March 23-07

Arrived at Victorville at 12:30 P.M.  
After making camp, I went out across  
the creosote-bush & yucca desert. Saw  
just 4 species of birds, the sage sparrow,  
the sage thrasher raven & turkey vulture. The  
first & second named species were, as  
usual very wild, tho I saw perhaps  
a dozen of each. There were about  
6 vultures & 2 ravens.

The three days have been continuously  
 raw and windy (S W). Cloud lie over the  
 Sierra Madre mts., and fine rain drops often  
 drive along with the wind, altho the sun  
 is shining. They evaporate at once, tho.  
 Have seen large numbers of cliff and tree  
 swallows going NW against the wind. Birds  
 are hard to see in the swaying foliage, and  
 lie low everywhere. Linnets are common,  
 as well as moulting intermediate sparrows (several  
 shot & caught in traps are not *l. leucophrys*);  
 several west. Lark sparrows, west. savanna sparrows,  
 and one west. vesper sparrow; a few Brewer  
 blackbirds in town. Saw several bush-tits,  
 and one nest with eggs reported; California jays  
 are common in the cottonwoods. Audubon  
 Warblers are numerous, and becoming full-  
 plumaged. Meadowlarks are singing in  
 spite of the wind. One ♂ rufous hummer,  
 and a red-shafted flicker. Horned larks,  
 10 or 12 in a flock on ground in front of store.

This morning was perfectly clear, tho frosty. There being no wind I went down thru the cottonwoods along the river. Birds didn't seem to me to be as plentiful as in midwinter two years ago. I think this largely due to the present absence of mistletoe berries. There are now no cedar waxwings, phainopeplas or solitaires to be seen. Even bluebirds are relatively scarce.

Today I saw birds as follows: -

Western Robin (Perhaps six quiet among willows & cottonwoods); Western Bluebird (few, one apparently prospecting for a nest-hole in a woodpecker tree); Western Gnatcatcher (2 pairs); Bush-tit (few); Dwarf-hermit Thrush (6 or more on ground or drift along river);

Ashy Kinglet (not over 6); San Diego Wren (?) (2 or 3 pairs in drift snags); Parkman Wren (1 in full song); West. Yellowthroat (very common in "sage" brush + snags - 25 or 30 seen + heard; evidently in full migration); Toluie Warbler (2 or 3 seen plainly, + other notes heard); Audubon Warbler (common); Golden Pileolated Warbler (1 shot = only one seen); Song Sparrow (scarce, not more than 3 seen or heard); West. savanna sparrow (several in alfalfa patch); Lawrence Goldfinch (several feeding among cottonwood catkins); Brewer Blackbird (common in pasture); Red-wing Blackbird (half-a-dozen along slough); Cabanis Woodpecker (several); Willow Woodpecker (5 shot the only one seen - not found 2 years ago); Red-shafted Flicker ("singing" loudly); Killdeer (several in pasture); Black-crowned Night Heron (one flushed from margin of willow-slough); Mourning Dove (a pair seen in about same place by railroad every day); Western Red-tail Hawk (2); Cooper Hawk (1 pair, with nest 35 feet up in cotton wood complete but with no eggs yet); 1 sparrow hawk; Turkey Vulture (several); Am. Raven (1 pair); Black Phoebe (2); Violet-green Swallow (8 or 10).

This afternoon I went out into the desert. Saw many sage thrashers. They have an individuality in posture & flight which distinguishes them from any other species I ever saw. They always fly up to the top of the bush after running along the ground between bushes. They fly lots more than a Parula Thrasher, and are very shy. Saw 2 or more Black-throated Sparrows, many Western Lark Sparrows, Intermediate Sparrows, several small scattering packs of horned larks. a flock of a dozen white-throated swifts were flying around the cliffs at the narrows this evening. Saw a pair of rock wrens there, too.

It is eight o'clock P.M. Camp, Tufts, and Jones have just returned from a long tramp

this afternoon. They went to the rocky hill on the other side of the river to lay for ravens. They wandered along to the northward over the next hill, watching the actions of three ravens. Finally they saw the three ravens circling around a certain large boulder on a certain hill when one suddenly ducked in, settling in a ledge. The others kept on circling. So the boys went up toward this hill and Camp noticed the raven fly out from this ledge. Finally they were able to climb up above the ledge and Camp clambered down thru a crack so as to get a view of it. What was his delight to find five large blue raven's eggs in plain sight! But they were out of reach. ~~But~~ A forked stick was rigged up with a handkerchief and the eggs were secured, however, in spite of the obstacles. Five handkerchiefs served as egg-cases, and the precious eggs were safely carried home in the boys' hands.

The boys also report seeing a roadrunner and several jacks. Tufts shot a black-throated sparrow with his rifle in the breast, which I stuffed.

This morning Camp caught another ~~skunk~~ Mephitis. A fat old male. This skunk

appeared to be a veteran, for one of his feet was entirely gone, and he had to walk on a stump. His skull was cracked and he was fat so I did not put him up.

It is still warm weather; have seen no reptiles, but ants <sup>and flies</sup> are beginning to "get busy" and mammals quickly decay.

Today we have been for a good long walk out on the desert. This is the first really warm day we have had. Insects and lizards have been very active today, and we secured several very interesting kinds of lizards. We picked up a turtle a mile and a half from the river at least, and up on an exposed side of the hill where it was very warm and dry. Almost every rock had its lizard. We secured one snake.

Mammals are exceedingly active, and we are having very good success with our traps. We catch mostly *Neotoma desertorum*, *Perognathus bangsi*, and *Dipodomys merriami*.

The purpose of our trip was to secure a

raven. Tho we did not get one, we thought that our lizards compensated for that. Furthermore, we examined two raven's nests. The most abundant birds on the rocky parts of the desert were the black-throated sparrow, with occasional linnets, rockwrens, and intermediate sparrows. We saw one pair of turkey buzzards. Probably they are nesting somewhere. We saw several ravens, but did not get any good shots at them.

One of the nests we examined was the one from which the boys got the set of five eggs. This nest is located on a cliff of decomposing granite, on a ledge perhaps thirty feet above the level of the hill upon which the granite rock or cliff is located. It is composed of a great heap of sticks and the lining was soft. It appeared to be rabbit-fur. Above the nest the cliff overhangs so that access to it would be impossible were it not for the fact that there is a crack or rift down which one may clamber to within a few feet of it. This morning (the boys took the eggs yesterday) the nest was all torn to pieces. Probably the disappointed ravens destroyed it.

William Trifts discovered an old raven's

nest on another rocky cliff across a canyon to the east of this one. This nesting site was in almost an identical situation, on a ledge under a beetling cliff. Camp was finally successful in looking into it. It was constructed of large sticks, and located twenty or twenty-five feet above the level of the hill.

1989 " " ♀

Today has been a very windy day. It started out cloudy, and gradually the wind increased in velocity. It is, however, a very warm wind. This afternoon a few scattering rain-drops fell.

Bullock's orioles are much in evidence. We yesterday saw two males with one female busily looking over the cottonwoods in front of the house. Vigors' wrens are now in full song. I heard and saw both *Astragalinus psaltria*

and Astragalinus lawrencei up in the rocks this afternoon. We captured a Geococcyx californianus in a steel trap. Black-throated sparrows, rock-wrens, say's phoebe, ravens, and various hawks were observed. The white-throated swifts at the narrows make a great fuss all the time over their nest-building. William Traft shot a large black <sup>water</sup> bird with a very long hooked bill and totipalmate feet. He called it a hell-diver. The lagoons about here teem with various water birds.
