a less fertile soil than this plain. It is even less fertile than the steppes of Southern Russia to the north of the Black Sea, but as it has the advantage of abundant rains, the German plain is much better cultivated and more thickly inhabited than the Russian steppes. The sub-stratum of this plain is formed by limestone, chalk, gypsum, and sandstone, which are covered by loam, clay, and sand to an average depth of 200 feet. If this country were situated under a tropical climate and deprived of the abundant rains and snow which annually descend upon it, the surface would resemble the Sahara or the great Indian plain. West of the Elbe the plain is nearly destitute of trees, and the fertile tracts occur only in the shape of oases, which are at great distances apart. The most fertile regions are along the rivers, which run in depressions from 100 to 200 feet below the level of the plain. These bottoms have a fertile soil, which is covered in its natural state by forest-trees, and when cultivated produces good crops. These bottoms vary in width, according to the volume of water in the rivers. Along the great rivers (Weser, Elbe) they are from three to six miles wide, where these rivers issue from the mountain tracts in which they originate; but farther down they widen to 20 or 30 miles, and even more. Where the rivers approach the sea the bottoms are united with the marshes which line the shores of the North Sea; these marshes are not of great extent, being only five or six miles across on the average, but they do not yield in fertility to any tracts in Europe. Being below the level of the sea at high tides, it is necessary to protect them by dykes from its invasions. Nearly in the middle of the plain occurs a fertile tract, inclosed by two ridges of high hills, which issue from the mountain tract farther south, on both sides of the parallel of 52° N. lat. The more northern of these ridges, called the Süntel, rises to the south of the town of Hanover, and runs westward; the southern ridge has the name of Egge east of Paderborn, but north-east of that town it turns west-north-west, and is known as the Teutoburger Wald, or Osnig. The valley between these two ridges is of considerable fertility; its eastern portion forms the principality of Lippe Detmold, and its western belongs to the Prussian province of Westphalia and the Hanoverian province of Osnabrück. That portion of the plain which lies east of the Elbe has a somewhat different character. Tracts covered with heath and moor occur here also, not contiguous, but separated from each other by great intervals of sandy surface. These sandy tracts however are not destitute of vegetation, nearly all of them being covered by various kinds of pine, which give the soil a greater degree of solidity. Still, all lands of this description are only cultivated in a comparatively few and favoured places, and the crops are very scanty; but this portion of the plain contains a greater number of fertile tracts, which in some places are of considerable extent. The beds of the rivers are less depressed below the level of the plain, and the rich lands along their banks have a greater width. The marshes which are adjacent to such lands, and nearly on the same level with them, have been drained, and changed into meadows and fields. Along the shores of the Baltic no marshes occur, but the larger rivers, especially the Vistula and Niemen, form deltas at their mouths, whose alluvial soil is of great fertility, and can hardly be exhausted by successive crops. Besides these there are several fertile tracts at some distance from the rivers, whose soil is a heavy loam of considerable fertility.

Through the northern part of this plain a higher tract may be traced, which in general runs west and east, but with two great bends. It begins on the west at Oldeale in Holstein, whence it runs east-south-east nearly in a straight line to Schwedt on the Oder, where it

is about 70 miles from the sea. East of that river it continues due east to Arendswalde, and then inclines to the north, gradually approaching the sea. Some distance west of Danzig it takes a short south-east course, and then again due east, terminating on the banks of the Niemen, near Grodno. This tract of high ground forms the watershed between a great number of small rivers which fall into the Baltic, and many others with a much longer course, which run off to the southward, and increase the waters of the Elbe, Oder, and Vistula. It is also remarkable for the immense number of small lakes which occur on its higher parts or near them. Some of these are lakes of considerable extent, as the Lake of Schwerin, near the western extremity, and the Lake of Spirding, towards the banks of the Niemen. On the northern side of this high ground we find those numerous erratic blocks or boulders which have attracted the attention of geologists.

The mountain region of Central Germany extends to the south of the low plain, and incloses the elevated plain on the east, north, and west. That portion of it which is to the east of the elevated plain may be called the mountain system of Bohemia, because it incloses that kingdom on all sides. That which extends to the north of the elevated plain may be called the Central mountain system of Germany; and the ranges inclosing the elevated plain on the west the Rhenish mountain system, because they run parallel to the middle course of the Rhine. This region is composed of numerous groups of mountains and hills, with connecting table-lands, such as the Fichtelgebirge, the forest of Bohemia, the Sudetes or Sudetch Mountains, the Moravian Mountains, the Reisingebirge, the Lusatian Mountains, or the Wolish Kamm, the Erzgebirge, the Frankenwald, Thüringerwald, Röngebirge, Spessart, the Harz Mountains, the Egge Mountains, the Haarstrang, the Sauerland, the Westerwald, and the Taunus. These mountain systems are described under their own names [ERZGEBIRGE, FICHELBERG, HARZ MOUNTAINS, &c.], or under the names of the states in which they are situated. [BADEN, BAVARIA, BOHEMIA, &c.] Most of the principal rivers of Germany have their sources in these mountains: the great rivers, as the Elbe, the Rhine, the Weser, the Ems, &c., are described in separate articles; the others under the states through which they flow.

The interior of the central mountain region, or the countries inclosed by the mountain ranges which we have described, presents nothing but a succession of valleys and high hills. The valleys are frequently wide, but generally of only moderate fertility. The hills have in general a gentle descent, and many of them are cultivated to some height. No hill rises to the elevation of a mountain except the Vogelsberg, north of the Spessart, and west of the Rön Mountains, which consists of basalt and lava.

The elevated plain is inclosed on the west by the Rhenish mountains, which rise at their northern extremity, at no great distance from the place where the river Main joins the Rhine, a few miles south of the town of Frankfurt. This range is known under two names, the northern being called Odenwald, and the southern Schwarzwald, or Black Forest, the division being made by the narrow valley through which the river Neckar flows.

The elevated plain, or the table-land of Bavaria, extends between the Schwarzwald and Odenwald on the west to the Böhmerwald on the east, as far north as the Thüringerwald and Rön Mountains, and is bounded on the south by the Alps. Its length from north to south is about 180 miles, and its mean breadth probably exceeds 120 miles. [BAVARIA.]

The fourth natural division of Germany comprehends the Alps and their numerous valleys, of which a description is given under AUSTRIA and ALPS.

That part of Germany which lies on the left bank of the Rhine contains level tracts only along the river, the greater part of it being occupied by mountain ranges which partly constitute the northern extremity of the Vosges Mountains, and partly the eastern districts of the Ardennes. The Vosges enter Germany as a broad-backed range, and descend rapidly towards the flat tract, which, with a mean breadth of 8 or 10 miles, separates them from the Rhine; they lower gradually towards the west, where they terminate in a flat level of moderate extent. The Vosges terminate properly at Kaiserlautern, where a valley, about 50 miles long and 4 miles wide, extends from the Rhine to the Saar; its mean elevation is 800 feet above the sea, and it is partly covered with moors. North of this valley lies a rather extensive mountain tract, the ridges of which are known by the names of Donnersberg (Thunder Mountain), Hochwald, the Idarwald, and Hundsrück. This mountain region occupies the whole tract between the valley of the Rhine and the rivers Moselle and Saar. On the other side of the Moselle is the Eifel.

The Eifel and the Höhe Veen constitute the southern boundary of the low plain on the west of the river Rhine. In this part the plain extends over Belgium and the southern provinces of the Netherlands. Though the districts united to the Netherlands are not much superior in fertility to that part of the low plain which lies on the other side of the Rhine, those which form Belgium, and which belong to Germany, exhibit a different character, being fertile to a considerable degree.

Climate.—The climate of the different parts of Germany differs in no great degree, if we except the countries situated on the southern

declivity of the Alps and its valleys. At Trieste, on the Adriatic Sea, the mean annual temperature is 58° Fahr.; but north of the Alps the temperature is nearly equal all over Germany. Though the northern districts are 7 or 8 degrees farther north than the southern, the difference of temperature due to this cause is compensated by the much higher elevation of the southern districts. The mean annual temperature varies only between 45° and 50° of Fahrenheit (that of London is 48° Fahr.). In the greatest degree of cold which has been experienced, the thermometer sunk to 31° below zero, and in the greatest degree of heat it rose to 95°. The countries along the banks of the rivers Rhine and Main enjoy the mildest climate, and here the almond-tree and the chestnut succeed very well. Vines do not grow north of 51° N. lat., unless peculiar care is taken to shelter them. The low plain, which lies exposed to the winds that blow from the northern seas, has a much moister and more variable climate than the interior, which, owing to its greater elevation, is much drier and less subject to sudden and frequent variations. The quantity of rain which annually falls varies greatly with the localities of places. It amounts at Wittenberg to 18 inches, at Berlin to 21 inches, and at Ulm to 28 inches.

Ancient Germany.—The word Germania was employed by the Romans to designate a country of greater extent than modern Germany. They included under this name all the nations of Europe east of the Rhine and north of the Danube, bounded on the north by the German Ocean and the Baltic, including Denmark and the neighbouring islands, and on the east by the Sarmatians and Dacians. It is difficult to determine how far Germany stretched eastward. According to Strabo (vii. c. 1) Germanic tribes dwelt nearly as far as the mouths of the Borysthenes (Dnieper). The northern and north-eastern parts of Gaul were also known under the name of Germania in the time of the emperors, after the province of Belgica had been subdivided into Germania Prima and Germania Secunda.

The Greeks and Romans had very little knowledge of Germany before the time of Julius Cæsar, who met with several German tribes in Gaul, and crossed the Rhine more than once, rather with the view of preventing their incursions into Gaul than of making any permanent conquests. His acquaintance was however limited to those tribes which dwelt on the banks of the Rhine. Under the early Roman emperors many of these tribes were subdued, and the country west of the Visurgis (Weser) was frequently traversed by the Roman armies. But at no period had the Romans any accurate knowledge of the country east of this river; and it is therefore difficult to fix with certainty the position of the German tribes, particularly as the Germans were a nomad people. Some parts of Germany were inhabited by the Gauls, who were, according to Cæsar ('Bel. Gal.' vi. 24) the more warlike nation in early times. Two great countries of Germany, Bohemia (Boihemum), and Bavaria (Boioaria), derived their names from the Boii, a Gallic tribe.

The name of Germani was first applied by Cæsar to the whole nation east of the Rhine, though it properly belonged only to those tribes which he conquered in Gaul. Tacitus states ('Germ.' c. 2) that the first tribe which crossed the Rhine were the Tungri, who were afterwards called Germani, which is supposed to be the same as Wehrmann; that is, 'Man of War.' It is doubtful whether the Germans themselves employed any one name to designate the whole nation. Tacitus ('Germ.' c. 2) divides them into three tribes—1, Ingævones, bordering on the ocean; 2, Hermiones, inhabiting the central parts; 3, Istævones, including all the others. Pliny ('Nat. Hist.' iv. 14) makes five divisions—1, Vindili, including Burgundiones, Varini, Carini, Guttones; 2, Ingævones, including Cimabri, Teutoni, and Chauci; 3, Istævones, near the Rhine, including the midland Cimabri; 4, Hermiones, inhabiting the central parts, including the Suevi, Hermunduri, Catti, and Cherusci; 5, Peucini and Bastarnæ, bordering on the Dacians.

History.—The origin of the Germanic nations, like that of all others, is uncertain. Some authors, taking as their guide the affinity of languages, have traced their descent from the inhabitants of Asia; and Von Hammer calls them a Bactriano-Median nation. But to assign to the Germanic nations a distinct historical origin is to make an assertion without evidence, though it is now indisputably established that the Teutonic dialects belong to one great family with the Latin, the Greek, the Sanscrit, and other European and Asiatic tongues. All the positive knowledge however that we have of the German nations previous to their contact with the Romans is mere conjecture. The Romans first became acquainted with them, B.C. 113, when they appeared under the name of Teutones and Cimabri on the confines of the Roman dominion and defeated the consul Papirius Carbo. They made successive attacks on the frontiers, but were repelled by Marius, who defeated these barbarians in the years A.C. 108 and 101. When Julius Cæsar had subjugated Gallia and penetrated to the Rhine, he became acquainted with a nation then designated by the name of Germani. Ariovistus, the leader of the nation which had formerly inhabited the banks of the Danube, attempted to establish himself in Gallia; but being defeated by Cæsar, was obliged to fly beyond the Rhine. Cæsar twice crossed the Rhine in order to secure Gallia from the inroads of the barbarians: he took some Germans into his army, whom he employed against the Gauls and afterwards against Pompey.

The civil wars which divided the Romans withdrew their attention for some time from Germany, and the Sigambri ravaged Gallia with impunity. After they had defeated Lollius, the legate of the emperor Augustus (B.C. 15), he himself hastened to the defence of Gallia ('Vell. Pat.' ii. 97); and in order to oppose the inroads of the Germans, he erected several fortresses on the Rhine, and gave his stepson Drusus the command of the forces stationed on the banks of that river. Drusus made several successful expeditions against the Germanic nations, and penetrated as far as the Elbe. After the death of Drusus (B.C. 9), his brother Tiberius commanded for two years the legions stationed on the Rhine. Tiberius employed policy rather than force against the Germans. He engaged many of them to enter the Roman service; and when he was again (A.D. 4) entrusted with the same command, he penetrated as far as the banks of the Elbe; and Germany would have perhaps become a Roman province if the imprudence of his successor, Quintilius Varus, had not destroyed all the advantages already gained. The violent measures which he adopted to change the manners and institutions of the Germans caused a general conspiracy against the foreign invaders. Arminius, who was educated at Rome, and who had served in the Roman armies, was at the head of this conspiracy. The legions of Varus were attacked by the Germans in the forest of Teutoburg (A.D. 9), and entirely destroyed. This defeat of the Romans was followed by the loss of all their conquests beyond the Rhine; and the Germanic nation of the Cherusci, among whom Arminius was born, became the most powerful nation in Germany. Four years afterwards, Germanicus restored for a time the fortunes of the Roman arms, but without regaining the former acquisitions. From that time the Romans seem to have abandoned the idea of extending their conquests in that direction, and to have contented themselves with repelling the inroads which the Germans occasionally made on their frontiers. The Germans were also prevented from making any serious attempts against the Romans by the internal wars which distracted them for many years. They again attacked the Roman empire under Domitian, Nerva, and Trajan, the last of whom entirely defeated them. From this time their attacks on the Roman empire became more frequent and more formidable, and their history becomes blended with that of the decline of the Roman empire, on the ruins of which they established several new states. We shall pass over the period to the death of Charlemagne, under whose successors the modern history of Germany begins. Those who would study the state of Ancient Germany may refer to the 'Germania' of Tacitus, and to the work of Mannert on Ancient Germany, published in 1829, as well as to several other German works on the subject, but particularly those of Barth and Ledebuhr.

Modern History.—Louis, surnamed the Germanic, son of Louis Le Debonnair, and grandson of Charlemagne, was, by the treaty of Verdun, 843, the first king of the Germans. Germany was divided at that time from France by the Rhine, and possessed on its left bank only Speyer, Worms, and Mainz, with their respective districts. Under the reign of Louis were established the margraves; and burghs, that is, fortified towns or castles, were founded in order to prevent the inroads of the Normans as well as of the Slavonians. This emperor increased his dominions by the acquisition of Cologne, Treves, Aix-la-Chapelle, Utrecht, Metz, Strasburg, Basel, and many other towns and districts which he inherited from his nephew, Lotharius II. Louis died in 876, and his three sons, Carloman, Louis the Younger, and Charles the Fat, divided his empire. In 884 Germany was re-united to France by the accession of Charles the Fat to the throne of the last-named country, who thus became sovereign of almost all the empire possessed by his great predecessor Charlemagne. But the Germans (in 887) renounced their allegiance to him, and raised to the throne his nephew, Arnulph of Carinthia, a natural son of his brother Carloman, who was crowned emperor in 896, after a victory over Berengar, duke of Friuli. He died in 899, and was succeeded by his infant son Louis, who died in 911, and with whom the Carolingian dynasty ended in Germany. Otho, duke of Saxony, having refused the imperial dignity on account of his great age, Conrad, the first duke of Franconia, was elected emperor of Germany. After Conrad's death (918), Henry the Fowler, duke of Saxony, was elected emperor. From that time the crown of Germany remained elective until the 6th of August, 1806, on which day the emperor Francis II. abdicated the imperial crown of Germany, and declared the dissolution of the Germanic empire. Henry the Fowler died in 936, and the imperial dignity continued in his house until the death of Otho III. in 1002. The emperors of Germany assumed the title of Roman emperors from the time of Otho I., who was crowned at Rome in 962: when a successor to the throne was elected during the emperor's lifetime, he was called the king of Rome. Conrad II. (1024-39) organised the feudal system, and first endeavoured to put an end to the factions and quarrels then universally prevalent, by the establishment of the so-called peace of God, *Freuga Dei*. He extended the limits of the empire by the incorporation of Burgundy. His successor, Henry III. (1039-56), humbled the Roman see by deposing three successive popes, but the papal influence was again restored by Gregory VII., who maintained a protracted struggle with the emperor Henry IV. (1056-1106).

The crusades began during the reign of this emperor, which was constantly disturbed by his quarrels with the Roman see, as well as with the powerful vassals of the German empire. Henry V. (1106-25),

son of the foregoing, was a prince without any talents, and of a bad character. Under his reign the great vassals of the empire became entirely independent, and thus the division of Germany into several states was established. The reign of Frederick I., or Barbarossa (1152-90), a prince of ability, is memorable for the establishment of the Hanseatic League. The reign of Frederick II., who died in 1250, is after that of Charlemagne perhaps the most remarkable period of the middle ages. His son, Conrad IV., was opposed by William of Holland, and died in 1254. Upon Conrad's death there were several competitors for the imperial crown, among whom was Richard, earl of Cornwall, brother of Henry III. of England. The parties who supported the different competitors took advantage of the disturbed state of the empire in order to strengthen their own power. Peace was restored by the accession of Rudolph I., count of Habsburg (1272-91). This great prince destroyed the strongholds of the nobles, who exercised constant depredations on the adjacent country, and established order by severe measures. Rudolph is the founder of the Habsburg dynasty, which through a female line still reigns in Austria.

After Henry's death Louis of Bavaria was elected emperor; he reigned from 1314 to 1347. The reign of Charles IV. of Luxembourg, king of Bohemia (1347-78) is particularly remarkable by the constitution of the empire which he proclaimed (in 1356) under the name of the Golden Bull. This constitution regulated the rights, privileges, and duties of the electors; the manner and formalities of the election and coronation of an emperor; the coinage, customs, and other articles relating to the commerce of the empire; the rights and obligations of the free imperial cities, &c. Charles's son, Wenceslaus (1378-1410), was a weak prince, whose reign was disturbed by internal commotions and distinguished by the commencement of Huss's reformation. After the death of Wenceslaus, his brother Sigismund ascended the throne (1411-37). During his reign the council of Constance was held, when Huss was executed, a transaction which gave rise to the wars of the Hussites.

The long reign of Frederick III. (1439-93), a weak-minded prince, was marked by the great progress of science, which was promoted by the foundation of many universities in Germany. Frederick's son, Maximilian I. (1493-1519), was a prince of a superior mind and character. He put an end to many abuses which had desolated the empire, particularly private feuds. He improved the organisation of the courts of justice, introduced a system of police for the better security of the inhabitants, and established (in 1516) the post. He gave also a new and better organisation to the army, being himself an accomplished military commander. It was also during his reign that the reformation of Luther began (1517), at the university of Wittemberg, which had been founded in 1502. The Reformation led to protracted and bitter dissensions, owing to the refusal of the emperor to grant religious liberty to the Protestants. Entire toleration was first granted to the Protestants by Ferdinand I. (1556-1564), a prince of a mild and conciliatory character, the grandson of Maximilian I., who became emperor on the abdication of his brother, Charles V., in 1556. Under Matthias (1612-19), the Thirty Years' War commenced in 1618. Matthias was followed by Ferdinand II. (1619-37), a bigoted Roman Catholic, whose fanatical zeal against the Protestants, as well as his political ambition, continued to involve Germany in the Thirty Years' War. The treaty of Westphalia, which terminated the war in 1648, established a new organisation of the German empire. By this treaty, which served as the basis of the constitution of Germany till the formation of the Confederation of the Rhine in 1806, the religious and political liberties of the Germans were established on a sure footing. The sovereignty of the states of the empire was acknowledged, as well as their right to form alliances among themselves and with foreign states, provided none were concluded against the emperor or the empire. It was also declared that the emperor should not, without the consent of the states, put any one of them under the ban of the empire. The Palatine of the Rhine, who had lost his states, recovered them by that treaty and was created an elector. The Protestants were confirmed in all the liberties which they possessed before the war, and the estates of the Roman Catholic Church, which had been seized by the Protestants and possessed by them in 1624, were left in their hands, but those seized after this time were restored to the Roman Catholics. The members of the Reformed Church received equal rights with the Lutherans. Several bishoprics and abbeys were secularised, and given as an indemnity to different states. All the sovereigns were put under an obligation not to persecute their subjects who professed a religion different from their own. Alsatia was ceded to France; Sweden received a part of Pomerania, Bremen, Verden, Wismar, and a sum of 5,000,000 dollars for its army; Brandenburg received the secularised bishoprics of Halberstadt, Minden, Kamin, and the expectation of the possession of Magdeburg; Mecklenburg, the secularised bishoprics of Schwerin and Ratzeburg. Hanover was invested with the right to have one of its princes created, alternately with a Roman Catholic, sovereign bishop of Osnabrück, and also received some convents with their estates. The abbey of Hirschfeldt and 600,000 dollars were given to Hesse-Cassel. Austria consented to all these measures in order to preserve her hereditary states. Holland was acknowledged by Spain as an

independent state. France and Sweden declared themselves guaranties of all the provisions of the above-mentioned treaty. Leopold I. (1657-1705), was involved in constant wars with France and with the Turks, who besieged his capital, Vienna, which was saved by John Sobieski, king of Poland. Leopold granted in 1692 the electoral dignity to the duke of Brunswick-Lüneburg, and conferred in 1701 the royal crown on the elector of Brandenburg, who took from that time the title of king of Prussia.

The elector of Bavaria, who was elected emperor in 1742, put forward claims to the succession of the Austrian states, and other sovereigns took advantage of that circumstance to attack Maria Theresa, who was married to the Duke of Lorraine. A war ensued, which was ended by the peace of Aix-la-Chapelle in 1748; but the emperor Charles VII. having died in 1745, the husband of Maria Theresa was elected emperor under the name of Francis I. In his reign the Seven Years' War was concluded by the treaty of Hubertsburg in 1763. Francis was succeeded in 1765 by his son Joseph II., who distinguished himself by the numerous reforms which he introduced into his dominions, and particularly by his act of toleration to all the religious persuasions, proclaimed in 1781. The short reign of Leopold II. (1790-92) is marked by the treaty of Pilnitz, which he concluded in 1791 with the king of Prussia against the French. Leopold was succeeded in 1792 by his son, Francis II., who, after the formation of the Rhenish Confederation, having resigned the title of emperor of Germany, took that of emperor of Austria.

It may be useful to give here an outline of the Capitulation, or Constitution of the German Empire as it existed prior to this Confederation, or rather before the French Revolution.

The states of the Germanic empire consisted of the following members, divided into three colleges, or chambers:—

I. The Electoral College, which consisted of the Ecclesiastical Electors; the archbishop of Mainz, arch-chancellor of the empire for Germany, the archbishop of Treves, arch-chancellor of the empire for Gallia and the kingdom of Arles (a purely titular office); and the archbishop of Cologne, arch-chancellor for Italy (also a titular office).

II. The Secular Electors were—the king of Bohemia, arch-cup-bearer of the empire; the elector of Bavaria, arch-carver of the empire; the elector of Saxony, arch-marshal of the empire; the elector of Brandenburg, arch-chamberlain of the empire; the elector palatine of the Rhine, who had the title of the arch-treasurer of the empire: this electorate became united with that of Bavaria by the accession of the elector to the throne of the last-named principality in 1777; and the elector of Brunswick-Lüneburg, or Hanover, created by the emperor Leopold I. in 1692, who received in 1706 the title of arch-treasurer.

The Second College consisted of the princes of the empire, who were in rank next to the electors: they had each a vote in the diet of the empire and were divided into Spiritual and Temporal princes.

The Spiritual princes of the empire who had a vote in the diet were:—the archbishop of Salzburg, and formerly the archbishop of Besançon; the grand-master of the German order; the bishops of Bamberg, Würzburg, Worms, Eichstædt, Speyer, Straßburg, Constance, Augsburg, Hildesheim, Paderborn, Freysingen Passau, Ratisbon, Trent, Brixen, Basel, Münster, Osnabrück, Liege, Chur, Fulda, Lubeck; the princely (gefürstete) abbot of Kempten; the princely prebendaries of Berchtolsgaden and Weissenburg; the princely abbots of Prüm, Stablo, and Cervey.

The Temporal princes were:—the archduke of Austria; the dukes of Burgundy, Magdeburg; the counts palatine of Lautern, Simmern, and Neuburg; of Deuxponts (Zweibrücken), of Veldenz, and Lautercken; the dukes of Bremen, of Saxe-Weimar, Eisenach-Gotha, Altenburg, Coburg; the margraves of Brandenburg-Culmbach, and of Brandenburg-Onolzbach; the dukes of Brunswick, Zell, Grubenhagen, Calenberg, and Wolfenbüttel; the prince of Halberstadt; the dukes of Upper and Lower Pomerania; of Verden, Mecklenburg-Schwerin, Mecklenburg-Gustrow (afterwards Strelitz); of Württemberg; the landgraves of Hesse-Cassel and Hesse-Darmstadt; the margraves of Baden-Baden, Baden-Durlach, and Baden-Hochberg; the dukes of Holstein, Gottorp, and Saxe-Lauenburg; the prince of Minden; the landgrave of Leuchtenberg; the prince of Anhalt; the princely count of Henneberg; the princes of Schwerin, Kamin, Ratzeburg, and Hersfeldt; the princely count of Montbeliard. The princes enumerated belonged to the old body; the following who were elevated to their dignities after the time of the emperor Ferdinand II., were called the new:—the duke of Aremberg; the princes of Hohenzollern, Salm, Lobkowitz, Dietrichstein, Nassau-Hadamar, Nassau-Dillenburg, Auerberg, East Friesland, Schwarzenberg, Lichtenstein, Thurn-Taxis, and Schwarzburg. Many of these principalities were in the possession of one individual, who had consequently several votes, the votes being attached to the states and not to individuals.

The prelates, abbots, and abbesses of the empire were divided into two benches, the Suabian and the Rhenish, of which each had one vote. The counts and nobles of the empire were divided into four benches; of Suabia, Franconia, Westphalia and of Wetterau, each having one vote. They belonged to the second college.

The free imperial cities formed a college at the diet divided into two benches, the Rhenish with 14 cities, and the Suabian with 37. Each town had a vote.

The above-mentioned three colleges formed the diet of the empire, whose ordinary meetings were formerly summoned by the emperors twice a year, in addition to extraordinary meetings. But from the year 1663 the diet sat at Ratisbon. Every college voted separately; and when their respective decisions on the subject under discussion agreed the matter was presented for the ratification of the emperor; after which it became law, and was called 'conclusum imperii.' The emperor could refuse his ratification, but could not modify the decisions of the diet.

The diet had the right of enacting, abolishing, and interpreting laws, of declaring war, concluding peace, contracting alliances, receiving foreign ambassadors, &c. A declaration of war was decided, on an imperial proposition, by a majority of votes; and when it was decided even those states that had voted against it were obliged to furnish their contingents. The diet also imposed taxes for the general expenses of the empire.

There were two tribunals for the decision of points in dispute between the members of the empire—the Aulic Council of the empire, which had its seat always at the residence of the emperor; and the Cameral Tribunal of the empire (Camerargericht), which sat at Wetzlar. They were composed of members delegated by the different states of the empire, and an imperial deputy presided.

The emperor was elected only by the electors, who could do it either personally or by deputies. The place of election was Frankfurt-on-the-Main, where the coronation also took place, although the golden bull of Charles IV. declared that the emperor should be elected at Frankfurt, but crowned at Aix-la-Chapelle. All strangers, even the princes of the empire and foreign ambassadors, were obliged to leave the town on the day of the election, which took place in a chapel of St. Bartholemew's church. Mainz was the teller; and after having collected the votes gave his own to Saxony. The emperor, immediately after the election, swore to the constitution, or, as it was legally termed, capitulation. He could do it either personally or by deputy.

The immediate nobility of the empire, who acknowledged no other sovereign than the emperor himself, and who, as we have mentioned, had their collective votes in the diets, were also judged by the two above-mentioned courts of justice.

The Confederation of the Rhine was established by an act, signed at Paris on the 12th of July 1806, by the various electors of the empire. The French emperor declared himself Protector of the Confederation. By the establishment of this confederation several princes received new and higher titles; many towns and principalities lost their political existence; and several petty sovereign princes were by the same act mediatised, or deprived of their sovereign rights. The events of 1813 however put an end to the Confederation of the Rhine; and the Congress of Vienna established by an act, June 8, 1815, the present Germanic Confederation, composed of all the states of Germany. The central point and the organ of the Confederation is the Federative Diet, which sits at Frankfurt-on-the-Main. It exercises its authority in a double form: 1st, as a general assembly, called Plenum; and 2nd, as a minor council, or the Federative government. The Plenum meets only whenever an organic change is to be introduced, or any affair relating to all the confederation is to be decided. The plenum contains 66 votes, of which Austria and the five German kingdoms have each 4 votes, and the other states in proportion to their importance, 3, 2, or 1 vote each. The Federative government is composed of 17 votes, out of which 11 principal states have each a single vote, and the remaining 27 only 6 joint votes. Austria presides in both the assemblies, and decides in case of equality. The Federative government has the initiative, and deliberates on the projects which are presented to the Plenum, where they are not debated, but simply decided by a majority of ayes or noes. It executes the enactments of the Plenum, and despatches the current business of the Confederation. It decides by a simple majority, and seven votes form a quorum. The meetings of the Federative Diet are either those wherein preparatory debates take place, but no protocols are made, or those wherein affairs are finally decided.

The object of the Germanic Confederation and the duties of the Federative Diet are—the maintenance of external security or mutual defence from a common enemy, and the preservation of internal peace among the Federative states, which have no right to declare war on each other, but must submit their differences to the decision of the diet. The maintenance of internal security comprehends not only the prevention of conflicts among the Federative states, but also the suppression of any attempt by the subjects of any of the states to subvert the existing order of things. A movement, which had for its original object a new and more thorough union of the German people, excited intense and general interest in Germany during 1848 and the following year or two. It was first formally embodied in a proclamation issued March 22, 1848, by the King of Prussia, under the stimulus of the violent revolutionary excitement then prevalent throughout Germany. In this proclamation he urged the German princes and people to the abandonment of their local names and independencies, and to a hearty and cordial union under one guiding hand; while, by way of showing his sincerity and commencing the work, he offered

himself as that guide, and "fused and dissolved" the name of Prussia into that of Germany. A congress of deputies was soon after constituted at Frankfurt to make arrangements for convoking a National Constitutional Assembly. This assembly met at Frankfurt (June 28th), and appointed a provisional central power, to be presided over by an imperial regent, or administrator (Reichsverweser), elected by the assembly. They then proceeded to elect the Archduke Johann of Austria regent of the German empire, and he at once accepted the office. The assembly next proceeded to discuss various measures for the government of the empire, but little real progress was made. The partisans of Austria and Prussia were nearly balanced, and the main business soon resolved itself into a struggle for the ascendancy of one or other of these powers. At length by one vote Austria was excluded from the German empire, and by another (passed March 28, 1849) the King of Prussia was elected hereditary Emperor of the Germans, but nearly half of the members refrained from taking part in this election; while Austria, by a circular note (dated 3rd of April) protested against this as well as all future proceedings of the Frankfurt National Assembly, and refused any longer to recognise its existence; and eventually the King of Prussia declined the Imperial crown and rejected the Frankfurt constitution. Other protests and withdrawals quickly followed, and the assembly, its members much diminished, and its resolutions utterly disregarded, fell into anarchy, impotence, and dissolution. Austria and Prussia entered (Sept. 30, 1849) into a separate treaty for the formation of a new, *ad interim*, central power, and the Archduke Johann, in consequence, resigned into the hands of the plenipotentiaries his office as regent of the empire. Meetings of the German princes, &c., were subsequently called, and various proceedings taken, but matters have eventually fallen back pretty much into the condition in which they were at the beginning of 1848. The diet of the German Confederation meets as of old, and discusses the state of Germany, but its resolutions do not at the present time appear to carry much weight. [See GERMANIC CONFEDERATION in Supp.]

German Language and Literature.—The German or Teutonic language may be divided into two great branches, which are subdivided into several dialects: the High German, or the language of Southern Germany; and the Low German, or Saxon, which is used in the northern part of that country.

The High German was formerly divided into two dialects, the Francic and the Allemannic. The Francic was the idiom of the Franks, and that of the French court till the reign of Charles the Bald, when it was replaced by the French. The principal monuments of this dialect are, the fragments of a treatise of Isidore, 'De Nativitate Christi,' which date from the beginning of the 8th century, and some fragments of the poem of Hildebrand and Hadubrand, which belong to the end of the same century, as well as the oath of Charles the Bald. It was used at the court of the German emperors till the accession of the Hohenstauffen. The Allemannic dialect prevailed in the south-western part of Germany, including a great part of Switzerland. Its most ancient monuments are—a translation of the 'Rules of St. Benedict,' made about the beginning of the 8th century; the poetical 'Paraphrase of the Gospels,' by Otffried, and a translation of Psalms, by a monk called Noker, made about the beginning of the 10th century. Both the above-mentioned dialects seem to have disappeared in the middle ages, and to have been replaced by the Suabian dialect, which became the language of the court under the Hohenstauffen dynasty, and in which the Minnesingers composed their poems.

The modern German, also called High German (Hoch Deutsch) may be considered as chiefly derived from the old High German, or southern dialect. Its universal usage as the literary language of all Germany dates from Luther's translation of the Bible, by which circumstance it acquired a decided superiority over all the dialects of Germany.

The written language of modern Germany must however be distinguished from that which is only spoken. The spoken language may be divided into the following dialects:—1, the Swiss, which is spoken in German Switzerland, and which itself may be subdivided into several dialects, as for instance that of Berne and Argau, that of the valley of Hasli, of Freiburg, of the Grisons, and of Appenzel; 2, the Rhenish dialect, which is likewise subdivided into many dialects, as that of Alsatia, of Suabia, &c.; 3, the Danubian, subdivided into the Bavarian, Austrian, and Tyrolese dialects.

The Saxon, that is, the language of Northern or Lower Germany, may be divided into the following dialects:—1, the old Low German (Alt Nieder Deutsch), called also the old Saxon, from the nation that spoke it. This language, which is now entirely extinct, was spoken at an early period, and during a part of the middle ages in all the north of Germany as well as in the Low Countries, except the parts inhabited by the Frisians and the Angles. The works written in this language were composed from the 8th to the 11th century; the principal of them is the 'Evangelien Harmony,' which seems to date from the beginning of the 9th century. 2, the Low German of the middle ages, which was in use from the 11th to the 16th century, contains many works; but its literature is very inferior to that of the Suabian, or the High German of the middle ages. The chief productions in that dialect are—a 'Vocabulary,' composed in the 12th century; a translation of the Bible, made at the beginning of the 13th century; and the well-known comic productions, 'Reineke der Fuchs' and 'Til

Eulenspiegel.' 3, the modern Low German, which is spoken over almost all Northern Germany, but has ceased to be a written language. Its literature is very poor, and contains, besides popular songs, only some grammars, vocabularies, and a few chronicles, of which the principal is that of Livonia by Russow. This language, which is subdivided into many dialects, is distinguished by the softness of its sounds, and has fewer gutturals and accumulated hissing consonants than the High German dialects. The Low German is divided into three principal dialects: 1, the Saxon proper, or the idiom of Lower Saxony, which is subdivided into the dialects of Hamburg, Holstein, Schleswig, Hanover, &c.; 2, the Oriental Saxon, which is also subdivided into the idioms of Higher Saxony, Brandenburg, Pomerania; 3, the Occidental Saxon, or Westphalian, which is also subdivided into several dialects.

The Frisian language is a branch of the German tongue. It may be divided into three dialects: 1, the Batavo-Frisian, which very much resembles the Anglo-Saxon, and which was formerly spoken in many parts of the north of Holland, but is now preserved only in a few places about the towns of Moleweren and Hindelopen in West Friesland; 2, the Westphalian Frisian, which was spoken in many parts of Westphalia, but is now entirely extinct and replaced by the Saxon; 3, the Northern Frisian, which still exists on the island of Heligoland as well as in some parts of Schleswig, where Frisian settlers established themselves in the middle ages. The Frisian literature is very poor.

The Anglo-Saxon; the Dutch and Flemish; and the Scandinavian languages are also branches of the German tongue.

Those who wish to study the history of the Teutonic languages will find ample information in the learned works of the two brothers Grimm, which have been republished several times in Germany.

The most ancient monument of German literature extant is the translation of the Bible into the Gothic language by Bishop Ulfilas. It was made in the second part of the 4th century, for the use of the Gothic tribe of the Thervingians, who, having settled on the banks of the Danube in the ancient Roman province of Mœsia, were generally called Mœso-Goths. Ulfilas on that occasion introduced a new alphabet by modifying the old Runic characters, which were in general use amongst the Teutonic nations. The library of Upsal in Sweden possesses a remarkable fragment of this translation, well known under the name of the 'Codex Argenteus,' being written in silver letters on a purple-coloured parchment. It contains the four gospels, and is supposed to have been written in the 5th or at least in the beginning of the 6th century, among the Goths of Italy. Some fragments of St. Paul's Epistles to the Romans were discovered on a palimpsest in the library of Wolfenbüttel; and several parts of the books of Esdras and Nehemiah, as well as several epistles of St. Paul, preserved in the same manner, were discovered in the library of Milan by Angelo Mai.

The reign of Charlemagne may be considered as the commencement of the German literature, although there are some fragments of translations from ecclesiastical books which were probably made prior to that epoch. Charlemagne, who was very anxious to promote the cultivation of his native language, introduced German names of months. He ordered the scattered monuments of the Teutonic language, particularly laws or customs, and songs to be collected. He also ordered the ministers of religion to preach in German, and directed the translation of several things from the Latin for the information of the common people. The two most ancient German poems are, the 'Lay of Hildebrand and Hadubrand,' and the 'Prayer of Weizenbrun,' which have been published by Grimm, and which belong to the 8th century.

After the reign of Charlemagne, the Christian religion being established throughout all Germany, many fragments of the Bible and some ecclesiastical writings were paraphrased from the Latin into the vulgar tongue. The separation of the Germanic empire from the French, which took place in the middle of the 9th century, acted beneficially on the national language and literature. The earliest known German poem of that time is a song written in commemoration of the victory which Louis III. of France gained over the Normans in 881. Another curious monument of the literature of that time is the laudatory poem on Saint Anno, archbishop of Cologne and tutor of the emperor Henry IV. But the most remarkable production is the metrical paraphrase of the Gospels by Otffried, a Benedictine monk, made about 870, which shows an uncommon poetical genius in the author, who had to contend with all the difficulties presented by a rude and uncultivated language. To this period belong also the chroniclers Wittikind, Dithmar, Lambert, and Bruno, who all wrote in Latin.

The reign of the emperors of the Suabian family of Hohenstauffen is the golden age of the romantic or chivalrous poetry of Germany. This poetry being written in the Suabian dialect, which came into fashion through the influence of the reigning family, is generally called the Suabian. The poets of that period are known under the name of Minnesingers, from the old German word 'minne,' which signifies 'love.' They may be compared in many respects with the Troubadours of Provence, and were generally knights and nobles, whose life was divided between the occupations of love, war, and devotion, which inspired their poetical effusions with tender, noble, and pious feelings. They lived chiefly

at the courts of German princes, who were fond of poetry, and many of whom were poets themselves. Love and the praise of ladies were the principal themes of their compositions, in which however were intermingled the description of chivalrous exploits generally performed either in defence of religion or for the honour of the fair. The versification of these poems is exceedingly varied, and they were generally set to music and sung by their authors. The most ancient Minnesinger whose works have reached us is Henry von Veldek; next to him the most celebrated are Walter von der Vogelweyde, Reimar the Old, Reimar von Zweter, Ulrich von Lichtenstein, Wolfram von Eshenbach, Hartman von der Aue, and some others, who all lived either at the end of the 12th or at the beginning of the 13th century. The last of these poets who deserve notice are John of Würzburg and John Hadloup, who both lived at the end of the 13th century.

The most remarkable production of that time is the celebrated 'Nibelungen Lied,' which is quite different from the poems of the Minnesingers, and whose origin is by many ascribed to a much more remote period. It is a kind of epic poem, of which the chief heroes are Attila, or Etzel, king of the Huns, and Dietrich, or Theodoric, of Berne, king of the Goths. There are several minor poems of the same kind and on similar subjects, which were collected and published for the first time in 1490 under the title of 'Heldenbuch,' or heroic book. This collection has been reprinted several times in the old language, and also translated into modern German. The decline of chivalry put an end to the Minnesingers, and the art of poetry descended from the nobles to the burghers of cities: welfare and civilisation being secured by their fortified towns, gave them a decided advantage over the nobles, who abandoned themselves to the greatest excesses, and lived in a most lawless state, being constantly engaged in mutual feuds and depredations during the troubles which agitated the German empire in the latter part of the 13th century, after the death of Frederick II.

The cultivation of poetry by the burghers became a kind of trade, and the poets, who formed a corporation like other artisans and tradesmen, were called Meistersingers, or master singers. They had their rules like other corporations, and the members were obliged to submit to an apprenticeship. Their poetry was of a different kind from that of the Minnesingers. The exploits of chivalry and the enthusiastic love or rather worship of ladies were no longer the exclusive themes of their compositions, although they produced some metrical chronicles. The general subjects of the poems of this period are of a moral and satirical character, but there are also some of the didactic kind. The most celebrated productions of this school are the well-known poems, 'Reineke der Fuchs,' translated into English and published by Caxton; and the 'Narrenschiff,' which has also been translated (not from the German original, but from a Latin translation entitled 'Stultifera Navis') into English under the title of the 'Shippe of Fools,' by Alexander Barclay.

There are many other productions of a similar kind, all characterized by an overflowing comic and satirical humour. The best specimen of this national humour is the celebrated production called 'Eulenspiegel,' translated into English under the title of 'Owl-glass,' London, 1709.

To this epoch belongs the commencement of the original dramatic literature of Germany, which is due to the Meistersingers' school of Nürnberg. Before that period the Germans were only acquainted with the so-called mysteries or dramatised biblical stories, written and performed for the most part in Latin. About the middle of the 15th century, Hans Volz, a barber by profession, Rosenblut, and some others, introduced a kind of farce called 'Carnival Plays.' They were all excelled by Hans Sachs, a shoemaker by profession, who lived from 1494 to 1576: his works are full of wit and invention, and next to the Spaniard Lope de Vega, he is the most fertile of dramatic writers.

Many historical and allegorical poems were written during the 15th century, and several ballads and other metrical productions were rendered into prose, which may be considered as the commencement of the novel in Germany. Amongst the historical works which belong to this period we may mention the chronicles of Bishop Otho, of Freisingen, and his 'History of Frederick I.:' the works of Henry of Erfurt, who died in 1370; those of Gobelinus, who died about 1420; and some others, all written in Latin. The 'Fürstenbuch,' or 'Book of Princes,' by John Euenkel, 1250; the 'Metrical Chronicle' of Ottokor, of Horneck, born about 1264; the 'Chronicles' of James von Koenigshofen, of John Rothe, of John Thurmayr (Aventinus); the 'Pomerian Chronicle,' by Kantzow, and that of Lubeck, by Detmar, were written in German. The 'Chronicle of the World,' by Sebastian Frank, is the first universal history in the German language. Among the scholastic philosophers several Germans distinguished themselves from the beginning of the 13th century; we may mention as one of the most celebrated Albert Groaz, or Grot, better known under the name of Albertus Magnus, who distinguished himself also by a knowledge of natural philosophy superior to that of his contemporaries, and who in many respects may be compared with Roger Bacon. Many collections of laws were also made during this period, of which the most celebrated are the 'Sachsenspiegel' and the 'Schwabenspiegel,' that is, the Saxon and the Swabian Mirror, both compiled in the 13th century. The

invention of the art of printing, of which the Germans are so justly proud, gave a new impulse to the national literature, and prepared the way for the Reformation. From this period dates the rise of the modern literature of Germany, rendered illustrious in all branches by a numerous array of writers of the highest eminence, in whose biographies, in another section of this English Cyclopædia, the further progress of German literature will be treated.

GERONA. [CATALUÑA.]

GERS, a department in the south of France, situated between 43° 17' and 44° 4' N. lat., 1° 11' E. and 0° 16' W. long., is bounded N. by the department of Lot-et-Garonne, N.E. by that of Tarn-et-Garonne, E. and S.E. by Haute-Garonne, S. by Hautes-Pyrénées, and W. by Basses-Pyrénées and Landes. The form of the department is very compact; its greatest length from east to west is 73 miles, from north to south 53 miles: the area is 2425 square miles, and the population in 1851 was 307,479, which gives 126.79 to the square mile, being 47.79 below the average population per square mile for the whole of France. According to the census of 1841 the population of the department amounted to 311,447. The department is formed out of the old districts of Condomois and Armagnac, and a small part of Comminges—territories formerly comprised in Gascony and Guienne.

Surface, Hydrography, and Communications.—The department is hilly; the lower slopes of the Pyrenees, running generally from south to north, cover the greater part of the surface. The most important of these ridges runs north by west, and separates the basin of the Garonne from that of the Adour. Thirty-eight watercourses mark out as many valleys of great beauty and fertility, opening in width from a few yards in their southern, to three or four miles in the northern extremities, and separated from each other by the ridges of hills before mentioned. The rivers Save, Gimone, Arratz, Gers, Baïse, and Lousse flow northward through the department on their way to join the Garonne. The Gers from which the department is named rises in the heathy moor of Pinas, in the arrondissement of Bagnères, and department of Hautes-Pyrénées. It passes Mauldon, Auch, and Lectoure, and enters the Garonne on the left bank about five miles above the city of Agen, after a course of above 90 miles: no part of its course is available for navigation or floatage except during the spring floods, when timber is sent down it to the Garonne. The Midou and the Douze flow north-westward, and unite at Mont-de-Marsan in the department of Landes to form the Midouze, a feeder of the Adour. The Arros joins the Adour in this department a little below Plaisance. The Adour itself crosses the south-western angle of the department, receiving several mountain streams on its left bank. All these rivers are subject to inundations at the time of the melting of the snows on the Pyrenees; none of them is navigable within this department. The gradual rise of the country from north to south is seen by the height of the hills inclosing the valley of the Gers. On the confines of Lot-et-Garonne these hills are 318 feet, at Auch 721 feet, and at Mont d'Astarac in the south of the department 1180 feet above the sea-level. The department is traversed by 8 imperial, 19 departmental, and 46 pariah roads.

The climate is very changeable. From October to May rain, snow, and frost alternate, the cold being most intense in January; from May to the end of June the weather is warmer, and thunder and hailstorms are frequent; July and August are very hot; September is the most agreeable month, but even then the mornings and evenings are cold. The prevailing winds blow from east and west.

The department contains 1,551,954 acres. Of this surface 824,336 acres are arable: 150,406 are natural pasture; 150,075 are covered with woods and forests; 216,897 are occupied with vineyards; 49,999 are covered with ponds, rivers and canals of irrigation; 88,347 are heath and moorland. The soil consists of a stiff loam resting on thick layers of clay of great depth, which are separated in some instances by thin strata of sand or tufa. The nucleus of the hills is argillaceous limestone. Breadstuffs are grown in quantity more than enough for the consumption; wheat, maize, oats, and rye are the principal grain crops; peas and beans, cabbage of various kinds, garlic, and onions are cultivated extensively. Horned cattle, sheep of inferior breed, mules for the Spanish market, swine, game, and poultry are abundant. Geese and ducks especially are very numerous, and of large size; their wings and legs are salted for export. Marble, building-stone, gypsum, marl, potters' clay, and a fusible spar used in glass and china works are found. Some mineral springs, but no metals, are found in the department.

Of manufacturing industry there is little. Coarse woollens, bricks, glass, pottery, and other articles of common necessity are made for home use. The quantity of leather tanned is in excess of the consumption, and some of it is exported. The other exports are brandy, wine, corn, flour, wool, poultry, and cattle. The number of wind-mills and water-mills exceeds 1000.

The quantity of wine produced in this department yearly is about 25,000,000 gallons, about one-fourth of which is used for home consumption, and the greater part of the remainder is distilled into brandy, known by the name of Armagnac, from the former name of the district. In quantity of alcohol, the Armagnac brandies bear to the Cognac the ratio of 19.5 to 22. But for mildness and delicacy of

flavour, and for a peculiarly agreeable aroma, both of which qualities improve with age, the Armagnac is a superior spirit.

The department is divided into five arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1861.
1. Auch	6	85	61,925
2. Lectoure	5	73	51,135
3. Mirande	8	152	83,113
4. Condom	6	87	69,901
5. Lombes	4	71	41,415
Total	29	467	307,479

1. In the first arrondissement the chief town is AUCH, which is also the capital of the department, and is described under its proper head. The more important of the other towns are here given; the population in each case being that of the commune. *Gimont*, E. of Auch on the Gimone, has a college, a good trade in agricultural produce, and 2816 inhabitants; the parish church and the market-house, which is built over the main street, are the most remarkable structures. *Jegun* is not far from the right bank of the Baise, to the north-west of Auch, and has a population of 2076. *Saramon*, a small place on the left bank of the Gimone, has 1276 inhabitants. *Vic-Fezensac*, which stands on the left bank of the Losse, is a well-built town with 3365 inhabitants, who carry on a brisk trade in brandy, wine, corn, hoops, &c.

2. In the second arrondissement the chief town, *Lectoure*, situated on the platform of an isolated rock not far from the right bank of the Gers, has a tribunal of first instance, a college, and 6030 inhabitants (in the commune), who manufacture coarse woollens, serge, and leather, and trade in corn, cattle, wine, brandy, hides, &c. It is an ugly and ill-built town; the principal buildings are—an hospital, which occupies the site of the old castle; a large and handsome gothic church, built by the English; and the former episcopal palace, which, purchased by Marshal Lannes, a native of the town, and presented to the corporation by his widow, now serves for the residence of the mayor, and for the courts of justice. A statue of the marshal in white marble has been recently erected in front of this building. *Lectoure* is surrounded by several fine promenades: from that of the Bastion the southward view embraces a magnificent scene, with the main ridge of the Pyrenees in the background. *Lectoure* is an ancient place. The castle was for a long period the residence of the counts of Armagnac, one of whom, Jean V., by his incestuous marriage with his sister Isabelle, and perhaps still more by his supposed leaning towards the English, incurred the displeasure of Charles VII., who seized *Lectoure*, drove the count to take refuge in Aragon, and confiscated his property (1455). He was restored to his estates by Louis XI. in 1461, against whom however he subsequently revolted. *Lectoure* was again taken in 1473 after a capitulation, the terms of which however were not observed; the count was murdered, the inhabitants of the town massacred, and the countess Jeanne de Foix, his legitimate wife, sent to the castle of Burzet and poisoned. The town of *Lectoure* had hardly recovered from this terrible disaster when the opposing parties in the so called religious wars of France frequently took and plundered it. The Duke of Montmorenci was confined in the castle of *Lectoure* previous to his trial and decapitation at Toulouse in 1632. *Fleurance*, a well-built town with 3409 inhabitants, stands 6 miles S. from *Lectoure*, on the left bank of the Gers. *Mauvesin*, on the Arratz, has a population of 2674, and the remains of an ancient castle which belonged to the counts of Fezensac.

3. In the third arrondissement the chief town, *Mirande*, stands upon the Baise, and has a tribunal of first instance and 3410 inhabitants. It is regularly and well built, and surrounded with walls pierced by four gates, from which the principal streets lead to a square in the centre of the town. *Mirande* was formerly the chief town of the county of Astarac, which now forms the arrondissement of Mirande.

4. In the fourth arrondissement the chief town is *Condom*, which is situated on the Baise, 32 miles N.W. from Auch, in 43° 57' 81" N. lat., 0° 22' 27" E. long., and has a tribunal of first instance, an agricultural society, a college, and 7027 inhabitants in the commune. The town seems to have existed in the 9th century; it was the capital of Condomois, and was governed by a seneschal. The fortifications were demolished in 1229, but were afterwards repaired. The town gave title to a bishop from 1817 till the French revolution. In 1569 *Condom* suffered much from the Calvinists. The town is built on a hill above the Baise, the highest part of which is an open square, with the parish church, a handsome gothic edifice, on one side of it. Like most old towns, *Condom* is an ill-built place, but it is improving every year. The ramparts are planted and laid out as promenades, and in the environs are many pretty country houses and numerous vineyards. The chief trade is in wheat and flour ground in the numerous corn-mills on the Baise; there is also a considerable commerce in wine and brandy, and also in leather, woollen-yarn, corks, paper, tiles, and porcelain, which are among the industrial products of the town. *Cazandon*, in the north-west of the department, has brandy distilleries and 2657 inhabitants. *Eauze*, the ancient *Elusa*, and the metropolitan see of the Roman division *Novempopulana*, lies N.W. of *Condom*, and

has 8340 inhabitants. The ancient city was sacked by the Goths in the 5th century, again by the Saracens in 732, and finally in the 9th century by the Northmen, who massacred the population. At this last period the seat of the archbishop was transferred to Auch. *Montreuil*, W. of *Condom*, has manufactures of woollen-yarn, tiles, and brandy, and a population of 2727. *Nogaro*, prettily situated near the Midou, and once the residence of the counts of Armagnac, has 2187 inhabitants.

5. In the fifth arrondissement the chief town, *Lombes*, situated in a plain of great fertility on the left bank of the Save, has a tribunal of first instance and 1677 inhabitants. It was formerly the capital of Bas-Comminges, and the seat of a bishop from 1817 till the first French revolution, when the see was suppressed. *Isle-en-Jourdain*, a neat well-built town in a pretty situation on the right bank of the Save, has 4938 inhabitants, including the commune; it was formerly fortified, but in 1799, in consequence of a royalist insurrection, its castle and ramparts were razed to the ground.

The department forms the see of the Archbishop of Auch, is included in the jurisdiction of the High Court of Agen, and belongs to the 18th Military Division, of which Bayonne is head-quarters. The department returns 8 members to the Legislative Body of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Official Papers.*)

GÉVAUDAN, LE, a district which formed a part of the old province of Languedoc, and was divided by the river Lot into Upper and Lower Gévaudan. It derived its name from the Gabali, its ancient inhabitants. It was bounded E. by the rivers Allier and Borne and the mountains of Lozère, which separated it from the districts of Vévey and Vivarais, which with Gévaudan form the country of Cévennes; S. by the diocese of Alais; W. by Rouergue; and N. by Auvergne. It now forms nearly the whole of the department of Lozère. Mende was the chief town of the Gévaudan, and is now the capital of the department.

GEX, a district on the eastern frontier of France, was ceded to France by Switzerland in 1601, and was included in the military government or province of Bourgogne. Under the empire it was comprehended in the department of Léman, but when at the peace of 1814 France lost the greater part of that department the district was included in the department of Ain. The county of Gex is mountainous, being traversed by the ridges of the Jura; it is bounded on the south-east by the Rhône, which is not here navigable. [Ain.]

GEYSERS. [ICELAND.]

GHAUTS. [HINDUSTAN.]

GHEEL. [ANTWERP, Province of.]

GHENT (in Flemish *Gend*, in German *Gent*, in French *Gand*), a city in Belgium, the capital of East Flanders, is situated in 51° 3' 12" N. lat., 3° 43' 51" E. long., at the intersection of the railroads that connect Malines with Ostende and Lille with Antwerp, from which towns it is distant 33, 38, 42, and 32 miles respectively. The population in 1850 amounted to 103,729. The city is built at the confluence of the Schelde and the Lys, and is intersected by a great number of navigable canals which communicate with those rivers, and thus form 26 islands connected with each other by above 80 bridges. The Sas-van-Ghent Canal, which runs northward from Ghent into Zealand (where it joins the Neuzen Canal) connects Ghent with the West Schelde at Terneuzen, and allows sea-going vessels, drawing 18 feet water, to enter the city, which thus enjoys all the advantages of a sea-port. It was opened in December 1823. At Sas-van-Ghent, about 14 miles to the northward of Ghent, are sluices, by means of which the whole country hereabouts can be laid under water.

The origin of Ghent is ascribed by tradition to the Vandals, who in their irruption into Belgium in the 5th century built a fort, named from them Vanda, which name was afterwards changed to Ganda, or Gandavum Castrum. This tradition receives some confirmation from the existence of a fort on the left bank of the Schelde within the city, still bearing the name of Wandelaers Kasteel (Castle of the Vandals). About A.D. 629 King Dagobert sent St. Amand to Ghent to convert its inhabitants from paganism, and he (the saint) founded two monasteries to the honour of St. Peter, one on a rising ground called St. Peter's Mount, the other near the Antwerp Gate. Many of the inhabitants, who were converted to Christianity by the preaching of St. Amand, bequeathed their wealth to the second of these monasteries. One of these benefactors gave his name to the abbey of St. Bavon, some parts of the ruins of which buildings are still visible: this quarter of the city for some time bore the name of St. Bavon.

In 868 Baldwin Iron-Arm, the first count of Flanders, built a fortress at Ghent, which was called Count's Castle, and Baldwin and his successors encouraged weavers and persons skilled in the woollen and linen manufactures to settle in Flanders. About the end of the 12th century the Flemish nobles, in order to equip themselves for the Crusades, sold their domains to their vassals, who by that means were enfranchised. At the same time the inhabitants of the Flemish towns, already become wealthy by trade and manufactures, were enabled to purchase great commercial and political privileges, which laid the foundation for the extraordinary prosperity and freedom enjoyed by these communities during the middle ages. Accordingly the men of Ghent proceeded to establish a form of municipal government; they

elected sheriffs, adopted a public seal, and established a court of justice. They joined the association of the Hanse Towns, and obtained from the emperor Frederick I. the free navigation of the Rhine. In 1180 Ghent, which was then a populous city, became the capital of Flanders, and obtained a charter from Count Baldwin of Hainault, with great privileges.

By these means the city increased so rapidly, that towards the end of the 13th century it exceeded in extent and population the capital of France. At the beginning of the 15th century the number of its citizens employed in the manufacture of woollens, it is said, amounted to 40,000, and in times of war furnished from their number 18,000 armed men. With wealth and freedom the weavers and artisans of Ghent waxed turbulent, and led on first by Jacques van Artevelde and afterwards by his son Philip, they gave many a proof of their sturdy valour and the extent of their resources in their frequent insurrections against the counts of Flanders, and in the subsequent century against the dukes of Burgundy. Temporary successes however were followed by humiliations, confiscations, and loss of privileges; and to this spirit of dissension and revolt, and to their intermeddling in the political quarrels of the times, may be ascribed the ultimate decline of Ghent and the other great Flemish towns. Charles V. was born at Ghent in February 1500: the site of the palace in which he was born is now occupied by the new street called Cour des Princes. During his reign the city contained 35,000 houses, and a population of 175,000. In 1537 Maria, sister of Charles V., who then administered the government of the Netherlands, demanded from Flanders an extraordinary subsidy of 1,200,000 florins of gold, one-third part of which was to be paid by the citizens of Ghent, who, having already advanced considerable sums to the emperor towards the expenses of the war with France, refused to comply with this fresh demand, and made a show of armed resistance, but were speedily reduced to submission; and the emperor, to punish the citizens, took away from them all their privileges, besides confiscating the property of such as had been actively concerned in the revolt, several of whom were condemned to death. On this occasion a citadel was erected for the purpose of holding the citizens in check.

When the confederation was formed for expelling the Spaniards from the Belgian provinces, a congress was held in Ghent; and a document known in history as 'the Pacification of Ghent' was publicly signed by the confederates met together in the town-hall 8th November 1576. On the 11th of the same month the Spanish garrison shut up in the citadel capitulated to the citizens. This citadel was afterwards destroyed; but some portions of it may still be seen near the railway station to the east of the town.

The capitulation signed 17th September 1584 again placed Ghent under the dominion of Spain; the citadel was rebuilt, and so many of the inhabitants quitted the city that one-third of the houses were empty. In 1598 the Belgian provinces were severed from the crown of Spain in favour of Isabella, daughter of Philip II., who married Albert, son of the emperor of Germany. Ghent was taken by Louis XIV. in 1678, after a siege of six days. The city was occupied by Marlborough in 1706. In 1745 Louis XV. having entered Flanders with Marshal Saxe at the head of 100,000 men, took Ghent by surprise, but the country soon again came into possession of Austria. In 1792 the Netherlands fell under the power of France, and Ghent was constituted the capital of the department of the Schelde, and so continued till the downfall of Napoleon in 1814, when Flanders became part of the kingdom of the Netherlands. In 1814 the treaty of peace was signed here between Great Britain and the United States of North America, which put an end to the war between the two countries. On the return of Napoleon from Elba in 1815, Louis XVIII. took refuge in Ghent. In consequence of the revolution of 1830 Ghent, with the rest of Flanders, was comprised in the new kingdom of Belgium.

Ghent is a handsome well-built city. It contains numerous squares, wide handsome streets, a large number of turret- or steeple-crowned churches, and many large and imposing public buildings. The tall, elegant, column-shaped chimneys which rise from above 60 cotton-mills, contribute their quota to the imposing appearance of the town, and indicate the existence of great industrial activity still within its walls. The houses in general are picturesque objects, their gable-ends rising like steps in every fantastic variety, and ornamented with scrolls and carving. The city is surrounded by walls about 8 miles in circuit and pierced by seven gate entrances, some of which date from the 14th century, and are interesting for their architecture; the Antwerp gate is the most admired.

There are several fine promenades in the interior of the city. The finest is on the bank of the Coupure Canal, which connects the river Lys with the Bruges Canal. It is planted with three rows of large trees, and is much frequented in spring and autumn. The Boulevards which surround the city are also much used as public walks. The Vrijdags Markt (Friday Market) is a large square space in which meetings of the citizens were formerly held, and where criminals are executed. In the centre of the square the citizens erected, in 1600, a column 50 feet high to the memory of Charles V. This column was surmounted by a statue of the emperor; it was restored in 1772, and taken down during the revolutionary troubles of 1793. In the Place St. Pharisilde, near the fish-market, stands an old turreted

gateway, which is a relic of the castle built here by Baudouin Bras-de-Fer, count of Flanders, in A.D. 868. The castle of which this relic formed a part was for some time (in 1838-9) the residence of Edward III. of England and his family; and here Queen Philippa gave birth to a son, who, from his birthplace, was called John of Gaunt. The site of the castle is now covered with mean buildings. The relic above mentioned is built into the walls of a cotton factory.

The cathedral church of St. Bavon (St. Baefs), a fine gothic edifice, was consecrated in 941. Its rebuilding was undertaken in 1228, but was not entirely finished until the beginning of the 16th century. It was formerly dedicated to St. John, and took the name of St. Bavon in 1540, when Charles V. caused the collegiate chapter of the abbey of St. Bavon to be removed to it; twenty years afterwards the church was constituted a cathedral. The tower is remarkable both for its elegance and its height, which is 271 feet. The high altar is adorned with a statue of St. Bavon, in his ducal dress, by Verbruggen. In front of it are four tall copper candlesticks, which belonged to Charles I., and still bear the arms of England. On each side of the choir are handsome monuments and statues of four bishops of Ghent. The twenty-four chapels in this cathedral contain some paintings of first-rate excellence. One of these pictures, a master-piece of Rubens, represents the reception of St. Bavon into the abbey of St. Amand, after having distributed his goods among the poor. The Adoration of the Spotless Lamb, the joint production of Hubert and John van Eyck, is perhaps the finest work of the early Flemish school; it contains above 300 heads, all finished with the most scrupulous minuteness. The beauty and grace of the countenance of the Blessed Virgin in this picture are only surpassed in the productions of Raffaele. This wonderful picture, which dates from 1432, is in the sixth chapel beyond the transept, on the right hand, as you go round the choir. The church of St. Michael, situated in the centre of the city, on the bank of the Lys, is built in a light and delicate style of architecture. It contains the only picture by Vandyck which is possessed by the city of Ghent; the subject is the Crucifixion, but the painting has been much injured by cleaning. The pulpit of carved mahogany, with a bas-relief of the Ascension, deserves notice. The parish church of St. James also contains several good paintings. There are many other churches within the city, several of them very ancient, and many among them contain paintings and sculptures of considerable merit. St. Nicholas's church is the oldest in Ghent. The only Protestant place of worship in Ghent is the English church on the Brabant Dam.

The University of Ghent, an institution founded by royal ordinance in 1816, stands on the banks of the Lys. The first stone of the building was laid in August 1819, and it was finished with great rapidity. The façade presents an octostyle portico of the Corinthian order, copied from the Pantheon in Rome. The building is large and commodious, and is well furnished with philosophical apparatus and specimens of natural history. The library contains about 60,000 volumes, besides numerous valuable manuscripts taken from suppressed abbeys and convents. This library is open to the public every day except Sunday. The number of students who attended the University in 1850 was 350. The Royal College of Ghent occupies the greater part of the ancient abbey of Baudeloo, a vast and very commodious building, in which several of the students, numbering from one to two hundred, as well as the professors, reside. The Royal Academy of drawing, painting, and architecture occupies the former Augustinian College. The students who avail themselves of the advantages offered by this institution are very numerous. The studies comprise drawing, geometry, arithmetic, perspective, and anatomy, as applied to sculpture and painting. The collection of statues in the academy is considered to be valuable. There is also an extensive gallery of paintings taken from the suppressed abbeys and convents in 1795.

The Beffroi, or Belfry Tower, which originally served as a watch-tower, and contained the tocsin-bell, dates from A.D. 1181. The gilt dragon on the top of it was brought from Bruges in 1382 as a trophy of the conquest of that town by the men of Ghent, under Philip van Artevelde. It was originally brought from Constantinople by the men of Bruges, who went on the first crusade with Count Baudouin of Flanders. The view from the top of this tower is very fine. Near the Beffroi is the town-hall, a striking building with two façades, one built in 1482, the other in 1620; the former in the florid gothic style; the latter, facing the butter-market, is in a mixed style, columns of three different orders appearing one above another. The Pacification of Ghent was signed in this building.

The Béguinage, a quarter inhabited by the Beguine nuns, deserves notice. It is of great extent, surrounded by a wall and ditch which inclose streets and squares. The sisters live in small communities in separate houses, the doors of which are inscribed with the names of saints; they are bound by no vow, and may return to the world if they please; they attend to the sick within their inclosure, and are constantly seen in the hospital. They wear black robes with white veils; and the whole sisterhood, numbering above 600, may be seen at the different services of the church.

Among other noticeable objects in Ghent may be named the new Casino, near the Coupure Canal; the Kauter, or Place d'Armes, which is planted with trees and surrounded with large buildings; the Maison

des Bateliers, the oldest house in Ghent, on the Quai aux Herbes, dating from 1513; the new theatre, built by the town at a cost of 100,000*l.*, in one corner of the Kauter, and containing a magnificent saloon, ball- and concert-rooms; the Palais de Justice (in the handsome Rue du Theatre), the lower part of which serves as an exchange, while the upper part is fitted up for the courts of justice; the modern citadel, finished in 1830, and built on Mont Blaudin, at the extremity of the elevation on which the western part of the city stands; the post office, in the Rue de l'Université; and the botanic garden belonging to the university.

Ghent contains 21 public hospitals, besides several private establishments for benevolent purposes. The Hospital of Byloke, which was founded in 1225, has accommodation for 600 patients, and ordinarily contains 200. It is believed that the body of Jacques van Artevelde was buried in the church of the Byloke, after his assassination at his own house, which stood in the Padden Hoek. The school for the poor, founded by the magistrates of the city in 1623, contains 150 youths, who receive an education suitable to artisans. Each scholar is instructed in some particular branch of industry. A similar establishment was founded at the same time for poor girls, and is still in existence.

The central prison of Ghent, situated in the Coupure, is remarkable for its size and its judicious arrangements. This establishment has all the appearance of a busy workshop. Weaving, and its accessories of spinning and winding, are the most common employments of both males and females. The two sexes are separated. The women are also employed in washing and mending the clothes of the prisoners, and in the other necessary household duties. The building will hold 2600 prisoners. This prison, so far from being a cause of expense, brings in an annual profit to the city of 4000*l.* (50,000 florins). A considerable portion of their earnings is given to the prisoners, part at the time and the remainder at their discharge from prison.

About 20,000 persons are employed in various occupations connected with the cotton manufacture, in spinning, weaving, bleaching, and printing. Sugar-refining is extensively carried on. Among the other industrial products of Ghent are lace, silk, salt, paper, leather, linen, and woollen goods, soap, pins, beer, spirits, sail-cloth, oil-cloth, haberdashery, cutlery, steam-machinery, chemical products, &c. There are some good ship-building docks in the town, which has a large trade in agricultural produce, and an active transit trade.

Ghent is the residence of the governor of the province; it is also the seat of a tribunal of first resort, and of a court of appeal, which last has jurisdiction over the whole province of Flanders; it likewise gives title to a bishop, and is the head-quarters of the first of the four divisions of the Belgian army.

Besides the market held every Friday, horse-fairs are held in Mid-Lent and on the 23rd of July; there is also a general fair in August.

GHILAN. [PERSIA.]

GHOOLGHoola, a remarkable hill in the valley of Bameean in Afghanistan, is situated about 35 miles N.W. from Cabul. It is chiefly noticeable here on account of the great number of excavations in the mountains which inclose the valley on both sides. The greater number of the caves occur on the northern face of the hill. The hill is detached and stands in the middle of the valley. The caves are very numerous and extend in every direction. On the face of the hill are colossal statues of a male and a female, in alto-rilievo, cut out in the mountain rock. They are not distinguished either by symmetry of form or elegance in their drapery. The male figure is about one hundred and twenty feet high, and the female about seventy feet.

GHUZNEE, Afghanistan, a fortified city, once the capital of an empire reaching from the Tigris to the Ganges, is situated in 33° 34' N. lat., 68° 21' E. long., distant about 80 miles S.S.W. from Cabul. The city was once adorned with the most splendid buildings in Asia, but the houses which now occupy the site are of mean appearance and considerably reduced in number. In the vicinity however some remains of the ancient grandeur of the city are observable. At a distance of about three miles is the tomb of Sultan Mahmood, the conqueror of India, which though not magnificent is spacious and covered with a cupola. The doors, or rather gates, of this tomb, which were of sandal-wood and said to have been brought as a trophy from the temple of Somnauth in Guzerat, were removed by the British in 1842. The population has been variously stated, but is probably about 6000. The city stands on a rock about 230 feet above the adjacent plain. The citadel contains a palace, a magazine, and a granary. The city was taken by Lord Keane July 23rd 1839, and was surrendered to the Afghans in 1842. On September 6th 1842 it was re-taken by General Nott. [AFGHANISTAN.] Ghuznee is a commercial depot for the trade between Afghanistan and the Panjab.

GIANT'S CAUSEWAY. [ANTRIM.]

GIBARA. [CUBA.]

GIBRALTAR, a British town and fortified rock in Andalusia, the most southern province of Spain. The rock, which is connected with the continent by an isthmus of low sand, and almost wholly surrounded by the waters of the Mediterranean, forms a promontory three miles in length from north to south. The width is irregular, but the entire circumference is about seven miles. Towards the south it terminates in a point called Europa Point, which is in

36° 2' 30" N. lat., and 5° 15' 12" W. long. This rock, under the name of Calpe, and Mount Abyla (now called Ceuta), opposite to it on the African coast, were called by the ancients the Pillars of Hercules, and in very early ages were regarded by the people dwelling to the east of them as the western boundary of the world. In the early part of the 8th century an army of Saracens under the command of Tarif, or Tarek, from the coast of Africa, landed near to Gibraltar with the intention of dethroning Roderic, king of Spain. The Saracens erected a castle on the shoulder of the rock, and called the rock itself Gibel-Tarif (the mountain of Tarif), whence its present name of Gibraltar is supposed to be derived. The ruins of this castle may still be seen. The African Moors continued in possession of Gibraltar till the beginning of the 14th century, when it was recovered from them by Ferdinand IV., king of Castile and Leon. It subsequently fell into the hands of the king of Granada, from whom it was taken in 1462 by the Christians under Henry IV., king of Castile, who gave it the arms it still bears, namely, a castle with a key hanging to the gate, alluding to its being the key of the Mediterranean. From this time to the end of the 16th century Gibraltar remained in the hands of the Spaniards, by whom the fortifications were so far increased and modernised that the place was looked upon as impregnable until taken by an English and Dutch fleet under Sir George Rooke and the prince of Hesse Darmstadt on the 24th of July 1704. During the nine following years several unsuccessful attempts were made to recover the fortress by force or stratagem, in which the loss of the assailants was very great. In 1713 the possession of Gibraltar was confirmed to the English by the peace of Utrecht. In 1727 it was again attacked by the Spaniards with an army of 20,000 men. The siege continued for several months, and was terminated by the general peace on the 12th of May. The last and most memorable of all the sieges of Gibraltar was commenced in 1779, and did not terminate till the 2nd of February 1783, when it was announced that the preliminaries of a general peace had been signed.

The rock consists principally of a gray compact marble. It abounds with caves, the most remarkable of which is St. Michael's on the south-west side. The entrance to this cave is 1000 feet above the sea-level, and leads to a spacious hall, apparently supported by massive stalactites. Beneath this is a succession of descending caves beautifully picturesque, but of difficult access. In the perpendicular fissures of the rock bones of various animals, including human bones, have frequently been discovered. The natural productions of Gibraltar are wild rabbits, woodcocks, teal, and partridges; there are also large numbers of monkeys, of a dark-fawn colour, and without tails. The climate is temperate during the greater part of the year, and even in the summer months the excessive heat is allayed by a refreshing sea-breeze that sets in during the forenoon and continues till sun-set. The temperature in winter is considerably higher than in the neighbouring country, so that the snow, which falls but seldom, soon disappears, while it continues for many weeks on the mountains of Africa and the Sierra Morena. On whichever side the rock is approached it has a barren and forbidding appearance. From the ship's deck not a spot of verdure can be seen, and yet it is by no means destitute of vegetation, for besides acacias, fig and orange trees, there is a great variety of odoriferous plants. The rock rises to a height of about 1600 feet above the sea. On the east and north sides it is so steep as to be wholly inaccessible. Towards the south it is also very precipitous, but on the west side, where the town is built, it gradually declines towards the bay, where the strength of the fortifications is such that the fortress appears to be impregnable. Besides the fortifications of which we have just spoken there are excavations, wrought with extreme labour, in the solid rock, called galleries, which extend from two miles to three miles in length, and are of sufficient width for carriages. Along these galleries, at intervals of every twelve yards, are portholes bearing upon the neutral ground and bay. Of late years the fortifications have been carefully strengthened at every vulnerable point. The Spanish lines, which extend across the isthmus, are defended by two forts, the principal of which is called St. Philip. The space between these lines and the foot of the rock is called the neutral ground, and it is here that the lazaretto is situated.

The town is built on a bed of red sand, near the foot of the north-west side of the hill. It is paved and lighted, and consists chiefly of one street, extending about a mile in length from South-Port to Water-Port. The principal buildings are the governor's and lieutenant-governor's houses, the Admiralty (formerly a monastery of White friars), the barracks, victualling-office and store-house, the cathedral, the Spanish church, and the Jews' synagogue. Towards Europa Point are the South barracks and navy hospitals, both fine buildings, pleasantly situated, and well adapted to the purposes for which they were built. There are also a chapel for Wesleyan Methodists, an exchange, a library, a news-room, several subscription schools, a lunatic asylum, almshouses, &c. The water for the supply of the town and garrison is collected during the rainy season, and conveyed to the garrison by means of an aqueduct erected by the Spaniards. The roofs of the houses are so constructed as to receive the falling rain and to conduct it to a tank beneath, with which every house is provided. The nearest spring is on the neutral ground, and even there the water is brackish. The provisions are principally derived from Africa. The town can neither be called clean nor neat. The

houses are built in the English style, without regard to their ventilation, so essential to the health of the inhabitants, and so studiously observed in all Spanish towns.

There is a charter according to which all criminal causes are to be determined according to the laws of England. Disputes between debtor and creditor are referred to the judge-advocate, from whose award an appeal may be made to the governor, whose decision is final, unless the sum exceed 300*l.*, in which case a further appeal may be made to the privy council at home. Every precaution is taken to prevent the increase of new residents. Foreigners are allowed permission to remain during specified periods on giving the required security. The trade of Gibraltar has much declined within the last half century. Gibraltar being a free port, subject to few duties and few restrictions, is a convenient entrepôt for merchandise destined for the neighbouring provinces of Spain and Africa. The principal articles imported into Great Britain and Ireland from Gibraltar in 1851 were sheep's wool, tobacco, wines, silk raw and thrown, and senna. The articles of foreign and colonial merchandise exported from Great Britain and Ireland to Gibraltar in 1851 included spices, spirits, tea, tobacco, wines, and cotton-wool. The declared value of British and Irish produce exported to Gibraltar in 1851 was 431,286*l.* The average annual revenue collected in the town appears to be nearly 30,000*l.*, which is about sufficient to defray the public civil expenditure of the place. The strength of the garrison in 1847 was 3667 of all arms. The population of the town in 1850 was 15,823, being 7752 males and 8071 females: of the whole number 3641 were aliens.

The *Bay of Gibraltar*, formed by the headlands of Cabrita and Europa Points, is commodious and secure from all the more dangerous winds. The greatest width from east to west is five miles; the greatest length from north to south, reckoning from Rocabillo to Cabrita Point, is about eight miles; the depth in the centre is about 110 fathoms. The tide rises about four feet, and the variation of the needle is 22° 31'. The bay supplies the garrison with abundance of fish. The shipping is protected by two moles, constructed at a great expense, and extending into the bay to the respective distances of 700 and 1100 feet. On the western side is situated the pretty town of Algeiras, which the Spaniards have fortified since Gibraltar has been in the possession of England. A little to the south-west of this town is an island (Isla Verde), which adds to the general beauty of the bay.

The *Straits of Gibraltar*, anciently called the Straits of Hercules, are about 12 leagues in extent from Cape Spartal to Ceuta Point on the African coast, and from Cape Trafalgar to Europa Point on the coast of Spain. Their width at the western extremity is about 8 leagues, but at the eastern extremity it does not exceed 5 leagues. A strong current is constantly running from the Atlantic into the Mediterranean, which renders the passage of sailing vessels bound to the westward extremely precarious, and only practicable by means of a brisk Levant wind. Dr. Halley was of opinion that the daily evaporation of the Mediterranean was sufficient to account for the consumption of this constant influx of water; but there are two counter currents along the shores of Spain and Africa respectively, although their breadth and rapidity are small compared with the principal current.

(Parliamentary Papers.)

GIEN. [LOIRET.]

GIESSEN, a town in the grand-duchy of Hesse, is built on the banks of the Lahn and Wieseck, which form a junction at this spot in the centre of a beautiful country. It is 41 miles by railway to the north of Frankfurt-am-Main, and has about 9000 inhabitants. The town is old and ill-built, with the exception of three or four broad streets. The fortifications have been razed and their site converted into promenades. It has three squares, an old castle, an arsenal, three churches, university buildings, an hospital, and a house of correction. The University of Giessen, established in 1607, has become famous in recent times for its school of organic chemistry under Professor Liebig, whose classes are attended by students from all parts of Europe. The buildings appropriated to its use are handsome, and contain lecture-rooms, a library of 36,000 volumes, clinical establishment, chemical laboratory, museums of natural history, &c. Connected with it are an academy for forest economy, a gallery of antiques, an obetetric institute and school, a botanic garden, and an observatory. The number of professors and teachers in the University of Giessen is about 40; of students, between 500 and 600. Giessen is the seat of government for the province of Upper Hesse. It is not a place of much commercial industry: it has some manufactures of woollen goods, cotton, tobacco, and leather.

GIRGEEH. [EGYPT.]

GIRGENTI, the chief town of a province of Sicily, is built on the slope of a hill about three miles from the coast, and about one mile from the ruins of old Agrigentum. The town is irregularly built; it is a bishop's see, and has a clerical seminary with a library and cabinet of medals. The population, which is about 15,000, carry on some trade in agricultural produce through the neighbouring harbour, which is frequented only by small vessels. The principal articles of exportation are corn, fruit, oil, and sulphur. The principal buildings are—the cathedral; the public seminary; the public library and museum; and several churches and convents. [AGRIGENTUM.] The province of Girgenti has an area of 889 square miles, and a population (according to the census of 1851) of 245,974. It is divided into three districts, Girgenti, Sciacca, and Bivona. The other towns besides Girgenti are—*Sciacca*, a maritime town with 13,000 inhabitants, whose chief occupation is the fishing and pickling of sardines, which abound on this coast. The country around has many plantations of pistachio nuts. Hot mineral springs, the ancient *Thermae Selinuntiae*, are in this neighbourhood. *Castronovo*, inland, on a mountain, with 6000 inhabitants. *Bivona*, with 6000 inhabitants, and a royal college. Petroleum is procured in the neighbourhood. *Aragona*, with an old castle and 6500 inhabitants, is situated in a delightful country interspersed with almond plantations. The mud volcano of *Maccaluba* is in the neighbourhood.

GIRONDE, a maritime department in the south-west of France, lies between 44° 10' and 45° 34' N. lat., 0° 15' E. and 1° 18' W. long. It is bounded N. by the department of Charente-Inférieure, E. by that of Dordogne, S.E. by that of Lot-et-Garonne S. by Landes, and W. by the Bay of Biscay. The form of the department is very irregular. The greatest length of the department is 106 miles; its greatest breadth 80 miles. The area is 3761 square miles. The population in 1841 was 568,034—in 1851 it was 614,387, which gives 163.35 to the square mile, being 11.23 below the average for all France. This is the largest department in France; it is formed out of the western part of the old province of Guienne.

Coast-line.—The coast, which runs in nearly a direct line north and south for 75 miles, is lined with sand-hills, and these are skirted on the land side by the shore-lakes of Carcans and Canau, and the Bay of Arcachon. The lakes communicate with each other and with the bay, which is shallow and studded with islets, and opens into the sea. On the land side the Bay of Arcachon forms a vast shallow lagoon inclosing several small islets. A considerable portion of this part of the bay has been recently drained and converted into arable land. The river Leyre runs into the south-eastern angle of the bay. The sand-hills along the coast between the Gironde and the Adour are in many places planted with pines, from which rosin and pitch are made, the chief exports besides fish from the Bay of Arcachon. The harbour is at Tête-de-Buch, a fishing village near the entrance of the bay which is rising into some importance since its connection by railway with Bordeaux, some of whose exports are shipped in the Bay of Arcachon. On Cape Feret (the ancient Curianum Promontorium), on the northern side of the entrance, there is a lighthouse, in 44° 39' N. lat., 1° 15' W. long.

Surface, &c.—The general character of the surface in the interior is level except towards the east, where there are some hills; the country west of the Garonne is a dead flat. The principal rivers are the GARONNE and the DORDOGNE, which unite in this department to form the Gironde; and the north-east is watered by the Isle, an affluent of the Dordogne from the north bank. The feeders of the Garonne which are in the department are, with the exception of the Dropt, all small. In the south of the department the Leyre flows into the bay of Arcachon. The department is crossed by 7 imperial, 19 departmental, and a great number of parish roads. A railroad running northward through Angoulême and Poitiers to the Paris-Nantes line at Tours connects Bordeaux with Paris. There is also the railroad to Tête-de-Buch. A line is projected to connect Bordeaux with Cetta, which is to run up the valley of the Garonne to Toulouse; and another railway is to run from the Tête-de-Buch line to Bayonne.

The climate is temperate, and, except in the Landes, generally healthy; the sea-breezes and the frequent rains temper the heat, which would otherwise be excessive. The Landes, or sandy heaths, of which only a small part has been brought into cultivation, occupy nearly half of the department, extending from the sea to the valley of the Garonne. The sands of the downs along the sea-shore, driven inland by the winds, gradually overspread a considerable tract of country, encroaching yearly from 70 to 80 feet along the whole extent of the coast. The increasing devastation has however been checked by planting pines, broom, and other shrubs, by means of which the sand has in most parts become fixed. Between the Garonne and the Dordogne, and in that part of the department which is to the north of the latter river, the soil is chiefly calcareous; it is mingled with considerable districts of sandy and some of gravelly soil, and with rich loamy tracts.

Products, &c.—The surface of the department measures 2,406,972 acres. Of this area 564,298 acres are arable; 159,650 are grass-land; 343,051 are under vine-culture; 806,606 are barren heath and sand; 274,030 are covered with woods and forests; 67,841 various cultiva-

tion; and 45,782 are rivers, brooks, and estuaries. The breadstuffs chiefly cultivated are wheat and rye; a considerable quantity of maize and millet are also grown. The rye and millet are raised in such parts of the Landes as have by dint of manure been brought into cultivation. Excellent fruits and a large quantity of hemp are grown. But the staple produce of the department is wine, of which 44,440,000 gallons are produced annually. The finest clarets are from this part of France, as the growths of Lafitte, Latour, Château-Margaux (these are in the Médoc district, on the left of the Garonne and Gironde, between Bordeaux and the sea), Haut-Brion, Sauterne, Barsac, and the Vins de Grave. The extensive woods which skirt the sea-coast, or pervade the Landes, consist chiefly of the pine (*Pinus maritima*), from which turpentine, pitch, and charcoal are procured, as well as timber for building and masts for vessels. The cork-tree is abundant.

Geological Character.—The department is occupied by the various supercretaceous strata, the chalk rising to the surface only on the north-east boundary. Good building stone is quarried.

Inhabitants.—The Landes are thinly peopled; the inhabitants make charcoal or tend the numerous flocks which obtain scanty food amid these sandy wilds. The shepherds, clothed in sheepskins, traverse the waste on high stilts, balancing and supporting themselves by the aid of a long staff, of the broad head of which they occasionally make a seat, and which they also use to guide their flocks: they employ their leisure in knitting coarse woollen stockings for their own use or for sale. They travel to markets and fairs on these stilts. Among the sheep of the department are many flocks of merinoes, and the proprietors are trying to extend the long-wooled English breeds.

Manufactures.—The chief manufactures are calico, muslin, soap, chemical products, pottery, paper, vinegar, brandy, sugar, beer, leather, glass, &c. Ship-building is extensively carried on in Bordeaux. There are several tobacco-factories, dye-houses, rope-walks; and a great deal of salt is made along the coast. The department contains 1826 wind-mills and water-mills, 46 iron-foundries, and 347 factories of different kinds.

Divisions and Towns.—The department is divided into six arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Bordeaux	18	153	296,632
2. Blaye	4	56	59,469
3. Lesparre	4	30	39,677
4. Libourne	9	132	111,104
5. Bazas	7	68	55,112
6. La-Réole	6	105	52,395
Total	48	544	614,387

1. In the first arrondissement the chief town is **BORDEAUX**, which is also the capital of the department. The more important of the other towns are here named, with the population of the commune in each case. *St. André-de-Cubzac*, on the road from Paris to Bordeaux, and not far from the Dordogne, has 2010 inhabitants. *Cadillac*, in a fertile plain on the right bank of the Garonne, is a pretty town, surrounded by old walls flanked with towers, and has 1967 inhabitants. The fine old castle of the Duke of Epéron, the great ornament of the town, and the finest edifice of the kind in France except the royal palaces, is now used as a penitentiary for women. *Carbon-Blanc*, 6 miles N. from Bordeaux, has copper and lead rolling works, potteries, and 1869 inhabitants. *Castelnau-de-Médoc*, not far from the left shore of the Gironde, stands in a district which produces excellent red wine, and has 1211 inhabitants. *Labrède*, a hamlet of 1329 inhabitants, deserves notice for its château, in which Montesquieu was born, and which was purchased in 1839 by the late Duke of Orléans. *La Teste-de-Buch*, a small sea-port on the south shore of the Bay of Arcachon, is about 33 miles S.W. from Bordeaux, with which it is connected by railroad. There is a large pine-forest near the town. The inhabitants number 3447, and are chiefly engaged in the coasting trade and in fishing.

2. In the second arrondissement the chief town is **Blaye**, which is a sea-port and fortress, on the right shore of the Gironde, and has tribunals of first instance and of commerce, and 4350 inhabitants. The town is built at the foot and on the slope of the rocky hill, the summit of which is crowned by a strong citadel. The citadel, with the fortified tower of Paté on an islet in the middle of the estuary, and the fort of Médoc on its left shore, completely command the passage of the Gironde. Blaye has linen and woollen factories, glass-works, potteries, ship-building-yards, and a considerable commerce in wines, brandies, spirits, oil, soap, fruits, ship-timber, staves, &c. Large vessels put into the port of Blaye to complete their cargoes, and to supply themselves with provisions. *Bourg*, advantageously situated for trade on the left bank of the Dordogne, and near its confluence with the Garonne, is a well-built town, with a small harbour for vessels of 300 to 400 tons, and has 2564 inhabitants.

3. In the third arrondissement the chief town is **Lesparre**, about 44 miles N.W. from Bordeaux. It has a tribunal of first instance, and contains 1520 inhabitants. The district in which it is situated produces grain, pulse, and wines of excellent quality; the pasturage is

also good, and the fruit is abundant. Its commerce consists entirely in the sale of agricultural produce. *St. Laurent-de-Médoc*, a town 12 miles S. from Lesparre, with 2692 inhabitants, has a considerable trade in wine, pitch, and tar. *Paulliac*, a maritime town on the Gironde, 26 miles N. from Bordeaux, with a commodious port and a lighthouse. Vessels drawing too great a depth of water to ascend to Bordeaux unload at Paulliac, and here they take in provisions and water on proceeding to sea. Near Paulliac is the lazaretto of Trem-loup. The local trade consists in the exportation of the wines of Château-Lafitte, which are produced in the commune: population, 3805. *St. Vivien*, a town with 985 inhabitants, who manufacture salt, of which 6,000,000 bushels are annually produced from the neighbouring salt-works.

4. In the fourth arrondissement the chief town is **Libourne**, a handsome ancient town, situated on the right bank of the Dordogne, at its junction with the Isle, 22 miles by railway E. from Bordeaux. It has a tribunal of first instance, a chamber of commerce, a hydrographical school of the first class, a communal college, and 11,552 inhabitants in the commune. It contains also a public library of 3000 volumes, a museum, and a botanic garden. A handsome brick bridge of nine arches crosses the Dordogne, and a suspension-bridge of remarkable elegance crosses the Isle. Its port, where the tide rises from 13 to 16 feet, receives vessels of 300 tons burden. The manufactures are of cotton-yarn, iron, leather, ropes, and nails; ship-building is also carried on. The chief trade is in wine and brandy, oak-staves, iron, coal, and salt. *Castillon*, on the right bank of the Dordogne, 25 miles E. from Bordeaux, has 3000 inhabitants. There are cotton-factories, tan-yards, rope-yards, and cooperages here; and nails are manufactured to a considerable extent. There is also some trade in wool. Near the town are the remains of an old castle, near which in 1451 the English were defeated, and Earl Talbot and his son slain. *Coutras*, a town with 3302 inhabitants, 10 miles by railway N.E. from Libourne, is built at the confluence of the Dronne and the Isle, which streams are employed for working flour-mills for the supply of Bordeaux. Under its walls Henry IV. gained a victory over the Duc de Joyeuse in 1587. *Sainte-Foy-la-Grande* has 2924 inhabitants, and its trade consists in the making of cotton and woollen caps, linen, and leather. The district around produces an esteemed white wine, brandy, grain of all sorts, and good pasturage for cattle. It is on the left bank of the Dordogne, about 38 miles E. from Bordeaux.

5. The fifth arrondissement has **Bazas** for its chief town. It is an ancient place, dating from the Roman period, and is mentioned by Ptolemaeus as an important place under the name of Cossio, the capital of the *Vasates*, or *Vocates*. It possesses a tribunal of first instance, and has 4437 inhabitants. It is picturesquely seated on an eminence, at the foot of which flows the Beuve. It is ill built on the woele, but has agreeable walks formed upon the walls, the remains of its ancient fortifications. In a handsome square surrounded by an arcade stands the cathedral, a gothic building of the 13th or 14th century, which, though not large, is well proportioned, and has been classed among the 'historical monuments' of the country. The inhabitants manufacture druggets, make glass-bottles, blanch wax, and tan hides. They deal in corn, cattle, wood for fuel, and timber for building. The town stands in a sandy country on the high road from Bayonne to Bordeaux, about 33 miles S.S.E. from Bordeaux. *Langon*, a handsome little town on the right bank of the Garonne, and on the road from Bayonne to Bordeaux, has distilleries, tan-yards, and 3986 inhabitants. The town is advantageously situated for commerce, as the tide ascends to its port, whence the excellent wines of the district are shipped. The town is not well built, but the scenery in the vicinity is fine. A suspension-bridge over the Garonne unites the town with that of *St.-Macaire* on the opposite bank.

6. In the sixth arrondissement the chief town, **La-Réole**, about 25 miles E.S.E. from Bordeaux, is built on the side of a steep hill on the right bank of the Garonne. It is a place of great antiquity, and there yet remain the ruins of a pagan temple, called the *Grande-Ecole*, and two towers of a fortress erected by the Visigoths, called the *Castle of the Four Sisters*. The town possesses a tribunal of first instance, and a communal college. The streets are steep and narrow, the houses ill-built. There are no noticeable public buildings, but the scenery around is pleasant, and from the summits above the town a prospect of great variety is afforded, which includes a large number of villa residences on the banks of the Garonne. The number of inhabitants is 4036, who are employed in manufacturing combs, hats, vinegar, leather, &c.; and they have some trade in corn, wine, brandy, and cattle. All the other chief towns of cantons are small. *St.-Macaire*, opposite Langon, is a small but ancient town with 1513 inhabitants. It is ill built, and surrounded with old walls, in a state of tolerable preservation. There is a handsome gothic church, classed among the 'historical monuments,' and a small port on the Garonne.

The department forms the see of the archbishop of Bordeaux. It is included in the jurisdiction of the High Court, and in the circuit of the University Academy of Bordeaux, and in the 11th Military Division, of which Bordeaux is head-quarters. It returns five members to the Legislative Body of the French Empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Statistique de la France; Official Papers.*)

GIRONS, ST. [ARIZEX.]

GIRVAN, Ayrshire, Scotland, a small town and burgh of barony in the parish of Girvan, is situated in 55° 14' N. lat., 4° 50' W. long., on a fine bay at the mouth of the Water of Girvan, which here forms a small harbour, 21 miles S. from Ayr, 61 miles S.W. from Glasgow. The population of the town in 1851 was 7319. The town consists principally of cottages containing each two rooms: one room devoted to domestic uses, the other containing the weavers' looms. The inhabitants are chiefly weavers; a few are employed in fishing. In addition to the Established Church, there are chapels for Free Church Presbyterians, United Presbyterians, and Episcopalians. There are in the town a subscription library and several friendly societies. (*New Statistical Account of Scotland*.)

GLAMMIS. [FORFARSHIRE.]

GLAMORGANSHIRE, a maritime county of South Wales, lying between 51° 23' and 51° 48' N. lat., 3° 3' and 4° 18' W. long. This county is bounded N. by Brecknockshire and Caermarthenshire, E. by Monmouthshire, and S. and W. by the Bristol Channel. Its form is irregular; the greatest length is from east to west, from Llanvedw bridge over the Rumney to the headland between Rossily Bay and the river Burry, 52 or 53 miles; its greatest breadth, from the head of the river Rumney to the coast near Sully Island, 27 miles. The area is estimated at 547,494 statute acres. Its population in 1841 was 171,138; in 1851 it was 231,349, being an increase of 35·4 per cent.

Coast-line, Islands, &c.—The line of the Glamorganshire coast, from the mouth of the Rumney, where it adjoins Monmouthshire, to Pennarth harbour, formed by the estuary of the Taafe and the Ely, is marshy. From Pennarth Point, on the south side of the harbour, to Lavernock Point, are high cliffs, which continue with a few interruptions to Sker Point. About midway between Lavernock and Nash points is Breaksea Point, the most southerly part of the county. Between Lavernock and Breaksea points are Sully Island and Barry Island, both small. Barry Island, the larger of the two, is joined to the mainland by an isthmus, or causeway, dry at low water; it is nearly surrounded by cliffs, is about a mile and a half in compass, and contains about 300 acres of land occupied by a farmer, but for the most part retained in the state of a heath or warren for rabbits. The island is supposed to have derived its name from St. Baruch, a Welsh saint, who is said to have died here about A.D. 700. Leland, who has described the island, says, "There is no dwelling in the isle, but there is in the middle of it a fair little chapel of St. Barock, wher much pilgrimage was used." The cliffs along this part of the coast and in Barry Island are chiefly composed of *lias*, except those in the neighbourhood of Sker Point, which are chiefly of mountain limestone.

From Sker Point to the Mumbles the line of coast forms Swansea Bay. There are no cliffs here; the coast is comparatively low, and skirted by broad sands, dry at low water. At the Mumbles, which are small rocky islets just off shore, the limestone cliffs recommence, and continue with some interruptions along the line of coast, which runs westward to Worms Head, forming several small bays. At Worms Head the coast turns northward to the point opposite Holmes Island, whence it runs eastward along the shore of the Burry estuary, making the western part of the county a narrow peninsula, called Gower. The river Loughor, which runs into the Burry, forms the boundary of Glamorganshire and Caermarthenshire. Whitford Point is a small headland of the peninsula of Gower, jutting out for a mile or two into the Burry. The length of the coast, following its principal windings, may be estimated at 89 miles.

Surface, Hydrography, Communications.—Glamorganshire is covered with mountains, some of which branch off from the principal range that extends east and west through Brecknockshire into Caermarthenshire. The centre of the county is occupied by a group of mountains branching off in every direction except the north, and having its chief extension from east to west from the valley of the Cynon to that of the Neath. The highest mountain in the county, Llangeinor (1859 feet high), from which some of the principal tributaries of the Ogmores flow, belongs to this group. Margam Down, 1099 feet high, is near the east side of Swansea Bay. The general course of the streams is from north to south. The *Rumney* rises just at the north-east extremity of the county, which it separates from Monmouthshire. Its whole course is about 30 miles; it is not navigable, nor does it receive any tributary worth notice. The *Taafe*, *Taff*, or *Taf*, the largest river in the county, rises in Brecknockshire, between the mountains Capellante and the Van, or Beacon of Brecon, and flows past Merthyr Tydvil, Llandaff, and Cardiff, into Pennarth harbour, which is formed by the joint estuary of this river and the Ely. The whole course of the Taafe is about 40 miles. Its chief tributaries are the Taafe Fechan, or Little Taafe, the Cynon, and the Rontha Vavr, or Great Rontha. The Ely, or Elwy, may also be considered a tributary of the Taafe, since they have a common estuary; it is not navigable. The *Daw* or *Thaw*, rises near Cowbridge, and flows 10 or 12 miles past that town into the sea. Its mouth forms the little harbour of Abertaw, close to Breaksea Point. The *Ogmores* rises in the central mountain group

of the county, and flows past Bridgend, about 18 miles, into the sea between Nash Point and Sker Point. It receives on its right bank the Garw, and the Llynfi, or Llynvi, which flow from the same group of mountains, and on the left bank, near its mouth, it receives the Ewenny. The *Avon* rises on the north side of Llangeinor mountain, and flows south-west 15 miles into Swansea Bay; it receives the Corrwg and the Avon Fechan, or Little Avon, both small. It is navigable a mile or two above its mouth for vessels of small burden, employed by the proprietors of some neighbouring copper-works. The *Neath*, or *Nedd*, rises in Brecknockshire and flows south to the border of Glamorganshire; in this part of its course it receives several tributaries. From the border it flows through Glamorganshire into Swansea Bay. Its whole course is about 23 miles; it is navigable for vessels of 200 tons up to Neath Bridge, about 2 miles. There is a bar at the mouth with several rocks. It receives only one tributary of any importance in Glamorganshire, the Dulais, or Dylais, which rises in Brecknockshire and joins the Neath about 2 or 3 miles above the town of Neath. The *Tawe* rises in Brecknockshire, and flows south-west through Brecknockshire and Glamorganshire into the sea at Swansea, called by the Welsh *Abertawe*, the harbour of which is formed by the mouth of this river. Its course is about 26 miles, about half being in each county. The *Loughor* rather belongs to Caermarthenshire; it has the lower part of its course, for 12 or 14 miles, along the border of this county, and is navigable up to the town of Loughor. Its principal Glamorganshire tributaries are, the Lan or Llan, and the Leu or Liu. The estuary of this river is called the Burry, which name it takes from a streamlet of the peninsula of Gower, which flows into it.

There are several canals in the county. The Glamorganshire or (as it is sometimes called) the Cardiff Canal commences on the east side of the river Taafe, near its entrance into Pennarth harbour, about a mile and a half below Cardiff. In its course it passes the town of Cardiff, and is carried over the river Taafe by an aqueduct bridge, soon after which it is joined by the Aberdare Canal. The remainder of its course is on the west side of the river, to the town of Merthyr Tydvil, near the border of Glamorganshire and Brecknockshire. Its whole length is about 25 miles, with a total rise of 611 feet. At its termination in the tideway of the river Taafe there is a sea-lock, with a floating dock 16 feet deep, capable of receiving vessels of 300 tons. The line from Merthyr to Cardiff was opened in 1794. There are several railways along its line, connecting it with the mines and coal-pits. The Aberdare Canal is connected with the Glamorganshire Canal near the aqueduct bridge over the Taafe; and runs along the valley of the Cynon, on the eastern side of the river, and nearly parallel to it, to within a mile of Aberdare. Its length is 6½ miles, with a total rise of 40 feet. From the termination of the canal near Aberdare is a railway, which extends 2 miles farther in the same direction. The Neath Canal commences at Abernant, on the north-west side of the river Neath, or Nedd; it crosses the river, and passes the town of Neath, a mile or two below which it terminates in the Neath River. The Neath Canal is about 14 miles long. A branch cut from this canal on the south-east side of the Neath is carried across that river, and runs on the north-west side of it till it terminates in the Britton Canal. The Britton Canal, which is little more than 4 miles long, is cut from the river Neath, opposite to where the main line of the Neath Canal opens into it, and runs nearly parallel to the coast into Swansea harbour. The Swansea Canal commences in Swansea harbour, and runs along the valley of the Tawe, on the west side of that river, into Brecknockshire. It is about 17 miles long, with a rise of 373 feet. Several railways connect it with the neighbouring mines. The Penclawdd Canal commences at the village of Penclawdd, on the estuary of the Burry, and has a crooked course eastward for nearly 4 miles. Some railways are connected with this canal, which runs through a part of the coal-field of South Wales.

There are several railways for the conveyance of minerals in Glamorganshire. Amongst these are the Cardiff and Merthyr Tydvil railway, the Duffryn Llynvi and Porth Cawl railway, the Bridgend railway, the Aberdulais railway, and the Oystermouth railway. Other railways connect the various canals with the mines near which they pass. There are others connecting the little harbour of Aberavon with the coal-pits and mines of the vicinity. The South Wales railway, the great passenger line in connection with the Great Western railway, enters Glamorganshire near Cardiff, and traverses the county in a generally western direction, quitting it at Swansea. Its length in this county is about 42 miles. A branch, called the Taff Vale railway, runs from Cardiff to Merthyr Tydvil. Another connected line, called the Neath Valley railway, about 22 miles long, runs from Merthyr Tydvil to the main line at Neath.

The principal coach-road enters the county from the east by Rumney bridge, over the Rumney, between Newport (Monmouthshire) and Cardiff, and runs by Cardiff, Cowbridge, and Neath to Swansea, and quits this county for Caermarthenshire at the bridge over the Loughor at Pontarddylais. From Cardiff one road leads to Caerphilly, and thence into Monmouthshire; another follows the valley of the Taafe to Merthyr; and a third runs north-west to Llantrissant and Bridgend. Several other roads traverse the county.

Geology, Mineralogy, &c.—The uppermost of the formations which are found in this county is the blue *lias*, which occupies the most

southern portion of the county. It forms, with some interruptions, the cliffs which are found from Lavernock Point to the mouth of the Ogmere, and occupies the lower part of the valley of the Ogmere. The lias here is chiefly found filling up the valleys and depressions in the subjacent formations. Its strata are nearly horizontal, except where disturbed by the faults of the lower formations. The cliffs formed by this rock are bold and lofty, and samphire grows more plentifully on them than on any other. In the southern part of the county the newer red marl or red-sandstone is also found, especially in the neighbourhood of Cardiff, and along the coast from the Rumney to Lavernock Point. The conglomerates associated with this rock predominate near Llandaff and in the vale of Ely. Gypsum is found near Lavernock Point. The newer magnesian or conglomerate limestone, which is the lowest rock before coming to the coal-measures, is found in several places in the southern part of the county; its thickness varies from 30 feet to as many inches, almost in the same cliff.

The rest of the county is occupied by the coal-measures and the associated beds, the mountain limestone, and the old red-sandstone. The coal measures occupy all the northern part of the county; they are bounded on the south by a line drawn across Gower Peninsula from Whitford Burrows to Oystermouth on Swansea Bay, by the shore of Swansea Bay, and by a waving line drawn eastward from Margam on that bay by Llantrissant and Caerphilly to the river Rumney. The miner finds coal without any considerable descent; for the whole country is intersected with deep valleys in a north and south direction; and the miner, taking advantage of this, drives levels into the adjacent hills and obtains ironstone and coal. There are however many mines in valleys and low places. Near Swansea an enormous fault, many fathoms thick and filled with fragments of the disrupted strata, traverses the field effecting a rise, on one side of the fault, of 240 feet in the strata. Near Merthyr, where the coal-field approaches its northern limit, and at the head of the Neath valley, is found a coarse conglomerate of the millstone grit formation, separating the coal measures from the subjacent carboniferous limestone, which skirts the coal-field nearly all round. A belt of this limestone crosses Glamorganshire south of the coal-field; and the old red-sandstone is found at each extremity of the county, in the valley of the Rumney, and in the peninsula of Gower, cropping out from beneath the carboniferous limestone. In the peninsula is a central ridge of old red-sandstone, with two parallel limestone belts resting one on each side of the sandstone ridge. In the lower part of the valleys of the Tawe and Neath, and along the southern limits of the coal-field, the coal is principally of a bituminous or binding quality; the pits round Merthyr and Aberdare yield 'coaking or iron-making coal;' and those in the upper valleys of the Tawe and Neath yield 'stone-coal,' which gives out little smoke, and is used, the large coal for malting, and the small coal, or culm, for burning lime.

Ironstone is found in the valley of the Neath, but most abundantly in Aberdare and near Merthyr, which last may be considered the capital of the iron district of South Wales. The black-band ironstone is found and extensively smelted by means of the anthracite or stone-coal. There are some lead mines in the district occupied by the carboniferous limestone, near Cowbridge and Llantrissant. Limestone is quarried in various places.

Produce.—The Vale, or Plain of Glamorgan, is distinguished by its fertility. Dairy husbandry is much attended to in this district, and butter and cheese are largely exported.

Divisions, Towns, &c.—The county of Glamorgan derives its name from Morgan, a chieftain, who possessed this territory after the departure of the Romans. Its designation was Morganwg (Morgan's country), or Gwlad Morgan, whence by corruption Glamorgan. This designation extended at first to Monmouthshire, but as the princes who held the district in aftertimes were gradually dispossessed of their territories, the limits of Morganwg were contracted. Down to the time of Henry VIII., when the present boundaries of the Welsh counties were fixed, the name Morganwg was given to the country between the Usk and the Neath, or perhaps the Tawe. The peninsula of Gower, and probably all that part of the county which is west of the Tawe, belonged at that time to Caermarthenshire. The modern divisions of Glamorganshire are as follows:—Caerphilly, or Caerphili, east; Cowbridge, south and central; Dinas Powis, south and south-east; Kibbor, or Cibwr, including Cardiff, south-east; Llangevelach, or Llangyfelach, north-west; Miskin, central and north; Neath, central and north; Newcastle, south-west; Ogmere, central and south; Swansea, including the borough of Swansea except the hamlet of St. Thomas in the hundred of Llangevelach, west.

Glamorganshire contains one city, LLANDAFF; ten parliamentary boroughs, CARDIFF, SWANSEA, MERTHYR TYDVIL, COWBRIDGE and LLANTRISSANT, LOUGHOR, NEATH, ABERAVON, KENVIG, or KENFIG, and ABERDARE. Loughor, Aberavon, Kenwig, and Aberdare are not market-towns. Besides the boroughs are the market-towns of BRIDGEND and Caerphilly.

Aberavon, or Port Talbot, 30 miles N.N.W. from Cardiff, is a small place on the right bank of the river Avon, about 2 miles above its mouth. The population of the borough in 1851 was 6567. A large increase has arisen from extended mining operations in the neighbouring valley of Cwm Avon, and from the construction of a floating

harbour at the port by Mr. Talbot. The parish church is a small modern edifice. There are chapels for Independents, Baptists, and other Dissenters. There is a stone bridge of one arch over the river. The borough is contributory to Swansea in returning a member to the Imperial Parliament. The sea-lock of the docks is 45 feet wide, and vessels of large burden can, at spring tides, enter the harbour. Considerable quantities of copper, iron, and tin-plate are shipped here. There is regular communication with Bristol by steam-vessels. A station of the South Wales railway is at Aberavon. The works in Cwm Avon valley, which are among the largest in South Wales, are under the management of the Bank of England, into whose hands they have come in consequence of some financial arrangement with the proprietors, styled—The Governor and Company of the Copper Miners of England. Several reading-rooms, and a mechanics institute, with lectures and musical performances, have been established for the benefit of the workmen and their families; the day-schools have been extended, and evening schools opened; and other measures of a like character have been adopted.

Aberdare is on the right bank of the river Cynon, 20 miles N.N.W. from Cardiff; the population of the parish in 1851 was 14,999; a large increase has taken place in consequence of the extension of coal and iron mining operations. Large quantities of the coal raised in the district are used in the iron-works, and a considerable amount of coal is exported. The parish church is a plain edifice. The Independents, Baptists, and other Dissenters have places of worship. Three fairs are held in the course of the year. The Aberdare Canal, communicating with the Glamorganshire Canal, commences about a mile west from the town. Aberdare forms part of the parliamentary borough of Merthyr Tydvil, which it adjoins.

Caerphilly is a small, irregularly-built town, 7 miles N. by W. from Cardiff, population of the hamlet of Ener-Glyn, in which the town is situated, 952. The town is situated near the river Rumney, which forms the eastern boundary of the county. It consists for the most part of well-built houses. The ruins of the ancient castle occupy a moderate elevation near the middle of a level tract, and consist of walls and towers with various apartments. The most remarkable feature of the castle is the leaning tower, a vast fragment of a tower, still called 'the Mint,' which has been thrown considerably out of the perpendicular without falling. This tower is 70 feet in height, and is at least 11 feet out of the perpendicular, and divided by a fissure. The ruins are now the property of the Marquis of Bute. There are in Caerphilly a chapel of ease, chapels for Independents, Baptists, and other Dissenters, and a savings bank. Some small woollen manufactures are carried on. In the vicinity are extensive coal-mines and iron-works. The market is held on Thursday, and there are six fairs in the course of the year.

Llantrissant, 10 miles N.W. from Cardiff, population of the borough 1007, occupies a commanding situation on the brow of a lofty hill which overlooks some of the finest parts of the vale of Glamorgan, the Bristol Channel, and the hills of Devonshire. The church is a capacious Norman building, and being dedicated to three saints, gave name to the town (Llan-tris-saint). In the town are chapels for Baptists, Independents, Calvinistic and Wesleyan Methodists. The town-hall and market-house are of modern erection. There are some remains of an ancient castle. The market is on Friday for provisions; there are four yearly fairs. The borough is contributory to Cardiff in returning a member to the Imperial Parliament.

Loughor (in Welsh *Cas Lluchwr*), 45 miles W.N.W. from Cardiff, population of the borough 821, is at the mouth of the river Loughor, on the left bank of the river. Loughor consists chiefly of one main street, having the church at the western end of it, on a point jutting into the river. There is a National school. A bridge was thrown across the river Burry in 1833, in lieu of the ancient ferry of Loughor, as a means of communication with Caermarthenshire. Several hands are employed in collieries and copper-works within the borough. Vessels of 200 tons burden can come up to the wharf. There is the shell of an old castle at Loughor, and east of the town are two small Roman camps. The borough is contributory to Swansea in returning a member to the Imperial Parliament. Two annual fairs are held.

The following are some of the more important villages, with the population of the parishes in 1851, and other particulars:—

Aberthaw, on the coast, 13 miles S.W. from Cardiff, is a small village in the parish of Penmark; the population of the entire parish in 1851 was 495. Limestone of a peculiar kind, which immediately hardens on being immersed in water, is raised in considerable quantity here, and is shipped at the port. A vessel plies between Aberthaw and Bristol once a fortnight. The headland named Breaksea Point protects the harbour. *Boverton*, 15 miles S.W. from Cardiff, population included in the parish of Lantwit Major, of which Boverton is a hamlet. Roman coins and other antiquities have been found here. Remains of an ancient castle, one of the chief residences of the Lords of Glamorgan, previous to the reign of Henry III., are still extant at Boverton. *Briton Ferry*, 33 miles W.N.W. from Cardiff: the population in 1841 was 718; in 1851 it was 1737, the great increase being attributed to the increase of trade at the port. Rolling-mills were established here a few years since, with an engine of 300-horse power. Much of the iron produced in the Vale of

Neath is here made into bars. The scenery of this neighbourhood is very fine. *Cadoxton-juxta-Neath*, 36 miles N.W. by W. from Cardiff, population of the parish 7314, is properly a suburb of the borough of Neath. Cadoxton parish church, dedicated to St. Catwg, has a curious monument, containing engraved on sheets of copper, a long pedigree of the family of Williams. *Cheriton*, population of the parish 312, is situated on the peninsula of Gower, near the left bank of the Burry estuary, about 14 miles W. from Swansea. Limestone is quarried in the vicinity, and vessels bringing supplies of coal to the harbour have limestone freights in return. An accumulation of sand however makes the harbour very shallow. *Dowlais*, 23 miles N. by W. from Cardiff, population of the ecclesiastical district, 13,636 in 1851. Besides Dowlais church there are chapels for Welsh Independents, Welsh Baptists, Welsh Calvinistic Methodists, and English Wesleyan Methodists. Connected with the Dowlais iron-works there are 18 blast furnaces, 77 puddling furnaces, and 66 balling furnaces, or 161 in all: the daily consumption of coal in the works is about 1000 tons. Sanitary arrangements were for a long period entirely neglected, both in Dowlais and in Merthyr Tydvil, and the result was an excessive mortality, arising from epidemic diseases. A Local Board of Health for the parish of Merthyr Tydvil, which includes Dowlais, has recently been established. *Kenwig* is a straggling village on the edge of the sand-hills which border the eastern side of Swansea Bay, 26 miles W. by N. from Cardiff. There are a small church and a town-hall of modern date, and near the town the remains of an ancient castle. Kenwig was once of some importance: its downfall dates from a tremendous inundation in the 16th century. Kenwig Pool, nearly 2 miles in circumference, is between the village and the sea. The population of the borough, which is contributory to Swansea, was 433 in 1851. Several British and Roman antiquities have been found in the neighbourhood. *Llantwit-Major* is situated on the coast, 17 miles W.S.W. from Cardiff, population of the parish 1077 in 1851. The church is dedicated to St. Illtyd, the head of a monastery and famous seminary for training young men for the priesthood. The church consists of a nave, aisles, and chancel; it is of considerable size, and of various styles and dates. Adjoining this edifice are the remains of the old church, which has been of much smaller dimensions; between the two churches rises an embattled tower, which contains six bells. The shaft of an ancient cross stands in the church-yard. *Newbridge*, or *Pont-y-Pridd*, 11 miles N.W. by N. from Cardiff, population included in the parishes of Llantwitvairdre and Llanwornno, in which it is situated. Newbridge derives its name from the bridge erected here about a century ago by William Edwards, the celebrated self-educated Welsh bridge-builder. The span of the bridge is 140 feet; it was Edwards's first successful effort at bridge-building. Messrs. Crawshay's iron-works at Treforest, and the chain-cable works of Messrs. Brown and Lenox give extensive employment. Besides two parochial chapels, there are chapels for Welsh Baptists and Independents. Stations of the Taff Valley railway are at Newbridge and Treforest. *Newton*, situated on the coast 23 miles W. by S. from Cardiff, was formerly a well frequented bathing village, but had fallen into decay, when the late Sir John Guest purchased property here, and commenced erecting new houses. The church, which is close to the shore, is a plain strong building. *St. Nicholas*, 6 miles W. by S. from Cardiff, population of the parish 414, is noticeable for several cromlechs and other druidical antiquities, which are found in the neighbourhood. *Oystermouth*, 48 miles W.N.W. from Cardiff, population 1938, was formerly called *Caer Tawy*. The old castle, which is here in ruins, and is now the property of the Duke of Beaufort, has been recently cleared of the rubbish which had accumulated. Oystermouth is a fishing village; at the most active period of the season the oyster fishery employs about 400 men and 70 boats. Factors or middlemen at Swansea purchase the oysters, and supply the dealers in Bristol, Liverpool, London, and other great markets. Limestone is abundant. Oystermouth is much frequented by visitors during summer. *Portcawl*, 24 miles W. by S. from Cardiff, is a small bathing village, possessing a harbour for the shipment of coal and iron which are brought down from the interior by the Llynvi Valley railway. *Southerndown*, 20 miles W.S.W. from Cardiff, population of the hamlet 271, is a small bathing village, a mile E. from which is Dunraven Castle, and about a mile and a half W. are three remarkable caves of considerable extent, which can only be visited with safety at the first ebb of spring tides.

Divisions for Ecclesiastical and Legal Purposes.—The parishes are for the most part in the diocese and archdeaconry of Llandaff; some in the western and north-western parts of the county are in the diocese of St. David's. By the Poor-Law Commissioners Glamorganshire is divided into five Unions, Bridgend and Cowbridge, Cardiff, Merthyr Tydvil, Neath, and Swansea, comprising 162 parishes and townships, with a population in 1851 of 239,571. The county is included in the South Wales circuit. The Lent assizes are held at Swansea, the summer assizes at Cardiff. The county jail is at Cardiff, and there are houses of correction at Cardiff and Swansea. County courts are held at Bridgend, Cardiff, Merthyr Tydvil, Neath, and Swansea. Five members of parliament are returned from Glamorganshire, namely, two for the county, and one for each of the three districts of boroughs.

History, Antiquities, &c.—Glamorganshire was originally included

in the territory of the Silures. [BRITANNIA.] Under the Roman dominion it was included in *Britannia Secunda*. A Roman road, the *Julia Strata*, traversed the county, in nearly its greatest extent, east and west; and several Roman stations are supposed to have been established within its boundaries. At *Caerau*, about 3 miles W. from Cardiff are traces of a Roman camp, in good preservation. The sites of *Bovium*, or *Bomium*, *Nidum*, and *Leucarum*, mentioned by *Antoninus*, have not been definitely fixed. Some vestiges of the *Julia Strata* still remain between *Ewenny* and *Neath*; and there are traces of two cross-roads, one from Cardiff and one from Neath, both leading to *Bannium*, now *Caer Banna*, near *Brecon*. About the close of the 11th century Glamorganshire fell into the hands of the Anglo-Norman barons, for whose warlike activity their sovereigns gladly found exercise by encouraging their efforts for the conquest of Wales. The county became subject to *Robert Fitzhamon*, a Norman knight, who proceeded to parcel it out in lordships among his followers, and, with wise though unusual policy, among the native chieftains who had assisted him, and even among the children of *Jestyn*, who had been his rival. About this period arose the Norman castles, of which there are several remains. *Fitzhamon* himself was raised to the dignity of Earl of Gloucester, and was in favour at the court of *William Rufus*. The Anglo-Normans retained possession of the conquered districts, though they conceded to the natives some immunities from the requirements of the feudal system. The district of Glamorgan passed by his marriage with *Mabel*, heiress of *Fitzhamon*, into the hands of *Robert Earl of Gloucester*, natural son of *Henry I.* Glamorganshire remained united with the other possessions of the earldom of Gloucester. In the troubled reign of *Edward II.* considerable lands in Glamorganshire were granted to his favourite the younger *Despencer*; in consequence of which the county became the scene of violence and confusion. At length the king and his favourite were captured near *Llantrissent*. The heirs of *Despencer* obtained the restoration of his Glamorganshire estates, and had the title of lords of Glamorgan. These estates came by marriage to the Earl of *Warwick*, the 'king-maker,' in the reign of *Henry VI.* and *Edward IV.*, and afterwards, also by marriage, to the Duke of Gloucester, afterwards *Richard III.* In the reign of *Henry VIII.*, when the territory of Glamorgan was made a county, the manors of the former lords of Glamorgan passed into other hands.

Of the middle ages Glamorganshire contains many memorials in its ruined castles and monastic remains. Besides the castles of Cardiff, *Caerphilly*, *Neath*, and *Swansea*, there are several others. *Coity Castle* is about 2 miles north-east of *Bridgend*; the ruins once among the most extensive in South Wales, are now in a very dilapidated condition. Of the castles of *Llanblethian* and *Talavan*, near *Cowbridge*; of *Morlais*, near *Merthyr Tydvil*; of *Penarth* and *Penrice*, in the peninsula of *Gower*; and of *Ogmore Castle*, near the junction of the *Ewenny* and the *Ogmore*, there are remains. *Oystermouth Castle*, a bold and majestic ruin, stands on the shore of *Swansea Bay*, south-west of *Swansea*; the grand gateway is still nearly perfect, and other parts of the building are in good preservation. The remains of *St. Donatt's Castle*, near *Nash Point*, on the coast, are considerable. Part of it is inhabited: it is principally in the perpendicular English style. Of *Marcross Castle*, near *St. Donatt's*, the remains are unimportant. Of *Oxwich Castle* and *Bewper Castle*, castellated mansions of the 16th century, there are some remains. *Penmark* and *Fonmon* castles are near the *Daw*; the first is in ruins: the second has been modernised.

Of the ecclesiastical remains the most conspicuous is *Margam Abbey*, between the *Ogmore* and the *Avon*, south-east of *Neath*. Of the chapter-house, a beautiful polygon of about 50 feet in diameter, the walls remain. Part of the abbey church, which is of Norman architecture, is used as the parish church. In the neighbourhood is a farmhouse called *Egley's Nynydd*, or the nun's church, probably a nunnery dependent on *Margam Abbey*. Of the *Benedictine priory of Ewenny*, at the village of that name near *Bridgend*, the church, an edifice in the Norman style, has been kept in repair and is used as a parish church. There are some remains of the college-house of *Llantwit Neath Abbey* is noticed elsewhere.

In 1647, in the great civil war between *Charles I.* and the Parliament a severe battle was fought at *St. Fagan's*, near *Llandaff*, and was obstinately contested for two hours, when the Royalists were defeated with great slaughter, and their leaders, with what forces remained to them, were compelled to retreat westward into *Caermarthenshire* and *Pembrokeshire*.

Statistics.—In 1852 the county possessed four savings banks, at *Bridgend*, *Caerphilly*, *Cardiff*, and *Swansea*. The amount due to depositors on 20th November 1852 was 179,732*l.* 0*s.* 2*d.* According to the Census of Education taken in 1851 it appears that of 348 schools in the county for which returns are given, 144 were public schools with 14,529 scholars, and 204 were private schools with 5728 scholars. The number of evening schools for adults was 13, with 416 pupils. Of Sunday schools there were 431, of which 121 were supported by Independents, 96 by Calvinistic Methodists, 78 by Baptists, 74 by the Church of England, 39 by Wesleyan Methodists, and 23 by minor bodies. The total number of scholars was 45,563. Of literary and scientific institutions there were 16, with 1405 members, and 21,735 volumes in the libraries under their superintendence.

GLANFORD-BRIGG, or GLANFORD-BRIDGES, or by familiar abbreviation, BRIGG, Lincolnshire, a market-town and the

seat of a Poor-Law Union, in the parish of Wrawby, is situated in 53° 33' N. lat., 0° 27' W. long., distant 24 miles N. by E. from Lincoln, 155 miles N. by W. from London by road, and 184 miles by the Great Northern and Lincolnshire railways. The population of Glanford-Brigg in 1851 was 3097. The living is a perpetual curacy in the archdeaconry and diocese of Lincoln. Glanford-Brigg Poor-Law Union contains 52 parishes and townships, with an area of 145,430 acres, and a population in 1851 of 33,541. The town is advantageously situated near to the Ancholme navigation, by means of which a considerable trade is carried on in corn, coal, and timber. The town possesses a handsome corn-exchange, gas-works, and a new police station. Besides the parochial chapel there are places of worship for Independents, Wesleyan and Primitive Methodists, Quakers, and Roman Catholics. The Free Grammar school, founded in 1674, has an income from endowment of about 250*l.* a year, and had 80 scholars in 1850. There is a savings bank. The market is on Thursday; a yearly fair is held on August 5th.

GLANWORTH. [CORK.]

GLARUS, a canton of Switzerland, is bounded N. by St. Gall, E. and S. by the Grisons, and W. by Schwyz and Uri. Its greatest length is about 32 miles, its greatest breadth about 16 miles: its area is 279 square miles, of which only one-fifth is arable land. It consists mainly of the great valley of the Linth, which river crosses it from south to north, and of the Sernft Thal, or valley of the Sernft, which is an affluent of the Linth. The Linth is subject to sudden inundations, which frequently cause much damage. The impetuosity of the river in its flooded state has deposited on each side of the channel a broad fringe of sand and gravel, which but for want of cohesiveness must long ago have formed a natural embankment, and saved the rest of the valley from the ravages caused by the inundations. There are also small valleys, such as the Klönthal, which open into the two principal ones. The canton is divided on the south from the valley of the Upper Rhine in the Grisons by a chain of the Alps, among which the summits called Dödiberg and Scheibe rise to 9000 or 10,000 feet above the sea. An offset of this chain detaches itself from the Dödiberg, and running northward divides the waters of the Linth from those which flow into the Reuss through the valleys of Uri and Schwyz. To this offset belongs the high and extensive group called Glärnisch (9000 feet above the sea, and covered with perpetual snow), which extends into the canton of Glarus, and rears its head above the town of that name. The general inclination of the surface of the canton is towards the north, to the banks of the Lake of Wallenstadt, and towards the low country between that lake and the Lake of Zürich. Glarus is chiefly a pastoral country. Cows, sheep, and goats are numerous. The green cheese called *schabzieger* is made here, and a great quantity of it is exported. Glarus has also manufactories of printed cottons, muslins, silks, and paper. It imports corn, wine, salt, and colonial produce. Quarries of slate and marble and iron-mines are worked in the mountains of Glarus.

The population of Glarus at the end of March 1850 was 30,197, of whom 3932 were Catholics, and the rest, with the exception of some Jews and a few hundred foreigners, Calvinists. The government is a pure democracy: the *Landsgemeinde*, or general assembly of all males above the age of sixteen, is the sovereign power. It assembles every year, appoints its magistrates, and decides upon the projects of law laid down before it by the *Landrath*, or executive.

The name of Glarus is a corruption of Hilarius, a saint in whose honour a shrine was built among these mountains. The abbey of Seckingen was at one time sovereign of this country, which passed afterwards under the dukes of Austria. In the 14th century it joined its neighbours of the *Waldstätten* in their insurrection; and the battle of Näfels, which the people of Glarus gained over the Austrian forces, insured their independence.

Glarus, the capital of the canton, is a bustling and cheerful town, in a narrow part of the valley, on the left bank of the Linth. It contains 4500 inhabitants, who manufacture cottons, muslins, and woollen cloth; it has also some iron-works, a printing-press, and a number of mills. The parish church, an old gothic building, is used for the service of both Catholics and Protestants. The other public buildings are the town-house, the hospital, and the free school. Glarus returns two members to the National Council of Switzerland.

GLASGOW, Lanarkshire, Scotland, a city, a royal and parliamentary burgh, market-town, and port, is situated on the river Clyde, about 20 miles from its mouth, in 55° 52' N. lat., 4° 16' W. long.; distant 43 miles W. by S. from Edinburgh by road, and 48 miles by railway; 396 miles N. by W. from London by road, and 404 miles by railway. The population of the city and suburbs in 1801 was 77,385; in 1821 it was 127,043; in 1841 it was 274,324; in 1851 it had increased to 358,952. In 1851 the population within the municipal boundary was 148,116; within the parliamentary city it was 329,097. The city is governed by a town council, consisting of 48 councillors elected by the constituency, a dean of guild elected by the Merchants House, and a deacon convener elected by the Trades House. The council thus constituted elect 8 bailies and a lord provost. The city returns two members to the Imperial Parliament.

The burgh, properly so called, is situated exclusively on the north side of the river. It has now spread its municipal and police jurisdiction over the burgh of Gorbals and the districts of Hutchesontown

and Kingston on the south side of the river, and over the burgh of Anderston on the west, Blythwood and Port Dundas on the west and north, and the burgh of Calton on the east.

Gorbals has been designated the Southwark of Glasgow, occupying a position with respect to that city similar to that which Southwark occupies with respect to London. Gorbals was formerly a burgh of barony, with a separate corporation, police, &c. It has increased with the growing prosperity of Glasgow. The wide fields on the south side of the river were gradually laid out and built upon, and the population of Gorbals is now 61,482. *Hutchesontown* is the name given to the eastern portion of Gorbals, from its having been built on that part of the old barony which belonged to Hutcheson's Hospital, as *Tradeston* is the name given to the western part of the same barony which belonged to the Trades House of Glasgow. *Kingston* is the extreme and more modern western district of Gorbals. The houses of the original village at the end of the bridge have been to a great extent replaced by new and substantial buildings. *Anderston*, which lies west of Glasgow, on the right bank of the Clyde, was made a burgh of barony in 1824. For a century before it had been first a country village, and then a suburb of Glasgow. *Blythwood* is the name of an extensive district lying north of Anderston and the road which formerly connected that village with Glasgow, west of Buchanan-street and south-west of Port Dundas. It has risen into existence since the commencement of the present century, and is now the fashionable or west end of the city, being nearly covered with the houses of the wealthier citizens. *Port Dundas*, on the northern boundary of the city, is composed of an assemblage of dwellings, offices, granaries, storehouses, &c., surrounding the basins of the Forth and Clyde and Monkland canals. *Calton*, formed out of the old villages of High and Low Calton, was made a burgh of barony in 1817. The district of the burgh is the low ground east of Glasgow, which is almost exclusively occupied by a population engaged in manufactures. Adjoining Calton are two other populous suburbs called Bridgeton and Camlachie, both chiefly inhabited by hand-loom weavers. All municipal and police jurisdiction is now by virtue of general municipal and police statutes vested in the town council and police board of the city of Glasgow.

Site, Aspect, &c.—On the southern side of the river, on which stand Hutchesontown, Gorbals, Tradeston, and Kingston, the land is almost entirely flat; on the north it gradually rises to the cathedral on the east, and on the west forms a series of gentle elevations on which Blythwood is built. Northward of the river a narrow belt or plain seems to have been at a remote period covered with water. In 1780 workmen digging a foundation for St. Enoch's church (a few hundred feet northward of the Clyde), found an ancient canoe at the depth of 25 feet from the surface. In 1781 a canoe was found, when digging a foundation in the Trongate; and in 1825, in digging a sewer at the head of Saltmarket, another canoe was found, at a distance of a quarter of a mile from the river, and 20 feet above high-water mark. An ancient canoe has also been discovered on the south side of the river. From these circumstances it has been supposed that the estuary of the Clyde once extended to the base of the hill on which the cathedral now stands.

In its extreme limits the city extends about 3 miles from east to west, and about 2 miles from north to south. The germ of the city was in the line of street leading southward from the cathedral to the river, by way of the High-street and the Saltmarket. In and contiguous to this line are the oldest buildings. The point of junction between the Saltmarket and High-street may be taken as the centre of the city, whence proceeds eastward the long street of Gallowgate, and westward the Trongate, which is continued by Argyle-street to the western extremity of the city. Southward of Argyle-street runs Clyde-street, in which there is a custom-house, and the Broomie-law, the street along the harbour. Eastward of the original High-street, or Old Town, the streets are invariably of an humble character.

On the left bank of the Clyde are numerous streets, branching out from the river side, and extending into the open country; other streets cross these nearly at right angles. The streets are wide and the houses substantial, and in many places elegant. On the right bank the quadrangle bounded by George-street and George-square on the north, Candleriggs-street on the east, Hope-street on the west, and the Trongate and Argyle-street on the south, contains within it a large proportion of the best buildings and of the most important commercial establishments of Glasgow. Ingram-street, stretching across part of this quadrangle from east to west, with the Exchange terminating the vista at its western end, has a very fine architectural effect. George-square, with its lofty Doric column surmounted by a statue of Sir Walter Scott, its bronze statue of Sir John Moore, by Flaxman, and its bronze statue of James Watt, by Chantrey, is a noble quadrangle. The houses of Glasgow are built of stone. The St. Rollox chimney of the vast chemical establishment of that name forms a very prominent object in approaching the city.

Civil History.—It is said that the Romans had a station on the site now occupied by the city, but its origin is generally attributed to St. Kentigern, or St. Mungo, who established a bishopric here in A.D. 560. Glasgow continued to be little else than a religious establishment until 1174-80, when by a charter of William the Lion, it

became a free burgh of barony. Soon after the Norman conquest the see was refounded, and the cathedral or church rebuilt. In the succeeding centuries the power and influence of the bishops were very great. A battle between Wallace and Percy in the streets of Glasgow in 1300; the destruction of the spire of the cathedral by lightning in 1387; the rebuilding of the great tower in 1408; and the raising of the see of Glasgow into an archbishopric about the end of the same century—are among the more important events in the history of Glasgow before the time of the Reformation. At the Reformation the cathedral was saved by the courage of the citizens, who assembled in the 'Burgher Guard,' to prevent its destruction. Down to the middle of the 16th century the town contained only about 1500 inhabitants, but after the founding of the university, which took place about that period, the population steadily increased in number. The citizens gained municipal power by slow steps. Previous to the reign of James I. of Scotland, the town was a burgh of barony. In 1450 William Turnbull, then bishop of Glasgow, obtained a charter, erecting the burgh and barony of Glasgow into a regality. In 1611 a charter was granted by James VI. to the magistrates, council, and community; and in 1636 Charles I., by royal grant, incorporated them into a free burgh, by which the city was placed in the rank of a royal burgh. These charters relate to the ancient royalty. The last charter granted to the city is that of William and Mary, dated the 4th of January 1690, and confirmed by Parliament the 14th of June following.

At Glasgow the meeting of the ecclesiastical Synod of 1688 was held, at which the Scottish clergy refused to accept the Liturgy sent to them by Laud, and commenced the eventful struggle between the Government and the Covenanters. A little later in the history a fire occurred, which consumed almost the whole of the city. After this event some improvement took place in the appearance of the city, for the former wooden houses and narrow streets were replaced by stone buildings and wide thoroughfares. The modern history of Glasgow is however to be traced from the period of the union of the two kingdoms, for it was about that time that the commercial enterprises of the citizens began to assume a national importance.

Cathedra, Churches, &c.—The cathedral, more commonly designated the High Church, occupies a commanding position in the north-east part of the city. The streets leading up to it furnish a gradual ascent to the spot on which it is built. From around this venerable structure nearly everything is gone that tells of past ages. Its site is about 100 feet above the level of the Clyde. The greatest internal length of the building is about 320 feet; the breadth 63 feet; the height of the nave is 85 feet, and of the choir 90 feet. It is supported by 147 pillars, and is lighted by 167 windows; many of which, in the decorated style of pointed architecture, are of great beauty. From the centre of the roof rises a beautiful tower, the spire of which has an altitude of 225 feet. Glasgow Cathedral is the only existing specimen of a cathedral still used, and in good condition, in Scotland, excepting that of Kirkwall, in the Orkneys. One of the most interesting portions of it is the crypt, which is beneath the choir. The length is 108 feet, the breadth is 72 feet: it is supported by 65 short pillars, many of which measure as much in circumference as in height—namely, 18 feet, and these pillars support low arches. A dim light enters in from about 40 small windows. Mr. Rickman thinks that this crypt "is not equalled by any other in the kingdom." During the last few years the cathedral has been judiciously restored in many parts; but much still remains to be done to obliterate the traces of violence and neglect.

The other churches of the city, with one exception, are not old enough to be venerable, and too much like other modern churches to claim any particular attention. The Barony Church, situated near the cathedral, and built to accommodate the congregation which before occupied the crypt, is a tasteless affair. The larger among the modern churches, such as St. Andrew's, St. Paul's, St. George's, St. John's, St. Enoch's, &c., are for the most part neat structures. The steeple of the Tron Church, or, as it is often called, the Laigh, or Low Kirk, in contradistinction to the cathedral, or High Kirk, is one of the most conspicuous objects in the Trongate. It was burnt down by accident, and immediately rebuilt, about fifty years ago. The Roman Catholic chapel, on the right bank of the Clyde, is a large and fine modern edifice. Several of the places of worship erected during the last few years by the Free Church and the United Presbyterian Church are very handsome as well as commodious structures. According to the Census of Religious Worship and Education, taken in 1851, it appears that there were then in the parishes which contain the parliamentary city 189 places of worship, of which 29 belonged to the Established Church, 27 to the Free Church, 20 to United Presbyterians, 11 to Independents, 8 to Roman Catholics, 7 to Baptists, 6 to Episcopals, and 31 to minor bodies. The number of sittings provided in 129 places of worship for which returns were procured was 100,574.

University.—About 1450 an application was made to the Pope for a bull to establish a University; and eight years afterwards a member of the house of Hamilton bequeathed four acres of ground and some houses to aid in this object. In 1577 a new and valuable charter was obtained from James VI., new estates were granted by the crown, and at various subsequent periods bequests were made to the University by private individuals, so that the institution gradually acquired a position of considerable importance. In 1698 a new disposition of

the revenues of the University laid the foundation of that prosperity by which its career has since that time been characterised.

The buildings belonging to the University have grown to their present importance by degrees: they occupy a large area of ground near the upper end of the High-street. The buildings comprise five quadrangles, bounded by the various rooms and offices belonging to the institution. The hall, the class-rooms, the library, the museum, and the houses of the professors occupy a large extent of ground. The library was founded almost as early as the University itself, and now contains a valuable collection of 60,000 or 70,000 volumes. The Hunterian Museum originated with Dr. William Hunter, a well-known Scottish physician, and brother to the celebrated John Hunter, who in the year 1781 bequeathed to the University a collection of books, coins, paintings, and anatomical preparations, valued at 60,000*l.* He also gave 8000*l.* for the erection of a building to contain the treasures. Many additions have been since made. On the upper floor of the museum building is an octagonal saloon with four recesses, occupied with minerals, books, shells, Hindoo paintings, illuminated breviaries of the 11th and subsequent centuries, early printed books by Caxton, and other curiosities. The museum contains statues and busts of Watt, by Chantrey; of Gavin Hamilton, by Hewetson; and of Thomas Campbell, by Baily. The collection of autographs is curious. On the ground-floor is a collection of minerals, fossils, coins, stuffed animals, &c. Beneath is the anatomical museum, the most valuable part of the collection, and the one to which Hunter had directed his chief attention.

The University consists in effect of two corporate bodies or establishments, one within another—the University and the College. The first is vested with the power of granting degrees; the second is an educational establishment. The University, as a separate body, consists of a chancellor, a lord-rector, a dean, a principal, the professors, and lecturers. The office of chancellor is wholly an honorary one, the only duty performed by him is to confer degrees on persons found qualified by the senate. The lord-rector is an officer of much more active powers; he is the guardian of the statutes, privileges, and discipline of the University; and, according to the charter, his jurisdiction over the members is so extensive as to authorise him to inflict capital punishment; he is elected annually by the dean, principal, professors, and matriculated students. These students are classed into four nations, called respectively, 'Natio Gtottiana sive Clydesdalie,' 'Natio Albanie,' 'Natio Loudoniana sive Thevidalie,' and 'Natio Rothseiana.' Each 'Natio' consists of the students who were born in a particular part of the country, strictly defined in the books of the University. In voting for a lord-rector each nation first decides among its own body, and the majority then constitutes one vote in a second election; if in this second election the four votes are equally divided, the former lord-rector has the casting vote. This office has become a test of political party in the University. The Principal superintends in person the whole internal arrangements of the University. The Professors are classed into the Faculties of Arts, Theology, Law, and Medicine; they comprise 'College' Professors, whose office is of ancient standing, and constitutes them members of the Faculty; and 'Regius' Professors, whose office has been more recently founded and endowed by the crown, and constitutes them members of the Senate. The Faculty has the management of the estates and revenues of the University; the Senate superintends all other matters. There are 22 professors, who are paid partly by salary, and partly by fees from students. The students are divided into 'togati' and 'non-togati.' The 'togati' wear a scarlet gown, and are required to attend the College chapel on Sundays; the 'non-togati' are restricted neither in their dress nor in their attendance on worship. The botanic garden, which is connected with the botanical class in the University, and the observatory connected with the astronomical class, have been removed outside the city on the west. The position of the new observatory is a very fine one, commanding an extensive view; and the new botanic garden is in its immediate vicinity. The University session commences on the last Wednesday in October, and closes on the 1st of May. The number of graduates in 1851-52 was 65. In 1852-53 the number of graduates was 60; of these 27 graduated M.D., 11 A.M., and 13 A.B. The others were:—Masters in Surgery, 6; Doctors in Divinity, 2; and Doctor of Laws, 1.

Schools, &c.—Glasgow is well supplied with educational establishments of a high character besides the University. The High school, or Grammar school, owes its origin to a date even more remote than the University. The present building is situated in Montrose-street. The Andersonian institution or university was founded by Mr. John Anderson, who was Professor of Natural Philosophy in the University of Glasgow in 1795. The object was chiefly the promotion of physical science; the citizens of Glasgow generally have control over the institution. Class-rooms, a lecture-room, a library, a museum, and a collection of apparatus are provided. The buildings are situated in George-street. In 1851 there were in all 18 literary and scientific institutions in Glasgow, with an aggregate membership, so far as ascertained, of about 8100. The aggregate number of volumes in the libraries attached to these institutions was about 48,000. Adherents of the Free Church have built a large and handsome Grammar school at the west end, and there are numerous other public

and proprietary schools. The Established Church and the Free Church have each a Normal school.

Buildings.—Glasgow contains the usual municipal public buildings. In 1814 the old Tolbooth, or jail, was taken down, and the new buildings containing offices for the various departments of municipal business were erected at the foot of the Saltmarket. The steeple or tower of the Tolbooth, with its oddly-shaped square battlements and pyramidal pinnacles, is however still left on the old site at the corner of Trongate and High-street. The new buildings have a façade and portico modelled after the Parthenon at Athens. With the increase of the city business the accommodation here was found to be too limited, and larger buildings were constructed in Wilson-street for the municipal business; the structure in the Saltmarket being now appropriated as the Supreme Criminal Court, or, as it is called, Justiciary Court, and local court-houses. The police buildings are extensive and substantial. The city and county bridewell, one of the largest public buildings in Glasgow, is situated between the college and the cathedral, and consists of a group of buildings in a sort of Norman style, comprising a rotunda and four radiating wings. The system adopted here provides for the maintenance of the prisoners in part from the produce of their own industry while in prison.

The charitable institutions of Glasgow are of considerable importance. A lunatic asylum at the northern end of the city was erected about 1810. The building consists of an octagonal centre, whence spring four wings of three stories each; and over the octagon is a fine dome. The city having extended itself to the immediate vicinity of the asylum, the municipal authorities purchased the building for the Town Hospital, or 'Poor's House,' and a new lunatic asylum was built about three miles west from Glasgow. The new asylum has accommodation for upwards of 500 patients. The Asylum for the Blind, situated near the cathedral, is admirably managed. Baskets, mats, twine, mattresses, rugs, sacks, netting, and various other articles are made by the inmates, and are sold to assist in providing funds for the institution. The House of Refuge, situated in the eastern part of the town, is a receptacle for juvenile offenders. The Royal Infirmary, occupying part of the site of the old Bishop's Palace, is an elegant structure; the institution has been of much benefit to the community. Hutcheson's Hospital was founded by two brothers, merchants of Glasgow, about a century ago. The revenues are applied to the support of a number of old men and women, and to the clothing and educating of the sons of decayed citizens. Among many other benevolent societies we may name the Sick Hospital, the Deaf and Dumb Asylum, and the Highland Society of Glasgow.

The Commercial Exchange is a very handsome building. The fine portico in Queen-street has over it a handsome lantern-tower, and in front is a bronze equestrian statue of the Duke of Wellington. The great room of the Exchange is 130 feet long, 60 feet wide, and 30 feet high. The whole structure is in the Corinthian style. The portico at the east front is octostyle, and three columns in depth, giving it a very noble character. The building is placed in the midst of a fine open area, lined on the north and south with uniform ranges of stone buildings, occupied as ware-rooms, offices, and shops. Two Doric arches, between which is placed the Royal Bank of Scotland, give access to this area from Buchanan-street. The buildings occupied by the various banking companies in Glasgow are in general very handsome and ornamental structures, situated in the principal streets. The market-places are commodious rather than ornamental. Some of the shops in Trongate, Argyle, Queen, and Buchanan streets rival the first-class London shops. In the north-west part of Glasgow is the 'Cleland Testimonial,' a group of houses erected by subscription, and presented to the family of Dr. Cleland to be possessed by them as an heir-loom. Dr. Cleland was one of the most active men in Glasgow during the present century in promoting the moral and material welfare of the city. The Western Club and the Union Club have handsome stone buildings for their club-houses.

Commerce.—Scarcely anything is known of the commerce or industry of Glasgow till the middle of the 16th century, when small vessels were engaged in the transport of salmon to England and France. In 1651 it is said that, "With the exception of the colligions [collegians], all the inhabitants are traders; some to Ireland with small smiddy-coals in open boats, from 4 to 10 tons, from whence they bring hoops, rungs, barrel-staves, meal, oats, and butter; some to France, with plaiding, coals, and herrings, from which the return is salt, pepper, raisins, and prunes; some to Norway for timber."

The Union was violently opposed here as well as elsewhere in Scotland; but an advantage followed which the people had not anticipated in the trade with the British colonies, not previously open to them. A Glasgow vessel of 60 tons first crossed the Atlantic in 1718. The trade in tobacco became gradually so large that the English merchants took alarm. So vast did the trade become, that in 1772 it was estimated that "out of 90,000 hogheads of tobacco imported into Britain, Glasgow alone imported 49,000." About the year 1770, when the tobacco trade had enriched Glasgow, the houses, the furniture, and the style of living were improved; wheel-carriages were set up; a theatre and an assembly-room were built; and wooden tenements with thatched roofs were replaced by stone mansions. The American revolution gave an irreparable blow to the tobacco trade; but the invention of the steam-engine and its application to the manufacture

of cotton excited the capitalists to increased vigour. If the Clyde had been deeper Glasgow might have had a great shipping trade at an early period, but the shallowness of the river below Glasgow caused Greenock to be made an emporium of trade in preference to Glasgow. As early as 1556 there was an agreement by the inhabitants of Glasgow Renfrew, and Dumbarton, to labour on the river for six weeks alternately to improve the communication. Glasgow had its shipping port in Ayrshire till 1662, when the Glasgow merchants purchased thirteen acres of ground a little above Greenock, and formed a town and harbour to which they gave the name of Port Glasgow. Having received the advice of Smeaton and other engineers, the people of Glasgow constructed in 1775 upwards of 100 jetties at different parts of the river, whereby the effective width was lessened, the rapidity of the stream increased, and the bottom scoured out to a greater depth. The quay which had formed the 'Broomielaw,' or harbour, was lengthened in 1792 by 360 feet, and in 1811 by 900 feet. Still Glasgow could only receive small vessels of 45 tons up to the beginning of the present century. But the trustees of the river kept steadily in view the improvement of the harbour, and the result has been very remarkable. By deepening year after year, the bed of the river had been so far changed, that by the year 1821 vessels drawing 13 feet of water could come up to the Broomielaw. By 1841 the quay space had reached a length of 3340 feet on the north shore, and 1200 feet on the south shore. At present the depth to the bridge has reached 18 feet at high water, and the quay offers a frontage of upwards of 10,000 feet. Loaded vessels of 1000 tons and steamers of 2000 tons can now occupy the harbour. From Glasgow to Dumbarton the bed and banks of the river are as carefully prepared as in a ship-canal. For the first seven miles of this distance the sloping banks are formed artificially of blocks or slabs of whinstone. There are no docks; and for the first mile or two below the bridge the shipping are moored so closely as to leave room only for a passage up and down; and there are times when the vessels are ranged nine tiers in depth off both south and north quays.

The vast increase in the trade of the harbour of Glasgow will be seen by a statement of the registered vessels belonging to the port, the customs duties, and the revenue of the harbour itself at different periods. The registered vessels in 1820 were 85, tonnage 6604; in 1830, 233, tonnage 40,978; in 1840, 351, tonnage 71,878; in 1850, 512, tonnage 140,741. The number and tonnage of vessels registered as belonging to the port on December 31st 1853 were:—Sailing-vessels, under 50 tons, 78, tonnage 2744; above 50 tons, 382, tonnage 152,528; steam-vessels, under 50 tons, 17, tonnage 610; above 50 tons, 91, tonnage 26,963. The number and tonnage of vessels entered and cleared at the port during the year 1853 were as follows:—Coastwise, inwards, 1435 sailing-vessels, tonnage 134,411; steamers, 1474, tonnage 351,129; outwards, 2940 sailing-vessels, tonnage 191,275; steamers, 1501, tonnage 358,336; colonial, inwards, 124 British vessels, tonnage 32,710; foreign vessels, 9, tonnage 3496; outwards, 327 British vessels, tonnage 115,388; foreign vessels, 5, tonnage 1433. In the foreign trade 275 British vessels of 51,522 tons, and 179 foreign vessels of 44,142 tons, were entered inwards; and 467 British vessels of 96,035 tons, with 244 foreign vessels of 63,269 tons, cleared outwards. The steam-vessels engaged in the foreign trade were:—Inwards, 6 British of 6912 tons; outwards, 11 British, tonnage 7577. The customs duties collected in the port were—11,000*l.* in 1820; 59,013*l.* 17*s.* 3*d.* in 1830; 463,974*l.* 12*s.* 2*d.* in 1840; 645,869*l.* 11*s.* 11*d.* in 1850; and 675,044*l.* 15*s.* 10*d.* in 1851. The revenue received by the river trustees was—in 1820, 6328*l.* 18*s.* 10*d.*; in 1830, 20,296*l.* 18*s.* 6*d.*; in 1840, 46,481*l.* 1*s.* 9*d.*; in 1850, 64,243*l.* 14*s.* 11*d.* Three bridges cross the Clyde at Glasgow—the Glasgow, Victoria, and Hutcheson bridges. The Broomielaw, or Glasgow Bridge, constructed by Telford in 1838, is to be regarded as the principal one on account of its fine proportions and construction, and of its contiguity to the harbour, it being the lowest bridge on the Clyde. Victoria Bridge is a handsome new granite bridge erected to replace the Stockwell Bridge, which dated from the 14th century. Hutcheson Bridge is a plain structure in a line with the Saltmarket.

Of the industrial occupations which give life and wealth to Glasgow, ships and steam-engines, iron and coal, are the chief elements. It was not until iron vessels came into use that any considerable number of ships were built at Glasgow. Steam-vessels of the largest and most costly description are now made in Glasgow in large numbers. Marine steam-engines are also very extensively made. The district which borders on Glasgow on the east and south-east is rich in iron-ore, which is so nearly associated with the coal, and lime, and clay, necessary for its smelting, as to be more than usually profitable. In 1809 there were only 7000 tons of iron produced in the whole county of Lanark; the quantity of pig-iron now sold annually in Glasgow exceeds 600,000 tons. With the exception of immense works in the southern suburbs, nearly all the great iron-works are at some distance from Glasgow; but almost the entire produce of the county is sent to Glasgow for sale or shipment. Coal is an important element in the commercial activity of Glasgow. The same districts which are so rich in iron are for the most part well supplied also with coal.

Glasgow is the commercial centre for the cotton manufactures of Scotland. Down to the period of the Union, linens and woollens were made for domestic use by the spinning-wheel or hand-loom;

but when the spinning of cotton became an important branch of manufacture in England, the capitalists of Glasgow lost no time in embarking in the enterprise. The first steam-engine employed at a Glasgow cotton-work was put up in 1792. Glasgow is now surrounded by more than a hundred cotton factories. It is calculated that there are 25,000 power-looms belonging to the city producing daily 650,000 yards of cloth. Some of the establishments are spinning factories only; some are weaving factories only; some combine both; while there are a few which print also. The calico-printing establishments are of a very high order. The use of bleaching-powder, and the Turkey red dye, were first introduced at Glasgow. Carpet weaving, silk weaving, the shawl manufacture, woollen and worsted manufactures, rope and sail-making, &c. are extensively carried on. There are also large glass, porcelain, iron and other works in the town and its immediate vicinity.

The St. Rollox Chemical Works are the most extensive chemical establishments in the world. The buildings occupy an immense square, from which shoot up numerous chimneys. Many of these chimneys are equal to the largest in other towns; but none of them approach the immense chimney already mentioned.

Gas was introduced into Glasgow in 1817. It is now generally used in factories, shops, and dwelling-houses. There are two water companies, which supply an average of 27 gallons daily to each inhabitant. The assessment for the poor of the old burgh in the end of last century was about 1000*l.*; it is now nearly 50,000*l.* annually; for the whole modern city it is 80,000*l.*

The Green of Glasgow covers an area of 140 acres, extending along the right bank of the Clyde, above the bridges for more than a mile, without a single building. It was laid out and greatly improved about 30 years ago, and 2½ miles of good carriage-road were formed around it. The Green was once the resort of the wealthy and fashionable; but the westward march of the city has now left it pretty much to the humbler classes of society.

The Necropolis is situated immediately behind the east end of the cathedral, from which it is separated by a narrow rivulet called the Molendinar Burn, running along the bottom of a tolerably deep ravine. The ground of which the Necropolis is formed rises 300 feet above the burn, and is laid out and planted up to the summit, from which the view of the city is very commanding. A monument has been erected here to the memory of John Knox.

Communications, &c.—Besides the small steamers which run up and down the Clyde between Glasgow and the various river-side towns on the coasts of Argyshire and Ayrshire, Loch Long, Loch Fyne, and the Gareloch, there are splendid vessels which trade regularly to the leading ports of England and Ireland. With every part of England and Scotland Glasgow is brought into direct communication by numerous railways; the Union Canal passes the northern, the Paisley and Johnstone Canal the southern boundary of the city. The ships of the Clyde find their way to every part of the world.

(*New Statistical Account of Scotland*; Cleland, *Enumeration of Glasgow*; McUre and Gibson, *Histories of Glasgow*; *Glasgow Guides*; *Land We Live In*, vol. ii.; *Communications from Glasgow*; *Parliamentary Papers*.)

GLASTONBURY, Somersetshire, a market-town and municipal borough in the parish of Glastonbury, is situated in 51° 8' N. lat., 2° 42' W. long.; distant 24 miles S.W. from Bath, and 124 miles W.S.W. from London by road. The population of the town and parish of Glastonbury in 1851 was 3125. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor. The livings of St. John and St. Benedict are perpetual curacies in the archdeaconry of Wells and diocese of Bath and Wells.

The town of Glastonbury stands on an eminence which is nearly insulated by marshy flats. A monastery or abbey was established here at an early period. Upon the settlement of the Saxons, the spot obtained the designation *Glaestingbyrig*. The monastery, which had fallen into decay, was rebuilt with great splendour by Ina, king of Wessex (about A.D. 708), and the establishment, enriched by the liberality of successive princes, flourished till the period of the Danish incursions, in the time of Ethelred I. and Alfred the Great. Under the abbacy of the famous Dunstan, and by the munificence of the Anglo-Saxon kings, Edmund I. and Edgar, it regained its former prosperity, and was conformed to the rule of the Benedictines. At the Conquest, the abbot of Glastonbury was a personage of importance in the Anglo-Saxon state; but the jealousy of William, who deposed the abbot and substituted a Norman in his room, and stripped the abbey of many of its lands, depressed the establishment for a while. It was however restored by the carefulness and influence of subsequent abbots. The buildings were in great part rebuilt in the reigns of Stephen and Henry II., and were subsequently repaired or enlarged. It became soon after this time a mitred abbey, and was for a short period annexed to the bishopric of Wells, which was during this interval called the bishopric of Glastonbury. At the time of the suppression, Richard Whiting, the abbot, who resisted the measures of Henry VIII., was, upon a charge of denying the king's supremacy, tried, and hanged on the adjacent eminence of the Tor Hill, in 1539. The yearly revenue at the dissolution was 3508*l.* 13*s.* 4*d.* gross, or 3311*l.* 7*s.* 4*d.* clear. The reputation of Glastonbury for sanctity did not cease at the Reformation. As late as 1750 and 1761,

crowds of invalids, to the number in one month (May, 1751) of ten thousand, flocked to Glastonbury in consequence of the account of a wonderful cure wrought by drinking the water of a spring near the town. We are not told how long the delusion lasted.

The town consists of several streets; four of these inclose a quadrangular space, in which are the ruins of the abbey; from the corners of this quadrangle other streets extend. The houses are generally low, and many of them have been built with stones taken from the ruins of the abbey. The remains of this splendid structure consist of some fragments of the church, the chapel of St. Joseph of Arimathea, and what is called the abbot's kitchen. The ruins of the church, which was cruciform, consist of two of the pillars which supported the central tower, some portions of the walls of the choir, and a fragment of the wall of the nave. The architecture belongs to the period of transition from the Norman to early English, with some portions of later date. The whole length of the church was 380 feet, the breadth of the choir and its aisles 70 feet. St. Joseph's chapel is in better preservation than the church, at the west end of which it is placed, and with which it communicates by an ante-chapel, of somewhat later date; both however belong to the same transition period as the church, but are of a more enriched character. St. Joseph's chapel is one of the very finest specimens existing of this transition style. The length of the chapel and ante-chapel together is 110 feet, the breadth 25 feet. The abbot's kitchen is a small building of the late perpendicular period. The roof is surmounted by a double lantern. Glastonbury has two pariah churches, both elegant structures in the perpendicular style, with graceful towers. The market cross is ancient. The only municipal building of importance is the town-hall. On a hill near the town is what is called the 'Tor,' a tower, which is the only portion remaining of a chapel dedicated to St. Benedict. It is of the decorated style, of beautiful though simple composition, and very perfect in its details. There are places of worship for Independents, Baptists, Wesleyan Methodists, and Quakers. The silk manufacture is carried on to a small extent in Glastonbury, and some hosiery and coarse gloves are made. A canal connects the town with the Bristol Channel by the river Bure, and affords facilities for the export of agricultural produce, timber, slates, tiles, &c. The market is on Saturday; fairs are held on the Wednesday in Easter week, September 19th, October 10th, and on the Monday week after November 30th.

GLATZ. [SILESIA.]

GLAUCHA. [HALLE.]

GLENARM. [ANTRIM.]

GLENCOE. [ARGYLESIRE.]

GLENDALE, a ward in the northern part of the county of Northumberland, which has been constituted a Poor-Law Union. Glendale Ward (East and West Divisions) contains 9 parishes, with an area of 109,816 acres, and a population in 1851 of 12,522. Glendale Poor-Law Union, the bounds of which are more extensive than those of the Ward, contains 45 parishes and townships, with an area of 143,605 acres, and a population in 1851 of 14,348.

GLENDALOUGH. [WICKLOW.]

GLENELG, RIVER. [AUSTRALIA.]

GLENNAMADDY, Galway county, Ireland, a village, and the seat of a Poor-Law Union in the parish of Boyounagh, is situated in 53° 36' N. lat., 8° 35' W. long., distant about 80 miles N.E. from Galway, and 126 miles W. by N. from Dublin. The population of the village in 1851 was 160. Glennamaddy Poor-Law Union comprises 18 electoral divisions, with an area of 100,319 acres, and a population in 1851 of 23,722. The village is situated in a wild uncultivated district, and possesses nothing of general interest. A dispensary is maintained in connection with the Poor-Law Union.

GLENTIES, Donegal county, Ireland, a small town and the seat of a Poor-Law Union in the parish of Inniskeel, is situated in a glen in the midst of a wild mountainous country, in 54° 47' N. lat., 8° 17' W. long., distant about 14 miles N.W. by N. from Donegal, and 160 miles N.W. from Dublin. The population of the town in 1851 was 506, exclusive of 279 in the workhouse. Glenties Poor-Law Union comprises 27 electoral divisions, with an area of 257,434 acres, and a population in 1851 of 40,103. The town has been considerably improved during the last few years by the Marquis of Conyngham, of whose domains the district forms a part. It consists chiefly of one street. A chapel has been recently built. There are here a National school, a sessions house, a police barrack, a corn-mill, and a corn-store for the district.

GLIN, Limerick county, Ireland, a market-town and sea-port, and the seat of a Poor-Law Union, in the parish of Kilfergus, is situated on the left bank of the estuary of the Shannon, in 52° 33' N. lat., 9° 18' W. long., distant 31 miles W. by S. from Limerick, and 150½ miles W.S.W. from Dublin. The population of the town in 1851 was 1243. Glin Poor-Law Union comprises 13 electoral divisions, with an area of 60,666 acres, and a population in 1851 of 17,634.

Glin possesses a good trade in butter and grain, for which there is a market in the town. There are here an Episcopal church and a Roman Catholic chapel. Glin Castle was besieged and taken by Sir George Carew in 1600, when most of the garrison were put to the sword. The remains of the ancient castle are in a dilapidated state.

The present Glin Castle, the residence of Fitzgerald, the 'Knight of Glin,' is about a mile west from the town.

(Fraser, *Handbook for Ireland*; Thom, *Irish Almanac*.)

GLOGAU. [LIEGNITE.]

GLOMMEN. [NORWAY.]

GLOSSOP, Derbyshire, a manufacturing town and the seat of a Poor-Law Union in the parish of Glossop, is situated on elevated ground rising from a deep valley near the north-western boundary of the county, in 53° 26' N. lat., 1° 55' W. long.; distant 49 miles N.W. by N. from Derby, 176 miles N.W. by N. from London by road, and 193 miles by the Great Northern and Manchester Sheffield and Lincolnshire railways. The population of the township of Glossop in 1851 was 5467; that of the entire parish, which contains 49,960 acres, and is the most extensive in the county, and one of the most extensive in England, was 28,626. The living is a vicarage in the archdeaconry of Derby and diocese of Lichfield. Glossop Poor-Law Union contains 10 townships and hamlets, forming a part of Glossop parish, with an area of 20,807 acres and a population in 1851 of 19,580.

The cotton manufacture, which is carried on more extensively in Glossop than in any other Derbyshire town, gives employment to many of the inhabitants. About 50 cotton-mills are in the town and neighbourhood; there are also woollen-mills, paper-mills, iron-foundries, dye-works, and bleach-fields. Besides the parish church, there are chapels for Independents and other Dissenters. A charity for clothing 24 poor men and women was founded by Joseph Hague, Esq. There is a savings bank. Melandra Castle, situated on an eminence near the town, is the site of a Roman station; the works appear to have been nearly square, 366 feet by 336 feet; the ramparts, parts of the ditch, and other portions may be distinguished. A Roman road called the Doctor's Gate runs from Melandra Castle to Brough.

GLOUCESTER, the capital of the county of Gloucester, an episcopal city, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on a gentle eminence on the left bank of the river Severn, in 51° 52' N. lat., 2° 14' W. long., distant 102 miles W. by N. from London by road, and 114 miles by the Great Western railway. The population of the city and parliamentary borough of Gloucester in 1851 was 17,572. Gloucester is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Gloucester and diocese of Gloucester and Bristol. Gloucester Poor-Law Union contains 37 parishes and townships, with an area of 29,255 acres, and a population in 1851 of 31,654.

The origin of this city is generally attributed to the Britons, by whom it was called 'Caer Gloew.' Shortly after the invasion of the country under Claudius, A.D. 44, the city became subjected to the Romans, who established a colony here as a check upon the Silures, or inhabitants of South Wales, and called it Colonia Glevum. Numerous Roman antiquities, including some fine specimens of tessellated pavement, and a statera, or Roman steelyard, have been discovered at various times, particularly in the suburb of King's Holm, which is supposed to have been the site of the Roman settlement. Several Roman roads passed through or near Gloucester. The city surrendered to the West Saxons about 577, and by them was called 'Gleau-Ceaster,' whence its present name is derived. About 680, Wuipher, son of King Penda, founded the monastery of St. Peter, and so far improved the city, that at the commencement of the 8th century, according to Bede, it was considered "one of the noblest of the kingdom." It however repeatedly suffered from fire and from the ravages of the Danes. In 1087 Gloucester was almost wholly destroyed during the contest between William Rufus and the adherents of his brother Robert. In 1263 it was the scene of many battles between Henry III. and the barons, whom he had offended by appointing a foreigner to the office of constable of Gloucester Castle. In 1641-2 it espoused the cause of the Parliament, and bade defiance to the king, with an army of 30,000 men; by way of punishment for which the ancient walls of the city were totally destroyed shortly after the restoration.

Gloucester has been represented in Parliament since the 23rd of Edward I. At a very early period the city was constituted a county in itself. As many as 27 charters have been granted to it by Henry II. and subsequent sovereigns: the last charter is that of Charles II. dated 1673. The city consists principally of two intersecting lines of street; each extremity was originally terminated by a gate, and the streets leading to them were respectively named Northgate, Southgate, Eastgate, and Westgate. There were formerly 15 churches, besides the cathedral; only 6 of these old churches now remain, but several new churches have been recently built.

Of the public buildings, the cathedral, dedicated to St. Peter, is by far the most important, and is particularly deserving of notice, not merely on account of its great antiquity and beauty, but also because it contains so many perfect specimens of the various styles of architecture which characterised the different periods in which the several portions were erected. The most ancient parts are the crypt, the chapels surrounding the choir, and the lower part of the nave, built between 1058 and 1089, the south aisle and transept in 1310-1330, the cloisters in 1351-1390, and the lady chapel towards the close of

the 15th century. The fine tower, surmounted by four pinnacles of the most delicate workmanship, is of somewhat more recent date. The extreme length of the cathedral is 427 feet, the extreme breadth 154 feet. The tower is 223 feet in height. Among the numerous monuments in the interior are those of Robert, son of William the Conqueror, who, together with his brother Richard, was interred here; that of Edward II. in white alabaster; that of Robert Raikes, the founder of Sunday-schools; and a marble statue of Dr. Edward Jenner, the discoverer of vaccination. The cathedral has recently undergone considerable repairs and restoration. The College Library, formerly the abbey chapter-house, was appropriated for the reception of the library formed by Sir Matthew Hale and others. The College school-room is an apartment over the audit-room at the end of the north transept. The Episcopal palace adjoins the cathedral at the west end. In St. Mary's-square, a short distance from the cathedral, is a monument to Bishop Hooper, who suffered martyrdom here in the reign of Mary.

Of the Gloucester parish churches, that of St. Mary de Lode was enlarged and almost rebuilt in 1326; St. Michael's has a square tower at the west end; St. Mary de Crypt is cruciform, with nave, transept, and aisles, and a pinnacled and ornamented tower rising from the intersection of the cross; St. John's is a comparatively recent erection on the site of a church of very ancient date. The Independents, Baptists, Wesleyan Methodists, Countess of Huntingdon's Connexion, Quakers, Roman Catholics, Jews, and Unitarians have places of worship. There are three public schools, namely, the College school, the Blue-Coat, and the Free Grammar school of St. Mary de Crypt. The Crypt school, founded in 1639, has an income from endowment of 30*l.* a year, and has two exhibitions of 50*l.* a year each, tenable during 8 years, for the maintenance of two scholars at Pembroke College, Oxford. The number of scholars in 1853 was 26. The College school was founded in 1636, and has long enjoyed considerable reputation as a classical seminary. The number of scholars in 1853 was 76. The Blue-Coat school, in which 20 boys are supported and educated, was founded in 1666 by Sir Thomas Rich, and is under the superintendence of the corporation, who appoint a master and matron. There are also National and British schools. Several hospitals of ancient foundation are now under the management of trustees, with endowments amounting to upwards of 2000*l.* annually. There are also in Gloucester the county infirmary, supported by voluntary donations; a lunatic asylum; an eye institution; a house of industry, and a savings bank.

The county-hall, in Westgate-street, wherein the courts of sessions are held, is a fine building with a portico of Ionic columns, erected by Robert Smirke in 1814. The county jail occupies the site of the ancient castle, and consists of a penitentiary, bridewell, and sheriff's prison. The assizes for the county and a county court are held in Gloucester. A commodious cattle market has been recently erected at a cost of more than 10,000*l.* The market-days are Wednesday and Saturday; fairs are held on April 5th, July 5th, September 28th, and November 28th, for horses, cattle, &c., and particularly for cheese. There is a monthly market for live stock.

The streets are lighted with gas, and are well paved. Water is supplied to the city partly from the Severn, and partly from springs situated near Robin Hood's Hill, about two miles from Gloucester. There are two handsome stone bridges over the two channels of the Severn. These bridges are connected by a paved road called Over's Causeway, which extends through the rich pasture land of the island. Hot and cold baths have been established in the city. Soap is manufactured; cutlery goods are made, and there is a very old bell foundry.

The town is surrounded by a large and most fertile district. It has water communication with most parts of the kingdom, and improvements in the navigation of the Severn, with the completion of the Gloucester and Berkeley Canal, by which vessels of 500 tons burden can come up to the city, have added considerably to its foreign and domestic commerce. A quay, with wharfs for loading and discharging vessels, extends about 1000 feet along the left bank of the Severn. Much business is now done in foreign wheat, and many warehouses for the storage of grain, West Indian produce, and other merchandise, have been erected near the dock. Timber is largely imported. The custom-house receipts in 1827 amounted to 2,336*l.*; in 1851 the amount was 93,139*l.* The shipping returns for the port of Gloucester for the year 1853 are as follows:—Vessels registered under 50 tons, 275 of 7687 tons aggregate burden; above 50 tons, 74 of 11,200 tons; and 2 steam-vessels of 54 tons. The number and tonnage of vessels entering and clearing at the port during 1853 were as follows:—Coastwise, sailing-vessels, inwards, 1225, tonnage 50,351; outwards, 2355, tonnage 90,467; steam-vessels, inwards, 29, tonnage 1778; outwards, 57, tonnage 3214; Colonial, inwards, 86, tonnage 37,108; outwards, 31, tonnage 10,539; Foreign, British vessels, inwards, 107, tonnage 21,207; foreign vessels 247, tonnage 46,760; outwards, British vessels, 42, tonnage 11,056; foreign vessels, 94, tonnage 24,270.

Although suffragan bishops of Gloucester are mentioned as early as 1223, yet it does not appear that the city was erected into a bishopric, with dean and chapter, till 1541, in the reign of Henry VIII. The bishopric of Gloucester was united with that of Bristol in 1836. The diocese of Gloucester and Bristol is in the province of Canterbury;

it extends over Gloucestershire, the city and deanery of Bristol, and parts of Somersetshire and Wiltshire, and comprises 442 benefices. It is divided into two archdeaconries, Bristol and Gloucester. The chapter of Gloucester consists of a dean, archdeacon, 4 canons, 10 honorary canons, 3 minor canons, and a chancellor. The chapter of Bristol consists of a dean, archdeacon, 6 canons, 6 honorary canons, 3 minor canons, and a chancellor. The income of the bishop is fixed at 3700*l*.

(Gough's Camden, *Britannia; Description of the City of Gloucester; Parliamentary Papers.*)

GLOUCESTERSHIRE, an inland county of England, situated in the south-west part of the island. It is bounded E. by Oxfordshire, N. by Warwickshire and Worcestershire, W. by Herefordshire and Monmouthshire, and S. by Somersetshire and Wiltshire. Small detached pieces of land, which were formerly reckoned as part of Gloucestershire, were by the Act 7 and 8 Vict. cap. 61, annexed to the counties in which they are respectively situated. By the same Act small portions formerly reckoned as belonging to Wiltshire and Worcestershire, but situated in Gloucestershire, were declared to be portions of that county.

Gloucestershire lies between 51° 25' and 52° 11' N. lat., 1° 37' and 2° 41' W. long. Its greatest length from north-east to south-west is 60 miles, and its breadth from east to west is 43 miles. The area is about 1258 square miles, or 805,102 acres. The population in 1851 was 458,805.

Surface, Hydrography, and Communications.—The county is naturally divided into three distinct districts, of very different character, which may respectively be termed the Hill, the Vale, and the Forest districts. The hill district is formed by a range of high land running entirely through the county from north-east to the south and south-west. Its course is nearly parallel to the Avon and Severn, at a distance varying from 6 miles to 10 miles, and running in a line from Chipping Campden to Broadway Beacon (1086 feet high), Winchcombe, and Cleeve station (1184 feet), on to Cheltenham. This range, which is called the Cotswold Hills, divides the basin of the Severn from the basin of the Thames. The extensive vale which lies between the Hills and the Severn is divided into the upper and lower, or the Vales of Gloucester and Berkeley. The former extends from the north of the county to Gloucester, and is about 15 miles in length from north to south, and 7 or 8 miles from east to west. The boundary line of the Vale of Berkeley is nearly a segment of a circle, the curved part of which is formed on the south and east by the hills which terminate on the north in the Painswick and Matson Hills, and on the west the Severn forms the irregular chord-line: the extent of this vale from the foot of Matson Hill on the north to Aust Cliff on the south is 25 miles, and its medium breadth is not quite 4 miles. On the west of the Severn, and entirely divided by it from the rest of the county, is the Forest district, which has an irregular surface, and is chiefly occupied by the Forest of Dean, great part of which is still crown property. The forest is limited according to the perambulations made in the 12th of Henry III. and 10th of Edward I. Since that time many encroachments or grants of freehold property have been made on it, but the quantity of ground still retained by the crown is above 20,000 acres. The government of the forest is vested in a lord warden, who is constable of the castle of St. Briavel's, 6 deputy wardens, and other officers. The whole forest is extra-parochial, and its inhabitants are exempted from rates and taxes, have free liberty of pasturage, the privilege of sinking mines, and access to the woods and timber for their works. One-sixth of the produce of the mines is due to the king. The general appearance of the Forest of Dean is picturesque; and it abounds with apple orchards, the cider made from which is in considerable repute.

The principal rivers in Gloucestershire are the Severn, the Wye, the Lower and the Upper Avon, the Frome, the Thames, the Calne, the Windrush, and the Ledden. The Severn enters the county from the north a little to the west of Tewkesbury, where it is joined by the Upper Avon, and the united stream takes a winding south-south-west course to Gloucester and Newnham, below which it widens considerably, passes near Berkeley, and at length becomes a broad estuary, into which the Wye and the Lower Avon fall. From its entrance into the county to the mouth of the Avon, the Severn, following its windings, is 60 miles long. In the estuary of this river, opposite the mouth of the Lower Avon, the tide rises 42 feet. [SEVERN.] The Wye forms the boundary between Gloucestershire and Monmouthshire and a small part of Herefordshire, bounding the south-east of Herefordshire for 11 miles and the east of Monmouthshire for 21 miles of its course. At Chepstow, near the mouth of the Wye, the tide sometimes rises 60 feet. The Lower Avon forms the boundary on the south-west for about 18 miles between Gloucestershire and Somersetshire, passes through Bristol, and falls into the estuary of the Severn, after a course of about 7 miles north-west from that city. The Upper Avon divides a very small part of this county from Warwickshire on the north-east, and after a winding course through a small part of Warwickshire and Worcestershire, flows in this county for 5 miles, till it falls into the Severn near Tewkesbury. The North Frome, a small stream which rises a little south-west of Wickwar, passes near Iron Acton and Stapleton, enters Bristol on the north side of the city, and passing through its centre falls into the floating-dock of the Avon.

In its short course it supplies a number of mills and manufactories, and in its last half-mile is used as a dock and harbour. The Ledden, which has its source in Herefordshire, a few miles north of Ledbury, enters this county near Donnington, and after a south-east course, passing by Dymock, falls into the east branch of the Severn at Alney Island; its course through this county is about 16 miles. The Stroud rises near Brimpsfield, passes on to Stroud, and joins the Severn 7 miles south-west from Gloucester. The Windrush rises near Winchcombe, and taking a south-east and then an east course passes into Oxfordshire, a mile or two west of Burford. The Calne, or Colne, one of the principal streams which unite in forming the Thames, has its source a little to the east of Cheltenham, and, taking a winding course to the south-east, passes by Shipton, Withington, Colne, and Fairford, and joins the other streams which unite with the Thames at Lechlade. The Leach, another small tributary of the Thames at Lechlade, rises near North Leach.

One of the sources of the Thames, or (as it is frequently called in its upper part) the Isis, is at Thames Head, near the road from Cirencester to Tetbury. This stream immediately passes into Wiltshire, and soon joins the Swill brook, which, united with another stream from another source of the Thames, passes by Cricklade (in Wiltshire), near which place it joins the Churn, the head stream of the Thames, which rises at Seven Springs, 8 miles from Cheltenham, on the east side of the hills, and passes Cirencester. From Cricklade the Thames flows to Lechlade, and becomes for a few miles the boundary between Gloucestershire and Wiltshire. From the source of the Churn to Cricklade the stream is about 20 miles long, and from Cricklade to Lechlade it is 9½ miles: at Lechlade it becomes navigable. [THAMES.]

The Thames and Severn Canal connects the two great navigable rivers. It commences at Lechlade, and joins the Stroudwater Canal at Wallbridge, near Stroud. Its whole length from Lechlade to Wallbridge is 30 miles 7 chains. At Siddington St. Mary a branch about a mile in length runs to Cirencester from this canal; and at Latton it is joined by a branch of the Wilts and Berks Canal. The Stroudwater Canal commences at the Severn, near Framiload, about 7 miles from Gloucester, and thence runs in a south-east direction, terminating in the Thames and Severn Canal at Wallbridge. The length is rather more than 8 miles, with a rise of 102 feet 5 inches. The Hereford Canal, which was intended to connect the towns of Gloucester and Hereford, is not completed, reaching only from Gloucester to Ledbury, a distance of 18 miles. The Gloucester and Berkeley Canal, by which the navigation up to Gloucester is shortened 11¼ miles, was projected in 1793; but it was not completed till 1826. From the basin of this canal in Gloucester a railway for coals, &c., runs to Cheltenham, a distance of 9 miles.

The high road from London to Gloucester, and thence through Herefordshire and South Wales, enters this county at Latton, near Cricklade, and passing through Cirencester and Gloucester, leaves the county about 4 miles short of Ross. The road from London to Cheltenham and so on to Tewkesbury, thence branching through Warwickshire and Worcestershire, enters the county at Little Barrington, about 10 miles from North Leach. The London road to Bristol, and thence to the west of England, enters the county at Marshfield. The direct road between Bristol and Gloucester is continued with numerous branches to the north and to Liverpool. The road between Gloucester and Cheltenham leads also, with numerous branches in all directions, to the rest of the county. A road extends from Gloucester through the Forest of Dean to Chepstow, and the forest is likewise intersected by several other roads. The Bristol and Birmingham line of the Midland railway traverses the county in a northern direction from Bristol, past Gloucester to Bredon, 53 miles. The main line of the Great Western railway merely touches the county at Bristol, but the Cheltenham branch, which enters the county near Thames Head, runs past Stroud, and joins the Bristol and Birmingham line a few miles farther on. A short branch connects Cheltenham with the Bristol and Birmingham line. Another short branch connects Cirencester with the Cheltenham branch. The Oxford, Worcester, and Wolverhampton line intersects the county for a few miles, passing along the northern part of it by Moreton and Chipping Campden. The South Wales railway runs from Gloucester through a part of the western side of Gloucestershire.

Geology, Mineralogy, &c.—The whole range of the Cotswold Hills belongs to the lower division of the oolitic series. The great oolite forms a flat table-land on the summits; and on the western escarpment beds of fullers'-earth, inferior oolite, and marly sandstone occur. The summits of some few of the detached hills east of the great range are capped by the sandy beds of the inferior oolite. The whole of the Vale district rests on the lias formation. The south-west corner of the county is occupied by the coal-field, which commences near Wickwar on the north and continues into Somersetshire. The whole of the Forest of Dean is a coal-field, encircled by an elevated border of carboniferous limestone and old red-sandstone.

The fossils of this county are extremely numerous, and are found both in the hills and the vales. There are some beds near the bottom of the lias series which occur in the cliffs of Westbury and Aust, in which are numerous remains of vertebrated animals; they are well known to the collectors of that neighbourhood under the name of the

'bone-beds.' Asteris are abundant at Pyston in Lydney parish, and under the adjacent cliffs on the banks of the river: they are also found at Laington, Dursley, Sherbourne, and Robin Hood's Hill. Belemnites, ribbed nautili, bivalve shells, coralloids, anomia, cochleas, and other fossils have been found in various parts of the county. Coal-beds, alternating with ironstone, occupy the Forest of Dean and the neighbourhood of Bristol. Lead ore is found in many parts of the county, but not in large quantities. Pyrites, or sulphuret of iron, have been found in great abundance and in various forms of combination. Lapis calaminaris, or oxide of zinc, is found at Redland, Yate, and elsewhere. In the parish of Abstone, 7 miles from Bristol, the hills rise perpendicularly to the height of 200 feet and upwards, and consist of a series of beds of limestone and petrosilex, alternating with each other. Towards the west a vein of coral occurs, 14 inches thick, and another of lead (both formerly worked), with a mass of petrosilex on each side. The centre of the glen is occupied by a bed of limestone, nearly 600 yards broad, lying between two beds of petrosilex, all dipping to the north-west, at an angle of 60 feet with the plane of the horizon. In this are embedded lead-ore, spathous iron-ore, and barytes. A very superior limestone is obtained in great abundance a few miles north of Bristol; and the limestone rocks of Clifton are capable of receiving a good polish. Pellucid quartz crystals, hexagonal and terminated by detached pyramids, are found in the crevices of the strata at Clifton; these crystals were formerly in considerable request under the name of Bristol diamonds. A good compact limestone is found in the Forest of Dean. Freestone of excellent quality is quarried on the hills, more particularly at Painswick. Blue clay-stone for building is found at Aust Cliff, which is composed of two strata of clay, the upper of a blue, the lower of a red tinge, resting upon a gray-limestone rock; embedded in the lower stratum is a bed of gypsum, which furnishes a plentiful supply for stuccoing, &c., to the masons of Bristol and Bath. Paving stones and grits are obtained in the forest. At Dursley a stratum of tophus occurs.

Climate, Soil, Agriculture.—The climate of Gloucestershire varies according to the elevation of the land. In the valleys, especially those which are sheltered on the north and east, the temperature is mild. On the Cotswold Hills the air is sharp and bracing, and as the progress of tillage has brought higher lands into cultivation, farm-houses have been built in situations which require a hardy race to bear the keenness of the air. The children who can be reared there are strong and healthy, but those who are born with delicate frames have little chance of life if not removed to a milder air. The Vale of Gloucestershire is noted for the early maturity of every kind of agricultural produce, owing partly to the nature of the soil, but chiefly to the shelter afforded by the hills on the north and east. It is however occasionally subject to very violent storms from the Atlantic.

In an agricultural point of view Gloucestershire may be divided into the Cotswold, or hilly portion, the Vale, and the Forest including the Ryelands. The first district traverses the whole county from Chipping Campden to Bath, and is divided into the upper and lower Cotswold Hills. The vale runs from Stratford-upon-Avon to Bristol, and is divided into the vales of Evesham, Gloucester, and Berkeley. The Avon runs along the upper part of the vale, and the Severn in the lower. The Forest of Dean lies on the right bank of the Severn, extending to the river Wye, which bounds the county on the north-west. The Ryelands are a sandy district of the Forest, bordering on Worcestershire and Herefordshire. The soil on the Cotswolds is chiefly a calcareous sand, a few inches deep, resting on oolite, a calcareous freestone commonly called stonebrash. The poorest is only fit for sheep pasture; but the feed is very sweet, and sheep thrive well on it. Where it has been improved by cultivation and by the repeated folding of sheep, it bears tolerable crops of oats and barley, and where there is an admixture of clay in the loam, even of wheat. The lower parts of the hills, and the valleys which are between them, contain a better and deeper soil, evidently made by the washing down of the soil from the hills. Where the subsoil is impervious, the water is apt to accumulate; but by judicious draining some excellent arable and grass land is produced. The dairies in these situations are productive; and the cheese made there is similar to the North Wiltshire. Some parts of the Vale contain a very deep and rich soil, as at Walford and its immediate neighbourhood. At a greater distance from the rivers up to the foot of the hills, the soil is chiefly of a tenacious nature, which produces abundantly when well drained and cultivated. Siliceous sand and gravel are found in a few spots, but not in sufficient quantity to form any considerable portion of the soil of the county, except in the forest, where the soil is chiefly a decomposed red sandstone, scarcely fitted for the growth of anything but woods and coppice.

The cultivation of the soil varies according to its nature and fertility; and improvements have been gradually introduced of late years. Wheat, rye, barley, and other ordinary crops are raised. Flax is but little cultivated, it being generally prohibited in leases. Teasels (*Dipsacus fullonum*) are raised for the use of the manufacturers of woollen cloth; but not to such an extent as they were once. Potatoes and turnips are raised in considerable quantities. The meadows on the Ledden are particularly fertile, from the rich soil which this river brings down from Herefordshire; but they are also

subject to sudden floods in summer, by which the whole crop is sometimes spoiled or swept away. The rich upland meadows contain the best grasses.

Gloucestershire is essentially a dairy country, and has been always renowned for its butter and cheese, of which great quantities are made, and sold in every part of the kingdom. London alone consumes a large proportion of it. The Gloucester breed of cows, although now eclipsed in public estimation by the improved short-horns and the Devon, has qualities which still render them favourites with many experienced dairymen. The Durham short-horned breed of cows is however gaining ground for the dairy.

The sheep peculiar to this county are the Cotswold and the Ryeland breeds. The Cotswold are large in the carcass, and rather strong in the bone, and the wool is coarse. This breed has been successfully crossed with the improved Leicester, and also with the South-Down, in both cases with decided advantage. The Ryeland or Herefordshire sheep are bred in the Forest district. They are small in size, but larger than the common Forest sheep. They have white faces and no horns; the wool is very fine; and when they are fattened the flesh is of a very delicate flavour. This breed has been improved in size by crossing with the Leicester and black-faced Shropshire breeds, but always at the expense of fineness in the wool and flavour in the mutton. When crossed with the Merino, the Ryeland sheep produce a wool which bears a good price. There are not many horses bred in this county, although they are generally preferred to oxen for the purposes of husbandry. The chief supply comes from the northern counties.

There are fine orchards in different parts of the Vale and Forest districts, and the cider and perry made in the county are considered to be of good quality. The Forest of Dean anciently contained much valuable timber, chiefly chestnut, oak, and beech. It has been gradually much denuded of trees, so that large tracts of land are entirely bare. In the forest, and dispersed through the county, are many productive coppices, which are cut every ten, twelve, or fifteen years. Many wastes, commons, and common-fields have been inclosed and improved.

Divisions, Towns, &c.—Gloucestershire is divided into 28 hundreds, containing 351 parishes, one city, and part of another, and 28 market-towns. The hundreds are as follows:—Barton Regis, Berkeley, Biale, Bledialoe, Botloe, Bradley, St Briavel's, Brightwell's-Barrow, Cheltenham, Cleeve, Crowthorne, Deerhurst, Dudstone and King's Barton, Grumbald's Ash, Henbury, Kiftgate, Lancaster, Langley and Swineshead, Longtree, Puckle Church, Rapgate, Slaughter, Tewkesbury, Thornbury, Tibaldstone, Westbury, Westminster, and Whitstone, with Bristol, Gloucester (city and county), and Tewkesbury town.

The market-towns, excluding Gloucester, are—BERKELEY, BISLEY, Chipping Campden, CHIPPING SODBURY, CHELTENHAM, CIRENCESTER, Coleford, DUBBLEY, Fairford, Lechlade, Marshfield, MINCHINHAMPTON, Mitcheldean, Moreton-in-the-Marsh, NEWNEM, Newnham, NORTHLEACH, Painswick, Stanley St Leonard, STOW-ON-THE-WOLD, SROUD, TETBURY, TEWKESBURY, THORNBURY, Wickwar, WINGCOMBE, and WOTTON-UNDER-EDGE. Those marked with small capitals are noticed under their respective heads. A short account is subjoined of the less important towns:—

St. Briavel's, 21 miles S.W. from Gloucester, population of the parish 1194, was once a borough and market-town, the inhabitants of which had many rights and exemptions. The castle was erected in the reign of Henry I. by Milo Fitz-Walter, earl of Hereford, to curb the incursions of the Welsh. The site, surrounded by a moat, includes a considerable area. The north-west front is nearly all that remains entire. It is composed of two circular towers three stories high, separated by a narrow elliptical gateway; within the towers are several hexagonal apartments, the walls of which are 8 feet thick. One of the towers is used as a prison. The constable of the castle is appointed by the crown, and is also the lord-warden of the forest.

Chipping Campden, 28 miles N.E. from Gloucester, population of the parish 2351, near the border of Worcestershire, is a very ancient market-town and borough, situated in a fertile valley. In 689 the Saxon kings assembled here to consult on the mode of carrying on the war with the Britons. In the 14th century this town was the principal mart for wool, and the residence of many opulent merchants. The church stands on a gentle declivity above the town, in the hamlet of Berrington: it is a handsome ancient structure, having an ornamental tower at the west end, 120 feet high; at the east end of each aisle is a chapel. Campden has an hospital and several other institutions founded by Sir Baptiste Hicks early in the 17th century.

Coleford, 19 miles W.S.W. from Gloucester, population of the tithing 2310, is a small market-town, consisting principally of one street, situated near the left bank of the river Wye: the houses are in general well built. The chapel, which was destroyed in the civil wars, was rebuilt in the reign of Queen Anne. The Baptists have a place of worship. The market-house was rebuilt in 1679. The market is held on Friday: there are two annual fairs.

Fairford, 27 miles S.E. by E. from Gloucester, population 1859, is pleasantly situated on the banks of the Colne: the town consists of two streets neatly and regularly built. It has a Free school and several charities. Fairford is celebrated for the beauty of its church,

which was built in the reign of Henry VII. This church is cruciform, 120 feet long by 55 feet broad. It contains some curious painted glass, which is disposed in 28 windows with four or more compartments in each. The Baptists and Independents have places of worship. There are a Free school, two National schools, and several charities. The market is held on Thursday. Roman remains have been found in the vicinity.

Lechlade, 31 miles E.S.E. from Gloucester, population 1373, is a market-town situated near the point where the counties of Gloucester, Wilts, Oxford, and Berks have their junction. Here the Thames and Severn Canal commences, and the Thames first becomes navigable for barges of 80 tons burden. The town contains several well-built houses. The church is a handsome building in the pointed style, with a tower at the west end surmounted with a spire; the pulpit is of sculptured stone. The Baptists have a place of worship. There is a savings bank. A priory formerly existed here. The market is on Tuesday, and there are three annual fairs.

Marshfield, a small market-town 32 miles S. from Gloucester, population 1648, consists chiefly of one street of old buildings, nearly a mile long. It is a clothing town; a considerable quantity of malt is likewise made here for the supply of the Bath and Bristol brewers. Besides the parish church there are places of worship for Independents and Unitarians. There are an Endowed school and well-endowed almshouses. The market is held on Tuesday; there are fairs on May 24th and October 24th.

Mitcheldean, a small market-town situated in a deep dell in the Forest of Dean, 12 miles W. from Gloucester, population 662, has a market-house and an old church. The church consists of a nave and chancel, with a tower at the west end surmounted with an octagonal spire. There are an Independent chapel and two National schools. The market is on Monday; fairs are held on Easter Monday and October 10th. Tanning is carried on.

Moreton-in-the-Marsh, a small market-town 28 miles E.N.E. from Gloucester, population 1512, consists chiefly of one long street, and occupies a low situation on the Roman Fosse-way. Besides the parish church there are an Independent chapel and a National school. The market has been long disused. Two annual fairs are held. Some linen cloth is made here. A goods railway runs from Moreton to Stratford-on-Avon.

Newnham, 12 miles S.W. from Gloucester, population 1288, is pleasantly situated on an eminence rising from the right bank of the Severn, which is here nearly a mile across at high water. A ferry is established at this place. Newnham appears to have been in the Norman times a fortified town designed to repress the incursions of the Welsh; and in ancient records mention is often made of the castle here. In the contest between Charles I. and the Parliament the castle was besieged and taken by the Parliamentarians. A sword of state, presented by King John, is still preserved in the town. The houses are chiefly ranged in one long street; the church stands on a cliff near the river. There are an Independent chapel, an Endowed school, and a savings bank. Cider is made in the neighbourhood. There are several coal-pits. The market is on Friday; fairs are held on June 11th and October 18th. A small quay was built here about a century ago by one of the Pyrke family. Some trade is carried on with Bristol and London.

Painswick, 6 miles S.S.E. from Gloucester, population of the parish 3464, is a small and irregularly-built town on the southern acclivity of Sponebed Hill. The church is an ancient building, with a tower and spire at the west end rising to the height of 174 feet. There are chapels for Independents, Wesleyan Methodists, and Quakers, an Endowed school, and several minor charities. Freestone quarries are in the neighbourhood: some of the inhabitants are employed in the clothing manufacture. The market is on Tuesday. On the summit of Sponebed Hill is an ancient fortification called Kinsbury Castle. Roman coins and other antiquities have been found here; and it is supposed to have been once a place of great strength.

Wickwar, 23 miles S. by W. from Gloucester, population 966, is an ancient market-town. It is well watered by two streamlets, over one of which there is a handsome stone bridge. The church is large and has a lofty tower. There are an Independent chapel and a well-endowed Free school. The market is on Monday. A station of the Bristol and Birmingham railway is at Wickwar.

The following are some of the more important villages, with the population of the respective parishes in 1851, and a few other particulars:—

Arlingham, on the left bank of the Severn, 14 miles S.W. from Gloucester: population, 737. There are fisheries here of considerable importance. The church is a commodious building, with a tower at the west end. There are here an Endowed school, founded in 1765 by Mrs. Yate, two Infant schools, and some parochial charities. *Avening*, 16 miles S. by E. from Gloucester: population, 2321. The parish church is an ancient cruciform edifice with a low embattled tower. There are chapels for Baptists and Independents, a Free school, and several parochial charities. British antiquities have been found here, and there are several tumuli in the neighbourhood. *Bicknor, English*, 19 miles W. by S. from Gloucester, population 584, is situated near the left bank of the Wye, on the western border of the Forest of Dean. The church stands on the site of an ancient fortification.

Geog. Div. Vol. III.

Coal and iron are wrought in the parish, which also contains some good orchards and meadow lands. *Bitton*, situated on the small river Boyd, which joins the Avon a short distance south of the village, is 42 miles S.S.W. from Gloucester: population of the hamlet of Bitton, 2395. Coal and iron are raised extensively in the neighbourhood. On the river Boyd are several flattening-mills. *Blakeney*, on the right bank of the Severn, 16 miles S.W. by W. from Gloucester: population of the parish of Awre, of which Blakeney is a chapelry, 1512. Blakeney is on the south-east border of the Forest of Dean. Besides the parochial chapel there are chapels for Independents and Baptists. *Bourton-on-the-Water*, 24 miles E. from Gloucester, population 1040, so called from its situation on the small river Windrush, is chiefly one long street of irregularly built houses. There was a church here previous to the Conquest. The present church is a neat structure in the Grecian style, with a tower at the west end. There are a Baptist chapel and an Endowed school. The Roman Fosse-way passes about half a mile W. from the village. A quadrangular encampment has been traced, and Roman coins and other antiquities have been found here. *Cam*, 14 miles S.S.W. from Gloucester: population, 1640. The village of Upper Cam is situated on the right, and Lower Cam on the left bank of the small rivulet Cam, a tributary of the Severn. The district is agricultural; good cheese is made here, and cider is also produced. Some corn-mills are in the vicinity. Cloth was formerly made here to some extent, but the manufacture has declined. The parish church consists of a nave and two aisles, with a lofty embattled tower at the west end. The Independents have two chapels. There is an Endowed school. *Chalford*, formerly *Chalkford*, 12 miles S.S.E. from Gloucester: population of the ecclesiastical district, 2000. The cloth trade has been long carried on here; this trade employs several mills on the river side. The village contains many good houses, and commands an interesting view of the valley of the Frome. The Thames and Severn Junction Canal passes Chalford on the south. The parochial chapel is a neat edifice erected by subscription in 1722. The Baptists and Independents have chapels. *Cleeve*, or *Bishop's Cleeve*, 11 miles N.E. from Gloucester: population of the township, 745. The village is situated a little to the westward of a ridge of hills called Cleeveclouds, the summit of which reaches the height of 1134 feet. In this locality have been traced tumuli and encampments, and other vestiges of ancient military works. The parish church is a commodious cruciform structure. From the centre of the building rises a handsome tower crowned with pinnacles, which was erected in 1700 to replace a spire which then fell. *Cromhall, Abbots*, 20 miles S.S.W. from Gloucester, population 766, is situated in a narrow valley. About a century ago a tesselated pavement was dug up in the neighbourhood. *Eastington*, chiefly on the left bank of the river Frome, 10 miles S.S.W. from Gloucester: population of the tithing, 790. The parish church is a commodious edifice, with a plain embattled tower at the west end. The Baptists and Wesleyan Methodists have chapels, and there are two National schools. Near the village are some woollen-mills. The Stroudwater Canal passes Eastington on the north-east. *Frampton-on-Severn*, 11 miles S.W. by S. from Gloucester, population 994; so called to distinguish it from Frampton near Bristol. The Severn, in high spring tides, sometimes inundates the lower parts of the village. The river Frome rises in the vicinity, and is supposed to have given name to the place, *Frome-Town*, or *Frampton*. The church, erected in 1315, is a spacious structure, with an embattled tower at the west end. The Independents have a place of worship. A fair, called *Frying-Pan Fair*, is held annually on February 3rd. The Gloucester and Berkeley Ship Canal passes between the village and the river Severn. *Iron Acton*, 25 miles S.S.W. from Gloucester, population 1265, so called from the iron found in the neighbourhood, is situated in a valley watered by a river which runs into the Avon at Bristol. Fairs are held here on April 25th and September 13th for horses, cattle, pigs, and cheese. *King's Stanley*, 10 miles S. by W. from Gloucester, population 2095, said to have been so called from one of the Mercian kings having resided here. Part of the village is called the borough. The cloth manufacture employs some of the inhabitants. Besides the parish church there are here a Baptist chapel and National and Infant schools. *Leckhampton*, 8 miles E. by N. from Gloucester, population 2149, is virtually a suburb of Cheltenham, from which it is about 2 miles distant. The parish church is a handsome structure, with a spire rising from the centre of the building. Many of the houses are of long standing. In the parish are some of the highest of the Cotswold Hills, which afford splendid views over Cheltenham and the surrounding country. *Lydney*, or *Lidney*, population 2577, situated in the Forest of Dean, 16½ miles S.W. by W. from Gloucester, near the right bank of the Severn. The church consists of a nave and two aisles, with a neat spire rising from the west end. The Baptists have a place of worship. Coal and iron are extensively wrought here; a mineral railway, with several branches, accommodates the district between Lydney and Monmouth on the river Wye. Lydney has a small market and two annual fairs. Roman remains have been found in the vicinity. *Nailsworth*, 14 miles S. by E. from Gloucester: population included in the parishes of Avening, Horsley, and Minchinhampton, in which the chapelry of Nailsworth is situated. There are here the parochial chapel, and chapels for Independents, Baptists, and Quakers. Woollen cloth is made to a small extent. In the

neighbourhood are some good country residences. *Oldbury-on-Severn*, 25 miles S.W. from Gloucester, population of the chapelry 724, is situated on the left bank of the Severn. Remains of two Roman encampments have been traced in the parish. *Pucklechurch*, near the southern border of the county, 35 miles S.S.W. from Gloucester, population 931, is chiefly remarkable as having been the residence of some of the Saxon kings. Coal is found in the vicinity. There is an Endowed Free school for boys and girls, founded in 1718. *Sherborne*, 24 miles E. by S. from Gloucester, population 674, on the right bank of a feeder of the Windrush, is pleasantly situated, and has several good mansions in its vicinity, including the seat of Lord Sherborne, which stands in a finely-wooded park. *Slimbridge*, 11 miles S.S.W. from Gloucester, population 859, is situated in the vicinity of fertile land, much of which has been reclaimed from the Severn. The Gloucester and Berkeley Ship Canal passes the village on the south-west. Besides the parish church there is here a Baptist chapel. *Stanley St. Leonards*, 11 miles S. from Gloucester: population, 861. The cloth manufacture formerly flourished here, and is still carried on to a small extent. Some remains of a Benedictine monastery are in the neighbourhood: there is a parochial Free school. *Stonehouse*, 9 miles S. by W. from Gloucester: population, 2589. Several woollen-mills are in the vicinity. Cloth-making employs some hand-loom weavers. Besides the parish church there are a chapel for Independents and two National schools. The Stroudwater Canal passes Stonehouse on the south. Three fairs are held annually. *Sudeley*, 18 miles E.N.E. from Gloucester: population, 77. In the church of Sudeley Manor, now in ruins, Queen Katherine Parr was buried. Some remains still exist of a strong castle erected here in the reign of Henry VI. About 3 miles N. from the village is *Toddington*, a spacious mansion, the seat of Lord Sudeley. *Uley*, 15 miles S. from Gloucester: population, 1327. The woollen manufacture which was formerly carried on here has been discontinued. Besides the parish church there are chapels for Baptists and Wesleyan Methodists. *Welford-on-Avon*, on the north-eastern border of the county (which is here separated by the Avon from Warwickshire), 35 miles N.E. from Gloucester: population, 659. The parish church is chiefly in the Norman style, and has at the west end a lofty tower with pinnacles. The Wesleyan Methodists have a chapel, and there is a National school. *Westbury-on-Trym*, 34 miles S.W. by S. from Gloucester, population of the township 1883, is situated near the foot of King's Weston Hill, about 4 miles N.N.W. from Bristol. A monastery formerly existed here. Besides the parish church, a commodious and handsome edifice, with a pinnacled tower at the west end, there are chapels for Baptists and Wesleyan Methodists. Roman remains have been found in the vicinity. A remarkable cavern of large extent, called Pen Park Hole, is in Pen Park estate, about a mile and a half from Westbury.

Ecclesiastical and Legal Jurisdiction.—The county is included within the diocese of Gloucester and Bristol. Gloucestershire is included in the Oxford circuit. Before the Reform Act Gloucestershire was represented by two members in Parliament. It is now formed into two divisions, eastern and western, each of which sends two representatives. The boroughs of Gloucester, Stroud, Cirencester, and Tewkesbury each return two members to Parliament, and the borough of Cheltenham one member. By the Poor-Law Commissioners the county is divided into 17 Poor-Law Unions, namely:—Bristol city, Cheltenham, Chipping Sodbury, Cirencester, Clifton, Dursley, Gloucester, Newent, Northleach, Stow-on-the-Wold, Stroud, Tetbury, Tewkesbury, Thornbury, Westbury-on-Severn, Wheatenhurst, and Winchcombe. These Unions comprise 360 parishes and townships, with an area of 688,711 acres, and a population in 1861 of 418,900. The boundaries of the Unions are less extensive than those of the county. The assizes are held at Gloucester. County courts are held at Cheltenham, Bristol, Chipping Sodbury, Cirencester, Dursley, Gloucester, Malmesbury, Newent, Newnham, Northleach, Stow, Stroud, Tewkesbury, Thornbury, and Winchcombe. Local Boards of Health have been established at Bristol, Cheltenham, Gloucester, and Tewkesbury.

Manufactures.—The manufactures carried on in Gloucestershire are numerous and important. The cloth manufacture is extensively carried on in a large district, of which Stroud may be regarded as the centre. At Frampton-Cotterell, Winterbourn, Bitton, and Westerleigh are considerable hat and felt manufactories, and some persons are also engaged in stocking-making. The stocking manufacture is extensively pursued at Tewkesbury, where frame-making gives employment to some of the inhabitants: some of them are likewise engaged in lace-making. In some parts of the county there are pin manufactories. At Newland and English Bicknor tin-plates are made. Edge-tools are made at Cooley. At Moreton and a few other places cheese-cloths and other articles of linen are made. The large commercial city of Bristol has several manufactories and works in brass, iron, glass, floor-cloths, lace, hats, soap, vinegar, &c.

Civil History and Antiquities.—The inhabitants of the most part of Gloucestershire and of Oxfordshire were at the time of the Roman invasion distinguished by the name of Dobuni. [BRITANNIA.] It appears that the Dobuni were subject to their neighbours the Catteuchlani before they were conquered by the Romans, A.D. 45, when they submitted to Aulus Plautius, the proprætor. On the division of the island into Britannia Prima and Secunda, that part of

Gloucestershire which lies south-east of the Severn was included in Britannia Prima; the other part in Britannia Secunda. After the subsequent division made under Constantine, the county, or the greater part of it, was included in the province named Flavia Cæsariensis. Cirencester was under the Romans the metropolis of the district, while Gloucester and the hills about the Severn were the great military positions. Gloucestershire formed part of the Mercian kingdom under the Saxon dynasty, and Winchcombe and King's-Stanley are mentioned as residences of the Anglo-Saxon monarchs. Under the Saxon kings it was much harassed by the Danes, and during the civil wars between Queen Maud and Stephen it also greatly suffered. The Welsh disturbed the peace of the county with many incursions during the reign of Henry II., and in the Barons' War the inhabitants took the side of the barons. In the contest between the houses of York and Lancaster it likewise became the scene of warfare; the result of the battle of Tewkesbury, fought at that time, is well known. In the civil wars between the parliament and the crown many struggles between the rival forces took place in different parts of this county.

The principal Roman roads in the county are the Fosse-way, Ermine-street, Ikenield-street, and the Via Julia. The Fosse-way enters Gloucestershire at Leamington, proceeds through Moreton-in-the-Marsh to Stow-on-the-Wold; passes on to Northleach, leaving Bourton-on-the-Water about half a mile to the east; then crossing the Calne at Fosse-bridge, it joins Ikenield-street about a mile north-east of Cirencester, at which place it crosses Ermine-street, and after a few miles passes into Wiltshire. Ermine-street enters the county at Latton, near Cricklade; passes through Cirencester, over Birdlip Hill, to Gloucester; and thence proceeds through the western part of the county into Monmouthshire. Ikenield-street crosses Oxfordshire, and entering Gloucestershire at Eastleach proceeds to Cirencester, and then to Aust—the Trajectus Augusta of the Romans. The Via Julia led from Bath across the Severn into Monmouthshire, whence its course was continued through Glamorganshire to Caermarthenshire and St. David's. There are several traces of Roman camps in this county. One of these occurs a short distance from the Fosse-way, near the village of Bourton-on-the-Water; it is quadrangular, inclosing about sixty acres, and on one side a paved aqueduct has been found. Numerous coins and other vestiges of the Romans have been discovered on this spot. Among these was a curious gold signet weighing nearly an ounce, having the representation of a Roman soldier, sitting on a tripod, with a spear in his left hand and the Roman eagle at his feet. In the parish of South Cerney, about three miles south from Cirencester, at Sydney Park, at Sapperton, at Frampton, at Uley, at Stanley, at Chedworth, at Combe-End, at Tetbury, and at various places in the Forest of Dean, numerous traces of the Roman occupation have been found in the shape of silver and brass coins, remains of baths, foundations and walls of buildings, fortifications, encampments, &c. Woodchester, a small village about two miles and a half south-west of Stroud, is much celebrated for the number and beauty of the Roman antiquities found there. A great tessellated pavement was discovered by the digging of graves in the churchyard of this village. It appears to have been a square of 48 feet 10 inches, and in its general design of much beauty. In 1795 and 1796 the ground-plot of a very large Roman building was almost completely ascertained, extending from the churchyard to an adjoining orchard and a field. The remains of two hypocausts were also discovered within a little distance of each other; several fragments of statues, of red glazed pottery and of glass, various pieces of stag's horns, and numerous coins have been found amongst the ruins of the buildings. Very extensive and beautiful remains have also been found at CIRENCESTER.

There are likewise many traces of British, Saxon, and Danish works in this county. At Beachley, a point of land formed by the confluence of the rivers Wye and Severn, extensive earth-works are still remaining, probably of British origin. Offa's dyke terminates here, and may be clearly traced crossing the road at Buttington Tump, and also near Brockweir. At Willersley, near Chipping Campden, is an ancient camp, about sixty acres in area, inclosed by banks in good preservation. Another ancient encampment occurs at Gravesend, about three miles nearly south of Thornbury, and near it an immense tumulus; at a little distance is a small square camp, with a single ditch and vallum. On the ridge of hills called Cleveclouds, about three miles nearly north of Cheltenham, there are also many vestiges of military occupation; the extremity of the ridge is fortified by a deep vallum extending 300 yards in the form of a crescent, and inaccessible on every side but the front. Near Little Sodbury is an ancient camp of a rectangular form, 320 yards long and 200 yards broad. In a field adjoining Gatcomb Park, near Minchinhampton, is an extensive oval tumulus which formerly had large erect stones at each end. On the summit stands a large fragment of rock known for ages by the name of Tingle Stone. In the common field near it are two large stones set upright in the ground. In Pen Park, in the parish of Westbury, there is a remarkable excavation called Pen Park Hole. It is supposed to be an exhausted lead-mine.

There are several fine old family seats in this county, some of which are of very ancient date; and there are also ruins of castles and abbeys. The ruins of Sudeley Castle, situated about a mile south-south-east of Winchcombe, are grand rather than picturesque. It was built in the

reign of Henry VI. by Ralph Lord Boteler, on the site of a more ancient castle. During the civil wars this castle was taken by the Parliamentarians, dismantled, and otherwise destroyed. A small side chapel or aisle is now used as the parish church of Sudeley. Badmington House, the family residence of the dukes of Beaufort, about five miles and a half east by north from Chipping Sodbury, was erected in 1682, and is enriched with many paintings of the old masters. Among other residences which are worthy of notice are Barnsley Park, and Oakley Grove, near Cirencester; Barrington Hall, near North-leach; Blaize Castle, near Bristol; Highham Court, near Gloucester; Miserden Park, near Bisley; and Southam House, near Cheltenham.

Statistics.—According to the 'Census of Religious Worship,' taken in 1851, it appears that there were then in the county 928 places of worship, of which 433 belonged to the Church of England, 214 to five sections of Methodists, 102 to Baptists, 96 to Independents, 14 to Roman Catholics, 12 to Quakers, 11 to the Countess of Huntingdon's Connexion; 9 to Mormons, 8 to 'Brethren,' 7 to Unitarians, and 22 to minor bodies. The total number of sittings provided was 280,746. In 1851 the number of day schools in the county was 1283, of which 459 were public schools with 41,295 scholars, and 794 were private schools with 14,923 scholars. There were 606 Sunday schools in the county, with 59,154 scholars on their books; of these Sunday schools 324 were supported by the Church of England, 117 by five sections of Methodists, 68 by Independents, 58 by Baptists, 8 by the Countess of Huntingdon's Connexion, and 31 by minor bodies. The number of evening schools for adults was 26, with 782 scholars; of literary and scientific institutions, mechanics institutes, &c., there were 16 in the county, with an aggregate membership of 2809, and upwards of 14,000 volumes of books in the libraries attached.

In 1852 the county possessed 15 savings banks at Bristol, Cainscross, Cheltenham, Cirencester, Dursley, Gloucester, Kingswood, Lechlade, Newnham, Stow-on-the-Wold, Tetbury, Tewkesbury, Thornbury, Winchcombe, and Wotton-under-Edge. The total amount owing to depositors on 20th November 1852 was 935,922*l.* 13*s.* 10*d.*

GNOSSUS, or CNOSSUS. [CANDIA.]

GOA, formerly capital of the Portuguese possessions in India, is situated in the province of Bejapore, on an island about 24 miles in circumference, formed by the river Mandova, and stands in about 15° 28' N. lat., 73° 51' E. long. The ancient city, which, being unhealthy, is now deserted except by about 4000 inhabitants, was once a splendid and populous place, containing many magnificent dwellings and a great number of elegant churches and monasteries. The architecture of its public buildings far surpasses anything attempted by Europeans in India. The palace church is built after the model of St. Peter's in Rome, the church of St. Dominic is, or was, ornamented with paintings by Italian masters; the cathedral would be an ornament to any city in Europe; and the Augustine monastery and church are noble structures. In the church of the Jesuits is the fine monument of St. Francis Xavier. Most of these edifices are now fast going to decay. Goa gives title to an archbishop and has a diocesan seminary. The new town, named Panjim, stands 5 miles nearer the sea than the ancient city. It is a handsome, well-built place, with 18,000 to 20,000 inhabitants. With the exception of the viceroy and the principal functionaries, who are natives of Portugal, the inhabitants are mostly a mixed race, the descendants of European and Indian women, and all of them are Roman Catholics.

GOAT ISLAND. [CANADA.]

GOBAIN, ST. [AISNE.]

Gobi, sometimes, but incorrectly, *Cobi*, is a Mongolian term signifying 'desert,' and employed to indicate the immense tract of desert country which extends from the neighbourhood of Yarkand and Khotan (80° E. long.) to the Kingkhan Oöla (120° E. long.). But a portion of this desert extends east of the Kingkhan Oöla to the northern boundary of the Chinese province of Leaotong, more than five degrees farther east. The Gobi lies between 35° and 45° N. lat. Its mean width may be between 350 and 400 miles, and its length perhaps not less than 1800 miles.

That portion of the desert which is partly included in the Chinese province of Kan-si seems to contain the least sterile part of it; and between the towns of Hami and Shat-shew (Sand-town) the desert probably is not much more than 200 miles across. West of the province of Kan-si its surface consists of loose sand, which is sometimes raised by the winds into the air, and moves along the ground like a body of water. This country is drained by the river Yarkand. That portion of the Gobi which extends east of the province of Kan-si is called Ta-Gobi (the Great Gobi), and is somewhat better known than the Western Gobi: its central part is a valley of uneven surface, extending east and west, and from 150 to 250 miles across. Its lowest part is from 2600 to 3000 feet above the sea-level, and is covered with gravel and small stones; whence it has received from the Chinese the name of Shamo (Sea of Sand). The soil is mostly impregnated with different kinds of salt, and the lakes, which are numerous, are brackish. To the north and south of this valley are mountainous tracts of country, which on an average may be from 100 to 150 miles across.

They are partly wooded, and contain in many places excellent pasture-ground.

The climate of the Gobi is extremely cold. The winter lasts more than nine months; and even in July and August snow falls, and it frequently freezes in the night.

(Du Halde, *History of China*.)

GODALMING, Surrey, a market-town and municipal borough in the parish of Godalming, is situated in a valley on the right bank of the river Wey, in 51° 11' N. lat., 0° 37' W. long., distant 4½ miles S. by W. from Guildford, 33 miles S.W. from London by road, and 34½ miles by the London and South-Western railway. The population of the town of Godalming in 1851 was 2218. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor. The living is a vicarage in the archdeaconry of Surrey and diocese of Winchester.

Godalming consists chiefly of a main street, nearly a mile long; with which the suburb of Mead-row and the village of Ferncombe on the north-east are nearly united. The town is paved and lighted. The town-hall is a neat modern building. The parish church, situated between the High-street and the river, consists of a nave and chancel, with aisles, and is 132 feet long; the tower is early Norman, the rest of the church is early English, with later insertions. In the interior is a monumental tablet to the Rev. Owen Mauning, the historian of the county. There is a district church which was opened in 1849. The Independents, Wesleyan Methodists, Quakers, and Unitarians have places of worship. There are National and British schools; a savings bank; and a public reading-room. A county court is held in the town. Godalming was the original seat of the manufacture of fleecy hosiery, some of which is still made here. Paper-making, the hosiery manufacture, and the preparation of wash-leather employ many of the inhabitants. Hoops for butter-tubs are made in large quantities. The Wey is navigable up to Godalming, and there is here a spacious wharf. Some corn-mills, oil-mills, and fulling-mills are near the town. A market for corn is held on Wednesday, and fairs are held on February 13th and July 10th, for cattle, &c.

(Manning and Bray, *Surrey*; Brayley, *Surrey*; *Communication from Godalming*.)

GODAVERY. [HINDUSTAN.]

GODERICH. [CANADA.]

GODMANCHESTER. [HUNTINGDONSHIRE.]

GODSTONE, Surrey, a village and the seat of a Poor-Law Union in the parish of Godstone, is situated on the left side of Broadmead water, a feeder of the Medway, in 51° 15' N. lat., 0° 3' W. long., distant 26 miles E. from Guildford, and 18 miles S. by E. from London by road. Godstone station of the London and South-Eastern railway, which is 2 miles from the village, is 27 miles distant from London. The population of the parish of Godstone in 1851 was 1657. The living is a vicarage in the archdeaconry of Surrey and diocese of Winchester. Godstone Poor-Law Union contains 14 parishes, with an area of 40,211 acres, and a population in 1851 of 8871. The place is chiefly remarkable for its quarries of sandstone of a particularly durable description. The neighbourhood, which is picturesque and healthy, contains several good mansions.

GODSTOW. [OXFORDSHIRE.]

GOES, or TER-GOES. [BEVELAND.]

GOJAM. [ABYSSINIA.]

GOLCONDA. [HINDUSTAN.]

GOLD COAST COLONY. The Gold Coast is a part of Upper Guinea, but its boundary is not exactly determined. Geographers state that Cape Three Points (2° 30' W. long.) constitutes its western boundary; but our navigators extend it farther west to the small river Assinnee (about 5° W. long.), nearly 70 miles E. from Cape Laboo. On the east, the eastern mouth of the river Lagos (4° 20' E. long.) is generally considered as constituting its boundary towards Benin, though the most eastern districts are often distinguished by the name of the Slave Coast. In the interior are the powerful kingdoms of the Ashantees and Dahomey, on which most of the small states along the coast are dependent. According to Governor Hill, in his despatch to the Secretary of State for the Colonies, transmitting the 'Blue Book' for 1851, the territory under British protection is estimated to include about 8000 square miles of country, with a population of about 400,000. In a despatch of April 15th, 1853, however, Governor Hill states that he considers his previous estimate of the population to be exaggerated, and that it is probably not more than 300,000. The revenue of the colony is derived from a government grant of 4000*l.* per annum, a duty of half per cent. ad valorem on all imports, and certain small fees. The income for 1852 amounted to 6739*l.* 19*s.* 6½*d.*, the expenditure to 6402*l.* 5*s.* 8*d.* The value of the imports for the year 1852 amounted to 71,635*l.*; the value of the exports for the same year amounted to 159,250*l.*

Nearly in the centre of the coast is the fortress of Accra. The country west of Accra has an undulating surface, with a small proportion of level ground: the hills are covered with shrubs and timber of small growth. The coast, though rarely high, is rocky and bold. At Accra the low country begins, and extends a considerable way to the eastward. It is a fertile, open, and level plain, which contains extensive savannahs covered with high grass; but in some parts it is thickly wooded with fine trees. The shores here

are flat and sandy. There are no harbours along the coast; and as the surf is very violent, the trading vessels are obliged to anchor four or five miles from the beach. This coast was formerly much resorted to by European and American vessels for slaves. At present it is visited by a few vessels for palm-oil, gold, and ivory: they give in exchange fire-arms, iron and iron-ware, tobacco, rum, Manchester cottons, and some other articles.

The whole of this coast being near 5° N. lat., is considered one of the hottest countries on the globe; yet the mean temperature is only 78°, and in the cold season the thermometer sometimes falls to 73° or 74°. During the Hamattan season, from the middle of December to March, which is the driest and coolest part of the year, the wind blows from north-east. The great rainy season begins in March, and continues to the beginning of June. From June to the end of September is the warm season, which is the most unhealthy, especially the month of August, when the fogs are denser than at other times, and generate fevers. In October and November showers of rain are frequent. Except during the Hamattan season, the winds blow from the west in the middle of the day, from 11 to 3 o'clock, but in the evening from south-west, and in the morning from north-west. The climate is in general unhealthy, especially to Europeans on their arrival. Every person is attacked by a fever, which is called the seasoning. This fever in many instances proved fatal; but it is stated that of late years the administration of quinine has been found exceedingly useful in promoting the recovery of persons attacked by the fever.

Cape Coast Castle is the principal English fortress; it is situated in 5° 5' N. lat., 1° 12' W. long., and covers a considerable area. In it are apartments for the officers, and barracks for the private soldiers. There are some spacious warehouses. It is built on a rock close to the sea. Near it are the small outposts called Fort William and Fort Victoria. The town, which is behind the fortress, is of considerable extent; it has about 10,000 inhabitants, of whom about 20 are Europeans. The streets are regularly arranged, but the houses are of mud, and huddled together. Within Cape Coast Castle is a government-school, which in 1852 was attended by 153 boys.

The other forts are Accra, Annamaboe, and Dixcove. Fort St. James at Accra is occupied by a small garrison. The native population is stated to be about 8000. The fort is situated on the coast in 5° 32' N. lat., 0° 12' W. long., and the station is regarded as among the most healthy on the Gold Coast. In the vicinity of Cape Coast Castle is the Dutch fort of Elmina, and near Accra that of Crevecoeur. About 3 miles E. from Accra is the fort of Christiansborg, and about 30 miles N.E. from Accra is the fort of Fredensborg, both recently purchased from the Danes by the British government. The purchase of the Danish forts on this coast has added considerably to the area of territory under British protection. ANNAMABOE has been noticed separately. The population is said to be about 4500. The exports include the articles usually sent from this coast, namely, palm-oil, gold dust, ivory, and grains, and the imports include British manufactured goods of a useful description, besides arms, gunpowder, spirits, and wines. Annamaboe is an entrepôt of commerce for Ashantee and the interior. Dixcove is situated in 4° 48' N. lat., 1° 57' W. long. The bay affords accommodation for vessels of 100 tons to take in their cargoes. The native population inhabiting the town is about 1200.

The introduction of civilising influences to the native population of the Gold Coast, is chiefly owing to the labours of the Wesleyan missionaries. From the despatches of successive governors of the colony, addressed to the Secretary of State, it would appear that considerable progress has been made in communicating to the natives the benefits of an educational and industrial training. In the year 1852 the Wesleyan chapels were attended by upwards of 6000 persons, and about 1200 children were in attendance at the schools of the mission. Mr. Freeman, the missionary superintendent, established in 1851 an industrial school and garden at Beulah, about 8 miles from Cape Coast Castle. In February 1852 there were 23 native youths under training at this establishment. On December 31st 1852 Mr. Freeman, writing to Governor Hill, says, "We have now about 750 vines, and 5000 coffee plants. The lads in the establishment work willingly, and behave well." The Wesleyan Missionary Society expends above 5000*l.* a year on the Gold Coast Mission. Among other evidences of advancing civilisation may be noticed the erection by the natives of many neat cottages for the residence of their families, with some pretension to the conveniences and comforts of European dwellings, and the construction of several good roads to facilitate communication between the towns and villages in the interior. The roads have been constructed voluntarily by the natives under the direction of the missionaries. These encouraging features have been more particularly noticeable in the neighbourhood of Abakrampa, the capital, and Domonasi, the second town of the Abrah tribe and district, in the Cape Coast territory. In some of the principal towns of the interior chapels for Christian worship have been built by the chiefs at their own expense.

Governor Hill has endeavoured to enlist the sympathies and co-operation of the native chiefs, by forming them into a kind of legislative body, including the council, with the executive at its head. Each chief has agreed to pay a poll-tax of 1*s.* yearly for each person

belonging to his tribe: from the fund thus provided each chief is to receive a stipend to support the dignity of his position, and from it is to be defrayed the cost of such general measures of improvement as the legislative body may agree to undertake. Besides the school at Cape Coast Castle, already noticed, the Governor has recently established one in the interior, which in April 1853 had 24 scholars, and he proposes to establish schools at such places within the range of his government as have not been already supplied by the Wesleyan body. He has also employed the natives composing the Gold Coast corps, numbering 333 non-commissioned officers, rank and file, in executing works of public utility, giving them the opportunity of attending the regimental school when they can be spared from other service. In this way many members of the corps have made considerable progress in reading, writing, and a knowledge of the mechanical arts. By their labours 40 miles of a military road has been opened through the Assin country, directly into the interior towards the capital of Ashantee; and a fine carriage-road to Annamaboe was in process of construction in April 1853. On this road a handsome bridge had been constructed, at the entrance of the town, the granite for which had been first quarried by the soldiers from a deposit opened by them in the immediate neighbourhood.

(Robertson, *Notes on Africa*; Hutton, *Voyage to Africa*; Adams, *Remarks on the Countries extending from Cape Palmas to the River Congo*; Monrad, *Gemälde der Küste von Guinea*; *Parliamentary Papers*.)

GOLDBERG. [LEGNITZ.]

GOMBROON, called also *Bunder Abbas*, a sea-port town, situated at the entrance of the Gulf of Persia, opposite the far-famed island of Ormuz. The town was once flourishing, and carried on such an extensive trade that the English, French, and Dutch found it advantageous to maintain large factories here; but owing to some dispute among the natives, the factories were destroyed, and the place abandoned by Europeans, after which its trade was removed to Abushehr, or Bushira. Before that event the town is said to have contained 30,000 inhabitants; now the population is reduced to 3000 or 4000 Arabs. It is surrounded by a mud-wall, about three-quarters of a mile in circumference. The houses are flat-roofed, but rather commodiously built; the streets, as in most oriental towns, are narrow and dirty. The best building in the town is the palace of the sheikh, which was formerly the Dutch factory, and has been converted into the residence of the Arabian chief. There is a good anchorage off the town, where a vessel may be perfectly sheltered. The sheikh of Gombroon is dependent on the Sultan of Muscat, in Arabia.

GOMERA. [CANARIES.]

GONDAR, a city of Abyssinia, and the residence of the Negus, or nominal emperor of that country, is situated on hilly ground at the north-eastern extremity of the plain of Dembea, 30 miles N.E. from the lake of Dembea, or Zana, at an elevation of 7420 feet above the level of the sea. It is irregularly built, the houses or huts are all of one story high and thatched. The emperor's palace, a square stone building flanked with towers, is the only building of any pretensions in the town. There are no shops or bazaars, goods and merchandise of whatever sort being exposed for sale on mats in the open market-place. The town has greatly declined from its condition before the emperors had lost their authority; it then contained from 50 to 100 churches (but Abyssinian churches are not imposing structures), and above 50,000 inhabitants. The town has some manufactures, which comprise fire-arms, sword-blades, knives, scissors, razors, shields, coarse pottery, &c. There is some trade by means of kafilas through Gondar between the southern parts of Abyssinia and Massowa: the chief articles of this transit trade are slaves, musk, wax, elephants' tusks, coffee, honey, some gold, and a kind of spice called khéif. Most of the inhabitants of Gondar (with the exception of the priests and the slaves) are engaged in this trade. There are caravan roads from Gondar to Baso on the Nile. Gondar is also the capital of the kingdom of Amhara, one of the states into which Abyssinia is divided. [ABYSSINIA.] A great quantity of rain falls at Gondar, but the temperature is warm; the mean temperature, according to Rüppell, of seven months from October to April inclusive, being 69°. The lowest temperature observed during the interval was 53°09", which was one morning in December. Gondar is situated in about 12° 36' N. lat., 37° 30' E. long.

GOOD HOPE, CAPE OF. [CAPE OF GOOD HOPE.]

GOODWIN SANDS. [KENT.]

GOOLE, West Riding of Yorkshire, a market-town, river-port, and the seat of a Poor-Law Union, in the parish of Snaithe, is situated on the right bank of the river Ouse at its junction with the river Dutch, in 53° 42' N. lat., 0° 50' W. long., distant 30 miles E.S.E. from York, 180 miles N.N.W. from London by road, and 196 miles by the Great Northern and Goole Pontefract and Wakefield railways. The population of the town in 1851 was 4722. The livings are perpetual curacies in the archdeaconry and diocese of York. Goole Poor-Law Union contains 17 parishes and townships, with an area of 36,914 acres, and a population in 1851 of 13,545.

Goole has only recently risen into importance. The opening of the canal from Goole to Ferrybridge, the establishment of Goole as a bonding port in 1829, the subsequent erection of docks, and the completion of the Goole, Pontefract, and Wakefield railway have greatly promoted the prosperity of the town. The ship-dock is 600 feet long

and 20 feet wide, with 18 feet depth of water, and will contain 54 square-rigged ships; at the quays there is sufficient accommodation for 17 ships. The barge dock, or dock for country vessels, is 900 feet long by 150 feet wide, and will contain 200 vessels averaging 50 or 60 tons each. There is a commodious dock for large steam-vessels, a dock called the railway dock, a dry dock of large dimensions, and a patent slip for repairing vessels. The basin or entrance harbour is 250 feet long by 200 feet wide, with 9 feet depth of water. The custom-house is a neat building. There are extensive warehouses for the bonding of grain and merchandise of every description. For the reception of timber under bond there are ponds capable of receiving upwards of 300 loads. Coal is largely exported coastwise, and a good deal is sent to London. The number and tonnage of vessels registered as belonging to the port on December 31st 1853 were as follows:—Sailing-vessels, under 50 tons, 116, tonnage 8824; above 50 tons, 396, tonnage 25,041; steam-vessels, under 50 tons, 2, tonnage 27; above 50 tons, 7, tonnage 680. During the year 1853 there entered and cleared at the port in the coasting trade, inwards, 1852 sailing-vessels, tonnage 106,172; outwards, 1888 sailing-vessels, tonnage 100,658, and 51 steam-vessels, tonnage 7319. In the colonial and foreign trade there entered 83 British vessels, tonnage 7658, and 156 foreign vessels, tonnage 15,176; with 72 British steam-vessels, tonnage 12,743, and 43 foreign steam-vessels, tonnage 7568; and there cleared 30 British sailing-vessels, tonnage 2386, and 75 foreign, tonnage 7542; with 72 British steam-vessels, tonnage 12,675, and 42 foreign, tonnage 7392.

The gross amount of customs duties received at the port in 1851 was 39,812*l*. Ship- and boat-building, sail-making, iron-founding, and agricultural machine-making employ many of the inhabitants. Several corn-mills, some of them worked by steam, are in the neighbourhood. There are in Goola a chapel of ease; a handsome church with a lofty tower, erected a few years ago at a cost of 8000*l*., of which the Aire and Calder Navigation Company contributed 4500*l*.; chapels for Independents and Wesleyan Methodists; National and Infant schools; a Wesleyan day school; a literary and scientific institution; a savings bank, and several charitable societies. A weekly market is held on Wednesday. The town is lighted with gas. A county court is held in Goola.

GOORIA. [GEORGIA.]

GORAM ISLANDS. [CERAM.]

GORBALS. [GLASGOW.]

GOREE is a small island near the west coast of Africa, to the south of Cape Verd. It is separated from the continent by the Strait of Dakar, which is about 3000 yards across. The island, which is about 3 miles round and has a bold coast on all sides except the north, consists of volcanic rocks, partly covered with sand, with which has been mixed vegetable mould, brought from the continent. At the north-east extremity of the island there is a roadstead which affords good shelter for shipping for eight months in the year. Goree belongs to the French, who have erected some fortifications and a town upon it. The town of Goree is an entrepôt for the gum, ivory, gold dust, oil, and other products of the neighbouring parts of the continent of Africa. The island is deficient in wood and water, although part of it is swampy. The total population is about 5000, all liberated or free Africans, except about a score of Frenchmen who fill official or mercantile situations on the island.

GOREE. [GEORGIA, Asiatic.]

GOREY, county of Wexford, Ireland, a market-town and the seat of a Poor-Law Union in the parish and barony of Gorey, is situated about 28 miles N. by E. from Wexford, and 60 miles S. from Dublin. The population of the town in 1851 was 2973, besides 1420 inmates of the Union workhouse. Gorey Poor-Law Union comprises 25 electoral divisions, with an area of 129,704 acres, and a population in 1851 of 31,281.

The town of Gorey was incorporated by charter of James I. when it was called Newborough, but this name has not been in general use. The town consists of one street nearly a mile long, a shorter street crossing it about the middle, and clusters of houses around the point of intersection. There are a court-house and a market-place. Besides the Episcopal church, there are a Roman Catholic chapel, with a nunnery attached, a National school, and a savings bank. Near the town is a fever hospital. The market on Saturday for agricultural produce and poultry is well attended; seven fairs are held in the course of the year. Several fine mansions are in the vicinity.

GORKUM. [HOLLAND.]

GÖRLITZ. [LIEGNITZ.]

GORT, county of Galway, Ireland, a market-town and the seat of a Poor-Law Union in the parishes of Beagh, Kiltartan, and Kilmacduagh, is situated in 53° 4' N. lat., 8° 50' W. long., distant about 18 miles S.E. by S. from Galway, and 125 miles W. by S. from Dublin. The population of the town in 1851 was 2405, besides 2637 in the Union workhouse. Gort Poor-Law Union comprises 20 electoral divisions, with an area of 107,919 acres, and a population in 1851 of 26,287.

The town of Gort is neat and tolerably regular. It is situated in a plain, which is nearly surrounded by a mountainous country, abounding with wood and water. Being remote from other market-towns it has a considerable retail trade. The principal public buildings are the parish church, a Roman Catholic chapel, a district bridewell,

and an infantry barrack. Three annual fairs are held. A stream from Loughcooter runs through the town of Gort to the Bay of Galway. In its course from the lough, both before and after reaching Gort, the stream several times disappears, and finds its way for considerable distances by subterraneous channels. Before reaching Gort it takes the name of the Blackwater.

GORTIN, county of Tyrone, Ireland, a village and the seat of a Poor-Law Union in the parish of Lower Badony, is situated on the Owenreagh rivulet in 54° 43' N. lat., 7° 18' W. long., distant 8 miles N.N.E. from Omagh, and 118 miles N.N.W. from Dublin. The population of the village in 1851 was 372, besides 241 in the Union workhouse. Gortin Poor-Law Union comprises 18 electoral divisions, with an area of 111,319 acres, and a population in 1851 of 17,248. Gortin is situated in the midst of secluded and very picturesque mountain scenery. Besides the parish church, there are here a dispensary, a distillery, and the Union workhouse.

GÖRTZ (*Goritz, Gorizia*), a large circle in the Küstenland, or Illyrian Littoral, in Austria, was comprised in the former government of Trieste. Its area is 1124 square miles. The population, according to the census of the empire in 1850-51, was 192,511. The circle is traversed by chains of the Alps in the north, which are of calcareous formation and well wooded, but a great part of the surface is level. It is watered by the Isonzo and Idriza; and produces wine, silk, flax, hemp, fruit, timber, and a small quantity of corn.

GÖRTZ, the chief town of the circle, is situated on the left bank of the Isonzo, about 25 miles N.N.W. from Trieste, and contains about 10,000 inhabitants. The older part of the town is built on a hill, part of which is occupied by an old castle, once the residence of the counts of Görtz, now a prison; this part is surrounded by walls. The lower part of the town is modern and well built. Görtz is the seat of a bishop, and has four churches besides the cathedral, an episcopal palace, and seminary; a college, town-hall, a theatre, a philosophical academy, Piarist college, and several other schools, including one for Jews. The barrack in the great square at the foot of the castle rock was originally a Jesuits' college. The Attems family possesses the well-known 'Roman Stone,' which affords evidence that the ancient Norica stood in the vicinity of this town. Görtz has large silk factories, dye-works, sugar-refineries, tan-yards, bleach-grounds for wax, &c. Rosoglio is also one of its industrial products. There is a brisk general trade. Charles X., ex-king of France died in 1836 in the castle of Grafenburg, and is buried in the chapel of the convent of Castagnovizza above the town. There is a good road from Görtz to Trieste.

GOSFORTH. [CUMBERLAND.]

GOSPORT, Hampshire, a market-town, sea-port, and fortified town in the parish of Alverstoke, is situated on the western side of Portsmouth harbour, near its mouth, in 50° 48' N. lat., 1° 7' W. long., distant 14 miles S.E. from Southampton, 77 miles S.W. from London by road, and 89 miles by the London and South-Western railway. The population of the town of Gosport in 1851 was 7414. The livings are perpetual curacies in the archdeaconry and diocese of Winchester. The town is governed by trustees, under an old Act of Parliament, vacancies, when they occur, being filled up from the general body of the inhabitants by vote of the surviving trustees.

Gosport in the reign of Henry VIII. was a mere village, inhabited by fishermen. It is now a place of considerable importance. The town is well lighted with gas. Gosport has two churches, Holy Trinity church, erected about 1680, a neat and spacious edifice, in the south part of the town, and St. Matthew's church, erected in 1846. The Independents, Wesleyan Methodists, and Roman Catholics have places of worship; there are National and British schools, two Young Men's societies for religious and mental improvement, a savings bank, an almshouse, and several charitable associations. A floating bridge affords constant communication with Portsmouth, and a floating pier enables passengers to embark on the Isle of Wight packets at all times of the tide. The coasting trade is considerable. There are several distilleries, and an extensive iron-foundry where chain-cables and anchors are made. Saturday is the principal market-day; secondary markets are held on Tuesday and Thursday. Fairs are held on May 4th and October 10th.

About fifty years since Gosport was fortified by a line of bastions extending from Weovil to Alverstoke. Within the lines is the Royal Clarence Yard at Weovil, containing the brewery, the victualling department, the establishment for baking biscuit by machinery, and storehouses for provisions for the Royal Navy. Near the extremity of the point of land which forms the west side of Portsmouth harbour is situated the Royal Hospital of Haslar, erected between 1750 and 1762. At the northern extremity of the point of land on which Haslar Hospital is built, an extremely strong fort and barracks have been lately constructed for the protection of the entrance of Portsmouth harbour. A deep creek, which intervenes between Haslar and Gosport, is spanned by a bridge. Bingham town is a populous suburb of Gosport, containing many genteel residences; and Anglesea, about 2 miles from Gosport, on Stoke's Bay, is a fashionable watering-place. (*Parliamentary Papers*; Warner, *Hampshire*; *Land We Live In*, vol. i.; *Communication from Gosport*.)

GOSSELIES. [HAINAULT.]

GOTHA, the capital of the duchy of Saxe-Gotha, which upon the

extinction of the direct line in 1825 came to the Duke of Saxe-Coburg. Gotha is situated at an elevation of about 750 feet above the sea, near the Leine, a feeder of the Nesse, in 50° 57' N. lat., 10° 42' E. long., and has about 15,000 inhabitants. It is a station on the Thuringian railway, by which it is 8 miles W. from Erfurt and E. from Eisenach. It is a handsome town, and since the ramparts have been taken down and laid out in public walks, presents an open cheerful appearance. Its form is a long irregular quadrilateral; it has 4 gate-entrances, 5 public squares, and 16 principal streets. The streets are well paved and lighted.

The principal public buildings are the ducal palace of Friedenstein, which stands on the summit of a high hill, and is surrounded by a terrace, gardens, and pleasure-grounds. It contains a library of 150,000 volumes and 5000 manuscripts, among which are 14 folio volumes of St. Bernard's Correspondence, and 500 Arabic manuscripts. In the palace are also one of the most celebrated collections of coins in Europe, comprising 10,000 ancient and 52,000 modern coins; a library of works on Numismatics of 6000 volumes; an Oriental museum; a gallery of above 1500 paintings; collections of antiquities, the fine arts, natural history, &c. The other buildings of note are—the arsenal, the old and new town-hall, house of assembly of the States, and seven churches (the principal of which are St. Margaret's, with the ducal vaults, and the church of the Orphan Asylum), all of which belong to the Lutherans. The Gymnasium, founded in 1524, is one of the best in Germany. Gotha has a training school for teachers, various other schools, and several charitable institutions. The 'Almanac de Gotha' has been published here annually since 1774.

The manufactures comprise muslins and cottons, porcelain, paper, cloth, linen, thread, yarn, camlets, tobacco, beer, sausages, musical and surgical instruments, toys, pewter and japan goods, furniture, gunpowder, saddlery, &c. The large geographical establishment of Justus Perthes employs several hundred designers, engravers, printers, and colourers of maps, which have a vast circulation. Near the town is the observatory of Seeberg.

GÖTALAND. [SWEDEN.]

GOTHARD, ST. [ALPS.]

GOTHENBURG (Gottenburg, in Swedish Göteborg), a town in Sweden, is situated on the river Göta, about 5 miles from the Cattagat, and has about 30,000 inhabitants. Opposite the town the river widens to nearly one mile and forms an excellent harbour. The town, which is built on the southern banks of the harbour, is traversed by numerous canals, which are supplied with water by a small river called the Ländal; these canals are crossed by 21 bridges. The houses are mostly built of stone or bricks well stuccoed. The streets are regular, and intersect one another at right angles; they are well-paved, but without foot-pavements. The canals running through them being planted with trees, give to Gothenburg a great similarity to many of the towns in the Netherlands. The town has few interesting buildings, and is far from being picturesque, but from the rocky hills in the neighbourhood many lovely views may be obtained. Among the most important structures in the town are the new exchange, the cathedral, the Swedish church, the arsenal, the town-hall, the theatre, &c. The town is in a very thriving state. Its commerce is extensive. Its exports consist chiefly of iron and steel, deals, tar, pitch, copper, bark, &c. The imports comprise colonial produce, salt, wine, rice, fish, &c. Many vessels are built here. The manufactures are numerous, and the town is the most important trading place after Stockholm in all Sweden. Among its industrial products are plain and printed cottons, woollen-cloth, sail-cloth, tobacco, refined sugar, snuff, glass, paper, porter, leather, &c. Gothenburg is the seat of the governor of Gotheborg-Län, and of a bishop. It has a college and public library, public baths, a society of arts, two free schools, two orphan asylums, a chamber of commerce, and several other useful institutions. The harbour is defended by three forts, and has about 17 feet water. Steamers ply between the Göta River and the line of the Göta Canal to Stockholm. [SWEDEN.] In 1849 there arrived from foreign ports 1018 vessels; the departures for foreign ports numbered 1011: this is exclusive of steamers, of which the number that entered and cleared out was 83. In the coasting trade there were 718 arrivals and 1462 departures. The population of the town at the commencement of this century was only about 14,000.

GOTHLAND (Gottland), an island in the Baltic, extends between 56° 55' and 58° N. lat., 18° 10' and 19° 10' E. long. Its greatest length from north to south is about 80 miles, from east to west about 33 miles. The southern part of the island is a peninsula about 10 miles in length, connected with the northern part by a narrow isthmus a little more than a mile across. Gothland, with the adjacent islets of Färö, Gottska Sandö, and a few others, forms the Län of Wisby, the total area of which is 1211 square miles, with a population of 43,268 in 1845.

The island of Gothland is of limestone formation; the surface rises from 80 to 150 feet above the sea; the coasts are indented by numerous bays.

The surface of this island is hilly, and mostly covered with wood: in a few places swamps occur, but they are not of great extent. The coasts are generally low. The climate is comparatively very temperate; the walnut, mulberry, and grape ripen in the open air

in favourable situations. The principal articles of exportation are timber, wood, sandstone, marble, and lime. Many districts of the island are fertile and well cultivated; rye, barley, and hops are grown. Its horses and black cattle are of small size, but its sheep have lately been much improved. The roads throughout the island are good, and the farmhouses well built. Game is abundant. There are ruins of above 100 churches on the island, dating from the 11th and 12th centuries. The island of Gothland is separated from Färö by Färö-Sund, which is hardly two miles wide.

Wisby, the capital, and the seat of a bishop, is situated on the western coast, and contains about 4000 inhabitants. It is an ancient place; but the date of its foundation is unknown. In the 10th and 11th centuries it was a great trading city; and to judge by the Anglo-Saxon, Arabic, Persian, and other coins found here, it must at one time have been a famous centre of commerce. The town never recovered its prosperity after its capture and plunder by Valdemar III. of Denmark in 1361. In the middle ages it was the centre of an extensive trade with all the countries round the Baltic Sea, and the commercial usages established by its merchants (known under the name of the Ordinances of Wisby) were long in force in all the northern countries. The town during this period was very considerable, and there still exist ruins of large buildings in its neighbourhood. There are no less than 18 ruined churches; the feudal walls and towers of the town still exist entire as they stood in the 13th century. St. Mary's church, the only one now kept up for the use of the inhabitants, is a gothic structure dating from A.D. 1190. There are the ruins of a castle also, and of several convents. These ruins, and many of the houses of the town, which were constructed by the wealthy merchants of Wisby in times long gone by, are highly interesting to the lover of gothic architecture. Steamers ply regularly between Wisby and Westervik on the coast of Sweden, and also to Stockholm. The commerce of the present town is confined to the produce of its forests and quarries, and to the exportation of rye, but it is rather active and thriving. It has a good grammar-school.

GÖTTINGEN, a town in Hanover, is situated in a broad and fertile valley interspersed with gentle eminences, at the foot of the Hainberg, a naked mountain, in 51° 31' N. lat., 9° 56' E. lon., at a distance of 60 miles S. from Hanover, to which a railway in part completed is being made through Göttingen to Cassel. It is built on both sides of the New Leine, an artificial arm of the Leine; at an elevation of about 470 feet above the level of the sea, and has about 11,000 inhabitants. The name of Göttingen first occurs in a record of the times of the emperor Otho I. About the year 1360, it became a member of the Hanseatic league; but it owes its modern celebrity to the university instituted by George II., king of England and elector of Hanover, in the year 1734. The town is surrounded by ramparts, which have been laid out in agreeable plantations and avenues of lime-trees. It is divided into the Old Town, New Town, and the quarter of Masch; has four gates, and some inconsiderable suburbs. It is in general well-built, and the streets are mostly broad, straight, and paved with basalt. There are three squares or open spaces, the chief of which are the market-place with a fountain and basin, and a handsome esplanade. There are three Lutheran churches, a Calvinist church, and a Roman Catholic chapel. The other edifices of note are the guildhall, hospital, observatory, and the university buildings.

The university, entitled the 'Georgia Augusta,' was opened in 1737. The number of students between 1822 and 1826 averaged 1481 annually; between 1831 and 1837 the average fell to 868, and the dismissal of some of its ablest professors by the King of Hanover for political reasons, reduced the number still lower. In 1845 the students numbered only 633; in 1850 the number rose to 715. It has four faculties: protestant theology, law, medicine, and philosophy. The library contains upwards of 400,000 volumes, and 3800 manuscripts. Connected with the university are a museum containing valuable collections of paintings, models, instruments, coins, &c.; an observatory, lying-in-hospital, chemical laboratory, and a botanic garden. A new hall was finished in 1837. Göttingen has also a royal society of sciences, a protestant gymnasium attended by above 200 pupils, several printing establishments, a female high-school, a house of correction, &c. The university is the main support of the town: but it has also considerable manufactures of woollens, leather, soap, and candles, musical and scientific instruments, stockings, &c. The linen trade is also extensive. Tobacco, sausages, books, and tobacco-pipes are important articles of trade. Under the French empire Göttingen was the capital of the department of the Leine.

GOTTORP. [SCHLESWIG.]

GOUDA. [HOLLAND.]

GOVAN. [LANARKSHIRE.]

GOYAZ. [BRAZIL.]

GOZZO ISLANDS. [MALTA.]

GRAAF or GRAAFF REYNET, the chief town of the district of Graaf Reynet, Cape of Good Hope, is situated on the Sunday River, in 32° 5' S. lat., 24° 57' E. long., distant about 140 miles N.N.W. from Port Elizabeth, and 120 miles N.W. from Graham's Town. The town stands at the foot of the Great Sneeuw Bergen, or Snow Mountain. In the month of February 1854 considerable excitement was caused in the town and district of Graaf Reynet by the report that gold had

been discovered near the town of Smithfield, on the Caledon River, about 160 miles N.E. by N. from Graaf Reynet town. The quality of the gold found was pronounced to be fine, and the quantity promised to be abundant. The gold was found imbedded in quartz. One nugget picked up within the first week weighed 83 grains: the pursuit however has not been very vigorously followed out, probably because the gold district itself is within what was called the Sovereignty, and which no longer forms a part of the colony of the Cape of Good Hope.

GRACIOSA. [AZORES; CANARIES.]

GRADISKA. [BOSNIA.]

GRAHAM'S TOWN. [ALBANY; CAPE OF GOOD HOPE.]

GRAMMONT. [FLANDERS, EAST.]

GRAMPIAN MOUNTAINS. [GREAT BRITAIN.]

GRAMPOUND. [CORNWALL.]

GRAN, a town in Hungary, is situated on a hill on the right bank of the Danube, nearly opposite the mouth of the Gran, in 47° 47' N. lat., 18° 45' E. long., and has about 12,000 inhabitants. It is a royal free town, and gives title to an archbishop, who is primate of Hungary. It has a strong castle on a rocky island in the Danube, which has undergone several sieges, and at the foot of which are warm baths. Among other public buildings are the cathedral and chapter-house, the house of assembly and town-hall, a gymnasium conducted by Benedictines, which has about 350 scholars, three Roman Catholic churches, a Greek church, an abbey, an hospital, and a Franciscan monastery. The cathedral was commenced in 1821, and though unfinished is, it is said, the most magnificent modern building in Hungary: it is built in the Italian style, on a height the site of a former fortress, and forms a conspicuous object from the Danube. Gran has seven suburbs, of which the 'Water-town,' at the foot of the castle, which is connected with the town by a flying bridge, belongs to the archbishop. The weaving and dyeing of woollen cloths is the chief employment of the inhabitants. Gran is supposed by many to have been founded by the Romans. It is the birthplace of St. Stephen, king and patron of Hungary, and was long the residence of Hungarian kings. The Turks held it for 70 years preceding 1683, when they were finally driven out of it by John Sobieski, king of Poland.

GRAN CANARIA. [CANARIES.]

GRANADA, an ancient kingdom and province of Spain, included in the territorial division of Andalucia, is bounded N. by the province of Jaen, N. and N.E. by that of Murcia, N.E. and E. by those of Sevilla and Cordova, and S. and E. by the Mediterranean Sea. It is situated between 36° 16' and 38° 4' N. lat., 1° 38' and 5° 30' W. long. The greatest length east to west is about 200 miles; the greatest width north to south is about 140 miles; but the greater part is much narrower. The area is 8622 square miles: the population in 1849 was 1,157,584. It is now divided into three modern provinces, as follows:—

Provinces.	Square Miles.	Population in 1849.
Granada	8622	427,250
Almeria		292,334
Malaga		438,000
Total	8622	1,157,584

A general description of the provinces comprised in Andalucia is given under that head. [ANDALUCIA.] The province of Granada is almost entirely mountainous. It includes the lofty mountains of the Sierra Nevada, the Sierra de Ronda, and other ranges connected with them. The Montes de Granada divide it from the province of Jaen. The Sierra de Sagra and Sierra de Aguaderas separate it from the province of Murcia. The only plain of great extent is the beautiful Vega of Granada. The Rio Jenil (Xenil) passes by the city of Granada, below which it receives the Darro, and then flows north-westward to the Guadalquivir. Most of the other rivers flow southward to the Mediterranean Sea. The largest of these are the Rio de Almeria, the Rio Adra, the Rio Guadalfeo, the Rio de Velez, and the Rio Guadaljorce.

Towns.—The city of Granada is the capital of the province. [GRANADA.] Adra, 65 miles S.E. from Granada, stands at the mouth of the Rio Adra, where there is a small port. The inhabitants of the town are chiefly employed in the neighbouring lead and silver mines: population, 7400. Alhama, 30 miles S.S.W. from Granada, is situated on the northern slope of the Sierra Tejada, at a great elevation above the level of the sea. Alhama (the Bath) is frequented for its warm sulphureous baths, which are about a mile from the town. The principal bath is in a Moorish edifice, which remains unaltered. It is from 30 to 40 feet long, and the greater part of it is filled by the water which issues from the main spring. The temperature at the source is 104° Fahrenheit. Another large building has been erected by the present proprietor to accommodate all classes of visitors, and the whole seems to be very well conducted. The old town stands on a sort of peninsula nearly surrounded by a deep ravine in which the river flows, and is only connected with the new town by a narrow neck of rocky land, which is now a public walk, and across which

water is conducted by an aqueduct. In the Moorish times it formed a strong position. The modern town is tolerably well built. The old town is becoming ruinous: population of the two towns, 6280. Almeria, 83 miles E.S.E. from Granada, is the capital of the modern province of Almeria. It has a convenient harbour, at the mouth of the Rio de Almeria, in a well-sheltered bay. The town stands at the bottom of the bay, at the foot of an eminence on which is a fortified castle. The bay is extensive, and the harbour was formerly of importance. The houses of the town are all flat-roofed. Cotton and sugar are cultivated in the plain, which extends some distance eastward towards the Cabo de Gata: the population in 1845 was 17,800. Baza, 60 miles E.N.E. from Granada, occupies a hollow in the midst of its fertile hoyas, or basins. In summer the heat is intense and oppressive in the highest degree. Baza is a bishop's see, and has a cathedral: the population, including military, is 11,485. Berja, 63 miles E.S.E. from Granada, is a busy, flourishing, and increasing town, at the foot of the Sierra de Gador, and in the centre of the lead-mines, which are very numerous in the vicinity. Smelting and flattening machinery have been erected on the coast, whence asses and mules carry the ore to be exported from the port of Adra, which is 7 miles distant from Berja: population, 9840. Guadix, 32 miles E. by N. from Granada, stands on the western bank of the Guadiana Menor. Like Baza, it lies in a hollow, and the first objects beheld on approaching it are the gray roofs of the houses in the midst of fruit-trees and foliage. It is inclosed by old walls, and surrounded by mulberry plantations, and contains a cathedral and an old castle: population, 1051. Huescar, 75 miles N.E. from Granada, contains a population of about 6000, who manufacture some woollen cloths, and weave woollen and linen fabrics. Loja, 30 miles W.S.W. from Granada, occupies the mouth of a gorge in which the Jenil traverses a narrow valley between high and rugged hills. The greater part of the town is built on the western slopes, the houses rising above each other so as often to have the floor of one nearly on a level with the roof of another. A suburb occupies the slopes of the opposite sierra, and communicates with the town by a bridge. The town contains three churches and two hospitals, and there are manufactures of coarse woollens and paper: population, 15,000. Malaga, 55 miles S.W. from Granada, is the capital of the province of Malaga. The city is encircled by an amphitheatre of hills, and is built at the bottom of a wide bay with deep water and sheltering promontories, while inland it is surrounded by a narrow but fruitful plain backed by vine-clad hills. The harbour is formed by a mole 700 feet long (on which is a lighthouse); it is large enough for about 450 merchant-ships, and may be entered with any wind. The town is spread irregularly along the margin of the bay, and consists mostly of narrow, ill-paved, and dirty streets. The cathedral occupies an elevation in the centre. It is unfinished, of a mixed Spanish and Italian architecture, and with a spire 302 feet high. The city contains also a bishop's palace, four parish churches, five hospitals, an opera-house, theatre, bull-arena, custom-house, and convict-depôt. The old Moorish dock-yard is used as a store-house. On the eastern side of the bay a rocky height is covered with remains of fortifications, the summit being crowned by the Gibralfaro, a fortified castle, formerly surmounted by a pharos, or lighthouse. Malaga has an active trade in raisins, grapes, wines, olive-oil, figs, almonds, oranges, and lemons. The imports are mostly salt-fish, iron-manufactures, and colonial produce. The chief manufactures are cloth, ropes, leather, paper, and soap. There are two iron-foundries actively wrought by English capitalists, and there is a royal cigar-manufactory. The Alameda, or public walk, is a noble promenade adorned with trees and fountains, and bordered by a long range of stately dwellings: the population of the city in 1845 was 65,865. Malaga was the Malaca of the Romans, who had a flourishing colony here. Marbella, 32 miles S.W. from Malaga, stands on the Mediterranean Sea, and has a small port fit for fishing purposes. Sugar-refining and tanning are the other chief occupations of the population, who amount to about 6000. Motril, 48 miles S.S.E. from Granada, is situated in a fertile plain near the coast of the Mediterranean Sea, but is not a sea-port. Sugar, cotton, silk, and fruits are cultivated in the vicinity: population, 12,700. Ronda, 80 miles W.S.W. from Granada, and 42 miles W.N.W. from Malaga, stands at a great elevation, and is the capital of the Serrania de Ronda. It consists of two towns, separated from each other by a deep chasm, the bottom of which is the bed of the Guadiaro. An ancient bridge of great strength spans the chasm by a single arch of 110 feet. The old town, encircled by Moorish walls, stands on the top of a precipitous rock, and contains a ruined Moorish palace. The modern town is regularly laid out. The principal streets are long and wide, and the houses are whitewashed, and look very clean. They are all furnished with balconies, which are decked with flowers. The Plaza de Toros (bull-arena) is one of the largest in Spain, and there is also a theatre. There are several churches. Ronda is a very gay place, and is much resorted to by contrabandistas for smuggling purposes. There is a great annual fair held here, chiefly for the purpose of buying and selling horses. It is attended by English merchants from Gibraltar. There are manufactures of woollens, leather, flannel, silk-stuffs, and numerous water-mills driven by the stream of the Guadiaro: the population in 1845 was 15,948. Ujijar, 58 miles W.N.W. from Granada, stands on the

north bank of the Rio Adra. It is an old Moorish village, with flat roofs and latticed windows, and green plots of garden attached to each dwelling. It is the capital of the Alpujarras. Grapes grow on terraces, and in such declivities that the peasants are let down by ropes to gather them: population, 3000. *Velez-Málaga*, 18 miles E. from Málaga, is a poor but populous town in a very fertile district. It is crowned by a Moorish castle in ruins, and backed by a rugged sierra. It was formerly a port, but the sea has receded. Fine jaspers are found in the neighbourhood: population, 16,000. *Vera*, 42 miles N.W. from Almería, stands near the shore of the Mediterranean Sea, and has a small harbour, whence an active fishery is carried on. Nitre is manufactured, and there is a small import and export trade: population, 8470.

(Ford, *Handbook of Spain*; Madoz, *Diccionario de España*.)

GRANADA, a city of Spain, capital of the ancient kingdom and province of Granada, and of the modern province of the same name. It is the see of an archbishop, and the residence of a captain-general. It is situated in 37° 17' N. lat., 3° 50' W. long. The population in 1845 was 70,000. It is 2445 feet above the level of the sea, an elevation which renders it a delightful summer residence. It is built partly on the slopes and partly in the valleys between two hills overlooking the extensive and fertile plain called the Vega de Granada. One of the two hills is surmounted by the Moorish palace and fortress called the Alhambra. The other hill is occupied by the suburb called the Albaycín. The suburb called the Antequerula is built in the plain. The city itself is encircled by high walls in ruins, flanked by strong towers. The small river Darro flows through it; the Jenil flows outside the south wall, and receives the Darro a little lower down. The streets are for the most part narrow and irregular. The houses, tolerably well built, exhibit the Moorish taste, the exteriors being heavy and gloomy, with projecting balconies and flat roofs; the interiors convenient, and suitable to the climate. There are several good squares, of which the three principal are—El Campo, La Plaza Mayor, and La Bivarambla, the last containing a handsome fountain of jasper. There are many other fountains and jets-d'eau, which refresh the air as well as supply water to the inhabitants. The great object of attraction to those who visit Granada is the Alhambra. [ALHAMBRA.] The cathedral, though irregular, is a splendid structure, profusely ornamented with jasper and coloured marbles from the quarries of the neighbourhood. Beneath its fine dome, which rests on twelve arches, supported by as many pilasters, stands the high altar, on the decoration of which the wealth of the kingdom was lavished. Annexed to it is the Capilla de los Reyes, where the bodies of Ferdinand and Isabella are deposited. The figures and ornaments of these sepulchral monuments are greatly admired. Besides the cathedral there are 23 parish churches. Many of the numerous convents have been converted to educational and other secular purposes, and others have been taken down to make room for architectural improvements. The other public buildings are—the archbishop's palace, the university, 6 colleges, 10 hospitals, 2 prisons, a theatre, and many schools. The chief manufacture is that of sewing silk. The public walks on the banks of the Jenil and the Darro are delightful. The Vega of Granada has an extent of about 70 miles in length by 20 miles in width.

The city of Granada was founded by the Moors in the 10th century, and was at first subject to the khalifs, or kings of Cordova. In 1235 it became the capital of the new kingdom of Granada, and was soon distinguished for its riches and power, the splendour of its edifices, and its progress in arts and industry. It offered a long resistance to the Christian kings of Spain. In 1492 it was taken by Fernando and Isabel after a siege of twelve months. It is said to have then contained 400,000 inhabitants.

GRANADA, NEW. [NEW GRANADA.]

GRANARD, county of Longford, Ireland, a market-town, and the seat of a Poor-Law Union, in the parish of Granard, is situated in 53° 47' N. lat., 7° 25' W. long., distant about 17 miles E.N.E. from Longford, and 70 miles W.N.W. from Dublin. The population of the town in 1851 was 1805, besides 1855 in the Union workhouse. Granard Poor-Law Union comprises 36 electoral divisions, with an area of 134,004 acres, and a population in 1851 of 41,473.

Besides the parish church, there are in Granard a Roman Catholic chapel, National schools, a sessions house, a market-house, and a dispensary. A market for agricultural produce is held weekly, and fairs are held on January 15th, May 3rd, August 15th, and October 1st. Some coarse linen is manufactured. On the top of a high artificial mound are vestiges of an encampment.

GRAND BAHAMA. [BAHAMAS.]

GRAND or GREAT BANK. [NEWFOUNDLAND.]

GRAND ISLAND. [CANADA.]

GRAND SERRE. [DRÔME.]

GRANGEMOUTH. [STIRLINGSHIRE.]

GRANTHAM, Lincolnshire, a municipal and parliamentary borough, market-town, and the seat of a Poor-Law Union, in the parish of Grantham, is situated on the right bank of the river Witham, in 52° 55' N. lat., 0° 37' W. long., distant 30 miles S. by W. from Lincoln, 110 miles N.N.W. from London by road, and 105 miles by the Great Northern railway. The population of the municipal borough in 1851 was 5375; that of the parliamentary borough was 10,873. The

borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage, with the vicarage of Braceby annexed, in the archdeaconry and diocese of Lincoln. Grantham Poor-Law Union contains 52 parishes and townships, with an area of 99,219 acres, and a population in 1851 of 29,851.

Grantham is situated a short distance westward of the ancient Ermine-street. The first charter of incorporation is that of Henry VI. in 1463. The borough was first represented in Parliament in the 7th Edward IV., since which time it has continued to return two members. The town consists chiefly of four streets, called respectively Castle-gate, Westgate, Watergate, and Swingate-street; it is well paved, cleaned, and lighted with gas. The public buildings are the guildhall, and the borough jail. The parish church, a beautiful specimen of the style of the 13th century, has an elegant spire, 273 feet high. The Independents, Wesleyan Methodists, Countess of Huntingdon's Connexion, and Roman Catholics have places of worship. The Free-Grammar school of Grantham was founded by Richard Fox, bishop of Winchester, in 1528, and subsequently endowed by Edward VI.; it has an income from endowment of 800*l.* a year, and provides eight exhibitions to either university, two scholarships of 20*l.* per annum at St. John's College, Cambridge, and two of 40*l.* each at Sidney Sussex College, Cambridge. The school had 72 scholars in 1852. At this school Newton received his classical education previous to entering Trinity College, Cambridge. Woolsthorpe, about 8 miles from Grantham, was his birthplace.

In Grantham are National, British, Infant, and Charity schools; a literary and scientific institution; a savings bank; a dispensary; almshouses; and several minor charities. In the town are some remains of religious houses. An ancient conduit still supplies excellent water. Grantham is connected with the Trent by a canal 30 miles long, which is supplied with water by means of large reservoirs. The trade consists principally in malt, corn, and coal; there is a paper-mill, and at Spittlegate, near the town, is a manufactory of agricultural implements. The market-day is Saturday: five fairs are held in the year for sheep and cattle.

GRANTON. [EDINBURGHSHIRE.]

GRANVILLE. [MANCHE.]

GRASLITZ. [EGER.]

GRASMERE. [WESTMORLAND.]

GRASSE. [VAR.]

GRÄTZ, an episcopal city in Austria, capital of the crownland of Styria and of the circle of Grätz, is beautifully situated on the Mur, about 1040 feet above the level of the sea, in 47° 4' N. lat., 15° 28' E. long., and has about 40,000 inhabitants, or, including the garrison, 50,000. It consists of the Inner Town, which lies between the eastern bank of the Mur and the Castle-hill (Schlossberg), and four suburbs, namely, the Murstadt, on the western bank of the Mur, connected with the town by two bridges, and the Jakomini, Müntzgraben, and Leonhardt suburbs, on the eastern bank. The village of Geidorf is also reckoned as part of Grätz. The whole circuit is about 7 miles. The Inner Town covers less than a sixth part of the area; it is separated by high ramparts and by a glacis from the suburbs. The glacis is planted with avenues of chestnut-trees, upon which six gates open towards the river and suburbs. The city is in the old style of building; the streets are narrow and irregular. It contains an open triangular space, the Place of the Corps de Garde, and the Carmelites-square; St. Agidi's cathedral church, a gothic structure built by the emperor Frederick IV. in the middle of the 15th century, all the altars in which are finely sculptured in marble; and near it, St. Catherine's chapel, the handsomest specimen of architecture in the town, built as a mausoleum by Ferdinand II., who lies interred here with his consort, mother, and eldest son; the Imperial Burg, with its tower, opposite the cathedral, where the princes of Styria formerly resided, and in which there are a number of Roman antiquities; the Landhaus, where the nobility hold their sittings, which contains an ancient armoury, many archives, &c.; the town-hall; the university buildings, containing a library of 44,000 volumes, a museum, &c.; the arsenal, a theatre, several palaces of the Styrian nobility, &c. Between two of the gates on the east side of the Inner Town, the Castle-hill, a mass of limestone, which rises 300 feet above the town, has the ruins of the castle on its summit, and is laid out in plantations and gardens, from the walks in which are presented fine views of the valley of the Mur and the surrounding country.

The Murstadt is the finest and most extensive of the suburbs of Grätz, being embellished with several handsome buildings and gardens. The Jakomini suburb has handsome and mostly regular streets, an equestrian riding-house, &c.; and the Leonhardt suburb, to the north and north-east of the Castle-hill, occupies a large space of ground at the foot of several hills, and is embellished with agreeable villas and gardens.

Grätz contains altogether 22 churches and chapels, five monasteries, and two nunneries, an Ursuline seminary for females, an institution called the Johanneum, founded by the archduke Johann in 1811, and comprising a cabinet of minerals, museum of botany, a library of 32,000 volumes, collections in geology, experimental philosophy, and

numismatics, and a reading-room; a botanical garden, with three conservatories; lunatic, orphan, and foundling asylums; a theatre, an hospital, and a lying-in institution, &c.

The university was founded by Charles, duke of Styria, in the year 1558, and entrusted to the management of the Jesuits, who though often expelled have been recently once more placed at the head of the institution. It has faculties of theology, law, medicine, and philosophy, which are taught by 28 professors. The number of students in 1835 was between 300 and 350, in 1842 it was 942, and in 1850 it was 866. The Convict, formerly a college of the Jesuits, is the largest building in the town; it is now used as a school in connection with the university. Grätz has also a gymnasium which is under the Benedictines, and had 24 professors with 644 pupils in 1850; an episcopal seminary, six hospitals, a gaol, a lunatic asylum, &c.

Grätz is the seat of administration and of the supreme tribunal of justice for the crownland of Styria, and the residence of the bishop of Seckau. It has flourishing manufactures of steel and ironware, cottons, printed cottons and linens, woollens and woollen stuffs, silks, ribands, furs, leather, paper, saltpetre, hats, potters'-ware, &c.

Grätz is a first-class station of the railway from Vienna to Trieste, by which it is 118 miles S.S.W. from Vienna. [STYRIA.]

GRAUBÜNDTEN (*Grisons* in French), a canton of Switzerland, is bounded N. by St. Gall, E. by the Tyrol and Vorarlberg, S. by Italy, and W. by the cantons of Ticino, Uri, and Glarus. It is surrounded on every side by lofty mountains, except on one point on the north, where the Rhine issues out of it through a narrow valley, along which runs the carriage-road from Coire to St. Gall and Zürich. A large offset of the Lepontian Alps detaches itself from the group of the St. Gothard, and running in a north-eastern direction marks the western boundary of the canton: dividing the waters of the Rhine from those of the Reuss and the Linth, it forms many high summits covered with perpetual snow, such as the Badus and the Crispalt, on the frontiers of Uri; the Dödißberg and Piz Rossin, on the borders of Glarus; and the Scheibe, on those of St. Gall. Another lofty range, which under the name of the Rhetian Alps forms part of the great central chain, runs east from the St. Gothard, dividing the waters which flow northward into the Rhine from those which flow southward into the Ticino; the high summits called Piz Val Rhein (above 10,800 feet), Moschelhorn, and Adula are in this range, over which the Bernhardin and the Splügen roads lead from the Grisons into Italy. East of the Splügen, at the mountain called Maloya, on the east slope of which are the sources of the Inn, the chain divides into two; one, continuing along the southern boundary of the Grisons, divides the waters that flow into the Adda from those of the Inn; and the other, running north-east, under the name of Julian Alps, Albula, &c., bounds the valley of the Inn to the north, and divides the waters of that river from those of the Rhine.

The inclination of the surface of the canton is therefore threefold: the largest part slopes towards the north along the course of the Rhine; another part, namely the Engadin, slopes towards the east along the course of the Inn; and lastly, there are several valleys belonging to the Grisons situated on the south or Italian side of the great central chain, and the waters of which run into the Adda and the Ticino, both affluents of the Po. No less than 241 glaciers are reckoned within the limits of the Grisons country, 150 of which send their water to the Rhine, 66 to the Danube by means of the Inn, and 25 to the Po, by the Adda and the Ticino.

The area of the canton is 2962 square miles; its greatest length is about 80 miles from east to west, and 55 miles from north to south. The surface presents numerous valleys, separated by alpine ridges and traversed by numerous rapid streams. Into the principal valleys many smaller transverse valleys open, some of them between 5000 and 6000 feet above the sea.

The population of the canton amounted in March 1850 to 89,840, of whom 38,039 were Catholics. About one-third of the population speak German, and the rest speak the Romansch dialect, except those of the valleys south of the Alps, who speak a Lombard dialect of the Italian. The climate is severe in the upper valleys, where the snow lies for seven months in the year. The scenery in many parts is magnificent. The productions of the soil are extremely varied, according to the elevation of the ground and the aspect of the respective valleys. Some enjoy almost an Italian climate, and the vine, wheat, maize, the fig, and the almond thrive in them; whilst others produce with difficulty scanty crops of barley and rye. Hemp and flax are largely cultivated, as well as potatoes, turnips, carrots, and other roots. A considerable part of the canton is occupied by pastures and forests. Cattle, sheep, goats, and pigs are numerous. Cattle and cheese are exported to the Italian markets. Iron, lead, and zinc are among the mineral products, but few mines are worked. There are some linen and cotton manufactures, but chiefly for domestic use. The transit trade across the passes of the Alps with Italy is considerable. Timber and cattle are the principal exports; corn, salt, oil, woven goods, colonial produce, and iron are imported. The mountains are inhabited by a vast quantity of game, besides bears, wolves, lynxes, and wild cats. Trout and salmon are found in the rivers.

The canton of the Grisons is a confederation of little republics, a Switzerland in miniature. It is divided into 25 jurisdictions; each jurisdiction appoints its own magistrates, and makes its own laws and

local regulations, by the consent of three-fourths of its citizens, that is to say, of all men above seventeen years of age, and appoints two or more deputies to the Great Council. The Little Council of three members is entrusted with the execution of the laws, and with the measures for general security. There is an upper court for the whole canton, which hears appeals from the local courts.

The principal town of the canton is COIRE.

The origin of the Confederacy of the Grisons dates from the beginning of the 15th century, when the chief inhabitants of various communes in the valleys of the Upper Rhine, weary of the cruelties and oppressions of their feudal lords, assembled in a forest near the village of Trons, and there entered into a solemn compact to defend each other's property and persons, and to oblige their lords to respect the same. The abbot of Disentis willingly agreed to the compact; the counts of Werdenberg, Sax, and the baron of Rhaßuna, followed his example; and in the month of May 1424 they all repaired to the village of Trons, and there under a large maple-tree swore, in the name of the Holy Trinity, to observe the conditions of the league, which was called Graubund (Gray League), from their being dressed in gray smock-frocks. The valleys of Lower Rhetia, near Coire, also formed themselves into another league with the consent of the Bishop of Coire, and this league was called Cadde ('Casa Dei,' the House of God), because those communes mostly belonged to the episcopal see. A third league was formed in 1436 in the valleys of the Albula and the Lanquart, and this was called the League of the Ten Jurisdictions, of which Davos was the chief place. The three leagues entered into a federal compact, and also formed an alliance with the Swiss cantons. They bravely defended their liberties against the emperor Maximilian I., and afterwards, in the 17th century, against Ferdinand II. with the assistance of Louis XIII. of France. When, in 1798, the French armies invaded Switzerland, and overturned its ancient confederation, the Grisons kept aloof, and being threatened by the French with an invasion they rose in a mass, and called in the Austrians from the Tyrol to their assistance. In 1799 their country was devastated by the French, who drove away the Austrians, and were themselves driven away again by the Russians under Suwarow. At length, by the Act of Mediation, under Bonaparte, in 1803, the Grisons became a canton of the new Helvetic Confederation, which they have continued to be ever since. The canton returns 4 members to the National Council of Switzerland.

GRAUDENZ. [MARIENWERDER.]

GRAVE, or GRAAF. [BRABANT, NORTH.]

GRAVE-EN-OYSANS, LA. [ALPES, HAUTES.]

GRAVELINES. [NORD.]

GRAVESEND, Kent, a market-town, port, and, with Milton, a Poor-Law Union, in the parishes of Gravesend and Milton, is situated on the right bank of the Thames, in 51° 26' N. lat., 0° 21' E. long., distant 32 miles N.W. by W. from Canterbury, 22 miles E. by S. from London by road, and 24 miles by the North Kent railway. The population of the municipal borough in 1851 was 16,633. The town is governed by 6 aldermen and 18 councillors, one of whom is mayor. The living is a rectory in the archdeaconry and diocese of Rochester. Gravesend and Milton Poor-Law Union consists of the two parishes, with an area of 1271 acres, and a population in 1851 of 16,210.

Gravesend occurs in the Domesday Survey as Graveham; it was however written Gravesend in the succeeding century. Its early history is unimportant. In the reign of Richard II. the town was attacked by a squadron of French galleys, and burned, and most of the inhabitants were carried into captivity. When Henry VIII. built Tilbury Fort, on the Essex coast, opposite Gravesend, he raised two platforms at Gravesend to protect the town and command the mouth of the river. The Board of Ordnance has replaced these by some modern works. Gravesend forms the limit of the port of London. For centuries past the prosperity of the town has been dependant on its intercourse with the metropolis. For the conveyance of passengers passage-boats, which with the progressive changes in the habits and manners of the people gradually increased in size and speed, have been maintained on the river, from the passenger barge of the 14th century, charging the legal fare of twopence each, and occupying a day in the voyage, to the swift river steamer of the present day, making the passage in two hours, and charging its passengers tenpence a head. The greater part of the present extensive passenger traffic has arisen since the commencement of steam navigation. As a place of residence during the bathing season, and for holiday trips, the town has been much frequented of late years, and the permanent population has been largely increased. The streets in the older part of the town are narrow and inconvenient. The new town, which is chiefly in the parish of Milton, has some handsome streets, squares, and terraces. Considerable improvement has been effected in the rebuilding of houses consumed in fires which have on several occasions occurred. The town-hall, in High-street, erected in 1836, has a massive Doric portico. The parish church, a brick edifice, situated near the centre of the town, has been considerably altered in the course of successive repairs: a church at Milton, erected by subscription in 1845, is a handsome structure in the decorated style; and there is another new church of neat appearance. There are two Independent, one Baptist, and some other places of worship, a Free Grammar school, National schools, a

literary institution, a savings bank, and various benevolent associations. From Windmill Hill, close to the town, once a very favourite resort of visitors, extensive prospects over the Thames, its shipping and scenery, may be obtained. Rosherville Gardens, to the west of the town, which have been within these few years laid out in a very picturesque manner, are now the principal resort of visitors. The town pier is substantial and well built; it is supported on cast-iron arches, and is 127 feet long and 40 feet wide; at the end is a transverse head 76 feet by 80 feet. The terrace pier, at the eastern end of the town, is a later structure, 190 feet long, built entirely of iron, and is supported upon massive columns. In the neighbourhood of Gravesend are extensive market gardens, much of the produce of which finds its way to the London markets. Fishing employs many of the inhabitants. Markets are held on Wednesday and Saturday, and fairs on May 4th and October 24th. The Thames and Medway Canal enters the Thames at Gravesend.

(Cruden, *History of Gravesend*; *Communication from Gravesend*.)

GRAVINA. [BARI, TERRA DL.]

GRAY'S THURROCK. [ESSX.]

GREAT BELT. [BELG.]

GREAT BRITAIN has been the legal name of the island containing England and Scotland, and of the kingdom, or part of a kingdom, which they compose since the legislative union of these two countries (1st May, 1707). The first article of the treaty of Union enacts that the two kingdoms of England and Scotland shall, from the above day, and ever after, be united into one kingdom by the name of Great Britain; and in subsequent articles the kingdom is called the United Kingdom of Great Britain.

Great Britain, the largest island in Europe, and one of the largest in the world, is divided from the mainland of Europe by a narrow arm of the sea called the English Channel, which extends along the southern shores of the island and separates it from France [ENGLISH CHANNEL], and by a portion of the Atlantic, which is separated from the main body of the ocean by the island of Great Britain itself. This sea, called the North or German Sea [NORTH SEA], separates Great Britain from Belgium, the Netherlands, Germany, Denmark, and Norway. The English Channel and the North Sea are united by the Straits of Dover. To the north of Great Britain lies the wide expanse of the Atlantic Ocean. On the west side of the island, and at no great distance from it, are numerous small islands, and a large one, Ireland, which is separated from Great Britain by St. George's Channel.

The Lizard Point, the most southern part of Great Britain, is in 49° 58' N. lat.; and Dunnet Head, in Caithness, the most northern point, is in 58° 42' N. lat. The most eastern point is Lowestoft, on the coast of Suffolk, 1° 44' E. long.; and the most western, Ardnamurchan Point, in Argyll, 6° 14' W. long. The distance in a straight line between the Lizard Point and Dunnet Head is about 608 miles. "The figure of Great Britain has been compared to an irregular triangle, the apex of which is at Dunnet Head, and the base is the long line of the southern coast from the North Foreland in Kent to the Land's End in Cornwall. The direct distance from Dunnet Head to the North Foreland is about 540 miles, and to the Land's End about 600 miles; the direct distance between the North Foreland lighthouse and the Land's End is about 820 miles." ('*Geography of Great Britain*,' published by the Society for the Diffusion of Useful Knowledge.) These distances give an outline of 1460 miles; but as the coast, especially on the western side, is a succession of projecting promontories and deeply-penetrating bays, the real coast-line probably exceeds three times that amount. The surface of the island is about 89,844 square miles, of which the northern part, called Scotland, contains 81,824; and the southern, or England and Wales, contains 58,820, namely—England, 50,922; and Wales, 7398. In statute acres the area is given thus:—England, 82,530,940; Wales, 4,793,975; Scotland, 90,047,462; islands in the British seas, 259,000: total, 87,624,377 acres. The line by which England and Scotland are separated begins on the west at the north-eastern angle of Solway Frith, and runs along the Esk, Liddel, and Kershope rivers to a range of mountains which successively bear the names of the Lauriston Hills, Peel Fell, Carter Fell, and the Cheviot Hills. Up to the last-mentioned mountains the boundary-line runs north-east, but at the Cheviot Hills it turns north-north-west, and continues in that direction to the banks of the Tweed, a few miles above Coldstream. The remainder of the boundary-line is formed by the course of the Tweed to its mouth, with the exception of the town of Berwick, which, though on the northern bank of the river, belongs to England.

General Survey of its Surface and Soil.—Though Great Britain does not contain such elevated mountain ranges as many parts of Continental Europe, it probably exhibits a greater variety in surface and soil than any other European country of equal extent. We shall endeavour to present a general view of the surface of this island, referring the reader for fuller details to the headings—'Surface,' 'Hydrography,' &c., in the notices of the several counties.

1. *Scotland, north and west of Glenmore.*—Glenmore is a long but comparatively narrow valley, which extends south-west and north-east in a straight line across the island. On the south-west it begins at the island of Mull, from whose eastern shores a wide gulf or sea-loch, called Loch Linaha, runs north-east, penetrates deeply into the mainland, and is continued north-eastward in Loch Eil. At the point

where Loch Eil makes a sharp turn to the west the valley of Glenmore properly begins; it terminates at Inverness, on the Moray Frith. The country north and west of Glenmore, which includes the counties of Sutherland, Caithness, Ross, and part of Inverness, is the most sterile portion of the island. Nearly the whole of it constitutes one enormous mass of rock, whose upper surface frequently extends in plains, but more usually is covered with rocks many hundred feet above the general level of the mountain plain, which varies between 500 and 1500 feet above the sea.

The northern part of the plain, extending from a line joining Loch Broom on the west and Dornoch Frith on the east to the northern shores and Cape Wrath, is an extensive moor, an open undulating land of rocks and bogs, on which a few hills rise at great distances from one another. The highest summits occur on the western side of the plain, where Ben Mhor attains 3220 feet above the sea. The mountain plain and the ridges which constitute its boundary do not extend over the north-eastern part of the island. Nearly four-fifths of the county of Caithness form a plain, with an undulating surface, which may vary between 50 and 200 feet above the sea-level. To the west of this comparatively low and level land rises Ben Wyvis, an extensive mass of lofty irregular rocks, 3720 feet above the sea. The region to the westward, extending to the Atlantic shore, is bare of trees, and in some parts, especially about Loch Torridon, almost destitute of vegetation. The greater part of this extensive moorland affords pasture for sheep, and contains a few habitations of shepherds. Along the western shores, at the innermost recesses of the numerous sea-lochs, are the huts of some fishermen. Towards the western coast are several high summits, as Kea Cloch, 3600 feet, and Ben Lair, 3000 feet above the sea-level.

2. *Scotland between Glenmore and the Grampians* is divided into two different regions by the high ridge of the Cairn Gorm Mountains, or Northern Grampians. The country west of that range, belonging to the counties of Inverness, Nairn, and Elgin, maintains generally the character of a mountain plain, and comprehends the valleys of the Spey, Findhorn, Nairn, and Spean. On the plain rise the Monagh Leagh Mountains, which traverse it in its length from south-west to north. They are sterile and of considerable breadth, but none of the summits probably exceed 2000 feet in height. The plain itself is partly covered with moor or heath, but extensive tracts produce fine grass, and make excellent sheep-walks. The comparatively level country which divides the mountain plain from the German Ocean contains several extensive moors, of which Culloeden Moor is the principal.

The country east of the Northern Grampians, or of the Cairn Gorm range, belonging to the counties of Banff and Aberdeen, is partly mountainous and partly hilly, and contains a considerable extent of arable land. Very few spots in the mountain region are fit for cultivation. The narrow valleys of this region are used as sheep-walks. Towards the sea are plains which in some places extend from ten to twelve miles inland.

3. *Scotland between the Central Grampians and the Plain between the Forth and the Clyde.*—This portion of Scotland is traversed by a mountain range running south to north. It begins on both sides of Loch Long on the south, and terminates on the north at the western extremity of Loch Rannoch. It includes parts of the counties of Argyll, Dumbarton, and Perth. In the northern district, bordering south on Loch Etive, Awe Water, Loch Awe, and Glenorchy, a few spots of arable land are found along the shore of the sea and the margins of the sea-lochs. High and rugged mountain masses occupy the country between Loch Leven and Loch Etive, and farther north; they extend also along Loch Awe, at the northern extremity of which Ben Cruachan rises 3390 feet above the sea-level. East of this mountain mass, as far as Loch Rannoch, extends the barren Moor of Rannoch, which on the south and north respectively reaches to Glenorchy and Loch Leven. Another mountainous desert of about equal extent, bounded by the valley of the Spean on the north, is much grander and more interesting in its features. The peninsula of Cantire extends for nearly 50 miles southward to the Mull of Cantire, a cape rising about 1000 feet above the sea.

On the eastern side of the district now under review extends a mountain region which occupies nearly half the surface of the entire district. Its eastern border runs in an oblique line over the whole breadth of the island, beginning at Loch Lomond, and passing through Aberfoil on the Forth, Callander on the Teith, Crief on the Earn, Dunkeld on the Tay, and Blair Gowrie on the Isla, whence it proceeds to the eastern extremity of the Central Grampians near Stonehaven. It is chiefly included within the counties of Perth, Forfar, and Kincairdine. This immense tract of country is covered by ridges of mountains containing several high summits; yet the valleys between the ridges are frequently wide, and contain extensive tracts of arable land, especially along the Earn and the Tay. East and south of this mountain region extends Strathmore, the Great Vale, which begins on the banks of the river Forth opposite Stirling, and extends to Stonehaven, occupying a space of at least 80 miles in length, and from 16 miles to 1 mile in breadth. This fertile and well-cultivated plain belongs chiefly to the counties of Perth and Forfar. Between Strathmore and the German Ocean lie the Sidlaw Hills to the northward, and the Ochill Hills to the southward. The higher portion of the Sidlaw Hills skirts the banks of the Tay, and their highest summit,

Craig Owl, not far from Lundie, attains an elevation of 1600 feet. Towards the sea these hills gradually form a succession of terraces, which become lower as they approach the sea. At the southern extremity of this region, along the Frith of Tay, between the towns of Perth and Dundee, lies the Carse of Gowrie, one of the most fertile tracts in Scotland. Its breadth averages between 2 and 3 miles. The region of the Ochill Hills and Strathmore is bounded on the south by the river Forth. South of this river lies a hilly country, extending westward to the banks of the Frith of Clyde. [CAMPSIE HILLS.]

4. *Scotland south of the Plain between the rivers Clyde and Forth, or Southern Scotland.*—This portion of Great Britain contains an extensive mountain region. On the west it advances to the sea, extending over the whole of Ayrshire south of the river Ayr. Its northern boundary follows the course of that river to the Haughshaw Hills, whence it extends to Lanark on the Clyde, and from Lanark to the Leven Seat. Nearly the whole of the county of Edinburgh is included in it. On the east it proceeds first southward along the boundary of that county, but afterwards enters the county of Berwick, of which it occupies the most western part, along both sides of the river Lauder, an affluent of the Tweed. From Melrose, near the mouth of the Lauder, it runs south by west to the Wisp Hill, in the boundary range between Roxburgh and Dumfries. Here the southern boundary-line begins, and stretches in a south-western direction across the county of Dumfries to Cross Michael, on the Dea River, in Kirkcudbright. It then follows the course of this river to Kirkcudbright Bay, where it again comes close to the sea, forming the high and very bold coast on the eastern shores of Wigton Bay as far as Creetown. From the innermost corner of this bay it runs along the Cree River to the boundary line of Ayrshire, so that only the county of Wigton is in this part excluded from it. The most extensive depression in this mountain region extends east and west, comprehending the valley of the Tweed from Melrose to Peebles and Lyne, and the valley of the Clyde from Covington to Lanark. In the western district of Kirkcudbright the Cairn Muir rises 2600 feet high; and situated about 6 miles north from Creetown is the Blacklurg, 1970 feet high. The Lowthers, between the beds of the rivers Nith and Clyde, attain an elevation of 3150 feet.

In the northern portion of the mountain region the land extends in spacious flats or inclined planes, which are mostly covered with bogs and mosses, and in some parts clothed with heath. Between the rivers which fall into the Tweed and into the Frith of Forth its elevation may be between 800 and 1000 feet. The Muirfoot Hills, between the sources of the Gala Water, an affluent of the Tweed, and of the Esk, which falls into the Frith of Forth, rise to 1860 feet, and the Leven Seat reaches about 1200 feet. On the northern declivity are situated the Pentland Hills. On the west of the mountain region, between the lower course of the river Clyde and the Frith of Clyde, lies a country, which may rather be called a plain, though it contains some ranges of hills. The highest part of the hilly tract is the Mistie Law, 1558 feet above the sea.

The county of Wigton constitutes a separate natural division, being on the north surrounded by mountains, and on all other sides by the sea. It contains no mountains, except on the boundary-line on the side of Ayrshire. The remainder is occupied by hills, intersected here and there by wide valleys and plains of moderate extent.

The counties east and south-east of the mountain region are separated from one another by a range of mountains running west and east. This range may be considered as beginning on the west, on the eastern border of the mountain region, with Wisp Hill (1940 feet), whence it continues to the boundary-line of England, which it attains between Peel Fell and Carter Fell. Hence it extends north-east along the boundary-line between England and Scotland to the Cheviot Hills, a name by which the whole range is generally designated. The highest portion of this range is either bare rock or covered with stones; but the declivities, though rather steep, are generally clothed with a rich close greensward, which affords excellent pasture for the breed of sheep called the Cheviots. The tract of country between this range and the Frith of Forth, east of the mountain region, is traversed by another range of high hills called the Lammermuir, which stretches eastward to the German Ocean, terminating in Lumsden Hill, 730 feet high, and the rocky promontory of St. Abb's Head. North of the Lammermuir Hills is the fertile vale of the Tyne. From St. Abb's Head a low ridge of hills extends along the shores of Berwickshire to the neighbourhood of the town of Berwick-upon-Tweed. These hills and the Lammermuir Hills inclose on the north and east the Merse of Berwickshire, a plain with a slightly undulating surface, which extends to the banks of the Tweed, between Coldstream and Berwick.

The country south of the mountain region contains a plain, which extends along the Solway Frith from the borders of England to the river Annan, about 20 miles in length, with an average width of about 8 miles. Solway Moss is included in Cumberland. The country west of the Annan, as far as Dumfries, is much more hilly, and contains a still smaller portion of cultivable ground. North of these districts the hills are generally covered with heath and moor; but many of them afford sheep-pasture. The south-eastern portion of Kirkcudbright, which is not included in the mountain region, is occupied by high hills along the Solway Frith, between the mouth of the Nith and Kirkcudbright Bay.

5. *England north of a line drawn from the mouth of the Mersey to Weaver Hill in Derbyshire (53° N. lat.), and thence to the junction of the Trent and Ouse.*—This is the only part of England which can be called mountainous. The general direction of the mountain range which traverses it is from north to south. This range belongs chiefly to Northumberland, Cumberland, Westmoreland, and Yorkshire, but extends into Lancashire, Durham, Derbyshire, and Staffordshire. At its most northern point it is connected with the south-western extremity of the Cheviot Hills, whence it extends southward, mostly along the boundary-line between Cumberland and Northumberland to Cross-Fell, 54° 42' N. lat., near the junction of the three counties of Cumberland, Westmoreland, and Durham. This portion of the chain is of comparatively small elevation and width. From Cross-Fell, which is 2901 feet above the sea, the range runs nearly south-east to the sources of the Eden River, but afterwards its course is nearly due south. In its course southward the range varies considerably in width. At the southern extremity of the Derbyshire Mountains, a little west of Ashborns in Derbyshire, stands Weaver Hill (1154 feet), which may be considered as the last link of this extensive range. The entire range extends from the Cheviots to the banks of the Trent, and is sometimes called the Pennine Mountains. West of the Pennine Mountains, and contiguous to the boundary of Scotland, the Cumbrian Plain, which is said to cover a surface of 300,000 acres, extends along Solway Frith from Solway Moss to the inlet of Abbey Holme, and eastward to the hills of Brompton and Croglin. At its southern extremity the Vale of the Eden extends to the south-east.

South of this plain lies the extensive group of the Cumbrian Mountains, which contain the highest summits in England. Opposite Morecambe and Lancaster bays the offsets of the Pennine range approach the sea within a distance varying from 6 to 12 miles. The intervening space is covered with heath along the foot of the ridge and its offsets, and only a narrow strip of fertile level land extends along the coast grows wider. This tract, which lies to the west of the road running from Lancaster through Garstang to Preston-on-the-Ribble, is from 8 to 10 miles in width, and is called the Fylde. Between the Ribble and the Mersey, and west of the Pennine chain, extends a high tract, which is encircled by a broad belt of low and level country. The soil is a loam of various quality, in some parts very light and sandy. South of the Mersey the moorlands, which skirt the mountains of Derbyshire on the west and divide them from the Plain of Cheshire, are not extensive; but at the south-western extremity of the Derbyshire Mountains occur the moorlands of Staffordshire, which occupy the whole of that county north of a line drawn from Newcastle-under-Lyne to Uttoxeter.

We pass to the east of the Pennine range. The most northern angle of England, as far south as the Coquet River, is a very hilly country, and some of the eminences are of considerable height. Towards the Coquet the high ground extends in elevated plains (Alnwick Moor, &c.), which are probably 800 feet above the sea-level, and are covered with heath. The Vale of the Coquet is wide, and contains considerable tracts of fertile land. South of the Coquet begin the extensive moorlands which occupy nearly one-third of Northumberland and portions of Durham and Yorkshire. The width of these moorlands varies between 10 and 30 miles; and they are said to be between 500 and 1000 feet above the sea-level. They are in general extensive, open, solitary wastes, producing little except heath, and affording only a scanty subsistence to flocks of sheep. In Yorkshire the moorlands are intersected by extensive valleys, containing considerable tracts of arable land.

The country which extends from the moorland to the German Ocean has in general a hilly character, with intervening tracts of good soil. Along the northern side of the Vale of Tyne the high land rises only to a moderate elevation. The country south of the Vale of Tyne is hilly. The valley of the Tees is the most extensive valley in that part of England which is north of the Plain of York. The Plain of York extends from the valley of the Tees southward to the confluence of the Ouse and Trent, and to Doncaster on the Don, a distance of 70 or 80 miles. It is separated from the Western Moorlands by a narrow hilly tract. The eastern boundary of the Vale of the Tees is formed by the Eastern Moors and the Wolds of York. South of the Eastern Moorlands is the Vale of the Upper Derwent, or of Pickering. Its form is an imperfect oval, being 35 miles from west to east, and 10 miles from south to north where widest. It is everywhere surrounded by heights of considerable elevation, and has all the appearance of a dried lake. The York Wolds, which form the southern border of this vale, occupy nearly half of the surface of the country between the Derwent and the German Ocean. To the east of the Wolds extends Holderness, a fertile plain with a low but undulating surface.

6. *England south of a line drawn from the mouth of the Mersey to Weaver Hill, and thence to the confluence of the Ouse and Trent on the north, and the Thames River on the south.*—The western boundary of this extensive region is formed by what may properly be called the Great Western Vale. It extends from the wide estuary of the river Mersey southward, and chiefly along the Severn to the estuary of that river and the neighbourhood of Bristol, comprehending the plain of Cheshire and Shropshire and the vales of Worcester, Eves-

Gloucester, and Berkeley. Its length may be about 120 miles in a straight line. Its northern portion, or the plain of Cheshire and Shropshire, extends about 50 miles from north to south, and its breadth varies between 25 and 30 miles. A ridge of low hills traverses this plain from north to south in the western districts of Cheshire. In this plain also is the elevated ground which unites the mountain system of Wales to the central part of England, and forms the watershed between the waters which fall into the Dee and Mersey, and the Severn. Though several tracts covered with heath and moor occur on this plain, the greatest part of it has a good soil, and is well cultivated. South of Wenlock Edge begins what is properly called the Vale of the Severn. It extends on both sides of the river for about 70 miles, and except at those places where the valleys of the tributary rivers of the Severn open into it, it never exceeds 12 miles in width, and is often narrowed to 5 or 6 miles. This vale is one of the most fertile and best cultivated districts of England.

Along the eastern border of this vale extends the highest ground of Central England. It is connected with the Derbyshire Mountains by the high land which extends along the borders of Cheshire and Staffordshire, and rises at its lowest point, where it is traversed by the Grand Trunk Canal, to 419 feet, and afterwards runs between Newcastle-under-Lyne and Drayton to the hill called the Wrekin, about 6 miles E.S.E. from Shrewsbury, which is 1320 feet above the sea. South of the Avon, near Pershore, rises the Bredon Hill, which has about the same elevation, and is connected with the Cotswold Hills, which terminate in the neighbourhood of Bristol and Bath.

On the east of this high land lies the Central Region of England, which on its eastern border is contiguous to the Great Eastern Plain, and on the south terminates on the banks of the Thames. Its surface rises and sinks in gentle undulations, between which there are wide valleys, which in some parts spread out into plains. None of the hills attain an elevation of 1000 feet above the sea-level. This extensive district is in general well and profitably cultivated.

The Great Eastern Plain extends from the river Humber to the mouth of the Thames, and is by nature divided into three different portions, a lower and two higher ones. The lower portion lies round that arm of the sea which is called the Wash, and extends to the south-west. This low and marshy country, called the Fens, extends 50 miles from north to south, and 30 miles in its greatest breadth from Market Deeping to Lynn, at the mouth of the Ouse. The rivers not having the necessary fall to carry off the water, this tract is exposed to floods from sudden falls of rain, and also to inundations of the sea. Dykes, canals, and other works have been constructed to prevent such accidents, and also to promote the general drainage of this extensive level.

That portion of the great plain which lies to the north of the Fens comprehends Lincolnshire north of a line drawn from Wainfleet to Sleaford. This tract is considerably higher than the fen region south of it, which is called Holland. On the north the high ground forms the banks of the Humber, from Winterringham on the west, to Great Grimsby on the east. From the last mentioned place a low belt of fertile marshes extends along the shores of the German Ocean. The marshes advance inland to Louth and Burgh, and vary in width from 3 to 7 miles. Along this coast is a submarine forest, visible as far as the limits of low water, or about a mile and a half from the land.

East of the Fens, and comprehending the counties of Norfolk, Suffolk, and Essex, extends a plain, which in its northern district is in the highest parts between 160 and 200 feet above the level of the sea. Its surface is gently undulating, but becomes more broken as we advance farther north. The small streams which drain this plain generally lie several feet below the general level of the surface. Its fertility, which towards the north is but moderate, increases to the south, and the soil in Essex is unrivalled in England for its rich crops of wheat. The southern boundary of this plain is marked by the high ground which extends from Epping Forest eastward to Brentwood and Langdon Hill, and then north-east, terminating between Chelmsford and Maldon.

7. *England south of the River Thames and the Bristol Channel.*—Towards the eastern extremity of this region is an extensive tract of high land, a transverse section of which forms the lofty chalk cliffs along the Straits of Dover, between the South Foreland and Folkestone. From the shores of the Straits it extends in a north-north-west direction to the estuary of the Thames, where it terminates in a moderately high coast between Reculver and the outlet of the East Swale; the high land of the Isle of Thanet may be considered as an eastern prolongation of it. The surface of this elevated tract may, on an average, be in its higher parts about 300 feet above the sea. Though the soil is chalky and dry, it has in parts a considerable degree of fertility, and is well cultivated.

The high land continues to the west of the valley of the Stour, and is several miles wide, with a longitudinal depression in the middle, so as to have the appearance of two parallel ridges. The northern ridge, which is a continuation of the chalk, is the higher, and contains Hollingbourn Station, 616 feet above the sea. This high ground runs first north-west, and in its depression lie the towns of Ashford, Charing, and Maidstone. At Maidstone the high lands are interrupted by the valley of the Medway, but west of it they appear again

in the same form, running nearly due west. Farther west there are few considerable elevations.

The country between the high lands north-east of Maidstone and the East Swale is a gently inclined plain, containing small depressions; but before it reaches the water's edge the high land entirely subsides, and is skirted by a low and level tract. The country farther west, between the high lands and the lower course of the Thames, is more diversified in its surface.

The country between the North Downs and the English Channel is divided into two very unequal portions by the South Downs, which begin on the shores of the English Channel in the high promontory of Beachy Head (564 feet), and run as far as Bramber, a distance of 28 miles, in a general direction parallel and close to the coast, which, as far west as Brighton, presents a line of cliffs formed by a longitudinal section of this chalk range. Their breadth from north to south is in some parts 6 miles. Ditchling Beacon, about 6 miles north from Brighton, is 858 feet high. North-west of Chichester is Butser Hill, which attains an elevation of 917 feet; and here the South Downs may be considered to terminate. Of the Alton Hills, which form a junction between the North and South Downs between Petersfield and Farnham, the highest summit, Hind Head, is 923 feet above the sea. The South Downs afford excellent sheep-walks, and the plain of Chichester, or the low tract along the sea-shore, is characterised by a high degree of fertility.

Between the North and South Downs, and bounded by the Alton Hills on the west, extends the Weald of Kent, Surrey, and Sussex. This tract may be considered as a plain, though there are undulating tracts in several places, and a few hills of considerable elevation. The highest summits are Leith Hill, south-west of Dorking, 993 feet high, and Crowborough Beacon in Ashdown Forest, 804 feet high. At the eastern extremity of the Weald, and nearly at an equal distance from the South Foreland and Beachy Head, is Romney Marsh, a low and level tract, containing nearly 50,000 acres. It has been wrested from the sea, from which it is protected by an embankment.

The Alton Hills, which extend, as already observed, from Butser Hill, south-west of Petersfield, to Farnham and the Hog's Back, may be considered as the eastern boundary of a more elevated terrace, which occupies the greater portion of the country south of the Thames, between 0° 40' and 2° 10' W. long. It begins south of Windsor with Bagshot Heath, and extends westward to the Salisbury Plain, which constitutes the highest portion of the whole tract. The southern boundary of this region runs from Butser Hill to Winchester, and thence to Salisbury and Shaftesbury; the western from Shaftesbury to Westbury. The northern boundary is not distinctly marked. Bagshot Heath rises in its highest point to 463 feet, and the lowest tracts of the whole region are probably not much less than 300 feet above the sea-level. Its surface is mostly level, though there are several hills, but they do not rise to a great elevation, except Highclere Hill (900 feet), and the Inkpen (1011 feet), near the place where Hampshire, Berkshire, and Wiltshire meet. Salisbury Plain, the most elevated district of this region, extends 22 miles east and west, and 15 miles north and south, and constitutes a kind of table-land, which at a distance has the appearance of a plain, but on a closer inspection is found to be traversed by numerous depressions. The Marlborough Downs, which are divided from Salisbury Plain by the river Kennet and the Kennet and Avon Canal, are in all respects similar to the plain, except that their surface is more uneven. From the northern side of the Marlborough Downs a tract of high land runs from Swindon westward past Malmesbury to Tetbury, where it joins the Cotswold Hills.

The country south of the elevated tracts just described, and extending from the plain of Chichester to Southampton Water, is tolerably level, and though inferior in fertility to the country about Chichester, it contains a considerable portion of good and well-cultivated land. But west of Southampton Water begin the extensive heaths of Hants and Dorset, which extend from the river Avon to near Dorchester, including the New Forest. The Purbeck Hills commence at Studland Bay on the east, and the high land continues in a westerly direction along the coast: it is united to Salisbury Plain by the elevated ground which runs from Beaminster to Shaftesbury, and contains Bulbarrow Hill (927 feet) and Wingreen Hill (941 feet).

The elevated tract of country which extends from Bagshot Heath to Westbury Down, and of which the heaths of Hants and Dorset may be considered as an appendage, forms the central region of England south of the Thames. Farther west the face of the country changes considerably, and presents a greater variety in its surface. The northern portion, or that tract which extends from the Vale of Berkeley, the southern part of the Great Western Vale, to the Mendip Hills, has a more broken surface than perhaps any other part of England. Some high summits occur, as Farley Hill, east-north-east of Bath, 700 feet; Lansdown Hill, north of Bath, 813 feet; and Dundry Hill, south-west of Bristol, 790 feet above the sea.

From the western edge of Salisbury Plain, near Warminster, a range of hills, or rather high land, commences, which continues westward to Shepton Mallet, where it assumes the character of a distinct range, and is called the Mendip Hills. On the southern side of the Mendip Hills lies an extensive level tract of low land, which is known by the name of the Brent Marsh. From the Bristol Channel this

low tract extends eastward to the towns of Wells and Glastonbury. South of this high tract is another plain, whose southern and more elevated portion is mostly covered with mosses and moors, and in general is barren. The northern part belongs to the Vale of Taunton, or of the Tone, which covers an area of about 100 square miles, with an undulating surface. The soil is of great fertility, and produces the finest crops, fruits, and herbage.

The Quantock Hills begin at some distance from the mouth of the river Parret, on the southern shore of Bridgewater Bay, and run westward along the coast and at a short distance from it; in some places they press close upon the sea. The widest portion of this tract, called the Brendon Hills, is also called Exmoor; and Dunkerry Hill, which may be considered as its eastern extremity, is stated to be 1668 feet above the sea. The Blackdown Hills, which form the southern boundary of the Vale of the Tone, extend westward to the mouth of the Exe.

To the west of the Blackdown Hills and the Vale of Taunton lies the Vale of the Exe, or of Exeter, whose northern extremity reaches the borders of Exmoor, and in that part is separated only by a hilly tract from the Vale of Taunton. Its surface is mostly strongly undulating, and in some parts even hilly. Contiguous to the Vale of the Exe on the west is Dartmoor, a high plateau of irregular surface, in some places covered with huge masses of granite, in others with swamps, or a thin and poor soil. Dartmoor is separated from the mountains of Cornwall by the comparatively narrow valley of the river Tamar. The high lands of Cornwall extend in one continuous mass to the most western point of England, the Land's End.

8. *England west of the Great Western Vale, including Wales.*—This region, the most rugged and mountainous part of England, is intersected, near its central parts, by two deep valleys, the upper extremities of which are separated by some high lands not more than 15 miles across. These are, the valley of the small river Dyfi from Machynlleth to Cardigan Bay, and the valley of the Upper Severn from above Llanidloes to Melverley, where the river enters the Great Western Vale.

North Wales, or the country north of this natural line, contains in its central district a very extensive mass of high land, which occupies more than one-third of the whole. The lowest tracts of this high land are probably not much less than 800 feet above the sea, and the cold climate, which is the consequence of such an elevation, renders the whole tract unfit for cultivation, except in a few sheltered places along the banks of the rivers.

Along the north-western edge of this elevated tract extends the Snowdon range, which contains the highest summits in Wales. It begins near the mouth of the river Conway, whence it runs south-west to the north-eastern corner of Cardigan Bay, a distance of 24 miles in a straight line. The width of the range varies from 5 to 7 miles. From both extremities it rises gradually towards the centre, where it contains several summits more than 3000 feet high; the highest is the extensive mountain mass known under the name of Snowdon, whose highest pinnacle, called Wyddfa, attains an elevation of 3571 feet. A range of high hills branches off from this range south of the highest part, and runs to Caernarvon Bay, where it terminates south of Clynnog in the Rivell, which is 1886 feet high. Between the Snowdon range and the Strait of Menai is an extensive and tolerably level plain, but it is not low, the shores of the strait being generally rocky and bold. The highest portion of the elevated mountain region extends south of the Snowdon range, comprehending the central part and more than half of Merionethshire. Several summits attain upwards of 2000 feet: the Arennig, between Llyn Arennig and Llyn Tryverin, is 2809 feet high. The country inclosed by these ranges contains some fine picturesque valleys, among which are those of Festiniog and Dolgellau. The Berwyn range, which constitutes the south-south-east boundary of the high mountain region, traverses the country from the Great Western Vale to Cardigan Bay. The highest summits are Arran Mowddwy and Cader Idris.

The country between the tributaries of the Upper Dee does not differ in its general description from the elevated mountain region, except that the hills decrease in height and in steepness as they advance farther north. Several of these however attain the height of 1500 feet and upwards. The country extending from the Berwyn range as far south as the valley of the Severn is rather hilly than mountainous; only a few of its summits exceed 1000 feet in elevation, except near the Berwyn Mountains.

The Plinlimmon range, which, beginning from the Plinlimmon Mountain at the source of the Severn runs along the southern side of the valley of that river in the form of an arc, and terminates on the west of the plain of Shropshire with the Breiddin Hills, forms a natural boundary between North and South Wales. Plinlimmon Mountain is a mass of rocks of great extent, whose highest summit rises to 2463 feet. This range presents a great regularity in its outline, its surface consisting of a succession of gradual slopes and rounded summits.

Contiguous to the Plinlimmon range, and on its southern side, extends a vast mountain tract of very desolate character. The towns of Tregaron and Lampeter on the Teify, of Llandovery on the Towey, and of Llyswen on the Wye, lie on its edge and mark its extent on the west and south, while the Wye River bounds it on the east from

Llyswen to Llangerrig. This is the most extensive waste of any in England or Wales, and resembles the high lands in Sutherland and Ross-shire. The country between this mountain tract and Cardigan Bay is extremely rugged north of the river Ystwith, and is noted for its beautiful scenery, especially along the small river Rheidol, where the Devil's Bridge attracts many travellers.

From the Bettws Hills, which occupy the centre of the Plinlimmon range, and lie south of Newtown on the Severn, a range issues, running due south, not far from the boundary-line between England and Wales, but still within the latter country. It terminates near Crickhowell on the Usk, and is divided into two parts by the wide valley in which the Wye flows from Llyswen and Whitney. That portion which lies north of the Wye is called Radnor Forest, and one of its summits attains 2163 feet. South of the Wye is the Black Forest, or Mynydd y Cader, whose highest summit, the Cradle Mountain, or Pen y Cader Fawr, is higher than Plinlimmon, being 2545 feet above the sea. The eastern offsets of this range enter Herefordshire, where they terminate, and are followed by the undulating Plain of Hereford, a country of great fertility, and one of the gardens of England. It extends north and south about 30 miles, and east and west perhaps 20 miles; it is divided from the Great Western Vale by the Malvern Hills, which extend along the boundary-line between Worcester and Hereford in an uninterrupted range for about 9 miles north and south; but their greatest breadth east and west does not exceed two miles. The Malvern Hills are separated by the wide valley of the river Ledbury, an affluent of the Wye, from another range of hills, which are much lower and run southward until they terminate not far from the place where the Wye enters the Severn. The southern and higher portion of this range, which is called Dean Forest, rises to an average elevation of 900 feet.

The highest land in South Wales begins in the eastern districts of Caermarthenshire, traverses the southern part of Brecknock, and enters the northern portion of Monmouthshire. This range is called, at least through a considerable part of its extent, the Black Mountains, or Forest Fawr. Its highest summits are the Caermarthenshire Beacons, on the boundary-line between Caermarthen and Brecknock, which rise to 2596 feet, and the Brecknockshire Beacons, about 5 miles S.W. from the town of Brecknock, which attain an elevation of 2862 feet, and are the highest mountains in South Wales.

Some miles south of the Forest Fawr, and nearly opposite to its centre, are the mountains of Glamorgan. This mountain system is upwards of 36 miles long, and extends nearly 15 miles in width, from Merthyr Tydvil on the north, to Llantrissant on the south. Along the southern declivity of this mountain-system is the Plain of Glamorgan, which extends over the southern district of that county. Its surface is undulating and intersected by numerous hills and ridges of small elevation. This is the most fertile tract in South Wales; its soil being excellent and productive both in corn and grass. At the western termination of the Forest Fawr begins the Vale of the Towy, which extends on both sides of that river with an average breadth of 2 miles to its mouth, a distance of about 30 miles. The most western promontory of South Wales is traversed by a range of high hills, which are connected with the high lands south of Lampeter on the Teify. The country south of this range, to Caermarthen Bay, Milford Haven, and St. Bride's Bay, presents the appearance of an uneven plain, intersected by numerous detached hills, or rocky eminences, of an irregular and conical shape.

Climate.—Being situated nearly in the middle of the temperate zone, Great Britain enjoys the advantages arising from such a geographical position; and in addition to this it has, in common with the greatest part of Western Europe, the mildness of climate peculiar to this portion of the globe. The difference between the climate of Great Britain and the neighbouring continent is chiefly due to its insular position, and its being exposed to the winds which blow across the wide expanse of the Atlantic Ocean. Great Britain is not subject to the same degree of heat in summer, or of cold in winter, as the continental countries lying in the same parallel. Differences in latitude of course cause considerable variety of temperature throughout the island. London is probably about the same elevation above the sea as Wick in Caithness is. In London the mean temperature of the whole year is 50°39'; in summer 62°32', in autumn 51°35', in winter 39°12', and in spring 48°76'. At Wick the mean annual temperature is 46°7'; in summer 53°77', in autumn 48°35', in winter 40°35', and in spring 44°41'. The south-western part of England, especially the peninsula between the English and Bristol Channels, has a much milder climate than the districts farther east. Thus the mean annual temperature of Plymouth is 52°1'. But this observation cannot be extended to the whole western coast. At Glasgow the mean temperature of the year is 47°75'. The highest mean range of the thermometer throughout Great Britain may be fixed at about 80°, and the lowest about 10°; the cases being rare in which it exceeds the former and falls below the latter; but on the continent of Europe, within the latitudes of Great Britain, it nearly every year attains 90°, and sinks as low as zero.

The air of Great Britain contains a greater quantity of moisture than that of most other countries, which shows itself in the frequency and duration of fogs; and it appears to be a fact that Great Britain has a greater number of rainy days than the countries of continental

Europe; but at the same time it must be observed that the quantity of rain does not differ materially from that in other parts of Europe. This apparent contradiction is explained by observing, that during the latter months of the year a drizzling rain is very common in this island, and that it is nearly impossible to form a true estimate of the whole quantity which fertilises the soil and imparts to vegetation the freshness and lustre which are admired by travellers.

Population.—Since 1801 there has been a decennial Census of the population. The result of the different enumerations is given in the subjoined table:—

Date of Census.	England.	Wales.	Scotland.	Islands in the British Seas.	Total.	Decennial Rate of Increase.
1801	8,350,859	541,677	1,808,420	78,000	10,578,956	
1811	9,553,021	611,235	1,805,864	80,000	12,950,120	14 per cent.
1821	11,281,883	718,353	2,091,521	89,508	14,181,265	16 "
1831	13,090,523	806,274	2,364,336	103,710	16,364,893	15 "
1841	14,997,427	911,705	2,620,184	124,049	18,653,356	13 1/2 "
1851	16,931,898	1,008,721	2,888,742	143,126	20,959,477	12 1/2 "

In 1851 the proportion between the sexes was—males, 10,928,558; females, 10,785,918.

In the columns which follow are given the area of the different counties of England, Wales, and Scotland, with the population of each in 1801, 1821, 1841, and 1851; also the estimated area of the Islands in the British Seas, with the population of each in 1821, 1831, 1841, and 1851.

Revenue, Debt, &c.—The following table exhibits the total revenue of the United Kingdom of Great Britain and Ireland, with the principal items specified, for the years 1848, 1848, and 1853:—

	1848.	1848.	1853.
Total Revenue	£32,582,817	£33,368,717	£34,430,344
Customs	21,033,717	20,999,152	20,903,734
Excise	12,877,529	14,184,035	15,397,724
Stamps	6,948,187	6,643,772	6,978,416
Taxes	4,190,486	4,314,704	3,153,867
Property and Income Tax	5,249,261	5,347,365	5,588,173
Post-office	395,000	815,000	1,104,000

For the years 1848, 1848, and 1853, the total expenditure, with the principal items stated, is here set forth:—

	1843.	1848.	1853.
Total Expenditure	£31,139,515	£34,185,136	£31,174,839
Interest and Management of National Debt	29,269,160	28,563,517	27,804,845
Civil List	290,307	292,245	299,573
Army	3,997,156	6,647,384	7,028,488
Navy	6,806,037	7,922,287	6,640,696
Ordnance	1,910,704	3,076,124	2,661,591

The capital of the National Debt amounted in 1843 to 790,576,392*l.*, in 1848 to 791,809,388*l.*; in 1853 it was 770,923,001*l.*

Poor Rates, &c.—In the year 1852 the local rates (for England and Wales) amounted to 10,674,962*l.*, of which the Poor's Rate, including Police Rate, was 6,552,298*l.*; the Highway Rate, 1,662,575*l.*; County and County Police Rates, 820,134*l.*; Borough, Borough Watch, and Lighting and Watching Rate, 509,038*l.*; and the Land Tax, 1,130,917*l.* The amount expended in relief of the poor in England and Wales in the year 1854 was 6,317,255*l.*; in 1853 it was 4,939,064*l.* The number of paupers relieved on 1st January 1849 was 940,851; on 1st January 1854 the number was 806,506.

Exports.—The total declared value of British and Irish produce exported from ports in the United Kingdom in 1842, 1847, 1852, and 1853 is as follows:—

	Exported to Foreign Countries.	To British Possessions.	Total.
1842	£34,019,203	£13,261,820	£47,281,023
1847	43,916,296	14,926,081	58,842,377
1852	58,579,898	19,496,959	78,076,854
1853	—	—	93,357,306

The value of foreign merchandise transhipped at ports in the United Kingdom to foreign countries and British possessions amounted in 1851 to 2,965,335*l.*, in 1852 to 3,706,662*l.*, in 1853 to 5,278,074*l.*

Shipping.—The total amount of tonnage entered and cleared with cargoes at the ports of the United Kingdom in the years 1843, 1848, and 1853 is given in the following table:—

	Entered.			Cleared.		
	British.	Foreign.	Total.	British.	Foreign.	Total.
	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.
1843	2,919,828	1,005,894	3,925,722	2,727,306	1,050,063	3,777,369
1848	4,020,416	1,559,046	5,579,461	3,553,777	1,497,460	5,051,237
1853	4,512,207	2,284,843	7,797,050	4,551,493	3,242,118	7,793,611

The number and tonnage of sailing and steam-vessels (exclusive of river steamers) belonging to the United Kingdom in 1853, were:—17,567 sailing-vessels, tonnage 3,511,327, employing 156,006 men, exclusive of masters; and 639 steam-vessels, tonnage 218,260, employing 17,519 men, exclusive of masters. The number of vessels built and registered in the United Kingdom during 1853 was 645 sailing-vessels of 154,956 tons, and 153 steam-vessels of 48,215 tons.

Education and Religious Worship.—According to the Census Returns of 1851, the number of places of worship and of Sunday schools is as follows, namely:—

	England.	Wales.	Islands in the British Seas.	Scotland.
Places of Worship—				
Established Church	14,077	979	75	1,183
Others	16,918	2,498	178	9,212
Totals	30,995	3,477	253	10,395
Sittings provided				
Established Church	5,317,915	264,546	37,463	767,088
Others	4,027,223	802,877	44,521	1,067,717
Totals	9,345,138	1,067,423	82,084	1,834,805
Sunday Schools—				
Established Church	9,997	430	56	1,095
Others	10,369	2,341	106	3,708
Totals	20,366	2,771	162	4,803
Sunday Scholars—				
Established Church	901,828	34,064	6,804	76,233
Others	1,197,833	239,314	8,673	216,316
Totals	2,099,661	283,378	15,477	292,549
Day Schools				
Scholars	43,152	1,684	340	5,242
Evening Schools	2,010,500	98,092	15,732	868,517
Scholars	1,500	39	—	433
Scholars	38,875	908	—	13,071

The proportion of day scholars to the population in 1851 for the whole of England and Wales was 12.0 per cent. (or 1 in 8); the districts or counties which were under 10 per cent. being South Wales, 8.6; North Wales, 9.0; Monmouth, 9.0; and Hereford, 9.9. The proportion for Bedfordshire was 10.4; Lancaster, 10.6; Middlesex, 10.6; Durham, 12.6; Cumberland, 13.0; Cambridgeshire, 13.1; Oxfordshire, 13.8; Hertfordshire, 14; Westmoreland, 15.4.

The proportion of day scholars to the whole population in Scotland was 12.76 per cent. As the returns were not furnished so freely in Scotland as in England, Mr. Horace Mann reports to the Registrar-General: "Making a fair allowance for deficient returns, it seems probable that about 14 per cent. (or 1 in 7) of the people of Scotland are at school. For the islands in the British Seas the proportion is 11 per cent. (or 1 in 9) of the population." In the above table the term Established Church as applied to Scotland, means of course the Presbyterian Established Church.

History.—In the article BRITANNIA will be found an account of Britain under the Romans; under ENGLAND a notice of the Anglo-Saxon period; historical notices respecting SCOTLAND and WALES are given under these heads, as well as in the articles on the different countries. We here insert a list of the sovereigns of England from William the Norman; separate notices of each of the sovereigns and of the more prominent events of their reign will be found in the Biographical Division of the English Cyclopædia.

Norman Line:—

1066	William the Conqueror.	1100	Henry I.
1087	William Rufus.	1155	Stephen.

Line of Plantagenet:—

1154	Henry II.	1272	Edward I.
1169	Richard I.	1307	Edward II.
1199	John.	1327	Edward III.
1216	Henry III.	1377	Richard II.

House of Lancaster:—

1399	Henry IV.	1422	Henry VI.
1413	Henry V.		

House of York:—

1461	Edward IV.	1483	Richard III.
1483	Edward V.		

House of Tudor:—

1485	Henry VII.	1553	Jane Grey.
1509	Henry VIII.	1553	Mary.
1547	Edward VI.	1558	Elizabeth.

House of Stuart:—

1603	James I.	1625	Charles I.
------	----------	------	------------

Commonwealth, from the Execution of Charles I. in 1649:—

1653	Oliver Cromwell, Protector.
1660	Richard Cromwell, ditto.

House of Stuart, restored:—

1660.	Charles II.	1685	James II.
-------	-------------	------	-----------

House of Orange:—

1689	William III., with Mary II., till 1695.
------	---

House of Stuart, restored:—

1702	Anne.
------	-------

House of Hanover:—

1714	George I.	1820	George IV.
1727	George II.	1830	William IV.
1760	George III.	1837	Victoria.

Government and Administration.—The English form of government is generally called a limited or constitutional hereditary monarchy; but this is an imperfect and inaccurate description. The sovereign power may be considered as residing in three bodies or estates—King, Lords, and Commons. These three estates constitute the Parliament, and the concurrence of these three limbs or members of the sovereign power is necessary for enacting, annulling, or altering any law. The House of Lords consists of the temporal peers of England, the elective peers of Scotland and Ireland, the bishops of England, and four Irish lords spiritual, who sit by rotation of sessions. The House of Lords is also the Supreme Court of Appeal for Great Britain and Ireland.

Since the Union with Ireland in 1801 the House of Commons has comprised 658 members, of whom there are—

For England,—County Members	143
Universities	4
Cities and Boroughs	324
Wales,—County Members	15
Cities and Boroughs	14
Scotland,—County Members	30
Cities and Boroughs	23
Ireland,—County Members	64
University	2
Cities and Boroughs	39
	— 105
	658

The administration is entrusted by the sovereign to certain great officers of state, usually from 12 to 14 in number, who together form what is called the Cabinet. The First Lord of the Treasury is generally considered the Prime Minister. The usual members of the Cabinet are, besides the Prime Minister, the Chancellor of the Exchequer, the Lord President of the Council, the Lord High Chancellor of England, the Lord Privy Seal, the Secretaries of State, the First Lord of the Admiralty, the President of the Board of Trade, the President of the Board of Control for the Affairs of India, the Secretary at War, and the Chancellor of the Duchy of Lancaster. In June 1854, in consequence of the pressure of the necessary arrangements for carrying on the war with Russia, a Secretary of State for the War Department was appointed, making in all four principal Secretaries of State—Home, Foreign, Colonies, and War.

The superior courts for the administration of justice are the High Court of Chancery; the Court of Exchequer; the Court of Queen's Bench, which is the highest Common-Law and Criminal Court in the kingdom; and the Court of Common Pleas. Besides these there are many inferior courts with local jurisdiction. Courts of assize are held by the judges in every county of England and Wales, for which purpose the country is divided into eight circuits. The judges of the superior courts are in all cases appointed by the crown for life, and are removable only upon an address from Parliament to the crown.

England and Wales are ecclesiastically divided into two provinces—York and Canterbury—containing 25 bishoprics or dioceses, besides that of the Isle of Man. Every parish is under the spiritual charge of a clergyman, who is either rector, vicar, or perpetual curate. Each parish has the management of various matters relating to its own concerns, the inhabitants meeting together in a body, or by a certain number selected from the general body, for the purpose of levying rates for the support of the poor and for other local purposes. Certain officers are chosen annually by the ratepayers to superintend the distribution of these funds. The government of the northern part of the island will be noticed in the article SCOTLAND.

Language.—1. The Irish language. This is generally admitted to be the purest form of the Celtic speech, which appears to have at one time been common to all the inhabitants of both islands. The Irish, as is well known, is still a spoken language. The oldest Irish manuscript, a collection of bardic legends called the 'Psalter of Cashel,' compiled by Cormac M'Culinan, bishop of Cashel and king of Munster, is believed to be no older than the latter part of the 9th century; but some of the bardic compositions that have been preserved in this and other records are supposed to be of much higher antiquity; though doubtless, if they are so, they must have been greatly altered from their original form before being committed to writing. The national chronicles pretend to furnish a list of the names of the bards from about the first century of the Christian era; and some of the fragments of their compositions that have come down to us are assigned to so early a date as the 5th century. Of the remains of the ancient Irish literature, however, by far the most valuable are the prose records of Tigernach and the other annalists, which appear to have been written in the 11th and 12th centuries, but profess to be compiled from documents of much earlier date. The natives of Ireland who in modern times have written either in Latin or in English, and among whom are some of the most distinguished names of which our literature has to boast, must be considered, in their literary capacity at least, as Englishmen.

2. The Gaelic, or Celtic of Scotland. This is also still a spoken language. It is a sister dialect of the Irish, which it so much resembles that the Bible and a few other books in Irish were, till very recently, the only printed literature which the Gael of Scotland possessed. It is believed that not even a manuscript in Gaelic exists which is older than the 15th century, although some of the compositions in verse which have been preserved in the language may be of greater antiquity. The celebrated Poems of Ossian appear to be founded upon the compositions of Irish bards who lived in the 11th and 12th centuries. The Gaelic originals, so far as they exist, of the productions published by Macpherson under this title, have been printed with a literal Latin translation by the Highland Society of Scotland; and besides a few grammars and dictionaries, there now also exist in a printed form Gaelic translations of the Bible, of the Psalms in verse, and of a very few English works, mostly religious.

3. The Manks, or language of the Isle of Man. This is another dialect of the Celtic. Formerly, at least, the language of the northern half of the island more resembled the Scottish Gaelic; that of the south, the Irish. (See Letter from John Meryk, bishop of the see, in Camden's 'Britannia.') The Bible, the English Prayer-Book, and a few religious tracts are almost the only works that have been printed in the Manks.

4. The Welsh. The remains which we possess of the ancient Welsh literature are very considerable, both in quantity and value. They consist chiefly of the poems of the bards, of the collections of verses called Triads, of the Bruts, or Chronicles, and of some early laws. The four principal and most ancient Welsh bards are Aneurin, Taliesin, Llywarch Hen, and Merlin, or Merdhin, the Caledonian, who are all believed to have flourished in the 6th century. The other ancient bardic remains extend over the five following centuries. The Triads are collections of metrical triplets, for the most part commemorative of historical events, which appear in their present form to be a compilation of the 13th century, though founded on earlier records now lost. The remains of the ancient Welsh laws, the most important of which are those enacted by Howel Dha, prince of South Wales, in the early part of the 10th century, have been printed by Wotton in his 'Leges Wallice,' folio, London, 1730. The Bible and some religious works have been translated into Welsh in modern times.

5. The Cornish. The Cornish was a spoken language little more than a century ago, but is believed to be now altogether lost, with the exception of the Lord's Prayer and the Creed (which are given by Camden), and a short vocabulary collected by Dr. Borlase in his 'Antiquities of Cornwall,' folio, 1754 and 1769. From these specimens it appears to have been a sister dialect of the Welsh. If any literary compositions ever existed in Cornish they have wholly perished.

6. The Norse. This is the name given to the tongue that used to be spoken by the people of the Orkneys, and that perhaps is not yet altogether extinct there. It is, or was, a Gothic dialect; but we are not aware that any composition in it exists, with the exception of a version of the Lord's Prayer, first given by the Rev. Dr. James Wallace, a clergyman of these islands, in his 'Account of the Orkneys,' 8vo., London, 1700.

7. The Anglo-Saxon. If we disregard the opinion which supposes

a Teutonic tongue, identical with or nearly resembling the Anglo-Saxon, to have been brought over to the south of Britain by the Belgic colonists that had settled in the country before the arrival of Cæsar (ENGLAND), the period during which the Anglo-Saxon was the spoken language of that part of the island, or rather indeed of the whole island from the Channel to the Forth, with the exception of the strips along the west coast, which continued to be occupied by the Welsh and other apparently cognate tribes, may be rudely defined as extending from the settlement of the Angles and Saxons about the beginning of the 6th century to the close of the 12th century. We possess a series of Anglo-Saxon literary compositions in prose and verse, from at least the latter part of the 7th century; and although the earlier specimens are both scanty and, in all probability, considerably corrupted, those of later times have come down to us in ample quantity, and to a great extent in perfect preservation.

8. The English language. We cannot here attempt any detailed account of the formation and progress of the English language; but we may note the great epochs of its history, from its rise out of the Saxon in the 12th century to its settlement into the form in which it now exists.

For the first century after the Conquest, as already observed, the language of the body of the nation continued to be Saxon, substantially of the same character with that which had for ages before been spoken by their ancestors. The transmutation of the Saxon into English appears to have been principally effected by the intermixture of the conquered people and their conquerors, which began to take place in the 12th century. Had the English been left to themselves, there seems to be no reason to suppose that they would ever have either abandoned or corrupted the tongue of their forefathers. The corruption of the Saxon, a language of a pure Teutonic lineage and character, and refined to a high degree of grammatical complication and artifice, into the inarticulate chaotic jumble which about this time began to take its place, must have been the work, not of those to whom it was vernacular, but of the foreigners who, in endeavouring to speak it, naturally mixed it with the vocables, and metamorphosed it by the imposition of the grammatical forms of their native tongue. In other words, it must have been the Normans that broke down the Saxon into English. This view is confirmed by three remarkable facts: first, that the change took place at the very time when, according to the testimony of contemporary writers, the two races that had till now had little association with each other, began to intermix; secondly, that one of the accompaniments or characteristics of the change was the infusion into the old Saxon of many Norman or French vocables; thirdly, that its other characteristic or constituting circumstance was the substitution of the very grammatical forms which were already in use in the French language, namely, the method of separate particles and auxiliaries, for that of inflection. No reason can be assigned why the Saxons themselves should have adopted either of these innovations; they could only have come from the Normans. To them therefore we must attribute the creation of our modern English tongue, which, although to a great extent founded upon the Saxon, and also retaining much of its genius and character, yet wholly differs from it in two important respects; first, that in its vocabulary it is a very mixed instead of a comparatively pure language; secondly, that its grammatical structure proceeds, as just explained, upon a wholly opposite principle to that which prevailed in the Saxon. The ancient forms of the language however were by no means at once thrown off, and in some respects what may be called its transition-state from Saxon to English may be said to have lasted till the middle of the 15th century; but although down to that comparatively recent date it still retained in its general structure various Saxonisms which are now obsolete, these remnants of its pre-existing shape and constitution had been gradually dropping off for at least a hundred years preceding. Dating then the dissolution of the Saxon and the birth of the English from the middle of the 12th century, we may say that the language continued still as much Saxon as English to the middle of the 14th century. It was nearly two centuries more before the Saxon peculiarities that refused to assimilate with the new forms had altogether disappeared. Before the middle of the 16th century, however, the language had assumed throughout very nearly the structural character which it still retains; it has been constantly indeed receiving accessions to its vocabulary down to the present hour, but in other respects the variations it has undergone from that date amount properly only to changes of style, not of structure. It was in all its essential characteristics the same language in the reign of Henry VIII. that it is now.

The details of English literature will be found in the biographies of the principal writers. [ENG. CYC., BIOG. DIV.]

GREAT MARLOW. [MARLOW.]

GREAT MISSENDEN. [BUCKINGHAMSHIRE.]

GREATHAM. [DURHAM.]

GREECE, ANCIENT, lay between 35° and 40° N. lat., and was bounded N. by Illyria and Macedonia, from which countries it was separated by an extensive range of mountains, which extend from Mount Olympus, in the north-eastern corner of Thessaly, to the Acroceraunian Mountains, in the north-western corner of Epirus. This country was divided into a number of independent states, the history and description of which are given in separate articles, as

GEOG. DIV. VOL. III.

ATTICA, ARCADIA, ACHÆA, BEOTIA, CORINTH, &c. It was called Greece by the Romans, whence the name has descended to us. The Græci however were only one of the ancient tribes of Epirus (Aristot., 'Meteor.' i. 14), and never became of any historical importance, though their name must at some period have been extensively spread on the western coast, since the inhabitants of Italy appear to have known the country at first under this name. In the Greek authors the country comprehended within the above limits is called Hellas, though it must be remarked that Hellas had a more extensive signification than we attach to the word, and was used in general to denote the country of the Hellenes wherever they might happen to be settled; thus the Grecian colonies of Cyrene in Africa, of Miletus in Asia, and of Syracuse in Sicily, formed as essential parts of Hellas as Attica, Arcadia, or Bœotia. Thus Herodotus tells us (ii. 182) that Amasis, king of Egypt, sent many presents to Hellas; and the places enumerated are Cyrene, Lindus in Rhodes, and the island Samus.

Greece is usually divided by geographers into two parts, which are united by the isthmus of Corinth. The northern part contained THESSALY; EPIRUS; ACARNANIA; ÆTOLIA; LOCRIS, divided into Opuntian and Epicnemidian Locris, and Ozolian Locris; DORIS; PHOCIS; BEOTIA; MEGARIS; and ATTICA. The southern part, called Peloponnesus, contained LACONIA; MESSENIA; ARCADIA; ELIS; ARGOLIS; ACHÆA; SICYONIA; and CORINTH. In addition to these states, we must reckon the numerous islands on the eastern and western coasts, which were all inhabited by the Greek race.

Greece, in the flourishing periods of its history, was in all probability densely populated. According to a calculation of Mr. Clinton ('Fasti Hellenici,' vol. ii., p. 386), in which he includes the population of the islands of Eubœa, Corcyra, Leucadia, Ithaca, Cephallenia, Zacynthus, Cythera, Ægina, and Salamis, it contained a population of more than 3,500,000 inhabitants, from the time of the Persian wars to the death of Alexander the Great. Greece, including the islands already named, contains about 22,121 square miles; consequently there were rather more than 158 persons to the square mile, a rate of population very little inferior to that of Great Britain in 1821, which contained 165 persons to the square mile. But it must be remarked, that Mr. Clinton's calculation of positive numbers rests on a basis which, for any country or age, cannot be depended on as giving trustworthy results.

History. First Period.—From the earliest times to the Trojan war.—The people whom we call Greeks (the Hellenes) were not the earliest inhabitants of the country. Among the names of the many tribes which are said to have occupied the land previous to the Hellenes, the most celebrated is that of the Pelasgi, who appear to have been settled in most parts of Greece, and from whom a considerable part of the Greek population was probably descended. The Caucones, Leleges, and other barbarous tribes, who also inhabited Greece, have all been regarded by some modern writers as parts of the Pelasgic nation. All these tribes however were obliged to submit to the power of the Hellenes, who eventually spread over the greater part of Greece. Their original seat was, according to Aristotle ('Meteor,' i. 14), near Dodona, in Epirus, but they first appeared in the south of Thessaly about B.C. 1384, according to the common chronology. In accordance with the common method of the Greeks, of inventing names to account for the origin of nations, the Hellenes are represented as descended from Hellen, who had three sons, Dorus, Xuthus, and Æolus. Achæus and Ion are represented as the sons of Xuthus; and from these four—Dorus, Æolus, Achæus, and Ion, the Dorians, Æolians, Achæans, and Ionians were descended, who formed the four tribes into which the Hellenic nation was for many centuries divided, and who were distinguished from each other by many peculiarities in language and institutions. At the same time that the Hellenic race was spreading itself over the whole land, numerous colonies from the east are said to have settled in Greece, and to their influence many writers have attributed the civilisation of the inhabitants. Thus we read of Egyptian colonies in Argos and Attica, of a Phœnician colony at Thebes in Bœotia, and of a Mysian colony led by Pelops, from whom the southern part of Greece derived its name of Peloponnesus. The very existence of these colonies has been doubted by some writers; and though the evidence for each one individually is perhaps not sufficient to satisfy the critical inquirer, yet the uniform tradition of the Greeks authorises us in the belief that Greece did in early times receive colonies from the East—a supposition which is not in itself improbable, considering the proximity of the Asiatic coast.

The time which elapsed from the appearance of the Hellenes in Thessaly to the siege of Troy is usually known by the name of the 'heroic age.' Whatever opinion we may form of the Homeric poems, it can hardly be doubted that they present a correct picture of the manners and customs of the age in which the poet lived, which in all probability differed little from the manners and customs of the heroic age. The state of society described by Homer very much resembles that which existed in Europe in the feudal ages. No great power had yet arisen in Greece; it was divided into a number of small states, governed by hereditary chiefs, whose power was limited by a martial aristocracy. Piracy was an honourable occupation, and war the delight of noble souls. Thucydides informs us (i. 4) that the commencement of Grecian civilisation is to be dated

from the reign of Minos of Crete, who acquired a naval power and cleared the Ægean Sea of pirates. Among the most celebrated heroes of this period were Bellerophon and Perseus, whose adventures were laid in the East; Theseus, the king of Athens; and Hercules. Tradition also preserved the account of expeditions undertaken by several chiefs united together, such as that of the Argonauts, of the Seven against Thebes, and of the siege of Troy, B.C. 1184.

Second Period:—From the Siege of Troy to the commencement of the Persian Wars, B.C. 500.—We learn from Thucydides (i. 12) that the population of Greece was in a very unsettled state for some time after the Trojan war. Of the various migrations which appear to have taken place, the most important in their consequences were those of the Boeotians from Thessaly into the country afterwards called Bœotia, and of the Dorians into Peloponnesus, the former in the 60th and the latter in the 80th year after the Trojan war. About the same period the western coast of Asia Minor was colonised by the Greeks. The ancient inhabitants of Bœotia, who had been driven out of their homes by the invasion of the Boeotians, together with some Æolians, whence it has acquired the name of the Æolian migration, left Bœotia, B.C. 1124, and settled in Lesbos and the north-western corner of Asia Minor. They were followed by the Ionians in B.C. 1040, who, having been driven by the Achæans from their abode on the Corinthian Gulf, had taken refuge in Attica, whence they emigrated to Asia Minor and settled on the Lydian coast. The south-western part of the coast of Asia Minor was also colonised about the same period by Dorians. The number of Greek colonies, considering the extent of the mother country, was very great; and the readiness with which the Greeks left their homes to settle in foreign parts forms a characteristic feature in their national character. In the 7th century B.C. the Greek colonies took another direction: Cyrene, in Africa, was founded by the inhabitants of Thera; and the coasts of Sicily and the southern part of Italy became studded with so many Greek cities, that it acquired the surname of the Great, or Greater Greece.

The two states of Greece which attained the greatest historical celebrity were SPARTA and ATHENS. The power of Athens was of later growth; but Sparta had from the time of the Dorian conquest taken the lead among the Peloponnesian states, a position which she maintained by the conquest of the fertile country of Messenia, B.C. 688. Her superiority was probably owing to the nature of her political institutions, which are said to have been fixed on a firm basis by her celebrated lawgiver Lycurgus, B.C. 684. Athens only rose to importance in the century preceding the Persian wars; but even in this period her power was not more than a match for the little states of Megaris and Ægina.

We have already seen that the kingly form of government was prevalent in the heroic age. But during the period that elapsed between the Trojan war and the Persian invasion hereditary political power was abolished in almost all the Greek states, with the exception of Sparta, and a republican form of government established in its stead. In studying the history of the Greeks we must bear in mind that almost every city formed an independent state, and that, with the exception of Athens and Sparta, which exacted obedience from the other towns of Attica and Laconia respectively, there was hardly any state which possessed more than a few miles of territory. Frequent wars between each other were the almost unavoidable consequence of the existence of so many small states nearly equal in power. The evils which arose from this state of things were partly remedied by the influence of the Amphictyonic council, and by the religious games and festivals which were held at stated periods in different parts of Greece, and during the celebration of which no wars were carried on.

In the 6th century before the Christian era Greece rapidly advanced in knowledge and civilisation. Literature and the fine arts were already cultivated in Athens under the auspices of Pisistratus and his sons; and the products of remote countries were introduced into Greece by the merchants of Corinth and Ægina.

Third Period:—From the commencement of the Persian wars to the death of Philip of Macedon, B.C. 336.—This was the most splendid period of Grecian history. The assistance which the Athenians gave to the Asiatic Greeks in their resistance to the Persians, and the part which they took in the burning of Sardis, B.C. 499, drew upon them the vengeance of Darius. After the reduction of the Asiatic Greeks, a Persian army was sent into Attica, but was entirely defeated at Marathon, B.C. 490, by the Athenians under Miltiades. Ten years afterwards the whole power of the Persian empire was directed against Greece; an immense army, led in person by Xerxes, advanced as far as Attica, and received the submission of almost all the Grecian states, with the exception of Athens and Sparta. But this expedition also failed; the Persian fleet was destroyed by the battles of Artemisium and Salamis; and the land forces were entirely defeated in the following year, B.C. 479, at Plataea in Bœotia. Sparta had, previous to the Persian invasion, been regarded by the other Greeks as the first power in Greece, and accordingly she obtained the supreme command of the army and fleet in the Persian war. But during the course of this war the Athenians had made greater sacrifices, and had shown a greater degree of patriotism and courage. After the battle of Plataea a confederacy was formed by the Grecian states for the

purpose of carrying on the war against the Persians. Sparta was at first placed at the head of it; but the allies, disgusted with the tyranny of Pausanias, the Spartan commander, gave the supremacy to Athens. The allies, who consisted of the inhabitants of the islands and coasts of the Ægean Sea, were to furnish contributions in money and ships, and the delicate task of assessing the amount which each state was to pay was assigned to Aristides. The yearly contribution was settled at 460 talents, about 115,000*l.*, and Delos was chosen as the common treasury. The Athenians, under the command of Cimon, carried on the war vigorously, defeated the Persian fleets, and plundered the maritime provinces of the Persian empire. During this period the power of Athens rapidly increased; she possessed a succession of distinguished statesmen, Themistocles, Aristides, Cimon, and Pericles, who all contributed to the advancement of her power, though differing in their political views. Her maritime greatness was founded by Themistocles, her revenues were increased by Pericles, and her general prosperity, in connection with other causes, tended to produce a greater degree of refinement than existed in any other part of Greece. Literature was cultivated, and the arts of architecture and sculpture, which were employed to ornament the city, were carried to a degree of excellence that has never since been surpassed. While Athens was advancing in power, Sparta had to maintain a war against the Messenians, who again revolted, and were joined by a great number of the Spartan slaves (B.C. 464-455). The Athenians after awhile began to treat the allied states with great tyranny, and to regard them as subjects, and not as independent states in alliance. The dependent states, anxious to throw off the Athenian dominion, entreated the assistance of Sparta, and thus, in conjunction with other causes, arose the war between Sparta and Athens, which lasted for twenty-seven years (B.C. 431-404), and is usually known by the name of the Peloponnesian War. It terminated by again placing Sparta at the head of the Grecian states. Soon after the conclusion of this war Sparta engaged in a contest with the Persian empire, which lasted from B.C. 400 to 394. The splendid successes which Agesilaus, the Spartan king, obtained over the Persian troops in Asia Minor, and the manifest weakness of the Persian empire, which had been already shown by the retreat of the 10,000 Greeks from the heart of the Persian empire, appear to have induced Agesilaus to entertain the design of overthrowing the Persian monarchy; but he was obliged to return to his native country to defend it against a powerful confederacy which had been formed by the Corinthians, Thebans, Argives, Athenians, and Thessalians, for the purpose of throwing off the Spartan dominion. The confederates were not however successful in their attempt; and the Spartan supremacy was again secured for a brief period by a general peace made B.C. 387, usually known by the name of the Peace of Antalcidas. Ten years afterwards the rupture between Thebes and Sparta began, which led to a general war in Greece, and for a short time placed Thebes at the head of the Grecian states; but after the death of Epaminondas at the battle of Mantinea, B.C. 362, Thebes again sunk to its former obscurity. The Spartan supremacy was however destroyed by this war, and her power still more humbled by the restoration of Messenia to independence, B.C. 369. From the conclusion of this war to the reign of Philip of Macedon Greece remained without any ruling power. It is only necessary here to mention the part which Philip took in the Sacred War, which lasted ten years (B.C. 356-346), in which he appeared as the defender of the Amphictyonic council, and which terminated by the conquest of the Phocians. The Athenians, urged on by Demosthenes, made an alliance with the Thebans for the purpose of resisting Philip; but their defeat at Chæronea, B.C. 338 secured for the Macedonian king the supremacy of Greece. In the same year a congress of Grecian states was held at Corinth, in which Philip was chosen generalissimo of the Greeks in a projected war against the Persian empire; but his assassination in B.C. 336 caused this enterprise to devolve upon his son Alexander.

Fourth Period:—From the accession of Alexander the Great to the Roman Conquest, B.C. 146.—The conquests of Alexander extended Greek influence over the greater part of Asia west of the Indus. After his death the dominion of the East was contested by his generals, and two powerful empires were permanently established; that of the Ptolemies in Egypt, and the Seleucids in Syria. The dominions of the early Syrian kings embraced the greater part of Western Asia; but their empire was soon divided into various independent kingdoms, such as that of Bactria, Pergamos, &c., in all of which the Greek language was spoken, not merely at court, but to a considerable extent in the towns. From the death of Alexander to the Roman conquest Macedonia remained the ruling power in Greece. The Ætolian and Achæan leagues were formed, the former B.C. 324, the latter B.C. 281, for the purpose of resisting the Macedonian kings. Macedonia was conquered by the Romans, B.C. 197, and the Greek states declared independent. This however was merely nominal: they only exchanged the rule of the Macedonian kings for that of the Roman people; and in B.C. 146 Greece was reduced to the form of a Roman province, called Achæa, though certain cities, such as Athens, Delphi, &c., were allowed to have the rank of free towns. The history of Greece from this period forms part of that of the Roman empire. It was overrun by the Goths in A.D. 267, and again in A.D. 398, under Alaric; and after being occupied by the crusaders and Venetians, at last fell into

the power of the Turks on the conquest of Constantinople. Its recent history will be noticed in the following article.

Language and Literature.—The Greek language forms a branch of that extensive family of languages which is known by the name of Indo-Germanic. It has existed as a spoken language for at least 3000 years, and has been more widely diffused than any other tongue, unless we except the Arabic and English. It had attained a great degree of perfection in the 9th century before the Christian era; and it was eventually spoken not only in Greece and the numerous Grecian colonies, but was extended over a large part of Western Asia by the conquests of Alexander. It is evident from the books of the New Testament, that the lower orders in Palestine could converse in Greek as well as in their native Syriac; and many of the books of the New Testament were written in Greek by men who had received very little education. In Egypt also, under the Ptolemies, Greek became the language of a large proportion of the townspeople, and was used, jointly with the native language, in the business of administration. The conquest of Greece by the Romans tended still further to the diffusion of the Greek language; and though the study was condemned by Cato and many others of the old school, "it soon became a fashion for well-educated Romans to read, to speak, to translate, and even to write in this foreign language." Under the dominion of the Cæsars the language and literature of Greece were not only taught at Athens and Rome, but in every part of the Roman empire Greek philosophers and rhetoricians were maintained by their numerous pupils. After the fall of the Western empire and the extinction of learning in the west, the Greek literature and philosophy were still cultivated in Asia and at Constantinople, where Greek continued the spoken language of the people till the city was taken by the Turks in the 15th century. This is usually considered as the time at which it ceased to be a living language; but the best specimens of modern Greek, as it is called, can be read without much difficulty by any person acquainted with the Greek of Xenophon and Demosthenes; and the resemblance between the ancient and modern language is sufficient to justify us in considering the Greek language as one which has not ceased to be spoken from the time of Homer to the present day.

The Greek language is usually divided into four dialects, the *Æolic*, *Ionic*, *Doric*, and *Attic*, the peculiarities of which are noticed under the articles *ÆOLIANS*, *DORIS*, and *IONIA*. The *Boeotian*, *Thessalian*, *Laconian*, and *Sicilian* dialects are only subdivisions. The four dialects may however be reduced to two, the *Æolic* or *Doric*, and the *Ionic* or *Attic*: the latter originally spoken in the northern part of Peloponnesus and Attica, the former in the other parts of Greece. Till the time of Alexander the Greeks generally wrote in that dialect in which they had been brought up, and thus we have works in the *Æolic*, *Ionic*, *Doric*, and *Attic* dialects. But the number and superiority of the *Attic* writers gradually caused this dialect to be adopted by Greeks who were not natives of Attica; and thus the *Attic* dialect, somewhat modified by the peculiarities of other dialects, was called the common or Hellenic dialect (*ἡ κοινή*), or *ἡ ἑλληνική διάλεκτος*; in which almost all Greek prose writers from the time of Aristotle composed their works. Writers in this common dialect are, Aristotle, Theophrastus, Polybius, Diodorus, Strabo, Plutarch, Dionysius of Halicarnassus, Lucian, *Ælian*, Dion Cassius, Appian, and many others; though some of these writers, such as Lucian, Arrian, in his *Anabasis*, *Ælian*, &c., endeavoured to write in the pure *Attic* dialect, and to avoid every phrase which was not sanctioned by some *Attic* writer such as Xenophon or Thucydides. Poetry however was not written in this common dialect; the peculiarities of the Homeric dialect were imitated by all succeeding poets; and the poets of the Alexandrian school, such as Apollonius and Callimachus, and at a later period Nicander, Oppian, and others, continued to write in the Homeric dialect, or in what they considered such, which could only be thoroughly intelligible to those who had received a learned education. In the countries where the Macedonians established themselves the *Attic* dialect received many modifications; and as Alexandria in Egypt was, under the Ptolemies, the principal place where this dialect was cultivated, it was called the Alexandrine or Macedonian dialect. The Septuagint version of the Old Testament was written in this dialect; but it can hardly be considered as a fair specimen of the language spoken at Alexandria, since the Jewish translators have introduced into the version many Hebrew phrases and constructions. The New Testament was written in the same dialect, whence it has passed with some variations into the writings of the fathers, and has been called Ecclesiastical Greek. The Greek spoken at Constantinople became more corrupted, and so many foreign words were introduced into the language, that a glossary is necessary for understanding the writers of the Eastern empire.

The history of Greek literature may be divided into three periods: the first extending from the earliest times to the rise of Athenian literature; the second comprising the flourishing period of Athenian literature; and the third comprehending all the writers from the time of Alexander to the taking of Constantinople by the Turks. We shall conclude the article with a few observations on the rise of Greek literature.

The Greek colonies of Asia Minor appear to have attained a considerable degree of civilisation soon after their foundation, a circumstance probably owing to their intercourse with the Lydians and other

Asiatic nations, and to their exemptions from the political revolutions to which the mother-country was exposed. It was in the *Ionian* and *Æolian* cities on the coast of Asia Minor that the literature of Greece originated; and to the Greeks transplanted into Asia we are indebted for the earliest specimens we possess of Greek poetry and historical composition. Whether we look upon the *‘Iliad’* and *‘Odyssey’* as the work of one individual or of many bards, it must be regarded as the composition of Asiatic Greeks, and is a proof of the perfection which the language had attained in the 9th or 10th century before our era. Of the poets previous to Homer nothing satisfactory is known. Olen is mentioned by Pausanias (ix., 27, 2) as the most ancient; he was followed by Linus, Orpheus, Musæus, and many others. There were many poems circulated in the later ages of Greek literature under the names of Linus, Orpheus, and Musæus, some of which have come down to us, but they cannot be regarded as the genuine works of these ancient poets. Their poems appear to have been upon religious subjects, and were entitled *‘Hymns’* (*ὕμνοι*). The *‘Iliad’* and *‘Odyssey’* formed a part of a series of poems, which are usually known by the name of the *‘Epic Cycle’*. The poems known under this name were arranged according to the order of events by the grammarians of Alexandria, and included the works of many bards, of whom the most celebrated besides Homer were Hesiod, Arctinus (b.c. 775), Cinæthon (b.c. 765), Stasinus, Prodicus, Augias, and Lesches (b.c. 657). Lyric poetry arose on the decline of the epos, and was much cultivated from about b.c. 776 to the commencement of the Persian wars. The lyric poems of this period were considered, even in the most flourishing periods of Athenian poetry, as one of the most valuable parts of Greek literature. Unfortunately we have nothing remaining of them but a few fragments, which are hardly sufficient to enable us to form an opinion upon the subject. Many of the lyric poems bordered upon the epic, and contained the subjects of heroic song. They were sung, accompanied by music, by bands of youths and maidens; and in course of time a performer was introduced during pauses in the song to narrate the history or personate the character of some celebrated hero; to which the origin of Greek tragedy may be ascribed. But the lyric poetry of the Greeks was written for all occasions: it was employed by Archilochus, Alcæus, and Hipponax, for the purpose of satire and personal invective; by Tyrtæus, Terpander, and Alcman, to rouse the martial spirit of the Spartans; and by Anacreon, Ibycus, and Minnermus, to exalt the pleasures of the senses. Many didactic poems, fables, proverbs, &c., were written in the 6th century b.c. (when *Æsop* is said to have lived), and served to prepare the way for prose composition. The earliest historical compositions treated principally of mythological subjects, and many of them were little else than the *Cyclic* poems turned into prose. The earliest historical writer appears to have been Cæmus of Miletus, who lived in the beginning of the 6th century b.c.: Herodotus, who well deserves the title of *‘Father of History’*, was born b.c. 484.

Physical philosophy began to be cultivated in Asia Minor in the early part of the 6th century b.c., under Thales of Miletus. He was succeeded by Anaximander, Anaximenes, Heraclitus, and others; but the reputation of the *Ionian* school was soon eclipsed by the *Pythagorean* and *Eleatic* schools in Italy. Anaxagoras introduced into Athens the philosophy of the *Ionian* school; but the Athenian philosophers were indebted to the *Eleatic* school for the first principles of dialectic, in which they became so celebrated. The school, of which Socrates was the founder, is chiefly known to us through the writings of Plato and Xenophon. From this period philosophy was extensively cultivated at Athens. The doctrines of the Academy, over which Plato presided for nearly half a century, were somewhat modified by Arcesilaus (b.c. 296), who is considered as the founder of the *Middle*, as distinguished from the *Old Academy*. The *New Academy* was founded by Carneades, who lived about a century after Arcesilaus. The *Peripatetic*, *Stoic*, and *Epicurean* schools were founded respectively by Aristotle, Zeno, and Epicurus. Greek philosophy was studied, as we have already remarked, by the Romans; and in Rome, Athens, Alexandria, and many other cities of the Roman empire, numerous teachers of the *Platonic*, *Peripatetic*, *Stoic*, and *Epicurean* sects were supported by salaries from the state, or by private fees from their pupils. Many of the fathers, such as Clement and Origen, paid great attention to the *Platonic* philosophy as it was then taught at Alexandria; but the study of Greek philosophy gradually declined in consequence of the progress of Christianity, and the schools in which it was taught were finally suppressed in the time of Justinian.

GREECE, KINGDOM OF, consists of three great divisions, namely, Northern Greece, the Peloponnesus, and the Islands, which include the Cyclades, some of the Sporades, and Eubœa. The boundaries of Northern Greece, as determined by the commissioners of the three allied powers, Great Britain, France, and Russia, are formed by a somewhat tortuous line drawn across the continent chiefly along the summit of the range of Mount Othrys from the mouth of the river Surlotico, on the Pægassan Gulf, or Gulf of Volo, about 39° 11' N. lat., 22° 42' E. long., on the east, to the village of Menidhi (39° 3' N. lat., 21° 5' E. long.), on the Ambracian Gulf, or Gulf of Arta, on the west, which is about 137 miles long, and defined by 95 landmarks placed on the most important points. It lies between 36° 16' and 39° 20' N. lat., 20° 42' and 26° 10' E. long. The continental portion of the country is bounded N. by the Turkish pashalics of Albania

(Epirus) and Trikhala (Thessaly); and elsewhere by the Mediterranean Sea, which is known on the east as the *Ægean*, and on the west as the *Ionian Sea*. The following table shows the area, principal divisions, and population of the kingdom:—

Names.	Capitals.	Area in Eng. Sq. Miles.	Population in 1853.	
Northern Greece (Hellas).				
1. Attica and Bœotia	Athens	3,821	88,275	
2. Phocis and Phthiotis	Lamia (Zeitun)			80,693
3. <i>Ætolia</i> and <i>Acarmania</i>	Mesolonghi			98,060
Peloponnesus.				
4. Argolis and Corinth	Nauplia	10,159	106,162	
5. Achaia and Ellis	Patras			116,757
6. Arcadia	Tripolitza			115,711
7. Messenia	Kalamata			98,130
8. Laconia	Sparta			86,899
Islands.				
9. Eubœa and North Sporades	Chalcis	1,255	64,821	
10. Cyclades	Hermopolis (Syra)			134,856
Total		15,235	990,373	

Surface, Hydrography, Communications.—The physical features of Greece are broadly distinguished in the three great divisions noticed above. As a whole the country is characterised by its irregularity of form, its extremely broken outline and surface, and the remarkable extent of its coast-line; it being in this last respect, as has been well remarked, "distinguished among European countries by the same character which distinguishes Europe itself from the other continents. [see EUROPE, vol. ii. col. 981]—the great range of its coast compared with the extent of its surface; so that while in the latter respect it is considerably less than Portugal, in the former it exceeds the whole Pyrenean peninsula." (Thirlwall, 'Hist. of Greece,' c. 1.) The interior of the continent is mountainous; the plains, which are small and narrow, are for the most part along the sea-shore or by the mouths of rivers, except such as are mere basins inclosed by lofty hills. On these plains are the sites of the great cities of antiquity and the most flourishing towns of modern times.

Northern Greece, which is bounded S. by the Gulf of Corinth, includes the ancient territories of *Acarmania* and *Ætolia*, which are distinguished by the name of Western Greece, and those of *Doris*, *Phocis*, *Bœotia*, *Attica*, *Megaris*, the country of the *Locri Opuntii*, and the valley of the *Sperchius*, which constitute the division called Eastern Greece. The physical description of the country will be found under the heads *ACARNANIA*, *ÆTOLIA*, *ATTICA*, *BŒOTIA*, *PHOCIS*, &c. The country is in great part mountainous. The principal range is that of *Ceta*, which, beginning on the east on the coast of the channel of *Eubœa*, runs nearly due west across the country, joins the group of *Mount Tymphrestus* in *Ætolia*, and is only separated from the mountains of *Acarmania* and *Epirus* by the valley of the *Aspropotamos*. Offsets from the range of *Ceta* connect it on the south with the ridge of *Parnassus* in *Phocis*, and with the mountains that border the northern coast of the Gulf of Corinth, whilst to the south-east are the ridges of *Helicon*, *Cithæron*, and *Parnes*, the last of which separates *Bœotia* from *Attica*.

The second great division of the kingdom of Greece is the peninsula of the Peloponnesus, or *Morea*. A general description of its physical geography is given under *MOREA*, and more specific notices under the respective heads *ACHEEA*, *ARCADIA*, *ARGOLIS*, *CORINTH*, *ELIS*, *LAONICIA*, &c. The interior of the Peloponnesus forms an elevated table-land, traversed by numerous ridges of hills, which inclose spacious basins, some of which are occupied by marshes and small lakes. The principal ridge of mountains is that known to the ancients as the *Erymanthus*, *Lampe*, and *Cyllene*. The highest summits of the *Morea*, *Taygetus* in the south, and *Cyllene* in the north, are about 5000 feet above the sea-level. The principal plains are those of *Elis*, *Inachus*, and *Argos*. The perennial rivers are the *Alpheus*, *Eurotas*, *Pamisos*, and *Peneus*.

The third great division of Greece consists of the islands in the *Ægean Sea*, including the *Cyclades* and the *Sporades*, besides the large island of *Eubœa*. The inhabited islands, besides *Eubœa*, are distributed as follows:—1. The Western *Sporades*—*Hydra*, *Spezia*, *Ægina*, *Poros*, *Salamia*, *Angistra*. 2. The Northern *Sporades*—*Scopelos*, *Khildromi*, *Skiathos*, *Skyros*. 3. The Northern *Cyclades*—*Andros*, *Zea*, *Thermia*, *Tino*, *Mikoni*, *Syra*. 4. The Central *Cyclades*—*Naxos*, *Paros* and *Antiparos*, *Siphnos* or *Siphanto*, *Seriphos*, *Milo*, *Kimolos*, *Polikandro*, *Sikino*, *Nio*, *Amorgo*. 5. The Southern *Cyclades*—*Santorin*, *Anaphi*, *Astypalea*. *Candia*, or *Crete*, *Chios*, *Samos*, *Lesbos*, and the other islands near the coast of *Asia Minor*, still belong to *Turkey*. The physical geography of this division is given under *ARCHIPELAGO*, (vol. i. col. 443—5), *CANDIA*, and *EUBŒA*.

Greece contains no navigable rivers; and few which possess a perennial stream of any considerable size. Most of the streams are indeed little more than mountain torrents, and many even of the

larger become nearly dry in summer. The *Achelous* is still as in *Homer's* time the King of the Rivers of Greece. [*ACHELOUS*.] The other more important streams—at the present day perhaps most interesting for their classical associations—are the *Cephissus*, *Ilissus*, *ACHERON*, *Sperchius*, *ALPHEIUS*, *Pamisos*, *Inachus*, *Eurotas*, &c.; they are noticed, where distinguished by small capitals, under their titles, in other cases under the various headings to which references have already been given. The want of navigable rivers is to a great extent supplied by the numerous gulfs and inlets of the sea, which on every side deeply indent the coast, and afford unusual facilities for commercial intercourse, while they add greatly to the picturesqueness of the scenery. The chief of these inlets is the extensive Gulf of Corinth, which being surrounded, except at its mouth, by lofty mountains has the appearance of an extensive inland lake, the scenery being of the very finest kind. The other large gulfs are those of *Ambracia*, or *Arta*, *Volo*, *Egina*, *Argos*, or *Nauplia*, *Kolokythi*, *Koron*, &c. The largest of the lakes is that of *Copais*, or *Topolias* [*BŒOTIA*]; the other larger lakes are those of *Apokuro*, or *Trichonis*, *Valto*, *Lykuria*, &c., but most of the lakes are little better than marshes, and many of them are quite dry in the summer. There are no canals.

According to *Murray's* 'Hand-book for Greece,' "The only roads practicable for carriages in the whole country are that from the *Piræus* to *Athens*, that from *Athens* to *Thebes*—passing through *Eleusis* and a gorge of *Mount Cithæron*, that from *Eleusis* to *Megara*, that from *Argos* to *Nauplia*, and a few others for a short distance round *Athens*." The Greeks have almost entirely neglected the making or even maintaining of roads. The paved causeways in various parts of Greece were the work of *Venetians* or *Turks*.

Geology, Mineralogy, &c.—The ranges of *Ceta*, *Parnassus*, and *Helicon* are composed of compact gray-limestone, and this may be regarded as the characteristic rock of the country. In the *Pindus* range the prevalent rocks are of the primitive and metamorphic formations, as granite, serpentine covered with a yellowish-green *steatite*, *mica-schist*, &c. The calcareous rocks contain much *silex*. Tertiary formations abounding in fossil shells prevail along the shores of the Peloponnesus. Over the whole of Greece are traces of volcanic agency. Caverns and fissures, from which sulphureous and other mephitic vapours arise, occur in various places; their use in ancient times for religious purposes, as at *Delphi*, will be remembered. Hot and cold mineral springs are numerous. Many minerals are found in Greece, but the quantity of any of them now obtained is very small. Gold, silver, and lead, have been found in *Attica*, in the islands of *Seriphos* and *Siphnos*, and one or two other places, and though now not worked to any extent are, according to *Thiersch*, far from exhausted. *Antimony*, *zinc*, *cobalt*, *manganese*, *copper*, *sulphur*, &c., are also found. Iron occurs in *Eubœa*, *Seyros*, and *Laconia*; coal is likewise found in considerable seams in those places, and also in *Elis*. Many very beautiful kinds of marble occur in various places, including the fine white *Pentelic* marble of the ancient sculptors, and the red and green marbles of the Peloponnesus. *Porphyry* and *gypsum* are also quarried.

Climate, Soil, Productions.—The climate of Greece is probably more varied than in any other country of the same extent in Europe. *Sir W. Gall* illustrates this variety by observing, that in the month of *March* he left *Kalamata*, on the shore of *Messenia*, in a summer of its own, found spring in *Sparta*, and winter at *Tripolitza*, on the upland plain of *Arcadia*. Again while in the month of *September* the heat is intense in *Argos*, the winter is setting in on the neighbouring mountains of the Peloponnesus. Along the coast the winters are short, but the cold is intense: in *Athens* the winters are confined to *January* and *February*. In the interior the winters are longer: the mountains are capped with snow in *November*, and it does not melt from them till *June*. The spring and autumn are rainy, but the atmosphere is delightfully clear and fresh. The summers are generally long and very warm; but the "long long summer" of Greece, celebrated by poets and travellers, appears to have gained its fame from a peculiarity of the climate of *Attica*, where the atmosphere is drier and the temperature milder than elsewhere, and where during spring and autumn as well as summer there is almost undisturbed as well as nearly unequalled purity of air, and brilliant blueness of sky. In the plains the mean temperature of the year is about 62° Fahr.: at *Athens* the thermometer frequently rises in summer to 100° Fahr. In *Attica* the harvest is usually in *May*; in other parts of Greece in *June*. Violent storms occur frequently in spring and autumn. Slight shocks of earthquakes are not uncommon. *Malaria*, inducing intermittent fever, sometimes prevails along the shores, and by the swampy lakes, but elsewhere the country is generally healthy.

In its vegetation Greece resembles for the most part the provinces of southern Italy. The vine, olive, fig, orange, pomegranate, with similar fruits; nearly all the cereals; cotton and tobacco, and the myrtle, cypress and similar evergreens, grow luxuriantly in the plains and lower slopes of the mountains. Above 1500 feet is the region of the beech, chestnut, white fir, pine, and other forest trees. From about 3000 to 5000 feet the pine alone flourishes. The pine is found some 500 feet higher, but above that is a sub-alpine region, where only a few wild plants grow.

The fine forests with which the mountains were once clothed have been for the most part entirely destroyed, in great measure by the carelessness or wanton rapacity of the inhabitants themselves, and

the mountains are now naked and barren, and the springs dried up in consequence. Forests however remain still on the Taygetus, on Mount Cronion and other mountains of Arcadia, on those of Megaris, on the ridges of Parnassus and Helicon, and on part of the Ceta range. The pine is the most common timber-tree, but fine oaks are found in the northern mountains near the borders of Thessaly.

The resources of the continental part of the kingdom are derived chiefly from agriculture; but agriculture and agricultural implements are in a very backward state. Farms are mostly rented on the 'Metayer' system. Not more than a tenth of the surface of the country is under cultivation, and of this nearly five-sixths belong to the church or the state, which in most places succeeded to the property which formerly belonged to the Turkish government or to the mosques. The vineyards are almost all private property. Grain is usually grown on the plains. Northern Greece is a better corn country than the Peloponnesus. Wheat, barley, and maize are the species cultivated; oats and rye are not much in use. Rice is grown in the plains of Argos and Marathon, and the marshy tracts along the coast. Tobacco thrives, especially near Argos and Kalamata, and cotton grows also in these plains in considerable quantity. Wine is chiefly the produce of the islands: enough is made for the home consumption; it is generally good-bodied, but for want of proper management in making it, and of cellars, it does not keep beyond a year or two. Currants are cultivated in various districts, especially along the northern shores of the Peloponnesus; the demand for currants in England having greatly stimulated the culture. The olives which are largely grown in Attica, Megaris, and Salona, are of good quality, but the art of pressing and refining the oil is very imperfectly understood, and the oil is inferior to that of Provence. Silk is made in Messenia and Laconica, and also at Tinos and in other islands, but is inferior to the Italian silk. Honey is an important article of produce and a considerable quantity is exported; the honey of Hymettus and Attica usually retains its ancient celebrity. A good deal of wax is exported from Nauplia. Of fruit-trees, the almond, the fig, the chestnut, the orange, and the lemon thrive the best, but a great variety of fruit is grown. Owing to the uneven surface of the country, Greece is still more a pastoral than an agricultural country. Horned cattle however are not numerous, being almost exclusively used for the labours of the field. There are numerous flocks of sheep and goats, which migrate to the mountains in the spring, and return to the plains after the harvest. The produce of wool is considerable, but of a coarse kind, and is used chiefly for home manufacture. Pigs are scarce, except in Arcadia, and their flesh is not deemed wholesome. The only milk used is that of ewes and goats, and the butter and cheese made of it is very inferior. Asses and mules are employed almost exclusively as beasts of burden; the horses are of a strong breed, but neglected.

The manufactures of Greece are almost wholly domestic; the few articles required being generally produced by the families of the peasantry. The articles made in the larger towns are those required for ordinary consumption, such as soap, leather, brandy and other spirits, vinegar, hats, common silk, cotton and woollen stuffs, pottery, cutlery, &c. In some places ship-building and sail-making are carried on to a considerable extent. Salt is largely made in the lagoons about Mesolonghi and elsewhere.

The commerce and navigation of Greece are centred in the ports of Nauplia, Mesolonghi, Patras, Galaxidi, and the islands of Hydra, Spezia, and, above all, Syra, which is the centre of the steam navigation of the Levant, and where a handsome town has risen since the independence of the kingdom, with churches, schools, hospitals, docks, warehouses, lazarettos, and companies of insurance. The number of Greek merchant vessels amounts to considerably over 1000, exclusive of small craft, or coasting-boats. The merchants, many of them, have large capitals, and they assist each other, and are also assisted by their wealthy countrymen, who are established all over the Levant and in the ports of the Mediterranean. The extensive line of coast and the numerous islands supply a multitude of good sailors, active, hardy, and frugal. The principal traffic of the Greek vessels is the carrying trade, especially of corn, between the ports of the Mediterranean and the Black Sea, and the export and import trade with England, France, and Germany. Almost the entire trade in corn between the Mediterranean and England, valued at nearly 4,000,000*l.* a year, is in the hands of Greek merchants. The principal exports are currants, figs, wool, silk, valonia, olive-oil, sponge, wine, tobacco, wax, &c. The imports are chiefly of Manchester cotton goods and the woollen manufactures of England and Germany, with hardwares and various minor articles and fancy goods from the former countries and France. A very important part of the commerce of the Greek merchants consists in their banking and exchange operations, which are on a most extensive scale.

Inhabitants.—The three divisions of the kingdom are inhabited by populations differing in their physical and moral character. The inhabitants of Northern Greece are distinguished by the name of Roumeliotes, while those of the Peloponnesus are styled Moreotes, and there is but little sympathy between the two. The Roumeliotes are a military people who have maintained in the mountains of the interior a sort of wild independence, which the Turks could never entirely subdue. The Moreotes, on the contrary, with the exception of Maina, had completely submitted to the Turkish yoke; and their

archontes, or primates, shared with the pashas and other agents of the Porte the spoils of their own countrymen. In Roumelia the population of the mountains of Parnassus, Agrafa, Baltos, Xeromenos, and other interior parts of *Ætolia*, is supposed to be of Hellenic stock; but the peasantry of the plains are chiefly Valachians, Bulgarians, or Albanians, and are a steady, quietly-disposed people. In the towns near the coasts the population is a mixture of many races.

In the Peloponnesus the Albanian race occupies Argolis and Triphylia; the rest of the population speak Greek. In the towns the population consists in great measure of families who emigrated from various parts of the Levant, after the Turkish conquest, to exercise various trades, or to manage the affairs of the Beys and other wealthy Turks.

In the islands there is a mixture of Albanians and Greeks, and descendants of the Latin invaders of the middle ages. The Albanian race inhabits almost exclusively Hydra and Spezia: the Chiote and Psariote emigrants, who now inhabit Syra, are probably of Hellenic descent. At Naxos, Santorin, and some other islands, there is a kind of territorial nobility, who date from the time of the Crusades, and belong to the Western or Latin Church: their lands are cultivated by a Greek peasantry. At Tinos the peasantry are proprietors, and cultivate their lands with great care. Mikoni and Milo are inhabited by active and thriving sailors and traders.

Besides these races there have been since the Revolution large immigrations of military refugees from various parts of the Turkish empire, such as the Candiotas, the Souliotes from Epirus, the Olympiotes from the mountains between Thessaly and Macedonia, &c., and a mixed body of Fanariotes from Constantinople, of emigrants from the Ionian Islands, of Asiatic Greeks, Epirotes, and adventurers from Italy, France, and other parts of Western Europe.

From the oldest times the organisation of society in Greece has been based on paternal authority. A father decides absolutely on the destiny of his children, their profession, marriages, &c., without even consulting them; and in some instances, until within a very few years, assisted by a family council of his nearest relations, he exercised the power of life and death over them. Most of the country population of Greece live in villages, for the sake of security and mutual protection. Once a year the heads of families assemble in the church to elect their demogerontes, or municipal magistrates, one in every village or commune, and three for a town. The demogerontes act as justices of the peace and also as treasurers of the commune, have no emoluments, and are generally chosen among the archontes, that is, landed proprietors, or notables of the place, who form in fact the aristocracy of Greece. A communal council, consisting of those who have filled the office of demogerontes and of the other notables, assist them in their functions, in laying the local taxes, &c. Deputies from the communes assemble in the chief town of the eparchy, or district, to elect three or more eparchical demogerontes, who, joined to the local demogerontes of the place, constitute a council which concert measures with the prefect or political authority concerning the police, the assessment of taxes, and other matters affecting the whole district.

Divisions, Government, &c.—Greece is divided into 10 nomes (*Νόμοι*), each of which is presided over by a nomarch; the nomes are divided into 49 eparchies (*Επαρχίαι*), and these are again divided into several hundred demes (*Δήμοι*). These divisions are intended to correspond to the departments, cantons, and communes of France.

The government is a constitutional hereditary monarchy. The king has the usual privileges of constitutional sovereigns, and is assisted by an executive council of ministers, who are responsible to the legislature, which is composed of a Senate (*Γερουσία*), the members of which are named by the king, and hold their office for life; and a House of Representatives (*Βουλή*), composed of deputies elected by the various towns and districts of the kingdom.

The revenue is derived from the tithe of the produce paid by all private lands, and from the fourth of the produce of the national domains, together with certain taxes on imports and exports, salt, stamps, &c. Altogether the available revenue is under 700,000*l.*, owing, as is commonly said, to the general and notorious corruption of the various grades of officials. The expenditure fully equals the receipts. About one-fourth of it is for the interest and charges on the debt, which amounts to about two millions and a half sterling, and the payment of which was guaranteed by the allied powers of Great Britain, France, and Russia.

The numerical strength of the Greek army amounts to 8600 officers and privates, including the phalanx, 410 strong, not now on active service, which consists of veterans who served in the war of independence, and the police (*χωροφύλακες*), a force resembling the French gendarmes, who number 1450 and are dispersed in small bodies throughout the kingdom. Besides the regular army, a kind of militia, consisting of some companies of irregular troops, has been raised to watch the frontiers and to suppress brigandage. The duration of military service is 4 years. All males between the ages of 18 and 30, except married men, only sons, ecclesiastics, students, officers in the civil service of the state, &c., are liable to serve.

The navy consists of two corvettes of 26 guns, 2 steam-packets, and 35 small vessels and armed boats, chiefly engaged in watching

the coasts and suppressing piracy. The royal naval station, dock-yard, arsenal, &c., are at Poros. At Athens is a military college.

The civil code of the kingdom of Greece is still in the main an abridgement of the Basilica drawn up in the 14th century by the Byzantine Aristenopoulos, and known as the 'Manual of the Laws'; but the commercial, criminal, and correctional codes are founded on the Code Napoléon. The chief court is the Areopagus, or court of appeal and cassation, at Athens. There are besides courts of assize and primary jurisdiction in the chief towns of the ten nomes, and various inferior courts. Trial by jury has been introduced, but it does not work very satisfactorily.

The religion professed by the people generally is that of the Greek Church, but full religious toleration is guaranteed by the constitution. The church in Greece acknowledges no superior external authority, while preserving unbroken dogmatic unity with all the eastern orthodox churches; in other words, it declares itself independent, or autocephalous, as regards its former head, the Patriarch at Constantinople. The King of Greece is supreme head in the administration of the church. The chief ecclesiastical authority in the church is a perpetual synod consisting of five bishops at first selected by the king, but now taken in order of seniority of consecration, and assisted by a royal commissioner and a secretary. The church is at present presided over by 24 bishops, but their number is to be eventually raised to 86. The clergy are generally miserably ill paid, and as an almost necessary consequence very insufficiently educated; they are however on the whole not unexemplary in conduct. There are only about 100 monasteries in the kingdom; their number having been greatly reduced since the war of independence; and they are much fewer than the Greek monasteries in the Ionian Islands and Turkey. Besides the members of the Greek Church there are about 15,000 Roman Catholics and 4000 Jews in the kingdom: the members of other religious bodies are quite insignificant in number.

In the early part of the reign of Otho a law was passed directing the establishment of elementary schools in every deme in the kingdom. Like many other of the most useful edicts it has not been carried into execution; but popular education is widely diffused, and its advantages are generally appreciated. The principal educational institution is the University of Athens, which occupies one of the finest modern buildings in that city, and has 89 professors, an average of 600 students in the faculties of theology, law, philosophy, medicine, and pharmacy, and a library of 80,000 volumes. There are besides 7 gymnasia, or colleges, in the principal towns, with 48 professors, and about 1100 students (the gymnasium of Athens having about half of that number); an ecclesiastical seminary, a polytechnic school, and a ladies' college at Athens, and an agricultural school near Nauplia; about 80 secondary schools with nearly 4000 scholars; 840 common schools for boys with 84,000 scholars, 81 common schools for girls with 4400 scholars; a normal and an infant school; and several private and semi-private establishments, among which may be named the excellent American female schools at Athens—the first schools established in Greece for the education of females. There are also several scientific, artistic, and antiquarian institutions, with museums and libraries, chiefly seated in the capital. About 120 political, religious, and literary newspapers and magazines are now published in the kingdom of Greece.

History.—The Greeks, who had long cherished the hope of throwing off the Turkish yoke, and with a view to facilitate their object had formed a powerful secret society, with a well-organised agency spread throughout the whole Ottoman empire, saw in the outbreak of war between the Porte and one of his most powerful vassals, Ali Pasha, in 1821, the long-desired opportunity. A general rising was accordingly solemnly proclaimed on the 6th of April 1821 by the archbishop of Patras, and universally responded to. The Greeks were at first successful, but disasters quickly followed, which their character, on which centuries of slavery had wrought their sure effects, did not enable them to retrieve. For seven long years the struggle was protracted, marked on both sides by the most atrocious cruelties, but relieved somewhat on the part of the Greeks by deeds of heroism worthy of their ancestors. The Greeks had succeeded in clearing the Peloponnesus of their enemies and defeating them by sea. The Porte, unable to subdue them, called to its assistance the disciplined forces of the pasha of Egypt, which invaded the Peloponnesus, and the cause of Greek independence had again become problematical. The feeling of the Christian nations was however at length fairly aroused, and the three powers, Great Britain, France, and Russia, resolved to put a stop to this war of extermination. The victory of Navarino, gained by the allied fleets in October 1827, obliged the Egyptian forces to evacuate the Morea. The Conference of London, in March 1829, established the principle of the independence of Greece as a state, and the successful campaign of the same year of the Russians against the Turks induced the Sultan to acknowledge it by an article of the treaty of Adrianople in September 1829. In January 1830 the total independence of Greece was settled by the Conference of London. Meantime the internal government of Greece had undergone many vicissitudes, and the country was in a very disorganised condition. When the independence of Greece was secured by the interference of the three allied powers, the congress of deputies from the various districts of Greece appointed count John Capodistria,

a native of Corfu, who had been employed with distinction as a diplomatic agent of Russia, to be the head of the executive of the new state of Greece, with the title of President, for seven years, and with very extensive powers. His measures however were very unpopular with the national party, an insurrection broke out, and the country seemed to be again falling into anarchy, when, on October 8th, 1831, Capodistria was murdered at Nauplia in open day, on the threshold of the church of St. Spiridon. His brother Augustin Capodistria succeeded him in the presidency, but the civil war continuing, he was obliged to resign. At last the allied powers offered the crown of Greece; which had been refused by Prince Leopold of Saxe Coburg, to the King of Bavaria for his younger son Otho, and the offer was accepted. In June 1835 king Otho, being of age, assumed the direction of the affairs of state. Otho refused to establish a representative system of government, and continued to govern absolutely till Sept. 1845, when an entire change of system was brought about by a revolution, which has hardly its parallel for the skill and success with which it was designed and executed. The leaders of the constitutional party, having matured their plans and gained over the army and a large portion of the people, surrounded the palace with troops, and presented to the king a charter, granting representative government among other popular objects, and enforcing the dismissal of the obnoxious Bavarian and other foreign ministers. The alternative was offered to the king of signing this charter, or of quitting Greece at once and for ever in a vessel which had been prepared, and was then lying ready for the purpose. After some indecision the king, finding himself wholly in the hands of the constitutionalists, signed the charter.

The only subsequent events of general interest are the interventions of foreign powers, which the duplicity of the government has rendered necessary. The first of these was in 1850, when, in consequence of the refusal of Otho's ministry to liquidate the claims of certain British subjects to compensation for various injuries inflicted on them, a British fleet blockaded the Greek ports for three months before the Greek government assented to the payment of the sums in question. The other intervention is that which has occurred within the last two or three months. The war between Turkey and Russia seemed at the commencement of the present year (1854) to afford to certain self-styled Greek patriots—but in reality, there can be little doubt, mere tools of Russia—a favourable opportunity for exciting the turbulent spirits of the less civilised portion of the community to make an inroad upon the neighbouring provinces of Turkey. A large number of the idle and profligate, attracted by the prospect of pillage—over an irresistible lure to a modern Greek—was soon collected; and their numbers were largely swelled by bodies of soldiers who joined them, in many cases with their officers, without even the semblance of an attempt at prevention on the part of the authorities. The feeble mind of Otho was unable to resist the visions which had been artfully displayed before it, of a widely-extended Grecian empire, with himself at its head, and he lent the marauders every possible countenance and encouragement, while with characteristic disingenuousness he issued protests and proclamations against them. At first the invaders were able to overcome the resistance of the weak and unprepared Turkish garrisons, and a considerable tract of country was subjected to the lust and rapine of the 'liberating army.' At the same time Greece itself, all restraint being removed, began to swarm with brigands and the Greek seas with pirates. But a check was promptly put upon these proceedings. The remonstrances of the allied powers being unheeded, a few British ships of war were sent into the Ægean, and a few French soldiers landed in the Piræus; and the king, awakened thus rudely from his dreams, accepted at once the proffered ultimatum—dismissed his ministry, recalled his officers, issued proclamations commanding the misguided adventurers to return to their homes and duties, and agreed on his own part to carry on the government for awhile under British and French surveillance.

Otho married in 1836. He has no issue; and it is settled that his successor is to be another prince of Bavaria, who has engaged to enter the communion of the Greek Church on his accession to the throne.

(Thiersch, *De l'Etat Actuel de la Grèce; Travels, &c., in Greece* of Leake; Mure; Bowen; Fiedler; and Ross; *Histories, &c., of the War of Independence*, by Gordon, Keightley, Stanhope, and Blanquière; Sir J. Emerson Tennent, *History of Modern Greece*; Murray, *Hand-book for Travellers in Greece*, 1854.)

GREENLAND is an extensive island situated between Iceland and the continent of America, and forming a colony of Denmark. Its southern extremity, Cape Farewell, is situated on an island, in 59° 49' N. lat., 48° 54' W. long, consequently nearly in the parallel of the southern extremity of the Shetland Islands. Its northern districts are buried under masses of eternal ice. The most northern points which have been observed are near 78° N. lat., namely, Edam Land on the eastern coast, and the entrance to Murchison's Sound on the western coast. The whole western coast-line has been visited and mostly surveyed by British, Dutch, and Danish seamen; but much of the eastern side remains unexplored.

The entire country may be considered as an enormous mass of rocks. The outline of this mass, forming the sea-coast, is high, rugged, and barren; close to the water's edge it rises into tremendous precipices and lofty mountains, crowned with inaccessible cliffs, visible from the

sea at a distance of above sixty miles. Though the western coast, in its general outline, forms nearly a direct line, trending north-north-west and south-south-east except towards the southern extremity, where it runs nearly east, the whole is indented by a great number of deep and narrow inlets, which extend a considerable distance inland, sometimes more than a hundred miles. Along these inlets, or fiords, and on some of the numerous islands which line the coast in all its extent, occur small patches or narrow strips of low land, as well as in a few valleys, which are watered by small brooks. In these places alone vegetation appears, but it is nothing more than grass and low brushwood. It has been established by a Danish naturalist, Dr. Pingel, that for the last four centuries this coast has been undergoing gradual subsidence.

The rocky mass which incloses the fiords and valleys, in its average height, probably does not exceed 2000 feet, except in the numerous summits which are scattered over it, some of which rise to 5000 feet; yet it is everywhere covered with eternal snow and ice. The whole of the eastern region is a vast table-land of ice: mountains and valleys are levelled to a uniform plain; the river-beds are concealed, and every vestige hidden of the original form of the country. Greenland may in fact be considered as one immense glacier, or more correctly an aggregation of glaciers, which are with an imperceptible but continuous motion pushing forward towards the sea; and, as in Switzerland, the glacier frequently bursts asunder with a tremendous crash, and crevices and chasms of great width and depth are sometimes formed. In the midst of the icy masses on the western side here and there rise some smooth and almost perpendicular rocks, which appear at a distance of a dusky-gray colour, and without any sign of vegetation; but on a nearer inspection a little earth is found in places, on which some hardy species of heath grow. The outer edges of this accumulation of glaciers, doubtless the most extensive on the surface of the globe, extend over the rocks on the sea-coast, and descend by the fiords into the sea, where in some places they skirt the shore for many miles, and advance a considerable distance into the water. One of the most remarkable of these icy rocks is that which occurs on the western coast between 62° and 63° N. lat. It seems to form the sea-shore for about twenty miles, and is called by the Danish colonists the Ice-Blink. But Dr. Rink, who resided several years in Greenland and paid great attention to the formation of glaciers and icebergs, thinks that it is from the east coast, between 68° and 74° N. lat., that many of the largest icebergs issue; and he mentions five principal ice-friths, from that of Jacobshavn in 69° 10' N. lat. to that of Upernivik in 73° N. lat., each of which receives and discharges annually many thousand cubic feet of ice. ('Journal of Royal Geog. Society,' vol. xxiii. p. 152.) When the ice in such places has protruded to a vast extent, the enormous mass at the outer end, unable longer to resist the upward pressure of the water, breaks off with a tremendous crash, and is carried into the sea, where it floats about as an iceberg, the marvel and the terror of navigators. The larger of these icebergs rise above the surface of the sea to a height of from 100 to 150 feet, and some are 4000 feet in circumference, yet the part above is scarcely more than one-eighth of that below the surface of the water; so that, as Dr. Rink observes, such a fragment of ice if fairly landed would form a mountain about 1000 feet in height.

It is now supposed that Greenland is traversed in all its breadth by narrow straits which divide it into several islands; but all such straits are at present filled up with masses of ice, except one, called Prince Christian's Sound, which occurs towards the southern extremity, and divides a group of islands from the mainland. It is about 100 miles long, but in many places hardly a mile wide. On both sides rise high and bold rocks, and it is only in a few places that there is low beach enough to allow of a boat being hauled up.

The sea which surrounds Greenland is distinguished by peculiarities not less remarkable. A current which issues from under the great masses of ice inclosing the pole runs southward along the eastern coast of Greenland, carrying down an immense body of heavy drift-ice. This ice sometimes occupies the whole extent of ocean between Greenland and Iceland, and often forms a belt round Cape Farewell reaching from 120 to 160 miles out to sea. It is carried hence along the western coast of Greenland northward as far as Queen Anne's Cape, near the Arctic Circle, where it passes to the other side of Davis Strait. On the northern portion of the eastern coast, as well as on the southern portion of the western coast, the current runs along the shores; but whenever the wind blows from the sea it presses the ice hard to the shore, and blocks up the inlets and harbours, rendering for a time the Danish settlements on the south-western coast inaccessible to vessels. On the south-eastern coast the current runs along shore, setting in towards the land; hence there always exists a broad belt of very heavy drift-ice, which renders this coast entirely inaccessible. The stream of ice disappears entirely near Cape Farewell and along the western coast in the month of September, but it always re-appears towards the end of January.

The climate of the small low tract inhabited by the natives and the Danish colonists is much less rigorous than might be expected from its high latitude and the neighbourhood of the immense glacier. On the eastern coast the mean temperature is below freezing point; yet south of 65° N. lat. the thermometer in February 1830 did not sink lower than from 4° to 6° below zero of Fahrenheit; but as early as

the close of August the sea was every night covered with a crust of new ice, and in the middle of September the ice on the bays and fiords was from an inch to two inches thick. The climate is somewhat milder on the western coast south of the polar circle, but farther north, where the sun rises only for a few minutes, or not at all, the cold becomes extreme, and even ardent spirits freeze in a room where there is a fire. In February and March it is so intense that stones are split and the sea smokes like a furnace. In general however the winter cold is several times interrupted by thaws, which last many days and sometimes even weeks. July is the only month when there is no snow. The earth begins to thaw in June, but at no great depth ice is always found. The heat in the long summer days is so great as to evaporate the water left in the rocks and clefts by the tide, and to reduce it to a beautiful fine salt; but towards evening the air becomes very cold, being chilled by the breezes which pass over the interior. Fogs prevail almost every day from April to August. Little rain falls, especially towards the north. Gales are not frequent, but in autumn they sometimes rage with the fury of a hurricane. There is lightning occasionally, but no thunder. Earthquakes occur, though rarely. The aurora borealis is frequent, especially in winter, and always appears either in the east or south-east.

The vegetation is scanty. It is composed chiefly of mosses and lichens, and includes a small number of annual plants and a few shrubs, most of which bear edible berries. Juniper, willows, and birch creep along the earth, and in the well-sheltered valleys birch and elder grow to the height of a man, and have a stem three or four inches thick. The attempts at raising oats and barley have not succeeded; potatoes are planted only towards the most southern extremity. Radishes succeed as well as in Europe. Salad and cabbage remain very small, and turnips seldom attain the size of a pigeon's egg.

Some sheep are kept, but the difficulty of procuring provender for the long winter limits them to a small number. The only domestic animal of the natives is the dog, which is used to draw the sledges. Rein-deer, hares, foxes, and white bears are the only wild animals. Land-birds are not numerous, but sea-fowl are so plentiful as to exceed all belief; among them are the eider-ducks (*Anas mollissima*). Fish constitutes the principal wealth of Greenland. Whales are far less numerous than formerly. Walrus are only met with in Davis Strait, and are not numerous. Seals however are extremely common, and supply all the wants of the natives.

From the researches of a body of scientific men sent out from Copenhagen in 1852 to explore the physical features of Greenland, it appears that the rocks are chiefly of granite, gneiss, porphyry, clay-slate, and calcareous rocks. Coal was found in the Isle of Disco. In the mainland valuable ores of copper appear to extend far to the north of Disco; and besides copper, blacklead, asbestos, serpentine, garnets, crystals, &c. were found in Southern Greenland; while Sir R. I. Murchison states it to be his opinion, from the crystalline character of the rocks collected in 1853 by Capt. Inglefield in the more northern parallel of 77°, that a very large portion of that region may prove to be metalliferous.

The low tracts along the coast and the fiords only are inhabited. The inhabitants consist of natives and Danish settlers, the latter amounting to between 300 and 400. The natives are Esquimaux. The total number of inhabitants subject to Denmark was 9400 in 1850, of whom about 600 live on the eastern coast south of 65° N. lat. But natives have been met with as far north as 77° on the western coast.

Greenland was discovered in 981 or 983 by an Icelander or Norwegian named Gunbiörn, and was soon afterwards colonised by a number of families from Iceland. The settlements increased rapidly, and it is said that in 1406 there were 190 villages; but the whole colony suddenly disappeared from the pages of history. Davis re-discovered Greenland in his voyage, 1685-87, and in the beginning of the 17th century the Danish government fitted out several expeditions to re-establish a communication with the lost colony. According to the usual explanation, it was supposed that the ancient settlements were on the eastern coast; and this opinion prevailed till 1829, when the researches made by the Danish Captain Graah proved conclusively that the ancient Icelandic colonies were on the western coast, where numerous ruins of old buildings, especially churches, occur. The modern colonisation of the western coast took place in 1721, and was due to the zeal of a Norwegian clergyman, Hans (John) Egede, who planted a colony at Godthaab (near 64° N. lat.) for the purpose of converting the natives to Christianity. After the foundation of the colony a regular commerce with the natives was established, which led to the erection of other settlements. These are, from south to north—Julianehaab (61° N. lat.), with about 1500 inhabitants; Frederikshaab, Lichtenfels, Godthaab and New Hernhut, Sukkertoppen, Holsteinsborg, Egedesminde, Christianshaab, Jacobshavn, Ritenbenk, Omenak, Upernivik (72° 48'). Between 68° and 71° N. lat. is an extensive bay, called Disco Bay, from a large island of that name. Disco Island extends about 80 miles south and north, and nearly as much east and west. On its southern shores is the settlement of Godhavn. The Danes obtain from these settlements seal-skins, fur, eider-downs, train-oil, whalebone, and fish.

GREENLAND. [BERWICKSHIRE.]

GREENOCK, Renfrewshire, Scotland, a parliamentary burgh, sea-port, and market-town, in the parish of Greenock, is situated on the left bank of the estuary of the Clyde, 22 miles W. by N. from Glasgow, in 55° 57' N. lat., 4° 55' W. long. The population in 1851 was 36,689. The town is governed by a provost and 15 councillors, and returns one member to the Imperial Parliament.

Greenock is situated on rising ground. The east end of the town, which is called Cartdyke, is occupied with manufactories, the west end with the villas of merchants and professional men. In the beginning of the 18th century the harbour was small, and fit only for the reception of fishing-boats. Since then it has been enlarged and improved, and dry docks have been constructed. Outside the harbour is depth of water and anchorage for vessels of any burden; but the roadstead is narrowed by a sandbank of considerable breadth which stretches from Dumbarton to a little below the town. The principal street is about a mile in length, and runs parallel to the quay. There are several ship-building yards, extensive sugar-works, and one large manufactory of machinery. Large quantities of herrings are cured, and there are several vessels employed in the Newfoundland and Nova Scotia fisheries. Rope and sail-making, block-making, and the other occupations of a sea-port constitute the branches of industry pursued by the inhabitants. In 1851 there were in Greenock 26 places of worship, of which 7 belonged to the Free Church, 5 to the Established Church, 4 to the United Presbyterian Church, 2 to Baptists, and 8 to other bodies. The number of sittings provided in all was 20,441. There are a grammar school, several congregational and other public schools, a mechanics institute with a library of 2500 volumes and a reading-room, the Greenock library which has 10,000 volumes, the Cartdyke mechanics' library with 2200 volumes, and 6 congregational libraries with an aggregate of about 3300 volumes. Greenock is connected with Glasgow by railway. All the steamers of the Clyde touch at the port. An abundant supply of water is obtained from a large artificial lake on the hills about six miles from the town. The stream from the water-works drives several water-mills in its course, the most important of which is an extensive cotton-spinning mill, which has a water-wheel 70 feet in diameter, being the largest in Britain. Greenock is well lighted with gas. The buildings of importance include the custom-house, situated on the quay, a large and handsome Grecian building, the Tontine Hotel, and the Exchange buildings. The town possesses a jail, an infirmary, and several charitable institutions. The public library occupies a large building in Union-street, erected at the expense of Mr. Watt of Soho, in which is a statue by Chantrey of the celebrated James Watt, his grandfather, who was a native of Greenock. *Cartdyke*, the east end of Greenock, was made a burgh of barony by Charles I. It has a small quay, but is included in the parliamentary boundaries of Greenock.

The vessels registered at the port of Greenock on December 31st, 1853, were 220 of an aggregate tonnage of 6209, and 184 having an aggregate burden of 65,677 tons; two steam-vessels of 47 tons aggregate burden, and 12 of 1965 tons. During 1853 there entered the port in the coasting trade, 574 sailing-vessels, tonnage 38,328, and 214 steam-vessels, tonnage 39,511; the clearings in the coasting trade were 162 sailing-vessels, tonnage 3662, and 102 steam-vessels, tonnage 10,752. In the colonial trade there entered 224 sailing-vessels, tonnage 84,454, and one steam-vessel, tonnage 190; and there cleared 103 sailing-vessels, tonnage 34,899, and 3 steam-vessels, tonnage 644. In the foreign trade 54 British and 89 foreign vessels entered, tonnage 23,694; and 47 British and 45 foreign vessels cleared, tonnage 32,062; one British steam-vessel of 336 tons entered, and two foreign steam-vessels cleared, tonnage 675. The amount of customs duties received at the port during 1851 was 410,206*l.* 10*s.* 8*d.*

(*New Statistical Account of Scotland; Parliamentary Papers.*)

GREENWICH, Kent, a market-town, a parliamentary borough, and the seat of a Poor-Law Union, chiefly in the parish of Greenwich, is situated on the right bank of the river Thames, in 51° 28' N. lat., 0° 0' W. long., Greenwich observatory being the point from which in British maps and charts the longitude of all other places is calculated. It is distant from Canterbury 47 miles N.W. by W., and from London 5 miles E. by S. The population of the Parliamentary borough was 105,784 in 1851. The borough returns two members to the Imperial Parliament. Greenwich Poor-Law Union contains four parishes with an area of 4800 acres, and a population in 1851 of 99,365.

The chief object of interest in Greenwich is the Royal Hospital. It occupies the site of an old palace called Greenwich House, Placentia, or 'the Pleasance,' a favourite residence of several sovereigns, particularly of Henry VII., Henry VIII., Edward VI., and Queen Elizabeth. Being in a dilapidated state at the period of the Restoration, the building was taken down, and the north-western wing of the present building erected under the superintendence of Inigo Jones. Queen Mary, the wife of William III., it is said, suggested the plan of founding an asylum for disabled seamen belonging to the royal navy, and the unfinished palace of Greenwich was enlarged and adapted to that purpose. Sir Christopher Wren undertook to superintend the work without any pecuniary emolument. The foundation was laid June 3rd, 1696, and the whole of the superstructure then contemplated was finished within two years, though the hospital was not opened for the reception of pensioners until 1705. During the last century and a half the buildings have been successively enlarged and

improved. The whole now consists of four quadrangular piles, built principally of Portland stone, and designated by the names of the kings or queens in whose reigns they were erected or commenced. The hall, a noble room opposite to the chapel, was painted by Sir James Thornhill, and contains a fine collection of paintings, consisting of naval portraits and sea-fights. The management of the hospital is in the hands of a governor, lieutenant-governor, two chaplains, and numerous other officers. The funds required for the hospital have been obtained from parliamentary grants, the rents of the forfeited Derwentwater estates, and the bequests of benevolent individuals. The pensioners, of whom there are about 3000, receive maintenance, clothing, and lodging, besides a weekly allowance for pocket-money. Besides the inmates of the hospital, there is a considerable number of out-pensioners, who, since 1829, have been provided for by special parliamentary grant. At the Royal Hospital Schools, which are chiefly supported out of the funds of the hospital, 800 boys, children of seamen in the navy and merchant service, are boarded, clothed, and educated.

Greenwich sent two members to the House of Commons in 1557, in the reign of Philip and Mary, but was not again represented in Parliament till the passing of the Parliamentary Reform Act. The town is lighted with gas and paved, and is supplied with water from the Kent water-works at Deptford. Considerable improvement has taken place during the last few years in the town and its immediate neighbourhood, by the erection of handsome buildings, the formation of new lines of street, and widening and improving the approaches to the town. The parish church, a handsome and commodious edifice, erected in 1718 from a design by Sir Christopher Wren, consists of a nave and two side aisles, and has a tower of three stories, surmounted with a dome and spire. On the walls are some portraits of royal personages and numerous monumental tablets. St. Mary's church is a neat Grecian structure, erected in 1825, and there is a new church on Croome's Hill. The Independents, Wesleyan Methodists, Baptists, English Presbyterians, and Roman Catholics have places of worship. There are numerous richly-endowed schools and hospitals in Greenwich, also National, British, and Infant schools, and an Orphan Girls school. The Marine Society maintains in the river a frigate for exercising and training 100 boys for the sea-service. The Dred-nought man-of-war has been fitted up as an hospital for seamen of all nations, and lies in the river off Greenwich. A Proprietary school, opened in 1849, had 132 scholars in 1852. There are in Greenwich a literary institute, a savings bank, and a building for baths and washhouses. A county court is held in the town. The market is held on Wednesday and Saturday. Extensive engineering establishments, iron steamboat yards, rope-walks, an iron-foundry, and some large factories, are in Greenwich.

Greenwich Park, which comprises near 200 acres, is diversified with lawns, and well planted chiefly with elms and chestnut-trees, and stocked with deer. Upon an eminence is situated the Royal Observatory. The park is a favourite resort of Londoners, especially at Easter and Whitsuntide, when the Greenwich fairs are held.

Blackheath, an extensive common or heath on the south side of Greenwich Park, is partly in the parish of Greenwich and partly in that of Lewisham. It has been the scene of numerous historical events and triumphal processions, and was the place where, in the 15th and 16th centuries royal visitors to England were frequently met by the British sovereign or his representatives, or by the corporation of London.

Deptford, on the right bank of the Thames, 3 miles S.E. from London, population 27,896 in 1851, situated in the counties of Kent and Surrey, at the mouth of the Ravensbourne River, forms part of the parliamentary borough of Greenwich: it contains Her Majesty's dock-yard and victualling-yard for the royal navy. The streets of Deptford are narrow, and the houses irregularly built. The place has a considerable retail trade. At New Cross, Deptford, is the Royal Naval School, incorporated in 1840, which had 184 scholars in 1852; and Deptford has several educational and benevolent institutions, including the Kent Dispensary, two old hospitals for decayed pilots and shipmasters, or their widows, a Charity school well endowed, and a savings bank. There is constant communication by railway and by steam-vessels between London, Greenwich, and Deptford.

(*Hasted, History of Kent; Lysons, Environs of London; Greenwich Guides; Parliamentary Papers; Communication from Greenwich.*)

GREIFSWALDE. [STRALSUND.]

GREITZ. [REUSS.]

GRENADA, one of the Lesser Antilles, lies between 11° 58' and 12° 20' N. lat., 61° 20' and 61° 35' W. long.: its greatest length from north to south is 25 miles, and its greatest breadth 12 miles; the total area is about 133 square miles. This island was discovered by Columbus on his third voyage in 1498, at which time it was inhabited by Caribs. The first settlement was formed in 1650 by Du Parquet, governor of the island of Martinique. In 1700 there were only three sugar plantations and some indigo works; the entire population consisting of 251 whites and 520 negroes. By the definitive treaty of Paris, signed in February 1763, Grenada was ceded to Great Britain and a legislative council and assembly were granted to the inhabitants.

The island is traversed through its whole length from north to south by an irregular range of mountains. Mount St. Catherine,

near the centre of the island, is 3200 feet high. Hills of less elevation branch off from the principal range in a lateral direction, forming a succession of rich and extensive valleys, which as they approach the shore open into level alluvial plains. Several hot chalybeate and sulphurous springs are met with in different parts. In the centre of the island, and 1700 feet above the sea, is a circular lake $2\frac{1}{2}$ miles in circumference and 14 feet deep. The soil of the island consists principally of a rich black or reddish coloured mould. The fall of rain is about 65 inches in the year. On the hills the atmosphere is cool and pleasant; in the low grounds the maximum heat is 89° Fahr., the minimum 77°. The hottest season is from June to October.

The town of *St. George* is situated on the south-west side of the island, at the foot of an amphitheatre of hills encircling an extensive bay. It is a well-built town, and contained at the census of 1851 a population of 4567, mostly coloured persons. The other towns of any consequence are *St. Andrew's* on the east coast, *St. Patrick's* on the north, and *Charlotte town* and *St. Mark's* on the west. The island is but thinly populated, having with its dependencies altogether only 32,671 inhabitants in 1851, of whom 28,082 were natives of the colony, 1168 other British West Indians, 2425 Africans, and 400 natives of Madeira. The number of British Europeans was 384.

In 1852 there were 24 places of worship in the colony, namely, Church of England, 10; Roman Catholic, 8; Wesleyan, 4; and Presbyterian, 2. The number of children attending schools was 1828, of whom 1018 were at schools of the Church of England, 508 at Roman Catholic schools, 276 at Wesleyan schools, and 31 at Presbyterian schools. African labourers have been brought into the colony on several occasions of late years, but they have in numerous cases purchased land and become small proprietors or tenants. The total revenue of the colony in 1852 was 17,366*l.*; the expenditure was 16,894*l.* The expenses of the civil and military department defrayed by the home government was 14,391*l.* in 1852. The staple produce consists of sugar, rum, and molasses. The cocoa of Grenada is the best that is grown in any English colony. The value of imports in 1852, consisting chiefly of British manufactured goods, was 149,718*l.*, and the exports amounted to 131,940*l.* On December 31st 1853 there were registered as belonging to the island 46 vessels, with an aggregate burden of 484 tons. The aggregate tonnage of the vessels which entered inwards during 1852 was 21,478; and of those which cleared outwards 21,964. In 1852 there were 7698 acres under cane cultivation, of which the produce was 8734 hogsheads of sugar; of this about 8352 hogsheads were exported.

The island of *Carriacou* is situated about 15 miles N.E. from Grenada. Its extreme length is 7 miles; its breadth $2\frac{1}{2}$ miles. The coast for about a mile from the shore consists generally of good arable land of deep rich loam; in the interior the country is mountainous. Many labourers have, since their emancipation in 1834, become proprietors of small patches of ground. The population of *Carriacou* in 1851 was 4461 (included in the population of Grenada given above). The principal town is *Hillsborough*. The island suffers occasionally from long-continued drought, which greatly reduces the amount of the sugar crop. *Bequia*, the most northerly of the Grenadines, is 8 miles S. from *St. Vincent*; it is about 7 miles long by a mile and a half broad. *Admiralty Bay* is an inlet on the west side of *Bequia*. *Union Island* and *Canaguan Island* are smaller islands between *Carriacou* and *Bequia*.

GRENADÉ-SUR-GARONNE. [GARONNE, HAUTE.]

GRENOBLE, the capital formerly of Dauphiné, now of the department of Isère, in France, is situated on the Isère, just above its confluence with the *Drac*, in 45° 11' 57" N. lat., 5° 43' 43" E. long., 345 miles S.E. from Paris, and has 26,852 inhabitants in the commune, exclusive of the garrison and the floating population.

Grenoble occupies the site of the ancient *Ularo*, which was situated in the territory of the *Allobroges*. Inscriptions which have been dug up speak of the fortifications and edifices within the town, which were erected by the emperors *Diocletian* and *Maximian*, from whose assumed designations of *Jovius* and *Hercules* two of the gates were named *Porta Jovia* and *Porta Herculea*. In the 4th century the name *Gratianopolis* was given to the town in compliment to the emperor *Gratian*; and this new name gradually superseded the old one, *Ularo*, and was the origin of the modern name *Grenoble*. *Grenoble* has given title to a bishop at least since A.D. 381.

The part of the town on the right bank of the *Isère* is called *St. Laurent*. It consists chiefly of one spacious street, which has been lately embellished by the construction of quays along the river; it communicates with the rest of the town by a stone bridge, lately rebuilt, and by an iron chain bridge, the approaches to which are adorned with some handsome modern buildings. Immediately behind this street rises a hill, the lower part of which is called *Rabot*; higher up it takes the name of *Bastille*, from an old feudal castle that once stood on it, and the summit is called *Mont Rachel*. The greater part of this hill is covered with formidable fortifications, the guns of which can sweep the valleys of the two rivers. The view from *Mont Rachel* is very picturesque, presenting as in a plan the town and its fortifications, the valley of the *Drac* on one side, and of the *Isère* on the other; the view up the *Isère* is terminated by the snowy mass of *Mont Blanc*. This part of *Grenoble* was formerly surrounded by an ancient wall, which has been demolished in recent times, and is now replaced by a

GRÉG. DIV. VOL. III.

handsome promenade. The quarter of *Bonne* on the left bank is also fortified, and *Grenoble* is now considered one of the strongest fortresses in France. This part of the town is extensive; the streets are well laid out, and the houses are good. Among the principal buildings are the office of the prefect; the court-house; the town-hall, once the residence of the Constable *Lesdiguières*; and the building occupied by the college, by the public library of nearly 60,000 volumes, by the museums of natural history and antiquities, and by the gallery of paintings. The other remarkable objects are the cathedral of *Notre-Dame*, the episcopal palace, the hospital, the colossal bronze statue of *Bayard* in the *Place-St. André*, the arsenal, the citadel, the botanic garden, several handsome fountains, the theatre, and the public walks. The town is well lighted with gas.

The chief manufactures of the town are kid gloves, of which about two million francs' worth are exported to England and America annually, liqueurs, chamolis and other leather, &c. The dressing of hemp gives employment to about 1000 workmen. The trade of the place is much promoted by the navigation of the *Isère*; other articles of trade are wrought iron, marble, and timber.

The diocese of *Grenoble* is co-extensive with the department of *Isère*. The city is the seat of a High Court and University Academy, which have jurisdiction over the departments of *Isère*, *Drôme*, and *Hautes-Alpes*. In connection with the academy there are two faculties of law and science. The town has also a college, a school of medicine, a school for artillery, two seminaries for the priesthood, a botanic garden at which courses of instruction are delivered, and other educational institutions. It has also tribunals of first instance and of commerce, and an exchange.

Grenoble was the first place which openly received *Napoleon I.* on his return from *Elba* in 1815. A railway is in course of construction from *Grenoble* to the *Lyon-Avignon* line, which it joins opposite *Annonay*; the town is connected with *Paris* and *Turin* by electro-telegraphic wires.

GREY ABBEY. [DOWN.]

GREYSTOKE. [CUMBERLAND.]

GRIFIN. [GEORGIA, U.S.]

GRIGNAN. [DRÔME.]

GRIMSBY, GREAT, Lincolnshire, a municipal and parliamentary borough, market-town, and sea-port, in the parish of Great Grimsby, is situated on the right bank of the river *Humber*, near its mouth, in 53° 34' N. lat., 0° 4' W. long., distant 40 miles N.E. by N. from *Lincoln*, 163 miles N. from *London* by road, and 1544 miles by the Great Northern and East Lincolnshire railways. The population of the municipal borough in 1851 was 8860; of the parliamentary borough, 12,263. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. For sanitary purposes it is under the management of a Local Board of Health. The living is a vicarage in the archdeaconry and diocese of *Lincoln*.

In the time of *Edward III.* *Grimsby* furnished the king with 11 vessels and 170 mariners for his armament against *Calais*. The gradual blocking up of the harbour by the accumulation of mud and sand led however to the decay of the port, until it was renovated by the exertions of some of the neighbouring landed proprietors about the beginning of the present century. The town is lighted with gas. The public buildings are a town-hall, a small borough jail, and a custom-house. The older part of the town, which is irregularly laid out, is at the head of the harbour, about a mile from the sea; the new part, commonly called 'the Marsh,' consists of several streets parallel to the harbour, on the east side. The harbour, which is a tide harbour, with a lock, &c., is at one of the mouths of the *Lacey Beck*, extending inland about a mile southward from the sea. The largest ships and steamers can enter the harbour at any time of the tide. There are here large warehouses and timber-yards. The opening of the *Manchester*, *Sheffield*, and *Lincolnshire*, and the *East Lincolnshire* lines of railway, and the construction of spacious docks, have added greatly to the commercial activity of *Grimsby*. The first stone of the new docks was laid by *Prince Albert*, April 17th, 1849. The works are according to the designs of *Mr. Rendel*, and when completed will inclose about 132 acres, of which 20 acres are appropriated to wharfs and quays, and 85 acres to warehouses and other buildings. A basin of 11 acres in extent connects the docks with the river *Humber*. The supply of fresh-water to the docks is from land streams. The plan includes a breakwater, to be constructed on a bank called the *Burcom Sands*, in the middle of the river, opposite the new dock, the intervening channel to be deepened and kept clear for the accommodation of vessels of large burden.

The vessels registered on December 31st 1853, as belonging to the port of *Grimsby*, were as follows:—Under 50 tons, 74 sailing-vessels, tonnage 2151; and 4 steam-vessels, tonnage 71; above 50 tons, 14 sailing-vessels, tonnage 1251; and 2 steam-vessels, tonnage 1030. The vessels which entered and cleared at the port during 1853 were as follows:—Coasting trade, sailing-vessels, inwards 251, tonnage 17,143; outwards 176, tonnage 14,656; steam-vessels, inwards 4,

II

tonnage 1563; outwards 1, tonnage 346. Colonial and foreign trade, sailing-vessels, inwards 110 British, tonnage 24,419; and 310 foreign, tonnage 57,978; outwards 28 British, tonnage 5818; and 215 foreign, tonnage 45,221: steam-vessels, inwards 84 British, tonnage 33,212; and 4 foreign, tonnage 548; outwards 91 British, tonnage 35,763; and 4 foreign, tonnage 548.

The amount of customs duty received at Great Grimsby in the year 1851 was 24,554*l.* 1*s.* 6*d.*

The parish church is a large cruciform structure with a tower in the centre; the architecture is chiefly early English; the west door is Norman. The Wesleyan and Primitive Methodists, Independents, and Baptists have places of worship. There are here a Free Grammar school, which had 37 scholars in 1850; a National school; and a mechanics institution, with a library of 1100 volumes. There are ship-building yards, a tan-yard, bone-mills, corn-mills, a large ropework, brick-fields, and breweries. The market is on Friday for corn and cattle; a fair is held on June 6th. A county court is held in Grimsby.

GRINDELWALD. [BERN.]

GRISONS. [GRAUBÜNDTEN.]

GRODNO, a government of Russia in Europe, lying between 51° 31' and 54° 21' N. lat., 23° 49' and 26° 44' E. long., is composed of a portion of the grand-duchy of Lithuania and other eastern parts of the kingdom of Poland. Its area is 14,652 square miles, and its population was stated to be 1,008,100 in 1848. Its greatest length is about 173 miles, and its greatest breadth about 120 miles. The surface is a wide plain broken only by a few chalk hills; it is covered in parts by extensive forests, particularly in the north, and in others by swampy lowlands. The soil is either a pure sand, or alluvial deposit intermixed with sand, and is in general favourable to the cultivation of grain and feeding of cattle. The principal river is the Niemen, which becomes navigable at Lititaha before it reaches Grodno, and is augmented in this province by the waters of the Shtahara, the western Beresina, Rossa, Kotra, &c. In the south-west the Bug separates Grodno from Poland, and the Narew, a tributary of the Vistula, rises in the circle of Prushana. The winter is very cold, and the climate damp and foggy.

Rye is the grain most cultivated: in ordinary years the yield is said to amount to above 2,346,000 English quarters, of which about one-third is exported by the Niemen Canal and overland to Baltic ports. Large quantities of barley, oats, hops, hemp, and flax are also raised. Vegetables and fruit are not of extensive growth. The crown holds a great number of the forests of Grodno, which are chiefly of the pine species. The pastures are extensive. Horned cattle and sheep of improved breeds are fed in considerable numbers. Much wax and honey are gathered; but the fisheries are unproductive. The minerals, which are insignificant in point of produce, consist of iron, limestone, clay, chalk, and saltpetre. The manufactures are inconsiderable and chiefly for domestic use; the principal are woollen-cloth, and leather.

Grodno is divided into eight districts, named from their chief towns. The more important of the towns are:—GRODNO; Lida, with a castle, college, and school, 2000 inhabitants; Novogrodek, a walled town defended by a castle, with 6 churches and 3 monasteries, 2 synagogues, and 4000 inhabitants; Slonim on the Shtahara, with 7 churches, a large woollen manufactory, and a population of about 7000; and Brzeso or Brzeso-Litewaky or Litovski, at the efflux of the Mushaviec into the Bug, a walled town, with an imperial palace, 12 churches, 2 synagogues, and about 8000 inhabitants, who carry on an extensive trade.

GRODNO, the capital of the Government of Grodno in Russia, is situated at the foot and on the side of a hill on the right bank of the Niemen, about 660 miles S.W. from St. Petersburg, in 53° 40' N. lat., 23° 52' E. long., and has about 16,000 inhabitants, many of whom are Jews. It is the seat of government for the province, and occupies a large extent of ground, but has neither walls nor gates. Most of the houses are built of wood. The town is as old as the 12th century, and had an ancient palace surrounded by a deep moat, which is now uninhabitable. The modern palace, erected by Augustus III., king of Poland, is spacious, handsome, and regularly built, and opposite to the quadrangle in front of it is a fine building containing the government offices. Grodno has 9 Roman Catholic churches, 2 United Greek-Catholic churches, a Greek church, a Lutheran chapel, and two synagogues. The churches of the former college of Jesuits and of the Carmelite convent are very fine. The Greek abbey of St. Basil is also a handsome structure. There are a good market-place; an equestrian seminary, a high school, and several other seminaries, besides the academy for medical science, with its library, collections in natural history, and botanic garden, founded by Stanislaus Augustus. The manufactures comprise some woollens, silks, and hats. The fairs, held three times a year, are well attended. Grodno was for a short time after 1673 the place of meeting for every third session of the Polish and Lithuanian Diets, but they were afterwards transferred wholly to Warsaw. The Diet held here in 1795 was for the mere purpose of ratifying the dismemberment of Poland. Grodno, two years after this, was the place of Stanislaus Augustus's abdication of the Polish crown.

GRONINGEN, a province in the kingdom of Holland, is bounded N. by the German Ocean, E. by Hanover, S. by the province of

Drenthe, and W. by Friesland. It lies between 52° 49' and 53° 27' N. lat., 6° 14' and 7° 10' E. long., its greatest length from south-east to north-west is 50 miles, its mean breadth is about 20 miles. The area is 882 square miles, and the population at the end of 1852 was 195,264.

The surface is level, intersected everywhere by canals and ditches, and protected from the sea by dykes. The principal rivers are the Hunze, which is navigable for large vessels from the town of Groningen to its mouth in the Lauwer-Zee; and the Aa, which runs into Dollart Bay. A great proportion of the land is marshy, and unfit for any purpose but pasturage, which however is rich, and supports a fine breed of cattle, and a great number of horses and sheep. A great quantity of turf is dug in the eastern part of the province. There are a few unimportant manufactures of broadcloth, calico, hosiery, linen, and silk. Some of the population are engaged in the coast fisheries, but the bulk of the people live by farming and grazing. The province is divided into three districts, Groningen, Winschoten, and Appingadam.

The capital *Groningen*, situated on the Hunze, is a large well-built town with 25,000 inhabitants. It is the most important town in the northern part of the kingdom, nearly circular in its form, and surrounded by walls and a fosse. The great church of St. Martin, the town-hall (a modern building in the Bree-markt, one of the finest squares in Holland), and the university are the most important structures in the town. The university was founded in 1614, and has usually about 300 students and 18 professors. There are also a public library, a museum of natural history, a botanic garden, and an institution for deaf-mutes, founded by Guyot, to whom a monument is erected in the Ossen-markt. The harbour is good, and a considerable trade is carried on in butter, cheese, rape-seed, rape-oil, corn, cattle, and other agricultural products. The Great Ship Canal from the Ems to Harlingen, on the western coast of Friesland, passes through Groningen, from which another canal runs north-east through Appingadam, and terminates at Delfzyl on Dollart's Bay. Groningen has ship-building yards, paper-mills, and a large trade in cattle, butter, and cheese. *Appingadam* is a small place of under 2000 inhabitants, situated on the Ship Canal, 14 miles E.N.E. from Groningen. *Delfzyl* is a strongly fortified town, 16 miles N.E. from Groningen, on the western shore of Dollart's Bay, with a good harbour inclosed by a dyke, and about 4000 inhabitants, employed chiefly in the fisheries and the coasting trade. *Winschoten* is about 17 miles E. from Groningen on the Ems and Harlingen Canal. It is fortified, and has a population of about 3500.

GROTTAMARE. [FERMO.]

GRUBENHAGEN, a principality in the southern part of the kingdom of Hanover, now forming a portion of the province or landrostei of Hildesheim. Its area is about 310 square miles. The eastern districts, which comprehend the Harz Mountains, are elevated, and not susceptible of cultivation: the highest summits are the Achtermanshöhe, 2706 feet, and the Bruchberg, 3018 feet above the level of the sea. The western districts, though bleak, consist of spacious, open valleys, which are well cultivated. The mountains are, with very few exceptions, richly wooded: the streams are only mountain brooks. The more important rivers are the Leine, Ilm, and Hahle; and there is a small lake near Seeburg. The climate is in general bleak and variable, and the sky seldom clear. In the lowlands much fruit and corn are raised; and besides these, hops, tobacco, flax, &c. Much attention is paid to the rearing of horses, and particularly horned cattle. Excellent butter and cheese are made. Sheep and swine are bred extensively. Wax and honey are collected. The chief wealth of the principality however consists in its woods and forests, which are estimated to cover above one-half of its entire surface. The mines of the mountain districts are productive, and yield silver, copper, lead, iron, zinc, vitriol, and sulphur: the quarries produce marble, freestone, slate, gypsum, alabaster, &c. Much charcoal is made. Linen yarn, laces, linen cloth, woollens, cottons, and metallic articles are also manufactured.

The chief towns of the principality are the following:—*Zimbeck*, the capital, situated on the Ilm, 40 miles S. from Hanover, is surrounded with walls, and contains about 6000 inhabitants. It has two religious houses, a gymnasium, three churches, in one of which (St. Alexander's) are the sarcophagi of the dukes of Grubenhagen; an orphan asylum, two hospitals, and manufactories of woollens, cottons, linens, tobacco, leather, &c. *Osterode*, a walled town, 10 miles S.E. from Zimbeck, on a feeder of the Leine, has a castle (now used as a granary), three churches, two hospitals, a gymnasium, and about 5200 inhabitants. The industrial products comprise woollens, cottons, hats, deals, white lead, tobacco, soap, linen, stockings, beer, spirits, leather, &c. *Duderstadt*, 16 miles S.E. from Osterode, is situated near the Prussian frontier, in the valley of the Hahle. It is surrounded by ramparts laid out in walks, and has about 4500 inhabitants, a Roman Catholic gymnasium, an Ursuline convent, a Lutheran and a Roman Catholic church, an orphan asylum, two hospitals, and manufactories of woollen stuffs, tobacco, tapes and ribands, brandy, &c. [HILDESHEIM.]

GRÜNBERG. [LIEGNITZ.]

GRUYÈRE. [FREYBURG.]

GUADALAJARA. [CASTILLA LA NUEVA.]

GUADALAJARA, or **GUADALAJARA**, the capital of the republic of Jalisco in Mexico, is situated on the river Santiago, in about 21° N. lat., 104° W. long., and has a population of about 60,000. The town is handsome, the streets are airy, and many of the houses excellent. There are 14 squares, 12 fountains, and a number of convents and churches. The cathedral is a magnificent building. The portales or colonnades, may be called the bazaars of the town, being filled with handsome shops, well stocked with foreign manufactures, and with the less important produce of national industry. These portales are much better than those of Mexico, and built with equal solidity and in good taste. The other remarkable buildings are the hall of congress, the mint, the episcopal palace, the opera-house, and the barracks. The city has a college and several schools. Great numbers of Mexican dollars are coined in the mint of Guadalajara. The Alameda, or public walk, is well laid out, and resembles in some respects an English park: it has a fountain in its centre, and a stream of water all round. The inhabitants are industrious, and carry on various trades. They are good blacksmiths, carpenters, silversmiths, and are noted for their skill in working leather, as well as in manufacturing a sort of porous earthenware, with which they supply not only Mexico but also the neighbouring states of the Pacific. Shawls of striped calico are also made in considerable quantities.

GUADALFEO. [SPAIN.]

GUADALOUPE, or, as the French write it, **GUADELOUPE**, an island (or more correctly, two islands, divided from each other by a very narrow channel, and forming part of the Lesser Antilles), lies about the point indicated by 16° 20' N. lat., 62° W. long. Guadeloupe was discovered and named by Columbus in 1493. It was previously called by the native inhabitants *Quéraqüera*. It was colonised by the French in 1635, and remained in possession of France until 1759, when it was taken by the English, who restored it to France in 1763. It was again taken by the English in 1794, and retaken in the following year. In 1810 it once more fell into the hands of the English, and was restored in 1814 at the general peace, since which time it has remained in the possession of France.

The channel which divides the island is called *La Rivière Salée*, or Salt River, runs north and south, and has a large bay at each end; that on the north is called *Grand Cul-de-Sac*, and that on the south *Petit Cul-de-Sac*. Between these bays the channel varies in breadth from 30 to 70 yards, and its length is about 5 miles. Its depth is so unequal that only vessels of small burden (60 tons) can pass through it. The land to the east of this channel is called *Grande Terre*, while that on the west, being the part first discovered and earliest settled, is properly called *Guadeloupe*, but is also denominated *Basse Terre*. The entire length of the whole island is from 60 to 70 miles, and its greatest breadth is 25 miles.

The island is apparently of volcanic origin. About the middle of the western division, somewhat towards the south, is a mountain called *La Souffrière*, or the Sulphur Hill, about 5100 feet above the sea. A thick black smoke rises from this mountain, mixed with sparks, which are visible at night. It is sometimes an active volcano. It forms part of a ridge which divides the western division, extending through it in a direction north and south. Several streams rise in these mountains. The eastern division is more level than the western side, but has no streams or springs; and the soil, being of a more sandy nature, is less fertile. Earthquakes and hurricanes are not uncommon. The rainy season lasts from the middle of July to the middle of October. The total rain-fall in the year averages 86 inches.

The former capital of the island, *St. Louis*, or *Point-à-Petre*, stands on *Grande Terre*, at the south entrance of the *Rivière Salée*, in 16° 16' N. lat., 61° 36' W. long. The harbour is sheltered and the anchorage good. It had formerly a population of above 15,000, including the suburbs, but in 1843 it was almost destroyed by an earthquake. The town of *Basse Terre*, which is in the other division of Guadeloupe, stands near its south-west point, in 15° 59' N. lat., 61° 47' W. long., and has about 6000 inhabitants. It is the residence of the governor of the island, the seat of a high court of assize, and has several schools. The harbour is merely an unsheltered roadstead with indifferent anchorage, unsafe during the hurricane season; but from its greater proximity to the most productive part of the island, it is more frequented by shipping than *Point-à-Petre*, and is the chief commercial station of the colony. The exports of Guadeloupe consist chiefly of sugar, with some molasses, rum, cotton, dye-stuffs, copper, &c. The imports are chiefly manufactured articles from France.

The population of Guadeloupe is about 130,000. Of this number about 100,000 were in a state of slavery previous to the French revolution of 1848. As an immediate result of that event they were all made free.

Guadeloupe exported to France, in 1848, 20,319,543 kilos. (= 20,000 tons) of sugar; in 1849, 19,191,700 kilos.; in 1850, during which the island was subjected to a state of siege in consequence of insurrection, the quantity fell to 13,020,900 kilos.; in 1851 it amounted to 16,922,630, and in the first six months of 1852 to 18,058,458 kilos.

GUANAXUATO, STATE OF. [MEXICO.]

GUANAXUATO, or **GUANAJUATO**, the capital of Guanajuato one of the United States of Mexico, is situated on the table-land of Anahuac, 7294 feet above the level of the sea, in 21° N. lat., 100° 50' W. long.: population about 40,000. It is built on extremely uneven ground, furrowed by numerous ravines. The town, which owes its origin altogether to the gold- and silver-mines which surround it, is very irregularly built. Many of the streets are very steep. It contains numerous splendid memorials of the former rich produce of the surrounding mines, in the magnificent palaces of the proprietors, the church which formerly belonged to the Jesuits, the numerous chapels and religious edifices, the Alhondiga, a large square building used as a public granary, and the road which leads to the mine of Valenciana. Before the War of Independence the town contained a population of 41,000, and its six suburbs nearly 30,000 more; but most of the works of the mines were destroyed during the civil war. Since that period they have been re-established; and in 1852 the silver coinage of Guanajuato amounted to 7,300,000 Spanish dollars. The mines have for many years yielded more silver than the mines of Potosi.

GUANCABELICA, or HUANCABELICA. [PERU.]

GUARDA. [BEIRA.]

GUASTALLA. [PARMA.]

GUATEMALA, Republic of, Central America, occupies the table-land of Guatemala, with the hilly country between it and the Gulf of Honduras, and a portion of the table-land of Yucatan. It lies between 13° 40' and 18° 10' N. lat., 88° 15' and 93° 20' W. long. On the S.E. it is bounded by the Republic of Salvador; E. by Honduras; N.E. by the Gulf of Honduras and the British settlement of Belize, or British Honduras; N. by the Mexican state of Yucatan; W. by Chiapa; and S. by the Pacific Ocean. The area is about 50,000 square miles: the population about 500,000.

Coast-line, Surface, &c.—The general bearing of the Pacific coast from the Salvador boundary of the state to the Barra de Guacalate is W. by N., and thence to the Rio Sitalapa, the boundary between Guatemala and Chiapa, it is N.W. The shore is for the most part low, the descent from the table-land being steep, and a strip of lowland, from 20 to 30 miles across, being left between its base and the sea; but in many places the shore is high and rocky, and several rocky barriers lie off it. The only port at present frequented on this coast is that of Ystapa, at the mouth of the Rio Michetoyat; but though it is a port of entry, the harbour is little better than a roadstead, affording no protection for shipping. Ocos, farther north, formed by the Barra de Ocos, is also an available port, but, owing to the absence of inhabitants, is not resorted to. The low tracts along the coast are very thinly peopled. On the northern coast Santo Tomas, in Honduras Bay, is a good and well-sheltered port; and somewhat inland, in the lake known as Golfo Dolce, is the port of Yzabal, in some respects the principal port of Central America; most of the European goods designed for that market being brought to it by vessels, and thence transported to the interior by mules: owing to a bar at the mouth of the Rio Dolce, Yzabal is inaccessible to vessels drawing over 7 feet of water.

The table-land of Guatemala occupies all the countries between the isthmus of Chiquimula and that of Tehuantepec in Mexico; the high-land in the interior of the peninsula of Yucatan, usually called the table-land of Yucatan, forms its north-eastern projection. Near its southern borders, about the town of Guatemala, it is nearly 5000 feet above the sea; and this may be considered as the mean height of that portion which is south of the Rio Motagua. But north of this river the country rises higher. The most elevated part of it appears to lie between the towns of Totonicapán and Gueguetenango (15° 30' N. lat.). From this point it begins to lower gradually, and its north-western edges, which belong to the Mexican state of Chiapa, are indented by deep and sometimes wide valleys. No continuous range of any considerable elevation traverses this plain, the surface of which is slightly undulating, like the central parts of England; but here and there it is traversed by a range of hills, rising a few hundred feet above the plain. The descent from this plain to the low shores of the Pacific is extremely steep, and consequently when seen from that side it has the appearance of a mountain range, an illusion which is confirmed by a few lofty volcanoes standing near the edge of this descent. The most remarkable are the active volcano of Atitlan, near Gueguetenango, and the two volcanoes situated S. and N.W. of the town of New Guatemala, of which the Volcano de Agua (or Water Volcano), according to Colonel Galindo, is 12,620 feet, but according to other authorities 13,578 feet high; and the Volcano de Fuego (the Fire Volcano), appears to be somewhat higher, but which has not been ascended. All the volcanoes, whether active or extinct, are situated near the Pacific, and are in line with those of Salvador and Nicaragua. The eastern border of the table-land, by which it descends to the Gulf of Honduras, is cut by deep valleys, between which the high land takes the shape of ridges, which extend to a great distance, and in some places, as between the Rio Motagua and the Golfo Dolce, advance to the very shores of the sea. The country between the table-land and the Gulf of Honduras may therefore be considered as a succession of valleys and ridges, except the part to the west and north-west of the Golfo Dolce, which is a low plain.

The state is well watered by a large number of rivers, but very few of them are navigable: the principal are the Dolce, Polochic, and Motagua. The *Rio Dolce*, though short, is the most important river of Central America, being the channel by which the Golfo Dolce discharges its waters into the Gulf of Honduras, 15° 35' N. lat. The Golfo Dolce is a fresh-water lake, about 50 miles in circuit, having on its southern bank the small port-town of Yzabal. The *Rio Dolce*, issuing from the eastern portion of the lake, turns to the north, and expands into a small lake, called the Golfetta (the Small Gulf), about 10 miles in width. This river is about 20 miles long, and of considerable depth, except on its bar, where there are only 6 or 7 feet water.

The *Rio Polochic* rises near the village of Tactic, on the table-land of Guatemala, but soon descending into a wide and deep valley, it becomes navigable at the Embarcadero de Teleman, a considerable distance above the Golfo Dolce, into which it falls. It is a rapid river, and deep enough for vessels drawing several feet of water, but on the bar at its mouth there are only 3 or 4 feet of water.

The *Motagua* rises near the town of Solola on the table-land of Guatemala, through which it runs in an eastern direction till it descends from it some distance west of Zacapa. At Gualán, some miles farther down, the river becomes navigable, but, owing to its numerous rapids and shoals, it can only be navigated by boats not drawing more than a foot and a half water. Towards its mouth the river turns to the north-east and falls into the Gulf of Honduras about 15 miles west of Omoa. By means of this river a considerable quantity of European goods, especially the heavier kind, is sent into the interior of Guatemala; they are transported from Gualán to the places of consumption on rafts.

The Lacantun, which rises in this state and separates it for a considerable distance from Yucatan, becomes an important river after its entry into the state of Yucatan. The rivers which enter the Pacific are numerous, but have all a short course. One of the most important is the Michetoyat, which at its mouth forms the harbour of Ystapa, the port of the city of Guatemala.

There are four rather considerable lakes in the state. Of these that called Golfo Dolce, noticed above, is the most important, as by means of it most of the foreign trade of the republic is carried on. The lake of Peten, situated in the most northern district of Vera Paz, on the table-land of Yucatan, is of an oval form and about 70 miles in circuit. It contains several islands, on the largest of which is a small fortress and a collection of houses forming the village of Flores. The lake of Atitlan is 80 miles north-west of the city of Guatemala, and near the western edge of the table-land. It is about 18 miles long and 9 miles broad, environed by lofty heights, including the volcano of Atitlan, and remarkable for its extraordinary depth and for having no outlet, though several small rivers fall into it. The lake of Amatitan, 18 miles south-east from the city of Guatemala, is 9 miles long and 3 miles wide, and of great depth. It is much resorted to as a bathing-place by the inhabitants of the city during the season from February to April; and near the lake are several hot and mineral springs. The *Rio Michetoyat* flows from this lake.

Climate, Soil, Productions.—The climate of the table-land is that of a perennial spring; the thermometer scarcely varying throughout the year. The average heat in the middle of the year is from 68° to 70° Fahr.; but during the north winds, which prevail in the dry season, from October to May, it sometimes though rarely descends 20 degrees within a few hours. The rainy season usually sets in in May and lasts till October; but rain seldom falls except between 3 o'clock in the afternoon and 6 o'clock in the morning. In June thunder is frequent; in August and September the Pacific coast is subject to violent storms from the south-west. The table-land is considered to be very healthy, but góitre is prevalent, especially among the mixed races, and is often accompanied by idiocy. Earthquakes are painfully frequent.

The soil is generally very fertile. The table-land is nearly without trees, and even bushes, except on the declivities of the hilly ranges, which traverse it in every direction. On the lower lands by the Pacific trees of very large size form extensive forests, and are a source of great natural wealth; but owing to the thinness of the population and the want of roads, are at present of little profit. Among the trees are mahogany, cedar, Brazil, Santa Maria, guaiacum, pimento, &c. Various medicinal plants are also abundant. On the low tract by the Gulf of Honduras there is a luxuriant and vigorous vegetation.

On the table-land wheat and maize of excellent quality are largely grown. Most European fruits and vegetables produce well; and tropical fruits and vegetables abound. In the lower tracts excellent rice is raised. Tobacco, cotton, sugar, cacao, vanilla, and indigo are raised for exportation. Most of the cochineal which forms so important an article in the commerce of Central America is obtained in Guatemala. The agricultural resources of Guatemala remain however but slightly developed. The country is thinly peopled, and owing to its unsettled state, and the inert character of the major part of the people, little has been done towards improving the rude systems of cultivation or introducing superior implements; and a considerable portion of the country lies almost waste. Of this uncultivated land a large part is used as grazing ground, and a rather large number of cattle is kept. Sheep are reared in considerable numbers,

the wool, which is somewhat coarse, being used for the native manufactures. The horses are small, but hardy and handsome. Mules are numerous, being largely used for carrying goods. Hogs abound, and are of good quality. A good deal of poultry is raised.

Several metals are believed to exist in sufficient quantities to be profitably worked under favourable circumstances. Gold, silver, lead, copper, and iron are said to have been found. Lead mines are worked by the Indians in Totonicapan. Jasper and marble are obtained. Brimstone of good quality is procured in the vicinity of some of the volcanoes. Salt is made along the Pacific coast.

The manufactures are chiefly confined to articles of domestic consumption. The cotton manufacture, one of considerable importance, has greatly declined. It is now chiefly carried on in the corregimientos of Guatemala and Sacatepeques. The manufacture of woollen cloth has retained more of its former consequence: the making of the ordinary coarse cloths, and of a kind of black cloak much worn in the country employs a large number of looms. Hats, jewellery, furniture, earthenware, and the ordinary articles of domestic use are largely made in several of the towns. The exports are confined to few articles. Of these the most important is that of cochineal, which was introduced into Guatemala as late as 1811, and did not for several years produce more than sufficient for home consumption. In 1811 about 15,000 lbs. were exported: in 1849 the quantity had increased to 1,469,100 lbs. The other articles of export are chiefly mahogany and other woods employed in cabinet work; vanilla, sarsaparilla, and other medicinal roots and plants; indigo; and hides. Sugar, coffee, and cotton are also exported in small quantities. The imports are British cotton and dry goods, linen and silk fabrics; outlery and hardware; porcelain and fine earthenware; fancy goods; wines, &c. In 1851 the exports amounted to 994,488 dollars; the imports to 1,354,430 dollars.

Divisions, Towns, &c.—Guatemala is divided into seven departments (corregimientos), which, with their chief towns, are as follows:—

1. Guatemala occupies the south-eastern portion of the territory, has an area of nearly 5000 square miles, and a population of about 90,000. The surface of the country is considerably diversified, the climate equable and genial, and the soil remarkably fertile. This and the following department form the great cochineal district. The nopal (*Cactus opuntia*), the plant on which the cochineal insect is produced, grows freely and luxuriantly, especially around the town of Amatitan, where are the chief plantations: the insects come to maturity in April, and the collecting of them continues for about a month. The other productions of this department are maize and wheat, sugar and coffee, most of which however is required for home consumption. The principal towns are GUATEMALA, the capital of the state, Amatitan, Escuintla (population 3,000), and Jalpatagua. *Amatitan*, at the foot of the lake of the same name, which formerly depended on the persons who annually resorted to it for bathing, is now, in consequence of the great increase in the rearing of cochineal, a rich and flourishing place, having a population including the suburbs of upwards of 9000.

2. Sacatepeques lies to the west of the corregimiento of Guatemala; it contains above 1900 square miles, and a population of about 56,000, who are chiefly settled in its southern part. The country around the city of Old Guatemala is one of the most picturesque in the world, and the soil is extremely fertile. Maize and other grains, and vegetables and fruit in great variety, are largely grown. Cotton, coffee, tobacco, and sugar flourish here, though they are not yet grown to any great extent. Poultry and hogs are raised in considerable quantities for the supply of the capital. The olive and vine grow well here, but are not cultivated to any extent. The chief town is Old Guatemala [GUATEMALA, City of], but there are several other populous places around it notwithstanding the proximity of the two volcanoes Agua and Fuego, and the frequency and severity of the earthquakes with which it is visited. The larger of these towns are Chimaltenango, population 4000, and Patsun.

3. Sololá, lies to the west of the former corregimientos, and contains about 4000 square miles. The surface is very much broken, and the soil, especially in the valleys, very fertile. The climate is colder than in some other parts of the state. Wheat, maize, and fruits are the chief products. Sheep are bred in large numbers. Jergas and other coarse woollens are manufactured. At least three-fourths of the inhabitants are Indians, who are mostly engaged in agriculture or weaving: twelve or fourteen of their villages are placed around the shores of the lake Atitlan, which is nearly in the centre of Sololá. From the midst of this lake rises the volcano of San Pedro. The chief towns of this department are Sololá, population 5000, Atitlan, and Masatenango, but neither of them is of any importance.

4. Quesaltenango lies to the north-west of Sololá; it contains above 4500 square miles, and 70,310 inhabitants; and is one of the most important of the departments in an industrial point of view. It has a tolerably level surface, a temperate climate, and a very fertile soil. The products are maize and wheat, sugar, cacao, and various fruits and vegetables, which are largely exported to the city of Guatemala, to Salvador, and Chiapa. Large herds of cattle and mules, and great flocks of sheep are maintained. The capital *Quesaltenango*, population 20,000, a large portion of whom are Indians, is the next town in importance to Guatemala. It stands on the little river Samala, and is a large well and regularly-built place. It contains a spacious

church, and six of smaller size, a large town-hall, a plaza, or great square, with a fountain in the centre, has a daily market, and is a place of considerable trade. In its vicinity is a hot spring which ejects the water to a height of above 20 feet. The other towns are San Marcos, Tapachula, and Tejutla.

5. Totonicapan, is an inland department, lying north-east of Quetzaltenango; it contains 5600 square miles, but is very thinly peopled; the larger part of the inhabitants are Indians. The surface is much broken; the climate is temperate but considerably varied; the soil in the valleys, which are well watered, is fertile. Maize and wheat, sugar, fruit and vegetables are the chief products of the soil. Sheep and cattle are largely bred. Lead-mines are wrought by the Indians in the neighbourhood of Chiantla. Salt is made from springs near Yxtatan. The only town of any importance is Totonicapan, which is said to contain 12,000 inhabitants, nearly all Indians, who make considerable quantities of woollen cloth, earthenware, and wooden utensils. The other towns are Momostenango, Gueguetenango, and Jacaltenango.

6. Chiquimula, occupies the north-eastern extremity of the state, bordering on the republic of Honduras: its area is nearly 5000 square miles; its population about 80,000. The surface is considerably diversified, and in parts very fertile; the valleys and low tracts by the Golfo Dolce and the Bay of Honduras are hot, moist, and unhealthy. Tobacco, cotton, rice, and sugar are raised largely, with maize, frixoles, &c. The sugar is grown chiefly for distillation or for making chicha, a favourite intoxicating drink of the Indians. Horses, mules, and cattle are reared in large numbers. The chief towns are Chiquimula, population 4500; Acasaguastlan, 3600; Jalapa, 3500; Jiloquepeque, 3200; Mita, 3800; Quetzaltepeque, 4000; Zacapa, 3000; and the little port town of Yzabel on the Golfo Dolce. Near this last place are the remarkable ancient remains of Quirigua, consisting of seven lofty columns, and various sculptured alaba.

7. Vera Paz, the largest of the seven *colegimientos*, comprehends the projecting tract of country which forms the most northern part of the republic; the area is about 11,000 square miles: the population is estimated at 65,000, of whom nine-tenths are Indians. The country is very varied in surface and character of soil; but comparatively very little of it is cultivated. Mahogany, rosewood, and other valuable timber-trees abound; the coffee, cacao, indigo, and nopal plants are said to be indigenous in the forests. In the northern part of Vera Paz is the lake of Peten. The most populous town is Coban, situated in a remarkably fertile valley of the same name, with a population of above 10,000, nearly all Indians, who are industrious and wealthy, possessing fine plantations of sugar-cane, bananas, pimentos, and various kinds of fruits; the other towns are Salamá, population 4500, Cajabon, 4000; and Rabinal, 6000; but none of them call for specific notice.

Government, &c.—According to the constitution of the 19th of October 1851 the executive is confided to a president elected by a general assembly, composed of the legislative chamber, the archbishop of Guatemala, the members of the supreme court of justice, and the members of the council of state having a deliberative voice. The president is elected for four years, but is eligible to be re-elected. The legislative assembly consists of 59 members. The council of state is composed of the ministers, eight councillors chosen by the legislative assembly, and of others appointed by the president. The revenue and expenditure average somewhat over 400,000 dollars. The debt amounts to 1,200,000 dollars. The army consists of 1000 men, with a patriotic corps and a militia of 5000 men.

The population consists of aboriginal tribes, some of whom live in a state of almost perfect independence, but the main body have obtained all the rights of free citizens of the republic, and form the bulk of the population; of the descendants of Europeans, and of the mixed offspring of Europeans and Indians who are known as 'ladinos.' The Roman Catholic is the established religion, and there are few if any open dissenters. The church is presided over by the Archbishop of Guatemala.

During the Spanish occupancy Central America was termed the kingdom of Guatemala, the city of Guatemala being the capital and seat of government. During the struggle for independence it remained quiet and subject to Spain; but on the declaration of independence in 1821 it was for awhile united to the Mexican empire of Iturbide. On the publication of the new constitution, July 2nd 1823, by which the federal union of Central America was formed, Guatemala became one of the united states. This union was however after a short time dissolved, and Guatemala then became an independent republic and has so continued to the present time.

(Hæfkin, *Central America*; Juarror, *Guatemala*; *Travels of Humboldt*, Dunn, Byam, Thompson, &c.; Baly, *Central America*.)

GUATEMALA, the capital of the republic of Guatemala, Central America. A city of this name was founded by Pedro de Alvarado in 1524, about 28 miles W. from the present city, near the town of Guatemala la Antigua, and was destroyed in 1541, it is said, by enormous masses of water bursting forth from a neighbouring volcano, which from that circumstance has obtained the name of Vulcano de Agua, or the Water Volcano. A new town was built at a little distance, and is now called Guatemala la Antigua, or briefly La Antigua. This second city, the capital of the Spanish kingdom of

Guatemala, was partly destroyed by earthquakes in 1773, after which disaster the present city, called Guatemala la Nueva, or 'the New,' was founded in 1774.

Guatemala la Nueva is situated in 14° 37' N. lat., 90° 30' W. long., on a plain which is about 14 miles long and 9 miles wide, and is 4961 feet above the sea-level; it is 90 miles from the Atlantic and 26 miles from the Pacific Ocean: population about 40,000. The city is built with great regularity; the streets are 40 feet wide, straight, intersect at right angles, and always terminate in some conspicuous building. The houses have only one story, but occupy a great deal of ground, containing within their walls one or more court-yards. The town is well provided with water brought by an aqueduct from a spring which rises on a hill about four miles from the city, and conducted by pipes into twelve public reservoirs, from which it is carried to every private house. The most remarkable buildings are round the plaza, or great market-place, a square of about 150 yards, situated nearly in the centre of the city. On the east side stands the cathedral, a simple but noble building; and near it on one side the palace of the archbishop, and on the other the university. The north and west sides of the plaza are occupied by other public buildings, and on the south side are the best shops of the city. Besides the cathedral there are 19 other churches and chapels. Guatemala enjoys a perpetual spring; the thermometer rarely rises above 70°, or descends below 64°. Earthquakes are however frequent. The commerce of the city is limited to its own consumption and that of the neighbourhood. Its manufactures consist of common cottons, muslins, gauze, porcelain, earthenware, cigars, jewellery, &c. The suburbs, which are mostly inhabited by Indians and mulattoes, here called *ladinos*, partly surround the city.

Guatemala la Antigua, about 26 miles W.S.W. from the capital, is situated in a wide valley of great fertility, at the western end of which rise the two vast and lofty volcanoes called De Agua and De Fuego, noticed in the previous article. The city itself is at an elevation of 5817 feet. After its partial destruction in 1773, and the foundation of New Guatemala, the Spanish government ordered the place to be abandoned, but a considerable portion of the inhabitants returned to it; and it now contains a population of about 16,000. This amount of population is mainly to be attributed to the great fertility of the valley, in which nearly all the vegetables are cultivated which are consumed in both cities: there are also some manufactures, and a considerable quantity of cochineal is collected. The city is regularly laid out, and the streets are spacious. Among the buildings which were not destroyed is the town-hall, a magnificent edifice, and a good example of the style in which the city was built. A great part of the place is still in ruins.

GUAYAQUIL. [ECUADOR.]

GUBEN. [BRANDENBURG.]

GUELDERLAND, or GELDERLAND, a province of the kingdom of Holland, lying between 51° 45' and 52° 32' N. lat., 4° 57' and 6° 47' E. long., is bounded N. by the Zuider-Zee and Overijssel, W. by Utrecht and South Holland, S. by North Brabant and Limburg, and E. by the Rhenish provinces of Prussia. Its area is 1962 square miles, and on the 31st of December 1852 the population was 383,394.

The surface is in general level: some of it is reclaimed marsh land; northward from Arnheim to the mouth of the Yssel, the country is hilly or undulating. The climate is healthy; the soil is good and the pasture luxuriant; but there is a considerable breadth of heath and naturally barren land, some of which is planted with pines, firs, and stunted oaks. Guelderland is watered by the Rhine, the Waal, the Yssel, the Maas, and the Leek, besides which rivers there are several canals. It is traversed by the railroad from Amsterdam to Arnheim, whence the line is to be continued across the province to Emmerich within the Prussian frontier. The greater part of the inhabitants employ themselves in agriculture. The principal crops are wheat, rye, buck-wheat, potatoes, hops, and tobacco. Orchards are very numerous, and the cultivation of the land is generally in a very advanced state. Some few manufactures are carried on; among these, paper-making and tanning are the principal: some linen is likewise produced. The province is divided politically into four districts, namely, Arnheim, Nimeguen, Thiel, and Zutphen. The capital of the province is ARNHEIM.

Nimeguen, or *Nymegen*, the Roman *Noviomagus*, stands on the left bank of the Waal, and has about 20,000 inhabitants. It is built on the slope of a hill, and is strongly fortified. The town is well built, but the streets are narrow. The quay is separated from the town by a wall. The most remarkable buildings are the town-house and the church of St. Stephen. Some Roman antiquities have been discovered. On an eminence above the town is the fine café and promenade of the Belvedere, from which there is a very interesting prospect. Leather, glue, Prussian blue, and a pale beer called *moll*, are the chief industrial products. Nymegen is famous for the treaties of peace concluded in it August 10 1678 between Spain, France, and Holland; and February 5, 1679, between Spain and France, the emperor of Germany, and Sweden.

Zutphen, at the siege of which in 1591 Sir Philip Sidney fell, is a strongly fortified town, on the right bank of the Yssel, and has 11,000 inhabitants. The ramparts are planted with trees, and form a plea-

sant public walk. The town is well built, and contains several pretty churches, a town-hall, a house of correction, and the S'Gravenhof, or palace of the counts of Gelderland, all of which are stately edifices.

Hardewyk is a fortified port on the *Zuider-Zee*: the inhabitants, about 5000 in number, carry on the herring-fishery, and have a considerable corn trade.

Thiel, a fortress on the right bank of the *Waal*, is a place of some manufacturing industry, and has 5000 inhabitants.

GUELDRES. [RHEIN PROVINZ.]

GUÉRET. [CREUSE.]

GUERNSEY, one of the islands of the English Channel, belonging to England, is situated in the Gulf of Avranches, between 49° 24' and 49° 30' N. lat., 2° 32' and 2° 47' W. long. It is distant 62 miles S. from Torquay; 120 miles S.W. from Southampton; 45 miles W. by S. from Cherbourg. The population of the island in 1851 was 29,757. The form of the island approximates to that of a right-angled triangle: the sides face the south, east, and north-west, and are respectively about 6½, 6, and 9 miles long; the circumference of the island is about 30 miles. The coast is somewhat difficult of approach, from the number of rocks and the rapidity of the currents around it. The tides rise to the height of 32 feet. The northern part of the island is a level tract, and the coast for the most part lies low: the southern part is more elevated, but the high ground is intersected by narrow valleys and deep glens, and the coast is lofty and abrupt. Springs and rivulets are plentiful. Good roads lead from St. Peter Port to different parts of the island.

The island is almost entirely of granitic formation: the rocks are chiefly gneiss, granite, and sienite. Sienite is quarried at Grande Rocque, on the north-west side of the island, for building; and at St. Sampson's, on the east of the island, a gray or black granite is wrought. It is used for building and paving, and large quantities of it are sent to London and Portsmouth. Some trap rocks and mica and argillaceous schist occur in the western part of the island. A lode of copper has been found near Fort George.

The climate of Guernsey is subject to frequent but not great variations: the thermometer seldom rises above 80° of Fahrenheit, or falls as low as 37°, and never remains long stationary at the freezing point. The mean winter temperature is about 41° 62'; that of summer 60° 7'. Snow is rare, and frosts are neither severe nor durable. During the spring easterly winds prevail, but the prevailing winds during the rest of the year are westerly.

The soil is fertile, but the improvement of the land has been checked by the minute subdivision of property. The country people live upon and cultivate their own estates, the largest of which is said not to exceed 200 Guernsey verges, or about 74½ English acres, and few of them exceed half that size. Wheat and barley are generally grown, the red wheat having the preference. Parsnips are used for winter fodder for cattle, and for fattening them; clover is largely raised. Potatoes yield excellent crops. The ploughed lands are never suffered to lie fallow. The principal manure used is sea-weed. The island breed of horses has been greatly improved of late years. The breeding of cattle, especially of cows, is in Guernsey an object of great attention. The dairy is in all farms of any size the principal object of attention, and the chief source of profit. The butter is in high repute. Swine are numerous, and the hogs attain a great size. Poultry is sent to market in large quantities.

The island is not so well wooded as Jersey. In some parts however there is tolerable abundance of wood. The hedge-rows are chiefly of furze. The orchards are productive, and a considerable quantity of cider is made. The mildness of the climate affords opportunities for raising in the open air fruit-trees which in England require artificial heat or shelter. The cultivation of flowers is carried on with great success.

A great variety of fish is taken on the shores of the island; crabs, lobsters, cray-fish, and oysters are abundant. There is also a shell-fish, said to be peculiar to the Channel Islands, called the ormer, which, when dressed, is a favourite dish.

The only division of Guernsey is into parishes: these are ten in number, and, with their situation, and population in 1851, are as follows—St. Andrew, central, 1204; Cdtel, or St. Mary-de-Castro, west and central, 2182; Forest, south, 673; St. Martin, south-east, 1968; St. Peter-du-Bois, west and south-west, 1152; St. Sampson, north, 2006; St. Saviour, west and central, 1087; Torsteval, south-west, 355; the Vale, north, 2110; St. Peter Port, east, 17,070.

The only town in Guernsey is *St. Peter Port*, situated on the slope of a hill about the middle of the eastern coast of the island, and extending for nearly a mile along the shore. The population of the town parish in 1851 was 16,778. New Town, as the upper part of the town is called, and what is termed *Hauteville* (the upper town), on the slope of the hill to the south-west of the old town, are the most modern and best built quarters. The appearance of *St. Peter Port*, on approaching it by sea, is imposing, the houses rising one above the other. The streets in the old town are narrow, steep, and crooked; and the houses are dusky looking and old: but both streets and houses have been considerably improved of late years. The government-house, the residence of the lieutenant-governor, is a substantial but heavy building. Near it is *Elizabeth College*, a handsome and extensive building, surrounded with spacious grounds. *St. Peter's*

church was consecrated A.D. 1812. *Trinity church*, formerly a proprietary chapel, has been enlarged, and is now a convenient building. *St. James's church*, erected in 1817, is a neat edifice, having accommodation for 1300 persons. *St. John's church*, erected in 1836, is a more ambitious structure. The Wesleyan, Primitive, and New Connexion Methodists, Independents, Baptists, Quakers, Roman Catholics, and Plymouth Brethren have places of worship in the town. There are several schools, numerous religious and charitable institutions, a literary institute, reading-rooms, several clubs, &c. The court-house, a neat building, and the new prison, an expensive but ill-contrived structure, are at *Hauteville*. The town hospital was erected in 1741-42, and enlarged and improved in 1809-10. In it are received all sick and destitute poor. There are three markets: the fish-market, which is well supplied, is a spacious and handsome arcade, 190 feet long, and broad and lofty in proportion, with a double row of marble slabs extending the whole length of the building; the other markets are commodious. The markets are open every day, but the principal market-days are Wednesday and Saturday. The theatre is a plain building. A promenade, called the *New Ground*, is pleasantly laid out. In the suburbs are numerous villas and excellent private residences.

The harbour is formed by two piers; it is small, and insufficient for the trade of the place. The roadstead affords a convenient anchorage, sheltered from the south-west winds, and defended by *Castle Cornet*, built on an insulated rock, somewhat less than half a mile from the shore, from which it is accessible at low water in spring tides. *Fort George*, a regular fortification on the heights, about half a mile south of the town, was begun in 1775: it is considered to be of great strength. Around the island are 15 martello towers. The chief shipping trade at present is the carrying trade: the amount of shipping belonging to the island is about 15,000 tons. The principal manufactures are those of tobacco and snuff, soap, candles, Roman cement, bricks, rope, cordage, &c.; cider is largely made, and spirits are extensively distilled for exportation.

St. Sampson's Harbour is the only harbour in the island besides *St. Peter Port*. Around it a small town has grown up, with an esplanade, &c., for visitors, and ship-yards, docks, and store-houses for the shipping traffic. The Guernsey granite is all shipped from *St. Sampson's Harbour*, and there is a steadily increasing trade attached to the place. *St. Sampson's church* is the oldest in the island: it is of the 12th century, and resembles the transition early English style. The harbour is defended by the *Mount Crevet battery*.

Guernsey, like the neighbouring island of Jersey, has a political constitution of its own. The legislative body is 'the States of Deliberation,' which are composed of the bailiff of the royal court, who is speaker; the procureur, or attorney of the royal court; the rectors of parishes; the delegates of the parishes, one from each of the country parishes, and six from the town parish; and the jurats, or judges of the royal court; in all 37. The bailiff and procureur are nominated by the crown; the rectors are presented by the governor; the delegates are elected by the islanders. The revenue of the island is derived from the general taxes, harbour-dues, publicans' and spirit retailers' licences, and other sources. The general taxes are levied for parochial as well as general purposes, and are assessed upon capital of almost every kind, including capital in the British or foreign funds, provided it belongs to an individual domiciled in Guernsey. Pensions, salaries, professional income, half-pay, &c., are not taxed. The chief court of justice in the island is the royal court, which consists of the bailiff and 12 jurats, the former appointed by the crown, the latter by the islanders. There is an appeal in certain cases to the queen in council. Judicial proceedings are conducted in the language of the island. Norman customs and ancient precedents form the basis of the civil jurisprudence, which is a complex mixture of Norman and English law. The power of the court is very extensive.

The island constitutes a deanery in the diocese of Winchester. The livings are 12 in number, including the chapelries. According to the 'Census of Religious Worship,' taken in 1851, there were then in Guernsey and the adjacent islands 64 places of worship, of which 26 belonged to four sections of Methodists, 16 to the Church of England, 7 to Independents, 6 to Baptists, and 9 to minor bodies. The total number of sittings provided was 23,827. There were 116 day schools, of which 28 were public with 2477 scholars, and 87 private with 1994 scholars. The number of Sunday schools was 33, with 4315 scholars. Of these Sunday schools 17 belonged to Methodists, 12 to the Church of England, 2 to Baptists, and one each to English Independents and French Independents.

The small proprietors often unite with their other pursuits the trades of carpenter or mason, or some handicraft. If near the coast, they frequently unite fishing with agriculture. The cottagers are the children of the small proprietors, or day-labourers. The cottages are remarkably neat and comfortable within and without. The dialect of the island, commonly considered a patois of the French, is rather the Norman of many centuries ago. The knowledge of English is general among the upper classes, and pretty common among the middle classes.

The principal place of education is *Elizabeth College* at *St. Peter Port*, founded by Queen Elizabeth in 1563. The education given in this institution is that usually given in a collegiate grammar school.

The building, a large and commodious structure in the Tudor collegiate style, was completed in 1829 at a cost of about 14,000*l.* The college has an income from endowment of 70*l.* a year, and the states further provide 200*l.* or 300*l.* a year. There are two exhibitions for four years. The number of scholars in 1852 was 95.

Guernsey and the Channel Islands generally must have been known to the Romans, but the only mention of them in any ancient writer is in the Itinerary of Antoninus, and it is difficult to identify the names there given with the several islands. Before the year 1035 Nigellius, or Néel, Viscount of St.-Sauveur, was lord of half Guernsey, and the six churches in his moiety belonged to the abbey of Marmoutier, at Tours. The other half of Guernsey belonged to Earl or Duke Robert of Normandy. In his moiety were five churches which belonged to the abbey of St. Michael; but one of these, that of St. Tugdual of Herm, appears to have belonged to the abbey of Cherbourg. The Channel Islands were included in the duchy of Normandy, and are the only relics of that duchy which remain to the English crown. On more than one occasion the islanders withstood and repelled the attacks of the French. In the great civil war the Channel Islands embraced the king's party, and were not subdued until after the death of Charles.

The primeval antiquities, or relics of the ante-Christian period, are numerous in the island. Several cromlechs remain in different places. The finest is that known as the Druids' Temple, which stands on an eminence near L'Ancrese Bay, and consists of five very large stones. There are also some cairns, and there was formerly a logan, or, as it was called here, a Roc Balan. The cromlech at L'Ancrese was explored in 1837 by Mr. Lukis, who found about forty urns of different sizes, with many fragments of broken pottery, besides unburnt human bones. In the cromlech Du Tus, in the parish of the Vale, Mr. Lukis found two vertical kneeling human skeletons. Other cromlechs examined by the same skilful antiquary yielded stone-hammers, arrow-heads, and other relics. Of these remains Mr. Lukis has a fine collection at his residence near St. Peter Port. An admirable account of the 'Primeval Antiquities of the Channel Islands' was contributed by Mr. Lukis to the 'Archæological Journal,' vol. i. In the 10th century Guernsey is said to have been called the Holy Isle, on account of the number of monks and hermits who inhabited it, and several monasteries were founded here; a few vestiges of these remain, but of the ecclesiastical remains at present existing the churches are the chief, and none of these require further notice. The principal fortress in the island has always been Cornet Castle, which appears to have been founded about 1204. Cornet Castle has undergone many sieges, and has been the scene of many gallant exploits. The present castle is a rather picturesque structure of very different dates. It is still maintained in a defensive state: it stands on a small islet off St. Peter Port. The Marsh Castle, or as it is frequently called Ivy Castle, north of St. Peter Port, erected in 1306, is now a ruin. Of Vale Castle, north of St. Sampson's Harbour, only a few fragments remain.

Dependencies of Guernsey: Alderney, Serk, Herm, and Jethou.—Of Alderney an account is given elsewhere. [ALDERNEY.] *Serk*, or *Sercq*, the next in size to Alderney, is about 6½ to 7 miles E. from Guernsey: the population in 1851 was 580. Its greatest dimension is about three miles from north to south, its greatest breadth is about a mile and a half; but it is so contracted near the centre of the island that it may be regarded as consisting of two parts, one of them called Little Serk, connected together by a high and narrow ridge or isthmus called the Coupée. The coast is indented on every side by small bays called by the islanders 'boutiques' (shops); and is so girt with cliffs that there is no way of landing on the island but by scrambling up the cliffs, or ascending by a tunnel cut through the solid rock in the little harbour of Creux, on the north-east side of the island. The eastern shore is lined with rocks running far out into the sea. The western side of the island belongs for the most part to the trap and schistose formation; the eastern side to the granite formation. On the west side of Serk, separated from it by a narrow strait, is the island of Brechou, or Brechnou, otherwise the Ile des Marchands, about a mile and a half round.

The land in Serk is generally under tillage. The manure used is vraic, or sea-weed. The produce consists of wheat, barley, oats, beans, potatoes, and parsnips. From the indivisibility of property, the inclosures are larger than in the neighbouring islands. There are many good orchards, which produce abundantly. The farms scarcely average more than fifteen acres, and as this does not afford sufficient occupation for the farmer and his family all the farmers are fishermen also. The farmers are their own boat-builders, and the little harbour of Creux, protected by a pier or breakwater, forms the building yard. Cows are very generally kept, and butter made, some of which is sent to Guernsey.

The island, in civil, military, and ecclesiastical affairs, is a dependency of Guernsey, but a power of making local enactments is vested in the lord of the manor and the forty copyholders, who form a little parliament that meets three times in the year. Serk is called Gers by the French.

Herm is within two miles and a half of Guernsey; its greatest length is from north to south about a mile and a half, the greatest breadth scarcely exceeds half a mile: the population in 1851 was 46. The

island is composed of gneiss and granite. It has one little harbour near the old granite quarries.

Jethou lies half a mile S.W. from Herm, and two miles and a half from Guernsey; it is less than half a mile long and about a quarter of a mile broad: the population in 1851 was 3. It is considerably elevated in proportion to its extent, and the sides are precipitous, except at one spot. It is chiefly composed of gneiss. The island has been purchased by the government for purposes connected with the construction of the harbour of refuge at Jersey.

GUIANA. [GUYANA.]

GUILCOWAR. [HINDUSTAN.]

GUILDFORD, Surrey, a market-town, the capital of the county, a municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the right bank of the river Wey, in 51° 14' N. lat., 0° 34' W. long., distant 29 miles S.W. from London by road, 30½ miles by the South-Western railway, and 42 miles by the South-Eastern railway. The population of the borough was 6740 in 1851. The livings are rectories in the archdeaconry of Surrey and diocese of Winchester. The town is governed by 4 aldermen and 12 councillors, one of whom is mayor, and returns two members to the Imperial Parliament. Guildford Poor-Law Union contains 20 parishes and chapelrys, with an area of 64,461 acres, and a population in 1851 of 25,054.

The town of Guildford is situated in that depression in the North Downs through which the river Wey passes. Alfred the Great in his will bequeathed Guildford as a royal demesne to his nephew Ethelwald. In 1036, in the reign of Harold I., Alfred, son of Ethelred II., was seized here, and his Norman attendants massacred to the number of nearly 600. The keep of a castle of Norman date stands on an eminence on the south side of the town. Guildford has sent two members to Parliament since the 23rd Edward I. The bridge over the Wey is a handsome structure of five arches. The town is well paved, and is lighted with gas. The old town-hall, or guild-hall, is a large building surmounted by a turret, and having a clock projecting into the street. There are a corn-market and court-house of neat and handsome appearance, and a neat theatre. The county house of correction is about a quarter of a mile from the town; there are extensive barracks on the site of an ancient Dominican friary. St. Mary's church, on a declivity to the south of the High-street, is a curious edifice, chiefly of chalk, very ancient and rudely built. Trinity church, situated in the higher part of the town, was rebuilt of red brick about the middle of the last century. St. Nicholas church is an ancient structure, rudely built of chalk and flints, with an intermixture of stone. It has a low embattled western tower entirely of stone, and some good lancet windows. The Baptists, Independents, and Wesleyan Methodists have places of worship. The Free Grammar school, founded in 1509 and chartered by Edward VI. in 1553, is free to 10 boys, sons of inhabitants, and has an income from endowment of more than 100*l.* a year, and an exhibition of 35*l.* per annum, tenable for six years, for either Cambridge or Oxford University. There are 4 masters; the number of scholars in 1851 was 53. The school-house is an ancient and spacious building. In the Blue-Coat school about 50 boys are educated; of the scholars 22 are on the foundation, and receive clothing every second year. There are also Lovejoy's Charity school, National, British, and Infant schools, and a savings bank. The Guildford Institute has a museum, with a library, and reading and lecture rooms. Abbot's Hospital, or Trinity Hospital (erected and endowed by Archbishop Abbot, a native of Guildford), is a quadrangular building in the Elizabethan style.

There are in Guildford paper-mills, powder-mills, corn-mills, breweries, brickfields, coach-works, and an iron-foundry. The timber trade is extensively carried on. There are markets on Wednesday and Saturday—the market on Saturday is a good corn-market. A weekly lamb-fair, or market, is held on Tuesday, from about Easter to Whitsuntide; and there are fairs for cattle and horses on May 4th and November 23rd. The Midsummer quarter-sessions for the county are held here, and the summer assizes alternately with Croydon; the quarter sessions for the borough, and the petty sessions. A county court is held in Guildford.

Stoke, a village situated about a mile N.N.W. from the town, may be regarded as a suburb of Guildford. Half a mile south of the town, on a hill to the left of the Godalming road, are the picturesque ruins of St. Catherine's chapel.

(Manning and Bray, *Surrey*; Brayley, *Surrey*.)

GUILDFORD. [CONNECTICUT.]

GUILLESTRE. [ALPES, HAUTES.]

GUILTCROSS, a hundred in the county of Norfolk, which has been constituted a Poor-Law Union. Guiltcross hundred is bounded N. and W. by the hundred of Shropham, E. by the hundred of Dias, and S. by the county of Suffolk; it comprises 12 parishes and a small extra-parochial district, with an area of 28,340 acres, and a population in 1851 of 7446. Guiltcross Poor-Law Union, which is much more extensive than the hundred, contains 21 parishes and townships, with an area of 41,575 acres, and a population in 1851 of 12,468.

GUIMARAES. [ENTRE DOURO E MINHO.]

GUINEA, an extensive country on the west coast of Africa, between 4° and 10° N. lat., 5° E. and 13° W. long., has a coast-line of more than 1800 miles. The countries along this coast are known to European sailors under the names of Sierra Leone, Grain Coast, Ivory Coast, Gold Coast, Slave Coast, and Benin. We shall notice here only a portion of the Grain Coast, Ivory Coast, and Slave Coast, having given an account of the GOLD COAST, of LIBERIA, and of SIERRA LEONE, in separate articles: see also ASHANTEE, BENIN, Bight and River, and DAHOMY.

The Grain Coast extends from Cape Mesurado (7° N. lat.) to Cape Palmas (4° 30' N. lat.), a distance of somewhat less than 300 miles: the western portion of it is included in the American settlement of Liberia. The high land, which occupies nearly the whole space between the Bay of Guinea and the Sahara, advances here, as in Sierra Leone, close to the sea, forming a bold and rocky coast. The interior is a succession of mountain ridges and of valleys. The mountains are mostly wooded, and the valleys wide and fertile, producing rich crops of rice, which is exported to a large amount, and of a coarse pepper. Cattle, sheep, pigs, goats, and poultry are abundant. Besides rice, ivory and cam-wood are exported. The coast is scarcely visited except by vessels which sail between the settlements of Sierra Leone and those on the Gold Coast, though several of its rivers offer great facilities for trade, being navigable for small vessels to a considerable distance in the interior. The country appears to be divided into three kingdoms. The most western is the kingdom of Cape Mount, which extends on both sides of Cape Mesurado, and comprehends a coast of about 160 miles, reaching more than 100 miles inland. Its capital, Couseea, is said to have a population of 10,000. The middle of the coast is occupied by the kingdom of Sanguin, from which much palm-oil is obtained. Its principal port is BASSA; its capital is the village of Monrovia.

The Ivory Coast occupies the countries between Cape Palmas and Cape Three Points (Tres Puntas), a distance of nearly 400 miles. In this part the high land of the interior is divided from the beach by a low tract, about 10 or 12 miles wide; it is inhabited by a number of small, and for the most part independent negro tribes. Near Cape Palmas is a harbour formed by a reef, which is the only spacious and secure one on this part of the coast. East of the Ivory Coast is ASHANTEE, extending from the Assinee River to the Volta.

The Slave Coast begins on the west at the Rio Volta, which empties itself into the Gulf of Guinea, near the meridian of Greenwich; it extends eastward to the neighbourhood of the river BENIN, a distance of more than 400 miles along the sea-shore. The Rio Volta, which comes down from a great distance, is a broad river in the interior, but towards its mouth it divides into several branches, and forms a kind of delta. The shores of this coast are flat and low, and partly rendered inaccessible by sand-banks. They are covered by extensive salt-marshes and numerous lagoons, traversed by several rivers, among which the Lagos is the most considerable. The plain extends inland 80 or 100 miles; it is fertile, open, and level, exhibiting large savannahs covered with high grass; in some parts however it is thickly wooded with fine trees. Farther inland, where the ground rises, it is covered with extensive and thick forests. The greatest part of the plain is converted into a swamp during the rainy season, from May to October. The whole plain, with the mountain region extending north of it, seems to be divided between the kingdoms of DAHOMY, ARDRAH, and LAGOS. The little kingdom of Ardrah extends east of Dahomy, and comprehends only a portion of the plain. Its capital, Ardrah (6° 26' N. lat.), is built on the banks of a lake, and contains a large number of inhabitants. Its port is Porto Novo. The kingdom of Lagos occupies the countries extending on both sides of the lower course of the river Lagos. In its territory are the populous towns of Lagos and Badagry. But the king of Lagos is dependent on the king of Yarriba, whose dominion extends over the whole breadth of the Kong Mountains to the banks of the river Quorra, and along that river to 10° N. lat. East of Lagos is the kingdom of Benin, which extends along the low and swampy banks of the river and bight of Benin, and far into the interior. The country, which is very populous, is described elsewhere. [BENIN, BIGHT OF; BENIN RIVER.] The capital, Benin, is said to have a population of above 15,000, but, though the residence of the king, it is like most of the towns in these parts, a mere collection of thatched clay huts. The king's palace is of great extent, including several squares, long galleries, and ranges of state apartments, but it has no architectural pretensions. The town is clean and orderly, and is a place of great trade, being a centre for the exchange of ivory, palm-oil, cattle, sheep, &c., for European goods. It was formerly a great slave-market. Along the river and in the interior are several other populous towns.

By Ritter and some other recent geographers the country along the coast, east and south of that above described, to about 18° E. long., is called Lower, or South Guinea, and includes LOANGO, CONGO, ANGOLA, and BENGUELA.

GUINEA, NEW. [PAPUA.]

GUINES. [PAS-DE-CALAIS.]

GUINGAMP. [CÔTES-DU-NORD.]

GUIPUZCOA. [BASQUE PROVINCES.]

GUISBOROUGH, GISBOROUGH, or GUILSBROUGH, North Riding of Yorkshire, a market-town, and the seat of a Poor-Law Union, in the parish of Guisborough, is situated at the foot of the Cleveland Hills, in 54° 32' N. lat., 1° 8' W. long.; distant 50 miles N. by E. from York, and 245 miles N.N.W. from London by road. Middlesborough station of the Stockton and Darlington railway, which is about 8 miles from Guisborough, is 241 miles from London via York and Northallerton. The population of the township of Guisborough in 1851 was 2062; of the parish 2308. The living is a perpetual curacy in the archdeaconry of Cleveland and diocese of York. Guisborough Poor-Law Union contains 27 parishes and townships, with an area of 80,090 acres, and a population in 1851 of 12,202. In the year 1129 a priory was founded at Guisborough by Robert de Brus, for canons of the order of St. Augustine. Of this building a small portion remains. The parish church was partly rebuilt in 1791. The Independents, Wesleyan Methodists, and Quakers have places of worship. The Free Grammar school, founded in 1561 by the Rev. Robert Purglove, the last superior of the priory, has an endowment of about 50*l.* per annum, and had 29 scholars in 1853. Providence school, established by subscription in 1790, was remodelled in 1821, when National schools were established. There are almshouses for six men and six women, and a savings bank. The town consists chiefly of one spacious street, running east and west, with many good houses. The market-house, erected in 1821, has in its upper part the town-hall, where petty sessions are held fortnightly. The market is held on Tuesday; there are several fairs, besides special markets for the sale of wool. Rope-making, brick and tile-making, and tanning are carried on. In the vicinity are several corn-mills.

GUISE. [ALSACE.]

GUJERAT, or GUZERAT. [HINDUSTAN.]

GULF STREAM. [ATLANTIC OCEAN.]

GUMBINNEN, one of the two governments into which the province of East Prussia is divided, lies east and south of the government of Königsberg, and between it and the frontier of Prussia. It has an area of 6310 square miles, and its population in 1847 was 632,366. It is a flat country except in the south, where a large portion of the surface is hilly, and abounds with lakes, the largest of which are the Spirding-see and the Mauer-see. The land is fertile. Agriculture and cattle feeding are the chief occupations. There is little manufacturing industry. Wheat, rye, flax, and hemp are the chief products. Cattle and sheep are numerous. There are extensive forests. The largest horses in Prussia are bred in the government of Gumbinnen. The chief rivers are the Memel [NEMEN], which passes Tilsit, and flows by several arms into the Curische-Haff; and the Pregel, which flows due west, and falls into the Frische-Haff below Königsberg.

In the government of Gumbinnen the most important town, Tilsit, is situated on the left bank of the Memel, at the point where the Tilsa falls into that river. It is a pretty, well-built town, and contains five churches, a fine town-hall, a gymnasium, very extensive barracks, two hospitals, and 17,179 inhabitants, including the garrison. The gymnasium had 12 professors and 224 pupils in 1850. The townspeople trade in corn, flax, hemp, timber, &c., and manufacture beer, spirits, leather, woollen-cloth, hosiery, firearms, and hardware. The town is defended by a strong castle. Tilsit has acquired celebrity by being the place where the famous treaties were concluded between France, and Russia and Prussia, on the 7th and 9th of July, 1807. Insterburg, a town of 8386 inhabitants, stands near the junction of the Pregel and the Inster, on the left bank of the Angerap, 14 miles W. from Gumbinnen and 30 miles S. by W. from Tilsit. It has manufactures of cloth, linen, woollen stockings, and spirits, and trades extensively in corn and flax. The town has a castle and a training school. Gumbinnen, the chief town of the government, stands on the Pissa, east of Insterburg, and has about 7000 inhabitants. The town is regularly built, and has woollen and linen factories, distilleries, and tanyards; the trade in corn and flax-seed is important. It has also a gymnasium with 11 professors and 237 pupils (in 1850), a public library, and schools of architecture and midwifery. Angerburg, 31 miles S.W. from Gumbinnen, is a small town of about 4000 inhabitants, situated on the Angerap, which issues from the Mauer-see a couple of miles to the south of the town. It has a linen market, a castle, and manufactures of coarse woollens and leather. The Mauer-see abounds in excellent eels.

GUNDUCK RIVER. [HINDUSTAN.]

GUNTOOR. [CIRCARS, NORTHERN.]

GURWAL. [HINDUSTAN.]

GUSTROW. [MECKLENBURG SCHWERIN.]

GUYANA, or GUIANA, is the name applied to the north-eastern portion of South America extending from the banks of the Orinoco to those of the Amazonas River. Guyana has an area of more than 650,000 square miles, of which about five-sixths are included within the boundaries of the empire of Brazil and the republic of Venezuela: a territory of about 50,000 square miles constitutes British Guyana, about 30,000 square miles Surinam, or Dutch Guyana, and about 14,000 square miles Cayenne, or French Guyana; but the boundaries of the respective districts are in some instances not very clearly defined.

The coast of Guyana is skirted by a mud bank which extends some miles out to sea. The water on this bank decreases gradually

towards the beach, so that vessels drawing more than 12 feet can find sufficient water only to within three miles of the land. Vessels of large size are unable to enter the rivers in consequence of large accumulations of mud or sand which collect at their mouths. The low and flat character of the land continues inland from 40 miles to 70 miles, the level corresponding generally with that of the sea at high water. When the lands are drained, banked, and cultivated, they become consolidated, and the level usually sinks about a foot, so that the most unremitting care and attention to the embankments and sluices is necessary to keep out the sea. In some places savannahs of considerable extent afford good pasturage, but by far the greatest portion of the surface is covered with trees and fit for the growth of every kind of grain and tropical products.

The high land which lies at the back of this plain was little known till about the year 1835, when the London Geographical Society sent out Mr. (now Sir R.) Schomburgk, who made considerable researches in British Guyana. The high land does not rise immediately from the plain to a great elevation, the hills on its southern edge attaining only a height of from 50 feet to 200 feet above the plain. Behind these hills the high land stretches out in level or undulating plains, rising here and there into eminences; but farther south ranges of hills appear running north-west and south-east nearly parallel to the coast, and south of them the surface is again depressed and extends in plains. These ranges appear to occupy an inconsiderable width, and the plains between them are of great extent. Between the Sierra Pacaraima and the Sierra Taripona the plain affords a natural communication between the rivers which traverse British Guyana and the Rio Branco, which falls into the Amazonas River. The Rupunoony flows near some of the upper branches of the Rio Branco, and is separated from them by a low and level tract (near 59° W. long.). This tract contains the Lake Amucu, which in the dry season is of small extent, but after the rains have fallen inundates the adjacent low country, and its waters run partly eastward into the Rupunoony, and partly westward into the Rio Branco. The plains south of the Pacaraima range are in general level, and form extensive savannahs covered with grasses and plants; the winding course of the rivers alone is marked by a fringe of trees, and some swampy tracts of small extent are overgrown with the *Mauritia vinifera*. In the country north of the Pacaraima range the belt of wooded and rich land along the water-courses is covered with high forest-trees. The proportion of rich and cultivable land in this region is very great.

Rivers.—The largest river is the *Essequibo*, which traverses nearly the middle of British Guyana. In 3° 14' N. lat., about 230 miles from its mouth in a straight line, the river is some hundred yards wide, and forms a great cataract, called King William's Cataract. Near 4° N. lat., it receives the river Rupunoony, which has a course of about 220 miles. It afterwards receives the Siparony, and at various points in its course forms rapids and cataracts, which can only be passed by small vessels, and with danger. North of 5° its tortuous course is in general to the north; here too there are several dangerous rapids, and a great number of rocky islands in the river, among which the island of Gluck is 7 miles long, but narrow. Fifty miles from its mouth occur the last rapids, which, though not high, are numerous: up to this point the tides ascend. Five miles lower down the river enters the low plain, and is here above a mile wide, growing continually wider until at its mouth it forms an estuary 14 miles wide. Within the plain it receives from the west the waters of the united rivers Mazarony and Cuyuni, which at the point of junction are more than a mile wide. In the wide estuary of the Essequibo there are numerous islands, some of which are extensive. Hog Island is large and well cultivated. Across the entrance of the river are three islands, the largest of which, which lies in the middle, is from 7 to 8 miles long. The entrance of the Essequibo is dangerous, even for small craft, on account of the banks of mud and sand. East of the Essequibo and parallel to it runs the *Demerara*, whose sources are probably a little south of 5° N. lat. At 5° 25' N. lat. it forms a great cataract, and below it becomes navigable for small craft. Towards its mouth it widens to a mile, and at Georgetown, where it enters the sea, it is more than a mile and a half across. This river runs more than 200 miles, and as it affords an easy means of transport for goods, there are many settlements on its banks. Farther east runs the *Berbice*, whose source is probably near 3° 40' N. lat. It has numerous rapids and cataracts, but is navigable for 165 miles, measured along the numerous windings of the stream. [BERBICE.]

The *Courantyne* River forms the boundary between British and Dutch Guyana. Its sources are probably in the Sierra Acaray. Like most of the rivers of Guyana, it has many rapids and cataracts, and its course is very tortuous. It is navigable for about 150 miles measured along its windings. Seventy miles from the sea the tide rises 30 inches. North of 5° 55' N. lat. it forms an estuary, which is 10 miles across where it meets the sea. South of the estuary is Parrot or First Island, which is 7 miles long and 1 mile wide, and divided from the eastern bank by a channel only 3 cables wide, but 9 feet deep at low water. Along the western shore is a mud bank.

The *Surinam* River, which traverses the middle of Dutch Guyana, is supposed to have its source about 4° N. lat. It enters the low plain about 4° 40' N. lat., and so far it is navigable for river barges. Vessels of considerable size can sail up the river to the town of Paramaribo.

GEOG. DIV. VOL. III.

The *Marony*, which separates Dutch and French Guyana, rises probably in the Sierra Acaray. Many rapids and cataracts occur in this river. Large river vessels can ascend to the town of Armina, to which the tide ascends. From Armina to the mouth of the river it is not less than a mile and a half wide, but is full of islands. Of the *Oyapoc*, which separates French Guyana from Brazil, very little is known.

Climate.—Guyana has two rainy and two dry seasons. The long rainy season sets in about the middle of April and lasts till August. The long dry season continues from August to November. February and March constitute the short dry season. The trade-winds, passing over the whole breadth of the Atlantic, reach this coast loaded with moisture, and both the wind and the moisture render the heat less oppressive than it would otherwise be. The thermometer, even in summer, seldom rises above 90°, and it does not often descend below 75°. The climate of Guyana is more healthy than that of most places in the West Indies. Thunderstorms occur only during the rainy seasons, and are violent, but rarely do any damage. The hurricanes so destructive in the West Indies are unknown in Guyana. Slight shocks of earthquakes sometimes occur.

Productions.—Guyana possesses many indigenous plants and large forest-trees. Many of the trees produce excellent timber, others are used for furniture, as the mahogany, or afford dye-wood, and others are valuable on account of their fruits. Indian corn and rice are cultivated, and yield abundant crops. Wheat is not successfully cultivated. Cassava, or mandioc, yams, sweet potatoes, and arrow-root are raised in considerable quantities. The chief fruits are the banana, the pine-apple, and the cacao-nut. The sugar plantations of British Guyana are hardly inferior in extent to those of Barbadoes or Jamaica. Coffee and cotton are cultivated to a great extent. Tobacco and indigo are also attended to. The cacao-tree and the plant which produces castor-oil grow wild.

The domestic animals are the same as in England. Black cattle grow to a greater size than in Europe, but their flesh is not so tender nor of so fine a flavour. The wool of the sheep is converted into hair. Among the ferocious animals are the jaguar and cougar. Other animals are the armadillo, agouti, ant-bear, the sloth, and a great variety of monkeys. Lizards are numerous; the iguana is common, and its flesh esteemed a delicacy, as well as its eggs. Alligators of great size, the manati, or sea-cow, the vampire-bat, and the boa constrictor are among the more remarkable objects in the natural history of Guyana. Parrots, humming-birds, the flamingo, Muscovy ducks, spoon-bills, peacocks, &c., are numerous.

History.—Guyana was discovered before the end of the 15th century by Vincent Pinzou. The Dutch formed the first settlement about 1590 on the Demerara River, and afterwards established themselves at other places. The English settled in 1634 in the neighbourhood of the rivers Berbice and Surinam; but in 1667 the English settlements were given up to the Dutch. The French occupied Cayenne in 1633. During the last war with France the English occupied the Dutch settlements; and by the treaty of Paris, 1814, they restored only those between the Courantyne and the Marony to the Dutch, retaining possession of the remainder.

Inhabitants.—Guyana is inhabited by Europeans, Africans, and native Americans. In British Guyana there are six tribes of natives. The Arawaaks surround the settlements on the Demerara and Berbice rivers; the Acaaways live on the banks of the Cuyuni and Mazarony, and also on the Essequibo, north of 5° N. lat. Between the Sierra Pacaraima and Sierra Taripona are the Macoosis, and south of them the Warpeshana. The Warrows occupy the coast between the Pomaroon and the mouth of the Orinoco. Several Carib tribes are dispersed among the natives. The Arawaak Indians visit the British settlements, and work in the wood-cutting establishments for daily wages. Some of the tribes are almost as fair as Spaniards or Italians, while those who live near the sea-coast are of a very dark brown.

British Guyana includes the countries from the Courantyne River westward to the Orinoco, and from the sea-coast to the sources of the Essequibo and Courantyne. The most western portion between the Orinoco and the small river Pomaroon is only inhabited, as already mentioned, by the tribe of the Warrows. The settlements on the Pomaroon and Essequibo rivers are few in number and not large in extent; but the settlements along the banks of the Demerara and Berbice, as well as along the sea-shore between these rivers, are numerous, and extend from 30 to 50 miles inland. On the river Courantyne there are numerous settlements, some of which are of considerable extent. Sugar and coffee are cultivated on a large scale. The cultivation of cotton has declined. Previous to 1831 the country was divided into three colonies—Essequibo, Demerara, and Berbice; but in that year they were united under one government, called British Guyana, the three districts being now called counties. The residence of the governor is in *Georgetown*, formerly called Stabrook, or Stabrook, on the Demerara River, a short distance from its mouth. Its wide streets are traversed by canals. The houses are of wood, and seldom above two stories high. Before them are porticoes and balconies, shaded by a projecting roof, which is made of red wood, resembling mahogany. New Amsterdam, on the river Berbice, not far from its mouth, is a small place.

British Guyana is under a governor, who resides in Georgetown, Demerara. Within the last few years considerable changes have

taken place in the circumstances of the colony. Many of the negro labourers have become proprietors, and to supply the demand for labour there have been brought to the colony many natives of Madeira and Coolies from Madras and Calcutta. The estimated value of exports from British Guyana was 978,296*l.* in 1852. The official value of the imports in 1852 was 964,986*l.* The number and tonnage of vessels belonging to British Guyana on December 31st 1853 were as follows:—Sailing-vessels, under 50 tons 49, tonnage 1141; above 50 tons 11, tonnage 803; with 1 steam-vessel of 69 tons. The tonnage of vessels which entered and cleared during 1852 amounted to 185,951 inwards, and 109,474 outwards.

The population of British Guyana on March 31st 1851 was 127,695; including an estimate of 7000 for aborigines, with 445 sailors and 854 soldiers, the population was 135,994. Of this number 86,451 were natives of British Guyana, 7168 were African immigrants, 7083 old Africans, 7682 Coolies, 7928 Madeirans, and 2088 English, Scotch, Irish, Dutch, and Americans; the proportion of males to females being as 6 to 5, arising from the large proportion of male immigrant labourers who have been brought during several years past from the East Indies, St. Helena, Madeira, and the West India Islands. In December 1851 there were 41 episcopal churches and chapels in the colony, with 10,210 attendants; of other chapels there were 71, with 22,374 attendants. The children at day-schools were 8000; the number of schools was upwards of 100. The Demerara Colonial Hospital, Small Pox Hospital, Seamen's Hospital, and Lunatic Asylum have been extensively useful. A penal settlement has been established for some years, in which the convicts are employed in public works, and thus made in part to work for their support.

Dutch Guyana, or Surinam, extends along the coast from the Courantyne to the Marony, and between them inland to their sources. Along the coast, and on the banks of the rivers, are many settlements and plantations. The Jews are numerous in this country; and in the interior is a village called Savanna inhabited by Jews, who cultivate their plantations. The higher and hilly part of the country is occupied chiefly by the Maroons, or runaway negroes, who have formed a kind of political society. The Dutch colony of Guyana is partly the property of the town of Amsterdam. It exports sugar, coffee, cotton, and cacao: the number of inhabitants in 1852 is given at 64,270, of whom more than five-sixths are negroes. *Paramaribo*, the capital, is situated on the bank of the river Surinam, about ten miles from the sea. It is regularly built in the Dutch style, and has a population of about 20,000. The streets, which are wide and straight, are planted with orange-trees. The houses are generally two stories in height, and built of wood. Near the town is the fortress Zelandia in which the governor resides.

French Guyana extends along the coast from the river Marony to the Oyapoc, which separates it from the empire of Brazil. Its area is still chiefly covered with large forest-trees. There are some settlements, not of much extent, from which the French export sugar, coffee, cotton, cacao, and arnotto. The capital, *Cayenne*, situated on the northern side of an island formed by the river Cayenne, is a miserable place, with a shallow harbour. On the mainland is the plantation La Gabrielle, where the experiment of transplanting from Asia to America the pepper-vine, the clove-tree, and the nutmeg-tree has been tried; the pepper and clove have succeeded better than the nutmeg: the population of French Guyana in 1841 was 22,010. Since the French revolution of 1848 Cayenne island has been made a penal settlement, to which have been sent multitudes of persons whose presence in Paris or in the provinces was considered by the government to be hazardous to the peace of the state.

GUYENNE, or GUIENNE, and GASCOGNE, two old provinces of France, forming together the largest of the thirty-two military governments into which in ante-revolutionary times France was divided. The government extended about 245 miles in extreme length from east to west, and about 205 miles in extreme breadth from north to south. The area of Guienne, the northern province, was estimated at 15,847 square miles, and that of Gascogne, the southern province, at 10,271 square miles, together 26,118, forming an area equal to more than half of England, watered by the Garonne, one of the finest rivers of France, with its feeders the Tarn, the Lot, the Dordogne, and a number of smaller tributaries, and by the Adour and its feeders. The military government of Guienne and Gascogne was bounded N. by Saintonge and Angoumois; E. by Limousin, Auvergne, and Languedoc; S. by Foix and the Pyrenees; and W. by the Bay of Biscay.

Gascogne, which nearly coincides with the Aquitania of Julius Cæsar and the Novempopulana of Augustus, takes its name from the Gascones or Vascones, a Spanish people, who in early times settled in this part of France. It included the countries west of the Garonne, distinguished by the names of Couserans, Comminges, Bigorre, Armagnac, Condomois, Marsan, Landes, and Labour; and now forms the departments of Landes, Gers, Hautes-Pyrénées, Haute-Garonne, and parts of Basses-Pyrénées, and Ariège, under which heads the particular features of the country are noticed. From this province the Bay of Biscay is sometimes called the Gulf of Gascogne.

Guienne lay to the north of Gascogne, and extended from the

Cévennes Mountains to the Bay of Biscay, including the districts of Rouergue, Quercy, Agenois, Périgord, Bazadais, and Bordelais. It now forms the departments of Gironde, Lot, Lot-et-Garonne, Dordogne, Aveyron, and part of Tarn-et-Garonne. The entire government of Guienne and Gascogne was sometimes spoken of under the name of Guienne.

The capital of Guienne was Bordeaux: among the other towns were—Libourne, Bazas, Périgueux, Agen, Cahors, Montauban, Rhodes or Rodez, Milhau, and Villefranche. The capital of Gascogne was Auch: the more important of the other towns were—Condom, St. Sever, Dax, Bayonne, Pau, Tarbes, St.-Bertrand-de-Comminges, and St.-Lizier. These towns are all noticed in this work either in separate articles or under the names of the departments to which they belong.

Guienne derives its name from the Aquitani, one of the three great branches of the Gallic people whom Cæsar found in possession of Gaul. These Aquitani occupied the country south-west of the Garonne, but when Augustus divided Gaul into four provinces he gave the name of Aquitania to the whole country from the Garonne to the Loire; the original country of the Aquitani becoming one of the subdivisions of the larger province, and taking the name of Novempopulana (that is, the country of the Nine Nations), from the number of principal tribes by which it was occupied. In the decline of the Roman empire Aquitania came into the hands of the Visigoths, who made Toulouse their capital; but in 507 Clovis, king of the Franks, wrested Aquitania from the Visigoths, and brought it under the dominion of the Franks. In 630 the kingdom of Aquitania, or Aquitaine, was re-established in favour of Charibert, or Charibert, son of Clotaire II., one of the Frankish kings of the Merovingian dynasty; but it was soon reduced from the rank of a kingdom to that of an hereditary duchy. Eudes, duke of Aquitaine (688-735) was possessor by inheritance or conquest of the whole country from the Pyrenees and the ocean to the Loire and the Rhône, and even of some districts beyond the latter. Waifre, grandson of Eudes, was defeated and despoiled of his territories by Pepin le Bref, king of France, 760-768.

The Gascons were originally a Spanish people, and were called by the Romans Vascones. Under the Roman empire we find a portion of the Vascones settled in the south of Gaul, in the immediate neighbourhood of the Pyrenees. It was not till A.D. 602 that they submitted to the Franks, to whom they became tributary. Their name may be traced in several modern designations, Biscay (Provincias Vascongadas) in Spain, the territory of the Basques in France, and in the more extended name of Gascogne, which appears in the Latin of the middle ages under the forms Vascitania, Vasonia, and Gasconia.

The Gascons were comprehended in the kingdom, afterwards the duchy, of Aquitaine; and though they remained near the Pyrenees the name of Gascogne was given to the country between the Pyrenees and the Garonne. It was Loup II. (son of Waifre above mentioned) who surprised the rear-guard of Charlemagne on the return of that monarch from Spain, 778, by means of an ambush in the valley or pass of Roncevaux. Loup was soon after taken and hanged as a traitor; but the Gascons were continually in rebellion against the Carolingian princes.

In the year 781 Charlemagne restored the kingdom of Aquitaine, and placed his son Louis le Debonnaire, then three years old, on the throne. On the death of Charlemagne, Louis became emperor of the West and was succeeded in Aquitaine by his son Pepin I., whose kingdom included not only the country to the south-west of the Loire, but a considerable territory on the right bank of that river. Pepin II., son and successor of Pepin I., was deposed by his uncle Charles le Chauve, whose sons, Charles and Louis le Bègue, were successively kings of Aquitaine; but on the accession of the latter to the throne of France, on the death of Charles le Chauve, A.D. 877, Aquitaine was united to the French monarchy. The duchy of Gascogne continued after the extinction of the kingdom of Aquitaine, and its dukes exercised an authority independent of the kings of France.

The duchy of Aquitaine also survived the kingdom, and became hereditary in the race of the counts of Poitiers. These nobles subsequently acquired the duchy of Gascogne, and consolidated under their sway a large territory in the south-west of France, including Poitou, Limousin, Guienne (excepting Quercy and Rouergue), and Gascogne; together with the suzerainty of the county of Auvergne. This rich inheritance came by marriage into the possession of Henry Plantagenet, afterwards Henry II. of England, and, united with his Norman and Anjevin inheritance, rendered the English kings as powerful in France as the kings of France themselves. [AQUITAINE.] By the sentence of confiscation pronounced by the court of the peers of France against king John these domains were confiscated to the crown; and the sentence was partly executed by Philippe Auguste. A portion however of the duchy of Aquitaine forming the duchy of Guienne, extending from the Charente to the Pyrenees, remained to the English, and was governed by English noblemen sent over from time to time. It more than recovered its extent and splendour for a short time under Edward the Black Prince, but soon shrank again in its dimensions, and in the years 1452 and 1453 was subjugated by the French king.

GWALIOR. [HINDUSTAN.]

H

HAARLEM, HAERLEM, or HARLEM, a city in the Dutch province of North Holland, stands on the Spaaren, a small stream which runs into the Y, 4 miles from the shore of the North Sea, in 52° 28' N. lat., 4° 38' E. long., and has 24,000 inhabitants. It is connected by canals with all the principal towns in Holland, and by railway with Amsterdam and Leyden, from which it is respectively distant 12 and 18 miles. Haarlem is famous for its resistance to the Spaniards in 1572, and for the cruel treatment of its citizens by the son of the Duke of Alva after their surrender. The town is well built; the streets are clean, planted with trees, and traversed by numerous canals. It contains 9 Catholic churches, one of which, the cathedral of St. Bavon, is the largest church in Holland, and celebrated for its great organ; there are besides 5 Calvinist churches and 1 Lutheran. The finest building in the town is the Stadhuis, or town-house, which stands on one side of the market-place. The Prinzenhof, in which the states-general of Holland formerly met, is now converted into a museum of arts, antiquities, medals, and pictures. The venerable gateway over the high-road to Amsterdam is an interesting relic of the old fortifications of the town. The public walks on the site of the ancient ramparts are exceedingly agreeable. Haarlem, besides many other benevolent institutions, has an academy of sciences, a botanic garden, a public library, a national normal school for schoolmasters, and an institution (named Teylerian from its founder, a rich merchant of the town), which comprehends an establishment for the poor, a society of natural history, valuable collections, and an observatory. The library boasts of the early productions of Laurence Coester, a native of this town, for whom the Dutch claim the invention of the art of printing. The neighbourhood of the town is studded with handsome country seats, and laid out in gardens. In the southern suburb of Haarlem are the famous nursery flower-gardens, which formerly supplied a great part of Europe with tulips, hyacinths, and other flowers. There are large steam-driven cotton-mills, and also extensive bleaching establishments here, which formerly supplied large quantities of linen to England, whence the article came to get the name of 'Holland,' as coming from that country. Silk, cotton, velvet, ribands, linen, soap, lace, carpets, and thread are among the principal manufactures. There is also a celebrated type-foundry for Greek and Hebrew letters.

The Lake of Haarlem, which has been recently drained, lay S.E. of the town; it was 14 miles long, 10 miles broad, and 14 feet deep, between water and mud. The mud of the lake was manufactured into valuable bricks called clinkers. The lake was drained in 1849, 1850, and 1851 by steam-engines, and its area, amounting to nearly 60,000 acres, converted into arable land.

HAARLINGEN. [FRIESLAND.]

HABESH. [ABYSSINIA.]

HACKNEY, Middlesex, a suburb of the metropolis, and the seat of a Poor-Law Union, in the parish of St. John, Hackney, is situated in 51° 32' N. lat., 0° 8' W. long.; distant two miles N. by E. from Shoreditch church. The population of Hackney sub-district in 1851 was 20,850; that of the entire parish 53,589. The livings are in the archdeaconry and diocese of London. Hackney Poor-Law Union comprises two parishes, with an area of 8950 acres, and a population in 1851 of 58,424.

Hackney, properly so called, has one principal street, known as Mare-street and Church-street; and some other streets, containing many good houses, some of them of old date, this having been one of the places first selected for rural retirement by the wealthy merchants and traders of London. St. John's parish church, a large plain brick edifice, was rebuilt in 1797. It has a stone tower, but as this was incompetent to bear the bells, the tower of the old church has been allowed to remain in the churchyard. Besides the parish church there are the district chapels of Stamford Hill, St. Philip, Dalston, St. James, Clapton, St. Barnabas, Homerton, and Ram's chapel, Homerton. South Hackney and West Hackney have each district parish churches. Subordinate to the rectory of West Hackney is the chapelry of St. Peter's, De Beauvoir Town. Homerton College, rebuilt some years ago for the education of Congregational ministers, is now the Normal School of the Congregational Board of Education. At Clapton are a neat iron bridge called Lea Bridge, over the Lea, and a handsome building erected for the London Orphan Asylum. In Hackney parish are about 20 places of worship for Independents, Baptists, Wesleyan Methodists, and other Dissenters. There are also several National, British, and Infant schools; a literary and scientific institute; and a savings bank. Among other institutions are the Cumberland Benevolent Institution; the Penitent Female Refuge; the Elizabeth Fry Refuge; the London Orphan Asylum; the New Asylum for Infant Orphans at Stamford Hill; and the boys' establishment of the Children's Friend Society, which is at Hackney Wick. There are two Proprietary Grammar schools; one connected with the Church of England had 54 scholars in 1852. A Theological seminary for Independents had 12 students in 1852. Several ranges of alms

houses are in the parish; among them is 'the Retreat' for twelve widows of Independent or Baptist ministers. Dyeing, calico printing, and some other manufacturing processes are carried on in the parish; and there are considerable brick fields. The Regent's Canal and the Lea navigation pass through the parish. At Hackney is a station of the North- and South-Western Junction railway.

HADDENHAM. [CAMBRIDGESHIRE; BUCKINGHAMSHIRE.]

HADDINGTON, the chief town of Haddingtonshire, Scotland, a royal and parliamentary burgh and market-town, is situated on the small river Tyne, about 16 miles E. from Edinburgh, with which it is connected by the North British railway, in 55° 58' N. lat., 2° 46' W. long. The population of the municipal burgh in 1851 was 2387; that of the parliamentary burgh was 3883. Conjointly with North Berwick, Dunbar, Jedburgh, and Lauder, it returns one member to the Imperial Parliament. Haddington lies at the foot of the Garlton Hills, which shelter it on the north. The town is connected with the suburb of Nungate by a stone bridge of four arches over the Tyne. The streets are paved, and lighted with gas. The parish church is a venerable gothic structure, with a square tower 90 feet high. There are also in the town a chapel of ease, a Free church, a chapel for Episcopalians, two chapels for United Presbyterians, and two for Independents. Besides the Parochial school, there are an Endowed Grammar school, a mechanics institute, several libraries, a savings bank, and several benevolent and friendly societies. The town-house has a lofty spire, and the county buildings form a handsome structure. A considerable trade is carried on in wool. There are tanneries, and works for preparing bones and rape-cake for manure. The Haddington market is one of the largest wheat markets in Scotland. Extensive nurseries are in the neighbourhood.

HADDINGTONSHIRE, a maritime county in the east of Scotland, one of the three counties which are designated the Lothians, and commonly called East Lothian, is bounded W. and N.E. by the German Ocean, N.W. by the Frith of Forth, S.W. by Edinburghshire, and S. and S.E. by the Lammermuir Hills, which are partly in Berwickshire. It lies between 55° 47' and 56° 5' N. lat., 2° 22' and 3° 1' W. long. The extreme length of the county from east to west is about 26 miles, and the extreme width from north to south is 17 miles. The area is 291 square miles, or 185,937 statute acres. The population in 1851 was 86,386. The county returns one member to the Imperial Parliament.

Coast-line.—The coast is generally low and rocky, the numerous small bays with which it is indented being often sandy, flat, and shallow. At Preston Pans is a small harbour. At Aberlady Bay, where the Peffer river falls into the Frith of Forth, vessels of 60 or 70 tons can enter at spring-tides. This is the port of Haddington, but its trade is extremely trifling. **NORTH BERWICK** is the most northerly port on the coast. On the north-eastern coast of the county, the only harbour is that of **DUNBAR**. The Bay of Belhaven is sandy and shallow. Eastward to Dunbar the coast is a series of low rocky ledges. The coast-line is diversified by the sandy outlets of the small streams which here fall into the Frith. Northward from Belhaven Bay, towards North Berwick, the coast is low and sandy, with the exception of the rocky promontories of Whitberry Head and Ravensheugh Craig. The small islands of Scarr, the Bass, Craigeith Lamb, and Fidra off the north coast belong to the county. The northern coast is elevated; at Tantellan the cliffs rise to the height of 100 feet.

Surface, Hydrography, Communications.—The surface of the county is extremely diversified, though not mountainous. It rises from the coast of the Frith of Forth in a series of parallel ridges towards the southern boundary, in which are the Lammermuir Hills. North Berwick Law is 800 feet, and Traprairie Law 700 feet above the sea. The only river of any importance in the county is the Tyne, whose source is in Mid-Lothian, a few miles west of Haddingtonshire. After entering the county it receives from the hills in the south the Arnot Water and the Salton and Gifford Waters, which drain the south-west district of the county. It passes Haddington and falls into the sea about 3 miles west of Dunbar, after a course of rather more than 20 miles. It abounds with trout, eels, and small salmon. The other rivers, or 'waters,' as they are termed, are the Coalstone, Biel, White-water, and Fastna, on the south of the Tyne, and the Peffer to the north. The turnpike roads of Haddingtonshire are generally kept in good repair. The coast is traversed by the North British railway, which has small branches to North Berwick and to Haddington.

Geology, Mineralogy, &c.—The old red-sandstone formation is that of a considerable portion of the county. It generally rests upon transition rocks, and is covered by the coal formation. Quartz, in grains, is the chief ingredient, either joined together without a basis, or ground, or imbedded in a red-coloured clay. The Lammermuir range is composed principally of grauwacke; the position of the strata is nearly vertical. The Garlton Hills consist of a sort of oolite-stone, apparently contemporaneous with North Berwick Law and

Traprairie. The harbour of Dunbar is in a red-coloured trap rock, which forms a single bed of great thickness. South-east of the harbour the coast consists of old red conglomerated sandstone, trap-tufa, and greenstone rock. The lower strata of the sandstone are calcareous, containing the impressions of animals and vegetables. Whitberry Head, towards the sea, presents a precipitous front, from 40 feet to 50 feet in height. It consists of basalt, with crystals of hornblende, red and green trap-tufa impregnated with lime, clinkstone, and clinkstone porphyry. North Berwick Law is composed of trap-tufa, above which is amygdaloid; the middle and upper parts of the hill being a variety of clinkstone-porphry, and the summit-rock clinkstone-porphry, intermixed with crystals of augite, forming a transition into greenstone. The clinkstone is occasionally columnar. The western part of the county contains excellent coal.

Climate, Soil, Agriculture.—The varying elevation of the different districts occasions a corresponding variation in the climate, and there is probably no county in Scotland in which so many varieties of temperature occur. The harvest is frequently three weeks or a month earlier in the northern than in the southern districts. Towards the coast the snow soon disappears, but in the uplands it lies long on the ground, and the highest parts of the Lammermuir are occasionally covered with it during a fourth part of the year. The vegetation is comparatively early.

In the north-western part of the county the prevailing soil is productive, and consists of a light rich loam with a substratum of clay. In the Lammermuir district the soil is principally moor or moss, though in the glens and flats which intersect the mountains it is of superior quality. In the upland district, which extends along the foot of the Lammermuir Hills nearly the whole length of the county, the soil is a gravelly loam resting upon a dry bottom, but it has been rendered comparatively productive. The midland district, through which the river Tyne flows, contains a considerable variety of soil, nearly the whole of which is extremely valuable, and principally arable.

Haddingtonshire holds a high rank in respect of agriculture and produce. The farmers of this county have a good character for intelligence and skill in farming. Wheat is the principal grain cultivated, though large crops of beans and oats are likewise raised. Barley is not much cultivated. The turnip crops are generally excellent. The breeding of sheep and cattle has been extended, and the amount of pasture-land increased. In the lowland and midland districts the more usual practice is to purchase and fatten for the Edinburgh market: in the Lammermuir district the breeding of live stock is the chief business of the farmer. The short-horned or Teeswater breed of cattle is that most in favour. The Leicester and Cheviot breeds of sheep are those principally reared. Drainage is carefully attended to. The farms average from 300 to 500 acres each, and are held on lease for terms of from 19 to 21 years.

Divisions, Towns, &c.—The county town is HADDINGTON. The other principal towns in the county are NORTH BERWICK and DUNBAR.

The following villages may be mentioned:—

Aberlady, on the bay of that name, population of the parish 1099 in 1851, is a small and neat village. In the neighbourhood is Bullencrieff, the seat of Lord Ellbank. *Cockenzie*, population about 1000, is a fishing village in Tranent parish, which has furnished many of the crews for the whale fishery. The fishermen here and at Portseton, an adjoining village, have about 30 boats, varying from 7 to 15 tons burden. At Cockenzie is a harbour which has a depth of 16 feet water at high tide. There are considerable salt-works on the coast. *Gifford*, population of the parish 1202 in 1851, a neat and well-built village, situated on the water of Gifford, at which a market for agricultural produce and several fairs are held during the year. Gifford was the birth-place of John Knox. *Prestonpans*, a fishing village and small harbour, population 1640 in 1851, is near the west boundary of the county. In the neighbourhood Sir John Cope was defeated by the Highlanders under Prince Charles Edward. The inhabitants are chiefly engaged in the oyster fishery. Salt is manufactured. Soap-making and tile-making furnish considerable employment. There is a brewery. *Prestonpans* is an old barony; the old village cross is still preserved, and is the scene of an annual festivity. *Tranent*, population 2096, a populous village in the parish of that name. The inhabitants of the village are engaged in agriculture and in the manufacture of salt. There is a large Free school. In this parish is one of the only two remaining stone-roofed chapels in Scotland. It is an interesting specimen of the architecture of the close of the 14th century.

History, Antiquities, &c.—Haddingtonshire has been the scene of some important events in Scottish history. It was inhabited by the Ottadini at the time of the Roman invasion; and when the Romans left it was taken possession of by the Saxons, and formed part of the kingdom of Northumbria. It was ceded to the Scottish king in the beginning of the 11th century. The siege of Dunbar is a well-known event. Somerset held the county in 1547, and it remained with the English till 1590. Queen Mary took refuge both at Seton in Tranent parish and at Dunbar. The whole county was held by Cromwell, and it was the scene of the first victory of the rising in 1745. Numerous remains, both of the early British occupation and of that of the Romans,

exist in different parts of the county. There are numerous castles of the feudal times, some of which are in a good state of preservation. Of these may be mentioned the castles of Dunbar, Tantallon, once the residence of the Douglasses, the castles of Dirleton, Luffness, Hailes, the residence of Queen Mary and Bothwell, &c. Throughout the county are numerous residences of landed proprietors.

Statistics of Religion and Education.—In 1851 the county contained 49 places of worship, with 17,160 sittings. Of these places of worship 22 belonged to the Established Church, 15 to the Free Church, 8 to the United Presbyterian Church, and one each to Episcopalians, Independents, Roman Catholics, and Mormons. The number of day schools was—public 52, with 4009 scholars; private 18, with 837 scholars. The number of Sabbath schools was 50, with 2764 scholars; of these Sabbath schools 23 belonged to the Established Church, 20 to the Free Church, 5 to United Presbyterians, and 2 to other bodies. There was 1 subscription library in the county in 1851, namely, the Gifford Subscription Library, which had 24 members, and had 350 volumes in its library.

HADLEIGH. [ESSEX.]

HADLEIGH, Suffolk, a market-town in the parish of Hadleigh, is situated on the left bank of the Bret, a feeder of the Stour, in 52° 2' N. lat., 0° 57' E. long.; distant 10 miles W. by S. from Ipswich, 64 miles N.E. from London by road, and 69½ miles by the Hadleigh branch of the Eastern Union railway. The population of the town in 1851 was 3338. The living, a rectory, is a peculiar of the diocese of Canterbury. Hadleigh has some interest as the place of martyrdom of Dr. Rowland Taylor, burned in the persecution under Queen Mary. A stone with an inscription marks the spot on the neighbouring common. The town consists of a principal street, and lesser streets branching from it. The church, which is chiefly of perpendicular date, is large and handsome, with a tower and spire and two south porches. There are chapels for Independents, Baptists, and Wesleyan and Primitive Methodists; National, British, and Infant schools, and a range of 12 almshouses with a chapel. There is a neat corn-exchange, or market-house. A good corn and general market is held on Monday, and there are two yearly fairs. A county-court is held. There is a savings bank. Some of the inhabitants are employed in weaving and silk-winding. (*Communication from Hadleigh.*)

HADRIA PICENUM. [ABRUZZO.]

HADRUMAUT. [ARABIA.]

HADSTOCK. [ESSEX.]

HÆMUS. [BALKAN.]

HAFOD. [CARDIGANSHIRE.]

HAGLEY. [WORCESTERSHIRE.]

HAGUE, THE (in Dutch, 's Gravenhage; in French, La-Haye), a large and beautiful city, the capital of the Dutch province of South Holland, stands in 52° 4' 50" N. lat., 4° 18' 32" E. long., at a distance of 2 miles from the North Sea, 37 miles S.W. from Amsterdam, and 13 miles N.W. from Rotterdam by the railroad which connects these cities. It is not fortified, but is surrounded with a moat crossed by drawbridges. It is ranked as one of the finest cities in Europe on account of its stately buildings, its broad and regular streets traversed by canals, and its pleasant, dry, and healthy situation. Many of the streets are planted with rows of trees and paved with coloured bricks. The finest parts of the town are the street called Voorhout, which is lined with trees, and contains several splendid hotels, and the Vyverberg, a sort of square, with a fine avenue of trees on one side, and on the other a spacious basin of water, backed by magnificent buildings. Among the public buildings are—the royal palace, a building of little pretension; the palace of the Prince of Orange; the Buitenhof, which contains a gallery of pictures; the town-hall; the brass-cannon foundry; the theatres; and the state-prison. The Binnenhof, on one side of the Vyverberg, contains a magnificent gothic hall, the only remaining portion of the original residence of the counts of Holland. The other parts of the building are used as chambers by the states-general and as public offices. Between the Binnen and Buitenhof (inner and outer courts of the old counts' palace) is an old gateway called Gevangpoort (Prison-gate), from which the De Witts were dragged and torn to pieces by the populace in 1672. The Mauritshuis contains the finest collection of paintings by Dutch masters in the world, a vast collection of Chinese and Japanese products and curiosities, besides numerous historical relics. The Royal Library in the Voorhout contains 100,000 volumes, and a collection of 34,000 medals. John De Witt's house in the Kneuterdyk, a short distance from the Gevangpoort, above mentioned, is historically interesting. Among the 14 churches are 3 Dutch Calvinist and 1 Roman Catholic. There are also 2 large synagogues, numerous charitable and scientific institutions, and fine private collections of pictures. On one side of the town there is a canal constantly covered with vessels, and on the other a fine wood of oaks called the Bosch, in which is the country palace of the royal family, with a fine collection of pictures and extensive gardens. There are numerous elegant villas in the environs, and on the west of the town is Scheveningen, a neat fishing village, which has become of late years much frequented for sea-bathing. Between that and the Hague is a fine avenue of oaks, beeches, and limes.

The Hague owes its origin to a hunting-seat built by the counts of Holland in 1250, and the Dutch name, 's Gravenhage, is said to be

taken from the circumstance that houses came to be erected along the inclosure surrounding the Counts' Park ('s Gravenhage, Counts' Hedge). In the 16th century the Hague became the residence of the states-general, the stadtholder, and the foreign ambassadors. The Hague ranked only as a village till Louis Bonaparte, during his reign, conferred on it the privileges of a city. The population, which in 1837 was 54,000, is now (1854) stated at 64,000. The Hague is not a commercial nor a manufacturing town.

HAIGH. [LANCASHIRE.]

HAIK LAKE. [ABYSSINIA.]

HAILSHAM, Sussex, a small town, and the seat of a Poor-Law Union, in the parish of Hailsham, is situated in 50° 52' N. lat., 0° 15' E. long., distant 48 miles E. by N. from Chichester, 59 miles S. by E. from London by road, and 64 miles by the London, Brighton, and South-Coast railway. The population of the parish in 1851 was 1825. The living is a vicarage in the archdeaconry of Lewes and diocese of Chichester. Hailsham Poor-Law Union contains 11 parishes, with an area of 54,076 acres, and a population in 1851 of 13,289.

The town of Hailsham is built on a gentle acclivity rising from Pevensey Level. The parish church is in the perpendicular style, with an embattled stone tower. The Baptists and Calvinistic Dissenters have places of worship. There are National schools and a mutual improvement society. Hailsham has one of the largest markets in Sussex for sheep and cattle, held every alternate Wednesday. A cattle fair is held on the market Wednesday immediately preceding Christmas. Twine and cordage are manufactured in the town, and there are gas-works. About two miles from Hailsham are a gateway and moat, a groined crypt, and other remains of Mitchelham Priory.

(Communication from Hailsham.)

HAINAN, an island in the Chinese Sea, opposite the southern extremity of the province of Quan-tong, or Canton, to which it is annexed, and from which it is divided by the channel of the Junks, a strait only 15 or 16 miles wide. It lies between 18° 10' and 20° 24' N. lat., 108° 50' and 111° E. long., and incloses the Gulf of Tonquin on the east. Its length from south-west to north-east is about 170 miles, its greatest breadth 100 miles, and its area about 12,000 square miles. The population numbers about a million Chinese, besides the tribes of the interior.

The interior of the island is occupied by an extensive mountain mass called Ta Utahi-shan, which rises in parts above the snow-line; from this there issue a great number of offsets, which towards the south-west and north-east advance close to the sea, but are separated from the south-eastern and north-western shore by a level tract of considerable width. These plains, which are of great fertility and well cultivated, yield annually two or three crops of rice and other grains; the rivers which descend from the mountain region are used for irrigating this tract. Sweet potatoes form the principal food of the people, though they cultivate fruits, sugar-cane, tobacco, indigo, and cotton on a large scale. But the extensive forests which cover the sides of the mountains form the principal wealth of the island. Besides different kinds of timber-trees, these forests produce sandal-wood, brailetto, ebony, rose-wood, and many other kinds of wood, which are used as dye-stuffs or for furniture. Wax is gathered in large quantities. An insect called Pelatshung produces a white wax from which candles are made at Khiung-tsheou, and exported to other parts of China. The climate of the island is not very hot, being exposed to the wind which blows over a large expanse of sea; fogs and heavy dews are frequent, and maintain a vigorous vegetation. The coast is frequently laid waste by typhoons, or violent hurricanes, which are peculiar to the Chinese Sea.

The mountains are inhabited by aboriginal tribes, which are still independent, and called Li. Those which are subject to China resemble the Chinese in figure, and have adopted their usages, but they speak a different language, though they use the Chinese characters. They are very industrious husbandmen. There are some very populous towns in this island. Khiung-tsheou, the capital, situated at its northern extremity on the channel of the Junks, is said to have 200,000 inhabitants; and Kai Kheou-so, where the governor resides, is said to contain as many. Some others have 80,000 or 90,000 inhabitants each.

(Du Halde; Klaproth; *Asiatic Journal*, vol. xx.)

HAINAULT (in Flemish, Henegouwen), a province of Belgium, bounded N. by East Flanders and South Brabant, E. by Namur, S. by France, and W. by West Flanders, lies between 49° 58' and 50° 48' N. lat., 3° 17' and 4° 33' E. long.: its greatest length is 63 miles and its breadth 32 miles. Its area is 1435 square miles, and the population in January 1849 amounted to 723,539.

The most southern part of the province consists of a narrow strip 22 miles long and 9 miles broad, which lies between the province of Namur and the French Ardennes. The surface is for the most part level, but there are some hills towards the south and east. The soil, except in the arrondissement of Charleroi in the south-east of the province, is very fertile. The chief crops are wheat, rye, oats, barley, beans, rape, flax, hops, and potatoes; tobacco and chicory are also grown. Much of the land near the rivers is laid out in meadow; in other parts trefoil, lucern, and sainfoin are cultivated. Horned cattle, horses and sheep of excellent breed are numerous; poultry, game, and bees abound.

The eastern half of the province is very rich in mineral wealth. The coal-fields of Charleroi and Mons are the richest in Belgium, and the mines worked give employment to above 40,000 men. There are also rich iron-mines. The other mineral products are—lead, slates, marble, building- and lime-stone. Many localities in this part of the country are studded with iron-foundries and blast-furnaces. Steam-engines are used in all the mines to pump out the water and draw up the coals, large quantities of which are exported by canals and railroads to France. In these districts the roads and cottages are black with coal-dust.

The *Schelde* enters the province from France a little below its confluence with the Scarpe, and flows north-west to Tournay; then changing its course to north, it forms the boundary-line between Hainault and West Flanders, and quits the province at its north-western angle. The *Sambre* enters the province also from France to the east of Maubenge, and flows north-east past Charleroi to join the Meuse at Namur. The *Dender* rises within the province, flows eastward to Ath, whence it turns almost due north, quitting Hainault at Grammont, and, having crossed a great part of East Flanders, enters the Schelde at Termonde. The *Haine*, or *Hene*, from which the name of the province is taken, is formed by three brooks, which rise a little to the west of Charleroi; it flows west past Mons, below which it is navigable by means of sluices, and joins the Schelde at Condé in France. The *Trouille* rises on the southern frontier, and flowing west enters France, but leaves it again almost immediately, and falls into the Haine near Jemmapes.

The province is traversed by several good roads and numerous canals, by which communication was much facilitated even before the making of railways; and, like every other part of Belgium, it is well supplied with this new and rapid means of transit. The great lines of railroad through Hainault are—the Brussels-Namur and the Brussels-Valenciennes, which coincide as far as Braine-le-Comte, where they branch off for Charleroi and Mons respectively. A junction line, 15 miles in length, connects these two branches, leaving the Brussels-Charleroi line at the Manage station, 17 miles N.W. from Charleroi, and joining the Mons line a little north of that town. A branch line from the Jurbise station, near Mons, runs through Ath to Tournay, to the west of which it joins the direct Lille-Antwerp-Ghent line. The Sambre-Meuse line, 51 miles in length (reckoning several branches to the iron-mines), connects Charleroi with Couvin in the south of the province of Namur, and opens up the rich iron district whence the great iron-works of Charleroi and Mons are supplied with ore. Another branch railway runs from Charleroi up the Sambre to the French frontier at Erquelinnes (near Maubeuge), where it is met by the St.-Quentin line, as yet uncompleted.

The commerce of the province is composed of its varied industrial products—glass, porcelain, pottery, salt, spirits distilled from grain, beer, machinery, nails, woollen stuffs, linen, lace, Brussels carpets (the centre of which manufacture is in Tournay), &c. The most considerable articles of export are coal, iron, and lime, which are transported by canals and railroads to France and the neighbouring countries.

The province is divided into three arrondissements, Mons, Tournay, and Charleroi, which are subdivided into 32 cantons and 424 communes. The principal towns are the following:—ATH. *Beaumont*, in the south of the province, on the road from Mons to Chimay, stands on a hill commanding an extensive view over a very diversified country, the surface of which is broken by steep hills, and limestone and schistose rocks. It was formerly fortified, but its defences were demolished by the English in 1691: population, 2100. *Binac*, W. of Charleroi, on the right bank of the Haine, is a well-built walled town, with 5500 inhabitants. In a fine square ornamented with a fountain, stand a church, a college, and an hospital. The principal articles of manufacture are hosiery, leather, outlery, glass, tiles, and pottery. *Braine-le-Comte*, at the junction of the Brussels-Namur and Brussels-Valenciennes railroads, has cotton-mills, breweries, dye-houses, tanneries, oil-mills, and 4500 inhabitants. *Charleroi*, a strong fortress on the Sambre, 19 miles E. from Mons, stands on the Brussels-Namur railway, and has 8000 inhabitants. The fortifications have prevented the town from extending, but the immediate neighbourhood has little short of 100,000 inhabitants. Charleroi is a manufacturing town of extraordinary activity; glass, iron, salt, sugar, leather, nails, woollen yarn, &c., are among its products. The town stands in a most extensive coal-field, which gives employment to 10,000 men, and yields annually 3,000,000 tons of coal. The number of smelting-furnaces, iron-foundries, and nail-factories in the surrounding district is very great. [CHARLEROI.] *Châtelet*, on the Sambre, is a small town, 4 miles E. from Charleroi, with 8000 inhabitants, who manufacture cotton, woollens, pottery, salt, beer, and leather. *Châteaux*, a small town with 3100 inhabitants, near Ath, has important linen manufactures, breweries, and oil-mills. *Chimay* stands 24 miles S. from Charleroi, near the French frontier; it contains a college, and about 4000 inhabitants, many of whom are engaged in the numerous iron-works and coal-mines of the vicinity. There is a castle and park at Chimay, and several breweries. *Enghien*, 12 miles N.E. from Ath, contains 3800 inhabitants. The town stands on the side of a hill: it is regularly laid out, and well built; it contains a college and an hospital. The château of the Duc d'Arenberg, which was surrounded by a beautiful park, was destroyed at the first French revolution

The park still remains; it contains a temple, to which seven noble avenues of beech and chestnut-trees converge. *Fontaine-Evêque*, 6 miles E. from Charleroi, contains 3000 inhabitants. It has several smelting-furnaces, iron-foundries, and nail and hardware manufactories. *Gosselies*, a town with 5000 inhabitants, stands 5 miles N. from Charleroi: nail-making, salt-refining, and glass-blowing are carried on. Woollen-cloth and hats also are manufactured here. Many of the inhabitants are employed in the neighbouring coal-pits. Near Gosselies is *Gilly*, which has a population of about 6000 in the commune, who are employed chiefly in the coal-pits and in the manufacture of cutlery. *Lessines*, a town with 5000 inhabitants, N. of Ath, is almost surrounded by the Dender. This is a place of much trade. The neighbouring quarries furnish large quantities of paving and building stone. There are salt-refineries, distilleries, and chicory-factories. The other chief branches of traffic are coal, wood, and oil. *Leuze*, 10 miles E. from Tournay, stands near the source of the Dender, and has 6000 inhabitants, many of whom are employed in bleaching, brewing, and dyeing. *Mons. Péruwelz*, 12 miles E. by S. from Tournay, on a feeder of the Schelde, is a town of 7000 inhabitants, who are principally occupied in manufacturing hosiery, cotton and woollen cloths, lime, beer, and leather. *Roculx*, a small town containing 2450 inhabitants, is situated 8 miles N.E. from Mons. The castle of Roculx, and the surrounding gardens and grounds, which are laid out in the English style, are much admired. *St.-Ghislain*, a small fortified town 7 miles W. from Mons, in the middle of a great coal district, stands on the Haine and the Mons Canal, and has about 2000 inhabitants, who are engaged in bleaching linen, tanning, salt-refining, soap-boiling, and brewing. *St.-Ghislain* is a station on the railway from Mons to Valenciennes. Near the fortifications is a modern village called *Horna*, which was founded in 1823, and is built with straight streets on a uniform plan, and houses all of the same height; it numbers about 4000 inhabitants, who are employed in the coal and iron-mines and iron-works of the neighbourhood. Steam-engines and steam machinery are manufactured here. West of St.-Ghislain is *Boussu*, a station on the same railroad, and a small town on the Haine, with about 3000 inhabitants engaged chiefly in the export of coals. *Soignies*, a well-built town on the Senne, is 9 miles N. from Mons, on the Brussels-Valenciennes railroad, and contains 6500 inhabitants. Many of the houses are large and handsome. The town is surrounded by old ramparts. The church of St.-Vincent is said to be the oldest building in the province. There is a college in the town, an orphan asylum, a convent of the Sisters of Mercy, and several other religious and charitable establishments. Beer, spirits, and leather are manufactured; and the large limestone quarries here are a source of considerable profit. *Thuin*, on the Sambre, 10 miles by railway from Charleroi to Erquelines, stands partly on a steep rock, and contains 4300 inhabitants, many of whom are engaged in the iron-mines and great iron-works in the vicinity. *TOURNAY. Courcelles*, 5 miles N.W. from Charleroi, contains 3228 inhabitants, who manufacture nails and table-linen. *Dour*, 8 miles S.W. from Mons, has a population of about 6000, many of whom find employment in the productive coal-mines and iron-works of the district. *Fontenoy*, an inconsiderable village, 4 miles S.E. from Tournay, is historically famous for the great battle fought there May 11, 1745, between the French under Marshal Saxe, and the allied English, Austrians, and Dutch, commanded by the Duke of Cumberland, who was defeated with the loss of 15,000 men. *Jemmapes*, the first station W. of Mons, on the railway to Valenciennes, has a population of 5000, who are employed in brewing, tanning, and in the coal-mines. It is celebrated for the victory gained on the 6th of November, 1792, over the Austrians, by the French under Dumouriez and the Duc de Chartres (the late Louis-Philippe), and which led to the conquest of Belgium. *Jumetz*, 3 miles N. from Charleroi, contains 6728 inhabitants, who are engaged in the coal-mines and in manufacturing glass, beer, spirits, and leather.

HAINAULT, FRENCH, a district in the north-east of France, which formed with the Belgian province of Hainault the territory occupied by the ancient Nervii, whose capital was Bagacum, now Bavay, to the west of Maubeuge in the department of NORD. It was ceded by Spain to France by the treaties of the Pyrenees (Nov. 7, 1659) and Nimeguen (Sept. 17, 1678). Valenciennes, Maubeuge, Condé, Bouchain, Avesnes, Le-Quesnoy, and Landrecies were the principal towns of this district, which is now included in the department of Nord.

HAINBURG. [Ena.]

HAINES, a river in eastern Africa, which traverses the countries comprehended on our maps under the name of Zanguebar. It flows through an extensive valley separated by a series of sand-hills from the coast south of Magadoxo, and filled with alluvial soil of great fertility. The river, it is supposed, originates in the high countries which surround the most southern affluents of the Abai. Lieutenant Christopher was informed that north of 4° N. lat. the river is already considerable. He visited it at Girédi, a town situated 22 miles north-west of Magadoxo, inhabited by more than 7000 persons, and surrounded by extensive fields, on which Indian corn and millet yield such abundant crops that large quantities are exported to Hadramaut and Oman. The river was here about 200 feet wide, and too deep to be forded in the dry season. From this place the Haines runs nearly

parallel to the coast, at a distance of from 4 to 20 miles, and numerous villages are found on its banks, surrounded by extensive fields irrigated from the river. The volume of water carried down decreases considerably in consequence of this irrigation, and is less at the most southern point where it was seen by Lieutenant Christopher, which was due north of the town of Brava, where it was only from 70 to 150 feet broad, but from 10 to 15 feet deep. From this place the river continues in a south-western direction, and terminates, according to the natives, in an extensive lake said to be unfathomable. This lake is about 60 miles from the eastern banks of the river Jubb, or Gavind, and perhaps not much more than 20 miles from the sea. The inhabitants of the broad alluvial tract traversed by the Haines River are a mixture of Somaulis, Gallas, and negroes, among which a small number of Arabs are settled. (Christopher, in *London Geographical Journal*, vol. xiv.)

HAL. [BRABANT, SOUTH.]

HALAS. [CUMANIA.]

HALBERSTADT, a town in Prussia, in the government of Magdeburg, is pleasantly situated on the river Holzemme a feeder of the Bode, one of the tributaries of the Saale, in 51° 53' 55" N. lat., 11° 3' 53" E. long., 30 miles by railway S.W. from Magdeburg, and has about 20,000 inhabitants. It is an ancient city, said to have been founded by the Cherusci; though the actual date of its foundation is unknown. It became a bishop's see in 804. The most ancient part is the Dom Platz (Cathedral Square), formerly a castle. In 1179 the greater part of the town was burnt by Henry the Lion; it was rebuilt in 1203 and surrounded with ramparts. In the Thirty Years' War it made a brave resistance; in the Seven Years' War the French destroyed the gates and a large portion of the ramparts. In 1809 Duke William of Brunswick-Oels stormed the city, and made prisoners of the whole Westphalian garrison under Count Wellingerode. In 1813 the Westphalian General Ochs, who was posted here with 20,000 men and 14 pieces of cannon, was suddenly attacked by the Russian general Czernitscheff, who took 1000 of his men and many officers prisoners. The streets of Halberstadt are for the most part long, broad, and tolerably straight. It has various manufactures, and a considerable trade. It is the seat of a high court of justice, and has a diocesan school, with a library of 8000 volumes, a cabinet of natural history, and a collection of instruments; a gymnasium, a seminary for schoolmasters, a literary society, several charitable foundations, &c. There are seven Lutheran churches, two Calvinist, three Roman Catholic churches, and a very handsome synagogue. The most remarkable of the churches are those of *Unsere Liebe Frau* (Our Dear Lady's), which is in the Byzantine style and was completed in 1003; and the cathedral dedicated to St. Stephen, built in the noblest style of the 15th century—it is 412 feet long, 72 feet wide, and 94 feet high inside, and has 32 altars. The cathedral contains several valuable pictures as well as interesting antiquities and some paintings on glass. The town has also a handsome town-hall and a theatre. The industrial products of Halberstadt comprise woollen stuffs, leather, carpets, linen, gloves, starch, tobacco, soap, &c. There are also many breweries, large oil-mills, and an active trade in corn and wool.

HALEB. [ALEPPO.]

HALES OWEN, Worcestershire, a market-town and borough, in the parish of Hales Owen, is situated in 52° 32' N. lat., 2° 5' W. long., distant 36 miles S.E. by E. from Shrewsbury, and 117 miles N.W. from London by road. The population of the borough of Hales Owen in 1851 was 2412. The living is a vicarage in the archdeaconry and diocese of Worcester.

The town of Hales Owen is pleasantly situated in a valley, and contains many good houses. The parish church is a fine building, with a handsome spire supported by four arches. The Independents, Baptists, and Wesleyan Methodists have chapels. In Hales Owen are a Free school, founded about 1652, which has an income of above 100l. a year, and had 60 scholars in 1853; National schools, and an Infant school. Nails and hardware are extensively made. The market-day is Monday; fairs are held on Easter Monday and Whit-Monday. Some remains exist of an abbey of Præmonstratensian canons, built in the reign of King John. Near Hales Owen is the Leasowes, the birth-place and residence of the poet Shenstone, and the grounds of which were arranged by him. Shenstone was buried in Hales Owen churchyard, and the church contains a monument to his memory.

HALESWORTH, Suffolk, a market-town in the parish of Halesworth, is situated in 52° 21' N. lat., 1° 30' E. long., 31 miles N.E. by N. from Ipswich, and 100 miles N.E. by N. from London. The population of the town of Halesworth in 1851 was 2529. The living is a rectory in the archdeaconry of Suffolk and diocese of Norwich. The town is irregularly laid out; the streets are wide and lighted with gas. A small river, a feeder of the Blyth, runs through the town, up to which the Blyth and its affluent have been made navigable, and wherries from Southwold come to the quay. Agricultural produce is exported, and coal, lime, and general merchandise are imported. The parish church is a handsome gothic building. There are chapels for Independents, Baptists, and Wesleyan Methodists; National and British schools, a savings bank, and a literary institute. A county court is held. Maltng is very extensively

carried on. The market, which is the largest corn-market in Suffolk, is held on Tuesday. (*Communication from Halesworth.*)

HALIFAX, West Riding of Yorkshire, a market-town, municipal, and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Halifax, is situated in 53° 44' N. lat., and 1° 52' W. long., distant 48 miles S.W. by W. from York, 197 miles N.W. by N. from London by road, and 217 miles by the North-Western and Lancashire and Yorkshire railways. The population of the borough in 1851 was 33,582; the population of the entire parish was 149,257. The borough is governed by a mayor, aldermen, and councillors, and returns two members to the Imperial Parliament. The living of Halifax is a vicarage in the archdeaconry of Craven and diocese of Ripon. Halifax Poor-Law Union contains 20 townships and chapelries, with an area of 51,624 acres, and a population in 1851 of 120,942.

The parish of Halifax is one of the largest in England, being 75,740 acres in extent, and includes 23 townships and chapelries. The borough comprises the township of Halifax and parts of the townships of Northowram and Southowram. In 1848 the borough was incorporated by royal charter. The town, which is almost wholly surrounded by hills, is situated on the south-eastern declivity of an eminence which rises to a considerable height above the river Hebble. The Hebble flows through the eastern parts of the town, and falls into the Calder. Halifax is well lighted with gas, and has an ample supply of water from reservoirs near the town. Many great improvements have been effected of late years; and the town generally has a handsome appearance.

The parish church of Halifax is a handsome and spacious edifice, erected at different dates. Trinity church is a handsome Grecian building, with Ionic pilasters, and an elegant tower surmounted by a dome: it was built in 1795. St. James's church, built in 1831, is in the pseudo-gothic style, with turrets at the west end. Besides these there are upwards of 20 churches in the parish. The other places of worship are the Roman Catholic chapel, which was built in 1836, three chapels for Independents, two each for Baptists, Wesleyan Methodists, and New Connexion Methodists, and one each for Primitive Methodists, Quakers, and Unitarians. The number of schools within the bounds of Halifax Poor-Law Union in 1851 was 239, of which 68 were public schools with 9469 scholars, and 171 were private schools with 5501 scholars. The number of Sunday schools was 136 with 23,644 scholars, of which 32, with 5916 scholars, were under the superintendence of the Established Church. Heath Grammar school, founded in 1585, has an income from endowment of about 270*l.* a year, and had 60 scholars in 1853. In 1851 there were 19 evening schools for adults with 724 pupils, and 13 literary and scientific institutions, with about 2300 members, and about 14,000 volumes in their libraries. The infirmary is a very noble building; the first stone was laid in September 1836. It affords medical and surgical assistance both to in and out-door patients. The public baths are of a superior class. There are assembly-rooms and a theatre. Halifax possesses a savings bank. A county court is held in the town.

Halifax ranks next to Leeds and Bradford as a seat of the woollen and worsted manufactures. Its ample supply of water power; its proximity to Manchester and Leeds; an abundant supply of coal; its inland navigation by means of the Rochdale Canal, and the rivers Calder and Hebble; and its central position with respect to the leading lines of railway, have combined to increase the manufacturing and commercial importance of Halifax. In an early period of the history of the woollen manufacture, a peculiar local law, known as the Halifax Gibbet law, was enacted for the protection of clothiers from the depredations to which their goods were exposed during the process of manufacture. The magistrates were invested with power to inflict capital punishment on all persons who stole property of the value of thirteen pence halfpenny within the liberties or precincts of the forest of Hardwick. The felon was to be deliberately and publicly tried by a jury consisting of the frith-burghers within the liberty, who could only convict however if the culprit were taken in the act of thieving; if the stolen goods were found on him; or on his own confession. On the first market-day following the conviction he was executed by means of an instrument somewhat resembling the guillotine. The chief articles manufactured at Halifax are worsted stuffs, including shalloons, tammies, calamancoes, duroys, everlasting, moreens, shags, serges, merinos; also baizes, narrow and broad cloths, and kerseymeres. Bombasins, crapes, damasks, and other fabrics composed of silk and worsted, are also made, and the cotton manufacture is extensively carried on. A small portion of the population is employed in making mill-machinery and wool-cards. Several paper-mills and a large carpet manufactory are in the parish. Coal, slate, and freestone are extensively raised. There is a large trade in corn.

A weekly market is held on Saturday, chiefly for the sale of woollen cloth. The Piece Hall, which was erected in 1779 by the shalloon and other worsted manufacturers, at a cost of 12,000*l.*, is a large quadrangular stone building. It contains 315 apartments for the reception of goods. Fairs are held on June 24th, and the first Saturday in November, for cattle, horses, &c.

Daniel De Foe resided in Halifax when he wrote Robinson Crusoe; and Sir William Herschel was for some time organist at the parish church. Archbishop Tillotson was born at Haughend. Sterne Mills

perpetuate the local remembrance of the family of Laurence Sterne. Throughout the parish are numerous villages; also many fine mansions, the residences of opulent families.

(*Communication from Halifax.*)

HALIFAX, a city, sea-port, and the capital of the colony of Nova Scotia, is situated in 44° 40' N. lat., 63° 38' W. long., on the west side of a deep inlet of the sea called Halifax Harbour, which extends several miles inland on the south-east coast of Nova Scotia, and forms one of the finest ports on the eastern side of America. The town is built on the declivity of a hill, and the harbour in front of it, where ships usually anchor, is a mile wide; higher up, the inlet contracts to a quarter of a mile, and then suddenly expands into a capacious bay called Bedford Basin, which comprises an area of 10 square miles, is completely land-locked, is easily accessible, has deep water throughout, and could accommodate the whole navy of Great Britain. Halifax is the principal naval station in British America. It is defended by forts and batteries; it has a dockyard which covers an area of 14 acres, and a well-appointed naval arsenal. Mail steamers run between Liverpool, Halifax, and Boston every alternate week, Halifax being regarded as the intermediate port between Liverpool and Boston. There is regular communication by canal with the Bay of Fundy, and by steamers and sailing-vessels with all the great ports of Canada, the United States, New Brunswick, Newfoundland, and the West Indies. Halifax imports the native products of the West Indies and the United States, and the manufactures of Great Britain: and exports dried and pickled fish, lumber, flour, cattle, whale and seal-oil, and furs. The estimated value of the imports in 1851 was as follows:—From Great Britain, 401,022*l.*; North American Colonies, 181,549*l.*; West Indies, 7385*l.*; other British colonies, 15,000*l.*; United States of America, 223,835*l.*; foreign states, 165,893*l.*;—total, 994,184*l.* The exports for the year amounted to 319,720*l.* The exports included 243,847 quintals of codfish, 92,484 barrels of mackerel, 56,281 barrels of herrings, 7046 boxes of smoked herrings, 5979 barrels of salmon, and 5985 casks of fish-oil. The shipping inwards during 1851 amounted in all to 1123 vessels of 147,600 tons, employing 10,630 men. The total shipping outwards was 1016 ships of 133,864 tons, manned by 10,001 seamen. The town is regularly laid out, and has a handsome appearance, though the houses are mostly of wood. The population of Halifax county in 1851 was 39,112, of which the city probably contains about four-fifths. In the county there were 74 places of worship. The respective numbers of adherents of the six principal religious denominations were as follows:—Roman Catholics, 13,317; Church of England, 10,245; Presbyterians, 6804; Baptists, 3525; Methodists, 2457; Congregationalists, 515. Among the places of worship in the city is a large Roman Catholic cathedral. The Province Building, in the centre of the town, a well-built edifice of freestone, 140 feet long, 70 feet wide, and 42 feet high, contains the chambers of meeting for the legislative bodies, the custom-house, the offices of the provincial government, and the superior law-courts. The other principal public buildings are—the court-house, the exchange, assembly-rooms, theatre, prison, workhouse, Dalhousie College, and several public schools.

HALL. [JANT; TYROL.]

HALLAMSHIRE. [YORKSHIRE.]

HALLATON. [LEICESTERSHIRE.]

HALLE, a town on the Saale, in the district of Merseberg, province of Saxony, in Prussia, is situated at the junction of the Thuringian railway with the line to Magdeburg and Leipzig, 53 miles S.S.E. from the former city, 20 miles N.W. from the latter: population, including the suburbs, about 30,000. It is celebrated chiefly for its salt-works, and as the seat of the Frederick University. It consists of three towns, namely, Halle itself with five suburbs, and Glaucha and Neumarkt, which have magistrates of their own. The town is old, and surrounded by walls. The university was founded in 1694, and by a decree of the king of Prussia was united in 1817 with that of Wittenberg. It has always maintained a very high character, and has a number of scientific institutions connected with it, such as the botanic garden, a museum, theological and philological seminaries, a medical, chirurgical, and clinical institution for surgery, midwifery, &c., an anatomical theatre, a chemical laboratory, an observatory, a mining institution with a cabinet of minerals, &c. There are four faculties—Protestant theology, law, medicine, and philosophy; the number of professors and teachers is 69; the number of students in 1850 was 693. Halle has also two gymnasias, or high schools—the Pædagogium, with 16 professors and 101 students; and the Franksche Stiftung, with 25 teachers and 388 pupils. The university library consists of 90,000 volumes. Although the town is on the whole an ill-built place, there are several remarkable buildings, among which are St. Mary's church, built in the gothic style in the 16th century; St. Ulrich's church, built in 1339; that of St. Maurice, of the middle of the 12th century; the cathedral, built in 1520-23; the red tower, in the market-place; and the town-hall. The ancient castle, called Moritzberg, formerly the residence of the archbishops of Magdeburg, was reduced to a ruinous condition in the Thirty Years' War, and only a wing of it now remains, which has been converted into a Calvinist church. In the Glaucha suburb there is an orphan asylum, founded by a professor named Franke, who gave name also to the

stiftung, or institute, above named, which forms part of the foundation. Besides the gymnasium and large schools for the poor, it contains a medical laboratory and Bible-printing establishment. A bronze statue of the founder, by Rauch, is erected in front of the building. Halle possesses many charitable institutions. The manufactures of Halle comprise woollen stuffs, silk, leather, hosiery, buttons, hardware, and starch; but the most important industrial product is salt, made from the brine-springs close to the town, to the amount of about 300,000 cwt. annually. Halle is the seat of a mining board.

HALLE, or HALLEIN, in the circle of Salzburg, in Austria, with 5000 inhabitants, has extensive salt-works, which produce annually 450,000 cwt. of salt.

HALSTEAD, Essex, a market-town and the seat of a Poor-Law Union, in the parish of Halstead, is situated in 51° 57' N. lat., 0° 38' E. long., distant 17 miles N.N.E. from Chelmsford, and 46 miles N.E. by E. from London by road. The population of Halstead in 1851 was 5658. The living is a vicarage in the archdeaconry of Colchester and diocese of Rochester. Halstead Poor-Law Union contains 16 parishes, with an area of 36,688 acres, and a population in 1851 of 19,028.

Halstead is pleasantly situated on the slope of a gravelly eminence rising from the river Colne, and consists of the main street, which runs along the high road from London to Norwich, and of some smaller streets. The town is lighted with gas. There is a newly-erected market-house and town-hall. The parish church is large, and one of the finest in the county. It is chiefly in the perpendicular style: the chancel is decorated. It has been almost wholly rebuilt within the last five years. The church of the Holy Trinity is a handsome edifice in the early English style, erected in 1844 by subscription. The Independents and Baptists have two chapels each, and the Quakers have a place of worship recently erected. Lady Mary Ramsey's Grammar school, founded in 1594, had 20 scholars in 1852. The school endowment provides 20*l.* a year for the master, with a convenient house. There are National, British, and Infant schools, a mechanics literary institute, and a savings bank. There is a manufactory for crape, silk, and velvet. Brick-making, the paper manufactory, and straw-plaiting are carried on. Petty sessions and a county court are held. Tuesday is the market-day: the market here is important for corn. Fairs are held on May 6th and October 29th.

HALTON. [CHESHIRE.]

HALTWHISTLE, Northumberland, a market-town and the seat of a Poor-Law Union, in the parish of Haltwhistle, is situated on an eminence on the left bank of the South Tyne River, in 54° 59' N. lat., 2° 27' W. long., distant 38 miles W. from Newcastle, 284 miles N.N.W. from London by road, and 315 miles by the Great Northern, and York Newcastle and Berwick railways. The population of the township in 1851 was 1420. The living is a vicarage with two curacies annexed, in the archdeaconry of Northumberland and diocese of Durham. Haltwhistle Poor-Law Union contains 17 parishes and townships, with an area of 112,687 acres, and a population in 1851 of 7240.

The town of Haltwhistle consists of a principal street extending along the Newcastle and Carlisle road, and of some smaller streets. The houses are poor and irregularly built. Besides the parish church there are places of worship for English Presbyterians and Wesleyans and Primitive Methodists, and an Endowed Charity school. Petty sessions and a county court are held. The market-day is Thursday: fairs are held on May 14th and November 22nd; a tryst for cattle is held on September 17th. The principal manufacture is that of baize; linen-weaving, brewing, brick-making, and dyeing are carried on.

(Communication from Haltwhistle.)

HALYS, RIVER. [ANATOLIA.]

HAM, EAST AND WEST. [WEST HAM.]

HAMADAN. [ECBATANA.]

HAMBATO. [ECUADOR.]

HAMBLEDON, Surrey, a village and the seat of a Poor-Law Union, in the parish of Hambledon, is situated in a picturesque spot near the south border of the county, in 51° 8' N. lat., 0° 37' W. long., distant 8 miles S. by W. from Guildford, and 37 miles S.W. from London. The population of the parish of Hambledon in 1851 was 586, of whom 196 were in the Union workhouse. The living is a rectory in the archdeaconry and diocese of Winchester. Hambledon Poor-Law Union contains 16 parishes, with an area of 58,810 acres, and a population in 1851 of 13,549.

HAMBLEDON. [HAMPSHIRE.]

HAMBURG, a great commercial city in Germany, the capital of a small republic of the same name, is situated in 53° 32' 51" N. lat., 9° 58' 33" E. long., and has, including the suburbs of St. George and St. Paul, 148,774 inhabitants. The origin of this city is attributed to Charlemagne. Its site is an elevated spot on the right bank of the Elbe and the left bank of the Alster, and about 75 miles from the German Ocean. Though at first merely the resort of fishermen, it had attained considerable commercial importance at the beginning of the 12th century. In the 13th century it concurred in the formation of the Hanseatic League. Till 1500 it was confined to the space between the Elbe and the east bank of the Alster; but the right bank of the latter was gradually built upon, and the walls were extended so as to

inclose the new part of the town. The actual fortifications of the city were thus extended to about 4 miles in circumference, and were not further enlarged after this time, though some outworks were made and a fortified line was formed inclosing the suburb of St. George. The kings of Denmark claiming the sovereignty as counts of Holstein, Hamburg was obliged at different times to avert a threatened attack by the payment of large sums, till a convention with the house of Holstein in 1768 removed all difficulties. In 1770 the claim of Hamburg to the rights of a free city of the empire (which claim had been long resisted by the kings of Denmark as counts of Holstein) was confirmed by the emperor. The possession of the cathedral had been always claimed by the archbishops of Bremen, but it was assigned by the treaty of Westphalia in 1648 to Sweden, and afterwards passed to Hanover with the duchy of Bremen. In 1802 the cathedral and all the property hitherto belonging to Hanover in the city and territory were finally assigned to Hamburg, and its independence still further secured. Its misfortunes commenced with the occupation of Hanover in 1803 by the French, who seized Ritzebüttel, at the mouth of the Elbe, to prevent English ships from entering the river. By the English blockade of the Elbe in 1803, the commerce of Hamburg was paralysed, and its direct maritime trade interrupted. Large sums were extorted from the city during the French occupation. At the end of 1810 it was incorporated with the French empire as the capital of the department of Bouches-d'Elbe. In 1813 the French evacuated the city, which was militarily occupied by a Russian corps; the old constitution was restored; a burgher guard of 7000 men was formed, 2000 of the inhabitants volunteered to join the allies, and the Russians repaired the fortifications, which had been partly razed. But the French soon returned and attacked the city on the side of the Elbe. The Russians being too weak withdrew, and Marshal Davoust and General Vandamme entered Hamburg, and imposed a contribution of two millions sterling; being afterwards besieged, they drove out 40,000 inhabitants in the depth of winter, and seized the treasure deposited in the bank, amounting to about 700,000*l.* sterling. On the 26th of May 1814, the French having evacuated the town, the old constitution was again restored, and on the 8th of June 1815 Hamburg joined the German Confederation as a free Hanseatic city. The public spirit of the inhabitants, its internal resources, and its favourable situation for commerce have since then gradually restored its former prosperity. A great calamity befell the city in 1842. On the 5th of May in that year a dreadful fire broke out, which destroyed 61 streets and 120 lanes, passages, and courts, and left about 20,000 of the population houseless. A universal sympathy was felt for this disaster in nearly all parts of the world, which poured in contributions for the sufferers, amounting altogether to nearly 400,000*l.* sterling. Hamburg was occupied by an Austrian force in 1851, during the disputes between Holstein and Denmark.

The territory of Hamburg, including the area of the city (which is nearly an oval 4 miles in circumference), is 150 square miles, bounded on the south by the Elbe and on the other sides by the Danish territories. It has likewise some islands in the Elbe, some parcels of land on the Hanoverian side of the river, and the bailiwick of Ritzebüttel at the mouth of the Elbe, in which is the harbour of Cuxhaven. Conjointly with Lübeck it has the bailiwick of Bergedorff, and the districts called the Vierländen, 16 miles from Hamburg, with 10,000 inhabitants. The population of the city in 1850 was 115,886; of the St. George suburb, 16,731; of the St. Paul suburb, 16,157; and of the country parts, 39,300, making the total population of the republic amount to 188,074. The great majority are Lutherans.

The constitution is a mixture of aristocracy and democracy. The Senate (previous to certain changes made in 1848, and to be noticed presently) consisting of 4 burgomasters (chosen for life), and 24 senators, with 4 syndics and 4 secretaries, had the executive power, and the sole right of proposing laws; but no laws could be made and no taxes imposed without the consent of the citizens in common hall. The citizens are divided into 5 parishes, each of which chose 36 members to the council of 180, from which was chosen a board of 60, and out of that the 15 elders or aldermen. For the administration of justice there are various tribunals. In the last resort the decision is with the High Court of Appeal for all the free cities, sitting at Lübeck. In the German diet Hamburg has one vote in the deliberations, but in the select council it has a vote only in conjunction with Lübeck, Bremen, and Frankfurt. Its contingent to the army of the Confederation is 1298 men, and its contribution to the general fund 129 florins per annum. It has also an admirably-organised burgher guard of 9000 infantry, cavalry, and artillery.

A constituent assembly elected in 1848 proceeded to concoct a new constitution, to which when completed the Senate made different objections; and it was resolved by the citizens, on the proposal of the Senate, and notwithstanding the protest of the assembly, to submit this draught of a constitution to the revision of a committee composed of four senators and five citizens. The council of 60 and the bourgeois agreed to the changes proposed by this committee, the principal points of which are as follows:—1. A senate of 15, of whom 7 must be acquainted with law and finance, and 6 must be merchants; 2. A civic body of 192 members, 96 chosen from among the inhabitants of the city, 48 from the landed proprietors by landholders paying a certain amount of taxation, and 48 named by the different authorities as representatives of the tribunals, commerce, manufacture, education,

finance, &c. : 3. A committee of 20, named by the civic body from among its own members to assist the Senate in matters of urgency and difficulty : 4. Annually elected burgomasters, none of whom in case of re-election can retain office for more than two successive years. There are now only three burgomasters. The first, chosen by the Senate and by a secret vote, presides in the Senate ; the second burgomaster is similarly elected by the Senate ; the third is chosen by the citizens.

In the part of the town that escaped burning in 1842, as in most of the old fortified towns of Germany, the streets are in general narrow, irregular, and dark ; the houses old-fashioned and awkward, and yet not interesting to the lovers of antiquity. In modern times handsome houses have been erected in some streets, but they are exceptions. From the number of canals that intersect it, the antiquated form of its houses, and the trees that grow along the streets, the old part of Hamburg greatly resembles a Dutch town.

In the part devastated by the fire of 1842 a complete system of drainage has been executed ; a large extent of marshy ground on the right bank of the Elbe filled up and raised with the rubbish of the old buildings ; the whole space laid out upon a regular plan ; and a great part of it covered with streets and warehouses. The finest new buildings are in the neighbourhood of the Alster and round the small lake which it forms within the city. Many of these buildings are large, with granite foundations, and superstructures of brick and stucco. The styles of the houses are various—Lombard, Gothic, Florentine, &c., which, combined in one view, form groups of domestic architecture almost unrivalled for beauty and extent. The finest hotels are built round the Alster Lake, and here is an arcade of great architectural beauty. A new Rathhaus, or town-hall, is being erected on one side of a square facing the Exchange. The churches of St. Nicholas and St. Peter, destroyed by the fire, are being rebuilt. The Börsé, or Exchange, which escaped the conflagration though surrounded on all sides by burning houses, is a stuccoed brick building of great beauty. The central part forms a hall 48 paces long and 26 paces wide, exclusive of the colonnade, which is double at each end and treble at the sides. A broad gallery runs round the hall, communicating with reading and refreshment rooms, a bank, library, &c. The board of trade holds its sittings in this building. The city has a fine theatre, one of the largest in Germany, and throughout the city there are numerous public ball-rooms.

Hamburg is not distinguished for ecclesiastical buildings. The number of churches has been considerably reduced : the ancient cathedral was pulled down almost as soon as it was ceded to Hamburg, and since the peace four or five smaller churches have been demolished. The church of St. Gertrude, consumed in 1842, is we believe not to be rebuilt. Of the eight or nine churches that still remain the most worthy of notice is the great church of St. Michael, which was begun in 1751 and completed in 1763, except the spire, which was not erected till 1778. This church is capable of accommodating 2000 persons : the height of the steeple is said to be 456 feet. The Roman Catholics use the small church of St. Michael. Hamburg has a great number and variety of charitable institutions, the bare enumeration of which would exceed our limits, but of which it may be affirmed that they are on the most liberal plan, and managed in the most exemplary manner. There are only two learned institutions supported by the state—the Johanneum, built on the site of the cathedral, designed to qualify young men for the university ; and the Gymnasium. Hamburg has numerous literary institutions ; a city library, containing nearly 160,000 volumes, besides 1000 volumes of manuscripts ; and a commercial library of 30,000 volumes. The favourite public walk is the Jungfernstieg, a broad terrace round three sides of the Alster Lake, or basin. Near the Jungfernstieg are the best shops in Hamburg. The greater part of the ramparts have been levelled and planted, and laid out in pretty walks and drives, affording at points fine views of the river and the neighbouring country. The public cemetery is outside the Damm Gate, near the Jungfernstieg. The gates of the city are closed at dusk, after which a toll is demanded. A guard is placed at the gates whilst they are closed. Consuls from almost every state in the world reside in Hamburg. Steam-boats ply regularly to London, Hull, Amsterdam, and Havre ; and daily up the Elbe to Magdeburg. Hamburg has direct railway communication with Berlin, from which it is distant 176 miles to the north-west ; from Harburg, on the left bank of the Elbe, it communicates with Hanover (106 miles), and thence by the Cologne-Minden line with the Rhine and Belgian railroads ; and from Altona, which adjoins one of its suburbs, with Kiel (65 miles) and the Baltic. The city is connected by electro-telegraphic wires with all the great towns of Europe.

The total debt of the republic, including 81,814,000 marcs borrowed in consequence of the fire of 1842, amounted to 66,940,288 marcs current, or 3,974,579*l.* 12*s.* sterling.

In the budget for 1853 the revenue from public property, direct and indirect taxes, was estimated at 6,142,350 marcs current, or 364,702*l.* 0*s.* 7*d.* ; and the expenditure at 6,155,280 marcs, or 365,469*l.* 15*s.*

The harbour admits vessels of 14 feet draught at all times ; ships with 18 feet draught can come up at high water. At the end of 1852 there belonged to the port 369 vessels measuring 87,628 lasts of 6000*l*ba.

OROA. DIV. VOL. III.

each ; in this number are included 6 steamers. In the course of 1852 the arrivals from different ports of Europe numbered 3960 ships ; from Asia, 46 ; from Africa, 17 ; from America, 413 ; and from Australia, 4 ; making a total of 4440 ships measuring 280,585 lasts, and manned by 37,787 men. Of the arrivals 403 were in ballast. In the same year the departures for European ports numbered 3991 ships ; for Asia, 19 ; for Africa, 15 ; for America, 447 ; and for Australia, 8 ; making a total of 4480 ships measuring 281,728 lasts, and manned by 37,973 men. Of the departures 2136, or nearly one-half, were in ballast.

The trade of Hamburg is in a great measure passive, that is, it depends more upon the varying wants of other countries than upon its own. The free navigation of the Elbe below the town is the great cause of its commercial pre-eminence. Through Hamburg, Prussia and a great part of Germany receive foreign produce and export their own. The great articles of import into Hamburg are tea, sugar, coffee, cocoa, tobacco, raw-cotton, rice, hides, pepper, indigo, pimento, ginger, olive-oil, dye-stuffs, raisins, almonds, iron, bullion, cotton-twist, wine, brandy, rum, dried fruit, palm- and fish-oil, salt herrings, &c. These articles of course enter also into the exports. The principal native exports are corn, wool, linen, clover-seed, bark, butter, salt provisions, rags, wooden clocks, Rhenish wines, German manufactures, pitch, tar, flax, wax, &c. The total value of the imports in 1840 was 177,000,000 marcs banco, or 13,575,000*l.* sterling ; it had increased for the year 1851 to 373,277,940 marcs banco, or 27,218,183*l.* 2*s.* 6*d.* sterling. The total value of the exports in 1840 was 105,500,000 marcs banco, or 7,912,500*l.* sterling ; in 1851 it had risen to 338,163,370 marcs banco, equal to 24,657,745*l.* 14*s.* 7*d.*

The largest vessels that trade to Hamburg sometimes load and unload into lighters at Cuxhaven at the mouth of the Elbe. The channel at the mouth of the river leading to Cuxhaven is three-fourths of a mile wide at the narrowest part, between the Vogel Sands on the north, and the Schaarhorn Sands and Neuwerk Island on the south. On the island are two lighthouses, 700 yards apart ; the more southerly is 128 feet high, and stands in 53° 54' 57" N. lat., 8° 29' 40" E. long., the other is only 64 feet high. The entrance of the river is marked by a light ship, and the channel all the way up to Hamburg is marked by black and white buoys on the starboard and larboard sides respectively. A pilot is necessary in navigating the river, and a pilot galliot is stationed near Neuwerk Island.

There are no docks or quays at Hamburg. Vessels moor in the river outside of piles a short distance from the shore, and load and unload by means of lighters. Small craft lie in a sort of inner harbour formed by an arm of the Elbe which runs into the city. The business done in Hamburg in banking, exchange, and insurance transactions is very extensive. A foreigner cannot carry on any business in his own name in the city without becoming a burgher, which he can do however by paying an amount of fees not exceeding 10*l.*, and thus acquire all the rights and privileges of a native.

HAMELN. [HANOVER.]

HAMILTON (anciently Cadzow), Lanarkshire, Scotland, a parliamentary burgh and market-town, in the parish of Hamilton, is situated near the confluence of the Avon Water with the Clyde, 11 miles S.E. from Glasgow, in 55° 47' N. lat., 4° 2' W. long. The population of the burgh in 1851 was 9630. The town is governed by a provost, three bailies, and eight councillors ; and jointly with Airdrie, Falkirk, Lanark, and Linlithgow, returns one member to the Imperial Parliament.

The town, which is lighted with gas, is irregularly built, but possesses some good buildings. The Episcopal church is much admired. The parish church is a Grecian edifice ; the United Presbyterians have four chapels, and the Roman Catholic and Free Church congregations have each a large chapel. The new academy, replacing the old Grammar school, is a handsome building. A mechanics institution and a savings bank are in the town. Handloom weaving is the chief occupation of the inhabitants. Young females are generally engaged in tambour or sewed muslin work. A few still manufacture Hamilton lace. In the neighbourhood of the town are extensive barracks.

Hamilton Palace is a superb building, and contains many valuable paintings. The building called Chatelherault, the ancient castle of Cadzow, and the remains of the Old Caledonian Forest, are among the objects of antiquarian interest in the town and its vicinity.

(Communication from Hamilton.)

HAMPRESTON. [DORSETSHIRE.]

HAMPSHIRE, or as it is styled in some official documents, the county of SOUTHAMPTON, and more familiarly HANTS, a southern maritime county of England, lies between 50° 34' and 51° 22' N. lat., 0° 43' and 1° 54' W. long. It is principally on the mainland of England, but includes the ISLE OF WIGHT. Hampshire is bounded N. by Berkshire, E. by Surrey and Sussex, S. by the English Channel, and W. by

K

Wiltshire and Dorsetshire. The length of the mainland part of the county from north to south varies from 37 to 46 miles; the breadth varies from 28 to 41 miles. The Isle of Wight is about 23 miles long from east to west, and 14 miles broad from north to south. It is separated from the main part of the county by an arm of the sea, averaging about 3 miles over, but in the narrowest part not more than a mile. A small detached part of the county 9 miles long, and for the most part less than half a mile wide, extending from near Haslemere in Surrey, to Midhurst in Sussex, was annexed to Sussex by the Act 7 & 8 Vict., cap. 61. The area of the county, including the Isle, is 1658 square miles, or 1,070,216 acres. The population of the county in 1841 was 354,682; in 1851 it was 405,370.

Coast-line, Surface, Hydrography, Communications, &c.—The coast of Hampshire (not including the Isle of Wight) is low towards the east side of the county, where there is a wide but not very deep bay or inlet, divided by Hayling Island and Portsea Island into three parts; Chichester harbour on the east, Langton harbour in the middle, and Portsmouth harbour on the west. Portsea Island, 4 miles long from north to south, and about 3 miles broad, contains the borough of Portsmouth and the town of Portsea, with their extensive suburbs.

From the entrance of Portsmouth Harbour the coast runs north-west to the entrance of the inlet or estuary called Southampton Water. In this part are some low cliffs. Southampton Water penetrates about 7 miles inland to the town of Southampton, at the junction of the Test and the Itchin: its breadth, when the tide is up, is from one mile and a half to two miles; at low water about half a mile. From the entrance of Southampton Water a low coast runs south-west until opposite to the western extremity of the Isle of Wight. Along this low coast are extensive salt-works, and at its extremity, upon the point of a long sandy neck, stands Hurst Castle. From Hurst Castle the coast runs west, forming the shallow bay of Christchurch, terminated at its western point by Hengistbury Head, from which the coast still runs west to the border of Dorsetshire. From Hurst Castle the coast is generally high and abrupt.

The surface of the county is rather irregular. The South Downs enter the county from Sussex on the south-east, near Petersfield, and cross it in a north-west direction into Wiltshire. The North Downs enter the county from Surrey, near Farnham, and extend across it by Odiham and Kingsclere into Wiltshire. The Alton Hills form a connection on the east side of the county between the South and North Downs, and run from Petersfield northward past Alton. These hills are in the chalk formation.

A large part of Hampshire is within the basin of the Southampton Water; a small portion on the north and north-east sides of the county is in the basin of the Thames; a small portion on the south-east side is in the basin of the Arun, and a small portion of the west side is in the Wiltshire and Dorsetshire basin.

The principal streams which drain the Southampton basin are the Anton or Test, which has a course of 35 miles, the Itchin 25 miles, and the Hamble, 10 miles. One branch of the Test rises near Hurstbourne Tarrant (between Newbury and Andover), and another near Whitchurch; their united stream flows by Stockbridge and Romsey to Southampton. The Itchin rises in the hills around Alresford, and flows past Winchester to Southampton. The Hamble rises near Bishop's Waltham, and joins the Southampton Water some miles below Southampton. The Itchin is navigable up to Winchester, but the navigation does not coincide with the natural bed of the river.

The New Forest is situated in the south-west corner of the county. It is drained by two small streams, the Ex or Beaulieu River and the Boldre Water, besides some smaller streams. The basin of the Thames is separated from the rest of the county by the North Downs, and drained by the Wey, the source of which is in Hampshire, and by the Auborne and the Loddon, which have their course along the border. The basin of the Arun is separated from the rest of the county by the Alton and Petersfield hills and the South Downs. It is drained by the Rother, which rises in this county and flows past Midhurst into the Arun. The Wiltshire and Dorsetshire basin comprehends a narrow strip of the county to the west of the New Forest. It is drained by the Avon, which, entering the county just below Downton, Wilts, about 6 miles from Salisbury, runs south past Fordingbridge, Ringwood, and Christchurch, into the sea, about 22 miles. A small portion of the Dorsetshire Stour, and of the Great Leonards Water, a tributary of the Stour, is in the county or upon its boundary; the Stour joins the Avon below Christchurch; their estuary forms Christchurch haven.

The county has two principal canals. The Andover Canal commences at Andover, and is carried in a generally southern direction past Stockbridge and Romsey to Redbridge, 4 miles above Southampton, where it enters the Anton. Its whole length is 22½ miles. It has a branch to Salisbury. The Basingstoke Canal commences at Basingstoke, and is carried in a very winding course 22 miles east on one level to the Loddon, which it crosses into the county of Surrey, its further course through which to the navigable part of the river Wey (near its junction with the Thames) is 15 miles. Part of the canal from Arundel by Chichester to Portsmouth is in this county.

Three principal mail-roads cross the county, namely, the road from London to Portsmouth, that to Southampton and Poole, and the great western road through Salisbury. At Andover a road branches off

from the great western road to Amesbury, in Wiltshire. Besides these there are other roads of less importance, along the coast, from Winchester, &c., which communicate with different parts of the county.

The main line of the London and South-Western railway enters the county at Farnborough, and proceeds in a nearly western direction to Basingstoke, where it turns south and proceeds to Southampton, and thence south-west through the New Forest, and by Ringwood to Woolbridge (in all about 76 miles), where it quits the county. From Bishopstoke a branch line of 16 miles runs south-east to Gosport, and another in the opposite direction to Salisbury, which quits the county at West Dean, 15 miles. From Basingstoke a branch runs north to Reading, of which about 7 miles are in this county. At Emsworth the Portsmouth branch of the London, Brighton, and South-Coast railway enters the county, in which its course is about 9 miles. A short branch runs along the back of Portsmouth harbour, and connects the South-Western and South-Coast lines. The Reading, Guildford, and Reigate railway runs for a short distance along the north-eastern border of the county. A branch to Alton in this county, 13 miles long, leaves the main line at Ash station, and passes Farnham.

Geological Character.—That vast district of chalk which overspreads so large a portion of Wiltshire, and of which Salisbury Plain forms a part, extends into Hampshire and occupies a considerable part of it. It is bounded on the north by a line drawn from Inkpen Beacon, near Great Bedwyn, Wiltshire, by Kingsclere and Basingstoke to Odiham; on the east by a line drawn from Odiham by Alton, and along the Farnham road to the neighbourhood of Bishop's Waltham; and on the south by a line drawn from the neighbourhood of Bishop's Waltham and north of Bishopstoke into Wiltshire. The extent of this chalk district from north to south is about 22 miles; from east to west its Hampshire extent varies from 22 to 32 miles, but its whole extent through Hampshire and Wiltshire together is much greater. The breadth of the North Downs range is 2 or 3 miles, that of the South Downs about 4 miles. Portdown Hill is an outlying mass of chalk.

The country to the north of the great chalk district and of the North Downs belongs to the London basin; the country to the south of the great chalk district and of the South Downs belongs to the Isle of Wight basin; and these are almost entirely occupied by the strata above the chalk. The country to the east of the great chalk district and embraced between the North and South Downs, is occupied by the strata which underlie the chalk, and which extend into Surrey and Sussex, and form the district of the Weald of the south-east of England. In the London basin the Bagshot sand is found at Frimley Heath, on the border of Surrey, and is surrounded by a belt of the London clay; the rest of this basin in Hampshire is occupied by the plastic clay, except near Kingsclere, where, for a short distance, the chalk marl and greensand crop out from beneath the chalk. The greater part of the New Forest, the country around the Southampton Water, and the whole line of the coast eastward from the Avon, and including Portsea and Hayling Islands, are occupied by the London clay; the country west of the Avon and a belt varying from 3 to 7 miles south of the chalk, are occupied by the plastic clay. No minerals are procured from this county to any extent, except near Petersfield, where gray chalk is quarried.

Forests.—There are several forests in this county, namely, the New Forest in the south-west, Alice Holt and Woolmer Forest in the east, and the forest of Bere in the south-east. William the Conqueror or his immediate successors afforested the tract extending from Godshill, near Fordingbridge, to the sea, and from Ringwood to Hardley, near Southampton Water, and comprehending 92,365 acres. The forest comprehends nearly 64,000 acres, and is the property of the crown, subject to rights of common and other ancient claims. By the Act 14 & 15 Vict. cap. 76, passed August 7th 1851, the commissioners were empowered to remove the deer, and to inclose and plant 10,000 acres, in addition to 6000 acres previously inclosed. The chief value of the New Forest is for the raising of oak and beech timber for the use of the navy. A diminutive breed of horses, and a peculiar breed of swine, bearing considerable resemblance to the wild boar, are found in a half-wild state in the forest.

The forest of Bere extends northward from Portdown Hill, and its bounds comprehend about 16,000 acres, of which one-third is inclosed. Alice Holt and Woolmer Forest lies between the Portsmouth and Southampton roads. It contains altogether nearly 15,500 acres, more than half of which belongs to the crown. The growing timber in Alice Holt is of considerable value. In the marshy bottoms of Woolmer Forest many trees have been found and dug up with the peat, and many hundreds of Roman coins, several of them those of Marcus Aurelius and the empress Faustina, were dug up in the bed of Woolmer Pond, when dried up in 1741 by the heat.

Waltham Chase, a waste of 2000 acres, belonging to the bishop of Winchester, is on the north-west side of the forest of Bere, near Bishop's Waltham. It is connected in our criminal annals with the atrocities of the deer-stealers, called the 'Waltham Blacks;' and with the statute known as the 'Black Act,' passed for their suppression.

Climate, Soil, Agriculture.—The climate of Hampshire is generally mild and favourable to vegetation. The southern part of the Isle of Wight is considered to have the mildest climate in Great Britain, and is resorted to on that account by invalids during the winter. But a great part of Hampshire consists of poor sands and gravelly soils or

chalk hills, having between them low bottoms, with no ready outlet for the water, which has produced marshes and peat-bogs. In such places the nature of the soil has a great effect on the climate. The northern part of the county, where it borders on Berkshire and Surrey, consists chiefly of the poor dark sand, mixed with an ochery loam, which is well known as the Bagshot-heath soil. The whole of this part of the county is naturally very unproductive. Much of it however, which was covered with heath and lay in common, has been inclosed and divided. Some of it has been brought into cultivation at a great expense, and a considerable portion has been planted with fir-trees.

South of this district, as far as Winchester and a few miles beyond it, the chalk prevails. The soil which lies over this chalk varies in depth, and, where it is sufficiently deep, produces good crops of barley, wheat, and oats. Where the soil is thin and very near the chalk, it is scarcely fitted for the plough, but remains in the state of down; and the natural grasses which grow there, when kept closely cropped by sheep, are sweet, and make the best sheep pastures. In the valleys and along the lower slopes of the chalk-hills the soil is of a tough, tenacious nature, being a mixture of stiff clay and of chalk washed down the hills by the rains. On the eastern side of the county bordering on Surrey and Sussex, is a small tract of land, which is provincially called malmy land, forming the Vale of Petersfield. It has a gray, tender, sandy soil of some depth, lying on a soft sandstone, which is almost impervious to water.

In October 1853 the extent of arable land in the county was returned at 608,219 acres; of which 96,228 grew wheat; 62,881, barley; 57,075, oats; 1907, rye; 14,097, peas and beans; 2801, potatoes; 88,847, turnip or rape; 100,114, clover, lucerne, &c.; and 123,520 acres were meadow and pasture. The woods and plantations covered an extent of 105,839 acres. The wastes and commons amounted to 89,630 acres.

There are no breeds of cattle, horses, or sheep, peculiar to Hampshire, unless it be the small New Forest ponies. The sheep are—the common small forest breed, or heath-sheep; the Dorset and Leicester sheep, in the richer meadows; and the South Down, on the chalky hills. Hampshire has long been famous for the curing of bacon; yet the native breed of pigs in this county is by no means remarkable for its qualities. Improved breeds are produced by crosses of the Berkshire, the Suffolk, Essex, and Chinese pigs. The reputation of the Hampshire bacon is owing entirely to the care with which it is cured. In October 1853 there were in the county 24,076 horses, 19,350 milch cows, and 13,148 other cattle. The number of sheep and lambs was 489,227, and of swine 61,860.

Divisions, Towns, &c.—The most ancient division of the county is into hundreds, of which there were 50 at the time of the Domesday Survey. There are now 39 hundreds, besides the city of Winchester with the liberty of Soke, the borough of Portsmouth with the district of Portsea and Portsea Guildable, the town and county of Southampton, and 11 liberties, including the liberties of East and West Medina in the Isle of Wight. From the great number of the hundreds and liberties they have been arranged in 'divisions' for administrative purposes. These divisions with their situation in the county and inclosed subdivisions, are as follows:—

1. Alton, east, contains the hundreds of Alton, Bishop's Sutton, and Selborne, and the liberty of Alresford.
2. Andover Division, west, contains Andover, Barton Stacey, Pastrow (upper half), Thorngate (upper half), and Wherwell.
3. Basingstoke Division, north-east, contains Basingstoke, Bermondspit, Holdshott (lower half), and the town of Basingstoke.
4. Droxford Division, south-east, contains Bishop's Waltham, Hambledon, and Meonstoke.
5. Fareham Division, south, contains Bosmere, Fareham, Havant, Portsmouth, and Titchfield, and the liberty of Alverstoke and Gosport.
6. Kingsclere Division, north, contains Chuteley, Evingar, Kingsclere, Overton, and Pastrow (lower half).
7. Lynton Division, south-west, contains Christchurch (upper half), New Forest (upper half), and the borough of Lynton.
8. Odiham Division, north-east, contains Crondall, Holdshott (upper half), and Odiham hundreds, with the town of Odiham and liberty of Bentley.
9. Petersfield Division, east, contains East Meon and Finch Dean.
10. Ringwood Division, south-west, contains Christchurch (lower half), Fordingbridge and Ringwood hundreds, Breamore and Westover liberties, and the borough of Christchurch.
11. Romsey Division, west, contains King's Sombourn (lower half), Redbridge, Thorngate (lower half), and the town of Romsey.
12. Southampton Division, west, contains Mainsbridge hundred and the liberties of Beaulieu and Dibden.
13. Winchester Division, central, contains Bountisborough, Buddleigate, Fawley, Mitcheldever, and Mainsborough.
14. Isle of Wight Division, south, contains the liberties of East and West Medina and the town of Newport. Separate Jurisdictions: city of Winchester and liberty of Stoke; borough of Andover; borough of Portsmouth, with Portsea; town and county of Southampton.

Hampshire, not including the Isle of Wight, contains one city—WINCHESTER; 6 parliamentary boroughs—ANDOVER, CHRISTCHURCH, LYNTON, PETERSFIELD, PORTSMOUTH, and SOUTHAMPTON; and 13 other market-towns—ALRESFORD, ALTON, BASINGSTOKE, BISHOP'S WALTHAM, FAREHAM, FORDINGBRIDGE, GOSPORT, HAVANT, KINGSCLERE, ODHAM, ROMSEY, STOOKBRIDGE, and WHITCHURCH. These are described under their respective titles. The other towns are as under:—

Emsworth is situated at the head of Emsworth Channel, on the

border of the county, 26 miles S.E. from Winchester: population in 1851 of the parish of Warblington, 2302. Oyster-fishing is carried on; sail-cloth, sacking, rope, twine, and fishing-nets are manufactured. Coal is largely imported, and timber, flour, &c., are exported. There are in Emsworth a neat proprietary chapel; a district church, in the Norman style, erected in 1840; chapels for Independents and Baptists, and National schools. Fairs are held on Easter Monday and July 18th.

Overton, formerly a market-town, is situated on the right bank of the Anton, or Test River, about 2 miles from its source. Overton has an ancient church, which was repaired and enlarged in 1832; the church has a massive square tower: there are places of worship for Wesleyan Methodists and Independents, and a Free school. A fair on July 18th for sheep and lambs is well attended. There is a silk-throwing establishment.

Titchfield, situated in the valley of the river Aire, 18 miles S. by E. from Winchester, population of the parish 3956 in 1851, formerly had a market. In the church, the date of which is 1243, are some fine monuments, including one to Sir Thomas Wriothesley, chancellor to Henry VIII. In Titchfield are an Independent chapel and National schools. There are corn-mills and breweries; bricks and parohment are made. Fairs are held on May 14th and September 25th. The ruins of Titchfield House are near the town. An abbey was founded here in 1232: at the dissolution Chancellor Wriothesley obtained from Henry VIII. the abbey and lands, and erected a fine mansion.

The following are some of the more important villages, with the population of the several parishes in 1851, and a few other particulars:—

Anglesea. [GOSPORT.] *Appleshaw*, 18 miles N.W. from Winchester, population 318, is chiefly noticeable for its sheep and cattle fairs, which are important. *Barton Stacey*, 8½ miles N. by W. from Winchester, population 553, has a cruciform church, a good specimen of the early English style, with an elegant perpendicular tower. There are here also a chapel for Methodists, an Endowed Free school for 12 children, and a National school. *Beaulieu*, 22 miles S.S.W. from Winchester, population 1177, is situated on the left bank of the river Beaulieu. Beaulieu Abbey, founded in 1204 by King John, gave refuge to Margaret of Anjou, Henry VI.'s queen, after the battle of Barnet, and to Perkin Warbeck, in Henry VII.'s reign. Beaulieu church was formerly the refectory of the abbey; it contains a curious stone pulpit. The parish contains many old ruins and interesting buildings. Fairs for horses and cattle are held on April 15th and September 4th. *Bishopstoke*, 7 miles S. from Winchester, population 1249, on the river Itchin. The church is a handsome stone-building with a square tower. There are a Dissenting chapel and a school for boys and girls. From the station of the South-Western railway, which is close to the village, the lines to Salisbury and Gosport branch off. *Boldre*, 24 miles S.S.W. from Winchester, population 2374; the parish church, a stone building, was partly rebuilt in 1697. A school for 20 boys and 20 girls was founded, and endowed out of the profits of his writings, by the Rev. William Gilpin, vicar of Boldre, and author of various works on picturesque scenery and art. *Bolley*, 11 miles S. by E. from Winchester, population 798, on the left side of the river Hamble, has a small church, situated about a mile south from the village, and places of worship for Independents and Baptists. The river Hamble is navigable for boats, and has on its bank extensive flour-mills. The traffic in timber and flour gives employment to many of the inhabitants. Eight fairs for cheese and cattle are held in the course of the year. *Bournemouth*, a bathing village in Poole Bay, 38 miles S.W. from Winchester, population of the parish of Holdenhurst, in which it is situated, 1330, has a church of early English style, erected in 1844, a National school, a reading-room and library, baths, large hotels, and many elegant mansions. The place has much increased of late years. *Bramshot*, 26 miles E. by N. from Winchester, population 1325, has a small cruciform church, of early English style, with a low tower surmounted with a spire; a chapel for Wesleyan Methodists, and a National school. In the neighbourhood are paper manufactories and flour-mills. *Broughton*, 13 miles W. by N. from Winchester: population 1009 in 1841; in 1851 it was 1010. The church is an ancient edifice, with a wooden tower, and there are chapels for Baptists and Wesleyan Methodists, an Endowed school for 40 boys, and several minor charities. *Burghclere*, 17 miles N. from Winchester, population 809, has a Norman church, decayed, and a gothic church built in 1838; the new church consists of nave, transepts, and chancel, and has a square tower. It occupies an elevated site. There is a Free school. *Crondall*, 25 miles N.E. from Winchester, population of the tithing 475; of the entire parish 2431. The parish church is a commodious structure, partly Norman. There are two Endowed schools and a National school. Remains of an ancient encampment are at Tewkesbury Hill, in the vicinity. *Eling*, at the head of Southampton Water, 14 miles S.S.W. from Winchester: population of the parish, which includes a large portion of the New Forest, 5852. The parish church dates from the 11th century; it is built of stone and flint, and has a square tower; the church has been lately repaired. At Marchwood, in the parish, are large powder magazines belonging to government. In the parish are several National, British, Infant, and Charity schools. *Fawley*, 22 miles S. from Winchester, population 1801; the parish church is an ancient edifice of stone, with a square tower; the western door has a fine Norman arch. The Baptists and Wesleyan Methodists have chapels,

and there are National and Infant schools. *Froxfield*, 15 miles W. by S. from Winchester, population 729; the parish church, which has been recently repaired, is a neat edifice, with some Norman portions. There are National and Infant schools, and a Free school. Remains of Roman earthworks and traces of an ancient encampment are in the vicinity. *Hambledon*, 18 miles S.E. from Winchester, population 2052, has an early English church, with a square tower. There are Endowed and National schools. Several handsome family residences are in the neighbourhood. *South Hayling*, a bathing village at the south end of Hayling Island: population, 824. The church is a fine building with two aisles and a large chancel; the font is Norman. There are a chapel for Independents and a National school. At South Hayling are some remains of an ancient monastery, and near the village an encampment with a moat may be traced. *Highclere*, 20 miles N. by W. from Winchester, population 525, has a small church with a square tower. There are National schools for boys and girls. Highclere Castle, the seat of the Earl of Caernarvon, is a magnificent building, finely situated in an extensive and picturesque park. Parts of the edifice are of Norman date. The castle has been recently altered and repaired under the care of Mr. Barry. On the site of the ancient keep a high massive tower has been erected. *Hordle*, on the coast, 32 miles S.W. by S. from Winchester: population, 832. Many fossils and shells have been found in the high cliffs which here skirt the English Channel. From the cliffs may be obtained beautiful prospects of the country inland, of the Channel, and of the Isle of Wight. Hurst Castle, erected by Henry VIII. for the defence of this part of the coast, is now used as a coast-guard station. *Hythe*, 19 miles S. by W. from Winchester, population of the ecclesiastical district 680, is on the right side of Southampton Water, nearly opposite the town of Southampton, with which there is regular communication by passage-boats. The church was erected in 1823. There are an Independent chapel and a National school. *Lynnhurst*, 10 miles W. by S. from Southampton, population 1527, is the capital of the New Forest, and seat of the Verderer's courts. The Forest courts are held at the Queen's House, where a stirrup, said to have been used by William Rufus, is preserved. There are a small church, rebuilt in 1710 by George II., a Baptist chapel, and a National school. *East Meon*, *Meon Stoke*, and *West Meon*, are three villages about 2 miles from each other: West Meon being about 11 miles E.S.E. from Winchester, population 901; East Meon 1543; and Meon Stoke 431. The churches of East Meon and Meon Stoke are ancient structures; that of West Meon, rebuilt in 1843, is in the decorated style, with a western embattled tower. *Milford*, 33 miles S.S.W. from Winchester, population 1782, is pleasantly situated on the coast: the church, an ancient stone structure, has a square Norman tower, surmounted with a spire. There are a Baptist chapel, a National school, and a Girls' Charity school. *Millbrook*, 13 miles S. by W. from Winchester, population 6121, at the head of Southampton Water, has greatly increased owing to its vicinity to Southampton. It has very extensive iron-foundries, a steam-boiler factory, and an agricultural implement manufactory. *Mitcheldever*, 7 miles S. by E. from Winchester, population 1082; the church, rebuilt by Sir Francis Baring at a cost of 10,000*l.*, is octangular, and surmounted with an elegant dome; the embattled tower, of the perpendicular style, formed part of the former building, the greater part of which was burnt down in 1806. In the interior are some interesting monuments and tablets, chiefly to members of the Baring family, whose seat, Stratton Park, is in the vicinity. *Porchester*, 20 miles S.S.E. from Winchester: population, 729. The ruins of Porchester Castle are of considerable antiquity and picturesque appearance; the castle stands on the northern margin of Portsmouth harbour, and comprises an area of upwards of 400 feet square. Two Norman towers, at the eastern and western entrances, a keep, and some other towers, still remain. During the French war one of the towers was used as a prison. The church was erected in 1135. There are a chapel for Wesleyan Methodists and a National school. Porchester has numerous visitors during the summer season. *Selborne*, 19 miles E. by N. from Winchester, population 1114, has an ancient church in the early English style, an Independent chapel, and a Free school. A priory of Black Canons was founded at Selborne in 1233. The beautiful scenery of this locality has been rendered famous by the 'Natural History of Selborne' of the Rev. Gilbert White, who was a native of Selborne, and resided in it the greater part of his life. *Monk*, or *West Sherborne*, and *Sherborne St. John*, two adjoining villages, about 20 miles N.N.E. from Winchester: population of Monk Sherborne 581; of Sherborne St. John 796. The church of Monk Sherborne is Norman; the porch is of later date. Of the priory buildings of Monk Sherborne a tower still exists. The church of Sherborne St. John has a square tower surmounted with a copper spire. In this parish is a curious mansion called the Vine, which in the 16th century was reckoned one of the best residences in the county. An ancient domestic chapel connected with the mansion has on each side carved stalls, and in the east windows are some good specimens of stained glass. The park is well wooded. There is here a Free school. *Silchester*, on the border of the county, next to Berkshire, 25 miles N.N.E. from Winchester, population 456, is remarkable for the remains of the Roman station, noticed at the end of this article. Numerous coins and other Roman antiquities have been found here. The parish church is a neat Norman structure. There are National

schools. *Soberton*, 15 miles S.E. from Winchester, population 1147; the church is a small early English structure, with a square tower. There are here a Roman Catholic chapel and National schools. Several corn-mills are in the vicinity. *King's Sombourne*, 8½ miles W. by N. from Winchester, population 1242, has, besides the parish church, a Wesleyan Methodist and an Independent chapel, and National schools one of these, for boys, under the care of the Rev. R. Dawes, now Dean of Hereford, attained a considerable reputation. Mr. Dawes caused a convenient school-house to be built, appointed a master qualified to give instruction of a higher order than is usually afforded in such schools, a trifling payment was required, and Mr. Dawes exercised a vigilant superintendence. In a short time the school was attended not only by the children of the poor, but by those of the farmer tenants, and by children of tradesmen from the neighbourhood. Here stood formerly a palace of John of Gaunt, duke of Lancaster. *Strathfeldaye*, 25 miles N.E. by N. from Winchester: population, 864. The mansion and estate presented by Parliament to the late Duke of Wellington is at the eastern end of the parish. The spacious park in which the mansion is situated contains also the parish church and rectory-house. The river Loddon flows through the grounds, and forms several sheets of water before the house. The church is a neat modern structure, with an hexagonal tower. There are National schools and an Infant school. *Twyford*, 3 miles S. from Winchester, population 1272, situated on the left side of the river Itchin, has an ancient church with an embattled tower; a district church recently built on Colden Common; a Roman Catholic chapel at Branbridge, and National schools for boys and girls. *East Tytherly*, or *Tytherly*, 16 miles W. from Winchester, population 399, is chiefly noticeable as the seat of the attempt made to carry into practice at Harmony Hall the 'social' co-operative scheme of Robert Owen. The attempt, like his previous experiment at New Lanark, proved a signal failure. The buildings are now used for a school. There are here a church and an Endowed Free school. *Upham*, 8 miles S.S.E. from Winchester, population 550, has a church, a Methodist chapel, and a National school. Young, the author of the 'Night Thoughts,' was born here. *Nether Wallop*, 13 miles W. by N. from Winchester, population 952, has an old gothic church, with a square tower, chapels for Baptists and Methodists, and a National school. On the summit of Danebury Hill is a circular encampment, the area of which is about 12 acres. *Weyhill*, on the edge of Salisbury Plain, 16 miles S.S.W. from Winchester, population 419, is noticeable for its extensive fair held on October 10th and five following days: horses, sheep, cheese, hops, and leather are sold to a very large amount. It is said that 140,000 sheep are sometimes disposed of on the first day of the fair. *Wickham*, 15 miles S. by E. from Winchester, population 1049, has a neat gothic church, with a small square tower, and National schools. William of Wickham, or Wykeham, the celebrated Bishop of Winchester, was born in this place. *Wooton St. Lawrence*, 20 miles N.N.E. from Winchester, population 922, has a Norman church, with a square tower. There are here an Independent chapel and a Free school.

Divisions for Ecclesiastical and Legal Purposes.—Hampshire is included in the diocese of Winchester and the ecclesiastical province of Canterbury, and constitutes (inclusive of the Isle of Wight) the archdeaconry of Winchester. County courts are held at Alton, Andover, Basingstoke, Bishop's Waltham, Christchurch, Fording-bridge, Lymington, Newport (Isle of Wight), Petersfield, Portsmouth, Romsey, Southampton, and Winchester. By the Poor-Law Commissioners Hampshire is divided into 23 Unions, namely: Alresford, Alton, Andover, Basingstoke, Catherington, Christchurch, Droxford, Fareham, Fordingbridge, Hartley Wintney, Havant, Hursley, Kingsclere, Lymington (New Forest), Petersfield, Portsea Island, Ringwood, Romsey, South Stoneham, Southampton, Stockbridge, Whitchurch (Isle of Wight), and New Winchester. Alverstoke, Farnborough, and Headley are Gilbert incorporations. Southampton and the Isle of Wight are each under a local Act. The whole comprises 336 parishes and townships, with an area of 946,498 acres, and a population in 1851 of 399,874. Local Boards of Health have been established for Fareham parish, Havant Shirley district, the town and county of the town of Southampton, and West Cowes township. The northern and southern divisions of the county return each two members to the Imperial Parliament. The Isle of Wight returns one member. The boroughs of Andover, Lymington, Southampton, Winchester, and Portsmouth return each two members; Christchurch and Petersfield return one each. Newport (Isle of Wight) returns two members.

History, Antiquities, &c.—Before the Roman invasion this county was inhabited by three tribes—the Regni, who occupied the coast, as well as the counties of Sussex and Surrey; the Belgæ, who inhabited the middle portion, and extended into Wiltshire; and the Atrebatæ, or Atrebatii, who probably occupied the northern part on the confines of Berkshire. Winchester and Silchester appear to have been British towns antecedently to their being occupied as Roman stations. This part of the island was reduced by the Romans, probably under Vespasian, who is distinctly recorded by Suetonius (Vespas. c. iv.) as having subjugated the Isle of Wight, called by the Romans Vectis. It was comprehended in Britannia Prima, and was crossed by several Roman roads, and contained several Roman stations. The Roman station Clausentum, mentioned in the *Iter VII.* of Antoninus, is generally admitted to have been near Southampton. At Bittern Farm

abundance of Roman remains have been found, and modern antiquaries seem to agree in fixing the station at this spot, which is on the east side of the Itchin, by a bend in which it is nearly surrounded. There are here considerable remains of Roman military works. A quantity of Roman coins and of fine red pottery, a glass urn, and sculptured and other stones have been dug up. The area of the station is about half a mile in circumference: Southampton probably arose from its ruins. Another station mentioned by Antoninus is Venta (a Roman modification of the more ancient British name *Caer Gwent*, 'the white city'), distinguished from some other places of the same name as *Venta Belgarum*. It is the modern Winchester, the first part of which name is a corruption of the British *Gwent*, or the Roman *Venta*. This was an important station: the walls with which the Romans inclosed it yet form the chief part, though frequently repaired and much altered, of the town walls.

But the most remarkable remains of a Roman station are at Silchester, a village on the border of the county, 6 miles due north from Basingstoke. It was certainly a station of importance, though it is difficult to determine whether it was the *Calleva Atrebatum* or the *Vindomis* of the 'Itinerary.' The remains of this station are among the most entire in the kingdom. The walls form an irregular octagon, and are about a mile and a half in compass; they inclose a space of about 100 acres, divided into seven fields, together with the parish church and churchyard, a farm-house and its offices. The inclosure contains several springs, and slopes to the south: the foundations of the streets may yet be traced running across it in parallel lines, and in the centre is an open space supposed to have been the forum, where the foundations of a large building and other remains have been dug up. There are four gates, facing the four cardinal points: some other openings have been made since the ruin of the town. The walls, which are from 15 to 20 feet in height, are formed by layers of flat stones of variable dimensions, and of rubble-stone consolidated by cement: the whole is surrounded by a ditch. At a short distance north-east of the walls are the remains of an amphitheatre.

The remains of a Roman station, supposed to have been the *Brige* of Antoninus, were observed by Mr. Gale at Broughton, not far from Stockbridge. The walls of Porchester Castle contain some portions of Roman architecture, and are probably on the site of one of the stations denominated *Portus*, either *Portus Magnus*, or, more probably, *Portus Adurni*, mentioned in the 'Notitia Imperii.' Roman roads may be traced leading from *Venta* to *Sorbiodunum* (Old Sarum); to Silchester and to Porchester; and from Silchester in various directions.

This county was the scene of contest in the Saxon invasion. Hampshire was included in the kingdom of Wessex; and *Venta*, called by the Saxons *Wintancester*, became the seat of government. Here *Cerdic*, the founder of the kingdom of Wessex, was buried, and here, on the conversion of the West Saxons to Christianity, a bishop's see was established. In the contests of the Saxon princes the Isle of Wight was taken by *Wulfhere*, king of Mercia, and annexed by him to the kingdom of Sussex: it was however soon after reconquered by *Ceadwalla*, king of Wessex. Upon the predominance of the West Saxon kings over the other Saxon potentates being permanently established by *Egbert*, Winchester became the metropolis of England.

When the Northmen attacked the island, Hampshire was exposed to their ravages. In the reign of *Ethelbert*, grandson of *Egbert* (A.D. 860-66), a body of them advanced to Winchester, which they partially laid waste: they were routed however as they returned to their ships, and much of the booty recovered. At *Basing*, near *Basingstoke*, *Ethelred I.*, king of Wessex, and his brother *Alfred*, were defeated by the Danes, A.D. 870. A year or two after, in the reign of *Alfred*, the invaders made another attack on Winchester, damaged the cathedral, and murdered the ecclesiastics belonging to it. In the reign of *Ethelred II.* the Danes ravaged the Isle of Wight. In the civil dissensions of the reign of *Edward the Confessor*, the same island was infested by *Godwin*, earl of Kent, and his son *Harold*, then in rebellion; and in the subsequent reign of *Harold II.* it was laid under contribution by *Tostig*, the king's rebellious brother. Winchester continued to be the principal seat of royalty in the reign of *William the Conqueror*.

The New Forest became the scene of several disasters to the family of *William the Conqueror*, which were popularly regarded as judgments on him for his arbitrary conduct in the formation or extension of the forestal jurisdiction. His son *Richard* lost his life here by what *Camden* describes as a 'pestilential blast': his grandson *Henry*, son of *Robert*, was entangled among the branches and killed while hunting; and his successor *William Rufus* was shot by a random arrow by *Walter Tyrrel* in 1100.

In the civil war between the supporters of *King Stephen* (then a prisoner) and the *Empress Maud*, Winchester Cathedral and *Wolsey Castle*, the residence of *Henry of Blois*, bishop of Winchester and brother of *Stephen*, were in the hands of the king's party, and Winchester Castle and other parts of the city in the hands of the empress. The empress's friends were gradually dispossessed of all they held, except the castle; and, when this was hard pressed, it is said that the empress escaped by being carried through the opposing army, wrapped in a sheet of lead, like a corpse for interment. Her natural brother and chief supporter, the *Earl of Gloucester*, was taken soon after at

Stockbridge and exchanged for the captive king. At the commencement of the French war of *Edward III.*, in 1338, Southampton was attacked and taken by the French with their allies the *Genoese* and *Spaniards*. In 1415, when *Henry V.* was about to embark at Southampton for France, a conspiracy against his life was detected; for which the *Earl of Cambridge* and others were executed in that town. In the reign of the same monarch the Isle of Wight was once attacked and a second time threatened by the French. About the close of the reign of *Henry VIII.* another attack was made by the same people, but repulsed. *Mary I.* was married at Winchester to *Philip of Spain* in 1554.

Of these early times the county contains several relics. [BISHOP'S WALTHAM; CHRISTCHURCH; SOUTHAMPTON.] *Porchester Castle*, at the head of *Portsmouth* harbour, is of great antiquity and doubtful origin. It is probable that the site has been occupied by a fortress from a period anterior to the Roman conquest; and the present structure exhibits traces of Roman, Saxon, and Norman architecture. It is a quadrangle inclosing an area of 4 or 5 acres. The walls are from 8 to 12 feet thick and 18 feet high, having in many places a passage round them, defended by a parapet. It is inclosed by a ditch (double on the east side), and has 18 towers including those of the keep. The keep forms the north-west angle of the castle, and incloses a quadrangle of 115 feet by 65 feet. The parish church of *Porchester* is within the outer court of the castle; it is a large Norman cross church, of which the south transept has been destroyed. *Calshot* and *Hurst* castles, erected in the time of *Henry VIII.*, are now occupied as coast-guard stations. Both are on small headlands jutting into the sea; *Calshot* at the entrance of *Southampton Water*, and *Hurst* near *Lymington*. *Netley Castle*, near *Netley Abbey*, of about the same date, is now a ruin.

The chief monastic remains besides those mentioned elsewhere [CHRISTCHURCH; ROMSEY; WINCHESTER] are *Netley* and *Beaulieu* abbeys, and the *Priory of St. Dionysius*, near Southampton. *Netley Abbey* is a short distance from the bank of the *Southampton Water*, about 3 miles E. from Southampton. It appears to have been founded in the 13th century, and was of the *Cistercian* order. At the time of the dissolution its possessions were valued at 160*l.* 2*s.* 9*d.* gross, or 100*l.* 1*s.* 8*d.* clear yearly value. The ruins stand on the declivity of a hill rising gently from the water, and are so environed by wood as to be scarcely observable except on a near approach. The chapel was in the form of a cross; the southern transept and the choir are the most perfect portions of the remains. Many parts of the ruins are finely mantled with ivy. *Beaulieu Abbey* (also *Cistercian*) was founded in 1204 by *King John*: its yearly revenue at the dissolution was 428*l.* 6*s.* 8*d.* gross, or 326*l.* 13*s.* 2*d.* clear. The stone wall which surrounded the precincts of the abbey is in several places nearly entire, and is clothed with ivy. The remains include the abbot's apartments, converted after the dissolution into a family seat, having a well-proportioned vaulted hall; a long building, supposed from the extent and height of the apartments to have been the dormitory; the ancient kitchen, and the refectory. The refectory, a plain stone building, with strong buttresses and a curiously-raftered oak roof, forms the parish church of the village of *Beaulieu*. *St. Dionysius's* (commonly called *St. Denis's*) *Priory*, is on the bank of the *Itchin* above Southampton. It was founded by *Henry I.* for *Augustinian* or *Black Canons*. The ruins are of small extent, and appear to have formed the west end of the priory church.

In the beginning of the reign of *Charles I.* the *Duke of Buckingham* was stabbed at *Portsmouth*, and in the civil war of that reign this county was the scene of partial hostilities. The strong posts of the Isle of Wight were early in the contest secured for the Parliament, and the island was thus preserved from subsequent disturbance. But the most remarkable event in the contest that occurred in this county was the defence of *Basing House*, near *Basingstoke*, by its possessor, *John Paulet*, marquis of Winchester. The investment commenced in August 1643, and continued, probably at intervals, for two years. *Cromwell*, in October 1645 took the house by storm, and burned it to the ground. In 1647, *Charles I.*, after his escape from *Hampton Court*, remained concealed at *Titchfield House* till he gave himself up to *Colonel Hammond*, governor of the Isle of Wight. He was imprisoned for some time at *Carisbrook*, and afterwards at *Hurst Castle*.

Statistics.—According to the *Census Returns* of 1851, there were then in the county 818 places of worship, containing 214,674 sittings. Of these places of worship 389 belonged to the Church of England, 187 to five sections of Methodists, 116 to Independents, 69 to Baptists, 13 to Roman Catholics, 7 to Mormons, 6 to Quakers, 6 to Unitarians, and 25 to minor bodies. The number of Sunday schools was 576 with 44,328 scholars. Of these Sunday schools 322 belonged to the Church of England, 98 to Independents, 58 to Wesleyan Methodists, 45 to Baptists, 21 to Primitive Methodists, 20 to Bible Christians, and 12 to minor bodies. The number of day schools in the county was 1508 with 57,960 scholars; of these 487 were public schools with 39,906 scholars, and 1021 were private schools with 18,054 scholars. Of evening schools for adults there were 33 with 677 scholars. Of literary and scientific institutions the county possessed 30, with an aggregate membership of 4239. The libraries connected with these institutions contained in all 19,305 volumes.

In 1852 there were 13 savings banks in the county, at Alresford, Alton, Andover, Basingstoke, Fareham, Gosport, Havant, Lympington, Newport (Isle of Wight), Petersfield, Portsmouth, Southampton, and Winchester. The total amount owing to depositors on November 20th 1852 was 576,650*l.* *cs.* 5*d.*

HAMPSHIRE, NEW. [NEW HAMPSHIRE.]

HAMPSTEAD, Middlesex, a village in the parish of St. John, Hampstead, is situated on a considerable eminence, about 4 miles N.W. from London, in 51° 33' N. lat., 0° 10' W. long. The parish has been constituted a Union under the Poor-Law Board, and contains an area of 2252 acres, and a population in 1851 of 11,986. The living is a perpetual curacy in the archdeaconry of Middlesex and diocese of London. The salubrity of the air, and the extensive and pleasant prospects obtained from the heath, which is on the summit of the hill on which the village is built, have rendered Hampstead a favourite place of residence and of holiday resort. Many handsome villas have been erected in the vicinity, and on the line of the Hampstead road to London. The village is lighted with gas and paved. Hampstead church, erected in 1745, was enlarged in 1844. It is in the Italian style, and will accommodate 1600 persons. In the parish are two district churches, a proprietary chapel, places of worship for Baptists, Independents, English Presbyterians, Wesleyan Methodists, Unitarians, and Roman Catholics, and several National, Infant, Presbyterian, and Roman Catholic schools. The village contains a savings bank, a literary institution, a public library, and a dispensary. At Haverstock Hill in this parish, is the extensive new building for the Orphan Working School. (*Communication from Hampstead.*)

HAMPSTEAD, NORRIS. [BERKSHIRE.]

HAMPTON. [MIDDLESEX.]

HAMPTON, LITTLE. [SUSSEX.]

HANAU, the capital of the province of Hanau in the Electorate of Hesse-Cassel in Germany, is situated in an extensive plain on the river Kinzig, near its junction with the Main, 12 miles by railway E. from Frankfurt-am-Main, and 86 miles S.S.W. from Cassel, and has a population of about 16,000 including the suburbs. It consists of an old and a new town. In the former is the magnificent castle, the gymnasium, the theatre, the hospital, and the synagogue. The new town has straight broad streets, and in the middle of it a large market-place, forming an oblong parallelogram, with handsome fountains in the four corners, and the large town-hall at one end. The cathedral has a leaning tower, like that at Pisa. Hanau is the leading manufacturing town in Hesse-Cassel: its industrial products comprise silks, ribands, cottons, carpets, leather, gloves, hosiery, porcelain, jewellery, carriages, &c. There is also a considerable trade in wine, timber, and casks. In the vicinity are the electoral palace of Philipruhe and the baths of Wilhelmabad. On October 30, 1813, Napoleon I. in his retreat from Leipzig totally defeated at Hanau an army of Bavarians and Austrians, commanded by Prince Wrede.

HANDSWORTH. [STAFFORDSHIRE.]

HANLEY, Staffordshire, one of the pottery towns, is situated near the centre of the pottery district, in 53° 2' N. lat., 2° 9' W. long., distant about a mile N. from Stoke, and 149 miles N.W. from London. The township of Hanley is united with that of Shelton into one market-town, the largest in the district, of which the population in 1851 was 25,369. It stands on the south-western slope of a gently-rising eminence. The streets, which are of good width, have side pavements for foot passengers, and are lighted with gas. The town contains some elegant houses and spacious shops. The market-hall is a convenient building. The chapel at Hanley is a commodious brick building, with a tower 100 feet high. The Wesleyan and New Connexion Methodists, Independents, and Baptists have places of worship, and there are National and British schools, a government school of design, and a mechanics institute. The population are chiefly engaged in the earthenware manufacture. There is a large paper-mill. Wednesday and Saturday are the market-days.

HANOVER, THE KINGDOM OF, is situated between 51° 18' and 53° 52' N. lat., 6° 35' and 11° 41' E. long. It is bounded N.W. by the German Ocean; N. by the Elbe (which separates it from Holstein, Hamburg, and Mecklenburg); E. and S.E. by Prussia and Brunswick; S.W. by Hesse-Cassel, Lippe, and Prussia; and W. by Holland.

Area and Subdivisions.—The entire area of the kingdom of Hanover is about 14,830 square miles: the population in 1852 was 1,819,253. The following table shows the principal divisions (landdrosteien) of the kingdom, with the extent and population of each:—

Landdrosteien.	Capitals.	Area in Eng. Square Miles.	Population, Dec. 3, 1852.
Hanover	Hanover	2,330	349,958
Hildesheim	Hildesheim	1,722	367,883
Lüneburg	Lüneburg	4,340	338,764
Stade	Stade	2,624	279,834
Osnabrück	Osnabrück	2,414	261,965
Aurich	Emden	1,156	185,129
Clausthal	Clausthal	244	35,720
Total	14,830	1,819,253

Surface, Hydrography, Communications.—The southern principalities of Grubenhagen and Göttingen are mountainous: in the former are the **HARZ**, in the latter the Sollingerwald Mountains. The greatest elevation is the Königsberg in the Harz range, 3300 feet high. Lower ranges, uniting the Harz and Sollingerwald, traverse the greater part of Hildesheim and Calenberg; but from the cities of Hildesheim, Hanover, and Osnabrück, the whole country is one vast plain sloping gently to the sea-coast, with only occasional and not considerable elevations. The mountains abound in mineral wealth, and are covered with forests of red pine and fir, with some oaks and other timber. Between the mountains are the most fertile valleys, and where the country slopes from the mountains to the plain there is excellent arable land. Then follows a sandy tract, the Heath of Lüneburg, from 50 to 70 miles in breadth, which crosses the kingdom from east to west, and, where left to itself, is covered with heath, and in some places with fir. It is an elevated flat, broken only towards the north by sand-hills. In the lower tracts are great marshes, or peat moors, as the Bourtanger and the Saterland Moor on the Ems, and the Hoch Moor, which occupies the north-western angle of the kingdom. The low-country by the sea-coast is below the sea-level, and is protected by embankments and dykes similar to those of Holland. All this part of the country is alluvial, and numerous marine substances are found preserved in it.

The principal rivers are the **ELBE**, which receives the Jetze, Ilmenau, Este, and Oste; the **WESE**, the chief affluent of which in Hanover is the Leine; and the **EMS**, which receives in its course the Lütke; all these rivers empty themselves into the German Ocean. There are only two large lakes; the Steinhudermeer and the Dümmersee, which latter abounds in fish. In East Friesland is the subterraneous Lake Jordan, the surface of which is so thickly overgrown with vegetation that waggons can pass over it.

Hanover has several railways, all of which centre in the capital. The Hanover and Bremen line connecting those towns is 76 miles long. The Hanover and Hamburg railway, which runs to Harburg opposite Hamburg, is 106 miles long; and has a branch between Lehrte and Hildesheim 14 miles long, and a short branch to Harburg. The Hanover and Brunswick line has about 30 miles in Hanover. The Hanover and Minden line has about 35 miles in Hanover. Some other lines are in course of construction or projected.

Geology and Mineralogy.—The mountain regions belong mostly to the Silurian system: under this is granite, which in several places forms the surface rock. Flinty-slate and clay-slate, known as grauwacké, are the most prevalent strata. Above these are shales and limestone rocks; and in the hills between the Weser and the Leine carboniferous strata occur. The great sandy moors and plains are composed of the clays and sands of the Wealden formation, and abound in fossil animal and vegetable remains. Over these wide districts numerous granite boulders, many of very large size, are scattered.

The mineral riches of the kingdom are very important; mining forming a principal branch of the national industry. The more valuable metals are chiefly found in the Harz Mountains; the mines are worked by the government, and some in conjunction with the government of Brunswick. Gold is found, but in extremely small quantities. Lead, rich in silver, is worked largely in the neighbourhood of Clausthal and on the Brunswick border. Copper mines are worked in the same localities, and the ore is very productive. Zinc is also obtained. Iron-ore is widely diffused, and the ore is rich, but the works are much less productive than they might be rendered under a better system of working. Coal is found in several places between the Leine and the Weser. There are considerable salt mines.

Climate, Soil, Productions.—The climate is on the whole mild and temperate, differing of course according to the relative situation of mountain or plain, &c. The lower parts are moist, and fogs are frequent; but the winters are milder than in the interior. On the sea-coast violent hurricanes are not unfrequent during the winter. The prevailing winds are the north-west in winter, the east in spring, and the south-west in summer. The mean annual temperature of the kingdom is about 46° Fahr., at Lüneburg it is 48°, in the Harz district it is only 43°. The average annual fall of rain is about 23·5 inches.

On the whole, the soil is of inferior quality. The most fertile districts are the flat alluvial tracts at the mouths of the Elbe and Weser, and generally in those parts occupied by the Wealden clays. Next to these are the banks of the rivers and the narrow valleys and lower slopes of the mountain districts, especially where the limestone rocks prevail. Much of Arenburg is only fit for grazing. The broad belt of sandy heath is for the most part barren, but many hundred thousand acres of land susceptible of cultivation still lie waste; and a large part of the inferior soil is, owing to insufficiency of manure and the backward condition of agriculture generally, far from being rendered as productive as it might be. The excessive subdivision of the land, with the consequent smallness of the farms and inadequacy of capital, is said to be a principal cause of this inferiority in the state of agriculture. Still agriculture is the chief source of subsistence to the inhabitants, and more attention has been paid to its improvement by landowners and other influential persons within the last few years. Of the entire area of the country about two-fifths are returned as arable and meadow land; a somewhat larger amount is occupied

by waste land, lakes, and rivers; and the remainder, equal to 1,484,000 acres, is occupied by forests. The richest corn provinces are—Hildesheim, Göttingen, the south of Kalenberg, the lower part of Grubenhagen, the marsh lands on the Elbe, Jetze, Oste, Weser, Leine, and Aller, part of Osnabrück and East Friesland. Rye is generally grown for bread. Oats and barley are largely grown, and a good deal is exported to England. Potatoes are universally cultivated. Turnips are also generally grown. The country produces flax, tobacco, hops, fruit, pulse, &c.

In the marsh-land the breeding of cattle is more followed than agriculture. East Friesland has the finest breed of cattle: it possesses a very favourite breed of large-sized cows and oxen, has numerous sheep, and excellent horses, of which several thousand are annually exported to Italy and elsewhere. The total number of horses in Hanover is estimated at about 300,000; of cattle, 950,000; sheep, 1,650,000, producing annually some 3,225,000 lbs. of wool, of which two-thirds are exported. The immense heaths in the duchy of Lüneburg are partly used as sheep-walks, and when the heath is in blossom the keepers of bees go with their hives from the villages to the heath: the honey so obtained is valued at nearly 50,000*l.* per annum.

The Harz forests are chiefly of fir and pine; in Kalenberg, Bremen, and the Upper Weser they are chiefly of beech and oak. Large quantities of timber are annually exported.

Manufactures and Trade.—Manufactures are not carried on to any considerable extent. Thread and linen, hempen-cloth, bagging, &c., are manufactured, partly for exportation, at Osnabrück and some other places; and woollens and calicoes at Göttingen, Münden, and some other towns. There is no other manufacture of any consequence. The commerce of the kingdom, though considerable, is far from being what might be expected from its favourable situation and fine navigable rivers. It is chiefly confined to the exportation of the produce of the country and the importation of colonial articles, English manufactures, French silks, jewellery, and wines, fruits, &c. The principal commercial port is Emden; and Münden, at the junction of the Werra and the Fulda, has an active trade with the interior of Germany. There are four annual fairs at Hanover, and two at Osnabrück, to which goods are brought from the fairs of Brunswick, Leipzig, and Frankfurt.

Religion, Education.—The religion is the Protestant: of the inhabitants, 1,494,033 are Lutherans; 95,220, Calvinists; and 1071 of other sects, chiefly Mennonites and Moravians. There are 217,367 Roman Catholics, chiefly resident in Osnabrück and Hildesheim; and 11,562 Jews. There is a minister of religious worship and public instruction. The affairs of the Lutheran and Calvinistic (or Reformed) Churches are under separate consistories. The Roman Catholic Church is under two bishops. A good deal of attention is paid to education. A superior board in Hanover directs all matters relative to the schools. Hanover has a university at GÖTTINGEN; an academy for the equestrian order; several special academies or colleges, and central and normal schools; 17 gymnasias, attended by about 2250 pupils; 13 grammar schools, with 2000 scholars; and 3430 popular schools, attended by 215,000 scholars, in the towns and country, of which schools 3086 are Protestant and 344 Roman Catholic. There are besides numerous poorhouses, workhouses, and charitable institutions. Justice is administered by six district courts, one for each of the landdrosteien except Clausthal, and by the magistrates of the royal, manorial, and other minor courts.

Hanover is a limited monarchy, with two chambers. Besides the ministry there is a council of state. The revenue is chiefly derived from the royal demesnes and forests, the mines and salt-works, the tolls on the Elbe and Weser, the receipts on the railways, the post-office, direct (land, house, and income) taxes, indirect taxes, export, import, and transit duties, and state lotteries. The total estimated revenue for 1853-4 was 8,005,099 dollars (about 1,200,000*l.*); the total expenditure was estimated at 8,332,718 dollars (1,249,900*l.*); leaving a deficiency of 327,619 dollars (49,000*l.*). The national debt amounts to 36,522,887 dollars (5,473,000*l.*).

The military establishment is 18,500 infantry, 3720 cavalry, 1450 artillery, in all 23,670 regulars, besides the militia, or landwehr. All men able to bear arms, from the age of 17 to that of 50 without exception, are liable to serve in the landsturm, or local militia. There are 10 garrison towns. The manufactures connected with the army are—one of small-arms at Herzberg, one of gunpowder at Hersen, and a cannon-foundry in Hanover.

History.—In the remotest times of which we have any record the countries between the Elbe and the Weser were inhabited by small independent tribes of hunters and herdsmen. The Cherusci, celebrated for their victory over the Roman general Quintilius Varus, dwelt about the Harz and far into Westphalia; the Chauci were at the mouth of the Weser; the Longobardi, or Lombards, on both sides of the Elbe. When Charlemagne first introduced the Christian religion the country was in the power of the Saxons. Though subsequently, as the imperial power declined, many powerful lords, both spiritual and temporal, arose with almost despotic authority, yet the condition of the people improved; the mines of the Harz and the salt springs of Lüneburg were discovered, and a considerable traffic began, by which Bardowick and Ganderheim in particular profited. Otho the Great gave in 970 the investiture of the duchy of Saxony to Hermann Billung, a wealthy

lord in Lüneburg, in whose family it remained till the death of the last descendant, Magnus, in 1107. His successor, Henry the Black, duke of Bavaria, and brother of Guelf, or Welf, a prince of the north of Italy, marrying a princess of the house of Billing, obtained with her the duchy of Lüneburg, and afterwards acquired Brunswick, Göttingen, and other principalities.

The broils and troubles which continued for nearly a hundred years after the death of his son, Henry the Lion, rendered general the habit of living for security in fortified towns. Numerous little republics rose, several of which became considerable cities. The Hansatic League found great favour here, and of the 85 towns composing that celebrated confederation 13 were in the present kingdom of Hanover. We cannot trace the various partitions of territory which took place in consequence of the division of the Guelf family into different branches, all of which have however become extinct except those of Brunswick Wolfenbüttel and Brunswick Lüneburg, the latter of which succeeded to the throne of England on the death of Queen Anne in 1712. In consequence of this event the electors of Hanover continued to be kings of Great Britain till, on the death of William IV., the crown of Great Britain devolving on Queen Victoria, and the succession to the throne of Hanover being limited to the male line, the two countries were separated; and the Duke of Cumberland, eldest surviving brother of King William, ascended the throne of Hanover by the name of Ernest Augustus.

Hanover co-operated with Great Britain in the war of 1741, and in the Seven Years' War, which latter was peculiarly disastrous to it, as the country was through the whole time the arena of hostile armies, and suffered both from friends and foes. The tranquillity which Northern Germany enjoyed for nearly thirty years after the peace of Paris, 1763, and the vast increase of the commerce of England in North America, doubled the trade of Bremen, Hamburg, and Altona with the interior of Germany, which was still further augmented from 1792 to 1803 by the ruin of the commerce of France and Holland; and this trade being carried on from those sea-ports through Hanover, gave an extraordinary impulse to the prosperity of that kingdom.

From the spring of 1793 Hanover took part in the war with France, but in 1795 was included in the convention between France and Prussia for the neutrality of the north of Germany. Bonaparte took possession of Hanover in 1803, and treated it like a conquered country. In 1806 Prussia announced that Hanover had been ceded by France in exchange for Anspach, Cleves, and Neufchâtel, and was for ever incorporated with Prussia. Bonaparte however again took possession of it in the following year, and retained it till after the battle of Leipzig in 1813, when the whole electorate was restored to the lawful sovereign, who assumed in 1815 the title of King of Hanover, that of elector having ceased by the dissolution of the German empire. In 1819 a constitution was introduced with a general assembly of the estates of the kingdom in one chamber; and in 1833 a new constitution was agreed to by the estates, and sanctioned by King William IV., who however made various changes in fourteen of the articles. This constitution was abrogated by a proclamation of his successor Ernest on his accession to the throne, a proceeding which led to very serious disturbances. The present constitution is virtually the same as that of 1819.

HANOVER, a landdrostei, or province, in the kingdom of Hanover, in Germany, comprises the former principality of Kalenberg or Calenberg, and the counties of Hoya and Diepholz. It is bounded N. by the territories of Bremen and the province of Stade, from which it is separated by the Weser and the Aller; E. by the provinces of Lüneburg and Hildesheim; S. by Brunswick, Lippe, and Prussian Westphalia; and W. by Westphalia, the Hanoverian province of Osnabrück, and the grand duchy of Oldenburg. The area of the province is 2930 square miles, and the population, according to the census of December 3, 1852, amounted to 349,958.

The principality of *Kalenberg*, which forms the southern portion of the province, comprises the basin of the Lower Leine, which river drains its central and eastern part; and a part of the basin of the Weser, which crosses the south-west of the principality and again touches its north-western border. The southern part of the principality is traversed by numerous offsets from the Harz Mountains, the highest ridges being the Deister Hills to the south-west of the city of Hanover, and the Süntel Hills farther west, near a detached territory of Hesse-Cassel. The plain between these two ranges is celebrated for one of the exploits of the Saxon hero, Wittekind, who here surprised and annihilated one of Charlemagne's armies in A.D. 782. A large sepulchral mound and remains of the Saxon entrenchments still mark the scene of the engagement. The northern districts are level, in parts marshy, but in general well adapted for agriculture, with the exception of Gess Moor, a large region of bog which extends to the north of the town of Hanover, between the Fuhse, the Leine, and the Aller. Another moor lies westward of this, between the Leine and the Weser. Wheat, rye, barley, oats, flax, potatoes, and colza are the principal crops. Some beet-root for making sugar, tobacco, and hemp are also grown. There is a good breadth of meadow and pasture land, and a considerable number of horned cattle and sheep are reared. Timber is abundant in the mountainous districts in the south-west of the province. Great quantities of turf are cut in the bogs for fuel. The principality takes its name from the village of

Kalenberg, on the left bank of the Leine, 12 miles S. from Hanover. On the right bank of the river are the ruins of an old castle, once the residence of the princes of Kalenberg. HANOVER is the chief town of the province and of the kingdom. *Hamelu*, a town on the left bank of the Weser, in the south-west of the province, 25 miles from Hanover, has about 7000 inhabitants. It is situated in 52° 5' 29" N. lat., 9° 20' 18" E. long., and is an important position, as it commands the navigation of the Weser. It is surrounded by a wall, and was formerly defended also by a citadel called Fort George, on the left bank of the river, but this the French blew up in 1806. The town though small has some large public buildings, including two Lutheran churches, a Calvinist meeting-house, and a monastery. Its position on a navigable river and on one of the high roads leading from Hanover to the Rhine, make it a place of some commercial activity. The inhabitants find occupation in the river trade, in the salmon fishery of the Weser, and in the tan-yards, breweries, distilleries, and pipe and tobacco factories of the town. A good river harbour was formed here in 1734 by the construction of a large sluice.

About 12 miles higher up the Weser, and inclosed by Brunswick, is the isolated district of *Bodenwerder*, belonging to the province of Hanover. The little walled town of Bodenwerder is built on an island in the Weser, and has about 1500 inhabitants. A little higher up the Weser, on its left bank, and touching Westphalia, is another outlying district of the province named *Polle*, with a small town of the same name and of about 1000 inhabitants.

The county of *Hoya* lies west of the principality of Kalenberg, and comprises the most north-western part of the province between the Weser, Oldenburg, and the republic of Bremen. The river Hunte separates it for a few miles from Oldenburg. The other rivers are the Aue, which runs east across the southern portion of the county, and joins the Weser on the left bank a little above Niemburg; and the Dehme, another feeder of the Weser, which drains the north-west district. The surface of the county is almost a dead flat, consisting for the most part of marshy and sandy wastes. The best land is along the rivers, where the soil consists of a rich fertile loam. The farm products are similar to those mentioned above. Horned cattle, light horses, pigs, and sheep are reared. Honey is abundant, especially in the moors, where the heath is said to be very attractive to the bees. There is a considerable portion of forest land, from which and the peat bogs the inhabitants obtain fuel. Linen and linen-yarn are the only industrial products properly so called. The county is named from the old castle and town of *Hoya*, situated on the left bank of the Weser, 40 miles N.W. from Hanover. Hoya is a market-town with about 2000 inhabitants, and some trade on the Weser, which is here crossed by a bridge. The capital of the county is *Nienburg*, situated 35 miles by railway N.W. from Hanover, on the right bank of the Weser, which is here crossed by a stone bridge. It was formerly fortified, but its defences have been dismantled. There are two churches, an hospital, and about 5000 inhabitants, who manufacture vinegar and linen, and trade in wood and coal.

The county of *Diepholz* is a small territory lying south-west of the county of Hoya, and like it presents a heathy marshy surface, interspersed with some fertile spots on which hemp and flax are grown, and diversified in the west and south by a few undulations. It is drained by the Hunte, which forms the outlet of the Dummersee, the largest lake in the whole province, situated close to the Oldenburg frontier. Near the lake there is good pasture land. Many of the marshes in this part of the province have been drained by canals after the Dutch fashion, and converted into arable land. The chief town of the county, *Diepholz*, stands on the right bank of the Hunte, 35 miles W. from Nienburg, and has about 2500 inhabitants.

The province is traversed by various railroads leading from the city of Hanover to Brunswick, Harburg, Bremen, Minden, Hildesheim, and Gottingen. [HANOVER, Kingdom of.]

HANOVER, the capital of the kingdom of Hanover, is situated in 52° 22' N. lat., 9° 42' E. long., in an agreeable, well-cultivated plain, on the river Leine, which is navigable from the city to its junction with the Weser; it contains with the suburbs about 40,000 inhabitants.

The city consists of three parts—the Old Town, the Egidian New Town, and the New Town on the left bank of the river. In the Old Town the streets are for the most part crooked and narrow, and the houses old-fashioned and irregular, but the two other parts are handsome and regularly built, the city having been much improved since it has become the permanent residence of the king. Outside of the walls are two suburbs, the Linden and the Gartengemeinde. The most interesting public buildings are the royal palace, with the opera-house and palace church, the viceroy's palace, the landstände-haus (meeting-house of the chambers), the mint, the arsenal, the royal mews, the town-hall (a fine old gothic edifice, with a good library of 40,000 volumes), and the royal library with the archives. Hanover has also Lutheran, German, and French Calvinist, and Roman Catholic churches, and a synagogue. Among the charitable institutions are the Orphan Asylum, infirmaries, hospitals, and poor-houses. For the purposes of education there are the Georgianum (a collegiate establishment for the sons of nobles), a lyceum, an industrial school, many elementary schools, and a seminary for schoolmasters; also scientific, artistic, and other societies. The manufactures are nume-

rous, but not of much consequence; the trade is extensive. The commercial institutions are an exchange, a chamber of commerce, and a market for mining produce. In the neighbourhood are the royal country palace of Montbrillant and the royal palace of Herrenhausen, the grounds of both of which are very famous.

Hanover was founded at the latter end of the 11th century, and in 1203 was assigned to the eldest son of Henry the Lion. In 1641 Duke Christian Louis took up his abode in the palace which had been lately erected, and it has ever since been the residence of the prince, and the capital of the country. In 1725 the alliance between England, France, and Prussia was concluded here: and in 1745 the convention which preceded the peace of Dresden. The walls, with five gates, and broad ditches, were partly levelled in 1780, and laid out in streets, and the remainder converted into a handsome esplanade, on which are the marble bust of Leibnitz, placed under a cupola in the antique style, and the Waterloo Column, 162 feet high, with the figure of Victory on the summit.

HANWELL. [MIDDLESEX.]

HARAMAT MOUNTAINS. [ABYSSINIA.]

HARBOROUGH, MARKET. [MARKET HARBOROUGH.]

HARBOUR ISLAND. [BAHAMAS.]

HARBURG, a sea-port town in the kingdom of Hanover, province of Lüneburg, is situated on the left bank of the southern arm of the Elbe, opposite Hamburg, 106 miles by railway N. from the city of Hanover, and has about 8000 inhabitants. It is surrounded by walls and defended by a citadel, which also commands the passage of the Elbe. There are two churches, an hospital, a gunpowder factory, sugar refineries, tanyards; manufactories of woollen stuffs, linen, and hosiery; and an active transit trade with Hamburg and the countries south of the Elbe. The timber trade of Harburg also is extensive. A steam ferry affords frequent and rapid communication with Hamburg. As sea-going vessels could not formerly be brought alongside the quays, goods were usually trans-shipped at Hamburg or Altona and brought thence to Harburg in lighters; but simultaneously with the construction of the railway from Hanover to Harburg (which, it may be added, connects the port with all the principal commercial towns of Germany) the harbour was deepened and enlarged so as to afford accommodation for 500 vessels, which may now land their cargoes on the wharfs. The depth of the channel between Harburg and Altona is 10 feet at low and 15 feet at high water. The port extends to the railway goods-station, and merchandise is lifted by a crane out of the hold of vessels and placed on the train. The improvement of the harbour, the completion of the railway, and the declaration of the freedom of the harbour in 1850 gave a great impetus to the commerce of Harburg, which still continues to improve, although the freedom of the port was suppressed in 1853 by the commercial treaty with Austria and Prussia. The distance to Hamburg across the Elbe is four miles and a half.

HARDINGSTONE, Northamptonshire, a village and the seat of a Poor-Law Union, in the parish of Hardingstone, is situated in 52° 13' N. lat., 0° 52' W. long., distant 2 miles S. by E. from Northampton, and 62 miles N.W. from London. The population of the parish in 1851 was 1196. The living of Hardingstone is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. Hardingstone Poor-Law Union contains 19 parishes and one hamlet with an area of 32,560 acres, and a population in 1851 of 9,156. Besides the parish church, which is partly of early English style, there are a National school for boys and an Infant school. In the parish, on an eminence near the road from London to Northampton, is one of the crosses erected in memory of Queen Eleanor by Edward I. It is octangular and richly ornamented.

HARRINGTON. [CUMBERLAND.]

HARROGATE, HARROWGATE, or HIGH HARROGATE, West Riding of Yorkshire, a small town and watering place in the parish of Knaresborough, is situated in 54° N. lat., 1° 31' W. long., distant 20 miles W. by N. from York, 203 miles N.N.W. from London by road, 196 miles by the Great Northern line of railway, and 222 miles by the London and North-Western line. The population of the town of Harrogate was 3678 in 1851. The living is a perpetual curacy in the archdeaconry of Richmond and diocese of Ripon. The local government is in the hands of 21 commissioners.

Harrogate rose into notice in the early part of the last century, in consequence of the reputed efficacy of its medicinal springs. It is now one of the principal watering places in the north of England. Harrogate is usually thronged with visitors during the season, which commences in May and continues till September. The town is lighted with gas. The church at High Harrogate, a neat early English structure, was consecrated about 20 years back. The Independents, Wesleyan Methodists, and Wesleyan Reformers have places of worship: there are in Harrogate British and National schools, and an Infant school; and at Bachelors Gardens, about a mile and a half

distant, is a small Endowed school. A mechanics institute is in the town. The Bath Hospital will accommodate about 100 patients. This institution is for the benefit of poor invalids. The mineral springs are of different qualities, sulphureous, chalybeate, and saline aperient. The principal sulphur well is in Low Harrogate, about half a mile from High Harrogate.

HARROLD, Bedfordshire, a market-town in the parish of Harrold, is situated near the Northamptonshire border on the banks of the river Ouse, in 52° 13' N. lat., 0° 36' W. long., distant 9 miles N.W. from Bedford, and 59 miles N.N.W. from London by road. The population of the parish of Harrold in 1851 was 1083. The living is a vicarage in the archdeaconry of Bedford and diocese of Ely. The parish church, which has been recently repaired, has a handsome spire. There are a chapel for Independents, a National school, and almshouses for six widows. The market-house is a neat building. Lace is manufactured to a small extent: malting, brewing, brick-making, and glove-making are carried on. Tuesday is the market-day: fairs are held on the second Tuesday of May and October 11th.

HARROW. [MIDDLESEX.]

HARTFORD. [CONNECTICUT.]

HARTINGTON. [DERBYSHIRE.]

HARTISMERE, a hundred in the county of Suffolk which has been constituted a Poor-Law Union. Hartismere hundred is bounded N. by Norfolk, S. by the hundred of Stow, E. by the hundred of Hoxne, and W. by the hundred of Blackbourn. The hundred contains an area of 49,895 acres, and a population in 1851 of 16,441. Hartismere Poor-Law Union contains 32 parishes and townships, with an area of 53,530 acres, and a population in 1851 of 18,850.

HARTLAND. [DEVONSHIRE.]

HARTLEPOOL, Durham, a sea-port and market-town in the parish of Hartlepool, is situated in 54° 41' N. lat., 1° 11' W. long., distant 20 miles E.S.E. from Durham, 253 miles N. by W. from London by road, and 264 miles by the Great Northern, and York Newcastle and Berwick railways. The population of the borough and parish in 1851 was 9503. The living is a perpetual curacy in the archdeaconry and diocese of Durham. The town is governed under a charter of Queen Elizabeth by a mayor, recorder, and 12 capital burgesses. For sanitary purposes it is under the management of a Local Board of Health.

Hartlepool is built on a small peninsula jutting out into the sea a few miles from the mouth of the river Tees: the peninsula is partly formed by a pool called the Slake, which is dry at low water, into which flows a small beck. A monastery at this place is mentioned by Bede. The Normans called the place Hart-le-pool, the pool or slake of Hart, whence the modern name. King John erected it into a borough by charter in 1200, and granted to Robert Bruce, who was its superior, a weekly market and a yearly fair. In the 13th century the walls were erected, and a haven of nearly 12 acres formed. Of the walls some portions still remain. The old haven is disused. The present harbour is formed by a pier run out on the south side of the town: it is easily accessible, and affords a safe retreat in rough weather. Laden vessels under 100 tons can be accommodated in the harbour. A lighthouse stands on Garrison point, and life-boats are maintained by subscription.

The town consists of one principal and several smaller streets. The town-hall was erected about a century ago. Extensive docks have been recently constructed, and in connection with railways which enter the town afford great facilities for the trade of the district, particularly in the shipment of coal. The West Harbour Dock, about half a mile westward from the town, is extensive, affording accommodation for a large number of vessels. There is an extensive take of fresh fish at Hartlepool. Turbot is sent to the London markets. Many tons of fish are salted for exportation. Saturday is the market-day. Fairs are held on May 14th, August 21st, October 9th, and November 27th. Hartlepool is visited in summer by numerous families for bathing.

The parish church, dedicated to St. Hilda, is chiefly in the early English style. It occupies an elevated site at the south-east end of the town; the south door has some late Norman enrichments. At the west end is a tower with an embattled parapet and crocketed pinnacles; it is supported by very large and bold flying buttresses. The Baptists, Independents, United Presbyterians, Wesleyan and Primitive Methodists, and Roman Catholics have places of worship. A Seamen's Bethel is maintained in Victoria Dock. There are two Free schools, National schools, a Roman Catholic school, a mechanics institute, a news-room, and a savings bank. A county court is held in the town. On the town moor are the remains of a breast-work, and along the shore the remains of some batteries.

The number and tonnage of vessels registered as belonging to the port of Hartlepool on December 31st, 1853, were:—Under 50 tons 3, tonnage 17; above 50 tons 124, tonnage 26,777; steam-vessels 6, tonnage 124. The vessels which entered and cleared at the port during 1853 were:—Coasting trade, inwards, sailing-vessels 327, tonnage 25,407; steam-vessels 16, tonnage 605; outwards, sailing-vessels 6584, tonnage 854,174; steam-vessels 30, tonnage 7533. Colonial and foreign trade, inwards, sailing-vessels, British 409, tonnage 75,868; foreign 652, tonnage 98,858; outwards, British 639, tonnage 124,368; foreign 1624, tonnage 214,344. Foreign trade, steam-vessels, British,

GEOG. DIV. VOL. III.

inwards 17, tonnage 3802; outwards 21, tonnage 4988. The amount of customs duties received at the port in 1851 was 6690*l.* 2*s.* 2*d.*

When Bruce declared his pretensions to the Scottish crown his English possessions were forfeited, and the borough of Hartlepool was granted to the Clifford family, by which it was long held. It was plundered by the Scots in 1312, and again taken by them in 1315, a year after the battle of Bannockburn. Hartlepool furnished five ships and 145 seamen to the fleet of Edward III. before Calais. In the northern rebellion under the Earls of Northumberland and Westmoreland, in the time of Elizabeth, Hartlepool was taken by the rebels. The Scottish army, which came to the aid of the Parliamentarians in the civil war of Charles I., took Hartlepool in 1644: it was retained by them till 1647, when they evacuated it, and it was occupied by a garrison of Parliamentarians.

HARTLEY. [NORTHUMBERLAND.]

HARTLEY-WINTNEY, Hampshire, a village and the seat of a Poor-Law Union in the parish of Hartley-Wintney, is situated in the north-eastern corner of the county, in 51° 18' N. lat., 0° 53' W. long., distant 26 miles N.E. from Winchester, and 38 miles S.W. by W. from London by road. The population of the parish of Hartley-Wintney in 1851 was 1582. The living is a vicarage in the archdeaconry and diocese of Winchester. Hartley-Wintney Poor-Law Union contains 13 parishes and townships, with an area of 37,168 acres, and a population in 1851 of 11,230. Coach-building and tanning are carried on. Fairs are held on Shrove-Tuesday and June 29th.

HARWICH, Essex, a seaport, market-town, and municipal and parliamentary borough, in the parish of Dovercourt, is situated on the extremity of a spit of land that projects into the estuary formed by the Stour and the Orwell, in 51° 57' N. lat., 1° 17' E. long.; 15 miles N.E. by E. from Colchester, and 66 miles N.E. from London: the population of the borough was 4451 in 1851. The parliamentary borough, which was created in 1318 by Edward II., returns two members to the Imperial Parliament; a privilege which it has more than once forfeited. The municipal borough is governed by 4 aldermen and 12 town councillors, one of whom is mayor.

The town stands on an elevated site in a pleasant and healthy situation. It chiefly consists of three principal streets, which are well paved and lighted with gas. The church of St. Nicholas, a large brick structure in the perpendicular style, with stone buttresses and steeple, was erected in 1821. The parish church of Dovercourt, which is in the decorated style, is situated two miles from Harwich on the Colchester road. There are chapels for Independents, Wesleyan Methodists, and Baptists. An esplanade, from which fine views of the harbour and the German Ocean are obtained, extends above a quarter of a mile southward from the town to Beacon Hill. A little east of the esplanade is a martello tower, and between this and the town on the north are two lighthouses to guide vessels into the harbour. Roman cement is manufactured in large quantities at Harwich from a particular kind of stone which is found imbedded in the London clay, and is dredged at the entrance of the harbour. There is a manufactory of fossil manure called coprolite. Ship-building and the fisheries give employment to many hands. There is a well-supplied royal dockyard at Harwich, and the property under the Ordnance department is extensive. Steamers ply to London during the summer. There is also daily communication by steam-vessel with Ipswich. A branch railway to Harwich from the Manningtree station of the Eastern Counties line is nearly completed. In the town are National schools for boys and girls; a Corporation Free school for 32 boys; a savings bank; baths; a royal yacht club and reading-rooms; and a custom-house. Fairs are held on May 1st and October 18th; weekly markets on Tuesday and Friday.

The harbour, which is formed by the junction of the Stour and the Orwell, is protected on the east by Landguard Point, a promontory from the Suffolk coast, and on the south by the Beacon Cliff. Between these two points lie the entrances to the harbour, which are commanded by Landguard Fort, erected in the reign of James I. The continued removals of the cement stone from the London clay, of which the Beacon Cliff is composed, have caused successive falls in the cliff to such an extent that since the beginning of the 18th century the low water-mark has gained full 600 feet on the Essex shore, and the harbour has been almost totally deprived of the shelter of the natural breakwater formed by the cliff. Landguard Point, against which the barrier formed by the Beacon Cliff tended to shoot the ebb tide, has by the deposit of shingle and beach advanced full 800 feet south of its former termination, and the main channel, which lies close under the Suffolk shore, was thus reduced to very narrow dimensions. In accordance with the Report of a Commission appointed in 1844, Harwich has been made a harbour of refuge. The works have cost upwards of 100,000*l.* The commissioners state that "Harwich harbour is remarkably well situated for the convenience of a north sea squadron, and for the protection of the mouth of the Thames. It is the only safe harbour along this coast, and is in the direct line of traffic between the Thames and the northern ports of the kingdom as well as of the trade from the north of Europe."

The number and tonnage of vessels registered as belonging to the port of Harwich on December 31st, 1853, were as follows:—Under 50 tons 72, tonnage 2170; above 50 tons 54, tonnage 5171. The number and tonnage of vessels entered and cleared at the port during

1853 were:—Coastwise, inwards, 584, tonnage 41,988; outwards, 424, tonnage 19,000: colonial and foreign trade, inwards, 80 vessels, 6185 tons; outwards, 178 vessels, 10,644 tons.

HARZ MOUNTAINS, the most northern mountain range in Germany, occupies an area of above 1000 square miles, between 51° 30' and 52° N. lat., 10° and 11° 30' E. long. It lies nearly parallel to the Frankenwald and Thüringerwald, and about 60 miles from it, and runs east-south-east and west-north-west. Its length is about 55 miles, its mean width about 19 miles.

On the north and south the Harz Mountains rise with a rather steep ascent; on the east they sink into an elevated plain, and on the west pass gradually into the hilly tract which joins it in that direction. A line drawn from Ilsenburg over the Brocken, the Achtermannshöhe, and the Bruchberg, divides the whole range into two parts, of which the eastern and lower is called the Lower Harz, and the western and higher the Upper Harz. The same line separates the waters which run to the Elbe and Weser respectively. No continuous ridge is observable. The range consists of an assemblage of irregular mountain summits, with generally level tops, and nearly all covered with earth and with trees. A few of the summits, which consist of granite and hornblende, are bare, and rise higher and with a steep ascent. The highest summits are—the Brocken, 3740 feet, the Königsherg, 3420 feet, the Bruchberg, 3420 feet, the Achtermannshöhe, 2880 feet, and the Warmberg, 3080 feet above the sea-level. The valleys, some of which are wide, and others very narrow, lie in every direction. The forests are mostly composed of pine, except to the east, where the mountains are lower, and covered with elms, ash, oak, and beech. The higher parts are covered with snow from October to May.

The nucleus of the Harz is granite, which however is generally covered with porphyry and silurian rocks as grauwacké, clay-slate, limestone, gypsum, and sandstone. In the western districts are rich lead-mines, which produce a considerable quantity of silver, and some copper mines: in the eastern districts iron-ore is abundant. There are some remarkable caverns in the range, as the Baumanns-Höhle near Elbingerode, a series of six chambers 800 feet long, the entrance to which is 136 feet above the bed of the little river Bode, which runs at the foot of the mountain: this cavern is much visited on account of the fine stalactites it contains.

The connection between the Harz Mountains and the Thüringerwald is formed at the western extremity of both ranges by an elevated table-land lying south of the Harz, called the Eichsfeld, whose surface is perhaps 1500 feet above the sea-level. The western extremity of the Harz Mountains is connected with a hilly country, which extends beyond the Weser to the Egge range, east of Paderborn. The hills which occupy this district rarely rise to the elevation of mountains, except in the Solling, where the Moosberg attains 1680 feet.

HASLEMERE. [SURREY.]

HASLINGDEN, Lancashire, a market-town, and the seat of a Poor-Law Union, in the parish of Whalley, is situated in 53° 43' N. lat., 2° 20' W. long., distant 36 miles S.E. from Lancaster, 204 miles N.W. by N. from London by road, and 206 miles by the North-Western and East-Lancashire railways. The population of the town of Haslingden in 1851 was 6154. The living is a perpetual curacy in the archdeaconry and diocese of Manchester. Haslingden Poor-Law Union contains 10 townships, with an area of 26,711 acres, and a population in 1851 of 50,424.

Haslingden is situated on an eminence; the newer part of the town being built about the base of the hill. The town is lighted with gas. The town-hall is a new building. The parochial chapel, a large and handsome edifice, was rebuilt, except the tower, near the close of last century. The font is about 300 years old. There are places of worship for Baptists, Independents, Wesleyan and Primitive Methodists, Quakers, and Mormons; National schools, a school supported by Wesleyan Methodists, and a mechanics institute with a library. Petty sessions and a county court are held in the town. The woollen, cotton, and silk manufactures are extensively carried on. Flannel is largely manufactured. Several coal mines and stone quarries are in the vicinity. Wednesday and Saturday are the market-days. Two great fairs are held on May 8th and October 3rd.

(Communication from Haslingden.)

HASSELLT. [LIMBURG.]

HASTINGS, Sussex, a market-town, municipal and parliamentary borough, cinque port, and the seat of a Poor-Law Union, is situated in 50° 51' N. lat., 0° 35' E. long., distant 70 miles E. by N. from Chichester, 64 miles S.E. by S. from London by road, 76 miles by the London and South-Coast railway, and 74 miles by the Tunbridge Wells and Hastings branch of the South-Eastern railway. The population of the municipal borough of Hastings in 1851 was 16,966; that of the parliamentary borough was 17,011. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. For sanitary purposes the borough is under the management of a Local Board of Health. The livings are in the archdeaconry of Lewes and diocese of Chichester. Hastings Poor-Law Union contains 13 parishes, with an area of 12,645 acres, and a population in 1851 of 21,215.

Hastings is a town of considerable antiquity. Mr. Dallaway, in his 'History of Western Sussex,' says that "In 893 the Danes in 250

ships, commanded by the pirate Hastings, landed at the mouth of the river Rother, near Romney Marsh, and immediately possessed themselves of Apuldore, where, and at Hastings (so called from their leader) they constructed forts and ravaged all the coast to the westward of the country." A more probable opinion however is that suggested by Mr. Kemble in his 'Saxons in England,' that it was the fortress, and probably at one time the town, of a tribe called the Hæstingas. In 924 it was of sufficient importance to have a mint. Hastings has returned two members to Parliament since the reign of Edward III. As one of the cinque ports it ranks next in importance to Dover.

The town is pleasantly situated on the sea-coast, in a hollow, sheltered on every side, except the south, by lofty hills. It consists principally of two streets, separated by the Bourne, a small stream which here falls into the sea. To the westward of the town, upon a lofty cliff, are the ruins of an ancient fortress. The town is lighted with gas, and paved. The more recent streets, squares, and terraces are well built, and have many good houses. The climate is mild, and the place has of late years been much resorted to during the bathing season by invalids and others, for whom commodious hotels, baths, libraries, and reading rooms, a theatre, an arcade, &c., have been provided. A spacious terrace, called the Marine Parade, runs along the sea-front of the town, joining the Grand Parade of St. Leonard's-on-Sea. There are two ancient churches, All Saints, erected in the early part of the 14th century, and St. Clements, erected in the 14th and 15th centuries. The church of St. Mary-in-the-Castle is modern. The Wesleyan Methodists, Independents, Countess of Huntingdon's Connexion, Baptists, and Roman Catholics have places of worship. There are National, British, and Infant schools. Saunders's school, founded in 1708, the endowment of which was stated to be 70*l.* a year in 1837, is under the patronage of the corporation. A Grammar school, founded in 1844, had 5 boarders and 40 day pupils in 1852. There are a mechanics institution, a savings bank, and numerous benevolent associations. The town-hall is a neat structure supported on arches, with a market-place beneath it. The other public buildings are a custom-house, a jail, dispensary, &c. The prosperity of the town is now to a great extent dependent on visitors. The chief occupation is that of fishing, which employs about 90 boats, and a considerable number of the male population. Many persons are engaged in boat-building, and in lime-burning. A market for corn is held on Saturday; one for poultry and provisions is held daily; and a fish-market is generally held every day on the beach. Fairs are held on Whit-Tuesday, July 26th, and November 23rd.

St. Leonard's-on-Sea, was originally above a mile to the west of Hastings, but the towns are now in fact united. In the Census returns, the population of St. Leonard's is included with that of the borough of Hastings. St. Leonard's is a new town, which was commenced about 1828 for visitors who found difficulty in procuring accommodation at Hastings. The chief feature in St. Leonard's is the Marina, a handsome range of buildings about 500 feet in extent, with a covered colonnade of the same length, which stretches along the sea-front of the town. There are many other well-built terraces and detached villas, besides assembly-rooms, bath-houses, and spacious hotels. The church will accommodate 900 persons. The Wesleyan Methodists and Independents have chapels; and there are National and Infant schools, a literary and scientific institute, and a mechanics institute. The Grand Parade is joined to the Marine Parade of Hastings, and together they form one of the finest sea-walks in the kingdom. In the vicinity are many picturesque walks.

HATFIELD. [ESSEX.]

HATFIELD, or **BISHOP'S HATFIELD**, Hertfordshire, a market-town and the seat of a Poor-Law Union, in the parish of Hatfield, is situated in 51° 46' N. lat., 0° 12' W. long., distant 7 miles W.S.W. from Hertford, 19 miles N.N.W. from London by road, and 17½ miles by the Great Northern Railway. The population of the parish of Hatfield in 1851 was 3862. The living is a rectory in the archdeaconry of St. Albans and diocese of Rochester. Hatfield Poor-Law Union contains 4 parishes, with an area of 23,157 acres, and a population in 1851 of 6274.

The town of Hatfield lies on the slope of a hill on the high north road, and consists of a principal street intersected by a smaller one. The bishops of Ely had a palace here, which with the manor was seized by Henry VIII.: the palace was the residence of Prince Edward, afterwards Edward VI., immediately before his accession. The Princess (afterwards queen) Elizabeth was here under the charge of Sir Thomas Pope during the latter part of the reign of her sister Mary, and held her first privy council here. The palace and manor were given by James I. in exchange for Theobalds, at Cheshunt, to Sir Robert Cecil, afterwards earl of Salisbury, in whose family they have since continued. The gateway and west end of the old palace are still standing. Hatfield House was built by Sir Robert Cecil, and is a fine specimen of the architecture of the Elizabethan period. It was almost destroyed by fire in 1835, but was rebuilt by the present Marquis of Salisbury. The grounds are very fine. The parish church, an edifice of the 13th century, consists of a nave, chancel, and aisles, with an embattled tower, which has been surmounted with a handsome new spire. The Independents and Methodists have places of worship. National and Infant schools, a reading-room, and a literary

institute are in the town. There is a market on Wednesday for corn and provisions, and two fairs are held yearly.

(Communication from Hatfield.)

HATHERLEIGH. [DEVONSHIRE.]

HATHERSAGE. [DERBYSHIRE.]

HATTERAS, CAPE. [CAROLINA, NORTH.]

HAUGHLEY. [SUFFOLK.]

HAUTEFORT. [DORDOGNE.]

HAUTEVILLE. [AIN.]

HAVANNA (*Habana*), a flourishing commercial town, with the best harbour in the West Indies, or perhaps in the world, stands on the north coast of the island of Cuba, in 23° 8' 15" N. lat., 82° 22' 5" W. long., and has a population, including the garrison, of 150,000, about 25,000 of whom are slaves, and the remainder whites and free blacks, in the ratio of 2 to 1. A channel half a mile long, 850 yards broad, 8 to 10 fathoms deep, and without bar or obstruction of any sort, leads to the harbour, which is formed by a magnificent bay nearly three miles long and half as much in width, sheltered by hills from every wind, and capable of accommodating 1000 ships of the largest size, vessels of the greatest draught coming close up to the quays. The city is built along the entrance to and on the west side of the basin. In the city the streets are narrow and dirty, but in the suburbs, which are now larger than the city, they are wide and well laid out. Of late years too all parts of the town are much improved in cleanliness, and less unhealthy in summer than formerly. The entrance to the harbour is defended by two strong fortresses, El Morro and La Punta, and a continuous series of batteries runs along both shores. The city also, which is entered by three gates, is defended by a strong citadel; and fortifications have been erected on all the neighbouring heights. In general the houses are of only one story, but of very solid construction; the windows are unglazed, and always kept open on account of the heat of the climate. Among the finest public buildings are the cathedral (in which the remains of Columbus now lie, having been removed hither from San Domingo in 1795) and eleven other churches. Other large structures, more remarkable for solidity than elegance, are—the two hospitals, the residence of the captain-general near the citadel, the naval arsenal, the post-office, and the great tobacco factories. Havanna is the seat of a bishop, has a university, an ecclesiastical college, a theatre, a botanic garden, a circus for bull-fights, and three fine promenades—one along the ramparts, one within the town, and a third without the walls (Paseo Extra-Muros.)

A glance at the map shows the great importance of Havanna in a political point of view, commanding as it does both the inlets to the Gulf of Mexico. Among the commercial cities of the western hemisphere it ranks inferior only to New York, and for a long period it engrossed the whole foreign trade of Cuba, but since 1809, when the old colonial system of Spain was relaxed, Matanzas has obtained a considerable share of the commerce of Cuba. The principal articles of export are sugar, coffee, copper-ore, raw tobacco and cigars of the best quality, molasses, and the precious metals. Other exports are—mahogany, cedar, rum, cocoa, cotton, wax, hides, fruits and preserves, honey, dye-stuffs, &c. The imports comprise flour, corn, salt, provisions, cotton manufactures, linen, hardware, silk, wine, bullion, spices, leather, butter, lard, cheese, deals, caaks, hoops, &c. The trade of Havanna extends to all the countries of Europe and America, but chiefly to Spain, the United States, and England. The exportation of sugar from Havanna and Matanzas in 1849 amounted to 847,676 boxes; in 1850 to 1,041,661 boxes; and in 1851 to 1,242,252 boxes of 400 lbs. each. Besides cigars, chocolate, some woollen goods, and straw hats are manufactured. Between 1000 and 2000 ships are engaged in the trade of Havanna. The town is joined to Matanzas by railroad. It was founded in 1511 by Velasquez on what was called the port of Carenas. [CUBA.]

HAVANT, Hampshire, a small market-town and the seat of a Poor-Law Union, in the parish of Havant, is situated near the head of Langston harbour, in 50° 50' N. lat., 0° 59' W. long., distant 22 miles E. by S. from Southampton, 66 miles S.W. by S. from London by road, and 88 miles by the London, Brighton, and South-Coast railway. The population of the parish of Havant in 1851 was 2416. The living is a rectory in the archdeaconry and diocese of Winchester. Havant Poor-Law Union contains 6 parishes, with an area of 14,379 acres, and a population in 1851 of 7214. The parish church is a cruciform edifice, with a tower rising from the intersection; some parts of it are of Norman date. It contains a fine brass of William of Wykeham's chancellor: in the chancel is some good modern stained glass. The Independents have a chapel, and there are National, Infant, and British schools, and a savings bank. Some parchment is made in the town. The market is on Saturday, and there are two yearly fairs.

HAVEL. [BRANDENBURG.]

HAVERFORDWEST, the capital of Pembrokeshire, South Wales, a market-town, sea-port, municipal and parliamentary borough, a county in itself, and the seat of a Poor-Law Union, occupies a picturesque situation on the West Cleddy River, in 51° 47' N. lat., 4° 47' W. long., distant 251 miles W. by N. from London. The population of the town and county of the town of Haverfordwest in 1851 was 6580. The borough is governed by 4 aldermen, and 12 councillors, one of whom is mayor; and, in conjunction with the boroughs of

Fishguard and Narberth, returns one member to the Imperial Parliament. The livings are in the archdeaconry and diocese of St. David's. Haverfordwest Poor-Law Union contains 63 parishes and townships, with a population in 1851 of 38,633.

Haverfordwest was a principal station of the Flemings who settled in the district in the reign of Henry I. Of the ancient castle of Haverfordwest the keep has been converted into a jail for the county and town. The guildhall and market-house are good buildings. The town is irregularly laid out, but contains many good modern houses; it is lighted with gas and paved. There are several picturesque walks around the town. The residents are in general shopkeepers, mechanics, and persons of moderate fortunes. There are four churches, two of which have been recently repaired at a considerable expense; chapels for Baptists, Independents, Moravians, Wesleyan Methodists, and Welsh Methodists; National and British schools; a literary institute; a savings bank; a dispensary; and several charitable societies. A county court is held. Haverfordwest is a creek of Milford Haven. Stone-coal, broken small and made into balls with clay, is much used for fuel. Markets are held on Tuesday and Saturday, and eight fairs in the course of the year. Near Haverfordwest are some remains of a priory of Black Canons.

HAVERING-ATTE-BOWER. [ESSEX.]

HAVRE, or HAVRE-DE-GRACE, LE, a large commercial town and fortified sea-port in the department of Seine-Inférieure in France, stands in a low marshy spot on the southern shore of the English Channel, at the embouchure and on the right bank of the Seine, in 49° 29' 16" N. lat., 0° 6' 37" E. long.; at a distance by railway of 143 miles N.W. from Paris, 55 miles W. by N. from Rouen; and has 26,410 inhabitants in the commune, but if the population of the suburbs Granville, Ingouville, and Sanvic, which were incorporated with Havre by a law passed in 1852, be added, the total population cannot be much short of 40,000. On the decline of Harfleur in the second half of the 15th century, and the blocking up of its port by the sandy deposits of the Seine, the importance was seen of having a safe resort for the French navy, and, above all, of blocking up 'the gate of the Seine' through which the English had so often penetrated into the heart of France. Accordingly, on a spot where then stood a fishing village with a humble thatched chapel dedicated to Notre-Dame-de-Grace, Louis XII. in 1509 laid the foundation of Havre, threw up some fortifications, and built two short jetties. His successor François I., by the sums he expended on the town, and the great privileges he conferred upon it, is however to be looked on as the true founder of Havre. In his reign the new city was in great measure built, the harbours improved, the town-hall and the ramparts erected, and the Tower of François I., which still exists, constructed for the defence of the harbour. In 1562 the Prince de Condé betrayed the town to Queen Elizabeth, who garrisoned it with 6000 troops under Dudley, earl of Warwick. The English were forced to capitulate in 1563, but carried away as a memorial of their occupation the archives of the town, which are now deposited in the Tower of London. Louis XIII. added to the fortifications, and built a citadel, which was afterwards rebuilt on a new plan by order of Cardinal Richelieu. Under Louis XIV. the extent of the town was nearly doubled; part of the fortifications and the old gate of Ingouville were demolished, a new quarter built, and the citadel converted into an immense military quarter, which comprises an arsenal, governor's residence, ammunition stores, and large barracks, forming together a spacious and handsome square round the Place d'Armes. The modern fortifications, which are only a nuisance from the obstruction they present to the extension of the town, consist of ramparts and three wet ditches. The ramparts are surmounted by a parapet, and parts of them are planted with fine trees.

The town is entered by 5 gates with drawbridges; of these gates the Porte-Royale, in form of a triumphal arch, is the most remarkable. The old part of the town, which is built round the harbour, presents regular but narrow streets. The wooden houses, of which it was formerly composed, are gradually giving way to more solid and more sightly structures. The new part is built on a regular plan; the streets are wide, cross each other at right angles, and present several handsome houses. The principal street in Havre is the Rue de Paris, which presents more commercial activity than is seen even in Paris. There are few buildings that call for special notice; besides those already mentioned may be named the church of Notre-Dame, the custom-house, the exchange, the great tobacco factory on the Quay d'Orléans, the bonding warehouses, the public library, which contains 15,000 volumes, the new theatre, and the Frascati baths on the sea-shore. Statues of Bernardin St.-Pierre and Casimir Delavigne, natives of the town, were erected in 1852 in the Place François I. in front of the principal entrance to the museum. Tribunals of first instance and of commerce are held in the town, which has also a chamber of commerce, a naval school of the first class, several insurance offices, &c. Foreign consuls reside in Havre.

The harbour consists of three wet docks, and an outer port, separated by locks, and capable of containing 450 ships. A fourth dock has been constructed for steamers, which on account of the narrow entrance could not get into the old docks, and used to lie in the outer harbour. The docks are surrounded by broad solidly built quays affording every convenience for loading and unloading vessels,

A narrow channel, which is formed by two long jetties running nearly east and west, and built between two banks of shingle, leads from the outer harbour into the embouchure, whence, by two passages between sandbanks, two roadsteads are reached; in these there is always deep water and good holding ground, but no shelter. At low water, when the outer port and the channel are dry, the water from a large reservoir (which is kept open till full tide and then closed by floodgates) is discharged to sweep away the sandy deposits which would otherwise soon block up the harbour. A singular local phenomenon respecting the tide, which rises at Havre to 20 and 27 feet, gives an important advantage to the harbour. It results from the position of the harbour with respect to the Seine that the tide having reached its maximum continues full for three hours in consequence of the strong current of the river damming up the water in the channel formed by the jetties; and this exception to the general tidal law gives vessels leaving the harbour time to reach the sea, even against a head wind, in a single tide. The fine quays which border the docks are always lined with vessels, and present great activity of business.

The trade of Havre produces in ordinary years customs duties amounting to about a million sterling, representing a total movement of merchandise to the value of over 20,000,000*l.* In 1849 the customs duties of the port of Havre rose to 29,243,956 francs, in 1852 to 34,611,401 francs (1,384,456*l.* sterling). Besides vast quantities of foreign and colonial produce for the supply of Paris and the north of France, such as coffee, sugar, spices, the imports consist of raw cotton for the manufacturing districts of Rouen, St. Quentin, &c., of indigo, dyewoods, tobacco, rice, hides, timber, iron, tin, tea, &c. The most important imports are sugar, coffee, and raw cotton. The principal exports are silks, broadcloth, cotton manufactures, lace, gloves, shoes, trinkets, plated and tin wares, perfumery, wine, brandy, glass, furniture, books, &c. In 1842 there entered the harbour 607 ships of 221,000 tons burden from ports out of Europe. In 1848 and 1849 the arrivals from foreign ports were respectively 1378 ships measuring 327,989 tons, and 1643 ships measuring 377,436 tons; the departures in 1848 were 1369 ships measuring 317,724 tons, in 1849 they were 1589 ships measuring 367,689 tons. The coasting trade in and out in these two years employed 5171 and 5163 vessels, measuring 366,522 and 356,340 tons respectively. The total tonnage of the commerce of Havre in 1848 and 1849 therefore amounted to 1,011,235 and 1,101,465 tons respectively. In 1852 the foreign and coasting trade employed altogether 9615 vessels measuring 1,254,607 tons, and employing 88,101 men. Above 450 vessels belong to the port, including 50 of 400 to 500 tons engaged in the whale fishery, and 40 large and small steamers. There is regular communication by powerful steamers with Rouen, London, Southampton, Bayonne, Hamburg, Lisbon, &c., and by packet-ships with New York, Bahia, Vera Cruz, and New Orleans. Small steamers ply to Honfleur, Caen, Rouen, and Paris. On Cape La-Hève, which is 2 miles N.N.W. from the town, and rises to the height of 390 feet above the sea, there are two lighthouses 325 feet apart and 50 feet high, with powerful fixed lights. There is also a brilliant harbour light on the extremity of the western jetty.

The manufactures of Havre comprise vitriol, pottery, lace, paper, oil, carpenters' tools, bricks and tiles, ship-cordage, tobacco, furniture, &c. There are also several sugar-refineries, and breweries. Outside the town and close to the shore are five ship-building yards, which have turned out some of the best sailing-vessels and swiftest steamers belonging to France.

Separated from Havre only by the fortifications is the handsome suburb of *Ingouville*, which is built on a high hill overlooking the town, the harbour, and the sea, and containing many pretty country seats belonging to the merchants of the town. It has about 10,000 inhabitants, many of whom are engaged in manufactures. Havre itself stands on low ground, and has often suffered from the sea in violent hurricanes.

In August 1854 it was announced that Havre was to be the capital of the newly-formed department of Seine-Maritime.

HAWAII. [SANDWICH ISLANDS.]

HAWARDEN. [FLINTSHIRE.]

HAWASH, RIVER. [ABYSSINIA; ADAL.]

HAWICK, Roxburghshire, Scotland, a burgh of royalty and market-town in the parish of Hawick, is situated on the right bank of the Teviot, at its junction with the Slitrig, which flows through the town, in 55° 25' N. lat., 2° 47' W. long. It is 9 miles S.W. from Jedburgh and 53 miles S. from Edinburgh by the Edinburgh and Hawick branch of the North-British railway. The population of the burgh in 1851 was 6683. It is governed by two bailies and 29 councillors.

The town consists chiefly of one long street parallel to the Teviot, which is here crossed by a stone bridge. Two bridges cross the Slitrig, one of which has been recently built. The streets are lighted with gas and paved. The old parish church was built in the middle of the last century: it is nearly in ruins, but a new church has been erected in the Norman style. There are places of worship for the Free Church Presbyterians, United Presbyterians, Episcopalians, Independents, Baptists, and Roman Catholics. The Parochial and Grammar schools are united, and there are an Episcopalian school and a Subscription school. There are public baths and wash-houses, a mechanics institute, a public library, a savings bank, and

manufactures of hosiery, woollen goods, woollen yarns, machinery, candles and gloves. There are four yearly fairs.

Hawick suffered much in the border warfare of former days; and both in the town and the rural parts of the parish are several towers or houses apparently designed for fortifications. About three miles above Hawick is Brankholm, the site of the Brankholm, or Branksome, of Sir Walter Scott's 'Lay of the Last Minstrel.' At the end of the town is a moot-hill.

HAWKHURST. [KENT.]

HAWKSHEAD. [LANCASHIRE.]

HAWNES. [BEDFORDSHIRE.]

HAY, or, as it is frequently called WELSH HAY, or the HAY, Brecknockshire, a market-town and the seat of a Poor-Law Union in the parish of Hay, is picturesquely situated on the right bank of the river Wye, in 52° 4' N. lat., 3° 7' W. long., distant 14 miles N.E. from Brecknock, and 164 miles W. by N. from London by road. The population of the town of Hay in 1851 was 1238. The living is a vicarage in the archdeaconry of Brecon and diocese of St. David's. Hay Poor-Law Union contains 24 parishes and hamlets, with an area of 59,010 acres, and a population in 1851 of 10,957.

The town of Hay is lighted with gas, and paved. The parish church was rebuilt in 1838, in the early English style. The Baptists, Independents, Wesleyan and Calvinistic Methodists, and Quakers have places of worship. There are National and British schools, and a savings bank. A county court is held. The market-day is Thursday; six fairs are held in the course of the year. Of the ancient castle of Hay, which was burned by King John in 1216, there still remain a tower, a gateway, and part of the walls.

HAYFIELD, Derbyshire, a village and the seat of a Poor-Law Union in the parish of Glossop, is situated in 53° 22' N. lat., 1° 56' W. long., distant 44 miles N.N.W. from Derby, and 171 miles N.W. by N. from London. Glossop station of the Manchester and Sheffield railway, which is 5½ miles from Hayfield, is 207 miles from London. The population of the chapelry of Hayfield in 1851 was 1757. The living is a perpetual curacy in the archdeaconry of Derby and diocese of Lichfield. Hayfield Poor-Law Union contains four parishes and townships, with an area of 17,068 acres, and a population in 1851 of 10,125. The parochial chapel is an ancient structure with a tower. In the village are a Methodist chapel, Church schools, and a Free school. Several cotton-mills and paper-mills are near Hayfield. Some woollen cloth is made.

HAYLE. [CORNWALL.]

HAYTI. [HISPANIOLA.]

HAZEBROUCK. [NORD.]

HEADFORD. [GALWAY.]

HEADINGTON, Oxfordshire, a village and the seat of a Poor-Law Union in the parish of Headington, is pleasantly situated in 51° 46' N. lat., 1° 12' W. long., distant 2 miles E.N.E. from Oxford, and 52 miles W.N.W. from London by road. The population of the parish of Headington in 1851 was 1653. The living is a vicarage in the archdeaconry and diocese of Oxford. Headington Poor-Law Union contains 23 parishes and townships, with an area of 24,890 acres, and a population in 1851 of 15,480.

Headington is supposed to have been a royal residence under the Saxon dynasty. The church is of the 13th century, but the tower was rebuilt in 1689: there is a lofty shaft of a cross in the churchyard. The Baptists have a chapel, and there is a National school. In the vicinity is the Warneford Lunatic Asylum. Near the village is Headington quarry, from which much of the stone has been taken for the public buildings at Oxford.

HEADLEY, Hampshire, a village, and the seat of a Gilbert Poor-Law Incorporation, in the parish of Headley, is situated in 51° 6' N. lat., 0° 49' W. long., distant 24 miles E. by N. from Winchester, and 45 miles S.W. from London by road: the population of the parish in 1851 was 1424. The living is a rectory in the archdeaconry and diocese of Winchester. Headley Gilbert Incorporation contains three parishes, with an area of 15,328 acres, and a population in 1851 of 2854. The parish church is an early English structure, and there are in the village an Endowed school and a National school.

HEAGE. [DERBYSHIRE.]

HEANOR. [DERBYSHIRE.]

HEBRIDES, THE (or Western Islands of Scotland), are islands scattered in the Atlantic Sea, along the western coast of North Britain, between 55° 35' and 59° N. lat., 5° and 8° W. long. They are 300 in number, but many are very small and sterile, and only about 80 are inhabited. Of the 300 some are mere rocks; throwing these out of computation there are about 170 islands worthy of a place in the map. These islands are commonly divided into the Northern and Southern Hebrides, the most western point of the mainland of Argyleshire, the promontory of Ardnamurchan (56° 45' N. lat., 6° 14' W. long.) being considered the point from which the line of division between them runs westward into the Atlantic.

The surface of the Hebrides is stated to exceed 3184 square miles. Some of the larger islands, especially those which approach the mainland, are mountainous: such are those of Arran, Jura, Mull, and Skye, in which some of the elevated masses rise more than 3000 feet above the sea. In the rest the most elevated parts do not in general exceed 1500 feet; and in some, as in Tyree and in the southern islands, the

hills do not rise to more than 300 feet. The coasts are rocky, and in many parts high, especially along the western shores towards the Atlantic; except the innermost angles of the bays and inlets, where they are frequently low and sandy. The shores are indented by many large bays and inlets, which form harbours of every description, some of which are very secure and capacious. There are numerous rivers, which however are generally small; all of them abound in salmon-trout and eels. On many of the islands there are numerous lakes; the whole number of lakes being upwards of 1500. The islands of Bute and Islay are considered fertile, as are also several districts in the islands of Arran, Mull, and Skye. But a comparatively small proportion of the whole surface is under cultivation. Of the area which the islands comprehend, little more than 200,000 acres are arable or meadow land; 600,000 acres mountains, morasses, and lakes; 70,000 acres pasture ground, commonly on hills, and of little value; 25,000 acres are barren sands; 22,000 acres are occupied by peat-mosses; and 30,000 acres are dry at ebb-tide, and serve as kelp-shores.

The backward state of these islands is to be attributed to the want of timber, to their distance from markets, and to the difficulty of intercourse on account of the boisterous seas which surround them, and the storms which frequently prevail nine months of the year. These are produced by the south-west winds, which bring torrents of rain almost annually from August to the beginning of March. Early in March, and often also in October and November, a north-east or north-north-east wind prevails; and although the coldest that blows here it is generally dry and pleasant. The climate is upon the whole mild. Grasses and corn ripen quickly: in Uist, Lewis, and Tyree, big, or bere, is frequently cut down ten weeks after being sown.

The great mass of the population resides within a mile of the sea-shore. The traveller meets with scarcely an inhabited house 1000 yards from the sea-mark, or 300 feet above the level of the ocean, except in the islands of Bute, Islay, and Arran. From their language and customs it is evident that the inhabitants of the Western Hebrides are of the same stock with those of the Highlands. In most of the islands they depend on the fishing of herrings, cod, and ling, with which the surrounding sea abounds, or by burning kelp. There is little agricultural industry, except in Islay, Bute, and Arran.

The Hebrides belong politically to four Scotch counties, ARGYLSHIRE, BUTESHIRE, INVERNESS-SHIRE, and ROSS-SHIRE. The islands are mentioned by Ptolemaeus under the name of Ebudes, and by Pliny (iv. 16) under that of Hebudes. Pliny makes the Hebudes thirty in number.

(McCulloch, *Highlands and Western Islands.*)

HECLA. [ICELAND.]

HEDINGHAM. [ESSEX.]

HEDJAZ. [ARABIA.]

HEDON. [YORKSHIRE.]

HEIDELBERG, an ancient city in the grand-duchy of Baden, is situated in one of the most beautiful parts of Germany, on the left bank of the Neckar, over which there is a covered stone bridge of nine arches, in about 49° 24' N. lat., 8° 41' E. long.; 23 miles by railway N.N.E. from Carlsruhe, 54 miles S. from Frankfurt-am-Main, and has about 16,000 inhabitants. The town stands on a narrow ledge between wooded vine-clad hills and the river. On the south is the Königstuhl, or Kaiserstuhl, on the summit of which a lofty tower has been erected. There is one long main street, into which a great number of narrow and gloomy streets and lanes open. On a hill above the town is the vast ruin of the castle of the Electors Palatine, who held their courts here till 1709. In the cellar of the palace is the celebrated Heidelberg tun, which contains 600 hogsheads. Heidelberg has three Lutheran churches, one Calvinist, and one Roman Catholic church, and a synagogue. The interior of the church of the Holy Ghost is divided by a partition wall, the Roman Catholics worshipping on one side, the Lutherans on the other. The town is famous for its university, which is the oldest in Germany except that of Prague. It was founded in 1386 by the elector Ruprecht II., and soon acquired a high reputation, to which its valuable library and numerous manuscripts greatly contributed. A new era for the university commenced in 1802, when it was assigned, together with the town and surrounding territory, to the grand-duke of Baden. It has faculties of Lutheran theology, law, medicine, and philosophy; in 1850 there were 71 professors and teachers, and 603 students. The library of the university of Heidelberg contains 150,000 printed volumes and 4000 manuscripts. Heidelberg has also a gymnasium, which had 205 pupils in 1850. There are no manufactures except on a small scale. Its trade is however improving, and the great beauty of the country about it (which is cultivated like a garden), and the cheapness of living, have caused a great number of foreigners to settle here. Heidelberg suffered terribly in the wars of the 17th century; it was taken by the imperialists under Tully in 1622, eleven years afterwards by the Swedes, by the French in 1674, again in 1683, and lastly in 1693.

HEIGHINGTON. [DUREAM.]

HEILBRONN. [NECKAR-KREIS.]

HEILIGENSTADT. [ERFURT.]

HELDER. [HOLLAND.]

HELENA, ST., an island in the Atlantic Ocean, 1200 miles W. from the coast of South Africa, and about 1800 miles E. from the

coast of Brazil, in South America. The circumference of the island is about 28 miles, and the area is 30,300 acres. The population in 1851 was 5490, of whom about one-third were Europeans, and the rest blacks, coloured persons, and Chinese. Rugged and almost perpendicular cliffs, from 600 to 1200 feet high, encompass the island, broken in several places by deep chasms which open to the sea-shore, and form narrow valleys winding up to the table-land in the centre of the island. One of the principal of these openings is called James-Valley, on the north-west coast of the island; and at the opening of it to the sea is James-Town, the only town and port of the island, which is defended by strong batteries, and is the residence of the government establishment. James-Town is in 15° 55' S. lat., 5° 49' W. long. In the upper part of James-Valley is the table-land of Longwood, situated in the eastern part of the island, and consisting of 1500 acres of fine land, nearly 2000 feet above the sea, sloping gently towards the south-east. Longwood House was the place of Napoleon's confinement from 1815 till his death in 1821, and his tomb is at a short distance from it. In 1841 his remains were removed to Paris. In the centre of the island rises Diana's Peak, 2693 feet above the sea. A calcareous ridge, which runs across from east to west, sloping abruptly on the south, divides the island into two parts, the larger and finer of which is on the north side of it. The climate of St. Helena is one of the healthiest under the tropics, and is found beneficial to invalids from India, and even from Europe. Rain falls in every month, but the wet season is usually from June to August. The interior of the island is covered with a rich verdure, and is watered by upwards of 200 springs. The soil of the valleys is very rich, and produces all the fruits and flowers of Europe and Asia. Although only about 150 acres are actually under cultivation, it appears that about 6000 acres in all are capable of being cultivated to advantage. Horned cattle, sheep, and goats feed on the rich pastures. Pretty cottages in picturesque situations are scattered about the island. The total revenue in 1851 was 17,177*l.*; the total expenditure was 16,427*l.*

The island of St. Helena was discovered by the Portuguese in 1502. It was afterwards taken possession of by the Dutch, who ceded it to the English East India Company in 1673, and it became a resting-place for their ships between India and Europe. In 1833 it was vested in the crown. It is still visited by ships returning from India, who take in fresh provisions and water. The number of merchant vessels which entered the port during the five years previous to 1852 averaged 896; in 1851 the number was 888, in 1852 it was 896. A duty of 1*d.* per ton is levied on all ships touching at the port for the support of an hospital for seamen. There is also a military hospital. There are three government schools, namely, a head-school, at which Latin, French, English, Mathematics, &c. are taught; an under-school, and a country-school. The Benevolent society supports four schools, and the Baptist Mission has four schools. The total number of scholars in 1851 was 620. An inspector of schools is employed by the government.

HELENSBURGH. [DUMBARTONSHIRE.]

HELICE. [ACHÆA.]

HELIER, ST. [JERSEY.]

HELIGOLAND, or HELGOLAND, an island in the North Sea, is situated in the centre of a circle, the circumference of which at a distance of about 40 miles passes through the estuaries of the Eyder, the Elbe, and the Weser. It has an area of about 5 square miles, with a population of 2500. The island consists of a cliff of red marl 170 feet high, and a lowland united by a rocky isthmus 500 paces in length. The ascent to the cliff is by a flight of 180 steps. The summit is a tolerably level plain about 4200 paces in circumference. The lowland, which is uninhabited, has two good harbours, one on the south side of the island, and another on the north side. The inhabitants live in a village on the cliff. They are descended from the Frislanders, and subsist chiefly by fishing for haddock and lobsters, and by acting as pilots. The English took the island from the Danes in 1807, and it was formally ceded to them in 1814. On the cliff are four batteries which are manned by a garrison of British soldiers, but no taxes are levied, nor is the internal government of the island interfered with. The lighthouse which stands on the cliff near the village is in 54° 11' 34" N. lat., 7° 53' 13" E. long. The British establishment on the island costs altogether about 1000*l.* a year.

In former ages the island was of much greater extent than it now is, and it is said to have been the seat of worship of a deity named Hertha, or the Earth: from this circumstance most probably it derives its name which means Holy Land. An island marked on some maps and called Sandy Island, was united to Heligoland previous to 1770. Sandy Island has now almost entirely disappeared in the wash of the sea, which is fast consuming Heligoland also. When Napoleon in his wars against England endeavoured to exclude British goods from the continent of Europe, Heligoland became of importance, not only as a naval station, but as a smuggling depôt. The island is much frequented in summer for the sake of its excellent sea-bathing.

HELLESPONT. [DARDANELLES.]

HELMOND. [BRABANT, NORTH.]

HELMSLEY, or HELMSLEY BLACKMOOR, North Riding of Yorkshire, a market-town and the seat of a Poor-Law Union in t

parish of Helmsley, is situated on a gentle eminence sloping towards the river Rye, in 54° 15' N. lat., 1° 2' W. long., distant 25 miles N. from York, and 222 miles N. by W. from London by road. The population of the township in 1851 was 1481. The living is a vicarage in the archdeaconry of Cleveland and diocese of York. Helmsley Poor-Law Union contains 31 townships and chapels, with a population in 1851 of 6832.

The town is neatly built, most of the houses being of stone and slated. The church is a fine old structure, in part of Norman date, with a tower. National schools are supported by Lord and Lady Faversham. There is also a library and a reading-room. A county court is held. The market-day is Saturday: fairs are held on May 19th, July 16th, and October 2nd, chiefly for sheep and cattle. In the vicinity are several coal-mines.

Helmsley Castle, with its keep, is an interesting relic of former times. It was built in the time of Edward I. and Edward II. It was held for Charles I. in 1644, and besieged by Fairfax, to whom it at length surrendered. The remains of Rievaulx Abbey, about 2½ miles N.W., and of Ryland Abbey, about 4 miles S.W. from the town, are very interesting and picturesque ruins. In the immediate neighbourhood is the fine mansion of Duncombe, the seat of Lord Faversham. The mansion was completed in 1718 from a design by Vanbrugh.

HELMSTEDT. [BRUNSWICK.]

HELMUND, RIVER. [AFGHANISTAN.]

HELSINGFORS, a fortified sea-port town and naval station of Russia, capital of the government of Finland, is situated on a double-headed promontory to the west of the mouth of the river Wanna, in about 60° 10' N. lat., 25° E. long., 270 miles W. from St. Petersburg, about 60 miles N. by E. from Revel, and has a population of 16,000, exclusive of military and marines. It was founded by Gustav I. of Sweden, taken and burnt by the Russians in 1728, again taken by the Russians in 1803, and ceded to them, along with the whole of Finland, at the peace with Sweden in 1809. In 1822 it was still a small insignificant place. Since then the town may be said to have been founded anew, and built on a regular plan: masses of rock have been blown up, and inequalities levelled; long broad streets laid out at right angles, and public squares have been built; so that the town already surpasses every other town in Finland in appearance. The houses are large and spacious, and painted externally yellow and green. Among the public buildings the most striking are the residence of the governor, the senate-house, university buildings, the assembly-rooms on the esplanade, the barracks, and the hospital. The university buildings, the senate-house, and a magnificent church form three sides of the principal square. A new church, built in the form of a Greek cross on a mass of granite, having on each side a handsome Corinthian portico, and surmounted by a dome in the centre, forms a conspicuous object from a distance.

Helsingfors became the capital of Finland in 1819, in which year the former capital, Abo, was destroyed by fire. The University of Abo was transferred to Helsingfors by ukase of the emperor Nicholas in 1827. It is called the Alexander University, and has 4 faculties, 22 professors, and in ordinary times about 400 students. In connection with the university are a botanical garden, which is about a mile from the town; a museum, rich in mineralogical and zoological collections; a library (part of which was brought from Abo), kept in an apartment of the senate-house, and containing 8000 volumes; and on an eminence near the town an astronomical and magnetic observatory. A large bathing-house and a manufactory for mineral waters have been built outside the town. Helsingfors is the residence of the Lutheran archbishop of Finland. The town has a considerable trade in Baltic produce: the exports are principally corn, fish, deals, and iron; the industrial products are sailcloth and linen.

The naval harbour of Helsingfors, the most important station of the Russian Baltic fleet, after Cronstadt, is capable of containing 60 or 70 men-of-war, and is formed by a small bay of the Gulf of Finland, the entrance to which is secured by a chain of seven or eight small islands, the largest of which is only five acres in area. The defences on these islands form what are called the fortifications of *Seaborg*. There is only one entrance by which large ships can reach the harbour; shoals or dams from one island to another blocking up all the other passages. The immediate entrance lies between the islands of Langern (which is 200 yards from the southern extremity of the town) and Vester-Svert, and is about 200 yards across; it is commanded by the fire from the two islands, besides being raked by the batteries on the Oster-Lilya-Svert, which lies south of the opening between the two former. These three northern fortresses not only defend the channel but also command points on the mainland, where an enemy after taking the town might attempt to plant his batteries. Three other islands to the southward (Vargen, Gustav-Svert, and Oster-Stuor-Svert), similarly situated, and if possible still more strongly defended, command the entrance from the Gulf, the whole front presented by the successive works being about a mile in length. The fortifications on these granite rocks are said to be of the most formidable description: the ramparts are scarped out of the rock itself; the batteries are armed with the heaviest ordnance; and each series of works has its own stores of all kinds and bomb-proof cover. Casemates are formed for 6000 or 7000 small arms, and the united fortresses

are said to mount 800 cannon and to be garrisoned by 12,000 men; and there are magazines, arsenals, and barracks both upon one of the islands (Gustav-Svert) and upon the mainland. The naval docks off the harbour have been cut in the solid granite promontory on which the town stands. The harbour itself is further defended on the land side by the two forts of Braberg and Ulricaburg built within the port.

(Fraser's Magazine for May, 1854; S. S. Hill, *Travels on the Shores of the Baltic*, London, June, 1854.)

HELSTON, Cornwall, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Wendron, is situated on the left bank of the Loo, in 50° 6' N. lat., 5° 15' W. long., distant 40 miles S.W. from Bodmin, and 276 miles S.W. by W. from London. The population of the borough and chapelry of Helston in 1851 was 3355; that of the parliamentary borough was 7328. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. Helston Poor-Law Union contains 18 parishes and townships, with an area of 71,520 acres, and a population in 1851 of 28,899.

Helston was made a borough by King John in 1201. King Edward I. made it one of the coinage towns; and from his reign till the passing of the Reform Act, it sent two members to Parliament. The town was in the reign of Henry VIII. one of the decayed towns for the repair of which an Act of Parliament was passed. The streets are lighted with gas, and paved, and the town presents a neat appearance. There are a market-house and town-hall. The ancient coinage-hall still stands. The church, dedicated to St. Michael, was erected in 1763. The Wesleyan and Association Methodists and Baptists have each a chapel. The town possesses an Endowed Grammar school, which in 1852 had 22 scholars; a National, a Commercial, and a Wesleyan school; also a savings bank, a dispensary, and a literary institute. Helston is the centre of an important agricultural and mining district: it has markets on Wednesday and Saturday, and there are nine fairs or great markets in the year. Shoes are extensively made in the town, and are sold at the markets and fairs, or sent to Redruth.

HELVELLYN. [CUMBERLAND.]

HELVOETSLUIS. [HOLLAND.]

HEMEL HEMPSTEAD, Hertfordshire, a market-town and the seat of a Poor-Law Union, in the parish of Hemel Hempstead, is situated in 51° 45' N. lat., 0° 23' W. long., distant 24 miles W. by S. from Hertford, and 23 miles N.W. from London by road. The population of the town of Hemel Hempstead in 1851 was 2727. The living is a vicarage in the archdeaconry of St. Albans and diocese of Rochester. Hemel Hempstead Poor-Law Union contains 6 parishes and chapels, with an area of 25,320 acres, and a population in 1851 of 13,120.

Hemel Hempstead stands on the side of a hill sloping down to the fertile valley of the Gade, and consists chiefly of one street of considerable length. The town-hall, a long narrow building, has under it an open market-place. The town is partially lighted with gas. The church is a commodious structure of the 12th century; the aisles and chancel are Norman; pointed windows have been inserted. The Baptists, Independents, Wesleyan Methodists, and Quakers have chapels, and there are National, Industrial, and Infant schools, a mechanics institution, a savings bank, and a well-conducted infirmary. The market on Thursday is one of the largest in the county for corn. Straw plat is extensively sold at this market. Fairs are held four times in the year. There are large paper-mills, an iron-foundry, a type-foundry, and some corn-mills. Brick-making, lime-burning, brewing, and malting are carried on.

HEMSWORTH, West Riding of Yorkshire, a village and the seat of a Poor-Law Union in the parish of Hemsforth, is situated in 53° 36' N. lat., 1° 20' W. long., distant 23 miles S. by W. from York, and 173 miles N.N.W. from London. The population of the parish in 1851 was 997. The living is a rectory in the archdeaconry and diocese of York. Hemsforth Poor-Law Union contains 24 townships and chapels, with an area of 33,011 acres, and a population in 1851 of 8017. The parish church is an ancient structure partly in the decorated style. The Wesleyan Methodists have a place of worship. There are National and Infant schools. The Free Grammar school, endowed in 1546 by Archbishop Holgate, had 60 scholars in 1851, and an income of 1704. a year. An hospital for 20 poor brethren and sisters, with a master, was also founded by Archbishop Holgate.

HEMYOCK. [DEVONSHIRE.]

HENDON, Middlesex, a village and the seat of a Poor-Law Union in the parish of Hendon, is situated near the right bank of the river Brent, in 51° 35' N. lat., 0° 13' W. long., distant 7 miles N.W. from London. The population of the parish in 1851 was 3333. The living is a vicarage in the archdeaconry of Middlesex and diocese of London. Hendon Poor-Law Union contains 8 parishes, with an area of 33,449 acres, and a population in 1851 of 16,917. The church, an ancient and commodious edifice, contains some curious monuments and inscriptions. At Mill-Hill are a district church, a chapel connected with the Mill-Hill Grammar school, and a Wesleyan Methodist chapel. The Protestant Dissenters' Grammar school at Mill-Hill, established in 1807, had 99 scholars in 1853. National schools are at Hendon

and Mill-Hill, and an Infant establishment in connection with the Union. There are 16 almshouses with an endowment; another endowment provides clothing for 50 children.

HENDRED, EAST. [BERKSHIRE.]

HENFIELD. [SUSSEX.]

HENHAM-ON-THE-HILL. [ESSEX.]

HENLEY-IN-ARDEN. [WARWICKSHIRE.]

HENLEY-ON-THAMES, Oxfordshire, a market-town and the seat of a Poor-Law Union in the parish of Henley, is situated on the left bank of the river Thames, in 51° 32' N. lat., 0° 54' W. long., distant 24 miles S.E. from Oxford, and 85 miles W. by N. from London by road. The population of the town in 1851 was 2595. The living is a rectory in the archdeaconry and diocese of Oxford. The borough is governed by 10 aldermen, 2 burgesses, and 14 burgesses, one of whom is mayor. Henley Poor-Law Union contains 24 parishes and townships, with an area of 57,795 acres, and a population in 1851 of 17,895.

Henley was anciently called Hanlegang and Hanneburg. The town is delightfully situated on a gentle ascent from the left bank of the Thames, amid hills covered with extensive beech-woods and other plantations. It consists chiefly of four principal streets, which are lighted with gas and paved. At the intersection of the streets is a plain stone cross and conduit. On the east side is a handsome stone bridge of five arches over the Thames. The church has a good tower, and several interesting portions both of decorated and perpendicular character. The Wesleyan Methodists and Quakers have places of worship. The Endowed Grammar school, founded in 1605, had 46 scholars in 1853. There are also a Commercial school, endowed by Lady Periam; National, Industrial, and Infant schools. The town-hall in the High-street is supported by sixteen Doric columns; beneath it is a market-house. The town possesses a savings bank and some almshouses. The market is on Thursday; fairs are held on March 7th and at the end of September. Henley is the head-quarters of the aquatic sports of the upper part of the Thames, and the scene of an annual regatta.

HENNEBON. [MORBIHAN.]

HENSTEAD, Norfolk, a hundred which has given name to a Poor-Law Union, is bounded N. and E. by the hundred of Blowfield, S. by the hundreds of Depwade and Clavering, and W. by the hundred of Humbleyard. It comprises 20 parishes, with an area of 19,331 acres, and a population in 1851 of 5781. Henstead Poor-Law Union contains 37 parishes, with an area of 41,986 acres, and a population in 1851 of 11,545.

HERACLEA. [BASILICATA; LUCANIA.]

HERAT, a city of Western Afghanistan, and the capital of a small independent state of the same name, is situated on the Heri River, in a plain 2500 feet above the sea-level and proverbial for fertility; distant 360 miles due W. from Cabul, 190 miles S.E. from Mushed, the capital of Persian Khorasan; and had a population of about 45,000 in 1838. The importance of Herat in a military point of view is very great, occupying as it does an opening in the great range of the Paropamisus, or Ghor Mountains, which alone affords facilities for a well-equipped army to march upon the frontier of Hindustan from the north-west. The city has been described as the 'Gate of India.' Within the limits of its territory all the great roads leading to India from the west converge; all the necessaries for an army—provisions, lead, iron, sulphur, saltpetre, &c.—may be procured in abundance. The importance of this position seems to have been thoroughly comprehended by Alexander the Great, who spent several months completing the subjection of Aria (which name still survives in the modern designation of the city and the province) before his march upon India.

Herat occupies the site of the ancient *Aria*, or *Aria Civitas*, which was built or more probably repaired by Alexander the Great, and is supposed to be the same as the *Artakoana* of Arrian, the *Artakana* of Strabo and Ptolemy, and the *Alexandria Arion* of Pliny, all of which are given as names of the chief town of the ancient province of Aria situated on the Arina, now called Heri. Of its ancient history little more is known than that it was included in the Persian empire. On the conquest of Persia by the followers of Mahomet in the middle of the 7th century of the Christian era, Herat was subjected to the khalifs with the rest of Khorasan, to which it then belonged. About the middle of the 12th century it became the residence of the Ghouride sultans. In 1220 it was seized by Genghis Khan, who demolished the city. In the following century it was again destroyed by the Mongols. In 1381 it fell with the whole of Khorasan into the hands of Tamerlane, under one of whose followers it again became the capital of an independent state, and rose to great eminence and prosperity. In the beginning of the 16th century the city was taken by the Turkomans, and in 1511 by the Shah Ismael Sophi, who re-united it to Persia. In 1749 it was taken from Persia and annexed to Afghanistan by Ahmed Khan, the founder of the Duranee dynasty. Mahmood, appointed governor of Herat by his step-brother, Shah Zeman, grandson of Ahmed Khan, again made Herat the capital of an independent state, and by the ability of his wuzer, Futteh Khan, twice ascended the throne of Cabul. This independence, though threatened by Persia on one side and by the Ameers of Cabul and Kandahar on the other, Herat still maintains. The Persians attacked the city in 1815, but were defeated by Futteh Khan, the able wuzer

of Mahmood, who however seized upon the city himself, and dismissed the acting governor, a brother of Mahmood's. In the following year Futteh Khan was barbarously deprived of sight by Kamran, son of Mahmood, and soon after murdered. The civil wars that arose out of this cruel act between the sons of Futteh Khan and Mahmood deprived the Duranee family of all their possessions except Herat. [AFGHANISTAN.] Mahmood died in Herat in 1829, and was succeeded by his son Kamran. The Persians again, instigated it was said by Russia, threatened Herat in 1833; but the death of Abbas Meerza prevented the prosecution of the siege by his son Mahommed Meerza, the general in command. But Mahommed, now Shah of Persia, returned in 1833, and laid close siege to the city with a large force, aided by the advice of Colonel Simonich, a Russian officer, and by a regiment of so-called Russian deserters. The siege, one of the most memorable of modern times, lasted ten months, from November 22, 1837, to September 9, 1838. It was unsuccessful, chiefly through the heroic courage and constancy of Eldred Pottinger, an English officer, who happened at the commencement of hostilities to be sojourning in the city, and who was allowed by Kamran and his wuzer Yar Mohammed to take a share in the defence. At the end of the ten months the Shah, terrified by a demonstration made by a small British force in the Persian Gulf, withdrew his army after reducing the city and its defences almost to ruins. On Kamran's death in May 1843 Yar Mohammed made himself master of Herat to the exclusion of Kamran's son; and the better to secure his power he made a sort of submission to the Shah, and entered into friendly relations with the Barukzye chiefs of Cabul and Kandahar. Yar Mohammed died in June 1851, and was succeeded by his son, who about a year after was attacked by the Kandahar Sirdars with a large force, which was defeated by the Herattees after eight hours' fighting, the forces on each side numbering about 12,000 men.

The following description of the city before its siege by the Persians in 1837-8, is chiefly taken from that given by Arthur Conolly and adopted by Mr. Kaye. It is given in the past tense, for the aspect of the city and its environs was greatly changed by that disastrous siege:—Herat was surrounded by a fair expanse of country laid out in corn-fields, vineyards, and gardens, and studded with little fortified villages, which were built by the side of small running streams that increased the beauty and fertility of the plain. The city was nearly a square in shape, the sides facing the cardinal points and less than a mile in length, and the site was a slope descending gradually from the north-east to the south-west. It was strongly fortified on every side by a solid earthen wall, surrounded by a wet ditch and pierced by five gates, each defended by a small outwork. But the real defences of the place were two covered ways on the exterior slope of the embankments, one within and the other without the ditch. On the northern side surrounded by a wet ditch stood the citadel (formerly called Kella-i-Aktyar-Aldyn, now the Ark) built of brick, with lofty ramparts and numerous towers, but from neglect a place of inconsiderable strength. Within, four long bazaars, roofed with arched brickwork, meeting in a small domed quadrangle in the centre of the city, divided it into four quarters, each containing about 1000 houses and 10,000 inhabitants. The principal of the bazaars terminated in the Kandahar Gate; it was 1300 yards long, 6 yards wide, and covered by a succession of small domes, springing from ill-formed arches that crossed the streets. Mosques, caravanserais, public baths, and reservoirs varied the wretched uniformity of the narrow dirty streets, which being roofed across were often little better than conduits, where every conceivable description of filth was suffered to collect and putrify. Without drains to carry off the rain that falls within the walls, it stagnates in ponds dug in different parts of the city. The refuse of the houses, dead cats and dogs, lie in the streets upon heaps of the vilest filth. The Khan's residence is a mean building. The principal mosque is a large structure of the 13th century. Outside the walls are some magnificent ruins of a religious edifice, and an enormous mound erected by Nadir Shah. Herat is in peaceful times a place of great commercial importance and a mart for the products of India, China, Tartary, and Persia. The native manufactures include carpets, dressed sheepskins, cloaks and caps, shoes, saddlery, harness, sabres, &c. The population numbered about 45,000 in 1838, including about 1000 Hindoos, several Armenian families, and a few Jews. The great majority of them were Mohammedans of the Sheeah sect, who were treated with the most remorseless tyranny by their Afghan masters, whose numbers did not exceed a fourth part of the population.

(Kaye, *History of the Afghan War*; A. Conolly, *Journey to the North of India*; *L'Art de Vérifier les Dates*; *Dictionary of Greek and Roman Geography*.)

HÉRAULT, a department in France, on the coast of the Mediterranean, which derives its name from the river Hérault, is bounded N.E. by the department of Gard, S.E. by the Mediterranean, S.W. by the department of Aude, and N.W. by the departments of Tarn, Aveyron, and Gard. It lies between 43° 11' and 43° 58' N. lat., 2° 38' and 4° 11' E. long. The greatest length from east to west is 84 miles, from north to south 49 miles. The area is 2393 square miles: the population in 1841 was 367,343, by the census of 1851 it was 389,286, being 162·67 to the square mile, or 11·91 below the

average population to the square mile for all France. The department is formed out of a portion of Lower Languedoc.

The department is traversed in the north and north-west by the Lower Cévennes, which attain the height of 4198 feet in the Espinouse range on the confines of Tarn, and of 4264 feet in the chain of Larzac, or Larjac, extending northward from Lodève into the department of Aveyron. From the main chain several ranges of hills of moderate elevation branch off towards the south, gradually subsiding as they approach the sea. The cultivable soil of the north and north-west consists of a chalky clay which produces only rye. The higher mountains are in general barren, or covered with woods. The plains in the interior, some of which are of large extent, consist of a light gravelly soil, very favourable to the growth of the vine and the olive. Along the lower courses of the Orb, the Hérault, and the Vidourle, and generally in the south of the department, the soil is a strong, deep, rich loam, and very productive of all the cereal grains. Here and there, all through the department, there are extensive wastes, locally called 'garrigues,' thinly covered with shrubs, dwarf oak, heath, broom, cistus, and aromatic plants, and producing tolerable coarse pasture. The department presents abundant evidence of volcanic action at some distant period, particularly in the extinct craters of Agde and of St. Thibéry, near Pézenas, and in the basaltic hills near Montpellier. Mont St. Loup near Agde is a volcanic hill and crater, which rises 752 feet above the sea-level; and nearer the sea is another volcanic circus called Conques. The crater of St. Thibéry some miles north from Agde is surmounted by three cones, the highest of which rises 636 feet above the sea.

The coast-line, extending from the mouth of the Aude to that of the Vidourle, measures 66 miles in length. The shore-lakes, or salt-lagunes of Thau, Maguelonne (so-called from the ancient city of Maguelonne, which stood on the peninsula of Maguelonne, and of which there remains a very interesting church), Pérols, and Mauguio extend eastward from Agde to the Vidourle; they are separated from the Mediterranean by a narrow bank, in which however there are a few openings called 'graus.' The Canal-des-Etangs, which joins the Canal-du-Midi at Cette, passes through these shore-lakes. The Canal of Cette connects the shore-lake of Thau with the sea. In the west of the department are the lagunes of Vendres and Capetang; the latter is land-locked and stagnant. The marshes round these two lagunes have been drained to a considerable extent, and converted into arable land. The neighbourhood of all the lagunes is marshy and unhealthy; agues and rheumatic fevers prevail in the summer and autumn, though to a less extent than formerly, owing to the partial drainage and cultivation of the marshes. Except in the vicinity of the lagunes, the department enjoys a pure air and a most healthy climate.

The rivers of the department all rise in the Cévennes, and flow directly into the Mediterranean or into the shore-lakes. The principal are—the *Vidourle*, on the confines of Gard [GARD]; the *Lez*, which passes east of Montpellier, and becoming navigable takes the name of Canal-de-Grave; the *Hérault*, rising in the north-west of Gard, and running south, enters the department to which it gives name at Ganges; here, having received the Ergue on the right bank, it passes Montagnac and Pézenas, and enters the sea through the port of Agde after a course of 80 miles, only 7 miles of which are navigable; the *Orb*, which, springing from the mountains west of Lodève, and flowing first south, then west till it meets the Jaur at Olargues, and finally south-south-east, passes Béziers, having previously received the Bernasobre from the west, and enters the sea near St. Geniès; and the *Aude*, which touches the western boundary. [AUDE.] Near the coast, most of the towns are joined to the Canals du-Midi and des-Etangs by short canals, thus establishing a communication with the Rhône, the Garonne, and the Bay of Biscay.

The department is crossed by the high road from Paris to Spain, through Perpignan, by 5 other state and 17 departmental roads. Montpellier, the capital, communicates with Cette and Nîmes by railroad; and a railway is projected from Bordeaux through Toulouse to Cette. [GARD; CETTE.]

The department contains 1,513,615 acres, of which 386,897 are arable land; 256,213 are under vineyards; 191,869 are covered with woods; 21,096 are meadows and grass land; 71,065 are under orchards, olive and mulberry plantations, nurseries, and different kinds of culture; 58,593 are covered with lagunes, rivers, canals, and marshes; and about 500,000 acres consist of the waste land or garrigues described above.

Wheat, rye, barley, and oats are produced in quantity more than sufficient for the consumption. There is a considerable breadth of artificial meadows; and large crops of lucerne, sainfoin, and clover are grown. For quantity of wine produced, Hérault stands at the head of the wine-growing departments of France, the average annual produce being 46,552,000 gallons. The red wines of St. Georges, St. Christol, and St. Drézéry, the muscadel wines of Frontignan, Lunel, and Béziers, and the white wines of Marseillan and Pinet are considered the best. Fruits, especially raisins, olives, almonds, figs, and chestnuts, and all kinds of pulse are grown. The mulberry is cultivated for the production of silk; aromatic and medicinal herbs, and madder and other plants used for dye-stuffs are grown. The principal material of the woods are the chestnut and green and white oak.

Sheep, cattle, and mules are numerous; game is very abundant; and fish, including the johndoré, tunny, oyster, lobster, anchovy, mackerel, eel, &c. are taken in immense quantities in the shore-lakes and in the sea.

The industrial products comprise woollen-cloths, silks, hosiery, calico, muslin, flannel, blankets, brandy, chemical products, pottery, tiles, honey, perfumes, leather, oil, beer, paper, &c. There are also numerous dye-houses, and establishments for the rearing of silkworms and reeling silk. Ship-building is carried on at Cette and other towns on the coast. Mines of coal and copper, quarries of marble of different colours and much used for ornamental architecture, building- and mill-stone, slate, gypsum, and granite are worked. A vast deal of salt is made by evaporation on the lagunes and on the shore of the Mediterranean, this department being one of the chief sources for the supply of that article to France. The exports consist of most of the articles enumerated, but chiefly of wine, dried fruits, and brandy. The imports are wool, cotton bales, staves, colonial produce, raw hides, cork, &c. The principal sea-ports are Cette and Agde. There are 545 wind- and water-mills, 11 iron forges and foundries, and 861 factories of different sorts. About 100 fairs are held annually.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Montpellier . . .	14	113	148,649
2. Béziers	12	99	134,605
3. Lodève	5	72	56,700
4. St.-Pons	5	44	49,332
Total	36	328	389,286

1. Of the first arrondissement, and of the whole department, MONTPELLIER is the capital. *Aniane*, a pretty little town, 16 miles N.W. from Montpellier, is situated in a rich plain on the left bank of the Hérault, and has 2542 inhabitants, who manufacture cream of tartar, verdigris, black soap, chemical products, cotton-yarn, leather, and lime. This town owes its origin to the abbey built by St. Benoit d'Aniane, who died here A.D. 821: the abbey (now the parish) church is an elegant structure; the abbey buildings are turned into a cotton-factory. *Frontignan*, a small town with 2000 inhabitants, situated on the shore-lake of Maguelonne, and on the Montpellier-Cette railroad, is famous for the excellent muscadel wines and raisins produced in its neighbourhood. Near Frontignan is *Balaruc*, famous for its warm springs, which have enjoyed a long celebrity for the cure of paralytic and scrofulous affections. The bathing establishments, furnished hotels for the accommodation of visitors, and a general hospital for poor patients, forming a pretty village, stand on the northern shore of the lagune of Thau. There are two seasons, May and June, September and October. *Ganges*, 25 miles N. from Montpellier, is prettily situated in a fertile plain closed in by high hills, and on the left bank of the Hérault. It is surrounded by pretty country houses, and commanded by an old castle. The population amounts to 4564, who manufacture silk- and cotton-yarn, silk stockings, silk gloves, and leather. Near the town there is a very extensive grotto, which is said to surpass in beauty the famous grotto of Antiparos. A good deal of raw silk is produced in the canton of Ganges. *Lunel-la-Ville*, 14 miles E. from Montpellier, and on the railroad from that city to Nîmes, stands near the right bank of the Vidourle, in a district famous for its sweet wines, and has 6385 inhabitants. The most attractive objects in the town are the barracks, a fountain in form of an obelisk, and the public promenade. It has communication by the Lunel Canal, which terminates in the shore-lake of Mauguio, with the Rhône, the Mediterranean, and the Canal-du-Midi. There are several brandy, spirit, and liqueur distilleries; and the trade in corn, flour, wool, wine, raisins, manufactured goods, and colonial produce is considerable. *Marseillargues*, or *Marsillargues*, 16 miles E.N.E. from Montpellier, on the Vidourle, is situated in a very fertile district: it has a fine old castle, and 3529 inhabitants. *St. Martin-de-Londres*, 17 miles N.N.W. from Montpellier, is a small place of only 1100 inhabitants, but interesting for the remains of its feudal fortifications, and for the view from it of the old castle of La-Roquette, which stands on an eminence near the Pic-St. Loup, a volcanic mountain nearly 2000 feet high. Silk hosiery and charcoal are manufactured here. *Mauguio*, 7 miles from Montpellier, stands on the shore-lake of Mauguio, has some brandy distilleries and 2131 inhabitants. In the middle of the town there is a hill surmounted by a windmill, from which Aigues-Mortes and Cette, on the coast of the Mediterranean, and to the northward the Cévennes are visible. *Mèze*, 19 miles S. from Montpellier, stands in a productive vine district on the shore-lake of Thau, where it has a good harbour for small craft. It is a pretty town with 4348 inhabitants, who manufacture liqueurs, brandy, and salt, and trade in these articles and in wine, corn, &c. The ancient abbey of Vallemagne (the beautiful gothic church and cloisters of which, erected in the 13th century, are still entire) stands near Mèze, and forms one of the finest structures of the kind in France.

2. In the second arrondissement the chief town, *Béziers*, stands on a hill above the Orb and the Canal-du-Midi, in 43° 20' 31" N. lat.

3° 19' 10" E. long., 46 miles S.W. from Montpellier, and has 17,376 inhabitants in the commune. The streets are narrow and ill-laid out, but the houses are in general well built of stone. Béziers contains several buildings interesting for their architecture or their antiquity; the principal are the cathedral of St.-Nazaire; the churches of St.-Aphrodise and La-Madeleine; the former episcopal palace, which now serves for the residence of the sub-prefect and for courts of justice; the public library; the house of Pierre-Paul Riquet, the engineer of the Canal-du-Midi; the market-house; and the barracks. The town has tribunals of first instance and of commerce, and a college. The manufactures comprise woollen-cloth, silk hosiery, brandy, spirits, liqueurs, chemical products, thrown silk, soap, leather, paper, glass, &c.; the commerce of the town consists of these articles and of corn, wool, iron, wine, oil, fruits, &c. A steam-engine raises the waters of the Orb to a considerable height into a reservoir on the terrace, near the cathedral, whence the different quarters of the town are supplied. The Canal-du-Midi is carried through nine locks close to the town. The town of Béziers is ancient; it contains a few Roman remains, and is noted for the massacre of the Albigenses, July 22, 1209. *Agde* is noticed in a separate article. [AGDE.] Among the other more important places we notice the following; the population given in each case is that of the commune. *Bédarieux*, a well-built manufacturing town on the left bank of the Orb, which separates it from one of its suburbs, stands 18 miles N. from Béziers, and has a college, a council of prud'hommes, and 9012 inhabitants. Fine and coarse woollens, cotton and woollen hosiery, hats, soap, olive-oil, leather, and paper are manufactured. There are also dye-houses, glass works, and a copper foundry. The trade in wine and in the articles just named is extensive and important. *Capetang*, which gives name to the lagune of Capetang, stands on the Canal-du-Midi, and has 2000 inhabitants. *Florensac*, situated near the left bank of the Hérault in a rich district of vineyard and meadow land, has a population of 3454. *St.-Gervais*, a small town of 2573 inhabitants, is situated in a well-watered valley shut in between hills, 23 miles N. from Béziers. There are excellent coal mines near the town, and also marble quarries, and limekilns. *Montagnac*, the birthplace of Latude, celebrated for his long captivity in the Bastille, stands on the left bank of the Hérault, and has brandy distilleries, some unimportant manufactures, and 3466 inhabitants. *Pézénas*, an ancient town situated near the left bank of the Hérault, at its junction with the Peine, has a tribunal and chamber of commerce, an exchange, a college, and 7759 inhabitants. The town is well built, with pretty wide streets and good houses; the parish church and the theatre are the most remarkable buildings. The neighbourhood of the town is remarkably beautiful, and so well cultivated as to have gained for it the title of the Garden of Hérault. Pézénas is celebrated for its salubrity; several craters, now extinct, and masses of basalt, are seen near it. It was in this town that Molière wrote his 'Précieuses Ridicules.' The manufactures are linen, muslin, calico, woollen stuffs, hats, soap, chemical products, syrup and sugar of grapes, cotton-yarn and raw silk. There are also brandy and spirit distilleries, establishments for washing wool, and a considerable commerce in corn, olive-oil, fruits, &c. *Roujan*, a small place in a volcanic district, near the right bank of the Peine, has a population of 1627; near it there are extensive coal-mines, and also cold mineral springs. *Servian*, 6 miles N.E. from Béziers, has 2203 inhabitants. There is a castle here, the construction of which dates from the 11th century.

3. In the third arrondissement the chief town *Lodève* is situated in a valley at the foot of the Cévennes, on the left bank of the Ergue, which here receives the Salondres, 32 miles N.W. from Montpellier, in 43° 43' 57" N. lat., 2° 26' 10" E. long., and contains 10,793 inhabitants in the commune. It is the seat of tribunals of first instance and of commerce, and has also a chamber of commerce, a college, and a council of prud'hommes. The town is surrounded by strong walls, but the interior is badly built and ill laid out. The approaches to it are by avenues of fine trees. The air is pure, and the environs delightful; the hills around it are cultivated to their very summits, and plantations of the vine, the olive, and the mulberry everywhere meet the view. The most remarkable building in Lodève is the former cathedral church of St.-Etienne, which contains a beautiful mausoleum in white marble of one of the bishops of Lodève. The town is the centre of a great cloth manufacture, and is celebrated for its piece-dyed goods, which are exported to the Levant. Soldiers' uniforms, other woollen stuffs, soap, leather, &c., are also manufactured. *Clermont-Lodève*, 10 miles S. from Lodève, stands on the slope of a hill above the little river Ydromiel, and contains 6294 inhabitants in the commune. A college, a tribunal of commerce, a council of prud'hommes, and a savings bank are the principal institutions of the town. The most remarkable building is a handsome gothic church with aisles and nave (terminating in a beautiful apsis), a very lofty tower, and, over the principal entrance, a rose window of noble dimensions. The principal manufacture is piece-dyed cloth; but woollen and cotton hosiery, handkerchiefs, cotton-yarn, leather, brandy, and chemical products are also manufactured. *Gignac*, near the left bank of the Hérault, is situated 15 miles S.E. from Lodève, in a country covered with vineyards, olive grounds, and mulberry plantations, and has 2669 inhabitants, who manufacture verdigris, olive-oil, sugar, brandy, and woollen-yarn, and trade in agricultural produce.

GEOL. DIV. VOL. III.

4. In the fourth arrondissement the chief town, *St.-Pons*, stands on the Jaur, a feeder of the Orb, 60 miles W. from Montpellier, and has 6947 inhabitants in the commune. It is a well-built town; most of the houses are constructed of marble from the neighbouring quarries. The church of St.-Pons, which is classed as an historical monument, is one of the most interesting in the department. Within the town the Jaur receives the waters of a very abundant spring, which forms a vast basin of considerable depth; in front of this there are two immense elms, on the right a church built in the time of Charlemagne and well preserved, and on the left a gothic tower. The town has a tribunal of first instance, a college, and an ecclesiastical school; the waters of the Jaur drive the machinery of several corn and fulling mills, saw-works, dye-houses, &c. There are important manufactures of woollen cloth in this town; hosiery, woollen-yarn, and leather are also among its industrial products; and there is a good trade in corn, cattle, and marble. *St.-Christian*, important for the manufacture of piece-dyed woollen goods, brandy, and leather, stands in a rich valley watered by the Bernasobre, 12 miles S.E. from St.-Pons, and has 3627 inhabitants in the commune. *La-Salvetat*, 7 miles N.N.W. from St.-Pons, is situated among high mountains, near the right bank of the Agout, a feeder of the Tarn, and has a population of 4009, who manufacture flannel, woollen-cloth, woollen-yarn, and swanakin, and trade in wool, cattle, and the excellent butter of the neighbourhood, which is considered the best in all Languedoc.

The department forms the see of the bishop of Montpellier, is included in the jurisdiction of the High Court and University Academy of Montpellier, and belongs to the 8th Military Division, of which Montpellier is head-quarters. Besides the university of Montpellier there are in the same town a theological college, an ecclesiastical school, a royal college or high school, and a primary normal school. There are communal colleges in Agde, Bédarieux, Béziers, Clermont, and Pézenas. The Calvinists have churches in Montpellier, Montagnac, Massillargues, and Ganges. To the Legislative Body of the French empire the department returns three members.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Statistique de la France; Official Papers; Richard, Guide Classique du Voyageur en France et en Belgique.*)

HERCULA'NEUM, a very ancient Italian city, situated on the coast of Campania, about 5 miles E. from Naples by the railway to Nocera which passes near it. It is said to have been of Phœnician origin and to have been afterwards occupied by the Pelasgians and Oscans; but its history is obscure, and it seems never to have attained any importance. In the time of Titus, A.D. 79, it was overwhelmed by the memorable eruption of Vesuvius which also ruined Pompeii. It appears to have been buried under showers of ashes, subsequently overflowed by streams of lava, and it lies about 70 feet below the present surface of the ground. It was re-discovered by the sinking of a well in the village of Resina in 1706, when the remains of the theatre were discovered. This led to further investigation, and after several years, in which little was done, the Neapolitan government undertook the work of excavation. But the circumstance that the ground over the buried city is occupied by the large and populous villages of Resina and Portici, has thrown great difficulties in the way of the excavations, which have been carried on wholly by subterranean galleries. The theatre, a chalcidicum, and two temples are the chief buildings explored; the private houses are chiefly small, and of one story, like those of Pompeii. The whole excavation is said to have been about 600 yards long by 300 yards broad; but it being impossible to remove the incumbent soil, in consequence of its thickness, as fast as one part was thoroughly searched it was filled up with rubbish from another. The theatre alone is now accessible; it is a noble edifice built of stone in a very massive style, with 18 rows of seats, and capable of holding 8000 persons. A handsome street 36 feet wide and bordered with porticoes, led from the theatre to the forum, on the north side of which stood a basilica of a fine style of architecture; two small temples (the walls of one of which were decorated with beautiful paintings, now in the Museum of Naples); and a villa, in which were some beautiful statues, and a number of papyrus rolls containing some worthless treatises on the Epicurean philosophy, were discovered. The papyri were found in a state resembling charcoal, dry, and crumbling, the laminae, for the most part, strongly adhering to each other. The chief advantage as yet derived from Herculanum is the magnificent collection, not only of statues, paintings, and vases, but of domestic implements of every use and description, deposited in the Museum of Naples. These are figured and described in the magnificent work, 'L'Antichità d'Ercolano,' Nap., 1757, 10 vols. fol. Some excavations were made in 1853 and 1854, when the ground-floor of the houses situated on the declivity leading to the sea were laid open, but the results are hitherto unimportant. In Romaneli's 'Viaggio ad Ercolano,' and in Blewitt's 'Handbook of South Italy' will be found an account of the general results of the excavations made at Herculanum.

HERCULES, PILLARS OF. [GIBALTAR.]

HEREFORD, the county town of Herefordshire, a city, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated on the left bank of the river Wye, in 52° 4' N. lat., 2° 42' W. long., distant 134 miles W.N.W. from London by road. The population of the borough in 1851 was 12,103. The livings are in the archdeaconry and diocese of Hereford. The borough is governed

by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. Hereford Poor-Law Union contains 47 parishes and townships, with an area of 68,116 acres, and a population in 1861 of 25,768.

In early times this city was important as a garrison town to restrain the inroads of the Welsh. From the 11th to the 17th century it was the scene of various important military and political events. There are still some remains of ancient religious houses. The castle consisted of two wards of different dimensions, having a keep within the smaller: the Wye formed its defence on the south side; on other points it was defended by moats.

Hereford is situated in a broad, fertile, and well-cultivated valley. The principal streets are wide and straight, and well paved, and the town is lighted with gas. The shire-hall was built after a plan of Sir Robert Smirke's: it is of plain but pleasing exterior. The town-hall stands in the High Town. The guildhall is a brick building in a remote situation. The Union workhouse and the county jail stand outside the city. There is a neat new post-office. Several curious old half-timber houses are in the town. The principal churches are those of All Saints, St. Peter, St. Nicholas, and St. John. All Saints church faces Broad-street on the north; the steeple is tall and well-proportioned, but its external architecture is generally uninteresting. St. Peter's church, founded by Walter de Lacy in 1085, is a plain building, with a spire.

Hereford cathedral stands upon the south side of the city, not far from the Wye. Ethelbert, who was murdered at the instigation of Offa, was buried in Hereford church, and gifts were offered at his shrine, where it was asserted that miraculous appearances had been shown. Milfrid, the governor of the province in the time of Egbert, erected about the year 825 in honour of St. Ethelbert a new church of stone. This was replaced by a new edifice erected by Bishop Athelstan about 1030, which was demolished by the Welsh in 1065. The present cathedral was commenced in 1079 by Bishop Robert of Lorraine, and was completed about 1115. In 1786 the western portion of the cathedral fell, and alterations were subsequently made, the spire was removed, and a new western end added by Wyatt: these alterations however detracted both from the beauty and the stability of the building. During the last few years the work of repair and restoration has been very efficiently and thoroughly executed. The principal dimensions of the cathedral are—extreme length 850 feet, breadth 174 feet, height of nave 63 feet, breadth of nave 28 feet, height of tower 160 feet. The cathedral contains many monuments of great antiquity, some of which are highly ornamented. In the chapter-room is a curious map of the world, probably one of the oldest original maps in existence. Triennial music-meetings have for many years been held in the cathedral, in rotation with those of Gloucester and Worcester.

In the city there are places of worship for the principal denominations of Dissenters. The Roman Catholic chapel is of considerable dimensions. There is a Cathedral school of uncertain foundation; connected with it are about 40 scholarships; the number of scholars in 1858 was 60. There are several National, Parochial, and British schools, a Natural History Society, a permanent library, a mechanics institute, an infirmary, and a savings bank. The county assizes, the quarter sessions, and a county court are held in the city. Gloves are manufactured to some extent, and there is an iron-foundry. Five yearly fairs are held. The October fair is one of the most considerable cattle fairs in England. The market-days are Wednesday and Saturday; the great market is on the Wednesday after St. Andrew's day.

The diocese of Hereford is in the province of Canterbury. It extends over the greater part of Herefordshire, with parts of Shropshire, Worcestershire, Radnor, and Montgomeryshire, and comprises 358 benefices. It is divided into the archdeaconries of Hereford and Salop. The chapter consists of the dean, two archdeacons, four residentiary canons, a precentor, a chancellor, 24 non-residentiary prebendaries, and 6 vicars choral. The income of the bishop is fixed at 42000 a year.

HEREFORDSHIRE, an inland county of England, is bounded E. by Worcestershire and Gloucestershire; N. by Shropshire and a portion of Worcestershire; W. by Radnorshire, Brecknockshire, and part of Monmouthshire; and S. by Monmouthshire and Gloucestershire. Several detached portions of the county were by the Act 7 & 8 Vict., cap. 61, declared to be portions respectively of Shropshire, Worcestershire, Monmouthshire, and Radnorshire. By the same Act small portions of land belonging to other counties, but locally situated in Herefordshire, were declared to be part of Herefordshire. The county lies between 51° 49' and 52° 24' N. lat., 2° 20' and 3° 7' W. long. Its greatest length is about 40 miles; its greatest breadth is 34 miles. Its area is 836 square miles, or 534,823 acres. In 1851 the population was 115,489.

Surface, Hydrography, Communications.—The surface of this county is generally hilly, but the valleys occasionally expand into open plains. The Hatterel range of the Black Mountains, which forms its border on the west-south-west, is the highest land within its limits. In the south-west are the Saddlebow and Garway hills; in the south the hills near Walford and Penyard, and the long chain extending from the Lea northward; in the east the Malvern Hills, and the range

stretching northward, and comprising Bromyard Downs; on the north are the hills of Downton and Leintwardine. Near the centre of the county are Dinmore, Westhope, Badnage, and other hills.

The principal streams which water Herefordshire rise in the higher counties of South Wales. They are—the Wye, the Lugg, the Teme, the Arrow, the Frome, the Leddon, the Dover, and the Munnow.

The Wye, which rises in Plinlimmon, on the borders of Cardiganshire and Montgomeryshire, enters Herefordshire on its western side, and running at first in a northerly direction, becomes for a short distance its boundary from Radnorshire: near Clifford the river flows east-south-east with many windings through a broad and fertile valley until it reaches the city of Hereford. Between that city and the town of Ross its general course is south, but its windings are numerous. From Ross the Wye runs in a general south and south-west course, and again forming the boundary of Herefordshire for a few miles, finally leaves it near the Leya. It is imperfectly navigable throughout its course in this county. After northerly or westerly rains the water sometimes rises 8 feet, or even 10 feet, in the course of 24 hours. For picturesque beauty this river is justly celebrated: the bolder and more celebrated scenery does not indeed belong to this county, but the banks of the Wye are here very beautiful.

The Lugg, rising in Radnorshire, enters Herefordshire near the Combe, flows first in an easterly direction and then southerly to Mordiford, where it falls into the Wye. The Teme, a tributary of the Severn, rises in Radnorshire, enters Herefordshire near Brampton Brynu, and near Downton crosses the border into Shropshire. At Ludlow it again enters Herefordshire, which it finally quits near Burford. The other rivers are small. Trout abound in all these streams, but are seldom of great weight.

There is a canal to Ledbury from Gloucester, which it is intended to continue to Hereford. The canal from Leominster to the vicinity of Tenbury in Worcestershire is part of a projected line from Kington in Herefordshire to Stourport in Worcestershire, intended to communicate with the Stourport and Dudley Canal.

The principal turnpike roads run from Hereford to Ross, to Ledbury, to Hay, to Kington, to Abergavenny, to Monmouth, to Leominster, to Ludlow, and to Bromyard. The Shrewsbury and Hereford railway and the Newport and Abergavenny railway afford direct communication between Newport, Monmouthshire, and Shrewsbury. The Hereford and Gloucester railway is in operation a part of the way, but is not yet completed at the Hereford end. There are several tram-roads for the conveyance of minerals, &c.

Geology, Mineralogy, &c.—The whole of Herefordshire appears to consist geologically of old red-sandstone. On the eastern side the mean direction of the strata, as determined by the outline of the trap and sienitic ridges of Abberley and Malvern, is from north to south. But there are many aberrations from that direction, and innumerable local disturbances, curvatures, and faults. On the western boundary the prevailing strike of the deposits is from north-east to south-west. Limestone has been raised to the surface at Aymestry, Ledbury, and other places.

The valley of elevation at Woolhope is a very symmetrical example of the upper Silurian formation. The two superior formations of the grauwacke series are incurvated round a central dome-shaped mass composed of the shelly sandstones of the third formation, from which the strata dip away on all sides at angles varying from 15 to 70 degrees. The harder strata of each formation having resisted destruction, whilst the shales have been worn away, the former constitute the higher encircling ridges, the latter deep trenches of intervalation.

Climate, Soil, and Agriculture.—The climate of Herefordshire varies greatly, according to the elevation and exposure. The air is healthy, and the population long-lived. The soil of this county consists principally of a deep heavy red loam, which varies in its degree of tenacity: in some districts there is a substratum of clay; in others, gravel approaches nearer to the surface. The whole is extremely favourable to the growth of trees, especially the apple and the oak. Wheat, turnips, barley, clover, and peas or vetches, are raised in the valleys and less exposed elevations: wheat is the chief object of attention. Hop-gardens are common in the middle and eastern portions of the county. Orchards are numerous and general. Cider is made in large quantities.

The prevalent breed of cattle is that for which this county is justly celebrated; their colour is red, with white or mottled faces, and frequently white along the back and about the legs. Graziers from the south and the middle of England drive a large number of this popular stock from the Hereford Cattle-mas and October fairs. The usual breed of sheep is a cross between the Leicester and the Ryeland. Agricultural horses of average quality are bred in considerable number. The northern part of the county produces many useful riding and coach horses.

Political Divisions.—Herefordshire is divided into 11 hundreds:—Broxash, Grimsworth, Greytree, Ewyas Lacy, Huntingdon, Radlow, Stretford, Webtree, Wormilow, Wigmore, and Wolphy. These contain 221 parishes and 7 market-towns—BROMYARD, HEREFORD, ROSS, LEDBURY, LEOMINSTER, KINGTON, and WOELEY. Notices of these towns will be found under their respective titles. The following are the more important villages, with the population of the parishes in 1851, and a few other particulars:—

Abbey-Dore. [DORE-ABBEY.] *Bosbury*, 16 miles W. by N. from Hereford, population 1133, is pleasantly situated on the small river Leddon. The Free Grammar school has an income from endowment of 82*l.* a year, and had 85 scholars in 1851. *Cradley*, 17 miles E.S.E. from Hereford, population 1641, contains an Endowed Free school, which has an income from endowment of 20*l.* a year, and had 78 scholars in 1853. *Eardisland*, on the left bank of the river Arrow, 15 miles N.N.W. from Hereford: population, 889. The Free school, founded in 1607, has an income from endowment of 55*l.* a year, and had 75 scholars in 1851. There are also National schools. *Eardisley*, 15 miles W.N.W. from Hereford, population 811, is situated on both sides of a small river that runs into the Wye. There is a National school. Fairs for cattle and dairy produce are held on May 15th and October 18th. *Leintwardine*, 25 miles N.N.W. from Hereford, population 1607, is situated on the left bank of the river Teme, into which the river Clun flows about half a mile west from the village. In the church are beautiful specimens of stained glass. The rivers Teme and Clun are much resorted to for angling. Limestone is quarried in the neighbourhood. *Madley*, 6 miles W. by S. from Hereford, population 927, has a commodious and handsome church, chiefly of the decorated style, with an embattled tower at the west end. There is a chapel for Baptists. *Mordiford*, 4½ miles E.S.E. from Hereford, population 677, is situated on the left bank of the Frome, near its junction with the Wye. The church, dedicated to the Holy Rood, has a tower at the west end, erected in 1814. There are National and Infant schools. Hops are cultivated in the vicinity. Limestone is extensively quarried. Near Mordiford are remains of an ancient camp. *Orleton*, 20 miles N. from Hereford: population, 618. There are here National schools. A great cattle fair is held on April 24th. Hops are extensively cultivated. *Pembridge*, 15 miles N.W. by N. from Hereford, population 1319, on the banks of the river Arrow, has a commodious church with a steeple of peculiar construction detached from the churob. There are chapels for Wesleyan Methodists and Independents, National schools, and an hospital for six poor persons. Hops are cultivated to a considerable extent. *Shobdon*, 20 miles N.W. by N. from Hereford: population, 538. Schools for boys and girls are supported by Mr. and Mrs. Hanbury. Hops are cultivated in the vicinity. Near the church is a mount, with remains of an ancient fortification. *Wigmore*, 22 miles N.N.W. from Hereford, population 494, contains National schools for boys and girls. Fairs for horned cattle, horses, and sheep are held on April 16th, May 6th, and August 5th. Limestone is quarried extensively in the vicinity. On an elevation westward from the village are the remains of Wigmore Castle, including some massive fragments of the keep. A priory was founded here in the reign of Richard I.

The churches of Kilpeck and Moccas are perhaps the oldest in the county: they are small churches of early Norman date, with semicircular apses. Avenbury, Castle Frome, Stanford Bishop, and Mathon are also of Norman date. The churches most distinguished for architectural beauty are at Ledbury, Leominster, Weobley, Dilwyn, Pembridge, Madley, Burghill, Abbey-Dore, and Kilpeck. The principal family mansions are—Eastnor Castle, a modern building of great size, and of considerable beauty, situated near Ledbury; Holme Lacy, Hampton Court, Stoke Edith, Berrington, Shobdon, Croft Castle, Garnons, Foxley, Garnstone, Downton Castle, Kentchurch, Goodrich Court, Harewood, and Whitfield. Kinnersley Castle, situated in the parish of the same name, is one of the oldest inhabited houses that we are acquainted with: it is asserted that it was built before the Conquest. At Brinsop is a curious fortified house, now occupied as a farm-house.

In Herefordshire industry is occupied, with little exception, in agriculture and retail trade. The manufacture of gloves employs a considerable number of women in the central and western parts of the county; some coarse hats are also made.

Ecclesiastical and Legal Divisions.—With the exception of a few parishes which are in the diocese of St. David's, the whole county is comprised in the diocese of Hereford, of which it forms an archdeaconry. By the Poor-Law Commissioners the county is divided into eight Unions—Bromyard, Dore, Hereford, Kington, Ledbury, Leominster, Ross, and Weobley. The Unions include 238 parishes and townships, with an area of 483,670 acres, and a population in 1851 of 110,708. Herefordshire is included in the Oxford circuit: the assizes and quarter-sessions are held at Hereford. County-courts are held at Bromyard, Hereford, Kington, Ledbury, Leominster, and Ross. Three members are returned to Parliament for the county, two for the city of Hereford, and two for the borough of Leominster.

History and Antiquities.—The greater part if not the whole of Herefordshire was comprised in the territory of the Silures, and was conquered by the Roman general Julius Frontinus, about A.D. 73. A line of Roman and British entrenchments may be traced from the Malvern Hills to Whitbourn, Thornbury, Croft, Brandon (near Leintwardine), and Coxwall Knoll (near Brampton Bryan). There are also traces of a camp on the east of Leintwardine, near Downton. The Roman road called Watling-street entered the county near Brandon, passed through Wigmore to Kenchester, and thence by way of Kington and Dore to Abergavenny in Monmouthshire. A second Roman road traversed a small portion of the south of this county near Ross; a third entered it from Worcester, and passing Frome Hill, Grandison,

Luggbridge, and Stretton Sugwas, reached Kenchester. During the Heptarchy Herefordshire belonged to Mercia, and in 680 a synod was held at Hereford.

The Danes for the second time obtained possession of Mercia about 819, and appointed Cenolph king. Cenolph was defeated by Alured, king of the West Saxons, whose successor Egbert united the seven principalities into one monarchy. The position of Herefordshire relative to Wales subjected it to continual inroads from the Welsh. A considerable part of the county was included in the debatable land called the 'Marches,' and was consequently the scene of frequent contests. Harold, after subduing the Welsh in one of his expeditions, made an ordinance that if any Briton was found on the English side of Offa's dyke (an artificial boundary which in part of its great length has been traced through the county of Hereford), his right hand should be cut off by the king's officers. The strife continued and was carried on with more or less vigour during several reigns. The demolition of castles enforced by Henry II., in order to limit the power of his barons, had no very beneficial effect on the security of Herefordshire. These garrisons being destroyed, the Welsh, who had for a long time lived in comparative tranquillity, recommenced their depredations, which were not quelled until an English army had been marched against them. During the troubled times of Edward II., Herefordshire was the scene of many executions; among others Hugh De Spenser, Baldoe, and Reding, the immediate adherents of the king, were executed at Hereford. At a later period the rebellion of Owen Glyndwr threw the Marches into confusion, and renewed the feeling of insecurity which the Welsh had so frequently excited.

During the wars of York and Lancaster a battle was fought in 1461 at Mortimer's Cross, in the parish of Kingland, between the Earl of March and the army under the Earls of Pembroke and Ormond, and Owen Tudor, husband of Catherine of France, was taken prisoner and afterwards beheaded at Hereford. In the contest between the King and the Parliament, the city of Hereford was thrice in the possession of the Royalists, from whom in 1646 it was taken by Sir William Waller and Colonel Birch.

A pile of stones, called 'Arthur's Stone,' situated in the parish of Dorstone, constitutes the only remains of primeval antiquity.

Statistics.—According to the 'Census of Religious Worship and Education,' taken in 1851, it appears that there were then in the county 426 places of worship, of which 213 belonged to the Church of England, 115 to Primitive and Wesleyan Methodists, 20 to Independents, 16 to Baptists, and 32 to other bodies. The total number of sittings provided was 69,575. The number of Sunday schools was 161, with 9150 scholars: of these schools 109 belonged to the Church of England, 14 to Baptists, 12 to Independents, 9 to Wesleyan Methodists, 5 to Primitive Methodists, and 12 to other bodies. Of day schools there were in the county 303, of which 149 were public day schools with 8763 scholars, and 154 were private day schools with 2697 scholars. The number of evening schools for adults was 4, with 75 scholars. Of literary and scientific institutions there were 3, all in the city of Hereford, which had 415 members, with 6076 volumes in the libraries belonging to them. In 1852 the county had 6 savings banks—at Bromyard, Hereford, Kington, Ledbury, Leominster, and Ross: the total amount owing to depositors on November 20th 1852 was 240,483*l.* 8*s.*

HERM. [GUERNSEY.]

HERMANNSTADT (in Hungarian *Nagy-Seeben*, in Wallach *Szibin*), an important town of Transylvania, capital of the 'Land of the Saxons,' is situated in a beautiful and fertile valley watered by the Zibin, a feeder of the Alt (from which it derives its Latin name of Zibinnium, or Cebinnium), in 45° 47' 4" N. lat., 24° 9' 20" E. long., 60 miles W. from Cronstadt, double that distance E. from Temesvar, and about 6 miles from the northern entrance of the Rothernthurm Pass over the southern Carpathians into Wallachia: population, about 20,000. It consists of an upper and lower town, the former built on an eminence, and communicating with the latter by stone steps; the whole is surrounded by a double wall pierced by five gates and girt by a moat. In the upper town is an old fortress or citadel. The streets are in most instances narrow, but clean, and the houses are well and regularly built in a quaint gothic style. The principal, or market-square is spacious, surrounded by good buildings, and adorned with a handsome fountain. There are four Lutheran and three Catholic churches, a Calvinist and a Greek chapel, the military hospital and barracks, a house of correction, and a theatre in the town. The principal buildings are the Lutheran cathedral; the Briakenal palace, which contains a gymnasium, a picture gallery, a public library of 15,000 volumes, a large collection of medals, and a museum of Roman antiquities found in Transylvania; and the town-hall, an old gothic edifice, which contains the archives of the Saxon colony of Transylvania. Hermannstadt is the residence of the Austrian governor of Transylvania, and of a Greek bishop; it is the seat of the supreme tribunal of the province and of a financial board, and the head-quarters of the 12th corps of the Austrian army. The ramparts of Hermannstadt are laid out in pretty promenades, and the environs in which are three suburbs abound with beautiful scenery.

including near views of the Carpathians. The manufactures of the town comprise linen and woollen stuffs, horn-combs, felt-hats, ropes, pottery, paper, leather, and gunpowder. There is a considerable local trade, but the overland commerce with Wallachia, formerly so important, has almost disappeared. Of the inhabitants, the Saxon element is the most numerous. Among them are also Wallachs, Hungarians, Armenians, Greeks, Gipsies, and Jews.

HERTFORD, the county town of Hertfordshire, a municipal and parliamentary borough, market-town, and the seat of a Poor-Law Union, is situated chiefly on the right bank of the river Lea, in 51° 48' N. lat., 0° 4' W. long., distant 21 miles N. from London by road, and 26 miles by the Eastern Counties railway. The population of the borough in 1851 was 6605. The livings are in the archdeaconry of St. Albans and diocese of Rochester. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. Hertford Poor-Law Union contains 18 parishes and liberties, with an area of 34,830 acres, and a population in 1851 of 15,188.

The town of Hertford is irregularly laid out, but the streets are well paved and are lighted with gas. All Saints parish church is a large cruciform structure of the 14th century; St. Andrew's church is smaller, and is supposed to be of earlier date than All Saints. There are places of worship for Independents, Baptists, Wesleyan and Primitive Methodists, Roman Catholics, and Quakers. A branch of Christ's Hospital, or the Blue-Coat school, is maintained at Hertford. In 1853 the number of boys was 450, and of girls 70. Connected with the school is an infirmary to accommodate 100 sick children. In Hertford are also the Cowper Testimonial National schools, erected in 1841 in memory of Henry Cowper, Esq.; the Green-Coat school for 40 boys and 30 girls; Hale's Free Grammar school for boys; a School of Industry; an Industrial training college; Infant schools, a literary and scientific institute, a Mutual Instruction Society, and a savings bank. The General Infirmary is supported partly by endowment and in part by subscription. The Corn Exchange, erected in 1849, is covered with a glass roof. The Shire Hall, a spacious building, contains the courts of law, an assembly-room, grand jury-rooms, the town-hall, council-chamber, and other judicial and municipal offices. Some portions remain of an ancient castle. A handsome brick edifice was built on the site of the castle about the time of James I., but some parts of it are of older date. The county jail and house of correction is situated a little way eastward from the town; one ward of it is appropriated as the borough prison.

In Hertford as in other towns of the county a good deal of business is done in malting. There are many corn-mills in the vicinity. The market on Saturday is one of the largest corn-markets in the kingdom. There are four yearly fairs. Quarter sessions and a county court are held in the town.

Hertford is a place of considerable antiquity. In the civil war of the reign of John the castle, which had been built by Edward the Elder about 905, was taken, after a brave defence, by the Dauphin Louis and the revolted barons: it subsequently came to the crown, and was granted in succession to John of Gaunt, and to the queens of Henry IV., V., and VI. Queen Elizabeth occasionally resided and held her court in this castle.

HERTFORDSHIRE, an inland county of England, situated between 51° 36' and 52° 5' N. lat., 0° 13' E. and 0° 45' W. long. It is bounded N. by Cambridgeshire, E. by Essex, S. by Middlesex, W. by Buckinghamshire, and N.W. by Bedfordshire. Its greatest length is 39 miles; its greatest breadth about 25 miles. Its area is estimated at 669 square miles, or 391,141 acres. The population of the county in 1851 was 167,298.

Surface, Hydrography, and Communications.—Hertfordshire has no lofty hills. The highest elevations are the Chalk Downs, which form the continuation of the Chiltern Hills, north-eastward into Essex and Cambridgeshire. Kenworth Hill, just within the border of the county, near Dunstable (in Bedfordshire), is 908 feet high. The surface of the county is generally undulating, and from the abundance of woods presents a variety of pleasing scenery.

The rivers for the most part belong to the basin of the Thames. The principal are the Colne and the Lea; the Hiz and some other streams in the northern part of the county belong to the system of the Ouse. The Lea rises near Houghton Regis, in Bedfordshire; it enters Hertfordshire on the north-west side of the county, and flows 9 miles S.E. to the neighbourhood of Hatfield: hence it flows east-north-east to Ware. At Hertford it receives the Maran or Mimram and the Beane, and between Hertford and Ware the Rib; all on the left bank. From Ware it flows to the border of Hertfordshire and Essex, where it receives the Stort, also on the left bank. At Waltham Cross it quits Hertfordshire. The navigation commences at Hertford.

The Colne rises near Hatfield, in this county, and flows through a projecting part of the county of Middlesex into Hertfordshire again. It has a very circuitous course of 13 miles to the junction of the

Verlam or Muse, on its right bank, near St. Albans; from this point it flows by Watford and Rickmansworth, partly through and partly on the border of the county, till it quits it to form the boundary of Buckinghamshire and Middlesex. Some of the feeders of the Thames, another affluent of the Thames, have their sources in the north-western part of the county, near Tring.

The streams which belong to the system of the Ouse have but a small part of their course in this county. They rise on the northern slope of the Chalk Downs. They are the Oughton, the Hiz proper, and the Pirral.

The New River, which is brought to London from springs in the neighbourhood of Ware, has a feeder from the Lea near that town. A part of its course is in Hertfordshire; it is carried along the valley of the Lea, and nearly parallel to the course of that stream.

The Grand Junction Canal enters the county near Tring, and runs along the valleys of the Quin, the Gade, and the Colne, till it enters Middlesex. There are cuts from the main line in the neighbourhood of Tring, to Aylesbury, and to Wendover; and one near Watford to the town of Watford.

The high north road runs through this county, through Chipping Barnet, Hatfield, Stevenage, and Baldock: the Liverpool road branches off from the North road, and runs through St. Albans to Dunstable; the Cambridge road runs by Waltham Cross, Hoddesdon, Ware, and Puckeridge, where it divides into two branches, one of which passes through Buntingford and Royston.

The London and North-Western railway runs through this county, nearly in the line of the Grand Junction Canal. The Great Northern railway enters the county near Barnet, and passes through it in a generally northern direction, quitting it near Hitchin. From Hitchin a branch is carried to Royston, and thence continued to join the Eastern Counties line near Cambridge. The Eastern Counties railway skirts the south-eastern border of the county from Waltham Abbey to Bishop's Stortford. A short branch runs from the main line near Hoddesdon to Ware.

Geological Character.—This county is comprehended in the chalk basin of London. The south-eastern corner at Cheshunt, and the south-western part, comprehended within a line drawn from North Mimms by Ridgehall, Aldenham, and Bushey, to Harefield, in Middlesex, are occupied by the London clay. From under this the plastic clay crops out, and extends to a line drawn from the Stort, between Sawbridgeworth and Bishop's Stortford, to the north of Ware, Hertford, and Hatfield, to St. Albans, and thence along the valley of the Colne. To the north-west of this line all the county is occupied by the chalk, except a few spots along the border of Bedfordshire, where the subjacent strata crop out.

Climate, Soil, Agriculture.—The climate of Hertfordshire is as mild and genial as that of most of the inland counties. The harvest is early where the soil is light and rich, as is the case in some of the valleys. On the cold wet clays, which are found in some parts of the county, and the most exposed tops of the chalky hills, the crops are later. The whole of the county is upon chalk at a greater or less depth below the soil; and in the north-western part, toward Bedfordshire, the chalk rises to the surface in considerable hills. Where the chalk lies deeper, the soil on the hills is mostly a heavy clay; and the valleys between them have variations of gravel and loam much intermixed. Rich loam occurs on the borders of Essex.

The number of resident gentry in Hertfordshire tends to introduce a high state of cultivation around their immediate residences; but, as the mansions are generally erected in the driest and best situations, the cold wet clays are a good deal neglected; the roads also on the clay soils are not good.

There are many orchards in Hertfordshire, chiefly for apples and cherries, which are sold in London. In the poorer soils are many woods and coppices, but they are fast diminishing in number, and the land is being gradually brought into cultivation as arable or pasture.

There are no breeds of cattle peculiar to Hertfordshire. The Suffolk cart-horses are esteemed for farm work, being active and tractable. The grass-lands are reserved for hay, and there are few rough pastures.

Divisions, Towns, &c.—The county is divided into eight hundreds, namely:—Braughing, east; Broadwater, central; Cashio, central and south-west; Dacorum, west; Edwinstree, north-east; Hertford, south-east; Hitchin, north-west; Odsey, north. But several of the hundreds are most irregularly formed. Cashio, Dacorum, and Broadwater hundreds have outlying portions in various parts of the county.

Hertfordshire has no city: it contains two boroughs and market-towns, namely, HERTFORD and ST. ALBANS; and twelve other market-towns, namely, BALDOCK, BARNET, BERKHAMPTON, BISHOP'S STORTFORD, HATFIELD, HEMEL HEMPTSTEAD, HITCHIN, HODDESDON, ROYSTON, TRING, WARE, and WATFORD. The markets of BUNTINGFORD and RICKMANSWORTH have fallen into disuse; but they are still frequently enumerated as market-towns. The places which have their names printed in small capitals are described under their respective titles.

The following towns had mostly markets, which are now generally disused; the populations are those of 1851:—

Ashwell, 24 miles N.N.W. from Hertford, population 1425, is situated on the slope of the chalk hills. A small corn and cattle market is held on Thursday, and fairs in July and November. There

are here an Endowed school for boys, which is supported by the Merchant Taylors' Company, and a girls school. Roman coins have been found in the vicinity.

Braughin, 9 miles N.N.E. from Hertford, population 1246, on the site of the Roman station *Ad Fines*, is built on both sides of the small river *Quin*, near its junction with the *Rib*. The parish church, an ancient edifice, has a tower surmounted with a spire. The Independents have a place of worship. There are here an Endowed school for boys, and a National school for girls.

Hadham, *Much* or *Great*, 7 miles N.E. from Hertford, population 878, had anciently a palace, the site of which is now occupied by the Hadham Palace Lunatic Asylum. There are here National and Infant schools.

Hoddesdon, in Hertford hundred, 4 miles S.E. from Hertford, population of the hamlet 1854, consists chiefly of two long streets, which are well lighted: some of the inns are of old date, such as the *Bull*, mentioned by *Matthew Prior*, and the *Thatched House*, frequented by *Izaak Walton*, when angling in the *Lea*. *Hoddesdon* is still much resorted to by London anglers. The chapel erected in 1734, and repaired in 1827, is a neat and commodious structure. The Independents and Quakers have places of worship, and there are National, British, and Infant schools.

Redbourn, a small but ancient town on the right bank of the *Verlam*, 16 miles W. by N. from Hertford, population 2085, has three fairs in the year. Some corn-mills are in the vicinity; glove-making and the straw-plat manufacture employ some of the inhabitants. Near *Redbourn* is an ancient encampment called *Aubury*.

Sawbridgeworth, on the right bank of the river *Stort*, is 8 miles E. by N. from Hertford: population, 2571. Besides the parish church there are chapels for Independents and Baptists. There are a National and a Free school. Some corn-mills are in the vicinity. Malting is carried on. Fairs are held on April 23rd and October 20th.

Stevenage, 11 miles N.W. by N. from Hertford, population 2118, was formerly a market-town. The parish church contains a fine painted window at the east end. The Free Grammar school was founded in 1558: its endowment yields 67*l.* a year, with a house and garden free; there were 33 scholars in 1858. There are National schools for boys and girls.

Wheatthampstead, a small ancient town 10 miles W. by N. from Hertford, population 1908. The parish church is an old cruciform building, with a tower springing from the intersection. There are chapels for Independents and Methodists, and National and Infant schools. Paper-making, malting, and brewing are carried on.

The following are some of the more important villages in the county, with their parish populations in 1851, and a few other particulars:—

Barkway, 16 miles N. by E. from Hertford, population 1288, has a handsome church, containing in the windows some fragments of stained glass which formed part of a series representing the history of the creation. *Broxbourn*, 5 miles S.S.E. from Hertford, population 717, situated between the *Lea* and the *New River*, is a station on the Eastern Counties railway. The parish church, a commodious and handsome edifice in the perpendicular style, contains some fine monuments and a curious font. *Cheshunt*, 8 miles S. by E. from Hertford: population, 5579. The name appears in *Domesday Book* as *Cestre-hunt*, and it is probable there was a Roman station here. There are here Free, National, Infant, and Industrial schools, and a Vicarage school. *Cheshunt Park* was formerly the residence of *Cardinal Wolsey*, of *James I.*, and of *Richard Cromwell*. *Cheshunt College* is an institution founded by the Countess of *Huntingdon* for training candidates for the ministry. The students reside in the college buildings, and pursue a course of theological and classical studies during several years. The number of students in 1853 was 23. In this parish is *Waltham Cross*, situated near the *Essex* border. The beautiful cross erected here by *Edward I.* to mark one of the resting-places of the corpse of *Queen Eleanor* on its way to *Westminster* for interment, was restored a few years back by *Mr. W. B. Clarke*.

Haileybury, in the parish of *Great Amwell*, situated about 3 miles S.E. from Hertford, is the site of the *East India College*, which contained 85 inmates in 1851. The college, which was founded in 1806, contains residences for the principal and for several professors, and accommodation for 100 students, who are trained for the civil service of the *East India Company*; about 30 are sent out to *India* every year. The number of students in June 1853 was 91. *Hertingfordbury*, 2 miles W. by S. from Hertford, population 752, on the right side of the small river *Maran*, a feeder of the *Lea*. In the church is a vault belonging to the family of *Earl Cowper*, the design and workmanship of which are much admired. *Earl Cowper's* seat, *Panshanger*, is about a mile north-west from the village; in the park is a celebrated large oak-tree, which is about 17 feet in girth at a height of 5 feet from the ground: in the house are some fine paintings. *Abbot's Langley*, 20 miles W.S.W. from Hertford, population 2384, was the birthplace of *Pope Nicholas Breakspere*, the only Englishman who has ever occupied the *Papal* chair. There is here a National school. There are paper-mills and corn-mills in the vicinity. *King's Langley*, 21 miles W.S.W. from Hertford: population, 1599. The church, which is partly in the Norman style, is situated on elevated ground near the small river *Gade*, and consists of a chancel and nave, with a tower at

the west end. There is here a type-foundry. Brewing is carried on, and the straw-plat manufacture employs some of the inhabitants. *Standon*, 8 miles N.N.E. from Hertford, population 2462, including 106 inmates of *St. Edmund's College*, has an ancient church; National schools for boys and girls; and the Roman Catholic College of *St. Edmund*, the buildings of which are of considerable extent. Paper-making and rope- and twine-making employ some of the inhabitants. *Watton*, 5 miles N. by W. from Hertford, population 976, has a church, National and Infant schools, and a savings bank. An extensive water-mill and a malting establishment are in the village.

Divisions for Ecclesiastical and Legal Purposes.—Hertfordshire is comprehended in the diocese of *Rocheater* and archdeaconry of *St. Albans*. County courts are held in *Barnet*, *Bishop Stortford*, *Hertford*, *Hitchin*, *Waltham*, and *Watford*. The county is divided by the *Poor-Law Commissioners* into 13 Unions:—*St. Albans*, *Barnet*, *Berkhampstead*, *Bishop's Stortford*, *Buntingford*, *Hatfield*, *Hemel Hempstead*, *Hertford*, *Hitchin*, *Royston*, *Ware*, *Watford*, and *Welwyn*. These Unions, which extend somewhat beyond the county, contain 174 parishes and townships, with an area of 453,345 acres, and a population in 1851 of 186,176. Hertfordshire is included in the *Home circuit*. The assizes and quarter-sessions are held at Hertford, except for the hundred of *Cashio*, the quarter-sessions for which are held at *St. Albans*. The county returns three members to the *Imperial Parliament*. Two members are returned for the borough of *Hertford*. *St. Albans* returned two members, but was disfranchised in 1852 for corruption and bribery in the election of representatives to *Parliament*.

History and Antiquities.—At the time of *Cæsar's* invasion Hertfordshire seems to have belonged to the *Catyeuchlani*, or *Catuallani*, of whom we have elsewhere supposed *Cassivellaunus*, the antagonist of *Cæsar* (B.C. 54) to have been the chief. [BRITANNIA.] In the revolt under *Boadicea* (A.D. 61), *Verolamium* was taken and the inhabitants massacred. The martyrdom of *Alban* occurred during the persecution in the reign of *Diocletian*.

Several of the ancient British roads or trackways crossed this county: *Watling-street* crossed it in a north-west direction, not varying much from that of the present road from *London* by *Edgware* and *St. Albans* to *Dunstable*; *Ermine-street* nearly coincided with the present road from *London* by *Enfield*, *Ware*, and *Buntingford* to *Royston*; *Icknield-street* ran along the downs from *Dunstable* towards *Royston*. The *Verolamium* of the Romans has been mentioned as having been probably a British town: it has been conjectured that there were British towns or posts at *Royston*, at *Braughing*, at *Raven-sburg*, and perhaps at other places. The Romans included Hertfordshire in the province of *Flavia Cesariensis*. They fortified the town *Verolamium*, near *St. Albans* [ALBANS, ST.], on which they conferred the rank of a municipium; and made military roads along *Watling* and *Ermine* streets, and in other directions. A Roman post or town, *Ad Fines*, on the *Ermine-street*, was most probably at *Braughing*, where are the remains of a vallum of a regular shape, and where a tessellated pavement, many silver coins, and other Roman antiquities have been found. At *Wilbury Hill*, three miles west of *Baldock*, are remains of an ancient camp on the *Icknield-way*, inclosing about seven acres. Between *Caldecote* and *Hinxworth*, five miles north of *Baldock*, various Roman antiquities have been dug up. Roman antiquities have been found at *Ashwell*; in *Rockley Wood*, near *Royston*; at *Westmill*, near *Braughing*, and at *Bishop's Stortford*, *Cheshunt*, and *Hemel Hempstead*. When the Saxons subjugated Britain, Hertfordshire appears to have been included in the two kingdoms of *Essex* and *Mercia*.

In the invasions of the Northmen which troubled the close of the reign of *Alfred* (A.D. 896), they brought their vessels up the *Lea* to the neighbourhood probably of Hertford or *Ware*; but *Alfred*, who pursued them, diverted the waters of the *Lea* into another channel, and obliged the Northmen to abandon their vessels and march across the island to the *Severn*.

When *William the Conqueror*, after the battle of *Hastings* (1066), advanced into the interior of the kingdom, his march was impeded near *Berkhampstead* by *Frederick*, abbot of *St. Albans*, who obliged the *Conqueror* to come to terms, by swearing, in a grand assembly of the clergy and nobles at *Berkhampstead*, to govern according to the ancient laws of the realm, and especially those of *St. Edward* the Confessor. Hertford Castle was defended for *King John* by *Walter de Godarvil*, a retainer of *Fulke de Brent*, against the revolted barons and the *Dauphin Louis* of France. In the reign of *Edward II.* the barons, who were confederated against *Gaveston* the king's favourite, assembled their troops at *Wheatthampstead*, a few miles from *St. Albans*, 1312. After the general rising of the peasantry under *Wat Tyler* and *Jack Straw* many of the ringleaders were tried and executed at *St. Albans*, the king being there at the time with a guard of 1000 men.

In the war of the *Roses* this county was repeatedly the scene of contest. In 1455 *Richard*, duke of *York*, and the earls of *Salisbury* and *Warwick*, at the head of 3000 men, advanced towards *London* in order to seize and bring to trial the *Duke of Somerset*, who had been impeached of treason by the *House of Commons*, but released by the influence of the queen, *Margaret of Anjou*. They stormed the town of *St. Albans*, which was occupied by the king, who had advanced

from London with a body of 2000 men to impede their progress. The Duke of Somerset and several other nobles and gentlemen of the Royalist side fell in the battle, and the king himself was wounded and taken prisoner. In 1461 a second battle was fought at St. Albans. The queen, who had just vanquished and slain the Duke of York at Wakefield in Yorkshire, was advancing to London when she was met near St. Albans by the Yorkists under the Earl of Warwick, having the king with them. The Lancastrians prevailed, and the king was restored to his own party.

Of the monastic or castellated buildings of the middle ages Hertfordshire possesses but few remains. St. Alban's Abbey is the chief; to which may be added Royston church, formerly conventual, and some remains of the priories at Hitchin and Wara. There are castles at Hertford and Berkhamstead; some slight remains of a castle at Bishop's Stortford, and the earthworks of Anstey or Anstie Castle, between Royston and Bishop's Stortford. Waltham Cross and Hatfield Palace have been already noticed. There are some remains of a palace built by King Henry III. at King's Langley.

On the breaking out of the war between Charles I. and the Parliament, Cromwell, while yet captain of a troop of horse which he had raised, arrested the high-sheriff of Hertfordshire as he was proceeding to St. Albans to publish the king's proclamation declaring all the parliamentary commanders traitors. No public event has since occurred of any moment connected with the county.

Statistics.—According to the Census Returns of 1851 there were then in the county 347 places of worship, with 95,585 sittings. Of these places of worship 162 belonged to the Church of England, 60 to Primitive and Wesleyan Methodists, 47 to Independents, 44 to Baptists, 7 to Quakers, 6 to the Countess of Huntingdon's Connexion, and 21 to other bodies. The number of Sunday schools was 236 with 20,584 scholars. Of these schools 137 belonged to the Church of England, 34 to Independents, 32 to Methodists, 27 to Baptists, and 6 to other bodies. Of day schools there were 554, of which 244 were public day schools with 17,507 scholars, and 310 were private day schools with 5866 scholars. The number of evening schools for adults in 1851 was 12 with 225 scholars. There were in the county 18 scientific and literary institutions, with an aggregate membership of 1410, and libraries containing in all 7916 volumes. In 1852 the county contained 8 savings banks, at Baldock, Bishop Stortford, Buntingford, Cheshunt, Hemel Hempstead, Hertford, Hitchin, and Watford. The total amount owing to depositors on November 20th 1852 was 155,668*l.* 16*s.* 7*d.*

HESKET, and HESKET NEWMARKET. [CUMBERLAND.]

HESSE-CASSEL, a small state in Germany with the title of Electorate, is situated between 50° 6' and 52° 25' N. lat., 8° 25' and 10° 45' E. long. It consists of three distinct portions, of which the largest, extending only to 50° 40' N. lat., 10° 15' E. long., is bounded N.E. by Hanover and the Prussian province of Saxony, E. by Weimar and Bavaria, S. by Bavaria, and W. by Nassau and Hesse-Darmstadt. The detached portions are the county of Schaumburg to the north, surrounded by Hanover and Lippe, and the lordship of Schmalkalden to the east, surrounded by the Saxon principalities and the Prussian circle of Schleusingen. The area of the whole is 4420 square miles.

Divisions.—The electorate is divided into four provinces, which, with their respective area and population, are as follows:—

Provinces.	Area in Square Miles.	Population in 1846.
Upper Hesse, with Schaumburg	2,080	366,663
Lower Hesse	874	122,432
Fulda	884	140,713
Hanau	582	124,782
Total	4,420	754,590

Face of the Country, Soil, and Climate.—The country is in general hilly; but it contains numerous valleys, which in some places expand into more extensive plains. On the south-east and south the Thüringer-wald, the Rhöngebirge, and the Spessart extend their branches into the country from the Saxon duchies and Bavaria, and cover the province of Hanau, and the whole tract between the Werra and the Fulda. Schmalkalden is situated on the Thüringer-wald (Thüringian mountain), on the northern frontier of which is the Inselberg (2932 feet high). In Hesse proper the highest point is the Meissner, to the south-east of Almerode (2325 feet). The Thüringer-wald is thickly wooded, chiefly with red pine and fir. The other principal chains are the Hundsrück, the Wesergebirge, and the Vogelgebirge. The soil of Hesse is not distinguished in general by great fertility, but it can by no means be called sterile. The finest parts are the beautiful valleys of the Fulda, the Schwalm, the Eder, and the Werra. The climate is on the whole temperate, and everywhere healthy; mildest on the banks of the Main, and most severe in the province of Fulda, on the summits of the Rhöngebirge. The principal rivers are the Main, the Weser, the Werra, the Lahn, and the Fulda. The last, though not the largest, is the most important river of Hesse; rising in Bavaria, it traverses the circles of Fulda, Hersfeld, Röttingen, Meisingen, and Cassel, becomes navigable at Fulda, and

joins the Werra at Münden, in the kingdom of Hanover, both together forming the Weser. The Main only just touches the south-west corner of the country, and being joined by the Kinzig near Hanau, flows into the Rhine. The Lahn, traversing the circle of Marburg, joins the Rhine below Coblenz. There are no lakes, but numerous large ponds, of which there are 40 of various sizes in the district of Diemel alone. The railway from Frankfurt-am-Main through Marburg to Cassel is connected at its northern end by the Thüringian railway with Prussia and Saxony, and by the Westphalian lines with Hanover and Belgium. By the trunk-lines up the right bank of the Rhine and the branches that open upon it, the province is connected with Würtemberg, Bavaria, Baden, and Switzerland; and by a branch now in course of construction from Frankfurt through Hanau (thus far it is completed) and Würzburg, the electorate communicates at Bamberg with the great railway of central Germany, connecting Munich with Leipzig, Dresden, and Berlin.

Natural Productions.—Rye, barley, oats, wheat, maize, pulse, and potatoes in great abundance are cultivated. Flax and timber are staple articles: tobacco, hemp, madder, some hops, and rapeseed are also among the products. The vine is cultivated only in some parts of Hanau. The pasturage is in general good. Garden produce of excellent quality is raised about Cassel and Hanau; fruits are cultivated chiefly in Upper Hesse, Hanau, and Hersfeld, whence large quantities of dried fruits are exported. Apples are extensively grown for making cider. The breeding of cattle is pretty general: there are horses enough for the purposes of agriculture; and sheep chiefly in Lower Hesse, Hanau, and Fulda. Domestic poultry and game are very abundant. Hesse abounds in mineral wealth, producing silver, copper, lead, iron, quicksilver, cobalt, salt (from saline springs in great quantities), saltpetre, vitriol, and alum. There are also coal, marble, very fine white alabaster, porcelain-clay, potters'-earth, and pipe-clay, &c. Turf, which is abundant, is used for fuel. There are numerous mineral springs; those of Neundorf are much frequented for sulphur baths.

Manufactures and Trade.—Manufactures, which are carried on chiefly in Cassel, Hanau, and Fulda, have extended considerably since the electorate joined the Zollverein in 1832. The principal are linen, flannel, and carpets; fine linen is made in Cassel and Herzberg;—silks, velvets, carpets, and jewellery at Hanau. Cotton-spinning and weaving has been introduced, and is become pretty general, especially about Fulda, where the cotton trade is supplanting the linen manufacture. Schmalkalden manufactures almost all the steel and iron of the country, it produces timber (and little else) which is used in the smelting-works and iron-furnaces, of which there are seven in the country. Grossalmerode is celebrated for its crucibles and pottery, which are exported to all parts of the world. Other manufactures are paper, musical instruments, chemical products, beet-root sugar, tobacco, wooden-ware, &c. With respect to trade, there is properly no commercial town, and the two fairs at Cassel are of little importance. The chief exports are the industrial products enumerated, timber, wrought iron, salt, &c. The imports are colonial produce, wines, silk, cotton, brandy, &c. The transit trade by the Main, the Weser, the Werra, and the Fulda, but more especially by means of railways, is very important.

Revenue, Government, &c.—By the triennial budget for 1852-54, the expenditure for the three years is estimated at 13,932,790 dollars, and the receipts at 12,475,440 dollars; leaving a deficiency on the period of 1,457,350 dollars. In 1840, the latest year of which a statement is given, the public debt was 1,642,566 dollars, bearing interest at 3½ per cent.

The army consists of six regiments of infantry of the line, two battalions of foot-guards, two battalions of light infantry, and two regiments of cavalry.

The Constitution of January 1831 was one of the most liberal in Germany. The states formed only one chamber; and all laws were debated in the chamber, which had the control over the taxes. The electoral dignity is hereditary, to the exclusion of females. Though there is no longer an emperor of Germany, and consequently no elector, the sovereign retains the title of elector or prince elector (Kur-Fürst). The elector is assisted by a council of ministers.

Education.—The court and great majority of the inhabitants are Calvinists, the Roman Catholics number 102,000, the Jews about 9000. A law for the emancipation of the Jews was passed in 1833. The Calvinists are under superintendents, and the Roman Catholics under the bishop of Fulda. Hesse has a university at Marburg, the oldest Protestant university in Germany, founded in 1527: it has faculties of Calvinist theology, law, medicine, and philosophy, and had 62 professors and teachers in 1850, and 263 students. The library contains 100,000 volumes. Among other establishments for superior education are the six gymnasia or lycœums of Cassel, Marburg, Fulda, Rinteln, Hersfeld, and Hanau, which were attended by a total number of pupils amounting to 923 in 1850. There is a Catholic theological seminary in Fulda. Elementary schools are established throughout the state.

Divisions and Towns.—Lower Hesse is divided into ten circles. The chief town is Cassel, the capital of the electorate, which is noticed in a separate article. [CASSEL.] *Bschwege*, on the Werra, 25 miles

E.S.E. from Cassel, has 6000 inhabitants, who manufacture woollen stuffs, canvass, ribands, needles, iron-ware, and machinery. Among the other towns are *Frislar*, 20 miles S.W. from Cassel, with an Ursuline convent and 3000 inhabitants; *Hofgeismar*, a small walled town 15 miles N.N.W. from Cassel, population 3500; *Melungen*, another walled town on the left bank of the Fulda, 15 miles S. from Cassel, with a castle and about 4000 inhabitants, who manufacture woollen cloth; *Rothemburg*, on the Fulda, 24 miles S.E. from Cassel, with a palace, formerly the residence of the landgrave, 4 churches, and 3000 inhabitants; *Kinteln*, capital of the detached county of Schaumburg, situated on the Weser, 10 miles S.E. from Minden, population 3200; *Homburg*, on the Elze, 22 miles S. from Cassel, with a population of about 4000, employed in woollen and linen manufactures, brewing, distilling, and in the iron-mines near it.

Upper Hesse, which comprises the most western part of the electorate, is divided into four circles. Its chief town is *MARBURG*. The other towns are small; but among them may be named *Frankenberg*, on the Eder, 19 miles N. from Marburg: population, 3300.

The province of Fulda comprises the south-eastern part of Hesse-Cassel, and consists of—1, the former duchy of Fulda, chief town Fulda; 2, the circle of Hersfeld, chief town Hersfeld; 3, the circle of Hünfeld; and 4, of the lordship of Schmalkalden, which lies on the Upper Werra, between Saxe-Gotha and Saxe-Meiningen. This province and the chief towns in it are noticed under *FULDA*.

The province of Hanau comprises the most southern part of the electorate, and lies east of the territory of Frankfurt-am-Main. It is divided into four circles, and has for its chief town *HANAU*, which is noticed in a separate article.

From the time of William IV. (1592), Hesse-Cassel, though it suffered much in the successive wars which desolated Germany, did not sustain any loss of territory, but on the contrary it made several acquisitions. After the Thirty Years' War Hessian mercenaries were hired out to foreign powers; a system which greatly enriched the princes of Hesse. Frederick II., who succeeded to the government in 1760, embraced the Roman Catholic religion, but made no change in the constitution, and had his children educated Protestants. He let out several thousand men to England in the American war, and received for them, from 1776 to 1784, above three millions sterling. He died in 1785, and was succeeded by the landgrave William IX., who in the war of the French revolution not only furnished his contingent as a prince of the empire, but had also a body of troops in the pay of England. In the French revolution his dominions on the left bank of the Rhine were seized by the French. In 1803 he assumed the title of Elector as William I. In 1806 his territories were seized by Napoleon, and incorporated with the new kingdom of Westphalia. After the battle of Leipzig (1813) he returned to his capital, and subsequently became a member of the Germanic Confederation. He did not live on good terms with his subjects, who were disappointed in their expectations of obtaining a new constitution. He died in 1821, and was succeeded by his son William II., who embroiled himself still more seriously with his subjects by his connection with the Countess of Reichenbach. In 1830 serious riots broke out; the countess left Cassel; and on the 9th of January in the following year the elector presented his subjects with the long-promised constitution. Fresh disturbances however arose in consequence of the return of the countess; and the elector was so angry that he also left Cassel, and could not be induced to return. He appointed his son, the electoral prince, regent, who entered on his functions October 1, 1831.

Hesse-Cassel joined the Prussian Customs Union (*Zollverein*) in 1832. With the exception of some discontent consequent upon this step, the electorate enjoyed tranquillity till the year 1850. In that year, when re-action set in against the revolutionary doctrines and movements which had kept Germany in commotion since 1848, the chamber of Hesse-Cassel was not summoned to meet till the unusually late date of August 26, and was then asked to authorise the receipt of taxes till the 30th of September, when a budget would be presented. The assembly voted the receipt of indirect taxes, but refused, in the absence of a budget, to authorise the levy of direct taxes. On the 2nd of September the assembly was dissolved, and the elector subsequently ordered his subjects to pay the taxes as usual. A system of passive resistance soon developed itself against this arbitrary proclamation; a decree of the elector followed in a few days declaring his dominions in a state of siege, suppressing the journals, and prohibiting popular meetings. The elector on the 14th of September transferred the seat of government from Cassel to Bockenheim, a small town in the province of Hanau, not far from Frankfurt-am-Main, and claimed the protection of the Germanic Confederation. The Frankfurt diet then sitting passed a resolution condemning the Hessian chamber, and promising to take steps for the re-establishment of legal order in the electorate. Prussia then interfered in the quarrel, protesting against the jurisdiction of the diet, to which she and several of the German states had refused to send representatives. Austria, on the other hand, supported the resolution of the diet, as binding upon the states represented, at all events. Angry notes followed between the two powers: the armies of both states were put in motion. Prussia took possession of the military road through Hersfeld with a force under General Gröben, with part of which he occupied Cassel and Fulda. Bavarian troops entered the

territory of Hesse at Hanau, supported by a division of the Austrian army under Field-Marshal Legeditz, who advanced upon Fulda, from which the Prussians retired for (it was said) strategic reasons. Everything threatened an angry civil war in Germany, when at a conference held at Olmütz between Prince Swarzenburg and Baron Manteuffel, it was agreed to settle the affairs of Hesse and of Holstein (for thither also the Austrians were on march to support the federal diet against Prussia) by means of two commissioners, one appointed by the Confederation and the other by Prussia. Accordingly the Prussians withdrew from the military road, and the Federal commissioner, Field-Marshal Count de Linange, conducted the elector back to Cassel on the 27th of December.

HESSE-DARMSTADT, a grand-duchy in the west of Germany which is governed by the second main branch of the house of Hesse, was founded in 1567 by George I., youngest son of Philip the Generous, of whose dominion he obtained one-eighth with Darmstadt, and a small addition on the death of his brother Philip without issue. On the death of George his dominions were divided among his three sons. Louis V. succeeded him in the principal line; Philip obtained Butzbach, which reverted on his death to the main line; and Frederick, the youngest, was the founder of the junior line of Hesse-Darmstadt, namely, that of Hesse-Homburg. Excepting the ruinous effects of the Thirty Years' War, the reigns of the succeeding princes were on the whole prosperous, and various acquisitions of territory were made. Louis IX., who found the country burdened with debt, which he paid off, left to his son, Louis X., an improved territory with 300,000 inhabitants at his death in 1790. Louis X., during his long reign of 40 years, acquired very large additions to the extent of his dominions and the number of his subjects by the treaty of Luneville in 1801. In 1806 he joined the Confederation of the Rhine, and obtained from Napoleon still further accessions of territory, with 112,000 inhabitants, and the dignity of Grand-duke, on which he took the title of Louis I. In 1809 his troops acted against Austria, and the peace brought him new accessions of territory. In 1813 he let his troops serve with the French; but after the battle of Leipzig he joined the allies, on their engaging to let him retain his newly-acquired provinces. In 1815 the grand-duke joined the German Confederation. By the decision of the congress at Vienna he indeed made large cessions on the right bank of the Rhine, with 185,000 inhabitants, to suit the convenience of Prussia and other states, but obtained on the left bank a part of the then late French department of Mont-Tonnère, with Bingen, Mainz, and other towns, containing altogether 203,854 inhabitants; so that he gained an addition of above 18,000 subjects.

The grand-duchy of Hesse-Darmstadt consists of two large portions, which are separated from each other by a long strip of land, extending from east to west, belonging to Hesse-Cassel and the city of Frankfurt. The grand-duchy from Wimpfen, a small detached portion surrounded by Würtemberg, to Bingen its most western point, is situated between 49° 12' and 51° 20' N. lat., 7° 50' and 9° 40' E. long. The northern portion is bounded W. by Prussia and Nassau; N.E. and S. by Hesse-Cassel. The southern portion is bounded N. by Nassau, Frankfurt, and Hesse-Cassel; and on the other sides by Bavaria and Baden. The area of the whole is 3231 square miles, and the population, according to the census of 1851, was 854,314.

Divisions.—The grand-duchy is divided into 3 provinces:—

1. *Ober-Hessen, or Upper Hesse*, has an area of 1542 square miles, and a population of 309,617; chief towns, Giessen, the provincial capital [*GIESSEN*], Friedberg (3000 inhabitants), Büdingen (2700 inhabitants), Alsfeld (3700 inhabitants), Lauterbach (3400 inhabitants), Schlitz (3200 inhabitants), Biedenkopf, on the Lahn (3200 inhabitants).

2. *Starkenbury* has an area of 1159 square miles, and a population of 319,050; chief towns, Darmstadt the capital of the grand-duchy [*DARMSTADT*], Pfungstadt (3000 inhabitants), Griesheim (2900 inhabitants), Bensheim (4000 inhabitants), Heppenheim (4100 inhabitants), Gernsheim (2900 inhabitants), Lampertheim (3000 inhabitants), Dieburg (3000 inhabitants), and Offenbach-am-Main (10,000 inhabitants). Near Heppenheim is the castle of Starckenburg, which gives name to the province. *Offenbach*, 4 miles S.E. from Frankfurt, stands on the left bank of the Main, which is here crossed by a bridge of boats. It has a castle the residence of the princes of Isenburg-Birstein, several churches and schools, and important manufactures of hosiery, carpets, cotton and woollen stuffs, carriages, pipes, musical instruments, and jewellery.

3. *Rhein-Hessen, or Rhenish Hesse*, has an area of 529 square miles, and a population of 225,647; chief towns, Oppenheim (2400 inhabitants), Mainz, the greatest fortress of the German confederation [*MAINZ*]; Worms (9500 inhabitants) [*WORMS*], Alzey (4500 inhabitants); and Bingen on the left bank of the Rhine at the mouth of the Nahe, population about 5000.

To the province of Upper Hesse belongs the entirely detached district of Wöhl, or Itter, the most northern part of the grand-duchy, a wild sterile country, surrounded by the territory of Waldeck.

The grand-duchy of Hesse, as a member of the German Confederation, is the ninth in rank, has three votes in the full council and one in the minor council, furnishes a contingent of 6195 men, and contributes 1500 florins annually to the treasury of the Confederation.

Ober-Hessen is traversed by the railway from Frankfurt-am-Main to

Cassel, which passes through Giessen. The Main-Neckar line, from Frankfurt to Heidelberg, traverses the province of Starkenburg, in which it passes through Darmstadt, Bensheim, and Heppenheim. The Main-Neckar line runs nearly parallel to and at a little distance west of the famous Roman road called Bergstrasse, which extends from near Darmstadt to Heidelberg, and traverses the district that lies at the western base of the Odenwald, the most beautiful region in Germany—so beautiful that it is popularly called the 'German Paradise.' The region itself is sometimes called the Bergstrasse. The province of Rhein-Hessen is traversed by the railway from Mayence to Paris, which passes through Worms.

Face of the Country, Soil, Climate.—A large part of the surface of the country is mountainous. The banks of the Rhine, and the Wetterau (valley of the Wetter in Oberhessen), which contain about 400 square miles, are pretty level and very fertile; the remainder of the country is traversed by branches of the Vogelsgebirge, the Odenwald, Taunus, and the Westerwald; but of the two latter only small portions extend into the grand-duchy. The Vogelsgebirge, in Upper Hesse, is a volcanic mass, which with its branches occupies 400 square miles: it consists chiefly of basalt, and of various compact and porous lavas. The Odenwald, in Starkenburg, presents a pleasing and picturesque rather than a wild mountain character. Most of its summits are clothed with forests of oak, beech, and fir, while the broad well-watered valleys and middle declivities are covered with numerous habitations and carefully cultivated. Hesse-Darmstadt is on the whole an agricultural country, and one of the most fertile and best cultivated in Germany. The chief productions are corn of all kinds, maize, and spelt; wheat and rye chiefly in Rhenish Hesse and the Wetterau; flax, hemp, hops, tobacco, pulse, potatoes, wines, both white and red, garden vegetables and fruit, and timber. Rhein-Hessen is nearly destitute of timber, but famous for its vineyards, which yield some of the finest Rhenish wines. The valleys of the Odenwald and Vogelsgebirge are well adapted to the breeding of cattle and sheep. Swine are kept chiefly in Upper Hesse and Starkenburg. The breeding of horses is much neglected. Domestic poultry is abundant. Mining is confined to copper, iron, coal, and salt. The iron mines are chiefly in Oberhessen and the Odenwald. Cobalt, basalt, lime, sandstone, marble, and slate, are found in different parts of the grand-duchy. The chief rivers are the Rhine (2500 feet broad at Mainz), and the Main, and next to these the Lahn, the Schwalm, the Nidda, the Ohm, and the Itter.

Manufactures, Trade, &c.—The chief manufactures are of woollens, cottons, and linen (of which manufacture the principal centre is the little town of Schlitz, situated on a feeder of the Fulda at the eastern base of the Vogelberg in Ober-Hessen), leather, and hardware. Wine is produced chiefly in the province of Rhein-Hessen, which lies entirely on the left bank of the Rhine. The most considerable manufacturing and trading town is Offenbach, which has two annual fairs. Mainz is the principal place for the transit-trade. The exports consist of the natural productions of the country and of some manufactures. Hesse-Darmstadt is a member of the German Customs Union, and derives a considerable annual revenue from the transit trade.

The revenue, according to the budget for the financial period 1851-1853, amounts annually to 8,206,873 florins, and the expenditure to an equal sum, including the interest of the debt. The public debt, properly so called, amounted at the end of 1849 to 4,346,267 florins; but besides this the state is accountable for 2 millions of florins in paper money, and 11,848,607 florins bearing interest and borrowed for the construction of railways.

The military establishment is fixed at 10,514 men, namely, 1446 cavalry, artillery 853, infantry 8041, a company of sappers and miners 126, general staff 48.

Religion, Education.—Of the 854,314 inhabitants, 409,658 are Lutherans, 36,520 Calvinists, 157,405 United or Evangelical, 217,798 Catholics (who are under the bishop of Mainz), 28,734 Jews, and 4199 belonging to small Christian sects. There is a university at Giessen [GIESSEN], an episcopal seminary at Mainz, gymnasia in Darmstadt, Giessen, Mainz, Bensheim, Büdingen, and Worms, and at least one elementary school in every commune.

HESSE-HOMBURG was formerly a part of Hesse-Darmstadt, till it came, in 1596, into the possession of Frederick I., youngest son of George I., who was the founder of the line of Hesse-Homburg. The Congress of Vienna in 1815 restored the Landgrave to the sovereignty of his principality of Hesse-Homburg (of which he had been deprived in 1806), and added to it the lordship of Meisenheim, on the other side of the Rhine. The landgrave was received in 1817 as a member of the German Confederation, and as such has one vote in the full council. The area of Hesse-Homburg, exclusive of the private estates of the landgrave, is only 106 square miles; the population in 1852 was 24,921, more than half of whom are Calvinists: the rest are Lutherans and Catholics with about 150 Jews.

Divisions.—1. The lordship of *Homburg*, which contains 32 square miles with 11,166 inhabitants. The chief town, *Homburg-vor-der-Höhe*, with 4500 inhabitants, is situated 9 miles N. from Frankfurt-am-Main, at the foot of an eminence on which the palace of the landgrave is built, commanding an extensive prospect of extraordinary beauty. Homburg is divided into the old and the new towns, the latter of which is open, and regularly built. Besides the palace the chief

buildings are the Catholic cathedral, an orphan asylum, a synagogue, and the government offices.

2. The lordship of *Meisenheim*, which contains 74 square miles and 13,755 inhabitants. It lies between the Prussian province of the Lower Rhine, the Bavarian Palatinate, and the principalities of Lichtenberg and Birkenfeld. The chief town is Meisenheim, with 1750 inhabitants.

The territory of Hesse-Homburg contains a considerable proportion of arable land. Meisenheim, which is occupied by the offsets of the Hundsrück, has mines of coal, iron, stone-quarries, and considerable forests. The landgrave possesses also the bailiwicks of Winnigen, Hötensleben, and Oebisfelde, in the Prussian province of Saxony, and some other private estates. This petty state has a constitutional government. The landgrave is assisted by a privy council and a chamber of deputies, one of whom is returned for every 1500 inhabitants. The revenue for 1853 was 374,803 Rhenish florins, the expenditure 377,869 florins. About 26,000 florins a year are derived from the gambling establishment in the town of Homburg, which was opened in 1841. The Frankfurt National Assembly passed a law to put an end to this system in 1849, and sent a battalion of infantry to put the law in execution, in which they succeeded, but as soon as the troops were withdrawn gambling commenced afresh. The public debt on the 1st of February 1853 amounted to 1,245,980 florins. The military consists of 333 men, which force forms its contingent to the army of the Germanic Confederation.

HESSEN, an extensive country of Germany, which in ancient times was inhabited by the Catti, or Chatti, part of whom however emigrated before the Christian era to Gaul, where they were called Batavi. The territory inhabited by the Catti seems to have extended from the Westerwald to the Saale, and from the Main to the sources of the Weser, thus coinciding with the modern country of Hesse, which derives its name (Hessen or Haasen) from its ancient inhabitants. The Catti are mentioned under the emperors Augustus and Tiberius. Germanicus burnt their chief seat, Mattium (probably Marburg), A.D. 15. In the sequel they belonged to the great empire of the Franks, losing their name in the 3rd or 4th century. The Christian religion was introduced among them even before Charlemagne's reign by Boniface, the apostle of the Germans, archbishop of Mainz; and Christian churches and convents flourished in the 7th century at Hersfeld, Fulda, Frizlar, Amöneberg, &c. Till about the middle of the 13th century the history of Hesse was blended with that of Thüringen; but Henry Raspe, landgrave of Thüringen, dying without children, in 1247, a war for the succession took place, which was terminated in 1263 by a compact, by which Hesse was separated from Thüringen, and assigned to Henry, son of Sophia, duchess of Brabant, daughter of the late landgrave's brother, who was the common ancestor of all the succeeding landgraves of Hesse. Philip I., surnamed the Generous, who succeeded his father William II. in the sovereignty of the whole country in 1509, and who introduced the Reformation, divided his dominions among his four sons: William IV., the eldest, obtained one-half, with Cassel, the capital; Louis IV. a fourth part, with Marburg; Philip II. an eighth, with Rheinfels; and George I. an eighth, with Darmstadt. But Philip II. dying in 1583, and Louis IV. in 1604, without issue, there remained only the two still flourishing main branches of Hesse-Cassel and Hesse-Darmstadt.

HETTON. [DURHAM.]

HEUSDEN. [BRABANT, NORTH.]

HEVER. [KENT.]

HEWORTH. [DURHAM.]

HEXHAM, Northumberland, a market-town, and the seat of a Poor-Law Union in the parish of Hexham, is situated in 54° 59' N. lat., 2° 5' W. long., distant 20 miles W. from Newcastle, 279 miles N.N.W. from London by road, and 298½ miles by the Great Northern and Newcastle and Carlisle railways. The population of the township of Hexham was 5231 in 1851. The township is under the management of a Local Board of Health. The living is a perpetual curacy in the archdeaconry of Northumberland and diocese of Durham. Hexham Poor-Law Union contains 70 parishes and townships, with an area of 202,638 acres, and a population in 1851 of 30,397.

Roman remains have been discovered at Hexham, and it is believed to have been a Roman station. In the 7th century (A.D. 674) a monastery was founded here by St. Wilfrid, who erected the monastic buildings in a style of magnificence little known at that day. About 678, on the division of the Northumbrian diocese into three parts, a bishop's see was established at Hexham. The diocese was afterwards united to Lindisfarne. The abbey and town of Hexham were sacked by the Danes early in the 9th century; and in 875 it was again attacked, the church burned, and the inhabitants massacred. In 1112 the archbishop of York established here a priory of regular canons of St. Augustine, and bestowed on them the former cathedral, and many other gifts. In the Scottish wars of Edward I. the town was burned, and part of the church was destroyed.

Hexham is pleasantly situated on the right bank of the Tyne River a little below the junction of the North and South Tyne. The principal streets are of good width, and the town is lighted with gas, and partially paved. The market-place is a spacious square, surrounded with good houses; there is a neat and commodious market-house, furnished with piazzas. The bridge over the Tyne at Hexham has

nine principal arches, with three supplementary arches, affording a passage for the waters in time of floods. The old priory church, now used as a parish church, is a cruciform edifice, with a lofty central tower, and is of the transition style of the 12th century. The nave, which was burnt by the Scots in the reign of Edward I., has never been rebuilt; the transepts are separated from the choir by a screen, richly carved in the lower part, and having in the upper part an emblematical painting. The choir is separated from the side aisles by three tiers of arches, supported by massive clustered pillars: the lower and the upper tiers are composed of pointed arches, the arches in the middle tier are circular. At the west end of the church are some remains of the monastic buildings. In Hexham there are places of worship for Independents, Wesleyan and Primitive Methodists, English Presbyterians, United Presbyterians and Roman Catholics. Hexham is the seat of a bishop of the Roman Catholic Church in England. The Free Grammar school, founded in 1599, has an income from endowment of 25*l.* a year, and had 55 scholars in 1853. There are also a Free school, a mechanics institute, a savings bank, and a dispensary. A county court is held in the town. Tuesday is the market-day. Fairs are held on March 25th, August 6th, and November 9th. Gloves and hats are manufactured in the town.

HEYTESBURY. [WILTSHIRE.]

HIBERNIA. [IRELAND.]

HIÈRES. [HYÈRES.]

HIERRO, or FERRO, ISLAND. [CANARIES.]

HIERTING, or HJERTING, a small sea-port town of Jütland in Denmark, is situated on the east shore of the Bay of Hierting, near the point indicated by 55° 31' N. lat., 8° 21' E. long. It has lately risen to consideration on account of its harbour, which affords to Denmark a direct means of import and export independent of Hamburg and Bremen. A railroad is in course of construction to Copenhagen, with breaks at the Little and Great Belts. Steamers occasionally ply with cattle and the agricultural produce of Jütland to Lowestoft in the English county of Suffolk.

The Bay of Hierting is a well-sheltered inlet of the North Sea, about 10 miles long and 3 miles broad. It is protected on the west by a long sandy peninsula and on the south by the island of Fanø, between which and the peninsula, an entrance about a mile and a half in width leads into the bay from the North Sea. The *Wardø-see* runs into the head of Hierting Bay a few miles west of the town of Wardø.

HIGHAM FERRERS. [NORTHAMPTONSHIRE.]

HIGHGATE. [MIDDLESEX.]

HIGHWORTH, Wiltshire, a market-town, and conjointly with Swindon the seat of a Poor-Law Union, in the parish of Highworth, is situated in 51° 38' N. lat., 1° 42' W. long.; distant 26 miles N. by E. from Devizes, and 74 miles W. by N. from London. The population of the tithing in 1851 was 698, of the entire parish, 4026. The living is a vicarage in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Highworth and Swindon Poor-Law Union contains 16 parishes and townships, with an area of 52,030 acres, and a population in 1851 of 17,332.

Highworth stands on a hill on the road between Lechlade and Swindon. It is lighted with gas. The houses are generally built of stone. The church is chiefly of the 14th century. On the south side is a chapel which is hung round with ancient armour. The Wesleyan and Primitive Methodists and Independents have places of worship, and there are National and British schools. Wednesday is the market-day. Two fairs are held in the course of the year.

HILDBURGHAUSEN. [SALE-MIENINGEN.]

HILDESHEIM, a *landdrostei*, or province, of Hanover, consisting of the principality of Hildesheim, which forms the most southern part of Hanover proper; of the principalities of Göttingen and Grubenhagen, which form an isolated portion of Hanover lying between Brunswick, Hesse-Cassel, Prussian Saxony, and Westphalia; and of the county of Hohnstein, another isolated district which lies south-east of the preceding, and extends southward from the Brunswick circle of Blankenburg into the Erfurt division of Prussian Saxony. The total area of the province of Hildesheim is 1717 square miles: the population according to the census of 1852 was 367,883, of whom 296,734 were Lutherans, 7627 Calvinists, 60,302 Catholics, 197 undefined Christians, and 3023 Jews.

1. In the south of the principality of *Hildesheim* the surface is traversed by branches of the Harz. The soil is stony and not generally fertile. In the centre and north the surface is undulating, and the soil rich and fertile. The principal rivers are the *Innerste*, *Leine*, *Ocker*, *Ecker*, and *Fuhse*. The climate is healthy. The agricultural products are corn, garden vegetables, fruit, flax, hops, and timber: the mineral products are iron, coal, and salt. Linen is the principal manufacture. The area of the principality is 721 square miles.

The principal town is *Hildesheim*, the capital, which stands on the *Innerste*, and is a place of considerable extent, but very irregularly built. It is connected by railway with Hanover, from which it is 24 miles distant to the south of south-east: population, 14,000. It is divided into the old and the new towns. There are seven gates; the ancient ramparts have been levelled and converted into public walks. The town gives title to a Roman Catholic bishop, but most of the inhabitants are Lutherans. The cathedral, founded in 818 by Louis

GEOL. DIV. VOL. III.

the Pious, has 10 altars, very fine paintings on glass, magnificent bronze doors covered with bas-reliefs, and numerous antiquities, among which is a pillar of greenish marble, said to have been a Saxon idol, which now supports an image of the Blessed Virgin. There are 3 other Catholic and 8 Lutheran churches, several hospitals, 2 gymnasia, and a well-regulated poor-house in the town. *Goslar*, on the Gose, a feeder of the Ocker, stands at the foot of the *Rammelsberg*, a northern spur of the Harz, famous for its lead and copper mines; the town, which was once a free imperial city and the residence of the emperors of Germany, has 7500 inhabitants, and is interesting for the remains of its ancient cathedral (finished in 1050, and partially demolished in 1820), and of an imperial palace, now a corn magazine; its principal manufactures are beer, spirits, vitriol, hardware, carpets, leather, shot, &c. *Goslar* is the seat of the mining board and of the corn depôt for the Hanoverian portion of the Harz. *Peine*, a small walled town N. E. of Hildesheim, stands on the *Fuhse*, and on the railway from Hanover to Brunswick, and has 8000 inhabitants. Among the other towns are *Bokenem* on the *Netze*, a branch of the *Innerste*; population, 2500: *Alfeld* on the right bank of the *Leine*, which has 2600 inhabitants: and *Elze*, a few miles W. of Hildesheim; population, 2000.

2. The principality of *Göttingen* is bounded N. and E. by Brunswick, and the principality of *Grubenhagen*, S. and W. by Prussian Saxony, Hesse-Cassel, and Westphalia. Its area is about 646 square miles. The north-eastern part of the principality is covered with offsets of the Harz, and the south-western part between the *Leine* and the *Weiser*, by the *Solling Mountains*. These eminences are of moderate height, chiefly of basaltic formation, and frequently assume conical forms. The *Weiser*, which is formed in this principality by the junction of the *Werra* and the *Fulda*, forms part of the western boundary. The *Leine* drains the eastern districts. The soil is for the most part stony, except in the river valleys, where it is very fertile; every part capable of cultivation is tilled with care. The corn crops are more than sufficient for the consumption; potatoes and pulse are grown in abundance; other crops are flax, tobacco, and colza. Cherries, apples, and plums are the chief fruits. Sheep are reared in great numbers on the natural pastures. The minerals of the principality comprise copper, lead, and iron; salt and alum are also found. Linen, woollen cloth, glass, paper, and iron are among the industrial products. Timber is abundantly produced. The navigable river *Weiser*, the high-road from Frankfurt-am-Main through Cassel, Göttingen, and Hanover to the towns on the *Elbe* and the *Baltic*, and the railway from Hanover through Göttingen to Cassel afford great facilities for commerce.

Göttingen, the capital of the principality and the seat of a university, is noticed in a separate article. [GÖTTINGEN.] Among the other towns we notice the following:—*Münden*, 15 miles S.W. from Göttingen, is built in the fork between the *Werra* and the *Fulda*, which here unite and form the *Weiser*. It is surrounded by walls flanked with towers, and has above 4000 inhabitants. *Münden* is the most commercial place in the principality. The river trade is in corn, timber, and millstones, and employs above 500 river barges, plying down the *Weiser*, the *Werra*, and the *Fulda* to Bremen. The imports consist chiefly of colonial produce and French wines and brandies. *Münden* has also a very important linen trade and market. Tobacco and earthenware are manufactured. *Nordheim*, 12 miles N. from Göttingen, on the left bank of the *Ruhme* and a little above its junction with the *Leine*, is also a walled town. It is well-built, and has manufactures of tobacco, linen, flannel, and hosiery: population, 4100. *Uslar*, a small fortified town 15 miles N.W. from Göttingen, is built in a valley watered by the *Ahle*, a feeder of the *Weiser*, at the western base of the *Solling Mountains*, and has iron-works, manufactures of linen and pipes, bleachworks, a copper foundry, a paper-mill, and 2300 inhabitants.

3. *Grubenhagen* is the subject of a separate notice. [GRUBENHAGEN.]

4. The isolated county of *Hohnstein*, or *Hohenstein*, has an area of 72 square miles. It is covered by the Harz Mountains, except towards the south, where it comprises a portion of the *Goldene-Aue*. The *Goldene-Aue*, or *Golden Vale*, watered by the *Helme* and its feeders, separates the region of the Harz from the offsets of the *Thuringerwald*, and is one of the most beautiful spots in Germany. It is chiefly in the Prussian government of Erfurt. The small part of it belonging to Hanover is very fertile in corn, and well cultivated. The mountains are covered with forests or with pasture; cattle are reared; honey and game abound. Iron, copper, cobalt, manganese, coal, marble, limestone, &c. are among the minerals; but iron-mines only are worked. The county is divided into two districts, named from the villages of *Neustadt* and *Ilfeld*, which have under 1000 inhabitants. Near *Neustadt* are the ruins of the castle of *Hohnstein*, from which the county is named.

HILLAH. [BABYLON.]

HILLSBOROUGH. [DOWNSHIRE.]

HIMALAYA MOUNTAINS, or HIMMALAY MOUNTAINS, form the boundary of Hindustan, on the N.E. and N., and of the valley of Assam on the N. They are situated between 27° and 35° N. lat., 73° and 98° E. long. The most western portion, which extends over more than 900 miles (between 73° and 88° E. long.), lies in a general direction from north-west to south-east, forming a slightly curved line, which gradually becomes nearly due east. Between 88°

and 98° E. long. the mountains run west and east, extending about 600 miles. Its breadth, as far as it has been ascertained, varies between 80 and 120 miles. The whole range may occupy a surface of 150,000 square miles.

This extensive mountain range lies between a low and level plain, drained by the Ganges and the Brahmaputra, and the elevated and partly hilly table-land of Tibet, which lies to the north-east and north of the range. The plain of the Ganges and Brahmaputra, at its southern extremity, is little elevated above the sea, and where it is farthest from the shore its elevation does not much exceed 1000 feet. The table-land of Tibet, as far as it is known, rises to an elevation of more than 10,000 feet. The Himalaya Mountains rise far above the level of the table-land of Tibet, and where they are contiguous to it they constitute an uninterrupted range, covered with snow in its whole extent, with the exception of a few mountain passes, which are partly free from snow during the hottest months. In the middle region of the Himalayas the surface varies considerably. The mountains terminate on the plain of the Ganges, in a wall-like range from 4000 to 5000 feet high, which however is frequently broken by gaps through which the rivers escape that carry off the water collected in the interior of the mountain region.

The most north-western extremity of the Himalayas, called the Gooseie Mountains, a high snow-topped range, protrudes into the most northern bend of the river Indus, and skirts its banks as far south as the neighbourhood of Attock. This range is separated from the great mountain range of Cabul, called the Hindoo-Kooh, by the narrow valley of the Indus. This valley is about 60 miles in length.

The river Sutlej, an affluent of the Indus, originates on the table-land of Tibet, and crosses the Himalaya range between 31° and 32° N. lat. in its winding course from east to west. That portion of the mountains which lies between the valleys of the Indus and Sutlej, incloses the valley of Cashmere on the north. On the south, between the upper course of the Chenab and the Sutlej, it incloses the valleys of the Ravee, the Beas, and others, which are probably between 5000 and 7000 feet above the sea.

Twelve mountain passes connect the valley of Cashmere with the adjacent countries, among which the most frequented are the Kandaiball Pass, to the east, near 34° 20' N. lat., to Leh, or Ladak, on the table-land of Tibet; the Sagam Pass, to the south-east, from Islamabad in Cashmere to Kishtewar on the Chenab; and the Barramulla Pass to the south-west, running along the course of the river Jelum to Mozufferabad and Attock. At the western extremity of this range, where the offsets of the Gooseie Mountains approach the Indus south of Attock, extensive layers of rock-salt occur, which are worked to a great extent. The other natural riches of this portion of the Himalayas are best known in the valley of CASHMERE.

The central part of the Himalayas, or that which extends between the valley of the Sutlej and Bootan (from 77° to 88° E. long.), is about 100 miles across, and is composed of enormous mountain masses, which protrude from the principal range. These masses contain between them a few transverse narrow valleys or ravines. Such protruding masses, rising to between 18,000 feet and 20,000 feet above the sea, extend from the valley of the Sutlej to the Jumna and the Bhaghiratee. Farther east lie the mountain masses of Gurwal, which, with their extensive snow-fields and numerous peaks, several of which rise to more than 20,000 feet, fill up the country between the two principal branches of the Ganges, the Bhaghiratee, and the Alakananda. Still farther east is the great mass of the Jawahir, which in its most elevated summit rises to 24,238 feet, and is surrounded by other peaks not much inferior in elevation. To the east of the upper branches of the river Gogra lies an extensive mountain region, of which we hardly know anything else than that it is covered with very high mountains, and partly with snow. It extends to the Dhawalaghiri range, which occupies the space between 28° 30' and 29° N. lat., 83° and 84° E. long., and is traversed by the principal source of the Gung-tuck. Its highest summit, called Ghosa Cotee, attains an elevation of 27,600 feet above the sea, the highest known land on the surface of the globe. Contiguous to the Dhawalaghiri Mountains on the east is the great mass of the Kinchinjungu Mountains, whose highest pinnacle rises to 28,178 feet. These extensive masses terminate north-west of Khatmandu on the banks of the Bori Gandaki. The space between the Bori Gandaki and the Arun, an affluent of the Coosy, is mainly occupied by the Salpoo range, which contains two summits exceeding 24,000 feet in height, and many others nearly as high.

The enormous mountain masses are separated from one another by long but very narrow valleys, which descend towards the south and south-west with rather steep slopes, especially in their higher parts. During the summer these upper valleys are covered with a vigorous vegetation, and are used by the inhabitants of the lower valleys as pasture-ground; but during the greater part of the year they are buried in snow, and uninhabited. Through these valleys lie the few roads by which the plain of the Ganges communicates with the countries on the table-land of Tibet. The most northern of these roads follows the valley of the Sutlej. At Shipkee, where it issues on the table-land, the road is 10,484 feet above the level of the sea. Other mountain passes, or ghauts, are at their highest parts from 16,000 to 18,000 feet above the sea-level. Nearly all the passes are

too steep and high for any beasts of burden, except sheep, which in the Himalaya Mountains are used for the transport of merchandize.

The high mountain masses advance so far from the principal range into the interior of the mountain region, as to occupy more than one-third of it, when they descend with a rapid declivity. The general elevation of the lower portion may be between 4000 and 5000 feet above the sea. On the hill sides, and in the valleys of these mountainous districts, between 29° and 30° N. lat., the cultivation and manufacture of tea is carried on. The Indian government has authorised an outlay of 10,000*l.* a year upon the tea-culture. Inferior kinds are carried through the passes, and compete with the Chinese teas in Tibet. The superior kinds are sold in Hindustan, and some portions have been sent to England. The usual varieties of black and green tea are cultivated, but the colouring of the green kinds, which is practised in China, is not permitted by the Company's manager. Almorah, the capital of Kumaon, on the river Koaila, and only 15 miles in a straight line from the lower edge of the mountain region, is 5485 feet above the sea-level. Only the valleys which are drained by the Bhaghiratee and Alakananda sink considerably below this level. Tiri, on the Bhaghiratee, being 2272 feet above the sea, and Sireenuggur, on the Alakananda, 1800 feet. The surface of this portion of the mountain region is extremely uneven; the more elevated summits are not numerous, and are considerably below the snow-line, as they generally do not rise above 8000 or 9000 feet. The tract between the upper branches of the Jumna and the Sutlej is much more mountainous, and several of the summits attain the snow-line. The difficulty which the general unevenness of this tract presents to an easy communication between the inhabited places, explains the circumstance of there being in it a great number of sovereigns whose dominion frequently extends only over a few villages. The remainder of this lower portion of the Himalaya range contains more cultivable land than is generally found in mountain regions, and is also pretty well inhabited, though the villages are mostly very small.

The mineral wealth of that portion which belongs to the British, or is under their protection, is unknown; but Nepal contains, according to Sir Francis Hamilton, rich mines of copper, iron, lead, and sulphur.

In such a mountainous country the climate must of course vary extremely. The snow-line occurs on the north-eastern declivity at about 16,600 feet; on the south-western declivity it occurs at 12,500 feet above the sea-level. It follows that the vegetation must be different at the same elevation on the two sides.

The portion of the Himalaya between the Sutlej and Bootan is in part immediately subject to the British or under their protection, and partly subject to the independent Raja of Nepal. About one-half of the country between the Sutlej and Kali Gogra is governed by about 80 rajas under British protection, and the other half constitutes the British province of Kumaon. The province of Kumaon is annexed to the sub-presidency of the North-West Provinces. The countries within the Himalaya range, extending from the eastern banks of the Kali Gogra to the boundary of Bootan, are subject to the independent Raja of Nepal, except a very small portion contiguous to Bootan, which is possessed by the Raja of Sikkim, an ally of the British, who resides in the town of Sikkim.

With the eastern portion of the Himalaya range, extending from the western boundary of Bootan to the sources of the Brahmaputra River, we are only acquainted as far as it is contiguous to the road which leads from the plain of the Ganges through Tassisdun, the capital of Bootan, to the table-land of Tibet. When seen from the valley of Assam it does not appear to rise to the snow-line west of 93° E. long.; but between 92° and 98° E. long., extensive ranges are visible, which rise above the snow-line.

The word Himalaya is a Sanscrit word, compounded of 'hima,' cold, or frost, or snow, and 'alaya,' abode. (Wilson's 'Sanskrit Dict.'). The resemblance of the first part of the compound to the Greek 'cheima' (*χειμα*) and the Latin 'hiems,' is obvious; the Greek and Roman geographers were acquainted with this enormous mountain range under the general name of Imaus or Emodus, though their limited geographical knowledge does not allow us to assume that their term Imaus comprehended so much as the word Himalaya. It was known to Pliny that the word 'Imaus' signified, "in the language of the natives, snowy." (vi. 17.)

HIMERA, an ancient Greek city on the north coast of Sicily, at the mouth of the river Himera, was founded (a.c. 648) by the Zancleans of Myle in Sicily. (Strab., vi. 272.) The application of Terillus, tyrant of Himera, expelled by Theron of Agrigentum to the Carthaginians for aid, gave that people a pretext for invading Sicily a.c. 480. Theron defended Himera against Hamilcar at the head of 300,000 Carthaginian troops, until Gelon of Syracuse arrived with aid and with far inferior forces fought the great battle of Himera, in

which the Greeks were entirely victorious. This battle was contemporary with (tradition said it was fought on the same day as) the battle of Salamis. In the Athenian invasion of Sicily the Himeræans took the part of Syracuse. After existing as a flourishing town for 240 years, it was totally destroyed by the Carthaginians A.C. 408, and its ornaments carried off. The inhabitants who survived this calamity established themselves at *Therma*, not far from the site of the ancient town (Cicero, 'In Verr.,' il. 85), and enriched their new abode with such works of art as they had saved from the wreck. Upon the capture of Carthage, Scipio restored to the people of *Therma*, of Gela, and other Sicilian towns, these monuments of art of which they had respectively been plundered in their wars with Carthage. ('In Verr.,' iv. 33.) *Therma* derived its name from its hot springs, which still remain. It was a flourishing place under the empire, and received a colony in the reign of Augustus. The site of *Therma* is occupied by the modern town of Termini, in which are numerous Roman remains. Termini is about 8 miles W. from the mouth of the Fiume Grande, the representative of the ancient Himera. At the mouth of the Fiume Grande there are no ruins, but many ancient relics, such as vases, bronzes, &c., and numerous sepulchres have been discovered—strong presumptive evidence that Himera stood at the mouth of the river, and not as some say on the left bank of the Fiume di Termini, opposite Termini, where no remains have been found. Himera was the birthplace of the poet Stesichorus.

Coin of Himera.

British Museum. Actual size. Silver. Weight, 268½ grains.

HINCKLEY, Leicestershire, a market-town and the seat of a Poor-Law Union, in the parish of Hinckley, is situated on the Chester and Liverpool high road, in 52° 33' N. lat., 1° 21' W. long., distant 13 miles S.W. from Leicester, and 99 miles N.W. by N. from London. The population of the town of Hinckley in 1851 was 6111. The living is a vicarage in the archdeaconry of Leicester and diocese of Peterborough. Hinckley Poor-Law Union contains 14 parishes and townships, with an area of 27,415 acres, and a population in 1851 of 16,560.

The parish church of Hinckley, supposed to have been built in the reign of Edward III., is a commodious structure, with a beautiful old oak roof. Trinity church is a new building. The Baptists, Independents, Wesleyan Methodists, Quakers, Roman Catholics, and Unitarians have places of worship in the town. There are in Hinckley a Free school, a Green-Coat school, a school supported by the Roman Catholics, and an Infant school; baths and washhouses; and a savings bank. The town is lighted with gas. A county court is held. The market-day is Monday: fairs are held five times in the year. Cotton and woollen hosiery is the staple manufacture of the town.

HINDIA. [CANDEISH.]

HINDLEY. [LANGASHIRE.]

HINDON. [WILTSHIRE.]

HINDOO-COOSH. [AFGHANISTAN.]

HINDUSTAN, that is, in the Persian language, the country of the Hindus, or Hindoos, is the name which has been adopted by geographers to designate that part of India, or the East Indies, which was formerly called the Peninsula within the Ganges, and which extends from Cape Comorin to the Himalaya Mountains. As the long declivity of this extensive mountain chain slopes towards the plains of Hindustan, the Himalaya Mountains are properly included in Hindustan. The seas which surround Hindustan on the south-east, south, and west, and the mountains which inclose it on the north-west and north-east, mark distinctly its boundary on these sides. On the east, where the valleys traversed by the Brahmaputra and the Soornah open into the plains of Bengal, the boundary-line is uncertain; but we may fix it at 92° 30' E. long. Within these boundaries Hindustan extends from Cape Comorin, 8° 4' N. lat., to Attock on the Indus, 34° N. lat., and from Cape Monze, west of the delta of the Indus, 67° 30' to 92° 30' E. long. Its length from north to south is about 1800 miles, and its greatest breadth between Cape Monze and Silhet, along the parallel of 25° N. lat., is about 1500 miles. The area is about 1,900,000 square miles, or more than ten times the area of Great Britain and Ireland.

The coast-line of Hindustan amounts, according to a rough calculation, to about 3280 miles, of which 1830 miles are washed by the Indian Ocean, and 1290 miles by the Bay of Bengal; about 160 miles, or somewhat more, extend along the Gulf of Manar and the Palk Strait. Beginning with the innermost corner of the Bay of Bengal, at Chittagong, the coast for about 320 miles is traversed by the numerous mouths of the Ganges, all of which are navigable either for

small or large vessels. Contiguous to the Hoogly branch of the Ganges is the open Bay of Balasore, with a coast of 120 miles, terminating at Cape Palmyra. From this point the coast stretches in a south-west direction to the mouth of the Kistna for about 420 miles, and is without harbours, except that of Coringa, near the mouth of the Godavary. From the mouth of the Kistna to Cape Calymere, an extent of about 430 miles, no harbour occurs, even for vessels of moderate size. Between Cape Calymere and Cape Comorin, about 160 miles, there is only the small harbour of Tuticorin. The coast, which stretches north-north-west, and afterwards nearly north, between Cape Comorin and the innermost corner of the Gulf of Cambay, a distance of about 1150 miles, contains a great number of small and several very good and safe harbours. The coast-line of the peninsula of Gujerat, which is about 380 miles in extent, has several harbours for vessels of moderate size. The coast-line of the island of Cutch extends about 150 miles. The coast intersected by the several mouths of the Indus extends as far as Cape Monze, about 150 miles, but it cannot be approached by vessels of more than 50 tons burden, except at the harbour of Curache, which admits vessels of moderate size.

Following what may be called the natural divisions of Hindustan, we shall distribute our description of it under the following heads:—1, Southern region, comprehending the southern extremity as far north as the Gap of Coimbatore; 2, the Deccan, which extends to the river Nerbudda; 3, Mountain region of North Hindustan, comprehending the terraces north of the Nerbudda, together with the peninsulas of Gujerat and Cutch; 4, the Plain of the Ganges; and 5, the Plain of the Indus. To these may be added, as a sixth natural division, the Himalaya Mountains. [HIMALAYA MOUNTAINS.]

I. *The Southern Region*.—The narrow sea which separates Hindustan from the island of Ceylon is traversed by a chain of islands and sand-banks called Adam's Bridge. [ADAM'S BRIDGE.] The island of Rameserum is low, sandy, and not cultivated, but celebrated for its great pagoda, the extent and splendour of which have called forth the admiration of many travellers; it is still visited by pilgrims from all parts of Hindustan. At the western extremity of the island is a small place called Paumben, where travellers cross the Paumben Passage to the continent. It is about a mile wide, and has 6 feet of water at high tide. The coast from Point Calymere to Cape Comorin is low and sandy, but at a short distance from the sea some sand-hills occur, between and behind which are numerous salt swamps and lagoons. Behind them the country rises very slowly to the foot of the mountains on the west, a distance of from 40 to 60 miles. This tract is well supplied with water, numerous small rivers descending from the mountains, and supplying plentiful means of irrigation. It is accordingly well cultivated and presents a succession of rice-fields and palm-groves. Among its rivers the chief is the Vaygaroo, which passes near the town of Madura, and falls into the sea not far from the Paumben Passage. [CARNATIC.]

At the foot of the mountains the plain may be about 300 feet above the sea. Of the mountain regions which border on it on the west little is known, except that between 9° 10' and 10° 20' N. lat. they occupy a considerable surface, and some of their ridges rise to a height of 7000 or 8000 feet. This isolated mountain region therefore may be considered as the highest land in Hindustan, south of the Himalaya range. The Aligherry Mountains, south-west of Madura, another offset of the same stock, rise to 4200 feet. South of 9° N. lat. the mountain mass runs southward in one single range, which is lower, but continues at a considerable elevation to a distance of about 20 miles from Cape Comorin, where it suddenly lowers about 2000 feet. The remainder is a low ridge of granite overgrown with thick forests. Two passes are at present known to exist across these mountains. The northern, called the Ariangawal Ghaut, occurs near 9° N. lat., and leads from Tinnevely on the east to Quilon on the west, through Cotallum. The southern, the Amboli Ghaut, lies about 20 miles from Cape Comorin. The country which lies to the west of the mountains exhibits a much more diversified surface than that to the east of them. Numerous offsets consisting only of low hills advance towards the coast and leave a level tract along the sea some miles broad. This tract is traversed by a chain of lakes, which extend from Trivandrum to Cochin. The low country which extends east of the lakes some miles inland, is in many places swampy, and used as pasture-ground in the dry season, or covered with jungle and forest-trees; but the higher tracts produce rice and other grain in abundance. These tracts are mostly uninhabited. The villages are built farther inland on the low ranges of the hills, where they are surrounded by extensive plantations of palms, plantains, and mangoes. Still farther inland the mountains rise with a steep ascent, and are covered with forests, especially of teak. A very heavy surf always runs along this coast, and renders landing difficult.

The southern part of this tract belongs to the Raja of Travancore, and is about seven-eighths of the whole; the northern part belongs to the Raja of Cochin. *Trivandrum*, the capital of Travancore, a few miles distant from the sea, is a large and well-peopled place, with a castle. *Anjengo* is a small harbour. *Quilon* has a small harbour, but a considerable population. [COCHIN.]

The Gap of Coimbatore or Ponany, which extends between 10° 40' and 11° N. lat., is a long valley, which unites the wide plains of the

lower Cavery with the level coast of Malabar. It takes its name from the town of Coimbatore, which lies near its eastern extremity, but outside of it, or from the river Ponany, which drains it in all its length. The town of *Ponany* stands near the mouth of the river. It has a good harbour, and a population of about 10,000. It carries on a considerable commerce with the towns along the Malabar coast, Arabia, and Bengal. [COIMBATORE.]

II. *The Deccan*.—This term was originally applied to the whole peninsula south of the river Nerbudda, including also the country south of the Gap of Coimbatore. [DECCAN.] We here apply it, in a geographical view, to the peninsula north of the Gap of Coimbatore, and we fix its northern boundary at the valley of the Nerbudda, and carry it thence eastward to the neighbourhood of Balasore, on the Gulf of Bengal. This boundary-line runs across the whole peninsula between 21° and 23° N. lat.

The interior and by far the greater part of this extensive region is an elevated table-land, which is inclosed on all sides by low plains extending to the sea-shore. The edges of the table-land are raised above the surface of the table-land itself, and appear in the form of mountains or high hills, and the descent from them to the low plains on the sea-shore is steep, and full of impediments to communication. The table-land extends from about 12° to 21° N. lat. Between 12° and 16° its average breadth probably does not exceed 150 miles, but north of 16° it widens gradually to 400 miles. By the natives it is called *Bala-Ghaut*, or the country above the Ghauts; and the low plains of the coast are named *Payan-Ghaut*, or the country below the Ghauts. The name *Ghaut* properly signifies a narrow pass through mountains, but is also applied to the mountain-ranges in which these passes occur. The word is a form of the Sanscrit, 'gati,' a way or path. The elevation of this table-land varies. The country south of 15° N. lat., which is called the table-land of Mysore, is the highest part, and it is higher towards the east than towards the west. Bangalore is 3026 feet above the sea. North of 15° N. lat., the table-land descends, and the greatest depression seems to occur between 15° and 17° N. lat., in the region drained by the Kistna and its tributaries, where the elevation is only about 1200 feet. Farther north it again rises higher, and the western and higher districts, as far as 77° E. long., vary between 2000 and 2500 feet. But east of 77° its slope, which is mostly to the south-east or south, is more rapid, and the elevation becomes less than 1000 feet above the sea. The surface of this table-land is a level plain, on which hills rise here and there in a conical form, from 300 to 900 feet above their base. Towards the mountains which constitute the western edge of the table-land the surface is much more uneven. Numerous short spurs branch off from the mountains and advance about 30 or 35 miles into the plain. The isolated hills, as well as these spurs, are of very steep ascent, and on them are built the numerous strong fortresses called *droogs*, or hill-forts, now mostly going rapidly to decay.

Here, as in other countries between the tropics, the year is divided into two parts, a rainy and a dry season. The rainy season occurs during the south-west monsoon, commencing in May, when only small showers fall. In June or July they become more regular and continuous, and they last till October. But the quantity of rain is not great, being estimated to amount only to 20 or 26 inches annually; whilst on the western coast it is 116 inches, and on the eastern 45 inches. The mean annual temperature of the higher districts of the table-land seems to be nearly 10 degrees less than at Madras; it is stated to be at Darwar 75° Fahr. and at Madras 84° Fahr.

The table-land is destitute of trees so far as the plain extends. On the low spurs of the Western Ghauts and in the valleys between them the country is wooded, and this is also the case with the most southern corner along the river Cavery. On the whole surface of the table-land a black soil prevails, which is favourable to the growth of cotton. The hills which rise on the table-land are bare and sterile, as are most of the small valleys between them, but some of the valleys are very fertile. The northern districts of the table-land are less fertile than the southern, and vast tracts without cultivation frequently occur there. During the rainy season and the cool months which immediately follow, this country is covered with a fine sward of grass, and much of it is cultivated or planted; but towards the spring the plains lose their verdure, and their surface becomes a brown level, intersected by numerous deep rents. Clouds of dust are raised by the dry winds, and the heat is excessive. The rivers flow slowly in their deep beds, and all the smaller streams dry up. The cultivation of rice is only carried on where there are artificial means of irrigation; tanks for this purpose are numerous in some places. The number of other grains, plants, and fruits is very great.

By far the greatest portion of this table-land is still under the sway either of Hindoo or of Mohammedan princes.

1. The most southern part is the kingdom of Mysore, governed by a Hindoo prince. The capital is *Mysore*, south of Seringapatam. Mysore is situated in 12° 19' N. lat., 76° 42' E. long. It occupies a large space of ground, and is inclosed by a wall. The streets are laid out with some regard to regularity, and the houses are intermingled with temples and trees. The fort is separated from the town by an esplanade, and besides the raja's palace contains the residences of the principal merchants and bankers. *Seringapatam*, formerly the capital of the principality of Mysore, stands on a small but beautiful and

fertile island in the river Cavery, about 10 miles N. from Mysore. The fortress is at the western extremity of the island. The streets of the town are narrow, crooked, and dirty; but there are several palaces, and a great number of pagodas and mosques. On the 4th of May, 1799, the fortress of Seringapatam was carried by assault by the British army, and Tippoo Saib himself was slain while fighting with desperate valour. The population is probably under 10,000. Besides these there are two other large towns which carry on a considerable commerce, BANGALORE and BEDNORE.

2. The territories of the Nizam, or Raja, of Hyderabad, or Hyderabad, a Mohammedan prince, occupy the centre of the northern portion of the table-land. The capital is *Hydrabad*, a large town, with a population of about 120,000. It is noted for its extensive traffic in diamonds. In its neighbourhood is Golconda, a fortress on a high hill, from which the whole country once received the name of the kingdom of Golconda. Other remarkable places are—*Beder*, a commercial town, situated on one of the great thoroughfares of the table-land; AURUNGRABAD, DOWLETABAD, and ELORA.

3. The possessions of the Raja of Berar, or Raja of Nagpoor, extend to the east of Golconda. Nagpoor was formerly included in the province of Berar, but is now in the adjoining province of Gundwana, of which the city of *Nagpoor* is the capital. *Ellichpoor* is the capital of Berar. The palace and seat of government of the Raja of Berar is at Nagpoor, and hence he is as frequently styled the Raja of Nagpoor as the Raja of Berar. The state of Berar, or Nagpoor, is one of those over which the British hold full political sway, with right of interference in case of mismanagement of the public revenue; and they have a political agent resident at Nagpoor. That portion of Berar which lies to the west of the river Wurdah is included in the territory of the Nizam of Hyderabad; and the title of Raja of Nagpoor is consequently now perhaps a more appropriate title than Raja of Berar, a large portion of the territory of Berar having been transferred to the Nizam after the termination of the Mahratta war. The capital, *Nagpoor*, stands in 21° 9' N. lat., 79° 10' E. long., on the table-land, about 1100 feet above the sea. It is about seven miles in circumference, but is of a very irregular form, the houses being placed in a straggling manner. The palace of the raja is a large brick building. The population is about 120,000. The prince is a Hindoo of a Mahratta family. *Bustar*, a town situated in 19° 13' N. lat., 81° 56' E. long., is the capital of the district of Bustar in Gundwana. The district of Bustar is occupied by a branch of the range of mountains that runs through the Circars parallel to the Bay of Bengal. Nearly the whole of the country consists of hills covered with jungle and of unhealthy morasses; the remainder, constituting not more than one-fiftieth part of the entire area, is very imperfectly cultivated by the scanty population, who live almost in a state of nature, and subsist on the produce of the chase. The principal rivers in Bustar are the *Indravati* and the *Mahanuddy*. The forests yield fine teak timber. The inhabitants are among the most ignorant and superstitious in India. The zemindar, or chief, of Bustar pays tribute to the Raja of Nagpoor.

4. The territory of Sattara extends along the Western Ghauts, but reaches far into the table-land. The Raja of Sattara was deposed, and died at the latter end of 1849. The territory is at present included in the Bombay Presidency. *Sattara*, the capital, stands in 17° 40' N. lat., 74° 3' E. long., 75 miles S. from Poona in a straight line. It is a small town on a rocky and precipitous mountain, with a strong fortress and a handsome palace. In this territory is the ancient town of *BEJAPORE*.

5. The territory of the Raja of Colapore extends likewise along the Western Ghauts, south of the territories of the Raja of Sattara. The prince is a Hindoo. The capital is *COLAPORE*.

6. The English possessions are partly annexed to the government of Madras and partly to that of Bombay. Only the Ceded Districts, or Balaghauts, belong to Madras. [BALAGHAUTS.] They contain the fortresses of Gootydrugg and Bellary. Two districts are annexed to the presidency of Bombay, namely, Darwar and the Deccan; the first lying south of the territories of the rajahs of Colapore and Sattara, and the second lying north of it. In Darwar is the town of *DARWAR*, and in the Deccan are the towns of *AHMEDNUGGER* and *POONA*. *Poona*, in 18° 30' N. lat., 73° 52' E. long., is situated at the confluence of the rivers *Moola* and *Moota*. It is about 80 miles S.E. from Bombay, direct distance. Poona is a handsome city, and contains a population of 100,000. The British have a cantonment a little to the west of Poona, which is laid out in wide streets and well arranged. Near Poona are the curious cave-temples of *Carlee*, and the town of *Nassuck*, which has 27,000 inhabitants.

Of the higher lands which encircle the table-land the most northern portion is the elevated table-land of *Omercuntuc*, which lies between 22° and 23° N. lat., 80° 30' and 82° 30' E. long. It rises considerably above the surrounding tracts, but its elevation is not known. On its eastern declivity rises the river *Sone*, and the *Nerbudda* traverses it in its length from east to west until it leaves it near *Mundla*. The table-land of *Omercuntuc* is the central link by which the higher lands of the Deccan are united to those which extend to the north of the *Nerbudda*. Below *Mundla* the high lands contiguous to the table-land extend westward on both sides of the narrow valley of the *Nerbudda* in extensive masses, which near 79° E. long. take the form

of three distinct ranges—the Vindhya Mountains, the Sautpoora Mountains, and the northern declivity of the table-land of the Deccan, which has no general name, but may be called the Northern Ghauts. Between these three ranges lie the two parallel valleys of the Nerbudda and Tapti.

The Northern Ghauts begin about 22° N. lat., between 78° and 79° E. long., with the high lands on whose eastern declivity the upper branches of the Wurdah, an affluent of the Godavery, and on whose western declivity those of the Tapti, rise. These mountain masses have probably an elevation of 4000 feet above the sea, and send off a very distinct and elevated range westward between the two upper branches of the Tapti. This range rises to the height of 4000 feet near the fortress of Gawulgur. The remainder of the Northern Ghauts lies in a general westerly direction along the southern side of the valley of the Tapti, and joins the Western Ghauts west of 74° E. long. The range rises with a very steep ascent from the valley of the Tapti, where it seems to be between 2000 and 3000 feet high; but its descent on the south is short and easy, the table-land of the Deccan being only about 500 feet lower than the range.

The Western Ghauts, which constitute the boundary of the table-land of the Deccan towards the Indian Ocean, begin about 10 miles from the southern bank of the Tapti and about 60 miles from the sea-shore. Somewhat north of the parallel of Bombay the range approaches within about 30 miles. The Western Ghauts continue to run from north to south generally at a distance of from 20 to 30 miles from the shore, but sometimes coming close to it, and forming a high coast. The range terminates a little south of the parallel of Calicut, about 11° N. lat., where it constitutes the northern border of the Gap of Coimbatore. This range varies considerably in elevation. North of Bombay it is stated not to exceed 3000 feet in height, and to be only about 1000 feet above the table-land on the east. South of Bombay it rises higher, and about 18° N. lat. has an elevation of about 5000 feet. Opposite Goa (15° 30' N. lat.) the mountains are traversed by a pass which is only 2477 feet high, and hardly more elevated than the contiguous plains of Darwar. Opposite Bednore (south of 14° N. lat.) the mountains rise to 4000 feet, and they seem to continue with this elevation to 13° 42' N. lat., south of which they rise to between 5000 and 6000 feet in the alpine region of Coorg, and at their termination they probably are not much lower. The width of the Western Ghauts is inconsiderable, and, if the spurs be excluded, perhaps nowhere except towards the southern extremity exceeds 12 miles.

The rapidity with which the Western Ghauts descend to the sea renders it very difficult to ascend the table-land of the Deccan on the west side. The mountain passes, or ghauts, are not numerous, and most of them are not passable for beasts of burden. One of the most frequented is the Hosso Angady Ghaut, which keeps up the commercial communication between Bednore and Mangalore.

The Western Ghauts, which are the abrupt and elevated edges by which the table-land of the Deccan descends towards the Indian Ocean, are entirely covered with thick forests of tall trees, except in a few places where the rocky masses are too steep to permit any accumulation of earth. In all other parts the mountains are covered with a thick layer of earth, capable of maintaining a vigorous vegetation. Many of the trees are very valuable. On the upper parts are forests of bamboo. Lower down the sandal-wood tree is abundant, and supplies an important article of exportation to China, Japan, &c. The middle of the range is occupied by forests of teak. During the rainy season the teak timber is floated down to the harbours on the coast, especially to Mangalore, and is thence conveyed to the other ports of Hindustan. It is said that on these mountains alone in Hindustan sandal-wood grows, and that it occurs only between 12° and 14° N. lat.

The whole of the narrow coast which intervenes between the Western Ghauts and the Indian Sea is sometimes comprehended under the name of Malabar. But the northern part of it, as far south as 15° N. lat., is called the Concan; the middle part, between 15° and 12° 3' N. lat., Canara; and only the southern part, as far as Cape Comorin, is properly named Malabar. The surface of this narrow tract is never entirely level except along the sea-shore, and to a distance at the utmost of five miles from it. This level tract is covered with sand, and overgrown with cocoa-palms. Near the termination of the low hills, which are offsets of the Ghauts, the soil is better, and is planted with rice. The sandy coast is indented with numerous small inlets, which during the rainy season are the receptacles of torrents. The small valleys which lie farther inland between the low ranges of hills are converted into swamps by the abundant rains, but when the water has run off they are cultivated, and give very rich crops of rice. On the sides of the hills which separate these valleys from one another are numerous villages, inclosed by extensive plantations of fruit-trees. The tops of the hills are level, but dry and naked.

The mean annual temperature at Bombay is about 80°. No kind of grain is cultivated except rice, for the growth of which no artificial irrigation is required, as the soil is saturated by the abundant rains. This country contains a great variety of fruit-trees, especially different kinds of palms; the cocoa-palms especially cover an immense tract of land along the sea-coast. The sugar-cane is also extensively cultivated. Cattle and buffaloes are the only domestic animals, and both are dis-

tinguished by their large size. Wild elephants are numerous; and also tigers, leopards, hyenas, and jackals.

This maritime tract, as far south as 10° 45' N. lat., is British territory, except the portion between 15° and 16° N. lat., comprising the Portuguese territory of Goa and that of the Raja of Sawunt Warree, and the towns of Mahé and Damaun, of which the first belongs to the French and the second to the Portuguese. The English possessions north of 16° N. lat. are annexed to the presidency of Bombay, and those south of 15° N. lat. to that of Madras. *Damaun*, the Portuguese settlement (20° 22' N. lat.), has lost much of its commerce since the rise of Bombay. It lies nearly halfway between Surat and Bombay, and has a safe harbour for vessels of small size, there being 17 feet of water over the bar. Farther south is *BOMBAY*. In 17° 55' N. lat. is the town of *Bancote*, or Fort Victoria, with 14,000 inhabitants. It has a harbour for small vessels, and carries on a considerable trade with Poona and Sattara. *Goa*, the Portuguese settlement, is situated in 15° 30' N. lat., on an island about 24 miles in circumference, formed by the river Mandova. The ancient city, which is now deserted by all its inhabitants except a few miserable ecclesiastics, was once a splendid and populous place. The new town, to which the name of Panjim has been given, stands five miles nearer the sea than the ancient city. It is well built, and has from 18,000 to 20,000 inhabitants. *Mangalore* is a thriving town. [CANARA.] *Cananore* (11° 52' N. lat.) is built at the end of a small lake, which is one of the best harbours on this coast. It has some commerce with Arabia and the harbours of Hindustan, and contains about 10,000 inhabitants. *Tellicherry* (11° 44' N. lat.), which was long the chief settlement of the English on the coast of Malabar, but has since been neglected, has still a considerable commerce in the produce of the country—coir, sandal-wood, cardamoms, pepper, cassia, and cocoa-nuts: the population is about 5000. *Mahé* (11° 42' N. lat.), the only French settlement on this coast, has a harbour for small vessels and 6000 inhabitants. It is rather well built, and principally exports pepper. Farther south is the town of *CALICUT*.

The mountain ranges which support the table-land of the Deccan on the south were scarcely known till within the last thirty years. They cover by far the greatest part of the space contained between 11° and 12° N. lat., 76° and 79° E. long. The western portion is occupied by the Nilgherry Mountains, which are well known to Europeans resident in India as affording them the climate and productions of Europe at a distance of only 11 degrees from the equator. These mountains are connected with the southern extremity of the Western Ghauts; they extend between 76° 28' and 77° 20' E. long., and between 11° 10' and 11° 35' N. lat., so that their length from west to east is more than 80 miles, and their width about 30 miles. All this space is occupied by one mass of high land, unbroken by ravines or deep valleys, but consisting of a succession of gentle ascents, with tracts of level ground between them. The lowest parts of these level tracts are estimated to have an elevation of from 5000 to 6000 feet. Through the centre of this region there runs a lofty ridge, containing various summits, the highest of which, nearly in the middle of the whole mountain mass, the Dodabetta Peak, is 8429 feet above the level of the sea. The surface of this region is a fertile soil overgrown with a green sward of grass and several kinds of alpine herbs where it is not cultivated. The excellent climate on these heights has led to the establishment of several sanitary stations, in which Europeans may re-establish their health when impaired by a long residence in the hot countries. One of these European settlements is at Utakamund, 7000 feet above the sea, at the foot of the Dodabetta Peak. The mean annual temperature at Utakamund is 56°, and consequently 28 degrees less than at Madras. The thermometer sometimes rises to 69°, and has been observed to descend as low as 20°, but very rarely. The changes in the temperature are slow, and the difference in 24 hours hardly exceeds 2 degrees. Moderate rains occur all the year round, but more during the south-west than during the north-east monsoon. Frost occurs between September and April, but it is moderate; the thickest ice does not exceed an inch and a half in thickness. Agriculture is limited to wheat, barley, millet, peas, and European vegetables. The fruit-trees of England succeed everywhere, and are frequently seen covered with blossoms and fruits in all stages at the same time. Oranges grow only in the lower districts. No animals are kept, except cattle and buffaloes; sheep, goats, deer, and hogs are found in a wild state. Game abounds everywhere. To the south this hilly table-land descends with a steep slope to the Gap of Coimbatore, from which it is divided by the river Bhovany. The deep valley through which the small river Moyar runs along its northern side separates it from the table-land of Mysore. The slopes on all sides are wooded, and it is only here that the animals of the tropical regions, as tigers, leopards, and elephants, are found. North-east of the Nilgherry Mountains is another mountain mass, which occupies nearly the whole space between the Cavery and the Bhovany, an affluent of the Cavery, as far west as 77° E. long. Very little is known of these mountains, beyond the fact that they occupy more than twice the space of the Nilgherry Mountains, and that some of their loftiest summits rise to a height of more than 5000 feet.

The river *Cavery*, which for about one-fourth of its course drains the table-land of the Deccan, for nearly the same space winds between high mountains, and for the remainder runs through a level plain.

After passing by Seringapatam, it enters the mountain masses, and has an extremely winding course between high rocks. At Caverypooram the river issues from between the mountains, and enters a valley. Where it receives the Bhovany it has already entered the plain, and is a large river in the rainy season. For about one-half of its course in the plains, it runs in one channel, but below the town of Trichinopoly it divides, and incloses the island of Seringham, famous for its two pagodas, and as a place of pilgrimage. Below this island the river again unites for a short distance, and then divides again. The northern arm, called the Coleroon, runs east-north-east, and falls into the Bay of Bengal between Deviacotta and Chillamburum; but its waters have been so exhausted by irrigating the adjacent fields, that it carries only a small quantity to the sea. The water of the southern arm is employed in feeding a great number of canals which traverse the sandy alluvial plain extending on the coast between Cape Calymere and Deviacotta. The waters of these canals being conducted over the adjacent fields, convert them into one of the most fertile tracts in Hindustan, their crops of rice being only inferior to those of the district of Burdwan in Bengal. The delta of the Cavery and the level country along its lower course in the plain lie in the parallel of the Gap of Coimbatore, which may be considered as a prolongation of the plain to the Indian Ocean. The whole course of the Cavery is about 450 miles.

The countries extending along these mountain ranges and the lower course of the Cavery constitute a portion of the Carnatic, the principal division of the presidency of Madras. The following are among the most remarkable places:—**COIMBATORE.** *Salem*, a well-built thriving place, with some manufactures and a good deal of commerce, but unhealthy. *Chillamburum* has an extensive and beautiful pagoda, one of the most ancient in India. Other towns of importance are noticed under **CARNATIC.**

The Eastern Ghauts, which separate the table-land of the Deccan from the low and level country extending along the Bay of Bengal, between 12° and 18° N. lat., occupy in width a much larger space than the Western Ghauts. South of 13° 10' N. lat., where their longitudinal direction is south-south-west and north-north-east, their average breadth is not less than 50 miles. Between 13° 30' and 16° N. lat., where they are called the Nella Malla Mountains, and lying in a generally northerly and southerly direction, occupy the whole space between 78° and 79° E. long., they are probably nearly 80 miles across; between 16° and 18° N. lat. they run south-west and north-east, and here their breadth is less. The surface of the whole region is stony, dry, and broken. In general it is almost without vegetation, and offers few spots fit for agricultural purposes.

Three rivers originating on the table-land pass through this mountain region in transverse valleys so narrow that they are, properly speaking, mere clefts. The most southern is the *Pannair*, which runs about 250 miles, and falls into the sea near Cuddalore. The *Palair*, passing by Arcot, flows about 220 miles, and falls into the sea in 12° 28' N. lat. The most northern of these rivers is the *Pennair*, whose course extends to 280 miles, and which falls into the sea not far from Nellore, in 14° 35' N. lat. *Nellore* is situated on the south bank of the Pennair; it is a populous place, and has a considerable amount of trade. Though its course is long, the Pennair brings down a comparatively small volume of water, and is of little use for irrigating the low lands; whilst the Pannair and Palair fertilise the whole of the countries which they traverse.

The mountain passes through this region are as difficult as those over the Western Ghauts. They are very little visited, and are nearly unknown, except the great military road which leads from Madras to the table-land. It runs over the plain to Arcot, on the Palair, and thence to Vellore, whence it begins to ascend the mountains, and runs to Santghur (1120 feet above the sea). Here it divides into two branches: the northern terminates at Colar, on the table-land; the southern at Bangalore, on the table-land. The Nella Malla Mountains are rich in metals. Iron is very abundant; copper and lead are worked in several places; and diamonds are found. The country which separates the Eastern Ghauts from the Bay of Bengal comprehends the central and northern Carnatic, with the Guntoor Circar. [**CARNATIC; CIRCARS, NORTHERN; COROMANDEL COAST; MADRAS; ARCOT; CUDDLALORE; PONDICHERRY.**]

The river *Kistna* originates on the eastern declivity of the Western Ghauts. All the waters collected on the eastern side of that range, between 13° and 19° N. lat., unite successively in its channel. The source of the river is near 18° N. lat., between Poona and Sattara. It runs for more than 100 miles south-south-east, receiving numerous small streams from the west. Afterwards it flows south-east, and its waters are increased by the two rivers Gatpurba and Malpurba. On the table-land it receives from the north the Beema, which has a winding course through the table-land of probably more than 300 miles. Where the Kistna approaches the Nella Malla Mountains, it is joined from the south by the Toongabudra, whose upper branches, the Toonga and the Budra, originate near 13° N. lat. Its whole course is about 650 miles. On the table-land, as well as in the low plain, the surface of the water is from 20 to 30 feet below the adjacent land, and consequently it cannot be used to irrigate the fields. The Kistna brings down a comparatively small volume of water, and is not navigable in any part. The mountain region between the Kistna

and Godavery, which separates the table-land of the Deccan from the low tract along the coast, and which may be considered as a continuation of the Nella Malla Mountains, occupies nearly 60 miles from west to east. The character of this region is but little known. The low country between the lower course of the rivers Kistna and Godavery comprehends the districts of Condapilly and Ellore [**CIRCARS, NORTHERN**], and resembles the delta of the Nile, though it is somewhat smaller. A considerable portion of it is annually inundated by the Lake of Colair, which is a fresh-water lake, situated in a deep depression, nearly in the centre of the low tract. This lake is about 24 miles long, and half as wide in the broadest part, and is connected with the Godavery and Kistna by channels which in the dry season contain no water, but from July to September convey a portion of the water of these rivers to the lake, which is then filled, when it becomes from 40 to 50 miles long, and inundates the adjacent country. During the dry season the water is conveyed by means of canals to a considerable distance from the lake. The lake covers 200 square miles, and contains 15 islands, which, as well as the neighbouring country, are fertilised by the deposit of mud brought down by the rivers. The superfluous water is carried off by the river Oopatair, in which the tides ascend to the lake, but are prevented from entering it by embankments. The Oopatair is navigable for small vessels, and is of great use for the export of produce. This tract contains the large commercial town of *Masulipatam*, 16° 10' N. lat., 81° 14' E. long. It is situated on almost the only part of that line of coast where the surf does not beat, and which affords good anchorage for vessels of 300 tons burden.

The *Godavery*, the largest river of the Deccan, rises in the most north-western corner of the table-land, north of 20° N. lat., about 60 miles from the Indian Ocean. It flows east-south-east and east for about 400 miles, receiving in its course the Manjera River from the south, and the Poorna and Wurdah from the north. After the junction of the Wurdah the Godavery is a mile wide, but at the end of the dry season it has only 15 inches of water. It then passes through the mountain region, and having entered the low country it becomes 4 miles wide, and has a great volume of water, but soon divides into two branches, which include a small delta. Approaching the sea it divides into many more branches, in which the tide ascends to some distance, and which admit vessels of considerable burden. On the most northern of these arms is the harbour of *Coringa*, the only smooth water on the coast between Cape Comorin and the Hoogly during the south-west monsoon. Coringa is a place of considerable traffic. The course of the river Godavery exceeds 700 miles.

The north-eastern portion of the Deccan, extending along the Bay of Bengal, between the mouth of the Godavery and the Bay of Balasore, and from that coast westward into the interior, contains several mountain regions which are little known. The inhabitants of this tract of mountainous country are called Gonda, and the country is called from them Gondwarra or Gundwana. The British government and the Raja of Berar are the rulers of this country in nearly equal parts, but the authority of both is only nominal.

The *Mahanuddy*, whose upper branches drain the plain of Ruttenpoor, between 20° and 22° N. lat., receives its principal supply of water from the unknown mountain region of Gondwarra. It flows east to Sumbhulpoor, where it is a mile across; it then turns south, but from the junction with the Kobragur at Sohnpoor to the sea its course is east. At Cuttack, where it is two miles across, it enters a level plain, which is fertilised by its waters. Below Cuttack it divides into three branches, one of which, called the Cajori, runs south, and passes near the temple of Juggernaut. The main body of the river, called Chittertola, continues east to the sea; and the northern arm, named Beroopa, runs north-east till it joins the Braminy, and then runs east to the sea, near Cape Palmyras. The whole course of the Mahanuddy is estimated at 500 miles. It is navigable for small vessels as far as Sumbhulpoor, and for river-boats to the mouth of its tributary the Hoostu, a distance of 380 miles.

The delta of the Mahanuddy extends along the sea from the Lake of Chilka (19° 40' N. lat.) to the town of Balasore (21° 30' N. lat.). The Lake of Chilka, which forms the boundary between the Circars and the province of Cuttack, receives its waters partly by one or two channels which branch off from the Cajori, or southern arm of the Mahanuddy. The lake is about 35 miles long, and 8 miles wide on an average. It is divided from the Bay of Bengal by a low and sandy tract, which is less than half a mile across. Its mean depth is only from 4 to 5 feet. A great quantity of salt is prepared from the water of the lake by evaporation. The delta of the Mahanuddy is occupied along the shore by a swampy tract, overgrown by jungle and low bushes, among which a few trees rise to a great height. This tract, which extends from 5 to 20 miles inland, is more the habitation of tigers, leopards, wild buffaloes, and crocodiles, than of men. Great quantities of salt, of the finest quality, are made here. Contiguous to the woody tract, but farther inland, lies the fertile portion of the delta, which in some places extends about 30 or 40 miles. It produces, when irrigated, abundant crops of rice, sugar, and tobacco; in the less fertile tract millet is raised. The chief town is **CUTTACK**. It forms, with the adjacent mountainous country, the province of Orissa, which is annexed to the presidency of Bengal. At the town of Pooree, 42 miles S. from Cuttack, and near the shore of the Bay of

Bengal, is the celebrated temple of *Juggernaut*. It stands in the centre of a quadrangle inclosed by a high stone wall, 650 feet in length on each side. The tower which contains the idols is 200 feet high. The festival takes place once a year, and the concourse of pilgrims is still exceedingly large. The idols are placed on a high platform mounted on wheels, and are dragged a certain distance and back again amid the acclamations of the devotees. Self-immolation beneath the wheels of the car is no longer permitted, but many of the pilgrims perish from disease and want of food. The latest account of this temple is given in the 'Orissa' of Lieut. F. B. Laurie.

The middle course of the Mahanuddy lies through a valley, which is generally wide and covered with alluvium producing rice, wheat, and sugar in abundance, and of the first quality. North-west of the delta of the Mahanuddy is an extensive mountain region, whose southern declivity forms part of the Deccan, while the northern belongs to the mountain region of Northern Hindustan. North of the valley of the Mahanuddy this mountain tract is generally from 3000 feet to 4000 feet above the sea; some ridges by which it is traversed, and which run east and west, rise about 2000 feet higher. Rice is cultivated in the lower districts. Forests cover the ridges and valleys, containing several kinds of trees useful as timber or for cabinet-work. A considerable portion of the population is employed in preparing these trees for the market, and in floating them down to Cuttack.

The table-land of the Deccan is separated from the mountain region of Northern Hindustan by the valleys of the parallel rivers Tapy and Nerbudda. The *Tapy* rises in the mountain tract which joins the table-land of Omercuntuc on the south-west. It consists of two branches, the *Tapy* and the *Porna*, the *Tapy* running south-west and the *Porna* west, till they unite, after a course of about 150 miles, near 21° 4' N. lat., 76° E. long. After the junction of the upper branches the *Tapy* flows in a wide valley between the Sautpoora Mountains on the north, and the Northern Ghauts on the south, for about 280 miles, until it enters the Indian Ocean by a wide estuary below the town of SURAT. In the upper valley of the *Tapy* is the town of *Burhampoor*, situated on a fertile plain; it is of considerable size, and carries on an active commerce with the countries both to the north and south of it. The *Nerbudda* rises on the table-land of Omercuntuc, about 22° 40' N. lat., 81° 40' E. long. It flows west over the mountain-plain, and having received a large tributary from the south is precipitated from its steep western declivity not far from the town of Mundla. Thence it runs in a narrow valley and between masses of rocks with a rapid course past *Jubbulpoor*, below which town it forms a cataract at *Bedaghur*. Farther west the valley widens, the mountains to the south rise with a gentle acclivity, and the river has a less rapid course. At *Hosungabad* it is 900 yards wide, and from 5 feet to 6 feet deep; it is here navigable for small vessels, and continues to be navigable as far west as 10 miles below *Chiculda*, where the river, which at *Mundlesir* is 1200 yards wide, is narrowed to 200 yards, and basalt-rocks rising from 10 to 12 feet above its usual surface lie across its bed. The water of the river rushes with great violence through three openings. Lower down the river is still more narrowed by rocks, and becomes unfit for navigation for a great distance; but about 10 miles above *Tulluckwarra* it enters the low lands of Gujerat, and is navigable from this place to its mouth for river boats, a distance of about 90 miles, and for vessels of moderate size half that distance. Below the town of *Baroach* it forms a wide estuary. The whole course of the river is about 600 miles.

The valley of the *Nerbudda* extends mostly along the southern bank of the river, since the *Vindhya* Mountains which inclose it on the north often advance to the river, or very near it. The upper part of the valley from *Mundla* to *Hosungabad* is comparatively narrow, and mostly filled up by low offsets from the mountains which lie farther south. South of *Hosungabad*, at the sources of the *Tapy*, the mountains take the form of a continuous chain, called the *Sautpoora* Mountains. This chain at its commencement runs nearly south-west, but by degrees turns westward and continues nearly parallel to the *Vindhya* Mountains, until it approaches that range, at about 76° E. long., but afterwards it resumes its western direction. These mountains are not very high, their mean elevation towards the east not exceeding 3000 feet, and farther westward they are somewhat lower. But both their declivities are steep, and the mountains are nearly inaccessible. The most considerable places in the valley of the *Nerbudda* are—*Jubbulpoor*, 1458 feet above the sea, whence a road leads over the *Vindhya* Mountains through *Belhari* to *Panna* in *Bundelcund*; *Hosungabad*, a large town with good buildings, and an important place for the communication between the plain of the *Ganges* and the western countries of the Deccan; *Mundlesir*, which, though not large, is an important place, because the most frequented pass leads from it northward over the *Vindhya* Mountains to *Oujein*; *Mheysir*, a little farther west, a large place, with good buildings and a well-stocked bazaar; and *Burwanee*, which is a considerable town, and contains many good buildings and a large palace.

The upper portion of the valleys of the *Tapy* and *Nerbudda* is subject to the British, and is named the *Ceded Districts* on the *Nerbudda*. The western districts on both rivers belong also to the British, with the exception of a tract in the middle, which is subject to the *Guicowar*. The country between *Allahabad* and the presidency

of *Bombay* is partly subject to *Scindia*, *Holkar*, and other *Mahratta* chiefs.

III. *The Mountain Region of Northern Hindustan* has nearly the form of a triangle, whose base is formed by the *Vindhya* Mountains, skirting the vale of the river *Nerbudda* on the north, and whose apex is at *Rewarree*, at no great distance from *Delhi*, on the *Jumna*, to the south-west. It contains a table-land of considerable extent, that of *Malwa*, which occupies its southern portion, and is everywhere inclosed by mountain ranges, and also a mountain region, called *Upermal*, which extends on the north of the table-land. To these two extensive portions are to be added the peninsula of *Gujerat* and the island of *Cutch*, which ought to be considered as detached members of this mountain region.

The *Vindhya* Mountains begin on the west near 74° E. long., 22° 10' N. lat., about 10 miles or 15 miles from the northern bank of the *Nerbudda*, and extend eastward along the vale of the *Nerbudda*. The western portion, as far east as *Chiculda* on the *Nerbudda*, has not the appearance of a continuous range, being frequently broken into isolated groups and presenting many steep summits. East of *Chiculda* (near 75° E. long.), the range approaches the river *Nerbudda* and continues along it like a steep wall, with a broad-backed surface and without summits. On an average it is about 1700 feet above the vale of the *Nerbudda*, and hardly more than 2200 feet above the level of the sea. As the table-land extending north of it, where it is contiguous to the range, has an elevation of 2000 feet above the sea-level, the mountainous character of the range disappears on that side. Towards the northern bank of the *Nerbudda* the declivity is exceedingly steep, and indented by ravines, which give to many of the projecting parts the appearance of bastions, on many of which fortresses, or ghura, were built, but they are rapidly going to decay. Only that portion of the range which extends east to the road which connects the town of *Bhopal* with that of *Hosungabad* is called the *Vindhya* Mountains by the natives. But the range continues east of the road, is connected with the table-land of *Omercuntuc* (between 80° and 81° E. long.), and occupies farther east the greatest part of the tract between the *Ganges* and the river *Sone*, approaching the *Ganges* within a short distance between the towns of *Mirzapoor* and *Chunarghur*; it terminates on the banks of the *Sone* between *Rotaaghur* and *Sasserat*, near 84° E. long. This eastern portion of the *Vindhya* Mountains is called by the natives the *Kimoor* Mountains. The roads leading over the *Vindhya* Mountains are few. The most frequented of them, which is the *Jaum* Ghaut, in 22° 23' N. lat., and 75° 49' E. long., rises to 2328 feet above the sea-level; it connects the towns of *Mheysir* and *Mundlesir* on the *Nerbudda* with *Mow* on the table-land, and thence leads to *Indore* and *Oujein*. Another road farther east connects the towns of *Bhopal* on the table-land with *Hosungabad*.

From the eastern side of the *Sone*, opposite *Rotaaghur*, a mountain range extends south and south-east towards the table-land north of the *Mahanuddy*, whilst another range called the *Goomah* Ghauts, extends east-south-east towards the *Rajmahal* Hills. The mountain tract included within these two ranges is not entirely covered with ridges, but includes numerous plains of considerable extent and elevation, some of which are fertile and well-cultivated, especially along the foot of the ridges. The highest parts of the ridges are estimated to attain an elevation of 4000 feet, and some parts of the plain are as high as 2000 feet. They seem to descend in terraces to the plain of the *Ganges*. The mountains are generally covered with high trees, useful both as timber and for cabinet-work. The *Rajmahal* Hills form a detached mass on the west bank of the *Ganges*, near the town of *Rajmahal*, 25° 2' N. lat., 87° 53' E. long. They are sometimes called the *Puharree* Hills, in consequence of their being inhabited by a native race of mountaineers called the *Puharrees*. The town of *Rajmahal*, though formerly a large city, and at one time the capital of the province of *Bengal*, now consists of little more than a long street of mud huts, some dilapidated mosques, and the ruins of a vast palace, built by *Sultan Sujah*, brother of *Aurangzebe*, and completed in 1630.

The table-land of *Malwa* has the *Vindhya* Mountains for its southern boundary. On the north it is inclosed by a chain of mountains which *Ritter* names the *Harraouttee* Mountains. The table-land of *Malwa* extends from *Dohud* on the west (near 74° 20' E. long.), to *Bhopal* on the east (77° 20' E. long.), about 170 miles, and its average width from south to north may be about 80 miles; its area consequently may be estimated at 13,600 square miles. *Malwa* is a plain, gently inclined towards the north, with an elevation varying between 1300 feet and 2000 feet. *Indore*, near the *Vindhya* Mountains, is 2000 feet above the level of the sea; *Oujein*, 1640 feet; and *Rampoor*, near the *Harraouttee* Mountains, 1276 feet. No range of any extent appears on the plain; a few hills only occur, which do not rise more than from 100 feet to 200 feet above their base. The soil is a black loam, producing rich crops of rice, Indian corn, peas, beans, &c. Large quantities of sugar-cane, tobacco, cotton, linseed, and sesamum are also raised and exported. Opium is the most considerable of its productions; a very large quantity is annually raised, of which the greater part is exported.

On this table-land are several towns of importance. *BHOPAL* has been already noticed. *Indore*, situated near the *Vindhya* Mountains,

is the residence of the Mahratta prince Holkar. *Dhar*, once a very large place, has still a population of 30,000. Nearly in the centre of Malwa is *Oujain*, a very ancient town. It was formerly the residence of Maharaja Scindia, is well built, full of temples, and other buildings, and contains 150,000 inhabitants. *Bhampoor*, on the river Chumbul, nearly opposite Rampoor, is a place of great commerce, being situated at the pass of Mokundra, which leads over the Harraouttee Mountains to Upermal; it contains 5000 houses. South of it is the town of *Gurrote*, with 1200 houses, and in its neighbourhood are the temples of Dhumnar ($24^{\circ} 12' N. \text{ lat.}, 75^{\circ} 34' E. \text{ long.}$), which are excavated in the rocks. In the north-western corner of the table-land is *Pertabghur*, a considerable place, situated on the great road which leads from the table-land to the plain of Gujerat and to Cutch.

Between $68^{\circ} 30'$ and 73° E. long. lies the district of *Gujerat*. On its eastern side the plain of Gujerat, with an average breadth of about 45 miles, extends southward to the banks of the Tupty at Surat, and northward to the river Subarmatti, which enters the most northern corner of the Gulf of Cambay. It is one of the richest and most populous districts of Hindustan, having a good soil, and receiving the heavy rains brought on by the south-western monsoon. It is also well watered, though some of its rivers, especially the largest, the Mhye, have furrowed out deep beds, sometimes more than 100 feet below the surface of the plain. Rice is nearly the only grain which is cultivated; but the numerous villages are surrounded by extensive plantations of cocoa, mango, and other fruit-trees. The number of large towns is considerable. [AHMEDABAD; BAROACH; BARODA; CAMBAY.] The GULF OF CAMBAY is described separately. At the most northern corner of the Gulf of Cambay, and on the western banks of the river Subarmatti, lies a very flat tract, covered with an alluvial soil, which continues in a north-western direction until it meets that part of Cutch which is called the Runn. [CUTCH.] This tract is so low, that when the Runn is covered with water, it is likewise inundated, and the peninsula of Gujerat is changed into an island. It is only used as pasture-ground, and may be considered as a continuation of the Runn.

The peninsula of Gujerat is separated by the Gulf of Cutch from the island of Cutch, and by the Gulf of Cambay from the plain of Gujerat. The greatest part of it is covered with mountains and hills, but a fertile plain extends along its northern shores from 15 to 20 miles inland, and the flat swampy tract along its eastern border continues along the Gulf of Cambay as far south as Bhownuggar. The mountains in the interior are imperfectly known. They seem to extend in a general direction from east to west in two continuous ranges, of which the northern is called the Mandwa Mountains, and the southern the Junaghur Mountains. The whole of the peninsula is well watered, and the rivers, with the exception of those which fall into the Gulf of Cutch, preserve their water all the year round: the Bhunder, which enters the sea at Nuvvee Bunder on the western coast, is even navigable for small river-boats during the greatest part of the year as far as Kotyana. In the lower country which separates the two mountain ranges several extensive tracts occur which are cultivated, but the best cultivated district is the northern plain, where the common grains of Hindustan are raised in abundance, together with cotton. Here also is the principal commercial town *Nouanuggur*, which carries on a considerable commerce with Arabia and the Persian Gulf. It is a large place, and has good manufactures of cotton, and many dye-houses. The most mountainous districts are inhabited by native tribes who live by the produce of their herds. The climate of Gujerat is rather mild, and not unhealthy even for Europeans. The highest point to which the thermometer has been observed to rise is 102° ; in January it sinks as low as 55° .

Gujerat is partly subject to the Guicowar, partly to the British, and partly to native chiefs. An account of the Guicowar is given under BARODA, which is his capital. At the most southern point of Gujerat the Portuguese are in possession of the small island of *Dis*, where there is a good harbour and a fort erected for its protection. It was formerly a considerable place, but has now little or no commerce.

The principality of CUTCH is described separately.

On the north side of the table-land of Malwa, and separated from it only by the Harraouttee Mountains, lies a mountain region called by the natives Upermal, or mountainous country. Its western boundary is well defined, and protected by the Aravulli range, which runs in a north-north-east direction between 24° and 28° N. lat., 73° and 76° E. long. [ARAVULLI.] The country between this range, the Harraouttee Mountains, and the Kimoor division of the Vindhya Mountains, is traversed by several ridges running nearly parallel to the Aravulli Mountains. They decrease in elevation and width as they advance eastward, and the valleys which divide them are also comparatively more narrow. This country occupies nearly double the area of the table-land of Malwa.

The Chitore Mountains are nearest to the Aravulli, with whose southern extremity they are united by a kind of mountain-knot, in which the Harraouttee range also terminates on the west. They extend from about 24° N. lat., 75° E. long., in a north-east direction, to about 26° N. lat., 77° E. long., within about 30 miles from the banks of the Jumna. Though of inconsiderable elevation, being only about 600 feet above their base, and 2000 feet above the sea-level,

their steep declivities and extremely broken surface oppose great impediments to an easy communication between the two valleys which they separate.

The country between the Chitore Mountains and the Aravulli, which, on an average is 60 miles across, but towards the north considerably wider, may be considered as a plain with an undulating surface, which becomes hilly towards the north. Its southern portion forms an inclined plain, descending gently to the east. Wheat, barley, and javary are produced in abundance; opium is also raised. The rains fall from June to September with west winds; but they are preceded by north-easterly winds, which last for four months, and are extremely hot. During these months vegetation almost entirely disappears. North of 26° N. lat., the plain has the appearance of a sandy desert, from which isolated and strangely-formed rocks rise, generally to an elevation of 300 feet, and occasionally to 700 feet. On the highest of these isolated rocks is the town of Alwur, 1200 feet above the plain. This country forms a portion of Rajpootana.

The country south-east of the Chitore Mountains, and between them and the Vindhya range, is known in its western districts by the name of Harraouttee, and in the eastern by that of Bundelcound. It is a succession of narrow valleys, separated by broad-backed mountain ranges. On the table-land of Panna, between the Cane and Tonsa rivers, is the town of *Panna*, a well-built place, perhaps 1800 feet above the sea, the neighbourhood of which contains the richest diamond-mines in Hindustan. North of Panna, on the banks of the river Cane, is the town of *Banda*, which is well built, and carries on a considerable commerce, especially in cotton. This town is situated where the mountain region borders on the plain of the Ganges. The fortress of Gwalior, situated in $26^{\circ} 17' N. \text{ lat.}, 78^{\circ} 4' E. \text{ long.}$, is built on a rock, having a tolerably level surface of considerable extent, and a steep descent on all sides. At the foot of the rock is the town of *Gwalior*, which contains 30,000 inhabitants. In the plain which extends between Kota and Pally is *Patun*, a thriving commercial town, in which nearly the whole commerce between Malwa and the other parts of Northern Hindustan is concentrated.

All the rivers which traverse the table-land of Malwa and the mountain region of Upermal fall into the Jumna or the Ganges, their course being north-east. The largest is the *Chumbul*, which originates on the northern declivity of the Vindhya Mountains, in three branches, between which the towns of Dhar, Sagore, and Indore are built: it receives a great portion of the drainage of the table-land before it leaves it. It then enters the Harraouttee range near Rampoor, and runs in a narrow cleft as far north as Kota. In the plain below Kota it is joined by other rivers, especially the Newy and Parbuttee, which bring to it the waters of the eastern districts of Malwa, and likewise traverse the Harraouttee Mountains in narrow valleys. The Chumbul begins to be navigable only a short distance above its junction with the Jumna, which takes place between the towns of Etawah and Calpee, after a course of about 400 miles. The other rivers of Upermal are the Sinde, Betwa, and Cane, which fall into the Jumna, and the Tonsa, which empties itself into the Ganges. The most eastern of the rivers of the mountain region of Northern Hindustan, the *Sone*, rises on the eastern declivity of the table-land of Omercuntic, south of 23° N. lat., and near 82° E. long. It skirts that table-land on the east, flowing north-north-west to 24° N. lat., where it suddenly turns east-north-east, in which general direction it continues until it joins the Ganges above Patna. Its course is in a narrow valley as far as Rataaghur, below which fortress it enters the plain of the Ganges and becomes navigable.

The mountain region of Northern Hindustan is for the most part in the possession of native princes. The British have however annexed the countries south of the Sone to the presidency of Bengal, and the tract between the Sone and the Ganges to the North-Western Provinces. Between the two British possessions the territories of the Raja of Rewa are inclosed, which comprehend a tract of mountainous country on the upper Sone and on the Tonsa. The remainder is divided between the Mahratta princes, Scindia, Holkar, the Guicowar, and the Rajpoots.

Rajpootana is an extensive territory, so called because the greater part of it belongs to the Rajpoot princes. It is, to a considerable extent, coincident with the ancient province of *Ajmeer*. *Rajast'han*, or 'the abode, or country of princes,' is another name for the same territory. Rajpootana is situated between $22^{\circ} 45'$ and 31° N. lat., $68^{\circ} 25'$ and $77^{\circ} 45'$ E. long. It is bounded N. and W. by the Hill States, Lahore, Moultan, Bahwulpoor, and Sinde; S. by Gujerat and Malwa; and E. by Agra and Delhi. Rajpootana comprehends the states of Alwur, Banswarra, Bikaner, Doongerpore, Jessulmeer, Marwar (or Joudpoor), Jypoor (or Jynagur), Jhalawar, Mewar (or Oodipoor), Tonk, Cutch, Sirahi, Kerowlee, Kishengurh, Pertabgurh, Kota, and Boondee. The city of Ajmeer, with a small territory surrounding it, belongs to the British.

The great chain of the Aravulli Mountains stretches, in a north-eastern direction, through the greater part of Rajpootana, from the hilly country which connects it with the Vindhya Mountains almost to the confines of Delhi. Nearly the whole of the country west of the Aravulli is a sandy waste, extending to the Gharra branch of the Indus, and rising towards the south in a succession of steppes. In this barren territory are comprised the principalities of Marwar,

Sirohi, Jessulmeer, and Bikaner. A few oases occur, the largest of which are those in which the towns of Joudpoor, Jessulmeer, and Bikaner have been built.

Marwar has a better soil, and is in a better state of cultivation than the other principalities on the west of the Aravulli Mountains. The capital of Marwar is *Joudpoor*, a large city with a castle in which the Raja resides. *Nagore* is surrounded by barren sand-hills. Rajpootana east of the Aravulli range, though its soil is sandy, is fertile and generally well cultivated. The periodical rains are abundant, and there are numerous wells for the purpose of irrigating the land in the dry season; some of these wells are 200 feet deep.

Jypoor, the capital of the principality of Jypoor, in 26° 54' N. lat., 75° 38' E. long., stands in a valley open to the south, and is surrounded by a stone wall. It is well and regularly built, with four principal streets, which meet in a large square. The small territories of Boondee and Tonk may be considered as included under the same head. The town of *Kota* is seated on the Chumbul, in 25° 12' N. lat., and 75° 47' E. long.

Mewar, though mountainous, is tolerably fertile, and produces all kinds of grain, sugar, indigo, cotton, and opium. Good pastures are rare, and the cattle are smaller than in the neighbouring districts. *Oodipoor*, the capital of Mewar, in 24° 34' N. lat. and 73° 45' E. long., is seated in a mountainous district, and is a place of great strength; it can only be approached by three narrow defiles. Chitore, the former capital, having been taken by the Mohammedans, Oodipoor became the residence of the Raja, or Ranah, as he is called. The town of *Chitore* is situated in a rocky plain, in 24° 53' N. lat., and 74° 45' E. long., on the banks of the Bunnass, over which are the ruins of a long, lofty, and handsome stone bridge of eight pointed arches, and one semicircular arch in the centre. Chitore is a tolerably large town, with many pagodas.

Ajmeer, in 26° 28' N. lat., and 74° 42' E. long., is a moderate-sized town on the slope of a high hill. The houses are well-built, and are mostly whitewashed. On the top of the hill is a remarkable fortress called *Taraghur*, which is a place of great strength, and is in most parts inaccessible. Just above the town of Ajmeer is a large lake, which was formed by the emperors of Delhi by damming up the outlet of an extensive valley, into which several rills were conducted. The lake is 4 miles in circumference in dry weather and 6 miles during the rains. It affords the means of irrigation to a large district on its banks, supplies abundance of excellent water to the inhabitants of Ajmeer, and is full of fish. In 1818 the city of Ajmeer, with the surrounding district, was ceded to the British by Dowlet Rao Sindia, in exchange for a part of the territory of Malwa.

The other principal towns of Rajpootana are the following:—*Bikaner*, in 27° 58' N. lat., and 73° 20' E. long., a large town surrounded by a wall and ditch. *Boondee*, the capital of the principality of Boondee, is a small town on the side of a hill, on the summit of which is the Raja's palace, a large stone edifice strongly fortified. *Jessulmeer*, in 26° 48' N. lat., 71° 6' E. long., is situated in an oasis of the great sandy desert, and contains a population of 20,000. *Tonk*, on the Bunnass, in 26° 12' N. lat., and 75° 47' E. long. *Kishengurh*, in 26° 38' N. lat., and 74° 57' E. long., is situated on a chain of granite hills, surrounded by walls of solid masonry, with its castle on the mountain top. The states of Rajpootana extend over an area of 123,019 square miles, with a population of 8,095,632, and an annual revenue of 1,743,995*l*. Three of the states have a population of upwards of a million each, namely:—Jypoor 1,891,124, Joudpoor 1,783,600, and Mewar 1,161,400. The others vary from 70,000 to 500,000. A military force is maintained in the states. The extent of the force varies with the circumstances of each state.

The inhabitants of Rajpootana consist principally of Rajpoots, who are Hindoos, and of Mohammedans. The remainder of the inhabitants consist of Bheels, Jains, Jauts, and Mairs. Till they came under the protection of the British the Rajpoots were little better than robbers, and were engaged in incessant warfare with each other; consequently the towns and many of the larger villages of Rajpootana are fortified, and generally placed in situations where they might be protected by a fortress on a rocky height. The Rajpoot states were never properly subjected by the Mohammedan emperors; for though they were compelled to pay a tribute and furnish a certain number of mercenary soldiers they continued in a state of half independence, and their frequent revolts occasioned their principal cities to be several times destroyed. After the death of Aurungzebe in 1707, Rajpootana continued nominally subject to the emperor of Delhi till 1748, when its chiefs became independent. Since then the desolating attacks of the *Mahrattas* have compelled the Rajpoots to place themselves under the protection of Great Britain. The *rajahs* of Rajpootana are independent sovereigns, but an English officer commands the forces; and a garrison has been established at Ajmeer sufficient for its protection against its enemies, and also to keep the Rajpoot chiefs themselves in subjection.

IV. *The Plain of the Ganges.*—The *Ganges*, or *Ganga*, rises with two principal branches in the highest elevation of the Himalaya Mountains, near 31° N. lat., and between 78° 30' and 80° E. long. The most western branch is called the *Bhaghirettee*. The other branch is called the *Alakananda*. The river formed by the junction of the *Bhaghirettee* and the *Alakananda* is called the *Ganges*. Its course within the region of the Himalaya Mountains is not long, but very

GEOG. DIV. VOL. III

winding, until it entirely leaves it below Hurdwar, and enters the plain of the Ganges. The surface of the river at this point is hardly more than 1000 feet above the sea-level. In its course through the plain it inclines to the south-south-east, and forms a junction with the *Jumna* at Allahabad. In this part of its course of more than 400 miles it receives no considerable affluent except the *Ram Ganga*, which with its principal tributary the *Kosila* joins the *Ganges* above *Canoge*. The *Jumna*, which joins the *Ganges* at Allahabad, rises west of the *Ganges*, within the more elevated masses of the Himalaya range, in two branches, of which the eastern soon takes the name of the *Jumna*. They unite near *Kalsi*, within the lower range of the Himalayas, and soon afterwards leave the mountain region. Though its waters during its course are increased by those of the mountain region of Northern India, the *Chumbul*, *Sinde*, *Betwah*, and *Cane*, yet at the point of their confluence the *Ganges* is much larger, being a mile across, while the *Jumna* is only 1400 yards. From Allahabad to below *Boglipoor*, near the foot of the *Rajmahal Hills*, the *Ganges* runs east with a winding course, and receives a great number of large streams, among which may be mentioned the *Goomtee*, the *Gogra*, the *Ghandaki Ganga*, or *Gunduck*, the *Bagmutty*, and the *Coosy*. At *Sicligully*, about 30 miles below *Boglipoor* and 10 miles above *Rajmahal*, the *Ganges*, turns southward. Here the great delta of the river may be considered to begin. At present the first bifurcation of the *Ganges* takes place at *Sooty*, about 20 miles below *Rajmahal*. The western arm is called the *Bhaghirettee*, and flows south. The eastern arm preserves the name of *Ganges*, and flows south-east. It divides again about 40 miles lower down, near *Jellinghy*, from which the western branch is called the *Jellinghy River*. The *Jellinghy River* flows mostly south, and joins the *Bhaghirettee* near *Nuddea*. Another arm branches off from the *Ganges* a few miles from *Jellinghy*. This arm, called the *Matabunga*, runs likewise south with many large bends, and joins the *Bhaghirettee* nearly at an equal distance between *Nuddea* and *Hoogly*. After the junction of these three arms of the *Ganges* the western branch of the *Ganges* is called the *Hoogly*, under which name it passes *Calcutta*, and reaches the *Bay of Bengal* near the island of *Sagor*. The principal branch of the *Ganges*, continuing its course to the south-east, sends off another arm near *Custee*, which is called the *Chundna*. The fifth great bifurcation takes place at no great distance lower down, near *Maddapoor*, and is called the *Gurroy*. These two great branches, the *Chundna* and *Gurroy*, unite again near *Colna*, and thence proceed southward to the *Bay of Bengal* under the name of *Ballisore River*, or *Horingotta*, which, like the *Hoogly*, forms a wide estuary at its mouth. Whilst the *Ganges* loses a great deal of its waters by sending off so many large branches, besides several smaller ones, it receives new supplies from the Himalaya Mountains and the *Brahmaputra*. The *Mahanada* and the *Teesta*, which both run from 250 to 300 miles, rise on the southern declivity of the higher Himalayas in *Nepaul* and *Bootan*, and run southward. They communicate by several branches with one another during the rainy season, but they join the *Ganges* at different points. At *Nabobgunge* the *Ganges* receives the first supply of water from the *Brahmaputra* by the branch called the *Jenye*, which leaves its principal stream opposite the town of *Sheerpoor*, is very deep, and brings down a great volume of water. Where the *Ganges* is increased by the waters of the *Jenye* it divides again, and its eastern branch, called the *Booree Ganga*, passes *Dacca* at no great distance, and enters the wide bed of the *Brahmaputra* below *Nuraingunge*. The *Booree Ganga* receives three other navigable branches of the *Brahmaputra*. The *Brahmaputra* is so much drained of its waters by these different offsets that during the dry season it is not navigable between *Sheerpoor* and the mouth of the *Booree Ganga*. The principal branch of the *Ganges* flows nearly parallel to the *Booree Ganga* and the *Brahmaputra*, but falls into the sea by a separate embouchure between the continent and the island of *Deccan Shabazpoor*. The *Ganges* runs nearly 1500 miles. All the affluents of the *Ganges* rising within the mountain region of the Himalayas are navigable for smaller or larger river-boats to the very foot of the range for about six months in the year. The *Ganges* itself and its arms within the delta, and also the *Jumna*, are navigable all the year round for vessels of larger or smaller size. The *Hoogly* can only be navigated as far up as *Calcutta* by vessels not drawing more than 15 feet water, and all larger vessels are obliged to remain at the island of *Sagor*, where the climate is very unhealthy. The tide at full and change causes a terrible bore in the *Hoogly*, and its ascent as far as *Culna*, and even *Nuddea*, is very perceptible; but though the bore in the *Megna*, or *Brahmaputra*, is said to be still greater, the tide does not ascend farther than the town of *Dacca*, on the *Booree Ganga*. In the *Horingotta* branch it is felt as far as *Custee*.

The great plain which is drained by the *Ganges* and its affluents may be divided into three parts, the plain of *Bengal*, the plain of *Bahar*, and the plain of the *Doab*, *Oude*, and *Rohilcund*.

The plain of *Bengal* extends from the mouths of the *Ganges* to the Himalaya Mountains, about 280 miles, and its width may perhaps exceed 180 miles. Its western boundary runs from *Balasure* on the *Bay of Bengal*, through *Midnapoor*, *Bishunpoor*, and *Nagore* to *Rajmahal*, and thence along the river *Coosy* to the mountains. On the east its border skirts the *Tiperah Hills*, includes the province of *Silhet* in the form of a gulf, and follows here and farther north the southern and western declivity of the *Garrow Hills*, until in the

o

meridian of Goyalpore it traverses the Brahmapútra, and attains in that direction the Himalaya Mountains. On this side the plain is connected with the maritime low tract of Chittagong and the valleys of Silhet and Assam, which differ considerably in their natural character from the plain of Bengal.

The plain of Bengal comprehends four natural divisions; the Sunderbunds, the country subject to inundation, the country which is not inundated, and the Tarai.

The Sunderbunds occupy the most southern part of the plain between the mouths of the Ganges and Brahmapútra, and as far north as the salt water of the sea is carried by the tides. The district extends farthest along the Horingotta branch, where it advances to the neighbourhood of Colna, a distance of 70 miles: the mean width may be about 50 miles. The tract is entirely uncultivated. The soil is extremely swampy all the year round, and overgrown with tall trees, which produce excellent timber. The thickets are inhabited by tigers, rhinoceroses, and other wild animals; while the numerous branches into which the different arms of the Ganges divide within this tract harbour crocodiles. The inhabitants are few, owing to the great unhealthiness of the country. Their occupations are the cutting down of timber trees, and the preparation of salt from the seawater, which enters the rivers and canals with the tides. It is only towards the two extremities, along the Hoogly and the principal branch of the Ganges, that some cultivated tracts occur within the Sunderbunds.

The country subject to inundation comprehends not only what is called the Delta, or the country between the branches of the Ganges, but also the country between the Ganges and the Brahmapútra, as far north as 25°. The inundation is greatest in the eastern districts, especially where the waters of the Brahmapútra are connected with the Ganges, in which part an immense tract of country is covered for several months with water many feet deep, so that at the end of June the towns and villages, which are built on artificial mounds and protected by embankments, appear like islands. The river has then risen 15 feet above its level in the dry season, but it still continues to rise for several weeks, about 5 inches every day. At Custee it rises between 31 and 32 feet; at Dacca, only 14 feet; at Luckipoor, not more than 6 feet; in the Sunderbunds it is not perceptible. In October, when the water rapidly decreases, the country is sown with rice, and the produce of this tract is sufficient to furnish the whole plain of Bengal with this principal article of food. The western districts of the country subject to inundation are only slightly covered with water; and though they likewise produce rice, they are principally covered with plantations of mulberry-trees; while in the northern parts indigo, sugar, cotton, and tobacco are raised in abundance. The plantations, with which the villages are surrounded, consist of mango-trees, cocoa-trees, and other kinds of palms. The whole of this plain is covered with alluvial earth to a depth of 130 or 140 feet, and no wells have been made in it.

The country not subject to inundation lies partly west of the Hoogly, and partly north of 25° N. lat. The district west of the Hoogly is of great fertility, especially Burdwan, which produces grain, sugar, cotton, silk, and indigo, in great abundance and of excellent quality: it is the best cultivated, most populous, and most productive district in India. The country north of 25° N. lat. is fertile and well cultivated in its southern districts; farther north large tracts of waste land occur, which are covered with rank grass and reeds. These sterile tracts increase in number and extent as they approach the Tarai.

The Tarai (the swamp) divides the plain of the Ganges from the lower region of the Himalaya Mountains, and extends from the banks of the Brahmapútra along the foot of the mountains to the place where the Ganges issues from them at Hurdwar. But it varies in width and also in character, narrowing insensibly as it proceeds farther to the north-west. In Bengal it is from 20 to 25 miles across, but towards its north-western extremity only a few miles wide. It is a deep swamp of great fertility, which is covered with a vigorous vegetation and large forest-trees, and is the haunt of numerous wild animals. The inhabitants are few and miserable; they chiefly maintain themselves by cutting down the forest-trees, which are sent to Calcutta and other towns in Bengal. Farther north, in Bahar, Oude, and Rohilcund, the underwood and the climbing plants disappear, and the ground between the trees is covered with long coarse grass, which being destroyed by putting fire to it, herds of cattle pasture on the new grass which immediately springs up.

The Plain of Bahar, which extends west of the river Coosy and the Rajmahal Hills as far as the meridian of Allahabad, is divided by the Ganges into two regions. The southern, or Bahar Proper, is narrowed at both extremities by the Rajmahal Hills and the projecting offsets of the Kimoor Mountains. Its surface along the banks of the river is undulating, but farther south it rises into hills. By the industry of its inhabitants this country has attained such a degree of cultivation that it resembles a garden. Its principal products are opium, indigo, rice, and cotton. [BAHAR.] The country north of the Ganges is called Tirhut or Trihuta. Its surface is undulating, and the districts which border on the Ganges do not differ much from Bahar Proper in soil and cultivation. But about 30 or 40 miles from the river large tracts are covered with forest-trees, especially saul-trees, which

increase in extent as the country approaches the Tarai. The great abundance of water in the rainy season forms extensive lakes, which render this part of the Gangetic plain very unhealthy, and prevent the extension of cultivation.

West of the meridian of Allahabad, the Gangetic plain comprehends the Doab, or country between the rivers Ganges and Jumna, together with Oude and Rohilcund. The surface slopes with rapidity, descending from north-west to south-east, from 1200 feet to 800 or 400 feet, and consequently the running water is soon drained off, and the soil is dry. As the heat of the summer, though excessive, lasts only a short time, and the cold in winter is considerable, the vegetation differs greatly from that of the lower plain. The winter crops resemble those of Europe, consisting chiefly of wheat, barley, oats, and millet, together with peas, beans, and vetches; also tobacco, flax, and hemp. The summer crops, which grow during the rainy season, are rice, javary, cotton, indigo, &c. The palm-tree disappears; but the European fruit-trees grow together with bananas, custard-apples, and fruits which have been transplanted from China.

The country which lies to the west of the Jumna, and extends as far as the banks of the Sutlej and Gharra, constitutes the connecting link between the plains of the Ganges and the Indus. It is a level tract. Where this plain borders on the Himalayas, it is in some measure watered and fertilised by the numerous small rivers which originate along the declivity of the lower range; and numerous villages, with some cultivated tracts, occur here. But the small volume of water brought down by these rivers is soon absorbed by the sandy soil, and some of them cease to flow at a distance of about 30 to 40 miles. The remainder unite in one somewhat larger stream, the Gagur, which continues to flow for about 100 miles, and then also is lost in the sand. With the decrease of the waters of these rivers the country gradually assumes the dismal aspect of the Indian desert. At the few inhabited places fresh water can only be found at a depth of from 50 to 100 feet.

In the Gangetic plain the rains set in towards the end of April or in May: they are however not abundant in Calcutta before the beginning of June. In the countries farther east, as Chittagong and Silhet, the abundant rains begin a month earlier. At Calcutta the mean annual quantity of rain is 71 to 72 inches, but at Dacca it probably does not fall short of 100 inches. The heat is excessive all the year round, but especially so before the setting in of the rains. The mean annual temperature of Calcutta is 79° of Fahrenheit; that of the hottest month (May) 86°; and that of the coldest (January) 67°. The climate changes greatly as soon as the hills of Rajmahal are passed in ascending the Ganges. In Bahar the difference between the hottest and coldest season is much greater. The quantity of rain at Benares does not exceed 40½ inches annually, and the rains set in there a month later. The difference between Bahar and the Doab, in respect of climate, is not so great as between Bengal and Bahar, though the difference of elevation is greater, a great portion of the Doab being more than 600 or 700 feet above Bahar. The western districts of the Doab are visited during the hot season by scorching westerly winds from the Indian desert. The rains are abundant in the districts between the Himalayas and the Ganges, but much less so in those farther west, and very moderate to the west of the Jumna. Farther to the west, in the desert country between the Jumna and Sutlej very little rain falls.

The Gangetic plain is the most fertile, the best cultivated, and most thickly inhabited portion of Hindustan. It contains more than one-half of all its population, and the number of large towns is considerable. Some of these towns are noticed elsewhere. [AGRA; ALLAHABAD; BACKERGUNGE; BAHAR; BAREILLY; BENARES; BOGLIPOOR; BURDWAN; CALCUTTA; CAWNPOOR; DACCA; DELHI; DINAGEPORE; FURRUCKABAD; FYZABAD; PURNAH; RAJMAHAL.] *Colna*, at the confluence of the Chundna and Gurroy, branches of the Ganges, is a rapidly increasing place. *Patna*, the modern capital of Bahar province, is situated on the right bank of the Ganges, in 25° 36' N. lat., 85° 15' E. long. The city within the walls is about a mile and a half long, from east to west, and about three-quarters of a mile broad, from north to south. This part of the city is very closely built, but the suburbs are of far greater extent, and the buildings altogether extend for 9 miles along the Ganges, with a breadth of about 2 miles; but the buildings outside the walls are irregularly placed, and there are considerable spaces between them. The greater number of the houses are of mud, the rest are built of bricks. Nearly all the roofs are tiled. The population is about 300,000, of whom two-thirds are Hindoos, and the remainder Mohammedans; the number of Europeans is very small. The city is the seat of a considerable banking trade. A considerable trade is also carried on in opium, rice, saltpetre, cotton cloths, and silk goods. *Monghir*, a fortress with a population of 20,000, is noted for its manufactures of iron. The great commercial town of *Mirzapoor*, on the right bank of the Ganges, between Allahabad and Benares, is the chief market for silk and cotton, and is estimated to contain a population of from 200,000 to 300,000. *Gaya*, the capital of Bahar district, situated on the Fulgo, a small feeder of the Ganges, has 86,000 inhabitants and a famous temple of Vishnu, which is visited by a great number of pilgrims. The towns of Tirhut have not yet risen to importance, but are rapidly increasing with the extension of cultivation in this fertile district. *Calpee* is still

a considerable place, and carries on an extensive trade in cotton. *Etawah* has also preserved a considerable population, but is not otherwise important. *Lucknow*, the capital of the kingdom of Oude, stands on the right bank of the river Goomtee, in $26^{\circ} 51'$ N. lat., $80^{\circ} 50'$ E. long. Lucknow became the residence of the court in 1775. It is now one of the wealthiest cities of Hindustan, with a population estimated at 300,000. *Muttra* is still a large town, and a sacred city, to which great numbers of pilgrims annually resort. *Hurdwar*, which is situated where the Ganges issues from the Himalaya Mountains, is a place of pilgrimage, and has a considerable commerce. *Serampoor*, on the right bank of the Hoogly, about 12 miles above Calcutta, in $22^{\circ} 45'$ N. lat., $88^{\circ} 26'$ E. long., extends nearly a mile along the river, but is of small width. The town is built in the European manner. It belonged to the Danes, who sold it to the British government some years ago. Serampoor has acquired some celebrity as the principal place where the Protestant mission was established about the close of last century. The mission has since been removed to Calcutta. The population is about 13,000. The Danes obtained possession of Serampoor in 1676. *Shahjehanpore* is situated in $27^{\circ} 54'$ N. lat., $79^{\circ} 50'$ E. long., on the Gurruck, a quiet winding stream. The town is large, and contains about 50,000 inhabitants. The houses are in good condition, and the bazaars show activity and opulence; but the mosques are mostly ruinous. There is a castle at Shahjehanpore. The town was founded by Shah Jehan. The French settlement of CHANDEENAGORE is separately noticed.

The states spread over the Gangetic plain are immediately subject to the government of the British, with the exception of the kingdom of Oude, which occupies that portion of the plain which extends, between 80° and 82° E. long., from the banks of the Ganges to the Himalaya Mountains. [OUDE.] The British possessions are annexed to the presidency of Bengal and to the North-Western Provinces, and now extend to the Beas, including the Jullindar Doab, and overlooking the Hill States, as far as the Cashmere territory.

V. *The Plain of the Indus.*—The *Indus*, called in its southern course also the *Sinde*, rises on the table-land of Tibet, about $31^{\circ} 20'$ N. lat., and near 80° E. long. After a course of perhaps not less than 250 miles on a table-land from 12,000 to 15,000 feet above the sea, it is joined below Leh by a large river called the Shayuk. Little is known of the Indus after its junction with the Shayuk till it issues from the Himalaya range a few miles east of Attock. Above Attock its course lies due west, and it is joined by the river of Cabul, the only considerable affluent which it receives from the west after it has left the mountains. After leaving the high mountains above Attock, it continues its course in a south-south-west direction for about 70 miles more between lower ranges, till at $33^{\circ} 7'$ N. lat. it enters the great plain, keeping the western side of the plain. The Hala Mountains, which run along the eastern border of the table-land of Beloochistan, rise at a short distance from it, in parts within a few miles.

As soon as the Indus has left the mountains it divides into four arms, which run with great bends, and sometimes unite but separate again, so that the whole volume of its waters is seldom united in one bed. South of 29° N. lat., near the small town of Mittun Cote, it is joined on the east by the Chenaub, or united rivers of the Panjab, or Punjaub, and changes its course to south-west. It is here 2000 yards wide. It continues its south-west course to Bakkur, and then turning to the south and south-south-east, it reaches Hyderabad, above which town a branch separates from the main stream, and flows south-east to the Runn, out of which it flows by the wide estuary which separates the island of Cutch from the plains of Sind. This estuary is called the Korie, and has 12 feet of water as far as Busta, but farther inland it is not so deep. The western and principal branch of the Indus divides again south of 25° N. lat. near Jarruck, and the smaller or eastern branch loses also a great part of its waters before it reaches the sea by the mouth called Sir. It is navigable however as far as Gunda for vessels of 38 tons burden, and it is much navigated, though the merchandise must be transferred into small river boats at Gunda. Below Tatta, and about 60 miles from the sea, the principal branch of the Indus separates again into two branches, of which the smaller, called Buggaur, runs west, and the larger, the Sata, continues in a south-south-west direction to the sea. The Sata is, after the bifurcation, still 1000 yards across. It divides into seven arms before it reaches the sea. The widest of its mouths, the Gora, is only accessible to small vessels on account of its shoals and rapid current. The navigation of the Indus along the Delta is very dangerous. At a distance of one mile and a half from the sea the main branch is only 12 to 15 feet deep. Farther from the shore are numerous sand-banks. The spring-tides rise 9 feet in the mouths of the Indus. In the river the tide ascends only 75 miles, and is not perceptible at Tatta.

The Indus receives only one great affluent in its extensive plain, but this affluent unites all the rivers which drain the Panjab, or the Five Rivers, the Pentapotamia of the Greeks. These five rivers, enumerated from east to west, are the Sutlej, or Satadru (the Zaradrus of Ptolemaeus), the Beeah, or Beas (the Hyphasis of Arrian), the Ravee (the Hydrates of Arrian), the Chenaub (the Acesines), and the Jhilum, or Behut (the Hydaspes). The *Sutlej* has the longest course. It originates on the table-land of Tibet. Its course on the table-land, where it flows in some measure parallel to the Indus, is more than 150 miles. So far it flows north-west. Changing its course to the south-west, it soon

enters the Himalaya range, through which it runs in a narrow valley, with numerous bends, more than 100 miles. It enters the plain near Ropur, whence it flows due west past Ludiana as far as Hurree, where it is joined by the Beas, $31^{\circ} 10'$ N. lat., $75^{\circ} 5'$ E. long. The *Beas* originates in the Himalaya Mountains, traverses the mountain region with two great bends to the south and north, and enters the plain above Nadaun after a course of less than 100 miles. Hence it flows west-south-west, gradually approaching the Sutlej until it joins it. The united river then takes the name of Garra, or Gharra, and continuing to flow south-west unites with the Chenaub below Bhawalpoor. The *Ravee* rises in one of the parallel chains of the Himalayas called the Santch Mountains. Its upper course is not long. Above Kotos, or Kothua, it enters the plain of the Panjab, where it flows south-west parallel to the Beas and Garra, until it joins the Chenaub at Fazilshah. The *Chenaub* rises in the Paralass range of the Himalayas near the sources of the Beas, and runs for about 100 miles in the mountain region to the north-west; it afterwards turns gradually to the west, passes the town of Kishtawar, and inclining by degrees more to the south leaves the Himalaya Mountains above Jommu, after a course of perhaps not much less than 200 miles. In the plain of the Panjab its course is west-south-west till it has joined the Ravee, when it declines to the south-south-west. The Chenaub is a very large river. At Alknur, where it leaves the Himalayas, it is 200 yards wide. At Ramnuggur, when at the lowest, it is 300 yards wide and 9 feet deep. The *Jhilum*, or *Behut*, rises in the Tibet range of the Himalayas, flows first north-west in a longitudinal valley of the mountain region, traverses the lake of Wooler, and issues from the valley by the narrow valley of the Baramula pass. It then passes near Mozufferabad, up to which place its course is to the west, and turns by a bold bend to the south, in which direction it reaches the plain. Its course within the range of the Himalayas exceeds 200 miles. The remainder of its course, somewhat more than 100 miles, is mostly south till it joins the Chenaub at Trimo below Jung. After the five rivers have united, they still flow between 40 and 50 miles until they fall into the Indus at Mittun Cote. The natives call the united river Chenaub, but in the other countries of India it is known by the name of Punjund. All the rivers of the Panjab are in general navigable up to the place where they issue from the mountains, and the Indus itself is navigable to Attock, but above that place there is a whirlpool which cannot be passed by boats.

The northern portion of the plain of the Indus, the Panjab, Punjaub, or country of the Five Rivers, extends from the lower ranges of the Himalaya Mountains to the confluence of the Chenaub with the Indus, between 34° and 29° N. lat., and has the form of an isosceles triangle, whose shortest line, or base, which is about 450 miles in length, lies along the Himalayas, and the equal sides, each about 600 miles, unite at the confluence of the Indus and Chenaub. Its surface may be on an average about 1000 feet above the sea. This immense tract of country contains very fertile and very sterile tracts. The country along the foot of the Himalayas, and to a distance of about 100 miles from it, is well supplied with water, and has the advantage of abundant rains, and a plentiful irrigation. A canal has recently been constructed, and much improvement has taken place in the district within the last two or three years. The Jullindar Doab, or country between the Sutlej and the Beas, is very populous, and so likewise is the Barri Doab, between the Beas and Ravee as far as Amritsir. Rice is the principal object of agriculture all over the Panjab, but wheat is also raised in sufficient quantity for the consumption. The sugar cane is cultivated with great care. Wine and different kinds of fruits are produced in many places. Cattle are very numerous, though commonly of small size.

In Lahore the maximum of heat in July is 102° , and the minimum in January 24° . In Moultan it seems to rise still higher; at other places even to 110° .

The principality of *Lahore*, formerly subject to the Raja of Lahore, extended from 30° to 34° N. lat., and from 71° to 78° E. long. It was divided from Sind, on the south, by the territory of the Raja of Moultan, extended northwards to Cashmere, and included, eastwards, the Jullindar Doab and Kohistan, or the Hill States. *Lahore*, the capital, is situated in $31^{\circ} 36'$ N. lat., $74^{\circ} 3'$ E. long., on the south bank of the Ravee. It is a large city, surrounded by a wall, but the streets are narrow, and the houses generally mean. There are several remarkable buildings, among which are some handsome tombs. There are numerous mosques, the domes and minarets of which give the city at a distance an imposing appearance, which is not confirmed by nearer inspection. The population is stated to amount to 80,000. In the principality of Lahore is situated the large town of AMRITSIR, or Umritsir. *Dera-Ghase-Khan*, is an important border town, situated near the right bank of the Indus, in about $29^{\circ} 58'$ N. lat., $70^{\circ} 40'$ E. long., which has a population of about 25,000, and extensive manufactures of silk, cotton-cloth, and cutlery, with considerable commerce.

Moultan, a large city, in $30^{\circ} 12'$ N. lat., $71^{\circ} 30'$ E. long., is situated at a short distance from the left bank of the Chenaub. It is a large town, with a population of about 60,000, and was defended by a citadel, strong walls, and other fortifications. It was taken by the British on January 22nd, 1849. Along the left bank of the Garra is Daoudpootra, or Bahawalpoor, which is subject to an independent chief, or khan, who resides at the town of *Bahawalpoor*, on the Garra,

The whole of the Panjab, including Lahore, Multan, and the Jullindar Doab, and also Sindh and certain of the Hill States north of Delhi, is subject to the British government.

The country south of the Panjab is occupied by the great sandy desert of Hindustan, which extends southward to the Aravulli range and the salt-morasses of the Runn. Its western border approaches the banks of the Indus, from which it is separated only by a fertile tract of land, from 10 to 15 miles in width. But as the Indus, in this part of its course, is almost always divided into several channels, of which some penetrate farther into the country east of it, the cultivated tracts extend in some places to 20 miles and more from its principal channel.

The Desert of Sindh, or the Thurr, which on the north-east is connected with the sterile country which separates the plain of the Ganges from that of the Indus, is covered with ridges of sand-hills. In some places these hills are overgrown with coarse grass or low bushes for about two months in the year; during the remainder of the year their surface is bare, and exposed to great changes from the winds. Between these ridges occur some lower tracts, which have a hard, loamy, or stony soil, and on these the vegetation lasts much longer. They are generally of very small extent, and are used as pasture-ground for camels and sheep, and for a small race of cattle, the only domestic animals which are kept here. The small oases are not numerous in the neighbourhood of the Indus, but increase in number and extent as we approach the Aravulli Mountains.

VI. *Sindh*, or *Scinde*, extends on both sides of the Indus from the sea to near the place where the river is joined by the Chenab. It lies between 23° 30' and 29° N. lat., and 67° and 71° E. long. It extends in length from south to north more than 360 miles, and its average width may be 200 miles. On the south and south-west it borders on the Indian Ocean, and its eastern districts are separated from the province of Cutch by the Runn. To the east of it, and chiefly within its boundary, is the Indian Desert or Thurr, where it borders on the Rajpoot States of Marwar and Jessulmeer. On the north-east are the territories of the Khan of Bhawalpoor, and north those of the Panjab. The north-western corner of Sindh reaches the Boogtee Hills, which belong to Afghanistan, but the other parts of the western borders are Beloochistan or the territories of Khelat, from which Sindh is mostly separated by the Hala Mountains.

The sea-coast of Sindh extends about 150 miles. Sindh is indebted for its fertility to the inundations of the Indus. As far as these inundations extend, the country yields abundant crops. These inundations are caused by the melting of the snow in the upper course of the Indus and its tributaries. As in the higher parts the difference of the snow-line in summer and winter amounts to 3000 feet, an immense volume of snow is annually dissolved, and the water thus produced greatly raises the level of the river. In many places the waters spread over the adjacent levels, and fertilise the soil. Artificial means are employed to increase these advantages, especially canals and dams. The canals are only full during the height of the inundation, and are dry in the winter months. The dams are made across the bed of the river, and are called 'bunds.' The river begins to rise in April. Early in May the swell of the waters begins to point out the necessity of deepening and cleaning out the various canals. Towards the middle of June there is sufficient water for sowing the crops, which ripen and are cut down in October. At the end of September the waters are confined to the bed of the river.

The Delta, or that part of Sindh which is below the town of Tatta, has an alluvial soil, consisting of successive layers of earth, clay, and sand. As the great branches of the river are here very numerous, and throw off many arms, the inundation of this tract is general; and in those places which have not this advantage, artificial drains, about 4 feet wide and 3 feet deep, conduct the waters through the fields. Close upon the sea there is abundance of green forage, which furnishes pasture for large herds of buffaloes. At the back of it extends a belt 10 miles in width, where the country is so thickly covered with furze and bushes that it is incapable of being brought under tillage. Agriculture is only carried on in districts more distant from the shores. If we except a few small towns and villages, the inhabitants reside in temporary villages, which they remove according as they are compelled by the increase of the inundation or other circumstances.

The extensive tract of country which lies west of the Indus, and extends from the sea-shore to the town of Sehwan (26° 22' N. lat.) has a different character. It is only along the banks of the river that there is a low alluvial tract, a few miles wide, which can be cultivated, as it has the advantage of being irrigated by short cuts from the river. Beyond its limits the country rises higher, and the soil is gravelly and intermixed with pebbles, and soon passes into low hills composed of sandstone. The Hala Mountains separate this tract from Beloochistan. On the same side of the Indus, north of the town of Sehwan, is one of the most fertile districts of Sindh, which extends some miles north of Shikarpoor. The country is level, and the means of irrigating the land are abundant; for besides the main channel of the Indus, which is used for irrigating the adjacent lands, the interior of this region for the greater part of its extent is traversed by the Western Narra, which partakes of the inundations of the principal river, and at some places is connected with it by transverse canals.

The country on the east of the Indus, from the northern boundary-

line to the parallel of Hyderabad and Omercoote, presents a different aspect. The banks of the river to the distance of two or three miles inland are covered with tamarisk and acacia shrubs, and mostly uninhabited, but frequently cut by canals, which carry the water of the river to the back country. On the edge of this back country the villages are built, and generally raised somewhat above the ordinary level, to avoid the inundations. Some of the canals which carry the water of the river to the back country are of great extent. The banks of all the canals are fringed with a broad agricultural band, on which numerous large villages are built, many of which contain 500 houses. Besides fertilising the land, these canals afford the means of transporting by boats the produce of the soil.

The country south of a line drawn from Hyderabad to Omercoote, and included by the Sata and Poorun branches of the Indus, generally resembles the region just noticed.

The climate of Sindh differs greatly from that of other parts of Hindustan. Though the south-west monsoons blow so hard along the shores as to prevent vessels approaching them from March to October, they do not bring any periodical rains. Rain is far from being frequent all over Sindh, nor does it occur as in other parts of Hindustan at certain seasons, though storms may be expected at the end of June or the middle of July. In Upper Sindh, that is, north of Hyderabad, the natives of the country divide the year into three seasons, the spring, the hot season, and the cold season. The spring is of very short duration. The cold of the winter continues to the end of February. The temperate weather between the extremes of the cold and hot seasons is very short. The hot season may be said to commence in the middle of March, and it continues generally without intermission till the middle of September. The heat in Upper Sindh is greater than in those parts of Hindustan which lie in the vicinity of the equator, and the sun is singularly fatal in its effects, not only to Europeans but to natives. At Sukkur the heat at 9 o'clock in the evening is three or four degrees more intense than it is at noon, a peculiarity which seems to be owing to the southerly winds which invariably continue to blow from the heated deserts till midnight. During the cold season, from October till the end of February, the climate of Upper Sindh is pleasant and salubrious. Frost and ice occasionally occur. The setting in of the cold and violent north winds of November stops all vegetation except a few stunted tamarisk and babool bushes.

Sindh is rich in agricultural products; rice, wheat, maize, and the other grains and pulse common to India are grown. Indigo is largely grown in the north-eastern districts. Opium is cultivated near Shikarpoor, and in some other districts. The sugar-cane is pretty generally grown. Cotton is generally cultivated; the best is that raised in the northern districts. Tobacco is grown in the vicinity of Khyrpoor. Hemp, cucumbers, water-melons, and musk-melons are extensively cultivated. The gardens produce carrots, turnips, radishes, onions, and several kinds of pumpkins. Among the fruits are the date, mango, pomegranate, apple, grape, lime, citron, fig, and various others. About Shikarpoor and Bukkur dates are so plentiful as to constitute the principal food of the lower classes. The tamarisk is the most abundant production of the uncultivated parts, and is useful for many purposes to the inhabitants.

Dromedaries and asses constitute the principal means of conveyance by land. The horses of Sindh are small but hardy, and capable of enduring great fatigue. Immense herds of buffaloes graze on the banks of the Indus and its arms, and at other places common cattle. Ghee and hides constitute important articles of export. Sheep and goats are met with almost everywhere in Upper Sindh, and wool is exported from that tract which lies west of the Indus and north of Shikarpoor. Tigers, wolves, jackals, wild hogs, porcupines, deer, and hares live in the woods. Among the amphibious animals are the alligator, otter, and badger.

Sindh is a thinly-peopled country. The whole population, as given in the 'Trigonometrical Survey of India,' 1851, is only 1,274,744. The greatest part is a desert on which only some nomadic tribes wander about with their herds, and the bulk of the population is settled on the banks of the Indus and on the canals which are fed by it. The population is divided into three distinct classes, the Sindies, the Belooch, and the Hindoo.

Sindh is divided by the natives into two parts: Lar, which comprehends the southern portion as far north as Sehwan; and Sirra, which extends over the northern districts. Lar contains the three sea-ports of the country, Shah-Bunder, Vikkur, and Kurachee. *Shah-Bunder*, built on the Mull mouth of the Indus, is a small place, accessible for sea-boats of 25 tons burden. *Vikkur*, situated on the Hujamree mouth, 25 miles from the sea, is larger, the river being navigable to that place for more than 35 miles for sea-boats of 40 tons burden. *Kurachee*, about 30 miles from the most western mouth of the Indus, the Pittes, is built at the head of a creek, distant from the sea 4 miles. A harbour at its entrance protected by a high headland affords safe anchorage at all seasons to vessels of 300 tons, whence large boats can pass close up to the town, which is built on a slightly rising ground and surrounded by a mud wall. The bazaars are extensive, but the streets are narrow and filthy. The inhabitants amount to 14,000, and carry on an extensive trade by sea with India, Arabia, and Persia, and by land with Shikarpoor.

Hyderabad, the capital and seat of the government, is built not far from the east bank of the Indus, between this river and the Fulaltee branch, on a rocky eminence. It has no remarkable buildings, and the population, amounting to nearly 30,000, live in mud huts. Nearly half way between Hyderabad and the Hujamree mouth of the Indus is *Tatta*, the ancient capital, which formerly was washed by the river, but is now five or six miles distant from it. It presents only a heap of mud ruins, and contains hardly 8000 inhabitants. Some good cotton fabrics are still made here. At nearly equal distances between Hyderabad and Tatta, on the right bank of the Indus, is the town of *Jurruck*, which is built on a hill 150 feet high, has a good bazaar, and 4000 inhabitants. *Meerpoor* is built on a canal which runs eastward from the Pinyaree branch into the interior, and fertilises a very large tract of country. This town has mud walls inclosing a circuit of three miles, and contains 10,000 inhabitants. There are more than 300 shops in the bazaar. *Omercote* lies on the banks of the eastern Narra, and is built near the edge of the Thurr. It exports the produce of the desert, and contains 2000 inhabitants, chiefly Rajpoots.

Sirra, or Upper Sinde, contains several large towns, especially on the west of the Indus. *Shikarpoor*, the chief commercial town of Sinde, is situated in 27° 58' N. lat., 68° 30' E. long., on the plain which extends from the Indus to the Hala Mountains, 26 miles from the right bank of the river. The walls, of sun-dried brick, but in a state of decay, inclose a space of nearly 4000 yards. The houses are also of unburnt bricks, and the streets are narrow, confined, and dirty. The great bazaar extends 800 yards, running through the heart of the town. The suburbs are very extensive, and a large proportion of the population, especially the Mohammedans and labouring classes, reside in them. The population is about 30,000, of whom about two-thirds are Hindoos and the remainder Mohammedans, including Afghans and Patans. There are from 30 to 40 bankers in Shikarpoor, who have extensive connections both in western and eastern Asia. The best commercial road between Hindustan, Afghanistan, and Persia passes through Shikarpoor, leading by the Bolan Pass. *Sahwan*, a large and formerly an important commercial place, is built on a rocky eminence not far from the place where the Arrul, or Western Narra, joins the Indus. It contains between 10,000 and 12,000 inhabitants, and carries on an active trade with the fertile country to the north. On the banks of a canal connected with the Western Narra is the town of *Khyrgaon*, which has 7 mosques and between 2000 and 3000 inhabitants, and is a thriving place. Farther north, on another canal of the Western Narra, is *Larkhana*, situated in the centre of a tract very productive in rice, which is exported in large quantities: it has 12,000 inhabitants.

On the eastern bank of the Indus stands the town of *Roree*, which is built on a rocky eminence, and contains about 8000 inhabitants. The streets are narrow; the houses, many of which have three or four stories, are built of sun-burnt bricks. Opposite this place, on an island in the river, is the fortress *Bukkur*, and on the other side the small town of *Sukkur*. *Khyrpoor*, built on the canal of Meerwah, has 18,000 inhabitants; the bazaar is spacious. *Subulcote* lies on the road leading from Roree to Bhawalpoor; it has some trade in the produce of the country, especially ghee, hides, and opium.

The manufactures of Sinde are not numerous; but they may be regarded as extensive when the scantiness of the population is considered. Cotton-cloth of a coarse description is manufactured in the principal towns and villages chiefly for home consumption, and a little is exported to Afghanistan and Persia. Among the silk manufactures those of Tatta have acquired repute in India, especially a rich fabric of silk, cotton, and gold, variegated in pattern and of close texture.

People of Hindustan.—The aboriginal tribes, besides the Hindoos, are at present only found in the mountainous parts of the country, where they live chiefly on the produce of the chase and their cattle, though they also cultivate some kinds of grain in the more level parts of the districts occupied by them. Many of them consist of a comparatively small number of families. The most widely dispersed of these tribes are the *Gonds*. They occupy the whole of the mountains extending from the Circars in a north-western direction over the higher branches of the Mahanuddy River to the table-land of Omercote, which is in their possession, and west of it to the sources of the Tapy and Wurdah. The Gonds are in a very low state of civilisation compared with the Hindoos; they live in a state of independence of the governments whose territories they inhabit, and rarely permit foreigners to traverse their country. The western neighbours of the Gonds are the *Bheels*, who occupy the Northern Ghauts and the Vindhya Mountains, together with the mountain region connecting the Vindhya Mountains with the Aravulli. Southward they extend to Poona, and they are also in possession of the northern portion of the Western Ghauts as far south as the parallel of Damsun. They are not more advanced in civilisation than the Gonds, though they are more intermixed with Hindoos, and less independent of their masters. The neighbours of the Bheels, the *Coulies*, are dispersed over a comparatively small tract of country. The Coulies occupy the Western Ghauts south of the Bheels, and as far as Bombay, and even farther. They enjoy no independence, are a laborious people, and at Bombay and other places serve as labourers, and especially as porters. Hence porters in Hindustan are commonly called Coulies by Europeans. The *Ramusis* are dispersed over the Western Ghauts, south of the Coulies.

The *Cathies*, or *Kathies*, are a singular race of people inhabiting a part of Gujerat. They are supposed to be the descendants of the ancient Cathie who in the time of Alexander's invasion occupied a portion of the Panjab. There are no castes amongst them. Besides priests they have bards, who possess authority almost equal to the Druids. These become security for the payment of debts, the conduct of individuals who have misbehaved, and the appearance of parties in actions both civil and criminal. They also conduct travellers and caravans through districts infested by robbers, or in a state of war. If a troop of predatory horse appear the bard commands them to retire, and, brandishing his dagger, takes a solemn oath that if they plunder the persons under his protection he will stab himself to the heart, and bring his blood upon their heads. Such is the veneration in which he as a person of celestial origin is held, and such the horror at being the cause of his death, that the threat in almost every instance deters them, and the party is allowed to pass on unmolested. The religion of these people consists of little else than adoration of the sun. They invoke this object of their worship before commencing any great undertaking, and if a plundering expedition be successful a portion of the money stolen is consecrated to the service of religion. The only functions of the priests are to celebrate marriages and funeral solemnities. They have but one sacred building, a temple dedicated to the sun, near Thuam, and containing an image of that luminary. The size of the Cathies appears to be above the average, often exceeding six feet. The women are tall and frequently handsome, and generally speaking modest and faithful. This people have no restrictions of any sort regarding food or drink. (Calcutta 'Christian Observer,' January, 1847.)

The foreigners settled in Hindustan are partly Asiatics and partly Europeans. The Asiatics have come by sea and by land. To the former class belong the Arabs, who are very numerous on the coast of Malabar. Some Parsees, or Guebres, are dispersed in the cities on the coast between Bombay and Surat. The Asiatics who entered India by land are chiefly settled in the plains of the Ganges and the Indus. They came to these countries with the conquerors who at several epochs have established their empires here. They are mostly Afghans, and commonly called Patans. Their number is said to amount to 10,000,000.

The Europeans in Hindustan are chiefly descendants of the Portuguese, who being rather conquerors than merchants established themselves permanently in the places where they settled; but they are only numerous along the western coast, where their whole population is said to be 2,000,000, an estimate which however seems exaggerated. Next to the Portuguese the British are the most numerous, but their number is stated not to exceed 60,000.

Political Divisions, Areas, and Population.—The whole of Hindustan is comprised in three great political divisions, the Presidency of Bengal, the Presidency of Madras, and the Presidency of Bombay. The Bengal Presidency includes the Sub-Presidency of Agra, or the North-Western Provinces. These divisions include not only the territories under the direct rule of the British government, but also to a greater or less extent all the native and foreign states from the Himalayas to Cape Comorin, and from the Indus to the Birmanese territory. Some of the states are subsidiary, some are tributary, some are protected, and some are nominally independent, but all are more or less under British superintendence and control. The British government have treaties of subsidiary alliance with the Nizam (or ruler) of Hyderabad, the King of Oude, the Raja of Nagpoor, and the Raja of Gwalior. The Bundelcund States and Nerbudda Territories are tributary and protected. Indore and Bhopal are protected, but not tributary. The States of Rajpootana are tributary and protected. Rohilcund is protected, but not tributary. The Hill States and Sikkim are tributary and protected. Bhawalpoor is protected, but not tributary. Gholab Sing is protected, but not tributary. Cossya and Garrow Hills and Munespoor are protected. Tiperah is independent. The Cuttack Mehals are tributary. With Cochin, Travancore, and Mysore there are treaties of subsidiary alliance; but Mysore is at present under British management. Jeypoor and the Hill Zemindaries are protected. With the Guicowar and the Raja of Cutch there are treaties of subsidiary alliance. Colapoor, Sawunt Warree, and Sattara are at present under British management. Nepaul is neither tributary nor protected, but is restricted in certain respects by a treaty of alliance. The French and Portuguese possessions are independent. Each of the great divisions comprises, for purposes of revenue, Regulation Provinces and Non-Regulation Provinces; and under the actual operations of the government many of the old names of the Hindoo and Mohammedan governments are gradually going out of use. The native governments, for purposes of protection, superintendence, &c., are also included in each of the divisions.

The Presidency of Bengal includes 7 Regulation Provinces (Jessore, Bhaugulpoor, Cuttack, Moorshedabad, Daoca, Patna, and Chittagong), and 8 Non-Regulation Provinces (Sugor and Nerbudda, Cis-Sutlej, North-East Frontier, Goalpara, Arracan, Tenasserim, South-West Frontier, and Panjab, including the Jullindar Doab and Kooloo territory).

The North-Western Provinces, which are under a lieutenant-governor and are sometimes called the Sub-Presidency of Agra, include 6 Regulation Provinces (Delhi, Meerut, Rohilcund, Agra, Allahabad, and

Benares), and 7 Non-Regulation Districts (Kumaon, Gurwal, and other Hill States).

The Presidency of Madras includes 18 Regulation Districts (Rajamundry, Masulipatam, Guntoor, Nellore, Chingleput, Madras, South Arcot, North Arcot, Bellary, Cuddapah, Salem, Coimbatore, Trichinopoly, Tanjore, Madura, Tinnivelly, Malabar, and Canara), and 3 Non-Regulation Districts (Gangam, Vizagapatam, and Kurnool).

The Presidency of Bombay includes 13 Regulation Provinces (Surat, Baroach, Ahmedabad, Kaira, Candesh, Tannah, Poona, Ahmednuggur, Sholapore, Belgaum, Dharwar, Rutnagherry, and Bombay Island), and three Non-Regulation Provinces (Colaba, Sinde, and Sattara).

The following are the areas and the population, as far as they are known, or as nearly as they can be ascertained, of the British Possessions, and of the Native and Foreign States, included under each of the three great divisions:—

	Sq. Miles.	Population.
BRITISH POSSESSIONS.		
Presidency of Bengal	325,652	47,958,320
North Western Provinces	85,571	23,800,549
Presidency of Madras	144,889	16,339,426
Presidency of Bombay	120,065	10,485,017
	676,177	98,583,312

SUMMARY.		
British Possessions	676,177	98,583,312
Native States	690,361	52,359,051
Foreign Possessions	988	671,217
Total	1,367,526	151,613,580

The above areas are in many instances only approximations; but by a careful estimation it has been found that the total area of British India, including Sinde, the Panjab, the Jullindar Doab, and Tenasserim, is 800,758 square miles, and that of the Native States is 508,442 square miles, making a grand total of 1,309,200 square miles. This superficial extent is included in a bounding-line 11,260 miles in length. This estimation has been made by the officers employed in the great trigonometrical survey of Hindustan, and probably does not include some of the native states which are given in the preceding list, while others of them are transferred to British India. Since the estimate was made, the province of Pegu in Birma has been annexed to the East India Company's territories. This was done in November 1852. The trigonometrical survey of Hindustan was commenced soon after the capture of Seringapatam, and of it, in 1848, the total area completed was 477,044 square miles, at a cost of about 312,389*l*.

Several important public works have been lately completed, or are

now in process of execution in British India. The Ganges Canal (898 miles in length), referred to in the article *BENGAL* (vol. i., col. 1008) is now completed, under the able superintendence of Major Cantley. It was formally opened at Roorkee on April 8th, 1854. At Calcutta about 44 miles of railway have been completed. The electric telegraph has been laid down over about 3000 miles, reaching as far north as the city of Agra, and instantaneous communication of intelligence has thus been secured between Calcutta, Agra, Bombay, and other important cities. According to a statement presented by the East India Company in 1851, the total amount of expenditure on public works in India during 10 years previous to 1849, was 3,460,930*l*.

History, Government, &c.—Commerce between India and the western nations of Asia appears to have been carried on from the earliest historical times. The Arabs brought the produce of India from the modern Sinde and the Malabar coast to Hadramaut, in the south-western part of Arabia, or to Gerra on the Persian Gulf, from which places it was carried by means of caravans to Petra, where it was purchased by the Phœnician merchants. Indian articles were also brought from the Persian Gulf up the Euphrates as far as Thapsacus, and thence carried across the Syrian desert into Phœnicia; whence Europe was supplied.

The knowledge which the Greeks possessed concerning India, previous to the time of Alexander the Great, was derived from the Persians; and such was the origin of the information contained in the third book of Herodotus (98-105). The expedition of Alexander first gave the Greeks a correct idea of the western parts of India. He did not advance farther east than the Hyphasis (the Gharra of the Panjab), but he followed the course of the Indus to the ocean, and afterwards sent Nearchus to explore the coast of the Indian Ocean as far as the Persian Gulf. After the death of Alexander, Seleucus, in his war with the Præsi, advanced as far as the Ganges. The Greek kingdom of Bactria, founded by Theodotus, a lieutenant of the Syrian monarchs, and which lasted from B.C. 255 to B.C. 126, comprised a considerable part of northern India. After the foundation of Alexandria in Egypt, the Indian trade was almost exclusively carried on by its merchants. The Romans never extended their conquests as far as India.

Hardly anything is known of the history of Hindustan from the time of Alexander to the Mohammedan conquest.

The Tatars (called Scythians by the Greeks), overthrew the kingdom of Bactria in B.C. 126, and remained in possession of the greater part of the north-western provinces of Hindustan till they were driven beyond the Indus in B.C. 56 by Vicramaditya I. The earliest invasion of Hindustan by the Mohammedans was probably made in the latter part of the 10th century. A succession of invasions and conquests followed, and in 1093 Delhi was taken, and made the seat of the Mohammedan government in India. In 1290 the dominion passed into the hands of the Afghans, but the Afghan dynasty was put an end to in 1526 by Baber, a descendant of Timur, who took Delhi, and established the Tatar dynasty, or as it is commonly called, the Mogul empire. That empire no longer exists, and its power has passed to the British.

The Portuguese were the first nation of Europe that obtained any dominion in Hindustan. Vasco de Gama landed with three ships at Calicut on the Malabar coast, on the 20th of May, 1498. The Portuguese rapidly acquired extensive power in the country. By the possession of Malacca, which fell into their hands 24 years after the voyage of Gama, they commanded the trade of the Indian Archipelago; and by their numerous settlements along the Malabar coast, especially at Goa and Diu, they monopolised the commerce with Europe. In the beginning of the 17th century, the English, Dutch, and French began to make settlements along the coast; and the Portuguese lost their dominions almost as rapidly as they had acquired them. They still possess Goa, Damaun, and Diu.

The Dutch never acquired much political power in Hindustan; though at one time they carried on the greater part of the Indian trade. The French on the contrary obtained extensive possessions in the Deccan. Their principal settlement was at Pondicherry, of which they acquired possession in the latter part of the 17th century, and which soon became one of the most splendid European establishments in the country. But their power in the Deccan was principally owing to the prudent and vigorous government of Duplex in 1749. Under his administration the Northern Circars were occupied by the French, and the English power was almost destroyed. Duplex was succeeded by Count de Lally, who was sent from France with a large fleet in 1756; but this expedition entirely failed; and Pondicherry was taken by the English in 1761. At present the French possessions consist only of Pondicherry, which was restored, Carical, Yanason, Mahé, and Chandernagore.

The commencement and early progress of British authority in Hindustan have already been described. [*BENGAL; BOMBAY.*]

The East India Company was first formed in London in 1599, when its capital, amounting to 30,000*l*, was divided into 101 shares. In 1600 the association obtained a charter from the crown, under which they were to possess certain privileges, and were formed into a corporation for 15 years with the title of "The Governor and Company of Merchants of London trading to the East Indies." The first

commercial adventures of the Company were small, but a profit of from 100 to 200 per cent. was realised upon the capital employed, and in 1609 the charter of the Company was renewed for an indefinite period, subject to dissolution on the part of the government, upon giving three years notice to that effect. The first factory of the Company was at Bantam, in Java, established in 1602. In 1611 the Company obtained permission from the Mogul to establish factories at Surat, Ahmedabad, Cambaya, and Goga. In 1639 permission was obtained to erect a fortress at Madras, in 1652 the first footing was obtained in Bengal, and in 1668 the Island of Bombay was ceded to the Company by Charles II., into whose hands it had come as part of his marriage-portion with the Princess Catharine of Portugal.

The functions of government were first exercised by the Company in 1624, when authority was given to it by the king to punish its servants abroad either by civil or by martial law, and this authority extended even to the power of taking life. The capital of the Company was successively augmented, till in 1794 it amounted to 6,000,000*l.* By an Act, 6 Anne, c. 17, the Company received the exclusive privilege, as regarded English subjects, of trading to all places east of the Cape of Good Hope, as far as the Straits of Magalhaens; and this privilege was confirmed by successive acts of Parliament till 1814, when the Company's charter was renewed for 20 years. Retaining only its monopoly in the importation of tea into this country, the Company resigned its exclusive privilege of trading to the East Indies, and allowed the unrestricted intercourse of British merchants with the whole of its Indian possessions. Under these circumstances the Company found it impossible to enter into competition with private traders, whose business was conducted with greater vigilance and economy than was possible on the part of a great company; its exports of merchandise to India fell off during the 10 years from 600,000*l.* in 1814-15 to 275,000*l.* in 1823-24, and to 73,000*l.* in the following year, after which all such exportation of merchandise to India on the part of the Company may be said to have ceased. The shipments to China were still continued, and large quantities of stores were also sent to India for the supply of the army and other public establishments.

The impossibility of the Company's entering into competition with private merchants had a powerful influence with Parliament when it was called upon to legislate upon the affairs of India, and in the charter of 1833 not only was the monopoly of the China trade and tea-trade abolished, but the Company was restricted from carrying on any commercial operations whatever upon its own account, and was confined entirely to the territorial and political management of the vast empire which it has brought beneath its sway.

The succession of wars, conquests, and treaties by which the territorial possessions and political power of the East India Company have been acquired, are matters of history. It may suffice to state, that in addition to the Non-Regulation Provinces attached to the presidency of Bombay, the Eastern Straits Settlements, as they are called, were also placed under the control of that government, namely, Penang, Province Wellesley, Singapore, and Malacca; but, by an order of the Court of Directors, Prince of Wales Island, Singapore, and Malacca, from Sept. 1st, 1851, were formed into a separate government, independent of Bombay.

The charter of 1833 (3 and 4 Wm. IV., c. 85) expired in April, 1854, and by the terms of the Act 16 and 17 Vict., cap 95, some alterations were made in the constitution of the Board of Directors, and its relation to the general government of the empire, by which the affairs of the East India Company are brought more directly under the control of the Government and of the British Parliament.

The home government of the East India Company consists of the Court of Proprietors, the Court of Directors, and the Board of Control. The Court of Proprietors elect out of the general body of proprietors twelve members of the Board of Directors (six others being appointed by the crown), declare the amount of dividend, and make bye-laws. The Board of Directors appoint the governor-general of India and the governors of each presidency; but as these appointments are all subject to the approval of the crown, they may be said to rest virtually with the government. The directors have the uncontrolled power of recalling any of these governors; and in 1844 they exercised this power by recalling Lord Ellenborough, the governor-general. All subordinate appointments are made by the directors, but, as a matter of courtesy, a certain portion of this patronage is placed at the disposal of the President of the Board of Control. The Board of Control was established in August, 1784, by the act of Parliament known as Mr. Pitt's India Bill. This board has the general superintendence of the territorial and political concerns of the Company, and the president has been correctly described as "a secretary of state for the affairs of India, governing by means of the Court of Directors as its instrument in all matters of a political nature."

The army of the British government in India, including her Majesty's troops and the Company's European and native troops of all arms, consists of 289,529 men, namely:—Queen's troops, Europeans, 29,480; Company's troops, Europeans, 19,923; natives, 240,121. The contingent troops of the native states commanded by British officers, and available under treaties to the British government, amount to about 32,000 men.

The total net revenues of India, for the year ending April 30th, 1853,

are estimated by Sir C. Wood, President of the Board of Control, at 26,915,431*l.*; the total charges for the same year at 26,275,966*l.* The total amount of the public debts, bearing interest, April 30th, 1852, was 48,014,244*l.*, on which the annual amount of interest was 2,279,531*l.*

Languages and Religion.—The languages spoken in India may be divided into two great classes, the one consisting of those languages which are derived from the Sanscrit, and which are spoken in the northern and central provinces—these include the Hindee, Bengalee, Punjabee, Mahratta, Guzerattee, Cutohee, Boondela, Brig Bhakhur, Ooriya, and Asamee: the other comprising those languages which are not so closely dependent upon the Sanscrit, and which are spoken in the southern parts of the peninsula—these are the Telooquo, Tamul, Canaree, Malayala, and Cingalee. The common language of Mohammedans throughout India is Oordoo or Hindostanee. This is a compound of Hindee, the primitive language of the Hindoos, with Arabic and Persian, the languages spoken by their Mohammedan conquerors. The Legislative Acts of the Governor-General in Council are translated for the benefit of the community into Persian, Bengalee, and Oordoo or Hindostanee. The Hindoos from the earliest times have been divided into four castes, or races—the Brahmans, Kshatriyas, Vaisyas, and Sudras. The Brahmans occupy the first rank in Hindoo society, and their proper duties are to teach the Vedas or sacred books, to perform sacrifices to the gods, and to meditate upon divine and holy objects. The Kshatriya, or military class, is said by the Brahmans to be extinct, but the Rajpoots claim to belong to this class. The Vaisyas are agriculturists, herdsmen, and hunters. The Sudras are the handicraftsmen and artisans, and form the lowest and most degraded class of Hindoo society. The sects into which the Hindoos are divided at the present day are numerous; but they are all of modern origin, and most of them differ very much from the ancient religion of the people of Hindustan.

Education and Christianity.—The amount laid out by government for the purposes of education is above 100,000*l.* a year. Some particulars under this head will be found in the article BENGAL.

In 1852 there were in India 128 clergymen of the Church of England, including three bishops; there were also 6 army chaplains, who were clergymen of the Church of Scotland; and in January 1853, there were, as far as could be ascertained, 42 Roman Catholic priests officiating throughout India. There are 12 Missionary Societies at present carrying on operations in India: their names, given according to the order in which their operations were commenced in India, are as follows:—Society for the Propagation of the Gospel, 1727; the Baptist Missionary Society, 1793; London Missionary Society, 1805; American Board of Commissioners, 1812; Wesleyan Missionary Society, 1814; Church Missionary Society, 1815; General Baptist Mission, 1822; Free Church of Scotland, 1830; Established Church of Scotland, 1830; Basel Missionary Society, 1830; American Presbyterian Mission, 1834; American Baptist Mission, 1840. According to a statement laid before a Committee of the House of Commons in July 1853, it appears that the state of the Protestant Missions in India presents the following figures:—The number of stations is 258; of preachers 983, of whom 383 are missionaries, and 600 are native catechists: there are 250 native churches, with 15,129 members, and a native Christian population of 94,145; the number of vernacular schools is 1120, attended by 38,102 boys; of English schools for boys there are 92, with 13,189 scholars; of boarding-schools 86, with 2167 boys; of day schools for girls 262, with 8772 scholars; and boarding-schools for girls 97, with 2576 boarders. The number of English chapels in connexion with the Missions was 62.

HISPANIA. [SPAIN.]

HISPANIOLA, HISPANO'LA, ESPAÑO'LA (that is, Little Spain), known also under the names of SAN DOMINGO and HAITI, is one of the Great Antilles or larger islands of the West Indies. It extends from the Mona Passage, which separates it from Puerto Rico, to the Windward Passage, which lies between it and Jamaica and Cuba, between 68° 30' and 74° 30' W. long., 17° 40' and 20° N. lat. Its length is about 360 miles. Its area is about 29,500 square miles, or nearly the extent of Ireland; and four times as large as Jamaica. The population is said to be about 940,000, of whom 490,000 are blacks, 420,000 mulattoes or creoles, and 28,000 whites. The island is now divided between two states; the western portion forming the empire of Haiti, the eastern the republic of San Domingo.

Hispaniola was discovered by Columbus in his first voyage (January 1493), at which time it received this name. The Spaniards formed settlements first at Isabella and then at San Domingo. For nearly half a century these settlements received much attention, and rose to great prosperity, until different parts of the American continent were discovered and conquered. From that time Hispaniola was neglected, and as the natives had been nearly extirpated, the island soon became depopulated, and the northern and western districts were nearly a desert. The buccaners now settled on the island of Tortuga, opposite

Cape Français, and also on the coast. Perceiving that they would be driven away by the Spaniards, they voluntarily submitted to France, and Louis XIV. sent them a governor. In 1697 the Spaniards were obliged to give up the western districts, or about one-third of the island, to France. The French, who considered their portion of Hispaniola as the most valuable of all their foreign settlements, began to cultivate it with great care. In 1791 the agricultural produce of the French portion only was valued at more than 8,000,000*l.* sterling. In 1794 the negro slaves were declared free by the National Convention, a declaration which was followed by a general insurrection of the negroes and mulattoes, who massacred a large number of the white inhabitants, and compelled the remainder to emigrate. One of their chiefs, Toussaint l'Ouverture, established in 1801 a kind of republic, but was obliged to submit to a French army sent out by Bonaparte in 1802. After he had been treacherously taken prisoner and sent to France, the negroes rallied under Dessalines, and expelled the French in 1803. Dessalines restored to the island the name of Haiti, a name by which it was called by the natives when discovered by Columbus. In 1804 Dessalines followed the example of Bonaparte and called himself emperor; in 1806 he was murdered. After his death the French portion of Hispaniola was divided into two states: the northern coast was formed into a negro republic under Christophe, who in 1811 also took the title of emperor; the plains about the Bay of Gonaves became a mulatto republic under Petion. Continual war was carried on between these two republics. After the death of Petion (1813) he was succeeded as president of the republic by Boyer. Christophe having killed himself on the breaking out of an insurrection in 1820, Boyer united the whole under his authority. In the meantime the Spanish part of Hispaniola had been ceded to France in 1795, but was re-occupied by the Spaniards in 1808. The following year however it declared its independence of the Spanish government, and remained in an unsettled state until 1822, when it was subjected to the authority of Boyer, who thus united the whole island under his government. France recognised the independence of Haiti in 1825, the Haitian government undertaking to pay the sum of 150,000,000 francs (subsequently reduced to 90,000,000 francs) as an indemnity for the losses of the French colonists during the revolution. Boyer retained the presidency till 1844, when he was deposed. The following years were spent in a struggle for the supreme power, which was terminated by the election, in March 1847, of General Faustin Soulouque as president. Although nominally republican, the government of Haiti was really despotic, absolute power having been usurped by the president; and even the name of a republic was at length put an end to by Soulouque declaring himself, August 1849, Emperor of Haiti. He was crowned as Faustin I. in April 1850.

Meanwhile, however, the eastern or Spanish part of the island had been formed into a separate state. Taking advantage of the weakness of the Haitian government, the inhabitants of Spanish Hispaniola, in February 1844, declared themselves independent under the title of the Dominican Republic. Their leader, General Santana, was elected the first president; and he was succeeded in 1849 by the present head of the republic, Baez. The independence of the Dominican republic was acknowledged by Great Britain in 1850, and subsequently by other powers. The Emperor of Haiti however still refuses to recognise the republic, or to withdraw his claim to the sovereignty of the whole island; although, after many failures, he appears to have abandoned all attempts to reconquer the republican territory.

Surface, &c.—Hispaniola is considered to be the most fertile island in the West Indies. Its outline is greatly broken by several promontories and peninsulas and other projecting points of land. Its surface exhibits a great variety on rather a large scale. Near the centre of the island, but somewhat nearer the northern than the southern shores, is a mountain-knot, called Cibao, the elevation of the highest summits of which are supposed to be not less than 7000 feet. From this point a range runs southward, and terminates on the southern coast in a broad and rugged promontory opposite the rocky island of Alta Vela. Three ranges, rising from 2000 to 5000 feet, branch off from the western side of these mountains towards the west. The two northern are immediately connected with the mountains of Cibao. The most northern gradually approaches the northern coast, which it skirts at a short distance from Cap Haïtien, and then continues near the shores to Cap St. Nicolas. The middle chain proceeds in a westerly direction until it nearly attains the Bay of Gonaïve, when it runs along the shore to its termination at Cap San Marc, south of the Bay of San Marc. The most southern chain is an offset of the mountain-mass of Mount Bahoruco, which occupies the centre of the peninsula opposite the island of Alta Vela. It runs along the southern shore at a short distance from it, through the whole length of the south-western peninsula, as far as Capes Tiburon and Dame Marie. These ranges perhaps occupy more than half the surface of the island, but contain between them two extensive valleys, or rather plains. The northern plain is called, after the river which flows through it, the Plain of Artibonite. In its eastern part are extensive savannahs, or natural meadows; but towards the west is a fruitful soil. The southern plain is called Cul de Sac. At its eastern extremity is the lake called Laguna de Henriquillo, which is 50 miles in circuit. The water is salt, and has no outlet. The surrounding country is exceedingly picturesque. West of it, at no great distance, is a smaller lake

of fresh water, called Saumacha. The country round these lakes is not cultivated, and abounds in game. The western district of this plain, which reaches to Port au Prince, is exceedingly fertile. Besides these two great plains several level tracts occur between the mountains and the shores, which are very fertile, but not of great extent.

East and south-east of the Cibao Mountains there is a very rugged and almost uninhabited mountainous tract, which seems to be connected with the range which runs along the northern shores from the bay of Monte Christi, on the west, to Vieux Cap Français, on the east, and descends to the coast with a steep declivity. Between this range and the Cibao Mountains is a wide and very fertile valley watered by the river Yague, and known as the Plain of San Iago. The remainder of the eastern part of the island is occupied by two large plains, lying east and west, with a range of low mountains between them, which issues from the uninhabited mountain tract, and terminates at the most eastern promontory of the island, Cap Engaño. On the north of this range is a plain, La Vega, 50 miles long and 25 miles wide, noted for its great fertility, though it has never been well cultivated. The rivers Cotuy and Yuna, which drain it, fall after their union into the Bay of Samana under the latter name. The southern plain, called Los Llanos, extends from the town of San Domingo to that of Higüey, about 80 miles in length, with a width of 30 miles; but it is only a savannah adapted for pasture-ground, the rank grass of which being burnt in the dry season, whilst the cattle take to the forests or the mountains, serves as a manure to the new grass, which springs up in the rainy season.

The coast, which is about 1200 miles in length, has a great number of harbours, which admit vessels of moderate size: some of them are spacious, deep, and safe. Near Cape St. Nicolas, at the north-western extremity of the island, is the port of St. Nicolas, which is 6 miles long, and capable of holding an immense fleet. Ships of the largest size may safely ride at anchor, sheltered from all winds, the harbour being surrounded on every side by mountains of considerable elevation. The harbour of Cap Haïtien, or Français, on the northern coast, is spacious, and though not so well sheltered, offers good anchorage. At the eastern extremity of the island is the Bay of Samana, which is very capacious, and offers excellent anchorage for the largest fleets, within the reef which blocks a large part of its mouth. The peninsula of Samana, which lies to the north of it, is about 32 miles long, and has an area of 225 square miles. The isthmus which connects the peninsula with the island is low and swampy, but the centre of the peninsula is traversed by a chain of mountains of which the Sugar-Loaf Mountain, near Cape Cabron, 1236 feet, is the highest. The harbour of the town of San Domingo is a very indifferent one, being too much exposed to the southern winds; but the ground is good for holding. In the Bay of Gonaïve are the ports of Port au Prince and Gonaïve. Port au Prince has two harbours, formed by some islets, which offer good and safe anchorage. The port of Gonaïve is rather large, and excellent in point of security, being formed by a little island, which leaves a narrow channel, but with sufficient depth of water. The island of Gonaïve in this bay has an area of above 200 square miles.

The geology of the island is but imperfectly known. Mountain limestone appears to be the prevalent formation. Schistose rocks occur in many places, having in Samana veins of calcareous spar. Quartz rocks occur frequently. Mica-slates are met with in the eastern part of the peninsula of Samana; but calcareous rocks are the prevalent formation. The most remarkable geological feature of this peninsula however appears to be the insulated conical limestone hillocks described by Sir R. H. Schomburgk ('Geog. Journal' vol. xxiii, p. 276.) as occurring in the vicinity of the Bay of San Lorenzo. These hillocks, of which there is a large number, are from 80 to 150 feet high, generally denuded of vegetation to a height of from 10 to 20 feet, and thence partially and sparingly overgrown with plants to the top. The action of the sea has undermined many of them, forming caverns in some instances 150 feet in extent, and 60 or 70 feet high, in which are numerous stalactites and stalagmites, some above 20 feet high. These caverns were formerly resorted to as places of assembly, for the performance of religious rites and for shelter from foes, by the aborigines, who appear to have regarded them with great veneration, and to have attached many singular legends to them. Gold in small quantities, copper, and platinum are said to have been found in the island. Iron ore occurs in many places, and in Samana are extensive veins of bituminous coal.

Climate, Productions, &c.—The climate of Hispaniola differs considerably from that of the other Antilles, the rainy season occurring in different parts of the year on the southern and northern coasts. On the southern it agrees with the rainy season of Jamaica, beginning with gentle showers from the south at the end of April. These showers continue for three weeks or a month, and are followed by dry weather, which lasts six weeks or two months. In July begin the abundant rains, which continue from August to November. The winter is rather cool, the thermometer rarely exceeding 70° and still more rarely descending below 60°. The northern coast has only showers between August and October; in November the rains cease for a short time, but in December and January they descend in torrents: afterwards they are moderate, and cease entirely in April. The heat of the summer is moderated by the prevailing northerly

winds. Hurricanes are as frequent on the southern coast as in Jamaica, but they occur rarely on the northern shores. Along the low lands and plains the yellow fever is very prevalent.

Fifty years ago Hispaniola was noted for its extensive plantations of sugar, coffee, cotton, indigo, and cacao, but they have now almost entirely disappeared, except those of coffee, which are much reduced. The present population having few wants, which the extreme fertility of the soil enables them with little labour or forethought to supply, and valuing their ease more than anything else, employ but a few hours daily, or even weekly, in productive labour. In Haiti a 'code rural,' promulgated by Boyer in 1826, provides for an enforced culture of the soil, but it does not apply to the proprietors of small portions of land, who are extremely numerous. Where pursued at all agriculture is carried on in a wretched manner. Coffee is the chief article of cultivation; the other articles of most importance raised are maize, millet, cassava, plantains, sweet potatoes, &c. Cotton is grown only to a small extent. Besides coconuts, mangoes, yams, and pine-apples, their gardens produce the fruits of the south of Europe, as figs, oranges, pomegranates, and almonds. The principal commercial wealth of the island is derived from the forests which cover the greater part of the mountains. The timber consists chiefly of mahogany-trees, which grow to a large size, and are still very numerous, espinellos, cedars, caps, lignumvite, fustic, palmettos, especially in eastern Hispaniola, and various other trees used for cabinet-work, ship-building, &c., with logwood and different kinds of dye-woods, which are exported to the United States, England and other parts of Europe. The total exports of the island do not however at the present time reach one-fifth of the exports of French Hispaniola alone under the French occupancy in 1790. The imports from Great Britain in 1852 amounted to 251,409*l*. Numerous herds of cattle pasture on the plains of San Domingo, and their hides and jerked beef likewise make an article of export. The horses are small, but the asses and mules are large and strong. Game abounds in the forests. Fish are plentiful along the coast and in the rivers.

The aborigines are now extinct, though it is stated that in 1717 there still existed about 100 individuals. But a considerable part of the present population consists of their descendants, mixed with the blood of Europeans and negroes. The relative numbers of the races have been already given. As far as can be judged the population is nearly stationary.

As already mentioned, the island has been, since February 1844, divided between the governments of Haiti and San Domingo.

The *Empire of Haiti* occupies the western, or what was formerly the French, part of Hispaniola. The area of Haiti is about 12,000 square miles; the population is about 740,000. The dominant race are negroes. The emperor, and most of the ministers and officers of state are negroes. All natives of Africa, Indians, and their descendants, termed alike by the constitution 'blacks,' may, after a year's residence, become citizens of Haiti; but whites are not admitted to citizenship, nor can they become proprietors of land. The emperor is to all purposes absolute: he maintains a court, with all its officers and paraphernalia, which purposes to be modelled on that of France. The revenue is obtained chiefly from customs and port dues, territorial imposts, sale of lands, &c. In 1850 the customs receipts amounted to 170,000*l*; the expenditure in the same year amounted to 216,856*l*. The established religion is the Roman Catholic; but other forms of worship are not prohibited. At the head of the church is the Bishop of Arcadopolis. Very little attention is given to education. A standing army is maintained.

The foreign commerce of Haiti is wholly in the hands of foreign merchants, who are however only permitted to reside in certain ports, and whose business is hampered by many irksome and mischievous restrictions. The coasting trade is carried on by Haitian citizens. The foreign commerce does not now exceed the annual value of 1,000,000*l*. The exports are chiefly mahogany and other timber, dye-woods, coffee, tobacco, and cotton. The imports are British cotton and woollen goods, cordage, hardware, cutlery, fire-arms, earthenware, glass, gunpowder, &c. From France are imported brandy, wines and liqueurs, silks and fancy goods; from the United States, provisions, lumber, and hides; from Germany and Holland, wines, and various of the commoner kinds of woollens and linens and other manufactured goods.

Cap Haitian, formerly Cap François, has been made by Faustin I. the capital and seat of government of the Haitian empire. It is situated on the northern coast, about 19° 45' N. lat., 72° 8' W. long., and contains about 13,000 inhabitants. The town is conveniently situated for commercial purposes, and carries on some trade with England and the United States. There are no public buildings of any consequence, and the private houses are mostly mean.

Port au Prince, population about 30,000, the former capital, is situated in about 18° 30' N. lat., 72° 10' W. long., between the large plain of Cul de Sac and a more narrow one extending along the southern shores of the Bay of Gonaïve. Both these plains are very fertile, but badly cultivated. The streets of the town are straight, and sufficiently wide and commodious; but the houses are low and mean, with the exception of a few built by the French, which outlived the revolution and the fire. Port au Prince has a considerable commerce with the United States and with Jamaica. On the

GEOG. DIV. VOL. III.

same Bay of Gonaïve are Leogane and Gonaïve, two small but thriving places. Cayes, on the southern coast, 18° 11' N. lat., 73° 50' W. long., is one of the busiest towns in Haiti, having a considerable smuggling trade with Cuba, Jamaica, and other places. Vessels of large size can lie securely in its harbour; and the agents of several British houses have establishments in the town.

The *Republic of San Domingo* occupies the eastern or Spanish portion of Hispaniola. Its area is about 17,000 square miles; the population is about 200,000, a large portion of whom are mulattoes. At the head of the republic is a president elected periodically; but the institutions of the country are in a very unsettled condition. The republic is now recognised as an independent state by Great Britain, France, and other European powers, but not by the neighbouring empire of Haiti. Of the revenue and expenditure of the republic we have no recent and reliable particulars. The established church is the Roman Catholic; at its head is the Archbishop of Santo Domingo. Other forms of worship are permitted.

The commerce is chiefly centred in San Domingo city, but a good deal is carried on in the little town of Samaná, on the peninsula of the same name. The exports are for the most part the same as those of Haiti—mahogany and other cabinet woods; dye-woods; coffee, which grows well and of fine quality, though its culture is greatly neglected; cotton, &c.; with vegetables, cattle, and poultry to the neighbouring islands. The imports are cotton and woollen goods, hardware, cutlery, and the other ordinary useful and fancy manufactured wares, with brandy and wines. But both exports and imports are very small compared with what they might be if the remarkable capabilities of the soil and the important geographical position of the country were made fairly available.

The capital of the republic is the city of San Domingo, which is situated at the mouth of the Ozama, on the southern coast, in 18° 28' N. lat., 69° 59' W. long., and is the oldest European establishment in America, having been built by Columbus in 1504; the town of Isabella, which was erected on the northern coast in 1493, was abandoned. The population of San Domingo is about 13,000. The city is defended by ramparts, bastions, and outworks. The streets are regularly laid out, wide, but ill paved, and lined with houses in the old Spanish style. The city contains a cathedral above three centuries old, several churches, convents, and hospitals, the palaces of the president and archbishop, extensive barracks, arsenals, &c., but has a listless and decayed appearance. The harbour of San Domingo is capacious, but owing to a bar at its mouth vessels of much burden are obliged to anchor in the open roadstead. The trade of San Domingo is now very limited. [See SUPPLEMENT.]

HISTONIUM. [ABRUZZO.]

HITCHIN, Hertfordshire, a market-town and the seat of a Poor-Law Union, in the parish of Hitchin, is situated near the small river Hix, in 51° 57' N. lat., 0° 17' W. long.; distant 17 miles N.W. from Hertford, 34 miles N. by W. from London by road, and 81½ miles by the Great Northern railway. The population of the town in 1851 was 5258. For sanitary purposes the town is under the management of a Local Board of Health. The living is a vicarage in the archdeaconry of St. Albans and diocese of Rochester. Hitchin Poor-Law Union contains 28 parishes, with an area of 61,170 acres, and a population in 1851 of 24,782.

The town consists of several streets, which are lighted with gas. Much straw plat is made; there are some breweries, and also a silk-mill; malting is extensively carried on. The town-hall is a new building. The parish church is a handsome edifice, supposed to have been built about four centuries ago. The south porch is a remarkably fine specimen of the perpendicular style. There are places of worship in the town for Independents, Wesleyan Methodists, and Quakers. The Free Grammar school, founded in 1640, has an income from endowment of 128*l* a year, and had 82 scholars in 1851. A girls school provides clothing and education for 36 girls. Hitchin possesses an infirmary, a mechanics institute, and a savings bank. A county court is held in the town. The market is on Tuesday, and there are fairs at Easter and Whitsuntide.

HOANG-HAI ('The Yellow Sea') is a large mediterranean sea, which runs into the eastern coast of Asia, being inclosed on the west and north by China proper, and on the east by the peninsula of Corea; on the south it is open and united to the Pacific Ocean. It lies nearly within the same parallels as the Mediterranean, which divides Europe from Africa, namely, 34° and 41° N. lat., and extends from 117° 40' to 127° E. long.

The northern portion extends in length from west to east somewhat more than 400 miles from the shores of the Gulf of Petchili, near the mouth of the river Pei-ho, to the coast of Corea, at the back of Hall's Group; and it comprehends two basins, being divided nearly in the middle by a peninsula, which projects towards the south-east, and forms a part of the province of Liao-tong. The strait, which lies between the most southern point of this peninsula and the northern shores of the province of Chan-tung, is about 60 miles wide, and it contains numerous small rocky islands. Between these islands are passages which lead to the most western basin, which consists of two gulfs, that of Petchili and that of Liao-tong.

The Gulf of Petchili washes the northern shore of Chan-tung and the eastern shore of the province of Petchili. These shores are low.

and cannot be seen from the deck of a vessel at a greater distance than about 9 miles. The uniformity of the soundings along these shores is unusual. At the distance of 10 miles from the beach they vary only between $4\frac{1}{2}$ and 6 fathoms, and at 12 miles between 6 and 8 fathoms. Large vessels cannot approach the shores, and must remain at anchor from 4 to 6 miles off. This part of the Hoang-hai is only navigated by flat-bottomed vessels, which find shelter in the embouchures of some small rivers. Where the gulf approaches the above-mentioned strait between Liao-tong and Chan-tung the shores rise higher, and are well defined. Here a range of mountains stretches from south-west to north-east at the distance of 10 or 12 miles from the sea, and between them and the shore is a lower belt of elevated ground in a state of high cultivation, covered with many towns and villages, and interspersed with scattered trees and several extensive woods. Along this coast the soundings are somewhat deeper than on the other, but not so deep as might be expected from the bold outline of the land; and there appear to be some harbours for larger vessels.

The northern portion of the western basin, or the Gulf of Liao-tong, is imperfectly known. The shores are rocky and high, but the soundings are rather regular and of moderate depth. Some good harbours for large vessels are known to exist. The mountains which inclose this gulf are in their upper part barren and nearly destitute of trees, but between them and the shores there are many fertile and well-cultivated tracts.

The water in this western part of the Hoang-hai is of a dirty yellow or green, which colour seems to be derived from that of the mud which constitutes its bottom. There are a few small islands in this part of the sea, but the group of three islands, called the Mostao, or Mistau, Islands, which lie partly in the strait between the western and eastern basin, are of moderate extent, and well cultivated and populous.

The eastern basin of the northern portion is very little known. In the most southern part of it, that which washes the north-eastern shores of the peninsula of Chan-tung, the navigation is safe, and there are only a few rocky islands. The soundings are regular and moderate, and there are some tolerable harbours for small vessels. The northern part is represented on the Chinese maps as containing several extensive groups of islands, especially along the shores of the peninsula of Liao-tong.

The most southern part of the Yellow Sea, or that which lies south of a line drawn from the most north-eastern cape of the peninsula of Chan-tung to the coast of Corea, at the back of Hall's Group, is at its southern extremity between the mouth of the river Hoang-ho and the south-west cape of Corea nearly 400 miles wide, but grows narrower as it proceeds north, being near its northern boundary hardly 200 miles across. The shores of this part of the Hoang-hai are high and rocky, with the exception of a tract of about 60 miles contiguous to the mouth of the Hoang-ho on the north, where the country consists of alluvium. Farther north on the peninsula of Chan-tung several ranges of high ground advance to the coast, and in this part some harbours of considerable extent are said to exist. The navigation along this country is not dangerous, though farther south between the mouths of the Hoang-ho and Yang-tse-kiang the sea is full of shoals and sandbanks. On the opposite side, along the coasts of Corea, the sea to the distance of 50 or 60 miles from the continent is literally dotted with islands and rocks, which are generally small. Though the number of islands renders the navigation dangerous, and requires great caution on the part of seamen, they contain numerous excellent harbours. The straits which separate the islands are generally from one mile to two or three or even four miles across, and are all close harbours, capable of containing in security all the navies of the world. They form in fact an almost endless chain of harbours communicating with each other. They appear to be all inhabited, and therefore must possess fresh water.

The Yellow Sea washes those parts of China proper which are most populous and best cultivated, and where the manufacturing industry is carried to the highest point. Accordingly the number of junks which are met with along its western coasts is very great; but along the coast of Corea these vessels are rarely met with.

(Staunton; M'Leod; Basil Hall.)

HOANG-HO ('Yellow River'), one of the largest rivers in the world, drains the northern provinces of China proper, a small portion of Mongolia, and the greatest part of Tangut. It rises in the high snow-covered mountains which fill up the greatest part of the southern districts of Tangut, at a distance of 1290 miles from its mouth in a straight line. But as there is perhaps no river on the globe which changes so frequently the direction of its course, and makes such large bends, its course is computed by Ritter to exceed 2380 miles. The countries drained by the Hoang-ho cover an area of 740,000 square miles.

The sources of the Hoang-ho have never been visited by any European, and are imperfectly known even in China. Where these true sources were situated was not exactly known until the emperor Kublai, of the Yuen or Mongol dynasty, towards the end of the 13th century, sent persons to explore the country surrounding them. According to the report made by these persons the sources of the Hoang-ho are found in a depression between the ranges of the Bayan

Khara or Pe-ling Mountains on the south, and the Kuen-luen range on the north. In this depression more than a hundred springs are stated to rise from a level swampy plain about 40 miles in circumference. The water brought up by these springs unites at a short distance from the plain in two lakes, called Ala-nor by the Mongols. This Ala-nor is therefore to be considered as the true source of the Hoang-ho.

The Ala-nor lies in $35^{\circ} 20'$ N. lat., and between 96° and 97° E. long. The river issuing from the lake on the east is called Tshi-ping-ho (the river with the red banks), and after having been joined by three tributaries it falls into the Alpine lake Oling-hai, from which it issues under the name of Hoang-ho. Its course being opposed by the immense rocky masses of the Kuen-luen, the river runs for more than 30 miles southward, when it resumes its eastern course and continues in that direction for about 160 miles. To avoid a high offset of the Bayan Khara range, which stands in its way, the Hoang-ho turns with a bold sweep to the west, as if it were returning to its sources, and flows in that direction about 120 miles, surrounding on three sides the eastern extremity of the Kuen-luen Mountains. But the wide-spread mountain-masses of the same system oppose its course farther to the west, and it turns by degrees to the north-east and east until it leaves the mountain region on arriving in Proper China at the town of Lant-tsheou, where it skirts the Great Wall, having run from its last great turning to this place about 520 miles. Its upper course lies entirely in Tangut, and extends to about 700 miles. On both of its banks the mountains rise with a steep and frequently precipitous acclivity beyond the snow-line, and the valley in which the river runs is very narrow, in many places so much so that there remains not a level wide enough for a road. No towns are found in this region, and the few inhabitants are savage tribes living on the produce of their herds, which consist mostly of sheep and yaks. They gather also the true rhubarb-root, which grows on the upper part of the mountains near the places covered with perpetual snow.

Below Lant-tsheou the Hoang-ho turns with a sharp bend northward, and flows in that direction with some deviation to the eastward through five degrees of latitude, crossing the Great Wall three times in the interval. Its course in this direction probably does not fall short of 430 miles. When the river has passed 41° N. lat. it meets the range of the In-shan Mountains, by which its course is turned to the east. After flowing near 41° N. lat. about 180 miles eastward, the mountains bordering on China proper on the north oppose its progress in that direction; and it turns to the south, crossing the Great Wall for the last time near $39^{\circ} 48'$ N. lat., $111^{\circ} 40'$ E. long., and runs through that mountain region a space of about 500 miles, until it enters the great plain of Northern China at the mouth of the river Hoey-ho. This middle course of the river amounts to about 1130 miles.

Where the Hoang-ho issues from the narrow valleys which its rapid current has scooped out in the snow-covered rocky masses of Tangut, and at the place where it begins to flow in a wider valley about 100 miles above Lant-tsheou, the fortress Tay-tshy-kuan is built. The valley which extends from this place to Lant-tsheou, and hence north and north-east to the mouth of the Thian-shui ($36^{\circ} 30'$ N. lat.), is compared by Father Martini, a native of Tyrol, with the valley of the Inn at Innsbruck. In this part of its course, especially above Lant-tsheou, the volume of its waters is greatly increased by several large affluents, among which the Huang-tshu, or Tai-tung-ho, originating in the Nanshan, flows to it from the north-west, and appears to have a course of more than 400 miles.

At the mouth of the Thian-shui the mountains on the east of the river disappear, and are replaced by a hilly region, in which tracts of fertile and cultivated land are intermixed with sandy hills. Proceeding farther north the extent of the fertile grounds decreases until, opposite the town of Ning-hia, it is replaced by the Steppe of the Ordos, a desert whose surface is mostly covered with sand-hills, but in the numerous depressions between them are extensive meadows and pasture-grounds, intermixed with tracts covered with thick bushes, the haunt of numerous wild animals. On the west of the river, in the vicinity of the town of Ning-hia, is a mountain range called Holang-shan, which rises to 3000 or 4000 feet above the surface of the river, and is stated not to exceed 3 or 4 miles in width. Its eastern declivity is overgrown with forests. The tract of country between the Holang-shan and the river is several miles in width and well cultivated, its soil though sandy being rendered fertile by numerous canals which are fed by the waters of the river. But this fertility decreases in proceeding northward, and disappears entirely when the river passes 40° N. lat. In these parts Ritter places the greatest elevation of the Gobi, or Great Desert; and the river at its most northern course runs in a valley greatly depressed below the surface of that extensive table-land, but it does not appear that it has a bottom along its bed, nor that any tract contiguous to it is cultivated. The edge of the Gobi being crowned by uninterrupted rocky masses which are known by the name of In-shan, the river is compelled to run eastward until it arrives at the numerous ranges which traverse Northern China east of the Hoang-ho, and are offsets of the Khing-khan Mountains of Mongolia. In a course of more than 500 miles from the mouth of the Thian-shui to the place where the Hoang-ho bends towards the south, not a single river above the size of a rivulet increases its

volume of water, and this fact more than any other indicates the extraordinary nature of the country which extends along this part of its course.

Where the Hoang-ho flows southward its course is very imperfectly known, as it has been seen by the Jesuits only at a few places, where they were obliged to pass it. Below the mouth of the river Targhuen (40° 30' N. lat.) its width amounts to about 800 feet, and farther down, at Paote-taheou, it is from 1200 to 1400 feet across, and so rapid that the imperial court required three days to pass, though great preparations had been previously made for that purpose. It is observed that at this part the current can only be stemmed by vessels when they have a strong wind in their favour, and that it cannot be used as a regular means of water-communication. Farther down, at Lung-men (Throat of Dragon), the bed of the river was originally narrowed by projecting high rocks, and also at some other places; but the rocks have been removed by art, and the bed of the river widened. This proves that the lowest part of its middle course is used as a navigable channel. In these parts, but the place is not more exactly indicated, are cataracts or rapids, which by the Jesuits are compared to those of the Nile. On both sides of the river high ranges lie in such a direction that they traverse the bed of the river obliquely. The number of rivers which fall into the Hoang-ho in the middle part of its course is very great, but most of them are of moderate size except the Fen-ho which joins it below Lung-men, and the Lu-ho, whose mouth is at no great distance above that of the Hoey-ho. These two rivers run about 250 miles. The country on both sides of the river is covered with a succession of mountain ranges and valleys. The mountains rise to a great elevation, but not above the snow-line, and contain many metallic ores and other minerals, among which coal is named. The valleys are generally very wide and well cultivated, producing every kind of grain which does not require a great degree of heat, for this region experiences severe cold in winter.

The lower course of the Hoang-ho begins at the sharp bend where at the confluence of the Hoey-ho it turns suddenly eastward in the direction of that river, and enters the great plain of Northern China. The general course of the river is to the east up to its mouth, a distance exceeding 650 miles. The Hoey-ho is the largest and most important of the affluents of the Hoang-ho. Its course probably does not fall short of 400 miles. It rises in the extensive mountain masses which lie between 34° and 36° N. lat., to the east of the first great northerly bend of the Hoang-ho. For about one-half of its course the Hoey-ho flows through a narrow valley between steep and high mountains. At Pao-ki it enters a large valley which widens considerably in proceeding farther east, but at the place where it joins the Hoang-ho it is shut in by two mountain ridges, forming the mountain pass of Thung-kuan, famous in the history of China. The lower valley of the Hoey-ho must be of great extent and of uncommon fertility, as the largest of its towns, Si-ngan-foo, more than once has been the capital of the empire; and even many centuries after the court had left it this place was compared by the Jesuits with Peking in size. From this town downwards the river certainly is navigable, but we do not know how far it is navigable above it. The great road leading from Peking to the southern provinces, especially to Su-tchuen and Yun-nan, lies through the lower part of the valley of the Hoey-ho.

After the Hoang-ho has left the Pass of Thung-kuan it enters the great plain of Northern China, but not immediately the low land, as for more than 150 miles its course lies through a hilly country. Along the river however is a low tract which grows wider in proceeding eastward; and its soil, which is formed of alluvium, is very fertile and well cultivated. The hills also have been subjected to cultivation by means of terraces. At its entrance into the low country, according to historical records, the Hoang-ho in former times divided into two branches, of which the northern ran to the north-east and north, and fell into the Gulf of Petchili. This arm seems to have been the principal branch, but at some later period it became unfit for navigation. On the northern side of the river, in this part of its course, morasses occur which are so extensive that they can only be traversed in several days. In these swampy grounds originates a river, called Wei-ho, which runs northward, and whose waters in the lower part of its course are used to feed the great canal. It is very probable that this Wei-ho (which is a feeder of the Pei-ho) runs in the ancient channel of the northern branch of the Hoang-ho.

At present the Hoang-ho runs in one channel eastward, and near the town of Kai-fong-foo it borders on a very low and flat country, exposed to occasional overflowings, which in China are more feared than war, plague, and famine. As the adjacent country is very low, it was at an early period considered necessary to protect it against the inundations by dykes built of granite of great strength. These dykes extend many miles along the southern bank of the river. This had the effect, which has also been experienced in the Po and the Rhine, of raising the bed of the river; so that even when the river is low its surface is considerably above the adjacent plain. This plain, whose soil is exclusively formed by alluvial detritus, is of extraordinary fertility, and covered with almost innumerable villages and towns. When therefore the river, being unusually swollen, breaks through the dykes, the loss of life and property is immense; and as the country subject to such inundations, according to the opinion of Barrow, is equal in area to the island of Great Britain, the truth of the assertion

made by the emperor Khien-long to Lord Macartney that the Hoang-ho gave him more trouble than all the other cares of government, may be understood in its full force. The towns in the province of Ho-nan, within range of the devastations of the river, are surrounded at a distance of about a quarter of a mile by strong ramparts of earth. In the reign of Khien-long a large canal was made for the purpose of preventing the too great accumulation of water in the Hoang-ho. This new canal begins at Y-fong-hien, in the province of Ho-nan, and extends in a south-eastern direction to an arm of Lake Hung-tseu-hu. It is nearly 100 miles long, and it is stated that it had the effect of lowering the general surface of the river by about 70 feet. Large tracts of land which formerly were always under water have been laid dry and rendered fit for cultivation.

About 70 miles above its mouth the Hoang-ho receives a great supply of water by the outlet of Lake Hung-tseu-hu. This lake receives not only the waters brought from the Hoang-ho by the New Canal, but also those of the river Hoai-ho. The numerous rivers which unite with the Hoai-ho drain the extensive country which extends between the Hoang-ho and Yang-tse-kiang, and most of them rise in the most eastern offset of the Pei-ling range, which is known by the name of Mu-ling: the whole course of this river exceeds 400 miles. The country drained by it is flat, but appears to be less fertile than other portions of the great plain. A short distance below the place where the outfall of Lake Hung-tseu-hu unites with the Hoang-ho are the two entrances of the Great Canal, which are lined with quays built of large square pieces of granite and marble, and are nearly a mile wide. In the upper course of the Hoang-ho the stream is said to be clear; but on its entrance into China proper its bed is hollowed out by its impetuous current in a yellow clayey soil, giving its waters a yellow tinge, which they retain till they have entered the sea. About 40 miles N.E. from the point where it is crossed by the Great Canal the Hoang-ho enters the Hoang-hai, or Yellow Sea, by a wide estuary.

(Du Halde, *Description de l'Empire de la Chine*; Staunton; Barrow; Ellis; Abel; Klaproth; Ritter, *Erkunde von Asien*.)

HOBART-TOWN. [VAN-DEKEM'S LAND.]

HOCHSTADT. [BLENHHEIM.]

HOCKLIFE. [BEDFORDSHIRE.]

HODDESDON. [HERTFORDSHIRE.]

HOEVORDEN. [DRENTHE.]

HOUGUE, LA. [MANCHE.]

HOENLOHE. [JAXT.]

HOENZOLLERN, until 1850 a sovereign principality in Germany, so called from a very ancient family of the same name, whose original seat was the ancient castle of Zollern, or Hohenzollern, which stands within two miles of Hechingen, on the road from Stuttgart to Schaffhausen. The family, which takes its origin from Count Thassilo, who died in 800, was divided towards the close of the 16th century into the two still existing branches of Hohenzollern-Sigmaringen and Hohenzollern-Hechingen. The territory is entirely inclosed between Württemberg and Baden; its surface is mountainous, and the soil is in general stony. Corn more than enough for the consumption is raised; flax is extensively cultivated; horned cattle and sheep are numerous; and the forests abound with fine timber. There are iron-mines in the northern part. The manufactures are unimportant. *Hohenzollern-Hechingen* (which takes its distinctive name from the chief town *Hechingen*, on the Starzel, a feeder of the Neckar, population 3400) occupies the more northern part, has an area of 116 square miles, and in 1850 had 20,471 inhabitants. *Hohenzollern-Sigmaringen* lies south of the former, occupies a surface of 334 square miles, and had in 1850 a population of 41,141. It is drained by the Danube and some of its small feeders. *Sigmaringen*, the chief town, is a small place on the Danube, with 1600 inhabitants. From the younger or Hechingen branch the royal family of Prussia is descended. The inhabitants are all Catholics.

By a treaty dated December 7, 1849, the reigning princes of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen ceded all sovereign rights over their respective principalities to the king of Prussia, who pays to the prince of Hohenzollern-Hechingen an annual revenue of 10,000 thalers, and 5000 thalers a year to his legitimate heir, if any; and to the prince of Sigmaringen and his heirs 25,000 thalers a year. The princes still retain possession of all their estates; they have merely parted with the sovereignty. By a decree of the king of Prussia the title of Highness (Hoheit) is conferred upon the heads of the two families. By a family compact, dated February 8, 1850, and executed May 10, 1850, the prince of Hohenzollern-Hechingen made over all his hereditary possessions to Prince Antony of Hohenzollern-Sigmaringen.

The principalities were members of the Germanic Confederation, and in conjunction with several other small German states had one vote in the committee of the Federal Diet; but in the full assembly each of them had a separate vote. The relations of the principalities to the Confederation are now fulfilled by Prussia.

HOLBEACH, Lincolnshire, a market-town and the seat of a Poor-Law Union, is situated in 52° 48' N. lat., 0° 1' E. long., 37 miles S.E. by S. from Lincoln, and 105 miles N. from London. Holbeach Poor-Law Union contains 10 parishes, with an area of 76,782 acres, and a population in 1851 of 19,120. The parish is under the management

of a Local Board of Health. The living is a vicarage in the arch-deaconry and diocese of Lincoln.

The town of Holbeach consists of a long street, which forms part of the coach-road from Spalding to King's Lynn, and of a few shorter streets. The church is a large and very beautiful structure, chiefly of the decorated style, consisting of a nave, chancel, aisles, and square tower 85 feet high, which is surmounted by an octangular spire 100 feet high. There are chapels for Wesleyan and Primitive Methodists and Baptists. A market-house and court-house have been built within a few years. A county court and petty sessions are held in the town. The town has a public library and news-rooms, National schools, and a Free Grammar school, established in 1869, which has an income of about 300*l.* a year from endowment, and had 200 scholars in 1858.

The inhabitants of Holbeach are engaged chiefly in agriculture. The land in the neighbourhood is level and extremely fertile; besides large quantities of wheat and other common kinds of grain, canary, carraway, mustard, and coriander seeds are partially grown. Chicory is also grown and prepared for use. A market is held on Thursday; three fairs are held in the year.

HOLDERNESS. [YORKSHIRE.]

HOLLAND, the leading province of the kingdom of the Netherlands (which is sometimes also called Holland), is situated between 51° 45' and 53° 30' N. lat., 3° 45' and 5° 20' E. long., and is bounded N. and W. by the German Ocean, E. by the Zuyder-see and the provinces of Utrecht and Guelderland, and S. by those of Zeeland and Brabant. The surface is flat, and in many places below the level of the sea, against which it is protected by stupendous dykes built along the Zuyder-see and the banks of the rivers. The sea of Haarlem also, which has been lately drained [HAARLEM], was surrounded by dykes. To these dykes the country is indebted not merely for safety, but for existence. But the dykes are not the only defence against the encroachments of the sea: on the west coast is a triple row of sand-hills or downs, which form a barrier thrown up by the ocean itself. The country is traversed by canals in all directions. A railroad passing from Rotterdam through the Hague, Leyden, Haarlem, Amsterdam, Utrecht, and thence to Rotterdam, traverses a very important part of the province. From Rotterdam a line is in course of construction to Antwerp. Electro-telegraphic wires are laid down along both lines.

The soil of the province of Holland, like that of Gröningen, is marshy, and produces rich pastures, which support a remarkably fine breed of cattle, to the number of nearly a million, and large flocks of sheep: very little corn is grown, except in some parts of South Holland. Flax is cultivated more than hemp, and is of excellent quality. Gardens and orchards are carefully cultivated; some barley, oats, peas, beans, mustard, and other seeds are the chief crops in the northern part of the province; in the southern part more corn is produced. But pasturage prevails much more than arable cultivation, the produce of the dairy farms, butter, and cheese, constituting the chief wealth of the landholder. A remarkable feature of the country are the 'polders,' a name given to lands that are below the level of the sea or adjacent river, and, having once formed a lake or marsh, have been surrounded by dykes, and cleared of water by means of pumps worked by windmills or steam-engines. The lands thus reclaimed are very fertile, and some of them of great extent, as the Beemster polders, near Edam, in the northern part of the province, which are 15 miles in circumference, and the lands recovered from the sea of Haarlem. A large portion also of the Biesbosch, a marshy lake formed by the terrible inundation of 1421, has been recovered and converted into meadow land. The Biesbosch, so called from its being overgrown with rushes (Bies) lies south-east of Dort, on the confines of Holland and North Brabant, to which latter a portion of it belongs. The recovered lands have the appearance of islands rising out of the lake. At the time of the inundation 72 villages and 100,000 inhabitants were destroyed. The waters of the Maas after flowing between the islands of the Biesbosch form the channel called *Hollands-diep*. [MUSEUM.] The grain sown in the polders is sometimes destroyed by water, but rarely, for the mills are always at work, when there is any wind, lifting up the water to such a height as gives it a fall into the nearest river, canal, or sea. The effect produced on foreigners who visit the polders for the first time is one of surprise, not unmingled with alarm, at the apparent inversion of the natural order of things; luxuriant corn and rich grass crops growing, and fat cattle and sheep pasturing where water should lie; while the large sails of the canal barges flit past high above dykes, houses, and trees. Flowers are cultivated in the tract between Alkmaar and the Hague, but especially about Haarlem. [HAARLEM.] Hemp, flax, and madder are grown. Wood, both for construction and for fuel, is scarce. The manufactures, which are chiefly carried on in the towns, are important; they are linen, paper, woollen cloths (for which Leyden is famous), silk, leather, tobacco, sugar, &c. The gin distilleries of Schiedam are very extensive, and have been long celebrated. Large quantities of fine lime are made from the shells gathered on the coast of the North Sea. The fisheries on the coasts are important, and most industriously plied. The sleekness of the cows and horses, and the cleanliness of the dairies in Holland, are proverbial. The horses are all tender in the hoof, owing to the softness of the soil on which they are bred.

The province is divided into two governments: North Holland (Noord-Holland) and South Holland (Zuid-Holland).

North Holland extends north of the Haarlem-meer, and the mouth of the Old Rhine. It has an area of 955 square miles, and the population on the 31st December 1852 numbered 508,006. The Amstel and the Vecht flow through the south-east of the country, the Zaan through its centre. The Helder Canal, by which the largest merchant-vessels reach Amsterdam direct from the German Ocean without encountering the difficult navigation of the Zuyder-see, runs from Amsterdam to the Mars-diep, or strait that separates the Texel from the main land. It is 120 feet wide, 25 feet deep, and above 50 miles in length. North Holland is sometimes called West-Friesland. The chief towns are ALKMAAR; AMSTERDAM; HAARLEM. Among the other more important places we give the following:—

Amstelveen is a well-built town or rather village with 5600 inhabitants, situated between the Amstel and the Haarlem-meer, and 6 miles S. by W. from Amsterdam.

Broek, a village of 1500 inhabitants, composed chiefly of retired merchants and their families, is the much praised model of the precise neatness and punctilious cleanliness of the Dutch. The narrow lanes that intersect it are paved with bricks, strewed with sand or shell, and always clean. No horse or vehicle of any kind is allowed to pass along them. The houses are of wood, painted white and green, and roofed with glazed tiles of different colours. The front doors and windows are never opened except on great occasions, such as a funeral, a wedding, or a christening. The interiors of the houses correspond to the exterior in order, cleanliness, and tidiness; but have more the appearance of large baby-houses than the dwellings of men. The cow-houses here are curiosities in their way; they are washed out, walls and floors, several times a day; the cows' tails are fastened to hooks in the ceiling, lest they might by accident besmeer their sides with them. Broek is 6 miles N. by E. from Amsterdam; it is famous for its sweet-milk cheese.

Edam, a town of 4200 inhabitants, stands south-east of the Beemster polders, and near the Zuyder-see, in which it has a good harbour. The export trade in sweet-milk cheese from this port is important; the chief industrial products are salt and fish oil.

Enkhuizen, or *Enkhuysen*, situated on a peninsula in the Zuyder-see, 28 miles N. by E. from Amsterdam, is a well-built fortified town with about 5000 inhabitants. It was formerly the centre of the great deep-sea herring fishery; 400 large vessels used annually to sail from its harbour, which is now nearly choked up with sand. The town possesses 9 churches, an hospital, salt-refineries, and a cannon foundry; the town-house with its lofty tower is the most imposing structure. Its commerce is composed chiefly of butter, cheese, timber, and herrings; ship-building is carried on. This place has declined greatly from its former commercial and industrial activity. In 1853 only 11 vessels were engaged in the herring-fishery.

Helder, a small fortified town of 2800 inhabitants, stands on the Mars-diep, at the extremity of the spit of land in which North Holland terminates, opposite the Texel. A little east of Helder is the fine harbour of *Nieuwe-diep*, formed by piers and jetties, and admitting the largest merchantmen and men-of-war close to the quays, where they are sheltered from every wind; by this harbour the great Helder Canal enters the North Sea. The great *Helder Dyke*, which protects the extremity of North Holland from the fury of the storms to which it is exposed, is one of the most astonishing monuments of Dutch industry, perseverance, and skill. It is nearly 6 miles in length, and 40 feet broad on the summit, along which there is a good road; it presents to the sea a slant side of 200 feet, inclined at an angle of 40°, the whole constructed of granite blocks brought from Norway.

Hilversum, a small town 15 miles S.E. from Amsterdam, has 5000 inhabitants, who manufacture carpets and calicoes.

Hoorn, a city and sea-port, on the Zuyder-see, eastward of Alkmaar, with which it is connected by a canal, is well built, surrounded by old ramparts, and has about 9000 inhabitants. The great fleet of Admiral De Ruyter was built in Hoorn; but the importance of the place has vanished; the present trade consists chiefly in exports of butter, cheese, provisions, and fish. There is a naval college at Hoorn. The manufactures of woollen stuffs, carpets, &c.; the ship-building and the herring fishery, though still important, are insignificant compared to their former magnitude. Schouten, who first doubled Cape Horn or Horn, in 1616, and Tasman, the discoverer of Van-Diemen's Land and New Zealand, were natives of Hoorn.

Medemblik, north-west of Enkhuizen, on the Zuyder-see, had formerly an extensive foreign commerce; it has now scarcely any foreign trade, and its population is only about 3000. It contains a royal naval academy, and its chief commerce is in timber and cheese. The harbour is large and good.

Naarden, a fortress, on the south shore of the Zuyder-see, 12 miles E. from Amsterdam, has 3000 inhabitants, who manufacture silk and velvet. It forms the key of all the water communication of Holland, and is important for the defence of Amsterdam, with which it is connected by a fine canal.

Zaandam (commonly corrupted into *Saardam*), a town of 12,000 inhabitants, on the north shore of the Y, and at the mouth of the Zaan, which divides it into *Oost-Zaandam* and *West-Zaandam*. The houses are mostly constructed of wood and painted; each of them is

surrounded by a small canal and completely insulated. From a distance, the town has a most singular appearance; it seems to consist of a line of windmills, some of which are of gigantic size and have houses attached to them, extending along the Zaan, and forming a street nearly 5 miles in length. The number of these mills is variously stated, but it seems to amount to about 700; they are applied to the various purposes of grinding corn, draining the land, sawing timber, making paper, grinding tobacco into snuff, crushing rapeseed to express the oil, grinding colours for the painter, grinding stones into sand for the floors of the Dutch housewife, and grinding volcanic tufs from the Eifel into dust in order to form a cement called *trass*, which hardens under water and is much used in Holland. [RIFEL; ANDERNAACH.] The town is often visited for the purpose of seeing the hut in which Peter the Great worked and slept during his short stay here to learn ship-building in 1696.

To North Holland belong the islands, *Marken* and *Urk*, in the *Zuider-zee*; and *Wieringen* (20 miles in circumference; population, 1500); *Vlieland* (which consists chiefly of sandhills, and has 800 inhabitants); *Ter-schelling* (14 miles long, and 2½ miles broad; population 2500, residing in four villages on the south coast, and engaged in fishing); and *Texel*, at the entrance of the *Zuider-zee*.

The *Texel* is separated from the north of the province by the *Mar-diep*; it is 12 miles long, and 6 miles broad, and has 5000 inhabitants, mostly shepherds and fishermen. The island is famous for its breed of fine-wooled sheep. The northern part of the *Texel* was formerly a distinct island, but is joined to the southern part by a sand bank since 1629; it is called *Eierland* or *Egg-land*, from the great number of gulls' eggs found on it.

South Holland has an area of 1170 square miles, and had 584,098 inhabitants on the 31st of December 1852. It lies S. of the *Haarlem-meer*, and is traversed by the Old Rhine, the *Yssel*, the *Lech*, and by the large branches of the *Maas*, which form the islands of *Voorne*, *Overflakkee*, *Goeree* (now united to *Overflakkee*), *Putten*, *Beyerland*, *Ysselmonde*, *Dordrecht*, and *Rozenburg* W. of *Ysselmonde*. The chief towns are *Briel*, *Delft*, *Dort*, *Hague*, *Leyden*, and *Rotterdam*. The more important of the other towns are noticed here:—

Delfshaven, the port of *Delft*, stands on the right bank of the *Maas*, at the embouchure of the canal that leads from the *Hague* through *Delft*; it is a place of some trade, and has ship-building yards, and a population of 3000. The lighthouse marking the entrance to the *Maas* and the channel to *Rotterdam* is in 51° 54' 11" N. lat., 4° 9' 51" E. long.

Gorkum, a fortified town, on the right bank of the *Maas*, and traversed by the *Linge*, a feeder of the *Maas*, is well built, and has a good trade in corn, fish, horses, cheese, agricultural produce, &c. The population numbers about 9000; many of them are engaged in the salmon and herring fisheries. The chief manufacture is tobacco-pipes. There is a college in *Gorkum*.

Gouda, or *Ter-Gouw*, N.E. of *Rotterdam*, on the right bank of the *Yssel*, at the mouth of the *Gouw*, is a large fortified town, with a population of 13,000. The town has 5 churches, an hospital, an orphan-house, tobacco-pipe factories that give employment to 6000 men, brickworks, the clay for the supply of which is taken from the bed of the *Yssel*, rope-walks, gin-distilleries, and breweries. The most important buildings are the town-house and the church dedicated to *St. John*, which is famous for its splendid painted windows; both these buildings stand in the great square, in which markets are held. *Gouda* numbers also among its industrial products woollen-cloth and sail-cloth; it is famous as a cheese-market.

Helvoet-sluis, a small town of 2000 inhabitants, important for its fortifications, its harbour, and large naval dockyards, stands in the isle of *Voorne*, on the right bank of the *Haringvliet* branch of the *Maas*, which separates *Voorne* from *Overflakkee*. The Prince of Orange sailed from this port for England, Nov. 11, 1688. The ships that passed *Helvoet* and *Briel* in 1849 in and out numbered 2417 and 2539 respectively.

Katwyk, N. of the *Hague*, is a small place famous for the canal and the stupendous dykes and flood-gates executed by the engineer *Conrad*, for *Louis Bonaparte* in 1809, to assist the *Rhine* in its struggles to reach the sea.

Maasland-sluis, or *Maas-sluis*, stands W. of *Rotterdam*, at the extremity of the canal that enters the *Maas* opposite the isle of *Rozenburg*, and has 5000 inhabitants, many of whom are engaged in the herring- and whale-fisheries. Sail-cloth, ropes, leather, and fish-oil are the chief industrial products.

Ryswyk, a village of 2400 inhabitants near the *Hague*, deserves mention as the place where the famous treaty of peace was signed in 1697 between England, France, Holland, Germany, and Spain. The site of the house in which this treaty was concluded is now marked by an obelisk.

Scheveningen, on the coast, N.W. of the *Hague*, is the rendezvous of the gay world of the *Hague* in the bathing season; it is joined to the *Hague* by a straight and magnificent avenue of oaks and limes. It has 3000 inhabitants, and a splendid bathing establishment, which includes also the accommodation of an hotel. The population is chiefly engaged in fishing for the supply of the *Hague* market.

Schiedam, a well-built town, 5 miles W. from *Rotterdam*, with a good harbour, near the outflow of the *Schie* into the *Maas* has

5 churches, an exchange, glassworks, rope-walks, and white-lead works. The town is surrounded by windmills, and contains above 200 distilleries for the manufacture of 'hollands,' or Dutch gin, for which it is universally celebrated. It has a large trade in pigs, 30,000 of which are said to be annually fattened on the grains from the distilleries. The inhabitants, many of whom are engaged in the fisheries, number 10,600.

Schoonhoven, E. of *Rotterdam*, famous for its salmon fishery, stands in a marshy but well-cultivated district, on the right bank of the *Leek*, which here forms a good harbour, and receives the *Vliet*. The population is 2500.

Vlaardingen, the head-quarters of the Dutch herring fishery, for which it fits out annually from 80 to 100 vessels, stands on the right bank of the *Maas*. It is a pretty and a well-built town, with a population of 7600.

HOLLAND, PARTS OF. [LINCOLNSHIRE.]

HOLLINGBOURN, Kent, a village, and the seat of a Poor-Law Union, in the parish of *Hollingbourn*, is situated in 51° 16' N. lat., 0° 38' E. long., distant 22 miles W. by S. from *Canterbury*, 39 miles S.E. by E. from *London*. The population of the pariah of *Hollingbourn* in 1851 was 1312, of whom 312 were inmates of the Union workhouse. The living is a vicarage in the archdeaconry of *Maidstone* and diocese of *Canterbury*. *Hollingbourn* Poor-Law Union contains 23 parishes, with an area of 55,487 acres, and a population in 1851 of 13,751. The parish church of *Hollingbourn*, partly built about the year 1400, is of various styles. The Wesleyan Methodists have a small chapel, and there are National schools. Tanning and brickmaking are carried on. There are several corn-mills. A fair is held on June 16th.

HOLLOWAY. [MIDDLESEX.]

HOLMEFIRTH. [YORKSHIRE.]

HOLSTEIN, a duchy in the north of Germany, belonging to Denmark, and comprised between 53° 30' and 54° 24' N. lat., 8° 41' 22" and 11° 2' E. long., is bounded N. by *Schleswig*, from which it is divided by the *Eyder* and the *Kiel Canal*; E. by the *Baltic*, the territory of *Lübeck*, and the duchy of *Lauenburg*; W. by the *North Sea*, between the mouths of the *Eyder* and the *Elbe*; and S. by the *Elbe* (which separates it from *Hanover*) and the territory of *Hamburg*. Its greatest length from north-west to south-east, between the *Eyder* and the *Bille*, is 90 miles; from north-east to south-west, between the projecting peninsula facing the isle of *Fehmern* and the right bank of the *Elbe* above *Glückstadt*, 83 miles. The area is 3259 square miles; the number of inhabitants was 325,743 in 1803; 401,528 in 1826; and 479,364 in 1845; nearly all are of the Lutheran religion.

The central part of *Holstein* is a flat plateau covered with barren sandy moors, heathy bogs, and numerous small 'seen,' or lakes, from which the waters flow towards the *Eyder*, the *Baltic*, and the *Elbe*. The eastern slope is furrowed by numerous well-wooded and fertile valleys abounding in beautiful scenery; the western slope descends into the fertile grazing district of *Dithmarsh*, which is protected by dykes against the encroachments of the sea. [DITHMARSH.] On the plateau there is some light soil between extensive regions of bog, and here and there are a few trees. Towards *Kiel*, on the north, the surface is undulating and well wooded. Since the opening of the railway from *Altona* to *Kiel* across this dreary district, great improvements have been made by means of extensive drainage; and the granite boulders with which it is strewn, instead of lying valueless as formerly, have become a source of profit, and are quarried for transport to *Hamburg* and *Holland*, where they are in demand for building purposes. These boulders are supposed to have been carried at some long distant period from the Scandinavian peninsula by glaciers; except in these masses which lie on the surface there is no granite in *Holstein*.

The principal rivers are the *Elbe*, which has been already described [ELBE], and the *Eyder*. The *Eyder*, or *Eider*, rises in a small lake about 10 miles S. by W. from *Kiel*, and runs first northward through the *Westen-zee* to the *Schleswig* frontier, whence it runs west between the two duchies past *Rendsborg* to its mouth in the *North Sea* near *Tönning*, after a course of about 90 miles, for 70 of which it is navigable. The tide ascends the river as far as *Rendsborg*. Its principal feeders are the *Sorg* and the *Treen*, which join it on the *Schleswig* bank.

The *Stör*, a feeder of the *Elbe*, rises in the marshes a little south of the source of the *Eyder*, and runs in a general south-west direction past the town of *Itzehoe*, a short distance below which it turns south and enters the *Elbe* below *Glückstadt*.

The *Trave* rises in the *Warder-zee*, which is situated near the lake of *Plön*, the largest and most beautiful of the lakes of *Holstein*. It flows in a general southern course past *Segeberg*, receiving numerous small feeders from the lakes on either side, to *Oldeslohe*, where it sweeps round to the north-east, in which direction it traverses the territory and town of *Lübeck* and the shore-lake of *Binnen-wasser*, and enters the *Baltic* at *Travemünde*. The whole length of the *Trave* is about 60 miles. Its principal feeders are the *Steckenitz* and the *Wackenitz*, both of which join it on the right bank beyond the *Holstein* boundary. By the *Steckenitz* and a canal which joins it to the *Delvenau*, a feeder of the *Elbe*, a water-communication is established between *Lübeck* and *Hamburg*, which runs at a short distance east of the *Holstein* territory.

The other rivers of Holstein are small: of these the Alster, which joins the Elbe at Hamburg, and the Bille, which forms part of the boundary towards Lauenburg, may be mentioned. Common roads, which are however not well constructed, traverse the duchy from Altona to Lübeck, Kiel, and Rendsborg. A railway runs from Kiel to Altona, with branches to Rendsborg and Glückstadt. The Hamburg-Berlin railroad crosses a portion of the south of Holstein; and the branch line to Lübeck runs near its eastern boundary. Trade is also greatly facilitated by the Kiel Canal, made in the years 1777-84, at the expense of above two millions and a half of dollars, to form a communication, in conjunction with the Eyder, between the North Sea and the Baltic. It is 23 miles in length, 100 feet broad at the surface, 54 feet broad at the bottom, and 10 feet deep. It has six sluices, through which ships 100 feet long, 26 feet wide, and drawing not more than 9 feet water, can pass. Steamers ply from Kiel and the mouth of the Trave to all parts of the Baltic, and from the Elbe there is communication with all parts of the world.

Holstein, with the exceptions already made, is on the whole very fertile, especially in the reclaimed marsh-lands of Dithmarsh and the eastern parts which have of late years been rendered almost equal to the marsh-lands, chiefly by the use of marl. The climate is damp but healthy. The chief mineral products are salt, lime, gypsum, and amber; but there are no metals. Agriculture is well understood. The chief products are corn, more than sufficient for the home consumption, pulses, potatoes, hops, flax, and hemp. The breed of horses and of horned cattle is excellent. There are likewise sheep, swine, and abundance of poultry and game. Storks are very numerous: their huge nests may be seen on the summit of the gable-end of most of the farm-houses. The manufactures are unimportant. The situation of Holstein between two seas is highly favourable to commerce. The exports consist of corn, timber, horses, cattle, butter, tallow, beef, hides, and turf; the imports of colonial produce, wines, and manufactures. The provision houses of Hamburg are supplied with beef chiefly from Holstein. The herring fishery, and the Greenland whale and sea fishery, are sources of considerable profit. The principal seats of trade are Altona and Kiel.

The Holsteiners are an athletic race, generally exceeding the middle stature: the women are good-looking, and wear a quaint but becoming costume. They are not a purely Germanic people, for they are largely mixed with Slavic blood; nor is German their language, though they generally understand that tongue, but a compound of several dialects, in which the Slavic is an important element. The inhabitants do not all live clustered in towns and villages; the country is dotted with country seats and well-built farm-buildings. Education is universally diffused among the people of Holstein; there is a school in every parish, besides grammar-schools in all the important towns, and a university in Kiel.

The principal towns of Holstein are ALTONA, KIEL, and RENDSBORG. The more important of the other towns are noticed here.

Glückstadt, the capital of the duchy, situated on the right bank of the Elbe, half-way between Hamburg and the mouth of the river, has 6000 inhabitants. It is a pretty, regularly-built, trading town, intersected by canals. The strong ramparts which formerly surrounded it were demolished in 1814. It has a Lutheran, a Calvinist, and a Roman Catholic church, a gymnasium, a school of navigation, and other public institutions. The old arsenal is now used partly as a prison, partly as a workhouse. Glückstadt was declared a free port in 1830, and has much trade, and several ships engaged in the whale-fishery.

Blankensee is a large and remarkable village, most beautifully situated on the Elbe, 6 miles from Altona. The inhabitants, about 3000 in number, are mostly fishermen and pilots.

Elmahorn, 18 miles by railway N.W. from Altona, is a well-built town situated on the Krückau, a feeder of the Elbe, and has about 6000 inhabitants. It has considerable manufactures and a large trade in corn. The town is particularly noted for its shoes, of which vast numbers are made and sold in all of the fairs of the duchies of Schleswig and Holstein. Elmahorn is one of the few places in the duchies where Jews are allowed to reside.

Itzehoe, in a valley screened by wooded hills, stands on the Stör, midway between Altona and Rendsborg, being 30 miles distant from each, and has 5500 inhabitants. It was founded by Charlemagne in A.D. 809. During the Thirty Years' War it was twice taken by Tilly, and twice recovered by the Danes; the Swedes bombarded the town and nearly reduced it to ashes in 1657. The church of St. Lawrence and the convent attached to it (now a foundation for unmarried noble ladies) are the most interesting buildings. Itzehoe is or was the place of assembly of the provincial states of Holstein. In the neighbourhood are many handsome country seats, one of which, the castle of Breitenburg, is beautifully situated on the margin of the Stör.

Plön, on a narrow tongue of land between the greater and smaller lakes of Plön, is one of the prettiest places in Holstein. The castle of the former dukes of Holstein-Plön stands on a hill above the lake: population, 2700. The larger lake is 7 miles long, 4 miles broad, and encircled by wooded hills.

Preetz, 8 miles S.S.E. from Kiel, prettily situated on the edge of a small lake, has 5000 inhabitants. It owes its origin to a convent founded here in 1216, and now converted into a house for unmarried ladies of noble birth. The convent is joined to the town by a shady

avenue. The church and cloisters of the original structure are very interesting.

Oldesloe on the Trave, 6 miles above its entrance into the Lübeck territory, has about 3000 inhabitants, many of whom are employed in the productive brine-springs and royal salt-works in the vicinity. At *Segeberg*, a pretty little town higher up the Trave, is a limestone rock which rises abruptly from the level surface of the country to a height of 200 feet, while about 400 feet in depth of the mass are sunk in the earth. Large quarries are worked beneath this rock; its summit commands very fine and extensive views, comprising the towers and spires of Hamburg and Lübeck.

The king of Denmark, as duke of Holstein and Lauenburg, is a member of the German Confederation; his place is the tenth in rank, and he has three votes in the full council. The contingent for both Holstein and Lauenburg is 3600 men. After the peace in 1815, the king at different times signified his intention of introducing a representative constitution, and on the 28th of May, 1831, there appeared a general law for the establishment of provincial assemblies in the duchies of Schleswig and Holstein, to deliberate on public matters but with power merely to advise the crown. The states met every two years. Those of Holstein and Lauenburg consisted of 48 members; and their place of meeting was Itzehoe. On the death of Frederick VI. (Dec. 3, 1839) the question of the succession to the throne, which was regulated differently in the two parts of the monarchy, began to cause differences between Denmark proper and the duchies, which at last terminated in war. In Denmark the law of succession was such that in case of the extinction of the direct male line (a contingency now becoming every day more probable) the females of the same line should be called to the throne; but in the case supposed the law of the duchies ordains that the males of the collateral line, Holstein-Sonderburg-Augustenburg, should have the right to succeed. Another cause of jealousy was the demand of the Schleswig states in 1844 to be united to those of Holstein. This was refused by the king, and the states of Jütland passed a resolution pronouncing the proceeding of Schleswig as tending to a dissolution of the monarchy. Later in the year, Oct. 1844, the states of Holstein pressed the subject of the succession on the attention of the government, and in the following month the states for the Danish part of the monarchy assembled at Roskild, demanded a declaration from the king to the effect that the duchies "being integral parts of Denmark, could never be separated from it." In July 1846 appeared the Letter Patent of Christian VIII., declaring the law of succession in Schleswig and Lauenburg to be the same as in Denmark, but expressing doubts respecting Holstein which it would be the duty of government to clear up, in order to maintain the integrity of Danish states. Holstein protested, but the king refused to accept the protest. The representatives of Holstein then appealed to the German Diet, which passed a resolution confirming the right of the collateral line. Soon after Schleswig protested against separation from Holstein, and against any other succession than that of the house of Augustenburg.

To put an end to these quarrels among the parliaments of the several parts of the monarchy, and with a view to consolidate its component parts into one compact united state, Frederick VIII. soon after his accession issued (Jan. 28, 1848) a decree for a united parliament to consist of 26 delegates elected by Denmark proper and 26 by the duchies, with 4 delegates for each duchy nominated by the king. The duchies elected their deputies, but instructed them to insist upon a separate chamber to manage their own particular interests. The deputies met at Rendsborg (March 18, 1848), appointed a deputation to the king to demand—a separate chamber, a constitution for the united duchies, and a national guard—and appointed a provisional government. On the 3rd of April the deputies of the two duchies voted at Rendsborg the incorporation of Schleswig with the Germanic Confederation; the king of Prussia openly encouraged the hopes of the duke of Augustenburg. War ensued between Denmark and the duchies, assisted by Prussia and auxiliaries from all parts of Germany now in a state of revolution. Hostilities continued with varying success, and interrupted only for a short time by the armistice of Malmö, till the 25th of July, 1850, when the great and decisive victory gained at Idstedt by the Danes over the Schleswig-Holsteiners under general Willisen, who retreated on Rendsborg, threw the whole of Schleswig into the hands of the Danes. The last action of the war was the attempt to storm the fortress of Friederickstadt (Sept. 29, 1850), which was repulsed by the Danes. The Frankfurt Diet then commanded the immediate suspension of hostilities, and an Austrian army entered Holstein to carry into effect the interference of the diet for the re-establishment of peace. On the 18th of February 1852 the commissaries of the diet formally transferred the government of Holstein to the Danish commissary at Kiel; and according to the terms of the pacification the integrity of the Danish monarchy is secured; each of the duchies has a separate administration; Holstein and Lauenburg remain as before members of the Germanic Confederation, and the material but not political union of Holstein and Schleswig is guaranteed; and the succession was subsequently settled upon the second or Glücksburg branch of the collateral line of Holstein-Sonderburg, the duke of Augustenburg having resigned his claims in consideration of a pension.

The early history of Holstein is obscure. Charlemagne subdued the Saxons, who then inhabited it; removed 10,000 families of them

to Flanders, Brabant, and Holland, and declared the Eyder, on its northern frontier, to be the boundary between Germany and Denmark. The emperor Lotharius made Holstein and Stormarn a county, which he granted as a fief in 1106 to Adolphus, count of Schauenburg, whose son, Adolphus II. conquered Wagria. The family became extinct on the death of Adolphus VIII., and the states chose, in 1460, Christian I., king of Denmark, for their count, securing to themselves the right of choosing their princes among his descendants, which they actually exercised to the time of Christian IV. and Duke Philip, in 1597. Various changes took place in the sequel, in consequence of the division of the families into different branches, and the subsequent extinction of collateral lines; and it was not till 1733 that the whole came permanently under Danish government. The king of Denmark had a seat in the diet as duke of Holstein; but on the dissolution of the empire and the formation of the Rhenish Confederation in 1806, he declared all his German possessions to be parts of the kingdom of Denmark; however, on the formation of the German Confederation in 1815, he became a member of it, and Holstein was re-annexed to Germany.

HOLSWORTHY, Devonshire, a decayed market-town and the seat of a Poor-Law Union in the parish of Holsworthy, is situated in 50° 48' N. lat., 4° 22' W. long., distant 38 miles W. by N. from Exeter, 214 miles W. by S. from London. The population of the parish of Holsworthy in 1851 was 1833. The town is governed by a court-leet. The living is a rectory in the archdeaconry of Barnstaple and diocese of Exeter. Holsworthy Poor-Law Union contains 19 parishes and townships, with an area of 72,924 acres, and a population in 1851 of 9850. The parish church is ancient: it has some Norman piers and a plain Norman doorway. The tower is a remarkably fine one. The Independents and Wesleyan Methodists have places of worship. A National school was erected in 1848; the Bude and Holsworthy Canal, which unites with the Bude and Launceston Canal, passes near the town. The market is on Wednesday; there are two great markets and three fairs held in the year.

HOLT. [DENBIGHSHIRE; NORFOLK.]

HOLY ISLAND. [NORTHUMBERLAND.]

HOLYHEAD, Anglesey, North Wales, a parliamentary borough, sea-port, and market-town, in the parish of Holyhead, is situated in 53° 19' N. lat., 4° 38' W. long., distant 24 miles W. by N. from Beaumaris, 260 miles N.W. by W. from London by road, and 272½ miles by the London and North-Western, and Chester and Holyhead railways. The population of the borough of Holyhead in 1851 was 5622. Holyhead unites with Amlwch, Beaumaris, and Llangefni in returning one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry and diocese of Bangor.

Holyhead, or Caer Gybi, as it is called by the Welsh, is situated upon a small island of the same name at the western extremity of the island of Anglesey, with which it is united by the embankment and bridges of the great Irish coach road, and the Chester and Holyhead railway, and also by a stone bridge at a point where the arm of the sea, which bounds the island on its eastern side, is narrow enough to be spanned by one. Numerous Roman coins have been found in the island at different times; there are also a cromlech and other primeval remains. The town is straggling and irregularly built, but has some good houses. The road from the railway station to the lighthouse is lighted with gas. The parish church is mostly of the perpendicular style, and has been enriched externally with a good deal of rude but curious carving. The churchyard appears to be a portion of an ancient fortification; and is partly surrounded by a very curious and interesting Roman wall. The Wesleyan and Calvinistic Methodists, Independents, and Baptists, have chapels. There are National and British schools, a library, and a savings bank. The inhabitants are principally employed in the coasting-trade, and in ship-building and rope-making. Holyhead is the station of the Dublin mail steam-packets. The harbour is formed by a pier 900 feet in length, constructed chiefly of hewn limestone, and at the pier-head there is, during ordinary tides, a depth of 14 feet at low-water. The pier is the prolongation of an islet, which is connected with the island of Holyhead by a swing bridge of cast-iron, and by a viaduct for the railway, laid down to convey materials to the new harbour works. At the head of the pier is a lighthouse; on the land side is a triumphal arch of Anglesey marble, erected to commemorate the landing of George IV. in 1821. A wooden jetty is carried into the harbour. Holyhead has been selected by government as the site of a harbour of refuge. The works when completed will inclose about 316 acres, with a depth of more than six fathoms water.

At the northern extremity of Holyhead Island is the South-Stack lighthouse, built on the summit of a detached rock. The lighthouse rock is united to the island by a small suspension-bridge. The coast here is exceedingly wild and rugged; it has been worn by the waves into numerous caverns, and swarms, during a portion of the year, with sea birds. Holyhead Island has many barren spots, but includes good pasture for sheep, and a proportion of fair arable soil.

(Communication from Holyhead.)

HOLYWELL, Flintshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, is situated in 53° 17' N. lat., 3° 7' W. long., distant 10 miles N.N.W. from Mold,

and 200 miles N.W. from London. The population of the borough of Holywell in 1851 was 5740. The living is a vicarage in the archdeaconry and diocese of St. Asaph. Holywell Poor-Law Union contains 14 parishes and townships, with an area of 64,834 acres, and a population in 1851 of 41,053.

The town is situated upon an eminence near the southern shore of the estuary of the Dee. Its mineral riches and the manufactures carried on in the neighbourhood have made Holywell one of the most important and flourishing towns in North Wales. The town is lighted with gas and paved. The parish church was mostly rebuilt in 1769. In the town are chapels for Independents, Baptists, Wesleyan Methodists, Wesleyan Reformers, Welsh Methodists, and Roman Catholics; National, British, Infant, and Roman Catholic schools; the Flintshire infirmary, and a savings bank. A county court is held in the town. The principal works are lead-smelting, and deal-merging works; copper works; a shot tower; flannel factories; and a paper mill. There are also collieries and lead-mines; large quarries of Aberdo limestone; and a Roman cement manufactory. Holywell owes its name to the famous Well of St. Winefred, which is situated close to the church, and was once in high repute for the cure of diseases. Near the spring are vestiges of the old British fortification of Dinas Basing, 'the fort in the bottom.'

(Communication from Holywell.)

HOLYWOOD. [DOWNSHIRE.]

HOLZMÜNDEN. [BRUNSWICK.]

HOMBURG. [HESSE-HOMBURG.]

HOMERTON. [HACKNEY.]

HONDURAS, Republic of, Central America, occupies the elevated country between the table-land of Guatemala and the plains of Mosquitos and Nicaragua. It lies between 14° 5' and 16° N. lat., and about 85° 30' and 88° 40' W. long.; but a narrow tract extends southward between Salvador and Nicaragua as far as the Gulf of Conchagua on the Pacific, 13° 30' N. lat. Honduras is bounded E. by the Mosquito territory, but the boundary line on this side remains undefined; S. by the republics of Nicaragua and Salvador, except where the narrow tract of land reaches down to the Gulf of Conchagua; W. by Guatemala; and N. by the Caribbean Sea. The area is about 30,000 square miles: the population is about 230,000, of whom three-fourths are ladinos or mulattoes.

Surface, &c.—The Caribbean coast from Cape Cameron to Cape Honduras bears, with a general concave sweep, due west; and thence to Caballo Point, and to the mouth of the Rio Motagua, a short distance east of which is the boundary of the republic, it bears W.S.W. Between Capes Cameron and Honduras the coast is low; thence westward it is for the most part high and rocky. The only available ports are Truxillo at the mouth of the river of the same name, which is merely an open roadstead in a bay formed by Cape Honduras; and Omoa, a small but good harbour near the western extremity of the republic. The whole of this coast is extremely unhealthy, and consequently very thinly peopled. The small tract owned by Honduras bordering on the Gulf of Conchagua, in the Pacific Ocean, is also low, subject to be inundated by spring tides, and very unhealthy; but in neither case does the miasmatic influence extend far inland.

The surface of the country is greatly broken. It may be described as a table-land traversed by several ridges of hills running from north-west to south-east with secondary ridges branching obliquely from them. The general level of the table-land is perhaps about 4000 feet; the highest part is the southern side, where it borders on Salvador. Close upon the shores of the Caribbean Sea a ridge of mountains, the Sierra Omoa, extends from Cape Honduras to Caballo Point, near which is Mount Omoa, 7000 feet high, which gives its name to the ridge. The culminating point of this ridge is the peak of Congrehoy, 87° W. long., which is 7500 feet above the level of the sea. The ridges which traverse the interior of Honduras do not attain any great altitude above the general level. Between the ridges are long, wide, open, and fertile valleys, which mostly descend gently to the great plain on the east. Near the western end of the state are the broad valleys of the Chamalicon and the Ulua, which are overgrown by thick forests of mahogany, cedar, and fustic trees. Along the southern side of the territory runs a ridge which divides the waters which flow into the Pacific from those which fall into the Atlantic; but only a few peaks attain any considerable elevation. From this ridge, and from the transverse ridges north-west of it, a series of high and steep hills rise from a broad-backed tract of high ground and connect the table-land of Honduras with that of Guatemala. The valleys between these ridges are of comparatively moderate width.

The principal rivers flow into the Caribbean Sea. Beginning on the west we have the Chamalicon, which rises on the Marendon Mountains near 14° N. lat. and flows in a generally northern direction into the Bay of Honduras a little east of Punta de Caballos. For a large part of its upper course it flows through a wild and uninhabited country; but as it approaches the sea the valley opens out to a great width, its slopes being covered with vast forests of valuable timber trees. Like most of the rivers of the state the navigation of the Chamalicon is impeded by a bar at its mouth. East of the Chamalicon is the Ulua, a much longer and more important stream. It is formed

by the union near Santiago of several branches, the longest of which rises not far from the borders of Salvador; it falls into the sea a short distance west of Punta de Sal after a course of about 300 miles; only a few miles of the lower part are navigable. The next river of any size is the Truxillo, the mouth of which forms the harbour of the same name. East of this is the Aguan, which after a course of about 100 miles discharges itself by two branches into the Caribbean Sea, about 20 miles east of Cape Honduras. None of these are navigable for more than a short distance, and then only by piraguas (a sort of river barges), except the Uluá and Chamalicon, which admit small schooners. The Choluteca, which falls into the Pacific at the Bay of Conchagua, a small stream draining a narrow valley, is the only river of the state which does not enter the Caribbean Sea. The roads throughout the republic are mere tracks worn by continual use.

Climate, Soil, Productions.—The climate, except along the coast, is on the whole salubrious, though the temperature is somewhat high. Gout is common in the elevated districts. The valleys opening to the sea are very fertile, but moist and unwholesome. Those from which the air of the sea is intercepted by ranges of hills are less humid and more habitable, but their fertility is not so great. On the table-land, and in the districts not contiguous to the Caribbean Sea, the dry season begins about the close of October, and lasts until the end of May; during which time only a few showers occasionally refresh the air. In the beginning of June thunder is frequent, and is followed by long and heavy rains. But even during this time it rains only in the evening and the night: from six o'clock in the morning till three or four o'clock in the afternoon, no cloud passes over the sky, and the air is dry and pleasant. Towards the middle of October the north winds set in with frequent thunderstorms, and after them the dry season begins.

The most important natural productions are the vast forests of mahogany, cedar, fustic, pimento, and numerous other valuable trees; but owing to the badness of the roads, the scarcity of labour, and other local causes, they are turned to comparatively little account. From the same causes, and from the indisposition of the inhabitants to steady labour in the fields, agriculture is in a very backward state; not only are immense tracts of fertile land wholly neglected, but the land which is under cultivation is very far from being rendered as productive as it easily might be. Maize, rice, some wheat and barley, frixoles, plantains, and various fruits and vegetables are the principal articles grown, but scarcely in sufficient quantities for the requirements of the inhabitants. In the western district of Gracias tobacco of very fine quality is raised, but not enough for exportation. The chief dependence of the husbandman is on the cattle, of which vast herds are reared on the plains in the interior. Yet though such large numbers are maintained, they form but a limited article of export, and tallow and hides are only exported to a comparatively small amount. Sheep are not so numerous as in some of the other countries of Central America. Horses are not much attended to, nor are they of superior kinds. Mules are numerous, they being generally used in the country for the transport of goods.

The manufactures are confined to the coarser articles of home consumption. The commerce is but small; the foreign trade is chiefly carried on through Belize. As already indicated the exports are principally of mahogany, cedar, Brasil, and other cabinet and dye-woods; sarsaparilla, hides, and the products of the mines. The imports are British cottons, woollens, and hardwares, with various French, German, and American goods. Honduras is the principal mining country of Central America. The chief mining districts are the southern and western portions of the republic, but some mines occur in every department. Gold is found in veins in quartzose rocks; and in grains in alluvial deposits in the ravines, and in the sands of several of the rivers. Silver mines occur in several places in the department of Tegucigalpa, and also more or less frequently in all the other departments. Copper is found of good quality in Choluteca and elsewhere. Lead and iron-ore are found in several places. Of the present annual products of the mines we have however no reliable statement. In Gracias occur veins of remarkably fine opals, as well as some yielding emerald. Jasper, asbestos, and cinnabar are likewise obtained. Excellent marble is wrought.

Divisions, Towns, &c.—Honduras is divided into seven departments—Comayagua, which occupies nearly the centre, and contains the capital of the republic; Gracias to the south-west, and Santa Barbara to the north-west of Comayagua, both of which extend to Guatemala, and Santa Barbara includes the coast as far east as Punta de Sal; Yoro, north of Comayagua, extends along the coast from Punta de Sal eastward to Cape Honduras, and contains the port-town of Truxillo; Tegucigalpa lies east of Comayagua, and is the chief mining district and most thickly inhabited department of the republic: on the north-east of it is the department of Juticalpa, which extends to the Mosquito territory; south of Comayagua is Choluteca, which stretches down to the Gulf of Conchagua, where is the little port-town of San Lorenzo, established a few years back in order to give the republic a port of entry on the Pacific. In the interior are few considerable towns; on the coast are only the small port-towns of Omoa and Truxillo.

Comayagua (*Valladolid de*), the capital, is situated in a fine but

unhealthy valley, at nearly an equal distance from the ports of Omoa and Truxillo, in 14° 30' N. lat., 87° 30' W. long., and contains 3000 inhabitants. The public buildings are a cathedral, several churches, a college, an hospital, &c.

Tegucigalpa contains from 8000 to 10,000 inhabitants, and is the most populous place in Honduras, being the chief town of the great mining district. In its neighbourhood are mines of gold, silver, copper, and iron. It is at a considerable elevation above the sea.

Omoa, on the Bay of Honduras, 15° 38' N. lat., 88° 5' W. long., 12 or 15 miles from the mouth of the river Motagua, is a small place inhabited by a few ladinos, but is a good deal frequented; the harbour, which is formed by a small bay, is very good. The goods imported from Europe or America are sent by barges to Gualán, on the banks of the Motagua. The town is very unhealthy.

Truxillo, farther to the east, formerly carried on an active trade with Havanna, but it now exports only mahogany and a few hides, with a small quantity of sarsaparilla and tortoiseshell to Belize. The town with its suburbs contains about 4000 inhabitants.

Government, &c.—The government is vested in a president and two chambers. The president is elected by the chambers, and assisted by a council of state consisting of the ministers and some other members. The chambers consist of a legislative assembly of 14 deputies, and a senate of 14 members. The republic has a debt of about 300,000 dollars. We have not a recent return of the revenue. The chief court of justice is the supreme court at Comayagua, which is presided over by three judges. The president is commander-in-chief of the militia. The established religion is the Roman Catholic, but other forms of worship are permitted. Education is in a very neglected state.

The coast of Honduras was discovered by Columbus in 1502. The Spaniards effected the subjugation of the country a few years later; from which time it remained a part of the Spanish kingdom of Guatemala until the declaration of independence by South America in 1820. Honduras was then comprised in the Mexican empire of Iturbide, on the dissolution of which in 1823, Honduras formed one of the federal states of Central America; but this union was also of short duration, and Honduras then became and has since continued to be an independent republic.

(Juarros, *History of Guatemala*; Haefkins, *Central America*; Baily, *Central America*, &c.)

HONDURAS, BRITISH, or Belize, a British settlement on the east coast of Central America, is bounded N. by Yucatan, W. by Vera Paz, S. by Guatemala, and E. by the Bay of Honduras and the Caribbean Sea. The settlement extends from 15° 54' to 18° 30' N. lat., and from 88° to 89° 30' W. long. The area is about 10,370 square miles, and the population, which consists chiefly of Caribs and negroes, is about 12,000.

The surface is very irregular. In the interior it is greatly elevated, while the coast is for the most part low, and fringed with reefs and small islands, termed keys, which render the navigation very hazardous. The country is watered by numerous rivers, the chief being the Belize, which is navigable for 150 miles from its mouth. The rocks are principally primary and calcareous. The easterly or sea-breezes which prevail during nine months of the year, temper the heat, which however is scarcely ever excessive; the thermometer seldom rises above 85° Fahr. even in the hottest time, and during the wet season it sinks to 60°. In June, July, August, and September heavy and frequent rains fall, and these are the most unhealthy months of the year, disease being engendered by the marsh miasmata arising from the lowlands and swamps. The soil by the coasts and rivers is a rich alluvial deposit, and very fertile. On the higher grounds are extensive forests of mahogany-trees of magnificent growth, and the logwood-tree abounds in the swamps. Cedar and other valuable timber-trees are among the natural products. The plantain is extensively cultivated. Maize, rice, cassava, arrow-root, yams, &c. are grown. Cotton, sugar, and coffee, though little cultivated, succeed well. In the woods the red tiger, the black tiger, the tiger-cat, the leopard, and other wild animals, and game, are found. Turtle abound on the keys.

British Honduras is governed by a Superintendent, and a Public Meeting, consisting of seven magistrates appointed by the inhabitants. The superintendent is immediately subordinate to the Governor of Jamaica, from whom he holds a commission. He is assisted in the administration of government by an Executive Council, consisting of the chief justice, the attorney-general, the officer commanding the land forces, and the public treasurer. An Act of the local legislature has however been passed by which the constitution of the council and assembly is proposed to be altogether remodelled. British Honduras is in the diocese of Jamaica. About 1000*l.* is voted annually by the legislature for the purposes of education.

The exports are chiefly of cochineal, which amounted to 169,140*l.* in 1851, of indigo and sarsaparilla, which commodities are altogether the produce of the states of Central America, and are brought to Belize merely in the course of transit to Europe. The total value of the exports in 1851 was 411,443*l.*, in 1852 it was 391,233*l.* The commerce of British Honduras is centred in the capital, and indeed only to town of any size, Belize, under which it is more fully noticed, and where will also be found mentioned various other facts relating to the settlement. [Belize.]

HONFLEUR. [CALVADOS.]

HONG KONG is one of the group of rocky islands situated at the mouth of the Canton River, about 37 miles from Macao, and 100 miles from Canton, in 22° 12' N. lat., 114° 13' E. long. The island is separated from the mainland of China by a narrow strait, which varies in width from less than a mile to 4 or 5 miles. The length of the island from east to west is about 8 miles; its breadth varies from 2 to 6 miles. The coast-line forms a succession of small bays and headlands. In Hong Kong Roads and Victoria Harbour is excellent anchorage, both opposite the town of Victoria. There is deep water for a man-of-war within a cable's length of the shore. The harbour lies between the mountains of Hong Kong and those of the mainland; yet is exposed to the violence of typhoons. The northern side of the island is traversed by a ridge of mountains which vary in height from 500 feet to upwards of 1000 feet. They present a steep declivity towards the coast, and their base approaches nearly to the edge of the sea. Mount Victoria is said to be 1827 feet high, and Mount Gough 1575 feet. These two mountains immediately overlook the town and harbour of Victoria. The elevation of Mount Parker, at the other or eastern end of the island, is said to be 1711 feet. The mountains furnish a supply of excellent granite for building; and there are numerous quarries which are skillfully worked by Chinese labourers. The southern side of the island is much less rugged. The land suitable for cultivation is small, and chiefly in one valley. Deep ravines extend from the interior towards the sea, and furnish a constant supply of good water. The mean temperature of Hong Kong in July is 88°. In October, November, and December the variations of the temperature are often from 10 to 20 degrees in the course of 24 hours. The northern side of the island is fully exposed to the north-western monsoon during the winter season. In the hot season the rain falls in torrents, and this is succeeded by a hot unclouded sun, which acts upon the undrained parts of the surface and creates malaria. The south side of the island enjoys the benefits of the south-western monsoon, and is healthier than the northern side; but it is destitute of a harbour of sufficient extent. An excellent road round the island has been constructed by the government at an expense of about 20,000*l.*—in many places it has been cut through granite rocks.

Hong Kong was taken possession of by the British during the war with China. By the Treaty of Nanking, signed August 30th 1842, it was ceded in perpetuity to Great Britain. On the 26th of June 1843 Hong Kong was regularly constituted a British colony. It is what is called a crown colony, that is, it has no legislative assembly, but is governed by orders from the Colonial Office at home. There is a legislative and executive council to aid the governor with assistance and advice. The governor, as superintendent of trade, is head of the consular establishments at the five ports opened in pursuance of the Treaty of Nanking. The offices of the government are at Victoria. There are a chief justice and an attorney-general, with other law-officers, and the usual departments of a colonial administration. All grave offences committed by British subjects must be tried at Hong Kong. The civil, judicial, and ecclesiastical establishments cost 28,415*l.* 2*s.* 10*d.* in 1852; the military expenditure amounted to 50,393*l.* The total revenue of the colony for the year ending March 31st 1853 was 23,432*l.* 13*s.* 5*d.*

The population on December 31st 1852 was 37,058, of whom 35,517 were Chinese. The inhabitants are engaged in trade, in agriculture, in fishing, and in stone-cutting. The number of boats anchored or plying in the harbour and bays of Hong Kong on December 31st 1852 was 1799, on board of which were 7154 men and 4675 women and children. The population of the city of Victoria was 14,671, of whom 11,283 were males and 3388 females. There are in Victoria an English Episcopal church, a Roman Catholic church, and four places of worship for Dissenters. The island contains also a Mohammedan mosque, and three Chinese temples. The city contains regular streets and bazaars for the Chinese, numerous large store-houses, substantial wharfs and jetties, two European hotels and billiard rooms, and various public buildings. A new government house is in course of erection. In consequence of the limited space between the beach and the base of the mountains, the town necessarily stretches in a line, which extends about three miles in front of the harbour. The town of Aberdeen and its vicinity had a population of 1208 in 1852. The town of Stanley and its vicinity had a population of 1617. At Aberdeen is a school for Chinese supported by government; and at Stanley are three schools, one connected with the Baptist Mission, one supported by the inhabitants, and the third supported by the government. The number of native schools in Hong Kong supported by government is 5, with 134 scholars in all. The number of Chinese coasting vessels which visited Hong Kong harbour during 1852 was 492; the number of salt-junks was 310, importing 173,000 piculs of salt. The number of vessels which arrived during the year was 1097, of an aggregate burden of 433,383 tons. A large amount of specie is remitted to India, chiefly in return for opium, which is sold to the Chinese along the coast. By the Peninsular and Oriental Company's steamers alone specie to the amount of more than a million and a quarter of pounds sterling was remitted to India in 1852. Much is sent also by other vessels, of which no account is taken, as the port is entirely free.

ÆTIO. DIV. VOL. III.

HONITON, Devonshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Honiton, is pleasantly situated on an eminence on the Great Western road, near the left bank of the river Otter, in 50° 48' N. lat., 3° 11' W. long., distant 16 miles N.N.E. from Exeter, and 143 miles W.N.W. from London. The population of the parish, which constitutes also the municipal and the parliamentary borough of Honiton, was 3427 in 1851. The borough is governed by a port-reeve, and returns two members to the Imperial Parliament. The living is a rectory in the archdeaconry and diocese of Exeter. Honiton Poor-Law Union contains 28 parishes and townships, with an area of 83,950 acres, and a population in 1851 of 23,798.

The town consists chiefly of one broad handsome street, running east and west, with a shorter street crossing it at right angles. Through the main street runs a small transparent stream, which supplies the inhabitants with water. The streets are well paved and lighted, and contain many good houses. The parish church, which stands on a hill about half a mile from the town, was originally a small chapel for mendicant friars. A screen of curious workmanship was erected about the year 1482 by Courtenay, bishop of Exeter. St. Paul's church, a gothic structure in the centre of the town, was erected in 1837. The Grammar school, founded in 1614, has a small income from endowment, and in 1850 had 17 scholars, of whom 5 were free. There are in the town a Free school, a Girls Industrial school, an hospital, and some parochial charities. The principal manufacture is that of lace, which is a much-admired and very beautiful fabric, and is designated 'Honiton lace,' from the name of the town in which it is chiefly made. In the neighbourhood of Honiton are extensive quarries. Markets are held on Tuesday, Thursday, and Saturday; a fair is held on the Wednesday following July 19th.

HOO, a hundred in the lathes of Aylesford, Kent, which has been constituted a Poor-Law Union. The hundred contains 6 parishes, with an area of 22,306 acres, and a population in 1851 of 2457; it is bounded N. and E. by the Thames, S. by the Medway, and W. by the hundred of Shamwell. Hoo Poor-Law Union contains 7 parishes, with an area of 20,862 acres, and a population in 1851 of 2840.

HOPE, CAPE OF GOOD. [CAPE OF GOOD HOPE.]

HORBURY. [YORKSHIRE.]

HORDLE. [HAMPSHIRE.]

HORNBY. [LANCASHIRE.]

HORNCASTLE, Lincolnshire, a market-town and the seat of a Poor-Law Union, is pleasantly situated at the foot of the Wolds, in 53° 12' N. lat., 0° 7' W. long., distant 21 miles E. by S. from Lincoln, and 134 miles N. from London. The population of the town in 1851 was 4921. The living is a vicarage in the archdeaconry and diocese of Lincoln. Horncastle Poor-Law Union contains 68 parishes and townships, with an area of 114,068 acres, and a population in 1851 of 24,961.

The town of Horncastle has been of late years much improved, and many of the houses are well built. The church is partly of the time of Henry VII., but the greater part has been rebuilt. There are chapels for Baptists, Independents, and Wesleyan Methodists, National and Infant schools, a mechanics institute, two libraries, and a savings bank. A county court is held in the town. Corn and wool are the principal articles of commerce. The market is held on Saturday: there are three fairs in the year; that held in August is among the largest horse-fairs in the kingdom. At Horncastle there are traces of a fortification in the form of a parallelogram, inclosing an area of 20 acres, and comprehending a considerable part of the modern town. Roman coins and other antiquities have been discovered in the vicinity.

HORNCHURCH. [ESSEX.]

HORNNDON-ON-THE-HILL. [ESSEX.]

HORNSEA. [YORKSHIRE.]

HORNSEY. [MIDDLESEX.]

HORNU. [HAINAULT.]

HORSFORTH. [YORKSHIRE.]

HORSHAM, Sussex, a market-town, parliamentary borough, and the seat of a Poor-Law Union, is situated on a feeder of the river Arun, in 51° 3' N. lat., 0° 19' W. long., distant 28 miles N.E. from Chichester, 36 miles S. by W. from London by road, and 37½ miles by the Brighton and South-Coast railway. The borough is governed by two bailiffs and a steward, and returns one member to the Imperial Parliament. The population of the borough in 1851 was 5947. The living is a vicarage in the archdeaconry and diocese of Chichester. Horsham Poor-Law Union contains 10 parishes and townships, with an area of 55,902 acres, and a population in 1851 of 14,017.

The town consists of two streets crossing each other at right angles, with an open space in the centre, occupied by the court-house, a handsome gothic structure, in which the spring assizes for Sussex were held from 1799 till 1830: the midsummer quarter sessions for West Sussex are still held in it. The town is lighted with gas. St. Mary's church is a spacious and elegant building, in the early English style, with a lofty tower, surmounted by a spire. There are also a district church, and places of worship for Roman Catholics

Wesleyan Methodists, Independents, Baptists, and Quakers. A corn-market is held on Saturday, and a poultry market on Monday. Yearly fairs are held April 5th, July 11th, November 17th, and 27th, and on the Monday before Whitsuntide. There are in the town a Grammar school, founded in 1532, which has an income from endowment, of 412*l.* a year, with houses for the masters, and had 60 scholars in 1852; British and Infant schools; a savings bank; and a literary and scientific institution. Horsham is a borough by prescription. Petty sessions are held here.

HOETA. [ASOREA.]

HORWICH. [LANGASHIRE.]

HOUGHTON-LE-SPRING, Durham, a village and the seat of a Poor-Law Union, is situated in 54° 50' N. lat., 1° 27' W. long.; distant 7 miles N.E. from Durham, 265 miles N. by W. from London by road, and 236 miles by the Great Northern and North of England railways. The population of the town of Houghton-le-Spring in 1851 was 3224. The living is a rectory in the archdeaconry and diocese of Durham. Houghton-le-Spring Poor-Law Union contains 16 townships, with an area of 14,041 acres, and a population in 1851 of 19,564.

The town of Houghton-le-Spring is irregular, and nearly half a mile long; it stands at the head of a fine vale, sheltered on the north and east by limestone hills. It contains several handsome buildings. Houghton Hall is a large mansion, built in the reign of Elizabeth or James I. The church is cruciform, with a square tower springing from the intersection of the transepts and nave. The church contains the monument of Bernard Gilpin, 'the Apostle of the North.' There are places of worship for Baptists, United Presbyterians, and Methodists; and National, Infant, and Free schools. The Keeper Grammar school, founded in 1574 by the exertions of Bernard Gilpin, has an income from endowment of about 150*l.* a year, and had 42 scholars in 1851. Extensive iron-works and numerous coal-mines in the vicinity give employment to many of the population.

HOUGHTON REGIS. [BEDFORDSHIRE.]

HOUNSLOW, Middlesex, a small town, formerly a market-town, in the parishes of Heston and Isleworth, is situated on the Great-Western coach-road, in 50° 28' N. lat., 0° 21' W. long., distant 12 miles W. by S. from London by road, and 13½ miles by the Windsor branch of the South-Western railway. The population of the town of Hounslow in 1851 was 3514. The living is a perpetual curacy in the archdeaconry of Middlesex and diocese of London. Hounslow consists chiefly of a street extending about a mile along the high-road; it is lighted with gas, and is irregularly paved. The church is a neat modern building, with 12 stone cupolas or spires, and a belfry, in the Italian style. The chapel of ease, which it replaced, had been the church of a priory, founded here in the 13th century. The Independents and Baptists have places of worship, and there are Subscription and Infant schools. The high-road from London to Southampton branches off at the west end of the town of Hounslow, proceeding to the south-west. Previous to the opening of the railways to Southampton and Bath, Hounslow possessed one of the most extensive posting businesses in England, having nearly 500 coaches passing through it every day. Hounslow Heath was until the present century notorious as the scene of numerous highway robberies. On many occasions there have been military encampments on the heath westward from the town; spacious military barracks and grounds for military exercises are still maintained. The Hounslow Heath gunpowder-mills are on a very large scale. The greater part of the Heath is now inclosed, and many villas have been built around the town. (Communication from Hounslow.)

HOUSSA. [SOODAN.]

HOUSTON. [TEXAS.]

HOWDEN, East Riding of Yorkshire, a market-town and the seat of a Poor-Law Union in the parish of Howden, is situated near the left bank of the river Ouse, in 53° 44' N. lat., 0° 52' W. long., distant 20 miles S.E. by S. from York, 180 miles N. by W. from London by road, and 192 miles by the Great Northern, and Selby and Hull railways. The population of the town of Howden in 1851 was 2235. The living is a vicarage in the archdeaconry of the East Riding and diocese of York. Howden Poor-Law Union contains 40 townships and chapelries, with an area of 67,121 acres, and a population in 1851 of 14,231.

Howden contains some good houses, and is lighted with gas. The church was formerly collegiate. The present parish church is a portion only of the old building; the remainder forms an extensive and beautiful ruin, which has a lofty and well-proportioned square tower rising from the centre. The chapter-house, which is octagonal, and contains thirty canopied seats, was erected in the 14th century. Near the town, and now used as a farm-house, are the remains of an ancient palace of the bishops of Durham. The town contains chapels for Independents, Wesleyan and Primitive Methodists, and Roman Catholics. The Endowed Grammar school was founded in Queen Elizabeth's reign: the school-house forms part of the structure of the church. Howden possesses a National school, a mechanics institute, and a savings bank. On the Ouse, which is about a mile from Howden, is a ferry, with a small harbour for boats, to accommodate the town. In the neighbourhood of the town are several large sacking manufactories. Flax-dressing, hat-making, brick- and tile-making, and tanning are carried on. Several corn-mills are in the vicinity. A county court

is held in the town. The weekly market is on Saturday: fairs for horses and cattle are held every alternate Tuesday, and an annual fair in April. The great horse fair generally lasts a fortnight before October 2nd, which is the principal day. This is considered the greatest horse fair in England. It is the principal source of supply of horses for the army; it is also resorted to by foreign as well as British dealers and breeders.

HOWTH. [DUBLIN, County of.]

HOXNE, a hundred in the county of Suffolk, which gives name to a Poor-Law Union. The hundred of Hoxne is bounded N. by the river Waveney, which forms here the boundary between Suffolk and Norfolk; S. by the hundred of Loes, E. by the hundreds of Blything and Wangford, and W. by the hundred of Hartismere. Hoxne hundred comprises 26 parishes, with an area of 56,625 acres, and a population in 1851 of 16,894. Hoxne Poor-Law Union contains 24 parishes, with an area of 53,036 acres, and a population in 1851 of 15,585.

HOYA. [HANOVER.]

HUDDERSFIELD, West Riding of Yorkshire, a manufacturing and market-town, parliamentary borough, and the seat of a Poor-Law Union, is situated on the slope and summit of a hill above the river Colne, in 53° 38' N. lat., 1° 47' W. long., 35 miles S.W. from York, 204 miles N.N.W. from London by the North-Western, and the Manchester Sheffield and Lincolnshire railways. The government of the town rests in a body of Improvement Commissioners. The parliamentary borough, which was created by the Reform Act, returns one member to the Imperial Parliament. The population of the borough in 1851 was 30,880. The living is a vicarage in the archdeaconry of Craven and diocese of Ripon. Huddersfield Poor-Law Union comprises 34 parishes and townships, with an area of 69,064 acres, and a population in 1851 of 123,843.

Huddersfield is one of the chief seats of the woollen manufactures, and has also some branches of the cotton manufacture. Its situation on the high road from Manchester to Leeds, and its supply of water-power, together with the immediate proximity of coal and building-stone, and the great facilities of conveyance afforded by abundant railway and canal communications, have contributed to its increased wealth and population. The greater part of the houses of Huddersfield are neatly built of a light-coloured stone. The streets are well paved, and are lighted with gas. Considerable improvements have been recently effected in widening the streets and making the approaches and principal thoroughfares worthy of the increasing importance of the town. The market-place is a large area, surrounded with good houses and shops. The most important industrial products of Huddersfield are broad and narrow woollen cloths, serges, kerseymeres, cords, and a great variety of fancy goods, such as shawls and waistcoatings, composed of worsted, silk, and cotton. A commodious cloth-hall was erected by Sir John Ramsden, the proprietor of the town, in 1765, and enlarged by his son in 1780. This edifice is circular, two stories high, and 880 yards in circumference. It has an avenue of stalls for the sale of woollen cloths, dividing the interior into two semicircles. The main building is divided on the one side into separate compartments or shops, and on the other into open stalls. Upwards of 600 manufacturers attend this hall each market day. The doors are opened in the morning and closed at half-past twelve: they are again opened at three in the afternoon for the removal of cloth. Above the entrance is a cupola with a clock and bell for regulating the time allowed for business.

The parish church of St. Peter's was rebuilt in 1837; the new church, which is in the perpendicular style, cost about 10,000*l.* The floor of the old church is now the floor of the crypt, under the new one. Trinity church, erected in 1819 at a cost of 12,000*l.*, is in the pointed gothic style. St. Paul's church, in the early English style, was built by the parliamentary commissioners in 1831. Besides these, in March 1851, there were 4 places of worship for Episcopalians, 9 for Methodists, 2 for Independents, 2 for Baptists, and 1 each for Quakers, Roman Catholics, Unitarians, and Mormons. The total number of sittings provided was 15,787. The Methodist chapel in Queen-street is one of the largest belonging to the connexion in England. The Roman Catholic church is a handsome structure. The number of public day-schools in the borough in March 1851 was 17, with 2932 scholars; private schools 30, with 1101 scholars. The number of Sunday schools was 21, with 4634 scholars. A Proprietary College, founded in 1838, is in connection with London University, and had 190 scholars in 1853. There is also a Collegiate school under the superintendence of members of the Established Church. The Philosophical Hall, a Grecian building, completed in 1837, belongs to the Philosophical Society, and is used for important public meetings. There is a large mechanics institute. The town possesses subscription libraries, a commercial news-room, and a savings bank. The water-works, about four miles west from the town, are admirably constructed. The infirmary, a large and elegant stone-building of the Doric order, situated on the Halifax road, is supported mainly by voluntary contributions. Lockwood Spa baths are about half a mile from the town, in the sheltered valley of the Holme. The buildings are elegant; the waters are strongly sulphureous; the baths comprise cold, tepid, warm, vapour, and shower baths.

There are many streams in the neighbourhood; the Holme and

Colme unite in the town and fall into the Calder 3 miles below it. Upon these streams a number of mills are erected for the manufacture of woollens, and for fulling and washing the cloths. The hills about the town are cultivated to their summits, and produce excellent crops. Many handsome residences are built in the vicinity. Markets are held weekly on Tuesday, and fairs for cattle and horses on March 31st, May 14th, and October 4th. There are several breweries, chemical factories, dye-houses, &c. A county court is held in the town.

HUDSON RIVER. [NEW YORK.]

HUDSON'S BAY TERRITORIES. Hudson's Bay is an extensive mediterranean sea on the eastern side of North America. It is connected with the Atlantic Ocean by Hudson's Strait, which extends about 360 miles from east-south-east to west-north-west, and is from 90 to 100 miles wide. The surface of Hudson's Bay is greater than that of any of the inland seas of the Old Continent, the Mediterranean only excepted. Its southern part is called James's Bay. From the most southern corner of James's Bay to Repulse Bay, which may be considered as the most northern point of Hudson's Bay, is upwards of 1000 miles (between 51° and 66° N. lat.). It is more than 500 miles across in its widest part. The coasts are generally high, rocky, and rugged, and in many places precipitous, except along the south-western shores between Cape Henrietta Maria and Cape Churchill, where they are generally low and swampy, and frequently exhibit extensive sands. The depth of water in the middle of the bay has been taken at 150 fathoms, but it is probably greater. The northern part of Hudson's Bay is occupied by Southampton Island, which is formed of high rocky masses, and seems to consist of numerous smaller islands, separated from one another by straits, which however are always closed by ice. It does not appear to be inhabited.

The countries which inclose Hudson's Bay on all sides constitute by far the greatest portion of the British dominions in North America; but they are not known under any one general denomination, and may therefore be described here under the name of the 'Hudson's Bay Territories.' These countries extend between 49° and 70° N. lat., and from Cape Charles in Labrador (near 55° W. long.) to the Rocky Mountains and the mouth of the river Clarence at Demarcation Point, between 141° and 142° W. long. The area exceeds 2,000,000 square miles.

This immense country may be divided into four natural regions. The most eastern is the sterile region, which lies along the shores of the sea, and extends far inland. East of Hudson's Bay it extends as far as the Belle Isle Strait, and includes the whole of Labrador. That portion of it which lies west of Hudson's Bay is called the 'Barren Grounds.' The rein-deer and the musk-ox are abundant, but there are few fur-bearing animals. This district is inhabited by Esquimaux and a few forlorn families of Indians. The winters are longer and more severe than in Greenland in the same latitude.

The second region extends on both shores of James's Bay, and along the southern shores of Hudson's Bay, as far westward as Cape Churchill. It extends inland to the ridge which forms the northern boundary of Canada, and to the lakes Superior, Winnipeg, Deer, and Wollaston. Along the shores and several miles inland it is mostly occupied by swampy tracts, which are separated from one another by comparatively narrow and dry but low ridges. Farther inland the country is generally well wooded, and produces the fur-bearing animals in great abundance.

To the west of the wooded region is the savannah region, which extends to the foot of the Rocky Mountains, and northward to the lake of Athabasca and the Peace River. Its surface stretches out in extensive plains, intersected only by the beds of several rivers, which are considerably below the plains. In the bottoms, along the rivers, trees grow abundantly. The soil of the plains is rather sandy and dry, and entirely destitute of wood, but supports a thick grassy sward, on which numerous herds of buffaloes and several kinds of deer find abundant pasture.

The fourth region is the valley of the Mackenzie River. It comprehends the country between the sterile region and the Rocky Mountains north of Lake Athabasca. The river generally runs through a bottom, rarely more than a few miles wide, whose alluvial soil is in many places covered with trees of moderate height. Towards the Barren Grounds the surface rises rapidly into high hills, which in many places attain 1000 and even 1500 feet of elevation, and frequently run parallel to the course of the river. White spruce-trees grow at the base of these hills as far as 68° 30' N. lat., north of which they become very stunted and straggling, and soon disappear. The delta of the Mackenzie, which is 90 miles in length (from 67° 40' to 69° 10' N. lat.), and from 15 to 40 miles in width, is formed by flat alluvial islands, which divide the various branches of the river.

Numerous large rivers traverse this extensive country. The most important of those on the east side of Hudson's Bay and James's Bay may be here named. These are—Great Whale River, East Main River, Rupert's River, and Harrecannane River. Most of the rivers on the east, like those in the south and west, issue from, or in some part of their course expand into lakes. Two very important rivers, on account of their situation, are the *Moose* River and its affluent the *Abbittobe*. Both issue from lakes situated on the high ground which separates Canada from the territories of the Hudson's Bay Company, and at no great distance from the upper branches of the *Ottawa*; and they are

accordingly used as the most convenient means of communication between both countries. The *Abbittobe* Lake, which may be considered as the source of the river, is about 60 miles long, and somewhat less than 20 miles broad. The river, which issues from it, runs west, but afterwards declines to the north, falling into the *Moose* River after a course of about 200 miles. The *Moose* River itself rises about 60 miles from the shores of Lake Superior, and falls into James's Bay after a course of about 230 miles.

Between the mouth of the *Moose* River and Cape Churchill are the embouchures of the *Albany* River, the *Severn*, the *Hayes* River, and the *Nelson* River. The *Albany* River runs about 500 miles, and the *Severn* about 250 miles in a straight line. *Hayes* River runs about 220 miles. About five miles from its mouth, on its west bank, stands Fort York, the principal settlement of the Hudson's Bay Company in these countries.

The *Nelson* River is only inferior to the *Mackenzie*; its remoter branches rise in the Rocky Mountains. All the waters which descend from the eastern declivity of that range between 47° and 53° N. lat., unite in two large rivers, the southern and the northern branch of the *Saskatchewan*. Both branches unite, about 420 miles from their source, below Carlton House, and the united river falls into Lake *Winnipeg* after a straight course of above 200 miles more. Lake *Winnipeg* extends from north-north-west to south-south-east between 50° 30' and 53° 50' N. lat., 96° and 99° 25' W. long. It is about 240 miles long, and its breadth varies from 5 to 50 miles. West of it are the two lakes, *Winnipegosis* and *Manitoba*, which together occupy in length nearly the same extent as Lake *Winnipeg*. They are united by the *Waterhen* River, which does not exceed 20 miles in length, and they discharge their waters into *Winnipeg* Lake by *St. Martin's* Lake and *Dauphin* River. *Winnipeg* Lake has its surplus waters carried off by *Nelson* River, which issues from the northern extremity of the lake, and after expanding several times into lakes, empties itself into Hudson's Bay, near the mouth of *Hayes* River, after a course of 350 miles in a straight line. The *Churchill* River, called in its upper course the *Mississippi* and *English* River, rises in *Methye* Lake, nearly 500 miles from its mouth in a direct line, but probably more than 700 miles along the windings of the river. It enters Hudson's Bay west of Cape Churchill. In its course it forms several lakes, on the shore of one of which is *Fort Nelson*. At the mouth of the river is *Fort Churchill*.

The largest river of this country is the *Mackenzie*. Its most southern branch is the *Athabasca* River, which rises on the eastern declivity of *Mount Bronn*, and falls into the western portion of *Athabasca* Lake. [ATHABASCA.] The river which issues from the north-western extremity of the lake is called *Stone* River, but at its confluence with *Peace* River it takes the name of *Slave* River. *Peace* River rises on the western side of the eastern range of the Rocky Mountains, within 300 yards of the *Tacootchesse*, or *Frazer* River, which falls into the Pacific. Within the mountains it is a large stream navigable for boats; it afterwards makes its way through a narrow gorge bounded by lofty mountains covered with perpetual snow. Through the plains it flows in a direct line for more than 300 miles, when it unites with *Stone* River, and under the name of *Slave* River flows first north and then north-by-west to *Great Slave* Lake. This lake extends between 109° and 117° 30' W. long., or about 250 miles from east to west, with an average breadth of 50 miles. Its total area is more than 12,000 miles.

From the north-western corner of the *Great Slave* Lake issues the *Mackenzie* River, which varies in breadth from one to three miles, except in a few places where it is narrowed by rocky hills. It flows first nearly west, declining by degrees to the west-north-west, till it meets *Mountain* River, now more generally called the southern branch of the *Mackenzie*. The remaining course of the *Mackenzie* is north-by-west to the Arctic Ocean, which it enters in 69° 10' N. lat. by several mouths. The division of the main stream into branches commences at 67° 40' N. lat.; the several mouths of these branches are spread over a space of about 40 miles along the shores of the Arctic Ocean. The most western of these branches is formed by the junction of the *Peel* River with one of the minor streams sent off by the *Mackenzie*. *Peel* River rises in about 64° N. lat., 130° W. long., and has a course of about 200 miles before uniting with the branch of the *Mackenzie*. Near 60° N. lat. the *Mackenzie* receives the *Great Bear* Lake River, which brings down the surplus waters of the *Great Bear* Lake. The form of the *Great Bear* Lake is very irregular; its area is about 8000 square miles: it lies between 65° and 67° N. lat., 117° 30' and 123° W. long. *Mackenzie* River, including the *Athabasca* branch, traverses 15 degrees of latitude, and its whole course has been estimated at 2000 miles. *Coppermine* River rises on the western border of the *Barren* Grounds, and finds its way to the Arctic Ocean after a course of about 200 miles. [COPPERMINE RIVER.] About midway between the source of the *Coppermine* River and the head of *Chesterfield* Inlet in Hudson's Bay rises *Back* River, discovered in 1834 by *Captain Back*, who descended it from 108° W. long. to its mouth. In its north-eastern course of more than 300 miles it forms several lakes. Its mouth is in 67° 15' N. lat., and between 95° and 96° W. long.

The climate of the sterile region is much colder than *Greenland* under the same latitude. At *Winter* Island (66° 11' N. lat., 83° 30' W. long.) the mean annual temperature does not exceed 7° Fahrenheit;

the maximum of heat observed is 54°, and the minimum -42°. At Fort Franklin, which is about 230 feet above the sea, and only one degree farther south (65° 12' N. lat., 132° 13' W. long.), but situated in the valley of the Mackenzie, the mean annual temperature is 17°, the maximum of heat 80°, and the minimum -58°. The mean annual temperature at Fort Chippewa, on the banks of Lake Athabasca (58° 43' N. lat.) does not rise above the freezing point, being 30°.

The wealth of the country consists in its animals, particularly rein-deer, musk-ox, moose-deer or elk, bears, wolves, foxes, beavers, otters, and raccoons, which are killed on account of their flesh or for their skins. Water-fowl are very numerous, and the lakes contain an abundant supply of fish.

The native tribes consist of Esquimaux and Indians. The Esquimaux occupy nearly the whole of the sterile region on both sides of Hudson's Bay, and the Indians wander about in the other regions. The southern tribes of the Indians belong to the Crees, but the northern seem to have sprung from another stock. They are divided into small tribes, rarely consisting of a hundred families, and yet each tribe occupies an immense tract of country. As they mainly rely for their subsistence on the produce of the chase, they are frequently exposed to starvation, which diminishes their numbers, or at least prevents their increase. The Europeans in the territory may amount to some thousands. They are either settled in the establishments of the Hudson's Bay Company for the purpose of receiving the furs and forwarding them to the places of embarkation, or they travel through these countries for the purpose of collecting them.

The *North-Western Territory* is a designation which may be applied to that portion of the British possessions which lies to the west of the Rocky Mountains. In the North-Western Territory the Rocky Mountains form two ranges nearly parallel to each other and to the coast, and from 80 to 100 miles apart. The western range is much the lower; the eastern range has some summits which attain an elevation of from 15,000 to 16,000 feet above the level of the sea. Several rivers rise between the two ranges. Frazer River has its sources in the western range, runs southward about 500 miles, and falls into Juan de Fuca Strait. Its course is rapid, but the river is navigable for canoes except where the navigation is interrupted by rapids.

Along the coast the country is mountainous, and opposite Vancouver Island this mountainous character is maintained over a width of about 80 miles, from the mouth of the Frazer River to Smith's Inlet, a distance of about 200 miles. The declivities of the mountains reach the shores of Queen Charlotte Sound, which separates Vancouver Island from the continent. Farther north the mountain groups are more isolated, the breaks being occupied by valleys and inlets, through which numerous streams discharge their abundant waters. The shores are generally high, and rise with a steep ascent frequently to an altitude of from 300 to 700 feet. The climate in the valleys and inlets along the coast is mild and moist, and the vegetation vigorous. The country farther inland, extending to the declivities of the Rocky Mountains, and occupying a width of about 100 miles, is an uneven plain crossed in all directions by rocky ridges of moderate elevation. There are many lakes, some of which are large, and the climate is very humid. Forests of timber-trees of large growth, and dense masses of underwood, cover nearly the whole country. The fur-bearing animals are very numerous, especially beavers and otters. The moose-deer is also abundant. Seals are very common along the whole of the coast. The Hudson's Bay Company have stations on Frazer River and elsewhere in the interior. Salmon, trout, and other fish abound in the rivers, and the natives obtain a great part of their subsistence by fishing. They live in houses, and seem to enjoy more comfort than the tribes east of the Rocky Mountains.

The hunters and traders employed by the Hudson's Bay Company generally cross the Rocky Mountains near the sources of Peace River. In Queen Charlotte Island, which is about 100 miles north from Vancouver Island, gold was discovered to a small extent in 1852. Vancouver Island has been granted by the British government to the Hudson's Bay Company, under certain limitations, for purposes of colonisation. [VANCOUVER ISLAND.]

Labrador was discovered by John Cabot in 1479, and it is probable that his son Sebastian entered and partly surveyed Hudson's Bay in 1512. It was re-discovered by Hudson in 1610. Meanwhile the French had colonised Canada, and thence carried on an active fur-trade with the Indians inhabiting the countries west of Hudson's Bay. In 1668 Prince Rupert sent a vessel, the party on board of which erected Fort Charles on the bank of Rupert's River in James's Bay.

The Hudson's Bay Company, established for the express purpose of procuring furs, was incorporated by Charles II., May 2nd, 1670. This company founded several establishments, and has ever since prosecuted the trade under the direction of a governor, deputy-governor, and committee of management, chosen from among the proprietors of the joint-stock, and resident in London. The company's charter never having been specially confirmed by Act of Parliament, another company entitled the North-West Company was established in 1783 by some parties who considered that all British subjects were entitled to trade in those regions. The jealousy and hostility which arose between the agents of the Hudson's Bay Company and the North-West Company impeded the operations of both parties for a series of

years. In 1821 a junction of the two companies was effected. The terms of the original charter give to the "governor and company, and their successors, the sole trade and commerce of all those seas, straits, bays, rivers, lakes, creeks, and sounds in whatsoever latitude they shall be, that lie within the entrance of the straits commonly called Hudson's Straits, together with all the lands and territories upon the countries, coasts, and confines of the seas, bays, lakes, rivers, creeks, and sounds aforesaid, that are not already possessed by or granted to any of our subjects, or possessed by the subjects of any other Christian prince or state, with the fishing of all sorts of fish, whales, and sturgeons, and all other royal fishes, in the seas, bays," &c. &c.; and the territory was to be holden of the crown "as of our manor of East Greenwich, in our county of Kent, in free and common socage, and not in capite, or by knight's service; yielding and paying yearly to us, our heirs and successors, for the same, two elks and two black beavers, whensoever and as often as we, our heirs and successors, shall happen to enter into the said countries, territories, and regions hereby granted." Under this grant the company state that they "have always claimed and exercised dominion as absolute proprietors of the soil in the territories understood to be embraced by the terms of the grant, and which are more particularly defined in" an "accompanying map, and they have also claimed and enjoyed the exclusive right of trading in those territories." These territories from 65° to 55° N. lat. reach on the west to 105° W. long.; south of 55° N. lat. the boundary stretches in a south-western direction to the Columbia River, about 116° W. long.; the territory extends on the south to 49° N. lat. the boundary-line of the United States, in the western part, and to Canada in the eastern part. Over the remaining part of the continent lying east of the Rocky Mountains, and extending north to the Arctic Ocean, the Hudson's Bay Company obtained by royal licence, May 13th, 1838, the exclusive privilege of trading for a period of twenty-one years from that date. This right of exclusive trading also includes the British territory westward of the Rocky Mountains. The trade of the Hudson's Bay Company thus extends to the Pacific Ocean, and to 141° W. long., where the Russian territory commences. The principal establishment of the company west of the Rocky Mountains is at Fort Vancouver, on the north bank of the Columbia River, 90 miles from the sea, and at the head of ship-navigation. Fort Vancouver consists of an oblong picketed inclosure, 600 feet long by 200 feet broad, containing dwellings, workshops, and granaries, surrounded by an open village, large farms, prairies, and woods, belonging to the company. (Mackenzie, *Voyages from Montreal to the Frozen and Pacific Ocean*; Franklin, *First and Second Journey to the Polar Sea*; Richardson, *Fauna Boreali-Americana*; Captain Back, in the *London Geographical Journal*; *Parliamentary Papers*.)

HUIS, L'. [AIN.]

HULL, or KINGSTON-UPON-HULL, in the East Riding of Yorkshire, a port, a municipal and a parliamentary borough, and a county in itself, is situated in 53° 44' N. lat., 0° 10' W. long., on the left bank of the Humber, and in the angle between this river and the Hull; 53 miles E. from York, and 174 miles N. from London by railway. The municipal borough is governed by 14 aldermen, one of whom is mayor, and 42 town councillors. The population of the parliamentary borough in 1851 was 84,690. The management of the poor of Hull is regulated by a local Act.

Previous to 1296 the town bore the name of Wyke-upon-Hull. For more than a century before this date the town had a good trade in the export of wools and leather, and in the import of wines. In 1296 the name was changed to Kyngeston-super-Hull, by Edward I., who, seeing the natural advantages of the place, had purchased it, and then began the formation of the harbour—thus laying the foundation of the permanent prosperity of the town. From this time the town improved rapidly. In the 27th of Edward I. the harbour was completed, and the town received a charter constituting it a free borough. In the next year a mint was established here by royal ordinance; and in 1316 a ferry was established across the Humber between Barton and Hull for the conveyance of passengers, cattle, and goods. In 1326 the fortifications were finished, and in the reign of Edward III. the town supplied 16 ships and 500 men for the invasion of France, whilst London upon the same occasion furnished only 25 ships and 700 men. At the commencement of the great civil war the magazines of Hull were stored with a large quantity of arms, which the Parliament desired to transfer to London. Charles I. sent the earl of Northumberland to take possession of the town in his name, but the authorities refused to admit him, and they received Sir John Hotham, who was sent as governor by the Parliament. The king soon after (April 23, 1642) besieged the town, but was repulsed after repeated sanguinary contests. During the short period of excitement which attended the downfall of the Stuarts, the town, fort, and citadel were in the hands of the Roman Catholic party. But measures were concerted and acted upon with such decision and promptitude that the governor was taken in his quarters before he had even heard of such

a design. The anniversary of this event is still celebrated by the name of 'the town-taking day.'

Hull is situated in a low level plain about 20 miles from the mouth of the Humber, and is protected in some places from the overflow of the tides by embankments, and in others by an artificial raising of the surface. The general level of the surface of the streets varies from 6 inches to 6 feet below the high-water mark of spring tides; the outfall of whatever drainage there is in the town is interfered with by the flow of the tide, which in all cases has to be shut out by flood-gates. Baths and washhouses have been in operation for some years. The town is lighted with gas.

The oldest and most densely inhabited part of Hull (Old Kingston) is now completely insulated by the Humber on the south, the Hull on the east, and on the west and north by a chain of docks and basins, which occupy the site of the old fortifications. In Souleates parish, which extends northward from the Old Dock, there are some handsome streets, most of which have been laid out within the present century. Still more modern is that portion of the town called Myton, which lies westward from the Humber Dock. A part of the town built along the left or Holderness bank of the river Hull, and called the Garrison-side, is connected with Hull by a bridge of four arches. Of the old fortifications there remain only two forts, by which and several batteries on the left bank of the river Hull the town and harbour are defended. The citadel, which stands on a triangular piece of ground between the Humber, the Hull, and the new Victoria Docks, and has a battery of 21 guns, commands the entrance of the Hull roads and the Humber. It is surrounded by a rampart and ditch, and is occupied by a regular garrison.

The public buildings connected with the trade and commerce of Hull are the custom-house, the dock-office, the pilot-office, the excise-office, the exchange, the chamber of commerce, the post-office, the stamp-office, the corn-exchange, and several banks. The upper part of the pilot-office is used as a telegraph station for signalling vessels in the Humber. The mansion-house is a plain brick edifice, at the rear of which is a court-house: the other law-courts are the county court and the court of venire, in which the recorder presides, for determining civil causes, and which has a jurisdiction over the town and county of Hull. The new jail and house of correction, in Kingston-street on the Humber bank, cost 30,000*l.* The public rooms in Jarratt-street form a handsome structure, and contain a great variety of offices, besides baths, assembly-rooms, a lecture-room, and a well stored museum. The places of amusement are the Victoria Concert Rooms, the Theatre Royal, and the Queen's Theatre. A neat equestrian statue of William III. is in the market-place. The Wilberforce Memorial at the end of Junction-street is a fine fluted Doric column, placed on a square pedestal, and surmounted by a statue of Wilberforce, who was a native of the town. The column with the statue is 80 feet high. There are botanic and zoological gardens in the western outskirts of the town.

The number of places of worship in the borough in March 1851 was 51, containing 36,177 sittings. Of these places of worship 15 belonged to the Church of England, 15 to four sections of Methodists, 8 to Independents, and 4 to Baptists. The number of Sunday schools was 39, with 8112 scholars. Of these Sunday schools 17 were under the superintendence of Methodists, 10 were connected with the Church of England, and 5 with Independents. There were 4 literary institutes, with about 1000 members, and with libraries comprising about 4200 volumes.

Among the educational charities are—the Trinity House school for 36 boys, who receive a nautical education; Cogan's Charity school for 40 girls; and a Roman Catholic Free school. The Free Grammar school, the school-room of which, rebuilt in 1578, is said to be one of the best in England, was founded by Bishop Alcock, a native of Beverley, in 1438. In 1853 it had 90 scholars. The Hull College, a proprietary school founded in 1838, is a handsome Grecian building. The total number of day-schools in the borough in March 1851 was 244, of which 27 were public schools, with 5090 scholars, and 217 were private schools, with 5119 scholars. The general infirmary was commenced in 1782; two wings were added to it in 1840. There are also two dispensaries, a lunatic asylum, and the Hull and East Riding School of Medicine and Anatomy.

The Holy Trinity church is the most ancient in Hull, and is an elegant cruciform structure, with a lofty and beautiful tower springing from the intersection. The nave and chancel have a total length of 272 feet; the breadth of the nave is 172 feet; of the chancel 70 feet; and the length of the transept is 96 feet. The transept is said to be the oldest brick-building, not Roman, in England. The chancel is in the decorated style, and was erected in 1270; the tower was built in 1312; and the nave, which is in the perpendicular style, dates from 1492.

The Charter-house is an endowed institution, which has 57 apartments for the residence of as many poor persons; the Trinity-house, founded in 1366 for the relief of decayed seamen, and the widows of seamen, now occupies handsome and extensive premises in Trinity-lane, with apartments for 12 elder brethren, and a number, not limited, of younger brethren, a separate suite of rooms for widows, a marine school, and a marine hospital.

In former times the chief articles exported from Hull were wool,

woolbells, and leather: the imports were wine, and timber. At the present time the coasting-trade is an important branch of the shipping business of the port. For many years there has been extensive commercial intercourse between Hull and the ports in the Baltic, with the north of Germany, Holland, Belgium, and Denmark. The chief articles imported are timber, corn, iron, wool, flax, hemp, tallow, hides, pitch, tar, rosin, bones, horn, &c.; the exports are principally hardware, and woollen and cotton goods. The industrial establishments of Hull include ship-building yards, rope-walks, and manufactories of canvass, chains, chain-cables, and steam machinery; corn-mills, bone-mills, colour-mills, crushing and oil-mills; steam saw-mills; chemical factories, potteries, tan-yards, sugar-refineries, flax- and cotton-mills, and an organ factory. The Greenland fishery owed its revival about 1766 and its subsequent importance to the mercantile enterprise of Hull, but since 1819 the number of ships engaged in this fishery has been gradually diminishing, and few, if any ships are now sent from this port to Greenland. Of late years Hull has become a principal steam-packet station. Ocean steamers ply regularly between Hull and Newcastle, Leith, Aberdeen, and Yarmouth; also to Antwerp, Bremen, Copenhagen, Hamburg, Rötterdam, and St. Petersburg (?). River-packets and steam-tugs ply between Hull and Gainsborough, Selby, Goole, York, Barton, New Holland, on the opposite bank of the Humber, Thorne, and Grimsby. The facilities of communication by roads and water are numerous; and the town is connected by railways with all parts of the kingdom.

The Old Dock, formed in 1775, is 1703 feet long, 254 feet broad, and 23 feet deep; the wharfs and quays cover an area of above 13 acres. The entrance by the Old Dock basin is 211 feet long and 80 feet broad. The Humber Dock, at the west part of the town, completed in 1809, is 914 feet long, 342 feet broad, and 31 feet deep; the area of the wharfs exceeds 10 acres. The basin by which it opens into the Humber is 434 feet long and 253 feet broad. The Junction Dock, completed in 1829, connects the Old Dock and the Humber Dock. Its length is 645 feet, breadth 407 feet; the locks are 120 feet long, 36 feet broad, and 25 feet deep; the draw-bridges are each 24 feet wide. The Railway Dock near the terminus of the Hull and Selby railway, and the Victoria Dock to the east of the citadel have been recently constructed. The Victoria Dock is one of the largest docks in the town. The amount of customs duties received at the port during 1851 was 353,623*l.* 10*s.* 2*d.* The number and tonnage of vessels registered at the port of Hull on the 31st December 1853 were as follows:—Sailing-vessels, 228 under 50 tons, tonnage 8223; above 50 tons, 223, tonnage 48,438; steam-vessels, 12 under 50 tons, tonnage 291; 30 above 50 tons, tonnage 7418. The number and tonnage of vessels which entered and cleared during 1853 were:—Coastwise, sailing-vessels, inwards, 772, tonnage 56,133; outwards, 854, tonnage 73,847; steam-vessels, inwards, 596, tonnage 95,629; outwards, 603, tonnage 97,693.

The ships and tonnage (inclusive of both sailing- and steam-vessels) employed in the colonial and foreign trade of the port of Hull for the years 1851, 1852, and 1853, are presented in the following table:—

Year.	Inwards.				Outwards.			
	British.		Foreign.		British.		Foreign.	
	Ships.	Tonnage.	Ships.	Tonnage.	Ships.	Tonnage.	Ships.	Tonnage.
1851	1185	295,859	1483	212,709	843	235,781	1081	173,368
1852	1087	285,957	1220	175,775	758	223,260	950	139,193
1853	1107	285,641	1753	269,212	776	217,411	1285	190,591

The declared value of British and Irish produce exported from Hull in 1851 was 10,126,421*l.*; in 1852 it was 9,894,253*l.*; in 1853 it was 10,788,790*l.*

The market-days are Tuesday and Friday: annual fairs are held on the second Tuesday in April, on the 11th of October for horses, horned cattle, &c., and on the following day for toys, pedlery, &c.

(Communication from Hull; Parliamentary Papers.)

HUMBER. [YORKSHIRE.]

HUNDSRÜCK. [GERMANY.]

HÜNFELD. [FULDA.]

HUNGARY. This name has been used sometimes in a more general, sometimes in a more limited sense. Under the denomination of Hungarian Hereditary Dominions were comprehended Hungary proper, Slavonia, Croatia, Transylvania, Dalmatia, and the Military Frontier. The kingdom of Hungary united under the same civil government, as determined after the peace in 1815, comprehended Hungary, Slavonia, and Croatia, to the last of which the circle of Carlsstadt (which previously made part of Illyria), and the Hungarian Littoral, Küstenland, or sea-coast, were annexed in 1822. After the revolutionary movements of 1848-49, Croatia, Slavonia, and the Banat were separated from Hungary: the Küstenland had been previously formed into a distinct district. The kingdom, within its present limits, is bounded N. by Moravia, Silesia, and Galicia; E. by Transylvania and the Bukowine; S. by Serbia and Slavonia; and W. by Styria, Lower Austria, and Moravia. It extends from 16° to 25° 3'

E. long., and from 46° to 49° 34' N. lat. The kingdom is now divided into five districts, which are named from the chief town in each, and of which the area and population, according to the last census, are as follows:—

Districts.	Area in English Square Miles.	Population in 1850-51.
Presburg	13,310	1,612,203
Kaschau	15,210	1,410,463
Grosswardeln	13,619	1,459,119
Buda-Pesth	13,532	1,599,819
Oedenburg	13,664	1,782,658
Total	69,325	7,864,262

Hungary is on all sides separated from its neighbours by natural boundaries. From Presburg to Skalitz it is bounded by the river March, and from Skalitz, by the Carpathian Mountains, which run in a north-east direction to Mount Trojatska, thence eastward, near the frontier of Galicia, and afterwards to the south-east to the vicinity of the Buckowina. From the border of Transylvania the frontier runs, with many great bends, first to the west, and then to the south, to Maros near Soborsin. On the south, from Soborsin to its junction with the Theiss at Szegedin it is divided from the Banat by the Maros, and thence by the Theiss to its junction with the Danube, which thence separates the kingdom from Slavonia; and from Essek to the Styrian frontier the Drave separates it from Slavonia and Croatia. On the west various small rivers divide Hungary from Styria and lower Austria.

Surface, Soil, Climate.—The surface, hydrography, &c., of the kingdom of Hungary are noticed generally under AUSTRIA, EMPIRE OF. The northern and western parts of the kingdom are very mountainous. The Carpathians on the north and east, and the Alps on the frontier south of the Danube, surround almost the whole kingdom like a girdle, and send out numerous branches which cover a large part of the kingdom with elevations varying in magnitude and character. These heights inclose many beautiful valleys drained by large and small rivers, verdant meadows, rich corn-fields, and gardens, yielding a variety of excellent fruit, vineyards many leagues in extent, and vast forests. The Carpathians, which begin at Presburg and sweep round the north and east frontier of Hungary and Transylvania, cover all the country between the 48th and 49th degrees of latitude, and are divided into several groups, distinguished by different names. [CARPATHIAN MOUNTAINS.] The loftiest summits are the Eisthal (8100 Vienna feet), the Lomnitz (8133 feet), the Hundsdorff, Csabi, Wysoka, Mengsdorfer, Hreben (each above 7500 feet), and the great Kryvan (according to Wahlenburg, 7538, and to Townson, 7818 feet.) Of the numerous valleys inclosed in the Carpathian Mountains, the Waagthal (Valley of the Waag) is generally considered the most beautiful, but there are numerous others perhaps equally picturesque; for instance, the Mengsdorferthal, which is distinguished by the grandeur of its forms, its magnificent views, and noble waterfalls. In the Carpathians and in other mountains there are innumerable caverns, some of which are remarkable for stalactites of extraordinary beauty, and in others are found the fossil remains of enormous animals, the gigantic inhabitants of the primitive world. But while the northern and eastern part of the kingdom is covered with mountains, the southern and central portions spread out into vast plains and sandy wastes; such as the Jaszag between the Danube, and the Theiss, the plains of Natron east of the Theiss, and much of the country bordering on the Banat. The Banat itself is physically an extension of the southern part of Hungary, but as mentioned above is now politically separated from it, and annexed to SERBIA.

Nearly the whole of Hungary lies within the basin of the DANUBE; into which all the numerous rivers flow, except the Poprad, which flows in a northern direction. The Theiss, itself a branch of the Danube, is one of the chief rivers, and its basin may be considered as forming a distinct part of Hungary: it is noticed under AUSTRIA, EMPIRE OF, under which article, or DANUBE, the lesser rivers are also mentioned. The Drave, the Raab, the Leitha, the March, the Waag, the Gran, &c. flow directly into the Danube. The Zagva, Sajó, Hernad, Bodrog, Koros, Maros, Temes, &c. flow into the Theiss. Of the lakes the most considerable are,—1, the Platten-see [BALATON], 46 miles long, and from less than 1 to 9 miles broad; 2, Neusiedler-see, or Fertő, which has an area of 120 square miles, but is very shallow, and the water of which is so impregnated with salt and soda as to be quite unfit for use: both of these lakes are in the western part of the country. The Palitsch lake is 14 miles in circumference, and both it and the White Lake, also near the right bank of the Theiss, are strongly impregnated with natron. There are numerous lakes among the Carpathians which are situated from 4000 to 6300 feet above the level of the sea. On the banks of the Danube, Theiss, Drave, and other rivers are extensive marshes which cover 2000 square miles. The Hamag, in Oedenburg, is a quaking bog, 18 miles long and 9 miles broad, and contains some small lakes, or meres. It is overgrown with reeds, rushes, and in many parts with low bushes, and has some little copses of alder and beech. In 1813 a canal several

miles in length was dug through the Hamag, but it was nearly destroyed by inundations in the same year. Many canals have been made in different tracts of Hungary, partly to drain the marahas, and partly for the purposes of commerce.

The only railways in Hungary are the Vienna, Presburg, and Pesth line, which connects these towns, and is continued eastward from Pesth to Szolnok with an extension, not yet completed, to Debreazin, and a short branch southward to Felegyhaza. There is also a short branch from the Vienna and Glognitz railway to Oedenburg, which is to be continued round the foot of the Neusiedler-see to the Danube.

The soil of Hungary is for the most part clayey and sandy. The best and richest mould is in the southern part, on the rivers Koros, Theiss, and Danube: the northern part is in general clayey and often stony. The districts next the Carpathians are the most barren. The climate varies considerably. In the counties nearest the snow-covered mountains it is so cold, and the winter so long, that the snow generally begins in September, and does not melt till May or even June. In the southern parts the air is warm, and the winter short; and the snow seldom lies on the ground more than three or four weeks. Notwithstanding the generally unfavourable opinion of the climate of Hungary, it is said to be on the whole very healthy, and that disorders are neither so frequent nor so fatal as in the neighbouring countries.

In the abundance, variety, and value of its natural productions Hungary excels almost any country in Europe. Corn is the main product of Hungarian agriculture, but in the north there is not sufficient for home consumption, while the south exports to Germany and Italy. Barley and rye are grown in the north; oats everywhere in great abundance; wheat, millet, and maize in the south. Maize is very extensively cultivated. Potatoes are now cultivated to a great extent. Garden vegetables of every kind are of good quality and abundant. More millet is produced than is require for home consumption. Fruit grows everywhere, even at the foot of the Carpathians. There are whole forests of cherry, plum, and chestnut-trees. In the south, lemon and orange-trees blossom the whole summer in the open air, and the fruit ripens perfectly well. No country in the world, France perhaps excepted, produces such an abundance and variety of wines as Hungary; and with respect to quality, aroma, and general excellence, the wine of the Hegyalla district is renowned throughout the world by the name of Tokay. Timber is most abundant, there being in Hungary proper 9,000,000 acres of forests of oak, beech, lime, birch, maple, and pine. Tobacco grows everywhere, except in a few of the colder counties, and is nearly as good and cheap as the American.

The productive land in Hungary (including Croatia, Slavonia, and the Banat, which had not then been separated from it) was thus occupied in 1846:—Arable land, 20,592,410 English acres; pasture, 4,539,571 acres; meadows and gardens, 4,509,131 acres; vineyards, 1,595,913 acres; forests and woodlands, 15,900,970 acres. The grain grown in the same year was, in English quarters:—Wheat, 5,077,460; rye, 4,046,694; barley, 4,775,911; oats, 6,324,242; and maize, 3,394,233.

Of domestic quadrupeds the horned cattle bred on the luxuriant pastures of Hungary are some of the finest in Europe; a race peculiar to the country, of a grayish-white, with large wide-spreading horns, is remarkable for size and beauty. The horses are small and weak, but swift and hardy. Of sheep the number is estimated at above 15,000,000. Great improvements have been made in the breed by the importation of merinos from Spain. Hundreds of thousands of swine are bred in the forests. The markets of Debreazin and Oedenburg are probably the largest in the world for swine and lard. Besides four-footed game of all kinds, the forests are the retreat of bears and of hordes of wolves. Domestic poultry of every kind is extremely plentiful. In the great heath of Debreazin there are millions of geese; turkeys are seen in large flocks, and vast numbers of pigeons, wild and tame, do no little injury to the corn-fields. The standing waters, marshes, and lakes are full of wild-fowl, especially countless flocks of wild geese and ducks. Flocks of bustards, often to the number of 40 or 50, are seen in the extensive plains. There are various species of birds of prey, the eagle, the vulture, falcon, &c.

The mineral treasures of Hungary entitle it to the name of South America in miniature: Beudant, Von Humboldt, and other scientific travellers have noticed the striking analogy between the two countries. It has metals of every kind except tin; and very considerable quantities are annually obtained of copper, lead, and iron; gold, silver, antimony, and quicksilver are also profitably worked. Hungary produces likewise a great variety of precious stones, such as amethyst, agate, jasper, opal, Hungarian diamonds, garnets, &c. The more useful mineral products are coals and salt, of which very large quantities are obtained. The country abounds in mineral springs; the number is said to be about 300, many of which are highly celebrated, and much frequented for their medicinal virtues.

The Hungarians have not yet attained to any degree of eminence in manufactures. But the inland trade of the kingdom is very active, and the foreign commerce of great importance. The exports consist of the natural produce of the kingdom; the imports chiefly, though not entirely, of manufactures (of which woollens, cottons, silks, and linens make one-half of the whole imports), and some foreign luxuries. The value of the exports is said to exceed that of the imports by about a third.

Divisions, Towns, &c.—Hungary was, until the last few years, divided into four circles, which were subdivided into 46 counties. It is now divided into five districts, Presburg, Kaschau, Grosswardein, Buda-Pesth, and Oedenburg, which are subdivided into 45 counties. The circles are named after their capitals: of these BUDA, OEDENBURG, and PRESBURG are noticed under their titles; Kaschau and Grosswardein, with some of the other more important towns of Hungary, we notice here. It is necessary to observe however, in reference to the population here given, that the estimate usually includes what are called the suburbs; but these often really comprise the neighbouring villages which are connected with the market-town.

Grosswardein is situated on the left bank of the Sebes Koros, in 47° 1' N. lat., 21° 54' E. long.: population, with the suburbs, about 19,000. The town itself is strongly fortified. The chief buildings are the cathedral and churches; there are a gymnasium, a royal academy, and national and other schools.

Kaschau, or *Kassa*, is situated on the right bank of the Hernad, in 48° 37' N. lat., 21° 17' E. long., at an elevation of 1060 feet above the level of the sea; with the suburbs it contains above 20,000 inhabitants. It contains several fine buildings, the principal being the Elizabeth-pfarrkirche, erected about the middle of the 14th century, and much the finest gothic church in Hungary, two or three other ancient churches, a court-house, gymnasium, theological school, a royal academy with museum and extensive library, &c. A small tributary of the Hernad, which flows through the town, forms in the central square an island, upon which stands a statue of John Nepomak.

At Arad, on the right bank of the Maros, on the southern border of the kingdom, population with suburbs 14,000, is a busy commercial town, having a considerable trade in corn, the principal cattle-market of the kingdom, and a large tobacco manufactory. It contains a gymnasium and other schools, and is the seat of a Greek bishopric. *Bacs*, the chief town of the county of Bacs, stands on a tributary of the Danube, 160 miles S. by E. from Buda-Pesth, and contains 3000 inhabitants. *Baja*, on the left bank of the Danube, 90 miles S. from Buda, population 14,500, contains a castle, Roman Catholic, Greek, and Protestant churches, a Jews' synagogue, several schools, &c. The market for swine is a very large one. *Bars*, or *Barsch*, 60 miles S. by W. from Buda, is situated on the Gran, which divides it into Old and New Bars. It is the mart of a rich corn and fruit district, but has much less trade than formerly. *Bekes*, at the confluence of the two branches of the Koros known as the Black and the White Koros, population 15,000, formerly a fortified town, has now a considerable corn and cattle trade. *Beregh*, or *Bereghazasz*, the capital of Beregh county, Upper Hungary, is a town of little consequence. *Bihar*, 8 miles N. from Grosswardein, population 3000, is a place of some local importance. *COMORN*, or *Komorn*. *Csaba*, 7 miles S.S.W. from Bekes, is noticeable as the largest village in Europe: it contains 23,000 inhabitants; Roman Catholic and other churches and schools; and has a considerable trade in grain, fruit, wine, hemp, flax, and cattle. *Csongrad*, at the confluence of the Koros with the Theiss, is a well-built and was once an important town, but has greatly declined. *DEBRECZIN*. *ERLAU*. *Felegyhaza*, about 60 miles S.E. from Buda-Pesth, population 17,000, has extensive cattle, corn, and fruit markets, and a large trade in wine. *Földvár*, population 9000, on the right bank of the Danube, is the first stopping-place below Buda-Pesth of the steamers which ply on the Danube: it is only noted for its sturgeon-fishery. *FÜNFKIRCHEN*. *GRAN*. *Güns*, 12 miles S. by W. from Oedenburg, population 6000, is almost wholly inhabited by Germans, and is the centre of an old German tribe called Hienzen. The town is famous for a remarkable and successful defence made against the forces of Sultan Solyman the Magnificent in 1532: it retains now little of its ancient fortifications besides the old castle. Some silks and woollens are made here. It contains Lutheran and Roman Catholic churches, a gymnasium, and an orphan asylum. *Jasz-Beregy*, on both sides of the Zagya, 37 miles E. from Buda-Pesth, population 17,500, has markets for cattle, horses, and corn. The principal buildings are the churches, convents, a gymnasium, town-hall, &c. In the centre of the town is a marble obelisk: a tomb is pointed out as that of Attila. *Ketzemet*, 50 miles S. by E. from Buda-Pesth, population 42,000, contains several churches, gymnasias and other schools, a school of arts, an orphan asylum, an hospital, and other benevolent institutions. It has five yearly markets: its cattle market is the largest in the kingdom. The breeding of cattle and horses is largely carried on in the district. A great deal of wine is made; there are extensive soap factories and tanneries. *Kremnitz*, an important mining town, lies in a deep valley, 8 miles W. from Neusohl: population, 6000. It contains a castle, churches, a mining hospital, and a mint. Smelting-works, paper-mills, and vitriol, vermilion, and earthenware works are in its immediate vicinity. *Miskolcz*, at the foot of the beautiful valley of Dics-Gyor, 25 miles N.E. from Erlau, population 28,000, contains several churches, a synagogue, schools, &c.; has a large trade in wine, and is the market-town of a mining district from which iron of fine quality is obtained. *Mohacs*, on the western arm of the Danube, 25 miles below Baja, is a station for the steamers. It contains a castle, the summer residence of the Bishop of Fünfkirchen, several churches,

and a gymnasium. *Newháuel*, population 6500, on the right bank of the Neutra, and on the Pesth and Vienna railway, is not now a town of much consequence. It was formerly a strongly-fortified place, and noted for having been several times besieged and taken both by Christians and Turks. No traces of the ancient fortifications remain. *Neusatz*, on the left bank of the Danube, opposite Peterwardein, with which it is connected by a bridge of boats, population 20,000, is a modern town, having been founded about 1700. Owing to its convenient situation on the Danube it is a busy and flourishing place, but contains little of general interest. *Neusohl*, or *Besztercebanya*, population 6500, or with the suburbs 10,000, on the right bank of the Gran, about 85 miles N. from Buda-Pesth, is the finest town of the principal mining district of Hungary. It contains a bishop's palace, a Roman Catholic and a Protestant gymnasium, smelting-houses, and the ruins of an ancient castle. *Neutra*, or *Nyitra*, population about 6000, or with the suburbs 20,000, stands on the right bank of the river Neutra, about 50 miles E.N.E. from Presburg. It is one of the oldest towns in Hungary; and with the ancient castle, cathedral, and bishop's palace, which are seated on a rocky eminence overlooking the river, has a very picturesque appearance. *Nyir-Egyháza*, 30 miles N. from Debreczin, population about 16,000, contains Roman Catholic, Lutheran, Reformed, and Greek churches, and has some salt and soda works. *Paks*, on the right bank of the Danube, 60 miles S. by W. from Buda, population 9000, contains Roman Catholic and Lutheran churches, and is a place of some trade. *Raab*, on the right bank of the river of the same name, near its junction with the Danube, about 45 miles S.S.E. from Presburg, population 18,000, is a steam-boat station and a place of considerable trade. It contains a cathedral, several churches, a gymnasium and other schools, and government tobacco manufactories. *Rosenau*, on the Sajó, is a mining town, situated in the midst of remarkably fine scenery: population, 7000. It is the seat of a bishopric; contains several churches, convents and upper and popular schools; and carries on manufactures of linen and woollen cloths, earthenware, leather, &c. *Saros-Patak*, on the right bank of the Bodrog, 35 miles S.E. from Kaschau, population 6000, is the seat of a celebrated Calvinistic college. *Schemnitz*, or *Selmeczbánya*, about 65 miles N. by W. from Buda-Pesth, the chief town of the mining district, is situated in a mountain gorge, and with its suburbs, or rather connected villages, contains 22,000 inhabitants. Here is a noted mining academy. *Stuhlweissenburg*, 38 miles S.W. from Buda-Pesth, population about 5000, or with the suburbs 20,000, is the seat of a bishopric, and contains a few fine buildings; but is situated in a low boggy site, and is an ill-paved and dirty place. The cattle-markets are very large; and there are manufactures of leather, woollens, &c. *Szathmar-Nemethi* is situated on the right bank and on an island in the river Szamos, 60 miles E.N.E. from Debreczin: population, 15,000. It contains a cathedral, a Roman Catholic collegiate school, and three or four churches. A good deal of wine is made in the vicinity. *Szarvas*, on the left bank of the Koros, 33 miles N.W. from Csaba, population 14,000, contains two or three churches, and upper and popular schools. *Szegedin* occupies a low site on both banks of the Theiss, at its confluence with the Maros: population, 84,000. The old town, or central town, in which are the residences of the merchants, is on the right bank of the Theiss; the new town is on the opposite bank, and is connected with the old town by a bridge of boats. There are several churches, convents, and schools, an old Turkish fortress, a theatre, town-house, very large market-place, &c.; but the streets are ill paved and lighted. Szegedin is one of the most active commercial towns in the kingdom. It exports wine in considerable quantities, corn, seed, tallow, &c.; and imports manufactured goods from Vienna and various German towns. Its manufactures are woollen goods, leather, soap, and tobacco. It is also celebrated for the construction of the boats and floating-mills employed on the Hungarian rivers. *Szentia*, on the right bank of the Theiss, 35 miles S. from Szegedin, population 14,000, has a market of some local importance, but is chiefly noted as the scene of a great victory gained in 1696 by Prince Eugene over the Turks. *Szentes*, near the left bank of the Theiss, 40 miles N. from Szegedin, is another market-town of local importance only. *Szolnok*, on the right bank of the Theiss, 40 miles N. from Szentes, is a place of some trade, and contains 12,000 inhabitants. *Tata*, or *Dotis*, near the right bank of the Danube, 13 miles N.E. from Comorn, population 9000, contains an old castle, an ancient church, and a residence of Count Esterhazy, where is a celebrated wine-tun, which contains 34,700 English gallons, and is generally filled with fine Hungarian wine. *Theresianopol*, *Maria Theresienstadt*, or *Szabadka*, about 27 miles S.W. from Szegedin: population, with the suburbs, about 40,000. The public buildings are, several churches, convents, upper and popular schools, a town-hall, and extensive barracks. There are manufactures of linen, tobacco, and leather; and large markets for the sale of horses, cattle, sheep, hides, wool, and grain. *Tirmau*, 30 miles N.E. from Presburg, population 7000, is celebrated for a large and well-filled wine-tun. The town is locally known as Little Rome, on account of its numerous churches and convents. *Vasarhely*, the name of two large straggling towns: *Hold-Mező-Vasarhely*, on Lake Hodos, 16 miles N.E. from Szegedin, population 26,500; and *Somló-Vasarhely*, on the Torna, population 25,000. In both towns the inhabitants are mainly dependent on the

wine and tobacco trades. *Waizen*, on the left bank of the Danube, 21 miles from Buda-Pesth by the Presburg railway, is an episcopal city with 12,000 inhabitants. It is divided into three quarters—one occupied by Roman Catholics, another by Protestants, and the third by Raitzen, or members of the Greek Church. Waizen is one of the oldest towns in Hungary, and contains Roman and other antiquarian remains. The chief modern building is the cathedral erected in 1777, and rendered conspicuous at a distance by its lofty dome. *Wesprim*, or *Veszprém*, also the seat of a bishopric, is about 27 miles W.N.W. from Stuhlweissenburg: population, 9000. The bishop's residence occupies the summit of a steep eminence, once the site of one of the most important fortresses in Hungary. A minaret, the only relic left of the former Turkish possessors of the town, is now used as a watch-tower against fire. Near the town is a round templar or baptistry church. *Zombor*, near the left bank of the Danube, and on the Franzens or Bacsér Canal, 30 miles N. by W. from Bacs: population, with the suburbs, 21,000. It has some trade in corn and cattle, and manufactures silk goods.

Government, &c.—The Constitution of Hungary, previous to the insurrection of 1848, was called a limited monarchy, of which it had indeed all the forms, but aristocracy was predominant. The diet consisting of the Catholic prelates, the magistrates, the representatives of the inferior nobles, and the representatives of the towns possessed considerable power. These classes called themselves the nation, and treated the peasantry as an inferior race, whose business it was to pay all the taxes (the nobles, about 350,000 in number, being exempt), and to bear all kinds of burdens. After the suppression of the revolutionary movements, the government was placed on nearly the same footing as in other provinces of Austria. The vassalage of the people and the feudal privileges of the nobles, which were abolished during the supremacy of the popular party, have not however been re-established.

There is perhaps no country of the same extent which contains such a variety of nations as Hungary. The Magyars, or proper Hungarians, are originally an Asiatic people; there are also Wallachians, Armenians, Germans, Italians, Jews, Servians, and a medley of tribes distinguished by names not easily accommodated to English orthography or English pronunciation; Rusniaks, Slovacs, Croats, Wendians, improperly called Vandals (these four and the Servians are of Slavonian origin). The inhabitants, except the Jews, are all Christians. The Roman Catholic religion is predominant; but Joseph II. established complete toleration, and his successors went much farther, and placed the other Christians on an equal footing with the Roman Catholics, so that all enjoy by law equal religious liberty, though not perhaps with equal security. The Roman Catholics, in 1846, and consequently before the division of the kingdom, numbered 6,086,280. The members of the Greek Church are divided into United (that is, such as have joined the Roman Catholics, and are often blended with them) and the Not-united: the former numbered about 605,800, the latter 725,700. The Protestants were returned as—Lutherans 220,400, Calvinists 858,300, but there is little doubt that these numbers are much under-stated. Jews are returned as 265,820. The Roman Catholic have three archbishops of Colocza, Erlau, and Gran, and several bishops. The United Greeks have four bishops. The Not-united Greeks have an archbishop and bishops. The Protestants have no bishops, but are governed by superintendents and synods.

With respect to education Hungary is in a backward state, though there are schools in every parish. The public provision made for the education of the people (including however the provinces since separated from Hungary) was as follows in 1846:—A university at Pesth, 8 schools of art, 21 lycœums, 28 grammar schools, 17 schools of philosophy, 95 gymnasia, 40 special, and 12 general schools—in all 222 upper schools. There were popular schools in every parish or district, but the total number is not given. The higher classes of Hungarians are highly educated and polished men, and in general remarkably well versed in foreign languages.

History.—The oldest known inhabitants of the country were the Pannonians. In the year 377 the Huns established a power here, which was vastly increased under Attila, but was overthrown in 489 by the Goths and Gepids. These yielded in 526 to the Lombards; and when the latter removed to Italy, in 568, the Avari entered, who extended their dominion to Bavaria, but were conquered and compelled to embrace Christianity by Charlemagne. In the 9th century the Magyars, originally a people from central Asia, penetrated into the country, and conquered it in ten years. Their chiefs divided the country among them: Arpad, their leader, took half for his own share; the remainder was divided among the inferior chiefs and their followers, and the ancient inhabitants became slaves. Arpad's grandson Geysa embraced the Christian religion, and his son Stephen, the last duke, assumed in the year 1000 the title of king, and added Transylvania to the kingdom. Ladislaus I. and Colomann subdued Transylvania and Croatia, and, after many wars, Dalmatia; Bela II. obtained Bosnia; Emerich, Servia; and Andrew II. and his son Colomann, Galicia. The family of Arpad became extinct in the male line in 1301. In 1310 Charles, brother to Louis IX. of France, was crowned king of Hungary, which he raised to a high degree of splendour. Charles having married a sister of Casimir, king of Poland, Louis, one of his sons, succeeded to that kingdom in 1370. This prince, who is called Louis

the Great, reigned from 1342 to 1382, and his united kingdoms extended from the Baltic to the Adriatic. On his death Poland and Hungary were again separated, and internal troubles broke out. Sigismund, who reigned from 1386 to 1437, lost almost all the annexed dominions; the Turks approached the frontiers, and took part in all the intestine broils. Under Ladislaus V. and VI. these powerful enemies were successfully resisted by the brave John Hunyades, whose son Matthias I. was made king in 1458. He proved a very able and fortunate monarch: he brought under his dominion Moldavia, Wallachia, Moravia, Silesia, Lusatia, and great part of Austria, forming an empire of 256,000 square miles in extent, about equal to the present Austrian empire. After his death in 1490 the kingdom fell to pieces; civil commotions and bad government made it an easy prey to the Turks; and Louis II. lost his crown and life in the fatal battle of Mohacs, which so weakened the Hungarians that they were unable for 160 years to free their country from the Mohammedans. Ferdinand I. of Austria, who had married the sister of Louis, being raised to the throne, the strength of Austria was indeed added to that of Hungary, but he was obliged to leave Ofen and the finest part of Hungary in the hands of the Turks, who were not expelled till 1686. This was partly owing to the unpopularity of the house of Austria, whose despotic habits and religious intolerance were most distasteful to the Hungarian nobles. Hence arose continued disputes, and frequent insurrections, in which the insurgents even went so far on some occasions as to call the Turks to their aid. This was done by the celebrated leader Tekely, who with his allies had nearly got possession of Vienna in 1688, which was chiefly indebted for its preservation to the Poles under John Sobieski. The treaty of Carlovitz, 1699, delivered Transylvania and Hungary from the Turkish yoke. The fatal civil wars and insurrections ceased in 1711, and the house of Austria has since remained in possession of the country.

In 1848-49 however the Austrian sovereignty was seriously imperilled. For some years a powerful national party had been organised and an active opposition maintained in the diet, chiefly under Count Szecheny, while patriotic feelings had been by every possible means stimulated throughout the country. The Austrian government had in vain endeavoured to repress the movement, and the diet of 1847-48 opened with more of hope and energy than ever on the part of the national party. Louis Kossuth, the avowed leader of the more advanced liberals, had been returned as representative for the county of Pesth. The Austrian government appeared inclined to conciliate the Hungarians, and the emperor gained great popularity by opening the diet by a speech in the Magyar language. The proceedings of the diet were however soon interrupted by news of the successful revolution in Paris, which created intense excitement, and was speedily followed by a large increase of the popular demands. The emperor yielded to most of the earlier popular requirements. A Hungarian ministry was formed, and various liberal measures passed the diet and received the royal assent. These measures formed Hungary and Transylvania into one kingdom, established an annual diet indissoluble by the king, very largely extended the suffrage, created a national guard, abolished all feudal privileges, and made numerous other concessions to the popular will. But they contained in them the germ of future mischief. With the intense feeling of nationality which always appears to render the Magyar blind to everything but the dominance of the Hungarian name and race, proposals had been made, which, if fully carried out, would have rendered Croatia and Slavonia subordinate to Hungary, and the use of the Magyar language necessary in all official communications. The Croats and Slavonians assembled and denounced the measures of the diet, and declared their determination not to obey the orders of the Hungarian ministry; at the same time they demanded from the emperor that Croatia, Dalmatia, and the Slavonian counties [SERBIA] should be united into a province, with a diet and ministry of its own. From protests and votes, they soon passed to action; an army was formed, and under their Ban, Jellachich, proceeded to invade Hungary, whose regiments were at this time in Italy. The Hungarian people freely supplied money, volunteers offered themselves abundantly, the government raised troops, and found excellent commanders in the numerous Polish officers who proffered their services. The Emperor of Austria issued a proclamation ordering the Croats to retire to their own country; but their leader had good reason to question the sincerity of the command, and did not hesitate to disobey it. The policy of the emperor was to play off the races against each other: dreading the strength of both, he wished to weaken both. As soon as he felt himself strong enough he threw off the mask. A royal commissioner, Count Lemberg, was sent with orders to dissolve the diet, and assume the direction of affairs. He was about to enter Pesth for this purpose when the populace, excited almost to frenzy by the speeches of their leaders, set upon him as he was crossing the bridge between Buda and Pesth, dragged him from his carriage, and assassinated him. From this time all hope of reconciliation may be said to have passed away. The Hungarian ministry resigned its functions, and a Committee of Defence was established to carry on the government, with Kossuth as its president. Their military proceedings met on the whole with remarkable success. On the abdication of Ferdinand, the Hungarian diet passed a resolution refusing

to acknowledge the right of the new emperor to the sovereignty of Hungary, and declaring that no allegiance was due to Francis Joseph until crowned with the consent of the nation. But the Austrian councils were now directed by men of firmer resolves; and the reply was a manifesto announcing the emperor's determination to reduce the revolted provinces by force of arms. Windischgratz marched into Hungary at the head of a large Austrian army, before which the Hungarian forces were fain to retreat. The diet now adopted the resolve of sending a deputation to the Austrian camp to treat for peace. The deputation headed by the patriotic Count Louis Batthyany accordingly went, but instead of treating, Windischgratz seized them as traitors. Buda-Pesth was occupied by the Austrians (Jan. 3, 1849), and the diet removed to Debrecsin. The war went on with varying success, but dissension broke out among the Hungarian leaders both in the council and the camp. General Görgei, who was appointed to the command of one of the most important divisions of the patriotic army, openly censured the proceedings of the national government in addresses to his troops. The chief command of the army had been given to a Polish general, Dembinsky, to the great annoyance of the superior Hungarian officers, a majority of whom refused to serve under him. Dembinsky was accordingly deposed by a council of officers. The government was too weak or too infirm of purpose to crush this insubordination. Kossuth repaired to the camp, but instead of insisting on obedience to the government, he succumbed to the decision of the officers, and nominated General Vetter as commander in the place of Dembinsky. Vetter however was soon made to give way to Görgei. These internal disputes were paralysing the movements of the main body, and might have been fatal, had not a renewal of strength been brought by the courage and the successes of the troops commanded by Damyanics; and when they joined, a great battle was fought at Szolnok, on the Theiss, followed by others at Hatvan, Becake, and Issaszeg, in which the Austrians were wholly defeated. In Northern Transylvania the Hungarians, under the Polish general Bem, met with brilliant successes, not only defeating the Austrians under General Lüdgers, but driving out also the Russian auxiliaries under Puckner. The Emperor of Austria having published the outline of a constitutional charter by which the whole Austrian empire was to be rendered 'one and indivisible,' and Hungary reduced consequently to a mere Austrian province, with the loss of all its long-cherished and peculiar privileges, Kossuth proposed to the diet to declare the independence of Hungary. His proposition was carried at once; and on the next day, April 14th, 1849, Hungary was declared to be an independent state, and Kossuth was chosen to be president of the provisional government, which was to conduct affairs until the future form of government should be decided on.

The declaration of independence was received with disfavour by the Hungarian officers, and does not appear to have been welcomed by the army generally or the great body of the people. It brought matters to a crisis. The army after a series of successes advanced to Buda, which after a short siege was stormed and taken. The government, with the diet, returned to the ancient capital. Görgei, notwithstanding his insubordination, was not only maintained in the supreme command of the army, but appointed minister of war. Availing himself of his additional power he removed from their commands Dembinsky, Guyon, and other foreign officers, with such of the native officers as were known to be attached to the government. He then pronounced against the declaration of independence. His retention as commander-in-chief and minister of war was of course incompatible with the maintenance of the government. Kossuth wished to remove him, but shrunk from the attempt. Resembling Lamartine in the extraordinary power which his eloquence possessed over the popular mind, Kossuth resembled him also in infirmity of purpose. When promptness was most needed he hesitated. When decision alone could avert ruin he wavered. He did so now, and the last hope of Hungarian independence vanished. It may indeed be doubted whether the utmost energy would not now have been too late. For the Emperor of Russia, on the plea that the declaration of independence threatened the dismemberment of the Austrian empire, announced his intention to interfere. A powerful Russian army, commanded by Paakiewitch, crossed the Hungarian frontier, and formed a junction with the Austrians under Haynau. Detached bodies of Hungarian troops in vain attempted to check their progress; and the main body slowly retreated towards Arad, leaving the capital open to Haynau, who took possession of it. The Hungarian army now concentrated in front of Arad, whither the government had removed, Haynau quickly followed, and succeeded in crossing the Theiss near Szoreg, after a hard fought battle in which the national forces, under Bem, were defeated with the loss of more than 10,000 men.

The government now giving way to despair sought to open separate negotiations with the Russian commander; these proved unavailing; and they then offered to invest Görgei with full powers to treat for peace. These he refused to accept; and eventually they resolved to appoint him dictator. Kossuth thereupon issued a proclamation, August 11th, 1849, in which he announced his own resignation of power into the hands of Görgei, and the investiture of the latter with dictatorial authority. Having solemnly 'before God and the people' charged Görgei to do his best to save the national existence, Kossuth fled into Turkey. Görgei immediately concluded the

GEOG. DIV. VOL. III.

negotiation he had already commenced with the Russian commander, by agreeing as governor and dictator to surrender unconditionally. Accordingly, on the 17th of August, his army 24,000 strong, with 150 guns, laid down their arms. Görgei directed the officers of the various garrisons and detachments scattered throughout the country also to surrender; most obeyed, but a few refused. Their resistance was of course unavailing, and the war was virtually at an end. A large number of the officers and soldiers as well as civilians succeeded in escaping into Turkey, where they were hospitably received. Austria and Russia made a united demand that the refugees should be given up to Austria, or at least expelled from Turkey, but the Porte nobly refused to do either, notwithstanding the threats of the Northern powers to use force; and England and France having announced their intention to support the Sultan's determination by sending a fleet, if necessary, the refugees were permitted to remain without further molestation.

In Hungary the suppression of the revolution was followed by a series of trials and executions, attended by circumstances of extreme cruelty. The country has been continued under military rule, until quite recently. All the national privileges have been abrogated, and the people have been subjected to a succession of severe coercive measures. Almost the only permanent benefit which has been secured by the revolution appears to be the abolition of the feudal privileges and distinctions, which have not been reimposed, and are not likely to be, as it is not the policy of the government to restore the power of the nobles.

HUNGERFORD, Berkshire, a market-town and the seat of a Poor-Law Union, in the parish of Hungerford, is situated on the river Kennet, in 51° 26' N. lat., 1° 31' W. long., distant 27 miles W. by S. from Reading, 64 miles W. by S. from London by road, and 61½ miles by the Great Western railway. The population of the town of Hungerford was 2255 in 1851. The living is a vicarage in the archdeaconry of Berks and diocese of Oxford. Hungerford Poor-Law Union contains 21 parishes and townships, with an area of 95,867 acres, and a population in 1851 of 20,131.

The town of Hungerford consists chiefly of one long street, in the centre of which is the market-house. The streets are lighted with gas and paved. Besides the parish church there are chapels for Wesleyan and Primitive Methodists and Independents. Near the church is the Free Grammar school, which in 1851 had 54 scholars, of whom 9 were free. The annual income from endowment is 204 and a house. There are also National schools and a savings bank. A county court is held. The town is dependent on agriculture. The market is on Wednesday. There are four fairs in the course of the year; two of them are sheep fairs. The Kennet is not navigable, but the town possesses water communication by the Kennet and Avon Canal. The river fishery is strictly preserved.

HUNS, HUNNI, the name given by historians to several nomadic Scythian tribes which devastated the Roman empire in the 5th century. These people inhabited the plains of Tartary near the borders of the Chinese empire for several centuries before our era, and were known to the Chinese by the name of Hiong-nu, and also Han. They made many incursions into China, and it was to put a stop to them that the Chinese built their great wall, about two centuries B.C. In aftertimes they became divided into the Northern and Southern Huns. The Northern Huns, defeated by the Chinese about A.D. 93, emigrated westward as far as the Volga, where they met the Alanni, or Alani, another powerful Scythian tribe, which they routed and drove beyond the Tanais, or Don. The Huns then encamped in the plains between the Volga and the Tanais, and as far south as the ridge of the Caucasus, where they remained for more than two centuries. Under the emperor Valens they first crossed the Cimmerian Bosphorus, drove before them the Ostrogoths and Visigoths, and obliged the latter to cross the Danube, when the emperor granted them lands in Thrace. The Huns were joined by numerous other Scythian hordes, and were looked upon with equal dread by the Gothic and Teutonic nations and by the Romans. Their features and general appearance are described by the Roman historians as hideous and repulsive, and their manners as savage in the extreme. ('Amianus,' b. 31.) The Huns being now on the frontiers of the empire, had frequent wars with the Romans, and their incursions were dreadful though not lasting. After the death of their chief, Attila, the various tribes under his sway quarrelled among themselves, and, being attacked by the Goths, were driven back beyond the Tanais. Part of them settled in Pannonia, to which they gave the name of Hungary, but the present Hungarians, or Magyars, came from a different and much later immigration. Under Heraclius many of the Huns embraced Christianity. After that period their name is no longer mentioned in history.

HUNTINGDON, the capital of Huntingdonshire, a market-town, parliamentary and municipal borough, and the seat of a Poor-Law Union, is situated on the left bank of the river Ouse, in 52° 21' N. lat., 0° 11' W. long., 59 miles N. from London by road and by the Great Northern railway. The population of the municipal borough in 1851 was 3882; that of the parliamentary borough was 6219. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Huntingdon and diocese of Ely.

Huntingdon Poor-Law Union contains 33 parishes and townships, with an area of 75,031 acres, and a population in 1851 of 20,994.

The town is connected with the village of Godmanchester by a causeway across the meadows, which in time of floods are overflowed by the Ouse. In this causeway are three bridges: the principal one, over the main channel of the Ouse, is of stone, and ancient; it has six arches. The principal street extends about a mile north-west from the bridge over the Ouse, and contains many respectable houses; it is lighted with gas and paved. All Saints church, rebuilt in 1820, is of the late perpendicular style, but is much mutilated. St. Mary's church has a fine tower in the perpendicular style; the chancel is early English. There are places of worship for Independents, Wesleyan Methodists, and Quakers. The market-place is tolerably spacious; the town-hall is a good brick building, containing court-rooms and an assembly-room. There are a county jail and house of correction, and a borough jail. Among the old structures must be named Oliver Cromwell's house, which is still designated Cromwell House. The trade of the town is principally in wool and corn: the market is on Saturday; fairs are held on the Tuesday before Easter, and on the second Tuesday in May. Patent bricks and tiles are manufactured. There are a small theatre, an old bath in a neglected state, and a race-course; the races are in the beginning of August. The town has an infirmary and dispensary, a savings bank, a literary institution with a museum and library, a county library, National and British schools, Walden's Charity school for boys, Fishborne's Charity school for girls, a Girls school of Industry, and an Infant school. The Grammar school, founded about A.D. 1200 by David, earl of Huntingdon, afterwards king of Scotland, has an income from endowment of 100*l.* a year, with a house for the master. It possesses two exhibitions for the Cambridge University. The number of scholars in 1852 was 67. At this school Oliver Cromwell received part of his education. The Grammar school is attached to St. John's hospital, the master of which is patron of the school. The County school for boys is supported by voluntary contributions.

Huntingdon is on the Ermine-street, and stands near the site of a Roman station. In the year 917 Edward the Elder built, or rebuilt, a castle at Huntingdon, of which traces of the outworks yet remain. In 1645 the king's forces entered Huntingdon after a short resistance, and plundered it. Henry of Huntingdon, one of our ancient chroniclers, and Oliver Cromwell, were born in this town.

HUNTINGDONSHIRE, an inland county of England, situated between 52° 8' and 52° 36' N. lat., 0° 8' E. and 0° 30' W. long. It is bounded N. and N.W. by Northamptonshire, S.W. by Bedfordshire, and on all other sides by Cambridgeshire. The area of the county is 230,865 statute acres, or 361 square miles. The population of the county was 64,183 in 1851. It is in size one of the smallest of the English counties, only Middlesex and Rutland being less.

Surface, Hydrography, and Communications.—Huntingdonshire has no high hills. An elevated ridge enters the county from the south, near Potton in Bedfordshire, and runs northward till it subsides in the valley of the Ouse near Huntingdon. Another elevated tract runs west from the border of Cambridgeshire to Huntingdon, and from thence turns north-west to the valley of the Nene at Wansford, west of Peterborough: to the north and north-east of this ridge the county is comprehended in the great fen district of the lower Ouse, Nene, and Welland.

The principal rivers are the Ouse and the Nene, with their respective tributaries. The *Ouse* touches the border of the county about a mile and a half above St. Neots, and flows past that town along the border to the junction of a stream from the neighbourhood of Higham Ferrers (Northamptonshire); after which it flows in a northerly direction to Huntingdon; thence in an easterly direction to Holywell, on the border of the county below St. Ives; and from thence along the border of the county to Karith, where it enters Cambridgeshire: its whole length within the county or on the border is 23 miles, all navigable. There are several feeders of the Ouse, which are all small.

The *Nene* runs along the border, and has no part of its course within the county. It first touches the county at Elton, below Oundle, whence it flows northward to Wansford; it then turns eastward to Standground Sluice, a little below Peterborough, where it leaves the county. The old channel of the river is only in parts made use of for the navigation. The *Forty-Foot Drain*, or *Vermuden's Drain*, is a navigable cut from the Old Nene, near Ramsey, to the Old Bedford River in Cambridgeshire, which belongs to the system of the Ouse.

The *'Meres'*, Ramsey, and Ugg, are large pools or lakes. Whittlesea Mere was the largest of this class of lakes, covering an area of several square miles, affording excellent sailing and fishing, and much frequented in the summer by parties of pleasure. It has recently been drained and reclaimed for cultivation. [BEDFORD LEVEL.] Ramsey Mere and Ugg Mere are visited by abundance of aquatic wild-fowl. A considerable part of the county is destitute of springs, and is supplied with water from ponds.

The high north road to Edinburgh enters this county on the south-east side between Gaxton in Cambridgeshire and Huntingdon; and passing through Huntingdon, Stilton, and Norman Cross, quits the county on the north-west side. Another road from London, which passes through Barnet and Baldock, unites with the high north road

at Alconbury Hill, between Huntingdon and Stilton. The Lincoln road turns off from the high north road at Norman Cross, and runs by Peterborough into Lincolnshire. A road which branches off from the north road through Baldock, on the border of the county, passes through Kimbolton, where one branch leads to Leicester, and another to Nottingham. There are roads from Huntingdon to St. Neots, Cambridge, Ramsey, and other places. The Great Northern railway enters the county near St. Neots, and proceeds through it past Huntingdon, in a northern direction to Peterborough; its whole length in Huntingdonshire being about 25 miles. The Cambridge, St. Ives, and Huntingdon railway runs from the Great Northern railway at Huntingdon to the Eastern Counties line at Cambridge. A branch from this line runs from St. Ives north-eastward to March.

Geological Character.—Huntingdonshire belongs to the oolite system. The south-eastern part of the county is occupied by the iron-sand, which rises into low hills in Huntingdonshire. The rest of the county, excepting the Fens, and perhaps a narrow strip on the western side of the county, is occupied by the Oxford clay, which forms the separation between the middle and lower assemblage of oolites. The thickness of this formation is probably from 500 to 700 feet: its position is nearly horizontal. On the south-eastern border of the county is some greensand. The hills on the confines of Huntingdonshire and Northamptonshire which overhang the valley of the Nene are of the stonebrash, or forest marble.

Climate, Soil, Agriculture.—The climate of Huntingdonshire partakes of that of the inland counties. The low and flat districts, which are mostly drained fens, are subject to fogs, and not so healthy as the higher parts; but when well drained and cultivated, they become more healthy. Only a very small portion of the surface of the county is unproductive. The soil varies considerably, and may be said to lie in patches of gravel, sand, and clay, intermixed with muddy alluvial vegetable earth, wherever the level of the surface is lowest, and the waters have formerly flowed over it, or stagnated upon it. Peat is found in many spots and dug out for fuel. The clay predominates generally.

Although water abounds, there are not many springs, but the inhabitants are supplied from ponds, rivers, and wells. The farms are mostly of considerable extent. Wheat, barley, oats, beans, rape, and clover are largely raised. Mustard seed is grown to some extent in this county. On the borders of the Ouse and Nene are some very rich meadows.

A great part of the county is in pasture. The county of Huntingdon is rather bare of trees. In the marshy parts willows grow rapidly, and are profitable. Horses are invariably used for the plough. The cows kept for the dairy are mostly of the Yorkshire or Durham breed of short-horns. The sheep are mostly of the Leicester breed. The hogs are of the Berkshire or Leicestershire breeds, with various crosses.

Divisions, Towns, &c.—The county of Huntingdon is divided into four hundreds as follows:—Norman Cross, north; Hurstingstone, east; Leightonstone, west; Toseland, south. There is one parliamentary borough, and county and market-town, HUNTINGDON, including the municipal boroughs of Huntingdon and Godmanchester; and four other market-towns, Kimbolton, RAMSEY, ST. IVES, and ST. NEOTS. Kimbolton we describe here, the others will be found under their respective titles.

Kimbolton, is on the western side of the county, 11 miles W. by S. from Huntingdon, and 68 miles N. by W. from London: population of the parish 1853. The town is pleasantly situated, but is small and unimportant. The church has a tower at the west end surmounted with a lofty spire; it contains some fine specimens of carved wood. The Moravians, Baptists, and Wesleyan Methodists have places of worship. The Grammar and Agricultural school, founded in 1600, had 14 grammar scholars, and 18 agricultural scholars in 1852; a Boys school and an Infant school are supported by the Duke of Manchester. Kimbolton Castle, an ancient stone building, the seat of the Montagues, dukes of Manchester, was the residence of Catherine of Aragon, first wife of Henry VIII., after her divorce: it has since undergone many alterations. Some lace is made in Kimbolton. The market is on Friday, and there are two yearly fairs.

The following are some of the more important villages, with their parish population in 1851, and a few other particulars:—

Alconbury, 5½ miles N.N.W. from Huntingdon, population 967, is situated on the line of the Ermine-street; the church, which is chiefly in the early English style, consists of a chancel and nave, with clerestory and aisles, and has a tower at the west end, surmounted with a spire. There are a chapel for Wesleyan Methodists, and National schools. *Brampton*, 2 miles S.W. from Huntingdon, population 1231, is situated on the river Ouse; the church is a handsome edifice, partly perpendicular, the chancel is decorated, the tower at the west end is of the 17th century. *Buckden*, 4 miles S.W. from Huntingdon, population 1172; the church is a fine specimen of perpendicular architecture: the tower at the west end is surmounted with a handsome spire. Near the church are the remains of the Bishop's Palace. The chief part of the edifice was erected about 1480, by Bishop Rotherham. The Wesleyan and Primitive Methodists have places of worship. There are Endowed, National, and Infant schools. Some fine residences for families are in the vicinity. *Elton*, near the right bank of the river

Nene, 20 miles N.W. by N. from Huntingdon: population, 878. The church has a fine tower, in the perpendicular style. The nave and chancel are of the decorated style. The Wesleyan Methodists have a chapel, and there are Woolley's Endowed school for boys, a school for girls, and a hospital for aged widows. *Eynesbury*, 9 miles S. by W. from Huntingdon, population 1233, is an ancient village close to the town of St. Neots. The church consists of a nave, chancel, and aisles, with clerestory, and a tower on the south side of the chancel. The Free school for boys and girls was founded by the Rev. William Palmer, rector of the parish. *Fenstanton*, 5 miles E.S.E. from Huntingdon, population 1070; the church consists of chancel, nave with clerestory, and aisles; a tower with a broach spire is at the west end. There is a magnificent east window of seven lights, 17 feet wide. There are two chapels for Baptists; National and British schools, an Infant school, and a Free school. *Great Gidding*, 12 miles N.W. from Huntingdon: population, 563. The church is chiefly early English. There are chapels for Baptists and Wesleyan Methodists, and a public school, chiefly supported by Earl Fitzwilliam. *Godmanchester*, population of the municipal borough 2337, a suburb of Huntingdon, forms a part of the parliamentary borough of Huntingdon. The church has a tower and spire of good outline, built in 1625; some parts of the church are late perpendicular. The Baptists and Independents have places of worship. There are a Grammar school for boys, founded in 1561, which had 36 scholars in 1852, a school of Industry for girls, and an Infant school. Godmanchester was for many centuries famed for the goodness of its husbandry. It appears to be the site of the Roman Duroliponte, or Durolipona. *Holywell*, on the left bank of the river Ouse, which here divides the county from Cambridgeshire, 7 miles E. by S. from Huntingdon, population 915; is named from a well at the foot of the hill on which the church stands, to which numerous devotees in former times resorted. The church is chiefly early English; the tower, at the west end, is decorated, the west side has a fine perpendicular doorway. *Sawtry*, 9½ miles N.N.W. from Huntingdon, is in the parishes of Sawtry All Saints, and Sawtry St. Andrew, and the extra-parochial district of Sawtry St. Judith, their populations being respectively 693, 420, and 230. All Saints church is chiefly in the early English style, with a low spire at the west end, but has undergone many alterations. In the church is a good sepulchral brass of a knight and lady, of the date of 1404. St. Andrew's church consists of a chancel, a nave with south porch, and a tower; some portions are early English. There are here a chapel for Wesleyan Methodists, and National schools for boys and girls. *Somersham*, 9 miles E.N.E. from Huntingdon: population, 1653. The church consists of chancel, nave with clerestory, aisles, and a tower at the west end. The chancel is early English, the tower is of the early decorated style. The streets are paved, the cost being defrayed from an endowment left for that purpose. The Baptists and Wesleyan Methodists have places of worship, and there is an endowed National school. Fairs are held in June and November. *Sancton* is on the Nene, 19 miles N. by W. from Huntingdon, and one mile and a quarter from Peterborough: population, 1762. The church, which has a tower and lofty spire, is a fine building in the decorated style; the south doorway is early English. There are a Wesleyan Methodist chapel, and a National school. *Stilton*, formerly a market-town, is on the high north road, 18 miles N.N.W. from Huntingdon: population, 803. The Stilton cheese takes its name from this village, but very little of it is now made here or in the neighbourhood. The church is chiefly of the perpendicular style. There are a Wesleyan Methodist chapel and a National school. *Warboys*, 7 miles N.E. from Huntingdon: population, 1996. The church is a spacious edifice, of various dates. The tower is a very fine early English one; and in the church is a handsome font of the same period. There are National, British, and Infant schools. *Yaxley*, once a market-town, is on the right of the high north road, 15½ miles N.N.W. from Huntingdon: population, 1445. The village is small, and irregularly laid out, but the houses are neatly built, and the situation, on a fine gravelly eminence, is good. The church is a spacious cruciform edifice, of the perpendicular and decorated style; it has a tower and fine crocketed spire with pinnacles and flying buttresses. The Wesleyan and Primitive Methodists and Unitarians have places of worship; and there is an Endowed school. Yaxley is called Takesle in Domesday Book.

Divisions for Ecclesiastical and Legal Purposes.—Huntingdonshire is in the diocese of Ely, and it constitutes an archdeaconry. The county is included in the Norfolk circuit; the assizes and quarter-sessions are held at Huntingdon, where is the county jail. Huntingdonshire and Cambridgeshire form but one shirevalty. By the Poor-Law Commissioners Huntingdonshire is divided into three Unions—Huntingdon, St. Ives, and St. Neots. These Unions contain 87 parishes, with an area of 202,362 acres, and a population in 1851 of 60,085. County courts are held at Huntingdon and St. Neots. The county returns two members to Parliament, and two members are returned for the borough of Huntingdon.

History and Antiquities.—Two Roman stations are considered to have been in this county—Durolipons, or Duroliponte, near Godmanchester; and Durobriva, at Water Newton, on the Huntingdonshire side of the river Nene. Stone-coffins, coins, fragments of Roman pottery, a small urn, and other Roman remains, have been dug up

at various places in the county. Of ancient roads, the Roman Ermine-street crossed the county, from south-by-east to north-by-west, through Durolipons and Durobriva, and nearly in the line of the present north road through Royston. The Via Devana crossed the county, passing from near Cambridge by Durolipons to Ratae, or Leicester.

In the earlier part of the Saxon period this county was included in the kingdom of the Eastern Angles, and is said to have been even then called Huntedunescyre, or Huntendunescyre: it was subsequently annexed to Mercia, and shared the fate of that kingdom. Waltheof, son of Siward, an Anglo-Saxon noble who held the earldom or county and most of the land in it, having married Judith, William the Conqueror's niece, was made by that monarch Earl of Huntingdon. He was afterwards beheaded by the Conqueror's order. The earldom of Huntingdon was successively conferred on Simon de St. Liz, and David, prince (afterwards king) of Scotland, who married Maud, or Matilda, daughter of Waltheof. The earldom is now in the possession of a branch of the Hastings family.

There were anciently two abbeys in the county; one at Ramsey, and one of the Cistercian order at Sawtry St. Judith. There are no remains of the buildings. At Stoneleigh was a small priory of Augustine canons, and a Benedictine nunnery on the site of Hinchinbrook House.

Of the churches, Woodstone had in the tower, before its recent re-erection, some portions of Anglo-Saxon architecture. Alwalton, Bury, Conington, Fletton, Hartford, and Ramsey have some portions of Norman architecture. The tower of Chesterton church is a good specimen of early English, with a fine spire. Upton, Leighton, Bromswold, and Wootton churches have also some fine portions of early English architecture. Elton church is partly of the decorated style; and St. Neots is a fine example of the perpendicular.

In the civil wars of Charles I. Huntingdon was plundered in 1645 by the Royalists under the king's own command. In 1648 the Earl of Holland and the Duke of Buckingham with 100 horse were beset in St. Neots. The Duke of Buckingham forced his way through the Parliamentary soldiers, but the Earl of Holland surrendered without resistance.

Statistics.—According to the Returns of the Census, taken in 1851, it appears that there were then in the county 196 places of worship, of which 96 belonged to the Established Church, 46 to Methodists, 30 to Baptists, and 7 to Independents. The total number of sittings provided was 45,023. The number of Sunday schools was 130, of which 77 belonged to the Church of England, 26 to Methodists, 19 to Baptists, and 8 to Independents. The number of Sunday scholars was 9444. The total number of Day schools in the county in 1851 was 280, of which 95 were public schools with 6631 scholars, and 185 were private schools with 2552 scholars. There were 4 evening schools for adults in the county, with 60 pupils. Of literary and scientific institutions there were 3 in the county with 242 members, and with 1936 volumes in the libraries belonging to them. In 1852 there was 1 savings bank in the county at Huntingdon. The amount owing to depositors on November 20th 1852 was 64,067*l.* 17*s.* 1*d.*

HUNTLY, Aberdeenshire, Scotland, a burgh of barony and market-town in the parish of Huntly, is situated in 57° 27' N. lat., 2° 48' W. long., near the junction of the rivers Bogie and Doveran, and on the road between Aberdeen and Elgin, distant about 40 miles N.W. from Aberdeen. The population of the town in 1851 was 3131.

The town is clean, and lighted with gas, and the streets are generally well built. The principal streets cross each other at right angles, and form at the point of intersection a market-place. An ancient bridge crosses the Doveran, and a modern one the Bogie. Besides the parish church there are chapels for Free Church and United Presbyterians, Episcopalians, Independents, and Roman Catholics. In the neighbourhood are the ruins of Huntly Castle, destroyed in 1594; near which is the modern mansion, Huntly Lodge, the seat of the Duke of Richmond.

HUNTSVILLE. [ALABAMA.]

HURDWAR. [HINDUSTAN.]

HURIEL. [ALLIER.]

HURLEY. [BERKSHIRE.]

HURON, LAKE AND DISTRICT. [CANADA.]

HURRAR, called also HARRAR and ADHARI, is a country with a large commercial town of the same name, in the eastern part of Africa, and situated between Ankober, the capital of Shoa, and the harbour of Burburah.

According to the accounts of the natives of the adjacent countries, the town is so large that it takes two hours to go round it at a quick pace. It is surrounded by a wall of stone and mud, which is about 12 feet high and 3 feet thick, and kept in good repair. There are 5 gates. The houses are generally built of stone and whitewashed, with flat roofs. There are however some few huts resembling those in Shoa. The emir and the principal inhabitants have houses of two stories. There are said to be many mosques within the town, which is well supplied with water from numerous springs in its vicinity. Close to the town is a river called Sambi.

The inhabitants are rigid Mohammedans, and, according to D'Abbadie, there is a law in force which prohibits any white man from entering the town. The principal occupation of the people is that of tilling the soil, which for several miles around is highly

cultivated, producing coffee, wheat, jowari, barley, and a variety of fruits and vegetables. The kaat (a small plant, the leaves of which are said to possess an intoxicating quality) is said to be very abundant. The ground is irrigated by artificial means from numerous springs. Coffee is the most important article produced, of which large quantities are annually exported to the sea-coast, to the ports of Burburah and Zeila, and thence to Arabia. There are weavers, blacksmiths, and gold and silver smiths. The lances made in Hurrar are in high estimation. Kafilas arrive at all seasons. The principal are those which pass between Hurrar and Burburah and Zeila, which two last-mentioned places may be considered as the ports of Hurrar. The March kafila is the largest, and consists usually of 2000 camels. They export coffee, jowari, ghee, ostrich-feathers, gum, myrrh, and wur: the last-mentioned article is like saffron in appearance, and is used by the Arabs as ointment for cooling the body; it is also mixed up with flour and made up into cakes, which are said to be very palatable. They export also to Burburah slaves, both male and female, and receive in return blue and white coarse cloth, Indian piece-goods, European prints, silk, silk-thread, red cotton-yarn, beads, zinc, copper-wire, frankincense, and some smaller articles. There are also annually three kafilas to Zeila. The imports are the same as those from Burburah, but the exports are increased by some articles, as wheat, millet, beans, &c.

Smaller kafilas depart almost every month to Shoa, except during the rainy season. They chiefly export articles obtained from Burburah and Zeila, especially blue cloth, red cotton-yarn, &c.; and receive in return slaves, mules, and horses. Other kafilas trade between Hurrar and Arusi and Chercher, two towns or encampments of the Gallas, situated west and south-west of Hurrar: the articles of export and import are imperfectly known.

The climate of Hurrar is said to be similar to that of Shoa, but not quite so cold. The language bears an affinity to the Amharic, but the Arabic character is used in writing. The ruler of Hurrar has the title of Emir, and the succession is hereditary. He is frequently at war with the Galla tribes.

(*London Geographical Journal*, vols. xii. and xiv.; D'Abbadie, *Letter*; *Transactions of the Bombay Geographical Society*, vol. ii.)

HURSLEY, Hampshire, a village and the seat of a Poor-Law Union in the parish of Hursley, is situated in 51° 1' N. lat., 1° 23' W. long., distant 5 miles S.W. from Winchester, and 67 miles S.W. from London. The population of the parish of Hursley in 1851 was 1532. The living is a vicarage in the archdeaconry and diocese of Winchester. Hursley Poor-Law Union contains four parishes, with an area of 16,200 acres, and a population in 1851 of 2570. The parish church is a handsome and costly building in the decorated style, erected within the last few years at the expense of the Rev. J. Kebble, vicar of Hursley. There are in the village National schools. Hursley Park adjoins the village; the mansion is finely situated, and the park is well stocked with deer.

HURSTPIERPOINT. [SUSSEX.]

HURWORTH. [DURHAM.]

HYDASPES. [HINDUSTAN.]

HYDE. [CHESHIRE.]

HYDRA ISLAND. [GREECE.]

HYDRABAD. [HINDUSTAN.]

HYERES, a town in the French department of Var, situated 11 miles E. from Toulon, on the southern slope of a hill that looks over a beautiful plain covered with plantations of the orange, citron, vine, olive, pomegranate, mulberry, and palm, and terminating in the Mediterranean, stands in 43° 7' N. lat., 6° 7' E. long., and has 9966 inhabitants. It is considered one of the healthiest winter residences in the south of France, being protected by hills from the north-west winds and also from the direct influence of the south-west, which sometimes blows with great violence in this part of the Mediterranean. The interior of the town is not inviting; most of the streets are steep, narrow, and ill-paved; the highest part is covered with rocks and the ruins of an ancient fortress, from which run two massive walls that formerly inclosed the town. On a steep rock in this part stands a curious old church, which has been classed among the historical structures of France. Below it is an ancient chateau, now used as the town-house, which fronts the market-place. Lower down is the principal square, which is adorned with a column surmounted by a white marble bust of Massillon, who was a native of Hyères. The suburbs form the handsomest part of the town; there are several fine houses and hotels, and visitors chiefly reside here. In the suburb of St.-Laurent, on the sea-shore, there is a large establishment for the manufacture of salt. Wine, brandy, perfumes, oil, silk, orange-flowers, and fruits are the chief articles of trade. The isthmus,

which joins the rocky peninsula of Giens to the mainland of the department of Var, lies between two large roadsteads, that of Hyères on the east, and that of Giens on the western side. The roadstead, or Gulf of Hyères, is protected on the south side by the three islands of Porquerolles, Port-Cros, and Levant, which are fortified, and form, with the many rocky inlets near them, the group called *Iles d'Hyères*. There was an ancient town on or near the site of Hyères. Several Roman remains have been found. (*Dictionnaire de la France*.)

HYMETTUS. [ATTICA.]

HYRCA'NIA, a province of the ancient Persian empire, was bounded N. by the Caspian Sea, E. by the Oxus, which divided it from Margiana, S. by the northern offsets of the Montes Sariphi (now Hazari), which divided it from Ariana and Parthia, and W. by a range of mountains called by Ptolemy Koronus, and with the river Charindas formed its limits towards Media. Its boundaries differed considerably at various times. Its proper limits were nearly coincident with those of Masanderan, and its name is supposed to be still preserved in the modern Gurkan or Jorjan, a town to the east of Asterabad. Hyrcania was a plain sloping from the mountains towards the Caspian Sea, and was according to Strabo very fertile, producing grapes and figs; though the land was not much cultivated by the inhabitants.

Previous to the Persian conquest Hyrcania appears to have been subject to the Chorasmii. (Herod., iii. 117.) It formed, together with the Parthi, Chorasmii, Sogdi, and Arii, the 16th satrapy of Darius Hytaspes, and contributed 300 talents. (Herod., iii. 93.) After the dissolution of the Persian empire Hyrcania became subject to the Macedonians; but it remained in their power for only a short time. (Strabo, p. 350.) It appears afterwards to have become independent; since Josephus ('De Bello Jud.' vii. 27) mentions a king of the Hyrcanians in the time of Vespasian, who had possession of the passes through the mountains, which are known by the name of the Caspian Gates.

Strabo informs us that there were several towns in Hyrcania, of which the most important were Talabroce, Samarane (the Samarane of Ptolemy), Carta, and Tape. Arrian mentions ('Anab.' iii. 28) Zadracarta, which (as well as Tape) was probably identical with Carta, as the capital; and Ptolemy gives us as the capital a town Hyrcania, which he places in the eastern part of the province. The principal rivers were the Maxera, the Socana, which is perhaps the same as the modern Gourgaun, the Sarneius (Atrak), the Syderis, and the Charindas.

HYTHE, Kent, a municipal and parliamentary borough, a market-town and Cinque Port in the parish of Hythe, is situated on the south coast in 51° 5' N. lat., 1° 5' E. long., distant 15 miles S. from Canterbury, and 65 miles S.E. by S. from London. The population of the municipal borough of Hythe in 1851 was 2857; that of the parliamentary borough, which includes the towns of Folkestone and Sandgate, with some smaller places, was 13,164. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor, and returns one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry and diocese of Canterbury.

Hythe, so-called from the Saxon word Hyth, a haven, is believed to owe its origin to the decay of West Hythe and Lympne, or Limne (the Portus Lemanianus of the Romans), which are now both inland. It was early a place of importance, being one of the Cinque Ports, and having once had, according to Leland, a fair abbey and four parish churches. The town stands principally at the foot of a steep hill or cliff, which appears to have been on the sea shore when the town was founded, though now about half a mile from it. Hythe consists chiefly of one long street, parallel to the sea, with some smaller ones branching from it, or parallel to it. The town-hall and market-place, rebuilt in 1794, are in the centre of the town. The church, which is situated on the slope of the hill above the town, is a cruciform edifice, partly Norman and partly early English, with a tower at the west end. Under the chancel is a remarkably fine groined crypt. The Wesleyan Methodists and Independents have places of worship. There are in Hythe two hospitals, or almshouses, of ancient foundation, National and Infant schools, a savings bank, a public library and reading-room, a dispensary, barracks, and a small theatre. A county court is held. The market is on Thursday: fairs are held on July 10th, and December 1st. Hythe has numerous visitors during the bathing season. The scenery in the neighbourhood is exceedingly picturesque. Within the last two or three years excavations have been made at Lympne, and many Roman remains discovered, as well as clear traces of the ancient port and town.

HYTHE. [HAMPSHIRE.]

IAXT. [JAXT.]

IBERIA was the ancient name of Spain in use among the Greek writers. The Iberi are said to have occupied also Southern Gaul as far eastward as the Rhone, where they bordered upon the Ligurians. (Strab., Casaub., 166.) They were a distinct race from the Celtes, who at a remote but unknown period had crossed the Pyrenees, and occupied the central parts of the peninsula, and from whose admixture with the Iberi the Celtiberi sprang. The aboriginal Iberi however seem to have retained possession of the south and east parts of the country from the Straits of Calpe to the Pyrenees, until the epoch of the Carthaginian invasion. The Lusitani were probably also of Iberian race. The Aquitanians, who were a distinct people from the Celtic Gauls, are supposed to have been of Iberian extraction. William Humboldt asserts that the Basque language is the remains of the old language of the Iberian race which at one time spread over Spain, Southern Gaul, part of Italy, and the islands of Corsica, Sicily, and Sardinia, and he attempts to prove this by the affinity between the proper names in those countries. [SPAIN.]

Iberia was also the name given by the Greeks and Romans to a country south of the Caucasus, having Albania to the east, Colchis to the west, and Armenia to the south, and corresponding to the central or principal part of modern Georgia. Lucullus and Pompey first carried the Roman arms into Iberia. Eutropius (lib. viii.) says that the king of the Iberi paid allegiance to Trajan, who at the same time gave a king to the neighbouring country of Albania. In the reign of Constantine the Iberians were converted to Christianity by a captive woman. The country of the Iberi is described by Strabo (Casub., 499) as well peopled, and the inhabitants as having made some progress in civilisation. The central part was a plain drained by the Cyrus (Kur) and its branches. The country was reduced to the form of a province by the Persian Sapor. The Georgians, who call themselves *Karkh*, but are called *Virk* by the Armenian historians, are the descendants of these Iberi.

IBRAÏL, IBRAÏLOW, or BRAÏLOW, a large town in Wallachia, is situated on the left bank of the Danube, 15 miles S. from Galatz, 103 miles N.E. from Bukharest, and has about 20,000 inhabitants. It stands nearly opposite the Turkish fortress of Matchin, and is the chief shipping port of Wallachia, whence the corn and other products of that principality are exported. The town has of late years risen rapidly in extent and importance. Its population in 1838 was estimated at only 6000. The harbour, formed by an arm of the Danube, is sheltered by an island. There are extensive granaries and warehouses in the town. Between 600 and 700 vessels enter and leave the harbour annually. Many of the inhabitants are engaged in the sturgeon fisheries of the Danube. In the wars between the Turks and Russians in the 18th century the town was more than once besieged and taken by the Russians, who burnt it in 1770. After the peace of Kutschuk-Kainardji in 1774 the town was strongly fortified in the European manner; but the Russians took it again in 1828, and demolished its defences. It was restored to Turkey by the treaty of Adrianople.

ICARIAN SEA. [ÆGEAN SEA.]

ICELAND (*Ísland*, in the native language), a large island in the North Atlantic, and a colony of Denmark, extends from 63° 24' to 66° 33' N. lat., 13° 25' to 24° 31' W. long. Its shape resembles somewhat that of a heart, with the point turned towards the south. Cape Nord, at its north-west extremity, is about 200 miles from the east coast of Greenland. Its area is 38,200 square miles: the population was estimated at 60,000 in 1850.

The coasts of Iceland, especially the western part, are deeply indented with fiords, or inlets of the sea, which are the estuaries of the rivers which flow from the numerous mountains and glaciers of the interior. The island is crossed from east to west by ridges of rugged and irregular mountains, which run nearer to the south than to the north coast, the longer rivers flowing towards the north. From these ridges numerous offsets branch out in all directions towards the coast, run through the various peninsulas, and terminate in high and steep promontories. Between these offsets in the vicinity of the fiords are fine valleys, in which the inhabitants have erected their dwellings; and many of the low mountains are covered with a coarse grass, which affords summer pasture to their cattle. The best inhabited spots are on or near the banks of the fiords, where factories are built for the purpose of trade and shipping. But the majority of the inhabitants live in detached cottages or farms, a certain number of which constitute a parish, having a church and an incumbent of the episcopal Lutheran communion as in Denmark. The interior of the island is a dreary desert, through which one may travel 200 miles without meeting any trace of human existence. It consists partly of snow mountains called *Jökula*, or *Jökula*, many of which are also volcanoes, and partly of vast tracts covered with lava, scorise, and volcanic sand. There are also several lakes, the largest of which, called *Myvatn*, is about 40 miles round; its banks are barren and

gloomy, and infested by clouds of gnats. The most extensive mass of icy mountains is that called *Klofa Jökul*, in the south-east part of the island, which lies behind another range of mountains that line the coast, and forms a mass of ice and snow estimated to cover no less than 3000 square miles. Magnificent glaciers cover the sides of the mountains, beginning at a great height, and sloping with a very rapid descent towards the plains. These icy masses are often rent by the internal heat and eruptions of the volcanoes, and fall down in terrible avalanches upon the plains. The glaciers present the same phenomena of progressive motion as those of Switzerland, and they deposit their moraines of large fragments of rocks. Vast agglomerations of basaltic pillars are seen in many places, as well as of tufa, and some mountains are covered with thick incrustations of sulphur.

There are numerous boiling springs, such as the Geysers in the south district of the island, which throw up at periodical intervals columns of boiling water to a considerable height. That known as the Great Geyser ejects a column more than 10 feet in diameter, which is estimated by many writers to reach above 200 feet in height; but Mr. Barrow asserts that it never attains 100 feet. The eruptions are preceded by a loud report like that of artillery. The Reykium and the sulphur springs of Krisúvik are near the south-west coast; those of Reykiadal in the west district; and those of Reykiahverf and Krabla in the north. There are also floods or bores of boiling mud, numerous cones and craters of volcanoes now quiescent, and columns of dense smoke and steam issuing from many spots in the immediate vicinity of the Geysers. The whole island appears to be of volcanic formation, and there are still numerous volcanoes in full activity: occasionally eruptions of fearful violence occur, such as that in 1755 from the volcano of Katlegia, near the east coast, which destroyed 50 farms; and one in 1783 of a still more terrible character from the Skeidara and other volcanoes of the Klofa Jökul ridge, which covered several fertile districts with lava, while the ashes and the effluvia corrupted the water and the atmosphere all around, the fishes were driven away from that part of the coast, and famine and pestilence followed, which in two years carried off 9000 people, and destroyed thousands of horses and cattle. The eruptions of Mount Hecla are frequent, but not so violent or destructive: one lasted from the 2nd to the 4th of September 1846, when ashes ejected from it were carried as far as the Orkney Islands. The highest mountain in Iceland is believed to be the Snæfell Jökul, which rises in one of the western peninsulas near the village or factory of Stappen, and was reckoned by early travellers to be 6862 feet high, but by later observations has been reduced to 4600 feet. Mount Hecla has been reckoned at 5210 feet; but according to recent observations it is only 4500, or even 4300 feet. On the southern and western coasts volcanic islands have risen from the sea, some of which still remain, while others have disappeared. In 1783 one rose from the sea on the west coast; it disappeared in the course of a month.

Formerly there were many forests in Iceland, but they have disappeared. The trees that now exist appear stunted in their growth, and seldom rise above 10 feet, and wood has become very scarce. It is alleged, but without sufficient reason, that the climate has become colder, and is less favourable to vegetation. It often happens in the spring that vast masses of floating ice drifted from the coast of Greenland are impelled by the wind and current against the western coast of Iceland, where they do considerable mischief and affect the temperature of the atmosphere. Instances have occurred of icebergs having been stranded of such a size as to have required several years to melt, and which have not only injured the hay harvest by cooling the atmosphere, but have driven away the fish from the coast by chilling and freshening the sea. Polar bears are carried on these masses to Iceland, and commit depredations among the cattle, and even attack men; they are however soon hunted down and destroyed.

It appears that corn was once cultivated to a considerable extent, but the inhabitants now find it more to their advantage to attend exclusively to the rearing of cattle. The number of farms is about 6000: rent is paid either in money or produce. The number of horned cattle in Iceland is estimated at about 40,000; sheep, 500,000; horses, 55,000: about 1,000,000 lbs. of wool are annually exported. Hay is the great harvest of Iceland. Those who live on the coast attend to fishing, which is very productive. There are no manufactures, properly so called; but coarse cloth, gloves, mittens, and stockings, with furniture and other articles required for domestic use, are made. Fancy silver trinkets, displaying considerable ingenuity, are also made by the peasantry. The common food of the people is butter, milk, and fish; fresh meat and rye bread are holiday fare. The *Lichen Islandicus*, or Iceland Moss, is a common article of food. Coffee, wine, and other luxuries are obtained in the factories on the coast, and are used by the wealthier class. The exports consist of cod and other dried fish, whale oil, salted mutton, wool, eider-down, and sulphur, which is abundant. Turf is the common fuel of the inhabitants; fossil wood impregnated more or less with bitumen

abounds on the island, but little use is made of it. Iron and copper are found, but are not worked for want of fuel. The rein-deer, which were at first introduced from Norway, have greatly multiplied, and live in a wild state.

Iceland is divided for administrative purposes into three large fiordunugs, or districts; these districts are divided into syssels, or sheriffdoms, a sysselman being a magistrate and receiver of the king's taxes in each of them. There is a governor-general, called stiftamtman, appointed by the king for five years, who resides at Reikjavik. He has under him two amtmen, or deputy-governors, one for the western, and the other for the northern and eastern districts. The affairs of the island are regulated by the althing, a council composed of 20 members, 1 for the town of Reikjavik, and 1 for each of the 19 syssels.

Reikjavik, the capital, is the only town in Iceland. It contains about 900 resident inhabitants, and is built on the south side of an inlet of the Faxefjord, on the south-west coast of the island. It consists of two streets: one built only on one side, fronting the shore, and entirely occupied by merchants and tradespeople; the other, striking off at an angle from it, contains the houses of the bishop of Iceland, of the tataroed, or president of the supreme court of judicature, of the landfoged, or receiver-general, and other persons not engaged in trade. The house of the governor, the house of correction, and the church, stand by themselves at the back of the town: the church contains a free library of 6000 volumes for the use of the inhabitants. The houses, with two or three exceptions, are constructed of wood, with a storehouse and a small garden attached to them, in which most of the common vegetables, as cabbages, Swedish turnips, small potatoes, and parsley, are cultivated, but they never arrive at any degree of perfection, and in some seasons entirely fail. To the south-west of Reikjavik is the peninsula of Alfanes, adorned with the church and school of Bessetad, and a number of pretty cottages. Gardá, in the same neighbourhood, is the residence of the archdeacon of Iceland; and Hafnarfjord, or Havnefjord, a small sheltered port some distance south of Reikjavik, contains 18 or 20 houses and a dry-dock: the population is about 100. The population of Reikjavik is more Danish than Icelandic.

In the northern district there is a kind of town or village, called Eyafjordur, and a factory, called Husavik, on the Skjalafandafjord, from which sulphur from the neighbouring mines is shipped. Holm has dwindled into insignificance. Other factories are scattered about the coast, especially in the west. These factories generally consist of one or two merchants' houses, with warehouses, and perhaps a shop; and they are built at the most convenient places for shipping the produce of the district, and also for the fisheries.

The Icelanders are the genuine descendants of the old Scandinavians or Norsemen; they are tall, but not generally corpulent, with a florid complexion, flaxen hair, and an open frank countenance. The women are shorter and more inclined to corpulence than the men; a certain degree of beauty is not rare among the girls. Longevity is not common: cutaneous disorders and pulmonary diseases are frequent. Contagious leprosy of the worst kind is indigenous in the country: there are four hospitals for lepers, but they are very inferior establishments.

Elementary education, and even a certain degree of superior information, is very generally spread among the Icelanders. There is a high school, or college, with three professors, at Bessetad, near the capital Reikjavik, in which most of the clergy are educated; but a few visit Copenhagen to complete their studies. During the last century the Icelanders have paid much attention to their early literature; and the Icelandic language and literature have of late years been studied by many scholars in Germany and England, but much more by those of Denmark.

The Icelandic language is the standard of the northern or Scandinavian dialect of the Gothic language: the Swedish, Danish and even the Norwegian, have been more or less subject to the influence of the Teutonic or German branch of the Gothic, whilst the Icelanders have preserved theirs pure as they imported it from Norway in the 9th century. This was the language called Dönsk Tunga in the middle ages, and was called by the Icelanders at first Norræna, which word corresponds to Nairn or Norse, the corrupt dialect spoken till lately in part of the Orkneya. Since the language has been no longer spoken in Scandinavia, it has been styled exclusively Icelandic.

Iceland was discovered in the middle of the 9th century. The first settlement was made in 874 by a Norwegian named Ingolf, who established himself at Reikjavik. He was soon followed by other Norwegians, many of them of distinguished families, who fled from the dominion of Harold Harfagra, tyrant of Norway. They established a republican government, appointed magistrates, and had their annual Althing, or national assembly, which was held at Thingvalla in the south part of the island. A few years back the Society of Northern Antiquaries of Copenhagen published, under the title of 'Islandinga Sögur,' (Historical Monuments of Iceland,) two very curious works on the discovery and settlement of Iceland, by the earliest Iceland historian, a clergyman named Are Thorgillson, surname Frode, or the learned, who lived at the end of the 12th century. The works are entitled 'Islandinga Bok,' and 'Landnamabok,' and enter into very minute details: they were edited by the eminent Danish antiquaries J. Sigurdsson and C. C. Rafn. About the year 1000 Christianity was established in Ice-

land. In the year 1057, Isleif, bishop of Skalholt, introduced the art of writing with the Latin alphabet; the Runic characters having been used till then only for inscriptions on stone, wood, or metal. Oral lessons however had kept up the historical traditions, and the feats of their ancestors were recorded in songs. Icelandic literature began to be cultivated immediately after the introduction of writing. Literary societies were formed for the purpose of mutual instruction and education. The historical compositions called Sagas have been since published, as well as many of their songs and other poetry. In 1120 the Icelanders framed their code of laws called Grágás, which has been published at Copenhagen by F. W. Schlegel. Snorro Sturluson, a native of Iceland, and an extraordinary personage, was one of the writers or compilers of the Edda, and he also wrote a history of Norway. Several monks, especially the Benedictines of the Thingeyra monastery, contributed largely to Icelandic literature. In 1264 the Icelanders, partly through intrigue and partly from fear, submitted to Haaco, king of Norway, on the condition however of their laws and privileges being maintained. In 1387 Iceland, together with Norway, became subject to Denmark. About 1529 the art of printing, and in 1550 the Lutheran Reformation was introduced into Iceland.

ICONIUM. [KONITZ.]

ICULISMA. [ANGOUËME.]

IDA. [CANDIA; TROY.]

IDLE. [YORKSHIRE.]

IDRIA. [KRAIN.]

IDUMÆA, usually called EDOM in the Old Testament, included, in the time of Christ, a considerable portion of the southern part of Palestine, and extended on the south-west as far as the Lake Serbonis (Pliny, 'Nat. Hist.' v. 14); but in the writings of the Old Testament it was used to designate the mountainous district in the north of Arabia which extended from the south of the Dead Sea to the Bay of Ailana in the Red Sea. The country of the Edomites, who were descendants of Edom, or Esau, the son of Isaac, was otherwise called Mount Seir. (Gen. xxxii. 3; Ek. xxxv. 15.) This name it derived from Seir, the patriarch of the Horims, its most ancient inhabitants. (Deut. ii. 12, 22; Gen. xiv. 6; xxxvi. 20.) The Edomites were governed by kings from the earliest times, and appear to have possessed considerable power when the Israelites invaded Canaan. They were defeated by Saul; and were made tributaries of the Jews during the reign of David. The conquest of Edom was of great importance to the Jews, since it enabled Solomon, by obtaining possession of the ports of Elath and Ezion Geber on the Red Sea, both of which were in the land of Edom (2 Chron. viii. 17), to participate in the advantages of the trade with India.

After the division of the Jewish kingdom during the reign of Rehoboam, the Edomites continued subject to Judah till the reign of Joram, when they revolted, and again established their independence. (2 Kings, viii. 20-22.) They were subdued again during the reigns of Amaziah and Uzziah; but in the reign of Ahaz the Syrians seized upon Elath, and drove the Jews out of Edom. (2 Kings, xvi. 6.) Edom, in common with the rest of Syria, appears to have been subdued by Nebuchadnezzar (Jer. xxvii. 2-7); but after the downfall of the Babylonish empire, the Edomites are again mentioned as an independent people, who had obtained possession of the southern part of Judæa as far north as Hebron. (1 Macc. v. 65.) They appear about this period to have been driven from their original settlements between the Dead Sea and the Bay of Ailana by the Nabathæi, the descendants of Nebaioth, the eldest son of Ishmael. The Nabathæi and their capital Petra were known to Greek and Roman geographers and historians. The Edomites were constantly at war with the Jews after the return of the latter from Babylon, till they were entirely subdued by John Hyrcanus, who compelled them to submit to circumcision and to observe the Mosaic law. (Josephus, 'Antiq.' xiii. 9, sec. 1.) From this time the Edomites were regarded as a part of the Jewish nation, and were governed by a prefect appointed by the Asmonæan princes of Judæa. (Josephus, 'Antiq.' xiv. 1, sec. 3.) One of these governors, Antipater, a native of Idumæa, was appointed by Julius Cæsar procurator of Judæa (Josephus, 'Antiq.' xiv. 8, sec. 5); and was succeeded by his son, the celebrated Herod, who afterwards became king of the whole country, and put an end to the dynasty of the Asmonæan princes.

The Idumæans marched to the assistance of Jerusalem when it was besieged by Titus, and entered the city; they did not however continue till it was taken, but returned to their own country laden with plunder. (Josephus, 'Bell. Jud.', iv. 4; vii. 8, sec. 1.) We have no further mention of the Idumæans in history. Origen, in his 'Commentary upon Job,' informs us that the name of Idumæa did not exist in his day; and that the inhabitants of the country were called Arabs, and spoke the Syriac language.

ILCHESTER. [SOMERSETSHIRE.]

ILDEFONSO, SAN. [CASTILLA-LA-VIEJA.]

ÎLE-DE-FRANCE, L', a province of France, forming one of the military governments into which France was formerly divided. It was bounded N. by Picardie, W. by Normandie, S. by Orléanais, and E. by Champagne. It was watered by the Seine and its tributaries, the Yonne, the Loing, the Marne, the Oise, and the Eure. It now forms the departments of Seine, Seine-et-Oise, and Oise, and part of those of Seine-et-Marne, Aisne, and Euro-et-Loir. Paris was its capital.

Le Parisis, or the Île-de-France proper, with large territories annexed to it extending southward to the Loire, was held in the decline of the Carolingian dynasty by a race of powerful nobles, who acted an important part in the history of France. In the year 861 Charles le Chauve bestowed upon his kinsman Robert l'Angevin, otherwise Robert le Fort, "the province between the Seine and the Loire," under the title of the Duchy and Marquisate of France. Robert died in battle against the Northmen, A.D. 866, and was succeeded by his son Eudes, count of Paris, which title he bore in his father's lifetime. He bravely defended Paris against the Northmen, who besieged it, A.D. 885, and compelled them to raise the siege. On the death of Charles le Gros, A.D. 888, Eudes was elected king of France. He was involved in hostilities with his competitor for the crown, Charles le Simple, and died A.D. 898.

On the death of Eudes, his brother Robert became duke of France. He rebelled against Charles le Simple, caused himself to be proclaimed king, and was consecrated at Reims, A.D. 922. Charles however, being supported by the counts of Toulouse and Auvergne, attacked Robert in the plain of Soissons. Robert fell in the battle, but his son Hugues continued the combat, and succeeded in putting Charles to flight. The battle was fought A.D. 923.

Hugues, surnamed le Blanc, otherwise Le Grand, and from his holding several abbeys in commendam, L'Abbé, succeeded his father in the duchy of France. He bestowed the crown on his brother-in-law, Raoul, duke of Burgogne. Upon the death of King Raoul, A.D. 936, Hugues procured the return of Louis IV., son of Charles le Simple, from England, where he had been conveyed by his mother. Louis was only sixteen years old; and Hugues at first virtually exercised the sovereign power, though without the title of regent. Louis having a year after emancipated himself from tutelage, Hugues formed a formidable alliance, which was joined by Otho I., emperor of Germany, against the king. But the rebel lords were after a time reconciled to Louis, A.D. 942, and peace was restored. Hugues subsequently obtained of the king the whole of the duchy of Bourgogne, of which he had previously held a part. Some years afterwards he became involved in new disputes with his sovereign, whom he got into his power, and retained, until compelled to release him by Otho of Germany, who came with an army to his rescue. The war between Hugues and Louis continued till A.D. 953, when the quarrel was made up. Louis died the year after, and Hugues assisted in raising his son Lothaire to the throne. Hugues however possessed the real power of the sovereignty till his death, A.D. 956.

Hugues, surnamed Capet, son of Hugues Le Blanc, was young at his father's death; but by the protection of Richard duke of Normandy, and Brunon archbishop of Cologne, he succeeded in obtaining from the king the investiture of his inheritance, comprehending the duchy of France, the counties of Paris and Orléans, and the abbeys which his ancestors had possessed. He became in effect ruler of the country, and exercised his power in a way to give general satisfaction. The emperor Otton or Otho II., having invaded France, was obliged to retreat, and Hugues attacked his rear-guard, and put it to flight on the banks of the Aisne. King Lothaire died A.D. 966, recommending his son and successor, Louis V., Le Fainéant, to the guardianship of Hugues. Louis died the year after at Compiègne; and his uncle Charles, brother of Lothaire, being unpopular, Hugues assembled his friends, and procured himself to be chosen king of France. Thus the Capetian dynasty replaced the Carolingian. The hereditary domains of Hugues were thenceforth united to the crown.

ÎLE-EN-DODON, L'. [GABONNE, HAUTE.]

ILFORD. [ESSEX.]

ILFRACOMBE, Devonshire, a market-town and sea-port in the parish of Ilfracombe, is situated on the shore of the Bristol Channel, in 51° 12' N. lat., 4° 7' W. long., distant 50 miles N.W. from Exeter, and 202 miles W. by S. from London. The population of the town in 1851 was 2919. The living is a vicarage, with the chapelry of Lee annexed, in the archdeaconry of Barnstaple and diocese of Exeter. The parish is under the management of a Local Board of Health.

The town consists chiefly of one main street extending along the sea-coast, and reaching to the harbour, which is formed by an inlet or cove of the Bristol Channel. The harbour affords anchorage to vessels of 230 tons, and is rendered additionally secure by a pier 850 feet in length. A battery and lighthouse are at the entrance of the harbour. The houses are tolerably well built; a number of good houses range along the harbour. The church, a commodious building, is partly of the 12th century. The Wesleyan Methodists and Independents have chapels; and there are National, British, and Infant schools.

The town is almost entirely dependent on summer visitors and wealthy residents. For their accommodation hot and cold salt-water baths have been erected, and by tunnels cut through the cliffs a communication has been made with a retired cove for sea-bathing. A broad public walk has been made round one of the hills, and on the verge of the sea, called Capstone Parade; it forms a singularly fine sea-walk. Some of the inhabitants are engaged in the herring-fishery. The market, which is generally well supplied with fish, is on Saturday. The coast scenery about Ilfracombe is bold and often exceedingly picturesque; the scenery inland is also very beautiful.

ILHA-DO-SAL. [CAPE VERD ISLANDS.]

ILISSUS. [ATTICA.]

ILIUM. [TROY.]

ILKESTON, Derbyshire, a small market-town in the parish of Ilkeston, is situated in the valley of the river Erewash, in 52° 58' N. lat., 1° 20' W. long., distant 9 miles N.E. by E. from Derby, and 126 miles N.W. by N. from London. The population of the parish in 1851 was 6122. The living is a vicarage in the archdeaconry of Derby and diocese of Lichfield. The market is only held occasionally, and the town is not of much importance. The church has a stone screen in the early English style. The principal manufactures are those of stockings and lace. In the neighbourhood are several coal-mines. Near the town is a mineral spring. The Erewash Canal and the Nutbrook Canal both pass through the parish.

ILKLEY. [YORKSHIRE.]

ILLE-ET-VILAINE, a department in the west of France, is bounded N. by the English Channel and the department of Manche, E. by the department of Mayenne, S. by that of Loire-Inférieure, and W. by the departments of Morbihan and Côtes-du-Nord. Its form approximates to a quadrangle, lying between 47° 37' and 48° 31' N. lat., 1° and 2° 18' W. long. Its length from north to south is 74 miles, from east to west 55 miles. The area of the department is 2597½ square miles. The inhabitants, by the Census of 1841, numbered 547,052; by that of 1851, 571,618, being 221,219 inhabitants to a square mile, or 46,635 above the average population per square mile for the whole of France. The department is formed out of a portion of the old province of Bretagne.

The department is crossed from west to east by the Armoric Hills, or Menes Mountains [CÔTES-DU-NORD; BRETAGNE], from which the surface slopes down towards the English Channel on one side, and the Bay of Biscay on the other. The Armoric Hills do not attain within this department to any considerable elevation. The surface presents a great variety of hill and dale, heaths, moors, forests, ponds, and marshes, which are rendered productive by drainage, or on the coast by banking out the sea. The soil, except in the marsh land, is shallow and light; the most fertile lands are in the neighbourhood of St.-Malo, Montfort, and Rennes, and in the marshes north of Dol. The coast, which extends between the embouchures of the Couesnon and the Rance, measures about 40 miles; it is washed by the fine Bay of Cancale, but access to it is much impeded by a great number of isolated rocks and islets. St.-Malo in the north and Redon in the south of the department are the most important ports.

The department takes its name from the Ille and the Vilaine, its principal rivers. The Ille rises near Combour, north of the Armoric range, through a gap in which it runs south and joins the Vilaine on the right bank at Rennes after a course of about 20 miles. Its waters supply the Ille-et-Rance Canal, which runs a considerable way along the Ille, and then, turning north-west, joins the Rance, a little above Dinan. [CÔTES-DU-NORD.] The Vilaine rises a little west of Ernée, in the department of Mayenne, and runs generally west past Vitré as far as Rennes, 5 miles above which it becomes navigable. Having received the Ille at Rennes, its course is south-south-west past Redon, whence to its mouth in the Bay of Biscay, below Roche-Bernard, it is a tide river and navigable for vessels of 250 tons. Its whole length is 116 miles, 78 miles of which are navigable. On the right it receives the Canlache, the Chèvre, the Ille before mentioned, the Meu, and the Oust [MORBIHAN]; on the left its feeders are the Seiche, the Semnon, the Cher (which enters it on the borders of Loire-Inférieure), and the Don and the Isac, which flow from Loire-Inférieure, and are both navigable for barges. The Couesnon rises east of Fougères, and runs first west, then north past Antrain, and enters the Bay of Cancale, below Pontorson, in the department of Manche. It is navigable at high water for barges from Antrain. The Rance is described under CÔTES-DU-NORD. The department is traversed by 11 imperial, 12 departmental, and 4 military roads; the railroad from Paris to Brest, now in course of construction, passes Vitré and Rennes.

The department contains 1,662,427 acres. Of this surface, 982,269 acres are arable; 181,256 are natural pasture; 32,621 are covered with orchards, nurseries, and gardens; 255,909 acres are heath and moorland; 147,016 acres are under woods and forests; 12,912 acres are covered with wet marshes, rivers, canals, &c.; and 341 acres are under vine-culture. The farms are small, the largest not exceeding 75 acres, and many consist of not more than 5 acres, small holders being generally linen-weavers as well as tillers of the soil. The food of the peasantry is composed of bread made of rye, oats, or barley, potatoes, milk, and butter, to which salt pork and dried sardines are occasionally added. The soil is made to produce all kinds of bread-

stuffs, in quantity more than enough for the wants of the population. In the rich soils, wheat of excellent quality is raised; some tobacco is grown near St.-Malo; rye, barley, oats, buckwheat, and mixed grain are produced in the middling and poorer soils. The cultivation of flax and hemp for the manufactures of the department is very extensive; the flax and hemp fibres in the dressed state, as also the seeds, are important objects of commerce. The apple and the pear are very extensively cultivated for making cider and perry, the chief drinks of the population; the cider is strong enough to keep for two years, and is considered the best made in France. The grass land along the river bottoms is rich; and, as the out-run on the heaths and moors is large, great numbers of cattle are reared, and excellent butter and cheese are made. There is a little meadow land; of artificial grasses only clover is grown. Horses in general of small breed, sheep, goats, poultry, and pigs of the large white breed, are numerous. Game, including wild boars, hares, rabbits, partridges, quails, woodcocks, &c., are abundant. The fisheries on the coast, which are actively plied, yield excellent oysters, soles, lobsters, turbot, skate, crabs, &c. The forests of the department contain fine timber: the prevailing kinds are oak and beech; next come chestnut, poplar, and birch. The cultivated land also presents the appearance of a forest, such is the number of apple-trees planted in the fields, and of timber-trees in the hedges that separate the fields, but, as these latter are regularly stripped of their branches to supply fire-wood, they are of little value as timber.

Several iron-mines are worked; roofing and clay-slate, white quartz for the glass factories, limestone, and granite are quarried; lead- and copper-ore are found. Mineral springs are numerous.

The most important manufactures are linen, sailcloth of the best quality, Russia duck, canvass, and shoe- and morocco-leather; felt and straw hats, sewing thread, thread stockings, ship-cordage and ropes, fishing nets, hooks and lines, pottery, cotton- and woollen-yarn, are also manufactured. There are, besides, several bleaching establishments, brandy distilleries, paper-mills, iron-forges and smelting furnaces, and flour-mills; in the towns on the coast ship-building is carried on to some extent. Salt is made in some of the marshes on the coast. The commerce is composed of the various articles named, and of groats, chestnuts, salt pork, hides, oak-staves, firewood, &c. About 300 fairs are held in the year; there are 990 wind- and water-mills, 7 iron-works, and 63 factories of different kinds.

The climate is damp but temperate; much rain falls in winter; the prevailing winds are the west, north-west, and south-west; hurricanes are less frequent and less destructive than in the more western departments of the Armoric peninsula.

The condition of the peasantry is similar, but rather superior, to that of the peasantry of FINISTÈRE. The department contains many Druidical and Celtic remains, consisting of monoliths (menhirs), altar tables (dolmen, kistvaen), cromlechs, and cairns.

The department is divided into 6 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Rennes	10	78	139,471
2. Fougères	6	57	85,151
3. Montfort	5	46	60,615
4. St.-Malo	9	60	123,585
5. Vitré	6	61	83,509
6. Redon	7	47	82,287
Total	43	349	574,618

1. Of the first arrondissement, and of the whole department, the capital is RENNES. Of the following places the population given in each case is that of the commune: this remark applies also to the other arrondissements. *Hédé*, a small place of about 1000 inhabitants, on the road from Rennes to Dinan, is remarkable for the remains of its ancient castle, which was taken by Henry II. in 1168. *Janzé*, S.S.E. of Rennes, has 4304 inhabitants, who manufacture sailcloth, and deal largely in excellent poultry. *Liffré*, N.E. of Rennes, has a population of 2402. *Mordelles*, S.W. of Rennes, on the left bank of the Meu, has mineral springs, and 2613 inhabitants.

2. In the second arrondissement the chief town is *Fougères*, which stands on a hill, at the intersection of five high roads, in the north-east of the department. It is one of the best built towns in the department, has wide straight streets, a tribunal of first instance, a college, and 8771 inhabitants, who manufacture sailcloth, canvas, tape, flannel, lace, hats, bricks, leather, paper, and glass. There is a good commerce in these articles, and in corn, groats, butter, honey, cattle, &c. The castle of *Fougères* is a picturesque object, but a feeble defence, as it is commanded by the higher part of the town. In the forest of *Fougères*, within half a mile of the town, there are many Druidical remains. *Astrain*, N.W. of *Fougères*, on the left bank of the Couesnon, which here becomes navigable, has a population of 1567 in the commune, and some manufactures of linen, coarse woollens, serge, and leather. *St.-Aubin-du-Cormier* stands on a steep hill, S.W. of *Fougères*, and has 1896 inhabitants. It owes its origin to a strong castle built by Pierre de Dreux, duke of Bretagne, in 1223, and is famous for the

victory gained here by the Count de la Tremouille, the commander-in-chief for Charles VIII., over François II., duke of Bretagne, the Prince of Orange, and the Duke of Orléans (afterwards Louis XII). *Louvigné-du-Désert*, 9 miles N. from Fougères, had formerly a large establishment belonging to the Templars, whose church is now become the parish church. It has a population of 8524, and several tan-yards.

3. In the third arrondissement the chief town, *Montfort-sur-Meu*, situated 10 miles W. from Rennes, on a hill above the confluence of the Meu and the Chailloux, has a tribunal of first instance, a college, and 1980 inhabitants. It is closed in by ramparts, flanked with towers, and encircled by a wide ditch. The town was formerly of much larger size. In the environs, which are very pretty, are the oak forests of Breceilien and Montfort, in the former of which are several Druidical remains; among others the reputed tomb of the enchanter Merlin, so celebrated in Breton fables. *St.-Méen*, 10 miles W. from Montfort, has an ecclesiastical school, and 2319 inhabitants. *Montauban*, formerly the chief town of a county belonging to the dukes of Rohan, is 7 miles N.N.W. from Montfort, and has a population of 2764. *Plelan-le-Grand*, 12 miles S. by W. from Montfort, has 3283 inhabitants, who manufacture great quantities of sewing-thread.

4. In the fourth arrondissement the chief town, *St.-Malo*, is built on the rocky isle of Aron, which communicates with the mainland by a causeway named *Le Sillon*, and defended from the violence of the waves by strong outworks. The town covers the whole island; it is surrounded by strong ramparts, which are flanked with towers and bastions, and form a fine promenade. The streets are narrow, but formed by high and in general well-built houses. There are four gate entrances, near one of which, called *La Grande Porte*, is a large reservoir, whence water is supplied to the fountains in the streets. The most remarkable building is the strong castle built by Anne, duchess of Bretagne, which forms part of the fortifications. The former cathedral is a very spacious church, built in the gothic style, and ornamented with several good marble statues. *St.-Malo* has tribunals of first instance and of commerce, a chamber of commerce and manufactures, a naval school of the first class, and 9383 inhabitants in the commune; but including the harbour and the suburb of *St.-Servan*, the population probably exceeds 21,000. The harbour lies south of the town; it is capacious and safe, but the entrance to it is rendered intricate by a great number of islets and rocks which stud this part of the coast, and many of which are fortified. It is a tide harbour, protected by a strong pier, and lined with a broad quay, which runs just under the walls of the town; it is dry at low water, but large ships can enter, as the tide rises very high here, 49 feet at spring. A wet-dock has been lately formed by throwing a strong granite wall across the head of the bay between the town and the suburb of *St.-Servan*; it contains an area of above 270 acres, and is entered by wide flood-gates, through which steamers and war frigates can pass. The roadstead of *St.-Malo* lies west of the town at the embouchure of the Rance; it is protected by seven forts, one of which, called *Conchée*, was constructed by Vauban. The manufactures of *St.-Malo* are hosiery, fishing-nets, ship-pulleys and cordage, soap, fishing-hooks, &c. Ship-building is carried on, and there is a large tobacco factory. The imports consist of colonial produce, spices, flax, hemp, &c.; there is also a considerable trade in corn, fruit, wine, brandy, salt, linen, cider, butter, honey, fish, salt provisions, &c. Vessels are fitted out for the foreign and coasting trade, and for the whale, cod, and mackerel fisheries. *St.-Malo* is much frequented for its excellent sea-bathing. *Cancal*, a small sea-port on the western side of the Bay of *Cancal*, with 5630 inhabitants, is 8 miles E. from *St.-Malo*. The principal part of the town stands on a height above the bay, of which it commands a fine view, and is well built. The other part, called *La-Houle*, is built on the shore, and is inhabited chiefly by fishermen, who take vast quantities of oysters and other fish in the bay for the supply of Paris and the towns in the interior. *Combourg*, the birth-place of Chateaubriand, 20 miles S.S.E. from *St.-Malo*, is situated on a small lake, and has 4847 inhabitants. There is an old château, flanked with towers, in good preservation in the town. *Dol*, remarkable for its ancient cathedral, which is one of the handsomest churches in Bretagne, is 15 miles S.E. from *St.-Malo*, and has 4018 inhabitants. It is surrounded by old walls and wide ditches, the remains of its ancient fortifications. The interior is irregularly built; the houses are constructed of dark granite with projecting gables; arcades, 7 or 8 feet wide, supported on granite pillars, run along the streets. The town has a good corn-market, which is held in a desecrated church; there is also some trade in cider, hemp, flax, tobacco, cattle, &c. The neighbourhood of *Dol* is fertile; all the land between it and the sea northward is drained marsh, protected from the sea by dykes. *Pleine-Fougères*, 25 miles from *St.-Malo*, has a population of 3107. *St.-Servan*, a wall-built town, and much frequented watering-place, situated on the south side of the harbour of *St.-Malo*, of which town it may be considered a suburb, has 10,257 inhabitants. The most remarkable structure is the isolated tower called *Solidor*, which is 60 feet high, and approached by a drawbridge. This tower is now used as a prison. Beer, ship-cordage and biscuits, wine, brandy, &c., are the chief articles of trade; ship-building is carried on. *Vitré*, on the *Ille-et-Rance Canal*, has 2050 inhabitants, who trade in corn, butter, poultry, &c.

5. In the fifth arrondissement the chief town, *Vitré*, situated on the

Cantache, 22 miles E. from Rennes, has a tribunal of first instance, an ecclesiastical school, and 8555 inhabitants. The town is large, but irregularly built; and its feudal fortifications, consisting of a castle and high ramparts, flanked with machicolated towers and surrounded by a deep ditch, give it a gloomy appearance. The church of Notre-Dame is the most remarkable structure in the town. Vitré has manufactures of thread-stockings, serge, flannel, hats, casks, brandy, leather, and sail-cloth, and trades in these articles, and in wine, linen, honey, wax, hides, cattle, and cantharides flies, which are found in the neighbourhood. The other towns are—*Argentré*, which is a few miles S. of Vitré, and has 1978 inhabitants: *La-Guerche*, a town of 4412 inhabitants, which stands in a rich corn and grazing country, 11 miles S. from Vitré; it gives name to a neighbouring forest, and has manufactures of fine linen, leather, and nut-oil, besides a good trade in butter, corn, flax, hemp, chestnuts, cattle, sheep, &c.: and *Rhetiers*, which is a few miles W. of La-Guerche, and has 2960 inhabitants.

6. Of the sixth arrondissement the chief town, *Redon*, stands at the foot of a hill on the Vilaine, which here forms a good tide harbour, with a rise of from 10 to 13 feet at high water. The town, which is situated in the most southern angle of the department, at the junction of the two branches of the canal from Nantes to Brest, and at the southern extremity of the river and canal navigation that terminates to northward in the harbour of St-Malo, enjoys great advantages for trade, in addition to its connection with the Bay of Biscay by a navigable tide-river. It is in general well built: the chief structures are the former abbey-buildings now used as a college, and the abbey-church, the semicircular apse of which is considered a masterpiece of its kind. Redon has a tribunal of first instance, a college, and 5216 inhabitants, who carry on a considerable trade in colonial produce, wine, brandy, salt, butter, chestnuts, timber, hemp, oak-staves, planks, masts, pitch and tar, slates quarried in the neighbourhood, sheet- and bar-iron, lead, resin, hides, linen, flax, canvass, &c. Vessels of 50 to 400 tons are built. A vote of 1,800,000 francs was taken in 1846 for the improvement of the harbour of Redon, to which the French attach great importance, as, in case of a war with England, their trading vessels could enter here without exposing themselves in the channel. The other towns are—*Bain*, which stands on the great road from Rennes to Nantes, and has a population of 3476 and some woollen manufactures: *Fougères*, 16 miles N.E. from Redon, which has 5254 inhabitants; it had formerly a strong castle, of which only one high massive tower remains, and from which the English were driven by Du Guesclin in 1356: *Guichen*, which is 25 miles N.N.E. from Redon, and has cold mineral springs, and 3534 inhabitants: *Mauve*, 15 miles N. from Redon, which has a population of 4000, and an ancient castle taken by Henri IV. in 1597: and *Pipriac*, 12 miles N. from Redon, which has 3116 inhabitants.

In Roman times the territory of this department was inhabited by the Redones, a Celtic tribe, whose name is still preserved in that of Redon. It was included in the district of Armorica. On the downfall of the empire it became part of Bretagne. The department forms the see of the Bishop of Rennes, is included in the jurisdiction of the Cour Imperiale and University Academy of Rennes, and belongs to the 16th Military Division, of which Rennes is head-quarters. For purposes of superior education there are besides the University of Rennes an imperial college and diocesan seminary in the same town, and colleges in Dol, Fougères, St-Servan, and Vitré. There is a school of painting, sculpture, and drawing, and a departmental museum in Rennes. The department returns 4 representatives to the Legislative Body of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Official Papers; Guide Classique du Voyageur en France.*)

ILLIERS. [EUPE-ET-LOIRE.]

ILLINOIS, one of the United States of North America, is bounded S.E. by the Ohio, which separates it from Kentucky for 130 miles; E. by the Wabash for 120 miles direct distance, and by a meridian line to Lake Michigan for 162 miles, by which river and line it is separated from Indiana; N.E. by Lake Michigan for 57 miles; N. by the parallel of 42° 30' N. lat. to the Mississippi, 157 miles, by which it is separated from Wisconsin; W. by the Mississippi, which separates it from Iowa for 200 miles, and from Missouri for 340 miles. It lies between 42° 30' and 37° N. lat., 87° 49' and 91° 28' W. long. The extreme length is 378 miles, the extreme breadth 212 miles; the circuit of the state is 1160 miles, of which 850 miles is formed by navigable rivers; and its area is 55,409 square miles, or nearly 3000 square miles less than England and Wales. The following table shows the population decennially since the first census of the state in 1810, with the proportion of free coloured persons and slaves. The total population in

1810 was	12,282,	including	613 free coloured persons,	and	168 slaves.
1820	55,211,	"	457	"	917
1830	157,445,	"	1637	"	747
1840	476,183,	"	3598	"	331
1850	851,470,	"	5436	"	None.

The federal representative population in 1850 being 851,470 entitles the state to send nine representatives to Congress. To the Senate, like each of the other United States, Illinois sends two members.

Surface, Hydrography, Communications.—Illinois is one of the most

level states in the Union. In the southern part of the state, by the Ohio, there is a range of low hills; the northern part is also somewhat broken, and there are some elevations by the Illinois, and lofty bluffs along the Mississippi; but with these exceptions Illinois is one great plain, having a general gentle slope to the south-west. The loftiest height is said to be under 1000 feet above the level of the sea, the lowest portion of the plain at the mouth of the Ohio River, is 340 feet above the sea. A large portion of the surface consists of prairie, much of it in its native state, but a great deal is reclaimed, and cultivation is rapidly encroaching on the remainder. The surface of the largest of the prairies, known as the Grand Prairie, and occupying the country between the Mississippi and the Wabash rivers is for the most part gently undulating and very fertile, with a good deal of timber about it; though considerable tracts of the southern part are flat and have an inferior soil. The character of the prairie is said to afford no insurmountable obstacle to its reclamation and settlement; no portion of it is more than eight miles from timber, and coal is found in abundance in most parts. The prairies are commonly known as the dry and the wet. The dry prairies are those which lie above the alluvial tracts, and, though less fertile, are preferred to them on account of their not being subject to inundations. The wet prairies are usually covered with coarse grass. The broad alluvial tracts bordering the several rivers, locally known as bottoms, are extremely rich and fertile, but owing to their moist state and liability to be flooded, are to a great extent uncultivated, though producing fine trees.

Illinois is well provided with rivers. Nearly three-fourths of its boundary is formed by navigable rivers, while its north-eastern angle is washed for 57 miles by Lake Michigan, thereby affording the state direct water communication with the whole lake country of the north. The rivers which belong to it in common with other states are the Mississippi, Ohio, and Wabash, which are described under MISSISSIPPI, KENTUCKY, and INDIANA. Of the rivers which belong wholly to the state the chief is the *Illinois*, which rises near Lake Michigan, and flows first west, and then south-south-west, into the Mississippi, which it joins 20 miles above the Missouri. About 200 miles above its mouth it expands into a fine lake called Peoria, 20 miles long and 2 miles wide. A morass at its source in wet seasons discharges a part of its waters into the river, and a part into the Chicago, a small stream which flows into Lake Michigan. This large river takes the name of Illinois only from the confluence of the *Plaine*, *Des Plaines*, or *Aux Plaines* River, from the north-east and the *Kankakee* from the east, both considerable streams, and navigable for boats. Thirty miles below their confluence *Fox* River, sometimes, but erroneously, considered the main branch of the Illinois, falls into the Illinois from the north; it rises in the Huron territory, and has a course of 200 miles south-south-west, more than half of which is in this state. The course of the Illinois is about 500 miles. It is navigable by large steamboats at certain seasons up to *Ottawa*, just below the *Great Rapids*, near the junction of the *Fox* River; at other times steamboat navigation is stopped by the *Little Rapids* at *La Salle*, where a canal commences which connects the Illinois with Lake Michigan. The Illinois flows with a gentle current, generally in a wide deep bed. The other principal tributaries of the Illinois are the *Vermilion* River from the south-east, the *Mackinaw* from the north-east, *Spoon* River from the north-west, the *Sangamon*, or *Sanganio*, from the east, and the *Big* and *Little Blue* rivers from the west; besides numerous lesser streams. *Sangamon*, by much the largest of these tributaries, has a very winding course to the west of more than 250 miles, of which 140 miles are navigable, and it falls into the Illinois about 130 miles above its mouth. *Rock* River rises in Wisconsin, and entering the state of Illinois on its north boundary, crosses it in a south-west course of about 300 miles to the Mississippi: it is navigable in its lower course; its upper course is impeded by rapids. The *Kaskasia* rises on the eastern side of the state, and, like the Illinois and *Rock* rivers, has a generally south-western course to its junction with the Mississippi, about 80 miles above the junction of the Ohio. The river has been rendered much more serviceable for purposes of navigation by the removal of various obstructions under the direction of the Board of Public Works; it is now navigable in high-water to *Vandalia*, 150 miles from its mouth, and in some seasons to *Shelbyville*, 30 miles higher: its entire course is about 300 miles. It has numerous small tributaries. The *Big Muddy*, farther south, is also a considerable stream. The affluents of the Ohio and the Wabash are generally much smaller streams than those which fall into the Mississippi, but some of them are navigable, and all are important as furnishing water-power for mechanical purposes.

The state possesses one very important canal, the *Illinois and Michigan* Canal, 110 miles long, constructed by the state at a cost of upwards of 8,000,000 dollars. It commences at *Chicago* on *Lake Michigan*, and is carried in a south-western direction near the right bank of the Illinois to *La Salle*, where the Illinois becomes navigable, thus opening to the lake ports and navigation the wide river country of the south and west.

Illinois appears likely to be eventually amply supplied with railways. In all, the lines completed or in progress amount to 2100 miles. Already some 600 or 700 miles are in operation, and above

1000 miles more are said to be in progress of construction; while the lines of country for 600 more miles have been surveyed. The principal lines in operation are those in connection with the commercial capital of the state, Chicago, in which city seven main-trunk lines meet. The Chicago and Rock Island railway runs from Chicago on Lake Michigan, in a south-south-west direction, to Rock Island city, at the confluence of Rock River with the Mississippi; its length is 180 miles. The Galena and Chicago runs from Chicago to Galena and Freeport at the north-western extremity of the state, 120 miles, with branches to Dixon 68 miles, and to Beloit, in Wisconsin, 20 miles. The Chicago and Aurora, 86 miles long from Chicago to Mendota, is the only other line from Chicago which is completed; but the Chicago and Cincinnati, to connect those places, 27 miles long; the Chicago and Fort Wayne, and the Chicago and Milwaukee, 92 miles; the Chicago and Mississippi, running to Alton, 130 miles; and the Chicago St. Charles and Mississippi, 135 miles, are in progress; and 100 miles of the last are open. The Great Western central line has under 100 miles in operation. The most important of the lines in progress is the Illinois Central, which is to be 700 miles long, and with the other lines will connect all the leading towns with each other, and with the chief trading places in the neighbouring states and most parts of the Union, and likewise of Canada. All the lines in progress are expected to be completed by 1857.

Geology, Mineralogy, &c.—The rocks of Illinois belong to the Palæozoic order. In the extreme northern and western portion of the state is a narrow band of Lower Silurian rocks, the southern extremity of the Lower Silurian basin of Wisconsin. They consist of sandstone, in which occur numerous specimens of the *Lingula antiqua*, and of blue limestones in which are the rich lead-mines of Galena. South of the above, and extending east and west, is a broad belt of Upper Silurian rocks, chiefly light gray and magnesian limestones. Between this belt of Lower Silurian strata and Lake Michigan, and also on the south of the Silurian rocks, is a narrow band of fossiliferous Devonian rocks. South of these again, also extending east and west across the state, and along the whole western and southern border, lying along the Mississippi and Ohio rivers, is a narrow strip of Lower Carboniferous strata, consisting of bituminous slate, and fine-grained sandstone. Above these, and occupying the entire centre and eastern part of the state is a vast bed of Upper Carboniferous strata, closely resembling the coal-bearing rocks of England, but here forming part of a basin of these strata of a grandeur and extent almost unparalleled.

Illinois is exceedingly rich in minerals. Silver is obtained in the north-western part of the state in connection with galena. Lead is very widely diffused over the northern, and especially the north-western district; the lead-mines about Galena are among the most productive known. Copper is also obtained largely in those parts. Iron-ore is very widely distributed. Coal is however the most extensive and valuable mineral of Illinois. It is bituminous in quality, and the beds are of great thickness. The great coal region is that vast space mentioned above, as occupied by the Lower Carboniferous strata, extending quite across the state from Missouri to Indiana, and from Iowa to Kentucky. Excellent building stone of various descriptions is quarried over almost every part of the state. Granite boulders of large size occur in many places. Salt springs exist in several of the southern and eastern counties, and there are sulphur and chalybeate springs in various parts.

Climate, Soil, and Agriculture.—The climate is very much the same as that of Missouri, except that it is more humid. There is a considerable difference in the temperature between the northern and southern parts of the state. At New Harmony, which is in 38° 11', and opposite the southern part of the state, on the east bank of the Wabash, the thermometer has been observed as low as 5° below zero of Fahrenheit. Everywhere however the winters are severe and the summers hot and long, and the temperature subject to frequent sudden changes. In the southern parts of the state the summer heat is very oppressive. South-westerly winds blow during three-fourths of the year. North and north-westerly winds prevail in winter.

Illinois possesses a vast extent of excellent arable land. The soil however varied is generally highly fertile. Along the river-valleys, or bottoms, it consists of an extraordinarily rich alluvial deposit. One of these tracts, the American Bottom, on the Mississippi, extending above the mouth of the Kaskaskia for 90 miles, is especially noted for its fertility. Its soil, which is the richest river alluvium, continues unchanged for 25 feet below the surface, and some portions of it which are cultivated about the old French towns, have produced Indian corn without intermission and without manure for nearly a century and a half. A sixth of this alluvial land is however unfit for cultivation, owing to its liability to inundations. The prairies though less productive are still very fertile, and where timber is to be obtained are preferred for farms on account of their superior salubrity. The prairies are consequently steadily and rapidly becoming covered with thriving groves of young trees, the forerunners of busy farms. The barrens, or oak openings, have frequently a thin soil. In the northern parts there are stony tracts, but everywhere else it is said that "the plough may pass over millions of acres without meeting so much as a pebble to impede

The following are the principal results of the inquiries made respecting the agricultural statistics of Illinois at the last census:—The number of farms under cultivation in the state on the 1st of June 1850 was 76,208. The extent of improved land in farms was 5,039,545 acres, of unimproved 6,997,867 acres, together valued at 96,133,290 dollars. The farming implements and machinery were valued at 6,405,561 dollars. The total produce of the principal crops in 1850 was as follows:—Wheat, 9,414,575 bushels; rye, 83,364 bushels; maize, 57,646,984 bushels; oats, 10,087,241 bushels; buckwheat, 184,504 bushels; barley, 110,795 bushels; peas and beans, 82,814 bushels; potatoes, 2,514,861 bushels; sweet potatoes, 157,433 bushels; tobacco, 841,394 lbs.; hops, 3551 lbs.; hay, 601,952 tons; clover and other grass seeds, 17,807 bushels; flax, 160,063 lbs.; maple sugar, 248,904 lbs. The value of orchard products was 446,049 dollars; of market-garden products, 127,494 dollars. Of wine only 2997 gallons were made. A good deal of hemp is grown and prepared, but the 'Census Report' states (p. 1015), that with regard to it the "returns were so confused, and all information from other sources so vague and indefinite, that it was deemed advisable to strike the items of hemp from the agricultural tables of the state." It may be as well to state here that it must not be supposed that these agricultural returns are as exact as their specific character would perhaps suggest, but there can be little doubt that they do, in the words of the 'Report,' "give a very fair idea," undoubtedly a far clearer and more correct idea than can be gathered from any other source, "of the state of the country in 1850."

With regard to live-stock, the returns show that the number of horses in the state in 1850 was 267,653; asses and mules, 10,573; milch cows, 294,671; working oxen, 76,156; other cattle, 541,209; sheep, 894,043; swine, 1,915,907. The value of live stock was 24,209,258 dollars; of animals slaughtered, 4,972,286 dollars. The products of animals were—wool, 2,150,113 lbs.; butter, 12,526,543 lbs.; cheese, 1,278,225 lbs.; bees'-wax, and honey, 869,444 lbs.; silk cocoons, 47 lbs.

Illinois is in general well supplied with timber. The most common trees are various kinds of oaks, sycamores, which in the alluvial soil along the rivers grow to an immense size, sugar-maple, walnuts, several kinds of ash, elm, cotton-wood, honey-locust, hickory, buck-eye, pecan, linden, wild cherry, sassafras, elder, and persimmon; in the southern and eastern parts yellow poplar and birch, and near the Ohio yellow pine and cedar. Hazel, red-bud, pawpaw, sumac, vine, dog-wood, and other under-growths are abundant. There are also various valuable medicinal plants.

The gray, black, and prairie wolf are still met with; the prairie wolf in considerable numbers. Panthers, wild-cats, foxes, racoons, opossums, and gophers, with musk-rats, otters, and occasionally beavers are also found, but they are being steadily exterminated. Partridges and prairie fowl abound; ducks, geese, swans, and various other aquatic birds visit the waters in the spring season. Fish in the greatest possible variety swarm in the rivers and lakes.

Manufactures and Commerce.—At present the manufactures of Illinois are chiefly connected with agriculture. Agricultural implements are extensively made; there are numerous wheelwright's shops; saw, grist, oil, flour, and other mills. The only important manufactures not immediately connected with agriculture are the iron-works, woollen-factories, and tanneries. The whole number of manufacturing establishments producing to the value of 500 dollars and upwards in 1850 was 3099. Of these two were pig-iron manufactures, employing 150 hands, and a capital of 65,000 dollars, consuming annually 5500 tons of ore and 170,000 bushels of coke and charcoal, and producing 2700 tons of pig-iron; and 29 establishments engaged in the manufacture of cast-iron, employing 332 hands, and a capital of 260,400 dollars: there was no wrought-iron manufactured in the state. The woollen manufacture employs 178 hands, including 54 females, and a capital of 154,500 dollars; tanneries 275 hands (240 males), with a capital of 188,373 dollars; flour-mills, 834 persons; saw-mills, 937; distilleries, 176; pork and beef packing, 245; lead-mining and smelting, 213 persons. The 'home-made manufactures' for the year were valued at 1,155,902 dollars. There are the usual classes of professional men; the number of the principal classes were—clergymen, 1023; lawyers, 817; physicians, 1402; and surgeons, 8.

The direct foreign commerce of Illinois is chiefly with Great Britain. The exports, wholly of domestic produce, for the year ending June 30th 1852 amounted to 51,325 dollars; the imports to 4832 dollars. The commerce of the state is chiefly centred in Chicago, in our notice of which lower down will be found some further particulars respecting the trade of Illinois; Alton on the Mississippi, and Galena, are the other principal commercial towns. The internal trade is very considerable, and it is rapidly increasing with the increase of facilities of communication.

Divisions, Towns, &c.—Illinois is divided into 99 counties. Springfield is the political capital of the state, but the most important town is Chicago. The towns for the most part have as yet but small populations; the following are all which seem to require notice here: the population is that of 1850:—

Springfield, the capital of the state, is situated on the border of a broad prairie, about 4 miles from the left bank of the Sangamon River, in 39° 48' N. lat., 89° 33' W. long., 801 miles W.N.W. from

Washington: population, 4533. The town was laid out in 1822 on a regular plan, with a central public square, and wide streets crossing at right angles. In the centre of the principal square is the capital, a showy stone-building of three stories, with porticoes. The other public edifices are the court-house, market-house, jail, United States land-office, eight churches, academies, &c. There are some manufactures and an iron-foundry. The town is the centre of a very fertile district, the products of which are brought to its market. The Great Western Central, the Chicago and Mississippi, and the Massac and Sangamon railways meet here. Two daily and one weekly newspaper are published in the town.

Chicago, a city, port of entry, and capital of Cook county, is situated at the mouth of the Chicago River, on Lake Michigan, 42° 0' N. lat., 87° 35' W. long., 183 miles N.N.E. from Springfield: population 29,963 in 1850, in 1840 it was only 4470. The city is well and substantially built. It extends along the shore of the lake for above a mile, and for two miles back along the river which is separated into two branches, each having a depth of 12 to 15 feet. The site is low and level, but the town is said not to be unhealthy. The bar at the mouth of the river has been reduced, and piers have been carried out into the lake in order to prevent the accumulation of sand and drift. The largest lake craft and steamers can now pass over the bar, and within there is commodious anchorage for an almost unlimited amount of shipping. The commerce of the town has increased within the last few years in full proportion to the great increase of means of internal communication, and its fine position with respect to the navigation of the lakes. In 1839 the total value of property was assessed at 236,842 dollars, in 1850 it was assessed at 8,562,717 dollars. The imports in 1840 were 562,106 dollars, the exports 223,635 dollars. In 1848 the imports were 8,338,639 dollars, the exports 10,709,333 dollars. The arrivals of shipping in 1850 were:—Steamers, 662; propellers, 183; schooners, 1182; brigs, 230; barges, 13: making a total of 2270 vessels, of an aggregate burdan of 958,600 tons. The principal exports in 1850 were:—Wheat, 437,660 bushels; maize, 3,221,317 bushels; oats, 767,197 bushels; hemp, 697,783 lbs.; coal, 2,091,552 lbs.; iron, 3,454,060 lbs.; lead, 1,376,879 lbs.; lumber, 67,957,287 feet; laths, 14,921,420 pieces; wool, 1,088,553 lbs.; besides considerable quantities of cheese, butter, flour, sugar, beef, pork, lard, and potash. The principal imports in the same year were:—Wheat, 358,077 bushels; maize, 2,647,465 bushels; bacon, 434,716 lbs.; hams, 1,086,933 lbs.; pork, 2,390,248 lbs.; lard, 2,069,625 lbs.; hemp, 1,035,648 lbs.; hides, 848,876; lumber, 125,523,122 feet; timber, 562,976 feet; laths, 27,583,475 pieces; shingles, 60,338,250 bushels; lead, 1,402,135 lbs.; wool, 731,956 lbs.; tobacco, 324,923 lbs. The public buildings are the usual county buildings, numerous churches and schools, banks, &c. There are several large hotels in the city. Besides the Illinois and Michigan Canal, the city is the terminus of several important railways, and a great many plank-roads facilitate communication with the interior. Five daily newspapers, each having also a weekly issue, six weekly, a fortnightly, and three monthly periodicals are published here.

Alton, on the left bank of the Mississippi, 3 miles above the confluence of the Missouri, is the chief port town of Illinois on the Mississippi, and the largest town on that river above St. Louis: population, about 12,000. Alton is a convenient port, and is now being connected with several railways; its commerce is greatly increasing. There are several churches, Shurtliff college and other buildings in the town. Bituminous coal is abundant in the vicinity. *Belvidere*, on the north branch of the Kishwaukee River, and on the Galena and Chicago railway, 78 miles W. from Chicago, population about 2000, is a flourishing and busy new town. There are several grist- and saw-mills. *Carlinville*, the capital of Macaupin county, 2 miles N. from Macaupin creek, and 41 miles S. by W. from Springfield, is one of the most flourishing places in the interior. The Sangamon and Alton railway has a principal station here. *Carrollton*, the capital of Greene county, on the border of Spring prairie, about 6 miles N. from Macaupin creek, and 56 miles S.W. from Springfield, is another rapidly increasing interior town, and the centre of a fertile district. *Carthage*, the capital of Hancock county, lies between Bear and Long creeks, and is a busy and prosperous place, being the mart of a fertile neighbourhood, and of a rich coal district. The village has acquired a wide notoriety as the scene of the murder of the Mormon prophet and leader, Joe Smith, and his companions. *Chester*, on the Mississippi, immediately below the confluence of the Kaskasia River, population about 1300; is a place of growing commercial importance, being the entrepôt for the produce of a considerable tract of back country. *Danville*, on the right bank of the Big Vermilion River, just below the confluence of the North and Salt Forks, 128 miles E. by N. from Springfield, population about 1200, is a good sized and flourishing place, and the centre of a fertile and populous district. Two weekly newspapers are published here. *Freeport*, on the Pecatonica River, 168 miles N. from Springfield, is another of the rising towns of Illinois, and from its position is likely to become an important commercial place. The surrounding country is rich in minerals, and very productive agriculturally. The Galena branch of the Central Illinois, and Galena and Chicago Union railways meet here. Two newspapers are published weekly. *Galena*, on the Feve River a little above its confluence with the Mississippi, and near the

north-western extremity of the state, population about 6500, is the centre of the lead mining district, and the chief commercial town of this part of Illinois. It is the capital of Joe Davies' county, and contains the usual county buildings, court-house, jail, several churches and schools, and some large copper smelting works, grist- and saw-mills, &c., and has a large lumber market. The chief exports in 1851 were—lead 33,082,190 lbs.; flour 39,339 barrels; barley 42,731 bushels; pork 3185 barrels; bacon 812,658 lbs.; lard 125,000 lbs.; butter 87,618 lbs.; eggs 22,880 doz.; hides and skins 9326; horses 800; cattle 1500, &c.; and in the same year it received 5,085,684 feet of lumber, and a very large quantity of shingles, timber, and wood of other descriptions. The largest river steamers ascend to Galena, and it has good railway accommodation. Two daily newspapers, having also weekly issues, are published here. *Jacksonville*, on the Mauvais-terre creek, 30 miles W. by S. from Springfield, population 2745, is a rapidly rising new town, situated on a rich prairie district. It contains a court-house, jail, churches, and schools. Illinois college, and the state deaf and dumb institution are situated here. There are extensive flour-mills, cotton-works, tanneries, and machine manufactories. The Sangamon and Morgan railway passes the town. A newspaper having tri-weekly and weekly issues is published here. *Joliet* on the Plane River, 40 miles S.W. from Chicago, population 2659, contains a court-house, jail, churches and schools, large hotels and warehouses. The river affords fine water-power, which is made available for numerous mills and factories. The Illinois and Michigan Canal, and Chicago and Rock Island railway pass the town. Two weekly newspapers are published here. *Kaskasia*, the original capital of Illinois, stands on the right bank of the Kaskasia River, 10 miles above its confluence with the Mississippi, 127 miles S. by W. from Springfield the present capital: population, about 1000. Kaskasia is one of the oldest towns in the state, having been founded by the French in 1683; it stands in the midst of very picturesque scenery, contains the usual county buildings, a Roman Catholic church, and a United States land office. *Mount Carmel* occupies a favourable site for commercial purposes, on the right bank of the Wabash, below the rapids, 140 miles S.E. from Springfield: population, 1500. It contains a court-house, jail, churches and schools, and several flour-mills, and machine-shops. *Naperville*, on the Du Page creek, 160 miles N.E. from Springfield, is a rising new town, the capital of Du Page county, having various county buildings, churches, schools, &c., and two weekly newspapers. *Ottawa*, at the junction of the Fox River with the Illinois, 120 miles N.N.E. from Springfield, is the capital of La Salle county, and a place of great and increasing commercial importance. By the Illinois and Michigan Canal the lake steamers reach the town, and the Chicago and Rock Island railway affords communication with the western districts; while the Illinois River yields immense water-power which is being turned to full advantage. The soil of the surrounding country is rich; there is a good deal of timber; and limestone and freestone abound. Two newspapers are published weekly. *Peoria*, on the right bank of the Illinois, at the foot of Peoria Lake, is the capital of Peoria county, and the shipping port for the surrounding grain district: population, 5562. It contains the usual county buildings, churches and schools, an incorporated academy, several steam-mills, factories, &c. Two weekly newspapers, and a semi-monthly magazine are published here. *Quincy*, stands on a high bluff on the left bank of the Mississippi, 88 miles W. from Springfield, population 6911; it is the capital of Adams county, and the mart for a well cultivated and populous neighbourhood. Besides the usual county buildings, churches, and schools, it contains a United States land office, numerous warehouses, stores, hotels, workshops, &c. Several steamboats arrive and depart daily during the season. Large quantities of barrelled pork and bacon are exported. One daily and three weekly newspapers, with two monthly periodicals are maintained. *Rock Island City*, at the junction of the Rock River with the Mississippi, and the terminus of the Chicago and Rock Island railway, by which it is 180 miles W.S.W. from Chicago, is a new town which has been laid out on an extensive plan, and though not at present very populous is expected to become one of the most considerable commercial towns on the upper Mississippi. The site is well adapted for trading purposes, and the surrounding country is not only a rich agricultural district, and well supplied with timber, but affords also abundance of coal and limestone. *Rockford*, the capital of Winnebago county, is situated at the rapids on Rock River, 92 miles N.W. by N. from Chicago by the Galena and Chicago railway: population, 2098. Steamboats ascend to the town. The rapids afford immense water-power, and there are several mills. A newspaper is published weekly. *Shawneetown*, on the Ohio, 164 miles S.E. from Springfield, population 1764, is one of the largest trading places in southern Illinois. Iron-ore and coal are obtained along the banks of the Ohio. There are very extensive salt-works at Saline creek, 12 miles from the town. Shawneetown possesses a paved levee of considerable length. An important branch of the trade of the place is the slaughtering and packing of hogs: one establishment has facilities for hanging up 1000 hogs a day. Tobacco is raised in the vicinity in considerable quantities: 300 hogheads were shipped from here in 1852. *Vandalia*, from 1818 to 1839 the capital of Illinois, stands on elevated ground, on the right bank of the Kaskasia, 66 miles S.E. from Springfield: population, about 1100. The town was laid out on a large scale in

1818 as the capital of the state, with a great central square in which the state buildings were placed, and streets 80 feet wide intersecting at right angles. After the removal of the state legislature, judiciary, &c., the place languished, but it is recovering, and as it is now being made a centre for the junction of several great lines of railway, and consequently one of the chief thoroughfares of trade in Illinois, its natural advantages appear likely to be more thoroughly developed, and it will probably become an important commercial town.

Waukegan, the port town and capital of Lake county, is a new town well placed on an eminence above lake Michigan. The town is of recent formation, but it already contains several handsome and substantial buildings, piers, &c., a good harbour, above 4000 inhabitants, and carries on a very considerable lake trade. The country inland is here of the best description of prairie, with abundance of good timber.

Government, Judicature, &c.—The first constitution of the state was drawn up in 1818: that under which the government is now carried on was adopted in convention in August, 1847, and accepted by the people in March 1848. By it the right of voting for all elective offices appertains to every white male citizen 21 years of age who has resided in the state for one year. Among other provisions of the constitution are the following:—Slavery is prohibited. No coloured person, free or slave, is permitted to come into the state. Lotteries are disallowed. Duelling is a disqualification for office. No state bank can be created or revived: acts creating banks must be submitted to the people, and receive a majority of votes in their favour in order to become law. Stockholders are individually liable to the amount of their shares. Corporations for other than banking purposes may be established under general laws. No alteration or amendment can be made in the constitution, unless it is passed by a vote of two-thirds of the whole number of members elected to both houses, published and referred to the next legislature, and, if passed again by a majority, then submitted to the people, whose approval by a majority makes it law. Only one article of the constitution can be amended in one session. The legislative body, styled the general assembly, consists of a Senate of 25 members, who must be 30 years old, and have resided in the state for five years; and of a House of Representatives of 75 members, who must be 25 years old, and have resided in the state three years. These members may be increased when the population of the state exceeds 1,000,000, but the number of representatives must never exceed 100. The senators are elected for four years; half the number to be elected every two years; the representatives are elected biennially. In forming senatorial or representative elective districts, regard is only to be had to the number of white inhabitants. The governor who has a qualified veto on the acts of the general assembly, is elected every four years by a plurality of votes. He must be 35 years old, and have resided in the state the 10 years preceding his election. His salary is 1500 dollars; he must reside at the seat of government, and he is not eligible for re-election at a consecutive term.

The public debt of the state on the 1st of January 1853 amounted to 16,724,174 dollars, in which is included a sum of 7,300,000 dollars borrowed for the construction of the Illinois and Michigan Canal. The amount of property in the state subject to taxation on January 1st 1851 was:—Real estate 98,748,533 dollars; personal property 39,069,546 dollars, total 137,818,079 dollars. The rate of taxation was 60½ cents on 100 dollars. The total receipts of the treasury for the two years ending November 30th 1852 (chiefly from taxes) was 503,561 dollars, the expenditure for the same period was 385,767 dollars. The state militia is composed of 170,359 men, of whom 4618 are commissioned officers.

The judicature consists of a supreme court, circuit courts, and county courts. The supreme court consists of three divisions, and has cognisance of all appellate cases, cases relating to the revenue, mandamus, habeas corpus, and some impeachments. The judges, who must be 35 years old and have resided in the state for 5 years, are elected by the people for 9 years; one of the judges must be elected every 3 years: the salary of each is 1200 dollars. There are 15 circuit courts, each presided over by a judge who is elected for 4 years, must be 30 years of age, and receives a salary of 1000 dollars: these courts have cognisance of all ordinary civil and criminal cases. In each county a court is held for the transaction of county and probate business, with limited civil and criminal jurisdiction: the judges are elected by the counties for 4 years.

The state has made considerable provision for the education of the children of white citizens. The total sum devoted to educational purposes on December 31st 1852 was 951,504 dollars; the whole of which has been borrowed or appropriated by the state, and applied to the payment of the current expenses of the government. The state pays 6 per cent. interest. The number of colleges in the state in 1851 was 6, having 35 teachers and 442 pupils; academies and other upper schools 81, having 156 teachers and 4179 pupils; public schools 4054, having 4252 teachers and 125,790 pupils. According to the returns by families there were in the same year in the state 181,969 white and 323 free coloured children attending school. The number of adults in the state unable to read and write was 40,054 whites and 1239 free coloured; of whom 35,336 were natives of the United States. The principal colleges are—the Illinois, at Jacksonville, founded in 1830, which has 6 tutors, 48 students, and a library of 3660 volumes;

the Knox, at Galesburg, founded in 1837, which has 7 tutors, 56 students, and a library of 3300 volumes; the Shurtliff (Baptist), at Upper Alton, founded in 1835, which has 6 tutors, 40 students, and a library of 1900 volumes; and the M'Kendree (Methodist), at Lebanon, founded in 1835, which has 10 tutors, 79 students, and a library of 7000 volumes. Among religious sects the Methodists are the most numerous. In 1850 the Methodists had 405 churches, affording accommodation for 178,452 persons; the Baptists 282 churches, with accommodation for 94,130 persons; Presbyterians 206 churches, with accommodation for 83,129 persons; 'Christians' 69 churches, with accommodation for 30,864 persons; Congregationalists 46 churches, with accommodation for 15,626 persons; Lutherans 42 churches, with accommodation for 16,640 persons; Episcopalians 27 churches, with accommodation for 14,000 persons; Roman Catholics 59 churches, with accommodation for 29,100 persons. There are besides churches for Moravians, Swedenborgians, Dutch Reformed, Mennonites, Tunkers, Quakers, Unionists, Unitarians, Universalists, and various minor sects. One hundred and seven newspapers and periodicals, having an aggregate circulation of 88,623 (5,102,276 copies annually) are published in the state.

This state is within the limits of the cession which Virginia made to the United States in 1787; but the first settlements made in it were by the Canadian French before 1763. It was governed, with Indiana, as a territory of the United States from 1800 to 1809. In 1809 they were made separate territorial governments, and in 1818 Illinois was admitted into the Union as a state.

(*Statistical Gazetteer of the United States, 1853; American Almanac, 1854; Seventh Census of the United States, Official Report, 1853; Marcou, Geological Map of the United States, with an Explanatory Text 1853.*)

ILLOK. [CROATIA.]

ILLYRIA, Kingdom of. Ancient Illyria comprehended all the provinces on the east coast of the Adriatic, with the adjacent islands as far as Epirus, and was inhabited by a people called by the general name of the Illyric Nations. Illyria also extended into the interior as far as the Ister (Danube) and the Alps which lie between Italy and Germany. The Macedonic nations formed the eastern boundary. Within these vague but extensive limits, which comprehend a considerable portion of the Austrian and part of the Turkish dominions, there were other nations, and particularly Gauls, mingled with the Illyrians. (Strabo, 312, &c.) The numerous excellent ports along this coast gave the natives great advantages for prosecuting a piratical warfare. The Illyrians defeated Amyntas II. of Macedonia B.C. 383, and his eldest son, Alexander II., was obliged to purchase peace of them, and give his brother Philip as a hostage. When Philip came to the throne he defeated the Illyrians, B.C. 359, and for a time broke their power. That the Illyrians were formidable neighbours to the Macedonians appears from the fact of their long-continued wars and the several great defeats which the Macedonians sustained from them. Piracy was the chief pursuit of the maritime Illyrians, which brought them into collision with the Romans, by whom they were subdued. On the division of the empire Illyria remained to the Western empire, but on its decline (476) fell to the Eastern empire. In the 6th century colonies of Slavonians from Russia and Poland settled in the country, and soon made themselves independent of the Byzantine government: thus arose the little kingdoms of Croatia and Dalmatia. The Venetians and Hungarians took some small portions (1090): in 1170 the kingdom of Rascia was created, out of which 200 years later Bosnia was formed. Dalmatia submitted to Venice, but was conquered in 1270 by the Hungarians; but both they and the Venetians soon lost almost the whole country to the Turks, the Venetians retaining only a small part of Dalmatia and the Hungarians Slavonia and Croatia. Thus the name of Illyria disappeared from the map of Europe till it was revived by Napoleon, who, after the conclusion of peace at Vienna in 1809, gave to several tracts of territory ceded by Austria, including Dalmatia, the name of the Illyrian Provinces. Those countries being recovered by Austria in 1813 and 1814, several of them were formed into the Kingdom of Illyria, the extent of which was reduced in 1822 by the separation of the circle of Carlsbad and of the Hungarian Littoral, which were annexed to Hungary. In 1849 a new territorial arrangement was made of the Austrian dominions, and the kingdom of Illyria ceased to be the title of one of the divisions of the empire.

The kingdom of Illyria, as constituted previous to 1849, lay between 44° 43' and 46° 25' N. lat., 13° 14' and 16° E. long., and was bounded N. by Austria and Styria, N.E. by Styria, S.E. by Croatia, S. by the Adriatic, and W. by Italy and Tyrol. The area was about 10,915 square miles: the population was 1,252,831 in 1842. The territory included in the kingdom of Illyria now forms the crownlands of CARNITHIA, CARNIOLA or KRAIN, and KÜSTENLAND, under which heads it will be found described.

ILMEN, LAKE. [RUSSIA.]

ILMINSTER, Somersetshire, a market-town in the parish of Ilminster, is situated near the river Isle or Ille, in 50° 55' N. lat., 2° 56' W. long., distant 44 miles S.W. by S. from Bath, and 136 miles S.S.W. from London. The population of the parish of Ilminster in 1851 was 3299. The living is a vicarage in the archdeaconry of Taunton and diocese of Bath and Wells.

Ilminster was a market-town at the time of the Domesday Survey. The town consists principally of two streets forming a cross; the longer street extends nearly a mile from east to west. The houses are neat and well built. The church, a large cruciform building, with a handsome pinnacled tower rising from the intersection, stands in the centre of the town. There are chapels for Wesleyan Methodists, Independents, and Unitarians; and National and Endowed schools. A Free Grammar school, founded in 1550, has an endowment of 600*l.* a year, and 4 exhibitions, value 15*l.* a year; in 1851 it had 51 pupils. The woollen-cloth, silk, and lace manufactures are carried on, and there are some tan-yards and a considerable malt-trade. The market is on Wednesday; there is one fair yearly.

ILSLEY, EAST, Berkshire, a market-town in the parish of East Ilsley, is situated in 51° 32' N. lat., 1° 17' W. long., distant 16 miles N.W. by W. from Reading, and 56 miles W. from London. The population of the parish in 1851 was 750. The living is a rectory in the archdeaconry of Berks and diocese of Oxford.

East Ilsley stands on the Berkshire Downs, in the midst of a country admirably adapted for sheep pasture. The town is celebrated for its sheep markets and great sheep fair, which are among the largest in England. The sheep markets commence on the Wednesday fortnight before Easter, and are held every alternate Wednesday till July. Fairs are held on the Wednesday in Easter week and the Wednesday in Whitsun week, the Wednesday after September 19th, the Wednesday after October 17th, the Wednesday after November 12th, for sheep, and the first Wednesday in July for wool. A great fair for sheep (at which 50,000 sheep and lambs have been penned for sale) is held on August 26th; and a statute fair on October 13th. The ordinary weekly market is held on Wednesday. The church, partly of Norman date, was repaired and enlarged in 1845. In the town are a Wesleyan chapel and a National school.

IMAUS. [HIMALAYA MOUNTAINS.]

IMBROS, an island of the *Ægean* Sea near the south-west coast of the Thracian Chersonesus, 18 miles south-east of the island of Samothrace, and about 22 miles north-east of Lemnos. It is now called Embro, and also Imru. It is of oval form, and its circumference is about 35 miles. Its surface is hilly and well wooded, and it abounds in game. The valleys produce abundantly corn, wine, oil, and cotton. The island is watered by a stream anciently called Ilius, and by many springs. The population consists of about 4000 Greeks, who inhabit four villages, the principal of which has a castle, and is called Imbro, being built on the site of the ancient town of that name, of which there are still some remains. This island was in remote times the seat of the worship of the Cabiri, like the neighbouring islands of Samothrace and Thasos. It was taken by the Persians about B.C. 503, under Otanes, general of Darius Hystaspes; and at this time it was still inhabited by the Pelasgians, its earliest known inhabitants. It was subsequently colonised by the Athenians. It was afterwards possessed in succession by the Macedonians, by Attalus, king of Pergamos, and lastly by the Romans. The island now belongs to Turkey.

Coin of Imbros.

Actual Size. Copper. Weight, 86 grains.

IMIRETIA. [GEORGIA.]

IMOLA, an episcopal town of the Papal States, in the province of Ravenna, is built in a fine plain on the banks of the Santerno (the ancient *Vatrenus*), over which there is a handsome bridge of recent construction. Imola is upon or near the site of the ancient Forum Corneli, but the present town was founded by the Longobards. Forum Corneli it is said was founded by Sulla, and surnamed from him; it was a place of some importance at the death of *Cæsar*, as in the civil war Octavianus made it his winter quarters. Martial resided for some time in Forum Corneli, which continued to flourish under the empire, and till about the 7th century. Its citadel was called Imolas, whence the modern name of the town. Imola with its suburbs contains 10,500 inhabitants. It has a fine cathedral and several other churches, a theatre, a handsome hospital, a college with a small public library, in which is a celebrated Hebrew manuscript of the Bible dating from the 13th century. The country around produces good wine: cream of tartar is manufactured in the town. Imola is on the high road from Bologna to Rimini, at the point where another road branches off to Ravenna. The bishopric of Imola was founded A.D. 422 by Pope Celestin I. Pius VII. and Pius IX. were bishops of Imola before their exaltation to the papal chair.

INAGUA. [BAHAMAS.]

INCHMARNOCK, Bute-shire, Scotland, a small island about a mile in length, lying off the west coast of Bute Island. In ancient times this islet was a seat of the Culdees. About one-fourth of the surface

is arable land, the remainder consisting of moor and pasture. Its mineral and agricultural products are similar to those of BUTE ISLAND. The area and population are returned with the royal burgh of ROTHESAY. On the island are the ruins of a chapel.

INDIA, BRITISH. [HINDUSTAN.]

INDIAN TERRITORY, United States of North America, an extensive tract of country set apart by the Congress and federal government for the permanent residence of the various tribes of native Indians removed from the settled states and territories of the Union. It lies generally between 33° 30' and 39° N. lat., 94° and 100° W. long., but the limits are not very strictly defined. It is bounded S. by Texas; E. by Arkansas and Missouri; and N. by the newly created territory of Kansas. The area, as given in the 'Report of the Census' of 1850, is 187,171 square miles, but this is considerably more than in previous statements of the area of what is sometimes called the Indian Territory proper, and perhaps includes a portion of the country since appropriated to Kansas Territory. The Indian inhabitants are estimated at from 100,000 to 120,000, four-fifths of whom have been transported from countries east of the Mississippi.

In the south-eastern part of the territory there is a range of hills of moderate elevation; the remainder is a plain, or at most has a gently undulating surface. A considerable portion of the country is prairie ground, but along the rivers there is a good deal of timber. The country is well supplied with water, having several good sized rivers running through it or along its borders on their way to the Missouri and the Mississippi. The Arkansas flows through the midst in a south-eastern direction, and receives in its passage numerous tributaries, some of considerable size. The chief of these tributaries is the Canadian River, which also has numerous affluents or 'forks.' The Red River waters the southern, and the Kansas the northern portion of the state: both of these, as well as the Arkansas, are navigable within the territory at certain seasons by steam-boats. The country possesses capabilities for the prosperous maintenance of a large population. The middle, and by far the larger part of the country, appears to belong to the Lower Carboniferous series of rocks. On the east are Upper Carboniferous strata, or coal-measures, a part of the great coal-basin of Missouri and Illinois. The western and north-western districts belong to the Cretaceous group of rocks. On the south is a narrow belt of Lower Silurian rocks, consisting along the Red River of blue limestone, with eruptive rocks. Coal is not the only mineral obtained. Both lead and iron are found; and there are saline springs, from which a large quantity of salt might be manufactured. The climate is generally healthy. The northern parts are subject to keen westerly winds from the Rocky Mountains, and the winters are rather cold; but in the southern parts the winters are mild, and all the plants are cultivable which are raised in other parts of the United States of the same latitude. The soil on the eastern side of the territory is generally fertile; the northern parts are well adapted for grazing cattle. Maize, wheat, and other grains produce good crops in almost every place where they have been tried.

As already said this large tract of country has been appropriated for the permanent residence of the Indian tribes transported from the settled parts of the United States. It need hardly be said that they have not turned to full account the capabilities of the country. But they have shown that they are capable of steady industrial efforts, and they have made very considerable advances in civilisation. Under the guidance of missionaries, who have settled amongst them, and with the sanction and assistance of the Commissioner of Indian Affairs, some of the larger tribes have established regular governments, legislatures, judicial officers, churches, schools, newspapers, &c.; have introduced the manufacture of agricultural implements, cloth, and most articles of ordinary farm and domestic use; cultivate the land with a considerable amount of skill; rear horses and cattle; build houses; and export to neighbouring states maize, cotton, hides, &c. By the treaty of removal and settlement, the federal government furnishes them with blacksmiths, wheelwrights, and some other mechanics, and at their first settlement gave them a stock of cattle, &c. Many of the tribes possess slaves.

The principal Indian tribes settled in the territory are the Cherokees, who numbered according to the Commissioner of Indian Affairs, about 17,600 in 1853, but whose numbers are usually estimated much higher; the Creeks, who numbered 25,000; the Choctaws, 16,000; the Osages, 4941; the Chickasaws, 4709; the Pottawatomies and Chippewas, 4680; the Pawnees, 4500; the Seminoles, 3000; the Sacs and Foxes, 2373; the Shawnees and Senecas, 1400; Delawares, 1130, &c. The Cherokees occupy a considerable tract lying on the north of the Arkansas River, and adjoining the state of Arkansas, and are the most civilised of all the Indian tribes. [CHEROKEES.] The Choctaws occupy the most southern part of the territory between the Red and Canadian rivers. The Chickasaws occupy a part of the same country, and are governed by the same laws. The country of the Choctaws is the most hilly and broken in the Indian territory, and is well watered by the above mentioned rivers and their tributaries. The Choctaws are extensively engaged in agriculture, raise large quantities of cotton and maize, and have good stocks of horses, cattle, and sheep. On the streams are numerous grist- and saw-mills, and cotton-gins. The houses and farms are well built, and the grounds fenced; the mechanical occupations are chiefly carried on by mechanics provided by the United States

government. The Choctaws have a written constitution and laws. The country is divided into four districts (one of which is occupied by the Chickasaws), each of which elects its own chief every fourth year. A general council of 40 members is elected annually, who meet in the council house, and pass all laws, &c., subject to a qualified veto by the chiefs. Trial by jury is established: with appeals to the higher courts. At the head of military affairs is a general elected by the people at large; and there are 32 captains in each district. Numerous missionaries are settled among both the tribes. The Creeks, with whom are united the Seminoles, occupy the country between the tracts of the Cherokees and Choctaws, watered by the Canadian River and the forks of the Arkansas. The country is less fertile than the districts occupied by those tribes, and the Creeks are on the whole a good deal less advanced in civilisation. But they have similar government, organisation, and judicature; they dwell together in towns, and to a certain extent cultivate their land in common; numerous missionaries are settled amongst them, under whose advice they have built several churches, and established good schools; and altogether the prospect of the future progress of the tribe is spoken of as highly promising. A proposition is said to have been lately made by the executive of the federal government through the Commissioner of Indian Affairs, to the Cherokees, Choctaws, and Creeks, offering to form a state out of the territory occupied by them, and thus admit them into the Union as citizens; but the Cherokees it is said were unwilling to be placed on the same level with the other tribes not so far advanced in civilisation, and the proposal fell to the ground.

Of the lesser tribes it may be enough to mention that the Shawnees and Senecas are settled in the northern part of the territory bordering on the Kansas River. They are a frugal industrious people, carefully cultivating their farms, and raising considerable crops of maize, cotton, vegetables, &c., and breeding horses, cattle, and swine. The Osages, Pottawatomies, and Chippewas occupy a tract north of the Cherokees; they are much less advanced in the arts of civilised life, and retain most of their old wandering habits. Their country is not very fertile, and they suffer much from the cold of winter, and from occasional droughts in summer.

(*Statistical Gazetteer of the United States*; Haskel and Smith, *Gazetteer of the United States*; Schoolcraft, *The Red Man of America*; *American Indians*; Brownell, *Indian Races of North America*; *Report of the Seventh Census of the United States*.)

INDIANA, one of the United States of North America, extends from the Ohio River on the south to Lake Michigan on the north, between 37° 51' and 40° 46' N. lat., 85° 49' and 88° 2' W. long. It is bounded E. by the state of Ohio; S. by the river Ohio, which divides it from Kentucky; W. by Illinois, the Wabash River forming the boundary from its confluence with the Ohio up to 39° 25'; N.W. by Lake Michigan; and N. by the state of Michigan. Its extreme length from north to south is 276 miles, its extreme breadth 175 miles; the average length is 242 miles, the average breadth 153 miles. The area is 33,809 square miles, or about 2500 square miles more than that of Scotland. The following table shows the state of the population, with the relative numbers of whites and coloured persons, at the decennial Censuses during the present century. The total population in

1800 was	4,875, including	163 free coloured persons,	and 135 slaves.
1810 "	24,520, "	393 "	237 "
1820 "	147,178, "	1330 "	190 "
1830 "	343,031, "	3629 "	8 "
1840 "	685,866, "	7165 "	8 "
1850 "	988,416, "	11,262 "	None.

The population in 1850 being all free, the state is entitled according to the ratio of representation, to send eleven representatives to Congress. To the Senate, like each of the other United States, Indiana sends two members.

Surface, Hydrography, Communications.—This state, like Illinois, has a general slope to the south-west. Like that state also it is, with few exceptions, one great plain. There is indeed a tract of hilly country north of the great bend of the Wabash, and the state is skirted on the south by those eminences called 'Ohio Hills,' which sometimes touch the Ohio and sometimes retire from it for two or three miles; they are generally very rugged in character; occasionally rise 300 feet above the river; and inclose what are termed the bottom-lands, which are chiefly covered with a rich alluvial soil, and thickly set with forests. The timbered and prairie lands are more intermixed in this state than is usual; and both prairies and timber lands are on a grand scale. The alluvial river bottoms are all wide. Of these wide valleys, the chief are the Ohio, White River, and Wabash valleys. The Ohio Valley, comprising an area of about 5000 square miles, is for the most part a limestone region, very rugged, and about one-third of it having a soil too poor or hilly for profitable culture. The White River Valley, extending from the Wabash through the centre of the state to the Ohio, with an area of 9000 square miles, is almost uniformly level and very heavily timbered, except in the western parts, where there are ranges of low rugged hills and some prairies and barrens. The soil throughout this valley is extremely rich, and water-power is abundant. The Wabash Valley is much larger than the others, comprising an area of upwards of 12,000 square miles. The eastern portion resembles the White River Valley, with which

it is connected. The other parts are hardly so fertile. Water-power is plentiful, especially in the middle part of the valley. The northern part of the country, watered by the St. Joseph and the Kankakee rivers, resembles the Wabash Valley in its general character, but in parts is much more swampy; and bordering on the latter it has extensive sand-hills, which are clothed with stunted pines and burr-oaks.

The state is amply watered by numerous fine rivers. Few of these however besides the Ohio and the Wabash are available for navigation; but most afford water-power for mechanical purposes. The Ohio and the Wabash are the two great rivers of Indiana. The Ohio is described under MISSISSIPPI RIVER. It forms the southern boundary of the state for a distance, by the windings of the river, of 330 miles, and is navigable throughout. It receives the water of nearly all the rivers of the state. The Wabash rises in Ohio and flows thence into this state, having a course first to the north and north-west and then to the south-west; it then makes a great bend to the south, and flowing in that direction about 90 miles it becomes the boundary of the state. Its whole course through this state, and along its western boundary is about 600 miles, for more than half of which distance it is navigable; but the navigation is interrupted by falls or rapids. All the other principal rivers of the state are tributaries of the Wabash. The White River, the most important of its tributaries, enters the Wabash about 110 miles above its mouth, and is formed of two main branches, of which the northern, called West Fork, has a south-west course of about 300 miles, and the southern, or East Fork, has also a general south-west course of 200 miles. Both of them receive several large tributaries. Above the great bend the Wabash receives the Tippecanoe and the Eel rivers from the north-east, then the Missisnewa from the south-east, and Little River from the north-east. White-water rises in Ohio, and entering this state on its eastern boundary after a course of 80 miles, returns to Ohio and falls into the Great Miami, which unites with the Ohio at the boundary of the two states. Many streams fall into the Ohio, but none of much magnitude. The same remark applies to the Calumic and Deep rivers, and some others which flow into Lake Michigan. The two branches of the Maumees, the St. Joseph's and St. Mary's, both enter this state from Ohio before their confluence, and, what is remarkable, in a course almost directly opposite to that which the united stream takes after the junction, when it turns eastward and re-enters Ohio, and passing in a north-easterly direction through the north-west corner of that state, falls into Lake Erie. Both the Kankakee, the principal arm of the Illinois, and its main branch the Pickimink rise in this state. The Kankakee rises near South Bend and runs sluggishly through the north-western counties for 100 miles, receiving on its way the Yellow River, 50 miles long; it is bordered throughout by extensive marshes. The Pickimink rises south of the Kankakee, runs nearly parallel to it for about 50 miles, and joins it in Illinois.

Besides Lake Michigan, its north-western boundary, the state possesses several lakes, but they are mostly small, and lie to the north of the Wabash River. Beaver Lake is six miles long, and three miles wide. Mexanuckee Lake, in Marshall county, though much less than Beaver Lake, has a far more picturesque appearance: it is about three miles long by a mile and a half wide. The other lakes seldom exceed a few acres in extent: they have mostly sandy bottoms and very clear water, and all of them abound in fish.

The state has two fine canals. The Wabash and Erie Canal extends from Evansville on the Ohio to Toledo on Lake Erie, 467 miles, of which 379 are in Indiana: it affords ready water communication with New York and Canada. The White River Canal extends from Lawrenceburg on the Ohio, to Hagerstown on the National Road, in Wayne county, 75 miles.

The ordinary roads are generally good, and there are many good plank-roads. The railways are numerous and well planned: considerably more than a thousand miles are in operation in the state, and almost as much more in course of construction. The lines mostly centre in Indianapolis, and place the capital and principal business towns of the state in communication with each other and those of the other states of the Union. The principal line is the State Central, which radiates in all directions from Indianapolis, and unites at the boundaries of the state with the lines of other states. Besides the lines which diverge from Indianapolis there are cross-lines between the other large towns in the state to connect the several branches or to join the railways of neighbouring states. We may enumerate the leading lines, including the arms of the State Central:—From Indianapolis there are lines—to Bellefontaine (Ohio), 118 miles; to Lawrenceburg, 90 miles; to Madison, 86 miles; to Evansville, 50 miles; to Terre Haute, 73 miles; to Peru, 73 miles; to Decatur—; to Shelbyville, 16 miles; to Steubenville, 149 miles; one in course of construction along the Wabash Valley; and some others projected or begun. Besides these from Indianapolis there are the Jeffersonville and Edinburg, 77 miles; New Albany and Salem, 287 miles; Shelbyville and Rushtown, 20 miles; Shelbyville and Knightstown, 27 miles; Lawrenceburg and Upper Mississippi, 90 miles; Martinsville and Franklin, 25 miles.

Geology, Mineralogy, &c.—The geology of the state is amply described in the Reports by Dr. Dale Owen of the Survey of Indiana made under instructions from the United States government. The most

striking feature in the geology of Indiana is the large space occupied by the Carboniferous strata. We will however notice the lower formations first. All the strata are Palaeozoic except some diluvial deposits in the northern part of the state, and a few patches of new red-sandstone which overlie the coal-measures. Silurian rocks occupy but a comparatively small area. Along the Ohio, at the south-eastern angle of the state, and extending for some distance northward, occur blue limestone rocks of the Lower Silurian order, forming a portion of the Silurian bed which belongs chiefly to Ohio and Kentucky. On the west and north they are encircled by strata of cliff limestone, in this part of the Union the characteristic rocks of the Upper Silurian system. Devonian rocks, connected with the beds which extend with few interruptions from Iowa through Illinois, Indiana, and Ohio to New York and Pennsylvania, occupy some of the northern and eastern counties. The upper cliff limestones belong to this series. The Carboniferous strata occupy nearly all the rest of the state. The Lower Carboniferous rocks consist of black bituminous and aluminous slates, which stretch in a narrow band north from New Albany in Floyd county to Decatur, and probably beneath the diluvium much farther north; of fine grained sandstone, forming the Knobs, or low isolated hills of the inner country; and of the oolitic limestones of Crawford, Orange, Lawrence, Putnam and other counties. These rocks occupy the country between 85° 30' and 87° W. long., as well as a belt quite across the northern part of the state. The remainder of the state west of 87° W. long., and up to 37° N. lat., is occupied by the Upper Carboniferous strata, or rocks of the coal-measures, being the eastern side of the great coal basin of Illinois. The freestones of this formation, according to Dr. Dale Owen, are soft and fissile, owing to the existence of mica disseminated in layers through their substance, as well as to the liability to decomposition of the ferruginous cement which unites their particles. The clay slates of this formation contain large quantities of iron-ore. In some places new red-sandstone rocks are said by Dr. Owen to overlie the coal-measures. The same authority states that a diluvium consisting of deposits of clay, sand, gravel, and boulders, overlies, and in many places covers up, the other formations to a greater or less depth, particularly in the northern parts of the state.

Neither of the precious metals occurs in Indiana. "The only metals," says Dr. Owen, "which need be looked for are iron, lead, antimony, manganese, zinc, cobalt, and possibly some varieties of copper and arsenic ore." Argillaceous iron-ore occurs largely in the clay-slates of the coal-measures; hydrated brown oxide of iron has been extensively found near the falls of Eel River, where large smelting-works have been established, and elsewhere also; bog-iron abounds in many places. Several detached pieces of native copper have been found in the state; but Dr. Dale Owen thinks that from the nature of the ore, its occurring in washed gravels, and only in isolated places, it does not originate in the state. Coal appears likely always to be the most valuable mineral product of Indiana, and from its abundance in the western counties, the whole of which are occupied by the coal-measures, Dr. Dale anticipates that they will some day become the seats of important manufactures. All the coal found in Indiana is bituminous. Salt is obtained in several places where the rocks are of the inferior members of the coal-measures. Sulphate of magnesia (Epsom salts) occurs in various parts. Good building-stone abounds. The oolitic limestones, which occupy a large space, make good building materials; as do also the encaustic limestones in the southern part of the state. The fossiliferous limestones of eastern Indiana are durable rocks, and some of them afford beautiful marbles. The fissile freestones of the coal-measures are too easily acted upon by the atmosphere to form a good building-stone, but there are excellent close-grained sandstones in other formations. Grindstones and whetstones of very superior quality are obtained and exported, to all parts of the United States. Some of the clay-slates of the carboniferous group make capital fire-bricks; and some of the clays of the coal-measures are well adapted for the manufacture of stone-ware and gray pottery. In the limestone rocks are numerous caverns. One of great extent near the Ohio is particularly noted: in it Epsom salts are found in lumps of from one to two pounds weight; a bushel of its earth yields from four to twenty-five pounds of the salt: nitre and gypsum are found in the same cave.

Climate, Soil, Productions, &c.—The climate resembles generally that of Illinois, but is somewhat more equable. In the northern parts the winters are severe; in the southern they are more genial. Except in the neighbourhood of the wet prairies and swamps the climate is everywhere healthy.

"The fertility of the soil of Indiana," says Dr. Owen, "is universally admitted, yet few are aware that it arises mainly from its geological position. It is well known to geologists that that soil is the most productive which has been derived from the destruction of the greatest variety of different rocks. . . . Now Indiana is situated near the middle of the great valley of north-western America, and far distant from the primitive ranges of mountains; and her soil is accordingly formed from the destruction of a vast variety of rocks, both crystalline and sedimentary, which have been minutely divided and intimately blended together by the action of air and water. It has all the elements therefore of extraordinary fertility. . . . The soil in Crawford, Lawrence, Orange, Monroe, Owen, and Putnam

[southern and midland] counties, being formed chiefly from the oolitic limestones, has a calcareous character, and is admirably adapted for the growth of grasses. Clay will be found to predominate in the soil of the counties of Floyd, Clark, Scott, Jennings, and parts of Bartholomew, Decatur, Shelby, Johnson, Marion, and Hancock [counties lying generally in the south-east], because the soil of those counties is underlaid by clay-slate. Hence we find the beech-tree, which delights in a clayey soil, there growing luxuriantly. The soil of Jefferson, Switzerland, Dearborn, Ripley, Franklin, Fayette, Union, and parts of Decatur and Rush [eastern counties], being formed upon alternating strata of clay and limestone, must partake chiefly of these two earths. This soil is also well adapted to the growth of grasses. The soil of the north-western counties appears to be a siliceo-calcareous sand, resting upon a clay bottom; this I conceive to be the reason why it is so much more productive than its external appearance promises." The alluvial tracts along the river courses are remarkably fertile.

Indiana is very rich in indigenous timber; all the trees natural to the soil and climate of the whole central region of the United States flourish in it; and many of the forest-trees, especially the oak, walnut, sycamore, and poplar, attain a noble size. Oak of various kinds, and beech, are the most prevalent; but the sugar-maple, ash, buckeye, hickory, walnut, elm, poplar, sycamore, coffee-tree, cherry, linden, honey-locust, and hackberry are as widely diffused though less abundant. The chestnut only occurs on the upper course of White River; the black locust is plentiful along the Ohio, but is not found in the interior; the pine occurs on the Knobs along the Ohio, and on the sand-hills bordering Lake Michigan; the tamarack is found only in the swamps of the Kankakee; the cotton-wood occurs chiefly in the valleys of the southern rivers; the catalpa, pecan, and cypress along the lower course of the White River. The dogwood, spear, thorn, and hazel are the principal of the smaller trees. In the forests, and on the borders of the prairies and barrens, are numerous indigenous fruit-trees, including the pawpaw, plum, cherry, mulberry, crab, &c.; and wild grapes, cranberries, gooseberries, blackberries, and strawberries abound.

The number of farms, the nature and proportion of the products cultivated, &c., will be sufficiently indicated by the following statement of the principal results of the inquiries made respecting the agricultural statistics at the last census. The number of farms under cultivation in Indiana on the 1st of June 1850 was 93,896; the extent of improved land in farms was 5,046,543 acres; of unimproved, 7,746,879 acres. The cash value of farms was returned at 136,385,173 dollars; of farming implements and machinery, 6,704,444 dollars. The total produce of the principal crops in 1850 was as follows:—Wheat, 6,214,458 bushels; maize, 52,964,363 bushels; rye, 78,792 bushels; oats, 5,655,014 bushels; barley, 45,483 bushels; buckwheat, 149,470 bushels; potatoes, 2,083,337 bushels; sweet potatoes, 201,711 bushels; peas and beans, 35,773 bushels; hops, 92,799 lbs.; hay, 403,280 tons; clover seed, 18,320 bushels; other grass seeds, 11,951 bushels; flax, 584,469 lbs.; flax-seed, 86,888 bushels; tobacco, 1,044,620 lbs. Of maple sugar 2,921,192 lbs., and 180,325 gallons of molasses, were made: the sugar-cane is not grown. Of wine 14,065 gallons were made; the wine, a kind of claret, made at the Swiss settlement of Vevay, is considered to be the best made in the United States. A very large quantity of hemp is grown and prepared; but of Indiana, as of Illinois, the 'Census Report' states the "returns were so confused, and all other sources of information so vague and indefinite, that it was deemed advisable to strike the item of hemp from the agricultural tables of the state." Scarcely any cotton is grown. The value of orchard products was 324,940 dollars; of market-garden products, 72,864 dollars.

The number of horses in the state in 1850 was 314,299; asses and mules, 6599; milch cows, 284,544; working oxen, 40,221; other cattle, 339,891; sheep, 1,122,493; swine, 2,263,776. The value of live stock was 22,478,555 dollars; of animals slaughtered, 6,567,935 dollars. The estimated value of poultry was 357,594 dollars. The products of animals were:—Butter, 12,831,635 lbs.; cheese, 624,564 lbs.; wool, 2,610,287 lbs.; silk cocoons, 387 lbs.; bees-wax and honey, 935,329 lbs.

Manufactures, Commerce, &c.—The western counties of Indiana are probably destined at some future day to become important manufacturing districts; but at present the manufacturing capabilities of the state are very imperfectly developed, though considerable progress has been and is constantly being made. The chief manufacturing towns are Madison, Cannelton, New Albany, and Indianapolis. At the census of 1850 there were returned as employed in commerce, trade, manufactures, mechanic arts, and mining, 45,318 free males over 15 years of age; the number employed in agriculture being 163,229, and in labour not agricultural 29,354. The whole number of manufacturing establishments producing to the value of 500 dollars and upwards in 1850 was 4326, of which 2 were cotton factories, 33 woollen factories, 19 iron-works, and 858 tanneries: the aggregate capital invested in manufactures was returned at 7,235,220 dollars. The cotton factories employed on an average 38 males and 57 females, and a capital of 43,000 dollars. The woollen factories employed 189 males and 57 females, and a capital of 171,545 dollars. The iron-works consisted of 14 for castings, employing 148 hands and

capital of 82,900 dollars; 2 for pig-iron, employing 88 hands and a capital of 72,000 dollars; and 2 for wrought-iron, employing 24 hands and a capital of 17,000 dollars. The tanneries employed 838 hands and a capital of 514,897 dollars. Besides these there are numerous flour, grist, oil, saw, and other mills; with coopers, wheelwrights, and other trades and handicrafts. The home-made manufactures of the year were valued at 1,681,089 dollars.

Indiana has no direct foreign commerce. It has however a very great trade with the other states, and a large domestic trade, for which its fine system of canals and railways, and its navigable rivers, afford remarkable facilities.

Divisions, Towns, &c.—Indiana is divided into 91 counties. Indianapolis is the political capital of the state; Madison and New Albany are however equally important towns. Of these, with such other places as call for particular notice, we append a brief account (the population is that of 1850):—

Indianapolis, the capital, stands nearly in the centre of the state, on the left bank of the White River, in 39° 55' N. lat., 86° 5' W. long., 573 miles W. by N. from Washington: population, 8091. On the admission of Indiana into the Union as a state, commissioners were appointed to select a site for the capital. This spot, then the midst of a dense forest, was chosen, and in 1821 the city was laid out. The main street, Washington Avenue, through which the National Road passes, is 120 feet wide; the secondary streets are 90 and 80 feet wide; they intersect at right angles. The state house is an imitation Greek building 180 feet long by 80 feet wide; the governor's house is a spacious edifice standing on a natural mound near the centre of the city; the other public buildings, many of them handsome and substantial structures, are the state offices, United States land office, spacious market-houses, several good churches, schools, colleges, benevolent institutions, hotels, bridges, &c. It is said that no other city of its size in the Union has equal public accommodation. The place has some manufactures and a good deal of trade, and from being the centre of the extensive railway system, mentioned above, has considerable goods traffic, and is a busy travelling station. Eight weekly newspapers (one or two with daily issues also) are published here.

Cannelton, on the Ohio, 124 miles S. by W. from Indianapolis, is a small but rising manufacturing town. It takes its name from the quality of coal obtained here; the manufactures are chiefly of cotton, and earthenware; fire clay, and building materials abound. *Columbus*, the capital of Bartholomew county, on the east fork of White River, 40 miles S. by E. from Indianapolis, population 1008, is another of the rising manufacturing towns of the state, and from its convenient situation and facilities of transport appears likely soon to become an important place. Two newspapers are published here weekly. *Connersville*, the capital of Fayette county, on the right bank of the White Water River, population 2200, is a place of considerable trade. The White Water Canal and the junction railway afford great facilities for communication with all parts of the country. The court-house is one of the finest public buildings in the state; there are several churches and public schools, and substantial stores and warehouses. Two newspapers are published weekly. *Crawfordsville*, on the left bank of Sugar Creek, an affluent of the Wabash, 46 miles W. by N. from Indianapolis, population 1513, is a busy manufacturing and commercial town, and the seat of Wabash College; two newspapers are published here weekly. *Evansville*, population 3235, stands on high ground, on the right bank of the Ohio, at the southern terminus of the Wabash and Erie Canal, and the Evansville and Illinois railway, and is the chief commercial town and travelling station on the Ohio between Louisville and the mouth of the river, a distance of 400 miles. In 1850 before the completion of the railway and canal the number of steamboat arrivals and departures was 5398; and the imports and exports were valued at 7,000,000 dollars: and since then the trade of the port has greatly increased. It will probably become the chief depôt of the coal-trade of the state. Besides the usual county buildings there are several churches and schools, a United States marine hospital, market-house, and several hotels, warehouses, and stores. Two daily newspapers, having also weekly issues, one tri-weekly, and one weekly newspaper are published here. *Fort Wayne*, the capital of Allen county, stands on high ground at the point where the St. Joseph and Mary rivers unite and form the Miami, about 105 miles N.E. by N. from Indianapolis: population, 4282. Being excellently situated for river, canal, railway, and plank-road communication, Fort Wayne has become within the last 10 years one of the most flourishing commercial towns in the state. Besides the county buildings, churches and schools, it contains a branch state bank, a United States land office, and extensive warehouses. Two newspapers are published here weekly. *Jeffersonville*, at the head of the falls of the Ohio opposite Louisville, 105 miles S. by E. from Indianapolis: population, 2122. The town contains besides churches and schools, a United States land office, several large stores and warehouses, and a good landing place. Steamboats are built here, and there is a considerable business carried on. *Lafayette City*, the capital of Tippecanoe county, stands in a very picturesque situation, on the left bank of the Wabash, 60 miles N.W. from Indianapolis: population, 6129. The city stands at the head of steamboat navigation, and is the centre of a large canal, railway, and plank-road traffic. Several considerable factories, and flour- and

paper-mills are in the city and its vicinity; and the surrounding country is extremely fertile. In the city are churches of all the leading sects; several public schools; a branch of the state bank and two other banks; and numerous stores, warehouses, and hotels. Two daily newspapers, having also weekly issues, and one weekly newspaper, are published here. *La Porte*, stands on the edge of a prairie, 130 miles N. by W. from Indianapolis, population 1821; it is the seat of the Indiana Medical College, and has a large trade in grain and live-stock. *Lawrenceburg*, on the Ohio, 2 miles below the confluence of the Great Miami, and 79 miles S.E. from Indianapolis: population, 3487. Partly as the shipping outlet of a singularly fertile valley, and partly owing to the great facilities for traffic which it possesses as the termini of the White Water Canal, and of the Lawrenceburg and Upper Mississippi railway, the city has become an important commercial centre. It carries on a considerable shipping trade, has several large mills, a very extensive distillery, and various manufacturing establishments; and supports two weekly newspapers. *Logansport*, the capital of Cass county, is situated at the head of steamboat navigation, at the confluence of the Eel River with the Wabash, 68 miles N. by W. from Indianapolis: population, about 3000. The falls of the Wabash, which are just above the town, afford vast water-power, by which several large mills are worked. The town is the mart for a wide and very fertile region, with which it is connected by river, canal, and plank-roads. Two newspapers are published here weekly. *Madison*, the capital of Jefferson county, on the Ohio, at the terminus of the Madison and Indianapolis railway, 56 miles S. by E. from the latter city; population, 8012. The city occupies a pleasant site; is regularly laid out with broad straight streets; contains the usual county buildings; several churches and schools; numerous trading establishments, cotton-factories, iron-works, flour- and other mills; and supports two newspapers. *New Albany*, a city, and the capital of Floyd county, stands on the Ohio, about 100 miles S. by E. from Indianapolis, and 4 miles W. by N. from Louisville: population, 8181, or with the suburbs, 9895. The city, now the largest in the state, is pleasantly situated, has wide streets running parallel to the river, with others crossing them at right angles; and is well provided with railway accommodation. The chief trade of the place is that of building and repairing the river steamboats; sloops and schooners are also built; and there are large iron- and machine-works, steam flour-, and saw-mills, &c. The city contains the county buildings, numerous churches, schools, a lyceum, &c.; and supports two daily and weekly newspapers. *New Harmony*, on the left bank of the Wabash, 143 miles S.W. by S. from Indianapolis, claims notice as the site of the establishment of two well-known socialist communities. The followers of the German socialist George Rapp, who on first emigrating from Suabia had established themselves in Butler county, Pennsylvania, removed here in 1814. For their colony they purchased 17,000 acres of land, which they cleared and laid out on a regular plan. They built good houses, churches, farm buildings, &c., and cultivated their land in a superior manner. Here they remained, having all things in common, until 1824, when not liking the climate they sold their settlement to Robert Owen of Lanark, and removed to Beaver county, Pennsylvania, where their new establishment, Economy, still exists. Owen and his followers formed a large community at New Harmony, but after awhile discord broke out, and the establishment proving a complete failure was broken up. *Rising Sun*, the capital of Ohio county, stands on high ground on the Ohio River, 87 miles S.E. from Indianapolis: population, 1654. It is a rapidly increasing commercial town, and the centre of a fertile district; contains the county buildings, six churches, several schools, cotton and woollen factories, tanneries, &c.; and supports two weekly newspapers. *Rushville*, the capital and centre of Rush county, on the left bank of Big Flat Creek, and on the line of the Rushville and Shelbyville railway, 38 miles E.S.E. from Indianapolis, population 2108, is a busy commercial town, containing the usual county buildings, several churches and schools, numerous mills, &c.; and supports two newspapers. *Shelbyville*, the capital of Shelby county, on the left bank of the Blue River, 26 miles S.E. from Indianapolis, population 995, though until the last two or three years a place of little note, is rapidly rising into importance in consequence of its having been made the point of junction of several lines of railway. *South Bend*, the capital of St. Joseph county, on the south bend of the St. Joseph River, at the northern extremity of the state, 192 miles N. from Indianapolis, population 1652, is one of the new towns of this state (it was founded in 1831) which are so rapidly growing into flourishing places, and of which the number of inhabitants conveys but a very insufficient idea of their activity and amount of business. The public buildings consist of a court-house, jail, market-place, 4 churches, schools, and a branch of the state bank, railway station, &c. There are a woollen factory, several saw-, flour-, and oil-mills; agricultural implement, edge-tool, and machine works, and a large peg, lathe, and veneer-mill. *Terre Haute*, the capital of Vigo county, and one of the most important towns in the state, received its name from the high ground forming the left bank of the Wabash on which it is built: population, 4051. The town contains a fine court-house, town-hall, 13 churches, several schools, a state bank, and numerous well-built stores, warehouses, and hotels. A very large business, wholesale as well as retail, is carried on. The

manufactories consist of 2 iron-foundries; 8 carriage and waggon factories; 13 cooperages; 2 soap-works; several steam-, oil-, flour-, and saw-mills; breweries and distilleries; and 4 large slaughter houses and packing establishments, in which 59,000 hogs were killed, salted, and packed in barrels in 1850. In the neighbourhood are rich beds of iron and coal. Terre Haute is on the Wabash and Erie Canal, and several of the most important railways of the state connect here. Six weekly newspapers are published in the town. Vincennes, the capital of Knox county, stands on the left bank of the Wabash, about 100 miles S.W. from Indianapolis: population, 2070. The town, which is the oldest in the state, having been founded by the French in 1702 as a trading port, and formed into a town with its present name in 1749, is regularly laid out, the principal streets lying parallel with the river, and others crossing them at right angles. The public edifices, which are of a somewhat superior character, are the county buildings, a fine town-hall, a market-house, United States land office, several churches, of which the Roman Catholic cathedral, a spacious and well-built structure, is the most noteworthy, and several schools, among others a Roman Catholic theological seminary, and 2 orphan schools. The Wabash is navigable up to Vincennes by steamboats, and the town has good railway accommodation. Washington, the capital of Davies county, on the left bank of the West Fork of the White River, 90 miles S.W. from Indianapolis, population 2578, is a place of local importance, containing, besides the county buildings, five churches, and several schools.

Government, Judicature, &c.—The present constitution of the state was passed in convention in February 1851, and having been ratified by the people a few months later, came into operation in November 1851. By it the right of voting appertains to every white male citizen of the United States who shall have resided in the state for six months; and every white male of foreign birth, 21 years old, who has resided in the United States one year, and in the state six months next preceding an election, and who shall have duly declared his intention to become a citizen of the United States. No coloured person can vote. All elections by the people are by ballot. The general assembly consists of a Senate of 50 members, who are elected for four years, half being elected every two years; and of a House of Representatives of 100 members, who are elected annually. The representatives are apportioned according to a census of white males taken every six years. The governor, who has a qualified veto on the acts of the legislature, is elected for three years, and has a salary of 1500 dollars. The total revenue of the state for the year ending November 1st 1852, was 1,283,604 dollars; the expenditure for the same year was 1,061,605 dollars. The public debt of the state, October 31st 1852, was, according to the financial statement of the state government—foreign debt, 6,712,880 dollars; domestic debt, 2175 dollars; total, 6,715,055 dollars: but Indiana though not a repudiating, was a defaulting state, and this amount does not include the entire sum borrowed and not repaid. In 1847 the state owed 11,048,000 dollars principal of her foreign debt, and 3,326,640 dollars interest, in all 14,374,640 dollars. In that year the legislature made proposals to the bond holders that they should complete the Wabash and Erie Canal and take the state's interest in it for half the sum due; and that the other half should be converted into new stock. It is only upon the new stock, made under this arrangement, that the state considers itself bound to pay either debt or interest. The redemption, principal and interest, of the half thrown upon the canal depends upon the receipts of the canal. Of the old bonds about 982,000 dollars remained unsurrendered and outstanding at the end of 1852. The assessed value of personal and real estate in Indiana in 1850 was 162,870,399 dollars; but the estimated or true value was placed at 202,650,264 dollars. No return of the state militia has been made to the federal government since 1832; it then consisted of 53,913 men, of whom 2861 were commissioned officers: it now probably comprises nearly treble that number.

The constitution prohibits slavery; and it further enacts that no coloured person shall come into, or settle in, the state; that all contracts made with such persons shall be void, and that all persons employing them shall be punished by a fine of from 10 to 500 dollars, and that the proceeds of such fines shall be appropriated for the colonisation of those negroes and mulattoes and their descendants who were in the state at the adoption of the constitution, and who are willing to emigrate.

The judicature consists of a supreme court, circuit courts, and courts of common pleas. The supreme court has appellate and certain original jurisdiction: it is presided over by four judges who have salaries of 1200 dollars each. There are eleven circuit courts, with civil and criminal jurisdiction, each presided over by a judge, with a salary of 1000 dollars, who is elected by the people of the circuit for six years. The district courts of common pleas are 44 in number; each is presided over by a judge who is elected for four years by the people of the district, and has a salary of from 300 to 800 dollars according to the number of inhabitants in the district; these courts have probate jurisdiction; and, under restrictions, civil jurisdiction where the amount in dispute does not exceed 100 dollars, and criminal jurisdiction in cases of misdemeanors and felonies not punishable with death.

Indiana has made liberal provision for the purposes of education.

GEN. DIV. VOL. III.

The total sum available for school purposes amounted in 1852 to 2,278,588 dollars; but the funds set aside, but not yet available will, with certain fines and forfeitures appropriated to the same end, it is estimated, amount to 5,000,000 dollars in 1857, when the chief amount will fall in. In 1850 there were 11 colleges in the state, having 61 teachers and 1069 pupils. The number of 'public schools' was 4822, having 4860 teachers, and 161,500 pupils. The total number of children in the state attending schools in that year, as returned by families was 220,034, of whom 923 were free coloured children. The number of adults in the state unable to read and write was 72,710, of whom 69,445 were natives and 3265 foreigners. The number of free coloured persons unable to read and write was 2170. The principal colleges are the Indiana State University, at Bloomington, founded in 1816, which has 5 professors, 32 students, and a library of 4200 volumes; Hanover College, at Hanover, founded in 1832, which has 6 tutors, 100 students, and a library of 5000 volumes; Wabash College, at Crawfordsville, founded in 1834, which has 7 tutors, 43 students, and a library of 6400 volumes; and Indiana Ashbury (Methodist) University, Greencastle, founded in 1837, which has 8 tutors, 120 pupils, and a library of 4000 volumes. There are state asylums at Indianapolis for the deaf and dumb, with 152 inmates in 1852; the blind with 51 inmates; and the insane with 159 inmates.

Of the members of religious sects in the state the Methodists are by far the most numerous, and after them the Baptists. In 1850 the Methodists had 778 churches, with accommodation for 266,372 persons; the Baptists had 428 churches, with accommodation for 138,783 persons; the Presbyterians had 282 churches with accommodation for 105,582 persons; the 'Christians' had 187 churches, with accommodation for 65,341 persons; the Quakers had 89 churches, with accommodation for 44,915 persons; the Roman Catholics had 63 churches, with accommodation for 25,115 persons; the Lutherans had 63 churches, with accommodation for 19,050 persons; the Episcopalians are returned as having only 23 churches, with accommodation for 7300 persons; and the Congregationalists as having only 2 churches, with accommodation for 1400 persons, while Moravians are much larger than the former, and Tunkers, Universalists, and several other sects exceed the latter. Indiana constitutes a diocese of the Protestant Episcopal Church, and also the Roman Catholic diocese of Vincennes. One hundred and seven periodicals, of which 2 are religious, 21 literary and miscellaneous, and 84 political, are published in the state: of these 95 are weekly publications; and the total annual circulation amounts to 4,316,823 copies.

Indiana formed a part of the cession of Virginia to the United States in 1787; and was included in the territory north-west of the Ohio until 1801, when it was with Illinois erected into a distinct territory. In 1809 it was placed under a separate territorial government; and in 1818 it was admitted into the Union as an independent state.

(Fisher, *Statistical Gazetteer of the United States*, 1853; Lippincott, *New Gazetteer of the United States*, 1854; Haskell and Smith, *Complete Gazetteer of the United States: Seventh Census of the United States, Official Report*, 1853; D. Dale Owen, *Geological Survey of the State of Indiana*; Marcou, *Geological Map of the United States, with Explanatory Text*; *American Almanac*, 1854, &c.)

INDRE. [HINDUSTAN.]

INDRE, a department in the interior of France, is bounded N. by the department of Loir-et-Cher, E. by that of Cher, S. by those of Creuse and Haute-Vienne, and W. by those of Vienne and Indre-et-Loire. It lies between 46° 21' and 47° 16' N. lat., 0° 53' and 2° 12' E. long., and measures 64 miles in its greatest length, with a mean breadth of 54 miles. The area is 2829 square miles. The population in 1846 was 268,977, in 1851 it amounted to 271,988; which gives 103.41 to the square mile, being 71.17 below the average per square mile for all France. The department is formed out of the western portion of the old province of Berri, and is named from its chief river the Indre.

Surface, Soil, &c.—The department is in general level; the only hills of any considerable size are the granitic swells on the southern border, and the gentle slopes that diversify the valleys of the Creuse and the Indre. The surface presents three marked and distinct divisions. The first called *Bois-Chaud* comprises seven-tenths of the whole department, including the arrondissements of La-Châtre, a great portion of those of Châteauroux and Le-Blanc, and a third of that of Issoudun; it is divided where arable into a great number of small farms, and presents a very varied appearance, from the number of its hedges, ditches, and woods. The second division, distinguished by the name of *Champagne*, is a flat treeless country, without hedge or inclosure of any kind, divided into large farms, and comprising two-thirds of the arrondissement of Issoudun and a part of that of Châteauroux. The third division, called *La-Brenne*, comprises parts of the arrondissements of Châteauroux and Le-Blanc, and presents a flat surface, covered in parts with shallow ponds, which rest on a bottom of compact clay, and which by their pestilential exhalations are very injurious to health. The land varies greatly in quality from light moss or barren sand to stiff clay, and from the vegetable mould half covered with flints to the rich homogeneous soil called 'terre de Beauce,' which is considered the most productive, and covers 194,790 acres. The flinty soils, amounting to 111,626 acres, are best adapted

for vine culture. All the land capable of cultivation is tilled, but agriculture is in a backward state. A line drawn from north-east to south-west through Châteauroux divides the chalk formation of the Paris basin from the new red-sandstone which occupies all the south-eastern division, except along the southern border, where the primitive rocks appear.

Rivers, Communications, &c.—The *Indre* rises just within the department of Creuse, and entering that of Indre flows north-west past Sainte-Sévère, La-Châtre, Châteauroux, and Châtillon, below which it enters the department of Indre-et-Loire; here passing Loches, where it becomes navigable, it continues in the same direction as far as Montbazou, and then turning west passes Azay-le-Rideau, below which it enters the Loire midway between the embouchures of the Cher and the Vienne. Its whole length is 124 miles, of which 44 miles are navigable; its mean width is 98 feet, and its ordinary depth from 5 to 6 feet. It is subject to floods, which rise from 10 to 11 feet at most, and spreading beyond the banks sometimes do great damage, but add greatly to the fertility of the soil. The number of mills along the banks of this river is very great. The south and south-west of the department is drained by the *Creuse* and its feeder the *Anglin*, which is itself increased by the *Abloux*. [CREUSE.] The west of the department is drained by the *Claise*, a feeder of the *Creuse*, which flows through the marshy district of Brenne; and the east and north are drained by feeders of the Cher, namely, the *Aron*, which receives the *Théols*, and the *Fouzon*, fed by the *Nahon*.

The department is crossed by a railroad which branches off from the Orléans-Bourges line at Vierzon, and runs through Issoudun and Châteauroux to Argenton on the Creuse. It is traversed also by 6 imperial, 16 departmental, and 31 parish roads.

Produce, &c.—The department contains 1,688,021 acres, of which 992,215 acres are under tillage; 210,796 consist of natural pasture; 44,752 acres are under vine culture; 166,609 are covered with woods and forests; 185,368 acres consist of sands, heaths, and barren moors; 18,274 acres are occupied as orchards, nurseries, gardens, and plantations of different sorts; and 31,055 acres are covered with ponds, rivers, canals, &c. The common breadstuffs are produced in quantity more than enough for the consumption; buck-wheat, hemp, flax, chestnuts, and fruits are also grown. The annual produce of wine is 6,600,000 gallons, about one-half of which is exported. Although the pasture land is of no great extent, yet considerable numbers of horned cattle are kept; hay is saved for their winter food, and in summer the scantiness of the pasture is eked out with the leaves of trees, especially with those of the elm. Sheep are a source of great profit to the farmer on account of the fineness of their wool; the quality of the wool of the Champagne district especially is very superior. The sheep are very carefully tended; ewes, lamb-hogs, and wethers are kept in separate flocks, each under its own shepherd; they are never folded: when the winter is severe they get a mixture of hay and straw three times a day. Great numbers of geese and turkeys are reared, and also of mules, pigs, and horses. The climate is mild and healthy except in the Brenne district, where the atmosphere is almost always charged with pestilential fogs.

Minerals, Manufactures, &c.—Several iron-mines are worked; marble, millstone, limestone, mica, flint, lithographic stones, granite, quartz, spar, marl, potters'-clay, variegated marbles, &c., are found.

The cloth manufactures of Châteauroux and some other places in the department are important; linen, hosiery, scythes, paper, porcelain, and earthenware are manufactured. There are also numerous establishments for the manufacture of woollen-yarn, leather, beer, parchment, &c. The number of iron forges and foundries is 17; of wind- and water-mills, 573; and of factories of different kinds, 217. The most important iron-works are those of Clavières. The commerce of the department is composed of the various agricultural and industrial products named. Fairs are held principally for the sale of sheep.

Divisions and Towns.—The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Châteauroux . . .	6	63	102,949
2. Le-Blanc . . .	6	66	61,077
3. Issoudun . . .	4	49	50,568
4. La-Châtre . . .	5	69	47,344
Total . . .	21	247	271,938

1. Of the first arrondissement and of the whole department the capital is CHATEAUX. Of the other towns we briefly notice the following, the population in each case being that of the commune:—*Argenton-sur-Creuse*, 19 miles by railway S.S.W. from Châteauroux, is built on both banks of the Creuse, and consists of an upper town which grew up round an ancient castle now in ruins, and of a lower town joined to the former by a stone bridge. The most remarkable structures now remaining in the upper town, which is entered by four gates, are the Gate of Auditory, now used as a prison, and the deserted church of St. Benoît, now used as the corn-market, on the roof

of which are still seen the arms of Louis de Bourbon, count of Vendôme. Linen, broadcloth, tiles, bricks, woollen-yarn, paper, leather, &c., are manufactured in the town, which has 4346 inhabitants. *Boury-Dieu*, or *Déols*, formerly a large town and the capital of Lower Berri, now a village of 2344 inhabitants, stands about a mile N. of Châteauroux. It was celebrated for its Benedictine abbey, the suppression of which by Pope Gregory XV. in 1623 caused the decay of the town. Of the vast buildings of the abbey only a single tower is now standing; the magnificent ruins which remained till 1830 were then sold and removed as materials for building. *Buzançais*, prettily situated 13 miles W. from Châteauroux, on a hill on the right bank of the river Indre, which is here crossed by five bridges, is an ill-built town with 4480 inhabitants, who manufacture coarse woollens and woollen-yarn. There are several flour-mills in the town, and in the environs there are large iron-works. *Châtillon-sur-Indre*, formerly an important fortress on the frontiers of Berri, is built on a height crowned by the ruins of an ancient castle, near the left bank of the Indre, 26 miles N.W. from Châteauroux, and has 3575 inhabitants. The church is a large and handsome structure, which dates from the 10th century, and contains some remarkable sculptures. In the principal street there is an ancient house, on the front of which are figures of Momus and a player on the pipe. From the market-place there is a fine view of the valley of the Indre. *Lévrault*, the ancient *Gabatium*, stands on the Nahon, 12 miles N. from Châteauroux, and has 3166 inhabitants, who manufacture cloth and leather, and deal in corn, wine, wool, and cattle. The parish church of Lévrault, though small, is considered the finest ecclesiastical edifice in all Lower Berry. It consists of a nave and aisles terminating in three distinct apses. The nave is separated from the aisles by lofty ogival arches, surmounted by an open gallery and clerestory with semicircular windows. In the principal façade is a portal doorway, the archivolts of which are ornamented with statuettes of angels and saints; and the lower part of the tympanum terminates in a broad band covered with bas-reliefs representing the Resurrection of the Dead. Several Roman remains and Celtic coins have been found in and near this town, some of the fortifications of which still remain. *Valençay*, farther north on the left bank of the Nahon, has a population of 3229, and manufactures of hosiery, cloth, cutlery, and fine woollen-yarn. The great ornament of Valençay is the magnificent chateau, or rather palace, built in the reign of François I. by the family of Étampes; it is surrounded by a large park in which there are beautiful gardens and waterworks. This chateau was the prison of Ferdinand VII., king of Spain, from 1808 to 1814; it was the property of Talleyrand, who for some time made it his residence.

2. In the second arrondissement the chief town, *Le-Blanc*, is beautifully situated in 46° 37' 47" N. lat., 1° 3' 41" E. long., on the Creuse, here crossed by a handsome bridge, above which the river expands so as to form a lake, and below it breaks into cascades, generating force to drive the machinery of several factories. The town is not well built, but it is improving, and has considerable cloth-factories, vinegar-works, potteries, a linen-yarn mill with 3600 spindles, a large brewery, and several iron-forges and smelting-furnaces. It is the seat of a tribunal of first instance, and has a savings bank, and 6330 inhabitants in the commune, who trade in wine, fish, timber, staves, and the articles named before. *Béâtre*, S. by E. of Le-Blanc, on the right bank of the Anglin, has 2175 inhabitants, and some remains of an ancient castle. *Mesdres-en-Brenne* (under 2000 inhabitants), stands N. by E. of Le-Blanc, on the right bank of the Claise, in a district not long ago an unapproachable marsh, but now drained, planted, and well cultivated. There is a remarkable church here, which was dedicated in 1339 to Sainte Marie-Madeleine, and contains many mementoes of the family of Anjou. *St-Gaultier*, E. of Le-Blanc, on the Creuse, which is here crossed by a suspension-bridge, has an ecclesiastical college, and a population of 1793.

3. In the third arrondissement the chief town, *Issoudun*, is situated partly on the slope, and partly at the foot of a hill above the river Théols, which is here crossed by three bridges, leading to as many suburbs, in 46° 56' 54" N. lat., 2° 0' 49" E. long., at a distance of 17 miles by railway N.E. from Châteauroux, and has 13,215 inhabitants in the commune. The older part of the town, called *Le-Château*, has very good houses, but the streets are dirty, narrow, and tortuous; the rest of the town is better built, having been constructed since the terrible conflagration of 1651, which broke out at a time when the city was assaulted by the army of the Fronde, and by which above 1000 houses were destroyed. The principal buildings are the residences of the prefect and the mayor; opposite the latter, in a picturesque garden, stands an ancient tower of great strength, called *La-Tour-Blanche*, the walls of which are 14 feet thick, and rise to the height of 95 feet. Other remarkable objects are—the former town-gate and tower, now used as a prison; the hospital, in the chapel of which are some curious sculptured monuments; the former Ursuline convent, now a barrack; the former Carmelite convent, now a private residence, the theatre, and the several public walks. The town has tribunals of first instance and of commerce; a consultative chamber of manufactures, and a college. Woollen-cloth and yarn, calico, hosiery, parchment, leather, and beer are the principal industrial products; there are some bleaching establishments also, and a good business is done in the articles enumerated, and in corn, wine, wool,

cattle, wood, timber, iron of superior quality, &c. *Vatan*, which stands 18 miles N.W. from Issoudun, has an ancient church dedicated to St.-Laurian, and rebuilt in 1005: population, 2978. *Reuilly*, 9 miles N. by railway from Issoudun, stands near the Théols and has 2241 inhabitants. In the town there is a remarkable structure in the Renaissance style, which is called *La-Grande-Maison*; and in the environs is the splendid residence of Ferté-Reuilly, built by Mansard in 1659 for Jacques de la Fond. An ancient gothic church stands half a mile south of the town, on the hill of Vergy, the summit of which was formerly crowned by a strong fortress.

4. In the fourth arrondissement the chief town is *La-Châtre*, which stands in the most fertile and picturesque part of Berri, on a hill that skirts the Indre on one side and overlooks on the other a deep narrow valley laid out in gardens and orchards. It is situated in 46° 34' 53" N. lat., 1° 59' 4" E. long., 19 miles S.E. from Châteauroux, and has a tribunal of first instance, a college, and 4889 inhabitants. The streets are well but not regularly built, yet the town makes an agreeable impression from the charming scenery which is presented to view from almost every point. The most remarkable structures are the church and two ancient wooden houses. Woollen-cloth and leather are manufactured; there is also a considerable trade in wool, goat-skins, feathers, cattle, and chestnuts (of which large quantities are grown in the neighbourhood). *Aigurande*, S. of La-Châtre, has a population of 2005. *Neuvy-St.-Sépulchre*, said to occupy the site of the ancient *Noviodunum*, is 8 miles W. from La-Châtre, and has a population of 2003. *Sainte-Sévère*, formerly a strong fortress, now a village of about 1000 inhabitants, stands near the Indre, 6 miles S.S.E. from La-Châtre. Of its formidable defences, which were with great difficulty mastered by Duguesclin, only a single tower remains.

The department forms, together with that of Cher, the see of the Archbishop of Bourges; it is comprised in the jurisdiction of the High Court and University Academy of Bourges, and belongs to the 19th Military Division, of which Bourges is head-quarters. It returns four members to the Legislative Body of the French Empire.

(*Dictionnaire de la France; Statistique de la France; Richard, Guide Classique du Voyageur en France; Official Papers; Annuaire pour l'An 1853.*)

INDRE-ET-LOIRE, a department in the interior of France, is bounded N. and N.E. by the departments of Sarthe and Loir-et-Cher, E. and S.E. by those of Loir-et-Cher and Indre, S. by those of Indre and Vienne, and W. by those of Vienne and Maine-et-Loire. It lies between 46° 43' and 47° 42' N. lat., 0° 5' and 1° 18' E. long.; its greatest length from north to south is 68 miles, from east to west 55 miles. The area is 2860.6 square miles; the population in 1846 was 312,400, in 1851 it amounted to 315,641, which gives 183.71 to the square mile, being 40.87 below the average per square mile for all France.

Rivers and Roads.—The department, which is formed out of the old province of Touraine, is named from the rivers *INDRE* and *LOIRE*, which unite their waters within its limits. The other rivers which ultimately or directly enter the Loire on the left bank are the *CHER*, which throws off several arms to the Loire, forming islands before its main stream enters that river: the *Claise*, which crosses the southern angle of the department [*INDRE*]: the *CREUSE*, which forms part of the south-western boundary: and the *VIENNE*, which enters this department at the point where it is joined by the Creuse, and, flowing in a north-western course past Chinon, enters the Loire at the extreme western angle of the department. On the right bank the feeders of the Loire in this department are the *Brenne* and the *Doit*. The *Doit* rises in a pond west of Savigné; flowing south past Bourgueil, it then turns west, and, under the name of *Aulon*, runs for the distance of 40 miles parallel to the Loire, which it enters in the centre of the department of Maine-et-Loire at St.-Aubin-des-Ponts-de-Cé, south of Angers. Except the Brenne, the Doit, and the Claise, all the rivers mentioned are navigable. The department is traversed by 6 imperial and 28 departmental roads; and by the railways that connect Paris by way of Orleans with Nantes and Bordeaux; the Nantes line running down the valley of the Loire through Tours, whence the railway to Bordeaux branches off nearly in a southern direction, crossing the Creuse on the southern border at a little distance from the Sainte-Maure station.

Surface and Soil.—The Loire and its principal feeders are subject to inundations, which frequently do incalculable damage to property on their banks. The most disastrous overflow of this kind on record occurred in October 1846, when in one night the Loire rose 20 feet, and continued to rise for two days, sweeping away bridges and viaducts, destroying many lives, and property to the amount of about 2,000,000 sterling. On ordinary occasions such disasters are prevented by the enormous dykes that line both banks of this great river from the neighbourhood of Blois to the mouth of the Aulon before mentioned, a distance of 93 miles. The dykes are 22 feet wide on the top, and so high as to intercept the view of the low grounds from passengers by the steamers that ply on the river; the parts most exposed to the flood are faced with uncemented masonry. The high road runs along the summit of the dyke on the right bank, and presents one of the finest drives in the world, curtained with poplars and diversified by the views of villas, towns, populous villages, and those curious dwellings hollowed out in the sides of the

rocky hills that now and then approach the right shore. The Loire below Tours incloses several large islands.

To the north of the Loire the surface of the department is hilly, and presents some extensive forests and several vast barren and arid wastes. The cultivation here is rude in the extreme, and the population scanty. Along the banks of the Loire however a very different aspect presents itself; well-cultivated fields, luxuriant pastures and meadows, vineyards and orchards, attesting equally the fertility of the deep alluvial soil and the industry of the inhabitants. Between the Indre and the Vienne there is a remarkable table-land, which contains an immense deposit of fossil shells. The great forests south of the Loire are those of Amboise, Loches, and Chinon. On the slopes surrounding the forest of Amboise are the vineyards that yield the rich Cher wines. In general the surface in this portion of the department presents strong deep wheat soils, rich pastures, vineyards, and orchards. There are however some barren wastes here as well as north of the Loire, but they are comparatively of small extent. The inundations of the rivers add greatly to the fertility of the soil.

Produce, Agricultural and Mineral.—The department contains 1,510,783 acres, of which 827,610 acres are arable land; 329,806 acres consist of grass land; 86,499 acres are under vine culture; 222,402 acres are covered with woods and forests; 155,630 acres consist of heath and moorland; 13,423 acres are under orchards, nurseries, plantations, &c.; 45,075 acres under various cultivation; 20,424 acres are covered with rivers and waters; and 50,631 acres are occupied by roads, streets, buildings, &c. The valleys of the Loire and the other principal rivers in this department contain some of the most fertile and best cultivated land in France. All kinds of bread-stuffs are produced in quantity more than enough for the consumption. One of the most important products is wine, of which 13,816,000 gallons are made in ordinary years. Among the other products are hemp, walnuts for making oil, plums, beans, leguminous plants, liquorice, anise and coriander, citrons, melons, almonds, apples, pears, truffles, &c. Bees and silkworms are carefully tended; game and fish are abundant.

Geologically speaking the department belongs to the chalk formation of the Paris basin; the chalk is covered over a large area with deep alluvial deposits. Iron-mines are worked; stone, especially a tuffaceous sandstone, of which most of the houses are built, is quarried out of the hills near the Loire, and excavations thus formed are occupied as dwelling-places by the poorer inhabitants. Millstone-grit, marl, potters'-clay, pipe-clay, and brick-earth are found. Copper ore is met with, but no mines are worked.

Industrial Products.—The chief industrial products are bar iron, powder, and files; woollen-cloth, of which manufacture Tours is the centre; silk, leather, paper, and pottery are also made, but the manufacture of these articles is not so important as formerly. The exports consist mostly of agricultural products, the imports of colonial produce, glass, cotton stuffs, fine linen and woollen-cloth, furniture, haberdashery, &c. About 90 fairs for the sale of cattle and agricultural produce are held. In the department are 726 wind- and water-mills, 46 iron-forges and smelting-furnaces, and 199 factories of different sorts. Druidical or Celtic remains are numerous in this part of France.

Divisions and Towns.—The department is divided into three arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Tours	11	126	160,875
2. Chinon	7	87	90,137
3. Loches	6	68	64,629
Total	24	281	315,641

1. In the first arrondissement the chief town, *Tours*, which is also the capital of the department, stands on the left bank of the Loire, in a plain that lies between that river and the Cher, in 47° 23' 46" N. lat., 0° 41' 24" E. long., 65 miles by railway S.W. from Orléans, and has 30,189 inhabitants in the commune. Tours, as well as Touraine (of which it was the capital), takes its name from the Turones, a Celtic tribe, of whose capital *Casarodunum*, or *Casarmagus*, it occupies the site. The entrance to the city from the Paris road is striking; a magnificent stone bridge of 15 arches, 475 yards in length and 16 yards wide, leads across the Loire into a spacious square, inclosed by the wide river on the northern side, and by the fine buildings of the town-hall and the museum on the south, while the east and west sides are formed by two terraces planted with trees. Passing through the square, a straight wide street (*Rue Royale*) is entered, consisting of houses built in good taste and on a uniform plan; this street, which is furnished with foot pavements, runs right across the town in its widest part, and terminates in the avenue of Grammont, at the end of which a bridge crosses the Cher into the Poitiers road. The other streets are, with few exceptions, ill-built, narrow, and crooked. There are several suburbs, but these can scarcely be distinguished from the town itself, as it has no ramparts except on the side next the Cher, and these are laid out so as to form

the fine promenade called Le-Mail. The wide quays along the Loire, which is joined to the Cher by a canal, are a great ornament to the town; they extend on each side of the bridge, are planted with trees, and backed by large buildings. The cathedral, originally founded by St. Martin A.D. 347, destroyed by fire in 561, rebuilt on a grander scale by Gregory of Tours, destroyed by fire a second time in the reign of Louis VII., and again rebuilt, but so slowly that the works were not completed till 1550, is dedicated to St. Gratien, first bishop of Tours. The west front presents an ornamented portal entrance, surmounted by a magnificent rose window; it is flanked by two square towers 263 feet in height and terminating in small domes. The cavalry barracks are built on the site of the English Henry II.'s castle, of which only a single tower now remains. Two lofty towers in the Rue St. Martin (one containing a clock, and hence called Tour d'Horloge, and the other called La Tour de Charlemagne, from the belief that Charlemagne's queen was buried beneath it) are the only remains of the great cathedral of St. Martin-de-Tours. Among the other remarkable objects in the town are the churches of St. Clément and De-la-Riche; the fountain of Beaune, which stands in the market-place and consists of an octagonal basin filled with water, gushing in four jets from a central pyramid adorned with sculptures and arabesques; the archiepiscopal palace; the court-house; the college buildings; the general hospital; and the residence of the prefect, which also contains a public library of 40,000 volumes and several valuable manuscripts. Tours has a tribunal of first instance, a tribunal and chamber of commerce, one communal and two ecclesiastical colleges, a botanic garden, and several literary and scientific societies. A statue of Descartes was erected in Tours in 1852. The chief manufactures are woollen-cloth, silk stuffs, ribands, serge, carpets, small wares, wax candles, woollen-yarn, leather, &c.; the commerce is composed of these articles and of corn, wine, brandy, plums and dried fruit, hemp, wool, &c. Tours had, in the middle ages, one of the most important mints in France, in which were coined the 'livres tournoises,' often named in history, and each worth a franc. In one of the suburbs of Tours, called Riche (2000 inhabitants), stood the castle of Plessis-les-Tours, in which Louis XI. died; the keep is the only part of the edifice now standing.

Among the other towns of the arrondissement we notice the following: the population in each case is that of the commune.—*Amboise* stands 15 miles by railway E. from Tours, on the left bank of the Loire, which is here crossed by a fine bridge erected in 1822: population, 4600. The town stands in a wine district, which from its richness has been called 'the Garden of France.' It has some manufactures of steel and files. There is an ancient castle in Amboise which was formerly the residence of several of the kings of France. King Louis Philippe, whose property it was, made great improvements in it, and restored the chapel, which stands in the gardens, and is one of the finest specimens of the florid gothic style of architecture in France. It was in Amboise the civil wars on account of religion broke out in the 16th century; and here also the epithet 'Huguenots' was first applied to the Calvinists in 1560. The castle of Amboise was the residence of Abd-el-Kader during the greater part of his captivity in France. *Blerb*, a busy little town of 3417 inhabitants, stands on the left bank of the Cher, which is here crossed by a bridge built by Henry II. of England. *Château-la-Vallière*, in the north-west of the department, has iron-forges and 1370 inhabitants. *Château-Renault* stands on the slope and at the foot of a hill in a pretty country on the Brenne, and has 2887 inhabitants, who manufacture cloth, flannel, leather, and tiles: the town is named from an old castle built in the year 981, and still standing. *Montbazou* is a small place on the right bank of the Indre, with a population of only 1181, but important for the great powder-mills and saltpetre-works near it. *Vouvray*, which is situated 5 miles E. from Tours, on the Loire, in a district famous for its white wine, has 2448 inhabitants.

2. In the second arrondissement the chief town, *Chinon*, stands in 47° 10' 7" N. lat., 0° 14' 27" E. long., on the Vienne, at the foot of a hill, the summit of which is covered with the ruins of the ancient fortress of Chinon, in which Henry II. died, and Joan of Arc had her first interview with Charles VII. It is 28 miles S.W. from Tours, and has a tribunal of first instance, a college, savings bank; and 6675 inhabitants, who manufacture serge, drugget, haircloth, earthenware, saltpetre, &c., and trade in cattle, corn, wine, brandy, plums, nut-oil, honey, wax, &c. Chinon is an improving town; the old ramparts are now replaced by quays. *Asay-le-Rideau*, prettily situated on the Indre, about 5 miles above its junction with the Loire, is remarkable for a fine structure called Château d'Asay, built on an island in the Indre: the commune has 2105 inhabitants. *Bourgueil*, situated in a very fertile district on the right bank of the Doire, at a distance of 10 miles N. from Chinon, has a college and 3498 inhabitants. *Cinq-Mars*, on the left bank of the Loire, 18 miles by railway W. from Tours, is a small place of only 1728 inhabitants. It deserves notice on account of its ancient square tower, which is built of bricks, perfectly solid, 90 feet high, 13 feet wide on each face, and surmounted at the angles by four pinnacles, each 11 feet high; a central pinnacle was thrown down by a storm in 1571. The purpose and date of its erection are unknown. *Langeais*, 18 miles N.N.E. from Chinon, and about the same distance by railway from Tours, stands on the right bank of the Loire, and has 3138 inhabitants, who trade in agricultural

produce and manufacture linen, tiles, and bricks. The castle in which Charles VIII. espoused Anne of Brittany is still in tolerable preservation, but has been converted into a stable. *Sainte-Maure* stands on the right bank of the Mause (a small feeder of the Vienne), 18 miles E. from Chinon, 23 miles S. from Tours by the Bordeaux railroad, and has 2602 inhabitants, who manufacture linen, printed calicoes, and haircloth. The church of Sainte-Maure is one of the finest in Touraine; it dates from the 12th century, and beneath it there is a crypt still more ancient. *Richelieu*, a well-built town, consisting of several wide straight streets that terminate in a handsome square in the centre of the town, stands 12 miles S. from Chinon on the Mable, and has 2832 inhabitants, who manufacture beet-root sugar and brandy, and have a considerable trade in wine, fruits, and other agricultural produce. Cardinal Richelieu erected a residence here in 1637, and the town was then built on a regular plan; the cardinal's palace is now a heap of ruins.

3. In the third arrondissement the chief town, *Loches*, stands on the left bank of the Indre, at a little distance from *Beaulieu*, a suburb of 2000 inhabitants, to which it is joined by several bridges thrown across the arms of the river. The town is 25 miles S. by E. from Tours, in 47° 7' 31" N. lat., 0° 59' 53" E. long. It is built round the base of a hill, the summit of which is crowned by the remains of its ancient castle. The situation of Loches in the rich and beautiful valley of the Indre, and the historical associations connected with it, renders it one of the most interesting towns in Touraine. A great part of the castle, in which several of the kings of France resided, and which also served as a state prison for illustrious political offenders, is now in ruins, with the exception of the keep, which is used as a prison, and a more modern portion, in which the sub-prefect resides. Between the keep and the residence of the sub-prefect is the church of St.-Ours, which has a stone roof surmounted by two lofty pyramidal spires; the tomb of Agnès Sorel, mistress of Charles VII., is in this church. At a short distance from the town, and near the forest of Loches, which supplies mast timber to the French navy, are the ruins of the Carthusian convent of Liget, founded by Henry II. in expiation of the murder of Thomas à-Becket. The town of Loches presents narrow streets and ancient houses; it has a tribunal of first instance, a college, and 5040 inhabitants, who manufacture linen, coarse cloth, woollen-yarn, and paper. *La-Haye-Descartes*, the birth-place of Descartes, is prettily situated on the right bank of the Creuse, and has 1459 inhabitants. *Liguil*, W. of Loches, stands on the Estrigneuil, a feeder of the Creuse, and has 1929 inhabitants, who grow great quantities of plums. *Le-Grand-Pressigny*, on the right bank of the Claise, with a population of 1876; and *Preuilly*, further south on the same bank of the Claise, which has iron-forges and 2264 inhabitants, give name to cantons.

The department forms the see of the Archbishop of Tours, is included in the jurisdiction of the High Court of Orléans, and belongs to the 18th Military Division, of which Tours is head-quarter. It has 3 representatives in the Legislative Body of France.

(*Dictionnaire de la France*; Richard, *Guide Classique du Voyageur en France*; *Statistique de la France*; *Official Papers*; *Annuaire pour l'An 1853*.)

INDUS. [HINDUSTAN.]

INGOLSTADT. [ESSEX.]

INGOLSTADT, a fortified town of Bavaria, is situated in 48° 45' 50" N. lat., 11° 25' 31" E. long., on the left bank of the Danube, 44 miles nearly due N. from Munich, and has about 9000 inhabitants. It was formerly the most important fortress in Bavaria, and sustained several sieges: in the year 1800 it withstood the French under Moreau for three months, but was at last taken and the fortifications were demolished. The fortifications have been recently rebuilt on an improved plan, and include ramparts strengthened by several massive round towers and a tête-du-pont. The town is well built, with long broad streets, situated in a fertile country on the Danube, over which there is a stone bridge. It is a dull place, too large for its population, and has very little trade. It has nine churches and two nunneries. The principal buildings are the upper parish church of St. Mary, which contains several monuments and is surmounted by two massive towers; the former Jesuits' college; and the former university buildings. The University of Ingolstadt was founded in 1472, and transferred to Landshut in 1800, and some years afterwards to Munich.

INISHOWEN, Donegal, Ireland, a Poor-Law Union which comprises nearly the whole of the peninsula of Inishowen. [DONEGAL.] It is divided into 21 electoral districts comprising an area of 159,408 acres, and a population in 1851 of 39,084.

INNISTOGUE. [KILKENNY.]

INN. [AUSTRIA; TYROL.]

INNISHANNON. [CORK.]

INNSBRÜCK, or *Innsbruck*, the capital of the Tyrol, is situated on the Inn, near the point where that river is joined by the Sill, in 47° 16' N. lat., 11° 23' E. long., 245 miles W. by S. from Vienna, and has 13,000 inhabitants. The town is built in a most beautiful situation, in the middle of the valley of the Inn, which is hemmed in on both sides by mountains varying from 6000 to 8000 feet high. It takes its name of Innsbruck (Inn's Bridge) from the wooden bridge which spans the river, and on and near which the Tyrolese, under

Hofer, after a fierce action, succeeded in repulsing the French during the war of independence. The town is in general well built; many of the houses are in the Italian style, the basement story consisting of arcades, which are occupied as shops. The street of Neustadt is the finest; here are the Landhaus or Tyrolese parliament house, the post-office, and, at its southern extremity, a triumphal arch erected by the empress Maria Theresa. Among the public buildings, the most interesting is the Franciscan church, which contains the tomb of Maximilian I., the most splendid monument of the kind in Europe, and the Silver Lady-Chapel. The 28 bronze statues that form part of the plan of Maximilian's tomb, and represent some of the worthies of Europe, including the most distinguished personages of the house of Austria, were cast by Tyrolese artists; the bas-reliefs on the tomb, and in the lady-chapel, which are masterpieces of art, are the work of Collin de Mechin. On the left of the entrance to this church is the grave of Hofer, which is surmounted by a statue of the hero in Tyrolese white marble. The other remarkable buildings are—the palace built for Maria Theresa in 1770, in the court-yard of which is an equestrian statue of Leopold V.; the university, in which is the Museum Ferdinandeum, rich in Tyrolese minerals, fossils, and works of art; the Capuchin church, in which is the penitential cell of Maximilian II.; the richly decorated church of St. James (Jacob's Kirche); the old palace of the counts of Tyrol; and the Fürstenburg, in which is the famous Goldene Dach, a sort of oriel window, covered with a roof of gilt copper, which projects in front of the building. The University of Innsbruck has faculties of law, medicine, and philosophy; the number of professors in 1850 was 24, of students 887. There is also an academy or gymnasium in the town, which had 17 professors, and 488 pupils in 1850. The public cemetery contains some fine monuments. The Schiesstadt, where the Tyrolese practise rifle-shooting, is in a very pretty situation on the left bank of the Inn, on a slope of the Berg-Isel, and is well worth visiting. The market-place of Innsbruck presents a very interesting appearance, from the great variety of picturesque costumes worn by the inhabitants of the different valleys, who frequent it. Eilwägen (travelling-vans) run daily to Salzburg, Vienna, and München, and two or three times a week to Italy, by the roads over the Brenner and the Stelvio. Electro-telegraphic wires are laid down to Vienna.

The chief manufactures of the town are silks, gloves, calico, ribands, glass, and wood and horn carved work; there is also an important transit trade. The neighbourhood abounds with beautiful scenery and charming promenades. Innsbruck is the seat of the supreme court of justice for the whole of the Tyrol.

INTERAMNA. [ABRUZZO.]

INTERLAKEN, or INTERLACHEN. [BERN.]

INTRODACQUA. [ABRUZZO.]

INVERARY, Argyleshire, Scotland, a royal burgh and port, and the chief town of the county, in the parish of Inverary, is situated at the head of Loch Fyne, in 56° 15' N. lat., 5° 4' W. long., 60 miles N.W. from Glasgow. The population in 1851 was 1164. It is governed by a provost, two bailies, and 18 councillors, and conjointly with Ayr, Campbeltown, Irvine, and Oban returns one member to the Imperial Parliament. Inverary was made a royal burgh by Charles I. The town consists chiefly of a main street built along the shore of Loch Fyne. Near the church is an obelisk erected to the memory of 17 gentlemen of the name of Campbell, executed here without trial, in 1685, for their opposition to the measures of James II. The present town only dates from the middle of the last century. The houses are well built; the town is lighted with gas. There is a small and convenient pier. The inhabitants are principally engaged in the herring-fishery. The herring are either cured, or sent to Glasgow by the daily steam-vessel to the Clyde. In addition to the parish church, which has services both in English and in Gaelic, there are places of worship for the Free Church and United Presbyterians. There is a burgh school.

Inverary Castle, the principal seat of the Duke of Argyll, is a quadrangular building, with a tower at each corner, and a high glazed pavilion rising from the centre of the roof.

INVERBERVIE. [BERVIE.]

INVERESK. [EDINBURGHSHIRE.]

INVERKEITHING. [FIFESHIRE.]

INVERNESS, Inverness-shire, Scotland, a royal and parliamentary burgh, sea-port, and market-town, the capital of the county, and the principal town of the Highlands, is situated at the southern extremity of the Moray Frith, on both sides of the River Ness, about half a mile above its fall into the Frith, and near the northern entrance of the Caledonian Canal, 155 miles N.W. by N. from Edinburgh, in 57° 28' N. lat., 4° 12' W. long. The population of the municipal burgh in 1851 was 9969, that of the parliamentary burgh was 12,793. The town is governed by a provost, bailies, and 21 councillors. It unites with Forres, Fortrose, and Nairn in returning one member to the Imperial Parliament.

The town is large and well built; the houses are lofty, and many of them elegant. The streets are paved, lighted with gas, and well supplied with water. The approach to the town is by a handsome bridge over the river Ness. The public buildings include the places of worship; the court-house and tolbooth; and the academy, a

fine building, which comprises a large public hall, with spacious apartments for classes, a library, and philosophical apparatus. This institution, which is called the Royal Academy, was incorporated in 1792; it is now in possession of upwards of 40,000*l.*, left by Captain Mackintosh and others for educational purposes, the interest accruing being applicable to these purposes. The number of scholars in 1853 was 160. The course of instruction includes ancient and modern languages, mathematics, and natural philosophy. The Raining school was founded in 1747 by Mr. John Raining of Norwich. Dr. Bell, the author of the 'Madras System,' left the magistrates of Inverness 10,000*l.* for the purposes of education. There are 12 places of worship within the burgh, of which 3 belong to the Establishment, 3 to the Free Church, 2 to United Presbyterians, and 1 each to Episcopalians, Independents, Wesleyan Methodists, and Roman Catholics. In the town are a public news-room, a mechanics institution, a savings bank, and several charitable and friendly societies. There are three harbours, of which the lowest, nearest the Frith, is capable of accomodating vessels of 250 tons burden.

The number and tonnage of vessels registered at the port of Inverness on December 31st 1853 were as follows:—Under 50 tons, 169, tonnage 4195; above 50 tons, 79, tonnage 6586: with 2 steam-vessels of 535 tons aggregate burden. The vessels entered coastwise during 1853 were:—Sailing-vessels, inwards, 972, tonnage 58,126; outwards 906, tonnage 44,898; steam-vessels, inwards, 180, tonnage 42,677; outwards, 177, tonnage 42,217. In the colonial and foreign trade there entered 12 vessels of 1901 tons, and cleared 27 vessels of 2221 tons. Tanning, a hemp manufactory, a woollen manufactory, and salmon fishing, afford occupation to the inhabitants. An extensive fair is held in July for sheep and wool. Wheat and oats, wood, wool, and hemp cloth are exported; timber, tar, coal, and hemp are imported. The town has steam communication indirectly with the east coast of Scotland, and with Glasgow and the south directly by the canal. Not far from the town is a curious wooded hill, on the top of which is a vitrified fort. Other remains of early times, as cairns and tumuli, and of a later period in the shape of ruined fortalices exist in the neighbourhood.

The burgh dates from the time of William the Lion. It was the scene of a parliament held by James I. It was visited and its castle besieged by Queen Mary. The town was held by Cromwell: in 1745 it was occupied successively by Charles Edward and the Duke of Cumberland. Culloden Moor, the scene of the battle of Culloden, is within five miles of the town of Inverness.

INVERNESS-SHIRE, a maritime county in the west of Scotland, bounded N. by Ross-shire, E. by the counties of Nairn, Elgin, Banff, and Aberdeen; S. by Perthshire and Argyleshire; and W. by the Atlantic Ocean. It comprehends a considerable number of the Hebrides, including the Isles of Skye, Harris, Benbecula, North and South Uist, Barra, Eigg, &c. The mainland portion lies between 56° 40' and 57° 36' N. lat., 3° 50' and 5° 50' W. long. Inverness-shire is one of the largest of the Scottish counties; it extends from north-east to south-west 85 miles, and from north-west to south-east 55 miles. Its area is 2,723,501 acres, of which upwards of 500,000 acres are in cultivation. The population in 1851 was 96,500. The county returns one member to the Imperial Parliament.

Surface, Hydrography, and Communications.—The mainland of Inverness-shire, which is extremely mountainous, is intersected by numerous lakes and rivers, and is divided into two nearly equal parts by the deep valley of Glenmore, which runs in a direction from Fort William on the south-west to the town of Inverness on the north-east. This district forms a large part of the Highlands of Scotland, and a general description of its geographical features will be found in the article GREAT BRITAIN. The greater part of the surface is covered with heath, but a good deal of the heathy ground is arable. Much of it has been brought into cultivation during the present century. The fertile and arable portions of the soil are generally in the glens and valleys, watered by the numerous streams of the county.

The fir woods in Glenmore and those of Strathspey in the adjoining county of Elgin are very extensive. Glen Morrison, which opens into Glenmore, and the parish of Kilmalie, contain a great many extensive plantations. The trees which grow naturally are the oak, fir, birch, ash, mountain ash, holly, elm, hazel, and Scotch poplar. Those which are planted are the larch, spruce, silver fir, beech, plane, and fruit-trees. In these forests red- and roe-deer, the alpine and common hare, and other game are abundant.

The Glenmore, or Great Glen of Albion, as it is sometimes called, is traversed by the CALEDONIAN CANAL. The western coast of the mainland is indented by three small arms of the sea, Lochs Hourn, Nevis, and Mirror, which are opposite the island of Skye, and by Loch Moidart. Loch Shiel, which has an outlet by a small river into Loch Moidart, Loch Eil at Fort William, Loch Leven, which falls into the Linnhe Loch, and Loch Ericht, which is partly in Perthshire, are all on the southern boundary of the county. Loch Laggan and Loch Treig in the south of the county form from their overflow the river Spean, which falls into Loch Lochie. Several small lochs and streams in the western district form numerous contributions to the rivers Spey and Findhorn [ELGINSHIRE], which traverse a considerable portion of the mountainous country north of the Grampians. The northern portion of the mainland is watered by the river Glass, and

stuffs, in quantity more than enough for the wants of the population. In the rich soils, wheat of excellent quality is raised; some tobacco is grown near St.-Malo; rye, barley, oats, buckwheat, and mixed grain are produced in the middling and poorer soils. The cultivation of flax and hemp for the manufactures of the department is very extensive; the flax and hemp fibres in the dressed state, as also the seeds, are important objects of commerce. The apple and the pear are very extensively cultivated for making cider and perry, the chief drinks of the population; the cider is strong enough to keep for two years, and is considered the best made in France. The grass land along the river bottoms is rich; and, as the out-run on the heaths and moors is large, great numbers of cattle are reared, and excellent butter and cheese are made. There is a little meadow land; of artificial grasses only clover is grown. Horses in general of small breed, sheep, goats, poultry, and pigs of the large white breed, are numerous. Game, including wild boars, hares, rabbits, partridges, quails, woodcocks, &c., are abundant. The fisheries on the coast, which are actively plied, yield excellent oysters, soles, lobsters, turbot, skate, crabs, &c. The forests of the department contain fine timber: the prevailing kinds are oak and beech; next come chestnut, poplar, and birch. The cultivated land also presents the appearance of a forest, such is the number of apple-trees planted in the fields, and of timber-trees in the hedges that separate the fields, but, as these latter are regularly stripped of their branches to supply fire-wood, they are of little value as timber.

Several iron-mines are worked; roofing and clay-slate, white quartz for the glass factories, limestone, and granite are quarried; lead- and copper-ore are found. Mineral springs are numerous.

The most important manufactures are linen, sailcloth of the best quality, Russia duck, canvass, and shoe- and morocco-leather; felt and straw hats, sewing thread, thread stockings, ship-cordage and ropes, fishing nets, hooks and lines, pottery, cotton- and woollen-yarn, are also manufactured. There are, besides, several bleaching establishments, brandy distilleries, paper-mills, iron-forges and smelting furnaces, and flour-mills; in the towns on the coast ship-building is carried on to some extent. Salt is made in some of the marshes on the coast. The commerce is composed of the various articles named, and of groats, chestnuts, salt pork, hides, oak-staves, firewood, &c. About 300 fairs are held in the year; there are 990 wind- and water-mills, 7 iron-works, and 63 factories of different kinds.

The climate is damp but temperate; much rain falls in winter; the prevailing winds are the west, north-west, and south-west; hurricanes are less frequent and less destructive than in the more western departments of the Armoric peninsula.

The condition of the peasantry is similar, but rather superior, to that of the peasantry of FINISTÈRE. The department contains many Druidical and Celtic remains, consisting of monoliths (menhirs), altar tables (dolmen, kistvaen), cromlechs, and cairns.

The department is divided into 6 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Rennes . . .	10	78	139,471
2. Fougères . . .	6	57	85,151
3. Montfort . . .	5	46	60,615
4. St.-Malo . . .	9	60	123,585
5. Vitré . . .	6	61	83,509
6. Redon . . .	7	47	82,287
Total . . .	43	349	574,618

1. Of the first arrondissement, and of the whole department, the capital is RENNES. Of the following places the population given in each case is that of the commune: this remark applies also to the other arrondissements. *Hédé*, a small place of about 1000 inhabitants, on the road from Rennes to Dinan, is remarkable for the remains of its ancient castle, which was taken by Henry II. in 1168. *Jansé*, S.S.E. of Rennes, has 4304 inhabitants, who manufacture sailcloth, and deal largely in excellent poultry. *Liffré*, N.E. of Rennes, has a population of 2402. *Mordelles*, S.W. of Rennes, on the left bank of the Meu, has mineral springs, and 2613 inhabitants.

2. In the second arrondissement the chief town is *Fougères*, which stands on a hill, at the intersection of five high roads, in the north-east of the department. It is one of the best built towns in the department, has wide straight streets, a tribunal of first instance, a college, and 8771 inhabitants, who manufacture sailcloth, canvas, tape, flannel, lace, hats, bricks, leather, paper, and glass. There is a good commerce in these articles, and in corn, groats, butter, honey, cattle, &c. The castle of Fougères is a picturesque object, but a feeble defence, as it is commanded by the higher part of the town. In the forest of Fougères, within half a mile of the town, there are many Druidical remains. *Aurain*, N.W. of Fougères, on the left bank of the Couesnon, which here becomes navigable, has a population of 1587 in the commune, and some manufactures of linen, coarse woollens, serge, and leather. *St.-Aubin-du-Cormier* stands on a steep hill, S.W. of Fougères, and has 1896 inhabitants. It owes its origin to a strong castle built by Pierre de Dreux, duke of Bretagne, in 1223, and is famous for the

victory gained here by the Count de la Tremouille, the commander-in-chief for Charles VIII., over François II., duke of Bretagne, the Prince of Orange, and the Duke of Orléans (afterwards Louis XII). *Louvigné-du-Désert*, 9 miles N. from Fougères, had formerly a large establishment belonging to the Templars, whose church is now become the parish church. It has a population of 3524, and several tan-yards.

3. In the third arrondissement the chief town, *Montfort-sur-Meu*, situated 10 miles W. from Rennes, on a hill above the confluence of the Meu and the Chailloux, has a tribunal of first instance, a college, and 1980 inhabitants. It is closed in by ramparts, flanked with towers, and encircled by a wide ditch. The town was formerly of much larger size. In the environs, which are very pretty, are the oak forests of Brescillon and Montfort, in the former of which are several Druidical remains; among others the reputed tomb of the enchanter Merlin, so celebrated in Breton fables. *St.-Méen*, 10 miles W. from Montfort, has an ecclesiastical school, and 2319 inhabitants. *Montauban*, formerly the chief town of a county belonging to the dukes of Rohan, is 7 miles N.N.W. from Montfort, and has a population of 2764. *Péllan-le-Grand*, 12 miles S. by W. from Montfort, has 3283 inhabitants, who manufacture great quantities of sewing-thread.

4. In the fourth arrondissement the chief town, *St.-Malo*, is built on the rocky isle of Aron, which communicates with the mainland by a causeway named *Le Sillon*, and defended from the violence of the waves by strong outworks. The town covers the whole island; it is surrounded by strong ramparts, which are flanked with towers and bastions, and form a fine promenade. The streets are narrow, but formed by high and in general well-built houses. There are four gate entrances, near one of which, called *La Grande Porte*, is a large reservoir, whence water is supplied to the fountains in the streets. The most remarkable building is the strong castle built by Anne, duchess of Bretagne, which forms part of the fortifications. The former cathedral is a very spacious church, built in the gothic style, and ornamented with several good marble statues. *St.-Malo* has tribunals of first instance and of commerce, a chamber of commerce and manufactures, a naval school of the first class, and 9383 inhabitants in the commune; but including the harbour and the suburb of *St.-Servan*, the population probably exceeds 21,000. The harbour lies south of the town; it is capacious and safe, but the entrance to it is rendered intricate by a great number of islets and rocks which stud this part of the coast, and many of which are fortified. It is a tide harbour, protected by a strong pier, and lined with a broad quay, which runs just under the walls of the town; it is dry at low water, but large ships can enter, as the tide rises very high here, 49 feet at spring. A wet-dock has been lately formed by throwing a strong granite wall across the head of the bay between the town and the suburb of *St.-Servan*; it contains an area of above 270 acres, and is entered by wide flood-gates, through which steamers and war frigates can pass. The roadstead of *St.-Malo* lies west of the town at the embouchure of the Rance; it is protected by seven forts, one of which, called *Conchée*, was constructed by Vauban. The manufactures of *St.-Malo* are hosiery, fishing-nets, ship-pulleys and cordage, soap, fishing-hooks, &c. Ship-building is carried on, and there is a large tobacco factory. The imports consist of colonial produce, spices, flax, hemp, &c.; there is also a considerable trade in corn, fruit, wine, brandy, salt, linen, cider, butter, honey, fish, salt provisions, &c. Vessels are fitted out for the foreign and coasting trade, and for the whale, cod, and mackerel fisheries. *St.-Malo* is much frequented for its excellent sea-bathing. *Cancalle*, a small sea-port on the western side of the Bay of Cancalle, with 5630 inhabitants, is 8 miles E. from *St.-Malo*. The principal part of the town stands on a height above the bay, of which it commands a fine view, and is well built. The other part, called *La-Houle*, is built on the shore, and is inhabited chiefly by fishermen, who take vast quantities of oysters and other fish in the bay for the supply of Paris and the towns in the interior. *Combourg*, the birth-place of Chateaubriand, 20 miles S.S.E. from *St.-Malo*, is situated on a small lake, and has 4847 inhabitants. There is an old chateau, flanked with towers, in good preservation in the town. *Dol*, remarkable for its ancient cathedral, which is one of the handsomest churches in Bretagne, is 15 miles S.E. from *St.-Malo*, and has 4018 inhabitants. It is surrounded by old walls and wide ditches, the remains of its ancient fortifications. The interior is irregularly built; the houses are constructed of dark granite with projecting gables; arcades, 7 or 8 feet wide, supported on granite pillars, run along the streets. The town has a good corn-market, which is held in a desecrated church; there is also some trade in cider, hemp, flax, tobacco, cattle, &c. The neighbourhood of *Dol* is fertile; all the land between it and the sea northward is drained marsh, protected from the sea by dykes. *Pleine-Fougères*, 25 miles from *St.-Malo*, has a population of 3107. *St.-Servan*, a well-built town, and much frequented watering-place, situated on the south side of the harbour of *St.-Malo*, of which town it may be considered a suburb, has 10,267 inhabitants. The most remarkable structure is the isolated tower called *Solidor*, which is 60 feet high, and approached by a drawbridge. This tower is now used as a prison. Beer, ship-cordage and biscuits, wine, brandy, &c., are the chief articles of trade; ship-building is carried on. *Tinténiac*, on the *Ille-et-Rance Canal*, has 2050 inhabitants, who trade in corn, butter, poultry, &c.

5. In the fifth arrondissement the chief town, *Vitré*, situated on the

Cantache, 22 miles E. from Rennes, has a tribunal of first instance, an ecclesiastical school, and 8555 inhabitants. The town is large, but irregularly built; and its feudal fortifications, consisting of a castle and high ramparts, flanked with machicolated towers and surrounded by a deep ditch, give it a gloomy appearance. The church of **Notre-Dame** is the most remarkable structure in the town. **Vitré** has manufactures of thread-stockings, serge, flannel, hats, casks, brandy, leather, and sail-cloth, and trades in these articles, and in wine, linen, honey, wax, hides, cattle, and cantharides flies, which are found in the neighbourhood. The other towns are—**Argentré**, which is a few miles S. of Vitré, and has 1978 inhabitants: **La-Guerche**, a town of 4412 inhabitants, which stands in a rich corn and grazing country, 11 miles S. from Vitré; it gives name to a neighbouring forest, and has manufactures of fine linen, leather, and nut-oil, besides a good trade in butter, corn, flax, hemp, chestnuts, cattle, sheep, &c.: and **Rhaiers**, which is a few miles W. of La-Guerche, and has 2960 inhabitants.

6. Of the sixth arrondissement the chief town, **Redon**, stands at the foot of a hill on the Vilaine, which here forms a good tide harbour, with a rise of from 10 to 13 feet at high water. The town, which is situated in the most southern angle of the department, at the junction of the two branches of the canal from Nantes to Brest, and at the southern extremity of the river and canal navigation that terminates to northward in the harbour of St.-Malo, enjoys great advantages for trade, in addition to its connection with the Bay of Biscay by a navigable tide-river. It is in general well built: the chief structures are the former abbey-buildings now used as a college, and the abbey-church, the semicircular apse of which is considered a masterpiece of its kind. **Redon** has a tribunal of first instance, a college, and 5216 inhabitants, who carry on a considerable trade in colonial produce, wine, brandy, salt, butter, chestnuts, timber, hemp, oak-staves, planks, masts, pitch and tar, slates quarried in the neighbourhood, sheet- and bar-iron, lead, resin, hides, linen, flax, canvass, &c. Vessels of 50 to 400 tons are built. A vote of 1,800,000 francs was taken in 1846 for the improvement of the harbour of Redon, to which the French attach great importance, as, in case of a war with England, their trading vessels could enter here without exposing themselves in the channel. The other towns are—**Bain**, which stands on the great road from Rennes to Nantes, and has a population of 3476 and some woollen manufactures: **Fougères**, 16 miles N.E. from Redon, which has 5254 inhabitants; it had formerly a strong castle, of which only one high massive tower remains, and from which the English were driven by Du Guesclin in 1356: **Guisen**, which is 25 miles N.N.E. from Redon, and has cold mineral springs, and 3534 inhabitants: **Mauve**, 15 miles N. from Redon, which has a population of 4000, and an ancient castle taken by Henri IV. in 1597: and **Pipriac**, 12 miles N. from Redon, which has 3116 inhabitants.

In Roman times the territory of this department was inhabited by the Redones, a Celtic tribe, whose name is still preserved in that of Redon. It was included in the district of Armorica. On the downfall of the empire it became part of Bretagne. The department forms the see of the Bishop of Rennes, is included in the jurisdiction of the Cour Imperiale and University Academy of Rennes, and belongs to the 16th Military Division, of which Rennes is head-quarters. For purposes of superior education there are besides the University of Rennes an imperial college and diocesan seminary in the same town, and colleges in Dol, Fougères, St.-Servan, and Vitré. There is a school of painting, sculpture, and drawing, and a departmental museum in Rennes. The department returns 4 representatives to the Legislative Body of the French empire.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Official Papers; Guide Classique du Voyageur en France.*)

ILLIERS. [EURE-ET-LOIRE.]

ILLINOIS, one of the United States of North America, is bounded S.E. by the Ohio, which separates it from Kentucky for 180 miles; E. by the Wabash for 120 miles direct distance, and by a meridian line to Lake Michigan for 162 miles, by which river and line it is separated from Indiana; N.E. by Lake Michigan for 57 miles; N. by the parallel of 42° 30' N. lat. to the Mississippi, 157 miles, by which it is separated from Wisconsin; W. by the Mississippi, which separates it from Iowa for 200 miles, and from Missouri for 340 miles. It lies between 42° 30' and 37° N. lat., 87° 49' and 91° 23' W. long. The extreme length is 378 miles, the extreme breadth 212 miles; the circuit of the state is 1160 miles, of which 850 miles is formed by navigable rivers; and its area is 55,409 square miles, or nearly 3000 square miles less than England and Wales. The following table shows the population decennially since the first census of the state in 1810, with the proportion of free coloured persons and slaves. The total population in

1810 was	12,282, including	613 free coloured persons, and	168 slaves.
1820 "	55,211, "	457 "	917 "
1830 "	157,445, "	1637 "	747 "
1840 "	476,183, "	3598 "	331 "
1850 "	851,470, "	5436 "	None.

The federal representative population in 1850 being 851,470 entitles the state to send nine representatives to Congress. To the Senate, like each of the other United States, Illinois sends two members.

Surface, Hydrography, Communications.—Illinois is one of the most GEOG. DIV. VOL. III.

level states in the Union. In the southern part of the state, by the Ohio, there is a range of low hills; the northern part is also somewhat broken, and there are some elevations by the Illinois, and lofty bluffs along the Mississippi; but with these exceptions Illinois is one great plain, having a general gentle slope to the south-west. The loftiest height is said to be under 1000 feet above the level of the sea, the lowest portion of the plain at the mouth of the Ohio River, is 340 feet above the sea. A large portion of the surface consists of prairie, much of it in its native state, but a great deal is reclaimed, and cultivation is rapidly encroaching on the remainder. The surface of the largest of the prairies, known as the Grand Prairie, and occupying the country between the Mississippi and the Wabash rivers is for the most part gently undulating and very fertile, with a good deal of timber about it; though considerable tracts of the southern part are flat and have an inferior soil. The character of the prairie is said to afford no insurmountable obstacle to its reclamation and settlement; no portion of it is more than eight miles from timber, and coal is found in abundance in most parts. The prairies are commonly known as the dry and the wet. The dry prairies are those which lie above the alluvial tracts, and, though less fertile, are preferred to them on account of their not being subject to inundations. The wet prairies are usually covered with coarse grass. The broad alluvial tracts bordering the several rivers, locally known as bottoms, are extremely rich and fertile, but owing to their moist state and liability to be flooded, are to a great extent uncultivated, though producing fine trees.

Illinois is well provided with rivers. Nearly three-fourths of its boundary is formed by navigable rivers, while its north-eastern angle is washed for 57 miles by Lake Michigan, thereby affording the state direct water communication with the whole lake country of the north. The rivers which belong to it in common with other states are the Mississippi, Ohio, and Wabash, which are described under MISSISSIPPI, KENTUCKY, and INDIANA. Of the rivers which belong wholly to the state the chief is the *Illinois*, which rises near Lake Michigan, and flows first west, and then south-south-west, into the Mississippi, which it joins 20 miles above the Missouri. About 200 miles above its mouth it expands into a fine lake called Peoria, 20 miles long and 2 miles wide. A morass at its source in wet seasons discharges a part of its waters into the river, and a part into the Chicazo, a small stream which flows into Lake Michigan. This large river takes the name of Illinois only from the confluence of the *Plane*, *Des Plaines*, or *Aux Plaines* River, from the north-east and the *Kankakee* from the east, both considerable streams, and navigable for boats. Thirty miles below their confluence *Fox* River, sometimes, but erroneously, considered the main branch of the Illinois, falls into the Illinois from the north; it rises in the Huron territory, and has a course of 200 miles south-south-west, more than half of which is in this state. The course of the Illinois is about 500 miles. It is navigable by large steamboats at certain seasons up to *Ottawa*, just below the *Great Rapids*, near the junction of the *Fox* River; at other times steamboat navigation is stopped by the *Little Rapids* at *La Salle*, where a canal commences which connects the Illinois with Lake Michigan. The Illinois flows with a gentle current, generally in a wide deep bed. The other principal tributaries of the Illinois are the *Vermilion* River from the south-east, the *Mackinaw* from the north-east, *Spoon* River from the north-west, the *Sangamon*, or *Sanganio*, from the east, and the *Big* and *Little Blue* rivers from the west; besides numerous lesser streams. *Sangamon*, by much the largest of these tributaries, has a very winding course to the west of more than 250 miles, of which 140 miles are navigable, and it falls into the Illinois about 130 miles above its mouth. *Rock* River rises in Wisconsin, and entering the state of Illinois on its north boundary, crosses it in a south-west course of about 300 miles to the Mississippi: it is navigable in its lower course; its upper course is impeded by rapids. The *Kaskaskia* rises on the eastern side of the state, and, like the Illinois and *Rock* rivers, has a generally south-western course to its junction with the Mississippi, about 80 miles above the junction of the Ohio. The river has been rendered much more serviceable for purposes of navigation by the removal of various obstructions under the direction of the Board of Public Works; it is now navigable in high-water to *Vandalia*, 150 miles from its mouth, and in some seasons to *Shelbyville*, 30 miles higher: its entire course is about 300 miles. It has numerous small tributaries. The *Big Muddy*, farther south, is also a considerable stream. The affluents of the Ohio and the Wabash are generally much smaller streams than those which fall into the Mississippi, but some of them are navigable, and all are important as furnishing water-power for mechanical purposes.

The state possesses one very important canal, the *Illinois and Michigan* Canal, 110 miles long, constructed by the state at a cost of upwards of 8,000,000 dollars. It commences at *Chicago* on Lake Michigan, and is carried in a south-western direction near the right bank of the Illinois to *La Salle*, where the Illinois becomes navigable, thus opening to the lake ports and navigation the wide river country of the south and west.

Illinois appears likely to be eventually amply supplied with rail-ways. In all, the lines completed or in progress amount to 2100 miles. Already some 600 or 700 miles are in operation, and above

1000 miles more are said to be in progress of construction; while the lines of country for 600 more miles have been surveyed. The principal lines in operation are those in connection with the commercial capital of the state, Chicago, in which city seven main-trunk lines meet. The Chicago and Rock Island railway runs from Chicago on Lake Michigan, in a south-west direction, to Rock Island city, at the confluence of Rock River with the Mississippi; its length is 180 miles. The Galena and Chicago runs from Chicago to Galena and Freeport at the north-western extremity of the state, 120 miles, with branches to Dixon 68 miles, and to Beloit, in Wisconsin, 20 miles. The Chicago and Aurora, 86 miles long from Chicago to Mendota, is the only other line from Chicago which is completed; but the Chicago and Cincinnati, to connect those places, 27 miles long; the Chicago and Fort Wayne, and the Chicago and Milwaukee, 92 miles; the Chicago and Mississippi, running to Alton, 130 miles; and the Chicago St. Charles and Mississippi, 135 miles, are in progress; and 100 miles of the last are open. The Great Western central line has under 100 miles in operation. The most important of the lines in progress is the Illinois Central, which is to be 700 miles long, and with the other lines will connect all the leading towns with each other, and with the chief trading places in the neighbouring states and most parts of the Union, and likewise of Canada. All the lines in progress are expected to be completed by 1857.

Geology, Mineralogy, &c.—The rocks of Illinois belong to the Palaeozoic order. In the extreme northern and western portion of the state is a narrow band of Lower Silurian rocks, the southern extremity of the Lower Silurian basin of Wisconsin. They consist of sandstone, in which occur numerous specimens of the *Lingula antiqua*, and of blue limestones in which are the rich lead-mines of Galena. South of the above, and extending east and west, is a broad belt of Upper Silurian rocks, chiefly light gray and magnesian limestones. Between this belt of Lower Silurian strata and Lake Michigan, and also on the south of the Silurian rocks, is a narrow band of fossiliferous Devonian rocks. South of these again, also extending east and west across the state, and along the whole western and southern border, lying along the Mississippi and Ohio rivers, is a narrow strip of Lower Carboniferous strata, consisting of bituminous slate, and fine-grained sandstone. Above these, and occupying the entire centre and eastern part of the state is a vast bed of Upper Carboniferous strata, closely resembling the coal-bearing rocks of England, but here forming part of a basin of these strata of a grandeur and extent almost unparalleled.

Illinois is exceedingly rich in minerals. Silver is obtained in the north-western part of the state in connection with galena. Lead is very widely diffused over the northern, and especially the north-western district; the lead-mines about Galena are among the most productive known. Copper is also obtained largely in those parts. Iron-ore is very widely distributed. Coal is however the most extensive and valuable mineral of Illinois. It is bituminous in quality, and the beds are of great thickness. The great coal region is that vast space mentioned above, as occupied by the Lower Carboniferous strata, extending quite across the state from Missouri to Indiana, and from Iowa to Kentucky. Excellent building stone of various descriptions is quarried over almost every part of the state. Granite boulders of large size occur in many places. Salt springs exist in several of the southern and eastern counties, and there are sulphur and chalybeate springs in various parts.

Climate, Soil, and Agriculture.—The climate is very much the same as that of Missouri, except that it is more humid. There is a considerable difference in the temperature between the northern and southern parts of the state. At New Harmony, which is in 38° 11', and opposite the southern part of the state, on the east bank of the Wabash, the thermometer has been observed as low as 5° below zero of Fahrenheit. Everywhere however the winters are severe and the summers hot and long, and the temperature subject to frequent sudden changes. In the southern parts of the state the summer heat is very oppressive. South-westerly winds blow during three-fourths of the year. North and north-westerly winds prevail in winter.

Illinois possesses a vast extent of excellent arable land. The soil however varied is generally highly fertile. Along the river-valleys, or bottoms, it consists of an extraordinarily rich alluvial deposit. One of these tracts, the American Bottom, on the Mississippi, extending above the mouth of the Kaskaskia for 90 miles, is especially noted for its fertility. Its soil, which is the richest river alluvium, continues unchanged for 25 feet below the surface, and some portions of it which are cultivated about the old French towns, have produced Indian corn without intermission and without manure for nearly a century and a half. A sixth of this alluvial land is however unfit for cultivation, owing to its liability to inundations. The prairies though less productive are still very fertile, and where timber is to be obtained are preferred for farms on account of their superior salubrity. The prairies are consequently steadily and rapidly becoming covered with thriving groves of young trees, the forerunners of busy farms. The barrens, or oak openings, have frequently a thin soil. In the northern parts there are stony tracts, but everywhere else it is said that "the plough may pass over millions of acres without meeting so much as a pebble to impede

The following are the principal results of the inquiries made respecting the agricultural statistics of Illinois at the last census:—The number of farms under cultivation in the state on the 1st of June 1850 was 76,208. The extent of improved land in farms was 5,039,545 acres, of unimproved 6,997,867 acres, together valued at 96,133,290 dollars. The farming implements and machinery were valued at 6,405,561 dollars. The total produce of the principal crops in 1850 was as follows:—Wheat, 9,414,575 bushels; rye, 83,364 bushels; maize, 57,846,984 bushels; oats, 10,087,241 bushels; buckwheat, 184,504 bushels; barley, 110,795 bushels; peas and beans, 82,814 bushels; potatoes, 2,514,861 bushels; sweet potatoes, 157,433 bushels; tobacco, 841,394 lbs.; hops, 3551 lbs.; hay, 601,952 tons; clover and other grass seeds, 17,807 bushels; flax, 160,063 lbs.; maple sugar, 248,904 lbs. The value of orchard products was 446,049 dollars; of market-garden products, 127,494 dollars. Of wine only 2997 gallons were made. A good deal of hemp is grown and prepared, but the 'Census Report' states (p. 1015), that with regard to it the "returns were so confused, and all information from other sources so vague and indefinite, that it was deemed advisable to strike the items of hemp from the agricultural tables of the state." It may be as well to state here that it must not be supposed that these agricultural returns are as exact as their specific character would perhaps suggest, but there can be little doubt that they do, in the words of the 'Report,' "give a very fair idea," undoubtedly a far clearer and more correct idea than can be gathered from any other source, "of the state of the country in 1850."

With regard to live-stock, the returns show that the number of horses in the state in 1850 was 267,653; asses and mules, 10,573; milch cows, 294,671; working oxen, 76,156; other cattle, 541,209; sheep, 894,043; swine, 1,915,907. The value of live stock was 24,209,258 dollars; of animals slaughtered, 4,972,286 dollars. The products of animals were—wool, 2,150,113 lbs.; butter, 12,526,543 lbs.; cheese, 1,278,225 lbs.; bees'-wax, and honey, 869,444 lbs.; silk cocoons, 47 lbs.

Illinois is in general well supplied with timber. The most common trees are various kinds of oaks, sycamores, which in the alluvial soil along the rivers grow to an immense size, sugar-maple, walnuts, several kinds of ash, elm, cotton-wood, honey-locust, hickory, buck-eye, pecan, linden, wild cherry, sassafras, elder, and persimmon; in the southern and eastern parts yellow poplar and birch, and near the Ohio yellow pine and cedar. Hazel, red-bud, pawpaw, sumac, vines, dog-wood, and other under-growths are abundant. There are also various valuable medicinal plants.

The gray, black, and prairie wolf are still met with; the prairie wolf in considerable numbers. Panthers, wild-cats, foxes, racoons, opossums, and gophers, with musk-rats, otters, and occasionally beavers are also found, but they are being steadily exterminated. Partridges and prairie fowl abound; ducks, geese, swans, and various other aquatic birds visit the waters in the spring season. Fish in the greatest possible variety swarm in the rivers and lakes.

Manufactures and Commerce.—At present the manufactures of Illinois are chiefly connected with agriculture. Agricultural implements are extensively made; there are numerous wheelwright's shops; saw, grist, oil, flour, and other mills. The only important manufactures not immediately connected with agriculture are the iron-works, woollen-factories, and tanneries. The whole number of manufacturing establishments producing to the value of 500 dollars and upwards in 1850 was 3099. Of these two were pig-iron manufactories, employing 150 hands, and a capital of 65,000 dollars, consuming annually 5500 tons of ore and 170,000 bushels of coke and charcoal, and producing 2700 tons of pig-iron; and 29 establishments engaged in the manufacture of cast-iron, employing 332 hands, and a capital of 260,400 dollars: there was no wrought-iron manufactured in the state. The woollen manufacture employs 178 hands, including 54 females, and a capital of 154,500 dollars; tanneries 275 hands (240 males), with a capital of 183,373 dollars; flour-mills, 834 persons; saw-mills, 937; distilleries, 176; pork and beef packing, 245; lead-mining and smelting, 213 persons. The 'home-made manufactures' for the year were valued at 1,155,902 dollars. There are the usual classes of professional men; the number of the principal classes were—clergymen, 1023; lawyers, 817; physicians, 1402; and surgeons, 3.

The direct foreign commerce of Illinois is chiefly with Great Britain. The exports, wholly of domestic produce, for the year ending June 30th 1852 amounted to 51,325 dollars; the imports to 4832 dollars. The commerce of the state is chiefly centred in Chicago, in our notice of which lower down will be found some further particulars respecting the trade of Illinois; Alton on the Mississippi, and Galena, are the other principal commercial towns. The internal trade is very considerable, and it is rapidly increasing with the increase of facilities of communication.

Divisions, Towns, &c.—Illinois is divided into 99 counties. Springfield is the political capital of the state, but the most important town is Chicago. The towns for the most part have as yet but small populations; the following are all which seem to require notice here: the population is that of 1850:—

Springfield, the capital of the state, is situated on the border of a broad prairie, about 4 miles from the left bank of the Sangamon River, in 39° 48' N. lat., 89° 33' W. long., 801 miles W.N.W. from

Washington: population, 4533. The town was laid out in 1822 on a regular plan, with a central public square, and wide streets crossing at right angles. In the centre of the principal square is the capital, a showy stone-building of three stories, with porticoes. The other public edifices are the court-house, market-house, jail, United States land-office, eight churches, academies, &c. There are some manufactures and an iron-foundry. The town is the centre of a very fertile district, the products of which are brought to its market. The Great Western Central, the Chicago and Mississippi, and the Massac and Sangamon railways meet here. Two daily and one weekly newspaper are published in the town.

Chicago, a city, port of entry, and capital of Cook county, is situated at the mouth of the Chicago River, on Lake Michigan, 42° 0' N. lat., 87° 35' W. long., 183 miles N.N.E. from Springfield: population 29,963 in 1850, in 1840 it was only 4470. The city is well and substantially built. It extends along the shore of the lake for above a mile, and for two miles back along the river which is separated into two branches, each having a depth of 12 to 15 feet. The site is low and level, but the town is said not to be unhealthy. The bar at the mouth of the river has been reduced, and piers have been carried out into the lake in order to prevent the accumulation of sand and drift. The largest lake craft and steamers can now pass over the bar, and within there is commodious anchorage for an almost unlimited amount of shipping. The commerce of the town has increased within the last few years in full proportion to the great increase of means of internal communication, and its fine position with respect to the navigation of the lakes. In 1839 the total value of property was assessed at 236,842 dollars, in 1850 it was assessed at 8,562,717 dollars. The imports in 1840 were 562,106 dollars, the exports 228,635 dollars. In 1848 the imports were 8,338,639 dollars, the exports 10,709,333 dollars. The arrivals of shipping in 1850 were:—Steamers, 662; propellers, 183; schooners, 1182; brigs, 230; barges, 13: making a total of 2270 vessels, of an aggregate burden of 958,600 tons. The principal exports in 1850 were:—Wheat, 437,660 bushels; maize, 3,221,317 bushels; oats, 767,197 bushels; hemp, 697,783 lbs.; coal, 2,091,552 lbs.; iron, 3,454,060 lbs.; lead, 1,376,879 lbs.; lumber, 67,957,287 feet; laths, 14,921,420 pieces; wool, 1,088,553 lbs.; besides considerable quantities of cheese, butter, flour, sugar, beef, pork, lard, and potash. The principal imports in the same year were:—Wheat, 358,077 bushels; maize, 2,647,465 bushels; bacon, 434,716 lbs.; hams, 1,086,933 lbs.; pork, 2,390,248 lbs.; lard, 2,069,625 lbs.; hemp, 1,035,648 lbs.; hides, 848,876; lumber, 125,523,122 feet; timber, 562,976 feet; laths, 27,533,475 pieces; shingles, 60,338,250 bushels; lead, 1,402,135 lbs.; wool, 731,956 lbs.; tobacco, 824,923 lbs. The public buildings are the usual county buildings, numerous churches and schools, banks, &c. There are several large hotels in the city. Besides the Illinois and Michigan Canal, the city is the terminus of several important railways, and a great many plank-roads facilitate communication with the interior. Five daily newspapers, each having also a weekly issue, six weekly, a fortnightly, and three monthly periodicals are published here.

Alton, on the left bank of the Mississippi, 3 miles above the confluence of the Missouri, is the chief port town of Illinois on the Mississippi, and the largest town on that river above St. Louis: population, about 12,000. Alton is a convenient port, and is now being connected with several railways; its commerce is greatly increasing. There are several churches, Shurtliff college and other buildings in the town. Bituminous coal is abundant in the vicinity. **Bevidere**, on the north branch of the Kishwaukee River, and on the Galena and Chicago railway, 78 miles W. from Chicago, population about 2000, is a flourishing and busy new town. There are several grist- and saw-mills. **Carlinville**, the capital of Macoupin county, 2 miles N. from Macoupin creek, and 41 miles S. by W. from Springfield, is one of the most flourishing places in the interior. The Sangamon and Alton railway has a principal station here. **Carrollton**, the capital of Greene county, on the border of Spring prairie, about 6 miles N. from Macoupin creek, and 56 miles S.W. from Springfield, is another rapidly increasing interior town, and the centre of a fertile district. **Carthage**, the capital of Hancock county, lies between Bear and Long creeks, and is a busy and prosperous place, being the mart of a fertile neighbourhood, and of a rich coal district. The village has acquired a wide notoriety as the scene of the murder of the Mormon prophet and leader, Joe Smith, and his companions. **Chester**, on the Mississippi, immediately below the confluence of the Kaskasia River, population about 1300; is a place of growing commercial importance, being the entrepôt for the produce of a considerable tract of back country. **Danville**, on the right bank of the Big Vermilion River, just below the confluence of the North and Salt Forks, 128 miles E. by N. from Springfield, population about 1200, is a good sized and flourishing place, and the centre of a fertile and populous district. Two weekly newspapers are published here. **Freeport**, on the Pecatonica River, 168 miles N. from Springfield, is another of the rising towns of Illinois, and from its position is likely to become an important commercial place. The surrounding country is rich in minerals, and very productive agriculturally. The Galena branch of the Central Illinois, and Galena and Chicago Union railways meet here. Two newspapers are published weekly. **Galena**, on the Feve River a little above its confluence with the Mississippi, and near the

north-western extremity of the state, population about 6500, is the centre of the lead mining district, and the chief commercial town of this part of Illinois. It is the capital of Joe Davies' county, and contains the usual county buildings, court-house, jail, several churches and schools, and some large copper smelting works, grist- and saw-mills, &c., and has a large lumber market. The chief exports in 1851 were—lead 33,082,190 lbs.; flour 39,339 barrels; barley 42,731 bushels; pork 3185 barrels; bacon 812,658 lbs.; lard 125,000 lbs.; butter 87,618 lbs.; eggs 22,880 doz.; hides and skins 9326; horses 800; cattle 1500, &c.; and in the same year it received 5,035,634 feet of lumber, and a very large quantity of shingles, timber, and wood of other descriptions. The largest river steamers ascend to Galena, and it has good railway accommodation. Two daily newspapers, having also weekly issues, are published here. **Jacksonville**, on the Mauvais-terre creek, 80 miles W. by S. from Springfield, population 2745, is a rapidly rising new town, situated on a rich prairie district. It contains a court-house, jail, churches, and schools. Illinois college, and the state deaf and dumb institution are situated here. There are extensive flour-mills, cotton-works, tanneries, and machine manufactories. The Sangamon and Morgan railway passes the town. A newspaper having tri-weekly and weekly issues is published here. **Joliet** on the Plane River, 40 miles S.W. from Chicago, population 2659, contains a court-house, jail, churches and schools, large hotels and warehouses. The river affords fine water-power, which is made available for numerous mills and factories. The Illinois and Michigan Canal, and Chicago and Rock Island railway pass the town. Two weekly newspapers are published here. **Kaskasia**, the original capital of Illinois, stands on the right bank of the Kaskasia River, 10 miles above its confluence with the Mississippi, 127 miles S. by W. from Springfield the present capital: population, about 1000. Kaskasia is one of the oldest towns in the state, having been founded by the French in 1683; it stands in the midst of very picturesque scenery, contains the usual county buildings, a Roman Catholic church, and a United States land office. **Mount Carmel** occupies a favourable site for commercial purposes, on the right bank of the Wabash, below the rapids, 140 miles S.E. from Springfield: population, 1500. It contains a court-house, jail, churches and schools, and several flour-mills, and machine-shops. **Naperville**, on the Du Page creek, 160 miles N.E. from Springfield, is a rising new town, the capital of Du Page county, having various county buildings, churches, schools, &c., and two weekly newspapers. **Ottawa**, at the junction of the Fox River with the Illinois, 120 miles N.N.E. from Springfield, is the capital of La Salle county, and a place of great and increasing commercial importance. By the Illinois and Michigan Canal the lake steamers reach the town, and the Chicago and Rock Island railway affords communication with the western districts; while the Illinois River yields immense water-power which is being turned to full advantage. The soil of the surrounding country is rich; there is a good deal of timber; and limestone and freestone abound. Two newspapers are published weekly. **Peoria**, on the right bank of the Illinois, at the foot of Peoria Lake, is the capital of Peoria county, and the shipping port for the surrounding grain district: population, 5562. It contains the usual county buildings, churches and schools, an incorporated academy, several steam-mills, factories, &c. Two weekly newspapers, and a semi-monthly magazine are published here. **Quincy**, stands on a high bluff on the left bank of the Mississippi, 88 miles W. from Springfield, population 6911; it is the capital of Adams county, and the mart for a well cultivated and populous neighbourhood. Besides the usual county buildings, churches, and schools, it contains a United States land office, numerous warehouses, stores, hotels, workshops, &c. Several steamboats arrive and depart daily during the season. Large quantities of barrelled pork and bacon are exported. One daily and three weekly newspapers, with two monthly periodicals are maintained. **Rock Island City**, at the junction of the Rock River with the Mississippi, and the terminus of the Chicago and Rock Island railway, by which it is 180 miles W.S.W. from Chicago, is a new town which has been laid out on an extensive plan, and though not at present very populous is expected to become one of the most considerable commercial towns on the upper Mississippi. The site is well adapted for trading purposes, and the surrounding country is not only a rich agricultural district, and well supplied with timber, but affords also abundance of coal and limestone. **Rockford**, the capital of Winnebago county, is situated at the rapids on Rock River, 92 miles N.W. by N. from Chicago by the Galena and Chicago railway: population, 2098. Steamboats ascend to the town. The rapids afford immense water-power, and there are several mills. A newspaper is published weekly. **Shawneetown**, on the Ohio, 164 miles S.E. from Springfield, population 1764, is one of the largest trading places in southern Illinois. Iron-ore and coal are obtained along the banks of the Ohio. There are very extensive salt-works at Saline creek, 12 miles from the town. Shawneetown possesses a paved levee of considerable length. An important branch of the trade of the place is the slaughtering and packing of hogs: one establishment has facilities for hanging up 1000 hogs a day. Tobacco is raised in the vicinity in considerable quantities: 300 hogsheads were shipped from here in 1852. **Vandalia**, from 1818 to 1839 the capital of Illinois, stands on elevated ground, on the right bank of the Kaskasia, 66 miles S.E. from Springfield: population, about 1100. The town was laid out on a large scale in

bruous. The upland prairies are generally healthy, owing to the genial periodic breezes which blow regularly over them. The temperature does not vary very remarkably throughout the state. Along the bottoms, where inundations occasionally happen, fevers sometimes occur; but from the rivers generally flowing rather rapidly the bottoms are less subject to miasmatic visitations than in the states lying along the lower courses of the great rivers. The winters commence in December and end in March; they are variable, and sometimes severe, but less so than is usual in similar latitudes. The summers are not oppressively hot, and showers are frequent.

The soil is generally good; indeed it is said that the government surveys have proved that there is no state in the Union which has a smaller extent of inferior land. Throughout the prairies a sandy loam prevails, which, while producing the finest natural grasses, has been found to be excellently adapted for the growth of grain. A red clay and gravel is also a prevalent soil in some parts of the state. Along the bottoms the alluvial deposits yield a deep and very rich black mould. The climate and soil seem to be generally suitable for the growth of most kinds of grain. All the usual fruits do well, and the melon tribe, grapes, &c., flourish. The various garden vegetables also grow extremely well.

At present Iowa is eminently an agricultural country. Its broad and fertile prairies not only afford the finest natural pastures, but very great facilities for the laying out of farms, from the circumstance of timber being always within comparatively easy reach, while there is abundance of good open and well-watered land. The progress of agriculture and the character of the products will be sufficiently shown by the following statement of the principal results of the inquiries made respecting the agricultural statistics of the state at the last census. The number of farms under cultivation in the state on the 1st of June 1850 was 14,805; the extent of improved land in farms was 824,682 acres, of unimproved 1,911,382 acres. The cash value of farms was returned at 16,657,567 dollars; of farm implements and machinery, 1,172,869 dollars. The total produce of the principal crops in 1850 was as follows:—Wheat, 1,530,581 bushels (154,693 bushels in 1840); rye, 19,916 bushels (3792 in 1840); maize, 8,656,799 bushels (1,406,241 in 1840); oats, 1,524,845 bushels (216,285 in 1840); barley, 25,093 bushels (728 in 1840); potatoes, 276,120 bushels (234,063 in 1840); sweet potatoes, 6243 bushels; buckwheat, 52,516 bushels (6212 in 1840); peas and beans, 4775 bushels; tobacco, 6041 lbs. (8076 in 1840); hay, 89,055 tons (17,953 in 1840); grass-seeds, 2438 lbs.; flax, 62,660 lbs.; flax-seed, 1959 lbs.; maple-sugar, 73,407 lbs.; molasses, 3162 lbs.; hops, 8242 lbs. (83 lbs. in 1840). The value of orchard products was 8434 dollars (80 dollars in 1840); of market-garden products, 8848 dollars.

The natural pastures afford great facilities for cattle-farming. Sheep and swine succeed admirably with little care; and wool has become a staple production of the state. The number of horses in Iowa in 1850 was 38,536; of asses and mules, 754 (in 1840 there were 10,794 horses and mules); milch cows, 45,704; working oxen, 21,892; other cattle, 69,025 (in 1840 the total neat cattle were 38,049); sheep, 149,960 (15,354 in 1840); swine, 323,247 (104,899 in 1840). The value of live stock was 3,689,275 dollars; of animals slaughtered, 821,164 dollars. The products of animals were:—Wool, 373,898 lbs. (23,039 lbs. in 1840); butter, 2,171,188 lbs.; cheese, 209,840 lbs.; bees'-wax and honey, 321,741 lbs.; silk cocoons, 246 lbs.

Manufactures, Commerce, &c.—The manufactures of Iowa are as yet but of small extent; but from the abundance of coal, and the immense supply of water-power, there can be little doubt that this will some day become an important manufacturing state. At the census of 1850 there were returned 9255 free males above the age of 15 as employed in trade, commerce, manufactures, and mining; and 32,779 employed in agriculture. The whole number of manufacturing establishments producing to the value of 500 dollars and upwards in 1850 was 482. Most of these were of the various kinds required in an agricultural country, as flour- and saw-mills, agricultural implement works, wheelwrights' shops, &c., with such others as were required to supply the demand for articles of ordinary domestic use. One woollen factory, 3 cast-iron works, and 14 tanneries, all on a small scale, were the only manufacturing establishments of a more general character.

Iowa has no direct foreign commerce, but it has an extensive and rapidly-increasing trade with the ports of the Atlantic and the Mexican Gulf, from which it receives European goods, the manufactures and products of the Eastern States, South America, &c., exporting in return its agricultural and mining products. Its interior trade is also very considerable.

Divisions, Towns, &c.—Iowa was divided into 49 counties at the census of 1850; but 49 new counties have since been formed. The city of Iowa is the political capital; but the most populous town is Burlington. The towns at present next in importance are Dubuque, the capital of the lead-mining district, and Keokuk, the chief shipping mart. Of these, with such others as seem to require notice, we append a brief account: the population, when not otherwise stated, is that of 1850; but as the returns as given in the 'Census Report' are acknowledged to be imperfect, and the numbers do not agree with those in other authorities, we have not always adhered to them, and they had better perhaps be received as approximations merely: all

the towns are however so rapidly changing that the want of definiteness is of comparatively little consequence.

Iowa City, the capital, is built on ground rising in terraces from the left bank of the Iowa River, 1485 miles W.S.W. from Washington: population, 1582. The city is laid out on a regular plan, and on a large scale; the principal avenues are 160 feet wide. The state-house is a handsome Grecian building, 100 feet long and 60 feet wide, surmounted with a dome resting on 22 Corinthian columns, and built of birds'-eye marble, a very beautiful variety of native limestone. The other public buildings are—a county-court house of good design, a United States land office, several churches, a jail, &c. Iowa city is the centre of communication between the principal ports of the Mississippi and the Pacific, and is to be the centre towards which the railways of the state are to converge. The Iowa River is navigable up to the city by steam-boats at all seasons; and the immense water-power which it affords immediately above the city has led to the erection of several extensive mills. Two newspapers are published here weekly. When this site was selected in 1839 as that of the capital of the state it was an entirely wild uncleared tract.

Burlington, the capital of Des Moines county, stands on ground rising gently from the Mississippi, 62 miles S.S.E. from Iowa city, population 4082; it was the original capital of Iowa territory, and is still the most populous town in the state. It contains some fine buildings, churches, &c., and several manufacturing and commercial establishments. Three weekly newspapers are published here. *Columbus*, on the right bank of the Iowa, 2 miles below the junction of Cedar River, and 27 miles S. by E. from Iowa city, population 1183, is a new and thriving city. *Council Bluffs*, on the Missouri, 216 miles W. by S. from Iowa city, is the last civilised settlement before entering on the wide unsettled country on the overland route to Oregon and California, and is consequently an important station for emigrants, who here complete their outfit before crossing the Missouri and entering the 'Indian country.' The distance from Council Bluffs to Oregon city is 1924 miles; to Sacramento city 2011 miles. *Davenport*, the capital of Scott county on the Mississippi, opposite Rock Island, and 51 miles S.E. from Iowa city, population about 2000, is already one of the busiest commercial towns of the state, and appears likely if the projected system of railways be constructed to become a place of considerable importance. It contains the county and other public buildings, and supports two weekly newspapers. *Dubuque*, the capital of the county of the same name, stands on an elevated terrace which stretches for some distance along the Mississippi, 72 miles N.E. from Iowa city, population 3108. The town is built on a regular plan; the streets, which are wide, intersect at right angles. It is one of the oldest places in this part of America, having been settled by the Canadian French in 1636, as a station for trading with the Indians. The town contains the county buildings, a United States land office, several churches, &c. Dubuque is the chief town of the lead-mining district, and a place of considerable trade. Its population had increased in 1852 to 4071, and is still rapidly increasing. Four weekly newspapers are published here, one of them in the German language. *Fort des Moines*, the capital of Polk county, on the left bank of the Des Moines River, 110 miles W. from Iowa city, is a flourishing little town, but is chiefly noticeable as a travelling station on the road to Council Bluffs, for emigrants taking the overland route to California, for whose convenience there are extensive stores, hotels, &c. It is on the line of the projected railway to the Pacific. *Fort Madison*, the capital of Lee county, on the Mississippi, 71 miles S. by E. from Iowa city; though only laid out as a village in 1835, is now a busy, commercial, and manufacturing town. It contains the county buildings, jail, penitentiary, and several churches. Steamboats arrive and depart several times daily, and it has a large trade with the interior. Two newspapers are published here weekly. *Kanawville*, the capital of Pottawattomee county, near the Missouri, 224 miles W. by S. from Iowa city, population in 1852 about 1200, is only noteworthy as having been settled and built by the Mormons, as a station on the overland route to their city on the Great Salt Lake. *Keokuk*, on the Mississippi, 3 miles above the confluence of the Des Moines, 86 miles S. by E. from Iowa city; population 2478 in 1850, and 3968 in 1852. The town is well laid out, and has a good landing-place and levee. Being at the foot of the Lower Rapids of the Mississippi, which are 11 miles long, steamboats at low water have to unload their freights here; but a canal is projected to be carried round the falls. Keokuk is the port of the rich valley of the Des Moines; and one of the most flourishing and busy towns in the state. It contains besides the county buildings, the state medical college and hospital, six churches, several academies and schools, and supports four newspapers. There are in the town and its immediate vicinity several steam saw-mills, and iron-foundries; large stores, warehouses, and hotels. Inexhaustible quarries of excellent limestone for building are in the neighbourhood. *Muscatine*, formerly *Bloomington*, the capital of Muscatine county, on the Mississippi, 30 miles S.E. by E. from Iowa city, population 2540, is the chief shipping port for the rich district between Iowa city and the Mississippi, and is steadily growing in importance. It contains besides the usual county buildings, several handsome churches, numerous large warehouses and stores, and supports two weekly newspapers.

Government, Judicature, &c.—The constitution by which the present government of Iowa is regulated was adopted in 1846. By it the right of voting in all state elections, &c. appertains to every male white citizen of the United States, infamous and insane persons excepted, who has resided in the state for six months, and in the county in which he claims to vote 30 days. The legislative body, styled the general assembly, consists of 30 members who are elected for four years (one half to be chosen every two years), and must be 25 years of age; and a house of representatives consisting of 59 members who are elected for two years, and must be 25 years old. The number of legislators is made dependent, to a certain extent, upon the population of the state; the representatives must not exceed 72 in number; the senators must not be less than a third, nor more than half of that number. The number of members and their apportionment among the counties is to be in accordance with a state census made for the purpose biennially of the number of white male citizens. The governor, who has a qualified veto on the acts of the legislature, is elected for four years, and has a salary of 1000 dollars: he must be 30 years of age and have resided for two years in the state. Among the special provisions of the constitution it is enacted that—no law shall embrace more than one object, and that object must be expressed in its title: no person holding any lucrative office under the state, or United States, is eligible to a seat in the house of representatives: no divorce shall be granted by the legislature: no state debt shall be created exceeding 100,000 dollars, except in case of war or insurrection, unless authorised by a special law which shall provide for the payment of the interest and of the principal within 20 years, which law shall be irrevocable, and before going into effect must be submitted to the people at a general election, after sufficient public notice, and be approved by a majority of the voters: no corporation with banking privileges shall be created; and all persons or associations shall be prohibited by law from banking or creating paper to circulate as money: corporations for other than banking purposes may be organised under general laws; the state shall never become a stockholder in any corporation. The funded debt of the state is 81,795 dollars, of which the interest is about 8000 dollars. The revenue is derived from taxes upon real and personal property. The total revenue for the two years ending October 31st 1852 was 139,633 dollars; the expenditure for the same period was 131,681 dollars. No return has been made of the state militia.

The judicature consists of a supreme court, district courts, and courts of local jurisdiction. The supreme court has appellate jurisdiction in chancery cases, and in common law cases under certain restrictions: it is presided over by a chief justice and two assistant justices, who are elected by joint vote of the general assembly for a term of six years, and receive a salary of 1000 dollars a year each. There are nine district courts, each of which is presided over by a judge, who is elected by the people of the district for a term of five years, and receives a salary of 1000 dollars a year. The courts of local jurisdiction are presided over by justices of the peace, and have jurisdiction in civil cases where the amount in dispute does not exceed 100 dollars, or by consent 500 dollars.

The constitution provides that a superintendent of public instruction shall be elected by the people every three years; and that all lands granted by Congress to the state, all escheated lands, and the percentage granted by Congress on the sale of public lands in Iowa, shall constitute a perpetual fund, the interest of which, and the rents of the unsold lands, shall be applied to the support of common schools; and that one such school shall be provided by the assembly in each school district for at least three months in the year. It also sets apart various fines, &c., for the maintenance of the schools and the establishment of school libraries. It further provides for the support of a state university. In 1850 Iowa possessed 3 colleges, having 8 teachers and 75 pupils; and 742 public schools, having 830 teachers and 29,616 pupils. The total number of children attending school, as returned by families, was 35,456, including 17 free coloured children. The number of adults unable to read and write was 5235, of whom 2318 were natives of the United States, and 2917 foreigners. The return of churches and church accommodation was too imperfect to be of any value. The number of newspapers and periodicals published in the state in 1850 was 29, circulating 1,512,800 copies annually.

The first settlement was made in Iowa by French Canadians at Dubuque in 1686. The country formed a portion of the French province of Louisiana, purchased by the United States in 1803. From that time it was included in the territory of Missouri till 1821, when it became a part of the territory of Michigan, and subsequently of that of Wisconsin. In 1838 it was erected into a distinct government with the title of the Territory of Iowa, and included within its limits the whole of the present territory of Minnesota west of the river Mississippi. In December 1846 it was admitted into the Union as an independent state; its area being circumscribed within its present boundaries. Since its acquisition by the United States there have been frequent 'difficulties' with the native Indians; but the several tribes have been successively expelled or induced to leave the territory, and there are now no Indians in Iowa.

IPSWICH. [AUBUSAMBOUL.]

IPSWICH, Suffolk, a market-town, port, municipal and parliamentary borough, the chief town of the county, and the seat of a Poor-Law Union, is situated in 52° 3' N. lat., 1° 9' E. long., distant 69 miles N.E. from London by road, and 68 miles by the Eastern Counties railway. The population of the borough of Ipswich in 1851 was 32,914. The livings are in the archdeaconry of Suffolk and diocese of Norwich. The borough is governed by 10 aldermen and 30 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. Ipswich Poor-Law Union contains 14 parishes, with an area of 7270 acres, and a population in 1851 of 32,104.

Ipswich is pleasantly situated on the side of a hill near the junction of the rivers Orwell and Gipping. The town was pillaged and the fortifications were destroyed by the Danes in 991 and in 1000. Ipswich had a charter from King John in the first year of his reign, and has returned two members to Parliament since the 25th of Henry VI.

The streets are well paved, lighted with gas, and plentifully supplied with water. There are many good buildings, especially in the modern portion of the town; the older streets are narrow and irregular; some of the old houses are decorated with curiously-carved figures. Many of the houses have convenient gardens attached, which render Ipswich an agreeable and healthy place of residence.

Ipswich had 81 places of worship in 1851, of which 15 belonged to the Church of England, 4 to Methodists, 2 to Baptists, 2 to Independents, and one each to Quakers, Roman Catholics, Unitarians, and Jews. The total number of sittings provided was 16,017. The number of day schools was 91, with 4252 scholars. There were 15 Sunday schools, with 1609 scholars. The literary institute had a library of 5000 volumes; the mechanics institute had a library of 5924 volumes. The Grammar school, founded in the reign of Edward IV., has an income from endowment of 116*l.* 6*s.* 8*d.*; it has six scholarships, and two exhibitions at Pembroke College, Cambridge; the number of scholars in 1853 was 180. The mother-church of Ipswich is St. Mary-le-Tower; it is attended by the judges, the mayor and corporation, the Grammar school, &c. St. Mary's church is of the 14th century. It has a peal of ten very fine bells, and the organ is one of the best in the kingdom. The church of St. Lawrence is a fine example of the perpendicular style; and some of the other churches are interesting buildings. A museum for the study of natural history among the working classes has been founded by Mr. George Ransome. There are some almshouses; and an hospital entitled the East Suffolk and Ipswich hospital, founded in 1836, which receives 38 in-door patients, and has an average of 170 out-door patients. Among the public buildings are the town-hall, the custom-house on the quay, the corn-exchange, the county jail, the borough jail, court-houses for the assizes and sessions, a temperance hall, an assembly room, and a theatre. A handsome building, the foundation stone of which was laid by Prince Albert, accommodates the Grammar school, public library, and museum. Ipswich has two prosperous savings banks. A county court is held in the town. An arboretum has been recently formed. Among the old edifices may be mentioned Cardinal Wolsey's Gateway and Sparrow's House.

The river Orwell has been deepened and otherwise improved, and a wet dock covering about 38 acres has been constructed. Vessels drawing 15 feet of water can float in the dock. The exports consist chiefly of corn, malt, cheese, butter, and agricultural implements and machinery. Coal, iron, and timber are largely imported. Mating, ship-building, paper-making, and stay-making are somewhat extensively carried on. Constant communication is kept up with Harwich by steam-vessels on the Orwell. The number of vessels registered at the port of Ipswich on December 31st 1853 was as follows:—Under 50 tons 51, tonnage 1453; above 50 tons 112, tonnage 12,180: steam-vessels 5, tonnage 192, and 4 of 447 tons. The vessels entered and cleared during 1853 amounted to:—Coasting trade, inwards 1425, tonnage 108,524; outwards 700, tonnage 33,093: steam-vessels, inwards 289, tonnage 31,019; outwards 287, tonnage 30,166. Colonial and foreign trade:—British vessels, inwards 71, tonnage 5888; outwards 68, tonnage 7117: foreign vessels, inwards 62, tonnage 5759; outwards 31, tonnage 3759. A market for corn and cattle is held on Tuesday; a general market on Tuesday and Saturday. Fairs are held in May, August, and September. The banks of the river Orwell display some beautiful scenery in the neighbourhood of Ipswich. In the vicinity are many fine residences of opulent families.

IREG. [CROATIA.]

IRELAND, the second in size of the British Islands, lies west of Great Britain, in the Atlantic Ocean, between 51° 26' and 55° 21' N. lat., 5° 20' and 10° 26' W. long. The arm of the Atlantic which separates Ireland from Great Britain is narrowest at its northern extremity, where it is called the North Channel, and the opposite coasts approach within 13 miles, between the Mull of Cantyre in Scotland and Fair Head in the county of Antrim. Southward from

this, that part of the Channel which contains the Isle of Man expands to a breadth of 120 miles, between the coasts of Louth and Lancashire, and bears the name of the Irish Sea. Being again contracted by the projecting coast of Wales to a breadth of about 65 miles, it assumes the name of St. George's Channel, which it bears until it expands into the Atlantic at its southern extremity. The remainder of the coast-line is formed by the Atlantic Ocean. The straight line joining Fair Head in the county of Antrim to Misen Head in the county of Cork, is the longest that can be drawn upon the island, and measures 302 miles; but the greatest length measured due north and south from Bloody Foreland, in the county of Donegal, to the Old Head of Kinsale, in the county of Cork, is only 237 miles. The greatest breadth, measured due east and west, from the eastern coast of the county of Down to the west coast of Mayo is 180 miles. The coasts are so indented by bays and inlets of the sea, that no part of the island is more than 50 miles from the sea. The area is 32,508 square miles, of which nearly 986 square miles are covered with fresh-water lakes and rivers. The population of Ireland in 1851 was 6,551,970; namely:—3,190,507 males, and 3,361,463 females. The majority of the inhabitants of Ireland are Roman Catholics.

Coast.—The southern and western coasts of the island are deeply indented by arms of the sea penetrating between rocky and mountainous promontories, and forming a great number of excellent harbours. The principal harbours on the south coast are those of Waterford, Youghal, Cork, and Kinsale. Along the western shore of the province of Munster the bays and harbours include Bantry Bay, Valentia Harbour (one of the finest and best sheltered natural harbours in the world, having a double entrance on the north and south sides of the island of Valentia), Dingle Bay, Tralee Bay, and the estuary of the Shannon, which is navigable for large vessels up to Limerick. On the west coast of the province of Connaught are Galway Bay, the numerous inlets that indent the coast of Connemara, Killery Harbour, Clew Bay, Killala Bay, and Sligo Bay. Farther north, penetrating far into the province of Ulster, are Donegal Bay, Sheep Haven, Lough Swilly, and Lough Foyle, which last is navigable for vessels of 900 tons up to the bridge of Derry. The shores of the island are in general lofty and precipitous. The eastern side is flat and little indented, except towards the north, where Belfast Lough, Strangford Lough, and Carlingford Bay run a long way into the land. The chief of the other harbours on the eastern side are Dundalk Bay; the beautiful Bay of Dublin, at the southern side of which is Kingstown Harbour; and Wexford Haven, which receives the river Slaney, a little west of Wexford town. It has been estimated that the total number of harbours on the Irish coast includes 14 capable of accommodating the largest men-of-war; 14 for frigates; upwards of 30 for coasting vessels; 25 good summer roadsteads; besides numerous inlets for fishing craft. There are 62 lighthouses and 3 floating lights round the coast of Ireland, of which 26 are first-class lights. About 196 islands are strewed along the coast, chiefly on the western side of the island: the largest are Rathlin, Tory, Arranmore, Achill, Clare, the South Arran Isles, Valentia, Dursey, Bear, Whiddy, and Cape Clear.

Surface and Geology.—The most remarkable feature in the distribution of high and low land over the surface is the great limestone plain which occupies, with little interruption, the central district extending from the sea at Dublin on the east to the Bay of Galway on the west, and from the counties of Sligo and Fermanagh on the north to the confines of Cork and Waterford on the south. The first interval between the limestone country and the Channel is occupied by the granitic range of the Wicklow and Mount Leinster Mountains, which extends southward from the confines of Dublin and Wicklow into Carlow, and terminates near the confluence of the Barrow and Nore. Lugnaquilla, the highest of the Wicklow Mountains, is 3039 feet above the sea. From the flanks of this chain a claylate formation extends on the one hand into the eastern portion of Kildare, and on the other to the sea, forming the more cultivable portions of Wicklow, and almost the entire of Wexford. Abutting on the southern extremity of the granite range commences a series of mountain groups, the main constituent of which is claylate and old conglomerate supporting flanks of yellow sandstone. This is the most extensive mountain district of Ireland. Commencing from the east the Slievenaman, Knockmeledown, and Galtee ranges extend in successive elevations of from 2000 to 3000 feet across the south of Kilkenny, Tipperary, and Limerick. After subsiding under the coal district which spreads from Limerick over the north-east of Kerry, they rise again towards the Atlantic, where Mount Brandon (3126 feet), between the Bay of Dingle and the mouth of the Shannon, terminates the series. The entire counties of Cork and Kerry are occupied by the same formation; the elevations attain a considerable altitude as they trend towards the sea, occupying the whole western part of Cork and the southern portion of Kerry with precipitous and sterile ridges, among which Carran-Tual, the highest summit of Mac Gillicuddy's Reeks in Kerry, rises to the height of 3414 feet, being the highest ground in Ireland. Throughout the western parts of Limerick and Clare the limestone is overlaid by the great Munster coal-tract, from under which it again emerges on the south side of the Bay of Galway. An extensive tract of granite with peaks of quartz and greenstone rising in Mulreea the culminating point to the height of 2688 feet, forms the

northern boundary of the Bay of Galway, and from this point northward to Killala Bay a series of primitive rocks, consisting chiefly of mica-slate and protruded masses of quartz is interposed between the Atlantic and the inland plain, except in one instance where the limestone reaches to the sea through the low country connecting the plains of Mayo with the head of Clew Bay. A primitive ridge of mica-slate and granite prolongs this district northward and westward through Sligo to within a short distance of the borders of Donegal, where it subsides to rise again in that extended primitive formation which occupies almost all the county of Donegal and a great part of the counties of Derry and Tyrone. The north-western portion of this district consists of granite and quartz with numerous veins of primitive limestone, which is also of frequent occurrence throughout the great field of mica-slate that constitutes the remainder and rises in mountains from 1500 to 2500 feet high. This district is succeeded on the east by the great trap-field of Antrim, which overlies it through an extent of nearly 800 square miles. The cap of trap is supported throughout by a bed of chalky white limestone reposing on lias, the denuded edges of which give an extraordinary variety of colouring and structure to the cliffs of that coast. A tract of claylate succeeds the trap-field on the south and west, extending over Down and Armagh into Monaghan, Louth, and parts of Cavan, Meath, Longford, and Roscommon. The granite group of the Mourne Mountains, which attain in Slieve Donard, their highest point, an elevation of 2796 feet above the sea-level, and the granite and greenstone group of Slieve Gallion occupy a considerable portion of this claylate tract, protruding in conspicuous masses in the southern parts of Down and Armagh to a height of 2500 feet and upwards.

The principal detached groups which occur within the limestone plain are the Slieve Bloom and Slieve Baughta ranges, consisting of nuclei of claylate supporting flanks of red and yellow sandstone, which extend to a considerable distance on each side of the valley of the Shannon in the county of Tipperary and Queen's County, and Clare and Galway counties respectively. A tract of old red-sandstone rises into a chain of moderate elevation on the borders of Roscommon and Sligo in the north-west part of the plain, and several greenstone elevations occur in the centre and south-west. The limestone plain also contains seven coal districts, the chief of which is in the province of Munster, extending through parts of Cork, Kerry, Limerick, and Clare counties. The Connaught or Lough Allen coal-field extends over a space of nearly 16 miles in its greatest length and breadth in the counties of Roscommon, Sligo, and Cavan; its total area is 140,000 acres. In the other coal-fields, which are small, the seams are narrow.

The central district of Ireland also contains upwards of 1,570,000 acres of flat bog, the greater portion of which lies west of the Shannon in the counties of Galway, Roscommon, and Mayo; the remainder, extending in various tracts through King's County, Longford, Westmeath, and Kildare, is known collectively as the Bog of Allen. The total area of turf bog, from which the chief supply of fuel is obtained, is 2,830,000 acres, of which above 1,250,000 acres are scattered over the uplands near the coast.

Besides these incumbrances the lower carboniferous limestone, which constitutes the central plain, is overlaid in many tracts towards the borders of the district by the upper limestone, and this is generally accompanied by a craggy and rough surface: as in the vicinity of the coal districts and throughout the counties of Sligo, Fermanagh, Cavan, and Leitrim. These districts contain numerous caverns; and streams sinking into subterranean channels are of frequent occurrence.

By much the greater part of the central plain however is unincumbered, and has the pure carboniferous limestone for its substratum. Throughout these districts the soil is rich and the surface gently undulating. The mountain groups and waste lands on the whole occupy a comparatively small portion of the entire island, and many of the districts lying outside the central plain rival the richest limestone lands in easiness of access and fertility.

Minerals.—The principal minerals are coal, iron, copper, and lead. Lignite is found in deep strata encompassing the southern half of Lough Neagh. Iron-ores are found in all the coal districts, and were largely manufactured while timber for smelting was abundant; but for a long time the mines have been abandoned. The iron-stone of Kilkenny is but little inferior to that of Arigna in Leitrim; and the ores of Lough Allen are only equalled in richness by the blackband iron-stone of Glasgow. The copper-ore is distributed throughout the claylate districts. The principal mines are in the counties of Wicklow, Waterford, Cork, and Tipperary. The total quantity of copper-ore exported to Swansea in 1851 was 10,577 tons, which sold for 77,713*l*. Lead is more extensively diffused through Ireland than copper. Numerous veins are found and worked in the granitic district of Wicklow, and also in the clay-slate districts of the island, where however but few of the mines are profitable. At the Ballycorus smelting-works, in the county of Wicklow, where the lead ores from the mines worked by the Mining Company of Ireland are smelted, 460 tons of lead were produced in 1851 from 674 tons of ore obtained from Luganure mines, being nearly 69 per cent. The machinery in all the Irish mines is driven by steam or water power, or by both, with the exception of three, where horse power is employed. Silver is found

in connection with lead ore in varying proportions of 7 oz. to 120 oz. in a ton of lead. Native gold was found at the end of the last century in the streams of the Croghan-Kinahela Mountain in Wicklow; but the quantity realised was not sufficient to pay for working. Tin-stone is found in the auriferous region of Wicklow, but no working deposits have been discovered. Other minerals found in various parts of the country are—manganese, antimony, zinc, nickel, iron pyrites, alum, clays of various kinds, gypsum, ochre, building-stone, marble, paving and roofing slates, besides the various substances incidentally mentioned above.

Rivers and Lakes.—From the arrangement of the mountain groups round the borders of the central plain, the courses of the greater number of the rivers of Ireland are necessarily short. Of those which drain the external districts, the chief are the Blackwater and Lee in Cork, the Foyle in Donegal and Derry, the Bann and Lagan in Antrim and Down, and the Slaney in Wexford. The rivers of the central district have longer courses and a much greater body of water. The chain of Slieve Bloom divides the central plain longitudinally into two unequal portions, of which the western division is by much the larger. The eastern or smaller division is again subdivided by the summit level of the Bog of Allen into a northern district, the waters of which discharge themselves into the Irish Sea by the Boyne, and a southern district, which sends its drainage in an opposite direction into the Atlantic by the united streams of the Barrow, Nore, and Suir, all navigable rivers. The western division, which much exceeds the united basins of these several rivers, is drained solely by the Shannon, which, from its great body of water and course through a flat country, possesses the extraordinary advantage of being navigable nearly from its source to its mouth, a distance of more than 200 miles. Those portions of the central plain which lie beyond the basins of the Shannon and Boyne, discharge their chief drainage into a series of lakes which skirt the limits of the limestone country on the west and north. The lakes of Galway and Mayo form such a series, separating the primitive district of Connaught from the plain on the west; the extended line of Lough Erne in like manner drains that portion of the central plain which stretches towards the primitive district of Donegal and the high lands of Tyrone on the north; and Lough Neagh, which covers an area of 98,255 acres, collects the waters of the remainder on the north-east. The other principal lakes of Ireland lie within the basin of the Shannon, those of most consequence being merely expansions of that river. The water-power afforded by the different rivers and natural dams of Ireland is greater than in any equal extent of accessible country in Europe.

Climate.—The climate of the island, owing to the proximity of the Atlantic, is more moist and less liable to severe cold than that of the neighbouring countries. The mean annual temperature of Londonderry is 49° Fahr.; of Dublin and the central parts of Ireland a little over 50°; and on the south coast nearly 52°. The maximum heat at Londonderry has reached 81° Fahr., at Dublin 81°50', at Kilkenny 79°, at Limerick 75°; and the greatest cold observed at these places respectively is expressed by 21°, 14°50', 29°, and 28° Fahr. The county of Cork is remarkable for its equable temperature, so much so, that Cove and some other places in the county are resorted to by consumptive persons in winter. The average annual quantity of rain which falls at Cork in the southern extremity of the island is, according to one authority, 40-20 inches, according to another 36-03 inches; at Dublin 30-87 inches; at Belfast 34-96 inches; and at Derry, in the northern extremity, 31-12 inches. Sir R. Kane estimates the average annual rain-fall over the entire surface of Ireland at 36 inches. Frosts are rarely severe in Ireland, and snow does not lie so long as in England; neither are thunder-storms of such frequent occurrence or of so formidable a character. The prevalent winds are from the west and south, and these are usually accompanied by a mild state of the atmosphere. Easterly winds are keen, and much dreaded by invalids. The chief characteristics of the scenery are freshness and verdure, whence Ireland has been poetically styled the Emerald Isle. The surface is less rugged than that of Scotland, and more varied and undulating than that of England; it is however generally deficient in timber.

Area and Population.—Ireland is divided into 4 provinces, Leinster, Munster, Ulster, and Connaught; and into 32 counties. Leinster contains twelve counties, Munster six, Ulster nine, and Connaught five. The following table shews the population of each county and city at the time of the Census in the years 1821, 1831, 1841, and 1851, with their respective areas in statute acres. The large decrease in population between 1841 and 1851 was mainly owing to the disastrous famine which afflicted Ireland in 1845-47, in consequence of the failure of the potato crop: it was partly owing also to emigration. It has been estimated that the total emigration from Ireland during the ten years between 1841 and 1851 amounted to 1,289,133. It is deserving of notice that emigrants who have gone to the United States and have succeeded in improving their circumstances, have sent home contributions to a large amount to enable their relations and friends to follow them, or to assist them in their struggle with difficulties at home. The Colonial Land and Emigration Commissioners say, in their twelfth 'Report,' that "The contributions so made, either in the form of prepaid passages or of money sent home, and which are almost exclusively provided by the Irish,

were returned to us, as in 1848, upwards of 400,000*l.*; in 1849 upwards of 540,000*l.*; in 1850 upwards of 957,000*l.*; in 1851 upwards of 990,000*l.*; and in 1852 upwards of 1,404,000*l.*" The commissioners calculate the Irish emigration in 1851 at 257,372; in 1852 at 224,830, and they add that "as this emigration has varied with considerable regularity according to the variations in the state of the labouring classes, we trust we may consider the decrease as indicative of the decrease of destitution among those classes." The returns for the first four months of 1853 indicate a still further decrease in the number of persons emigrating from Ireland. The spontaneous emigration from Ireland is chiefly to the United States and British North America.

Meadow and Clover	1,200,124	1,266,699	1,270,713	1,270,309
Total	5,758,292	5,868,951	5,789,214	5,695,347

The produce of corn, beans, and peas, reduced to tons of 2240 lbs. each, was 2,182,514 tons in 1849; 2,113,327 tons in 1850; and 2,165,864 tons in 1851. The quantity of potatoes grown in 1851 amounted to 35,528,175 barrels of 20 stones each, or 4,441,022 tons.

The number of each description of live stock on 570,338 holdings (of which 29,057 holdings exceeded 100 acres) in Ireland in the year 1851, stood as follows:—Horses and mules, 543,312; asses, 136,981; cattle, 2,967,461; sheep, 2,122,128; pigs, 1,084,857; goats, 235,313; poultry, 7,470,694. The estimated value of the live stock throughout Ireland in 1841 was 21,105,808*l.*; in 1847 it was 24,820,547*l.*; in 1850 it was 26,951,957*l.*; in 1851 it was 27,737,393*l.*

In 1851 there were 17,175 deer in Ireland, namely:—in Leinster, 4857; Munster, 7008; Ulster, 3380; and in Connaught, 1930.

The Commissioners employed in procuring the 'Returns of the Census' of Ireland in 1851, in their report to the Lord-Lieutenant, congratulate his Excellency on "the evidence which" the "tables afford of the steadily increasing amount of farm stock, and the generally improved condition of agriculture in Ireland."

The Flora of Ireland contains some rare varieties; the *Arbutus unedo* flourishes along the lakes of Killarney; new varieties of saxifrage and ferns have been discovered on the Kerry Mountains; scarce alpine plants are found in Connemara, Benbulbin Mountain in Sligo, and in the county of Antrim; and many new or rare species of *Alga* have been met with on various parts of the coast.

The elk or moose deer formerly had its habitat in Ireland, where its bones have been found in several places. Wolves were once numerous, and the Irish wolf-dog, a race now all but extinct, was kept for hunting them. Venomous animals are unknown. The surrounding seas abound with round, flat, and shell-fish; the sun-fish frequents the western coast, which is occasionally visited also by whales. [GALWAY COUNTY.] Seals are met with about the exposed headlands.

Government, Revenue, &c.—The executive government is administered by a viceroy, whose official title is Lord-Lieutenant-General and General Governor of Ireland. The Lord-Lieutenant is assisted by a privy council, appointed by the crown, and by a chief secretary, a member of the House of Commons. Ireland is represented in the Imperial Parliament by 4 spiritual and 28 temporal peers, and 105 commoners, namely, 64 for the 32 counties, 2 for Dublin University, 12 for the cities and towns of Dublin, Cork, Limerick, Waterford, Belfast, and Galway, and 27 for the boroughs. The number of electors on the register for 1852-53 was 179,488, being 149,854 for the counties, and 29,634 for the boroughs. The militia of Ireland comprises, when embodied, 38 regiments, namely: 6 of 10 companies each; 1 of 9 companies; 14 of 8 companies each; 15 of 6 companies each; and 2 of 7 companies each. The constabulary force consists of 12,346 men, including 620 officers, and cost 572,541*l.* in 1852, of which 29,007*l.* was charged on the counties, cities, and towns of Ireland, the rest being charged on the consolidated fund. The judicial establishment consists of the lord-chancellor, the master of the rolls, four judges each in the Courts of Queen's Bench, Common Pleas, and Exchequer, those of the Exchequer being styled Barons, a Bankrupt Court with two judges, two commissioners of the Insolvents' Court, and the judges of the Prerogative Court and the Admiralty. The superior courts are held in Dublin. For the assizes there are six circuits, in which two of the judges try causes twice a year, in spring and summer. There are 595 petty sessions courts in Ireland. There are 34 county prisons, 10 city or town prisons, and 114 bridewells: of the county prisons 27 have treadmills. In the year 1852 the number of summary convictions for petty offences was 59,215; for drunkenness 19,504; the number of cases at assizes and quarter-sessions was 17,678; the number of convictions was 10,454; of these the sentences for 6 months' imprisonment and under amounted to 6446; the capital sentences to 22; the number of executions was 6. The number of male convicts in custody on January 1st 1853 was:—In depôts, 3567; in jails 477: total 4044. Of female convicts there were 187 in custody. The number of paupers receiving relief at the Union Workhouses in 1852 was, in-door, 504,864, out-door, 14,911: total 519,775. The total expense of the Poor-Law establishment for 1852 was 883,267*l.*; for the year ending September 29th 1853, the total expenditure was 814,000*l.* The total number of persons receiving relief on October 15th 1851 was 145,743; on October 16th 1852 it was 115,810; on October 15th 1853 it had fallen to 82,846. From 1848 to 1851 there were sent to the Australian colonies 4385 orphan girls from workhouses in Ireland, the government granting a free passage, and the boards of guardians in each case defraying the cost of outfit and conveyance to the port of embarkation. In the year ending March 1853, the total number of emigrants sent out or assisted to emigrate by boards of guardians was 3825, from 93 unions, of whom 495 were males of 15 years of age and upwards, and 2218 females, with 1116 children under 15 years of age dependent on them.

By an Act passed in 1849 (12 and 13 Vict. cap. 77), a Commission for the Sale of Incumbered Estates was appointed, the operations of which have been considered on all hands to be highly beneficial, and to give promise of much improvement in the social condition of the Irish people. Large estates have thus been transferred from bankrupt proprietors, groaning under the weight of irredeemable mortgages and without capital to employ labour, to the hands of competent and

improving landlords, of whom a large proportion are skillful cultivators from England and Scotland. From the opening of the court in October 1849 to October 21st 1853, the number of lots sold by the Commissioners was 5809; the gross amount realised was 10,430,463*l.*, of which 7,578,483*l.* had been applied in liquidation of claims upon the estates sold. About 1,691,702 acres, the net rental of which is estimated at 635,723*l.*, have thus been disposed of to new owners.

The ordinary revenue of Ireland for the year 1852, exclusive of the receipts from the Crown lands, amounted to 3,816,357*l.* 4*s.* 6*d.*; the expenditure, so far as paid from the Irish exchequer, was 3,576,802*l.* 5*s.* 10*d.* The gross amount received for Customs duties in 1852 was 2,060,469*l.*; for Excise, 1,632,302*l.* 18*s.* 2*d.* The gross income from the Irish Post-office in 1852 was 200,262*l.*; the cost of management was 192,667*l.* The number of letters which passed through the post-office in one week in November 1839 was 179,931; the number in one week in November 1853 was 772,215. The number of post-office orders issued at the post-offices throughout Ireland in 1852 was 393,879, representing an amount of 656,111*l.*; the number paid during the same period was 526,233, amounting in value to 730,490*l.* There are 108 newspapers published in Ireland, of which 27 appear in Dublin. Of the whole number 3 are published daily (in Dublin); 12 three times a week; 21 twice a week; 4 monthly; 1 occasionally; and the rest once a week. The number of newspaper stamps issued in 1852 was 8,509,937.

Religion and Education.—Ireland is divided into two ecclesiastical provinces, the northern province having the Archbishop of Armagh, Primate and Metropolitan of all Ireland, as its president, and the southern province having the Archbishop of Dublin and Primate of Ireland as its metropolitan. The income of the two archbishops, and of their ten suffragan bishops, amounts to 67,539*l.* The number of the clergy is about 2000. The dignitaries of the Roman Catholic Church are the four archbishops of Armagh, Dublin, Cashel, and Tuam, and 25 bishops. The number of parochial clergy is upwards of 2000. Of Presbyterian, Methodist, Baptist, and Independent churches and ministers there are upwards of 800. The University of Trinity College, Dublin, comprises a provost, 7 senior fellows, 23 junior fellows, and 70 scholars. The library includes about 106,000 printed volumes, and 1500 manuscripts; there is also a well-stocked botanic garden and a museum. The income of the college amounts to about 64,000*l.* a year, about half of which is received from the students and graduates. The number of students is about 1500. The Queen's Colleges, opened for students in October, 1849, had at the close of the session in June 1853 the following number of students:—Belfast, 182; Cork, 126; Galway, 124. At Maynooth College, for the education of Roman Catholics for the priesthood, there were 516 students in December 1851. The College of St. Columba, at Whitechurch, Rathfarnham, near Dublin, is a classical preparatory school, under the management of members of the Established Church. In 1849 there were in Ireland 7 Royal Endowed schools attended by 289 boys, and 3 Private Endowed schools attended by 51 boys. In September 1852 there were 4875 National schools in operation, with an attendance of 540,310 scholars, about six-sevenths of whom were Roman Catholics. The number of teachers trained during 1852 was 302, of whom 240 were Roman Catholics. Nine district Model schools, 133 Workhouse schools, a Model farm (at Glasnevin, near Dublin), and 25 Model Agricultural schools, have been established by the National Board. In December 1852 there were 23 Workhouse Agricultural schools, with 2355 pupils. The Church Education Society had 1858 schools in the year 1852, with 105,387 pupils, of whom 61,630 were of the Established Church, 15,674 Protestant Dissenters, and 28,083 Roman Catholics.

Shipping.—The number of sailing-vessels registered as belonging to the various ports of Ireland on December 31st 1853 was:—Under 50 tons 1037, tonnage 29,721; above 50 tons 1061, tonnage 199,419. The number of steam-vessels was:—Under 50 tons 17, tonnage 554; above 50 tons 104, tonnage 29,670. In the coasting and cross-channel trade during 1853 the number of sailing-vessels inwards was 18,101, tonnage 1,417,465; outwards 8570, tonnage 648,195: of steam-vessels 4860 of 1,484,127 tons entered, and 4692 of 1,459,410 tons cleared. In the colonial and foreign trade there entered 1159 British vessels of 234,892 tons, and 1195 foreign vessels of 237,499 tons, and 2 British steam-vessels of 704 tons; and there cleared 539 British vessels of 144,204 tons, 1014 foreign vessels of 219,105 tons, and 2 British steam-vessels of 166 tons.

Savings Banks.—The number of savings banks in Ireland on November 20th 1852 was 51; the number of accounts remaining open at that date was 52,184; and the total amount owing to depositors was 1,449,297*l.* 16*s.* 7*d.*

IRVINE, Ayrshire, Scotland, a royal and parliam

sea-port, and market-town, in the parish of Irvine, is situated on a rising ground on the right bank of the river Irvine, in 55° 38' N. lat., 4° 40' W. long., 10 miles N. from Ayr, 68 miles S.W. by W. from Edinburgh, and 29½ miles S.W. from Glasgow by the Glasgow and South-Western railway. The population of the parliamentary burgh in 1851 was 7584. It is governed by a provost and 16 councillors, and, conjointly with Ayr, Campbeltown, Inverary, and Oban, returns one member to the Imperial Parliament.

The town consists chiefly of one broad street, which communicates with a southern suburb by means of a stone bridge of four arches, rebuilt in the year 1826. It is well paved and drained, and lighted with gas. The principal public buildings are the church and the town-house. Besides the parish church there are two chapels for United Presbyterians, and one each for the Free church, the Baptists, and the Roman Catholics. The harbour has from 9 to 11 feet of water on the bar at spring-tides, though during violent gales from the south it rises to 16 feet. In 1853 there were 118 vessels belonging to the port, of 18,908 aggregate tonnage. During 1853 there entered the port in the coasting trade 175 sailing-vessels of 9242 tons, and 154 steam-vessels of 35,230 tons; and cleared 3657 sailing-vessels of 230,382 tons, and 289 steam-vessels of 43,501 tons. In the colonial and foreign trade there entered 37 vessels of 10,000 tons, and cleared 322 vessels of 86,507 tons. The amount of Customs duties received at the port during 1850 was 668*l.* 1*s.* 8*d.*; in 1851 the amount was 395*l.* 1*s.* 4*d.* Ship-building and its attendant trades are carried on. Coal is the principal export. Many females are employed in muslin-sewing. Young trees are largely grown and exported; oats, butter, hides, limestone, timber, &c., are imported. The town is during the summer months frequented for sea-bathing. Besides the academy, (which was incorporated by charter in 1816, has an income from endowment of 90*l.* a year, and had upwards of 300 scholars in 1853), the town possesses several other schools, a savings bank, a news-room, and a subscription library. An extensive common, called the Golf-Fields, and a town-moor belong to the burgh.

ISCHIA, the ancient *Ænaris*, an island situated at the northern entrance of the Bay of Naples, the smaller island of Procida lying between it and the promontory of Misenum on the mainland. Procida (*Prochyta*), according to an old tradition, was rent from Ischia by an earthquake. The island is mountainous and of volcanic origin; the highest summit, called Mount Epomeo, which is an extinct volcano, rises about 2500 feet above the sea, and has near its summit distinct traces of two very large craters, and numerous cones on its sides. The volcanic district of Naples is considered to comprise not only Vesuvius, with Pozzuoli and Cumæ, but also the islands of Procida and Ischia. The last eruption of the Epomeo was in 1301, when a broad stream of lava ran over the eastern part of the island, nearly two miles, as far as the sea. Strabo calls this island by the name of *Pitheussa*, which is not, as Pliny observes, derived from *πίθηκος* (an ape), but from *πίθος* (an earthen vessel). This name and the other ancient names of the island have been traced by some to Phœnician, or Syriac words, expressive of the volcanic action to which it was subject in early times. The modern name is a corruption of *Iscla*, under which designation it is spoken of in ecclesiastical records of the 8th century. The clay of the island, it seems, has been used for earthenware from the remotest time. The island was settled by Greeks of Chalcis and Eretria. There were numerous traditions of volcanic action having taken place in this island; and Timæus mentions a violent eruption of Epomeo a little before his time. The soil of Ischia is very fertile, and produces corn, abundance of wines, and all sorts of fruit. The hills are covered with chestnut-trees. The island is about 20 miles in circuit, and contains 25,000 inhabitants. Ischia forms part of the province of Naples; it contains four small towns or villages: *Ischia*, which is a bishop's see and has a castle, is situated on the north-east coast, and has about 5500 inhabitants. *Fornia*, which is the most commercial place on the island, is situated on the western coast, and has a harbour and 6000 inhabitants. *Casamicciola*, the neighbourhood of which contains excellent clay, of which a great quantity of pottery is made and sent to Naples, stands on high ground about a mile and a half from Fornia, and has 3800 inhabitants. The most famous springs in the island are situated around *Casamicciola*. *Lacco*, a pretty village, is situated on a cove in the shore below *Casamicciola*, and has about 1600 inhabitants mostly engaged in the tunny fishery. The island abounds with warm springs, which are much frequented by invalids from Naples. Ischia is altogether one of the finest islands near the coast of Italy. The Latin poets sometimes call the island *Isarime*. (De Quintia, *Isarime*, Naples, 1726; Scrope, *On the Volcanic District of Naples*, in 'Geol. Trans.,' Blowitz, *South Italy*; Strabo, Casaub., p. 248; Pliny, 'Nat. Hist.,' ii. 88, iii. 6.)

ISEHIL. [ENB.]

ISEGHEM. [FLANDERS, WEST.]

ISER, or ISAR, a feeder of the Danube, rises in the Tyrol to the north-west of Innsbruck, near 11° E. long. It runs at first for a few miles eastward along the northern base of the Solstein Mountain, which separates it from the Inn and enters Bavaria near the village Mittenwald, whence it runs with rapid course in a north-north-east direction down to Munich, receiving in the interval the outfall of several alpine lakes. From Munich the Isar gradually bends to the

east of north-east, passing Landschut and Landau, and enters the Danube on the right bank at a short distance below the village of Deggendorf, and near 18° E. long. The whole length of the river is about 170 miles. The stream is too impetuous to be navigable; but large rafts are floated down it. Its principal feeder, the *Ammer*, joins it on the left bank between Landschut and Munich, and brings into it the surplus waters of the Wurm-see, the Ammer-see, and a few other small mountain lakes. There are numerous islets in the lower course of the Isar: particles of gold have been found in its sands.

There is another *Isar* in Bohemia which carries down a considerable portion of the drainage of the southern slope of the Riesengebirge into the Elbe near Brandeis, a few miles north-east of Prag. Turnau and Jung-Bunzlau are on its banks. This river also rolls down particles of gold, and many chalcodones are found in its bed.

ISÈRE, a department in the east of France, is bounded E. and N. by Savoy and the department of Ain, S.E. and S. by the department of Hautes-Alpes, S.W. and W. by those of Drôme and Rhône. It lies between 44° 42' and 46° 52' N. lat., 4° 42' and 6° 20' E. long.; its length from north-west to south-east is 94 miles; the average width is about 41 miles. The area is 3201½ square miles. The population in 1846 was 598,492; at the census of 1851 it amounted to 608,497, which gives 188,528 to the square mile, or 13,944 above the average per square mile for all France.

The department is formed out of a portion of the old province of Dauphiné, and named from its principal river the Isère. The surface presents lofty mountains, which are branches of the Alps, peaks covered with snow that never melts, glaciers, dark pine forests, numberless steep, narrow, and abrupt gorges, torrents, waterfalls, and extensive plains towards the north and in the centre, the whole forming perhaps the most varied and picturesque scenery in France, ranging between the extremes of the bleakest barrenness and the most smiling and luxuriant fertility. The cols of Saix and Sept-Laux, and the peaks of Granier and Belledonne, rise respectively to the height of 10,968, 9742, 9840, and 9781 feet above the level of the sea. The mountains abound in grottoes of great extent and rich in stalactitic concretions. Lakes are numerous, but small. There are no navigable canals; but canals and rills of irrigation are employed very extensively in most of the valleys and plains. The plain of Echirolles near Grenoble presents the most complete system of irrigation in the department. Every spot capable of cultivation is carefully tilled; the mountain sides are shaped into terraces, which are formed with carried earth, supported by walls of dry-stones; and crops are grown at the height of 2700 feet above the level of the valleys.

The arrondissement of Grenoble contains no plains; the tillage is confined to the valleys and mountain slopes. The valley of Grésivaudun, remarkable for its extraordinary fertility and high cultivation, is watered in its whole length by the Isère, and extends from the point where that river enters France to its junction with the Drac in the neighbourhood of Grenoble, a length of 29 miles, with an average breadth of 3 miles. It is inclosed in its whole extent by two chains of mountains of great and varied beauty, the lower slopes of which are converted into corn-fields, meadows, orchards, and mulberry plantations; the central parts are covered with forests of oak, chestnut, and pine, or clothed with pasture, while the summits and crests are crowned with snow or with naked rocks. In this valley the walnut, mulberry, and vine flourish. Wheat, barley, maize, hemp (which frequently grows 15 feet long), clover, &c. are produced in great abundance. The whole of the valley is cultivated like a garden, and manure and an extensive system of irrigation excite the naturally fertile soil to extraordinary productiveness. Rye and oats are the chief crops in the mountain districts. Oxen are employed in farm-work. Numerous flocks from this and the neighbouring departments graze upon the mountain pastures during the summer. The arrondissement of St-Marcellin presents towards the north a vast plain, known under the names of Bièvre and Côte-St-André, consisting of a dry gravelly soil, which is tolerably fertile and well cultivated. The centre of this arrondissement is hilly, and contains some good wheat land. Another part of the arrondissement is the valley of Tullins, a prolongation of that of Grésivaudun, to which it yields neither in beauty nor fertility. The southern part of the arrondissement of La-Tour-du-Pin, known as the *Terres Froides* (cold lands), consists of high ridges divided by narrow vales, while the northern part consists of hills of moderate height, intersected by moist and marshy plains. In this part are the lakes of Paladru and Lempis, and the extensive morasses of Bourgoin. The arrondissement of Vienne presents in its northern part a vast dry sandy plain, on which rye is the chief crop; in the central parts it is covered with hills, the lower slopes of which are well cultivated and very productive, while their summits are covered with wood; to the south this arrondissement comprises the extremely fertile plain of Valoir, which yields corn, wine, oil, and silk. The slopes that screen the valley of the Rhône in the neighbourhood of Vienne produce some of the finest Rhône wines.

The *Isère* rises on the western slopes of the Graian Alps in the Tarentaise district of Savoy, flows in a general westerly direction to Moutiers, whence its course is north-west for a few miles, then south-west to its junction with the Arc and as far as Montmeillan, where it becomes navigable, and soon after enters France. Here its

course is nearly south to Grenoble, where it is joined by the Drac from the left bank: below this point it makes another bend first to north-west, then to south-west, passing St-Marcellin, below which town it enters the department of Drôme, and falls into the Rhône a few miles above Valence after a course of 180 miles, 87 miles of which are navigable. This river, which is subject to disastrous floods, is of moderate width, but very deep; its waters are always of a blackish tint, owing to the débris which it receives from the slate-quarries of the Tarentaise. Of the other streams, which are very numerous, the most important are the *Drac* [ALPES, HAUTES]: the *Romanche*, which drains the valley of L'Oysans and the south-east of the department, and joins the Drac on the right bank, a few miles south of Grenoble: the *Bourbre*, which rises south of Virieu, and flowing past La-Tour-du-Pin and Bourgoin enters the Rhône on the northern boundary of the department: the *Guiers*, which is formed by the union of the *Guiers-Vif* and the *Guiers-Mort* (two streams that run down from the mountains of the Grande-Chartreuse), and flows along the frontier of Savoy from Les-Echelles to its junction with the Rhône, a few miles south of Belley. The waters of the Romanche, the Bourbre, and most of the other streams are turned to advantage in irrigating the land and in driving machinery. The Rhône forms the northern and western boundaries of the department, and is navigable. Salt and other articles are conveyed in barges from the Rhône up the Isère; the transports down the latter are iron, hemp, linen, woollen-cloth, timber, &c. Many of the mountain streams of the department form beautiful cascades.

The department is crossed by 7 imperial and 17 departmental roads: the Lyon-Avignon railroad, now in course of construction, runs along the west of the department down the left bank of the Rhône, sending off a branch to Grenoble, which lies on the electro-telegraphic route from Paris to Turin and French Africa.

The department contains 2,048,716 acres, of which 781,837 acres are under tillage; 164,857 are pasture land; 68,446 are under vine culture; 499,695 are covered with woods and forests; 20,009 are occupied as gardens, orchards, nurseries, and plantations of different sorts; and 38,276 acres are covered with rivers, lakes, canals, &c. The rest of the surface, amounting to about 500,000 acres, consists of irreclaimable rocks and mountains. The products are of the most varied description—wheat, rye, barley, maize, buckwheat, peas and beans, potatoes, fruits of all kinds, walnuts, mulberries, almonds, medicinal plants, hemp, &c. Vines are mostly grown in the fertile valleys, trained either to greenwood supports of maple or cherry-tree, or to tall dry poles of chestnut-wood; vines thus grown are called high vines (*hautains*). But on the hill slopes, in favourable situations and in the Rhône district in the arrondissement of Vienne, the low vines, as they are called when unsupported, produce a stronger better-keeping wine, and more fitted for transport. The produce of wine in ordinary years is 5,324,000 gallons, the best of which is produced in the neighbourhood of the Rhône. Horses, asses, and cows are numerous, but small; mules of large size are reared in the mountains; sheep are bred in great numbers, and yield a fine silky wool; pigs, goats, and poultry are plentiful. The rivers and lakes abound in fish. The art of pisciculture, or the rearing of fish from deposits of spawn in the rivers, is extensively practised in the department. Game is abundant; among the wild animals are the boar, wolf, chamois, ibex, porcupine, weasel, red and gray partridge, &c. The mulberry grounds are extensive; the number of trees exceeds a million.

The climate is healthy; cold in winter, very hot in the valleys and plains in summer. The prevailing winds are from the north and north-west; about 85 days in the year are rainy; hail-storms are sometimes very destructive.

In mineral wealth the department is very rich. Iron, lead, copper, and coal mines are worked; gold and silver mines have been worked, but are now abandoned. In the year 1837 a vein of platina was discovered in the valley of the Drac. Marble, granite, porphyry, gypsum, and slate are quarried. Antimony, zinc, cobalt, rock-crystal, vitriol, and sulphur are found.

The industrial products consist of sailcloth, table and household linen, gloves, soldiers' uniforms, calicoes, printed cottons, oil, turpentine, liqueurs, and mineral acids. There are iron, copper, and lead foundries, steel-works, zinc and copper rolling factories, marble-works, saw-mills, paper and vellum works, naileries, dye-houses, glass-works, cotton-yarn manufactories, and establishments for the rearing of silkworms and the reeling of silk. Large quantities of charcoal are burnt in the forests round the Grande-Chartreuse. The number of wind- and water-mills is 1367; of forges and smelting furnaces, iron- and steel-works, 119; of factories and workshops of different kinds, 969.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Grenoble	20	212	220,192
2. La-Tour-du-Pin	8	122	136,593
3. St.-Marcellin	7	84	87,198
4. Vienne	10	134	159,514
Total	45	552	603,497

1. Of the first arrondissement and of the whole department the capital is GRENOBLE. Of the other towns we notice the following, giving the population of the commune with each:—*Allevard* stands in a high valley N.E. of Grenoble, watered by the Breda, a feeder of the Isère, and has 2638 inhabitants, who are chiefly employed in the neighbouring iron-mines, forges, smelting-furnaces, and foundries, the machinery of which is driven by the Breda. *Bourg-d'Oysans*, S.S.E. of Grenoble, in the picturesque valley of the Romanche, which is hemmed in by high wooded mountains, echoing with numerous cascades, has an ecclesiastical college and 3196 inhabitants, who manufacture cotton, and work in the lead- and rock-crystal mines of the neighbourhood. *St.-Laurent-du-Pont*, 20 miles N. from Grenoble, is most picturesquely situated at the foot of very high and almost perpendicular mountains, on the road to the monastery of the Grande-Chartreuse, which was founded by St. Bruno in 1084, in a wild and rocky defile traversed by the *Guiers-Mort*; population, 1734. *Mens*, 25 miles S. from Grenoble, stands among the Trièves Mountains, and has 2126 inhabitants, important linen manufactories and glass factories. *La-Mure*, S. of Grenoble, on the road to Gap, situated at the extremity of the valley of the Matésine, which is inclosed by the Trièves Mountains, has 3106 inhabitants, who manufacture coarse linen and leather, and work in the coal-mines and marble-quarries near the town. *Vif*, 10 miles S. from Grenoble, has potteries, silk-throwing factories, and 2314 inhabitants. *Villard-de-Lans*, near the right bank of the Bourne, has a population of 2298. *Visille*, in a fertile plain on the right bank of the Romanche, has an ancient castle now converted into a factory for printed cottons, and contains 2907 inhabitants. *Voiron*, N. of Grenoble, a well-built town of 7694 inhabitants, stands at the foot of a hill on the Morge, a small feeder of the Isère, which drives the machinery of several industrial establishments. The principal manufactures are cloth, silk-stuffs, canvas, liqueurs, soap; there are also iron- and steel-works, paper- and hemp-mills, naileries, and tan-yards. *Voreppe*, a flourishing village S. of Voiron, has oil- and corn-mills, tan-yards, and 3005 inhabitants.

2. In the second arrondissement the chief town, *La-Tour-du-Pin*, stands on the left bank of the Bourbre, on the road from Lyon to Chambéry, in 45° 33' 50" N. lat., 5° 27' 7" E. long., at an elevation of 1046 feet above the level of the sea, and has 2559 inhabitants, and some beet-root sugar factories. It was formerly important on account of its fortifications, of which there are still some remains. The tribunal of first instance is at *Bourgoin*, a town of 4271 inhabitants, situated among hills at the junction of three small rivers, and at the point where the Lyon road branches off southward to Grenoble, and eastward to Italy through Chambéry. Its situation is favourable for trade, but unhealthy on account of the marshes and bogs near it. Its manufactures are printed calicoes, canvas, cotton cloth and yarn, thrown silk, and beet-root sugar; there are also several flour-mills. *Crémieux*, 6 miles N. from Bourgoin, has 2292 inhabitants, and is famous for its poultry. It stands at the foot of a chain of calcareous hills, in which is the famous grotto of La Balme, reckoned as one of the seven wonders of Dauphiné. The grotto consists of two long galleries, one facing the entrance, the other to the right, and both contain beautiful stalactites; in the former there is a lake of pellucid water, the transit of which to and fro occupies one hour, and is made by torchlight in a boat kept for the purpose. *Le-Pont-de-Beau-voisin*, is situated on the *Guiers*, here crossed by a bridge of one arch, the line joining the keystones of which marks the boundary between France and Savoy. The larger part of the town is on the Savoy side; the commune on the French side has 2268 inhabitants.

3. In the third arrondissement the chief town, *St.-Marcellin* is situated in 45° 9' 18" N. lat., 5° 19' 32" E. long., 1073 feet above the level of the sea, 20 miles W. from Grenoble, in a pretty country at the foot of a vine-clad hill, at a short distance from the right bank of the Isère; and has a tribunal of first instance, a college, and 3344 inhabitants in the commune. The town is surrounded with walls pierced by four gates; it is well built, with straight streets, ornamented with fountains. *Rives*, N.N.E. of St.-Marcellin, is situated in a smiling valley, watered by the Fure, and has 2270 inhabitants. This town is the centre of considerable manufactures of iron, steel, paper, crape, and silk handkerchiefs; the steel forges, of which there are 23 in the town and neighbourhood, are famous for the excellence of their products. *Roybon*, N.W. of St.-Marcellin, has manufactures of coarse woollens and 2288 inhabitants. *Tullins*, formerly a well-fortified town, stands a few miles S. of Rives in a beautiful valley, and has 4701 inhabitants. It is surrounded by iron-forges, steel-works, copper foundries, and hemp-dressing establishments. Arms and tools of various kinds are manufactured here. *Vinay*, 5 miles N.E. from St.-Marcellin, has iron-works, silk-throwing establishments, and 3351 inhabitants.

4. In the fourth arrondissement the chief town is *Vienne*, the *Vienne* of the Allobroges, and the capital of the first and second kingdoms of Bourgogne. It stands in 45° 31' 28" N. lat., 4° 52' 33" E. long., 492 feet above the level of the sea, at a distance of 50 miles N.W. from Grenoble, on the left bank of the Rhône, which is lined with quays and crossed by a suspension-bridge. The town has tribunals of first instance and of commerce, a consultative chamber of manufactures, a college, and 19,052 inhabitants in the commune. Hemmed in between steep hills and the river, Vienne has a much

greater length than breadth; it is like most ancient towns, ill-built, with narrow winding streets, with the exception of that traversed by the road from Lyon to Marseille. It contains some Roman remains, among others a temple now converted into a museum, a triumphal arch, some vestiges of an amphitheatre on Mont-Pipet, and south of the town, near the gate of Avignon, a pyramidal obelisk, called Plan-de-l'Aiguille, which is 46 feet high, and constructed with cut stone without cement. The modern structures of most note are the fine Cathedral of St. Maurice, the church and cloisters of the former abbey of St. André-le-Bas, the cavalry barracks, the public library of 10,000 volumes, the college, which is one of the finest structures of the kind left by the Jesuits, the hospitals for the sick and poor, the voin-market, and the abattoir. The Gère, which joins the Rhône at Vienne, drives the machinery of several factories. This town is one of the principal seats of the woollen manufactures in the south of France; common cloth, pasteboard, soap, leather, glass bottles, paper, chemical products, &c., are also made; and there are establishments for reeling and throwing silk, dye-houses, iron furnaces, steel-works, sheet-copper and lead works, copper and brass foundries. The commerce of the town is composed of its industrial products, and of wine, zinc, &c. Vienne formerly had an archbishop of its own; but the archiepiscopal province is now united to that of Lyon. The railway in course of construction from Lyon to Avignon passes through Vienne. In the suburb of St. Colombe, on the right bank of the Rhône, and in the department of Rhône, stands the old square tower of Mauconseil, from which it is said Pontius Pilate precipitated himself into the river. *Beaurepaire*, 16 miles S.S.E. from Vienne, has cloth-factories, corn- and fulling-mills, and 2322 inhabitants in the commune. *La Côte-St.-André* stands at the foot of a hill, in a pretty situation on the Frette, 21 miles S.E. from Vienne, and has 4083 inhabitants, who manufacture liqueurs, pyroligneous acid, wax-candles, and plate-glass. *St-Jean-de-Bournoy*, 14 miles E. from Vienne, on the Veronne, a small stream that drives the machinery of several factories and then loses itself underground, has 3492 inhabitants, who manufacture woollen plaids, beet-root sugar, and leather.

The department forms the see of the Bishop of Grenoble; is included in the jurisdiction of the High Court of Grenoble, and belongs to the 8th Military Division, of which Lyon is head-quarters. It returns 4 members to the Legislative Body of the French Empire.

(*Dictionnaire de la France, Annuaire pour l'An 1853; Official Papers, &c.*)

ISIGNY. [CALVADOS.]

ISLA, or ISLAY, Argyleshire, the most southern of the Hebrides, an island in the Western Ocean, 15 miles W. from Cantyre, and S.W. from Jura, from which it is separated by a strait nearly two miles wide. It is 23 miles long and about 18 miles broad, and is generally of a mountainous character, especially towards the north; there is however much low and well-cultivated land. The population of the island, which was 13,602 in 1841, was only 12,334 in 1851, the decrease being accounted for in a great measure by emigration. The houses are good, and the roads are in good repair. There are a few small lakes, and the island is watered by several streams and rivulets, which abound with trout and salmon. One of the chief productions is whisky, which is exported from Port Askaig in the Sound of Jura, or Port Ellen on the south-east coast of the island, at each of which places are small harbours.

Bowmore, population 1202, is a post-town of the island, and the seat of a sheriff small-debt court. Port Askaig, and Port Charlotte, are also post-towns.

Islay possesses steam communication with Glasgow by Campbeltown, and a great many small coasters belong to the island. Besides the parish churches there are several chapels for Free Church and Independent congregations.

ISMAIL, or IZMAIL, a strongly fortified town of Russia in the province of Bessarabia, is situated on the left bank of the northern or Kilia arm of the Danube, 20 miles E. from the mouth of the Pruth, and about double that distance from the Black Sea, in 45° 21' N. lat., 28° 50' E. long., and has about 20,000 inhabitants. It was taken by storm by the Russians under Suwaroff, Dec. 22, 1790, when the Turkish garrison numbering 30,000 men were put to the sword; the Russians lost 20,000. Under the Turks Ismail was important not only in a military but in a commercial point of view; it contained 17 mosques, a large number of khans and bazaars, and many splendid houses. On its capture by the Russians all was put to fire and sword, and the town remained in a ruinous condition till 1812, when it was ceded to Russia by the treaty of Bukharest. Since then it has been rebuilt, and now contains about 2300 houses and 12 churches. The Kilia arm of the Danube is navigable for steamers and for vessels of considerable burden, of which about 150 enter the harbour of Ismail annually, and are chiefly engaged in the corn trade. There are remains of a

GEOG. DIV. VOL. III.

fine Turkish palace in the town. Ismail is now chiefly of importance in a military point of view, and the Russians have rendered its defences very strong.

ISTRES. [BOUCHES-DU-RHÔNE.]

ISTRIA, or HISTRIA, a peninsula in Austria projecting into the Adriatic Sea from the former kingdom of Illyria, between the Bay of Trieste on the west and the Gulf of Quarnero on the east. It is nearly triangular in shape, the base or isthmus from near Capo d'Istria to the head of the Gulf of Quarnero, a few miles west of Fiume, measuring about 30 miles, and the altitude measured from a point on the road between Trieste and Fiume, near 14° E. long., to the Punta di Promontore, its most southern point, being 54 miles. The greatest breadth of the peninsula is about 40 miles. Its total area is stated to be 1900 square miles; and its population, according to the official estimate of the population of the Austrian empire for 1850-51, was 232,909. According to the new division of the empire Istria is included in the *Küstenland*, or Maritime District, which comprises also the circle of GÖRTZ, and the Territory, but not the town, of Trieste.

The country is in general mountainous. Towards the north it embraces a portion of the high naked rocky district called Karst, which is connected with the Julian Alps; and from this dreary region a chain runs down the centre of the peninsula, reaching its culminating point in the Monte Maggiore (4570 feet above the sea), and terminating in the Punta di Promontore. From the central chains, which, as well as the whole peninsula, are of calcareous formation, long ridges of hills radiate, gradually declining as they approach the coast, which though hilly and rocky cannot be described as either very high or bold, except along the Gulf of Quarnero, where it is in parts precipitous. The western and southern coasts are indented by deep inlets, which form excellent harbours: among these the basin of Pola sheltered and land-locked on all sides, even towards the entrance, where it is screened by the rocky Brioni Isles, has been celebrated in all ages. The soil of Istria is dry, calcareous, and rocky, of no great natural fertility, but well adapted for the growth of the olive; and the oil of Istria has always been held in high repute. A little corn, wine of excellent quality, lemons and other fruits, chest-nuts, hazel-nuts, honey, and silk are also produced. A good many cattle are reared on the mountain pastures. The principal minerals are marble, freestone, alum, and coal. The Brioni Isles are famous for their marble-quarries. The coast fisheries are profitable, and a good deal of salt is made by evaporating the sea-water. The peninsula abounds with fine oak-timber. The climate is mild; it is also healthy, except in the low grounds along the western coast, where malaria prevails at certain seasons.

The calcareous rocks of which the peninsula is composed are scored and furrowed by numerous glens and vales, but there are no rivers of importance. Among its streams however may be mentioned:—the *Arsa* (the ancient *Arsia*), which flows south from the Monte Maggiore through the Lake Zepich, and enters an inlet of the Gulf of Quarnero to the west of the town of Albona; the *Quisio*, which flows from the central mountains westward, through a fine forest-country into the Adriatic near Citta-Nuova; and the *Risano* (the ancient *Formio*), which enters the sea a little north of the town of Capo-d'Istria, and separates Istria from the territory of Trieste, as it formerly did from Venetia.

Istria seems to have derived its name from a fabulous notion entertained by the Greeks that an arm of the Danube (which they called Ister) flowed into the Adriatic near the head of the peninsula. The inhabitants belonged to the ancient Illyrian stock, and became first known to the Romans by their piratical expeditions, for the suppression of which the legions of Rome often invaded Istria in the third and second centuries before Christ. The country was reduced to subjection to Rome by Caius Claudius a.c. 177. Augustus extended the limits of Italy so as to include all that part of Istria west of the Arsa; the remaining part, afterwards called East Istria, was included in Liburnia. The country remained subject to Rome till the 6th century, when it was overrun by the Goths, from whom it was taken by the Byzantine emperors. In the 10th and 11th centuries Istria formed an earldom subject successively to the dukes of Carinthia and Dalmatia. In 1204, on the outlawry of Henry duke of Dalmatia, the Italian part of Istria fell to the Patriarch of Aquileia, from whom it was taken by the Venetians, who held it till 1797. East Istria, which formed the earldom of Mitterburg, belonged to the counts of Görz, from whom on failure of issue it passed to Austria and was incorporated with Carinthia. By the treaty of Campo-Formio the Venetian part of Istria also came into the possession of Austria; but she was obliged by the treaty of Presburg to cede the whole of Istria, with the other Venetian provinces, to Napoleon I. Istria was then united to Illyria, and continued so until its restoration to Austria in 1813. Subsequently, and up to 1849, Istria was included in the government of Trieste. The inhabitants of the coast towns are mostly of Italian origin, and speak a dialect of Italian; the great

X

bulk of the population however speak a Slavonic dialect, and are almost wholly of the Slavonic stock.

Towns.—*Capo-d'Istria*, an episcopal town of 6000 inhabitants, is situated on a circular island joined to the mainland by a causeway-bridge, about 8 or 10 miles S. from Trieste. It occupies the site of the ancient *Algida*, which after its reiteration by the emperor Justin took the title of *Justinopolis*. The town was long a dependency of the Venetian republic. The most remarkable buildings are the cathedral, the citadel, and the town-house, a gothic structure erected on the site of a temple of Cybela. There are a great number of churches, three monasteries, a gymnasium with six professors, and three hospitals. A considerable trade is carried on in wine, oil, and sea-salt made by evaporating the sea-water in the shallow strait between the island and the shore.

Citta-Nuova, supposed to occupy the site of the ancient *Neapolis*, stands on the north shore of the estuary of the *Quieto*, in $45^{\circ} 18' 20''$ N. lat., $13^{\circ} 33' 13''$ E. long., and has a cathedral, three other churches, a good harbour, and about 1000 inhabitants, who are chiefly engaged in the coast fisheries. East of *Citta-Nuova*, in the interior, and near the left bank of the *Quieto*, is *Montona*, with about 1000 inhabitants. The oak-forests in this neighbourhood formerly supplied the arsenals of Venice with oak-timber. Still farther east, in the heart of the mountain district, is the small town of *Pinguente*, which is supposed to occupy the site of the ancient *Piguntum*, and has about 1000 inhabitants, who are engaged in the alum-mines, vitriol-works, and millstone-quarries of the vicinity. *Pinguente* stands on the high-road from Trieste to Rovigno and Pola. A couple of miles N. from *Montona* is the ill-built straggling town of *Portole*, with about 2500 inhabitants.

Isola, 4 miles W. from *Capo-d'Istria*, is situated on the southern shore of the Bay of Trieste, and has about 3700 inhabitants, who are engaged in the coasting trade and in the cultivation of the vine, which in this district yields an excellent wine named 'ribolla.' Four miles farther west is *Pirano*, a town of 6500 inhabitants, built on the extremity of a peninsula which separates the Bay of Trieste from the Bay of Largone. It is supposed to represent the ancient *Piræon*, which rose on account of its port to some eminence in trade under the Roman empire. It is a well-built town, with a good harbour, a handsome gothic cathedral, and an old castle. In the neighbourhood are the largest salt-works in Istria. The inhabitants export wine, oil, and salt. Between *Pirano* and *Citta-Nuova* is another coast-town, *Omago*, or *Umago*, which retains its ancient name. It is now an unhealthy place, with about 1800 inhabitants. Eight miles S. from *Citta-Nuova* is *Parentino*, on the site of the ancient *Parentium*. The town, which gives title to a bishop suffragan of the Patriarch of Venice, stands on a peninsular projection into the Adriatic, forming a good harbour, which is further sheltered by several small islets. On *San-Nicolo*, the largest of the islets, is a convent and an ancient tower, which was formerly a lighthouse ($45^{\circ} 13' 47''$ N. lat., $13^{\circ} 35' 47''$ E. long.). The cathedral, which is surmounted by a dome, is the most remarkable building in the town; it dates from A.D. 542, and presents in the interior a nave and two aisles terminating in three apses, being an unaltered specimen of the ancient basilica: the style is Byzantine. The population of *Parentino* is about 3000.

Rovigno, 10 miles S. from *Parentino*, is also called *Trevigno*, and occupies the site of the ancient *Ruevignis*. It is built on a rocky promontory, which forms a double harbour, in $45^{\circ} 4' 56''$ N. lat., $13^{\circ} 28' 5''$ E. long. The town has superior courts of justice, and about 10,000 inhabitants, who are engaged in ship-building, in the tunny and sardine fisheries, in the coasting trade, and in the manufacture of ship-cables, sail-cloth, &c. It is about a mile in circuit, and contains ten churches, among which the cathedral, a large and handsome gothic structure, is remarkable for its lofty tower, built after the model of the tower of St. Mark in Venice. The neighbourhood produces abundance of wine and olive-oil, and possesses quarries of fine marble. *Rovigno* has a gymnasium and two hospitals.

About 20 miles S.S.E. from *Rovigno* is the episcopal town of *Pola*, situated at the head of a beautiful bay of the same name. *Pola* is girt by bastioned walls, built by the Venetians, and entered by four gates. It is further defended by a castle. The principal building is the cathedral, which is a basilica built in the Roman style from the ruins of ancient buildings; there are also three convents and a Greek church in the town. On the island of *Santa-Catharina*, in the Bay of *Pola*, is a very ancient Byzantine church surmounted by a dome. *Pola*, the origin of which is ascribed to the Colchians sent in pursuit of Jason, was destroyed by Julius Cæsar for its adherence to Pompey; rebuilt by Augustus at the request of his daughter Julia, and from her named *Pictas Julia*. It was the station of a division of the Roman navy; and had in the time of the emperor Septimus Severus a population of 30,000. It still possesses many splendid remains of antiquity—an amphitheatre, outside the walls of the present town, remarkably fresh in appearance, 366 feet long, 292 feet broad, and 75 feet high, constructed of marble, and capable of containing 27,000 spectators; and within the town an elegant Corinthian temple of Augustus and Roma, a temple of Diana, and a triumphal arch of the Corinthian order called *Porta Aurea*. There are many fragments of Roman architecture built into the walls round the market-place of *Pola*, which is supposed to be the site of the ancient forum. *Pola*, long

decaying and neglected, is likely again to become a place of some importance, the Austrian government having expressed an intention of making it a naval station and port of war. For this purpose fortifications have been erected on the heights around and on the island of *Scoglio-Grande*, which commands the entrance to the harbour; roads have been laid out and drains cut. The harbour—safe, commodious, and spacious—admits the largest three-deckers close in shore.

Six miles due north of *Pola*, on the high road to Trieste, and pleasantly situated on an eminence, is *Dignano*, with 8600 inhabitants, who trade in the excellent wine of the neighbourhood, which is celebrated for its rose-like perfume. Fourteen miles farther north on the same road, and at the point where it is joined by a branch road to *Rovigno*, is the small town of *Gessino*; 5 miles N.E. from which is *Pisino* (in German *Mitterberg*), which is beautifully situated round a limestone bluff crowned with a castle. It is a thriving little town, with 2500 inhabitants, a gymnasium with 8 professors, and some trade in corn, wine, and oil, the produce of the vicinity. The little river *Fluva* has excavated an immense cavern in the limestone below the town.

On or near the coast of the Gulf of Quarnero are several small places, among which we notice *Albona*, the ancient *Albon* or *Albona* situated in a rocky district east of the *Arza*, productive of oil, wine, and chestnuts, population about 1000; *Flanona*, on the site of the ancient *Flanona* (a town probably of the *Flanates*, who gave name to the *Flanaticus Sinus*, now the Gulf of Quarnero), situated at the head of a small bay of the same name, population 900; and, further north, *Loarana*, or *Laurana*, which has a small harbour and about 500 inhabitants.

The islands *Losini*, *Oberso*, and *Veglia* were annexed to Istria whilst it was included in the government of Trieste. *Losini* (which is also called *Osero*) and *Cherso* were in ancient times called *Abeyrtides*, or *Apyrtides*, from a tradition that *Abayrtus* was here slain by Jason and Medea.

ITALY, one of the great natural divisions of Europe, consists of a peninsula stretching in a south-eastern direction between the Adriatic and Mediterranean seas, and of the islands of Sardinia, Sicily, and adjacent smaller islands. The Italian mainland, or Italy proper, extends from its most southern point, *Capo dell' Armi*, in $37^{\circ} 55'$ N. lat., to $46^{\circ} 32'$ N. lat., its most northern limit, where the *Piave*, the *Adda*, and the *Ticino* have their sources at the foot of the *Pennine*, *Rhætan*, and *Noric Alps*. It lies between $6^{\circ} 30'$ and $18^{\circ} 30'$ E. long., the latter being the longitude of the most eastern part of Italy, near *Otranto*. The northern part of Italy is bounded N., N.E., and N.W. by the *Alps*, which sweep round it in a semicircle, beginning from the coast near *Nizza* on the Mediterranean, and extending to the Adriatic in the neighbourhood of Trieste; it is bounded E. by the Adriatic, and S. and W. by the Mediterranean. The area of Italy, with Sicily, Sardinia, and the adjacent small islands, is about 120,000 square miles, or rather more than twice that of England and Wales. The entire population, according to the most recent censuses, is somewhat under 25,000,000.

The political divisions of Italy are as follows:—LOMBARDY AND VENICE, the former Lombardo-Veneto kingdom, of which the Emperor of Austria is king; SARDINIA, or the Sardinian monarchy, consisting of the *Stati di Terra Ferma*, or continental territories, and the island of Sardinia; the kingdom of the TWO SICILIES, consisting of the *Dominj di quâ dal Faro*, or kingdom of Naples, and *Dominj di là dal Faro*, or island of Sicily; the PAPAL STATES; the grand duchy of TUSCANY, including the duchy of *Lucca*; the duchy of *PARMA*; the duchy of *MODENA AND MARRA*; the principality of *MONACO*; and the republic of *SAN MARIÑO*; the area and population of all of which, except *Lombardy* and *Venice*, which are given under AUSTRIA, will be found under EUROPE. The island of *CORSIKA*, which physically belongs to Italy even more strictly than does Sardinia, is politically united to France.

These states being described under their respective titles, and the great physical features of Italy being separately noticed, it would be superfluous to repeat such descriptions here. We shall therefore under the present heading merely give such a general notice of the physical geography of Italy as may facilitate reference to particular articles, adding a brief sketch of its history, language, and literature.

Physical Geography.—The ridge of the *Apennines*, which runs along the *Riviera* of *Genoa* and the northern boundaries of *Tuscany* to near *Rimini* on the Adriatic coast, divides Italy into two distinct regions. One of these regions is situated north of the *Apennines*, and is chiefly occupied by the basin of the *Po* and its numerous affluents; while its north-east extremity, which is contracted between the *Carnic Alps* and the *Adriatic*, contains the basins of the *Brenta*, the *Piave*, and the *Tagliamento*. The whole region extends in length from west to east, from *Mount Viso* in 7° E. long. to the river *Isone* in $13^{\circ} 25'$ E. long., a distance of 320 miles. [FRULL.] Its greatest breadth, from the *Tuscan Apennines* to the sources of the *Adda*, is about 150 miles. [Po.]

The other region, which is the real peninsula, extends in a south-east direction, between the *Adriatic* and the *Mediterranean seas*, for above 500 miles, its breadth varying from 130 to 50 miles, and still less in some parts of *Calabria*. The *Apennines*, and the lower ranges which are connected with them, occupy the greater part of the Italian

peninsula. The tracts of level country, with the exception of the Roman Campagna and the plains of Foggia and Campania, are of inconsiderable extent, and the peninsula may be viewed as determined in its chief physical features by the long mountain range which traverses it in its whole length. [APENNINES.] The Tuscan Apennines, after running in a direction east-south-east to within a few miles of the Adriatic near Rimini, make a bend to the south-south-east, and run parallel to and near the Adriatic coast, towards which they detach numerous offsets which terminate abruptly on the sea, whilst towards the Mediterranean the slope of the ground is much more gradual, the offsets or secondary ridges running more obliquely to the coast, and forming considerable longitudinal valleys. The larger rivers of the peninsula are on the western side, and the principal basins are those of the Arno, the Tiber, the Garigliano, and the Volturno. [ABRUZZO; ARNO; CAMPAGNA DI ROMA; PAPAL STATES.] In the neighbourhood of Isernia, between the sources of the Volturno and those of the Sangro, the main ridge of the Apennines begins to run more in the centre of the peninsula, leaving to the east the vast plain of Foggia [CAPTANATA], and to the west the plains of Campania. [LAVORO, TERRA DI.] Farther south, near the sources of the Ofanto, two ridges detach themselves from the main group, one of which runs eastward through the Messapian peninsula, and the other westward through the peninsula of Sorrento to Cape Campanella. The central chain continues to run southward between the basin of the Sele on one side, and those of the Bradano and Basiento on the other. [BASILIATA.] It then runs through Calabria, keeping however nearer to the western than to the eastern coast, but occupying with its offsets nearly the whole breadth of that part of the peninsula. [CALABRIA.]

Northern Italy includes the Sardinian states, Lombardy, Parma, Modena, the Venetian territories, Bologna, Ferrara, and the Romagna. Southern Italy includes Tuscany, the greater part of the Papal States, and the kingdom of Naples. With regard to climate and aspect, the narrow strip called the Riviera of Genoa, which stretches between the Apennines and the sea, may be included in Southern Italy. The islands of Sicily and Sardinia, and several minor ones near the coast, belong to Italy. A general view of the surface and geology of Italy is given in the article APENNINES.

The climates of North and South Italy are very different. In the north frosts and snow are of common occurrence in winter, and delicate plants, such as the orange and the lemon, do not thrive except in sheltered situations; but in the south, especially near the sea-coast, tender plants thrive in the open air, and in the southernmost part of the peninsula, as well as in Sicily, even tropical plants, such as the sugar-cane, the cotton-plant, the Indian fig, and the date-palm, come to maturity. The vine grows all over Italy, but the best wines are made in the south. The high Apennine regions however are bleak and cold even in the south, and as they are hardly anywhere much farther than a day's journey from the coast, there is great variety of climate in the peninsula. The staple products of Italy are corn, rice, wine, oil, silk, and fruits of every kind, and the mountains afford summer pasture for the cattle. In the north a careful system of irrigation prevails, especially in Piedmont and Lombardy, but the southern parts are subject to droughts in summer. The rivers which have their sources in the Alps or in the higher Apennines are perennial, whilst the other streams are mostly dry in summer. The atmosphere is remarkably clear, especially all along the coast of the Mediterranean, and the tints of the mountains and of the clouds are beautifully warm. Italy is emphatically the land of painting, of melody, and of poetry. The scenery of the Bay of Naples, of the Straits of Messina, and of the Riviera of Genoa, is unrivalled in the world.

History.—The name 'Italia' appears to have been limited in remote times to the most southern part of the peninsula as determined by a line drawn from Tarentum to Posidonia (Herodotus, i. 24; Dionysius, i. 73); and indeed its boundaries were once even more contracted. In the age of Timæus (about B.C. 264) it stretched as far north as the Tiber, and beyond Picenum. Until the time of Augustus, Italia Proper was understood to extend only as far as the Rubicon on one side and the Macra on the other; the rest was called Cisalpine Gaul, the country of the Veneti, and Liguria.

The history of ancient Italy, as a whole, is a part of the history of Rome; and sketches of the history of the several ancient divisions, such as Etruria and others, requiring a separate consideration, are given in the articles APULLA, CAMPANIA, ETRURIA, &c. The period that elapsed after the fall of the Western Empire is noticed in the articles BELLSARIVS, LONGOBARDS, and THEODORIC, in the Historical and Biographical division of the ENGLISH CYCLOPEDIA.

The modern history of Italy begins properly with the reign of Charlemagne, who was crowned king of the Romans and emperor of the West in the year 800. Under the weak rule of his successors, the counts, marquises, and other great feudatories of the new Western empire became, de facto, independent, and Italy was parcelled out into numerous principalities or states. As the principal towns rose in population and wealth they made themselves independent of the feudatories, and formed so many commonwealths. Then came innumerable quarrels between the towns and the great lords; of the towns among themselves; of the lords with one another; and last of all,

of part of both towns and lords against the kings of Germany, who styled themselves the successors of Charlemagne, and assumed the often merely nominal title of kings of Italy and emperors of the West. In the midst of all this confusion some considerable states were formed, such as the Papal State, the kingdom of Sicily and Apulia under the Normans, the republics of Venice, Florence, and Genoa, and lastly the duchy of Milan. The dukes of Savoy, originally a transalpine dynasty, also acquired large possessions on the south side of the Alps. Here we have the origin of the present Italian states. A general history of modern Italy is a most intricate and unmanageable subject; sketches of the history of the various states are given in the articles FLORENCE, GENOA, SICILY, VENICE, &c.

At the beginning of the 16th century Charles V. established by conquest the dominion of the house of Austria over the duchy of Milan and over the kingdoms of Naples and Sicily, which dominion on his abdication he gave up to his son Philip II. and his successors of the Spanish branch of the house of Austria. Spain continued to rule these fine territories till the beginning of the 18th century, when by the extinction of the Spanish branch of the house of Austria, Lombardy was transferred to the German branch of the same house, and Naples and Sicily were formed into an independent kingdom under a Spanish infant. The duke of Savoy at the same time assumed the title of king of Sardinia. The work of amalgamation, consolidation, and national independence in Italy made great progress during the 18th century. Venice, Tuscany, Genoa, the Sardinian monarchy, Naples and Sicily, figured among the sovereign states of Europe, while the only part possessed by a foreign power was Lombardy. The French revolution and subsequent invasion of Italy deranged this order of things. Under the pretence of establishing republics the French exercised a military sway over Italy, whilst Venice disappeared from the list of sovereign states and became an Austrian province. Napoleon, having become emperor, formed a kingdom of Italy, which however did not include one-third of Italy: he annexed another third to the French empire, and gave Naples to his brother-in-law Murat. In 1814 the French evacuated Italy, and the former states were restored, with the exception of Venice, which remained under Austria. Genoa was annexed to the Sardinian monarchy, which kingdom and that of the Two Sicilies are now the two principal Italian powers: the Papal States and Tuscany are the two next in importance. Several little territories and jurisdictions on the coast and the island of Elba were annexed to Tuscany; and it was also stipulated that on the demise of Maria Louisa, duchess of Parma, the duke of Lucca should succeed to her states, and Lucca should be annexed to Tuscany. Upon the whole, therefore, the work of amalgamation made progress in the earlier part of the present century.

The desire for still greater unity however continued to gain strength among educated Italians, particularly the younger ones, and the feeling was kept alive and stimulated by patriotic appeals, both in verse and prose, of remarkable eloquence and fervour. Secret societies were organised, with branches in almost every city, and all was carefully prepared for a general rising, with a view in the first place to effect the expulsion of the Austrians, but also directed against the more despotic of the native princes. Partial risings occurred in some of the larger cities about the close of 1847 and commencement of 1848. At the end of January 1848 Palermo and the other principal towns of Sicily were in open insurrection against the king of Naples. The Italian rulers showed an inclination to conciliate their subjects. The Sicilians obtained a renewal of their constitution; the grand duke of Tuscany granted a representative government to his states; and the king of Sardinia issued a proclamation containing the basis of a liberal constitution. But the news of the successful revolution in France, followed immediately by an insurrection in Milan, and the flight from that city of the Austrian viceroy and his troops, produced a general ferment, which was not a little increased when Carlo Alberto, the 'liberal' king of Sardinia issued a proclamation (March 23rd) in which he openly espoused the cause of Italian nationality; and followed it up by sending his army across the boundary of Lombardy. This was of course a declaration of war against Austria, in which all Italy may be said to have joined. In the first encounter at Goito on the 29th of May, the Austrians, after a battle which lasted two days, were entirely defeated by the Sardinian army commanded by king Carlo Alberto, and forced to retreat hastily. But the Italian successes were soon checked. Field-marshal Radetsky, the commander-in-chief of the Austrian army in Italy, after bombarding Vienna for 18 hours, forced it to capitulate, and quickly regained possession of the whole of the Venetian territory, except the city of Venice, which he closely blockaded. He then with the main body of his forces followed the Sardinian troops, whom after a protracted resistance he forced to capitulate. Meanwhile the struggle between the rulers and their subjects had been fiercely fought in Naples and Rome: and when the year 1848 closed, all Italy was in a state of open or concealed revolt. Between Austria and Sardinia an armistice had indeed been concluded, but by both parties it was regarded as one of those hollow truces useful only as a means of preparing without molestation for a future campaign: Austria however held possession of only a portion of her Italian territories, but the Imperial troops were being brought into a condition of the highest efficiency. In Naples the struggle had so far proved on the whole favourable to the king. In Rome the popular

party had been as yet successful: the Pope was a fugitive, and the state was governed by a provincial council, to be soon succeeded by a triumvirate at the head of which was Mazzini, the acknowledged leader of the cause of Italian regeneration and unity. Hostilities recommenced in earnest among the several parties early in the new year; and everywhere with similar results. So long as the rallying cry had been freedom from the foreign yoke there had been success on the popular side. But the patriot leaders were too much under the influence of personal and local jealousies, too much divided by political differences, to keep that before them as their first object. Before independence was secured, they disputed as to the supremacy of particular cities and provinces, and individuals. While the foreign yoke was still unbroken they quarrelled whether republicanism or monarchy should be the rule of the future. The other side was perplexed by no divided councils or political theories. The Austrian commander, Radetky, was a man of iron nerve and great military genius, and he was now waiting with a large and well organised force to bring matters to an issue. There could be little doubt that on the fate of this campaign the final result would depend. Rome and Naples were subordinate actors in the drama.

Hostilities were resumed by Sardinia early in March. On the 21st of that month the two armies met: the Sardinians were defeated on that day; and again and thoroughly on the 23rd, at Novara. As far as Sardinia was concerned the struggle was at an end. Poor Carlo Alberto abdicated his throne in favour of his son, and retired to Oporto, where he died four months after. His son concluded a peace with Austria; and Radetky turned towards the cities which had ejected the Austrian garrisons, and reduced them in succession, though sometimes only after a severe bombardment.

In Naples there had been an active resumption of hostilities, but the British and French governments offered their mediation, advising the king to yield assent to the principal claims of his subjects and grant an amnesty. The king at first refused to comply, and when he was willing, the Sicilians in their turn rejected the ultimatum of the allied powers. The Neapolitan troops then bombarded and captured Catania and Syracuse; and the king of Naples was able to turn his attention to Papal affairs. We need not follow the outbreaks in Genoa and elsewhere, as they were soon suppressed.

In Rome a national assembly was called, which (February 8th) declared the Pope divested of all temporal power, and Rome a republic. The Pope, who was at Gaëta, published a protest against the proceedings of the assembly, and called upon the Catholic powers to interfere by an armed intervention in his behalf. The French government responded to his appeal; and the French National Assembly resolved by a large majority in favour of the proposition of the government to send an army to restore the papal authority in Rome. The first army was repulsed in its attack on the city; but a second and much larger force under General Oudinot commenced a formal siege of Rome on the 3rd of June. The defence was conducted under Garibaldi with eminent but unavailing skill and bravery; and the French having made practicable breaches in the walls, sent storming parties through them on the 21st. On the 3rd of July the city surrendered unconditionally: and the Austrians having been everywhere successful, the Italian rising was at an end. What might be called the official declaration of its suppression was made by the publication, by the Austrian authorities, of the amnesty for all political offences at Milan on the 18th of August 1849. There have been occasional and disconnected popular outbreaks in some of the Austro-Italian cities since then, but they have been always easily suppressed, and have only been the occasion of calling forth additional confiscations and military severities. The only apparent gain to the popular party from the revolt of 1848-9 is the retention by Sardinia of her liberal constitution. On the other side is a terrible account of confiscation, banishment, and loss of life; while the governments have relapsed into the old hard and depressing despotism.

Italian Language and Literature.—The language called Italian is the written language of Italy, and bears the same analogy to the spoken language of Tuscany and Rome as the written languages of France and England bear to the oral language spoken in the towns and provinces of those respective kingdoms in which dialects do not prevail. But while in France and England the use of dialects is confined in great measure to the peasantry of districts remote from the capitals or to mountainous parts, most of the Italian states have each a living dialect, which is the oral language of the people, and spoken even by educated people among themselves, although all educated people speak also the Italian or common written language, which they learn as a branch of education. The dialects of Italy are numerous, and most of them contain written and printed works, especially plays and other poems. The principal dialects are the following:—1. The Milanese is spoken at Milan and its territory, with some variations according to the different districts. It has been cultivated by several writers of real poetical genius, such as Maggi, Parini, and in our times by Grossi and Porta. 2. The Venetian is one of the most graceful of the Italian dialects, and under the republic was the language of the senate and of the courts of justice. There are numerous writers in this dialect; among others, Gritti, Lamberti, Goldoni, and, in our time, Buratti. 3. The Mantuan dialect has been illustrated by the writings of the eccentric wayward monk Folengo.

4. The Piedmontese has considerable affinity with the Languedocian and other Romance dialects. Calvo has written in the Piedmontese, and Alfieri has given a short vocabulary of it, with the corresponding words in Tuscan. 5. Genoese: Foglietta and Cavalli are two of the best writers in this dialect. 6. The Bolognese is one of the most uncouth dialects of Italy, but it has some poets, among others Giulio Cesare Croce. These are the principal dialects of North Italy, besides which there are many other local ones, such as Bresciano, Bergamasco, that of Padua, which resembles the Venetian, and that of the Friuli. In South Italy the principal dialects are the following:—7. The Neapolitan, or Apulian, was the language spoken at the court of Frederick II. in the 13th century, and in which the history of that prince by the contemporary chronicler Matteo Spinello is written. It was afterwards spoken at the court of the Anjou and Aragonese kings of Naples, and has been in fact used within our own times by King Ferdinand and his courtiers. It is very copious, abounds with diminutives and vituperative terms, and is well suited for broad humour and for the purpose of imitative harmony. The Neapolitan among all other Italian dialects has been perhaps the most cultivated by writers. The other South Italian dialect is, 8. The Sicilian, which can boast of Giovanni Meli, who ranks among the first lyric poets of Italy. Between the Neapolitan and Sicilian is the Calabrian dialect, which participates more of the latter, and in which there is a spirited version of Tasso's 'Gerusalemme.' Lastly, 9. The dialect of the Island of Sardinia has a great resemblance to the Catalanian and Valencian and other dialects of the Romance or Provençal language. The Sardinian is also a written dialect.

The Italian dialects must not be considered as corruptions of the written Italian, but as languages which have an affinity to and are anterior to it, and derived from the corrupt dialects of the familiar Latin or Roman which were spoken in the provinces of Italy remote from Rome, and perhaps also in part from the older languages of Italy existing previous to the Roman conquest. The influx of the northern nations effected a total corruption of the spoken Latin; articles and auxiliaries were introduced; terminations were altered or neglected; some, though not a great many, words of Teutonic origin were introduced; and various dialects resulted from these various combinations, which were called by the general name of Romance, Romanic, or Romance language, like those spoken in the south of France. The dialects spoken in Central Italy retained a greater affinity to one another, as well as to their common Latin parent. If we look at the old chronicles and other documents of the 13th century, written in a familiar style, whether at Naples, Rome, Bologna, or Tuscany, we see a great similarity in their syntax and etymology. The oral dialect of Tuscany seems to have attained a considerable degree of polish and grammatical regularity sooner than the others; probably it had never been so corrupt as the rest, owing to the local position of Tuscany, which was not extensively or permanently colonised by the northern tribes, and also owing to the early independence of the Tuscan cities, and their prosperity and civilisation. In the rest of Italy a few men of education used also an oral language more refined than the generality of the people, which was called *Lingua Aulica*, or *Cortigiana*, and thus the early versifiers, including princes and courtiers, Frederick II. and his chancellor Pietro delle Vigne at Naples, Guido Guinicelli and Frà Guidotto at Bologna, Guido delle Colonne, a Sicilian, Can della Scala at Verona, Guido da Polenta, prince of Ravenna, wrote in a language which differs little from that of Brunetto Latini, Guitton d'Arezzo, Guido Cavalcanti, and other Tuscan poets of the same age. But Tuscany had this advantage over the rest, that its familiar spoken language was more generally polished, so as to resemble the poetical and select language of the other Italians, and the Tuscan poets had the benefit of writing in a living dialect, '*lingua volgare*,' and their poems were understood by the generality of their countrymen. The writers of the 14th century, Dante, Dino Compagni, Petrarch, Boccaccio, Cino da Pistoja, Sacchetti, Villani, Pandolfini, were all Tuscans, and they permanently impressed on the written language of Italy the stamp of Tuscan spirit and idiom. As people of education in every part of Italy applied themselves to write in the '*lingua volgare*,' the use of writing in Latin being gradually dropped, this '*lingua volgare*,' or written Italian, began to form an essential part of education, and all those who received school instruction learned to speak it more or less correctly. It came afterwards to be adopted in many places as the language of the government, of the courts of justice, of the pulpit, and of the stage, and thus it has been styled emphatically the Italian language, because it is used as the general medium of communication, written and oral, all over the peninsula. But it is nowhere, except in Tuscany and in part of the Roman states, the language of the lower orders, the language of the nursery, of the markets, of convivial familiarity, of every-day life. Its general adoption is however strongly urged of late years by the various governments, and particularly attended to in all elementary schools.

The writers of the 14th century are called by the Tuscans the '*Trecentisti*,' and they are considered by many as the purest models of Italian composition. In the 15th century there was a retrograde movement in the cultivation of the Italian language. The Latin again resumed the ascendancy as a written language, and the '*lingua volgare*' was left to the vulgar, or employed merely for familiar purposes. The discovery of the ancient classics, the revival of the

study of the Roman law, the arrival of many learned Greek refugees flying from the Ottoman conqueror, the influence of the Roman hierarchy, whose language was the Latin—all these circumstances gave a general impulse towards classical learning, and the Italian literati disdained to write except in the language of their presumed forefathers. Alberti, Bracciolini, Bruni, Filelfo, Panormita, Platina, Pontano, Valla, Ficino, and other learned men and also women of that age wrote in Latin. But Lorenzo de' Medici at Florence, the Este at Ferrara, the Gonzaga at Mantua, countenanced Italian poetry; and Pulci, Bello, and Bojardo gave the first specimens of the Italian epic, while Poliziano and Lorenzo himself excelled in lyrics. In this same century Cennino Cennini wrote an Italian treatise upon painting, and the illustrious Leonardo da Vinci, painter, architect, and engineer, composed his precepts on the same art, which were published long after his death, 'Trattato della Pittura,' 1651.

The 16th century was the second era of Italian literature. It has been styled the age of Leo X., because that pontiff, in the early part of the century, surrounded himself with some of the most learned men of his time. But the two great historians and statesmen, Machiavelli and Guicciardini, the 'Divino Ariosto,' and Michelangelo Buonarroti, who was sculptor, painter, architect, and poet, are four names sufficient of themselves to adorn any age or country; and there were numerous other excellent writers in almost every branch of learning. The learned Sigonio, Baronius, Panvinio, Vida, the jurists Alciati and Turamini, the mathematicians Maurolico and Cardano, and many other men of science, wrote in Latin. The authors of the 16th century are called by the Italians 'Cinquecentisti,' and are considered as models of Italian writing, though some critics observe in most of them a falling off from the freshness and raciness of the great Florentine writers of the 14th century.

The 17th century, called by the Italians the age of the 'Scientisti,' exhibited a degeneracy of taste, both in literature and the arts. The leaden yoke of Spanish viceroys, armed with all the terrors of delegated absolutism and of clerical inquisition, ignorant or careless of the very elements of government and administration, weighed heavily over the finest regions of Italy. The Italian writers, and especially the poets, adopted a turgid hyperbolic style, replete with false conceptions and all the tinsel of rhetorical adulation. The school of Marini and of his worse disciples has become proverbial as the school of depraved taste in composition. However the same causes of mental degradation and corruption did not operate equally over all the peninsula. Tuscany, Venice, Genoa, Piedmont, retained their independence and with it their national spirit. Accordingly we meet here and there with writers distinguished by their sentiments as well as by their language, such as the celebrated Sarpi, the learned prelates Bentivoglio, Pallavicino, and Bellarmino; the historian Davila; the Jesuits Segneri and Bartoli; the poets Guidi, Chiabrera, Filicaja, Tassoni, Rinuccini, Menzini; the painter and poet Salvator Rosa; the philologist Salvini; while Italian science can boast in the same age of Galileo, Cassini, Torricelli, Malpighi, Borelli, Marsigli, Redi, Viviani, and Guglielmini. Antonio Serra, one of the earliest, if not the earliest, writer on political economy, published in 1613 a treatise showing the various causes through which countries may become enriched; a work neglected and forgotten for ages after. The historian Noris, the learned antiquarian Bianchini, and the jurist Gravina, wrote in Latin.

In the 18th century Italian literature assumed a new character. The historians Maffei, Muratori, and Giannone, and the philosophic writers Vico, Stellini, and Genovesi, brought a new light into their respective departments. The spirit of investigation and deep reflection was now busy at work. Goldoni effected a revolution on the Italian stage, and Metastasio imparted a new vigour and poetical freshness to the melodrama or opera. In the department of criticism there were Zeno, Baretti, Gozzi, Mazzuchelli, and Cesarotti; Milizia, Lanzi, and Bottari wrote eloquently on the fine arts; Martini and Tartini on music; Verri, Carli, Galiani, Neri, on political economy; Bettinelli, Tiraboschi, and Corniani, on the history of Italian literature; Buonafede on the history of philosophy; Beccaria, Filangieri, and Mario Pagano on legislation; Vallianieri and Spallanzani on natural history; Volta and Galvani on physics; Denina on the history of Italy; Passeroni, Varano, and Parini wrote moral poetry; and lastly Alfieri created the Italian tragedy.

The invasion of Italy by the French in 1796 and the political revolution which followed, whilst they served to stimulate the minds of the Italians to exertion, had an unfavourable influence upon the language. French was the language of the conquerors, and it became the fashionable language of the conquered. Those Italians, and they formed an immense majority, who did not know French, intermixed French idioms with their already imperfect and dialectic Italian, and a spurious compound was thus formed which was neither French nor Italian, and which found its way into the political essays, the newspapers, the pleadings, and even the acts of government. A few writers, formed in a better school, opposed the torrent; among these are Alfieri, Monti, Foscolo, Ippolito Pindemonte, Napione, Cesari, and Giordani. The reaction against French style has been continued by later writers; and Italy has in our own days produced eminent authors in almost every branch of literature, science, and art.

Italy, which has been for ages the nurse of the fine arts, has still,

since the death of Canova, many respectable artists, but hardly a first-rate sculptor or painter. With architects and engineers she is better provided; and the art of engraving is in a highly flourishing state.

Religion.—The religion of Italy is the Roman Catholic, with the exception of a few valleys among the Alps of Piedmont, inhabited by the Valdenses, and of the Jews, who live in most of the principal towns, and have synagogues. At Leghorn, Florence, Venice, and other mercantile places, chapels for foreign Protestants and Greeks are tolerated.

ITAPARICA. [BRAZIL.]

ITHACA. [IONIAN ISLANDS.]

ITHOME. [MESSENIA.]

ITZEHOE. [HOLSTEIN.]

IVES, ST., Cornwall, a market-town, sea-port, and municipal and parliamentary borough in the parish of St. Ives, is situated in 50° 12' N. lat., 5° 28' W. long., distant 39 miles S.W. from Bodmin, and 277 miles S.W. by W. from London. The population of the municipal borough in 1851 was 6525; that of the parliamentary borough was 9872. The borough is governed by 4 aldermen and 12 councillors, of whom one is mayor; and returns one member to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Cornwall and diocese of Exeter.

The town of St. Ives is finely situated at the north-eastern extremity of the spacious St. Ives Bay, near the entrance of the Bristol Channel. St. Ives is a town of great antiquity, and has a picturesque appearance. The church, a large low granite building of the time of Henry V., stands close to the sea-shore. There are several chapels for Dissenters, and a National school. The harbour accommodates vessels of 200 tons burden. It is the principal station of the pilchard fishery. The number and tonnage of sailing-vessels registered as belonging to the port on 31st December 1853 were:—Under 50 tons 63, tonnage 1380; above 50 tons 93, tonnage 11,038; and 4 steamers, with a tonnage of 726. The number and tonnage of vessels that entered and cleared coastwise during 1853 were:—Sailing-vessels, inwards 1704, tonnage 127,151; outwards 939, tonnage 72,173; steam-vessels, inwards 180, tonnage 32,471; outwards 178, tonnage 32,242. In the colonial and foreign trade there entered 56 vessels of 7928 tons, and cleared 63 vessels of 9050 tons. In the vicinity of St. Ives are extensive tin- and copper-mines. Markets are held on Wednesday and Saturday; fairs on May 29th, and the Saturday before Advent. About a mile from the town is Tregony, or Tregenna Castle, a large castellated mansion. The coast here is bounded by cliffs and rugged rocks, and is somewhat dangerous to shipping.

IVES, ST., Huntingdonshire, a market-town and the seat of a Poor-Law Union in the parish of St. Ives, is situated on the left bank of the river Ouse, in 52° 20' N. lat., 0° 4' W. long., distant 7 miles E. by S. from Huntingdon, 59 miles N. from London by road, and 72½ miles by the Eastern Counties railway. The population of the town in 1851 was 3522. The town is governed by town commissioners. The living is a vicarage in the archdeaconry of Huntingdon and diocese of Ely. St. Ives Poor-Law Union contains 24 parishes, with an area of 64,136 acres, and a population in 1851 of 20,267.

St. Ives is so called from Ivo, or St. Ives, a Persian ecclesiastic, said to have visited England as a missionary about A.D. 600, and whose supposed remains were discovered here some centuries afterwards. On the spot where they were found the abbots of Ramsey, to whom the manor belonged, built a church and a priory. The dove-house and barn, and some fragments of the priory, are still standing. The town stands on a slope; the lower part is exposed to inundations of the Ouse. A stone bridge of six arches forms the entrance to the town on the London side; an ancient building stands over one of the piers. The approach to the bridge on the south is by a causeway raised on arches, to admit the passage of the waters in the time of floods. The streets are well paved and lighted. Brewing and malting are carried on. The market is on Monday, and is one of the largest provincial markets in the kingdom for sheep and cattle; there are two large yearly fairs on Lady-day and Michaelmas; at the Michaelmas fair much cheese is sold. The church is a neat building, chiefly late perpendicular. It has a handsome tower and spire at the west end. There are chapels for Wesleyan and Primitive Methodists, Independents, and Baptists, and National and British schools. Slepe Hall was for some time the residence of Oliver Cromwell.

IVINGHOE. [See Ivinghoe, in SUPPLEMENT.]

IVIZA, IVIÇA, or IBIZA, the *Ebusus* of the ancient geographers, one of the Balearic Islands, lies 50 miles S.W. from Majorca, and is about 23 miles long from north-east to south-west, and about 15 miles in its greatest breadth. It is divided by a channel four miles wide from the island of Formentera, which lies due south of it. The south-west point of Iviza is 60 miles E.N.E. from the Cabo San Martin, on the coast of Valencia on the mainland of Spain. The coast is indented by many small bays, the largest of which are those of Iviza and San Antonio. The island is hilly and stony in many parts, but in others very fertile. It produces oil and wine, oorn, fruits of every kind, has a large stock of sheep, and the sea near the coast abounds with fish. The manufacture of salt in salt-pans constitutes a great branch of industry. The mountains are covered with timber-trees. Salt and timber are almost the only exports. The inhabitants are indolent and uninformed: their mode of agriculture is slovenly. They speak a dialect of the Limosain, the language of Catalonia, which

is a branch of the Romance language once spoken all over the south of Europe. The capital, *Ivrea*, built on a peninsula on the south-west coast of the island, is fortified, has a good harbour, and contains about 6000 inhabitants: it has a cathedral and six other churches, two hospitals, and a public school or gymnasium. San Antonio and San Miguel are two small towns.

IVREA, a province of Piedmont, stretches from the foot of the Alps, which divide it from Savoy and the Val-d'Aosta, southward to the Po, and is watered in its length, which is about 20 miles, by the Dora Baltea. The Orca, another affluent of the Po, having its source on Mount Iseran, one of the high Graian Alps, waters the western parts of the province of Ivrea, where it borders upon that of Turin. On the E. Ivrea is bounded by the province of Vercelli, and N. by that of Aosta, which with Ivrea now forms an administrative district of Piedmont. The country consists in great part of hills, being the lowest offsets of the Alpine chain, and some fine valleys between; the southern part of it merges into the great plain of the Po. The soil produces abundantly corn, good wine, hemp, and pasture on which a great number of cattle are fed. The system of irrigation by water drawn from the Dora and other streams is here in full operation. Silk is an important product of the province. The mountains produce plenty of chestnuts. This province was a marquiseate in the middle ages, when Berengarius, marquis of Ivrea, became king of Italy. It is called 'Il Canavese,' from the quantity of hemp ('canapa') which it produces, and the inhabitants are noticed in the 'History of Piedmont' as quarrelsome and warlike. The area of the province is 561 square miles, and the population in 1848 numbered 168,561.

The chief town, *Ivrea*, stands in a fine situation on the slope of

a hill on the left bank of the Dora, across which is a Roman bridge of a single arch, at the entrance of the lowland of Italy for travellers coming by the St. Bernard Pass. Ivrea is an old-looking town, with walls and a castle; it is a bishop's see, has six churches, besides the cathedral and several convents, a seminary for clerical students, a royal college, an hospital, and about 8000 inhabitants. There are some remains of antiquity at Ivrea. The cathedral is built on the ruins of a temple of the Sun. Ivrea, called anciently Eporedia, was a town of the Salassi, and afterwards was colonised by the Romans. The town has some important silk manufactures, and a good trade in rice, hemp, cheese, and cattle.

The other towns of the province are the following, the population in each case is that of the commune:—*Castellamonte*, with 5100 inhabitants; *Caluso*, with a college, and 5500 inhabitants; *Cuorgne*, with a grammar-school, copper-works, and 5600 inhabitants; *Agliè*, with a castle, a handsome park, and 4500 inhabitants; *San Giorgio Canavese*, with a college, and 3700 inhabitants; *Locana*, with brass-works, and 5400 inhabitants; *Valperga*, with 3500 inhabitants; *Ponte*, in a delightful valley watered by the Orca and its affluent the Saona, with 4200 inhabitants. In this valley are many natural curiosities, and the traces of silver and gold mines, said to have been once worked by the Romans. Copper is found in the Val-d'Orca, and iron in the Val-Brozzo, where are several iron-works. There are several other small towns of above 3000 inhabitants.

IZALCO, or YZALCO. [SAN SALVADOR.]

IZERNORE. [AIN.]

J

JACA. [ARAGON.]

JACKSON, PORT. [SYDNEY.]

JACKSONVILLE. [FLORIDA; ILLINOIS.]

JAEN, a province of Spain, included in the territorial division of Andalusia, is bounded N. by Castilla-la-Nueva, S. by the province of Granada, E. by the provinces of Murcia and Granada, and W. by the province of Cordova. It is situated between 37° 27' and 38° 35' N. lat., 2° 52' and 4° 20' W. long. The greatest length from north to south is about 75 miles, from east to west about 80 miles, the average width being about 60 miles. The area is 4446 square miles. The population in 1849 was 307,410.

A general description of the provinces comprised in Andalusia is given under that head. [ANDALUCIA.] The northern part of this province is entirely filled with the ridges of the mountain range of the Sierra-Morena, the summit-level of which forms the division between the province of Jaen and the modern province of Ciudad Real, or La-Mancha, in Castilla-la-Nueva. The southern part of the province is occupied by the offsets of the Montes de Granada, which separate the province of Jaen from that of Granada. The central part of the province is an irregular valley in which several rivers and numerous small streams unite to form the Guadalquivir, the slope of the ground being generally from east to west.

Towns.—The capital of the province is the ancient city of *Jaen*. [JAEN.] *Alcala-la-Real*, 32 miles S.W. from Jaen, stands on a conical hill. It is a picturesque town, with bold towers and steep streets. It was the stronghold of the Alcaide Ibn Zaida. In 1340 it was taken by Alonzo XI. in person, and from him received the epithet *Real* (Royal). The beacon tower called *La Mota* was erected by the Conde de Tendilla, the first governor of the Alhambra. Population, 6648. *Andujar*, 22 miles N.W. from Jaen, is situated on the north bank of the Guadalquivir, which is here crossed by a bridge. It stands in a fertile plain, and is surrounded by gardens and orange-groves. It contains a large church in what has been called the plateresco style of architecture, which is peculiar to Spain. This town is distinguished for the manufacture of the porous earthenware vessels called *alcarrasas*, which are used for cooling water. Population, 9353. *Baza*, 25 miles N.E. from Jaen, is a handsome town situated on an eminence overlooking a fertile plain between the rivers Guadalquivir and Guadalimar. It is the see of a bishop united with Jaen, and contains a cathedral, the halls and courts of a university, the oratorio of San Felipe Neri, and a handsome fountain with caryatides in the principal plaza. The population in 1845 was 10,851. *Baylen*, 23 miles N. from Jaen, stands on the main road from Andalusia to the Castiles over the Sierra Morena by the pass of the Despeña Perros. It is a poor town, with old walls, a ruined castle, and a machicolated tower. Population, 4976. The French army, under General Dupont, was defeated here, July 20, 1808. *Carolina*, 18 miles N. from Baylen, a thriving town, with a population of about 2000, is situated on the same road, near the foot of the pass. It would form a strong military position. *Linares*, 25 miles N.N.E. from Jaen, stands at the foot of the Sierra Morena, in a plain abundantly watered. There are mines of copper and lead in the vicinity, which were wrought by the Romans, and are still productive.

Population, 6567. *Martos*, 16 miles W.S.W. from Jaen, stands on the slope of a steep hill which is surmounted by a ruined castle. It contains several churches. It is resorted to for its mineral waters. Population, 11,000. *Ubeda*, 28 miles N.W. from Jaen, was originally built by the Moors with the materials of the Roman *Betula*, now *Ubeda la Vieja*. It was taken by Alonzo VIII., and destroyed, but was afterwards rebuilt. It contains a cathedral, which was originally a mosque, a fine hospital, and other good specimens of architecture. The vicinity is very fertile, and the inhabitants are mostly employed in agricultural labour. The population in 1845 was 13,809.

JAEN, a city of Spain, capital of the province of Jaen, formerly a Moorish kingdom [ANDALUCIA], is situated in 37° 44' N. lat., 3° 43' W. long. The population in 1845 was 17,327. It is built at the foot of a hill, which is crowned by a castle, and overlooks an extensive vega, or plain, through which the Rio de Jaen, passing the city on the eastern side, flows northward to the Guadalquivir. The hill is rugged and steep, and appears to be the termination of the Sierra de Jaen, but is in fact cut off by a ravine, which converts it into an isolated and very strong military post. A wall extends round the brow of the hill inclosing an area of many acres, while the city wall, flanked by towers, is carried up the irregular slopes of the hill, and connected with the fortifications of the castle above. The principal street of the city encircles the base of the hill, and has other streets, narrow and crooked, on each side. The houses, built of a dark-coloured limestone, are massive and gloomy, with low doorways and small windows, and the whole city has more appearance of antiquity and of Moorish construction than either Cordova or Sevilla. Jaen, conjointly with Baza, is the see of a bishop. The cathedral occupies the site of the Moorish mosque, which was pulled down in 1492, and replaced by the present structure about 1525, when the Greco-Roman style in which it is built had been introduced into Spain by Pedro de Valdelviro. It has four entrances, the western façade being flanked by two fine towers. The interior is Corinthian. The city has another cathedral, several hospitals, public fountains, and a beautiful promenade. A new road from Jaen to Granada was opened in 1823. Part of it passes through a tunnel under the Puerto de Arenas, a part of the Montes de Granada. The vicinity is very fertile.

JAEN DE BRACAMOROS. [ECUADOR.]

JAFFA, a sea-port town in Syria, is situated on an eminence which projects into the Mediterranean, in 32° 3' 25" N. lat., 34° 46' 18" E. long., 33 miles N.W. from Jerusalem, and has a fixed population of about 4000. The town is built on a hill, the top of which is crowned with an old citadel; on the land side it is surrounded by high walls. The houses are built of stone, but the streets are narrow and irregular. There are three mosques in the town, and the Catholics, Greeks, and Armenians have each a convent. The sea near Jaffa is shallow and strewed with rocks, so that vessels discharge and load about a mile from the shore, by means of small lighters which land at the quay, the approach to which is defended by two small forts. The trade of the place is inconsiderable; but Jaffa has always been celebrated as the landing-place for European pilgrims to Jerusalem, in consequence most probably of its proximity to that

city; for as to its claims to be a haven, few places could have less. European consuls reside in Jaffa. The adjacent country produces excellent melons, oranges, citrons, and other fruits; some oil and soap are exported; wheat, rice, linen, and piece-goods are imported from Egypt and Beyrut. Coral is found along the coast.

Jaffa is a European corruption of the Arabic *Yāfa*, which preserves the Hebrew name *Japho*, the representative of the Phœnician name *Joppa*, which is descriptive, and means 'an eminence.' Ancient legends give Joppa an antediluvian existence, and near it Andromeda was said to be rescued from the monster by Perseus. In the distribution of Canaan, Joppa fell to the tribe of Dan, and it was the only port (so-called) which the Jews possessed on the Levant, till Herod constructed the harbour of CÆSARĒA. Timber from Lebanon for the building of the first and second temple was landed at Joppa, and here Jonah embarked for Tarshish. The town suffered much, and was often taken in the Maccabean wars. It was annexed to the Roman province of Syria by Pompey, and was afterwards given by Julius Cæsar to Herod. In the New Testament it is celebrated by Tabitha's restoration to life by St. Peter. During and after the Jewish war Joppa became a receptacle for pirates, was taken by Cestius, who put 8400 of the inhabitants to death, and it was totally demolished by Vespasian. The town gave title to a bishop from an early age of the church; a bishop resided here in the time of Constantine the Great, and also when the city was taken by the Arabs in A.D. 636. In the time of the Crusades when the name Jaffa came into vogue, the town was alternately held by Christians and infidels. After its sack by Malek Adel, it was rebuilt by Frederick II. and St. Louis. It was finally taken from the Christians by the Sultan Bibars in the 13th century. In 1799 the French, under Bonaparte, took Jaffa, and suffered terribly here from an attack of the plague.

(Pomponius Mela; Pliny; Strabo; Josephus; Wilken, *Die Kreuzu; Géographie Universelle; Dictionary of Greek and Roman Geography.*)

JAFFNAPATAM. [CEYLON.]

JAICZA. [BOGNIA.]

JALAPA, or XALAPA. [MEXICO.]

JALIGNY. [ALLIER.]

JALISCO, or XALISCO. [MEXICO.]

JALPUCH, RIVER. [BESSARABIA.]

JAMAICA, one of the Greater Antilles, and the most important possession of the British in the West Indies, extends from 76° 15' to 78° 25' W. long., and from 17° 40' to 18° 30' N. lat. Its length from east to west is nearly 150 miles, and its width may on an average be 40 miles. It contains 2,724,262 acres, or 4256 square miles. About two-fifths of the soil is under cultivation.

The surface of this island is very uneven, but it is only the eastern part that can properly be called mountainous. This part is almost entirely filled up by the Blue Mountains, whose principal ridge varies from 5000 to 6000 feet in elevation. One peak has an elevation of 7150 feet above the sea. The western boundary of this mountain-region is formed by a ridge which runs across the whole island from south-east to north-west, beginning on the south at Yallah Point, and terminating to the north-east of the mouth of the Agua Alta, or Wagwater. It rises in several parts to 2500 and 3000 feet; and St. Catherine's Peak, at the point where it is united to the range of the Blue Mountains, is 4500 feet above the sea-level. The declivities of the Blue Mountains are only partially wooded, but the level summits are generally overgrown with trees. The principal level ground is the Vale of Bath, which extends about 8 miles from the town of Bath to the mouth of the Plantain Garden River, near the promontory of Morant Point, the most eastern cape of the island. This vale is about one mile and a half wide, and is covered with sugar plantations.

West of the range in which St. Catherine's Peak stands the mountains subside, and are divided from those farther west by a depression which extends across the island over the plain of Liguanea and the hilly country which incloses the banks of the Wagwater. The plain of Liguanea begins a few miles east of Kingston, and extends westward to a point west of Old Harbour, a distance of about 30 miles; its average breadth is about 5 miles. A part of this plain consists of savannahs, or natural pasture ground, covered with grass. West of Port Henderson a range of low hills called Healthshire Hills lies between the plain and the sea.

The plain of Liguanea is divided from the plain of Vere by a narrow range of low hills, which approach the sea west of Old Harbour, near Salt River Bay. The plain of Vere extends from south-east to north-west about 18 miles, with an average breadth of 7 or 8 miles. On the south-east of this plain is the Portland Ridge, which terminates in Portland Point, the most southern cape of Jamaica. On the north-west it is joined by the Mile Gully, a picturesque valley, several miles in length, traversed by the upper course of the Rio Minho. The soil of the plain of Vere is of moderate fertility, and mostly used as pasture ground. The mountains which inclose the plains on the north rise with a steep and abrupt ascent, but they do not attain a great elevation. They inclose valleys of considerable extent and fertility, especially that of St. Thomas-in-the-Vale, about 9 miles long and 2½ miles across, which is covered with sugar plantations, and is very fertile. Towards the northern coast the mountains sink down into low and well-wooded hills.

The mountains which cover nearly the whole of the island west of

St. Thomas-in-the-Vale, have their highest summit in the peak near Blewfields, not far from the southern coast, which rises to 2560 feet. Near the central line of the island, the hills present the characteristics of the limestone formation, of which they consist. Caverns occur in several places, and some of them are very extensive. Except during the rains, running water is scarce, and the inhabitants collect the rain in tanks. In the western part of the island the largest plains are the Pedro Plains, near Great Pedro Point, and the Savannah la Mar, towards South Negril Point, the most western cape of the island. A considerable portion of these plains is covered with swamps. The country between Montego Bay on the west and St. Ann's Bay on the east consists only of low though abrupt and precipitous hills; the valleys between them are covered with high forest-trees, which exhibit a very luxuriant vegetation.

Except in the districts which lie within the limestone formation above mentioned, Jamaica has the benefit of numerous rivers, rivulets, and springs. The Black River, north-west of Great Pedro Point is navigable, and goods are conveyed by it about 30 miles in flat-bottomed boats and canoes. The other rivers are of importance for the irrigation of plantations, the service of numerous mills, and the beauty and interest they impart to the aspect of the country. Some of them form beautiful cascades.

Jamaica has a coast-line of more than 500 miles, hardly any place is more than 30 miles from the sea, and along its shores are about 30 harbours for shipping, besides more than double that number of bays, creeks, and coves, capable of affording more or less shelter to vessels. The safest and most capacious of the harbours are those of Port Morant, Kingston, and Old Harbour on the southern coast, and those of Lucia and St. Antonio on the northern coast.

The climate is exceedingly hot in the lower plains along the southern coast of Jamaica. For the whole island the mean heat of the summer months (from June to November) is about 80°, whilst the mean heat of the other six months does not exceed 75°. In summer the thermometer sometimes rises to 96°, and occasionally, though rarely, to 100°. In winter it sinks to 60°. But the changes of the temperature are very slow and gradual; the difference between noon and midnight rarely exceeds 5 or 6 degrees. Snow has never been observed, even on the most elevated peaks; hail sometimes falls, but it melts as soon as it reaches the ground. The climate is cooler and more salubrious on the north side of the island than on the south. The heat of the low coast is considerably diminished by the daily sea-breeze, which sets in generally about nine o'clock in the morning and ceases only towards sunset. Its salubrious effects have obtained for it from the seamen the name of the 'Doctor.' During the hottest part of the day, and in the most sultry months, a succession of light flying clouds continually pass over the sun, and have the effect of moderating the heat of its rays.

In Jamaica there are two rainy and two dry seasons. The spring rains, which are generally partial and light, begin in the middle of April or beginning of May. The heavy rains commence in June or even later, and last about two months; at this time the air is intolerably sultry, presaging approaching torrents, which frequently come on with little previous warning. In such cases, while the rain pours down in torrents, there are incessant peals of thunder, and quick and vivid flashes of lightning. The rains set in regularly every day, and continue from two to three hours, sometimes for the space of several weeks. Occasionally very heavy rain descends for several days and nights with little intermission. The autumnal rains come in October and November; they are not so heavy as those already referred to, nor are they usually accompanied by thunder and lightning, but they are often attended by heavy gusts of wind from the north. Jamaica is from time to time visited by hurricanes, which generally set in from the north or north-west. They occur however only in the summer months between the two rainy seasons, which months are therefore called the hurricane months in the West Indies.

The low tracts along the coast are unhealthy, but the hilly and mountainous country is much less so. The most common diseases are the yellow fever, common bilious fever, and the typhus fever; the first is by far the most destructive, especially to new comers. From October 1850 till the early part of 1852 cholera carried off about 30,000 of the inhabitants, or nearly one in twelve of the whole population. It was followed by small-pox which also proved fatal in numerous instances.

Sugar, rum, and molasses form the most important articles of export from the island. The sugar plantations are numerous and extensive, especially in the lower and warmer tracts of the island. On the hills and their declivities coffee is cultivated to a great extent. Next to these in importance are the pimento plantations. Arrow-root, indigo, ginger, turmeric, and cacao are also cultivated. A considerable quantity of castor-oil is produced. Tobacco is cultivated by the negroes for their own use; maize is universally cultivated, and yields an abundant produce; two and even three crops of it can be raised within the year. Guinea-corn is raised extensively in some districts on the south side of the island. A variety of nutritious roots cultivated in this island are called by the name of 'Ground provisions;' such as the yam (*Dioscorea alata*), cassava (*Jatropha Manihot*), the sweet potato (*Convolvulus Batatas*), and some other roots.

None of the European fruits arrive at perfection except grapes. Apples are of very inferior quality, and peaches rarely produce fruit. The pine-apple, the orange, the shaddock, the pomegranate, the fig, the granadilla, the sapodilla, the star-apple, the sweet-sop, the sweet-lemon, the citron, the avocado-pear, &c., are reared in great variety and abundance. Several exotics have been introduced, as the mango, the cherimoyer, the bread-fruit, &c.; the most important is the plantain, or banana, which is extensively cultivated on every plantation.

The forests of Jamaica abound with a great variety of the most valuable woods. The most beautiful woods for cabinet-work are the mahogany, the bread-nut tree, and the satin-wood. The cedar-tree attains a great size, but it is not of so fine a grain as that of the Levant. Other trees produce dye-woods, as fustic, logwood, &c. The cotton-tree is the largest of all; its wood is used for making canoes, which are hollowed out from the trunks: its cotton is employed for stuffing beds. The bamboo grows wild, and is also cultivated. The cabbage-palm (*Areca oleracea*) and the cocoa-nut tree are the most useful trees of the palm tribe. Notwithstanding this abundance of useful trees white oak is imported for rum-punches, and a considerable quantity of pine of all dimensions from the United States, this wood being sold at a lower price than the native timber.

The horned cattle are very numerous, oxen being employed in the waggons which bring down the produce to the wharfs, and also in carts and in the plough. The horses are of a middle size, hardy and active, but only fitted for the saddle and harness. Mules are numerous, and employed in the sugar-mills and in conveying the sugar-canes to the works. Sheep and goats abound; many of the sheep have no fleece, and are covered with hair like goats. Hogs are very plentiful: they are of a smaller size than the English hog, but their flesh is superior in delicacy to the British or American pork. All kinds of poultry, except geese and the common duck, are raised in great abundance. The Muscovy-duck, the turkey, the Guinea-fowl, and the common fowl thrive very well. Domestic pigeons likewise abound. Rats exist in incredible numbers, and commit extensive ravages on the sugar-canes.

No metal except lead is known to exist in the island. There are some salt-springs.

Jamaica is politically divided into three counties, Surrey, Middlesex, and Cornwall, and contains one city, Kingston, and 33 towns and villages. The counties are subdivided into 21 parishes.

The county of *Surrey* extends over the eastern portion of the island, comprehending the whole of the region of the Blue Mountains and the eastern portion of the plain of Liguanea. In this division are Port Antonio, Morant Bay, and the harbour of Kingston. *Kingston* is a considerable city and a place of great trade, with a population of more than 35,000. It is regularly built, and contains many good houses, two churches, five schools, and some charitable institutions. The harbour is protected by the narrow slip of land on whose western extremity Port Royal is built. The greatest part of the produce of the southern districts is sent to Kingston, and thence exported to Europe or America. *Port Royal*, once the capital of the island, has been repeatedly destroyed by earthquakes, hurricanes, and fire, but is still a considerable place, as its harbour is the station for the ships of war, and it contains the naval arsenal and good fortifications. The bulk of its inhabitants are people of colour. *Morant Bay*, nearly at an equal distance between Port Royal and Morant Point, carries on a considerable trade and is a thriving place. The population is between 6000 and 7000. *Antonio* possesses a good harbour, but has little trade.

The county of *Middlesex* occupies the central part of the island, comprehending on the south the western portion of the plain of Liguanea. On its southern coast are Port Henderson and Old Harbour; but they are only visited by small vessels, which carry the produce of the country to Kingston. On the northern shores are Annotto Bay, Maria, and St. Ann's Bay, which carry on some commerce by sea. On the shore of Annotto Bay is a small but thriving town. On St. Catherine's Plain is built the town of *San Jago de la Vega*, commonly called *Spanish Town*, which is usually considered the capital of the island. It is a small town with about 6000 inhabitants, but embellished by the king's house (a residence of the governor), and the public offices. The superior court sits here. It has a Free school and some charitable institutions. A railway from Kingston to Spanish Town was opened in 1845.

The county of *Cornwall* extends over the western part of the island, comprehending the plains of Pedro and Savannah la Mar and the hilly country lying between them and north of them. The two most frequented harbours on the southern shores, Black River and Savannah la Mar, have little trade; but on the northern coast are three thriving towns, *San Lucia*, *Montego Bay*, and *Falmouth*, each containing a population of between 5000 and 8000. *Montego Bay* is the chief town of the county, and the assize-courts are held here. The harbour is exposed to a heavy swell; but a breakwater has been erected as a protection against the sea. Fifty years ago *Falmouth* was an inconsiderable village, but it is now nearly as large and populous as *Montego Bay*, and has a considerable commerce. A handsome suspension-bridge has been lately erected across the *Martha Brae River*, 2 miles E. from *Falmouth*.

The population of Jamaica was 377,432 in 1844; in 1849 Governor Sir C. Grey estimated it at more than 400,000, probably not more than 15,000 or 16,000 being Europeans, or of unmixed European descent; about 70,000 of the mixed or coloured race, and the rest negroes and coolies. In 1834 there were 297,186 negro slaves, all of whom were made free in 1838, by separate acts of the legislatures of Great Britain and of Jamaica.

The Maroons were originally runaway slaves, partly from Jamaica itself, partly from Cuba, who lived in the forests on the northern side of the island. In 1738 a tract of land was granted to them in those parts, which they cultivated, and on which they built two small towns; and though a portion of them forfeited their privileges by a rebellion, others have preserved them to this day. The other inhabitants are either whites or people of colour. The people of colour are the offspring of Europeans and negro women. They are subdivided into 'mulattoes,' the offspring of a white and a black; 'samboes,' the offspring of a black and a mulatto; 'quadroons,' the offspring of a white and a mulatto; and 'mestees,' the offspring of a white and a quadroon. No traces of a native population of the island existed when it was taken by the English from the Spaniards.

Some trade in British manufactures is carried on with Mexico, Central America, New Granada, and Venezuela. Dyewoods, hardwoods, indigo, and other articles are sent to Jamaica in return. From the United States and the British North American colonies lumber and provisions are obtained. The most important commerce of Jamaica however is that with the mother-country. Ships arrive from Great Britain from October to May, and they continue to depart as they get freighted, from April to the 1st day of August, after which and until the hurricane months are over, ships and their cargoes sailing for Great Britain pay double insurance. The estimated value of the imports into Jamaica in the year 1850 was 1,287,297*l.*, being more than one-third of the value of imports into all the British West Indies for that year. The amount of the imports has considerably fallen off during the last two or three years. The estimated value of the exports from Jamaica in the year 1850 was 1,211,915*l.*; in 1852 it was 818,757*l.* The quantities of sugar, rum, cotton, coffee, pimento, and arrow-root exported in the years ending October 10th, 1851, 1852, and 1853, are shown in the following table:—

Years.	Sugar.	Rum.	Cotton.	Coffee.	Pimento.	Arrow-root.
	hhds.	punchns.	lbs.	lbs.	lbs.	lbs.
1851	40,270	18,481	5516	5,595,273	4,524,072	259,863
1852	34,449	15,703	7675	7,127,780	5,447,203	195,999
1853	29,199	10,484	2966	5,017,689	4,679,106	146,718

The financial position of the island has been for some time past in a very unsatisfactory condition. The pecuniary embarrassments of proprietors of estates, on the one hand, and the differences between the legislative and executive authorities on the other, together with the increased expenses occasioned by the visitation of cholera and its extensive ravages, have tended to paralyse the resources of the public revenue. It is expected that some measures which have been recently adopted will help to relieve the undue pressure, and stimulate agricultural improvement and general prosperity. The revenue for the year ending October 10th 1851 was 299,546*l.* 8*s.* 10*d.*; the expenditure for the same period was 282,161*l.* 8*s.* 6*d.*

Shipping.—The number of vessels registered as belonging to the island on December 31st 1853 was 84, namely:—75 under 50 tons, tonnage 1798, and 9 above 50 tons, tonnage 1054. The amount of tonnage which entered inwards during nine months, from October 5th 1850 till July 5th 1851 was 81,550; during the period from October 5th 1851 to July 5th 1852, the amount was 82,075 tons.

Religion and Education.—There is a bishop of Jamaica, whose see comprises the Bahamas and British Honduras, and includes 116 clergy, of whom about 100 hold appointments to parishes or districts in Jamaica. The see is divided into the archdeaconries of Surrey, Cornwall, and Middlesex, in Jamaica, and the archdeaconry of Bahamas or Nassau. The United Presbyterian Church of Scotland has upwards of 20 ministers and catechists, and there are ministers of the Wesleyan Methodist, Baptist, and Moravian connexions. A Theological Academy, intended for the training of natives for the office of the ministry is supported by the United Presbyterian Church. At Wallin on the north side of the island is an Endowed school, which affords a classical education to about 50 pupils. Several educational endowments in many of the parishes have suffered much from mismanagement. From returns furnished to the governor in 1853, it appears that besides Presbyterian, Baptist, and London Missionary schools, and some Church of England schools, from which returns were not received, there were then at Church of England schools 6709 scholars; at Moravian schools 3054; at Wesleyan schools 1874; at Hebrew schools 53; and at Free and other schools 1102. The amount of the grant to the Board of Education in 1851 was 2388*l.*

History and Government.—Jamaica was discovered by Christopher Columbus on his second voyage, the 3rd of May 1494, but was not settled by the Spaniards before 1510. In 1655 it was taken from the Spaniards by the English, who for some time did not appreciate its value. Since 1655 it has remained in the undisputed possession of

the British, and its internal peace has only been disturbed by the rebellion of the Maroons in 1795. Though Jamaica has had an assembly since 1663, its present constitution was only completed in 1728. The executive is in the hands of a governor, who is styled Captain-General and Governor-in-Chief, and has a salary of 5000*l.* a year. The governor, as well as the council, consisting of twelve persons, is appointed by the sovereign of Great Britain. The governor has the chief civil and military authority. The council constitutes the Upper House. The Lower House, or the Assembly, is composed of 45 members chosen by the freeholders: two members are sent from each of the 21 parishes; Spanish Town, Kingston, and Port Royal send one member each. The present governor, Sir Henry Barkly, resides at Kingston. [See SUPPLEMENT.]

JAMES RIVER. [VIRGINIA.]
 JAMES TOWN. [HELENA, ST.]
 JAMMA RIVER. [ABYSSINIA.]

JANEIRO, RIO DE (San Sebastião de Rio de Janeiro), commonly called Rio, the capital of the empire of Brazil in South America, is situated in 22° 54' S. lat., 43° 15' W. long., on the western shore of the Bay of Rio de Janeiro, which is 24 miles in length from north to south, from 4 to 15 miles wide, and, being inclosed by high hills, forms perhaps the finest, safest, and most capacious harbour in the world. The entrance to the bay is formed by two rocky and projecting tongues of land, whose extremities are hardly a mile distant from one another. On the extreme point of the eastern tongue is built the fortress of Santa Cruz, and on the western promontory are the batteries of San José and San Theodosia; to the south of the latter, at the distance of about half a mile, is the remarkable eminence called Sugar-loaf Hill, rising 900 feet from the water's edge. At no great distance from, and opposite to the entrance, but within the bay, is a low rocky island, Ilha da Lagem, on which also a fortress is built, so that the entrance of the bay is very well defended. The average depth of the entrance is 14 fathoms: good anchoring ground is found everywhere within the bay, in which the tide rises 18 feet at full and change. The bay is diversified by numerous islands and rocks, but only one of them is of considerable extent, the Ilha do Governador, situated in the northern and wider portion of the bay. Numerous rivers fall into the bay. Though all of them have a short course, most of them are navigable for a few miles from their mouth, and facilitate the transport of the produce to Rio de Janeiro. An amphitheatre of hills and mountains springing up one behind another and separated by fertile valleys which enjoy a perpetual spring and yield the choicest fruits and flowers, rises up all round the bay.

Near the entrance of the bay, and where it is only from four to eight miles wide, the town is built on its western shore, as already observed. It extends along the shore about three miles on an undulating plain, which contains a high hill with the church of Nossa Senhora da Gloria on it. To the west of the plain rises a range of high hills called Corcovado, containing many picturesque valleys, among which that of Laranjeiras, or of 'the oranges,' is distinguished by its beauty. The substance of the mass of the hills round the town is gneiss, in which numerous quarries are opened near the city. That part of the town which is south of the hill Da Gloria is very narrow, consisting only of one or two streets which extend south as far as the small bay of Botafogo. The city or principal town is built a little north of the hill Da Gloria, and on a rocky shore opposite the small island called Ilha das Cobras. A fine pier of stone projects a short distance into the bay, and is ascended by a flight of steps. It leads immediately to the Praça de San José, two sides of which square are occupied by the Imperial palace. The northern side of the square is occupied by a row of houses two stories high. The chapels of the emperor and empress in the square are splendid churches. The street called Diretta, the most crowded and business-like street in the city, abuts on the square of San José; and out of it runs the street of Ouveador, which is lined with fancy stores and with shops of French goods, and is a very busy and fashionable street. Another street near this, called Ourives, is entirely occupied by silversmiths, jewellers, and lapidaries. The city itself stands on a low level plain, and extends in the form of a rectangular oblong from north-west to south-east; on its northern border are five low hills. It consists of straight and parallel but narrow streets, intersected by many still narrower streets at right angles. A large square, called Campo de Santa Anna, which joins it on the north-west, divides the city from the Cidade Nova, or New Town, which extends westward to the neighbourhood of the royal villa of San Christovão. The museum at the corner of the Campo de Santa Anna, or Aclamação, contains fine collections of minerals and precious stones, American ornithology, and native Indian curiosities, besides many foreign curiosities, specimens of natural history, some good pictures, and a few sarcophagi.

The streets are paved, and they also have foot-pavements, which however are narrow and dirty, for the streets are hollow in the middle, serving the purpose of open drains. In time of rain the whole street is overflowed. The houses, generally built of stone and two stories high, are white-washed or rough-cast, with red-tiled roofs and projecting eaves, and without chimneys, as fires are needless in the climate of Rio. The lower story is generally a coach-house or stable. The windows of the second story reach the floor, and open upon iron

GEOG. DIV. VOL. III.

verandahs, guarded by trellis-work shutters. The entrance is properly a large gate, which is guarded by a black slave in livery. The market-places are well supplied, but are not kept clean.

The most distinguished buildings are the cathedral and the churches De Candelaria and San Francisco de Paula. There are 39 churches in the city: some of them are splendidly decorated. The church of San Francisco de Paula, just mentioned, is one of the largest; it is lighted through stained-glass windows, and has catacombs beneath. The college, which once belonged to the Jesuits, is a fine building. An exchange in a good style has been erected. To the rear of the emperor's chapel is the public library of above 60,000 volumes. The Carcalada, or prison, in which both debtors and felons are confined, is ill regulated, dirty, and very unhealthy. The principal theatre is the Italian Opera, which is large and well arranged.

From the Corcovado Mountain (which is 2307 feet above the sea, and on the summit of which is an observatory and watch-tower) the city is supplied with good water, which rushing down the mountain is collected into the Casa de Agua, or reservoir, about 4 miles from the city. From this the water is conveyed by an aqueduct (the greatest work in Rio), which enters the city across a valley 200 yards wide, supported on two rows of arches one above another, and reaching a total height of about 90 feet. The water thus brought to the town is distributed into several fountains.

The Botanic Garden of Rio, which is admirably laid out and very rich in exotics, lies about two miles beyond a lake which is separated from the head of the bay by a narrow strip of land. It covers a space of about four acres. The tea-plant and spice-shrubs have been successfully cultivated here. In the climate of Rio the operations of nature in the seasons of spring, summer, and autumn, may be witnessed every day in the year, the bud, the bloom, and the fruit in every plantation.

Rio de Janeiro contains a population of more than 200,000. The number of whites and blacks seems to be nearly equal; the people of colour are comparatively few in number. Most of the inhabitants are engaged in the different branches of commerce. The trade of Rio is extensive, and increasing rapidly. It exports as much, if not more coffee than all the ports in the world. In 1830 the shipments of coffee amounted to 396,785 bags of 154 lbs. each; in the year ending June 30th 1843 there were shipped 1,176,138 bags (or 181,125,262 lbs.); and in the first six months of 1849 the quantity shipped was 780,764 bags. The production of sugar in this part of Brazil has been long decreasing: in 1844 about 10,000 cases (of 10 cwt. each) were exported; in the first six months of 1849 only 3048 cases were shipped. Other great articles of export from Rio are hides, rice, tobacco, rum, tapioca, ipocuanha, manioc-flour, &c. Cotton, gold, and diamonds have now almost disappeared from the list of exports. The imports comprise chiefly cotton goods; next are linen, woollen, and silk manufactures, port wine, jewellery, ironmongery, flour, meat, fish, butter, provisions, spirits, salt, earthenware, paper, &c. The value of the cotton goods (supplied almost entirely by Great Britain) is full one-third of the total value of the imports. About 1000 vessels from foreign ports arrive in the harbour yearly. The railway lately opened from a point of the bay opposite Rio to Petropolis is likely to increase the export trade of Rio.

There are several manufactories, sugar-houses, tanneries, cotton-factories, rum-distilleries, and train-oil factories. Several persons are occupied with cutting diamonds and other precious stones. Charitable institutions are scanty in proportion to the population. There is an academy of arts, a military academy, and several other educational establishments.

A more efficient police, and the abolition of the slave trade, have of late years rendered Rio less unhealthy than it used to be. The harbour is a stopping-place for foreign men-of-war and for merchantmen trading to the Pacific. The neat village of Praya Grande on the eastern shore of the bay, opposite Rio, is a place of great resort with the citizens; it contains several potteries, and is famous for its sweetmeats. White châteaux, numerous country-houses, and two or three large convents are seen high up on the hills and rocks to the northward.

(Casal, *Cronographa Brasílica*; Henderson, *History of Brasil*; Spix and Martius; M'Culloch; *Three Years in the Pacific*.) [See SUPP.]

JAN-MAYEN ISLAND is an island in the Arctic Sea, lying between 70° 49' and 71° 9' N. lat., 7° 28' and 8° 44' W. long. It extends from south-west to north-east about thirty miles, and is in no place above nine miles in breadth; at some places it is less than two miles wide. On the northern extremity, where the island is widest, stands Beeren Mountain, a snowy peak flanked with glaciers, and rising to 6870 feet above the sea-level. In other parts the rocky masses appear to attain an elevation of between 1500 and 2000 feet. A large portion of the island is composed of lava and other volcanic matter, and two craters have been discovered on the eastern side; smoke and fire have been observed in these parts. Even in the beginning of August all the high lands are found covered with snow and ice, and the lowlands retain part of their covering to the very border of the sea. The coast has several roadsteads with good anchorage in five to ten fathoms water, but no harbour. The whole island is generally surrounded with ice in spring; but in autumn, and even in summer, the ice sometimes sets so far to the westward that it is not visible from any part of the land.

T

There are foxes and white bears. Water-fowl are numerous, especially burgomasters, fulmars, puffins, guillemots, little auks, kittywakes, and terns. Cetaceous animals abound. The vegetation is very scanty, and limited to a few species scattered widely about among the volcanic minerals. Iron has been observed at several places.

The island was discovered in 1611 by a Dutch navigator called Jan Mayen, and was much visited up to about 1640 on account of the great number of whales, which however afterwards retreated to other parts of the Arctic Sea. In 1633-1634 seven Dutch seamen wintered here, probably for the purpose of establishing a permanent colony, and they kept a regular journal; but on the arrival of the Dutch fleet in the following June all were found dead in their huts from scurvy. Their journal terminated on the 31st of April.

(Scoresby, *Account of the Arctic Regions*.)

JAPAN is an empire in Asia, which consists of an unknown number of islands of different dimensions. These islands may be considered as constituting the western boundary of the Pacific, between 31° and 45° N. lat.; but the Japanese settlements on the island Tshoka, or Tarakai, better known by the name of Sakhalia, seem to extend as far north as 47° or 48° N. lat. Between these islands and the continent of Asia is a closed sea, called the Sea of Japan, which at its southern extremity is united to the Tong-Hai, or Eastern Sea of the Chinese, by the Strait of Corea, and at its northern with the Sea of Okhotak, or Tarakai, by the strait which divides the island of Tarakai from Manchuria. The Sea of Japan is united to the Pacific by several straits, which divide the Japanese Islands from one another. The most remarkable is the Strait of Sangar between the large islands of Nipon and Yeso. Japan is situated between 129° and 150° E. long. It is divided into Japan proper and the dependant islands.

Japan proper consists of three large islands, Kioosioo, Sitkokf, and Nipon, or Nifon, which are surrounded by a great number of smaller islands. Kioosioo, the most western, may be about 200 miles long, with an average breadth of 80 miles, which would give it a surface of 16,000 miles. On its western coast are two deep bays, that of Simabara, in the middle, which is by far the largest, and that of Omooora, north of it: at its southern extremity is the Bay of Kangosima. Kioosioo is separated from Sitkokf by the Boongo Channel, and from Nipon by the Suwo Sound and the Strait of Simonosaki. Sitkokf may be 150 miles long, with an average breadth of 70 miles; it probably contains more than 10,000 square miles. The long strait which divides it from Nipon on the north is in some places hardly more than a mile wide; but about the middle a large bay enters deeply into the island of Sitkokf. The eastern extremity of this island is separated from Nipon by the Kino Channel and the Bay of Osacca, which contains the island of Avasi. Nipon, the largest and the principal of the Japanese Islands, has a curved form. Its length, measured along the middle of the island, exceeds 900 miles, and its average width may be estimated at more than 100 miles; its surface may therefore cover an area of about 100,000 square miles. Its largest bays are along the southern coast, as Osacca Bay, Mia Bay, and Yedo Bay.

The dependant countries are the large island of Yeso, with some of the Kurile Islands and the southern districts of Tarakai. Yeso has a very irregular form. Its length, from south-west to north-east, is about 300 miles, and its average width does not fall short of 100 miles. This gives a surface of 30,000 square miles. Only the two southernmost of the larger Kurile Islands, Kunashir and Uturup, are occupied by the Japanese: the others belong to the Russian empire. The island of Tarakai, whose southern portion is called Tahoka, is divided from Yeso by the Strait of Perousa. It is certain that the Japanese have formed some settlements here, but it is not known how far they extend northward. According to this rough estimate, and excluding the settlements on the island of Tarakai, the Japanese empire contains about 160,000 square miles. According to some statements however the area of the Japanese empire is carried much higher, so as to make a total of above 260,000 square miles. Nor of the population is there any certain knowledge, some estimating it at about 25 millions, and others carrying it to double that amount.

All these islands are very imperfectly known: not even the coasts are laid down with any degree of correctness. This arises partly from natural and partly from political causes. Nearly all the coasts are very difficult of access, being surrounded by numerous rocks and islands, and by a very shallow sea. This latter circumstance accounts for the smallness of all Japanese vessels, and their unfitness to keep the open sea in a gale. They can only be employed in the coasting trade. The sea, besides containing numerous rocks, has some very dangerous whirlpools, two of which especially have been noticed by navigators, one near the island of Amakoosa, at the entrance of the Bay of Simabara, and the other near the southern extremity of Nipon, between the bays of Osacca and of Mia. To this must be added, that no part of the ocean is subject to heavier gales than the sea which surrounds Japan: they frequently blow with the fury of hurricanes. The government also and the laws of the Japanese are less favourable to intercourse with foreigners than those of any other country on the globe. If foreigners who arrive at the ports, after a delay of many days and even weeks, are at last permitted to set foot on shore, a small spot of ground is assigned to them, which has

previously been inclosed with strong palisades. The Dutch alone are permitted to trade in the harbour of Nagasaki, and are obliged to send annually an embassy to Yedo, which gives them an opportunity of examining, though very imperfectly, the southern coast of Nipon between Simonosaki and Yedo. But by the treaties recently concluded by the emperor of Japan with Russia and the United States of America, several ports are to be opened to foreign traders in the course of three years. Meanwhile all our knowledge of the country is derived from the accounts of the Dutch.

Some of these travellers assert that the whole surface of the islands is only a succession of mountains, hills, and valleys; but Kämpfer expressly says that he passed through several plains of considerable extent, as that which runs from the town of Osacca to Meaco, a distance of about twenty miles, and a similar plain west of Yedo, and extending to that town. A large plain occurs also along the northern shores of the Bay of Mia, and numerous smaller plains are noticed by Kämpfer. But generally the hills run down close to the sea, or leave only a narrow strip of level ground between them and the sea-shore. Though Japan is doubtless a very hilly country, it can hardly be said to be mountainous, as by far the greatest number of the eminences are cultivated to the very top, and those few which are not cultivated are left in their natural state on account of the sterility of the soil. The Dutch have observed only one single peak of great elevation, the Fudai Jamma, not far from the Bay of Tomina, west of the Bay of Yedo. They compare it in shape with the Peak of Teneriffe, and observe that the snow seldom melts on its top. According to the accounts of navigators however, it would seem that the northern part of Nipon is traversed by a continuous chain of mountains with several peaks. Volcanoes, some active, some extinct, are numerous; to the latter class the Fudai Jamma seems to belong. Some active volcanoes occur on the islands scattered in the Strait of Corea, as the Sulphur Island, noticed by Captain B. Hall.

From the peculiar form of these islands it may be presumed that they have no large rivers; and the rapidity with which they run down shows that the country in the interior rises to a considerable height. Many of them are so rapid that no bridges can be built over them, and they are not passed without danger. Several others are less rapid, and though they cannot be navigated, timber and wood are floated down them. A considerable number however seem to be navigable for small river-boats to a distance of some miles from the sea. The most considerable and important of those which are known is the river Yedogawa, in Nipon, which rises in the lake of Oita, a sheet of water 60 miles in length, but of inconsiderable width. After leaving this lake it traverses the fine plain which extends from its shores to the harbour of Osacca, and in all this course it is navigated by river barges.

The southern part of the empire about Nagasaki (the only part of which we have a meteorological account) seems to resemble in many points the climate of England. In winter it does not freeze and snow every year, though this is generally the case: the frost and snow, when there is any, last only a few days. In January the thermometer descends at Nagasaki in mild winters to 35° Fahr.; in August it rises to 98°. The heat would consequently be great but for the refreshing breeze which blows during the day from the south, and during the night from the east. The weather is extremely changeable, and rains are abundant all the year round; but they are more heavy and frequent during the 'satkasi,' or rainy season, which occurs in June and July. Storms and hurricanes seem to occur frequently. Thunder-storms and earthquakes are also common. It is observed that water-spouts are nowhere of such frequent occurrence as in the seas inclosing Japan.

In no part of the world is agriculture carried to a higher degree of perfection than in Japan. All the declivities of the hills to the top, except those which are too steep, are formed into terraces or beds of different width, according to the slope, and these terraces are cultivated with the utmost care. Here, as in China, the greatest attention is paid to the collection of manure. The raising of rice is the principal object, but wheat, barley, and rye are also cultivated. As the Japanese use no butter nor tallow, they cultivate numerous oleaginous plants, from which they obtain oil for dressing victuals and for their lamps. The seeds of panic, millet, and dog's-tail grass (*Cynosurus Coracanus*) are much used as food for man and beast. Of esculent roots chiefly batatas and potatoes are raised. Other vegetables are turnips, cabbages, carrots, radishes, lettuces, melons, pumpkins, cucumbers, and gourds. Different kinds of beans and peas are raised in astonishing abundance, and several provinces have obtained a name from producing them in superior quality. Among the beans are the daidsu beans (*Dolichos Soja*), from which the Japanese make the liquid which is known in England under the name of Soy. The plantations of the tea shrub are extensive in some districts, but their produce is inferior to that of China, and does not constitute an article for exportation. Ginger is cultivated, and the pepper shrub is planted for the consumption of the country. The orchards are stocked with the fruit-trees of southern Europe, as oranges, lemons, medlars, figs, grapes, pomegranates; and they produce also chestnuts, walnuts, pears, peaches, and cherries. The raising of cotton and silk are objects of great importance, and the paper mulberry is planted extensively, its bark being used for making cloth and paper. Hemp is also much

cultivated, but only employed in making cloth; the cordage is made from different kinds of nettles. Besides the different trees mentioned they plant the varnish-tree (from which they make excellent varnish for furniture), the cedar, the bamboo-cane, and the camphor-tree, though all these trees are also found in a wild state. They extract a blue dye-stuff as a substitute for indigo from several kinds of polygonum.

The horses are of a middling size, but strong. The number is small, as horses are used only for the saddle and by the princes. Horned cattle are still less numerous. The Japanese do not use either their flesh or their milk, and they are kept only for drawing carts or for ploughing such fields as lie almost constantly under water. Buffaloes are found only in some districts. Sheep and goats are not kept. Swine are found only at Nagasaki, where they have probably been introduced by the Chinese, as the Japanese do not eat them. Fowls, ducks, and geese are plentiful, but principally valued for their eggs, of which the Japanese are very fond. Of wild animals hares, deer, bears, and other animals are met with. Fish is extremely plentiful, and numerous villages are inhabited by fishermen only. Their rocky coasts are covered with oysters and several other kinds of shell-fish, and many families live exclusively on them. Even the flesh of the whale, of which some kinds are rather numerous along these coasts, is eaten.

Japan abounds in mineral wealth. Gold seems to be very plentiful in several provinces, but is not worked everywhere. The government seems to use corrective means to prevent such undertakings. Silver is not abundant; but copper, which contains a good deal of gold, is extensively worked, and supplies the most important article of export. Iron is said not to be common, but still there is enough for the consumption of the country. Some tin-mines are also stated to be worked. Salt in great quantity is made in several districts along the southern coast, where there exist salt-lagunes. Of other minerals only fine clay is mentioned, which is used in the manufacture of china; the porcelain is equal, if not superior, to that of China. The sea gives pearls and ambergris.

All travellers speak of the populousness of the country and the extent of the villages, which frequently occupy two English miles and more in length. In some more fertile districts they are so close to one another as to form nearly one continuous street; as, for instance, in the plain which extends from the harbour of Osacca to Meaco. The smaller towns commonly contain five hundred houses, and the larger two thousand and upwards, and though they have generally only two stories they are occupied by a comparatively large number of persons.

I. The Island of Kioosioo is extremely well cultivated, and generally fertile, with the exception of its eastern coast bordering on the Boongo Channel, which is mountainous, barren, and, comparatively speaking, thinly inhabited. In several places there are considerable manufactures of cotton-cloth, silk goods, and paper. The best known towns of importance are Nagasaki, Sanga, and Kokoora.

Nagasaki, the only place as yet open to foreigners, lies on a peninsula formed by the deep bay of Omcoora, in 32° 45' N. lat., 129° 51' E. long. Its harbour is spacious and deep, extending in length about four miles, with an average width of more than a mile. At its entrance is the small island of Popenberg, where the water is 22 fathoms deep, but it grows shallower as it proceeds inward, so that opposite to the town it has only a depth of 4 fathoms; so far it runs north-east, it then turns north, and has less depth. The town is built on its eastern shores, in a narrow valley which runs eastward, and on the inclining slopes. It is well-built and clean. The houses generally are only one story high, timber framed, the interstices being filled with clay, and the whole coated with cement. Each house is furnished with verandahs; oiled silk is used for glass. There are some good buildings in the town, as the palaces of the two governors, and those of some princes and noblemen of the empire, but especially the temples (above 60 in number), within and without the town. There are some manufactures of gold and silver. The population is variously estimated; some make it amount to 18,000, others to 60,000. Nagasaki is one of the five imperial towns of the empire.

Sanga, situated on a fine and well-watered plain at the northern extremity of the large bay of Simabarra, the capital of the fertile province of Fisen, is a very large and populous town, with canals and rivers running through its wide and regular streets. It has considerable porcelain manufactures. Sanga is fortified; it is 60 miles N.E. from Nagasaki.

Kokoora, built near the entrance of the Strait of Simonoski, has a shallow harbour, but carries on a considerable trade. The town was found in a thriving state in 1775 when visited by Thunberg.

II. The Island of Sitkoff has not been visited by Europeans. According to a Japanese geographer, cited by Kämpfer, it contains many mountainous and barren districts, and less fertile tracts than the other large islands.

III. Nipon, or Nifon, which constitutes the main part of the Japanese empire, is stated to be well cultivated and fertile, with the exception of a few barren tracts of moderate extent. It contains the largest towns, and the manufactured articles produced in this island are considered the best. The most important towns visited by Europeans, along its southern side, are:—

Simonoski, built at the foot of a mountain, on the shore of the narrow strait which bears its name, and which is only one mile and a half wide. It is not very large, but it carries on a very active coasting trade with all the districts to the east of it.

Osacca, one of the five imperial towns, and the most commercial place in the empire, is situated in the northern angle of the Gulf of Osacca, on the banks of the river Yedogawa, which, near the town, divides into three branches, and, before it falls into the sea, into several more. The middle or principal branch of the river, though narrow, is deep and navigable. From its mouths, as far up as the town and higher, there are seldom less than a thousand barges going up and down. Several navigable canals, which derive their water from the river, traverse the principal streets of the town, and serve as means for conveyance of goods. The banks of the river and of the canals are of freestone, coarsely hewn, and formed into ten or more steps, so as to resemble one continued staircase. Numerous bridges, built of cedar-wood, are laid over the rivers and canals; some of them are of large dimensions, and beautifully ornamented. The streets are narrow but regular, and intersect at right angles; though not paved, they are very clean. A narrow pavement of flat stones runs along the houses for the convenience of foot-passengers. The houses are not above two stories high, and are built of wood, lime, and clay. At the north-eastern extremity of the city is a large castle. The population is very great. According to the exaggerated accounts of the Japanese an army of 80,000 men may be raised from among its inhabitants. Many of the residents are very wealthy men, especially the merchants, artists, and manufacturers. The Japanese themselves call Osacca the universal theatre of pleasure and diversion; and plays are daily exhibited in public and private houses. In its neighbourhood the best saki, a kind of strong beer obtained from rice, is made, and exported into the other provinces.

South of Osacca, on the shores of the same gulf, is the town of *Sakas*, an imperial town, which however has never been visited by Europeans.

Meaco, or *Kio*, the residence of the ecclesiastical emperor, or Dairi, is about 20 miles N. from Osacca, and contains more than 500,000 inhabitants, besides the numerous court of the Dairi. It stands in a plain surrounded by mountains, the slopes of which are laid out in gardens and dotted with temples. The city is nearly four miles long and three miles wide. The Dairi resides on the northern side of the city, in a particular ward, consisting of 12 or 13 streets, and separated from the city by walls and ditches. On the western part of the town is a strong castle, built of freestone, where the Kubo, or secular emperor, resides when he comes to visit the Dairi. The streets are narrow, but regular, and always greatly crowded. The houses are like those at Osacca. Meaco is the principal manufacturing town of the empire: here every kind of manufacture is carried to great perfection. Nearly every house has a shop, and the quantity of goods which they contain is astonishing. At the same time Meaco is the centre of science and literature, and the principal place where books are printed; it is also the residence of the lord-chief-justice of the empire, who is invested by the emperor with supreme authority over all officers of government. The town is united by a wide canal to the river Yedogawa, which flows not far from its walls.

Kvano and *Mia* are two very considerable and thriving towns on the Gulf of Mia, each containing 2000 or 3000 houses, and carrying on a considerable trade with the neighbouring districts.

Yedo, *Yeddo*, or *Jeddo*, the capital of the empire, is situated at the northern extremity of the gulf of the same name, in an extensive plain. According to the Japanese it is about 10 miles long, 7 miles wide, and is nearly 30 miles in circuit. All travellers agree that it is the largest and most populous town in the empire, but none of them venture to state the probable number of its inhabitants. The population is stated by some to be only 700,000, by others it is carried to 1,200,000; but it is clear from what has been already stated that nothing certain is known by foreigners on this subject. A large river runs through the town and sends off a considerable arm, which incloses the Imperial palace, that of the Kubo, or secular emperor. There are several good bridges over the river. The principal is called Niponbas, or the Bridge of Japan, and from it the mile-stones are counted, which are erected along the principal roads that traverse the empire. Yedo is not so regularly built as Meaco, and the private houses are constructed like those of Osacca; but as the families of all the hereditary princes, lords, and noblemen are obliged to reside at the court the whole year round, the town contains a great number of fine palaces, though they are not above one story high. Rows of trees are planted along the numerous canals which traverse the town, to prevent the fires from spreading, which are very common. Yedo is not less famous for its manufactured goods than Meaco. The palace of the Kubo is built in the middle of the town. It consists of five palaces or castles, and some large gardens behind it, and is more than 8 miles in circumference.

IV. The Island of Yeso is very imperfectly known. On its western coast are high mountains which rise at several parts into high peaks. The island contains many extinct and active volcanoes. Its eastern and southern coasts seem to be very thickly inhabited. The southern extremity of the island presents a deeply indented peninsula, the narrowest part of which, between Volcano Bay on the south coast,

and Soukhtelen Bay on the west coast, is only 20 miles wide; but the actual isthmus which joins the peninsular part to the main body of the island between Strogonor Bay on the west, and the head of Edermo Bay on the south, is 35 miles across. The northern part of Yesso is said to be very fertile, its products comprising wheat, rice, hemp, tobacco, and fruits. Timber is abundant. Dried fish are exchanged with the Japanese for clothing. Near the Strait of Sangar are two considerable towns, Kokodade and Matsmai. The latter is the capital, and the residence of the governor. Yesso was occupied by the Japanese in consequence of the encroachments of Russia in the Kurile Islands. Its inhabitants retain their own religion and laws; their officers are chosen subject to approval by the emperor.

The Japanese are not so strong as Europeans; but they are well made and have stout limbs. They are of Mongol origin, and seem to have derived their civilisation from China. In manufacturing industry and in scientific knowledge they seem to be equal to the Chinese, and in some articles the Japanese are superior. Their manufactures in metals, silk, cotton, china, glass, paper, lacerated ware, and cabinet-work are highly esteemed. They also make excellent watches and clocks, telescopes, and thermometers. The fine arts are much admired, but the Japanese taste differs from ours, and is like that of the Chinese. The most ancient religion is that of the Sinto, who was the offspring of the sun, the founder of the ancient royal family and of the empire. But the greater part of the inhabitants have embraced Buddhism, which seems to have been introduced from Corea at a very remote epoch. Besides these two religions, a considerable number adhere to the doctrines of Confucius, the Chinese philosopher, and are called Syooto. In the 17th century the Roman Catholic religion was introduced by the Portuguese, and made great progress, but it was eradicated by a civil war and great persecutions, and entirely forbidden. All travellers who have been acquainted with both nations prefer the Japanese to the Chinese. They find them of a more manly and open character. The Japanese show a great desire for knowledge, and their institutions for instructing the lower classes seem to be not inferior to any on the globe. Indigence and pauperism are said to be almost unknown.

The government is despotic, but the emperor himself is considered as subject to the laws, which are of long standing, and cannot easily be changed. Formerly, the Dairi Soma, the head of the Sinto religion, was the only sovereign of the empire; but as the public offices are hereditary, the chief general (or siogun) acquired gradually such an authority, that in 1535 he deprived the Dairi of his influence, leaving him only the supreme administration of ecclesiastical affairs; still however no enactment has legal force without having been previously sanctioned by the signature of the Dairi. The descendants of the chief general now govern the empire under the title of Kubo Soma. The constitution of the Japanese empire is materially different from that of the Chinese in its hereditary nobility, dignitaries, and officers. The government of the provinces resembles in some respect the ancient feudal system of Europe. The nobility, or hereditary governors of the provinces and districts are called Daimio (High-named), and hold their offices from the Dairi emperor, and Saimio (Well-named), who derive their authority from the military emperor. The first-mentioned govern the provinces, and the Saimio govern the districts. Six months of the year these noblemen are in their provinces to watch over their government, and six others they must pass at Yedo, but their families must remain in that town the whole year round as a security for the loyal conduct of the governors. According to Meylan, the population of the country is divided into eight classes—the princes or governors, the nobility, priests, military, civil officers, merchants, artisans, and labourers. All these dignities, offices, and employments are hereditary.

The Japanese females have almost as much liberty as European females; most of them can play on a musical instrument which is like a guitar.

The inland trade is very considerable. The coasting trade is much favoured by the great number of small harbours, and the interior communication by well-planned and well-maintained roads, which are always thronged with carriages and people. Most of the roads are wide, and ornamented with lines of trees. The foreign commerce is limited to the Dutch and Chinese. The Dutch have a factory on the island of Desima, which is connected with the town of Nagasaki by a bridge. To prevent all communication with the inhabitants it is planked on all sides, and has only two gates, one towards the town and the other towards the harbour. These gates are strictly guarded during the day, and locked at night. In this inclosure are the store-houses, the hospital, and some houses built of wood and clay, and covered with tiles. The Japanese export principally copper, camphor, and lacquered wood-work; with some china, silk-stuffs, rice, saki, and soy. The principal articles of importation are sugar, elephants'-tusks, tin and lead, bar-iron, fine chintzes, Dutch cloths, shalloons, silks, cloves, and tortoiseshell; with some saffron, treacle, Spanish liquorice, watches, spectacles, and looking-glasses. The Japanese copper does not reach the European market, being disposed of on the coast of Coromandel to great advantage.

The Chinese, like the Dutch, are shut up in a small island, but they are permitted to visit a temple in the town of Nagasaki; their trade is much more extensive. About seventy junks arrive annually from

the ports of Amoy, Ningpo, and Shanghai; but as the Chinese have no factory they cannot remain during the winter in the harbour of Nagasaki. The Chinese junks arrive at three different times in summer. [See SUPPLEMENT.]

JAROSLAV. [YAROSLAW.]

JARROW. [DURHAM.]

JASSY. [MOLDAVIA.]

JAVA, one of the Greater Sunda Islands, the third in extent, but the first in importance, is situated between 5° 52' and 8° 4' S. lat., 105° 11' and 114° 13' E. long. The Java Sea and the Indian Ocean form respectively the northern and southern boundaries of the island; and their connecting straits, Sunda and Bali, respectively separate Java from Sumatra on the west and from Bali on the east. The Strait of Sunda, where narrowest, is only 14 miles across, and the Strait of Bali only 2 miles. The length of Java from Java Head on the west to East Point (Oost Hoek) is 666 miles; its breadth varies from 56 to 135 miles. The area is about 50,000 square miles; including the adjacent island of Madura and some smaller dependencies, the area is stated officially to be 51,728 square miles. The population in November 1849 was estimated at 9,560,380. Those of European descent do not exceed 20,000.

The island of Madura lies to the north-east of Java, from which it is divided by the Strait of Madura, which in one part is only between 80 and 90 fathoms broad. Madura is 91 miles long, and 31 miles wide in the widest part. The area is about 1300 square miles, and the population about 300,000. It is in parts mountainous and covered with forests; the soil is moderately fertile, the chief products being cotton, cocones, and ornamental woods. The island is nominally subject to a sultan, who resides in Bankhalan, near the west coast. The principal town however is Sumanap, on the east coast. There is another town, Pamakasan, near the south coast.

Surface and Soil.—The southern coast of Java in its whole extent is high and steep, rising in many places perpendicularly to an elevation of 80 or 100 feet, and in some places much higher. It runs in a continuous line, with few indentations, and those not deep. Still a few good harbours occur; the best are Chelachap, about 109° E. long., and Pachitan, about 111° E. long.

The hilly country which is contiguous to the southern coast rises rapidly towards the interior, where it attains a mean elevation of more than 1000 feet, and extends in elevated undulating plains. This elevated region is traversed by numerous ridges of hills, probably rising to 2000 or 2500 feet above the sea-level, running mostly in the direction of the island's length, and crowned in many places with conical peaks. It is stated that there are 38 of these peaks. They are all volcanic. Indications and products of their former eruptions are numerous and unequivocal. The craters of several are completely obliterated; those of others contain small apertures which continually discharge vapours and smoke. Many of them have had eruptions during the present century.

The highest and most remarkable of these volcanic peaks are the Pangerango, south of Buitenzorg, more than 8000 feet high; Mount Gede, south-east of the former, rising to 9388 feet; the Dahirmai, south-south-west of Cheribon, more than 8000 feet high; the Gede Tegal, near 109° E. long., 10,650 feet; and Mounts Sindoro and Sumbing, called the Two Brothers, near 110° E. long. Three large volcanoes, called Ung'arang, Merbidu, and Merápá, lie in a direction almost south and north across the hilly region near 110° 30' E. long. Near the eastern peninsula is the Arjuna, 10,614 feet high, and south-east of it, not far from the Indian Ocean, the Smeero, or Semiru, probably the most elevated of these peaks. At the north-eastern extremity of the island near Cape Sedano is the elevated volcano of Telágawurung.

The hilly region contains some extensive plains and valleys of great fertility, inclosed by the ridges of hills which connect the peaks. The largest of these elevated plains is that of Bandung, which seems to occupy nearly the whole tract from Mount Gede on the west to Mount Gede Tegal on the east. It is of great fertility, though somewhat inferior to the two valleys which lie contiguous to it on the east—the Vale of Banyumas, traversed by the beautiful river of Serayu, and the Vale of Kediri, on the banks of the river Elo. East of the last-mentioned vale is the elevated plain of Solo, which extends round the town of Sura-kerta, and exhibits a great degree of fertility. The elevated plain of Kediri, traversed by 112° E. long., is equally extensive and fertile. The eastern peninsula, whose surface is mostly occupied by peaks and high ridges connecting them, has only narrow and close valleys.

The elevated and hilly region terminates to the north in rather a steep slope, and between it and the Java Sea extends a flat country which descends imperceptibly from the foot of the hills to the very shores, where it terminates in some places in swamps. This low tract, which is mostly alluvial, is widest towards the west, where it is about 40 miles wide between Bantam and Cheribon. Between Cheribon and Samárang it is hardly more than 10 miles wide. This portion of the low lands is not equal in fertility to the inland districts. In Samárang are the flats of Demák, which extend between the elevated

region and the mountains of Japára; they were once an extensive swamp, and are hardly inferior in fertility to any part of the island. East of these flats and between the same mountains are the low lands of Jipang and Surabáya, which terminate on the strait and gulf of Madura with the delta of the Surabáya River; the delta is also distinguished by its fertility. The low lands of Demák, Jipang, and Surabáya divide the mountains of Japára and some lower ridges from the elevated regions. The mountains of Japára, which contain a peak of considerable elevation, occupy the peninsula of Japára, on which the low coast-tract is very narrow. This isolated mountain system is separated by a deep valley, covered with alluvial soil, from a low ridge which occupies the whole tract of the coast between Cape Lerang and Cape Panha, and perhaps 10 or 15 miles inland.

The northern coast is lined by numerous small islands, and is marked by many projecting points and headlands. Accordingly the harbours are numerous. But the whole coast line affords anchorage at nearly all seasons of the year, and vessels of any burden can approach all the principal stations at a convenient distance for the exchange of their merchandise. The sea being generally smooth and the weather moderate, the native vessels and small craft always find sufficient shelter at the change of the monsoon by running under some island, or passing up the rivers, which though in general difficult of entrance on account of their bars, are for the most part navigable for such vessels as far up as the maritime towns.

The soil of Java is generally deep and rich. The best soils are the alluvial soils along the beds of the rivers, and on the slopes of the largest mountains; the worst are on the declivities of the lower ranges. But though there are these varieties, the general character of the soil is that of extraordinary fertility. The eastern districts however are superior to the western. The neighbouring countries, especially Sumatra and the Malayan peninsula, cannot be compared with Java in this respect. The best soils annually produce two crops without manure, and even the poorest remunerate the labour of the husbandman.

Rivers.—Java is watered by numerous rivers, but few of them have a considerable course, on account of the comparative narrowness of the island. There may probably be fifty streams, which in the wet season bear down rafts loaded with timber and other rough produce of the country. Five or six are navigable at all times to a distance of some miles from the coast. The rest, in number many hundreds, if not thousands, are used to irrigate the fields.

The *Solo* rises with many branches near the southern coast in the mountains of Damong, and runs northward to Sura-kerta, where it is a stream of considerable depth and breadth; it afterwards turns to the east, and at Awi it is joined by the Madion. From this point to its mouth its course is regular and steady. It enters the Strait of Madura by two mouths at Gresek and Sidayu. From Sura-kerta to Gresek it is stated to run 356 miles, measured along the windings of the river, though in a straight line the distance is only 140 miles. In this part of its course there is no impediment to navigation. During the rainy season it is navigated by boats of considerable size, and, except in the height of the dry season, it floats down boats of middling size from a considerable distance above Sura-kerta.

The *Kediri*, or *Surabáya*, forms nearly a circle, and its source and mouth are situated almost in the same latitude. It rises at the base of the volcano Arjuna, winds round Mount Kawi, and is a large river at Kediri. From this place its course is no longer interrupted by any impediment, and it bears boats of a very considerable size to its outlets in the Strait of Madura. Its mouths are five in number, and they include a pretty extensive and very fertile delta.

There are no lakes in Java, but some low lands are converted into temporary swamps during the rains. Two of these swamps are of considerable extent; one, called the Binnen See, is at the foot of the Japára Mountains, and the other is not far from Samárang.

Climate.—In Java, as in other countries between the tropics, the year is divided into a wet and a dry season, and these seasons depend on the periodical winds. The westerly winds, which are always attended with rain, commence in October, become more steady in November and December, and gradually abate, till in March or April they are succeeded by the easterly winds and fair weather, which continue for the remaining half year. The heaviest rains fall in December and January, and the driest weather is in July and August. During the rainy season there are many days without showers; and in July and August the atmosphere is refreshed by occasional showers. The degree of heat varies considerably in the low lands and the hilly region. On the low northern shores at Batavia, Samárang, and Surabáya, the mean annual heat is 78°; but in the dry season the thermometer rises above 90°. The elevation of the interior offers the rare advantage that, from the sea-shore to the top of the mountains, there is almost from one end of the island to the other a regular diminution of temperature, at the rate of two or three degrees of Fahrenheit for every ten miles. The mean temperature on the elevated plains probably does not exceed 66° or 68°, and the thermometer rarely rises there to 72°. On the summits of the peaks it sinks below the freezing-point: ice as thick as a Spanish dollar has been found, and hoar-frost, called by the natives 'the poisonous dew,' has been observed on the trees and vegetation of the higher regions.

Hurricanes are unknown. With the exception of a few days at the change of the monsoons, or when the westerly winds are at their height, vessels of any description may ride with safety in most of the bays along the northern coast; and on shore the wind is never so violent as to do damage. Thunder-storms are frequent and destructive. Earthquakes are common in the vicinity of the volcanoes. Java was formerly considered one of the most unhealthy countries of the globe, and this character is certainly due to the greatest portion of the low coast along the Java Sea; but by far the greatest part of the island, in point of salubrity, is equal, if not superior, to any other tropical country.

Productions; Vegetables.—The Javanese cultivate rice and other grains on the slopes of the mountains and hills, which are formed into terraces. They practise irrigation, and in some parts they grow in the wet season a crop of rice, and in the dry season some pulse, farinaceous roots, or cotton. In the richer lands however, it is usual to take from them without interruption a double harvest during every twelve months. Rice is here, as in India, the principal object of the husbandman, and its produce determines the value of the land. Maize also is grown, yielding in rich lands four or five hundred-fold; and even in poor lands it yields sixty- or seventy-fold. Wheat has been introduced by the Dutch, and is cultivated on the more elevated lands, but its produce is in small quantity and of inferior quality. Millet is grown in some places on a limited scale. Among the many esculent roots cultivated the principal are the yam, the sweet potato, the Java potato, arrow-root, and the common potato. The last is only grown in the more elevated and colder districts, where also artichokes, cabbages, and peas succeed, but carrots not so well. The Javanese also cultivate cucumbers, onions, and capicums. As they do not use butter they consume a great quantity of different kinds of oil, made from the fruit of the cocoa-nut tree, the ground-nut, the *Palma Christi*, and the sesamum, all of which are cultivated with considerable care. They also plant the areca palm, on account of its nuts, and the Gomuto palm, partly on account of the toddy, or palm-wine, obtained from it, and partly on account of a fibrous substance resembling black horse-hair, which forms between the trunk and branches, and is used for making cordage. There are also extensive plantations of the betel and of tobacco. Among the fruit-trees are the plantain or banana, the bread-fruit tree, the mangustin, the durian, the mango, the shaddock, the pine-apple, the guava, the papaya, the custard-apple, the cashew-nut, &c. Besides these the pomegranate and the tamarind are grown. European fruit-trees have not succeeded: the grape is cultivated in several places, but it is seldom of a good quality.

The plants which afford articles for foreign exportation are the coffee-tree, the sugar-cane, the pepper-vine, the cardamom, the ginger, the sandal-tree, and the cotton-plant. Java is the greatest coffee exporting country in the world next to Brazil. The cultivation of cinnamon has greatly extended since 1839; 3000 bales of it were exported in 1852. The forests, which cover a part of the elevated region, contain a great number of teak-trees. Ebony-wood is also found; and among their creeping plants are the rattan and two species of caoutchouc-trees. The mulberry thrives, and silk-worms have been introduced. As dye-stuffs there are cultivated indigo, safflower, arnotto, and turmeric. Several fruit-trees produce dye-woods, as the sappan, the mangkuda, and the ubar, similar to the logwood of Honduras.

There are two trees in this island from which poison is extracted, the antjar and the chetik. The antjar, also called the bopon upas (or the poisonous tree), is a high forest-tree, from whose outer bark poison is extracted in the form of a milk-white sap. But its exhalations are not poisonous, nor is it, as was formerly supposed, hurtful to plants around it, creepers and parasitical plants being found winding in abundance about its trunks and branches.

Animals.—Under this head are horses of small breed, but strong, fleet, and well made; buffaloes, which are very numerous, and used in agriculture; and black cattle. Goats are abundant, but sheep are scarce; both are of small size. The hog is reared chiefly by the Chinese. Among beasts of prey are the tiger, the leopard, the tiger-cat, and the jackal. Other wild animals are the rhinoceros, the wild Java ox, the wild hog, and the stag or axis deer. Of domestic birds there are turkeys, geese, ducks, fowls, and pigeons. Among the wild birds the most remarkable is the *Hirundo eculeuta*, whose nests are edible, and exported in large quantities to the Chinese market. They are called Salanga-nests. Crocodiles, turtles, and fish abound in the rivers. Of serpents there are said to be several poisonous varieties. Honey and wax are obtained.

Minerals.—Few minerals are known to exist in Java. Iron is said to be found in small quantity, and indications of gold have been observed at several places. Salt is made of sea-water in some parts of the northern coast. Saltpetre is extracted from the earth of some caves, and sulphur is found near the volcanoes.

Political Divisions, Towns, &c.—The greatest part of the island is in possession of the Dutch. The districts situated on both extremities of the island, as well as the whole of the northern coast, are immediately subject to them; but the southern coast and the adjacent countries, between 108° 30' and 112° 20' E. long., with the exception of the small district of Pachitan, is subject to two native princes, the

Susuhunan, or emperor, and the sultan. Their dominions extend more than 250 miles along the southern coast, and form about one-fourth of the whole island.

I. The Dutch possessions are administered by a governor-general, who has authority over all the Dutch possessions in the East, and is assisted by a secretary-general and a council of four members, all of Dutch descent. The island is divided into residencies, or provinces, each administered by a European governor, and divided into sub-residencies, and these again into communes, in each of which there is a justice of peace. The supreme court for the whole island has its seat in Batavia. There are district courts with superior jurisdiction in Batavia, Samaráng, and Surabáya. The inhabitants enjoy perfect religious toleration. A good road runs along the northern coast from Bantam nearly to Bali Strait. From Batavia a branch road runs into the interior through Buitenzorg (the capital of a sub-residency), and joins the main road again near Cheribon. Another important branch runs south from Samaráng to Djokjo-Kerta, near the south coast, and then runs north-east past the magnificent ruins of Brambanan (where about seven acres are covered with the remains of massive Hindoo temples to Siva and Buddha), and down to Sura-Kerta, in the valley of the Solo. The Dutch have many commercial stations on the south of the island. Steamers ply regularly from Batavia to Singapore.

The country west of 108° 30' comprehends the five residencies of Bantam, Batavia, Buitenzorg, the Preanger districts (which are governed by native princes tributary to the Dutch), and Cheribon. The most considerable and remarkable towns in this country are on or near the northern shores. *Sirang*, or *Ceram*, where the governor of Bantam resides, is a thriving place some miles inland. BANTAM and BATAVIA are noticed in separate articles. *Cheribon* is a thriving sea-port town, with a good roadstead and 12,000 inhabitants. It contains a beautiful mosque and a Christian church. In the interior of the country is *Buitenzorg*, a thriving and well-built town, 40 miles from Batavia, and at the foot of the volcano of Pangerango. It contains the summer palace of the governor-general and many fine country houses. A navigable canal unites it to the harbour of Batavia. The most considerable town in the Preanger districts is Chanjur.

The Dutch possessions east of 108° 30' to the Strait of Madura contain the nine provinces of Tegal and Brebes, Pakalongan, Kedú, Samaráng, Japára, Rembang, Gresek, and Surabáya. The chief towns from west to east are the following:—*Samaráng*, with more than 30,000 inhabitants, has an extensive commerce in coffee, pepper, and rice. Foreign vessels are permitted to trade to it. The town is well built, and has a church, a military academy, theatre, hospital, and observatory. It is an unhealthy place, but stands in a district of surprising fertility. *Rembang* has 8000 inhabitants and some trade. *Surabáya* is situated on the Strait of Madura, which forms an excellent and spacious harbour with good anchorage, and secure against the violence of the sea and wind. It is one of the most populous and thriving towns of Java; its population exceeded 80,000 in 1815. Its harbour is open to foreign vessels. *Surabáya* has a handsome government house, a mint, and large storehouses, ship-building docks, a naval arsenal, and a cannon foundry. The harbour is defended by many forts and batteries. In the interior, in the vale of Kedú, are the extensive and admired ruins of the temples of Boro Bodor, and of Majapahit, once the capital of Java.

The eastern peninsula, which extends to the Strait of Bali, is less fertile than any part of the island, being almost entirely occupied by mountains. It contains three provinces, Passaruan, Besuki, and Banyuwangi, of which the last is noted for its coffee, which is stated to be superior to that of Mocha, and for the great quantity of sulphur which abounds there. [BANTUWANG.] Passaruan is a small town on the sea-coast.

II. The dominions of the Susuhunan, which contain a population of nearly one million, consist of two separate tracts. The largest lies between 108° 30' and 110° E. long., and contains the fertile vale of Banyumas, with the town of the same name, which has 8000 inhabitants. From this the smaller portion is separated by the Vale of Kedú and some territories of the Sultan. It lies in the interior of the island, between 110° 30' and 111° 20' E. long., and contains the residence of the Susuhunan, called Sura-Kerta, or Soer-Karta, on the Solo River, which has a population of 105,000. This town is now the capital of a Dutch residency, and has a Dutch garrison and fort.

III. The territories of the Sultan extend between 110° and 112° 20' E. long., and contain nearly 700,000 inhabitants. In their eastern districts is the fertile plain of Kediri. The capital is *Yugya-Kerta*, or *Djokjo-Kerta*, a town with 90,000 inhabitants. In its vicinity are the ruins of Brambanan, called Chandi Sewu, or the Thousand Temples.

Inhabitants.—The natives of Java belong to the widely spread race of the Malays. They profess Mohammedanism, which was introduced among them in the 14th century, and is modified by the doctrines and ceremonies of Buddhism. Three different dialects of the Malay language are spoken on the island, but they have also an ancient sacred language called Kawi, which contains a great number of Sanscrit words. The Javanese have a native literature, which however is not rich. They have also translations from the Sanscrit and Arabic; the latter are few in number and solely on subjects of religion and jurisprudence. In civilisation the Javanese are much superior to all other

nations who inhabit the Indian Archipelago. This is evidently shown by the state of their agriculture, though it cannot be compared with that of the Hindoos or Chinese. In the art of fishing they are very expert. The Javanese are distinguished in working gold. Their cotton cloth is coarse but durable. The raw-silk, imported from China, is manufactured into a rich thick tissue. The Javanese show also considerable skill in the construction of their vessels and boats, of which there is a great variety. The fishing-boats, according to the description given of them by Captain Keppel, are justly entitled to be called 'flying canoes.'

Besides the native population of Java many foreigners are settled on the island, comprising Chinese, Malays, Hindoos, Bugis, Arabian merchants, and slaves brought by the Europeans and Chinese from Bali and Celebes.

Commerce.—Java is extremely well adapted for an extensive commerce. Batavia is the centre of all the trade which Holland carries on with its extensive settlements in the Indian Archipelago. The exports of these countries, intended for the European and American markets, are likewise sent to Java and thence to Europe. The trade of the island was always open to the independent Asiatic nations, and since its re-occupation by the Dutch the vessels of all European nations are admitted into the ports of Batavia, Samaráng, and Surabáya.

The exports from Java to Europe and America are chiefly coffee, sugar, rice, pepper, and arrac; minor articles are, long pepper, cubeb pepper, ginger, turmeric, cajeput oil, tamarinds from Madura, specie, sapan, rattans, and some hides and horns of buffaloes and oxen; also vessels built of teak, and teak-timber. The imports are cotton fabrics, especially chintzes, white-cottons, handkerchiefs, and velvets; broad-cloth; iron, steel, some cutlery, nails, and small anchors; Banca tin, copper, some fire-arms and ammunition; glassware and earthenware; opium; Wenham Lake ice, &c.

The Chinese chiefly visit the harbours of Batavia and Samaráng, and import black tea, coarse porcelain, wrought iron (principally in the form of pans for the sugar-houses, and other culinary vessels), cotton-cloths, raw and wrought silk, especially satins of various colours, with a few velvets and brocades, brass-ware, paper, books, paint, shoes, fans, umbrellas, and toys. They take in return black pepper, long pepper, sandal-wood, mostly imported from the island of Timor, betel-nut, bees'-wax, cotton, edible birds'-nests, sharks' fins, rhinoceros horns and hides, ox and buffalo hides and horns, European woollens and cottons.

The inhabitants of the other islands of the Indian Archipelago carry on an active commerce with Java by means of the Bugis, or inhabitants of Boni, in Celebes. These active navigators and adventurers leave their country in the beginning of the eastern monsoon, and carry on a trading voyage as they proceed westward, until they reach the limit of their navigation at Malacca, Penang, and Achin, and prepare to return with the change of the monsoon. The commodities which they export from their own country and the islands which they visit before they arrive at Java are, the durable cotton-cloth of their native country, gold-dust, nutmegs, Spanish dollars, camphor, frankincense, and tortoiseshell. They take in return birds'-nests, European and Indian cotton goods, unwrought iron, salt, rice, different kinds of pulses, and tobacco.

The inhabitants of Coromandel and Malabar bring to Java blue cotton-cloth, cotton chintzes, and tobacco; and take in return betel-nut, bees'-wax, black pepper, nutmegs, and mace, brought from the Moluccas, ivory and damar from Borneo and Sumatra, and tin from Banca.

A few vessels from Mocha in Arabia annually visit Java. They first go to Malabar and import cotton-cloths, fruits, and bullion; and take in return cloves and nutmeg, black pepper, betel-nut, rice, and sugar.

In the year 1831 the total value of the imports into Java and Madura amounted to 1,206,533*l.*; in 1841 to 2,456,980*l.*; and in 1851 the imports by the Dutch alone are officially stated to amount to 1,207,967*l.* in value.

The total exports, which in 1831 amounted in value to 1,225,179*l.*, were officially valued at 5,482,817*l.* in 1841; and in 1851 the Dutch part alone of the export trade was estimated at 5,308,174*l.* The trade of Java was, and most probably still is, hampered by restrictive import and export duties; the revenue from these sources in 1840 amounted to 633,178*l.*

The colonial revenue of Java is involved in great obscurity. It is said that but half the duties imposed on goods imported by British and other foreign ships are paid by Dutch vessels, and that the ships of the Dutch East India Company (Maatschappij) pay no duty. The chief source of the revenue is the land-tax. Among the Javanese the proprietary right of the soil was vested in the sovereign, to whom the Dutch East India Company has succeeded. The land is lent or given in trust, not alienated to the subject. One-half the produce of wet lands and about one-third of the produce of dry lands, after deducting the cost of reaping, are the established shares of the government. There is a direct tax on the fisheries. Extensive tracts of marsh-land along the sea-shore, and small inlets of the sea, are formed into inclosures for breeding fish. The proprietary right in these preserves is claimed by the government, which derives a large revenue from them. Revenue is also raised on articles of consumption, and the

roads and rivers are infested with transit duties. The public revenue in all its departments is farmed chiefly by Chinese: the revenue farms are disposed of by public sale. The Dutch have assumed the right of levying the revenues even in the few states that still maintain a show of independence; but notwithstanding this all-grasping policy the colonial government has been in financial difficulties and in debt ever since 1825. The causes of these embarrassments are said to be an imprudent craving on the part of the colonial government to be traders as well as rulers, the loss of cargoes by sea, the occasional failure of crops and fatal diseases among the native population, the expense of maintaining a colonial marine, and the erection of military works. For as might be expected from the system just sketched, the Dutch have been unpopular among their subjects: insurrections of the natives have often taken place and been put down by force, but expensive military and naval forces have still to be maintained, the people being too numerous to be kept in subjection by any trifling demonstration. Under a generous system of policy which put down monopolies, abolished restrictions on trade, and gave the peasant some right in the soil he tilled, it is beyond question that an island like Java, teeming with fertility, would yield a great surplus over the expenditure and enrich its cultivators: as it is, a pernicious system, established to enrich a corporation of individuals, oppresses with its galling load the large native population, and weighs heavily also on the resources of the mother-country. All duties and taxes are paid into the colonial treasury, but except the import and export duties nothing is published, as far as we can find, regarding either their amount or disposal.

History.—Java was subject to Hindoo princes till 1478, when the island was conquered by the Mohammedan Arabs. The Portuguese reached Java in 1511, and soon after began to form small settlements. The Dutch established themselves at Bantam in 1595, and in 1602 the English erected a factory at the same place, which was the first possession of the English in the East Indies. But the English as well as the Portuguese were soon obliged to give way to the Dutch, who built the town of Batavia, and by degrees enlarged their dominion, until they succeeded, about the middle of the last century, in dividing the empire of the Susuhunan into two parts and appropriating the greater portion of it to themselves. This system of gradual encroachment has been continued, so that the Dutch now actually possess the sovereignty of the whole island. When Holland was united to the empire of Bonaparte, the British took possession of the island in 1811, but restored it to the Dutch after the fall of Bonaparte in 1816.

JAVA, LITTLE. [BALL.]

JAXT, LA. [ALFES, BASSER.]

JAXT, or IAXT, one of the four circles into which the kingdom of Würtemberg is divided, is bounded N.W. by Baden, N. and E. by Bavaria, S. by the circle of the Danube, and W. by the circle of the Neckar. Its greatest length from the point where the Tauber enters Baden on the north-west to the Brenze, a small feeder of the Danube in the south-eastern angle of the circle, is 74 miles. Its greatest breadth is 44 miles; but the most northern part of the province is in parts not more than 20 miles broad. The area is stated to be 1974 square miles, and the population, according to the census of Dec. 3, 1852, amounted to 374,193.

The southern and south-western part of the circle is covered with offsets of the Raube-Alb, or Suabian Alps, which here form the watershed between the Danube and the Rhine. The rest of the circle is pretty level. Only a small portion of the circle belongs to the basin of the Danube, small feeders of which, the Eger, the Egge, and the Brenze, drain the south-eastern districts. The principal rivers on the Rhine slope are—the Tauber, a feeder of the Mayn, and the Jaxt, the Koher, and the Rems, feeders of the Neckar.

The *Tauber* rises near the eastern boundary, and runs first towards the south-east into Bavaria, where, being met by a branch of the Steigerwald, it turns northward, passing Rothenburg, below which, turning more to the west, it flows near the boundary, sometimes in Würtemberg, sometimes in Bavaria, until it leaves the former kingdom at the most north-western point of the circle of Jaxt. It then enters the grand-duchy of Baden, through which its course is generally towards the north-west to its junction with the Mayn below Wertheim. Its whole length is about 70 miles.

The *Jaxt*, from which the circle is named, rises east of Ellwangen, and sweeping round first to northward and then to the north-west it reaches the Baden frontier at Krautheim; thence it runs with a very winding course, partly in Baden partly in Würtemberg, to its mouth in the Neckar opposite Wimpfen. The length of the Jaxt is about 90 miles.

The *Koher* rises in the Raube-Alb, a little south of the village of Aalen, and runs north-north-west past Hall to Kunselsau, where it turns west, and enters the circle of the Neckar, and joins the river Neckar about five miles below Heilbron, and about a mile above the mouth of the Jaxt. Its whole length is about 70 miles.

The *Rems* rises near the source of the Koher, and flows in a general western direction through a valley celebrated for beautiful scenery past Gmünd and Schorndorf, below which it leaves the circle of Jaxt

and enters that of Neckar, where it passes Waiblingen, and joins the Neckar on the right bank near Ludwigsburg, after a course of about 50 miles.

None of these rivers is navigable; but some of them are available for floating timber from the mountain forests.

The soil, in parts sandy and stony in others, consists chiefly of a fertile loam, and is generally well cultivated. The chief crops are the common cereals, hemp, flax, colza, and other oleaginous plants, together with wine, the best sorts of which are produced in the valleys of the Tauber, the Jaxt, and the Koher. Cattle, sheep, and pigs are numerous; poultry, fish, game, and honey are plentiful. The hills in the east of the circle, and the ridges that separate the river valleys in the south and west, are clothed with forest timber, or with good pastures. The highlands of the circle are composed of calcareous rocks which in many places contain caverns and grottoes; the muschelkalk rock is very prevalent, and contains rich brine-springs, the most productive of which are found in the district between the Koher and the Jaxt, a short distance above their mouths, in the neighbourhood of Hall, and at Weissbach, a village near Kunselsau. The muschelkalk is bored sometimes to the depth of 600 feet, and the brine is raised by hydraulic machinery into the evaporating houses. Iron-mines are worked in the south-east of the circle on both slopes of the Raube-Alb. The ores are smelted and manufactured into bars, &c., in the furnaces and foundries of Königsbrunn and Heidenheim in the valley of the Brenze, and of Wasseraffingen, on the Koher, between Aalen and Ellwangen. Other mineral products are—marble, gypsum, alum, potters'-earth, and porcelain-clay. Linen, various articles of utility or ornament in wood, leather, paper, &c., are among the industrial products. The chief exports are—cattle, corn, salt, iron and ironmongery, wool, and timber.

The circle is traversed by numerous common roads, but there is neither a railroad nor a navigable stream within its limits.

Among the towns the following are noticed as they give names to the 14 bailiwicks into which the circle of Jaxt is divided:—*Aalen*, on the right bank of the Koher, 9 miles S. from Ellwangen, stands in the iron district. It is surrounded by walls flanked with high towers, and pierced by two gates: the inhabitants number about 3000. *Craibheim*, a small place with a castle, a gunpowder factory, and only 800 inhabitants, stands on the right bank of the Jaxt, 13 miles N. from Ellwangen. *Ellwangen*, the chief town of the circle, is situated between two hills, on the right bank of the Jaxt, 44 miles E.N.E. from Stuttgart, and has about 8000 inhabitants. It is the residence of the governor and other administrative officers of the circle, and the seat of a superior court. One of the hills above it is crowned by a castle, the other with the church of Our Lady of Lorette. The town is well built; the gothic cathedral and the former church of the Jesuits, now occupied by the Lutherans, are the most noteworthy buildings. There are a gymnasium, an hospital, and several breweries in the town. The Catholic gymnasium, established in Ellwangen in 1813, has been united to the university of Tübingen since 1817. Ellwangen is famous for its horse-fairs. It was formerly the seat of a celebrated priory, which was founded about A.D. 764, and secularised with the consent of the Pope in 1460. The property belonging to the priory extended over 120 square miles; it conferred the title of Prince Prior on its possessors. It was seized by Würtemberg in 1796. The last prior, who was a Saxon prince, died in 1812. *Gaidorf*, a small town on the Koher, 14 miles W. by N. from Ellwangen, has two castles, vitriol- and alum-works, and about 1500 inhabitants. *Gerabronn*, a mere village, with a brine-spring and about 600 inhabitants: near it is *Kirchberg*, with 1600 inhabitants, and a castle, the seat of a branch of the Hohenlohe family. *Gmünd*, 18 miles S.W. from Ellwangen, on the left bank of the Rems, is an old town surrounded by turreted walls, and has about 6000 inhabitants. It is a place of considerable extent for its population. The streets are wide. The town possesses 8 churches, a handsome town-house, an hospital, a normal school, an institution for deaf-mutes, and an orphan asylum. The industrial products of the town are—jewellery, broadcloth, and cotton-hosiery. The valley of the Rems is very beautiful and well cultivated about Gmünd. *Hall*, a picturesque old town famous for its salt-works, is situated 20 miles N.W. from Ellwangen, on the right bank of the Koher, and has 6300 inhabitants. It is surrounded by a wet ditch and a thick wall flanked with towers. The most remarkable buildings are the town-hall, the fine gothic church of St. Michael (which contains a representation of the entombment of Christ beautifully carved in wood), and the gymnasium; there are five other churches, an hospital, and two public libraries in the town. The industrial products comprise woollen and cotton stuffs, sugar, starch, &c. The town is sometimes called the Suabian Hall, to distinguish it from other towns of the same name. *Heidenheim*, on the southern slope of the Raube-Alb, has a population of 2500. *Kunselsau*, N.W. of Ellwangen, on the Koher, has two castles and 2800 inhabitants. *Mergentheim*, a walled and well-built town of 2500 inhabitants, stands on the left bank of the Tauber, 42 miles N.N.W. from Ellwangen. It has an old palace, a gymnasium, a library, and some manufactures of hosiery and clock-work. *Neresheim*, in the south-east of the circle, on the Egge: population, 1100. *Oehriegen*, 32 miles N.W. from Ellwangen, near the Oehr, a feeder of the Koher, has a fine castle belonging to a prince of Hohenlohe, two churches, an hospital, a lyceum,

a normal school, and 3200 inhabitants, who manufacture carpets and cotton-stuffs, and trade in corn and cattle. *Schorndorf*, on the Rems, a few miles below Gmünd, is a walled town with an old castle and 3800 inhabitants, who manufacture tobacco and carpets. *Welzheim*, a small place of 1700 inhabitants in the south-west of the circle, has an important corn-market.

The greater part of the possessions of the princes of the house of Hohenlohe is situated in the centre and north of the circle of Jaxt.

JEAN-D'ANGELY, ST. [CHARENTE-INFÉRIEURE.]

JEAN-DU-GARD. [GARD.]

JEDBURGH, Roxburghshire, a market-town, royal and parliamentary burgh, and the chief town of the county, is situated in the parish of Jedburgh, in a narrow valley on the left bank of the river Jed, in 55° 28' N. lat., 2° 36' W. long., distant 51 miles S.E. by S. from Edinburgh by road. The population of the municipal burgh of Jedburgh was 2948 in 1851, that of the parliamentary burgh was 3615. The burgh is governed by a provost and 14 councillors, and conjointly with Haddington, North Berwick, Dunbar, and Lauder, returns one member to the Imperial Parliament.

Jedburgh parish was celebrated in ancient times for its woodland fastnesses, its castles and fortified dwellings, and the magnificence of its ecclesiastical establishments. On the south side of the present town are the remains of Jedburgh Abbey, which appears to have been founded early in the 12th century. It suffered much during the wars with the English; was pillaged and burned by the Earl of Surrey at the storming of Jedburgh in 1523, and again injured by the Earl of Hertford (afterwards Duke of Somerset) in 1545. The church alone remains: it is 230 feet long. The choir is much dilapidated, and the south transept has disappeared; but the nave, north transept, and central tower, 100 feet high, are in good preservation. The western part of the nave has been fitted up, and is used as the parish church. Some repairs have been recently made with a view to preserve what remains of this interesting structure. On the south side of the choir is a chapel, formerly used for the grammar-school. The United Presbyterians have three chapels, and the Free Church, the Episcopalians, and the Independents have each one chapel in the town. The mechanics institution had 169 members in 1851, and 900 volumes in its library. There is also a savings bank.

Jedburgh is said to have been a royal burgh as early as the reign of David I. The town consists chiefly of several streets converging in the market-place, and of a small suburb on the right bank of the river. Three bridges cross the Jed. The principal streets are tolerably wide; the houses have generally an air of antiquity. In the outskirts are several pleasant villas and extensive orchards. The county-hall is near the market-place; and at the southern end of the town is the county prison, including a jail, bridewell, and debtors' prison, with a house for the governor.

The principal manufactures in Jedburgh are of blankets, flannels, tartans, shawls, shepherd's plaidings, hosiery, lamb's-wool yarn, and carpets: there are an iron and a brass foundry, and a factory for patent printing-presses. Quarries of red and white sandstone are worked in the parish; and there are several corn-mills. The markets are on Tuesday and Saturday; the Tuesday market is a well-attended corn-market. There is a monthly cattle-market; four horse and cattle fairs are held in the year.

Jedburgh is the seat of the circuit Court of Justice, and of Justice of Peace, Sheriff, and Small Debt courts. Near the town is the castle of Ferniehurst, formerly the seat of the Kerr family, the ancestors of the Marquis of Lothian.

JEDDO, or YEDDO. [JAPAN.]

JEGUN. [GERS.]

JELLALABAD, Afghanistan, is situated in 34° 26' N. lat., 70° 36' E. long., in the valley of the Cabul River, on its right or southern bank, at a nearly equal distance from Cabul and Peshawur. Though the river begins to be navigated by rafts at this place, Jellalabad does not appear to be a commercial town. The ordinary population is between 2000 and 3000, but this is much increased in the winter season. The houses are low, and the streets narrow. The town was occupied by the British during the Afghan war, 1839-1842. General Sale held it under great disadvantages against Akbar Khan, who besieged the place with a large force in January 1842. At the conclusion of the war the British forces under General Pollock left Jellalabad in October 1842, first destroying its mud walls, and the fortifications which had been erected for its defence.

JEMMAPES. [HAINAUT.]

JENA, a town in the grand duchy of Saxe-Weimar, is situated in a romantic valley, partly surrounded by steep naked mountains, at the conflux of the Leutra with the Saale, over which there is a stone bridge of nine arches, in 50° 56' N. lat., 11° 37' E. long. It consists of the town, through which the Leutra flows, and several well-built suburbs. The town is also well built on a regular plan, and surrounded by ramparts. Jena is celebrated for its university, which was founded in 1558, and has faculties of Protestant theology, law, medicine, and philosophy, taught by 61 professors and teachers: the number of students in 1850 was 421. The university has a library containing 100,000 volumes; and there are in connection with it a botanic garden, a veterinary school, a school of midwifery, an anatomical theatre, a clinical institution, a collection of physical and mathe-

tical instruments, a cabinet of minerals, an observatory, &c. The principal edifices in Jena, besides the university buildings, are a ducal palace, a Roman Catholic church, three Lutheran churches, three hospitals, and a lunatic asylum. The population numbers about 6500. The industrial products comprise coarse linen, hats, tobacco-pipes, &c. The town is the seat of a court of appeal for the Saxon duchies. Jena has given name to the disastrous battle fought in its vicinity on the 14th of October, 1806, between the Prussian army under the Duke of Brunswick, and the French under Napoleon. The Prussians were totally defeated, and the duke mortally wounded. This victory effected the complete subjugation and humiliation of Prussia.

JENESEI, or YENESEI. [SIBERIA.]

JENI-BAZAR. [BOSNIA.]

JENISEISK, or YENESEISK. [SIBERIA.]

JERES (KERES) DE LOS CABALLEROS. [ESTREMADURA.]

JERICO. [SYRIA.]

JERM. [BADAKHSHAN.]

JERSEY, an island in the English Channel, about 18 miles S.E. from Guernsey; between 49° 9' and 49° 16' N. lat., 1° 58' and 2° 14' W. long. Its form approximates to a quadrangle, having its sides facing the cardinal points. Its greatest length from east to west is about 12 miles; its greatest breadth from north to south about 7 miles. The area of the island is about 40,000 acres. Its population in 1831 was 36,582; in 1841 it was 47,544; in 1851 it was 57,020.

The surface of the island has a gradual slope from north to south. On the north side the coast is abrupt, rising to the height sometimes of 200 feet, broken by a succession of small bays and coves. On the north side of the island is a very picturesque bay called Boulay, where, some years since, the States of the island of Jersey erected a pier on a limited scale. At St. Catherine's Bay, on the east side of the island, a harbour of refuge, commenced in 1847, is in process of construction. The works are extensive, including two piers and a breakwater. On the west side is the wide shallow bay of St. Ouen, with a shelving sandy beach, skirted in nearly all its extent by ledges of rocks. On the south side of the island the character of the coast is less uniform: at the bottom of the deep bays of St. Aubin and St. Brelade it is low and shelving, with a broad belt of sand nearly a mile wide in St. Aubin's Bay, and dry at low water. St. Helier Bay, on which stand the towns of St. Helier and St. Aubin, is the most frequented; but most of the bays afford anchorage. Groups of rocks surround the island at various distances from it.

The surface of the island is everywhere undulating. The valleys generally run from north to south; they are narrow at the north end, where the high ground forms an almost unbroken hill, and grow wider as they approach the southern coast, where they expand into several flats of good pasture land. At the base of the cliffs are numerous caverns, hollowed out by the beating of the sea and the rapid flow of the tide; they run a considerable depth into the rocks. The principal water courses flow from north to south. The valleys watered by these streams are often very lovely.

The high land in the northern part of the island consists for the most part of granite rocks; the southern part of a mass of schistose rocks incumbent upon them. The rocks along the northern coast consist for the most part of sienite; they present perpendicular faces to the sea, and are frequently intersected by perpendicular veins running north and south. The sienite is quarried on the northern coast: part is used on the island, part is exported to Guernsey and England, and also to France. Roads which are wide, and well constructed, traverse the island in all directions. The large hedges and deep fences formerly so common are fast disappearing, and giving place to neatly dressed banks and low walls.

The climate of Jersey, from its insular situation, is milder than that of other places under the same latitude, and the mean annual temperature is higher than that of any part of England. The temperature varies from 76° to 24°, mean temperature 52.5°. Snow and continued frost are rare, but there is a good deal of rain, and the dews are very heavy. High winds are prevalent and violent; gales frequently blow, especially from the west. The predominant diseases are rheumatism, chiefly chronic, indigestion, dropsy, and remittent and intermittent fevers.

The state of agriculture in Jersey has greatly improved, and is now good, though the minute subdivision of property, arising from the custom of gavelkind, has somewhat retarded its advancement. Wheat is the principal grain crop; barley is grown, and some oats; parsnips are extensively grown, and used for fattening hogs and bullocks. Potatoes for exportation are widely cultivated. Lucerne is one of the most valued crops. A considerable portion of the land is laid out in orchards: cider constituting the most important produce of the island. The principal manure is *vraic*, or sea-weed, either fresh or after it has been burnt for fuel. Fallows are seldom seen. The wheat harvest commences about the beginning of August. The common English fruits are raised in Jersey, and the melon and the grape grow in the open air. The fine Charmontel pears grow to great perfection in Jersey; they ripen late in the autumn, keep well all the winter, and are remarkably sweet, and of delicate flavour; they weigh from half a pound to one pound and a quarter. Great benefit has been conferred on the island by the Horticultural and Agricultural Society, which was established in 1836.

The dairy is an object of great attention in Jersey. The breed of cows is a variety of that known in England as the Alderney. Large quantities of butter are exported. A few sheep are kept by persons in humble circumstances who have right of common. The horses are small but hardy. The annual races and the prizes given for island bred horses, have induced attention to the breeding of cart, riding, and carriage horses.

Game is nearly extinct, a few rabbits and hares, with an occasional covey of red-legged partridges, being all that remain as indigenous to the soil. During the winter flocks of wild fowl from the north, with a few snipes and woodcocks from the French coast, make their appearance. La Chasse (the shooting season) commences on the 1st of October, and terminates on the 1st of February.

Jersey is divided into 12 parishes, the names of which, with their respective populations in 1851, we subjoin:—St. Clement, population 1553, St. Saviour, 3404, and St. Helier, 29,133 (with 511 military in barracks), to the east and south-east of St. Helier Bay; with St. Laurens, 2306, St. Peter, 2497, and St. Brelade, 2468, to the north-west, all terminating in the same bay; St. Ouen, 2458, to the west; St. Mary, 1086, St. John, 1021, and Trinity, 2610, to the north; St. Martin, 3711, and Grouville, 3262 (including 619 sailors on board the oyster fleet in Gorey harbour), to the east. All the parishes run from the interior to the coasts, except St. Clement and Grouville, which run nearly parallel to the coast. The parishes are subdivided into 'vingteines' ('scores'), supposed to be so called from having originally contained 20 houses. Of these vingteines there are from two to six in each parish, and in all 52. In the island there were 57 places of worship in 1851, of which 20 belonged to the Church of England, 24 to three sections of Methodists, 5 to Independents, 2 to Roman Catholics, and 1 to the Free Church of Scotland. The total number of sittings provided was 25,192. There were 42 Sunday schools with 2242 scholars, of which 16 schools belonged to the Church of England, 13 to Methodists, 10 to French Wesleyan Methodists, 2 to Independents, and 1 to French Independents. The number of day schools was 99, of which 14 were public schools with 1990 scholars, and 85 private schools with 2938 scholars.

There are three towns in the island, St. Helier and St. Aubin, both on the bay of St. Helier, and Gorey, on the east coast.

St. Helier is situated at the end of a low valley running down to the sea, at the south-east end of St. Helier Bay: the population of the town and parish in 1851 was 29,133. The streets in the lower or old portion of the town are narrow, but are generally well paved. St. Helier is perhaps superior in appearance to most English towns of the same size. It has usually a garrison of from 600 to 800 soldiers, with two permanent fortifications, and a military governor constantly resident. It is also the residence of many retired military and naval officers. The parish church, built in the beginning of the 14th century, is situated at the bottom of the town, near the old harbour. There are also several proprietary and district churches, namely, St. Paul, in the centre of the town; St. James, in the east; All Saints, on the parade at the west end; St. Mark, at the upper or north end of the town; and St. Luke, in the south-east or lower part of the town. There are several chapels for Wesleyan Methodists and other Dissenters, both French and English, and two Roman Catholic chapels. The theatre is a neat edifice, with a light portico; the court-house, situated in the Royal Square, an open-flagged space in the lower part of the town, is a plain structure, too small for the business furnished by the increased numbers of the population. The courts held in it are presided over by the bailiff, assisted by two or more of the jurats, or elected civil magistrates. The States of the island also hold their meetings in the same house. In Royal Square are reading-rooms, and a gallery of art. The market-place is a large and well-constructed flagged area in the centre of the town. The market days are Wednesday and Saturday.

Fort Regent, the principal fortification, at the south side of the town, commands the coast and the adjoining country. It is an irregular fort with outworks and flanking defences, and is remarkably strong; it was finished in 1812, and is said to have cost 1,000,000*l.* Elizabeth Castle, another fortification, is built on a ledge of rocks about a mile distant from the shore, to which it is accessible at low water by a bridge, or naturally formed causeway, consisting of shingle and sand. It is defended by bastions and curtains, with heavy guns on the lower or sea faces; and with ramps and revetments on the upper bastions, defended by caronades and long guns. It is capable of containing 600 men. Within the last ten years the town of St. Helier has nearly doubled its area. In the neighbourhood are numerous dwelling houses, with neatly laid-out grounds and gardens, the residences of the merchants and island visitors. The British residents amount to upwards of 5000, the greater number of whom reside in St. Helier and the adjoining parish of St. Saviour. The labourers are principally English, with some Scotch and French, and, since the commencement of the harbour of refuge, and other works, a large proportion of Irish. The harbour is very extensive; it consists of the inner or old harbour and the outer or new harbour. The outer harbour, commenced in 1841 and completed in 1846, is called Victoria Pier, the Queen having landed at it when she visited Jersey on the 2nd and 3rd of September, 1846. The western arm of the new harbour is near three quarters of a mile in length, with a broad and commodious quay, and

GEOG. DIV. VOL. III.

a raised promenade, with landing steps, and a very broad slip at the southern end, where boats can easily land their passengers at all times of the tide when there is water within the harbour. The new North Pier is very commodious. The whole of the expense attending these works is defrayed by means of a duty levied on wines and spirits. St. Helier has regular stands of coaches, as in the large towns in England, which ply for very moderate fares; there are also omnibuses, which run to different parts of the island.

St. Aubin, in the parish of St. Brelade, situated at the western end of St. Helier Bay, is but thinly inhabited. The harbour is small but convenient. The little town has a very picturesque appearance; and the prospect from the adjoining height, called Noirmont, is very fine and extensive. St. Aubin has a pier, and is protected by a battery, known as St. Aubin's Castle. There are a chapel of ease, a Wesleyan Methodist, and an Independent chapel. In the town is a market-place.

Gorey, is in the parish of St. Martin, although hitherto returned with Grouville parish. It is situated on Grouville Bay, and is built partly close to the sea and partly on the height which rises towards Mont Orgueil Castle. The importance of Gorey depends on its oyster fishery. The larger oysters are sent to St. Helier for sale, the smaller are sold and transported to the English oyster-beds. In the neighbourhood of Gorey is Mont Orgueil Castle, once the principal fortress of the island. It stands on a head-land between St. Catherine and Grouville bays, and is a picturesque and striking object. It was the place of confinement of Prynne, and the residence of Charles II. during part of his exile.

Of the villages in the island may be named Beaumont in St. Peter's parish, Conuerie in St. Brelade's, Georgetown, a suburb of St. Helier, La Croiserie in Trinity parish, Le Bourg in St. Clement's parish, and Millbrook in the parish of St. Laurens.

Jersey contains several primeval antiquities, chiefly stone circles and cromlechs similar to those noticed in our account of GUERNSEY. Scattered over the island are the ancient manor-houses, and there are numerous modern villas, especially near the towns. Every house and cottage, not in a street, has its garden. Myrtles, hydrangeas, and various other plants, which in England commonly require shelter, grow luxuriantly in the open air.

Much of what has been said of the state of society and the constitution of the local government in GUERNSEY will apply to Jersey. The spirit of independence is very generally diffused; industry, the love of gain, and frugality are characteristics of the island character. Bacon is very generally used by labourers at their principal meal. With the liquor in which the bacon is boiled is made a soup peculiar to Jersey, adding to it some vegetable, usually cabbage, turnip, parsnip, or potato. The people are generally healthy, and many live to a great age.

The States of Jersey consist of the governor and the bailly of the royal court, both appointed by the crown: the 12 judges or 'jurats' of the royal court (the court of judicature for the island in civil and criminal cases), elected to office for life by the suffrage of the rate-payers; the rectors of the parishes, appointed to their livings by the governor; and the 12 constables elected every three years, one for each parish, by the inhabitants. The officers of the crown have seats, and can speak, but not vote. The 'viconte,' or high sheriff, and the two 'denonciateurs,' or under sheriffs, occupy seats in the assembly as its officers.

The dean of Jersey, who is appointed by the crown and is always rector of one of the 12 parishes, is at the head of the church of the island, and holds a spiritual court, from which there is an appeal to the see of Winchester. The livings are generally small (the great tithes going to the crown), and there are no pluralities. Some addition was made a few years since to some of the poorest of the livings by the ecclesiastical commissioners. There are two ancient chartered schools, those of St. Anastase, and St. Manelier. St. Manelier's, founded in 1497, has an income from endowment of about 100*l.* a year, and had 40 scholars in 1851. Victoria College, St. Heliers, founded in 1852, had 130 scholars in 1853. The foundation-stone of the building was laid on her Majesty's 30th birthday, May 24th, 1849. The cost of its erection (8000*l.*), has been defrayed from the proceeds of the duty on wines and spirits. The island hospital, or poor-house, is a large and handsome building, situated near the western extremity of the town; in it are placed the aged who are destitute, a great number of sick persons, and a large number of children, orphans, or foundlings. A good school for the children is attached to the hospital; a shoemaker's and tailor's shop is in the building; in a chapel adjoining week-day and Sunday services are held. The number of inmates in 1851 was 426.

There are several newspapers published in the island, some in French and others in English; they are for the most part devoted to the interests of the island; the English papers report more fully than those in French political matters connected with England.

The trade of Jersey, owing to the privileges possessed by the islanders, is very considerable. The agricultural produce of the island, potatoes, apples, cider, butter, cows, and other live stock, are sent to England; the articles required for the consumption of the island being in a considerable degree supplied from France.

The shipping returns furnished to Parliament give the figures for the Channel Islands without distinguishing the proportions belonging to each island. More than half of the ships and tonnage returned for

the Channel Islands may be considered as belonging to Jersey. The number and tonnage of vessels entered as belonging to the Channel Islands on December 31st, 1853, were as follows:—Sailing-vessels under 50 tons, 207, tonnage 5445; above 50 tons, 286, tonnage 43,743; with 1 steam-vessel of 21 tons, and 4 of 271 tons aggregate burden. The number and tonnage of vessels entered and cleared during 1853 in the colonial and foreign trade, were:—Sailing-vessels, inwards 1285, tonnage 62,993; outwards 1365, tonnage 63,031; steam-vessels, inwards 83, tonnage 9045; outwards 102, tonnage 10,705.

The general history of the Channel Islands has been noticed elsewhere. [GUERNSEY.] Jersey was the *Cæsarea* of the Romans. In the reign of Edward III. this island was unsuccessfully attacked by Du Guesclin, constable of France. In the war of the Roses it was attacked by a Norman baron, Pierre de Breze, who, after holding part of the island for a time, was forced to surrender. Henry VII., while Earl of Richmond and an exile; and Charles II., while an exile, both before and after his father's death, found refuge in Jersey, which was held for Charles by Sir George Carteret, until taken by the Parliamentarians under Admiral Blake and General Haines. During the first American war, Jersey was thrice attacked. The third attack was in December, 1780, when the Baron de Rullecourt landed with 700 men, took possession of St. Helier, made the lieutenant-governor, Major Corbet, prisoner, and induced him to sign a capitulation. The British troops and island militia, under Major Pierson, next in command, refused to recognise the capitulation; and attacking the French, killed Rullecourt, with the greater part of his men, and obliged the rest to surrender. Major Pierson fell in the beginning of the attack.

The island possesses a well organised and well drilled body of militia, divided into six regiments, for the defence of the island. They are called the North, East, North-West, South-West, St. Helier, and St. Laurens battalions. Each of these battalions has from four to eight companies, with competent officers; they are clothed at the expense of the crown, but receive no pay. Field batteries are attached to each regiment. All persons, between the ages of 16 and 60, are liable to serve in the Jersey militia, but those who do not wish to serve are excused on payment of one pound annually, which is appropriated to the maintenance of the horses used in the batteries.

(Communication from Jersey; Parliamentary Papers.)

JERSEY, NEW. [NEW JERSEY.]

JERUSALEM, the ancient capital of the Holy Land, the centre of the ancient Jewish religion and polity, is situated in 31° 46' 43" N. lat., 35° 13' E. long., at an elevation of 2000 feet above the level of the Mediterranean, 29 miles E. from the nearest point of the shore of that sea, and 21 miles W. from the mouth of the Jordan in the Dead Sea. It is identical with *Salem*, the city of Melchizedek, which appears in the latter half of the name; the first half is most probably a corruption of *Jebus*, a name which the city, or part of it, bore for nearly five centuries after the entrance of the Israelites into the Promised Land. As the city stood at the junction of the territories of the Amorites, the Jebusites, and the Hittites, it is highly probable (and the Egyptian monuments strongly confirm this supposition) that it was inhabited in pre-Israelitish times by all three in common, the ascendancy resting in the Amorites and the Jebusites successively. It is supposed also that there were originally two towns or strongholds corresponding to the upper and lower cities of after times, the upper city being identical with the Canaanitish *Jebus*, the stronghold of the Jebusites, who obtained the ascendancy on the extinction of the power of the Amorites in the person of Adonizedek. According to Josephus (*Antiq. v.*) the Israelites occupied the lower city for a time, but were expelled by the garrison of the upper city, which was held uninterruptedly by the Jebusites from about B.C. 1585 to B.C. 1049. About this latter date David drove the Jebusites from their stronghold, inclosed the upper and lower towns within one wall, and made the city thus formed the capital of his kingdom. The name *Jebusalem* thus naturally originating would be changed for the sake of euphony into Jerusalem; or it might be that the change was made in order to avoid a name of evil omen (which all ancient nations seem to have dreaded), *Jebusalem* in Hebrew meaning a 'trampling down of peace,' whereas Jerusalem signifies the 'abode of peace.' It is no objection to the derivation just given that the name Jerusalem occurs in the Scripture narrative before the time of David: it is not the only name that is used in the Old Testament by anticipation. The Rabbis, who are followed by Lightfoot and others, derive the first part of the name from *Jireh* in *Jehovah-jireh*, the title given by Abraham to Mount Moriah (*Gen. xxii.*).

From the name and office of Melchizedek ('righteous king') and Adonizedek ('righteous lord') the city seems to have been in Canaanitish times a religious as well as a political centre. The most ancient name of the city, discovered on the Egyptian monuments of Sethos and Sesostris favours this view. These monuments (as explained in Mr. Osburn's 'Egypt, her Testimony to the Truth') represent in succession the siege of a city, then a fortress of the Amorites, by Sethos II.; a joint embassy of Jebusites and Hittites to Sesostris entreating that king for aid against the Ammonites then laying siege to the city; the advance of the Egyptian army, and a great battle on a hill to the south of the city. From the pictorial representation of the site of the city showing its surrounding valleys and its river (Kedron) running into the north part of the Dead Sea, there can be no question

that the city thus indicated occupied the site of Jerusalem. The name of the city is written in hieroglyphs on one of the towers, and when translated into Coptic gives *Chadash*, in Hebrew *Kadash* or *Kadesh* 'the Holy.' The Syrian city of *Kadytis* in Palestine, described by Herodotus (*iii. 5*) as not much smaller than Sardis, and which he states (*ii. 159*) was taken by Pharaoh-Necho after his victory at Magdolum (an evident corruption of Megiddo), can be no other than Kadesh. This ancient name survived in the Syrian *Kadatha*, and still survives in the Arabic *El-Khuds* or *El-Kods*, all signifying the Holy (city), showing the wonderful tenacity with which these ancient races adhere to native names.

The Greek form of Jerusalem was *Hiero-solyma*, the first half of which means 'holy' but this is probably a mere accident, as in sound it is as near as possible an exact equivalent of the first half of the Hebrew name. The name *Sion* sometimes given to the city is merely an extension of a part to the whole. The name *Abia Capitolina* given to it after it was rebuilt and colonised by Hadrian never took hold on the native population, and was probably used only on coins and in state papers. Among the native races the city is now known only by the designation *El-Kods*.

The site of Jerusalem is an elevated piece of ground within a basin of inclosing hills. The separation between this spot and the outward borders of its inclosure is well marked by ravines and valleys, except towards the north. The inclosed platform extends about 1800 yards from north to south, and (in the widest part) 1100 yards from east to west: it has a general slope from west to east, so that the town is fully displayed, like a panorama, to those who view it from the east. The surface is uneven. The south-western part of the site is occupied by Mount Sion, on which stood the stronghold of the Jebusites. To the north-east of this, but separated from it by a ravine or valley called by Josephus Tyropoieon (or Cheese-makers), is Mount Acra, the site of the Lower City, or Salem; and east of this lies Mount Moriah, the site of the Temple, from which a spur called Ophel, or Ophla, extends to the southern wall, between the Tyropoieon and the Valley of Jehoshaphat. The Valley of Tyropoieon, though distinctly traceable, is now shallow, having been nearly filled up in the long course of ages. In the north and north-west of the city was the hill Bezetha, or New City, which was built upon as the population of the city increased, and was included in the wall of Agrippa; but a very small portion of it is included in the modern city, and it rises high above the deep external ravine which it overlooks. The other eminences of the platform, such as Mount Moriah (on which the Temple stood), and Mount Acra, are now scarcely distinguishable as elevations, from the filling up of the interjacent valleys. Except at Mount Sion the general level of the site is below that of the immediately surrounding country.

On the west and south of the site is the Valley of Hinnom; on the east the Valley of Jehoshaphat. The Valley of Hinnom originates in a depression containing an ancient pool, about 500 yards westward of the north-western angle of the modern wall; it thence runs south and east along the western and southern sides of Mount Sion, to the east of which the Tyropoieon opens into it. About 800 yards from the upper pool is another and a larger pond called the Lower Pool; and to the south of the valley, nearly opposite Mount Sion, is a high rocky hill called the Hill of Evil Council, from the tradition that Annas, father-in-law to Caiaphas the high-priest, had a residence upon it. (*St. John, xviii. 13, 14, 24.*) A little below some ruins on the hill is the Potters' Field, the white clay of which is still worked.

On the north-west side of the city is a broad swell of land extending in a north-east direction for about 1500 yards, between the upper pool of the Valley of Hinnom and the Tombs of the Kings, which are situated at the head of the Valley of Jehoshaphat. This valley then commences at the extreme north of the Wall of Agrippa, more than 800 yards beyond the precincts of the modern city, and runs first to the east, and then turning abruptly south it skirts the eastern wall and meets the Valley of Hinnom at the south-eastern angle of the city. From this junction a valley runs south-eastward to the Dead Sea. In ancient times the brook Kedron flowed through the Valley of Jehoshaphat. In this valley are many ancient tombs, among which may be mentioned those of Jehoshaphat, Absalom, and Zechariah. About the middle of its length, on the eastern side of the city, is the Garden of Gethsemane, with its venerable olive-trees; and near it is a subterranean church, which contains the reputed Tomb of the Virgin. Nearly opposite the Tomb of the Virgin, within the city, and about 300 yards from the north-eastern angle of the city wall, is the Pool of Bethesda. Lower down the valley is the Fountain of the Virgin; and a little to the west is the Pool of Siloam, near the junction of the Tyropoieon with the Valley of Hinnom. On the top of Mount Sion, about mid-way between the Pool of Siloam and the lower pool of the Valley of Hinnom (which is now called Birket-es-Sultan), is a mass of building supposed to be the tombs of David and the succeeding kings of Judah. The Pool of Siloam is now filled up and cultivated as a garden; a small tank however still fixes the site. On the eastern side of the Valley of Jehoshaphat is a group of hills called the Mount of Olives, on the highest point of which is built the church of the Ascension. On an eminence a little farther south are the tombs of the Prophets. South from Mount Olivet, and to the east of the junction of the three valleys, is the Mount of

Offence, on which Solomon erected altars for idolatrous worship; and in the southern valley, between the mounts of Offence and Evil Council, is a deep well, called the Well of Nehemiah, or Job, and supposed to be identical with Enrogel, or the Well of the Spies, situated on the border of Judah and Benjamin. (Josh. xv. 7.) There is scarcely any incident mentioned in Scripture, as connected with Jerusalem and its neighbourhood, of which the site is not pointed out.

"The houses," says Chateaubriand, "are massive squares, very low, without chimneys or windows; they terminate in flat terraces or in domes, and have all the appearance of prisons or sepulchres. The whole would present a perfect level to the eye, were it not for the belfries of the churches and the minarets of the mosques." The streets, narrow, unpaved, and gloomy, rise and fall with the inequalities of the site. In the dark vaulted bazaars are a few miserable shops.

The Moslems have appropriated the site of Solomon's Temple to their own worship. The renowned mosque built by the Khalif Omar is an octangular structure surmounted by a dome, and stands upon an elevated platform paved with polished marble. This is in the midst of a grand quadrangle called Haram-es-Sherif, or the Noble Sanctuary (1489 feet by 995 feet), which contains at its southern extremity another mosque, that of El-Aksa, which was originally a Christian church built by Justinian. The site of the ancient Acropolis, originally called Baris, but after its enlargement and embellishment by Herod the Great, Antonia, stood in the north-west angle of the Temple inclosure. It was at once a castle and a palace; a defence to the Temple, as the Temple was to the city itself. This building was the official residence of the Roman procurator of Judæa and his guards; and its site is now occupied by the Serayah, which comprises the official residence of the Turkish pasha who governs Jerusalem and the quarters of the garrison. But to the thousands of Christian pilgrims who yearly visit Jerusalem the great object of interest is the church that contains the sepulchre of Christ, to redeem which from infidel hands was the object of the Crusades. This church was one of the numerous foundations of the empress Helena. As a whole this extensive structure takes a prolonged oblong figure, with irregular extensions in particular parts for the sake of comprehending the various spots connected with the death and burial of Christ; for this church is not only supposed to contain the sepulchre, but the scene of the Crucifixion. Among other noteworthy objects are the monasteries of the several Catholic communities, the Greek convent of St. Constantine near the Holy Sepulchre, and the Armenian convent of St. James, on the highest point of Mount Sion; and the colleges or hospitals of the Moslems in the vicinity of the mosques. The other public buildings of Jerusalem are not of much importance.

Jerusalem is in shape an irregular square; it is surrounded by a high embattled wall, built of out-stone by the Sultan Suliman in 1542, and has four gates facing the cardinal points—the Jaffa Gate on the west, the Damascus Gate on the north, St. Stephen's or St. Mary's (Bab-Sitti-Miriam) Gate on the east, and Sion Gate on the south. A line drawn from the Damascus to the Sion Gate, and another drawn from the Jaffa Gate to the southern part of the Haram-es-Sherif, would divide the city into the four quarters by which it is usually distinguished. These are—the Christian quarter to the north-west; the Armenian quarter to the south-west; the Jewish quarter to the south-east; and the Moslem quarter, comprising all the rest of the city, west and north of the Temple inclosure. The city is about 2½ miles in circumference. The fixed population of the city has been variously estimated, some accounts stating it at 30,000, others at 10,000. About one-half of the population are Moslems, the other half are Christians and Jews in about equal numbers. The number of Christian pilgrims amounts to a few thousands.

Melchizedek, king of Salem, came forth to meet Abraham when he returned from the slaughter of the kings; and this Salem has been identified with Jerusalem, as before stated, and as demonstrated in an able article in the 'Christian Remembrancer' for October, 1849. When the Israelites entered Canaan they found the place in the occupation of the Jebusites. The lower city was taken and burnt by the children of Judah (Judges, i. 8); but the Jebusites had so strongly fortified themselves in the upper city, on Mount Zion, that they maintained themselves in possession of it till the time of David. That monarch expelled the Jebusites from Mount Zion, and made Jerusalem the metropolis of his kingdom, B.C. 1049. His son Solomon built the temple on Mount Moriah, and further embellished the city with palaces and public buildings. Jerusalem was sacked by the Philistines and Arabs in the reign of Jehoram, about B.C. 884, and subsequently by the Israelites about B.C. 808. When invested by the armies of Sennacherib, who encamped on the hill of Bezetha, afterwards the site of the new city, it was miraculously delivered B.C. 713. (2 Chron., xxii. 21.) From the carrying away of Manasseh to Babylon, it is probable that the Chaldeans captured Jerusalem about B.C. 650. It was taken by Pharaoh-Necho, king of Egypt, B.C. 600, after the battle of Megiddo, corrupted into Magdolom by Herodotus (ii. 159). The Egyptians held it two years; it then passed with the whole country under the sway of the Chaldeans, and Jehoiakim was carried away to Babylon. Restored, he tried to regain his independence, and lost his life. Three months after the accession of his son, Nebuchadnezzar again took the city (B.C. 598), and carried the king, royal family, and principal officers captives to Babylon. The revolt

of Zedekiah, appointed to the nominal dignity of king, brought Nebuchadnezzar a third time against the city, B.C. 587, when the Temple and all the buildings of Jerusalem were destroyed by fire, and the walls levelled to the ground. The first decree of Cyrus in favour of the Jews dates in B.C. 538; the decree contemplating the restoration of the Temple, which however was vexatiously delayed for about 120 years. The rebuilding of the city went on still more slowly, and it was not till B.C. 385 that the city and its walls were completely restored. The city came (B.C. 332) under the power of Alexander the Great, who, according to Josephus, visited Jerusalem after the capture of Gaza. After Alexander's death the city and the whole of Judæa fell successively under the Ptolemies of Egypt and the Seleucids of Syria, who conferred many favours on Jerusalem and the Jews. The city for a long period enjoyed peace and prosperity under these princes, until its internal dissensions subjected it to Antiochus Epiphanes, B.C. 175, through whose tyranny the Temple was stripped of its costly vessels, the city walls demolished, and an idol-altar erected in the Holy of Holies, whereon swine were offered in daily sacrifice. The Jews were massacred not only in Jerusalem but in many parts of Judæa, and the most strenuous measures were taken to extirpate the Jewish religion and to establish Greek paganism in its stead. An insurrection headed by Matathias and his five sons followed, and resulted in a national revolution which secured for the Jews a greater amount of independence than they had enjoyed since the captivity. This state of things continued under the Maccabees until the conquest of the country by the Romans with one short interval, about B.C. 135, when the city in the reign of John Hyrcanus was taken by Antiochus Sidetes, and the walls which had been restored by Judas Maccabeus were again demolished. Pompey captured Jerusalem B.C. 63, and levelled part of the fortifications. Crassus on his way to Parthia plundered the Temple, B.C. 54. The Parthians, who had been called in by Antigonus to aid him against Herod, son of Antipater, sacked Jerusalem B.C. 40. Herod, who had been appointed king by the senate, gained possession of his capital only after a long siege in which he was assisted by Roman soldiers. He built the fortress Antonia, which was so named in honour of his patron Mark Antony, and restored the Temple, but erected a theatre and circus, and instituted games in honour of the emperor, after the usual pagan fashion. On the death of Herod and the banishment of his son Archelaus, Judæa became a Roman province within the prefecture of Syria, and was governed by a subordinate officer called procurator, who however was invested with the power of life and death. Coponius was the first procurator, A.D. 7. Pontius Pilate, who was procurator (A.D. 26-36), and under whom the Jews crucified the Saviour of mankind on the hill of Calvary, which is now inclosed with the church of the Holy Sepulchre in the Christian quarter of the city, seized the sacred Corban, and constructed the aqueduct still existing, which crosses the valley of Hinnom on nine arches to the north of the Birket-es-Sultan, and conveys water from Etham, or the Pools of Solomon, two miles south of Bethlehem, to the great mosque. In A.D. 70 occurred the terrible siege and destruction of the city by the Roman army under Titus; the siege occupied 100,000 men from the 14th of April till the 8th of September, as the three walls, the fortress Antonia, and the Temple had to be taken in detail, so that the operation involved five distinct sieges. By force or fire the whole city was utterly demolished with the exception of the palace of Herod, which with its gardens occupied the north-western angle of Mount Sion, and the three adjacent towers of Hippicus, Phasaelus, and Mariamne, which stood on the northern wall of the upper city to the north of the palace. These buildings were spared to serve as barracks for a Roman legion which was left to crush any fresh insurrection of the Jews who soon returned to occupy the ruins. Sixty years after its destruction the site was visited by Hadrian (A.D. 130), who conceived the idea of rebuilding it; and this idea he carried out, though thwarted for some time by insurrectionary outbreaks. Palaces, a theatre, temples, and other public buildings required for a Roman population, were erected. A temple built to Jupiter Capitolinus occupied the once sacred inclosure on Mount Moriah, and over the site of the Holy Sepulchre rose a tetrastyle fane in honour of Venus. From the new city, which was styled *Ælia Capitolina*, part of Mount Sion was excluded as at present. Under Constantine the city, which had already been a place of pilgrimage for Christians, recovered its former name; and the empress Helena added new attractions to it by the erection of churches, and by the designation of other sacred sites. The church of the Holy Sepulchre was dedicated A.D. 336. The pagans again became interested in Jerusalem under the apostate Julian, who permitted the Jews to rebuild the temple: the defeat of their attempt is related by Ammianus Marcellinus (xxiii. 1.). The city was still further embellished with churches and hospitals by Justinian. In A.D. 614 the churches and all the sacred places of the city were desolated by the Persians under Chosroes and by the Jews, who to the number of 26,000 accompanied him from Galilee to gratify their hereditary hatred against the Christians, of whom they massacred 90,000 of all ages and of both sexes. The churches were soon after restored by Modestus. Heraclius visited Jerusalem in A.D. 629. In A.D. 634, after an investment of four months, the city capitulated to the Khalif Omar; and with the exception of a short interval, to be noticed presently, Jerusalem has since remained in the hands of the followers of Mohammed.

In 1076 the Khalif of Egypt lost Jerusalem, which then fell to the Turks, and the horrible cruelties practised by these new conquerors upon the Christians of the Holy Land, described in a letter to Pope Urban II. by Simeon, patriarch of Jerusalem, and more fully dwelt upon in the fiery harangues of Peter the Hermit, himself the bearer of the letter and an eye-witness of the sufferings of the Christians, led to the first Crusade, in which the flower of the chivalry of Europe took arms to rescue the Holy Places from the hands of the Infidels. An immense host, 700,000 strong, headed by Godefroi de Bouillon, laid siege to Nicæa, May 14, 1097: that city surrendered on the 20th of June following. On swept the host, conquering, but diminishing in numbers. June 3, 1098, Antioch fell by assault, and after having taken and garrisoned the principal towns of the coast and the interior, the siege of Jerusalem was opened June 7, 1099, with an effective force of only 21,000 infantry and 1500 cavalry; and at the end of thirty-nine days, on Wednesday the 15th of July, at three o'clock in the afternoon, they forced their way into the city, massacred the garrison and the inhabitants without distinction, and then—blood-stained, barefooted, shedding tears, and singing hymns—they prostrated themselves before the Holy Sepulchre, the object of their long labours and perils. Contrary to the advice of the bishops a king was chosen, and Jerusalem became the capital of a Christian kingdom.

We can here merely give the names and dates of the several kings. Godefroi de Bouillon, elected July 23, 1099; died July 18, 1100. Baudouin I., brother of Godefroi, reigned till April 1118. Baudouin II., a relation of the former king, and eldest son of Hugues, count of Rethel, was crowned on Easter Sunday, 1118; died August 21, 1131. He was succeeded by his son-in-law, Foulques, count of Anjou, who was crowned on the 14th of September 1131, and died in 1144. Baudouin III., son of Foulques, was crowned with his mother, Melisenda, on Christmas-day 1144, when he was only 13 years of age. He rebuilt and fortified Gaza, and took the city of Ascalon. Dying without issue, February 10, 1162, he was succeeded by his brother, Amauri I., who reigned till July 11, 1173. Baudouin IV., the Leper, son of Amauri, died March 16, 1186. Baudouin V., son of William of Montferat and Sibylla, sister of Baudouin IV., succeeded his uncle at the age of five years, under the regency of the Count of Tripoli, and died at St. Jean d'Acre within a year. Gui de Lusignan, second husband of Sibylla, the mother of the late king, was crowned king of Jerusalem in the middle of September 1186. In this reign the arms of Saladin prevailed against the Christians, who were defeated in a terrible battle, which lasted three days, near Tiberias, in 1187. Gui himself was taken prisoner, and Jerusalem again opened its gates to a Moslem conqueror, after fourteen days' siege, October 2, 1187. Antioch, Tyre, and Tripoli were the only considerable places left in the hands of the Christians, and the kingdom of Jerusalem may be said to have terminated; for notwithstanding the brilliant exploits of the third Crusade under Philippe Auguste and the English Cœur de Lion, the kings afterwards appointed—Conrad, 1192; Henri, 1192 (both appointed by Cœur de Lion); Amauri II., 1197; John de Brienne, 1210—enjoyed a barren title, and reigned at St. Jean d'Acre. John de Brienne went to France for aid against the Mussulmans in 1223, and whilst there married his daughter to the emperor Frederick II., who in consequence assumed the title of King of Jerusalem, and by treaty with Meledin, the sultan of Egypt, made his entry into the capital March 17, 1229, but he returned to Europe in May following, leaving Richard Felingher governor of the country, which soon fell into a state of anarchy. In 1239 Raoul, a brother of the count of Soissons, who had married Alice, widow of Hugh, king of Cyprus, claimed the kingdom in right of his wife, who was grand-daughter of Amauri I., but disgusted with the reception he met with from the Christian chiefs he left Palestine and his wife and returned to France. Jerusalem was then besieged by Nodgedmeddin, the sultan of Damascus, and taken in a few days. In 1241 however, Saleh-Ismaïl, sultan of Damascus, gave up to the Christians Ascalon, which he had just taken from the Knights Hospitallers, Jerusalem, and some other strong places, in order to have them for allies in a war which he meditated against the sultan of Egypt. The Chorasmanian Turks, driven from the country by the Tartars, swept over Palestine in 1244, and in October of that year took Jerusalem, where they exercised the greatest cruelties. Since then no Christian prince has possessed the city of Jerusalem.

JOANNINA, or JANINA, a city of Albania, situated in a valley in the heart of that province, on the south-western bank of a lake, from which a subterraneous stream flows into the Kalaini (the Thyamis of

the ancient Greeks), in 39° 47' N. lat., 20° 53' E. long.: its population is variously estimated, but perhaps does not exceed 12,000, although some state it at 30,000. Its site is about 1000 feet above the level of the sea.

The origin and early history of this town are very obscure. In the later period of the Byzantine empire it gradually rose to be the chief city of Greece west of Mount Pindus. It is probably not very far from the site of the ancient Dodona. In the 7th and following centuries to the 11th, the country around became a field of contention between the Byzantine Greeks and the Wallachians and Slavonians, large colonies of whom settled in the district; but Janina seems to have continued in the hands of the Greeks till the year 1082, when it was taken by the Normans under Bohemond (son of Robert Guiscard), who defeated the emperor Alexius Comnenus under the walls of the town. In 1432 it fell into the hands of the Turks. An unsuccessful attempt made by the Albanian Greeks in 1611, to shake off the Turkish yoke, led to their expulsion from the old or fortified part of the town, and to the extension of the city along the shores of the lake on each side of the fortress. Janina was the capital of the famous Ali Pasha, under whom it contained 40,000 inhabitants, including the garrison, 16 mosques, 8 Greek churches, the seraglio and palaces of the pasha, the fortress mentioned above, and two others named Coulia and Litharitsa. When Ali found himself no longer able to defend his capital against the Turks, he ordered it to be set on fire. So great was the destruction that followed, that the city has still a deserted and ruined appearance. The house situated on the small island opposite to the peninsula on which the fortress stands, still bears marks of the violence used in the murder of Ali. A British consular agent resides in Janina. The plain round Janina, which formed the territory of Dodona, yields fruit and grain of most kinds in abundance.

The *Lake of Janina* is in its greatest length 12 or 14 miles measured from north-west to south-east; the greatest breadth is about 5 miles, the least about half a mile to a mile. It is bounded on the north-east by the Mitsikéli Mountains (a branch of Pindus), which rise with very steep ascent to the height of 2500 feet above the lake; on the south-east by a rocky mountain of moderate height crowned with the extensive ruins of an Epirote city, which Colonel Leake considers to have been the ancient Dodona. On the south-west side of the lake is the plain of Janina, and beyond that a range of low vine-covered hills. Opposite the town of Janina is a small island on which is a fishing village, containing in Ali's time about 200 houses: on this island were several convents, frequently used as state prisons; Ali, who had a house on it, kept a herd of red deer. The lake abounds with fish; among them are pike, perch, carp, tench, and eels. Myriads of wild-fowl breed in the covert of the lofty reeds which surround the lake.

The lake is very commonly represented as divided into two parts, the north-western part being called the lake of Lapsista, the south-eastern that of Janina. But the middle part is rather a marsh than a lake, and is traversed by two long channels which connect the two portions of the lake. The lake of Lapsista is much reduced in its dimensions in summer, and maize is grown on the desiccated ground. The waters of both lakes are absorbed by subterranean channels; that which communicates with the river Kalaini is in the lake of Lapsista.

JÜLICH-CLEVE-BERG, a former sub-division of Rhenish Prussia, consisting of the three duchies of Jülich, Cleves, and Berg, which now form the governments of COLOGNE, DÜSSELDORF, and a part of that of Aachen in the Rhein-Province. BERG and CLEVES have been already noticed in this work. The town of *Jülich*, from which the duchy of Jülich or Jüliers was named, stands on the Roër, about 26 miles W. from Cologne, and has 3800 inhabitants, who manufacture soap, leather, and vinegar. It is fortified. Jülich is the ancient *Juliacum* which is mentioned in the 'Itinerary' of Antoninus. After the withdrawal of the Romans from this part of the empire the town gave title to imperial counts, one of whom, Girard I., assisted the emperor Henry the Fowler in his war against the

Huns in A.D. 933. The emperor Charles IV. in 1356 erected the county into a duchy in favour of Girard's descendants. On the extinction of this family in 1609, Maurice of Nassau seized the duchy, which was taken from him by the Spaniards under the Count of Berg in 1622. At the peace of the Pyrenees, the territory was made over to the Palatine house of Neuburg, in which it remained till 1794, when the French took possession of it, and incorporated it with the department of Roër. On the downfall of Napoleon I., the duchy came into the possession of Prussia.

JURA, Argyleshire, Scotland, an island of the Hebrides, in the district of Islay, is bounded E. by the Sound of Jura, and W. by that of Islay. The population of the island in 1851 was 1064. Its greatest length is 25 miles; its greatest breadth is 8 miles. The island is a continuous mountain range, elevated towards the south into five distinct points, of which the three principal are called the Paps, and rise to the height of 1083 feet. The proportion of cultivated land on the island is about 7 parts in 100. Besides the great inlet of Loch Tarbet, the coast-line is indented by several bays and harbours, the chief of which are Small Isles Bay, and Lowlandman's Bay. On the western shore are found large quantities of fine sand, which is used in the manufacture of glass. Large flocks of sheep and goats are fed upon the mountains. At the north end of the island, between Jura and Scarba, is the strait of Coryvrechan, in which is the dangerous whirlpool of that name. A pyramidal rock, rising to within 15 fathoms of the surface of the water, checks the flow of the tide stream, and occasions the violent eddy so fatal to inexperienced or incautious navigators.

JURA, a department in the east of France, is bounded N. by the departments of Haute-Saône and Doubs, E. by Switzerland, S. by the department of Ain, and W. by those of Saône-et-Loire and Côte-d'Or. Its greatest length from north to south is 72 miles, its greatest breadth at right angles to the length is about 40 miles. The department lies between 46° 17' and 47° 20' N. lat., 5° 13' and 6° 9' E. long. Its area is 1928 square miles. The population by the census of 1836 was 315,355; in 1846 it amounted to 316,150; and in 1851 to 313,299, which last gives 162.5 inhabitants to a square mile, being 12.0 below the average to the square mile for the whole of France. The department was formed out of the old province Franche-Comté, and is named from the Jura Mountains which traverse it.

Surface, Soil, and Produce.—The surface is diversified by mountains and plains. Two-thirds of its extent are covered with the JURA MOUNTAINS, of which the highest summits in the department are Reculet, La-Dôle, and Mont-Poupet, which rise to the respective heights of 5959, 5513, and 6000 feet above the sea. The surface presents throughout its whole length three very marked and distinct divisions:—1. The western part, which consists of a low plain about 7 miles wide; 2, the first mountain elevation, which rising suddenly from the plain forms a plateau nearly 10 miles wide; and 3, the high mountain district to the east of the other two, consisting of lofty summits and deep valleys, and extending in width as far as the other two divisions together. The soil of the plain, which consists of a marly clay resting on alternate beds of earth and shingle, is very productive in wheat, rye, maize, buckwheat, hemp, &c. On the plateau the soil is calcareous and shallow; it yields barley, oats, maize, nuts, &c. Among the mountains the soil is stony and thin, only in some parts a little barley and oats are produced; but there is abundant pasture, on which, during summer, from June to October, great numbers of cattle and horses are fed.

Dairy Farming on the Mountains.—During summer the chalets, or solidly-constructed huts, on the heights, serve as habitations for the herds, stores for the dairy produce, and as sheds for the cattle; in these the cows are milked, and butter and cheese made. There is one herdsman for every 20 cows, and one cheesemaker for every 80. The cows from the different communes pasture in separate inclosures, each about 300 or 400 acres in extent, and surrounded by a wall of dry stones; they come of their own accord to the chalet to be milked by the herdsman, and immediately after return to pasture, for they never lair in the chalet. In these annual migrations of the cattle, the milking of the cows and the making of the cheese and butter are entirely managed by men. An account is kept of the quantity of milk given by the cows of each owner, so as to apportion his just share of the butter and cheese made, or of their price when sold. On the 9th of October (St. Denis's Day) the little establishments are all broken up, for then or soon after the rigours of a boisterous winter set in; the herdsmen tie their wardrobe, no great burden, between the horns of the best cows, and the descent is commenced. But, as all the cattle do not come from the same village, the herdsman follows only his own; the others, led by some sage old cow, direct their steps to their own village, where finally separating each one repairs to the house of her own master.

The farm buildings in the mountain districts are in general solidly built of stone and lime, but only 7 feet high, and covered-in with lengths of rough deals, which are kept from being blown away by numerous stones laid on them. They include a dwelling-house, stable, barn, and hay-loft, all under the same roof, and communicating with each other. All the animals lair in the same stable,

which extends quite across the building, and in which they are arranged in two rows, head to head, and feed from a manger that runs from one end of the apartment to the other. The cattle are never littered; but the floor is covered with loose planks, and overhead there is a covering of the same; otherwise the cattle could not stand the cold of the winter, which generally lasts from six to eight months. In that part of the structure appropriated to the family the chief apartment is about 13 feet square; in the centre stands a stove, whence the smoke issues through a tube carried up a wide chimney, which by means of a trap-door is kept closed on the windy side, and serves for a window all the year, and during the deep snows for a door also, the ascent being made by means of a short ladder. Adjoining this apartment is a chamber containing beds for the father, mother, and the daughters of the family; the sons and men-servants, if any, sleep in the hay-loft.

Hydrography and Communication.—The department is drained by a great number of rivers, the principal of which are—the AIN: the DOUBS: the OIGNON, which bounds it on the north [DOUBS]; and the LOUE, which enters it from the department of Doubs, and running west enters the river Doubs, a few miles south of Dôle. Of these the Ain, the Loue, and the Doubs are navigable. Among the smaller rivers the most important is the Bienne, which rises near the eastern boundary, and passing Morez and St.-Claude it then turns westward and falls into the Ain on the left bank, just before that river touches the southern boundary. A large quantity of squared timber and deals is floated down the Bienne, the Ain, and some of the other streams in rafts, to the timber wharfs of Lyon. The north of the department is crossed by the Canal-du-Rhône-au-Rhin. There are numerous marshes and lakes in the department, which is traversed by 5 imperial, 24 departmental, and by 30 parish roads. As yet (1854) there is no railway in the department, but several have been projected, among which are a line from Dijon through Dôle to Salins; another from Châlon to Dôle and Besançon, with a branch from Dôle southward through Lons-le-Saulnier to Bourg in the department of Ain.

Climate.—The climate differs with the elevation of the surface; it is intensely cold in the mountains, where the snow lies frequently for six months; in the plain, which is cold enough in winter owing to the proximity of the snow in the highlands, the air is hot and close in summer, but on the plateau it is pure and healthy during that season. High winds are frequent at all seasons, and very impetuous during winter on the mountains; they are attended by heavy rains in spring, and oftentimes in summer also.

The department contains 1,234,091 acres. Of this area 452,498 acres are under cultivation; 124,909 are natural grass land; 51,961 are under vines; 859,289 are covered with woods and forests; and 195,242 acres consist of heaths and moors. The agricultural produce, which has been specified before, is barely enough for the consumption. Horned cattle are exceedingly numerous; there are but few sheep; poultry, bees, game, and fish are abundant. The produce of wine amounts to 7,864,000 gallons annually, the best growths being those of the districts about Arbois, Château-Chalon, and Lons-le-Saulnier. The forests abound with pine and oak timber.

Geology and Mineralogy.—The north-east of the department is occupied by the supercretaceous formations; the rest of the department consists of the strata that lie between the chalk and the new red-sandstone; the chalk itself we believe nowhere rises to the surface. The mineral treasures of the department are considerable. Several iron-mines are worked; gold, copper, lead, and coal are found; the peat beds are dug for fuel; marble, alabaster, and lithographic stone are quarried. There are important salt-works at Salins and Montmorot.

The manufacture of iron and iron wares, carried on in numerous smelting furnaces, forges, and foundries, is the most important object of industrial activity. The other manufactures are paper, watch and clock works; turnery in wood, bone, ivory, and horn; coarse woollens, linen, mineral acids, salt, casks, steel, scythes, nails of all kinds, tiles, and leather. There are 632 wind- and water-mills (the latter including saw-mills), and 345 factories of different sorts, besides the iron-works before mentioned; about 90 fairs are held in the year.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Lons-le-Saulnier . . .	11	212	108,214
2. Poligny	7	152	78,249
3. St.-Claude	5	82	51,486
4. Dôle	9	138	75,350
Total	32	584	313,299

1. In the first arrondissement the chief town, *Lons-le-Saulnier*, which is also the capital of the department, is situated at the foot of high vine-clad hills that surround it on every side, except the west, in 46° 40' 28" N. lat., 5° 33' 11" E. long., at a distance of 225 miles S.E. from Paris, 845 feet above the level of the sea, and has 8450 inhabitants in the commune. It is a pretty, well-built town, and lighted with gas; the principal street is lined with arcades; and there are

several handsome fountains. In the northern angle of the town are important salt-springs, from which the brine is constantly pumped up into a wooden canal that conveys it to the great salt-works at Montmorot, about a mile distant from the spring. The town is the seat of tribunals of first instance and of commerce, of communal and ecclesiastical colleges; it has also a public library, a museum, and a theatre. The manufactures consist of hosiery, potash, and leather; the commerce is considerable in salt, iron, timber, wine, brandy, cheese, &c. *St. Amour*, 18 miles S. from Lons-le-Saulnier, has marble-sawing-mills, naileries, tan-yards, and 2527 inhabitants in the commune. *Baume-les-Messieurs*, 6 miles from Lons-le-Saulnier, is a small place of 770 inhabitants, situated in a wild rocky gorge on the Seille, and is famous for its ancient Benedictine abbey, the church of which is in tolerable preservation, and contains tombs of the counts of Bourgogne.

2. In the second arrondissement the chief town, *Poligny*, is situated at the extremity of an extensive plain, and at the foot of a spur of the Jura chain, near the source of the Glantine, at a distance of 18 miles N.E. from Lons-le-Saulnier, 1064 feet above the level of the sea, and has a population of 5615. It consists chiefly of four well-built streets, parallel to each other, and to the direction of the mountain. It is well supplied with excellent water from the numerous fountains that adorn the town. *Poligny* has a college, manufactures of pottery, casks, saltpetre, and oil; iron-works, dye-houses, tan-yards, and hydraulic saw-mills. Marble and alabaster are quarried in the neighbourhood. The tribunal of first instance is at *Arbois*, a pretty town 5 miles to the northward, the birth-place of Pichegru. *Arbois* has a college and 7000 inhabitants, who manufacture paper, oil, and leather, and trade in the excellent white wines of the district. There are iron-works, hydraulic saw-mills, nitre-works, and nurseries at *Arbois*. *Champagnole*, a well-built town, with 3276 inhabitants, situated at the foot of Mont-Rivel, on the right bank of the Ain, and near the village and extensive iron-works of *Sirod*, is a place of some commercial activity. It has a large iron-wire factory, hydraulic saw-mills, naileries, &c. *Salins*, 8 miles N.E. from Poligny, situated on the slope of a hill above the little river Furieuse, a feeder of the Loue, and near a narrow gorge between two high mountains, has a college, a handsome church dedicated to St. Anatole, and 7481 inhabitants. In the centre of the town are numerous salt-springs, and one of the greatest salt-works in France, which are inclosed by thick walls, flanked with towers, and extending 306 yards in length by 100 yards in breadth. Sulphate of soda, brandy, and leather are also manufactured, and in the neighbourhood there are gypsum-quarries, paper-mills, and iron-works.

3. In the third arrondissement the chief town, *St. Claude*, situated between three wooded and rocky mountains, at the confluence of the Tacon with the Bienne, which is here crossed by a suspension-bridge, and at an elevation of 1432 feet above the level of the sea, 28 miles S. by E. from Lons-le-Saulnier, has tribunals of first instance and of commerce, a college, and 5835 inhabitants in the commune. The town, which is the residence of the Bishop of St. Claude, is well built, and ornamented with some pretty promenades and handsome fountains. The cathedral church of St. Pierre is the principal building. The town is famous for turnery in bone, ivory, horn, and wood; buttons, tobacco, and musical boxes, wind instruments, combs, hardware, pine, crape, cotton-yarn, leather, paper, tiles, and pottery are also manufactured. *Mores*, on the Bienne, is situated in a gorge formed by two mountains, which rise almost perpendicularly to the height of 1200 feet, and scarcely leave room between their naked sides for two rows of houses and the street that separates them. The population amounts to 2726, who maintain themselves by manufacturing iron, iron-wire, cotton-yarn, leather, and watch and clock movements.

4. In the fourth arrondissement the chief town is *Dôle*, which is described in a separate article. [DÔLE.] The other cantons of this arrondissement are named from mere villages.

The department forms the see of the Bishop of St. Claude, is included in the jurisdiction of the High Court of Besançon, and belongs to the 7th Military Division, of which Besançon is headquarters. To the Legislative Body of the French Empire it used to return two members.

(*Dictionnaire de la France; Annuaire pour l'An 1853; Official Papers.*)

JURA MOUNTAINS, the name given to a mountain system which consists of several parallel chains extending along the frontiers of France, Savoy, and Switzerland, in a direction from south-south-west to north-north-east from the Rhône and the Lake of Geneva to the left bank of the Rhine, towards the north, where it is connected by some lower elevations with the Vosges. The length of the system is about 180 miles; the breadth varies from 30 to 50 miles. The highest summits of the Jura Mountains are found in the most eastern chain, which extends between France and Switzerland; the other chains diminish in height towards the west, and do not form continuous ranges, but rather consist of isolated elevations connected at their bases. Very few of the valleys among these mountains are transversal; most of them run in the direction of the length of the chains. The highest points in the crest of the eastern chain are those of Reculet, Tendre, La-Dôle, and Colombier, which rise respectively to 5959, 5543, 5513, and 5494 feet

above the sea-level; the mean height of this chain is about 4800 feet. The highest point in the second chain does not much exceed 4300 feet. The highest part of these mountains, which is full 3000 feet lower than the line of perpetual snow on the Alps, is covered with forests of pine and other resinous trees; farther down, the beech, the ash, the lime, and the oak flourish; and the lower slopes are occupied with vineyards or cultivated for the production of maize or barley. The mountains also abound in excellent pasture, on which great numbers of cattle are reared and fed, and a great quantity of cheese is made. [JURA, Department of.] Wolves are common; the brown bear and the wild cat are said to be met with, but rarely.

On the eastern side the chain of the Jura Mountains presents in general steep abrupt sides, but on the west they slope down by almost insensible degrees. They are composed of a hard gray limestone, mixed with alternate beds of marl and clay; in some places alabaster, gypsum, asphalt, coal, marble, and petrifications of various kinds, especially those called oolites, which are characteristic of the Jurassic system, are found. Iron-mines, sulphurous and salt springs abound; stalactitic grottoes and waterfalls are numerous; among the latter is the magnificent Saut-du-Doubs. [DOUBS.] An important and interesting feature of the Jura system is the number of erratic stone-blocks that are found high up the eastern slopes, at points opposite the opening of the great valleys which descend from the high Alps.

The region just described is that which is usually known as the Jura Mountains, but the name among geologists has a wider acceptation, the continuation of the same limestone country through Suabia and Franconia being distinguished as the German Jura, rising in the Rauhe-Alb, near Ulm, to 2400 feet above the sea. The general direction of all these calcareous mountains is north-eastward, but in Franconia it changes to northward; their boundaries are little sinuous: their breadth averages about 20 miles, and from the vicinity of Bamberg to the passage of the Rhône the length exceeds 400 miles.

Nearly parallel to the Swiss and German Jura on the south calcareous rocks, belonging to the same geological era, range in front of the primary rocks of the Alps, from Chambéry to Vienna, more than 500 miles; and similar ranges of the same strata occupy the right side of the Saône and the left of the Meurthe and Moselle, and connect themselves with the oolites which encircle the basin of Paris. Thus the Swiss Jura described above occupies a nearly central position with respect to an immense and ramified system of elevated limestone districts all belonging to one geological system; and hence it has become the almost universal practice of the continental geologists to designate that series of rocks by the title of the 'Jura formation,' a term exactly equivalent to the oolitic system of English geologists.

The mountains of the German, Swiss, and French Jura, regarded in a general point of view, may be described as inclosing between their ranges an immense basin, which contains the greater portion of Burgundy and Lorraine, the whole of Alsace, Suabia, Franconia, and Hesse. Against this inclosed region the oolitic ranges present bold and abrupt descents, while toward the exterior the slopes are gentle. The chalk formation partially surrounds the Jura ranges on the French and German sides, but in the interior of the basin not a trace of it is to be found.

In the Swiss Jura the strata are thrown up at high angles of elevation, and consequently form long extended ridges and chains; the Suabian region is formed of rocks which lie in regular and nearly horizontal layers, and constitute an extended and uniform plateau; in Franconia dolomite abounds, and crowns the heights with picturesque rocks resembling the towers and pinnacles of ruined castles. The mineral composition of the Jura ranges is everywhere similar, and form a series comparable to the larger divisions of the oolitic series of England and Normandy. The German Jura contains the subdivisions of the oolitic series from the lias upwards to the cornbrash. The dolomites and lithographic slates constitute a distinct upper band of the Jura formation, corresponding to the Portland oolites.

The determination of the geological epoch of the elevation of the Jura ranges to constitute dry land is important, especially in reference to two phenomena which are witnessed in these mountains, namely, the ossiferous caverns of Franconia, and the dispersion of erratic blocks from the High Alps. The opinion of John Hunter that the caverns of the district of Muggendorf were filled by bears which voluntarily retired thither, has been confirmed by the researches of Buckland and Von Meyer. The geological era of their existence is perhaps subsequent to the whole tertiary period; but Von Buch's view of the origin of the Jurassic limestones seems to imply their prominence as islands in the ancient European sea before the deposition of the chalk. The erratic blocks mentioned above as lying in vast abundance on the eastern slopes of the Jura, and ascending towards their summits even to the height of 1000 or 2000 feet above the Aar and the Lake of Geneva, which now interpose their waters between the Jura and the mountains whence the blocks were drifted, are disposed in such a manner that ordinarily those which came from a particular district are distinct from the others and seem to have been brought by a distinct channel. Blocks from the Grisons have descended the valley of the Rhine; those found on the shores of the Lake of Zürich and in the drainage of the Limmat are derived from the mountains of Glarus; while in the valley of the Aar and on the slopes of the Jura lie fragments from the Bernese Alps.

To account for these facts numerous speculations have been proposed. De Lue imagined a projectile force to have displaced the blocks when the Alps were raised; Saussure, Escher, Von Buch, De Beaumont, &c., speak of the effects of water thrown into violent agitation (as some think by the elevation of the mountains); Dolomieu attributed the inequalities of surface, which render the physical explanation of the phenomena by the ordinary agencies of nature almost desperate, to operations subsequent to the scattering of the blocks; Venturi introduced the consideration of floating ice-rafts; the very feasible theory of Agassiz is that they were deposited by glaciers; while others have attempted to master the difficulty of the problem by admitting great changes of level since the blocks were moved from their native sites.

JÜTLAND, or JYLLAND, a large province of the kingdom of Denmark. The name was formerly given to the whole of the peninsula, which constitutes the continental portion of the kingdom, but at present it is restricted to the northern half, which is sometimes called North Jütland, the duchy of Schleswig being considered as South Jütland. It is bounded W. and N. by the German Ocean, E. by the Cattegat and the Little Belt, and S. by Schleswig; and lies between 55° 20' and 57° 42' N. lat., and 8° 6' and 10° 50' E. long. Its form as far as 57° 12' is a pretty regular parallelogram lying nearly due north and south; the northern part is almost a right angled triangle. The extreme length is about 170 miles; the breadth of the parallelogram varies from 70 to 85 miles, but in the centre it is 100 miles, the district of Kalløe projecting towards the east. The area is 9696 square miles; the population was 604,525 in 1850.

Few countries have such an extensive line of coast in proportion to their area as the Danish peninsula, which, especially on the more elevated east coast, is indented with numerous bays and inlets, and no town is above 45 miles from the sea. The most considerable of these inlets, the Lüum-Fiord [DENMARK, vol. ii. col. 710], extends across and insulates the northern part of the peninsula. It is about 100 miles long, and contains numerous islands, the largest of which, called Mors, situated in the broad part, has an area of 136 square miles. In 1825 the North Sea broke through the narrow strip of land which separated it from the Lüum-Fiord, and the breach has since been gradually enlarged, but the openings are too shallow to admit vessels of much draught. The apparent advantage of the extensive line of coast possessed by Jütland is much diminished by the shallowness of the sea, and the innumerable little islands, sandbanks, and shoals which render access difficult. The north coast, besides an immense range of sandbanks rising almost to the surface of the water, is rendered dangerous to navigators by numerous currents and the shortness and rapidity of the waves. The west coast, facing the German Ocean for above 200 miles, is bordered by a narrow strip of moving sand and a chain of sandhills, within which there are many good pastures. The southern part of the west coast is alluvial soil, extremely fertile, but swampy and unhealthy, and requiring dykes to protect it from the inroads of the German Ocean, which however sometimes breaks through them, as happened in 1634, when 15,000 persons perished. The east coast is more elevated, rising in chalk-cliffs above the sea,

and to the south of Aarhus it presents a series of fertile and well-cultivated eminences. [BELT.]

The only elevations in Jütland are a range of low hills, seldom rising above a few hundred feet: they are the prolongation of the chain which runs through Mecklenburg and Holstein, and thence extends through the whole peninsula, terminating at its extreme northern point, the promontory of Skagen. Only the Himmelsberg attains the height of 1200 feet; no others attain more than 700 feet. The rivers are very small, and are all called 'aas;' the largest are—the Scholmæe, Widæe, Brædesæe, and Ribsæe.

The climate is comparatively temperate, but very variable, with frequent fogs and rains. The winters are not very rigorous, but the summers are often extremely hot. With respect to the soil, more than half is arable land, a quarter is heath, above 700 square miles are meadows and marshes, about 300 square miles are forests, and about 235 tracts of moving sand. The productions are corn (more than sufficient for the inhabitants), hemp, flax, tobacco, and some timber. In the 11th century the country was covered with vast forests, and there are still considerable woods of oak, fir, beech, &c., on the east coast, but on the west there are only willow, beech, and alder. The horses are large, but fitter for draught than for riding. The breed of black cattle is good, and numbers of them and of hogs are exported to Holstein. There is abundance of game, and some wild boars are still found in the forests. The lakes, gulfs, and bays afford an inexhaustible supply of fish.

The peninsula is divided into four large districts called 'stifts,' in this instance equivalent to diocese or bishopric. Aalborg in the north; Aarhus in the east; Wiborg in the centre; and Ribe in the south and west. AALBORG, including the capital, Aalborg, the towns of Hiörring, Thisted, and Nyekiöbing, with the islands of Mors and Lessöe, and AARHUUS, with its capital, Aarhus, and the town of Randers, have been already described. Wiborg has an area of about 1100 square miles, and about 95,000 inhabitants. Wiborg, the capital, is situated on a small lake nearly in the centre of the peninsula, and has about 5500 inhabitants. It is 2½ miles in circuit, is surrounded with ramparts, has six gates, and is pretty well built. There are a cathedral and two other churches, and a few manufactories. The bishopric of Ribe, or Ripen, the most extensive of the stifts, has an area of 3900 square miles, but is in proportion the least populous, having only 170,000 inhabitants. Ribe, the capital and seat of the bishop, is a small walled town with 3500 inhabitants. It is situated on a little river called the Ribsæe, 2 miles from the German Ocean. Only small vessels can come up to the town, which has some trade in corn, oxen, and horses. Besides the cathedral there are a church, and the oldest Latin school in Denmark (founded in 1248), with a library. Fredericia, the only fortress in Jütland, is in this diocese; it is situated on the Little Belt, has 5000 inhabitants, a Calvinist, a Roman Catholic, and two Lutheran churches, a synagogue, a custom-house for ships passing through the Little Belt, and other public buildings, and several manufactories.

KAADEN. [EGER.]

KABYLES. [ALGÉRIE.]

KAFFA, *Caffa*, or *Theodosia*, a fortified sea-port town of Russia, is built on the south-eastern shores of the Crimea, in 45° 2' N. lat., 35° 20' E. long., on a wide open bay, which is more than twenty miles across. The town stands on the most western angle of this bay, and its harbour is protected by a projecting cape. In ancient times the town was called Theodosia, and was one of the towns of the Greek kingdom of the Bosphorus. According to the author of the 'Periplus of the Euxine,' it was a Milesian colony. Its importance appears to date from the time of Leucon, the contemporary of Demosthenes, who made it a port, and gave certain advantages to Athenian ships which came there for the purpose of carrying grain back to Athens. According to the author of the Periplus (who probably lived in the 2nd century of the Christian era), it was then called Ardauda in the Alan or Tauric dialect, which name signifies 'the seven gods.' It seems to have been a considerable place between the 12th and 14th centuries, when it was in possession of the Genoese, who carried on a considerable commerce with India through Persia from this town. In 1474 it was taken from the Genoese by the Turks, but still continued a considerable place, though its population had decreased from 80,000 to 20,000. The population now, exclusive of military, does not exceed 8000. The wars which the Russians, in the latter half of the last century, carried on in these parts, ruined Kaffa. The space inclosed by the walls, which are strengthened by numerous towers, is an oblong square more than a mile in perimeter. In 1806 Russia tried to restore the prosperity of Kaffa by declaring it a free harbour, and by establishing a quarantine, an assurance company, a botanic garden, a museum of antiquities (which are frequently found in the neigh-

bourhood), a library, &c.; the effect of these efforts was at first considerable. In 1817 the exports were valued at 4,000,000 rubles, but in 1830 the exports did not exceed 1,148,288 rubles, nor the imports 890,910 rubles; and now the exports hardly average 400,000 rubles. Fishing is the principal occupation of the inhabitants. In its neighbourhood are oyster beds. Caviar is made here, as well as a small quantity of tobacco. Kaffa exports wool, skins and hides, fish, and a great quantity of salt.

(Pallas; Lyall, *Travels in Russia*; Demosthenes, *Leptin.*, c. 9; Strabo, vii.; Steph. Byzant.)

KAFFA, a country in eastern Africa south of Abyssinia, is said to be of considerable extent. It contains several high mountains, which are separated from one another by wide valleys. Numerous water-courses drain the country, and all of them join the Goshop, or Gojeb, a large river originating in several branches to the south and west of Kaffa. On the north of Kaffa is Enarea, and on the west a wilderness, in which numerous herds of large quadrupeds (elephants, giraffes, &c.) are found. The country is fertile, and partly well cultivated. Cotton is grown to a great extent. The coffee-tree is there, as well as in the neighbouring country of Enarea, indigenous and a forest-tree. It is not stated that coffee is an article of export, but it is thought that the coffee called in these parts 'Gava,' has derived its name from this country, as the Arabs assert that it has been transplanted to Yemen from that part of Africa.

The capital is Soonee, a town which, according to the accounts of African travellers, has between 6000 and 7000 inhabitants. This place and some others are visited by the merchants of Enarea, who exchange their goods (rock-salt, copper, horses, cattle, and some India stuffs, brought from Gondar), for cotton, cotton-cloth, which is made in the

country, and slaves. The inhabitants, it is said, call themselves Christians.

(Krapf, in the *Monatsberichte der Berliner Gesellschaft für Erdkunde.*)

KAFFRARIA, is the name given by Europeans to the eastern part of South Africa, from the north-east frontiers of the Cape Colony to about 24° S. lat. The Kaffir race extend farther north, probably as far as the Zambesi River. At Sofala Bay, in 20° S. lat., Salt saw natives whom he considered to be nearly allied to the Kaffirs.

The complexion of the Kaffirs varies from a yellowish-brown or copper hue to that of deep black. The nose approaches to an arched form; they have thick lips and hair curly, but less woolly than the negroes. The Kaffir females are among the handsomest in Africa.

The Arabian and other Mussulman traders and conquerors who formed establishments on the Mozambique coast, bestowed the general appellation of Kafir, or 'Unbeliever,' on the native population. The name was adopted first by the Portuguese, and afterwards by the Dutch and the English.

Kaffraria, properly so called, extends for about 600 miles along the coast, from the Great Key River to Dalagoa Bay, and inland as far as the high land which divides the waters that flow into the Indian Ocean, from those which flow into the Orange River and the Atlantic. It runs in a north-east direction at an average distance of about 100 miles from the sea. The eastern or Kaffir side of the ridge is more abrupt than the western, which slopes in a sort of table-land towards the Atlantic. Kaffraria is a land of rugged hills and deep valleys.

In the Amaponda country Kaffir villages are scattered about, and numerous herds of cattle graze in the plains, while the lower sides of the hills exhibit patches of cultivated ground. Beasts of prey are not numerous: now and then a lion, and more frequently a tiger, or rather leopard, are met prowling in the more secluded ravines. The hippopotamus is found in most of the rivers, and its flesh is eaten by the natives. The country abounds in game, antelopes, hares, pheasants, and partridges. There are quantities of baboons and monkeys, and also serpents and other reptiles.

Four nations, originally of one stock, are the chief occupants of the country from the frontiers of the Cape Colony to Dalagoa Bay—the Amakosa, the Amatimba, called by the Dutch Tambookies, the Amaponda or Hambona, whom the Dutch have named Mambookies, and the Vavahs or Zoolahs, sometimes called Amozoolah.

The Vavahs or Zoolahs acquired considerable influence under their late chief Chaka. They were originally a small tribe who came not many years since from the north, somewhere about the mountains west of English River, which falls into Dalagoa Bay. Their language is different from that of the Amakosa and other southern Kaffirs, and is said to have more affinity to the Sichuans or Betchouana language. They are a fine athletic race; in war they carry large oval shields of bullock's hide, and an umkonto, or spear, besides a bundle of assegais. The country is represented as very fine, rich in pasture, and abounding with cattle.

The tribes who live in the low lands round Dalagoa Bay are said to be industrious, well-behaved, and favourably disposed to trade with strangers. Captain Owen mentions the arrival at Dalagoa Bay of a caravan from the interior, consisting of 1000 natives, with from 300 to 400 elephants' tusks, and a great quantity of cattle. He represents the people as honest in their manner of dealing; their prudence will not allow them to give their merchandise for the momentary gratification of rum or tobacco; but they have a great desire for cloth. Of the countries to the north of Dalagoa Bay we know very little.

Mr. Duncan in 1844, and Lieutenant Ruxton in 1845, travelled into the interior of those regions. The government of the Kaffirs is a sort of clanship system. The population of each Kaffir tribe is divided into kraals, or hamlets, containing from ten to twenty families, each family occupying a separate hut. There is a petty chief in each kraal, who exercises a kind of patriarchal authority over the people. A higher chief rules over a whole district, containing a certain number of kraals. These higher chiefs are hereditary and independent of each other, although they acknowledge to a certain extent the authority of the Umkumkani, or great chief of the whole tribe, who is supposed to be the original possessor of all the land and cattle within its territory. No individual is allowed to kill any of his cattle without permission of the chief, who claims part of the carcass as his right: likewise the first-fruits of the season are not allowed to be gathered without permission of the great chief of the tribe. All the land is held in common, except a small patch to each family. The Kaffirs have no written laws, but certain long-established principles and usages, any infraction of which by a chief would be opposed by his subjects at large. The Kaffirs acknowledge the existence of a supreme being, for whom they have several names in the language, but they have no form of worship, and their notions of a future life are very vague and unsettled. They have no idols, but have an abundance of superstitious usages.

The huts of the Kaffirs are hemispherical, and mostly from 18 to 20 feet in diameter, and from 6 to 7 feet high. They are made of flexible boughs covered with thatch, and plastered with clay or cow-dung. A few mats, coarse earthenware pots of native manufacture, a rush basket so closely woven as to contain liquids, a calabash, and a bundle of assegais—these constitute all the furniture of a common Kaffir hut.

The wars which have disturbed the south African territories of late years, and the effect of these wars on the relations of the Kaffir tribes with the British government, are noticed under BRITISH KAFFRARIA.

KAFFRARIA, BRITISH. [BRITISH KAFFRARIA.]

KAFFRISTAN. [KAFFRISTAN.]

KAHIRA, or CAIRO (*El Chahireh Musr*), the capital of modern Egypt, is situated in 30° 2' N. lat., 31° 15' E. long., in a plain midway between the right bank of the Nile and the ridge of Mokattam, near the apex of the Delta of the Nile, and has about 250,000 inhabitants, including the suburbs. The tract of land between the town and the river, which is above a mile in width, in the direction of Boolak, the northern harbour of Cairo, becomes narrower farther south, so as to be less than half a mile wide, in the direction of Musr el-Ateekah, or Old Cairo, the southern harbour or landing place. Cairo occupies about three square miles; it is surrounded by a wall, the gates of which are shut at night, and is commanded by a large citadel situated at an angle of the town, on one of the lower elevations of the contiguous ridge, in which is the residence of the Pasha. The streets of Cairo are unpaved, irregular, and narrow; they are more like lanes than streets. The great thoroughfare streets have generally a row of shops on each side. Above the shops are apartments which do not communicate with them, and which are inhabited by private families. Most of the by-streets have a wooden gate at each end, closed at night, and guarded by a porter within, who opens it to persons who require admittance. There are also many courts with several narrow lanes branching out of them, but no thoroughfare, and only one common entrance, with a gate, which is also closed at night. The external walls of the better sort of houses are raised to the height of the first floor with the soft calcareous stone of the neighbouring mountain. The superstructure, the front of which generally projects about two feet, is of burnt brick of a dull red colour, but often plastered. The roof is flat, and covered with a coat of plaster. The ground-floor apartments next the street have small wooden grated windows; but the windows of the upper apartments are mostly formed of turned wood lattice-work, which is so close that it shuts out much of the light and sun, but admits the air. In the better houses the windows are furnished with frames of glass in the inside, which are closed in the winter, for a penetrating cold is felt in Egypt when the thermometer is below 60°. The houses in general are two or three stories high, and most of them inclose an open unpaved court, into which the principal apartments look. In the court is a well of slightly brackish water, which filters through the soil from the Nile; and on its most shaded side are commonly two water-jars, which are daily replenished with water of the Nile, brought from the river in skins.

There are in the town three or four squares or open places of considerable extent, two of which are overflowed during the high floods of the Nile. Some of the squares are surrounded with good private houses. Among the mosques, which number between 300 and 400, four are distinguished for their size and architecture—that of Tooloon, which dates from the 9th century; that of El Hakim; that of El Azhar, which has a splendid dome, and a college attached to it; and lastly, the mosque of Hhasanayn, with its high dome, its two lofty minarets, and its marble and other ornaments. These buildings are considered master-pieces of Arabian architecture. Among the other remarkable buildings are the public baths, of which there are between 60 and 70 in the town, several of them very spacious, handsomely ornamented and painted externally and internally, the various apartments being paved with marble. The coffee-houses, which are very numerous, are extremely plain and unadorned. There are in Cairo numerous buildings called wekalehs, for the accommodation of merchants and their goods. These buildings are square or oblong, having an open court in the middle, with vaulted warehouses for merchandise on the ground floor opening into the court, and lodgings above them. The shops in the streets are small square recesses or cells, about 6 or 7 feet high and between 4 and 6 feet wide, in which there is just room enough for the seller and one or two customers. The public gardens consist of groves of orange- and lemon-trees and vines; and the cemeteries, both within and without the town, are also frequented as promenades.

Of the population of Cairo about 135,000 are native Mussulmans, 60,000 Copts, between 3000 and 4000 Jews, and the rest strangers from various countries. The police maintained in the metropolis is tolerably strict: punishments are arbitrary but lenient; convicted malefactors are mostly employed in the public works.

In the neighbourhood of Cairo are, Boolak, with the custom-house, the bazaar, the printing-press, a school or college, some silk manufactories, and about 18,000 inhabitants; Musr-el-Ateekah, where the town of Fostat, or Old Cairo, once stood, and where the vast granaries, consisting of seven square towers, and called 'the granaries of Joseph,' are now seen; Schoobra, with a country-house and fine gardens of the Pasha; Aboo Zabel, where is a school of medicine, anatomy, and surgery, and a large military hospital, all created by the Pasha Mehemet Ali; and between Boolak and Old Cairo are the palace and gardens of the late Ibrahim Pasha. Nearly opposite Cairo, on the left bank of the Nile, are the great pyramids of Jizeh; and in the island of Roda is the celebrated Nilometer, a graduated column, for marking the height of the inundations of the river.

Cairo still maintains the reputation of being the best school of Arabic literature; and for Mohammedan theology and jurisprudence the fame of its professors remains unrivalled. Schools for children are very numerous: almost every mosque has a koottab, or day-school, attached to it, in which children are instructed in reading the 'Koran,' and, if required, in writing and arithmetic. The schoolmasters are mostly persons of very little learning. Those youths who propose to devote themselves to religious employment or the learned professions pursue their studies in a great college attached to the mosque of El Azhar, which has a considerable library. The instruction is given gratuitously. The number of students is about 1500, from almost all parts of the Mohammedan world. Mehemet Ali having seized the lands of the mosques, the Azhar has scarcely any revenue; the professors therefore are obliged to subsist by teaching in private houses, by copying books, and on the presents which they receive from the wealthy. Besides this college or university, there are, an elementary school of arts and sciences at Casr-el-Ain, a school of administration to instruct those who are designed for civil offices, and a school of artillery and engineering. In the city there are also four primary schools, a magnetic observatory, a theatre, several hospitals, and a lunatic asylum.

Cairo was founded in the reign of Moez Ledinillah, fourth Mahadi, and first Fatimite Khalif of Egypt, about A.D. 970. It was called Masr-el-Kahirah, and became immediately the capital of Egypt and the residence of the khalifa. After the destruction of Fostat by the Crusaders the city increased rapidly in size and population. It was taken by Schirkouh, general of the Sultan of Damascus, in 1169, and soon after Saladin, who succeeded his uncle in the command in Egypt, surrounded Cairo with walls and built the citadel. Under Saladin and his successors Cairo became one of the finest and most commercial cities in the world, a sort of central mart for the products of the east and west. Its capture by the Turks in 1507, and the discovery of the way to India by the Cape of Good Hope, put an end to its prosperity. Under Mehemet Ali and his successors the city has recovered considerably in population and appearance; but its trade is comparatively insignificant, Alexandria being now the commercial capital of Egypt. Murzuk, Sennaar, and Darfur send a few kafilahs yearly to Cairo, exchanging slaves and raw produce for manufactured goods.

(Lane, *Account of the Manners and Customs of the Modern Egyptians*; Wilkinson; Minutoli; Planat, *Histoire de la Régénération de l'Egypte; L'Art de Vérifier les Dates.*) [See SUPPLEMENT.]

KAISARIYEH, a town in Asia Minor, is situated in a plain to the north of the Erjish-Dagh (the ancient Argæus) in about 38° 41' N. lat., 35° 25' E. long., and has a population variously estimated at 25,000, 40,000, and 50,000, consisting of Turks, Greeks, and Armenians. The plain is laid out in corn-fields, and screened on the east and west by low hills covered with gardens and vineyards, and the whole neighbourhood abounds with volcanic deposits. The town is surrounded by an old walled moat, and further defended by an old citadel partly in ruins. The houses, which are from 8000 to 10,000 in number, are built of stone and lime, but many of them have a cracked and dilapidated appearance caused by the frequent earthquakes. The streets are narrow and dirty, the squares and market-places also abound with filth; and the naturally healthy climate is poisoned by the absence of all sanitary arrangements. The bazaars are extensive and well supplied with European manufactured goods, woollens, silks, hardware, iron, &c. The Armenian merchants display their wares in a large place called the Vizir Khan; these consist of hardware, snuff-boxes, glass beads, Red Sea shells for ornamentation, paper, cards, padlocks, &c. Of native articles exposed for sale the chief are yellow berries, which are grown in the plains of Cæsarea, wool, gall nuts, goats'-hair, tragacanth, cotton, skins, furs, sultana raisins and other fruits, madder and other dyestuffs. Among the principal structures in the town are the mosques, the convent of Siddi-Battal, and some mausoleums. The Armenians have a bishop and two churches in Kaisariyeh; the Greeks also have a church. The manufactured products of the town are chiefly yellow marocoo leather, cotton-stuffs, and cotton-yarn.

Kaisariyeh in site and sound is identical with the ancient *Cæsareia*, the capital of Cappadocia, which was originally called *Mazaca*. The plain in which it stands is watered by the Melas, now called the Kara-su, which was dammed up by king Ariarathes to form a lake a little above its entrance into the Halys (not Euphrates as erroneously stated by Strabo). *Mazaca* was called also *Eusebeia*, and numerous coins with this epigraph have been found on the site. It was taken by Tigranes and its inhabitants carried off to his new capital Tigranocerta. When Cappadocia was made a Roman province in the reign of the emperor Tiberias, *Mazaca* was named *Cæsareia*. It became a place of great importance in the later times of the empire. When taken by Sapor in the reign of Valerian (about A.D. 259) it had a population of 400,000. In the reign of Justinian the walls were repaired. There are many ruins and heaps of rubbish of ancient structures about the town.

Cæsareia gave title to a Christian bishop from an early period of the Church; it is the birthplace of St. Basil the Great, who became bishop of *Cæsareia* A.D. 370.

(Strabo; Suidas; Eutropius; Hamilton, *Researches in Asia Minor*; *Dictionary of Greek and Roman Geography.*)

GEORG. DIV. VOL. III.

KALENBERG. [HANOVER.]

KALGUJEW, a considerable island in the circle of Mezen, in the Russian government of Archangel, lies between 68° and 69° 40' N. lat., 47° 30' and 48° 10' E. long., and is about 66 miles in breadth. The surface is undulating; it has some low mountains, which rise in the centre, two small rivers, and several brooks of fresh water. The surface is covered with mosses; there are also extensive morasses. The ground bears nothing but berries, some antiscorbutic plants, and stunted bushes. The surrounding sea is shallow, but swarms with fish; the coast abounds in seals, walrusse, and other such animals. The cliffs are covered with an incredible number of sea-birds; the interior is full of polar bears, foxes, &c. It is only frequented by fishermen and seal-hunters from Mezen and Archangel. The little island of Plokti-Kookti and some others are near to Kalgujew.

KALMAR. [CALMAR.]

KALMUCKS. [RUSSIA.]

KALU'GA, a government of European Russia, lying between 53° 24' and 55° 21' N. lat., 33° 20' and 37° E. long., is bounded W. and N.W. by Smolensk, N.E. by Moskwa, E. by Tula, and S. by Orel. The area measures 12,134 square miles. The population in 1846 was 1,008,400. The surface is level, but here and there broken by a low hill or the wooded banks of the numerous rivers that flow through it. Forests cover about half the area, the arable lands about one-third. The soil for the most part is sandy clay. The Oka and its numerous feeders are the principal rivers. There are lakes and marshes in the centre and west of the government. The rivers, several of which are navigable for barges, or available for floating timber, are frozen from November to March. The soil of Kaluga being generally poor requires abundance of manure: the chief products are rye, oats, barley, wheat, hemp, and flax. Barely enough for the consumption is produced. Horses and horned cattle are scarce. Horticulture is carefully attended to. The mineral products are bog-iron, millstones, lime, gypsum, and turf. There are several great iron-forges. The manufactures of distilled spirits, coarse woollens, linen, sail-cloth, calico, silk, velvet, ribands, leather, paper, and glass are important. *Kaluga*, the capital of the government, is situated in 54° 30' N. lat., 36° 5' E. long., on the Oka, and has 32,345 inhabitants. It is surrounded with a rampart converted into a public walk. The streets are narrow, and for the most part consist of wooden houses. The best buildings are the bishop's palace, the residence of the governor, and the principal church. Hemp-seed, hemp, flax, linseed, honey, and wax are largely exported.

KAMENITZ. [CROATIA.]

KAMPEN. [OVERYSSEL.]

KAMTCHATKA, a peninsula projecting from the north-eastern part of Asia into the Pacific Ocean, in a direction nearly due south, lies between 51° and 63° N. lat., 155° and 165° E. long. Its length is above 800 miles, and its width varies between 30 and 120 miles. Its area is stated to be about 80,000 square miles.

Its southern extremity, Cape Lopatka, is a low and narrow tongue of land (51° N. lat.), which widens as it proceeds northward, and gradually rises into mountains. The country south of 53° 5' N. lat. is covered with hills and mountains, which are rocky and barren, and only in some inconsiderable valleys clothed with creeping cedar, willow, and stunted birch. At about 53° 5' N. lat. is a mountain-knot, whence issue two ranges, one running due north, and the other north-east. These ranges inclose the vale of the river Kamtchatka. The western range, which first runs nearly due north, declines afterwards to north-north-east, and in that direction traverses the whole length of the peninsula, joining north of it the eastern branches of the Aldan Mountains. It does not appear to contain high summits, and its mean elevation probably does not rise above the line of trees, which in this country is about 3000 feet above the sea. But the range running east of the river Kamtchatka is distinguished by several high summits, which are of volcanic origin, and most of them still are active. The highest, from south to north, are the Awatchanskaja, which rises to about 9500 feet; the Tolbatchinskaja, which attains 8346 feet; the Kliotchewskaja, the highest of all, rising to 15,825 feet; and the Shiwelutchkaja, whose highest summit is 10,591 feet above the sea-level. These volcanoes constitute the northern extremity of that extensive series which incloses the eastern coast of Asia, and, traversing the islands of Japan and the Philippines, probably has a connection with another series of volcanoes which traverses the Sunda and Molucca islands from east to west.

The mountains approach close to the eastern coast, which is composed of high rocks, rugged cliffs, and bold promontories, forming numerous inlets, the entrances to which are blocked up by reefs of rocks. The mountains are mostly covered with trees, which grow to a considerable height towards the south, but diminish in size to the northward. Numerous rocks are scattered in the sea at a distance of from one to three miles from the shores; some of them are only discernible by the breakers, while others tower up to a considerable height. The depth of the sea varies considerably and suddenly from 30 to 90 fathoms and more. Earthquakes are frequent, and sometimes very violent.

The western districts along the Sea of Okhotsk, or Tarakai, north of the mountain-knot, are uniformly low and sandy to a distance of about 25 or 30 miles inland. They produce only willow, alder, and

mountain-ash, with some scattered patches of stunted birch, and towards the north they are almost entirely overgrown with rein-deer moss. The sea is shallow to a considerable distance, and the soundings very regular. The small rivers which traverse this region have at their mouth not more than six feet at low water, with a considerable surf breaking on the sandy beach.

The best part of the peninsula is the vale of the Kamtchatka River, which towards its southern extremity is 40 miles across, but grows narrower to the northward. Its length is 180 miles. Its soil is deep and rich, composed of a black earth of considerable fertility.

Among the rivers only the Kamtchatka requires notice. It rises on the northern declivity of the mountain-knot, runs in general in a northern direction through the vale, but at Nishnei Kamtchatka, where it approaches its northern extremity, it turns east, and empties itself into a large but shallow bay, which is only 8 feet deep at high water, and in which the breakers are very violent when an easterly wind blows. It flows about 300 miles, and is the only navigable river in the peninsula.

The climate of Kamtchatka, when compared with that of Europe under the same latitude, is very severe; but it is much milder than the eastern districts of Siberia. The frost sets in about the 10th of October; but up to the middle of December the thermometer commonly varies between 23° and 27° Fahr. During the following months it averages between 14° and 20°. In very severe frosts it descends to -10° and -15°, and sometimes though rarely, to -25°. On the sea-coast vegetation does not begin before the end of April, but in the vale of the Kamtchatka, which is sheltered on all sides by mountains, it begins at the end of March. Rain is frequent in summer, and in winter a great deal of snow falls.

Agriculture was introduced by the Russians about 100 years ago. In some places on the western coast, but more extensively in the vale of the Kamtchatka River, rye, barley, buckwheat, potatoes, white cabbages, turnips, radishes, and cucumbers are grown, but these articles are only cultivated by the Russian settlers. The number of horses and cattle is on the increase. The natives formerly lived chiefly on the produce of the chase, by hunting bears, wild sheep or argalis, wild rein-deer, ermines; black, red, and stone foxes; wolves, sables, seals, and otters; but since the number of these animals has considerably decreased their time and industry are employed in fishing. In no part of the globe is fish more abundant. The natives scarcely know any other kind of food, and the bears and dogs, wolves and foxes, sea-otters and seals, water-fowl and birds of prey of various sorts, all feed upon fish. The most numerous kinds are herrings, salmon, and cod. Wild-fowl, both land and aquatic, are very numerous. Some of them are eaten; but their eggs, of which whole boats-full are easily collected, are of more importance to the inhabitants. Poultry is very scarce on account of the dogs, who devour the fowls wherever they find them. Whales are numerous.

The forests contain chiefly birch, larch, fir, and cedar-pine (*Pinus cembra*). The mineral wealth is little known: in some places there is iron-ore, and sulphur is found in the vicinity of the volcanoes.

Two native tribes inhabit the peninsula, the Kamtchatdales and the Koriakes, the former occupying the peninsula as far as 58° N. lat. The Koriakes wander through the country north of the Kamtchatdales. The Kamtchatdales are short, but stout, and broad in the shoulders: their head is large, their face flat and broad, their cheek-bones are prominent, their lips thin, and their nose flattened; their hair is black, hard, and lank; their eyes sunk in the head, and their legs thin. The Koriakes are principally distinguished from them by the smallness of their head. Both nations differ in language and in mode of life. The Kamtchatdales are hunters and fishermen, have fixed habitations, and use dogs to draw their sledges in winter. The Koriakes are a wandering tribe, subsisting on the produce of their numerous herds of rein-deer, of which the richer among them frequently possess several thousands, and their sledges are drawn by these animals. The whole population of the peninsula is stated not to exceed 5000 souls, but it seems that the wandering Koriakes are not included in this estimate. The number of Russian settlers and their descendants is said to amount to 1400, a few Cossacks included. The remainder are Kamtchatdales.

The principal place is now Pétropaulovski, built on an extensive bay [AWATKA BAY], with about 600 inhabitants. Nishnei Kamtchatka, on the river Kamtchatka, formerly the residence of the governor, hardly contains more than 100 inhabitants. Bolcheresk has a small harbour on the western coast and about 200 inhabitants.

The commerce of Kamtchatka is inconsiderable. It exports only the furs of several animals which are taken by the natives, and imports flour, sugar, colonial goods, whisky, &c., chiefly from Okhotak, and partly from Java.

Kamtchatka is a Russian province annexed to the government of Eastern Siberia, or that of Irkutak.

(Cook, Beechy, Suer, Krusenstern, and Langedorff, *Voyages*.)

KANAGA. [ALEUTIAN ISLANDS.]

KANDAHAR, or CANDAHAR, a fortified city of Central Afghanistan, and formerly the capital of the whole of that country, is situated in a fertile plain watered by the Arkand-ab, the Turnuk, and the Arghasan, tributaries of the Helmund, at an elevation of about 3500 feet above the level of the sea, in 32° 37' N. lat., 66° 20' E. long.

200 miles S.W. from Cabul, 265 miles S.E. from Herat; and has about 60,000 inhabitants, chiefly Afghans, Persians, and Hindoos. The ancient *Arachotus* stood somewhere in the same plain as Kandahar, which is also said to occupy a very ancient site. Be this as it may, the present city was built by Ahmed Shah, the founder of the Duranee dynasty of Afghanistan, in 1754. That ruler made it the capital of his dominions; but on the accession of Timur Shah in 1774 the seat of government was removed to Cabul. The city is still the capital of a small state, which is subject to the brothers of Dost-Mohammed, ruler of Cabul. [AFGHANISTAN.] The form of the city is oblong, and its plan perfectly regular; four streets meet in the centre, in a circular place 50 yards in diameter, surmounted by a dome. This is called the Chaursoo (Sharshee), and is a public marketplace surrounded by shops; the four principal streets are 50 yards in width, are lined with shops, and extend to the gates of the city. The smaller streets are narrow, but straight, and all cross at right angles. The town is well watered by canals from the Urghund, or Arkand, a tributary of the Helmund, and a small stream runs through almost every street; but nevertheless the streets are not clean. The houses are mostly built of wood, with flat or domed roofs. The mosques are numerous, but meanly built. The tomb of Ahmed Shah, covered by a gilt cupola, stands near the palace, and is held as a sacred asylum. The city is inclosed with bastioned mud-walls and a ditch, and is further defended on the north side by a citadel. Kandahar is a place of considerable manufacturing industry, and its transit trade is considerable. [AFGHANISTAN, vol. i. col. 94.] The plain round it is irrigated by canals from the rivers, and produces excellent fruits, corn, tobacco, madder, &c. The occupation of Kandahar by a British force under General Nott from 1839 to 1842 is related under AFGHANISTAN.

KANDY. [CEYLON.]

KANESVILLE. [IOWA.]

KANNSTADT. [CANNSTADT.]

KANSAS, or KANZAS, a territory of the United States of North America, established by Act of Congress 1854, occupies the country lying along the river Kansas, north of the Indian territory, and extending northward to the Nebraska River. It is bounded E. by the Missouri River, which divides it from the states of Iowa and Missouri; S. by the Indian territory; W. by offsets of the Rocky Mountains; and N. by the territory of Nebraska. Of its limits we have no very definite statement; and no census has been taken of its population. The settled population is however at present extremely small.
