BOCK, JEAN-NICOLAS-ETIENNE, baron de, born at Thionville in 1747; died at Nelon in 1809. Bock emigrated at the time of the Revolution, settled at Anspach, where he supported himself by tuition, and by translating German books into French. After ten years of exile his name was erased from the list of emigrants. He was afterwards appointed conseiller de prefecture at Luxemburg, where he found leisure to pursue the study of literature. He has left several works on subjects connected with history and archæology, and tracts of his, many of them in German, are printed in the transactions of learned societies. Among these the most interesting are those on Persian antiquities and literature.—J. A., D.

BOCK, JEROME, in Latin TRAGUS, was a German botanist of the seventeenth century, who published at Strasburg, a *Krauterbuch*, or description of indigenous German plants.—J. H. B.

BOCK, KARL AUGUST, a distinguished German physician and anatomist, born at Magdeburg in 1782. He studied medicine at Leipzig, and occupied the position of prosecutor in the university of that city up to the time of his death in 1833. His principal works are—a "Description of the Fifth Pair of Nerves;" a "Manual of the Practical Anatomy of the Human Body;" a treatise on the "Nerves of the Medulla Spinalis;" and "Anatomico-Chirurgical Tables," a work which was completed by his son.—W. S. D.

\* BOCK, KARL ERNST, son of the preceding, born in 1809, professor in the Faculty of Medicine at Leipzig, and author of several anatomical works, of which the principal is a "Manual of Pathological Anatomy."—W. S. D.

BOCKENBERG, PIERRE VAN, better known under the name of PETRUS CORNELISSONIUS BUCKENBERGIUS, a Dutch chronicler, born in 1548; died in 1617. Author of "Prisci Bataviæ et Frisii Reges," 1589, 12mo, and other works on the history of the Low Countries.

BOCKHORST, JOHN VAN, surnamed LONG JOHN, was born at Munster in 1610, and studied under the robust Jordaens, under whom he became a distinguished portrait and historical painter, sometimes imitating Vandyck. His pictures are to be found in Flemish churches, and stand high there. His colour is sometimes of the mellowed apple, Rubens' style; he drew women gracefully; his pictures have force and harmony, and his management of the chiaro-scuro produces an agreeable effect. Pilkington mentions good works by lanky John at the church of St. James in Ghent—a "Martyrdom;" and another Ghent church rejoices in an "Annunciation," inscribed 1664.—W. T.

BOCKHORST, JOHN VAN, perhaps a descendant, was born at Deutekom in Holland in 1661; studied under fluttering Kneller, went to Germany, returned, and died in 1724. He painted history well, but excelled in portraits and battles.—W. T.

BÖCLER, JOHANN HEINRICH, an erudite German historian, born at Cronheim in Franconia in 1611; died in 1692. In his twentieth year he was appointed to the chair of eloquence at Strasburg; in 1648, on the invitation of Queen Christina, he removed to Upsal, where he was appointed professor of eloquence and royal historiographer; and afterwards filled a chair of history in the former university, the state of his health having obliged him to leave Sweden. His extraordinary reputation for scholarship procured him the honour of being created count palatine by the emperor, Ferdinand III., who, to compensate him for declining a pension of 2000 livres offered him by the court of France, made him an annual allowance of 600 rix-dollars. He was not only admirably skilled in classical literature and in Hebrew, but boasted a profound acquaintance with history, politics, and law. Besides editions of a number of Greek and Latin authors, poets as well as historians, he published an immense number of historical dissertations, which, together with his miscellanies, were collected into four volumes, quarto, at Strasburg in 1712. His "Bibliographia Critica" appeared at Leipzig in 1715.—J. S., G.

BOCOUS or BOCCUCI, JOSÉ. This dramatist was born at Barcelona in 1775. He studied at Murcia and Bologna, in which last city he lectured on ancient history. Having taken out his degree of A.M., he went to Milan and studied Italian literature; from thence he proceeded to Padova and edited two periodicals, the *Encyclopedia* and the *Literary Gazette*. His poetical compositions procured him the admission into many academies. Being anxious to enter on the military career he returned to Spain, and was devoting his time to the study of mathematics when France declared war against Spain. Bocous got immediately his commission, and under the generals Ricardos, La-Union, and Urritia, he made the campaigns of 1793 and 1794, in which he was wounded several times. At the termination of the war Bocous went to Madrid and wrote several plays, which were successfully represented on the stage. He travelled afterwards through the south of France and Italy, and collected many informations and documents connected with the history of those countries, which, it is to be regretted, have not yet been published. Bocous was in Florence when war broke out anew against Spain. By order of the French government, which then ruled over that duchy, he, together with other Spanish subjects residing in Florence, was arrested and sent to Dijon, in which city he was obliged to give lessons in modern languages to provide for his subsistence. Bocous asked and obtained the permission of going to Paris, where he fixed his residence, and spent all his time writing on literary subjects, either in Spanish, Italian, French, or Portuguese, being quite familiar with all these languages, in which he has left many valuable works, of which the principal are—"Raccolte di varie poesie," "Los Genios opuestos," and "Amelie et Clotilde," a novel written in classic French. He also furnished many articles on Spanish and Portuguese writers to the *Biographie Universelle*, and continued the *Historical Dictionary of Zeller*, as also the *Historical Account of the French revolution*, which stands as the prologue to the supplement of Zeller's Dictionary. It is to be regretted that nothing is known about this polyglot author's death. We are only certain that he was alive in 1821, the year in which was published the *Biographie Nouvelle des Contemporains*.—A. C. M.

BOCOTHOR, ELLIOUS or ELIE, born at Siout in Upper Egypt in 1784; died in 1821. In the French expedition to Egypt he joined the army in the capacity of interpreter. In 1819 he was named professor of Arabic, succeeding in this office Raphael, a Syrian priest, connected with the *Bibliothèque du Roi*. Bocothor died within two years of his appointment. He published some grammatical works connected with the duties of his professorship, and left in manuscript a French Arabic dictionary, which has passed through two editions, 1829, 1848, under the care of Caussin de Perce Val.—J. A., D.

BOCZKAI, STEPHEN, a patriotic noble of Transylvania, the leader of the revolt of the protestants of his native country in 1604 against the intolerable yoke of Austria. A prior attempt in 1603 to regain their independence had been unsuccessful, but Boczkai utterly routed the imperial general Belgiojoso, and drove him from the country. The victorious leader was immediately elected to the throne by the assembled states of the principality. In the following year he overran Upper Hungary, and having entered into a league with the Turks, received a firman from the sultan creating him king of that country, to be held as a fief of the Turkish empire. He was accordingly crowned on the plains of Rakosch, near Buda, in the presence of the vizier and the pashas of Buda and Temesvar. His avowed intention was to establish the independence of Hungary and the security of the protestant religion, and he contemptuously refused to listen to the overtures made to him by the court of Vienna. But peace having been concluded between the Porte and Austria, Boczkai was obliged to lay aside these lofty projects and to conclude a separate peace with the emperor, by which he consented to remain satisfied with the rank of hereditary prince of Transylvania, with the reversion to Austria in failure of his male line. The liberties of Hungary, however, and the free exercise of the protestant religion, were solemnly guaranteed by the emperor. Boczkai died without issue December 30, 1606, in the fifty-first year of his age, about six months after the conclusion of this treaty, not without suspicion of poison. "He died," says old Knolles, "to the great sorrow and grief of all the people in generall, who had him in great honor and regard. He was honorably descended, and a man of great spirit, ambitious, wise, and politicke; a great lover of his country, but an extreme

enemie unto the Germans and their government in Hungarie." (Knolles' *Hist. of the Turks*; Rose.)—J. T.

BOD, PETER, an eminent Hungarian scholar, was born at Felscho-Czernatow in Transylvania, in 1712. He was professor of Hebrew, and a profound theologian. He died in 1768, having left learned works in his native tongue. Amongst them are the "History of the Bible," and a Hungarian dictionary. He also wrote some treatises in Latin.—J. F. W.

BODARD DE TEZAY, NICOLAS-MARIE FELIX, born at Bayeux in 1757; died at Paris in 1823. His early years were occupied altogether with poetry; in other words, he was what the world calls an idler. In 1792 he was employed in one of the public departments, and continued in subordinate government situations for many years. When M. Laumond was sent as consul to Smyrna, Bodard acted as vice-consul there. In some negotiations with the police, he is said to have conducted the affairs intrusted to him with intelligence and skill. During the French occupation of Naples he was what they called commissaire, or civil administrator; he was afterwards consul-general at Genoa—this terminated his official or diplomatic career. A number of works, chiefly dramatic, the names of which we need not give, were published by him between the years 1783 and 1790; and poems, one of which is an ode on electricity crowned at Caen, appear with his name, scattered through the French journals of the day.—J. A., D.

BODDAERT, PETER, a Dutch physician and naturalist of the last century, was born in Zealand about the year 1730; and died toward the end of the century. He studied and took his degree at Leyden, and then established himself at Flushing. On the death of his intimate friend, Albert Schlosser of Amsterdam, in 1769, Boddaert continued the description of the most remarkable objects in his collection of natural history. Boddaert published translations of the "Elenchus-Zoophytorum" and "Miscellanea Zoologica" of Pallas into Dutch; and of the Natural History of the Teeth by John Hunter, into Latin and Dutch. He was also the author or translator of several other memoirs on various subjects in medicine and natural history.—W. S. D.

BODÆUS A STAPEL, JOHN, a Dutch botanist, died in 1636. He studied medicine at Leyden, and had Vorstius as his botanical instructor. After his death, his "Commentaries on Theophrastus" were published by his father.—J. H. B.

BODARD, PETER HENRY HIPPOLYTE, a French medical man and botanist, lived at the beginning of the present century. He took his degree at the university of Pisa, and afterwards practised as physician in the department of the Seine. Besides some medical memoirs, he wrote a "Course of Comparative Medical Botany;" "A View of Exotic Medicinal Plants;" "Monographs on Veronica Cymbalaria;" on "Chamomile;" on "Tussilago Petasites;" and on "Hypocarpogean Plants."—J. H. B.

BODE, CHRISTOPH AUGUST, a German orientalist, born at Wernigerode in 1722, and died in 1796. He was a pupil of Steinmez at Kloster-Bergen, and of Hebenstreit at Leipzig, particularly distinguishing himself as a linguist under both these celebrated masters. In 1747 he began a course of lectures on the text of Scripture and on Hebrew grammar at Halle, whence he removed in 1754 to Helmstaedt, where he occupied the chair of oriental languages till his death in 1796. He published "Nov. Test. ex versione Æthiopicæ interpretis," 1752-55.

BODE, JOHAN ELERT, a celebrated German astronomer, born at Hamburg in 1747; died at Berlin in 1826. Until his seventeenth year he shared with his father the management of a commercial academy in his native town, devoting his leisure with great ardour to the study of mathematics and astronomy. His first observations of astronomical phenomena were made with the help of a telescope of his own construction; and although until, in his nineteenth year, chance brought him acquainted with Professor Busch, who lent him his books and instruments, he possessed few advantages for the cultivation of his favourite science, at that age he could calculate with precision the courses and eclipses of the planets. In 1768 he published an elementary treatise, entitled "Anleitung zur Kenntniss des gestirnten Himmels," which had great success; and in the same year drew the attention of the scientific world by his dissertation on the expected transit of Venus, June 3, 1769. In August of that year he discovered, in the constellation Taurus, a comet, the return of which he calculated for the following October, thus making known the first example of a comet with a short period. Soon afterwards Frederick II. called him to Berlin, where he

became a member of the Academy of Sciences. In 1724 appeared his Ephemerides of Berlin (Astronomische Jahrbucher), the atlas of which, as it appeared in the second edition of the work, published in 1828, consisted of twenty sheets, on which were indicated the positions of no fewer than 17,240 stars. A very remarkable law of the planetary system, which, although it had previously engaged the attention of Kepler, is generally known under the name of this discoverer, may be thus stated: Taking as 4 the radius of the orbit of Mercury, we have for the radii of the other planetary orbits  $4 + 3$  (Venus),  $4 + 2 \times 3$  (the Earth),  $4 + 4 \times 3$  (Mars),  $4 + 8 \times 3$  (Ceres),  $4 + 16 \times 3$  (Jupiter),  $4 + 32 \times 3$  (Saturn),  $4 + 64 \times 3$  (Uranus); that is to say, as we recede from the sun in the planetary system, we find the intervals between the orbits double, or nearly double,—the interval, for example, between the orbits of the Earth and Mars nearly double of that which separates the orbits of Venus and the Earth, and the interval between the orbits of Saturn and Uranus nearly double of that observed between Jupiter and Saturn. The anomaly, which, on the first publication of Bode's law, presented itself in the enormous interval between Jupiter and Saturn, the discovery of the telescopic planets in the course of the present century has completely accounted for; and there now remains only one exception to be noted against the law of double intervals, namely, that the distance of Mercury from the orbit of Venus is almost equal to the whole of the two orbits of Venus and the Earth, while, by the theory under consideration, it ought to be no more than a half. In view of this difficulty, it has been proposed to give the law a slightly altered form; but to sacrifice its simplicity for the purpose of getting rid of a seeming anomaly, which, to say the most of it, is no more formidable than that which recent discoveries have reduced under rule, would seem to be wholly unnecessary. Bode for half a century was at the head of European astronomers. In honour of his patron, Frederic the Great, he gave the name of Friedrich's Ehre (Frederic's Glory) to a group of stars in the neighbourhood of Cepheus and Cassiopeia. Besides the works above mentioned, he published "Uranographia, or Great Celestial Atlas" (in Latin), Berlin, 1801, and "The Solar Planetary System," 1788. By the former work, an addition of upwards of 12,000 stars was made to older catalogues.—(*Nouv. Biog. Univ.*)—J. S., G.

BODE, JOHANN JOACHIM CHRISTOPH, a distinguished German translator, was born at Brunswick, January 16, 1730; and died at Weimar, December 13, 1793. His translations of the Sentimental Journey, 1763; Tristram Shandy, 1774; Tom Jones; the Vicar of Wakefield, &c., are indeed classical performances, and still enjoy a well-earned fame.—(See K. A. Büttiger, Bode's *Literarisches Leben*. Berlin, 1796.)—K. E.

BODEGA Y QUADRA, DON JUAN FRANCISCO, a Spanish navigator, whose name conjoined with that of Vancouver, has been attached to one of the largest islands on the American coast, Quadra and Vancouver's island, was born towards the middle of the eighteenth century. From an account of his voyages preserved in MS. in the library of the French marine, it appears that he had taken possession of the coast opposite the island about the year 1775, and in 1790 had founded Nootka. His death occurred at San Blas in 1794.—J. S., G.

BODENSCHATZ, JOHANN CHRISTOPH GEORG, a German orientalist, born at Rof in 1717; died in 1797. His knowledge of Jewish antiquities was remarkable, and he applied it ingeniously to the elucidation of the scriptures. He wrote "Kirchliche Verfassung der heutigen, sonderlich der Deutschen Juden," 1748-9, and a work in which he applied his knowledge of Jewish antiquities to the interpretation of the New Testament.

\* BODENSTEDT, FRIEDRICH MARTIN, a German poet, born at Peine, kingdom of Hanover, April 22, 1819; was bred to the mercantile profession, but relinquished it in order to follow the poetical and literary bent of his mind. In 1840 he became domestic tutor to the family of Prince Galitzin at Moscow; and in 1844 undertook the management of an academy at Tiflis. He then visited Asia Minor, the Crimea, &c., and went home in 1846, where he became editor of the *Austrian Lloyd* at Trieste, and afterwards of the *Weser-Zeitung* at Bremen. He now lives at Munich. His poetical works are—"Gedichte;" "Die Lieder des Mirza-Schafly," 5th ed.; "Ada, die Lesghierin;" "Demetrius, a historical tragedy," &c. Among his prose works rank first: "1001 Tag im Orient" (translated into English by Waddington, London, 1851), and "Die Völker des Kaukasus." He has also

translated the poetical works of Alexander Puschkin, 3 vols., and has just now begun the publication of a comprehensive work on Shakspeare's contemporaries and their works.—K. E.

**BODENSTEIN, ADAM VON**, a German physician and alchemist of the sixteenth century, was born in 1528. He was a zealous disciple of Paracelsus, whose alchemical works he translated into Latin, and whose theories he developed with great ardour at Basle, where he was professor of medicine. After living an intemperate and vagabond life, he died of the plague at Basle in 1577, notwithstanding his employment of the preservative recommended by Paracelsus. His attention was strongly directed to the discovery of the philosopher's stone, in behalf of which he addressed an epistle to the celebrated bankers, Fugger of Augsburg. His writings were collected and published at Basle in 1581, in one folio volume.—W. S. D.

**BODEKKER, JOHN FRANCIS**, a portrait painter, born at Cleves in 1660. He was the son of a musician, and studied under John de Baan. He received great encouragement at Bois le Duc, Breda, Amsterdam, and the Hague, and died in 1727.

**BODEL, JOHN**, a troubadour, a native of Artois, lived in the latter half of the thirteenth century. He took part in the first crusade of St. Louis, and in 1269 was about to accompany this king on his second expedition, when he was attacked by leprosy, and took a most affecting farewell of his fellow-countrymen. He composed a dramatic piece on the life of St. Nicolas, bishop of Wyse. This piece is one of the oldest specimens of the language in which it is written; unfortunately the most obscure and barbarous of the romance dialects.—J. G.

**BODEWYNS, NICOLAS**, and **BOUT, FRANCIS**, friends who worked together. The latter was born at Brussels in 1660, and died in 1700. Bodewyns painted landscapes, and Bout figures. Bout sometimes painted alone—winter pieces and sea-shores, with statues, and fish-markets, and weddings, the figures small and neat. The Beaumont friend of this Dutch Fletcher took to himself the Flemish manor-houses, to which Bout added fetes and feastings. Bout sometimes etched in a light pleasant manner. Their colouring is generally agreeable, and their touch light and neat, the figures handled with some of the freedom of Velvet Brenghel. Sometimes they are slight, careless, and hasty. The smallest are the most valuable; the deer and cattle are well drawn and disposed.—W. T.

**BODIN, JEAN**, born at Angers, 1530; died at Laon, 1596. He was educated at Toulouse, where he first thought of establishing himself as a teacher of jurisprudence. He then went to Paris intending to practise at the bar, but did not succeed in obtaining business. He published in 1555 a translation of Oppian into Latin verse, with a commentary, in which he was said to have made more use of Turnebus' notes than he ought. In 1576 he published in French the "Republique," the work by which he is most favourably known. It is a book of considerable value. Montesquieu is said to have been indebted to it and to Bodin's work "On the Study of History," for some of his speculations with respect to the effect of climate on political institutions. The book, though calculated to deter the indolent modern reader, every now and then reappears, and seems to have some influence on students. At the close of the last century, Condorcet and Peysonel published an interesting account of it. In our own days it has been referred to with praise by Dugald Stewart, and been carefully analysed by Hallam and Lerminier. The author, a man of great and sound, if not very various learning, is in his work much more than a compiler of authorities; he thinks out his subject thoroughly, and does not, like Grotius and his followers, seem oppressed by the rusty armour in which the literary warriors of that day were clad. Lerminier's analysis gives probably the best modern account of the book, as he gives large extracts, in all of which there is great generosity of sentiment and justness of thinking. The passages in which he reprobates slavery, would seem to be cast in the mould of the thinkers of our own day. The relation of subjects to their sovereign is also examined in a spirit the most remote possible from faction,—in the spirit of one who feels what freedom essentially is, and who has but little sympathy with those of whom Milton speaks—

"License they mean when they cry liberty,  
For who love that must first be wise and good."

Bodin is described by M. Baudrillart as borrowing from Aristotle without confessing his obligation. This accusation is made too broadly. The works of Aristotle were known so familiarly

in Bodin's day, as to preclude the necessity of formal reference, and Bodin's theory of government differs essentially from Aristotle's. Bodin's "Methodus ad facilem Historiarum Cognitionem" was an earlier work; it does not enjoy the same reputation as his "Republique," but it is not without its value, and is one of the books which D'Aguesseau advised his son to study. The "Republique" was followed by a law book, "Juris Universi Distributio," and, within a year or two, by his "Demonomanie des Sorciers," a book more suited to the popular feeling, and in which Bodin advocated the burning of witches and wizards with such zeal as to make us feel surprised at his general orthodoxy being a matter on which grave doubts were entertained. Perhaps, however, his mention in this book of having been attended from the 37th year of his age by a familiar spirit may account for the suspicion. The friendly demon touched his right ear whenever he was about doing anything which conscience did not approve, and made himself felt on the left ear when Bodin meditated anything good. Passages from Job and Isaiah and from the Psalms, are quoted by him to prove that spirits indicate their presence not alone by vocal utterance, but by their touching, and at times pulling men by the ear. The gift, however, of an attendant spirit making himself thus palpable, is one very unusual, and was vouchsafed to Bodin only after long periods past in prayer and meditation, and in the constant study of the bible, with the earnest desire of discovering which of the many religions of mankind was the true one. He was able to distinguish dreams in which his attendant spirit communicated to him the commands or the warnings of heaven, from the mere fumes of ordinary sleep, by the fact, that awaked, as he believed, by his angel at about three o'clock in the morning, he used to lie awake, chanting the psalms, most of which he had by heart. When after this he slept, he felt that his dreams were from heaven.

Bodin was conseiller to the duc d'Alençon, and from him had some valuable appointments. He past into the service of Henry III. of France, but royal favour is capricious, and we find Bodin again with the duke on more than one visit to England, when some matrimonial speculations of his or Elizabeth's brought that prince in the character of what would seem a favoured suitor to the court of the mature virgin queen. Bodin visited Cambridge, and found that his book, "De Republica," had been translated into Latin by some Englishman, and that it was referred to in their lectures by some tutors at Cambridge. This led him, on his return to France, to translate it into Latin, the form in which it is most pleasant to consult it. We have read the book, and think it merits all the praise bestowed on it. The book is altered and enlarged in the Latin translation. A chapter or two of the original is omitted in the translation, and there are some important additions, particularly in the fifth book, on the varieties of government as adapted to different nations. In the fourth book is a curious chapter, in which he enters into astrological inquiries with the view of ascertaining whether the fate of kingdoms can be foreseen, by examining the horoscope under which their capital cities were built. Of Bodin's works, one, which remained in manuscript till 1841, "Heptaplomeres, sive Colloquium de abditis rerum sublimium arcanis," was extensively circulated in manuscript. Grotius obtained a copy for the purpose of answering it; the reputation of its being an infidel tract suggesting the fitness of its being placed in his hands. It is a dialogue between believers of different creeds, each vindicating his own, and a sceptic, who resists all. The sceptic represents pure theism. Bodin was sent from his department deputy from the tiers état to the parliament of Blois. He was what would be called in the language of modern politics a liberal. He resisted some objects of the crown, and was in consequence deprived of a lucrative office which he held during the royal pleasure. He died of the plague at Laon in 1596, directing in his will that he should be buried in the church of the Carmelites. Bodin lived at a period when we are to regard little the accounts which learned men give of each other's religion. In spite of his zeal against witches and all familiar spirits except his own, Bodin, in his greater works, preaches toleration to prince and people; and it would seem that he required the indulgence which he was disposed to give. He is said by Mercier to have been a Carmelite in his boyhood, by De Thou to have been for a while a Calvinist, and a correspondent of Scaliger enters into serious details with the object of proving him a Jew. He died in poverty, leaving a daughter who became insane, and who is mentioned as having lived to a great age.—J. A., D.

**BODLEY, SIR THOMAS**, founder of the Bodleian Library. Few names demand more respectful mention in a work so much occupied as the present with bibliographical references, than the name of the generous and accomplished Englishman, whose untiring labours in collecting and arranging the literary treasures of his country are attested by so magnificent a monument as the great library of Oxford. Sir Thomas Bodley was born in 1545 at Exeter, where his father, John Boadley, or as he spelled the name, Boadleigh, the descendant of an opulent Devonshire family, was then residing. John Boadley being a known enemy to popery, shortly after the commencement of the reign of Queen Mary, found it convenient to exchange his residence at Exeter for a safer one at Geneva, and accordingly arrived in the latter town with his family in 1557. Here Thomas, who had previously learned grammar, attended lectures on Hebrew and Greek, and those of Calvin and Beza on divinity, manifesting for these studies remarkable talents and enthusiasm. The family having returned to England on the death of Queen Mary, he was entered at Magdalen college, Oxford, in 1559; shortly after was received B.A.; and in 1563 was elected fellow of Merton college. In 1566, after earning considerable reputation by reading lectures to his college on the Greek language, he proceeded M.A.; next year read natural philosophy in the public schools; and in 1569 served the office of junior proctor. In 1583 we find him employed on a mission to the king of Denmark, the duke of Brunswick, and other German princes; some time afterwards intrusted with an embassy of great secrecy and importance, which resulted, as a state communication from the great protestant princess to Henry III. could not fail to do, in advantage to the protestant party in France; and still later, in charge of English interests at the Hague, which he did not finally quit till 1597. On his return to England, Burghley recommended him for secretary of state; but his claims to that high distinction having also been urged by Essex, the former withdrew his patronage, and Bodley, disappointed of a reward to which his diplomatic services had fairly entitled him, retired altogether from the arena of politics, carrying with him, however, a determination to make himself useful to his country in a private station. That determination, as he says himself, at last took the shape of setting up his staff at the library door of Oxon, and of endeavouring to reduce that place, which then in every part lay ruined and waste, to the public use of students. When in 1598 he set about the accomplishment of this toilsome work, in consequence of the desolation which attended the wars of the Roses, still more of the Vandalism which marked the period of the Reformation, and yet more of the worse Vandalism of theftuous visitors, all that remained of the ancient library of Oxford was so insignificant a part of the riches bequeathed to it by Roger Lisle, Humphrey of Gloucester, and others, as to be at once an insult to their memory and a reproach to the nation. In 1602 the task which Bodley had assigned himself, and which, as Camden says, "would have suited the character of a crowned head," was so far advanced, that 2000 volumes having been deposited in the library and duly catalogued, a solemn procession of members of the university was ordered, to mark so important an epoch in its history. After this period the literary stores of Oxford increased so rapidly, that a larger building was required for their accommodation, and of this Bodley, who had shortly before been knighted, had the satisfaction of laying the foundation-stone. Before its completion, however, his honourable and useful life closed at his house in London, January, 1617.—J. S., G.

**BODMER, JOHANN JACOB**, a celebrated German critic and poet, was born at Greifensee, near Zurich, July 19, 1698. At an early age he became conversant not only with the ancients, but also with the classical poets of France, England, and Italy, and thus was awakened to a sense of the low state of German literature, and of its want of sound criticism. Both by his critical writings—"Discourse der Maler;" "Kritische Briefe," &c.,—and his able editions of old German poetry—the "Nibelungen," and the "Manesse Collection of the Minnesingers,"—he greatly improved the prevalent taste of his countrymen, and rendered such important services to German literature, that he is justly reckoned one of the forerunners of its golden age. He and his friends, Bretinger, &c., are distinguished by the name of the Swiss school, and are particularly famous for their controversy with Gottsched, the head of the Saxon school. His own poetical writings, of which only the "Noachide," an epic poem, is worth mentioning, are deficient in elevation and imagi-

nation. He died at Zurich in 1783, where he had been professor of history and member of the great council.—K. E.

**BOECE** or **BOYCE, HECTOR**, a Scottish historian, born at Dundee about the year 1465. He received the first rudiments of learning in his native town, and completed his education in Montague college, Paris, where he took the degree of A.M. in 1494. Three years later he was appointed professor of philosophy in the same college. Here he gained the friendship of a number of learned men, among others of the celebrated Erasmus, who kept up a correspondence with him, and as a mark of his regard, dedicated to him a catalogue of his works; he calls Boece "vir singularisingenii felicitatis et facundioris." On the establishment of King's college, Aberdeen, by Bishop Elphinstone, Boece was induced to resign his professorship, and to accept the office of principal of the new seminary. His zealous efforts, combined with those of his coadjutor William Hay, his fellow-student both in Scotland and France, contributed greatly to promote the cause of learning and education in the northern districts of the country. In 1522, Boece published his first work, the "Lives of the Bishops of Mortlach and Aberdeen, from 1015 down to 1518." One-third of the work is occupied with the biography of his friend, the excellent Bishop Elphinstone. Five years later appeared Boece's most famous work, "The History of the Scots." The publication of Major's history in 1521, is supposed to have led Boece to undertake a similar work. He professes to have found in the monastery of Icolmkill, the writings of certain Scottish historians, among others, of Veremundus, archdeacon of St. Andrews, and Cornelius Campbell, and to have made these the groundwork of his history. Bishop Stillingfleet, however, alleges that these authors and their writings never existed, save in Boece's fertile imagination, and it is at least certain that not a single vestige of their works is now to be found. Boece's object seems to have been to clothe the rude chronicles of his native land in a classical dress, and to embellish the meagre lists of its fictitious kings with what he considered suitable characters and actions, without the slightest regard to facts. According to Bishop Lloyd, he put Fordun's tales "into the form of a history, and pieced them out with a very good invention—that part in which he chiefly excelled." His work, indeed, which once enjoyed a high reputation, and undoubtedly displays great command of the Latin language, is now remembered only as a receptacle for the wildest of the fables which used to be authoritatively received as a faithful record of the early history of Scotland. In justice to Boece, however, we must not pass unnoticed the ardent patriotism and love of freedom, which his work displays throughout. It has been well remarked by Maitland, that, "in forming a final estimate of the literary character of Boece we must bear in mind that when scholarcraft—in this country at least—was rare, he was a scholar, and contributed by reviving ancient learning to dispel the gloom of the middle ages; and that while the history of his country existed only in the rude pages of the chroniclers who preceded him, or in the fading records of oral tradition, he embodied it in narrative so interesting, and language so beautiful, as to be worthy of a more refined age." In 1527, the year of the publication of his history, James V. bestowed upon Boece a pension of fifty pounds, which apparently was doubled two years later. He was also appointed a canon of Aberdeen, and subsequently rector of Fyvie in the same county, which preferment he held till his death in 1536, when he must have attained the age of threescore and ten. Bellenden's translation of Boece's history was published in the same year. The learning and ability of Boece seem to have been highly appreciated by the citizens of Aberdeen, for in 1528 the magistrates voted him a present of a tun of wine when the new wines should arrive, or, according to his option, the sum of twenty pounds Scots, "to help to buy him bonnets." His brother Arthur, a doctor of canon law, and a licentiate in civil law, held the office of professor of canon law in King's college, while Hector was principal. He was the author of a book of excerpts from the canon law.—(*Irving's Literary Scotchmen of the last four centuries*, vol. i.; *Maitland's Biog. Introduction to Bellenden*)—J. T.

\* **BOECKH, AUGUST**, one of the greatest living philologists, was born at Karlsruhe, November 24, 1785, and studied at Halle under F. A. Wolf. As early as 1807 he was appointed professor extraordinary, and two years later professor ordinarius, at Heidelberg. In 1811 he was called to a chair at Berlin. The results which for more than half a century have been flowing from his lectures, his writings, and his example, have been most

extensive and most beneficial. The several branches of antiquarian lore which formerly had laid claim to the name of philology, have been united by Boeckh into one organic structure. Philology, according to him, is the systematic knowledge of everything that has been known; it is the learned revival of a nation's life in all its bearings upon public and domestic affairs, upon history and politics, upon religion, literature, science, and arts. This definition, of which Boeckh has given an outline in the Transactions of the German Association of Philologists, Berlin, 1850, engaged him in a protracted controversy with the Saxon school of philologists, and particularly with the celebrated G. Hermann, who pertinaciously stuck to what is now generally considered a misconception, that the true aim and office of philology was the art of elucidating and correcting the texts of the ancients. Boeckh has given ample proofs of the import of his theory in his own works. In his edition of Pindar he has not only admirably corrected the text of this author, but at the same time laid down a new theory of ancient versification. His "Political Economy of the Athenians," translated into English by Lewis, London, 1828, and his "Corpus Inscriptionum Græcarum," which he edited together with Joh. Franz for the Berlin Academy, are works of vast erudition and admirable critical acumen. Among the other productions of his pen, deserve to be mentioned—"Metrologische Untersuchungen;" "Urkundee über das Attische Senwesen;" "Manetho und die Hundsternperiode;" his edition of the Antigona of Sophocles; and his academical speeches.—K. E.

**BOECKH, CHRISTIAN GOTTFRIED**, a German educational writer, born in 1732 at a village near Nördlingen, became deacon of the principal church in that town. By the publication of a weekly journal, devoted to a discussion of questions connected with popular instruction, and by such works as his "Journal for Children," 14 volumes, 1780-83, and his "Chronicle for Youth," 4 volumes, 1785-88, he materially influenced the progress of education in Germany. Died in 1792.—J. S., G.

**BOECLER, JOHN**, a French medical man and botanist, was born in 1681, and died in 1733. He was professor of medicine at Strasburg, and in 1719 he exchanged this office for the chair of chemistry and botany. He was the author of numerous memoirs on medical, chemical, and botanical subjects.—J. H. B.

**BOECLER, JOHN PHILIP**, son of the preceding, was born at Strasburg, 21st September, 1710, and died 19th May, 1759. He took the degree of doctor of medicine in 1733. In 1734 he became professor of physics, and in 1736 he succeeded Salzmann as professor of chemistry, botany, and materia medica. He visited France, and secured the friendship of many of the learned men of that country. He is the author of works on physics, memoirs on various remedies, as fennel, coriander, &c.—J. H. B.

**BOEHM, JACOB**, commonly called **BEHMEN**, the celebrated German mystic, was born of poor parents, near Gorlitz, in Upper Lusatia. At the age of ten years sent forth from home to earn his daily bread, as a shepherd boy, among the hills and forests of his native district; although utterly uneducated, it was with a character for pious and imaginative susceptibility already formed that he followed his very humble destiny into the desert and along the mountain ridge, every voice and feature of which was fitted to awaken in such a nature as his emotions that would appear to be more spoken of than felt in the history of mysticism. At a later period, when he had exchanged his pastoral occupation for the respectable but not very romantic trade of a shoemaker, the visionary voices that beset him in the desert did not forsake him in the shop; but still increasing in volubility, occupied his imagination to the point of making him appear to his fellow-workmen an idiot, or at the least a fool. At Gorlitz, where he settled after making the customary tour of a journeyman mechanic, he married in 1594, and continuing to labour in the way of his calling, at the same time that he pursued the theologico-mystical researches into which his early familiarity with the spirits of the air had conducted him, lived unknown for the long period of sixteen years. In 1612, however, emerging from obscurity, not so much by means of his "Aurora," then published, as by the help of some clergymen of the neighbourhood, who made their complaints of its dangerous tendencies heard throughout Germany, he was thenceforth to give to the world innumerable visions, to be reputed the head of a sect, and to occupy a distinguished, if not an enviable place in the history of mysticism. In all he published no fewer than thirty pieces; each of which, abounding in the errors of Paracelsus and the English mystic, Robert Fludd,

and what was no less a charming feature of each, in the vagaries of an imagination which it is impossible to characterize except as the imagination of Jacob Boehm, was eagerly bought by a host of enthusiasts, declaimed with great energy in every German hamlet, and then all but forgotten. He died at Gorlitz in 1623. His works were collected and printed at Amsterdam in 1730, under the title of "Theosophia Revelata."—J. S., G.

**BOEHRER, GEORGE RALPH**, a German physician and botanist, was born at Liegnitz in 1723, and died in 1803. He studied at Leipzig under Platner and Ludwig, and became doctor of medicine in 1720. In 1752 he was appointed to the chair of anatomy and botany in the university of Wittemberg. He kept up the botanic garden, and founded an anatomical and surgical museum. In 1783 he was chosen professor of therapeutics, and he finally became dean of the medical faculty of the university. Jacquin has named a genus of Urticaceæ Boehmeria after him. He published a large number of treatises, chiefly on botany. Among them may be noticed, "Flora of Leipzig;" "An Account of writers on Natural History;" "Account of Economical Plants;" a "Botanical Lexicon;" "Dissertations on Meleæctus, Nectaries of Flowers, Colours of Flowers, Deciduous Leaves," &c.—J. H. B.

**BOEL, CORNELIUS**, a Flemish engraver, born at Antwerp about 1580. He worked with that neat, clear graver, in the style of the Sadclers, of whose school he was. He worked in England; but his chef-d'œuvres were plates of Charles I, and battles after Tempesta.—W. T.

**BOEL, PETER**, a painter of birds, animals, flowers, and fruit, born at Antwerp in 1625, and a pupil of the robust Snyders and his uncle, Cornelius de Waal, whom he followed to Genoa. On his return to Flanders he was much patronized. He finally went to Paris, and became successor to Nicasius, another pupil of Snyders, as court painter. He died in 1680. His best pictures are the "Four Elements;" and he etched some muscular birds of prey and animals. He drew from nature; his pencil was bold, free, and fluent, and his colour—"tint of colour," as Pilkington calls it—was much admired.—**QUERIN BOEL**, his relation, was born at Antwerp in 1622. He engraved several merry-makings from Teniers for a book called the Teniers' Gallery, published by the Archduke Leopold, who had a collection of D. T.s.—W. T.

**BOEL, WILLIAM**, a botanist of the seventeenth century, was a native of the Netherlands. He travelled in various parts of Germany and Spain, and he also visited Tunis. He published a Herbal during his residence at Lisbon. He was a correspondent of Clusius.—J. H. B.

**BOENNINGHAUSEN, C. M. F. VON**, a German botanist of the present century. He published in 1821 a "Nomenclator Botanicus," containing an account of Westphalian plants, and in 1824 a work entitled "Prodromus Floræ Monasteriensis Westphalorum Phanerogamiae."—J. H. B.

**BOERHAAVE, HERMANN**, one of the most celebrated physicians of the eighteenth century, was born at Voorhout, about two miles from Leyden, on 31st December, 1668, and died on 23d September, 1738. He was carefully educated by his father, who intended him for the clerical profession. He made rapid progress in his studies, and by the time he was eleven years old he had become acquainted with Greek and Latin. His studies were interrupted for some time by ill health. In 1682 he went to school at Leyden. About a year and a half afterwards his father died, leaving a family of nine children, who were by no means well provided for. Hermann, the eldest, was only sixteen years old. He was enabled, however, to enter the university of Leyden, where he prosecuted his classical and philosophical studies. By means of mathematical teaching, he secured funds sufficient for continuing his studies. In 1689, under the presidency of Gronovius, he delivered an oration proving that the doctrine of Epicurus concerning the chief good was well understood by Cicero. In this he gained a gold medal as a reward. In 1690 he obtained the degree of doctor of philosophy, and produced an inaugural dissertation on the distinction between mind and body, in which he attacked the doctrine of Epicurus, Hobbes, and Spinoza. He now entered on theological studies by attending the classes of Hebrew and church history under Trigland and Spanheim. By the advice, and with the aid of John Vandenburg, burgomaster of Leyden, he entered upon the study of medicine, while he continued his mathematical and theological classes. He finally, however, devoted himself entirely to medical

science. In his anatomical pursuits, he was assisted by the works of Vesalius, Fallopius, and Bartholin. He studied especially the fathers of physic, and took as his models Hippocrates and Sydenham. Chemistry and botany also claimed a large share of his attention. In July, 1693, he took the degree of doctor of medicine at the university of Harderwyck in Guelderland, his thesis being on the advantages which result from an examination of the excretions in diseases. In 1701 he was chosen lecturer on the institutes of medicine in Leyden, in room of Drelincourt, and he commenced his duties by a discourse in favour of the study of Hippocrates. In 1709 he became professor of medicine and botany in place of Hotton, and inaugurated his work by a lecture on the necessity of returning to the primitive simplicity of medicine. His zeal for botany was great. He extended the botanic garden at Leyden, and published many botanical memoirs. He gave descriptions of new plants, and formed many new genera. In 1714 he became rector of the university, and succeeded Bidloo in the chair of practice in physic. He may be said to be the founder of clinical instruction in medicine, for he not only gave lectures on medicine, but also explained cases in the hospital to his pupils. He published at this time two standard medical works—"Aphorismi de cognoscendis et curandis hominum morbis," and "Institutiones Medicæ." He attained a high reputation in Europe as a medical man, and acquired a large fortune by practice. His fame attracted pupils from all quarters. In 1718 he succeeded Le Mort in the professorship of chemistry, and delivered an inaugural discourse, which is the basis of his famous "Elements of Chemistry." He was elected a member of the Academy of Sciences of Paris in 1728, and of the Royal Society of London in 1730. His health began to fail about the year 1722, and he finally resigned the chair of botany and chemistry in 1729. In his final address to his pupils, he reverted to the doctrines of Hippocrates, and declared that man to be the first physician who knew how to wait for and second the efforts of nature. Although he had relinquished his public duties, he still continued his private labours until the year 1738, when he expired at the age of sixty-nine. At the age of sixty-seven he had an interview with Linnæus. The town of Leyden erected a monument to him in the church of St. Peter's. His funeral oration was delivered by his friend, the Rev. M. Schultens. Few medical men have attained such celebrity as Boerhaave. With all his learning he seems to have been a humble christian. Haller speaks of his venerable simplicity and his power of persuasion, and he states that he had often heard him say, when speaking of the gospel precepts, that the Divine Teacher had shown in the Bible far more knowledge of the human heart than Socrates with all his wisdom. The works of Boerhaave are multiplied, and embrace the whole range of medical science. Among them may be noticed his various inaugural orations, on entering on different chairs—"Institutiones Medicæ;" "Medical Aphorisms;" "Catalogue of Plants in the Leyden Garden;" "History of Plants;" "Materia Medica;" "Elements of Chemistry;" treatises on lues venerea, on plague, on mercury, on diseases of the eyes, on clinical practice, besides numerous works edited by him.—J. H. B.

BOERNE, LUDWIG, one of the most eminent humorous and political writers of Germany, was born at Frankfort-on-the-Maine, May 22, 1786. His father, Jacob Baruch, was a Jewish banker in easy circumstances, who is said to have been a school-fellow of Prince Metternich, and who enjoyed so high an authority with the members of his community, that afterwards he was chosen their representative at the congress of Vienna. His grandfather, a fine old gentleman, had been financial agent to the electoral see of Cologne; and by his efforts the election of the Archduke Maximilian, son to Maria Theresa, had been brought about in 1780, a service which for a long time was gratefully remembered at the court of Vienna. Young Löb Baruch, when yet a child, already keenly felt the hateful oppression under which the Jews were labouring in his native town; shut up in their "Judengasse," they were subject to the most humiliating insults from their christian fellow-citizens; and even some twenty years later Baruch was described in his passport as a "Juif de Frankfort." Having taken his degree as Ph.D. at Giessen, he became secretary of police in his native town, a remarkable circumstance in the life of such a radical and indeed revolutionary writer. When, however, instead of the Napoleonic grand-duchy the free town of Frankfort was re-established, Dr. Baruch, as a Jew, was dismissed from office with a

pension of 700 florins. In 1818 he in secret became a convert to the protestant church, and adopted the name Ludwig Börne, of which he has given a ludicrous etymology in his "Letters from Paris." Free from all official and religious restraint, he now entered upon his literary career. From 1818-22 he published the "Waage, eine Zeitschrift für Bürgerleben, Wissenschaft und Kunst" (The Balance, a Journal for Civic Life, Science, and the Arts), which at its very outset won him the esteem of the German literary world; and in 1819, "Die Zeitschwingen" (The Wings of Time). He then led a sickly and unsettled life until 1830, when, attracted by the French revolution, he fixed his residence at Paris, where he died February 13, 1837, and was buried in the cemetery of Père la Chaise. Börne's political writings, especially his "Letters from Paris," which roused the German people to all but action, are dictated by a violent revolutionary spirit, which, however, had its only source in his fervent patriotism. There were in Germany no freedom of conscience, no liberty of the press, no juries, no uniformity of law; and all legal means of obtaining redress of such an unnatural and unworthy state had been exhausted in vain. The liberal party, therefore, at last could not bar themselves from the melancholy conviction, that only a passage through the Red Sea of revolution could lead Germany to the land of promise of national and political independence. By the eloquent display of such principles, Börne, of course, gave great offence, not only to the powers that be, but also to a great number of well-meaning men, and even members of his own political creed, who meekly endeavoured to attain the same ends by means of political reform. No one, however, of all his enemies dared to doubt the disinterestedness and integrity of his motives and character. Börne's literary fame chiefly rests upon his non-political writings. His style has all the beauties of Jean Paul's, without its blemishes: it is distinguished by deep thought and tender feeling, blended with sparkling wit and sprightly playfulness; by purity, clearness, and easy elegance. His humorous essays are unrivalled masterpieces; his dramatic critiques take rank with those of Lessing. The last production of his pen, his political and literary will, as it were—for it was written only a few months before his death,—was "Menzel der Franzosenfresser" (Menzel the Gallophagus), an annihilating reply to Wolfgang Menzel, the well-known critic and historian, who had taxed him with his revolutionary principles and his love of the French. Börne indeed loved France, not as his own, but as his adopted country, and had gradually become a great admirer of the French; his great political ideal being an independent alliance of the French and German nations, between whom, to speak with Hamlet,

"Freedom, like the palm, might flourish,  
And peace her wheaten garland wear."

It therefore was an object of the highest importance to him to make himself understood also by the French, with whom he hoped for a speedier success than with his dull and tardy countrymen. At his own expense he started two French periodicals, *Le Réformateur* and *La Balance*, to which he contributed a number of eminent articles in French, which after his death were collected and edited by M. de Cornenin—"Fragments Politiques et Littéraires par L. B.," Paris, 1842. His collected writings appeared in 16 vols.; his posthumous writings in 6 vols.—(*Life*, by K. Gutzkow; Hamburg, 1840.)—K. E.

BOERNER, CHRISTIAN FRIEDRICH, a noted German divine, born at Dresden in 1683. After travelling through Holland and England, he became professor of theology at Leipzig, where he died in 1753. An ancient MS. of a part of the New Testament is called, from having been in his possession, Codex Boernerianus. It contains, with the exception of the Hebrews, the epistles of St. Paul, and is supposed to have been written in the West between the eighth and twelfth centuries. Boerner is the author of a number of works, which amply sustain his fame for prodigious erudition. These are editions of Luther's works and Lo Long's *Bibliotheca Sacra*; "De Exulibus Græcis isdemque Litterarum in Italia Instauratoribus," 1750; "De Socrate;" "De Ortu atque Progressu Philosophiæ Moralis," 1707; and "Disertationes Sacræ," 1752.—J. S., G.

BOESCHENSTEIN, JOHANN, professor of Hebrew at Wittenberg, noted as one of the restorers of that language in Germany, was born toward the close of the fifteenth century. His Hebrew grammar was published in 1514 under the care of his pupil Melanethon.—J. S., G.

BOETHIUS, ANICIUS MANLIUS SEVERINUS, a philosopher, was the son of Flavius Manlius Boethius, who held the consulship in 487. The fancy of Bertius, one of his editors, has prefixed the prænomèn of Flavius to the philosopher's name, and the earlier editions inserted Torquatus into it on worthless authority. The exact date of his birth has been disputed, some assigning it to about 455, and others to about 475. The latter is the true one. For he tells us himself (*De Consol. Phil. I. carm. 1, 9*), that his exile brought on him premature grey hairs, and, as he was beheaded about the year 524, the statement would be absurd of a man of seventy. At an early period he lost his father, but some of the chief men in Rome took charge of the youth, and thus he had the benefit of a thorough education. He was a great student of mathematics and music, but his time was principally devoted to the study of Greek philosophy. Some authors indeed state that he went to Athens to prosecute his studies, but this is a mistake, arising from a misinterpretation, or rather an incorrect reading of a passage in Cassiodorus (*Var. Ep. I., 45*), which, correctly read, states exactly the reverse. He tells us himself that he had civil honours heaped upon him, that he was blessed with a chaste wife, and that he had the rare felicity of seeing his two sons proceed from his house as consuls amid a concourse of senators, of acting as public orator of the king's praises, while they occupied their curule chairs, and of showering down on the multitude a triumphal largess, as he sat in the circus between the two consuls. (*De Consol. Phil. II. 3.*) The name of his wife was Rusticiana. She was his only wife, though later traditions speak of Elpis, the authoress of a hymn (*Daniel. Thes. Hymn. I., p. 156*), as having been married to him. His two sons were called Anicius Manlius Severinus Boethius and Q. Aurelius Memmius Symmachus. Boethius was not destined to enjoy uninterrupted prosperity. His very goodness seems to have brought upon him earthly misfortunes—we cannot say misery, for he was as happy in his disgrace as when fortune lavished her smiles upon him. Before he had been created consul, he had gained the friendship of Theodoric, king of the Goths, and through his assistance he had performed many important services to the state, especially in reforming the coinage, and preventing the people of Campania from being exposed to famine. He showed himself also a friend of the oppressed, and was often the means of liberating men who were accused for base purposes by informers of the court, though perfectly innocent. His active benevolence brought upon him the hatred of the courtiers, and so on the first opportunity that presented itself, he fell a victim to their malice. The informers against him were three scoundrels, one of whom, Basilius, had been discharged the royal service, and now thought to clear off some debt by informing against Boethius; while the other two, Opilio and Gaudentius, had been sentenced to banishment on account of innumerable frauds, but on the very day on which they were to have left, conceived the project of prolonging their stay by discovering a plot against the king. Boethius was accused of wishing to restore liberty to the Romans and their old rights to the senate, and he was said for this purpose to have sent a letter to the Emperor Justinus. Boethius expressly affirms that this letter was a forgery. (*De Cons. Phil. I., 4.*) Theodoric confined Boethius and his son Symmachus in the prison at Ticinum without granting them a hearing. It was in this prison that Boethius wrote his famous work, "*De Consolatione Philosophiæ.*" His property was confiscated, and several years after he and his son were beheaded. His noble wife, Rusticiana, was reduced to such straits that she had to beg her daily bread. (*Procop. Goth. III., 20.*) The Roman catholic church subsequently canonized Boethius, and the story was current that the philosopher had been beheaded in consequence of his opposition to Arianism, and had given a decided proof of his Roman catholic saintship by holding up with both his hands his head, after it had been torn off by a royal javelin-thrower.

Boethius translated very many Greek works, and commented on them. He tells us himself that it was his wish to translate the whole of Aristotle's works, and to attempt the reconciliation of Aristotle's philosophy with that of Plato. He did not accomplish his design. He translated only Aristotle's *Analytica priora et posteriora*, and Aristotle's *Topica* and *Elencha Sophistica*; and wrote commentaries on the *Isagoge* of Porphyrius, on Aristotle's *Categoriæ*, on Aristotle's book *περὶ ἑρμηνείας*, on the *Topica* of Cicero, and also a commentary on the *Topica* of Aristotle, though this last has not come down to us. Besides this, he

wrote "*Introductio ad Categoriicos Syllogismos*," in one book; "*De Syllogismis Hypotheticis*," in two books; "*De Definitione*," in one book; "*De Divisione*," in one book; "*De Differentiis Topicis*," in four books; "*De Arithmetica*," in two books; "*De Musica*," in five books; "*De Consolatione Philosophiæ*," in five books. He also translated Nicomachus on Arithmetic, Pythagoras on Music, Euclid on Geometry, Ptolemy on Astronomy, and the Mechanics of Archimedes. Even this is not a complete list of the works ascribed to him by his contemporaries. The writers of the middle ages ascribed to him a vast number in addition to these. The works *De Unitate et Uno* and *De Hebdomadibus* have been generally assigned to him, though most probably they are not his. Four theological works have also been attributed to him—*De Sancta Trinitate*; *Utrum Pater et Filius et Spiritus Sanctus substantialiter prædicantur*; *De Duabus Naturis in Christo contra Eutychem et Nestorium*; *Complexio brevis Christianæ fidei*.

His work "*On the Consolation of Philosophy*" is by far the most remarkable of his productions. It consists of five books. He sets out with lamenting the wretched fortune that sent him into exile, when a woman of dignified aspect, with clear and burning eyes and fresh colour, appears to him and holds conversations with him. This woman is Philosophy. She discusses the nature of his grief; shows that there is no real cause for it, by exhibiting the fleeting nature of earthly possessions and joys; and then points him to the source of true happiness. Finding in God the highest good, she proves that only the wicked are really unhappy; and she answers the doubts and difficulties which suggest themselves to him by discussing the true nature of providence and fate; and she ends with unfolding to him what is implied by the word chance and by freedom of the will. The book is written with great clearness and beauty, and the interest of it rises, like that of a great poem, till in the fifth book, the solution of the questions connected with free-will draws out the highest powers of the author, and charms, if it does not satisfy, the student of metaphysics. The structure of the book is peculiar, being half poetry half prose, the poetry generally being the poetical expression of what has been discussed in prose.

[His work on music is the most complete account extant of the ancient musical system. It contains extracts from several authors of important authority, whose writings are wholly lost, and, besides valuable deductions from these, extensive original views of Boethius himself. It maintains the principles of Pythagoras in opposition to those of Aristoxenus, referring the determination of ratios entirely to calculation, the effort of reason, which is infallible, rather than to hearing, the effort of sense, which may fail. It demonstrates, in the beautiful spirit of the old philosophy, the moral influence of music, which modern experience fully verifies. The most perfect MS. of this interesting treatise, is said to be in the Bodleian library, by which the edition of Meibomius was corrected. So great was the esteem in which, until a little more than a century since, the opinions of Boethius upon music were held, that the granting of degrees in this faculty at Oxford and Cambridge, depended upon the candidate's acquaintance with them; and, at the latter, an essay on his writings was the only necessary exercise for a doctor's diploma; he is, on this account, justly supposed to have retarded the progress of the art, his influence having occasioned it to be estimated solely by mathematical principles, long after its liberal exercise as an embodiment of passionate impulse had changed its character from an abstract theory to a living art.—G. A. M.]

The best edition of the complete works of Boethius is said to be that published at Basel, 1570. The "*Consolation of Philosophy*" was very frequently edited in the middle ages; indeed its influence was most powerful, and it was a favourite with almost all the great minds of those days. Dante praises Boethius; Asser wrote commentaries on the work. Alfred the Great translated it into Anglo-Saxon, and interpolated it with reflections of his own. It was also translated into Greek, and into the French and German of the middle ages. It was also frequently imitated, the imitation most worthy of note being that of Chaucer in his *Testament of Love*. The recent editions are that of Valpy in his *Delphin Classics*, London, 1823, Nos. 54 and 55 of the series; and that of Theodorus Obbarius, Jena, 1843. The latter is the only edition supplied with a critical apparatus. Prefixed are *Prolegomena*, consisting of three admirable chapters—one on the life of Boethius, another on his religion and philosophy, and the third on the editions and

manuscripts of the "Consolation." The notes, unfortunately, are meagre and unsatisfactory, and the text is occasionally disfigured by awkward misprints, yet it is by far the best edition.

The sources for the life of Boethius are his own "Consolation of Philosophy," the Letters of Eumodius and Cassiodorus, and the History of Procopius. A list of the editions of Boethius is given at the end of Valpy's edition.—J. D.

**BOETHIUS, DANIEL**, a Swedish philosopher, professor at the university of Upsal at the commencement of the present century. He was of the Kantian school, and wrote several works on the history of philosophy.—J. D. E.

**BOETHIUS, JACOB**, a Swedish divine, successively professor of theology at Upsal and pastor of Mora in Dalecarlia, was born in 1647 and died in 1718. On the accession of Charles XII. in 1697, he was condemned to perpetual imprisonment, for having vented some unsavoury political opinions in his sermons. After a short release in 1702, for which he was indebted to the Russians, he was again imprisoned, but was finally set at liberty in 1710. He wrote "De Orthographia Linguae Suecane Tractatus;" "Mercurius Bilinguis;" and some theological dissertations.

**BOETHUS**. The tradition of the Jews traces to Sadok, in conjunction with Boethus, the origin of the sect of the Sadducees. Of the life of Boethus nothing is known. It is probable that, as the Sadducees were the *religious* opponents of the Pharisees, so the followers of Boethus were the *political* adversaries of the dominant party. With the fall of the Jewish polity, political antagonism naturally lost its object, and thus it was, that the Boethusians merged into the sect of the Sadducees, and disappeared from history.—(Grätz, *Geschichte der Juden*).—T. T.

**BOETIE, ETIENNE DE LA**, born at Sarlat in Perigord in 1530; died in 1563 at Germignan, near Bordeaux. He was educated at the college of Bordeaux under the care of tutors who directed the studies of Montaigne. At the age of twenty-two he was admitted a conseiller of the parliament of Bordeaux. Boëtie married a widow, a daughter of whom by her first marriage married Thomas, brother of Montaigne, the author of the essays. A son of hers married a sister of Montaigne's wife—hence the intimacy with Michael de Montaigne, owing to which, more than any other cause, Boëtie is now remembered. Boëtie published some Latin and French verses at a very early age, and a tract of his, entitled "Voluntary Slavery," written by him at the age of sixteen, was for many years circulated in manuscript. This tract is written in a generous spirit, and refers the servitude which men undergo to their own servility of mind. Like most political tracts written without party views, it was attacked severely by parties opposed to each other. The proposition that

"War is a game which, were their people wise,  
Kings should not play at,"

is one not unlikely to give offence both to prince and people. The book was translated into English and into Italian. It was edited by Lamennais in 1835; and there is more than one version of it into modern French. Some poems of Boëtie are annexed to many of the editions of Montaigne's Essays. Boëtie died of fever. Disregarding the danger of infection, Montaigne attended his deathbed. After his friend's death he published several of his works.—J. A., D.

**BOETTCHER, BOETTGER, or BOETTIGER, JOHANN FRIEDRICH**, a celebrated German alchemist, born at Schleiz in the district of Reuss, about the year 1681. At the age of fifteen he was apprenticed to a druggist in Berlin named Zorn. Here he devoted himself with great zeal to the study of chemistry, and having been excited to search after the secret of the transmutation of metals by a manuscript lent to him by another apothecary, he passed whole nights in his master's laboratory, making experiments with a view to this great discovery. Zorn finding that these experiments were made at his expense, whilst, at the same time, his apprentice neglected his proper duties, dismissed him to his own home, but received him again into his service with a promise of better conduct. This, however, was soon broken. Boettcher again returned to his alchemical experiments, and soon showed his companions some gold which he took out of a crucible. He was then in danger of arrest, but escaped into Saxony, where he was received by the elector at Dresden with distinction, and furnished with large sums of money to enable him to continue his experiments. The patience of the Elector Augustus lasted for about three years, when Boettcher, probably seeing that a discovery of his trickery was becoming inevitable,

took his departure from Dresden in the night. He was, however, arrested, and carried back to Dresden, where he gave in a long report upon his secret to the elector, who was by no means satisfied with it. Count von Tschirnhausen now recommended the elector to make use of the great knowledge of chemistry possessed by Boettcher, with the object of developing the resources of the state; and about the end of the year 1705 he succeeded in making a porcelain nearly equal to that of China in beauty, from a reddish clay found in the neighbourhood of Meissen. The value of this discovery was fully appreciated; Boettcher was loaded with presents, but was not set at liberty; and on the occurrence of the Swedish invasion in 1706, his laboratory was transferred in the middle of the night into the fortress of Königstein. In 1710 this porcelain manufactory was removed from Dresden to the Albrechtsbourg at Meissen, and from that time this branch of industry has gradually increased in value. Boettcher himself was appointed the first director, a position for which his irregular mode of life rendered him by no means fitted. He even attempted to sell his secret to the people of Berlin; and there was every prospect of his falling into disgrace, when he died on the 3rd March, 1719.—W. S. D.

**BOETTGER or BETTICHER, CHRISTOPHER HENRY**, a German medical man, was born at Cassel on 12th June, 1737, and died in that town on 3rd September, 1781. He practised medicine, and was professor of botany at Cassel. His works are—"Account of the Botanic Garden of Cassel;" "The Trees and Shrubs in the Park at Weissenstein;" "Inaugural Disputation on Uterine Inflammation;" and "Description of the Mineral Waters of Hofgeissmar."—J. H. B.

**BETTICHER, ANDREW JULIUS**, a German physician, was born at Wolfenbüttel on 7th July, 1672, and died on 26th July, 1719. He was successively professor of anatomy, surgery, and botany at Giessen, and of pathology and semeiotics at Helmstadt. He published works on the voice, on the bones, on respiration of the foetus, on diabetes, and on the plague.—J. H. B.

\* **BETTIGER, CARL WILHELM**, a German historian, born at Bautzen, 1790, studied at Weimar, Gotha, and Leipzig; in 1819 was inducted to a chair in the latter university; and in 1822 became one of the librarians of the university of Erlangen. He has published "Allgemeine Geschichte," 1849; "Deutsche Geschichte," 1838; "Geschichte des Deutschen Volks und des Deutschen Landes;" and "Weltgeschichte in Biographiën."

**BOETTO, GIOVANNILE**, died at Turin in 1683. He painted allegorical subjects in fresco with knowledge, power, and elegance. He was also an engraver.—W. T.

**BOGAN, ZACHARY**, a learned English puritan, celebrated as a linguist, was born at Little Hempston, Devonshire, in 1625. He graduated at Oxford, and, excepting the period of the king's residence in that city, passed his life at the university in devoted application to the study of languages and theology. He wrote, besides his additions to the *Archæologiæ Atticæ* of Francis Rous, "Meditations on the Mirth of a Christian's Life;" and "An Alphabetical View of Scripture Threats and Punishments." Died in 1659.—J. S., G.

**BOGATZKY, KARL HEINRICH VON**, author of the book known as "Bogatzky's Golden Treasury," a German religious poet of note, was born at Jankowa in Silesia, September 7, 1690, and died at Halle, June 15, 1774. He belonged to the school of Spener and Franke.—K. E.

**BOGDANE, JAMES**, son of a Hungarian deputy, and a self-taught painter. Died in 1720. He rejoiced chiefly in fruit, flowers, game, and fowls, which he painted in a graceful, but thin and timid manner, without any bold impaste, or loving minute finish. He was a careful copier, and yet often erred in making his heads too large and in false perspective. He came to England and was employed by Queen Anne; some of his paintings, inferior in strength to Hondekoeter, lumber about the royal palaces. His foliage and foregrounds are false, and supernaturally dark in tone. He collected a reasonable fortune, but imprudently assigned it over to his son, who had been snared into a marriage with an adventuress. Bogdane died of vexation at the discovery of the cheat.—W. T.

**BOGDANOWICH, HIPPOLYTUS FEDEROWICH**, one of the most esteemed lyric poets of Russia, born at Prewolchno, in Little Russia. His father, having powerful interest in the mathematical institute of Moscow, sent his son there, intending him to devote himself to the study of the exact sciences. The youth's own inclinations, however, pointed in a different direction; a

volume of Lomonsoff's poems, and a visit to the theatre at Moscow, sufficed to decide him to abandon mathematics. He addressed himself to Kheraskoff, the director of the theatre, and begged to be admitted a member of his company. His personal appearance and remarkable talents so interested Kheraskoff in his favour, that he took him into his own house, and gave him the means of entering the university, where he applied himself specially to the study of modern languages and the fine arts. He was then appointed dragoman to the minister of foreign affairs, and in 1760 secretary of the embassy at Dresden. The lovely scenery round Dresden, and the noble works of art in the Dresden gallery, appear to have first revealed to him his poetical vocation. It was at Dresden that he commenced his first and best poem, "Dushenka," published in 1775. Though nominally a mere translation of the *Psyches* of La Fontaine, Bogdanowich has introduced so many new beauties, and so great a charm of style, that the work has a character of its own, and appears more like an original than a translation. Russian critics are agreed in considering it far superior to the poem of La Fontaine, and it is remarkable that, in an age when the so-called original Russian writers were mere imitators of the French classicist school, Bogdanowich, in a work assuming to be a simple translation, has shown himself eminently romantic. He returned to St. Petersburg in 1768, and published a translation of the Abbé Vertot's *History of the Revolutions of the Roman Republic*. He gained the favour of the empress, Catherine II., by adapting to her honour a canzone of Giannetti. In 1778 and 1779 he was concerned in a journal called the *Indicator*, published at St. Petersburg, and in 1785 he wrote several dramas at the command of Catherine, and published a collection of Russian proverbs. In 1788 he was appointed president of the imperial archives. In 1795 he retired first into Little Russia, and thence to Kursh, where he died in January, 1803. The high position to which he rose in no way altered the natural modesty and gentleness of his nature, nor the original simplicity of his habits. A complete edition of his works, in six volumes, appeared in 1809, and another, in four volumes, in 1818.—M. Q.

BOGLE, JOHN, a Glasgow miniature painter, much distinguished in his day. His portraits are beautiful, says the judicious Pilkington. "One of Lady Eglinton, to whom Allan Ramsay dedicated his *Gentle Shepherd*, in the possession of Mr. C. Kirkpatrick Sharpe, is in the highest finish." He died in the greatest poverty.—W. T.

BOGORIS, prince of Bulgaria, died in 896. He succeeded to Baldimir or Valdimir, having usurped the throne to which the son of that prince was the lawful heir. Having embraced christianity, he was baptized in 853. This occasioned a revolution among his subjects, which, however, was quickly suppressed, and Bogoris succeeded in introducing among them the new religion which he had embraced. After the schism between the eastern and western churches, the Bulgarians, after some hesitation, submitted to Constantinople, and Bogoris remained faithful to that church, notwithstanding the sentence of excommunication fulminated against him by Pope John VIII. A considerable time before his death he resigned his crown in favour of his eldest son, and retired into a monastery; but, having learned that his son had been attempting to reintroduce idolatry, he issued from his seclusion, and, putting himself at the head of an insurrectionary movement, seized on the person of his son, put out his eyes, and condemned him to perpetual imprisonment. He then summoned a general assembly, and, having in their presence nominated his second son as his successor, once more retired to his monastery, where he ended his days.—G. M.

BOGSCH, JOHN, a German agricultural writer, was born in 1745 at Deutschendorf, and died at Presburg on 18th January, 1821. His works are on the art of cultivating fruit-trees and other economical plants, and on the care of bees.—J. H. B.

BOGUE, DAVID, D.D., an eminent dissenting minister, was born in the parish of Coldingham, Berwickshire, February 28, 1750. He was the fourth son of John Bogue, Esq. of Halydon, one of the justices of the peace for that county. He was one of the founders, and continued through life one of the main directors and advocates of the London Missionary Society; and when that body resolved to establish a college for the education of persons whom they had elected to go out as missionaries, it was to Dr. Bogue that they intrusted the conducting of that institution. For such a task he was eminently fitted, not only by natural endowments, but by large and valuable acquirements in theolo-

gical and biblical science, the fruit of protracted and well-directed study for many years. Constantly engaged in his ministerial or tutorial duties, he had little time for authorship; the only works, besides occasional sermons which he published, were an essay "On the Divine Authority of the New Testament," intended as an introduction to an edition of the christian scriptures in French, and which has been translated into French, Italian, Spanish, and German, and a volume of discourses on the Millennium. He also produced in conjunction with Dr. Bennett, a "History of Dissenters" in two vols., octavo. In all his writings the marks of a clear vigorous intellect, a solid judgment, and a manly candour predominate. He died at Brighton, whither he had gone to attend a missionary meeting, on the 25th of October, 1825, in his seventy-sixth year.—W. L. A.

BOGUPHAL, a Polish chronicler, died in 1253. Author of "Chronicon Poloniæ," printed in the *Scriptores rerum Silesiæ* of F. G. Sommerberg, Leipzig, 1729.—J. G.

BOGUSLAWSKI, ADELBERT, an admired dramatic author of the time of the *renaissance* of Polish literature in the reign of Poniatowski, last king of Poland. Boguslawski was of an ancient Polish family, but he fell into poverty in early youth, and was obliged to earn his own livelihood as a comic actor. The exact date of his birth is uncertain, from his having always shown great unwillingness to speak of his past, but it must have been in or near the year 1750. He was not naturally inclined to the stage, but gifted with great determination of character and energy of mind, he applied himself with great earnestness to his profession, and became distinguished not only for his talent as an actor, but as a dramatic writer. In 1780 the theatre of Varsovia, where he had introduced an Italian opera, was closed, and for three years he devoted himself to writing and translating for the stage. From 1784 to 1789 he travelled with his dramatic company to the cities of Wilna, Grodno, Dubno, and Lemberg. The king then appointed him director of the national theatre of Varsovia, and by his excellent selection of the plays performed, and intelligent direction of the representations, he greatly elevated the taste and tone of the Polish stage. His undertaking, however, was repeatedly interrupted by the continual wars in which Poland was engaged. In 1812 he retired from the theatre, and occupied himself in literature until his death in 1829. Although he cannot be classed among writers of the first rank, Polish literature is under great obligations to Boguslawski. He did much to improve the public taste, to purify the language from the various Latinisms, Germanisms, and Gallicisms with which it had become corrupted, and to restore its national originality and vigour.—M. Q.

BOHADSCH, JOHN BAPTIST, a German physician and naturalist, died at Prague in 1772. He was professor of botany and natural history at Prague, and published descriptions of Bohemian plants, and of their uses and advantages; on the use of wood in domestic economy; besides dissertations on electricity, on fevers, &c.—J. H. B.

BOHA-EDDIN, ABUL HASSEN YOUSEF, a distinguished Arabic historian, was born at Moussul in 1145. He fixed his abode at Bagdad, where he soon acquired a high reputation as a scholar, and especially in theology and jurisprudence. He subsequently visited Jerusalem, after it had fallen into the hands of Saladin, and that monarch made him *cadi* of the city, and employed him upon several important missions. Boha-eddin remained in the service of Saladin till the death of the latter, when he attached himself to his third son, under whose auspices he founded a college. Boha-eddin is known by two works of great historical interest—the one a history of the wars of the sultans in the propagation of Islamism, which he calls "The Holy Wars;" the other the "History of the Life of the Sultan Saladin," containing all that we know of that sovereign. This history has been translated into Latin. Died 1232.—J. F. W.

BOHAIRE-DUTHEIL, a dramatic and satiric author, born at Reuil about 1750; died in 1825. Author of "La Nouvelle Heloise," a tragedy.—J. G.

BOHEMOND, the crusader, son of Robert Guiscard, first Norman duke of Calabria. He was of age to bear arms when his father entered on his ambitious strife with the Greek empire. At the famous battle of Durazzo, where the magnificent design of overwhelming in one campaign the dynasty of the Eastern empire, with which Robert Guiscard entered the dominions of Alexius, was all but consummated, Bohemond gained his first laurels as a skilful captain. On his father's return to Calabria

he was left in command of the victorious army; but its strength had been exhausted in the battle, and, after ravaging Thessaly, he was obliged to follow his father into Italy. Four years afterwards he shared in the honours of the naval victory gained by his father off Corfu over the Greeks and Venetians. In 1085 Robert Guiscard died, leaving to his younger son Roger his duchies of Apulia and Calabria, and to Bohemond only the principality of Tarentum. With this unequal division of the family estates commenced a war between the brothers, which promised to be long and bloody. But the mighty passion to which the preaching of the hermit of Picardy had stirred the chivalry of Europe, was to sweep the wily Bohemond, who surrendered to no enthusiasm, but was always in the way of an adventurous movement, out of the sphere of a paltry strife into one where his ambition had ample scope. He heard of realms to be won for the honour of the cross, and discerning that an invasion of the East might be for the profit of christian princes, he joined with his illustrious cousin, Tancred, the host of the first crusaders. At the head of twenty thousand infantry and ten thousand cavalry he advanced on Constantinople. In vain he had urged Godfrey of Bouillon to make the reduction of that city the first object of the holy war. He could not besiege the capital of the empire; he, therefore, made a conquest of Alexius. The son of Robert Guiscard was lodged in royal style, loaded with presents, and, it is said, promised an independent principality by the feeble monarch from whom the Norman duke had all but wrested an empire at Durazzo. At the battle of Dorylæum, and throughout the fearful campaigns of Asia Minor and Syria, he approved himself the bravest of Norman knights. His reputation with the motley host who formed the siege of Antioch, might have been the envy of Tancred; but as soon as the city fell into the hands of the crusaders, it was discovered that the prince of Tarentum had other purposes in view than those of punishing the infidels of Jerusalem, and recovering the holy sepulchre. The count of Toulouse claimed a share of the conquest; the leaders of the army urged Bohemond to advance with them to Jerusalem; but here was a city and a principality exactly suitable to his ambition, and so taking possession of both, he took leave of the army and the count of Toulouse. In 1101 he was defeated by the Turks and taken prisoner. His ransom, after two years' captivity, was 130,000 byzants. Shortly after his release he recommenced his wars with Alexius, who claimed, according to treaty, the surrender of Antioch and its territory. He went to France, and by his marriage with the daughter of Philip I. acquired the right to levy an army, with which he invaded the empire in 1107. Repulsed before Durazzo, he was obliged to sue for peace. A treaty was concluded the following year, which he was on the point of breaking when he died at Canosa in Apulia in 1111. Gibbon fairly enough describes him as "an adversary whom neither oaths could bind, nor dangers could appal, nor prosperity could satiate."

**BOHEMOND II.**, at his father's death was only four years of age. He went to Palestine in 1126, and received from Baldwin II. investiture in the sovereignty of Antioch, which, since the death of his father, had been united to the kingdom of Jerusalem. His reign was short and troublous. He was killed in an encounter with the Turks at Aleppo in 1130.

**BOHEMOND III.** reigned at Antioch in 1163-1201. He was crafty, treacherous, and unwarlike, and made himself infamous by refusing to shelter the fugitives from Jerusalem after its capture by Saladin.

**BOHEMOND IV.**, after a long struggle with his nephew, Raymond Rupin, son of his elder brother, became by the death of his rival, master of Antioch and Tripoli in 1222. Died in 1223.

**BOHEMOND V.**, son and successor of the preceding, died in 1253. He was long and unsuccessfully at war with the Kharizmians and Armenians.

**BOHEMOND VI.** surrendered Antioch to the Mameluke sultan, Bibars, in 1268, and retired to Tripoli, where he died in 1274.

**BOHEMOND VII.**, count of Tripoli, son of the preceding, died in 1287. A year after his father's death his estates were taken possession of by Calaoun, sultan of Egypt and Syria.—J. S., G.

**BOHLE, SAMUEL**, a German protestant theologian and Hebraist, author of various commentaries on the Old Testament and of a Hebrew grammar, born at Greiffenberg in Pomerania in 1611; died in 1689.—J. S., G.

\* **BÖHM, JOSEPH**, a violinist, was born in Pesth in 1798.

He received his first instruction in singing and on his instrument from his father. In 1806 his family removed to Poland, and there, when in 1810 the war with France obliged Rode to leave Russia, this distinguished artist saw him, perceived his promising talent, and aided its development no less by his encouragement than by his counsel. In 1815 Böhm went to Vienna, where he played before the emperor with success. After spending three years in the Austrian capital, he made an artistic tour in Italy, and gained honours in every city he visited. In 1819 he returned to Vienna, where he was appointed professor in the conservatory. In 1821 he was engaged as solo violinist in the imperial chapel. Two years after this he made a tour through Germany and France, and appeared in Paris with the same success he experienced in all the smaller cities. Since this time he has resided constantly at Vienna, and has for very many years ceased to appear in public; a habit of nervousness which has grown upon him, having in a great measure unfitted him for playing. He has, however, eminently distinguished himself as a teacher, in which capacity he will always be remembered with interest, since it is his instruction which has developed the transcendent talent of Ernst and of Joachim. He has published some light pieces for his instrument.—G. A. M.

\* **BÖHM, THEOBALD**, the improver of the flute, was born at Munich, where his father was a goldsmith and jeweller, about the year 1802. Though he learned and practised his father's trade, he applied himself early to the study of the flute, on which instrument he obtained such proficiency that in 1818 he was appointed principal flutist in the royal chapel of the king of Bavaria. Dissatisfied with the imperfect construction of his instrument, he constantly considered how he might improve it, and, after many experiments, sketched and completed his system of ringed keys in 1831. The deficiency of the old flute consists in the irregular position of the holes (necessitated to bring them in reach of the fingers) and the various sizes of these, which occasions inequality in the tone of the different notes, but is the only means by which an approximation to correct intonation can be obtained. Böhm's improvement is, the arrangement of the holes so as to certify the intonation and equalize the tone, and the employment of keys to render the fingering practicable. His knowledge of mechanics, acquired in his father's workshop, was of no less value to him in his experiments than was his executive skill. Some years after he had made his first flute, he further improved upon this by changing the form of the bore, making that of the head joint a parabolical cone, and of the body joint a cylinder, with advantage to both the quality and the intonation, in the construction of the second flute. He was greatly assisted throughout his labours by the scientific investigations of Dr. Schafhautl who verified, upon acoustical principles, the results of his friend's practical experiments. The new flute was first made and sold in 1832. From 1833 to 1836 Böhm was much in England, where his speculations in iron-works chiefly occupied him. Here he was most successful as a player, but found the greatest opposition to his invention. This opposition arose from his flute requiring entirely different fingering from that of the old one, and the natural disinclination of accomplished players to cast aside their accustomed method. In May, 1837, he read a paper upon his improvement before the French Academy of Sciences, after which his flute was adopted in the conservatoire of Paris. Mr. Cart and Mr. Clinton, about the year 1843, publicly adopted Böhm's flute, in consequence of which a most vehement discussion on its merits was maintained for many months in the London musical journals. At the Great Exhibition in 1851, Böhm received the council medal for his invention. The flute is now very generally approved, and the principles of its construction have been successively applied to all the other wood wind instruments. Besides being a distinguished performer and an extensive manufacturer, Böhm has had considerable success as a composer for his instrument. He still holds his court appointment at Munich, where he is greatly sought as a teacher.—G. A. M.

\* **BOHN, HENRY GEORGE**, bookseller and publisher, eldest son of the late Mr. John Bohn, of an ancient German family, was born in London in 1796. After receiving a liberal education, he travelled extensively on the continent, and gradually formed, and for many years conducted, his father's business, as a foreign and classical bookseller. In 1830 he married the only daughter of the late William Simpkin, Esq., head of the firm of Simpkin & Marshall, and then commenced business on his own account in

York Street, Covent Garden; dealing principally in the higher walks of literature, especially Greek and Latin classics, and works on the fine arts. By degrees he extended his grasp to every branch of literature (as may be seen in his memorable guinea catalogue of 1841), and then, after having carried retail bookselling to a higher pitch perhaps than it had ever reached before, embarked with great energy as a publisher. His first project in this department was a comprehensive series of sterling English literature, in compact but elegantly-printed volumes, in the old library form of demy 8vo; and his editions of Roscoe's Lorenzo de Medici and Leo X., which compress six quartos into three octavos, are as perfect examples as paper, print, and graphic illustrations can make them. But half-guinea volumes, however cheap in proportion to anything that had been previously produced, failed to enlist the sympathies of the multitude, and the speculation was necessarily abandoned. Immediately after this, quickened by some encroachments on his copyrights, he commenced, and followed out in rapid succession, his various well-known "Libraries," remarkable as being among the first examples in this country of high-class literature in an extremely cheap and attractive form. Under the various titles of the "Standard, Classical, Scientific, Antiquarian, Illustrated, Historical," and other "Libraries," these serials extend to nearly five hundred volumes, and entitle him to the warmest thanks of the reading multitude. Mr. Bohn is himself not unknown as an author. So far back as 1813 he translated from the German a two-volume novel called "Ferrandino;" and he has co-operated largely in his libraries. Schiller's Robbers, and several other of his dramatic pieces, as well as considerable portions of Goethe and Humboldt are translated by him; and he has edited Ockley's History of the Saracens, Grammont's Memoirs (adding a Life of Charles II.), Addison's works, the Handbook of Proverbs, Polyglot of Foreign Proverbs, and Fosteriana. He also wrote an appendix to his edition of Walton's Angler, and contributed the essays which form in fact the text of the useful treatise on Pottery and Porcelain, published in his Illustrated Library. Mr. Bohn is a fellow of the Royal Geographical Society; of the Society of Arts; of the Royal Society of Literature; of the Archaeological Institute and Association; one of the council of the Horticultural Society of London, in whose proceedings he has taken an active part; foreign secretary to Lord Brougham's National Association for the promotion of Social Science; and honorary member of several foreign institutes. In 1851 he was elected chairman of the book department of the Great Exhibition, and in 1856 vice-president of the Brussels Congress of Free Trade.—E. W.

BOHN, JOHANN, or in Latin BOHNUS, a German physician, born at Leipzig in 1640. In 1663 he travelled through Denmark, Holland, England, France, and Switzerland, to visit the principal universities; and in the year following that of his return, 1666, took his degree as doctor of medicine in his native place. In 1668, Bohn was appointed professor of anatomy in the university, and in 1691 stipendiary physician to the city of Leipzig; in 1670 he became dean of the faculty of medicine, and died in 1718. Bohn merits a high place in the history of medicine, from his having been the first to attack successfully the chemical system of physiology, inaugurated by François de le Boë. He proved by experiment that the bile contains no true alkali, and that the pancreatic juice is not acid, and denied the existence of a nervous fluid. In physiology he was a follower of Borelli, but without any servile imitation. He was aware that all the muscles are not under the influence of the "animal spirits;" in other words, he distinguished the voluntary and involuntary muscles, placing the heart in the first rank of the latter. Like François de le Boë, from whom he differed in so many other points, Bohn was most zealous in the propagation of the doctrine of the circulation of the blood, which he demonstrated by means of Boyle's machine at Pavia. Upon medical jurisprudence he was also a great authority; he was frequently consulted by various German tribunals, and has left several works upon this branch of medicine which are still regarded as valuable. Of these we may mention his treatise "De Renunciatione Vulnerum," &c., published at Leipzig in 1689, 1711, and 1755, and at Amsterdam in 1710; and his "Medicinæ forensis Specimina Triâ," Leipzig, 1690, 1691, and 1692, in which he displays profound knowledge and great sagacity. Of his other writings the chief are "Exercitationes Physiologicæ xxvi.," published at Leipzig in 1668-1677; and "Circulus Anatomico-

physiologicus," which contains all his ideas upon anatomy and physiology, and was published at Leipzig in 1680, and republished in 1686, 1697, and 1710. Bohn also published an edition of the works of Fabricius of Aquapendente, and of Bellini's Treatise De Urinis et Pulsibus. Before his death he is said to have caused all his papers, including the materials for a great work on medical jurisprudence, to be burned.—W. S. D.

BOHOMOLEC, FRANCIS, a Polish author of the last century, who has left several dramatic and biographical works. He also translated La Harpe's Histoire Générale des Voyages. He died in 1790.—J. F. W.

BOHSE, AUGUSTUS, better known by the name of TALANDER, was one of the most distinguished authors and teachers of his day in Germany. He was born at Halle in 1661; and after studying law at Leipzig, he commenced teaching at Hamburg, and subsequently at Dresden and Leipzig. His reputation was now such as to attract the notice of the duke of Saxe Weissenfels, who gave him the direction of his theatre. He became professor at the university of Jena, and afterwards at Lignitz, where he continued till his death about 1735. He has left a considerable number of dramatic works, principally operettas.—J. F. W.

BOHTORI, ALVALIDE, one of the most distinguished Arabian poets of his age, was born at Hierapolis about the year 821. He left his native city, and settled in Bagdad, where his reputation soon brought him into favour with the Caliph Motavakkel. He has left many poetical works, the principal being a collection called the "Divan." His verses were considered so harmonious that they were called "Chains of Gold." He died towards the end of the ninth century.—J. F. W.

BOHUN, EDMUND, a voluminous political writer, born at Ringsfield in Suffolk. His father, Baxter Bohun, was lord of the manor of Westhall in that county. He was entered a fellow-commoner of Queen's college, Cambridge, in 1663, and resided there till 1666. In 1675 he was put into the commission of the peace for his native county, and, except during a part of the reign of James II., exercised the functions of a justice till about the commencement of the eighteenth century. Of his political pamphlets, which are very numerous, we may mention, "A Defence of the Declaration of King Charles, against a pamphlet entitled 'A Just and Modest Vindication of the Proceedings of the two last Parliaments,'" and "A Defence of Sir Robert Filmer against the Mistakes and Representations of Algernon Sydney, Esq.," &c. His other works are, "A Geographical Dictionary," London, 1688, and "The Great Historical, Geographical, and Poetical Dictionary," London, 1694.—J. S., G.

BOHUSZ, XAVERIUS, a Polish historian, born in 1746 in Lithuania. From Wilna, where he settled after making the tour of Europe, he was carried away to Siberia by the Russians, and returned to his country only after a long exile. His fame, which is considerable, rests on a work entitled, "Researches into the Antiquities, History, and Language of the Lithuanians," 1808. Died in 1825.—J. S., G.

BOIARDO, MATTEO MARIA, count of Scandiano, was born at the castle of Scandiano about the year 1434. His birthplace is about seven miles from Reggio at the foot of the Apennines. His father was the second count; his mother was of the Strozzi family of Ferrara. We are most concerned with Boiardo as a poet. In his own day his political character was not undistinguished. In 1469 he was one of the noblemen who, in the suite of the duke of Este, went to meet the emperor, Frederick III., on his way to Ferrara. In 1471 he accompanied Borso, marquis of Ferrara, to Rome, where he went to receive the title of duke. In 1472 Boiardo married a daughter of the house of Gonzaga. In 1473 he appeared among the noblemen who were deputed to escort to Ferrara, Eleanor, daughter of the king of Naples, who had married the duke. In 1478 he is said to have been governor of Reggio, and in 1481 capitano of Modena. In 1487 he returned to Reggio, of which he resumed the government, and died in 1494. Some Latin verses are preserved of a friend of Boiardo's, in which the poet is depicted in his character of magistrate. He is described as looking little at law-books, as indisposed to punish love offences, as fond of the fair sex, and as a great equestrian. One of the lawyers, writing about half a century after Boiardo's death, describes him as "plus componendis versibus, quam vindicandis facinoribus aptus." He is said to have had a fixed opinion that no crime ought to be punished with death. In Panizzi's edition of Boiardo's "Inamorato" we find large extracts from his smaller poems in Latin and Italian—

many passages of which are very graceful. At Ferrara a comedy of his, "Il Timone" (Lucian's Timon), was acted, and is said to have been the first comedy in modern Italian. Boiardo's reputation for scholarship was high. He translated Herodotus and Xenophon, and wrote some historical works himself, which are praised by Muratori; but his best title to fame is the "Inamorato." The feats of Charlemagne's peers and paladins had already been the subject of romance. The prowess of Orlando—his adventurous life and his death at Roncesvalles, were recorded in the chronicle of Turpin, the great authority to which on all occasions the Italian poets of chivalry refer; but on the subject of his love for Angelica, and the adventures which spring from this source, the archbishop is discreetly silent. The proprieties of ecclesiastical decorum might have rendered such topics unfit for him to dwell upon, as the human infirmity of the universal passion was not to be alluded to in the case of so great a hero as Orlando; it was a secret to be whispered in the confessional, not confided to the public; and even if the archbishop knew or suspected it, the thing was not to be revealed. The poet has no such difficulties arising from professional delicacy to contend with, and Boiardo, even without any authority from the old chronicler, looks into the hero's heart, and gives us the legendary story of Angelica's witchcraft and its effects. The result is a poem of very considerable interest, and unluckily too of very considerable length. It occupied its author for many years, and was left unfinished at his death. A very dull writer, Agostini, added a weary supplement to it, and another, to whom we cannot give higher praise, Domenichi, printed the "Inamorato" with patchwork alterations. How it survived all this would be a matter of surprise; but life and original power it must have had, for it inspired Ariosto, whose *Furioso* is a continuation of the story commenced in the "Inamorato." (See *ARIOSTO* and *BERNI*.) Boiardo is said to have taken the names of his heroes from the vassals on his estates, and of the imaginary localities of his romance from those of the district round Reggio. If there be any foundation in fact for this statement, it must be just the reverse, and something in the character of an individual may have easily led to his being called by one of the names in the romance, as we believe has often happened in the cases of Scott's novels. Of Berni's *Rifacimento* we have spoken in our article on *BERNI*. It has so superseded the original, that though the necessity of rendering Ariosto's story intelligible would have naturally led to the reprint of the earlier poem, Berni's is always substituted for it. We owe to this, and to Mr. Panizzi's desire to supply the want, his very beautiful and valuable edition of the "Inamorato."—J. A., D.

**BOIELDIEU**, **FRANÇOIS ADRIAN**, a musician, was born at Rouen, December 15, 1775, and died at Jarey, near Grosbois, October 8, 1834. His father was a secretary to the archbishop of his native city. He was placed as a boy in the choir of the cathedral, and showing more talent than his companions, he received more particular attention from Broche, the organist, whose lessons on the pianoforte and in harmony were the only regular instruction Boieldieu ever had. His master treated him with such tyrannical severity, that he once ran away to Paris to escape the effects of his anger. He was soon brought back by his friends, and after the resumption of his studies, Broche assumed a more successful manner towards him. Until sixteen years of age he remained under the care of this teacher. He had at this time a devoted fondness for music, but it was not the austerity of the church style which fascinated him; on the contrary, he delighted in the performances of the theatre, and would sometimes secrete himself in the building during the day, when he had not money to pay for admission at night, in order to enjoy them. The pleasure he felt in hearing the operas of Gretry, Daleyrac, and Malhiol, stimulated in him a desire to produce one of his own, and this desire soon led to its own fulfilment. The good reception of his opera at the Rouen theatre further stimulated him to wish for distinction in Paris, and his want of means to carry him thither was not a sufficient obstacle to hinder his visiting the capital. He accordingly set out on foot, with thirty francs in his pocket; and, strengthened by the ardour of his expectations, he accomplished the entire distance in two days. Arrived in the metropolis before the completion of his nineteenth year, Boieldieu was sorely disappointed to find that success among his friends in a provincial town was insufficient recommendation to secure the acceptance of his opera by the *Société des Acteurs*, then directing the *Opera Comique*. He would have consoled himself by teaching the pianoforte, and so

at least obtaining the means of subsistence; but having no connection, he could get no pupils. Since he could not teach, he had no resource but to tune, and in this capacity he was engaged at Erard's factory, where he made the acquaintance, which quickly ripened into friendship, of the chief musicians of the day. He now wrote some romances, several of which became extremely popular; but, for the best of them he could not obtain more than twelve francs apiece from a publisher. Pleased with the talent of the young composer, Fiévée, the author of the *Dot de Suzette*, adapted this favourite tale into an opera for Boieldieu, and his interest was sufficient to insure the performance of the work. Thus, before the completion of his twentieth year, was Boieldieu brought before the Parisian public; and the success of his first attempt was such, that he obtained a ready hearing for a similar work in each of the two following years; and in 1798 fully established his reputation by the three-act opera of *Zoraime et Zulnare*, which surpassed in merit, as much as in importance, all his previous productions. On the opening of the conservatoire he was appointed professor of the pianoforte, though he had no distinction as an executant; his intelligent æsthetical remarks, however, fully made up to his pupils for his want of mechanical excellence. At this time he wrote some concertos and sonatas for the pianoforte and for the harp, which were admired in their day. He continued to produce an opera in every year; that of "*La Prisonnière*," given in 1799, was written in conjunction with Cherubini; and it was probably in consequence of this connection, and because of the greater purity of his subsequent compositions, that it has been falsely stated he took lessons of that master. In 1800 he brought out "*Beniousky*," which, though then unsuccessful, was revived in 1825 with better fortune. In 1800, also, he produced "*Le Calife de Bagdad*," the immediate popularity of which not only attracted all Paris, but carried the composer's reputation to every city in Europe. From this time forward Boieldieu acquired the habit of rigid self-criticism, which he exercised to such an extent, that he would sometimes set the same words no less than ten times before he could satisfy himself with a composition. This habit increased as he grew older, and was so strong in its influence as greatly to counteract his natural facility, protracting the time of writing one opera to what would before have sufficed for several; but it induced, also, the greater purity of style which distinguishes all his subsequent works from those written prior to this period. "*Ma Sante Aurore*," given in 1802, first exemplifies the scrupulous care, to which, doubtless, is due the survival of many of the composer's works over the operas of contemporary writers. In the March of this year Boieldieu married *Mlle. Clotilde Augustine Mafleuroy*—popular by the first name as a dancer—an event most inauspicious for his future happiness. To escape from the ill effects of this connection he determined to quit Paris; and, accordingly, on April 3, went with his friends Rode and Lamare to Russia. He arrived in St. Petersburg at a fortunate moment. Sarti was just dead; and the office of imperial chapelmaster, thus rendered vacant, was at once given to Boieldieu. The condition of his appointment was the production of three new operas every year, in fulfilment of which he wrote many meritorious works; but, as he employed for these some librettos that had already been successfully set by Berton, Lesueur, and others, he could never reproduce them in Paris. "*Calypso*" (most esteemed by himself) and "*Aline*" are the best operas he wrote in Russia; but a work that is extolled above these, as being perhaps the most earnest of all his productions, is the choruses in Racine's *Athalie*, and yet this has not been brought out upon the Parisian stage. The breaking out of the war with France in 1810 obliged Boieldieu to leave Russia, and he again arrived in Paris in January, 1811. Here he had to oppose Nicolò Isouard, a composer in great popularity. The contest was one of a hare and a tortoise; for though his rival, wanting his conscientiousness, produced three or four operas while he wrote one, the greater pains he bestowed upon his works insured for them a more permanent esteem. "*Jean de Paris*," given in 1812, introduced him anew to the French public, who warmly acknowledged the great advance in his style since the last work of his they had heard. This very favourite opera was followed by several written in conjunction with other composers, which are now forgotten; while "*Le Nouveau Seigneur*" and "*La Fête du Village*," of which the music was entirely by Boieldieu, continue in esteem. On the death of Méhul in 1817, the membership of the Institut thus

vacated was conferred upon Boieldieu. Particularly gratified by this distinction, he considered his next work as a necessary test of his worthiness of the honour, and, with this feeling, he bestowed even more than his usual pains upon it. "Le Petit Chaperon Rouge" was the opera which thus occupied him; and its reception, when it was brought out in July, 1818, was such as to satisfy him that he had not toiled in vain. He now experienced a long and trying illness, induced, it is said, by the careful pains he bestowed on this production. About this time he was appointed professor of composition in the conservatoire, with the rare provision, in consideration of his delicate health, that he should be allowed to receive his class at his country residence. For several years he rested almost entirely from composition, his only efforts being the revision of "La Voiture Versée," one of his early successful operas, and the contribution of some unimportant pieces to works chiefly written by other composers. In May, 1821, he was created a member of the legion of honour; when, with a modest conviction that Catel merited this distinction better than himself, he used every exertion till he procured the same honour for his friend. He at length amply made up to the world for his long repose, by the production, in December, 1825, of "La Dame Blanche," the opera in which above all others his fluency of melody, his purity of harmony, his simplicity of modulation, his clearness of construction, his brightness of instrumentation, and his truthfulness of dramatic effect, are proved, and by which, more than any of his works, these admirable qualities are kept familiar to the world. The long delay in bringing this work forward was greatly occasioned by the composer's dread of competition with his former productions. Success, which too often weans a writer from carefulness in composition, and care for the result, alike increased these qualities with him to an extent amounting to nervous irritability, and when even he could find nothing to improve in his score, it was still with difficulty that he could be prevailed upon to give his work to the public. In 1826 he was relieved from the restraint of his unfortunate marriage by the death of his wife, from whom, though never legally divorced, he had been parted since the first year of their union; and shortly after this he contracted a new alliance with Mdle. Philis (whose sister had sustained the principal characters of his operas in Russia), by whom he had an only son. The same reasons that had procrastinated first the completion and then the production of "La Dame Blanche," had a similar operation on "Les Deux Nuits," the next and the last opera of Boieldieu. This was produced in May, 1829, and mainly in consequence of the weakness of its libretto, met with less success than any previous work of equal importance the composer has given us. The effect of this failure upon Boieldieu was so great, that his health gave way under the vexation; and he in consequence resigned his professorship, as feeling no longer equal to the discharge of its duties. On the dissolution of the Société des Acteurs, some years earlier, the annual pension of 1200 francs, which they had settled upon Boieldieu, was discontinued by the new management of the Opera Comique, as not being bound by the engagements of its predecessors. The pension of the conservatoire, however, added to a private pension from the king, promised him a competency for the rest of his days; but the revolution in 1830 deprived him at once of both these dependencies, as well as some court offices he had long held, and reduced him to a state of serious apprehension as to the means of subsistence. In extreme anxiety he proposed to resume his professorship; this brought his situation under public notice, in consequence of which the minister of the interior granted him a pension of 3000 francs from the Fondes des Beaux Arts. He did not long enjoy this new acknowledgment of his many successes; his constitution was broken, and he sought relief in vain from the baths of the south of France. A short time before his death he was with difficulty removed to a place which was endeared to him by the memory of many hours of recreation he had spent there, where he expired without pain. His funeral obsequies were celebrated in the church of the Invalides, and the government conferred a pension of 1200 francs upon his son. Boieldieu's name is more conspicuous in the musical history of France than those of some more profound musicians, who had neither his temporary popularity nor his lasting influence. His "Dame Blanche," if none of his other operas, must for long remain a standard work in every lyric theatre; but we trace the effect of his genius in what is most national and most natural in the existing French school; for neither Herold, Adam, Thomas,

nor even Auber would have been what they are to us, had he not written before them.—G. A. M.

BOIGNE, BENOIT LE BORGNE, comte de, an Indian general, born at Chambéry, March 8, 1741; died in the same town, June 21, 1830. He was the son of a furrier, and was originally destined to the profession of the law; but, preferring a military career, he joined an Irish regiment, which he accompanied to the Isle of France. We find him afterwards captain of a Greek regiment in the service of Catherine II. After a series of adventures, he resolved to seek his fortune in India, which he reached by way of Suez. He was for many years engaged in the service of several native princes successively; and, by his military skill, and the introduction of European discipline among the native troops, won many a victory for his patrons. Having amassed an immense fortune, he returned to Europe with the rank of general. He first visited England, where he married, and soon after retired to his native town, where he employed a large portion of his vast wealth in deeds of private charity and public munificence.—G. M.

BOILEAU, GILLES, elder brother of Despreaux, born at Crône, near Paris, 1631; died in 1669. Between Gilles Boileau and Despreaux there was continued jealousy, supposed to have arisen from poetical rivalry. Gilles unluckily wrote verses, and did not understand why his younger brother refused his admiration. The courtesies of life led Gilles to pay some compliments to poets who were the subjects of his brother's satire. Gilles Boileau was member of the Academy. The contests on the subject of his admission created a kind of civil war, which is adverted to in several works of the period. He was at the time of his death "contrôleur de l'argenterie du roi."—J. A., D.

BOILEAU, JACQUES, a French theologian, brother of Gilles and of Nicolas, born 1635; died 1716. He was grand-vicar of the diocese of Sens, doctor of the Sorbonne, and canon of the church of Sainte-Chapelle at Paris. He was so much of a humourist in his talk and in his writings, that it was said of him by his brother Despreaux, if he had not been a doctor of the Sorbonne he would have filled the part of the doctor in the Italian comedy. In his works, the extensive erudition proper for the one, and the vivacity requisite for the other, are both conspicuous. The principal of these are—"Historia Flagellantium, sive de perverso flagellorum usu apud Christianos," Paris, 1700—a work which made a great noise at the time, and brought its author rather more fame than he wanted, certain passages, which were not adapted for indiscriminate perusal, having been submitted to that process by means of a French translation; "Historica Disquisitio de re vestiaria hominis sacri," 1704; "Disquisitio theologica de Sanguine corporis Christi post resurrectionem, ad epistolam 146 Augustini," 1681.—J. S., G.

BOILEAU, NICOLAS DESPREAUX, was born in 1636, and died in 1711. His father was one of the registrars of the parliament of Paris. The family claimed descent from Etienne Boileaux, who held high judicial office at Paris in the days of St. Louis, and the pedigree which seemed to prove this was, at the instance of the poet, authenticated as far as the seals and signatures of heralds' offices can authenticate such a narrative of family mythology. While no difficulties of evidence seem to have embarrassed the inquiry as to remoter periods of the narrative, the part which more immediately relates to the poet himself presents some. The precise place of his birth is unknown; most of his biographers fix it at Paris, and in the very chamber which had been occupied, about half a century before, by Gillot, one of the authors of the Satire Menippée; while Racine, with somewhat more probability, makes his birthplace to have been Crône—a little village near Paris, the meadows in the neighbourhood of which suggested the aristocratic affix of Despreaux. On the precise year, too, of his birth (which, however, seems fixed to the date we have given) doubt has been thrown. The king, it seems, on some occasion, asked Boileau his age,—“Sire,” said the poet, “I was sent into the world a year before your majesty, my destiny being to proclaim the miraculous glories of your reign.” It is said that he mistook the year, but could not spoil the compliment, such as it was, by correcting the mistake.

We are, however, anticipating. Boileau was one of four brothers, all carefully educated, and all distinguished in their respective professions. He was educated at the college of d'Harcourt—afterwards called the College Royal de Saint Louis. While there he underwent a painful and not perfectly successful operation for the stone. To some mistake originating most probably in this

circumstance, a story to which, as it is often mentioned, we cannot but allude, is to be referred. It is said, that Boileau when a child, being left in a garden alone by a negligent old-nurse, was attacked and thrown down by a turkey-cock, and before he was rescued received some serious injuries in the groin. Helvetius ascribes to this Boileau's detestation of turkey-cocks—of jesuits who had brought them into France—of his nurse who did not come sooner to the rescue—and of womankind, all of whom, old and young alike, he associated in imagination with the nurse and the accident. The whole course of Boileau's life, says the philosopher, but for this would have been different.

Boileau early showed talents for verse, which his family in every way they could discouraged. For awhile he studied law, and was actually admitted an avocat. He next pursued the study of theology, and was appointed to a benefice—the priory of Saint Paterne. This gave him about forty pounds a-year, which he enjoyed for eight or nine years. He, however, gave up the thought of an ecclesiastical life, and found some means of repaying the sum which he had so received. The death of Boileau's father gave him some independent means, and enabled him to indulge his genius for poetry, unfettered by the claims of a profession. Of his friendships, that with Racine gave him most pleasure, and it lasted through Racine's life. Each encouraged the other. Racine despaired of the success of *Athalie*. "It must succeed," said his friend, "disregard present appearances—*le public y reviendra*;" and when Boileau was almost overwhelmed by the storm which his satire against women evoked, Racine was near him with the comforting words—*l'orage passera*. In 1666 Boileau published his first satires. Boileau's poems have in the successive editions undergone so many changes, that any minute criticism on them as they first appeared would be difficult under any circumstances, and, within our limits, impossible. It is enough to say, that like those of Pope and Byron, the earlier satires seem cast in the mould of Juvenal, and that the subjects are for the most part suggested by Juvenal—to such an extent as in many parts to exhibit a brilliant translation of some of his most striking passages. In the case of Gifford, whose Baviad and Mœviad completely annihilated the writers whom he attacked, the satirist himself has wholly perished with the reputations he dragged down—the ruin alike overwhelming him and them. Boileau has been more fortunate, partly from the accident of the Chapelains, Quinaults, and Cotins whom he satirized, being not without some just claims to be remembered in the literature of their country. Boileau's "Art of Poetry" seems to us of more value, as exhibiting a far higher range of thought, than his earlier satires. In this poem he followed the example of Vida, and was emulated by Pope in the artificial ornament of imitative harmony—seeking, in Pope's language, "to make the sound an echo to the sense." In 1674 the "Lutrin" appeared, to our apprehension Boileau's best work. The general admiration of Boileau's poems led to his introduction at court. He was commanded to read some cantos of the "Lutrin" to Louis XIV. He also read to him the epistle (*Épître au roi*), in which the French monarch is compared to Titus. "How admirable," said the king, "Tres beau! how I would praise you if it were not me but some other that you were praising. I give you a pension of 2000 livres, and the royal privilege to print your works"—the 2000 livres was about £100 a-year—the privilege conferred a valuable copyright. He was at the same time appointed joint historiographer with Racine. This office gave him frequent access to the court. His admission to the academy was in consequence of the expressed wish of the king, yet was not obtained without some difficulty. Boileau attended with more pleasure the meetings of the Académie des Inscriptions. It would appear that at court Boileau spoke with what—if the narratives preserved be true—would seem almost rudeness, but without, however, giving offence. Of Scarron, though patronized by the queen, he courted occasions to speak contemptuously in her presence. Racine trembled, and said, "I cannot again go to court in company with you." It tells better for Boileau that when the king showed him some of his own verses—right royal lines—the poet felt compelled to tell him—"Sire, nothing is impossible to your majesty; it was your pleasure to make poor verses, and the success has been perfect." The king, on another occasion, praised bad verses—not his own—and cited the opinion of the dauphiness as confirming his view. "The king," said Boileau, "is successful in every campaign—he can storm forts and take cities; the dauphiness is an accomplished princess, but

this is a subject I understand and they do not." "How insolent," said the courtiers. "He is right," said the king. Madame Maintenon, in comparing him and Racine, said—"I love Racine, he has all the simplicity of a child;—as to Boileau, the most I can do is to read him. I cannot endure his conversation—*il est trop poëte*." After Racine's death, Boileau ceased to go to court, though encouraged by the king, who told him he had always an hour in the week for him.

Boileau, in addition to the talents which after ages have equal opportunities with his own to estimate, possessed others more likely to render his appearance at court an agreeable thing, he excelled in mimicry; he had the power of imitating any one whom he once saw—the gait—the gestures—even the very tones of the voice, he could represent to perfection. The stories told in proof of this are scarcely credible. One is mentioned by the younger Racine in his Memoirs. Having undertaken to imitate in any gesture a person in the company, that person got up and executed a very difficult dance. Boileau succeeded in giving a perfect imitation of it, though, says Racine, he had never learned to dance. He imitated all the leading actors, on one occasion, to amuse the king. The king asked Molière, who was present, and who was one of those whom Boileau imitated, what he thought of the imitation of himself. "Of that," said Molière, "I have no way of judging but from his imitation of others; that is perfect, and I have no doubt so is the imitation of me." On all questions of poetical criticism, Boileau was regarded as a judge from whose decision there was no appeal. On questions of general literature his views were not so quietly assented to. In the controversy concerning the relative merits of the ancients and moderns, which agitated Paris more deeply than in Boileau's day, it would have been possible to stir the waters by any subject connected with political liberty. Boileau declared for the ancients, and wrote essays on Longinus in support of his opinion. In religious matters Boileau shrunk from ostentatious formalities of devotion, but he regularly attended the observances of his church. A story is told of his going to confession to a priest who did not know his person. After listening for awhile the priest asked him what was his occupation, and was surprised at being told that it was making verses. "Bad work," said the curé.—"Verses, and pray of what kind?" "Satires," said the penitent. "Worse and worse," said the priest. "And pray who are the objects of these satires." "Bad poets," said Boileau,—"bad men—bad women—playhouses—operas." "Call you this confessing your sins?" said the priest; and he dismissed the penitent to prepare another catalogue of offences. In the ecclesiastical disputes of his day, Boileau sided with the Jansenists. Of his satires by far the feeblest is that entitled "Sur l'Équivoque," which is chiefly directed against the jesuits. His latter years were passed in retirement. He refused to listen to those who would praise his verses. "I prefer," he said, "being read to being praised."

Boileau was a man of real benevolence. Hearing that a friend was in such distress as to be obliged to sell his library, he purchased the books, adding a third to the price at which they were valued, and giving the life-use of them to the former owner, who was not allowed to know to whom he owed this obligation. A conversation is recorded, in which an abbé of his acquaintance, who had several benefices, said to him, "Cela est bien bon pour vivre." "Ay," said the poet, "mais pour mourir, monsieur l'Abbé, pour mourir." Hearing that Corneille's pension was withdrawn, he instantly tendered the resignation of his own, saying that were Corneille's cancelled he could not receive one without a feeling of shame. He was fond, it is said, of quoting any passage of merit in the writers whom he had most ridiculed in his satires. It seems strange that he saw nothing to admire in Scarron, whom he seems to have felt an almost insane hatred to; still more strange, that he was insensible to the graces of La Fontaine, if, indeed, this assertion repeatedly made be true. We doubt it. La Fontaine is mentioned by him together with Molière, whom he admired more than any other man of the period. That he is not mentioned in the "Art Poétique" is the great offence as charged in the indictment of the French critics. The publication of the Fables and of his Art of Poetry were, it should be remembered, almost contemporaneous, and though the Fables were published some short time before Boileau's poem, it is not improbable that his poem was the first written. In the parts of Boileau's works where La Fontaine is mentioned, the praise is earnest and cordial.

Boileau died of dropsy in the chest. A large number of persons attended his funeral. "What a number of friends he had," said a woman in the crowd to Louis Racine, as he moved in the procession, "and yet this is the man said to have spoken ill of all the world!" He was buried at the Chapelle de Paris, under the spot occupied once by the reading-desk, which his poem of the "Lutrin" had rendered famous. His resting-place, in the days of the Revolution, which left neither the living nor the dead at peace, was disturbed, and the body removed. In July, 1819, the mortal remains of Boileau were again removed from the Musée des Monuments François to the parish church of St. Germain-des-prés, and placed in the chapel of St. Paul. The place is marked by a tablet of black marble, recording the dates of Boileau's birth and death, the fact of the reinterment, and the regard in which his memory is held by his country.—J. A., D.

**BOINDIN, NICOLAS**, born at Paris in 1676; died in 1751. At the age of twenty he went into the army, which, however, he soon left from delicacy of constitution. In 1706 he became a member of the Academy of Inscriptions; Cardinal Fleury interfered to prevent his admission into the French Academy, saying that he was an atheist. He published three tracts on Roman antiquities in the Transactions of the Academy of Inscriptions; on the "Roman Tribes," on the "Forms and Architecture of the Theatres of the Ancients," and on the "Theatrical Dresses of the Ancients." These papers still possess some interest. Boindin produced some dramatic pieces, one of which was, after a few representations, not permitted to be acted. It is probable that Boindin's reputation as an atheist made phrases which, from another would be disregarded, be looked upon with suspicion. The matter was of some importance in the history of the French stage, as the incident led to the establishment of the censorship. Boindin was not allowed to die at peace, and the name of atheist robbed him of the ordinary decencies which humanity owes to the dead. The rites of sepulture were refused, and he was secretly interred by night. Boindin's works have been collected, Paris, 1752.—J. A., D.

**BOINVILLIERS-DESJARDINS, JEAN-ÉTIENNE-JUDITH FORESTIER**, a French grammarian, born at Marseilles in 1764; died in 1830. At the time of the creation of central schools, he obtained the chair of belles-lettres at Beauvois. He was a very voluminous writer; and besides several other works, too numerous to specify, published editions of Phaedrus, Terence, &c. He was member of a great number of literary societies in the departments, and correspondent of the Institute since 1800.

\* **BOISDUVAL, JEAN ALPHONSE**, a French naturalist, was born at Ticheville, 17th June, 1801. He prosecuted his studies at Vimoutiers, and he subsequently gave attention to pharmacy at Falaise, Rouen, and Paris. In 1824 he gained a botanical prize, and one for medical natural history at the school of pharmacy in Paris. He graduated as doctor of medicine in 1828. His chief works are his "French Flora;" his "Arrangement of European Lepidoptera;" and his "Account of the Lepidoptera of Madagascar, Bourbon, and Oceana."—J. H. B.

**BOISGELIN DE KERDU, PIERRE-MARIE-LOUIS DE**, a French historian, brother of the Cardinal and Count Louis-Bruno, born at Plelo in the diocese of Saint Brieno in 1758; died in 1816. He pursued the military career, became knight of Malta, in which island we find him in 1793; from this place he started for Toulon, then occupied by the English for Louis XVII. When the republicans made themselves masters of this place, he retired with his regiment into Corsica. He afterwards went to England, and did not return to France till the restoration of the Bourbons. Author of "Ancient and Modern Malta," London, 1803, 3 vols. 8vo; "Travels through Denmark and Sweden," *ibid.*, 2 vols. 4to; a continuation of the Abbe Vertot's History of the Revolutions of Portugal, *ibid.*, 1809, 12mo, &c.—J. G.

**BOISJOLIN, JACQUES FRANÇOIS MARIE DE**, born at Alençon, 1761, was one of that rather large class of writers, who, during the latter part of the eighteenth century, in France, devoted attention to English literature. He had written a poem in imitation of Thomson, and had translated Pope's Windsor Forest, when the Revolution breaking out turned his thoughts in a different direction. Under the directory he obtained a situation in the foreign office, and when Bonaparte became first consul, Boisjolin obtained a seat in the tribunat, but his poetical vein never returned. He died in March, 1843.—J. F. C.

**BOISMONT, NICOLAS THYREL DE**, a French preacher of considerable celebrity, born at a village of Normandy in 1715;

died at Paris in 1786. In his youth he was indolent and somewhat dissipated; but latterly did justice to his talents by indulging an ambition to be the first of preachers in the metropolis. He was admitted into the academy in 1744, and afterwards became preacher in ordinary to the king. He is the author of two sets of letters on the morals of the clergy in France, and of a volume of "Oraisons Funebres, Panegyriques et Sermons."

**BOISMORAND, CLAUDE JOSEPH**, born at Quimper, 1680. This singular man, who, without knowing a word of English, turned a poor literal translation of the Paradise Lost into a striking and spirited copy of the great original, was a priest, and although a priest, a habitual swearer and gambler. When pressed for money he would write attacks on the jesuits, to whom he originally belonged, bring them to Father Tournemine, and obtain from the chief of the order, promises of reward, with present earnest, for demolishing the foe. As he possessed great talents, he always succeeded in inflicting satisfactory chastisement upon the imaginary enemy, then gambled away the profit, and solaced himself with swearing. He wrote some works, chiefly of an anecdotal character, and, before his death, submitted to the severest penance for the irregularities of his life. He died in 1740.—J. F. C.

**BOISOT, JEAN BAPTISTE**, born at Besançon in 1638, and died in 1694. The family to which he belonged was one of high distinction. He studied at Besançon in the classes of philosophy and law till his eighteenth year, graduated at Dôle in civil and canon law, then went to Paris, where he was favourably received in the best society. He next passed three years in Italy. At Rome he attracted the attention of Cardinal Azzolini and Christina, queen of Sweden, and found interest enough to obtain from the pope the gift of two priories in Franche Comté. He then visited Germany; and was one of the deputies of the clergy to the états of Franche Comté. He was afterwards employed by the crown in several negotiations in Italy and Spain, in all of which he acquitted himself satisfactorily. He passed two years in Spain, principally in the library of the Escurial, in which, however, he said he found nothing of the same value as the books and manuscripts he himself possessed. He purchased from St. Amour the library of cardinal de Granvelle. He arranged, classified, and secured the preservation of the memoirs of the cardinal and his father, one of whom had been prime minister of the Emperor Charles V., and the other of Philip II. Among the documents thus secured by his diligence, were most of the treaties concluded in the reigns of Charles V. and Philip II., and numberless letters in all the languages of Europe—several in cypher, and these he decyphered—from popes and kings and emperors: more important service to history could not have been performed. Leibnitz made great use of his collection in his Codex Diplomaticus, and Flechier, bishop of Nismes, in his history of Cardinal Ximenes. In 1678 Franche Comté was united to the crown, and Boisot was given the abbey of St. Vincent de Besançon: 1694 being a year of famine in his district, Boisot gave among the poor a sum of 12,500 livres, and had to borrow money for the daily expenses of his house. He died of a malignant fever, caught during his exertions for the poor.—J. A., D.

**BOISROBERT, FRANÇOIS LE METEL DE**, born at Caen in 1592, and died in 1662; son of a procureur des aides de Rouen, was first an avocat, but was too fond of society to continue long in this occupation. His company was sought everywhere; his memory was good, and he is said to have had by heart all the best stories of Boccaccio and Beroald. He travelled in Italy, and Pope Urban VIII. gave him a priory in Bretagne. Boisrobert, who had not before thought of the church as a profession, now took orders, and soon obtained a good canonry at Rouen. Citois, Richelieu's physician, when the cardinal was ill, told him that an hour of Boisrobert's witty conversation would do more for him than all the drugs in the pharmacopœia. The remedy was tried, and succeeded. Boisrobert, however, got out of favour. The physician insisted on his being recalled. "Recipe Boisrobert" was the language of his prescription. The prescription was tried, and is said to have effected a cure, but the cardinal died within the year. Boisrobert's influence with Richelieu led to the incorporation of the French Academy. It is said that he offended Richelieu on one occasion, by introducing to a private representation of the tragedy of Mèrème, some acts of which were supposed to be of the cardinal's own composition, two females of doubtful character; and that at another time he

was banished for awhile from Paris for the indecency of cursing and swearing at a fashionable gaming-table, when there was a run of luck against him. He was more often spoken of by the name of a favourite actor than by his own—the Abbé Monclori was what he was generally called. He seems to have been an idle, good-humoured, and good-natured fellow—a sort of small Sir John Falstaff. The list of his works, most of them dramatic pieces, would occupy more room than we can spare. The first published was "Poems," printed in 1626; his last, "Epistles in Verse," &c., 1659. Two volumes of tales in imitation of Fontaine's, published under the name of his brother, Antoine Ouville le Metel, are said to be by Boisrobert.—J. A., D.

BOISSARD, JEAN JACQUES, born at Besançon in 1528; died at Metz in 1602. He commenced his studies at the university of Louvain, then went to Germany and Italy. Here he entered into the service—we are not told in what capacity—of Cardinal Caraffa. Antiquarian tastes were soon formed among the wonder-works of Rome. Our young student cultivated his talents for design, and made drawings of the most remarkable objects in Rome and the islands of the Archipelago. He was proceeding to Greece when ill health compelled his return. He was now assisted and encouraged by Cardinal Carpi. Boissard's earliest studies were directed by his uncle, a distinguished Greek scholar. On the continent, as in England—(see the article on ROGER ASCHAM)—the study of Greek was, in the sixteenth century, regarded as connected with protestantism. However this may be, before leaving Rome, Boissard professed the reformed doctrines. When he returned to Franche Comté he found that protestantism, in any form, was not tolerated there. He left at Monbeillard a valuable collection of antiquities, which he had found in Italy, with a friend for safe keeping, and he fixed his tent at Metz. His antiquarian treasures were plundered or destroyed in the miserable religious wars which convulsed France. Of Boissard's works there are none without some interest. They are chiefly, we might almost say exclusively, on subjects of art and archæology—volumes of poems, valuable for their engraved illustrations; books of emblems, often very fanciful; folios of topography, and of history and biography; in which faithful portraits of the features of each person whose life is given, are held out as the great temptation to purchase. These, could we believe the promise fulfilled, would be valuable.—J. A., D.

BOISSAT, PIERRE DE, born at Vienne in Dauphiné in the latter part of the sixteenth century; died in 1613. He was vice-bailli of Vienne. He wrote several historical and genealogical works, the most important of which is a "History of the Knights of Malta," edited by his son, the best edition of which is that of Paris, 1659.—J. A., D.

BOISSAT, PIERRE DE, born at Vienne in Dauphiné in 1603; died in 1662. He appears to have had a quick ear for verse, and wrote Latin in metrical forms with facility. This talent was exhibited while he was yet a child, and from it he was called "Boissat l'Esprit." He was first intended for ecclesiastical life, then the bar was thought of; while thus irresolute, accident or idleness threw him into a dragoon saddle. Our young officer visited Malta, where the recollection of his father's History of the Knights of Malta secured him a hospitable and kindly reception. Boissat had the reputation of a brave man, and what served him even better, that of a skilful duellist. Society, in its various grades, seemed determined to show him such honours as it could. He was named by the court, gentleman of the chamber to Gustav d'Orleans, was received as a member of the French Academy, and by Gaspar Lascaris, vice-legate of Avignon, he was given the title and dignity of count palatine. Less distinctions than these would have made him a dangerous visitor to ladies with or without hearts; and we have a strange story of his having been found at a ball in female costume with Madame Sault, whose husband was lieutenant du roi in Dauphiné. The story is not very intelligibly told; perhaps there was more to tell than the lady communicated—perhaps less than her servants suspected. The servants fell upon him with sticks and beat him unmercifully. Six years' litigation followed—pleadings and counter-pleadings, oral and written. The affair, somehow or other, not taking the natural course of a duel—the lieutenant du roi perhaps not being gentleman enough for the comte palatine—but getting into the law-courts at last, the noblesse of Dauphiné thought that too much had been made of the matter by the public, and too much also by the lawyers. The result of their movement was, that the count had to quit Grenoble and

trudge back to Vienne. Whether a condition to that effect was insisted on by the friends of the lieutenant to give him the opportunity of retaliation, or whether he was led only by his own free fancy, the count soon reappeared as a married man. Years past on, and we find him again alone—his wife dead or forgotten. He is now a devotee, a worshipper, seen of all men in streets and marketplaces; a long white beard, hair streaming in negligent strings, clothes ragged and filthy. He called himself a pilgrim, and wished to teach children their catechism; but though they gathered round him, it was only to laugh at the fantastic figure of the poor man, who yet could not be treated as if actually insane. Queen Christina of Sweden passed through Vienne, and Boissat presented himself before her. She did not or would not believe that it was the same person whom she had seen under other circumstances, and said that some frantic fanatic had assumed his name. He published in 1631, under the name of Baudon, a romance, entitled "The Negropontine Story, or the Loves of Alexander and Olympia." Under the same name he published, in 1633, Fables from Æsop, and was in the habit of printing poems on flying sheets, or broadsides as they are called. Some of these were bound together, and issued as his "Pièces en prose et en vers." One hundred and fifty copies thus entitled are said to have been in the hands of his family, and issued for sale so late as the year 1720. It is probably the same collection which we find mentioned with the title "Petri de Boissat Opera et operum fragmenta Historica et Poetica." He published "Relation des miracles de notre dame de l'Ozier." This book also contained "Des vers à la louange de la Sainte Vierge," in five languages—Greek, Latin, Spanish, Italian, and French; 1659. He published also "Morale Chretienne." These were with his own name.—J. A., D.

BOISSEAU, FRANÇOIS-GABRIEL, a French physician and medical writer, was born at Brest in 1791. He served in the French peninsular army as a junior assistant-surgeon, and continued attached to the imperial army until the battle of Waterloo. He then entered the military hospital of the Val-de-grâce, where he continued his medical studies, and took his degree as doctor of medicine in April, 1817. From this year to 1829, Boisseau was the principal editor of the *Journal universel des Sciences Médicales*, and also assisted in the preparation of the *Biographie Médicale*, published during the same period by Panckoucke. After the revolution of 1830 he was appointed professor of the hospital at Metz; but excessive literary labour had undermined his health, and he died in Metz on the 2nd January, 1836. Of his numerous writings the principal are—"Considérations générales sur les classifications en Médecine," Paris, 1826; "Nosographie Organique," Paris, 1828-1830; and "Pyréologie Physiologique ou Traité des fièvres," &c., Paris, 1823.—W. S. D.

BOISSEREE, SULPICE, a noted German architect and archæologist, borne at Cologne in 1783. A journey which he made to Paris in 1803, and another along the course of the Rhine, in company with his brother Melchior, and his friend, J. B. Bertram, were the occasions of his resolving to make a collection of German art-antiquities. This resolution he carried out in his native city, by amassing upwards of two hundred pictures, which, as representative of various schools of painting that, predominating in one century, were almost entirely lost sight of in the next, were considered of such value that, after being removed to Stuttgart, the price of 120,000 thalers was offered for them by Louis of Bavaria. This collection is now at Munich. In 1835 Sulpice Boisserée was named curator-general of plastic antiquities in Bavaria, and shortly afterwards a member of the French Academy of Fine Arts. He had an important share in the composition of the following work—"Sammlung alt-nieder-und oberdeutscher Gemaelde der Brüder, S. und M. Boiserée und Bertram," &c. 1822-1839.—J. S., G.

\* BOISSIER, EDWARD, a Swiss botanist of the present century, member of the Society of Natural History of Geneva. He has travelled much in Spain, and has published an account of a botanical trip in the south of Spain during the year 1837, and a description of the new plants collected during the journey; also a *Flora Orientalis*, which is still incomplete.—J. H. B.

BOISSIEU, JEAN JACQUES, a French portrait and landscape painter, born at Lyons in 1725. His manner was a little after Ostade. His engravings after Berchem, Ruysdael, and Asselyn, are numerous; and Bryan tells us "his point is remarkably pleasing and picturesque, yet spirited and masterly."—W. T.

BOISSONADE, JEAN FRANÇOIS, a distinguished Greek

scholar and critic, born in Paris, 1774. It was in the early part of the present century, that after having filled some important situations under the government of Napoleon, Boissonade abandoned politics for the sake of giving himself up exclusively to the study of Grecian literature, of which, in 1809, he was nominated professor at the French academy. In 1813 he was elected member of the Academy of Inscriptions, and in 1828 was raised to the chair of Greek literature in the college of France. His philological works, all bearing on his favourite pursuits, are very numerous, and connected with his lectures in the college of France, gave a remarkable impetus to the study of that branch of classical literature with which his name is so honourably connected.—J. F. C.

BOISSY, CHARLES DESPREZ DE, a French barrister, author of "Lettres sur les Spectacles," in 2 vols. The second volume contains an account of works for and against plays.—J. T.

BOISSY, JEAN-BAPTISTE THIANDERE DE, a French archæologist, born at Paris in 1666; died in 1729. He was member of the Academy of Inscriptions, and left two dissertations, "Sur les Sacrifices de Victimes Humaines dans l'antiquité," and "Sur les Expiations en usage chez les Anciens."—J. G.

BOISSY, LOUIS DE, born at Vic in 1694; died in 1758. He wrote several comedies, the best of which is "l'Homme de Jour." Boissy was an improvident man, and always in distress. He found a strange resource in expressing in verse, for writers who were ambitious of literary distinction, but who had not acquired this accomplishment, their conceptions, and thus satisfying the requirements of the French theatre. He married; and he and his family were reduced to entire destitution, when, through the interest of Madame Pompadour, he was appointed editor of the *Mercur*. During his editorship, Marmontel, from whom we learn the fact, was led to write, for the purpose of serving Boissy, his *Moral Tales*.—J. A., D.

BOISSY D'ANGLAS, FRANCIS ANTHONY, Count, a French statesman and author, born 1756; died 1826. He was originally bred to the bar, but obtained an appointment in the household of Monsieur, afterwards Louis XVIII. Like the famous vicar of Bray, he seems ever to have had a strong inclination to swim with the current, and was usually a partisan of the dominant party for the time being. He took part in the overthrow of the monarchy, then of the republic, and finally of the empire. In consequence of the aid he gave in promoting the downfall of Buonaparte, he was nominated a peer in 1814. But, true to his principles, he joined the emperor on his return from Elba, and obtained a place in the chamber of peers. On the final downfall of Napoleon he was at first excluded from the upper house, but was restored to his place in the course of a few weeks. Count Boissy must have possessed some sterling qualities, which caused his failings to be thus overlooked. He is the author of an essay on the life, writings, and opinions of Malesherbes; of some political pieces; and of the "Etudes Littéraires et Poétiques d'un Viellard," in 6 vols., 12mo.—(*Biog. Univ.*)—J. T.

BOISTE, PIERRE CLAUDE VICTOIRE, a French lexicographer, born at Paris in 1765; died at Ivry-sur-Seine in 1824. He first applied himself to the law, but afterwards turned his attention entirely to literature. He published a universal dictionary of the French language—a gigantic work that has placed him in the same rank that Johnson has attained among us. He also wrote an epic poem entitled "l'Univers Délivré," Paris, 1805, which though frequently brilliant in its language and execution, is now entirely forgotten.—J. G.

BOISTUAU DE LAUNAI, PIERRE, a French historian, lived in the first half of the sixteenth century. Author of "Theatre du Monde," a work that has been printed more than twenty times at Paris, Lyons, Rouen, Antwerp, &c. A translation of St. Augustine's City of God has been attributed to him.

BOISY, ARTUS DE GOUFFIER, seigneur de, also comte d'Etampes, was intrusted by Charles VIII. with the education of his son, afterwards Francis I., on whose accession Boisy was placed at the head of affairs, with the rank of grand-master of the household. He was subsequently employed in negotiating with Chièvres, the envoy of Charles V., for the adjustment of the disputes between the two sovereigns, but died of fever in 1519, before achieving the result for which he and Chièvres laboured with a zeal augmented by the strength of their personal friendship.—W. B.

BOIT, CHARLES, a Swedish enamel painter, who practised in France and England with success, and died in 1726.—W. T.

BOITARD, PETER, a French naturalist and agricultural writer, born at Mâçon in 1789. He at first followed a military life, and afterwards devoted himself to literature and natural science. Among his writings are—"The Cabinet of Natural History;" "Manual and Elementary Course of Natural History;" "Manual of Entomology;" "Botany for Ladies;" "Manual of Botany and Physiology;" "Gardening and Foresting Manuals;" and "Description of Mammifers in the Garden of Plants at Paris."—J. H. B.

BOIVIN, DE VILLENEUVE, JEAN, born in 1663, and died in 1726, a younger brother of Louis Boivin, by whom he was supported and educated. An appointment was given him in the Bibliothèque du Roi. A manuscript of part of the Bible in uncial letters, and believed to be of the eleventh or twelfth century, over which, on the same parchment, were written homilies of one of the Greek fathers, was discovered and decyphered by him. In 1705 he became a member of the Academy of Inscriptions, and soon after was appointed professor of Greek in the college de France. In 1712 he edited some volumes of the Byzantine Historians. On Huet's death he succeeded him as one of the forty of the academy. He published several tracts on classical subjects, and some translations in French verse, among them one of Homer's *Frogs and Mice*. Several papers of his on antiquarian subjects are printed in the *Memoirs of the Academy of Inscriptions*.—J. A., D.

BOIVIN, FRANÇOIS DE, baron de Villars, a French chronicler, died in 1618. He was councillor and maitre d'hôtel to the dowager queens, Elizabeth and Louise. From 1550 to 1559, he accompanied the marechal Cossé-Brissac, commander of the French army in Piedmont, as private secretary, and has left memoirs of the campaigns in Piedmont, Montferrat, and the duchy of Milan.—J. G.

BOIVIN, LOUIS, born in 1649 at Montreuil d'Argile, a small town in Upper Normandy, and died in 1724. Boivin's father was the avocat of the highest reputation in the district, and his maternal uncle, Pierre Vatier, was royal professor of Arabic. Young Boivin was educated in the jesuit establishment at Rouen. He afterwards attended at Paris lectures on theology, jurisprudence, and medicine. He was fond of writing verse; but Chapelain, who had then the character of being the best poet and critic in France, seeing some of his verses, dissuaded him from the exercise of the unprofitable art. In 1701 he became member of the Academy of Inscriptions. His manners are described as savage. He was irritable and impracticable. He purchased land in Normandy, and found the acquisition a plague. He is said to have expended a large sum of money, and to have wasted twelve years of time in disputing through every form of litigation, with the abbey of La Trappe, a demand of a shilling a year, which he had finally to submit to. He had ready for publication, when death interrupted his purpose, a "Narrative of Joseph's Life," framed from the scripture account, in French verse, at which he had been working for thirty years. Several papers of his on Greek and Roman antiquities are published in the *Memoirs of the Academy of Inscriptions*. He was in the habit of making so many alterations in what he wrote, that the printers ceased to send him proof sheets, and these essays had not the advantage of his superintending the press.—J. A., D.

BOJE, CASPAR J. See BOYE.

BOJE or BOIE, HEINRICH CHRISTIAN, a German poet, was born at Meldorf in Holstein, March 9, 1744, where he died, March 3, 1806. He was a conspicuous member of the Göttinger Hainbund, and editor of the first German *Musenalmannach*, 1770. He also edited the *Deutsche Museum*, 1776-91.—(See Prutz *Der Göttinger Dichterbund*, 1841.)—K. E.

BOJER, WENCESLAUS, a distinguished botanist, was born at Prague in Bohemia, on 1st January, 1800. His love of botany and natural history brought him under the notice of the late emperor of Austria, who paid for his education, with the view of preparing him for missions of scientific discovery. In 1820 he went to the Mauritius. After visiting various parts of Madagascar, making extensive collections, he sent to Vienna a large number of valuable specimens. He was rewarded by the emperor with a pension, and the decoration of the order of merit. He made a second voyage to Madagascar, and crossed over to the eastern coast of Africa, in search of new plants. He then visited the Comoro islands, &c. In these different places he resided for six years, making Madagascar, however, his head-quarters. In 1837 he published his "*Hortus Mauri-*

tianus," which contains an enumeration of the exotic and indigenous plants growing in the island, arranged according to their natural orders. Besides being a botanist, Bojer was also a chemist and geologist. He founded in the Mauritius the Society of Natural History, afterwards denominated "The Royal Society of Arts and Sciences, Mauritius." He was appointed in 1855 professor of natural history and chemistry at the royal college of Port-Louis. His last work was an account of the borer insect, which had committed great ravages in the island. At the time of his death, he was engaged in drawing up an illustrated monograph of the genus *Mangifera*. He died on 4th June, 1856, in the 56th year of his age.—J. H. B.

**BOKHARI, IMAM ABU-ABDALLAH MOHAMMED EBEN ISMAIL AL-JAAFI AL-BOKHARI**, a Moslem doctor of great celebrity, whose collection of traditions concerning the prophet, his companions, and successors, entitled "Ssahih" (the Undoubted), enjoys an authority among the Soonite or orthodox sect of the Moslems, second only to that of the Koran. He was born in Arabia, of the tribe of Jaafa, about the year 810. In his eighteenth year he repaired to Mecca, and began the compilation of his great work, which occupied him no less than sixteen years. Each separate tradition was committed to writing only after the pious scribe had observed the ceremony of purification by prayer and ablution at the well of Zemzem; and when the work was to be divided into sections and chapters, he chose for his residence Medinah, where, with daily prayers for the success of his undertaking, he laid each section and chapter as it was completed on a tablet between the tomb and the pulpit of the prophet. Many copies of the work exist in European libraries. Its author, after confounding by his skill in tradition some legists of Bagdad, who challenged him to a public discussion, took up his residence in Bokhara. He died in 870.—J. S., G.

**BOL, CORNELIUS**, a Dutch painter, living in England during the Great Fire, out of which great misery he made money by painting scarlet views. He also etched some views of seaports and public buildings.—W. T.

**BOL, FERDINAND**, born at Dort in 1611, and a pupil of Rembrandt at Amsterdam. He painted religious and historical pictures, but excelled chiefly in portrait and engraving, although not equal in playful and daring freedom of hand to the great magician his master. He painted faces in a bold, dashing, free manner, but muddled his carnations too much with brown. Though often, in his historical scenes, defective in drawing and clumsy in attitude and proportions, he often rises to high merit, composing well, and throwing ease and nature in expression into his canvas creatures. His greatest work, celebrated by the poet Vondel, was in the admiralty at Amsterdam. The court of justice in the town-house had other works of his; and the council-chamber at Dort had, and perhaps still has, some of his chef-d'œuvres, such as "Moses breaking the Tables," the "Appointment of the Seventy Elders," and "Fabricius in the Camp of Pyrrhus." He died in 1681. His etchings are numerous, and remarkable for a certain bold spirit. They consist of a motley tribe of astrologers, philosophers, officers, learned persons, and brave young women in caps and feathers.—W. T.

**BOL, HANS**, a landscape painter and engraver, born at Mechlin in 1534. He studied at Heidelberg, where he learned to copy the old masters, and afterwards studied at Amsterdam, where his works were esteemed, and died there in 1593 or 1583, for Sandart and Deschamps differ. His best works were a "Crucifixion," and the "Story of Dædalus and Icarus," in distemper. He etched cleverly his own works, and was renowned in the Dutch world for his harmony and unity of colour, his broad and free pencilling, and his general pleasing invention and composition. His landscapes were chiefly views of Low Country cities and scenes outside Amsterdam, for he excelled in representing the waving spectral reflections of vessels in the canal water. The great Dutch city where he lived, with its quaint mingling of red roofs, green trees, and pennoned masts, was his special delight.—W. T.

**BOLANGER, JOHN**, born in 1606. He became an eminent pupil of Guido, whose composition and colour he so carefully imitated, as to become court painter to the duke of Modena. Like most of the eclectics, aiming low, he reached nothing higher than "exceedingly pleasing design, an elegant taste of composition, and a delicate colour," attempting sacred and profane history in the manner of his pale and effeminate school. He died in 1660.—W. T.

**BOLDINI NICCOLO, VICENTINO**, an early engraver on wood, born at Vincenza about 1510. His prints are chiefly after Titian, under whom it is supposed he studied. They are in a bold, free style, and scarce.—W. T.

**BOLESLAS**. This name was borne by five of the early sovereigns of Poland, whose original title was duke (dux; military leader):—

**BOLESLAS I.**, surnamed **THE VALIANT**, succeeded his father, Miecislus I., in 999, and married a niece of the emperor, Otho III., who conferred upon him the title of king, which the pope ratified. Meditating the invasion of Russia, he was attacked by the duke of Bohemia, whom he speedily conquered, made prisoner, and deprived of his eyesight. Having taken possession of that duchy, and of Moravia, he resumed his designs against Russia, then distracted by the civil wars which followed the death of the grand duke Vladimir. A considerable portion of the country submitted to him, and he afterwards extended his conquests into Prussia and Pomerania. But these acquisitions were lost under his immediate successors, Miecislus II. and Casimir.

**BOLESLAS II.**, great-grandson of Boleslas I., was also an enterprising and warlike monarch. Three distinguished refugees having thrown themselves on his protection—Jaromir, brother of the duke of Bohemia; Bela, brother of the king of Hungary; and Zaslaf, his own cousin, eldest son of the duke of Russia—he first invaded Bohemia, and restored Jaromir; then he entered Hungary, and placed Bela on the throne. But his designs against Russia, though in part successful, were interrupted by dissensions requiring his presence at home. A subsequent quarrel with the pope, Gregory VII., proved fatal to his sovereignty, and he died in exile and wretchedness about 1090.

**BOLESLAS III.**, nephew of the preceding, came to the ducal dignity in 1103, the regal title having been abolished by the pope. The early part of his reign was disturbed by contests with an illegitimate brother, Sbigmiew, with whom he had kindly shared his dominions. A war with the emperor, Henry V., followed, and was conducted by Boleslas with so much spirit and success, that the emperor was glad to ratify a peace by giving his sister in marriage to the conqueror. A subsequent disastrous defeat by the Russians before Halitz shortened his life; he reigned, however, thirty-six years.

**BOLESLAS IV.**, second son of Boleslas III., fell heir at his death to a portion of his dominions, from which his elder brother, Uladislus, attempted to drive him. In the contest that ensued, the aggressor was compelled to take refuge in Germany, and Boleslas was invested with the dukedom of Poland in his stead. Attacked by the imperial power in the interest of Uladislus, he resisted Conrad, and conciliated Barbarossa. But his subsequent attempt to conquer Prussia issued in a humiliating defeat, and the claims of the children of Uladislus threatened to disturb his later years. By a temperate and wise policy, however, he averted this danger, and having set himself to improve the condition of his subjects, he held the dukedom in peace and honour till his death in 1174.

**BOLESLAS V.**, surnamed **THE CHASTE**, inherited the ducal throne at the age of seven, and his minority was disturbed by the ambitious designs of his uncle Conrad; but on attaining his majority in 1237 he took possession of his sovereign rights, with the help of the duke of Silesia, whose daughter, Cunegonda, he married. The Tartars, who had established themselves on the frontiers of Hungary, made repeated incursions into Poland at this period, and Boleslas proved inadequate to the task of heading his people in a brave and vigorous resistance. It was not till near the close of his reign that his passionless and indolent temper was roused to an energetic effort, which resulted in a victory over the invaders. He was subsequently defeated in an expedition against the Russians, and died in 1279.

This name was also borne by three dukes of Bohemia:—**BOLESLAS I.**, surnamed **THE CRUEL**, who acquired the sovereignty in 932, by the murder of his brother, Wenceslas II., and was put to tribute by the Emperor Otho; his son, **BOLESLAS II.**, who succeeded in 967, and received the surname of **THE PIOUS**, as the founder of the bishopric of Prague, and many churches in other parts of his dominions; and **BOLESLAS III.**, son of Boleslas II., who inherited the throne at the close of the century, during a war with Poland, which he conducted feebly, and which issued in his abdication in 1012, after he had been deprived of his eyesight by the Polish monarch.—W. B.

**BOLEYN or BULLEN, ANNE**, the second wife of Henry

VIII. of England, was the eldest daughter of Sir Thomas Boleyn and the lady Elizabeth his wife, and was born probably about 1501. Her father represented an ancient and noble family in Norfolk. She was carried to France in September, 1514, by Mary Tudor, the youngest sister of Henry VIII., when she went to marry Louis XII. After the death of Louis, Mary returned to England, but Anne remained in France, in the service first of Claude, the queen of Francis I., and after her death, in the household of the duchess of Alençon, where her beauty and varied accomplishments attracted universal admiration. She danced and played the flute and rebec to perfection, and dressed with marvellous taste. When, in due time, she returned home, Henry VIII. saw her in her father's garden at Hever, and was charmed with her wit; and, through the interest of Wolsey, she was appointed maid of honour to Queen Katharine of Aragon. Here she was receiving the addresses of Lord Percy, the eldest son of the duke of Northumberland, when Henry formed the project of making her his bride. For this purpose he divorced Katharine; and when the pope would not consent to so arbitrary a measure, he disowned the papal authority, and threw off the sacerdotal yoke of Rome. Anne Boleyn was privately married to King Henry, some say at Dover, the same day that the king returned from his celebrated visit to Francis I.; some say in the chapel of Sopewell Nunnery; and others at Blickling Hall in Norfolk. The probability is that the nuptials took place at Whitehall on the 25th of January, 1533. They were openly solemnized again at Easter-eve of the same year, April 12th; and she was crowned queen on Whit-Sunday, June 1st, "of all days the most lovely in England." On the 7th of the following September, to the great disappointment of her husband, she gave birth to a daughter, afterwards the renowned sovereign Elizabeth. Anne continued mistress of Henry's affections until the year 1536. Then her ill-disguised vanity having somewhat alienated his esteem, she discovered him one day caressing Jane Seymour, one of her attendants. Deeply wounded by this spectacle, she fell into transports of grief; and after some hours of intense agony, brought forth a dead son, January 29th. Henry was now thoroughly alienated from her. He caused her, on very slight grounds, to be indicted for high treason. He accused her of having allowed several persons to invade his conjugal rights. She was tried and condemned by a jury of peers, of whom her uncle, the duke of Norfolk, her inveterate enemy, was president. She defended herself before them with admirable presence of mind, convincing all of her innocence. Commending her little daughter Elizabeth to the care of Henry, and renewing her protestations of fidelity, she prepared for death, not only with serenity but cheerfulness. The executioner of Calais was sent for, as expert in his vocation. She was beheaded in the tower on the 19th of May, 1536. Her body was thrown into a common elm chest, made to hold arrows, and then interred. Henry married Jane Seymour the very day after her execution, and thus explained the secret reasons of his suspicions against her. Her private copy of Tindal's translation of the Bible is still in existence. She was not less accomplished than beautiful; and the verses which she composed shortly before her execution prove that she had considerable poetical powers.—T. J.

**BOLIGENI, GIOVANNI VINCENZO**, an Italian jesuit, who, after the suppression of his order, was summoned by Pope Pius VI. to Rome, where he published a number of works, which so abounded in commendations of the suppressed order, that even his friends joined in the remonstrance which was addressed to him by the sacred college. He was born at Bergamo in 1733, and died at Rome in 1811.—J. S., G.

**BOLINGBROKE, HENRY ST. JOHN**, Viscount, filled so long as he was on the stage as large a space in the public eye as any of his contemporaries, although he has no place in the *Biographia Britannica*. His family was of old standing; his father was a baronet, his mother the Lady Mary Rich, a daughter of the earl of Warwick. He was born at his father's seat of Battersea, near London, on the 1st of October, 1678. To impress this date, it may be remarked that Henry Lord Bolingbroke came into the world exactly a century, almost to the day, before one of the most remarkable men of our time—Henry Lord Brougham. Then his public life coincides almost exactly with the first half of the eighteenth century. He entered parliament in February, 1701; and he died at Battersea, where he first drew breath, on the 15th of December, 1751. He and that half century—which, however, extends its penumbra back to the

Revolution, and onward to the death of George II.—had a good deal in common. It may be said that "he and it did in each other live; nor could *he it*, nor could *it him* survive." There is no thinking of that time without the image of Bolingbroke rising to the mind. We see him in it as in a glass. His political career is soon sketched. When he first appeared in the house of commons, William of Orange was still on the throne; but the coming reign was already casting its shadows before, and toryism was everywhere in the ascendant. St. John from the first attached himself to Harley; and so important had he very soon made himself that in 1704, when Harley became secretary of state, he was also brought into the ministry as secretary at war. They both remained in office until the whigs came in, under Marlborough and Godolphin, in 1708. Then again, when Harley returned to power in 1710, and became head of the government, with the office of chancellor of the exchequer, St. John was made one of the secretaries of state. Harley was soon after promoted to be lord high treasurer and earl of Oxford; and in July, 1712, St. John was also called to the house of lords by the title of Viscount Bolingbroke. Up to this time they had been to all appearance the fastest of friends; they now suddenly became—even while sitting in the same cabinet—rivals and enemies. At length in the end of July, 1714, Bolingbroke, chiefly through the aid of the bedchamber-woman, Lady Masham, succeeded in ousting the treasurer; but in less than a week the death of the queen snatched his victory from his hands. The lords justices, acting for the new king, turned him adrift at once. Neither he nor Harley ever held office again. Both were immediately impeached, and the late lord treasurer, after lying for some time in the tower, was brought to trial and acquitted; his rival had in the end of March, 1715, made his escape to France.

Bolingbroke was thus twice in power, each time for four years, between 1704 and 1714, the middle two years of the ten being the interval; and this was all over before he had reached the age of thirty-six—not quite half his term of life. The former of the two periods in which he was minister is famous for the most splendid of the campaigns of Marlborough; the latter, familiar both in our political history and in our literature as the four last years of the queen, for the peace of Utrecht, which was concluded in April, 1713, and which Bolingbroke was mainly instrumental in negotiating. There was little doubt at the time, and there can be none now, that the scheme of the desperate politician for the perpetuation of his power, after the death of Queen Anne, went the length of bringing in the Pretender. Apparently, indeed, that was his only chance.

As soon as he reached France, he went and offered his services to that personage; but by him too he was very soon dismissed. He then tried to make his peace with the English government, but without success. It was not till he had lived in exile for seven years that he obtained permission to return home. The matter is understood to have been managed through the good offices of the duchess of Kendal, the king's mistress, whose services are said to have been purchased at a cost of eleven thousand pounds. But even now he was not allowed to return to the house of lords: nor could he ever obtain that full restoration—a very unwelcome compliment to his power in debate. Thus tongue-tied, he set to work with his pen, and for some years attracted great attention by his attacks on the ministry in the *Craftsman*, and by other papers in the same publication, two series of which were afterwards published separately under the titles of "Letters upon the History of England, by Humphrey Oldcastle," and "A Dissertation upon Parties."

In the beginning of the year 1735 he again suddenly left England; and he remained mostly abroad for a second period of seven years. But he finally returned to England in 1742, on the death of his father, who in 1716 had been raised to the peerage by the title of Viscount St. John, with remainder to his sons by his second wife, who was not the mother of Lord Bolingbroke. In this same year, also, his great enemy Walpole, who had been in office, with the exception of a short interval, ever since his own expulsion, fell from power; but even that change, he soon found, was not likely to open to him the door of the house of lords. Harley and St. John, in their early days of brotherhood, besides being the chiefs of a political party, had formed together a centre of attraction for the literary luminaries of which Pope and Swift were the most remarkable, and seem both to have been sincerely loved as well as admired by the wits and poets with whom they thus lived in the freest association.

But all this, with so much more, was now past and gone; Pope was the only one of his old friends whom Bolingbroke found still remaining to receive him on his return home from his second exile; and he survived for only about two years; and in that short space they quarrelled and became bitter enemies.

[The following statement has recently been made on the authority of the *Court Journal*:—"A most extraordinary discovery, which, for obvious reasons, is sought to be kept a profound secret, has taken place in an old ruined house at Triel, near Versailles. An immense chest, full of gold and silver coins of English stamp, has been found concealed in one of the cellars, where it had been carefully walled up. From the papers and documents contained likewise in the chest, it has become evident that the house was once inhabited by Bolingbroke, who must have lain concealed here during the period wherein his whereabouts has always remained a puzzle to biographers and historians. In one of his letters he mentions that 'his retreat is convenient to the Seine,' and the house in question is found to possess a subterranean passage leading down to the water's edge. The money is evidently the result of the subscription raised by the party of the Pretender, for want of which the latter was prevented from striking a decisive blow. At present papers and coin remain in the hands of the owners of the house."]

Besides a few pamphlets and other political papers which he published in his lifetime, Bolingbroke left a mass of manuscript behind him, most or all of which has been given to the world since his death. His printed works make 5 vols. 4to.; besides which there are two collections of his letters, one in 2 vols. 4to., or 4 vols. 8vo., the other, consisting of French letters, in 3 vols. 8vo. The most remarkable of his writings are, a long and elaborate letter to Sir William Windham, written apparently about 1716, being a vindication of his political life down to that date, which was first published the year after his death; his short tract, entitled "Reflections upon Exile" (partly a translation from Seneca), and his "Letters on the Study and Use of History," also published together in 1752; and his "Idea of a Patriot King," which was published in his lifetime, with a prefatory notice signed by David Mallet, the poet, speaking with great asperity of Pope, then lately dead, who, in his admiration of the piece, had a short time before sent the manuscript, which had been lent to him, to the press without the knowledge of the author. The reason why he reserved nearly all that he had written to be published only after his death, was no doubt the infidel character of his whole system of philosophy, and his aversion to expose himself to what penalty or inconvenience the avowal of such sentiments might draw upon him. "Having loaded a blunderbuss, and pointed it against christianity," Samuel Johnson remarked, "he had not the courage to discharge it himself, but left half-a-crown to a hungry Scotchman to pull the trigger after his death." The merit of whatever Bolingbroke has written lies much more in the style than in the thought. He is frequently ingenious, but seldom or never profound; nor is his rhetoric of a brilliant or imposing character. There is no richness of imagery, nor even much peculiar felicity of expression; yet it always pleases by its clear and easy flow, and it rises at times to considerable animation, and even dignity.

He was twice married, the second time to a French lady, a niece of madame de Maintenon, with whom he lived in great affection till he lost her only the year before his own death; but he had no family by either wife. His peerage was inherited by his nephew, Lord St. John, the son of his half-brother; and from him is descended the present viscount, who thus enjoys both titles.—G. L. C.

**BOLIVAR, GREGORY DE**, a Spanish Observantine friar of the first half of the seventeenth century, who laboured with success as a missionary in Mexico and Peru, and prepared a work on the geography and history of those countries, which, however, has never been published. Another work of his, "Memorial de Arbitrios para la reparacion de Espana," was published at Madrid in 1626.—J. S., G.

**BOLIVAR, SIMON**, was born in 1783 at Caraccas, of a noble family of Venezuela. He received his education principally in Europe, visited Paris during the Revolution, and travelled in the United States also, where he probably imbibed that love for free institutions which, on his return home, prompted him to join the ranks of the Venezuelan patriots. They declared their independence in 1811, and Bolivar, holding a colonel's commission under

General Miranda, was intrusted with the defence of Puerto Cabello, an important position, which, however, he was unable to retain, and ere long the successes of the royalist leader, Monteverde, compelled him to seek refuge in Curaçoa. Thence he repaired to New Granada, joined the patriots of that province in their struggle, and rendered great service to their cause by taking in succession Teneriffe, Mompox, Ocana, and Cucuta, with other Spanish posts on the Magdalena. His heart, however, was set upon the liberation of Venezuela, and the next year found him entering that country with a force that scarcely exceeded five hundred men. The people rallied to his standard; he drove the royalists from the western provinces, and pressed on towards the capital, proclaiming war to the death against the Spaniards, in retaliation for the cruelties practised by Monteverde. Similar successes of Marino having liberated the eastern provinces also, that general was forced to shut himself up in Puerto Cabello, and a convention of the patriots at Caraccas invested Bolivar with the power of dictator. But the struggle was not ended. A new and formidable opponent appeared in the person of Boves, who, after a series of sanguinary battles, re-established the authority of Spain, and Bolivar was again compelled to seek safety in New Granada, where he distinguished himself by the capture of Santa Fe de Bogota. On the appearance of Morillo with an overwhelming force, he retired to Jamaica, and thence to Hayti, where he organized a new expedition, while Arismendi raised again the standard of independence in Margarita. In the campaign that followed, the Spaniards sustained a series of disastrous defeats, and Bolivar, in conjunction with Santander, re-established the cause of freedom in New Granada. Strengthened by these victories, the dictator speedily resumed operations in Venezuela, at the head of a powerful army, to which England contributed supplies of men and military stores. Complete success now crowned his efforts. The battle of Carabola, fought in June, 1821, decided the independence of his native country, and in August of the same year, Venezuela and New Granada united to form the republic of Colombia, Bolivar being elected president. He subsequently commanded the patriot forces in Peru, and there also, notwithstanding the factions which impeded his progress for a time, he was ultimately successful. The republic of Bolivia, formed under his auspices, and called after his name, proclaimed him its perpetual protector, and intrusted him with the preparation of its constitution, continuing him for another year in the dictatorship with which he had been invested during the struggle. His conduct in this office has been suspected, but if we except the fact that he showed no desire to lay down his authority and return home, there is little evidence that he sought to add Bolivia to his Colombian presidency. A congress was summoned, his proposed constitution was laid before it; on its declining to give a decision, and requesting that the matter should be sent down to the provinces, Bolivar did so, and it was by the unanimous voice of the provincial assemblies, that he was nominated president for life. Meanwhile difficulties had arisen in Colombia. Paez, who held command in Venezuela, being accused of oppressive measures, refused the control of the general government, and actual hostilities were only prevented by the willingness of both parties to await the decision of Bolivar. His return had the effect of restoring quiet, but mistrust of his designs was now prevalent. Accordingly, in the beginning of 1827, he resigned his presidency, and declared his intention of retiring into private life. This step being opposed by Santander, and a majority of the congress, he resumed office, and summoned a national convention at Ocana to decide what measures should be adopted for the restoration of harmony. Serious differences, however, disturbed its deliberations, and it was ultimately dissolved, by the secession of the deputies friendly to Bolivar. In the course of the same year, 1828, he issued a decree by which he assumed the supreme power, and, as the people were generally favourable to him, he continued to hold the reins of government till his death in December, 1830. His character will be in some points variously estimated, but no one can deny him the credit of eminent abilities, military and administrative. He fought the battle of South American independence with a constancy and a disinterestedness not often equalled; and it was probably the suspicions of others, as much as his own faults, that required him to pen, a few days before his death, an address to his country, in which he asserted his integrity, complained of the aspersions cast upon him, and declared that he would die happy if his death should promote the peace and glory of Colombia.—W. B.

**BOLLA, BARTHELEMY**, an Italian poet, born at Bergamo in the sixteenth century. His compositions are of the class called macaronic, a species of burlesque consisting of a melange of words of different languages, with the common words Latinized. His work, entitled "Nova novorum novissima," though the title-page promises a most alarming amount of eachinnation, may still be read without any very great peril. The book, however, has become very rare, and still rarer is another work by the same author, "Thesaurus proverbiorum italo-bergemascorum," which has hitherto eluded the search of the most active collectors. His burlesque eulogium on cheese is to be found in the curious collection of Dornarius, Amphitheatrum Supilutiæ Socraticæ: Hanan, 1619 or 1670.—J. G.

**BOLLANDUS, JOHANNES**, born at Tillemont in the Low Countries in 1596; died in 1665. Bollandus was a jesuit, and is known as being the first to whom was intrusted the execution of Rosweide's plan of publishing, from manuscripts in the Dutch libraries, the Lives of the Saints. Rosweide had scarcely announced the project when he died in 1629. Bollandus then undertook the task, and in concert with Henschen set to work in earnest. In 1643 the "Lives of the Saints," whose festivals occur in January, appeared in two folio volumes; in 1658 those of February followed in three volumes. Bollandus had commenced March, when he died in 1665. The work was interrupted by the abolition of the order of jesuits; was resumed and again interrupted by the French invasion of 1794, and again resumed. The last volume was published so lately as 1853, and it may give some notion of the great scale on which the work is executed, when the reader is told that this volume—an enormous folio—is the eighth of the saints, whose festivals fall in October, and only goes to the middle of that month. Besides his portion of the "Acta Sanctorum," he published some poems and sermons, translated some French and Italian books, and, in connection with Tollemar and Henschen, published the work entitled "Imago primi sæculi Societatis Jesu."—J. A., D.

**BOLLANDUS** or **VAN BOLLANDT, SEBASTIAN**, a Franciscan friar, born at Maestricht, edited the *Historica, Theologica et Moralis Terræ Sanctæ Elucidatio* of Quaresimus, and the *Golden Sermons of Pierre Aux-Bœufs*. Died in 1645.

\* **BOLLEY, POMPEJUS**, a distinguished living Swiss chemist, born at Zindelberg on the 7th of May, 1812. He was first professor of chemistry at the school of Aarau, and at present occupies the same position in the polytechnic school of Zurich. Bolley has devoted himself principally to technological chemistry, especially the chemistry of colours, on which he is one of the first authorities in Europe. He has also proposed a new areometer scale, which is considered by many to be far preferable to that of Baumé, generally in use. His writings are not numerous, but for the most part of great value. The most important is his "Manual of Technical Analysis," of which an improved English translation has been published by H. G. Bohm. Dr. Bolley has edited the *Schweizerisches Gewerbeblatt*; and since 1856 he has published the *Schweiz. Polytechnisches Zeitschrift*, in conjunction with J. H. Kronauer.—W. S. D.

**BOLLMAN, ERICH**, born at Hoya in Hanover in 1770; educated at Göttingen, where he received his medical degree, and settled at Paris in 1792 as a physician. Immediately after the outbreak of August 10th in that year, he was engaged by madame de Staël to effect the escape of Count Narbonne, which he accomplished with skill and address. Two years afterwards, he undertook to release Lafayette from his imprisonment in Austria, being employed for that purpose by Lafayette's friends in London. He first ascertained, with much difficulty, that the place of imprisonment was the fortress of Olmütz in Moravia. He then engaged the help of young Francis K. Huger of South Carolina, whom he accidentally met in Vienna, to effect the rescue, having opened a communication with the prisoner through his physician, and learned that he was every day taken out for an airing with a small escort. On the day agreed upon, Bollman and Huger met the riding party, deceived and drove off the guard, and set Lafayette free; but through an unfortunate mistake in their arrangements, the three were immediately separated from each other. Lafayette was recaptured three days afterwards, and the two friends also were taken into custody. But they were liberated after an imprisonment of eight months, and Bollman then went to America, where ten years afterwards, he was engaged in the wild enterprise of Aaron Burr. He pub-

lished some tracts on subjects connected with the currency and the theories of political economy, and died at Kingston, Jamaica, in 1821. He was a man of great hardihood and love of adventure, but of a noble spirit.—F. B.

**BOLOGNA, ANTONIO**. This nobleman, from Palermo, or as some pretend, from Bologna, flourished at the beginning of the 15th century. He was presented with the citizenship of Naples by Alphonsos I. of Aragon, who in 1449 made him one of his privy council, president of the royal chamber, and poet laureate. He was sent by that magnificent patron of literature to the republic of Venice, for the purpose of obtaining an arm of Titus Livius. Bologna left five books of lectures, poetry, and discourses, which were published at Venice in the year 1554.—A. C. M.

**BOLOGNA, GIOVANNI BATTISTA**, a Latin poet, born in Milan, lived in the first half of the seventeenth century. He at first studied law, but afterwards abandoned every serious pursuit, and attempted the life of his father. Author of "Corona Poetarum," Milan, 1616; and "Ratio de attentato ut dicebatur, parricidio, ac de somniata dementia," *ibid.*, 1619, 4to.—J. G.

**BOLOGNA, LATTANZIO DE**, a pupil of the enervating Caracci, went to Rome where he was employed by Sixtus V. to work at a ceiling in the palace of St. John Lateran. He painted an "Angelical Choir" in St. Maria Maggiore, and a "Scourging of our Saviour" in the St. Maria di Monti. Died young in 1597.—W. T.

**BOLOGNE, PIERRE DE**, a French lyric poet, born at Martinique about 1706; died at Angouleme about 1789. His poetry is distinguished by its purity, elegance, and harmony, and the natural easy flow of its versification. Author of "Amusements d'un Septuagenaire," odes, and miscellaneous poems.

**BOLOGNESE**. See GRIMALDI.

**BOLOGNI, GIROLAMO**, born at Treviso on the 26th of March, 1454. This celebrated Latin poet, who in his early youth practised as a barrister, took his degree of LL.D., and was admitted a member of the college of jurists in 1475. Although married, and the father of many children, he entered the church, and took the first orders in 1479. His life was embittered by many misfortunes, and Valeriano numbers him amongst the most unhappy literary men of Italy. For many years he supervised the editions of the classics published at Treviso by Michele Manzolo, and wrote all the prefaces, some of which are in verse. Having dedicated to Frederick III., emperor of Austria, a poem entitled "Mediolanum, sive Itinerarium Hieronymi Bononii senioris poetæ Tarvisini carmen epicum," he was crowned by that sovereign poet laureate. He wrote also a Latin dissertation "On the territory and illustrious men of Treviso," and left a collection of poetical compositions in twenty books, of which, however, nothing is published but the poem of "Antenor." His death took place at Treviso on the 23rd of September, 1517.—A. C. M.

**BOLOGNINI, ANGELO**, an eminent Italian surgeon of the early part of the sixteenth century, was born, according to some writers, in the neighbourhood of Padua, and according to others in Bologna. All are agreed that he was for some years professor of surgery at Bologna; according to Aldori, this was from 1508 to 1517, and in the latter year he is said to have retired to Padua, and to have devoted the rest of his life to private practice. He has left a surgical treatise entitled "De Cura Ulcerum Exteriorum," &c., published at Bologna in 1514, republished there in 1516, at Basle in 1536, and at Zurich in 1555. It contains far sounder views upon the treatment of wounds and ulcers than are to be met with in the writings of Bolognini's contemporaries. He is said to have been the first to adopt the practice of friction with mercurial ointment.—W. S. D.

**BOLOGNINI, GIOVANNI BATTISTA**, a Bolognese painter and engraver, born in 1611. He became one of Guido's best pupils. His best church pictures in his native town were a "Virgin and Child with Saints," at St. Maria Nuova; a "Dead Christ" in the church of the Servi, and an "Immaculate Conception" in the St. Lucia. He also etched some plates after Guido in a vivacious, flimsy way (his impressions not being of the strongest). He died in 1688. **BOLOGNINI, GIACOMO**, his nephew, born in 1664, became a reasonable, religious, and historical painter. **BOLOGNINI, CARLO**, a painter of the same period, perhaps of the same family, born at Bologna in 1678; died in 1718. He studied under Aldrovandini and Paradosso. He excelled in fresco, architecture, and perspective, and was much employed in Vienna, where he died.—W. T.

**BOLSWERT, BOETIUS ADAM**, the great masculine engraver,

born at Bolswert in Friesland about 1580. In conjunction with his younger brother, Scheltius, he settled at Antwerp as printseller and engraver. He worked entirely with the graver, in the free open manner of Cornelius Bloemaert. His engravings, however, after Rubens, that raging gladiator of art, are more finished, and fuller of colour. His chief works are—seventy-seven plates of the Life of Christ; fifty of the Hermits; twenty Landscapes; some wild beast hunts; and Rubens' grand Resurrection of Lazarus, Judgment of Solomon, and Last Supper. SCHELTIVS A., born 1586, worked entirely without the point, reproducing almost the very colour and expression of Vandyck and Rubens, whether portraits, huntings, landscapes, or history. Rubens frequently retouched his proofs with chalk, so that he literally worked in harness with that robust Fleming. He also engraved the works of Seghers, Jordaens, Quelinus, Diepenbech, and Rombouts. One of his most beautiful engravings is the Crucifixion of Vandyck; in the best impressions the hand of St. John is not seen on the Virgin's shoulder. In all the pomp of satyrs drowned in flowers; of bleeding and raging lions; of torch-waving furies; of blazing armour; of fruit, strewn over golden roads, and trod under foot by triumphant Cæsars, saints, and martyrs;—wherever Rubens went followed Bolswert with his potent and enduring steel.—W. T.

BOLTIN, IVAN, a Russian historical writer, born at St. Petersburg in 1735. He entered the army, and latterly attained the grade of major-general. His first publication, a "Chorographical Description of the Waters of Sarepta," appeared in 1782, in Russ, and was followed in 1787 by his critical remarks on the French physician Leclerc's History of Russia. In this latter work, as well as in one subsequently published on the same subject, in answer to Prince Stcherbatow, to whom Leclerc had been indebted for much of his information, Boltin exhibited some of the higher qualities of a historian and a critic. Died in 1792.

BOLTON, JAMES, an English botanist, lived at the end of the eighteenth century. His works are, "Filices Britannicæ, or a History of the British Ferns," the 1st part published at Leeds in 1785, the 2nd at Huddersfield in 1790; also a "History of Fungi growing about Halifax," published in Huddersfield from 1788–1791.—J. H. B.

BOLTON, ROBERT, a puritan divine, born in 1572 at Blackburn in Lancashire, educated in the free-school of that place, and at Oxford. His scholarship, particularly in Greek, was so well reputed, that he was chosen to dispute before James I. on his majesty's visit to Oxford in 1605. He was latterly rector of Broughton in Northamptonshire, where he died in 1631, leaving a fairer name for clerical virtues than could have been anticipated from the early part of his career. He wrote—"Sermons;" "A Discourse on Happiness;" and "The four last things, Death, Judgment, Hell, and Heaven."—J. S., G.

BOLTON or BOULTON, EDMUND, an English historian and antiquarian of the reign of James I., appears to have had a place in the household of that monarch's favourite, Villiers, duke of Buckingham. He wrote a life of Henry II. for *Speed's Chronicle*, which, being found too favourable to Archbishop Becket, was not inserted in that work; "The Elements of Armories," 1620; a poem on the removal of the remains of Mary Queen of Scots from Peterborough to Westminster; and "Nero Cæsar, or Monarchie Depraved," 1624.—J. S., G.

BOLTRAFFIO, GIOVANNI ANTONIO, a native of Milan, and a pupil of Da Vinci, under whom he became a great historical fresco painter. His best picture, an altar-piece of "Virgin and Saints," was painted in 1506.—W. T.

BOM, PETER, born at Antwerp in 1530; he excelled in distemper landscape, and died in 1572.—W. T.

BOMBACI, GASPARD, an Italian historian, born at Bologna in 1607. Author of a history of Bologna.—J. G.

BOMARE, VALMONT DE. See VALMONT DE BOMARE.

BOMBASIO, GABRIELE, also called BOMBARIO. The dates of his birth and death have not been recorded by any of his biographers; it appears, however, from one of his letters, that he assisted at the performance of *Il Pastor Fido*, by Guarriini, whose intimate friend he was. He also enjoyed the friendship of Ariosto, and although he did not succeed in becoming equal in merit with the author of *Orlando Furioso*, yet he has been often compared with him. Two of his tragedies, "Lucrezia" and "Alidoro," have been noticed by many writers, and the second was performed at Reggio, in the presence of Queen Barbara of Austria and the duchess of Ferrara. The only work published by

him is a funeral oration in Latin, which he pronounced at the death of the Duke Ottavio Farnese, and we find also some of his letters scattered through various collections. He was often employed by the Duke Farnese on many important negotiations; and the education of Odoardo, afterwards Cardinal Farnese, was intrusted to his care. His long residence in Parma led some of his biographers to consider him a native of that city, but this notion is quite erroneous, and contradicted by himself in a letter in which he calls Parma his adopted country.—A. C. M.

BOMBELLI, RAFAELE, a celebrated Italian writer on algebra, of whose life almost nothing is known, except, as we are informed in the preface to his work on algebra, published 1572, that he was a native of Bologna, and was patronized by a bishop of Melfi. A notice of the history of algebra is prefixed to that work, in which the author, following older writers, attributes the invention to the Indians. It is divided into three books, the last of which is occupied with a set of problems. Bombelli had the honour of being the first to investigate satisfactorily the nature of the irreducible case in quadratic equations.—J. S., G.

BOMBELLI, SEBASTIANO, born at Udina or Bologna, in 1635. He was a successful scholar, therefore imitator of Guercino, but born to imitate. He went to Venice, and, allured by the siren, colour, he became an admirer and copier of the compositions of Veronese and Tintoretto. Unable to settle whether to invent or to copy, or whether to confine himself to portrait or history, he eventually was allured by mammon to mere portrait painting, into which gulf for so many ducats he threw all his past study and present talent. His colour was mellow and sweet; his carnations were fresh; his likenesses good; and he gained universal applause through his ideal. He died in 1685.—W. T.

BOMBERG, DANIEL, a celebrated printer, born at Antwerp; died at Venice in 1549. He printed several Hebrew bibles, all esteemed for the beauty of their type, and purity of text. The first appeared in Venice, 1518, 4 vols. folio. He also printed the first impression of the Hebrew concordance of Isaac Nathan, 1521, folio. Bomberg brought his art to perfection, but expended enormous sums, and ruined himself.—J. G.

BOMILCAR, a Carthaginian admiral, lived about 209 B.C. Having obtained reinforcements for Hannibal after the battle of Cannæ, he was sent with a fleet of fifty-five galleys to support the Carthaginian army, who were then defending Syracuse against the Romans; but finding them nearly cut off by the plague, he returned to Carthage. Here he succeeded in reviving the drooping spirits of his fellow-citizens, by whom he was sent back with a greatly increased force; but at sight of the Roman fleet under the command of Marcellus, he lost courage, and fled without striking a blow.—G. M.

BOMILCAR, a Carthaginian general, lived about 310 B.C. Not satisfied with enjoying the highest dignity the republic of Carthage could bestow, he aspired to sovereign power; and, taking advantage of the public alarm occasioned by the invasion of Agathocles, he entered Carthage at the head of a thousand mercenaries about 308 B.C. After being proclaimed king, his hiring troops turned against him, made him prisoner, and put him to death by crucifixion.—G. M.

BOMILCAR, a Numidian adventurer, died about 107 B.C. He was a favourite of Jugurtha, and the instrument of many of his cruelties. Having by order of Jugurtha murdered Massina, grandson of Masinissa, he fled to Africa. Here he had an interview with Metellus, who promised him impunity for his crime if he would either kill or betray Jugurtha. To this condition Bomilcar consented, but the plot having been discovered by Jugurtha, he caused Bomilcar and the greater part of his accomplices to be put to death.—G. M.

BOMMEL (in Latin BOMMELUS), HENRY VAN, a Dutch historian, born at Guelders; died in 1542. His principal work is "*Bellum Ultrajectinum inter Gueldriæ duces Carolun et Henricum Bavarum episcopum ultrajectinum*," 1542, 8vo.

BOMPARD, ALEXIS, a French physician and medical writer, formerly physician to the prison of Doullens, was born at Conflans on the 3rd August, 1782. He was the author of several works, most of them of small size, of which the most important are—"Considérations sur quelques maladies de l'Encephale," &c., published at Paris in 1827, and a second edition in 1828; and "Traité des maladies des voies digestives, et leurs annexes, suivi de tableaux de substances vénéneuses," published at Paris in 1829. Bompard also translated Garibaldi's treatise on

Physical Education into French; of this two editions appeared in Paris in 1818 and 1830.—W. S. D.

**BOMPIANO, IGNATIUS**, an Italian litterateur, a jesuit, born in 1612; died in 1675. Author of "A History of Gregory XIII.," Rome, 1655; a work on Latin style; a "History of Christianity," &c.—J. G.

**BOMTEMPO** or **BONTEMPO, J. D.**, a pianist and composer, was born at Lisbon in 1781; the date of his death is uncertain. In 1806 he went to Paris, where he was well esteemed as a player and as a teacher. He spent some years in England, revisited Paris in 1818, and finally returned to his native city in 1820, where he organized a philharmonic society. He wrote a requiem which is much praised, and some concertos, sonatas, and lighter pieces for his instrument.—G. A. M.

**BON DE SAINT HILAIRE, FRANÇOIS-XAVIER**, a learned Frenchman, born at Montpellier, 1678; died in 1761. He was member of the Academy of Inscriptions and Belles-Lettres, and of the Royal Society of London. He ranged through almost every branch of human knowledge, jurisprudence, the fine arts, physics, natural history, &c. His memoirs on different subjects are to be found in the collections of various societies. His work on the spider, with reference to the manufacture of silk, has been translated into all the European languages, but is of very little practical value.—J. G.

**BONACOSSI**, the name of four sovereigns of Mantua:—

**BONACOSI, PINAMONTE**, successively prefect, captain, and sovereign of Mantua, and by turns a leader of the Guelfs and the Ghibellines; died in 1293. While prefect he assassinated his colleague, Ottonello Zanicali; and after the murder, conducted himself so artfully that the people intrusted him with the duty of avenging it. During his reign of eighteen years, he was generally successful in his encounters with the captains of Brescia, Padua, and Vicenza.

**BONACOSI, BARDELLONE**, son and successor of the preceding, a cruel and avaricious prince, who wrested the sovereignty from his brother, Taino, persecuted the Ghibelline party that his father had left in power, and was expelled from the city in 1299 by his nephew and successor, Bottesella. He survived three years at Padua in extreme poverty.

**BONACOSI, BOTTESELLA**, nephew and successor of the preceding. Until the arrival of Henry VII. in Italy he was at the head of the Ghibelline party. He died in 1310.

**BONACOSI, PASSERINO**, brother of the preceding, obtained from Henry VII. the title of imperial vicar, and being one of the most skillful politicians, as well as one of the greatest captains of his age, under that title contrived to conduct himself as an absolute sovereign. He perished in defending his palace against the retainers of Phillipino de Gonzaga, a prince whom his worthless son, Francesco, had outraged in the grossest manner. Francesco was killed in the tower of Castellero in 1319.—J. S., G.

**BONAFIOUS, MATHIEU**, a celebrated Piedmontese agriculturist, director of the Agricultural Institution of Turin, was born at Turin in 1794, and died in 1852. He was descended from a French family that took refuge in Piedmont during the religious wars of the continent. In 1814 he introduced the Bell and Lancasterian systems of teaching into Piedmont. He did much to encourage agriculture, by giving prizes, and by aiding institutions which had for their object the advancement of that art. His works are—"On the Cultivation of the Mulberry, and the Care of Silk-Worms;" "Monographs on Cuscuta, Maize, Polygonum Tinctorium, and Chloride of Calcium;" "Account of Swiss Agriculture;" besides various articles in the *Revue Encyclopédique*, and in the *Annales de l'Agriculture Française*.—J. H. B.

**BONALD, LOUIS-GABRIEL-AMBROISE**, vicomte de; born in the department of Aveyron in 1753; died, after a life of some trouble (for he was an *émigré*), at the place of his birth on 23d November, 1840. Bonald belonged to that reactionary school which, under his guidance and that of d'Eckstein and Count Joseph de Maistre, attempted, after the Restoration of the Bourbons, to establish absolutism in government, and unity or intolerance in religion, on what they considered the sure basis of speculative first principles. One of the leading intellectual characteristics of French writers, and of the French people in general, is an excessive fondness for logic, and a tendency to blind trust in the results of any formal process, no matter how absurd these results may be or how inconsistent with every sound human intuition. In this country we have had, in the

course of its history, many practical advocates of absolutism, but exceedingly few Sir Robert Filmer; nor did these few ever make much impression on our philosophy. Bonald is a good specimen of a large and popular class of writers in France. Acute, distinct, and highly accomplished, the merits and apparent precision of his style, as well as his undoubted genius and good faith, gave him repute and an influential following,—notwithstanding that his first principles were untenable, and his conclusions impracticable and bizarre. To ordinary minds, social and religious doctrines might seem sufficiently remote from an abstract theory of language; such, nevertheless, is the point in which Bonald's long series of deductions find their origin. His doctrine as to language is what we would term in this country, the lowest possible; it is, that words contain all conceivable thought, or, rather, that they are the masters of thought. The consequences of this postulate are evident enough, and assuredly they sufficiently subserve his main social dogmas; for if man has nothing in his thought or intellect beyond what his speech reveals to him, it is very clear that he is shut up within the conditions or the power of the language he uses; and that neither religious, political, nor social maxims or forms, except such as are transmitted to him and in action around him, can be rightly conceived by any one. Bonald avoids the unmitigated materialism consequent on this doctrine—(with materialism in any form he could have no sympathy)—by asserting that language is of miraculous origin, or the *immediate*, as contradistinguished from the mediate, gift of God. Hence, all speculation and practice in this world—everything must be governed by a pure and absolute theocracy; man has no spontaneity, his reason no sphere of freedom; he has simply to act and think as controlled. To this first principle as to language, the author adds another, which he asserts to be the necessary form of every logical result:—everything, whether fact or thought, belongs to one of the three essential categories—*cause, means, effect*. In religion we therefore must have the three terms, *God, Mediator, and Man*, and we can have no other; in physical science we have correspondingly, *prime mover, movement, effect or matter*; in social or political science, these terms become, *power or government, ministers or the executive, the people as subjects*. It is not difficult to discern whether this new refinement inevitably leads.—We cannot follow De Bonald farther; but we may be permitted to repeat our surprise that, at this period of the world, abstractions so artificial and far-fetched as these, could have obtained credit as a rational basis of action. But France is altogether a puzzle. She now bends the knee before theories not so defensible as even Bonald's. She claims a high place in civilization, and yet her practical life and European action are shaped by transparent sophisms like these! Few are now sanguine enough to think of the future of that country with cheerfulness or exceeding hope.—De Bonald's chief treatise, the "Theorie du Pouvoir Social," occupies three volumes; his entire works fill up a much larger space.—J. P. N.

\* **BONALD, LOUIS JACQUES MAURICE DE**, cardinal, archbishop of Lyons, born at Milhau, in the department of Aveyron in 1787. After completing his studies at the seminary of Saint Sulpice, he became secretary to the archbishop of Besançon, whom he accompanied on a secret embassy to Rome, and on his return was appointed grand-vicar and archdeacon of the cathedral of Chartres. In 1823 he was raised to the see of Puy, which he occupied till 1839, when he was promoted to the archbishopric of Lyons. Two years afterwards he was created cardinal. As a zealous churchman, he has frequently been embroiled in the politico-ecclesiastical troubles of the last thirty years of French history, but always in a manner honourable to his uprightness and consistency.—J. S., G.

**BONAMY, PIERRE-NICOLAS**, a French historian, born in 1694; died at Paris in 1770. Author of a great number of curious memoirs relative to the antiquities of Paris, published in the collections of the Academy of Inscriptions.—J. G.

**BONANNI, FILIPPO**, a jesuit born at Rome, January 16, 1638; died March 30, 1725. He was the author of several antiquarian works, the most important of which is the "Gabinetto Armonico," a singular collection of 136 engravings of musical instruments, with letterpress descriptions, published at Rome in 1722, 4to. The Biog. Univ. mentions an edition in 1716, but it is evidently an error. The Abbé Cerutti edited a second edition of the "Gabinetto Armonico" in 1776. Bonanni also wrote "Numismata pontificum Romanorum," from Martin X. to Innocent XII., folio, 1699.—E. F. R.

BONAPARTE, originally BUONAPARTE, the patronymic of the most remarkable Family or House of modern times. Although this is a dictionary not of *history*, but simply of *biography*, we have thought it right to construct a chart of the relations of this memorable House; nor is that chart irrelevant even to what is rightly expected of biographers, inasmuch as a glance over it will enable our readers to spare us tedious explanation and inevitable repetition. We have sought to penetrate no further into the past, than to the times of CARLO BONAPARTE and LETIZIA RAMOLINO—the parents of the family which Napoleon made so conspicuous. It is averred, indeed, that a long and superb pedigree would reveal itself to minute research, and that Carlo Bonaparte could have linked himself with noble families of the party of the Ghibellines; but we prefer sympathizing with the proud words of the great soldier himself, when Francis of Austria inquired concerning his emblazonments—"Tell the emperor of Austria, that I am the *Rüdolf of Hapsburg* of my Family." But it is not necessary to peer through antiquity, to secure for Napoleon and his brothers a most honourable origin. CARLO BUONAPARTE (he was the last who employed the orthography *Buonaparte*) was a Corsican lawyer of moderate but adequate means; and in the gallant contest under Paoli, he showed that he understood and could answer the call of patriotism. LETIZIA RAMOLINO was reputed the most beautiful young woman in Corsica of her time. Reflecting on the chiselled and stately symmetry of the countenance of Napoleon, and on the soft and exquisite loveliness of the Princess Borghese, one is little inclined to question the rightfulness of Letizia's fame; but—passing from beauty of mere feature—we are assured by the facts of history, that she was a woman excelled in nobility of mind by few, that she possessed an integrity which nothing could shake, a firmness which never wavered, and that temperance amid unlooked for prosperity, which cannot exist apart from greatness of soul. As with Goethe and other men like him, Napoleon was fond to trace whatever quality he considered good in himself or permanently great, to his having some resemblance to his mother; nor is the honour given to *Madame Mère*, or the fine traditions connected with her, yet wholly forgotten at the Parisian court. Alas! that her equanimity, her justice, her proud stainlessness, should have ever failed to find in these spacious palaces fitting representatives!—The chart we have spoken of is printed on the following page.

This Chart indicates not obscurely, the course that should be taken regarding the biographies which belong to it. Concerning the right hand portion of it, we need offer no special or elaborate memorials. MARIA ANNA, or ELIZA, grand duchess of Tuscany, lived unobtrusively, without accomplishing anything that requires to be recorded. Of the PRINCESS BORGHESE we have indeed stirring reminiscences. *That* could have been no ordinary beauty, which moved a Canova from his composure; but it is best perhaps, that, surrounded by the halo of so fine a myth, the exquisite Princess should be permitted to sleep in peace. CAROLINE had higher attributes; she bore misfortune as a heroine. Nor has her family passed out of the sphere of instant European interests: the name of her son is one of the few sounds that appear to move the present king of Naples.—Another group may at present also be dismissed: the dynasty of the NAPOLEONS rightly falls to be portrayed under the name of its founder; and the events of the life of the mother of the present Emperor may best be narrated under HORTENSE. It remains, therefore, that in this place, we present short biographies of JOSEPH, LUCIEN, and JEROME:—the comparatively quiet life of LOUIS—apart from HORTENSE—being characterized in a very few sentences.—One general remark is of some importance. Joseph dying without male offspring, Lucien and his family were heirs of the Empire by right of primogeniture; but the elder Napoleon disinherited Lucien by a formal act of absolute power—named rather humorously, as some might think, a *plebiscite*—bequeathing the State to Joseph and Louis; so that—Joseph's claim having lapsed—the Imperial heritage lies with the existing wearer of the purple. Should the Prince Imperial not attain to manhood, the heredité, we presume, falls to NAPOLEON, son of Jerome. But it were worse than useless to speculate concerning the heritage of dominion in France!—We shall now take these sons of Carlo and Letizia, in the order of their birth.

I. BONAPARTE, JOSEPH, the eldest of the Bonaparte family: for the bare outlines of his life our chart will suffice. As a private citizen, Joseph must have been distinguished. In per-

son he resembled Napoleon, only he was taller; and he preserved a graciousness to which, in his latter years, the Emperor was a stranger. Joseph himself tells us, that once on a time while the leaf was green, that stern soldier was gracious also, nor do those early letters to the "*frere bien-aimé*" belie the averment; but affection, love, and faith withered in the end under the cares of government and the lust of power. Previous to the consulate, Joseph was employed on delicate missions by the Directory; nor was the administration ever slow to avail itself of the effect of his conciliatory manners, his devotion to the honour of his country, and his skill in diplomacy. It was he who virtually delivered Rome to General Berthier; he concluded treaties with the United States and Germany in 1800 and 1801; and he was chosen as representative of the French government during the negotiations that led to the so-called peace of Amiens. Joseph afterwards wore two crowns,—that of Naples, and that of Spain. On the shipwreck of his family he retired to the United States, where, as Count de Survilliers, he dispensed kindly and sumptuous hospitality on the banks of the Delaware. On the occurrence of the revolution of 1830 he repaired to England and thence to Italy, where he died at Florence in 1844.—The two important incidents of Joseph's life are those which, while revealing most concerning his personal qualities, throw the greatest light on the character and policy of Napoleon, and help us to the origin of those grand crimes that issued in his destruction. The incidents referred to are also very definite, nor can the illustration they afford be questioned. The ardour of French publicists has led them sometimes to impugn the fealty or at least the firmness of Joseph, during the sad events that ushered in the abdication at Fontainebleau and subsequently Napoleon's surrender at Rochfort. Impartial investigation is alone needed to establish his loyalty to his Brother, and to France. But it seems as if the history of his two Reigns were beyond reach of doubt; and if it is so, how strange a history! After declining the honour of a new kingdom of Upper Italy, Joseph was sent to Naples at the head of an army in 1806. The conquest of that misgoverned state was easy, nor does it appear that any order of persons belonging to it—nobles, clergy, or people—had a thought of regret because of the expulsion of Caroline and that wretched Sicilian branch of the Bourbons. Joseph entered on the functions of royalty, indeed, under conditions the reverse of unfavourable; and it has to be recorded, that the most favourable of all these conditions was his own resolve to govern well, to secure the safety of property, the stability of commerce, and that equity should characterize all public relations and transactions among the people he had undertaken to rule. In minor details connected with this enterprise he may sometimes have been injudicious, and sometimes have failed; but the obstacle of which his sagacity appears not to have warned him—the obstacle that neither wisdom nor philanthropy could remove—lay in the mind and objects of Napoleon. The letters published in Joseph's posthumous memoirs are among the most remarkable that have seen the light in any age. The activity of the Emperor—unless perhaps in the case of Cæsar—is unparalleled in history. In the midst of the morasses in the north of Europe, and requiring to deal every hour with pressing circumstances that bore directly on the destinies of the old world, he yet could think on the smallest details connected with the government of Naples, and felt disposed to issue regarding them very absolute decrees. If Joseph was uneasy under the eye of such an omniscience, he was grieved the more when he fully comprehended its object. Joseph desired to organize and govern Naples well. Napoleon held at the cheapest rate both Naples and the Neapolitan people. He had no idea save one—"The wealth, the power of every subjected state, must subserve the purposes of France; and all kings and governors are my lieutenants." Let us record a few characteristic extracts from these extraordinary letters:—"Mon frere, je vois que vous promettez de n'imposer aucune contribution de guerre...A mon avis, vous prenez des mesures trop étroites. Mettez trente millions des contributions sur le royaume de Naples; payez bien votre armée. ... Vos proclamations aux peuples de Naples ne sentent pas assez le maitre... Vous vous fiez beaucoup trop aux demonstrations qu'ils vous font... Quel amour voulez-vous qu'ait pour vous un peuple, pour qui vous n'avez rien fait?... Ces gens la s'enorgueillieront, et croiront n'être pas conquis. Tout peuple etranger qui à cette idée n'est pas conquis... Si vous gouvernez votre pays avec vigueur, et que vous en retiriez cent quarante à cent

Born 1750; Died 1836.

cinquante millions de contributions, vous aurez six vaisseaux de guerre, et autant de frégates, qui joints à ma marine de Toulon, rendront plus difficile et plus chanceuse aux Anglais leur domination sur la Méditerranée. N'employez pas trop les troupes Napolitaines, qui vous abandonneraient si j'étais battu en Italie. Il faut calculer ainsi. Employez des troupes qui ne vous abandonneront pas. Souvenez-vous de ce que je vous dis : le destin de votre règne dépend de votre conduite à votre retour de Calabre. Ne pardonnez point ; faites passer par les armes au moins six cents révoltés : ils m'ont égorgé un plus grand nombre de soldats. Faites brûler les maisons de trente des principaux chefs de villages, et distribuez leur propriétés à l'armée. Désarmez tous les habitans, et faites piller cinq ou six gros villages de ceux qui se sont le plus mal comportés... Recommandez aux soldats de bien traiter les villes qui sont restées fidèles. Privez de leur biens communaux les villages révoltés, et donnez-les à l'armée ; surtout désarmez avec vigueur." These are not extracts selected for a purpose. They illustrate very pertinently the naive words of the present occupant of Napoleon's throne,—“L'Empire a tombé pour avoir étendu trop loin son action civilisatrice. Il n'était donné, ni à la plus grande nation, ni au plus grand génie, de combattre à la fois l'ancien régime sur les bords du Tage et sur ceux de la Moscowa, et de régénérer l'Europe en dix ans !” The regeneration spoken of, had roots very different from that whose proposal has immortalized the Macedonian. Few will marvel, and still fewer lament, that the artificial fabric all fell with the statue of Napoleon.—On the 9th of July, 1808, Joseph left Bayonne on his entry into Spain, of which country he had been proclaimed king on the 6th of June previous. We presume that few persons ever required to leave such a history as he has bequeathed in his memoirs of that extraordinary crime of Napoleon I. He had scarcely entered on Spanish soil before making the discovery that every one of the circumstances which rendered a beneficent reign possible in Naples, had there its opposite. Although exasperated with Godoy, the Spanish people looked with affection on young Ferdinand, and their long monarchical traditions. It was a people proud in its nationality ; and the influence of municipalities that had survived for so many ages, rendered French centralization utterly hateful, as indeed was the whole spirit of the French people. Spain and France can never harmonize. The descendants of the Goth and the Moor cannot meet in fraternity any branch of the family of the Celt. The good sense, the tact, and the humanity of Joseph speedily discerned the amount of his brother's fatal error ; but he failed to dissipate illusions, which were already pointing to Fontainebleau and the rock of St. Helena. For instance, he writes very early :—“Sire ! Personne n'a dit jusqu'ici toute la vérité à votre majesté. Le fait est qu'il n'y a pas un Espagnol qui se montre pour moi excepté le petit nombre de personnes qui ont assisté à la junte et qui voyagent avec moi.” And again, “Je ne suis point épouvanté de ma position, mais elle est unique dans l'histoire ; je n'ai pas ici un seul partisan !” And in August, after he had fully acquainted himself with the position of affairs, he writes, “Votre gloire, Sire ! échouera en Espagne !” Had not Napoleon been blinded by good fortune, the incursion he afterwards made personally into Spain, would have satisfied him of the fidelity of his brother's judgment ; as it was, he subjected two hundred leagues of territory, but did not gain one adherent ; his triumphal entry into Madrid did not confirm Joseph's throne, it merely opened a retreat as far as the Pyrenees. We wish we could pass over and forget the personal relations between the brothers during these disastrous years. Unable to silence the remonstrances which duty constrained the brother—once “*bien-aimé*”—to make, Napoleon trampled alike on them and their author. His marauding generals felt little of Joseph's responsibilities—certainly they had not a touch of his sense of justice. Napoleon accordingly sent orders to these men directly ; and his brother had the mortification of finding himself a king with no people to follow him, and nominally at the head of an army which he had no power to direct in the most trifling point of strategy. The issue belongs to history ; we shall not dwell on its disasters. But in final vindication of the character and wisdom of Joseph, we subjoin an extract from another letter addressed to Napoleon from Naples, bearing date 29th March, 1807. “Sire, je suis dans cette situation d'esprit que votre majesté connaît en moi, et dans laquelle j'aime à dire, tout ce que je crois bon. Eh bien ! Votre majesté doit faire la paix à tout prix.

Votre majesté est victorieuse, triomphante partout ; elle doit reculer devant le sang de ses peuples ; c'est au prince à retenir le héros. Quelque étendue de pays de plus ou de moins ne doit pas vous retenir ; toutes les concessions que vous ferez seront glorieuses parce qu'elles seront utiles à vos peuples dont le plus pur sang s'écoule, et que victorieux et invincible comme vous êtes, de l'accord de tous, nulle condition ne peut vous être supposée prescrite par un ennemi que vous avez vaincu. Sire, c'est l'amour que je porte à un frère qui est devenu un père pour moi, c'est ce que je dois à la France et aux peuples que vous m'avez donnés qui me dictent ce discours de vérité. Quant à moi, sire, pour attendre ce but salutaire, tout ce que vous ferez me conviendra ; je m'estimerai heureux des dispositions qui me regarderont, quelles qu'elles puissent être. Sire, vous ne devez plus exposer au hasard d'une rencontre, le plus beau monument élevé à la grandeur de la race humaine, je veux dire la masse de gloire et la grandeur inouïe qui compose votre vie depuis dix ans.”

## II. BONAPARTE, NAPOLEON.

See NAPOLEON I.

NAPOLEON II.

NAPOLEON III.

See also JOSEPHINE and MARIA LOUISA.

The relations and history of the descendants of Josephine are described and narrated under the name of the Empress ; and in some principal cases under BEAUMARNAIS and HORTENSE. See also MURAT.

III. (a) BONAPARTE, LUCIEN, Napoleon's brother, younger by six years ; the ablest of all the family with the exception of the Emperor ; equal to him in resolution ; greatly his superior in worth and wisdom, for he never sacrificed a principle to his own *self*. Emigrating to France in 1793, Lucien soon made himself known as a republican, and received offices of trust. But he did not hesitate to put his head in peril, by withstanding—as member of the municipality of St. Maximin in the south of France—the sanguinary decrees of the terrorist commissioners. About this time he married an interesting but obscure young girl of Provence, who, dying early, left him two daughters—the first, the Princess Gabrielli ; the second, when widow of a Swedish count, became the wife of an esteemed and lamented Englishman, Lord Dudley Stuart. As affairs in Paris grew more and more complicated, Lucien's sternness and ability obtained for him higher and higher place. He was one of the council of Five Hundred ; even then, his house was resorted to by the best literary men ; and he belonged to the only political section which pretended to principle or philosophy—that, viz., of the Abbé Sieyès. But the exigencies of the times could not be met by doctrine, or the problem of the safety of France solved by the followers of Rousseau. A crisis of such requirements goes beyond all philosophy ; nor can a revolution be otherwise than marred by popular assemblies. Cromwell was required to make the English revolution ; Washington was nearly shipwrecked in America ; France has fallen because the crises of her fates neither produced nor were guided by a Washington or a Cromwell. The dissolution and dispersion of the fabric of the executive Directory had become inevitable ; and Lucien, in this case, was the Cromwell. The occasion referred to was one of the few in which the emperor's resolution threatened to fail him : Lucien was really the author and great actor of the 19th Brumaire. As Napoleon's star ascended, the station and fortunes of Lucien ascended also ; nor might there have been a limit to his influence over the destinies of Europe but for two causes. In 1803 Lucien married a second time, viz., the beautiful and wealthy M<sup>me</sup>. Jouberteau, and so deliberately frustrated Napoleon's designs concerning princely and royal alliances. Nor could he profess complete allegiance to his brother's policy. A republican by conviction, he refused to resign his doctrines simply through impatience ; and he did not conceal his disappointment at Napoleon's reckless disregard of all rights save his own, whether personal or national. After various efforts at assimilation, the brothers finally parted ; Lucien refusing a sovereignty in the north of Italy, because he would not, at the same time, wear fetters and a crown ; Napoleon paying him this great compliment,—“Then you must quit the continent of Europe ; my safety cannot consist with your silent opposition.”—After various changes of residence, Lucien purchased the estate of Canino, on the borders of Tuscany. Pursued by an odious *surveillance*, he resolved to emigrate to America ; but, intercepted by the British cruisers, he resided for

some time at Ludlow castle on parole. Every sincere effort to save Napoleon after 1814 failing, he returned to Italy and spent the remainder of his life in lettered leisure. Lucien might have averred with justice at the close of his prolonged political career, that he had fought throughout for his convictions. His principles, indeed, have stood as yet; Napoleon's have undergone utter shipwreck: nor would Lucien's natural eloquence have been listened to with unconcern, at any period when bulletins and pretences fell powerless on the ear of Europe. The autumn of his life was spent at Canino. The Pope adorned him with a principedom; and he repaid the gift by a generous reception of strangers, and efforts for promotion of the arts. He wrote an epic on Charlemagne in two quarto volumes, which few persons have read;—another instance of orators not being poets. His estate being in old Etruria, he had the satisfaction to disinter valuable Etruscan antiquities; and he formed a museum superior to any other existing. It was an object visited by every classical traveller in Italy. At some assemblies in Rome the princess of Canino—equally skilled in antiquities with Lucien—created a great sensation by her magnificent parure of jewels, obtained from old tombs on her husband's estate. Lucien died at his residence in 1840, having reached the age of sixty-five. It were useless, although curious, to speculate as to the probable present condition of Europe, had the arbiter of its fates partaken more of the integrity, the self-abandonment, the human affections, as well as of the promptitude, courage, and perseverance of Lucien. Lucien left many descendants; among his sons we find Pierre Bonaparte, somewhat known in French politics. Lætitia, wife of Mr. Wyse, is his grandchild.

(b.) BONAPARTE, CHARLES LUCIEN, prince of Canino and Musignano, the eldest son of Lucien, born in Paris in 1803. This prince has special claims to notice. Inheriting the literary tastes of his father, although following them out according to his own predilections, he became one of the best ornithologists and naturalists of our time. During his residence in the United States he followed the track of our own Wilson, not, as men often do, seeking for a scientific position by picking up crumbs left by predecessors, but really and in good faith with a view to complete Wilson's great work. Among the three, Audubon, Wilson, and Charles Lucien, it were difficult to award the pre-eminence. They had different and special faculties, and each of them did his part so well that the union of their works forms the most gorgeous and complete ornithology ever yet completed regarding any great region of the earth. It falls, we think, as an important duty, to the government of the United States—already rich in desert with regard to such achievements—to reproduce these great works in a style befitting them. The Prince on his return to Italy did not lay aside his tastes. He produced, of course at great expense to himself, the "Iconografia della Fauna Italica," in three superb volumes folio,—a work yet unrivalled in illustration of the animal kingdoms of Italy. To Charles Lucien the honour is unquestionably due of originating those scientific congresses within Italy, which may establish a communion founded on considerations more general than political ones; and he was a favourite guest at the meetings of the British Association in England, to which people sometimes crowded, to see in a living face the almost exact effigy of the superb Napoleon.—It was impossible for a prince of this family, and of so much intelligence, to abide inactive and obscure amidst the events that stirred and shook Italy during 1848, 1849, and 1850. With other leading Italian noblemen, he hastened to sustain the reforming Pope; but his associations were too broad to permit his desertion of reform, at the nod of the pontiff. He abode by the national government at Rome, and was president of the house of deputies, while Mazzini was triumvir. His prudence taught him that resistance to the arms of France ought not to be carried out after success had become impossible: in our modern age, a Curtius would be a rash and imprudent man, simply because no Curtius could be of the slightest use. The Prince did not abandon his opinions; he took again to science, but he never "turned his back on himself." Desirous to reach England, he solicited liberty to pass through France. His cousin, the present emperor, granted his request, but on the condition that Prince Lucien should travel under surveillance of the police. It must have seemed pregnant with humour to the true head of the House of Bonaparte, that, in the centre of France, he dared not dine except in presence of a gendarme!—The prince died in 1857.

IV. BONAPARTE, LOUIS, fourth son of Carlo; born in 1778; died in 1846. Louis was a quiet unobtrusive man, given somewhat to sentiment, and as keen an admirer of Rousseau as his great brother once was; he was an author likewise, his works being "Marie ou les peines de l'amour," by no means a work worthy of immortality; and a thoroughly good and candid account of his own government, "Documens Historiques et Reflexions sur le gouvernement de la Hollande." After having been obliged, by the fiat of Napoleon, to surrender an early and sincere attachment, he married unwillingly HORTENSE, daughter of JOSEPHINE. They separated soon, and were finally divorced; it is certain that their life together was not a happy one; nor are authorities yet agreed that a full certificate is due to the brilliant Hortense, on the point of fidelity to her spouse. Three children were born by Hortense in wedlock, viz., Napoleon, who died in 1807, after having been designated by the Emperor as his successor; Napoleon-Louis, who died in 1831; and Charles-Louis-Napoleon, the present possessor of supreme power in France. In 1806, Louis was offered by the States-General the title of king of Holland. The offer was made under dictation; but, had Louis been free, the people of that country would never have regretted their choice. He was not inferior in his sense of duty to Joseph; and he felt, after accepting its crown, that Holland was his country—not France. Nothing could well be in greater disaccord with the notions and policy of his brother, who accounted him only as a lieutenant, whose first duty was submission:—at that very time Napoleon was instructing Joseph how, by sufficient confiscations, and the dotation of French soldiers out of these, Naples might be changed into a French military colony! On Louis' resignation, the Emperor named his son as his successor, addressing him in words which men in those days thought not too shameful for publication in the *Moniteur*, "Never forget that whatever position you may be required to occupy—in order to conform to *my* line of politics and the interest of *my* empire,—your first duty must always regard *ME*, your second must have reference to *France*. All your other duties, even those towards the countries which I commit to your charge, are secondary to these primary obligations." Is it astonishing that Napoleon fell? This world below is not yet quite ripe for a Kehana! Minor disagreements on matters which touched the honour of Louis, were fast consolidating into a permanent coolness, when an event occurred that left the king of Holland no choice or alternative. The wealth and importance of that country have ever come from its commerce; and, of all successful or lucrative commerce, freedom of exchange is a prime and indispensable condition. Urged by his blind, or rather insane hatred of Great Britain, and utterly miscalculating his forces, the Emperor established what was termed the "Continental System," or a virtual blockade on paper, of every British commercial port. The states of Holland could not, consistently with their own preservation, give assent to the destruction of intercourse with Great Britain; and Louis protested as their representative. He obtained at first some concessions; yielded, however, only that they might be recalled. The integrity and clear insight of his character as derived from his mother, prevailed without a struggle; and he abdicated a sovereignty which—carrying with it no opportunity for the use of wisdom or the practice of beneficence—could have, for an honourable man, no charms. The effort to make the son of Louis a viceroy failed, and Holland was absorbed in France:—in the words of his tool Champagny, whom Napoleon had put forward as a responsible minister, "*Holland being in a manner an emanation from the territory of France, and necessary to the full complement of the empire!*" Surely the time will come when transactions like these, shall be rightly estimated by history. Louis Bonaparte will at that time receive the high reward which belongs to simple honesty manifested in high places, and in the face of great difficulties and temptations. This prince lived until 1846 in comparative retirement, assuming the title of Count of St. Leu.

V. (a.) BONAPARTE, JEROME, the youngest of the family, was born at Montpellier in 1784. We have not to record in the case of Jerome any of those struggles and sacrifices that consumed the happiness and thwarted the energies of Joseph, Louis, and Lucien. He was a man of considerable ability, but it may be doubted whether considerations would ever have weighed with him, which assuredly would have been held imperative by *Madame Mère*, but which, all the world knows, were lightly esteemed

by Napoleon. Jerome certainly quarreled with the emperor also, but he composed the quarrel, not quite without damage to his own honour. This prince was destined for the sea, and became noticed in the service; but his predilections were with the army, in which he subsequently distinguished himself, and rose to dignity and command. His courage was unquestionable; nor did the emperor hold lightly by his judgment—witness the important duties assigned him on the day of Waterloo. At the beginning of his career, after a fruitless cruise round by Martinique, he put into New York; and here, the serious complication of his private life began. Visiting Philadelphia, he was smitten by the charms and worth of Elizabeth Paterson, daughter of a rich merchant of Baltimore; and he married her in 1803. They had one son, who settled in America, and became a respected and rich citizen of the Republic. This plebeian connection roused the anger of Jerome's great relative, whose affections were being fast dissipated, and his equanimity yielding before the rude shocks of success and arbitrary power. Napoleon's conduct to the American lady betrayed meanness as well as tyranny: he refused her permission to touch the soil of France. Failing to procure a bull from the Pope sanctioning divorce or separation, he carried out his resolve with the usual high hand; and—submissive to his menace—Jerome married Frederika Caroline, princess of Wirtemberg. Two children of this marriage survive, Mathilde, princess of Demidoff so recently in charge of the honours of the Tuilleries, and Napoleon Joseph Charles, of whose character we have briefly spoken below.—Alone of his family, Jerome lived to witness the striking temporary reversal of the effects of his calamities. On the occurrence of the revolution of 1848, he hurried to Paris at the head of scions of his house, who had been living and well-nigh lost amid obscure haunts over the world; and he found himself received by France with open arms. In the first National Assembly he might read the names as representatives, of Pierre, second son of Lucien, of his own son Napoleon, of Napoleon Charles Lucien Murat, formerly a lawyer in New York, and lastly of Louis Napoleon himself. He subsequently saw, the gift of the purple to his nephew Napoleon III., the most strange rehabilitation of many *Napoleonic ideas*, and the birth of the prince imperial. Jerome died on the 24th of June, 1860, at his seat of Villegenis, near Paris.

\* (b.) **BONAPARTE, NAPOLEON JOSEPH CHARLES**, son of Jerome and the princess of Wirtemberg; born at Trieste in 1823. Until the recent recall of the Bonaparte family, this young prince passed his time at Vienna, Trieste, Florence, Rome, Brussels, and at diverse places in Switzerland and America. On his return to Paris in 1848, on the reversal of the decree of exile against the Bonaparte family, he was elected to the Constituent Assembly; and—notwithstanding the stirring and absorbing nature of subsequent events—it cannot be yet forgotten, with how profound an interest and amazement, the body of Deputies found seated in their midst, a young man—previously unknown to them—whose countenance was an exact reproduction of the features of the grand Napoleon.—The son of Jerome adopted a peculiar although not an inexplicable course in that Assembly. After some hesitation he was installed leader of the new *Mountain*; and, acting as such, he manifested both courage and ability. There has ever been a well-pronounced inclination towards socialism and mob-worship among the Napoleons. The question is, as to its origin, or whether that origin is simple. It might spring from sympathy with the sufferings and respect for the rights of the masses; it might spring from that peculiar mysticism which envelopes every exposition we have yet met with of Napoleonic ideas concerning government; or Despots—in possession or expectation—may know now, as they have done from Cæsar downwards, that despotism signifies the subjection of the educated and the honourable; and that the arm to effect this, is the arm of the mob.—It is said that Ledru-Rollin owed his escape to Napoleon Joseph; but withal the advanced guard of the Mountain did not trust him. They felt it safest to remain masters of their most important secrets, and to mature their designs apart.—Failing issue on the part of the present Emperor, Napoleon is heir to the crown; a position which at all times, and in all circumstances, has been an unpleasant and uneasy one. Louis Napoleon sought in vain for devices to induce his kinsman to absent himself from Paris. He induced him to join the expedition to the Crimea; but he returned early and unexpectedly, and seriously damaged the credit of that ill-planned and most fruitless expedition, by disclosures revealed in a pamphlet published with his concur-

rence. He was subsequently appointed minister of the colonies and viceroy of Algeria; a position in which, as the event proved, he was certain to claim an independence of action quite incompatible with the views of an autocratic sovereign. Napoleon was president of the council of the Parisian Art Exhibition. In January, 1859, he sued and obtained the hand of Clotilde, daughter of Victor Emmanuel, king of Sardinia. He held the command of a division of the French army, which, in conjunction with the forces of Sardinia, attempted in that eventful year, the expulsion of the Austrians from Italy.—J. P. N.

**BONARELLI DELLA ROVERE, GUIDO UBALDO**, born at Urbino in 1563, of a patrician family. He commenced his studies at an early age, in his native city, and was afterwards sent by his father to the university of Paris. Scarcely had he entered on his nineteenth year when his extraordinary talents drew on him the attention of the authorities of the Sorbonne, and having publicly sustained a theological thesis, he was elected professor of philosophy in that college. From thence he went to Milan, where he was befriended by the celebrated Cardinal Frederigo Borromeo. His father having died at Modena, he repaired thither, and met with the most flattering reception at the court of Alfonso, duke of Ferrara, who appointed him gentleman of the bedchamber, and for five years his negotiator and adviser on many important political questions. At the death of Alfonso, which happened in 1596, Bonarelli accepted the same office at the court of Cæsar d'Este, duke of Modena, by whom he was employed as ambassador on three different occasions—first, to Clement VIII.; second, to Queen Margaret of Austria; and thirdly, to Henry IV. of France. Having succeeded in all his negotiations to the full satisfaction of his sovereign, he retired to his native place, where his private affairs strongly required his presence. After a short stay at Urbino, he resumed his travels, and came to Rome, where every literary man of repute sought his acquaintance and courted his friendship. He was amongst the first founders of the Academy of *GI'Intrepidi* at Ferrara, and took the name of *Aggiunto*. Whilst in this city he wrote his famous pastoral poem entitled "*Filli di Sciro*," which met with such universal approbation that it was translated many times into English, French, Spanish, and German; and although by far inferior to the Pastor Fido of Guarrini, and to Tasso's *Aminta*, yet it ranks immediately after them, and has been highly praised by Marini. His biographer, Guarrini, who was continually corresponding with our author, most earnestly urged him not to deprive the literary world of such a beautiful production. He left also many academical discourses, some sonnets, two madrigals, and an eclogue, which were published by Scajoli in his *Parnasso di Poetici Ingegni*. Having been invited to Rome by Cardinal d'Este, to assume the functions of major domo, he was attacked by a violent fever at Fano; and after sixty days of excruciating sufferings, he died at the age of 45, on the 8th of January, 1608.—A. C. M.

**BONASONE, GIULIO**, a historical painter and engraver, born at Bologna in 1498. He studied under Sabbatini, Marc Antonio, Raphael's engraver, teaching him his art. His best work was one representing the souls in purgatory, painted for one of the many churches he decorated—St. Stefano at Bologna. Giulio engraved many of the works of Michel Angelo, Raffiello, Giulio Romano, Parmegiano, and even some of his own works. Many loving Nativities, and weeping Passions, and pallid, dead Christs, and triumphant St. Georges, and operatic St. Cecilians, the careful eyes of this Bolognese rested on. Many galloping Clelias, robust Alexanders, and wounded Scipios, slowly grew under his biting and potent steel. His style is not so clear, firm, and masterly as Marc Antonio's, nor his outline so pure; but still his works have a facile elegance about them. He is especially masterly in the management of his masses. He worked his prints entirely with the graver. He executed portraits of Philip II., Cardinal Bembo, and Floris the Flemish painter.—W. T.

**BONATI, GIOVANNI**, a historical painter, born at Ferrara in 1635, and a pupil of Guercino and Mola; being patronized, when quite a boy, by the childless Cardinal Carlo Pio. He died in 1681, after having ornamented many churches and the gallery of the capitol. He flew at all game—Tasso or the Book of Judges; it was always all one to the eclectic, who treated the bible as a mere playground for fancy; so he painted Rinaldo and Armida, and Sisera and Jacl.—W. T.

**BONATO, GIUSEPPE ANTONIO**, an Italian botanist, lived at the end of the eighteenth and beginning of the nineteenth century. His works were published at Padua, and consisted of a

"Catalogue of the Plants in the Medical Garden at Padua;"  
 "Treatises on Fungi," &c.—J. H. B.

**BONAVENTURA, FREDERIGO**, an Italian philosopher, born at Ancona in 1555; died in 1602. Author of several essays on the tides, weather, winds, and other physical subjects.—J. G.

**BONAVENTURE, GIOVANNI DE FIDENZA**, Saint, designated by the schoolmen and by his order, the Seraphic Doctor, and by the Greeks styled Eustachius and Euty chius. The name under which he is canonized was given him, according to the monkish chroniclers, from the circumstance that, during an illness which befel him in his infancy, the prayers of Francis of Assisi having been invoked on his behalf, the aged monk exclaimed as he saw the child recover, "O buona ventura" (What good fortune)! He was born at Bagnarea in Tuscany, 1221; entered the order of St. Francis, 1243; studied at Paris, it is said, under the English schoolman, Alexander Hales, famous as the Irrefragable Doctor; and after having taken his doctor's degree, in company with Aquinas, in 1255, was chosen public lecturer on the Sentences. The following year, on the demission of John of Parma from the dignity of general of the Franciscans, Bonaventure succeeded him in that office, and avoiding the error of over-rigour into which his predecessor had fallen, not only restored peace among the brethren of St. Francis, but insinuated some reforms into their establishments, at the same time that his erudition and eloquence were employed in the defence of their privileges. For reasons which, if they do not, as Wikes has said, exhibit advantageously his disinterested character, yet do honour to his prudence, he refused in 1265 a nomination of Clement IV. to the see of York; in 1273 was raised to the bishopric of Albano by Gregory X., of whom it is said, had he been so disposed, he might have taken precedence in claiming the honours of the pontificate; and having been decorated with the Roman purple, was sent as legate to the council of Lyons in 1274. In that city, while the council was still sitting, he died in July, 1274. His relics were preserved by the inhabitants until the sixteenth century, when the Huguenots, indignant at the honours which were paid to them, cast them into the Saone. Sixtus IV. canonized him in 1482, and Sixtus V., by a decree of 1587, assigned him the rank of fifth doctor of the church. To both distinctions he was amply entitled, as the greatest of the Franciscans; as the rival in scholastic reputation of the Dominican Aquinas; as the great apologist of celibacy, transubstantiation, and the worship of the Virgin; and still more, as the author of numerous treatises in practical theology, and of many more of an ascetic character, which, abounding in the freaks of an imagination that resorted to mystical lore with the keenest relish, and to mystical invention with a power over the art almost unequalled, are also characterized by a devotional spirit of so much fervour and pathos, that that was felt to be their ruling feature even by the fathers of the Reformation. His collected works were published at Rome, 1588-1596.—J. S., G.

\* **BONCOMPAGNI, BALTASARE**, a descendant of the princes of Piombino, and related to Pope Gregory XIII., born at Rome on the 10th of May, 1821. He was privately instructed by the celebrated poet and writer, Santucci; and so rapidly did he advance in his studies, that he was soon known all through Italy as a literary man of great expectation. His works on various branches of literature and science are very numerous. Boncompagni was elected by the present pope to the important and responsible post of librarian and treasurer to the pontifical academy of I Nuovi Lincei, the acts and transactions of which he published in 1851. His great wealth, which he most liberally distributes in charitable and noble deeds, affords him the means of undertaking costly literary works, which have already ranked him amongst the most eminent literati of the present time.—A. C. M.

**BONCUORE, GIOVANNI BATTISTA**, an Italian historical painter, born at Abruzzo in 1645. He became a pupil of Albano, and learned to draw well and spiritedly, though his colour was as heavy as his manner. He upholstered many of the Roman churches, and ceased to disfigure them in 1699.—W. T.

\* **BOND, WILLIAM CRANCH**, director of the astronomical observatory of Harvard college, Cambridge, Massachusetts, was born at Portland, Maine, 9th September, 1790. He was educated as a watchmaker, and continued in that business for half a century. But he had a taste for the science of astronomy, and established at his residence in Dorsetshire one of the earliest private observatories in America. In 1815 he visited Europe, on a commission from the government of Harvard college, to

examine and make plans of the observatories in England, and to collect information respecting the appointment and furniture of an observatory, which it was then intended to erect at Cambridge. He performed this mission successfully, but, owing to the want of funds, nothing more was done towards carrying out the intention for nearly a quarter of a century. In 1838 Mr. Bond was employed by the government of the United States to conduct a series of astronomical and meteorological observations in connection with Wilkes' exploring expedition. The next year the college engaged him to transfer his whole apparatus to Cambridge, where he was appointed astronomical observer. A mansion-house was fitted up temporarily for the location of the instruments, and measures were taken to obtain the funds requisite for establishing a permanent observatory. In this place a "Gauss" magnetometer was mounted, and a complete series of magnetic observations, according to the system recommended by the Royal Society of London, was commenced in March, 1840, and continued for three years. Then a suitable site near the college being obtained, and the requisite funds procured by subscription, the erection of the building was begun, and a contract was made with Merz and Mahler of Munich, to construct a Fraunhofer equatorial telescope, with an object-glass 15 inches in diameter, and having a focal distance of 22 feet 6 inches, equal in quality to that which the same makers had recently constructed for the imperial observatory at Poulkova. This instrument was received and mounted in June, 1847; and its excellence has been attested by the remarkable series of astronomical discoveries which it has enabled Mr. Bond to make, he being aided in most of them by his son, Mr. George P. Bond, who is attached to the establishment as assistant observer. Immediately after it was erected, it was mounted upon the great nebula of Orion, and that designated as 27 Messier, commonly known as the Dumb-bell Nebula, both of which it clearly resolved, though they had hitherto resisted the highest power of the best instruments; and the former especially, even when viewed in Lord Rosse's magnificent six-foot reflector, had afforded only probable evidence of resolvability. Interesting discoveries were also made by this instrument in the great nebula of Andromeda. A record of the other discoveries and improvements which have been made by the Messrs. Bond at this observatory, would furnish a large portion of the history of the progress of astronomical science for the last ten years. Among them may be specially mentioned the results of the observations made upon the planet Saturn, such as "the discovery of the new inner ring; the singular fact of its transparency; the abnormal divisions and shadings of the rings; the demonstration of their fluid nature, and of the conditions of their equilibrium; the investigation of the unexplained phenomena of the shadows projected upon the ring, and of the curious appearances presented at the time of its disappearance; and lastly, the discovery of the eighth satellite." To these must be added the discovery of the satellite of Neptune, and the consequent determination of the mass of that planet. Seventeen new comets have also been observed by the Messrs. Bond, either for the first time, or independently of the observation in Europe. Under their direction, also, photography has been first successfully applied to observations of the sun, moon, and fixed stars. They have also prepared and published a catalogue of nine thousand stars, forming a complete zone of all stars to the eleventh magnitude inclusive, from the equator to forty minutes of north declination; and they have first accurately determined the distances and angles of position of the stars in the cluster in Hercules, in order to decide satisfactorily the question as to relative change of their position. They have also perfected and brought into very general notice and use "the American method" of recording astronomical observations by the aid of the electric current, by means of an apparatus invented by Mr. Bond, consisting of the electric clock and "the spring-governor," to which a council medal was awarded by the British Association for the Advancement of Science. Mr. Bond is a corresponding member of the Institute of France, a foreign associate of the Royal Astronomical Society of London, and a member of many other scientific bodies in Europe and America. He is now in feeble health, but is still able to superintend, with much energy and minuteness, the operations of the observatory, with which his name is so closely connected.—F. B.

**BONDE, GUSTAVUS**, count of, a learned Swede, was born at Stockholm in 1682, and died in 1764. He was the descendant of a noble family, and was a senator of Sweden, and for a long

time chancellor of the university of Upsal. He has written various works on theology, physics, and science. Among them is a "Monograph on Fraxinus excelsior."—J. H. B.

**BONDI, CLEMENTE**, born of a respectable family at Mezzano, a village in the duchy of Parma, in 1742. At the age of eighteen, having completed his studies, he entered the order of the jesuits, and studied belles-lettres under the celebrated Berlendis. He was afterwards sent to Padua as professor of Italian literature in the college belonging to that company, and there he won the reputation of being an elegant poet and an accomplished orator. His order being suppressed, Bondi wrote an ode on that subject, which is still considered a very fine composition. His poverty compelled him to accept the position of tutor in a nobleman's family, until Count Zinardi of Mantua appointed him his librarian. His fame having reached the ears of Archduke Maximilian of Austria, and the Duchess Beatrice d'Este, he was appointed their librarian, in which capacity he went to Brunn, and finally to Vienna, where he was highly esteemed by the imperial family. Bondi has been often compared with Metastasio, but certainly he does not possess that versatility of genius and that easy versification which are so peculiar to the great dramatic writer, although his language is undoubtedly more correct, and his style more refined and elevated. His translation of the *Æneid* comes next in merit to that of Annibal Caro, and by some is even preferred; but his *Georgics* and *Bucolics* are scarcely worth any notice. His translation in blank verse of Ovid's *Metamorphoses* has been often reprinted; and he has left many original compositions, such as sonnets, epigrams, odes, and idyls. His funeral oration for Leopold II. is considered by Lorenzi, his biographer, a masterpiece of eloquence. He died at Vienna in 1821.—A. C. M.

**BONDI, SIMON BEN WOLF**, died at Dresden in 1816. He left a learned work, "Or Esther" (the Light of Esther), on the foreign words to be met with in the Talmud, the Targumim (the Chaldee paraphrases), and the Midraschim (the homiletic expositions of scripture) of the Jews, with a valuable introduction.—T. T.

**BONDIOLI, PIETRO ANTONIO**, an Italian physician, born in Corfu in the year 1765. He studied at Padua, and before he had completed his course, he had already presented three memoirs to the academy, "On the use of Friction in Medicine;" "On Electricity as a Remedy in certain Maladies;" and "On Sound," with a new theory founded on the structure of the brain. He took his degree on the 1st July, 1781, and then practised medicine, first in Venice, and afterwards in Constantinople, to which city he accompanied the Venetian ambassador. On his return from the East, Bondioli visited Paris, and afterwards became attached to the army of Italy, until in 1803 he was appointed professor of *materia medica* in the university of Bologna, to which he added in 1806 that of clinical medicine at Padua. He died at Bologna in 1808.—W. S. D.

**BONDT, NICOLAS**, a Dutch naturalist of the eighteenth century, has written works on the value of botanical labour, and on the bark of *Geoffrya Surinamensis*. These works were published at Leyden and Amsterdam from 1788 to 1794.—J. H. B.

**BONDT, NICOLAS**, a Dutch litterateur and philologist, born at Voorburg in 1732; died in 1792. Author of a "History of the United Provinces," Utrecht, 1756; a very careful edition of the *Lectones Variæ* of Vincent Contarini, *ibid.*, 1754.—J. G.

**BONE, HENRY**, the first and foremost of the English enamellists, was born at Truro, 1755. The fact of his being a Cornish man led a mind with a natural tendency to design, to a sort of mineral art, such as the men of Limoges since practised. Elsewhere he might have grown up merely a miniature painter; here, surrounded by china and clay, he began to think of porcelain, and, unable to become a more ambitious artist, entered into the employment of a manufacturer of china at Plymouth; and from the sea-washed town removed to Bristol, acquiring there a reputation for his delicate skill in drawing landscapes and groups, guelder roses and ripe apples, lilac bloom and snowdrops, and all those pleasant floral chains and garlandings that ring round our ewers or trim our fruit plates, and delight us by their brilliant durability. He also studied the chemistry of his art, and learned to bake these brittle treasures and render them imperishable by heat, turning the destroyer fire into the preserver of art. In 1778 he removed to the larger field of London, and began to paint ladies' lockets, patch-boxes, and water-colour miniatures. But amidst all these mere bread-and-cheese labours to keep the caitiff wolf from

the door, he did not neglect his new art of enamelling, but arrived at softer, deeper, and more lustrous colours, and at more certain and reliable firing. In 1796 he began to get famous; his very first picture, enamelled after the *Sleeping Girl* of Reynolds, was a great success, and his portrait of the earl of Eglinton was purchased by the prince of Wales. But while these efforts were rewarded, his real masterpieces remained neglected and unsold. These were a brilliant set of enamels of the great poets, warriors, and statesmen, from Queen Elizabeth to Charles I.—taken and reduced from often unique pictures lent from royal and noble galleries. There was the pure brave Sidney; the unhappy platonic Spenser; the demigod Shakspeare; the chivalrous Raleigh; the noble gemini Beaumont and Fletcher; "rare Ben Jonson;" the quarrelsome Inigo Jones. All these treasures the guarded fire of Bone's studio had rendered enchanted, and all but imperishable. The souls' caskets of these men could not be lost to us, as those of Homer and David and Mahomet had been. This great collection, valued at ten thousand pounds, the niggard nation would not buy even at four thousand (they had been better to it than crown jewels); and at the artist's death in 1834 they were scattered over England, realizing the poor sum of two thousand guineas—(will the Finlayes' collection be dispersed and regretted in the same way?) Bone was admitted to the empty honour of membership in the Royal Academy, where merit is not always very rapturously received; and he was chosen enamel painter to George IV., a monarch whose idea of painting was drawn chiefly from the colouring applied to the cheeks of brazen and infamous women, with heads of wood and hearts of stone. He filled the same position to George III. and William IV. He died in 1831. His first success was an enamel portrait of his wife, exhibited in 1780, with an original picture of a Muse and a Cupid. The Elizabethan collection consisted of eighty-five portraits.—W. T.

**BONELLI, BENEDETTO**, an Italian Franciscan, born at Cavalese, near Trento, in 1704; author of some polemical publications, and of a work, interesting for its notices of historical matters connected with his native district, entitled "Dissertazione intorno alla santità e martirio del B. Adalpreto o Albreto, vescovo di Trento," 1755.—J. S., G.

**BONELLI, FRANCESCO ANDREA**, an Italian zoologist of the present century, born at Cuneo in Piedmont in the year 1784. His taste for natural history was early developed, and when only twenty he had already formed an extensive collection of the mammalia, birds, and insects of Sardinia. In 1809, when only twenty-five, he replaced Professor Giorno in the Academy of Sciences of Turin, and was appointed professor of natural history in the university of that city. To these offices he added that of director of the museum, and retained this honourable position until his death, which took place at Turin on the 19th November, 1830. Of his writings, which are not numerous, the most important are his "Specimen Faunæ Subalpinae," published in 1807, and his "Observations Entomologiques sur le genre carabus," which appeared in 1809 in the *Memoirs* of the Academy of Turin.—W. S. D.

**BONELLI, GEORGE**, an Italian physician and botanist, lived during the second half of the eighteenth century. He was professor of medicine at Rome, and cultivated botany more particularly. His works are—"Hortus Romanus juxta systema Tournefortianum paulo strictius distributus," 1772-1784; and a "Treatise on Castor Oil."—J. H. B.

**BONER, ULRICH**, a German poet of the fourteenth century, was a Dominican friar at Berne. He is the author of a collection of fables entitled "Der Edelstein," which was first published at Bamberg, 1461. Of this edition only one copy is known to exist (in the library of Wolfenbüttel). The best editions are by Eschenburg, Berlin, 1810, and by G. F. Benecke, Berlin, 1816.—K. E.

**BONFADIO, JACOPO**, born at Gazzano, a small village in the diocese of Brescia, at the beginning of the sixteenth century. He studied first at Verona, then at Padua. His ambitious views brought him to Rome, where he became private secretary to Cardinal Merinos, then archbishop of Bari. At the death of his patron, which happened in 1535, Bonfadio was obliged to accept the offers of Cardinal Ghinucci, who appointed him his secretary; but finding his new master's temper and disposition quite incompatible with his own, he quitted Rome and travelled through Italy, visiting Naples, Florence, Ferrara, and Padua, in which

city he resided for four years. In the year 1545 the republic of Genoa offered him the professorship of philosophy, and intrusted him, at the same time, with the task of continuing the history by Uberto Foglietta. Accused of a horrible crime, and tried before the courts of Genoa, he was found guilty, and condemned to be burned alive; but his sentence was commuted, and he was beheaded, and his body consumed by fire. Mazzuchelli, who wrote his life, and Boccalini, are of opinion that he was innocent, and that his death was a private vengeance for having too sarcastically spoken against some very powerful Genoese families. However, Manuzio, his contemporary, and Tiraboschi, seem disposed to believe that he was really guilty of the imputed crime, and that his condemnation was but too well deserved. His works, both in verse and in prose, are remarkable for their elegant simplicity and purity of language. It is to be regretted that such a man, in the prime of life, should have met with such an untimely and unhappy fate. His lyric poetry is highly praised by Crescimbeni, and his letters are cited as models of the epistolary style. He has left a classic translation of Cicero's *Oratio pro Milone*, and the *Annales Genovenses*, from 1528 to 1550, in which year, on the 19th of July, he so tragically terminated his mortal career.—A. C. M.

**BONFANTE, ANGELO MATTEO**, an Italian poet, philosopher, and botanist, born at Palermo; died in 1676. Author of "*Vocabularium Botanicum*," Italian synonyms, &c.—J. G.

**BONFANTI**, surnamed **IL TORRICELLA**. He was born at Ferrara (uncertain date), and spent his life chiefly in painting frescos in the churches and monasteries, with some taste and pains, and no doubt much quiet self-satisfying enjoyment. His best pictures were a "Purification," a "Holy Family," and a "Christ disputing with the Doctors."—W. T.

**BONFIGLIO, BENEDETTO**, born at Perugia, where he flourished as a painter about 1505, surpassed only by his great contemporary Perugino. His "Adoration of the Magi" and "Annunciation" are still preserved. He never reached the purity and repose of Raphael's master, his fine drawing, nor his saintly quietude and purity of colour.—W. T.

**BONFINI, ANTONIO**, an Italian historian, translator, and philologist, born at Ascoli in 1427; died in 1502. Author of a work on Hungarian history, distinguished by its lucid arrangement of matter, and elegance of style.—J. G.

**BONFOS** or **BONAFOS, RABBI MENACHEM BEN ABRAHAM**, of Perpignan, wrote "*Michlal Yophi*" (the Perfection of Beauty), an explanation in Hebrew of the scientific terms employed in logic, ethics, physics, and in the versions of Aristotle's philosophical writings. It was printed at Saloniki in 1567, and at Berlin in 1798, with a Hebrew commentary.—T. T.

**BONFRERE** (in Latin **BONFRERIUS**), **JACQUES**, a Flemish jesuit, celebrated as a Hebraist, was born in 1573 at Dinant in the territory of Liege. He left some valuable commentaries on the Old Testament, and an *Onomasticon*, or account of places in Palestine, from Eusebius and Jerome. A complete edition of his works appeared in 1736. Died at Tournay in 1643.

**BONGARD, H. GUSTAV**, a Russian botanist of the present century. He has given a sketch of the botanical works undertaken in Russia, from the time of Peter the Great to the present epoch; also descriptions of new plants. Along with Karl Auton Meyer, he has published a supplement to the *Flora Altaica*. These works have been published at St. Petersburg from 1834 to 1841.—J. H. B.

**BONGARS, JACQUES**, a learned Calvinistic critic, born at Orleans in 1546; died at Paris in 1612. He was employed by Henry IV., during a period of thirty years, in several important negotiations. Bongars is celebrated for the spirited reply he made to the bull of Sixtus V. in 1585, fulminated against the king of Navarre, and the prince of Condé. Author of a compilation of Hungarian history.—J. G.

**BONGIOVANNI** (in Latin **BONJOHANNES**), **ANTONIO**, a learned Italian, born at Ferrarolo in 1712. He drew up a catalogue of the library of St. Marc at Venice, published a Greek scholia on Homer, &c. Died towards the end of the century.—J. G.

**BONGO** or **BONGES, PIETRO**, a learned Italian, born at Bergamo; died in 1601. Celebrated for his acquaintance with the ancient languages, mathematics, music, and the occult sciences. Author of "*De mystica numerorum significatione*," Bergamo, 1583, 8vo, &c.—J. G.

**BONI, GIACOMO**, born at Bologna in 1688, and finally a pupil and assistant of Marc Antonio Franceschini and Carlo

Gignani; the latter he specially imitated in his frescos in the saloon of the Salazzo Pallavicini. He died in 1766, leaving behind him an infant Jupiter and a wonderful ceiling at St. Remo.—W. T.

**BONI, MAURO**, an Italian archæologist and bibliographer, born in 1746; died in 1817. He commenced his studies with the jesuits at Cremona; afterwards studied theology at Rome; then became professor of rhetoric in a college in Germany; afterwards professor of literature at Cremona, and subsequently vice-rector of the college of Bergamo. He corresponded with Morcelli, Lanzi, Andrès, Tiraboschi, &c. While tutor to Prince Giustiniani at Venice, he collected several precious documents relating to Venetian history. He wrote several learned critical works.—J. G.

**BONICCHI, BINDO**, an Italian poet; died in 1337. He was of a noble family of Sienna, where he filled high official functions. He is quoted as one of the poets contemporary with Petrarch, whose poetry he seems to have imitated. Sighs, tears, &c., offered up at the shrine of some unknown fair one, constitute the staple of his poetic effusions.—J. G.

**BONIFACCIO, FRANCESCO**, a painter born at Viterbo in 1637. He was a scholar of Pietro da Cortona with Ciro Ferri and Romanelli. He was a painter of history and religion, and died in 1700, leaving in the Palazzo Braschi (perhaps there still, just where he hung it) a fine picture of the adulteress before Christ.—W. T.

**BONIFACE**, the apostle of Germany. His original name was Winfred, and he was born at Credeantun (now Crediton) in Devonshire, of a noble family, about the year 680. His education commenced in the monastery of Exeanceastre or Exeter, under Abbot Wolfhard, and was continued in that of Nutselle, near Southampton, under Abbot Winberct. It had been his earliest wish to dedicate himself to the service of God, and he soon distinguished himself by the zeal with which he prosecuted his studies, and by his sincere and earnest piety. When thirty years of age he took priest's orders; his reputation rose as a preacher; and the extent of his influence was proved, by his being chosen by the bishops of the kingdom of the West Saxons to explain to Beretwald, archbishop of Canterbury, the circumstances under which a synod had been held by them. Gradually, however, he formed a resolution, to the carrying out of which he devoted the rest of his life. He had heard of the miserable condition of some of the German tribes, and of the paganism which still prevailed amongst them; and he determined at all hazards to go and preach the gospel among them. In the year 716 he proceeded, with two or three companions, to Lundenwie (now London), and embarking thence, he landed at Dorstadt, in the Frisian territory. A war which he found raging there, frustrated his plans for the time, and he returned to England. But his purpose remained unshaken; the abbacy of Nutselle, which was now offered to him, was declined by him; and two years later he again set out, going this time by way of France and Rome. He took with him letters commendatory from the bishop of Winchester to the pope, to whom he thenceforward became entirely subservient. Gregory II., who at that time occupied the papal chair, gave him a commission to examine into the state of Germany, and after some stay at the Lombard court, he entered upon his missionary labours in Thuringia and Friesland. His boldness in denouncing the idolatries he encountered won him great fame. He fearlessly cut down everywhere the sacred trees; tradition tells how at a place called Eichsfeldt (Oakfield), a local god named Stoffo fled at his exorcism into a cave, which still bears the name of *Stuffensloch* or *Stoffo's hole*; other places witnessed the same daring zeal; the pagans were overawed; and thousands received christian baptism. He became marked out as the apostle of the Germans; numbers of missionaries came over from England to assist him; and while on another visit to Rome to give an account of his success, in 723, he was consecrated bishop by Pope Gregory, who gave him (or, as some say, confirmed to him) the name Boniface (Doer of good), by which posterity has known him. He then returned to fresh efforts and fresh successes in his self-denying work. In 742 he presided as apostolic legate at a council of twelve bishops, which was held at Augsburg; and four years later he succeeded his former superior, Willibrord, as archbishop of Mentz (Mayence). In 752 he crowned Pepin king of France at Soissons, Pepin having desired that the prelate of the greatest sanctity that could be found might perform the ceremony.—(Gibbon, *Decline and Fall*, chap. xlix.) The death

of Boniface was worthy of so devoted a life. He had once more visited Frisia, and having again baptized many converts to the christian faith, had appointed a day for their confirmation. When the day came, however, the heathen surrounded his encampment on the banks of the river Bordue, with the evident purpose of attacking it. His attendants wished to defend themselves, but this he would not allow. "Let them not," he said, "fear those who may kill the body, but cannot touch the soul. Let them pass with boldness the narrow strait of death, that they might reign with Christ for ever." As the pagans drew near, he fell upon his knees, and placed a copy of the holy gospels on his head. He then commended his soul to God, and in this attitude awaited the blows of his murderers, who quickly dispatched him. Thus nobly died this great missionary, on the 5th of June, 755. He was afterwards canonized at Rome, and the day of his martyrdom is still marked in the English calendar, though not observed as a saint's day by the English church. His life was written by several of his contemporaries, especially by his nephew Willibald, bishop of Aichstadt.—(See also *Cave, Dupin, Fleury*, and a Life of S. Boniface, by the Rev. George W. Cox, London, 1853.) His epistles were published at Mentz in 1605, by Ferarius, and again reprinted in 1629. Two of them are quoted by William of Malmesbury, in his History of the Kingdom of the Mercians—one addressed to King Ethelbald, and the other to Cuthbert, archbishop of Canterbury. They refer to scandals both among the laity and clergy, and were not, the historian intimates, without effect.—R. S. O.

**BONIFACE**, a Roman general of the fifth century, by birth a Thracian, was governor of Africa under Honorius, and became the chief councillor of the Empress Placidia. Driven from the court by intrigues, he sought to avenge himself by inviting the Vandals into Spain. Subsequently recovering the favour and confidence of the empress, he was employed against Ætius, by whom he was killed in single combat.—W. B.

**BONIFACE**. The name borne by several popes:—

**BONIFACE I.**, a Roman, was canonically elected, after the death of Zosimus, in December, 418. But the archdeacon, Eulalius, was set up by a faction among the clergy and people, and took possession of the Lateran church. Symmachus, the prefect of Rome, favoured Eulalius, and the emperor, Honorius, was at first induced by his letters to do the same; but having afterwards received a petition from those who had participated in the election of Boniface, he summoned a council to Ravenna to decide the matter, and meantime ordered that neither party should enter Rome. Eulalius, however, disobeyed this order; upon which he was expelled by order of the emperor, and the election of Boniface was confirmed. The Pelagian controversy was raging at this time, and Boniface sent a request to St. Augustine, through his friend, Alypius, that he would write against the Pelagians. St. Augustine did so, and addressed his work to Boniface. This pope strenuously maintained and extended the authority of the Roman see both in Gaul and in the East. He died at a great age in the year 422.

**BONIFACE II.**, a Roman by birth, but of Gothic parentage, succeeded Felix III. in 529. An antipope was set up in the person of Dioscorus, who, however, died at the end of a month; in spite of which, Boniface anathematized his memory. St. Benedict, the patriarch of the western monks, founded at this time the great monastery of Monte Cassino. By an illegal stretch of power, Boniface named his own successor, Vigilius a deacon; but the act having been condemned by a council, he appears to have seen his error, and to have cancelled the nomination, which certainly was not acted upon. He died in December, 531.

**BONIFACE III.**, a Roman, was elected in February, 606, and occupied the papal chair only nine months. Having been sent as nuncio to Constantinople, he ingratiated himself while there with the Emperor Phocas, from whom, after his election, he obtained a formal acknowledgment of the primacy of the Roman see, in opposition to the pretensions of the patriarch of Constantinople. He assembled a council in St. Peter's, by which it was enacted—that in the lifetime of the pope, or any other bishop, it should not be lawful even to speak of a successor. He died in November, 606.

**BONIFACE IV.** was elected in September, 607, after the see had been vacant for ten months. He was a native of Valeria, in the country of the Marsi. Having obtained permission from the Emperor Phocas to convert the Pantheon into a christian church, he dedicated it in honour of the Blessed Virgin and

all the martyrs, the title it still bears. This dedication gave rise to the festival of All-saints on the first of November. In 610 Mellitus, archbishop of Canterbury, came to Rome, and assisted at a council held by the pope, the decrees of which he took back with him to England, together with letters from Boniface to the clergy, and to King Ethelbert. The pope turned his house into a monastery, which he richly endowed. He died in May, 614, and was canonized after his death.

**BONIFACE V.**, a Neapolitan, succeeded Deusdedit in December, 617. Hearing of the inclination of Edwin, king of Northumbria, to embrace christianity, he wrote earnestly exhorting him to embrace the true religion, and pointing out for his imitation the example of all the other princes. He wrote also to Edwin's queen, Ethelburga, who was already a christian, urging her to pray and labour for the conversion of her husband. He died in October, 625.

**BONIFACE VI.**, a Roman, was elected after the death of Formosus, in April, 896, but died fifteen days afterwards.

**BONIFACE VII.** Benedict VI. having been imprisoned in the castle of St. Angelo, Franconi, a Roman, deacon of the Roman church, was elected in his place in 974, and took the name of Boniface VII. Shortly afterwards, Benedict having in the meantime been put to death in prison, Franconi was expelled from Rome, and fled to Constantinople. He died in 985.

**BONIFACE VIII.** (Cardinal Benedict Gaetani), a native of Anagni, was elected in December, 1294, on the resignation of Celestine V. He was well versed in the civil and canon law, and had been employed many years in conducting the political and diplomatic affairs of the holy see. Fearing that the party which did not recognize the legality of the abdication of his predecessor, might, if they got him into their hands, use him as an instrument for creating a disturbance, he caused Celestine to be confined in the fortress of Fumona, where, being ill treated by his guards, he died in 1296. Boniface possessed the qualities rather of a temporal sovereign than of a prince of the church. His pride and ambition led him to aim at the extension of the papal power in temporal matters, to a point far beyond what even Gregory VII. or Innocent III. had attempted; and, when he met with opposition, he recklessly employed against his adversaries the whole armory of ecclesiastical censures, in such a manner as to bring both himself and them into contempt. He is made the subject of a withering invective in the nineteenth canto of Dante's *Inferno*, although there seems reason to believe, that the particular crime, simony, there ascribed to him, cannot justly be laid to his charge. He attempted, but vainly, to weaken the hold of the house of Aragon upon Sicily. In 1297 a rupture occurred between him and the powerful family of the Colonnas. He excommunicated the whole family, including two cardinals, and having taken Palestrina, one of their strongholds, he caused the town to be demolished, and another to be built in its stead on a different site. But his pontificate is rendered chiefly remarkable by the long struggle between him and Philip the Fair, king of France. There were grave faults on both sides. Philip, by his unjust exactions and illegal exercises of power in the affairs of the French church, had furnished the pope, to whom many of the French clergy appealed, with a reasonable ground for interference. By the bull, *Clericis laicos*, published in 1296, Boniface attempted to put a stop to these exactions, and again by the bull, *Ausculta fili*, published in 1298. But as Philip refused or delayed to make reparation, the pope summoned all the heads of the French clergy to a council, to be held in Italy, to consult on the affairs of the French church. Philip forbade any of his subjects to leave the kingdom without his permission. The council was, nevertheless, opened in 1302, and well attended by the French prelates, and one result of its deliberations, was the celebrated bull, *Unam sanctam*, in which the absolute superiority of the spiritual over the temporal power is asserted in the strongest terms. Boniface, however, in the course of the quarrel, put forward pretensions which were evidently extravagant. He interfered in the civil administration of France to such a degree, that nearly the whole nation turned against him. At an assembly of prelates and barons held at Paris in 1303, Boniface was declared to be guilty of heresy and simony, and an appeal was made from his judgment to that of a future general council. The pope, in return, prepared to fulminate an excommunication against Philip and his adherents, and to lay France under an interdict. But before these bulls could be expedited, Boniface was seized at Anagni by a party of

Ghibellines, headed by William of Nogaret, an agent of the king of France, and Seiarra Colonna. The aged pope behaved with great intrepidity, and was subjected to gross indignities during three days by his captors, especially Colonna. At length the people of Anagni rose in a body and rescued him. Boniface went up to Rome, but his proud spirit could not recover the shock which the outrages and insults heaped upon him had occasioned, and he died at Rome soon afterwards in October, 1303.

**BONIFACE IX.** (Cardinal Pietro Tomacelli of Naples), was elected during the schism by the cardinals of the Roman obedience on the death of Urban VI. in 1389. He openly testified the exultation which he felt at his election. He was the youngest on the list of cardinals, and though a fluent speaker, could neither write nor chant, and was wholly ignorant of the mode of conducting ecclesiastical affairs. During the whole term of his pontificate, which extended over fifteen years, his efforts were unceasingly directed to the task of extending, by fair means or foul, the Roman obedience, and reducing the power of the French antipopes, his rivals, to the narrowest limits. In the first year of his pontificate, he resorted to the most terrible ecclesiastical censures against the antipope; but Clement retaliated with equal vigour, and the combatants thenceforward seem to have laid aside these ineffectual weapons. Boniface in vain endeavoured to induce the king of France to withdraw his support from the antipope, and transfer it to himself. In 1392, and again in 1394, he sent envoys to Charles VI. for this purpose, but without success. In the last-named year, Benoit XIII. was elected in succession to Clement by the cardinals at Avignon. Disgusted by his duplicity, the French prelates and doctors, at a council held at Paris in 1398, solemnly renounced his obedience, but without recognizing the claims of Boniface. Castile also, in the same year, withdrew its obedience from Benoit. It seems probable, that had the conduct of Boniface been different, the schism might now have been terminated. But his open practice of simony, in its most gross and shameless forms, must have indisposed those princes who had not previously acknowledged him, to admit his claims now for the first time. He is said to have sold the same benefice to several persons on the same day, offering it to each as vacant. This may perhaps explain why the king of France in 1403 restored his obedience to Benoit. England, however, steadily adhered to Boniface, whose claims were ably vindicated in 1399 by the university of Oxford. Germany, also, after the deposition of the Emperor Wenceslaus, and the election of Robert of Bavaria, remained in the Roman obedience. Naples, under King Ladislaus, did the same. Boniface first instituted, in 1399, the annates, or first fruits, by which the first year's revenue of every benefice to which a new incumbent had been appointed, was reserved to the Roman see. In 1404 Benoit sent envoys to Boniface to propose a compromise. The pope gave them a hearing, but insisted that he was the true pope, and his rival an antipope. The envoys retorted that Benoit was at least not simoniacal. The excitement produced by this interview aggravated a dangerous malady from which the pope was suffering, and he took to his bed and died shortly after, in October, 1404.—T. A.

**BONIFACIO, BALDASSARE**, nephew of Giovanni, was born at Crema about the year 1584. He studied at Pavia, and obtained the degree of doctor of laws in his 19th year. Soon after he went to Germany as secretary to the papal nuncio, John Porzio, and was intrusted with many diplomatic negotiations. Having returned to Italy, he went to Rome, where he entered the church, and was raised to the dignity of archpriest at Rovigo. The university of Padua offered him the professorship of belles-lettres, which he refused, preferring to devote the whole of his time to the cultivation of his own mind. On the following year, however, he yielded to the intreaties of the senate of Venice, which had elected him professor of civil law in the college of the nobles. Pope Urban VIII. had appointed him bishop in the island of Candia, which dignity he did not fill, on account of his unsurmountable aversion to sea voyages, and therefore he preferred the archdeaconry of Treviso, in which city he was the vicar-general under four successive bishops. In 1637 he was called upon by the senate to take the supreme direction of a new college founded at Padua, of which he was the first rector; and finally in 1653 he was created bishop of Capo d'Istria, which see he administered for six years. His works are numerous, but of little interest, except in a historical point of view, being good specimens of the wretched style which prevailed in his time. He published a

tragedy, "Amata," which Crescimbeni considers the best of that age; and has left many other historical, juridical, and poetical productions, the most part in Latin, enumerated at length by David Clement in his *Bibliothèque Curieuse*. Died in 1659.—A. C. M.

**BONIFACIO, GIOVANNI**, born of a noble family at Rovigo on the 6th of September, 1547. Having completed his university career at Padua, he studied law for five years, at the end of which period he obtained the degree of LL.D. He continued, however, to cultivate belles-lettres, and particularly poetry. Having married a lady from Treviso, he fixed his residence in that city, and wrote its history. He was appointed to the dignity of assessor in many cities in the Venetian territory; and finally, in 1624, his health requiring some rest, he gave up all his occupations, and retired to his native place. He has left many works, both in Latin and Italian, some very good fables, lectures, orations, and a treatise on jurisdiction, entitled "De Furtis." His most remarkable production is the "History of Treviso," in twelve books. He died on the 23rd of June, 1635.—A. C. M.

**BONIFACIO**, surnamed **IL VENEZIANO**, was born at Venice in 1491, and was a pupil of the elder Palma, and perhaps a student of Titian. His style partook of both manners. His colour is "suave," says Pilkington, using one of his rarest subtleties of phrase, and his compositions abundant and ingenious. "Christ driving the Cheating Tradesmen out of the Temple," was one of his best works; but most of the Venetian churches and sea-girt palaces were adorned by his grand pencil. His "Baptism of Christ," "Sacrifice of Abraham," and "Michael driving out the Evil Spirit," were his choicest marvels. He died in 1553.—W. T.

**BONINGTON, RICHARD PARKES**, a landscape painter, son of a drawingmaster, and born at Arnold, near Nottingham, in 1801. Born thus under canvass, he precociously began to sketch almost before he could speak; while still a child he even began to design, which is to drawing what writing is to learning spelling. At seven he drew and sketched with accuracy and taste, guided by his delighted father, who turned him into the fields, as other children are turned into a school-room. Of what is usually called education, and which is often no more fitting to genius than train oil to a canary bird, Bonington had his reasonable modicum. In his thirteenth year a strange Danish thirst for the sea came on the boy, and the green trees of Nottingham grew as hateful to him as London's grey pavements would be to an Arab. He painted the sea before he knew it; he longed to paint it with the fresh salt spray blowing in his face. At home he had no thwarting, no extra stiles put up to make life's road rougher than it need be. At fifteen his father took his son to Paris, and at the Louvre he astonished the quick Gauls by his landscape copies from Poussin and Berghem. At sixteen his works were the admiration of the school, but he would not obey rules. He left the academy as soon as he could draw the living model. The rapid sale of his works kept him too long in Paris. He became a student of the Institute, and drew sometimes in Gros' atelier, poor, wind-bag manufactory that it was. Bonington loved river banks and bold sea-shores, where land and sky, cloud and water met. The motion of ships moved him. He portrays fish-markets, and fish with white bellies and green backs quivering on brown and yellow sand. He liked to see the net drawn, and the fish laid in lines on the pebbly water-mark. His second drawing of a marine subject obtained for the clever, unsettled, striving boy a gold medal, at the same time that Sir Thomas got his red ribbon, and Constable and Fielding their golden honours. Then he rose and went to Italy, setting up his easel at Venice, taking short-hand sketches of a city, which he said naively, "seems just going off to sea." His "Ducal Palace" was exhibited at the British gallery, and surprised everybody. "It is," said a connoisseur, "a grand Canaletto-sort of thing, and is as beautiful as sunshine, and as real as Whitehall." Allan Cunningham thought it too much like a surveyor's literalism; but the "Ducal Palace" picture, he says, was true, yet more poetical than Canaletto. Bonington's great fault was imitation, and borrowing other people's spectacles. Like Gainsborough, he was fond of figures, and judicious in their use. In his gardens he had ladies playing on the lute, or listening to night winds, pleasanter than the song of all the birds of day. He had fishermen in barges, and pinnaces full of Fiammettas; but imitate or not, rough English shore or shaven Italian garden, true to his nation, his colouring was always beautiful and poetical. His great ideal was an eclectic one—to combine Dutch fidelity, Roman

science, English sense, and Venetian vigour. Much to Fuseli's horror, he had even selected a series of mediæval subjects, on which to make the experiment. He tried the manner of every school, but his "Henry the Third of France" the academy hung out of sight, much to the disgust of all but a clique. This picture was correct, skilful, and harmonious; but to be young and successful is always a sin in the eyes of our privileged body of worn-out old men. His mind teemed with projects; his conception was rapid, his execution rapid; but death took the brush out of his hand, and pointed to the inevitable grave. Every one saw he was branded for death; but still he rose early and studied late, and fame went on increasing like the school-boy's snow globe. The French watched his progress with pride, for he was their adopted son, and they are quick and generous of feeling. Gros, who for some unknown reason had shut his studio against him, now declared it a proud honour to have such a pupil. In 1827 he went to Paris, having, with his usual shyness, refused an introduction to Lawrence till he was better known. The almost numberless orders he received excited an overwrought brain; he fell away, and a quick and overmastering consumption swept him into the grave. He had just strength to reach London, where he died in his twenty-seventh year. Lawrence was at his funeral—a sad introduction. The artist was tall and well-made. "His face," says a French writer, "was truly English, and we loved him for his melancholy air, which became him more than smiles." Carpenter engraved twenty-six of his paintings, which are now scarce. His works are distinguished by great picturesque beauty, good colour, and a singular grace of execution. His handling was delicate and true; his tone of colour, clear and harmonious. "He wants," says Cunningham, "vigour and breadth; his copies are sometimes too bold and literal; his poetic scenes, too slight and flimsy. He had not the strength of Gainsborough, but much of his grace and art." It was his dream to have gained a competency by painting commissions, and then to have dedicated his time to an epical series of historical compositions. Who can say whether this wonderful boy might not have grown up a worn-out reproducer of dead shadows, a conventional Master Betty of art, a phenomenon run to seed, a colt run too early, and broken-kneed before its full strength had come? Taking him to France while still a suckling, to be overpowered by the visions of past greatness, was a cruel mistake; but then poor Bonington never had stamina enough for an original genius; he was a precocious, consumptive lad. Had God willed him to have improved English art, he would have lived.—W. T.

BONINI, GIROLAMO, a native of Ancona, lived about 1600, pupil of the weak but graceful Albano, whom he assisted in the Sala Farnese, and in many of the Bolognese palaces.—W. T.

BONISOLI, AGOSTINO, a historical painter of Cremona, and pupil of Tortiroli. Diligent study of Veronese's works made him a reasonable painter. Died in 1700.—W. T.

BONITO, GIUSEPPE, a Neapolitan portrait and historical painter, born in 1705, and died in 1789. He was a pupil of Solimena, and became painter to the king of Naples.—W. T.

BONJOUR, CASIMIR, born in 1795 at Clermont. Some thirty years have elapsed since the amiable librarian of the Bibliothèque St. Genevieve, gave the last of that agreeable series of comedies which will insure for his name a respectable place in the brilliant list of French dramatic writers. His works possess the distinguishing merit of high moral aims, treated with easy and pleasant familiarity.—J. F. C.

BONNAIRE, LOUIS DE, a voluminous French theological writer, a priest of the congregation of the Oratory, born at Ramerup-sur-Aube about 1680; died at Paris in 1752. He wrote "Parallele de la morale des jesuites et de celle des paiens," 1726; "L'esprit des lois quintessencié," 1751; "Religion Chretienne meditée dans le veritable esprit de ses maximes," 1745-1763; and "Les Leçons de la sagesse," 1737-1744.

BONNAL, FRANÇOIS DE, a French prelate, born at the manor-house of Bonnal, near Agen, in 1734. In 1758 he was raised to the see of Clermont, and in that year was present at the general assembly of the clergy of France. In 1789 he was deputed to the states-general, and protested against the limitations of the power of the clergy proposed by the popular leaders. In 1791 he refused to sign the *constitution civile*, and exerted himself so zealously to increase the number of recusants that he was denounced to the assembly, and obliged to retire to Holland. He died in 1800.—J. S., G.

BONNAR, WILLIAM, R.S.A., a portrait and historical painter of moderate calibre, born at Edinburgh; died in 1853. He was the son of a house-painter, and was, when young, apprenticed to the rose-garland decorative branch of art. His picture of "the Tinkers," exhibited in Waterloo Place in 1824, established his fame; and on the formation of the Royal Scottish Academy he was elected an academician. Many of his pictures have been engraved.—W. T.

BONNARD, BERNARD DE, a poet, born at Semar in 1744; died in 1784. He first went to the bar, which he subsequently renounced for the profession of arms. In 1770 he was appointed tutor to the son of the duke of Orleans, in which office he was succeeded by madame de Genlis. His poems, with a biographical notice, have been published at Paris, 1791, 8vo.—J. G.

BONNARD, JEAN LOUIS, a French missionary and martyr, born at Saint-Christophe in Jarret in 1824; executed in Cochinchina in 1852. He arrived in that country in 1850, set himself to acquire the Annamite language, and had made some progress in his missionary labours, when he was denounced to one of the mandarins, and condemned to death.—J. S., G.

BONNARD, ROBERT ALEXANDRE DE, a French geologist, the son of the poet, Bernard de Bonnard, was born in Paris on the 8th October, 1781, and became inspector of mines. He has devoted himself especially to the investigation of the geognostic questions connected with mining, as is shown by the titles of his principal writings—namely, "Aperçu des terrains houilliers du nord de la France," and "Essai Géognostiques sur l'Erzgebirge." He has also written several memoirs on mining and metallurgical processes.—W. S. D.

BONNATERRE, JOSEPH P., a French abbé and naturalist, born at Saint-Seniez in 1747 or 1752, was one of the authors of the zoological portion of the great Encyclopédie Méthodique. The portions written by Bonnaterre include the "Natural History of Fishes and Cetacea," and the Tableau Encyclopédique et Méthodique of the "Birds, Reptiles, Fishes, and Cetacea." His other writings consist of a "Flora of Aveyron," a notice of a wild boy found in that district, and a "Recueil de Médecine Veterinaire," published at Toulouse in 1805. At the outbreak of the French revolution the abbé Bonnaterre retired to his native district; he died at Rhodéz on the 26th September, 1804.—W. S. D.

BONNAUD, JEAN BAPTISTE, a French jesuit, grand vicar of Lyons, born in America in 1740. He published during the ten years preceding the Revolution, several works on politico-ecclesiastical questions, which brought him into celebrity as a vigorous writer and zealous churchman. His last publication, however,—"A Defence of the Rights of the Church against the Spoliatory Measures of the National Assembly"—attracted to him the undesirable notice of the revolutionary party, by whom he was shut up in one of the Carmelite convents of Paris, and in September, 1792, massacred along with other prisoners.—J. S., G.

\* BONNECHOSE, FRANÇOIS PAUL EMILE, born at Leyerdorp in Holland in 1801, of French parents. He first entered the army, which he quitted in 1830 for the sake of devoting himself to literary pursuits. Having written a tragedy, "Rosemonde," which succeeded, and a poem which was crowned by the French Academy, he turned his attention to history, and has given to the world a history of France, a sacred history, and a history of "The Four Conquests of England," in which he fairly and impartially renders justice to the great characteristic qualities of the British people.—J. F. C.

BONNECORSE, BALTHAZAR DE, born at Marseilles, and died in 1706. Wrote poems, the name of one of which, "La Montre d'Amour," was found jingling in a passage of Boileau's *Lutrin*. Balthazar's wrath was roused, and he wrote the "*Lutrigot*," a parody of the *Lutrin*, in ten cantos. Bonnecorse also published Latin verses.—J. A., D.

BONNEFONS, AMABLE, a French jesuit, born at Riom in Auvergne in 1600; died at Paris in 1653. He devoted himself to charitable instruction, and left a number of devotional treatises, particularly "Les Douze Portes de la bienheureuse éternité, et les clefs qui les ouvrent," 1644.

BONNEFONS or BONEFONS, JEAN, an amatory poet, born at Clermont in Auvergne in 1554; died in 1614. He studied law, and followed the profession of an advocate at Paris. Opposite judgments have been passed on his poetry. Some have compared him to Catullus. Others have alleged that he imitated rather modern Italian poets than those of the

Augustine age, and point out grave errors in grammar and prosody. His poems were published at Paris, 1587, 8vo, under the title of "Pancharis," the name of an imaginary mistress. They are also to be found with the *Juvenilia* of Th. de Beze in the *Amœnitates Poeticæ*, Paris, 1754, 12mo.—J. G.

BONNEFOY, FRANÇOIS LAMBERT, a French theologian, born in 1749 in the diocese of Vaison; died in 1830. He refused to take the oath exacted of the clergy by the constituent assembly, and in consequence was obliged to emigrate. On his return to France, he engaged in the composition of a history of the Revolution, devoting all his time to the work, and had prepared it for the press, when he died suddenly of apoplexy.

BONNER, EDMUND, bishop of London, was born of poor but respectable parentage at Stanley in Worcestershire, and was educated by an ancestor of Nicholas Lechmere, a baron of the exchequer in the reign of King William. He was entered a student of Broadgate hall (now Pembroke college), Oxford, in 1512, became bachelor of the canon, and took orders in 1519, and in 1525 received the degree of doctor of canon law. Except as a canonist his learning was not remarkable, but his dexterity in the management of affairs was sufficient to gain him preferment. He became commissary for the faculties to Cardinal Wolsey, and was in attendance on that prelate when he was arrested at Cawood. After the death of his patron he insinuated himself into the favour of Henry VIII., who made him one of his chaplains. This promotion converted him into a Lutheran, and a zealous advocate of the king's divorce. Cromwell recognizing his talents for diplomacy, also took him under his particular patronage. In 1532, after having been envoy at several courts, he was sent along with Sir Edward Karne to excuse at Rome Henry's refusal to answer the pope's citation. Next year he was despatched to Clement VII. at Marseilles, charged to deliver Henry's appeal from the papal court to a general council. The message was not conciliatory, and the messenger was a furious priest. Clement proposed to toss him into a caldron of melted lead. In 1538 Bonner was nominated to the bishopric of Hereford, but before consecration was translated to London. At the time of the king's death in 1547, he was ambassador at the court of the Emperor Charles V. A few months after that event he began to have scruples about his conduct under the late reign—he would no longer renounce and deny the bishop of Rome, nor would he swear obedience to the king while a minor. He even protested against the royal injunction and homilies. This refractory behaviour cost him an imprisonment in the Fleet, whereupon he recalled his protest, submitted to the king's grace, and promised to help on to the utmost of his power the work of the Reformation. But although after this he conformed outwardly to recent changes in ecclesiastical rule, his convictions were with the party who had suffered from them, and hence he continued to be an object of suspicion to the ministry. In August, 1549, he was summoned before the privy council, and after being subjected to a reproof for negligence in the discharge of his duties, enjoined to preach a sermon at St. Paul's cross, deprecating rebellion, Romish ceremonialism, and enforcing the right of a king, even while a minor, to make laws. On September 1st the prescribed sermon was delivered. It turned altogether upon rebellion and ceremonies, and ignored the question of obedience to sovereigns under age. Bonner was again brought before the council, and this time deprived of his bishopric. He was in prison when Mary entered London, August, 1553. A month afterwards, the sentence deposing him from his see was reversed by a commission called, it may be said, for that purpose. In 1554 he was made vicegerent and president of the convocation in room of Cranmer, who was committed to the tower. Armed with unlimited authority, he proceeded to reform the church after its reformation; to revive the ceremony of the mass, and burn all who professed abhorrence of it; to turn out the reformed bishops and supply their places with his own minions; to vindicate Romanism by fire and fagot till every heart should quail at the mention of dissent; and to indulge the brutal cruelty of his disposition by whipping prisoners with his own hand. In 1555 and the three following years, two hundred innocent persons were burned at the stake by order of this mitred Nero. The brutality of his conduct when executing the commission to degrade Cranmer reminds us of Judge Jefferies, and of him alone. On Elizabeth's accession, Bonner and other prelates repaired to Highgate to congratulate the new sovereign. He read his fate in the reception they met with. Each was allowed to kiss her

hand, except Bonner. In May, 1559, he was called before the privy council, and asked to take the oath of allegiance and supremacy. He refused, was deposed from his see, and committed to the Marshalsea, where he died in 1569.—J. S., G.

BONNET, ANTOINE, a French jesuit, born at Limoges in 1634; died at Lunel in 1700. He left a Latin panegyric on Louis XIV., and a work entitled "Pax Lud. XIV. et Mariæ Theresiæ Austriacæ conjugio sancita," 1660.

\* BONNET, AUGUSTE, a French surgeon, who has devoted much attention to the management of prisons. His earliest work is a "Treatise on Diseases of the Liver," published at Paris in 1828. In 1844 he produced three works—"On the Modifications to be introduced into the Prisons of France;" "On the Penitential Systems;" and "On Solitary Confinement."

BONNET, CHARLES, a naturalist and philosopher, was born at Geneva on 13th March, 1720, and died in the same town of water in the chest, on 17th June, 1793. His family were originally French, and were expatriated in 1572, after the dreadful slaughter of St. Bartholomew's day. He devoted much attention to natural history, and in 1745 published a treatise on insects, in which he gives interesting views of the structure and reproduction of these animals. He took his degree of doctor of laws in 1743, and afterwards was admitted a fellow of the Royal Society of London. In 1752 he was made a member of the grand council in the republic of Geneva. To vegetable physiology he has also devoted his attention, and in 1754 published a valuable work on the use of the leaves of plants, in which he detailed numerous experiments in vegetable absorption and respiration. He subsequently published essays on psychology, and on the mental powers, as well as a work on the origin and reproduction of organized bodies. In 1764-65 his work on the contemplation of nature appeared; and in 1773 his philosophical researches into the truth of christianity. In 1783 he was elected honorary member of the Academies of Sciences of Paris and of Berlin. A genus of plants was called by Wahl, *Bonnetia*, in honour of Bonnet.—J. H. B.

BONNET or BONET, B. DE LATTES, rabbi, a native of Lattes, near Montpellier, was a profound mathematician, astronomer, and physician. When obliged to leave his country through his adherence to his faith, he found a protector in Pope Leo X., to whom he dedicated an astronomical work, in which the rabbi explains the use of a curious astronomical instrument invented by him, and by means of which the hour could be ascertained at any time of the day or of the night. Bonnet came to Rome in 1498.—(E. Carmoly, *Histoire des Médecins Juifs*.)—T. T.

BONNET or BONET, JEAN, a Swiss physician, born at Geneva in the year 1615, took his degree at the early age of nineteen, and soon acquired such a reputation that patients came to consult him from foreign countries. He visited France in 1668, and stayed for some time in Paris, where his attainments appear to have aroused some little envy. Jean Bonnet died at Geneva on the 25th December, 1688. The only work ascribed to his pen is a "Traité de la Circulation des Esprits Animaux," published at Paris in 1682; but this is said to have been written by another person.—W. S. D.

BONNET, SIMON, a French Benedictine, prior of St. Germer de Flée, born in 1653. In 1696 he began a work, "Biblia maxima Patrum," a collection of patriotic commentaries, on which he laboured till his death in 1705.

BONNET or BONET, THEOPHILUS, a Swiss physician, was born at Geneva on the 5th March, 1620, took his degree as doctor of medicine in 1643, and afterwards practised with great reputation in his native city, where he died on the 29th March, 1689. He was the author of numerous treatises on medicine and surgery, but he is most celebrated as having, to a certain extent, originated the science of pathological anatomy. The most important of his works were written during the last ten years of his life, when, being afflicted with deafness, he was compelled to relinquish his practice. His chief work, entitled "Sepulchretum Anatomicum, seu Anatomie Practica," &c., was published in 1679, and a new edition, with corrections and additions by Mauget, appeared in 1700.—W. S. D.

\* BONNETTY, AUGUSTIN, a distinguished French theological writer, born at Entrevaux in 1798. He has conducted since 1830 the monthly journal, *Annales de Philosophie Chrétienne*, and since 1836, *l'Université Catholique*, both periodicals of extensive popularity. In 1845 Pope Gregory XVI. conferred on him the order of St. Gregory the Great.

**BONNEVAL**, an ancient illustrious house in the Limousin, founded by Giraud de Bonneval, who lived in 1055. Not a few heads of this house held important offices at the French court. One of them, Antoine, was councillor and chamberlain to three kings, Louis XI., Charles VIII., and Louis XII. Another, Germain, was killed at the battle of Pavia. A third, Cæsar-Phœbus, acquired great distinction in the wars of Louis XIV. The best known member of the family was:—

**CLAUDIUS ALEXANDER**, third son of the marquis de Bonneval, a military adventurer, born in 1675. He entered the navy in 1686, but quitted it in 1698, in consequence of a duel with the count de Beaumont. He then entered the army, and served with distinction in the Italian wars under Catenat, Villeroy, and Vendôme. His fiery temper, however, led him into several duels, and involved him in a quarrel with the minister of war, which ultimately caused him to quit the French service and to accept a commission in the Austrian army. He served under Prince Eugene against his native country, and afterwards against the Turks, and gained great distinction at the battles of Peterwarden and Belgrade, at the first of which he was severely wounded. As a reward for his services an important command in Sardinia and Sicily was bestowed upon him in 1719. His quarrelsome disposition, however, once more brought him into disgrace, and he was stripped of all his honours and expelled from the country. He then took refuge in Turkey in 1730 and embraced the Mussulman faith. He was appointed to a high office in the army under the name of Achmet Pacha, and instructed the Turkish troops in European tactics and the management of artillery. His military reforms, however, excited the enmity of the janissaries, and his political projects were regarded with dislike by the divan, and he was exiled into Asia in 1738–39. His last years were passed in intrigues and vain regrets. The pope offered him an asylum in Rome, and the king of the Two Sicilies a pension, but he died at the moment he was about to return to Christendom. A memoir of Bonneval was published by the prince de Ligny, 1 vol., 8vo, Paris, 1817. A work, purporting to be the autobiography of this remarkable adventurer was published in 1755, but its genuineness is doubtful.—J. T.

**BONNEVILLE, NICHOLAS DE**, born at Evreux in 1760, is looked upon as one of the founders of the French school of communists. It seems not unlikely that his doctrines may have originated in those sufferings to which he, like many other ardent aspirants for literary fame and fortune, became exposed in that brilliant capital to which all youths of real or imaginary genius repair from the provinces. He has left on record, in a preface to a volume of early poems, a description of the miseries he underwent, and which worked upon his ardent imagination and susceptible temper, so as to excite anger against society at large. Yet he was, although a dreamer, a hard student, and mastered the German, English, and Italian languages and literature. He aided Le Tourner in his translation of Shakspeare, and wrote imitations of German stories with a success which procured him the patronage of Marie Antoinette. When the Revolution broke out, the excitable feelings of Bonneville caught the general enthusiasm, and he promulgated plans for insuring the permanent good of mankind, more benevolent in intention than practical or wise. Yet was he openly denounced by Marat as an aristocrat, for articles in his journal, the *Bouche de Fer*, denouncing all cruelties and excesses. Thrown into prison, he narrowly escaped the guillotine by the timely fate of Robespierre. When Bonaparte had risen to the imperial throne, Bonneville had the simplicity to write an article in his new journal, the *Bien Informé*, comparing the emperor with Cromwell, and was again thrown into prison, and when let out, subjected to close surveillance as long as the empire lasted. In his latter days he opened a bookshop in the Quartier Latin, which became the resort of the students and professors, who loved to hear Bonneville's animated and learned conversation. He was simple, credulous, enthusiastic, and imaginative, and withal remarkably well read. His death took place 9th November, 1828.—J. F. C.

**BONNIVARD, FRANCIS DE**, celebrated in the annals of Geneva for his labours and sufferings in the cause of liberty, was born in 1496 of an influential Savoyard family. In 1510 his uncle resigned to him the priory of St. Victor, near Geneva, which had been previously held by several of his ancestors. A dispute was at that time raging between the Genevese and Bishop John, who attempted to cede his territory to the duke of Savoy. Bonnivard incurred the enmity both of the bishop

and the duke, by his interference in behalf of a citizen whom the former had imprisoned and tortured, and in 1519 was betrayed into the hands of the duke, who imprisoned him for two years in the castle of Grolée. On his liberation he took a deep interest in the cause of the Reformation, which was now making progress, and showed himself a decided, yet prudent friend of protestant principles. He in consequence became peculiarly obnoxious to the enemies of liberty, and in 1530 he was taken prisoner and plundered by a band of robbers, who again delivered him up to the duke of Savoy. He was confined for six years in the castle of Chillon, and during the greater part of that time he occupied a dungeon hewn out of the rock below the surface of the neighbouring lake. He was liberated by the Genevese when they conquered the Waatland in 1536, and returned to Geneva, where he died in 1570. He was held in high honour by the citizens of that republic, and had a house assigned him and a liberal pension. He wrote a history of Geneva down to 1530, in compliance with a wish of the magistrates, as well as several other historical works, which are still preserved in manuscript in the library of that city. His own books, many of which were rare and valuable, he presented to the city in 1551. He was a man of great intellect and learning, combined with true nobility of character and singleness of purpose. The captivity of this upright patriot is the subject of Byron's celebrated poem, the Prisoner of Chillon.—J. T.

**BONNYCASTLE, JOHN**, a very meritorious mathematician, the author of valuable elementary mathematical works. He died at Woolwich, where he was professor, in 1821. His most useful works are, the "Algebra," in two volumes, and his larger treatise on "Trigonometry." The progress of science has rendered these books somewhat antiquated; but it would be fortunate if all modern treatises were equally luminous.—J. P. N.

**BONO, GIOVANNI BATTISTA AGOSTINO**, an Italian canonist, professor in the university of Turin, and afterwards a noted partisan of the French directory, born at Verzuolo in 1738; died in 1799. He retired from his chair in 1792, after endeavouring to draw over his colleagues to the side of the French who had just occupied Savoy and the county of Nice. In 1798 he became, by the nomination of the French general, Joubert, president of the provisional government of Piedmont. In that capacity he urged strenuously on the directory the propriety of annexing Piedmont to the empire, but did not live to see his views carried out. His works treat of the line of separation between the civil and the ecclesiastical power.—J. S., G.

**BONOMI, GIOVANNI FRANCESCO**, born of a patrician family at Cremona on the 6th of October, 1536. He studied at the university of his native place, and applied himself to the law in the universities of Bologna and Pavia, where he took his degree of LL.D. He was particularly befriended by the celebrated Saint Carlo Borromeo, archbishop of Milan, and was employed by him in many important negotiations. As a reward for his services, he was raised to the dignity of abbot of Nonantula; and having resigned his abbey, he was created bishop of Vercelli in 1572, and consecrated by his illustrious patron in the cathedral of Milan in 1573. Such was the esteem in which Bonomi was held by Carlo Borromeo, that at his death he bequeathed all his manuscripts to him. The popes, Gregory XIII. and Sixtus V., sent him as nuncio to Switzerland and Germany, and having been successful in all his missions, he was sent as an *alter ego* to Liege in Flanders, where he died on the 26th of February, 1587, leaving all his property to the poor of that city. This zealous prelate was well versed in history and Latin poetry. Besides many Latin works and pastorals connected with his sacred functions, he has left a life of Saint Carlo Borromeo, and an epic poem in four books, entitled "Borromacidos," published at Milan in 1589.—A. C. M.

**BONONCINI or BUONONCINI, GIOVANNI BATTISTA**, a celebrated musician, the son of Giovanni Maria, and brother to Marc Antonio, two eminent composers of the same name, was born at Modena about 1672, and educated under his father. After his musical studies were finished, he went to Vienna, where, being an excellent performer on the violoncello, he was admitted into the band of the Emperor Leopold. Alessandro Scarlatti had gained great reputation by his operas, and Bononcini, desirous to emulate him, though at that time but eighteen years of age, composed one entitled "Camilla," which was performed at Vienna with greater applause than had before been given to any work of the kind. Nicolo Haym, one of the early conductors of

the Italian opera in England, adapted it to English words, and produced it at the theatre in the Haymarket, London, in the year 1706. So deep was the impression which the music made on the minds of the English public, that, for three or four years afterwards, the managers were under the necessity of introducing into every opera they exhibited some of the melodies of the same composer. One of the airs in "Camilla" has lately been revived, and attributed, upon the authority of Mr. Hogarth's Memoirs of the Opera, to Marc Antonio Bononcini—an injustice which we hope to see corrected. In 1694 Bononcini visited Rome and produced his operas of "Tullio Ostilio" and "Xerse." From this period down to 1716 he composed a number of operas, which were performed with success at Rome, Berlin, and Vienna. In the latter year, upon the foundation of the Royal Academy of Music in London, Bononcini (then at Rome) was sent for to assist in composing for it; and in consequence of his engagement with the directors, he wrote, during a period of about seven years, the operas of "Astartus," "Crispus," "Griselda," "Pharnaces," "Erminia," "Calphurnia," and "Astyanax." A great degree of rivalry soon took place betwixt Bononcini and Handel (the latter was at the head of the academy), and two parties were formed amongst the nobility, each professing to patronize their favourite. Handel was honoured with the immediate notice and protection of the electoral family, and Bononcini by that of the duke of Marlborough. So strange and capricious are sometimes the motives of party opposition, that the former was patronized by the tories, and the latter by the whigs. The contest betwixt the friends of the two composers was brought to a crisis by the performance of the opera of "Muzio Scavola," of which Handel, Bononcini, and Attilio Ariosti, each contributed an act. The judgment of the public was given in favour of Handel, which put an end to the competition, and left the giant without a rival. On the death of the duke of Marlborough, Bononcini was employed to compose the anthem performed at his interment in Westminster abbey, which was afterwards printed in score. The countess of Godolphin (who, on the decease of her father, by a peculiar limitation of the title, became duchess of Marlborough) took Bononcini into her family, and settled upon him a pension of £500 per annum. She had concerts twice a week at her house, which chiefly consisted of the music of this her favourite master. But, being a man of haughty and imperious disposition, he at length rendered himself unworthy of the patronage which he had so long enjoyed. He was convicted of the paltry dishonesty of pretending to be the composer of an Italian madrigal, which had been written many years before by Lotti, organist of St. Mark's at Venice, who proved his claim. The surges of party feeling, which had been powerfully excited, continued to heave and murmur, and Bononcini was compelled to leave the kingdom. He did not quit it alone, but became a sharer in the fortunes of a man who, under the assumed name of Count Ughi, was a common swindler, and a pretender to the secret of making gold. Their connection, however, did not last long, and Bononcini was again compelled to have recourse to his profession in order to procure a subsistence. He visited Paris, and composed for the royal chapel there a motet with an obligato accompaniment for the violoncello, which he himself performed before the king. This composition was afterwards printed at Paris. At the conclusion of the peace of Aix-la-Chapelle, he was sent for to Vienna by the emperor of Germany, in order to compose the music for that celebration, and was rewarded with a present of eight hundred ducats. He next visited Venice, in company with Monticelli (a singer who had appeared at the opera in London), the one as composer, the other as principal singer. In this city he is supposed to have died about 1750. The merits of Bononcini were very great, and it can scarcely be considered any diminution from his talents as an operatic composer, to say that he had no superior but Handel. His melodies are peculiarly tender and pathetic, and his harmonies are original and at the same time natural. A list of his works will be found in Fetis' *Biographie Universelle des Musiciens*.—E. F. R.

BONONE, CARLO, born at Ferrara in 1569. He studied till twenty under Bastaruoli, and became the stripling rival of Scarsellino, falling below him in tenderness of tint and beauty of expression, but excelling him in the opposite pole of bold design and vigorous colouring. But Bonone was born not to circumnavigate unknown seas, but to hug the well-known shore, and ply the ferry between the narrow eclectic wastes. He first went

to Bologna and studied the Caracci; then Rome, and fed on the antique; then back to Bologna; then to Paul Veronese's great tapestries at Venice; then to the skirts of heaven, that roof, Correggio's dome, at Parma, always borrowing, always imitating. In his smaller works he was called the Caracci of Ferrara. In his machinal pageantries he looks more like Veronese grown dotting. Ferrara is full of his works, and his academy peopled the city with painters. His best spectacle works are the "Feast of Ahasuerus," the "Feast of Herod," and the "Miracle at Cana." He ceased to imitate in 1632. His nephew, LIONELLO, promised excellency, but fell away.—W. T.

BONPLAND, AIMÉ, a celebrated traveller and naturalist, was born on 22d August, 1773, at Rochelle, where his father practised medicine. His medical studies were interrupted by political disturbances in France, and for a time he entered the naval service as an assistant-surgeon. After the revolutionary period had passed, he went to Paris, for the purpose of continuing his studies, and there he was introduced to many medical men of eminence. Among others he became acquainted with Corvisart, whose pupil he became. At his house he met Alexander von Humboldt, who was then studying in Paris. These two young naturalists became intimate friends, and carried on their scientific studies together with zeal and enthusiasm. Bonpland turned his attention in a special manner to botany and anatomy. Soon afterwards Humboldt began to make preparations for his great scientific journey, and he requested Bonpland to accompany him. The two travellers visited the equinoctial regions of America, and made varied and extensive observations in all departments of science. Bonpland was intrusted chiefly with the botanical part of the expedition, and he collected and dried more than 6000 hitherto unknown species of plants. On his return to France, after five years' travel, Bonpland handed over his extensive collection to the Museum of Natural History at Paris. He became director of the gardens at Malmaison, and he devoted himself assiduously to the publication of his travels. He became the friend of Gay Lussac, Arago, Thenard, and other celebrated men of that day. After Napoleon's reverses he resolved to return to America, and at the end of 1816 he sailed from Havre for Buenos Ayres, carrying with him a large collection of useful European plants and fruit-trees. He was elected there professor of natural history, but he held this office only for a short period. His desire of enterprise led him to take a journey across the Pampas, the provinces of Santa-Fé, Great Chaco and Bolivia, to the foot of the Andes, which he wished to explore a second time. He located himself at Parana. The wars which prevailed in the Argentine confederation under Dr. Francis, rendered his residence here unsafe, and in December, 1821, he was seized by the soldiers of Francis, and was sent to Santa Maria, where for two years he supported himself by his medical and pharmaceutical practice, and did much good by his attention to the poor. He was liberated in 1858, and he then proceeded to Brazil, and took up his residence in the little village of San Borgia. There he continued to devote his attention to botany and horticulture, and died in 1858, at the advanced age of more than eighty, retaining to the last his vigour of mind and body. He published various works, among which may be noticed, "Plantes Equinoxiales, collected in Mexico, the island of Cuba, the provinces of Caracas, Cumana, the Andes of Quito, and the banks of the Orinoco and the Amazon;" a "Monograph of Melastomaceæ;" and a "Description of the Rare Plants of Navarre and of Malmaison." He was associated with Humboldt in the publication of his "Voyages aux Regions Equinoxiales du Nouveau Continent," and in his "Vues des Cordillères;" and along with Humboldt and Kunth he published "Mimosées et autres plantes Legumineuses du Nouveau Continent," and "Nova Genera et Species Plantarum." All these works are standard books of reference.—J. H. B.

BONSENIOR, RABBI BEN YACHIA, lived in Provence. He composed in Hebrew an elegantly written poem on the game of chess, which T. Hyde published in a Latin translation, with a preface on the history of that game, at Oxford in 1694, under the title "De Ludo Scacchico." The Hebrew poem had been previously printed at Mantua in 1557. Several editions of it have appeared since.—T. T.

BONSTETTIN, CHARLES VICTOR DE, born in 1745 at Berne; died in 1832. A moralist and philosopher of the Leibnitzian school, and an ardent admirer of the writings of Bonnet. His studies were prosecuted successively at Berne, Iverdun, and

Geneva (where he made the acquaintance of Bonnet and Voltaire), Leyden, Cambridge, and Paris; he also travelled over great part of Italy. On returning to Switzerland he was made a member of the sovereign council at Berne, and received other political appointments. At this time he became very intimate with Matthison the poet, and Muller the historian. The troubles of his country obliging him to flee, he repaired first to Italy, then to Copenhagen, and finally to Geneva, where he remained till his death. Those of Bonstettin's works which are devoted to social science, display extensive knowledge of mankind, a keen insight into human nature, and considerable originality of view; but his psychological writings are very deficient in analytical power, and are neither accurate nor profound. The titles of his principal works are—"Researches into the Nature and Laws of Imagination;" "Studies of Man, or researches into the faculties of feeling and thought;" "On National Education;" "Thoughts on various objects of Public Good;" and "The Man of the South and the Man of the North."—J. D. E.

BONTEKOE, CORNELIUS VAN, a Dutch surgeon, born at Alkmaer in 1647. His principal works are a "Short Treatise on Human Life," published at the Hague in 1684, of which a German translation passed through four editions; and a "Treatise on that most excellent herb, Tea," also published at the Hague in 1672. A complete edition of his writings appeared at Amsterdam in 1689, in two volumes quarto.—W. S. D.

BONTEMPI, GIOVANNI ANDREA ANGELINI, a musician, was born at Perugia about 1630, and educated under Mazzochi, the eminent chapelmaster of St. Peter's at Rome. After filling various offices as choirmaster at Rome and Venice, he passed into the service of the margrave of Brandenburg, whom he left for the post of director of the music at the court of the elector of Saxony. He wrote several operas, but is chiefly known by his two treatises—"Nova Quatuor Vocibus Componendi Methodus," Dresden, 1660, 4to, and "Istoria Musica nella quale si la piena cognizione della teoria e della Pratica Antica della Musica Armonica," Perugia, 1695, folio.—E. F. R.

BONTIUS, JACQUES, a distinguished Dutch physician and naturalist of the seventeenth century, was born at Leyden about the year 1590. In 1627 he quitted his native country for the East Indies, and resided for many years in the island of Java, where he held the appointment of first physician to the governor of Batavia and to the Dutch East India Company. The period of his death is not known, but it must have occurred before 1658. During his residence in the East, he laboured with much assiduity in investigating the diseases prevailing there, and the qualities of the native plants; upon which subjects he published a remarkable and valuable work, entitled "De Medicina Indorum libri IV.," which originally appeared at Leyden in 1642, and afterwards passed through numerous editions, and was translated into French and English. His "Historia naturalis et medica Indiæ Orientalis," an improved edition of the preceding work, was published at Amsterdam in 1658, in folio, with Piso's treatise on the plants of Brazil. The writings of Bontius contain the earliest information accessible to Europeans on the natural history of Java.—W. S. D.

BONVICINO, ALESSANDRO, called IL MORETTO DI BRESCIA, born in 1514, and studied under Titian, being indeed the best pupil that great old man produced, painting at the stripling age of sixteen a painting of St. Nicholas, in the church of the Madonna de Miracoli. But the accidental sight of some of Raphael's angelic designs set Bonvicino on the road to Rome in full cry after quite a new ideal. He began to learn how to unite colour and design, gave a graceful turn to his heads, devotion and inward burning fervour to his religion, something of Titian's purity and depth of colour, and somewhat of Raphael's elevation of design. This Dutch Venetio-Roman excelled also in portraits, and finished his draperies to the utmost refinement of texture. His colour is colder than his master's, his frescos inferior to his oils. Lanzi, eulogizing this not-sufficiently known master, praises his simple dignity, tranquil grace, purity of motive, noble sentiment, and quiet, self-resigned, contemplative religion. His altarpieces are his best works, as we might expect from such a Fra Angelico as Moretto, who, when painting a picture of the Holy Virgin, is said to have always prepared himself by prayer and fasting. His choicest pictures are a "St. Lucia and Catherine" at Brescia; a "Virgin and Infant with Saints;" a "Conversion of St. Paul;" an "Adoration of the Shepherds" at Berlin; a "St. Justina;" a "Coronation of the

Virgin;" and an "Assumption." The celebrated portrait painter Moroni was Moretto's pupil.—W. T.

BONZI, PAOLO, called indifferently IL GOBBO CORTONA or IL GOBBO CARACCI, born in 1580. He painted a few histories and landscapes, but was best known for his baskets of fruit and festoons of flowers. Died in 1640.—W. T.

BOOKER, JOHN, a haberdasher of London, who figured as an astrologer in the early part of the seventeenth century. He was for some time writing-master at Hadley, Middlesex, and afterwards licenser of mathematical books (under which title were ranked all publications relating to the celestial sciences). "He had a curious fancy of judging of thefts," says Lilly, "and was as successful in resolving love questions." A work of his, "Bloody Irish Almanac," contains some interesting matter. Died in 1667.—J. S., G.

\* BOOLE, GEORGE, LL.D., professor of mathematics at Queen's college, Cork. Professor Boole is one of the most accomplished mathematicians of our time, and he has found for himself a novel and remarkable course. His peculiar inclinations first appeared in a comparatively short treatise, entitled "Mathematical Analysis of Logic;" but his conception was not adequately developed until the publication of a very elaborate volume, entitled "An Investigation of the Laws of Thought, on which are founded the Mathematical Theories of Logic and Probabilities." The design of that treatise is—to use the author's own words—"to investigate the fundamental laws of those operations of the mind by which reasoning is performed; to give expression to them in the symbolical language of a calculus, and upon this foundation to establish the science of logic and construct its method; to make that method itself the basis of a general method for the application of the mathematical doctrine of probabilities; and, finally, to collect from the various elements of truth, brought to view in the course of such inquiries, some probable intimations concerning the nature and constitution of the human mind." Mr. Boole establishes, in the first place, that the *fundamental principles* of logic are as indubitable and absolute as the fundamental truths of geometry, and that its *processes* are fixed and determinate. Hence the applicability of symbols to express the relations of these principles, and of symbolic processes to carry out their development and detect their issues. The laws of such processes must be deduced of course from the nature of the subject itself; but they are found to be almost identical with the laws of the general symbols of algebra. If, indeed, we can conceive an algebra in which the symbols  $x, y, z$ , &c., admit indifferently of the values of 0 and 1, and of these values alone, the laws, the axioms, and the processes of such an algebra, are identical with the laws, the axioms, and the processes of an algebra of logic. It will be discerned on a moment's reflection, how powerful and fertile is such a principle; nor indeed do we know any modern work, on this class of subjects, so suggestive and full of promise as Professor Boole's. In every separate portion of it, inquiries that were deemed exhausted and familiar, come up under new and enlarged forms, and the knot of difficulties that never before was loosed, simply and almost without parting word, disappears. No recent volume has thrown on the puzzling philosophy of probabilities, in its widest relations, a tithe of the light that is here brought to bear on it. The author is understood to abide by his subject, and to have in preparation a still more important essay.—It may be further stated, that Professor Boole is distinguished otherwise. He has recently communicated to the Royal Society a profound and highly interesting memoir on the comparison of transcendentals, with certain applications to the theory of definite integrals.—J. P. N.

BOON, DANIEL, a buffoon Dutch painter, who established himself in England in Charles II.'s reign, when everything, good and bad, was turned into joke. He painted drunken, sickening revels (nor always without a certain gross humour, large or small), grimacing deformed boors, and street characters. This Boon died in 1698.—W. T.

BOONE, DANIEL, a celebrated American explorer and backwoodsman, was born of English parents in Bucks county, Pennsylvania, in February, 1735. While he was still very young, the family removed to Berks county, Pennsylvania, near Reading. This was then a frontier settlement, the country abounding in game, and the settlers constantly liable to attacks from the Indians. And here began the training as a hunter and backwoodsman, which made Boone so celebrated in after life. In

1753 the family again changed their place of residence, and settled upon the river Yadkin in North Carolina. Here Boone was married, and employed himself in farming for several years. About this time explorations began to be made into the wild country to the westward of Virginia, and glowing accounts were given of the abundance of the game, and the fertility of the soil. Boone's desire for the life of a hunter and explorer could no longer be resisted, and in 1767 he set out for Kentucky, in company with six others. For two years his life was one of constant excitement, privation, and danger. The party divided; and Boone, with a single companion, first a man named Stewart, and afterwards his younger brother, Squire Boone, devoted himself to a hunter's life. They were constantly engaged in hostilities with the Indians, by whom Stewart was shot and scalped; and for the two years of their absence, Boone never tasted bread or salt. Finally convinced of the fertility of the soil, and the practicability of a settlement in the country, Boone returned to the Yadkin for his family. After two years spent in preparation, he set out with five other families; but being attacked by the Indians, and several of the party killed, they returned to the settlement on Clinch river. During the next year a company was formed in North Carolina for the purchase of lands from the Cherokees. After considerable difficulty, their claim to a certain tract of land was established, and Boone was sent out at the head of a small party to begin a settlement. They built a fort upon the Kentucky river, and called it Boonesborough; and to this place Boone removed his family.

The revolutionary war had now begun, and the attacks of the Indians threatened destruction to Boonesborough and the other new settlements which had been formed. The title of captain had been conferred upon Boone some years before, and under his command the little garrison at Boonesborough maintained a successful defence. Finally, however, in 1778, while he was engaged with about thirty others in making salt at the Blue Licks, he was surprised by the Indians, and compelled to surrender with all his men. They promised to treat him with kindness, however, and this promise was literally fulfilled. He was taken to Detroit, and then to an Indian town in Ohio, where he was formally adopted as a son of the tribe, and where he remained several months. But his fears for the garrison left behind were soon aroused by the discovery, that a large number of warriors were preparing to march against Boonesborough. With great difficulty, and only by the aid of his unparalleled sagacity and skill, he contrived to make his escape, and reach home in time to give the alarm, and prepare the garrison for defence. The Indians, together with a number of Canadians commanded by Captain Duquesne, soon made their appearance before the fort. They proposed a capitulation on the most liberal terms, and requested a number of the garrison to meet the besiegers without the fort, where an ancient custom should be revived, and, as a sign of amity, two Indians should shake hands with each white man. Boone perceived the treachery concealed under this proposal, and a number of men with loaded rifles were placed in a position to command the place of meeting. The Indians endeavoured to secure their antagonists, but they were knocked down or tripped up, and the Kentuckians fled to the fort, under cover of their friends' fire. A violent attack was then made, but it was successfully repulsed, and the siege was soon afterwards raised. Some blame had attached to Boone in consequence of the surrender of his men at the Blue Licks, and his friendly conduct to the Indians while a prisoner. He was summoned before a court-martial, but was honourably acquitted, and soon afterwards promoted to the rank of major. During his captivity, his family had returned to North Carolina, whither Boone now went, and again removed them to Boonesborough. In this journey he was robbed of a large sum of money, partly belonging to himself, partly to a number of friends. Some suspicions, if not of dishonesty, at least of carelessness, seem to have rested on him in consequence of this transaction; but his nearest friends never doubted his truth and honour.

While the Indian hostilities continued, numerous attacks were made on the various settlements, which generally resulted in the defeat of the Indians. In the summer of 1778 an unsuccessful attack was made on Bryan's Station, near Boonesborough. The Indian force, which was large, having retreated, a number of the militia were called out to pursue them, and Boone commanded the party from Boonesborough. Colonel Logan, with a large detachment, did not reach the rendezvous in time, and Boone,

with several others, strongly advised the party to await his arrival. But they were overruled by the impetuosity of the other officers, and the little army proceeded to the banks of the Licking, where deep ravines and thick woods formed a covert for the enemy. Boone again advised a halt, but in vain. They crossed the river, and after advancing a short distance, found themselves in the midst of the Indians, who were lying in ambush. A complete rout followed. Many were killed, and among them Boone's eldest son. After this defeat, several successful expeditions in which Boone joined, generally as a volunteer, were fitted out, and finally, in 1783, the peace with Great Britain put an end to hostilities. The settlement of Kentucky now proceeded with great rapidity. Towns sprang up in the wilderness, and agriculture and trade flourished. Boone had applied himself to farming; but, ignorant of the law, he had not taken proper measures for securing his title to the land which he had cleared and defended. In his old age, he found himself without an acre of land, and indignant at the treatment which he had received, he resolved to leave Kentucky. One of his sons had emigrated to Upper Louisiana, now Missouri, and thither Boone resolved to follow him. Accordingly, in 1795, he removed to the Femme Osage settlement, forty-five miles west of St. Louis. Louisiana then belonged to Spain, and Boone's life and misfortunes being known to the Spanish governor, he conferred upon him the office of syndic or commandant, together with a large tract of land. Here Boone spent the rest of his life, residing with his son and a son-in-law by turns. His duties occupied but a small portion of his time, and his leisure hours were passed in hunting. In 1803, Louisiana was ceded to the United States, and when the claims for land were brought before the government, Boone's was not confirmed. Under these circumstances he sent in a petition to the general assembly of Kentucky. This was successful. Application was then made to congress, and the land in the Femme Osage district, where he first settled, was confirmed to him. He passed the rest of his life among his descendants, universally loved and respected, and died in 1820, in the 86th year of his age.—F. B.

BOONEN, ARNOLD, a portrait painter, born at Dort in 1669. He studied under Verbuis and Schaleken. At the end of six years the blunt candle-light painter drove him out into nature, saying he could teach him nothing more (how much better had he sent him to nature sooner), as he was already thought a great painter of a small age. He was quick, faithful, sweet in colour, neat in touch, and, above all, he drew well, and caught the likeness flying as it shot across the face. As for his candle-light pieces, "delicate and natural," he had more applications for them than he could supply. He painted all the triflers and lions of the day—Peter the Great (the tamed savage), the elector of Mentz, the landgrave of Hesse Darmstadt, Frederick of Prussia, the duke of Marlborough, the prince and princess of Orange, besides large pictures for the halls of companies at Dort and Amsterdam. He died in 1729, killed partly by overwork. His son, Gaspard, became a portrait painter, and A. Pilkington mentions also Arnold's brother.—W. T.

BOORHAN, NIZAM SHAH I., king of Ahmednugger in the Deccan, at the beginning of the sixteenth century. His reign of forty-five years was full of contests with the neighbouring princes, in the course of which he was tributary for five or six years to Bahadoor, shah of Guzerat. In his later years he embraced the heresy of the Sheahs, which embittered the hostilities between him and the other rulers of the Deccan. He died of cholera in 1553.—W. B.

BOORHAN, NIZAM SHAH II., grandson of the former, was for many years a refugee at Delhi, and had reached an advanced age before he obtained, in 1589, the throne of Ahmednugger, to which his son Ishmael had been raised by the nobility. His reign contained no events of importance, but was followed by civil wars, which prepared the way for the conquest of the kingdom by the emperors of Delhi.—W. B.

BOOT, ARNOLD VAN, a Flemish physician who practised for some time in London, and afterwards in Dublin, where he was attached to the court of the earl of Leicester, was born at Gorcum in 1606. He was a scholar of considerable mark, and besides a number of professional treatises, published some works on subjects of philology, criticism, and history. His brother, Gerard Boot or Boate, is the author of a work on the natural history of Ireland, in which he was assisted by Arnold. Died in 1650.—J. S., G.

**BOOTH, ABRAHAM**, a well-known baptist author, was born at Blackwell, Derbyshire, in May, 1734, and died on the 27th of January, 1806. He was the eldest son of a large family, and received the scantiest education. By indomitable perseverance he perfected himself in arithmetic and writing, and, when still quite young, became a preacher among the General Baptists. For some years he laboured in Derbyshire and Nottinghamshire, with much success. His doctrinal sentiments on the points of difference between General and Particular Baptists undergoing a change, he published his "Reign of Grace," being the substance of discourses preached at Sutton Ashfield. In 1768 he was called to the pastoral office of the church in Prescot Street, Goodmans Fields, London. He now studied intensely, and soon became eminent as a theologian and a scholar. In 1770 he published a tract on "The Death of Legal Hope," and in 1778 "An Apology for the Baptists." In 1784, in consequence of a posthumous publication from the pen of Matthew Henry, Mr. Booth gave to the world his "Pædobaptism Examined, or the Principles, Concessions, and Reasonings of the most learned Pædobaptists." This work elicited a reply from Dr. E. Williams of Rotherham, and this again a reply from Mr. Booth, under the title of "A Defence of Pædobaptism Examined," 1792. Both works display great learning and research. Among Mr. Booth's minor productions may be mentioned his "Essay on the Kingdom of Christ," his "Pastoral Cautions," and his "Amen to Social Prayer." His "Glad Tidings to Perishing Sinners, or the genuine Gospel a complete warrant for the ungodly to believe in Jesus Christ," 1796; and his last publication, "Divine Justice essential to the Divine Character," are both happy illustrations of an enlightened mind, and of powerful reasoning. Mr. Booth was a man of unbending integrity, great holiness, and exhibited to all a pattern of the christian minister. In 1758 he married Miss E. Barnam, by whom he had a large family.—See Jones' *Christian Biography*.—J. A., L.

**BOOTH, SIR FELIX**, an English merchant, born in 1775; died in 1850. This gentleman, who, until he had passed middle life, was only known as a successful and opulent London merchant, has achieved an undying reputation by his extraordinary liberality in fitting out, at his own expense, and without any hope or desire of pecuniary remuneration, the second expedition under Sir John Ross for the discovery of the North-West Passage. Many similar expeditions have from time to time been fitted out at a vast expense by the English government; and at first with such hopes of success, that a statutory grant of £20,000 was procured from parliament to be bestowed on the fortunate discoverer. In consequence, however, of the uniform failure of all attempts made to accomplish this object, both the government and the nation at length ceased to take much interest in the subject; and in 1827, when Captain Ross proposed to the duke of Wellington, then prime minister, to engage a second time in this perilous enterprise, his offer was coldly declined. Sir John then applied to Mr. Booth, with whose zeal in the cause of geographical discovery he was previously well acquainted, expecting that that gentleman would be inclined to aid him in fitting out an expedition, in the hope of being more than reimbursed by the promised grant of £20,000, in the event of its proving successful. Mr. Booth, however, refused to advance anything towards it as a mercantile speculation, and the project seemed on the eve of being finally abandoned. In the course of the same year the parliamentary grant was revoked; but this circumstance, which the enterprising navigator at first considered as the death-blow of his long-cherished hopes, was, in fact, the removal of the only obstacle to their fulfilment. Mr. Booth now entered warmly into the project, and, with rare munificence, expended nearly £18,000 in equipping the expedition. He gave unlimited powers to Captain Ross to furnish at his expense whatever he might judge necessary, imposing on him only one condition, that his name should not be mentioned in connection with the expedition. The results of Captain Ross's voyage have been long before the world. He failed in the primary object of his search; but the discoveries he made have been valuable contributions to science, and he had the happiness to immortalize his friend by inscribing his name, in the designation of *Boothia Felix*, on a portion of the American continent. After Captain Ross's return to England the king conferred on Mr. Booth the title of baronet.—G. M.

**BOOTH, GEORGE**, Baron Delamere, son of William Booth, Esq., and grandson of Sir George Booth, remarkable as the

leader of a royalist insurrection in Cheshire about a year after the death of Oliver Cromwell. Having received a commission from Charles II., constituting him commander-in-chief of all forces to be raised for his majesty's service in Cheshire, Lancashire, and North Wales, he assembled about four thousand men, and declaring that his object was to deliver his country from a tyrannous soldiery and a usurping government, took possession of Chester, where he was joined by various leaders of the presbyterian party, particularly the earl of Derby, Sir Thomas Middleton, and Major Brook. Although he had carefully abstained from intimating the ulterior aim of the rising, so far from its being a secret, rumour gave out that Charles II. had actually been proclaimed by the insurgents at Wrexham and other places, near Chester. The parliamentary forces under Lambert were soon on the spot, and having defeated Sir George in a smart engagement, August, 1659, compelled him to evacuate Chester, and seek safety in flight. On his way to London, in the disguise of a female, he was arrested August 22. The house of commons immediately committed him prisoner to the Tower; but in February following, on the intercession of some powerful friends, and on his giving bail for £5000, voted his release. He was afterwards member of parliament for Chester, and was the first of twelve members sent to Charles by the house of commons in May, 1660, with a tender of the crown. In July following, the house, in consideration of his eminent public services, awarded him a sum of £10,000; and the king, in whose interests he had sacrificed his fortune, raised him to the peerage. The remainder of his life was passed in privacy. He died in 1684.—J. S., G.

**BOOTH, HENRY**, earl of Warrington and Baron Delamere, son of George Booth, born in 1651. He succeeded his father in 1673 in the office of *custos rotulorum* of Cheshire, and shortly afterwards entered parliament. His politics, from the commencement of his public life, were obnoxious to the court. As a zealous protestant and an unflinching advocate of constitutional government, he warmly supported the bill for excluding the duke of York from the throne; inveighed against the tyranny of the royal favourites, and the corruption of his fellow-senators and the judges, and allowed no opportunity to escape of damaging popery. In 1684, after the death of his father, on some pretence of his having been concerned in treasonable practices, he was committed to the tower of London. He recovered his liberty at the end of a few months, but was again incarcerated on the accession of James II. This time he underwent a trial before a select number of the peers—Jefferies presiding as lord high steward. The chancellor had an ancient grudge against Lord Delamere, which he did not forget to show on this occasion; but the only witness against the prisoner was a notorious scoundrel who, in the course of the trial, was convicted of perjury, and the charge thus failing for want of evidence, Jefferies and the papists missed their revenge; a unanimous verdict of acquittal being returned by the twenty-seven peers who constituted the judicial bench. After his release, Lord Delamere retired to his seat at Dunham-Massey, and was lost to public life till the commencement of the Revolution. After the landing of the prince of Orange he assembled a body of men in Cheshire and Lancashire, with whom he joined William at London. He was one of the three commissioners sent to Whitehall, December 17, to desire James instantly to evacuate the palace. In the execution of this commission he conducted himself with so much urbanity, that James afterwards declared himself to have been far better used by that one of the three to whom he had behaved ill, than by the other two who had received kindnesses from him. With the settlement of the new government he began to reap the honours of his patriotic career. He was appointed chancellor of the exchequer in 1689, and the following year created earl of Warrington, and decreed a pension of £2000. He was too little of a courtier, however, to remain long in office. His connection with the government lasted only a year. He died in London in 1694. A vindication of his friend, William, Lord Russell, and a volume of parliamentary speeches, &c., 1694, are from the pen of the first earl of Warrington.—J. S., G.

**BOOTH, JAMES**, an eminent English property lawyer of the last century. Mr. Booth was a Roman catholic, and persons of that communion, who took the law for their profession, directed their views to the conveyancing branch, for the practice of which the test of the oath of supremacy and declaration against transubstantiation (imposed by St. 7 and 8, W. III., and

modified in the oath of abjuration a century after, by St. 31, G. III., c. 32, s. 6) was not required. Booth was admitted of the inner temple in 1721, and at first practised in the country. But, from the circumstance that the Roman catholic nobility and gentry themselves owned a considerable portion of the landed estates of the country, and always patronized their coreligionists, the metropolis was the proper field for a practitioner looking to their resort. At the time Booth thought of pursuing business in London, N. Pigot was there in possession of the conveyancing goodwill of the Roman catholic connection. His probable want of success under these circumstances at first disheartened Booth. But he enjoyed the friendship of the solicitor-general, Murray, afterwards Lord Mansfield, who, in a letter given in most memoirs of his life, encouraged Booth in a way which does credit to the writer's discernment of character, and proffered personal and material assistance with the warmth and delicacy of generous friendship. Mr. Booth became a member of Lincoln's Inn in the year 1740, with Robert Harley and W. Murray for his mancipators or sureties, and he continued in great practice for thirty years. Booth possessed a profound knowledge of the law of uses, powers, and trusts—the most important agents in effecting modern property arrangements. His style of drafting instruments was prolix and verbose. Indeed, Booth and his contemporary, Ralph Bradley, established, if not founded, that school of conveyancers which flourished in the latter half of the eighteenth, and first quarter of the nineteenth centuries, and cumbered property dealings with the heavy forms devised for the disposal of great estates.—S. H. G.

\* BOOTT, FRANCIS, M.D., an eminent English botanist and medical man, has gained distinction by his researches on the natural order Cyperaceæ. He has paid much attention to the genus *Carex*, and has published a standard illustrated monograph of that genus. Papers by him on the species of this genus have appeared in the Transactions of the Linnean Society.—J.H.B.

\* BOPP, FRANZ, an eminent Sanscrit scholar, was born at Mentz, September 14, 1791, where his father held an office in the electoral court. He followed his parents to Aschaffenburg; and at an early age became imbued with a bias towards the study of Eastern languages, to which he devoted himself at the universities of Paris, London, and Göttingen with unremitting assiduity. In 1821 he was called to the Oriental chair at Berlin, and since that time has been an ornament to that metropolis of learning and literature. By his "Comparative Grammar of the Sanscrit, Zend, Greek, Latin, &c., Languages," Berlin, 1833-49, he has added comparative philology to the domain of learning. His other works are—"Über das Conjugations-System der Sanskrit-Sprache," 1816; "Ausführliches Lehrgebäude der Sanskrit-Sprache," 1827; "Grammatica critica linguæ Sanscritæ;" "Kritische Grammatik der Sanskrit-Sprache;" "Glossarium Sanscritum," 2nd ed. 1840-47; "Nalus, Mahabarati episodium," London, 1819; "Die Celtischen Sprachen in ihrem Verhalten zum Sanskrit, Zend," &c.—K. E.

BOR, PETER CHRISTIAN, a Dutch historian, born at Utrecht in 1559; died in 1635. Author of a history of the Low Countries, to which the most learned men of Holland have accorded the praise of exactitude and impartiality.—J. G.

BORA, KATHARINA VON, the wife of Luther, was born of noble parentage at Lüben, near Schweinitz, Saxony, January 29, 1499. She was entered of the Cistercian convent of Nimptschen, near Grimma, and here became acquainted with the doctrine of Luther. Having in vain intreated her family to take her home, she asked Luther for his assistance. Luther directed a respectable citizen of Torgau, Leonhard Koppe, to set her free, along with eight other nuns, in the night from Maundy Thursday to Good Friday, 1523, and bring her to Wittenberg, where she was received into the family of the mayor, Mr. Reichenbach. She declined to become the wife of Dr. Kaspar Glaz, but declared her willingness to be married either to Nicolaus von Amsdorf or Luther himself. Luther accepted this offer, June 13, 1525, and had three sons and three daughters by her. After her husband's death she fled to Magdeburg and Brunswick, and died at Torgau, December 20, 1552. Her life has been written by Walch, Halle, 1752-54, 2 vols.; by Beste, 1843; and Weidinger, Greiz, 1854.—K. E.

BORADILLA, GERONIMO DE, a Spanish painter, born near Seville in 1620. He was a pupil of Zúbarán, whom he imitated. He painted small historical pictures and perspective views, and died in 1680.—W. T.

BORASTUS, GREGORY LAWRENCE, a Swedish publicist and poet, born at Norköping about 1584. He left his country and became secretary to the king of Poland. He is not to be confounded with another Swede, Stephen Borastus, who was cardinal, and played an important part at the court of Rome.

BORCH. See BORRICH.

BORCH, M. J. COUNT VON, a Polish naturalist, born of illustrious parentage in the province of Witepsk; died in 1810. His principal works relate to the natural history of Sicily, where he resided a number of years. They are still read with interest. He was governor of his native province. Among his works was one on the mineralogy of Sicily.—J. S., G.

BORCHT, HENRY VAN DER, a painter and engraver. This double-handed man was a pupil of Giles Valkenburgh, and studied in Italy. He painted fruit and flowers, especially for Charles I., in a pleasant enough way; but on that narrow-minded Stuart losing his crown, and subsequently losing his head, he returned to Antwerp, and died there in 1660—the year of that worst of all revolutions, a Restoration. Borcht was also a well-known virtuoso, and was employed as a collecting agent by that judicious amasser to whom we all owe so much—the earl of Arundel. The prince of Wales also employed him in the same capacity. The few etchings of this artist are after Parmegiano and the Caraccis, and are religious subjects. There was a JAMES BORCHT who flourished at Antwerp in 1628, and executed fleets for Thibault's Academie de l'Espée. BORCHT, PETER VAN DER, was a Flemish painter and engraver (for in these robust ages such double-barrelled men were not rare), born at Brussels in 1540. His works as a painter are poor; his etchings are rough, careless, and show a prodigal invention, though indifferent in drawing and composition. They include 178 illustrations of Ovid.—W. T.

BORDA, JEAN CHARLES, born at Dax in 1733; died in 1799. A very eminent mathematician and civil and naval engineer of France. The services he rendered to the department of practical science which engrossed him, were invaluable. We owe to Borda the introduction of the reflecting circle, as the chief instrument for stellar observations at sea; the description and analysis he has left of it—"Description et Usage du Cercle de Reflexion"—is still as good as any extant. He invented the repeating circle, so long a favourite in conducting geodetic surveys, although for good reasons it is now much more rarely employed. He found the length of the seconds pendulum (proposed as the invariable basis of the new system of measures) by methods so well chosen and exact, that his name has been coupled with Coulomb's as one of the fathers of precise experiment in France. He contributed greatly to the improvement of ship chronometers; and laid before the Academy of Sciences numerous memoirs on hydrostatics, ship-building, and navigation. And he obtained, at his own expense, the calculating and printing of that extensive table of logarithmic sines, &c., still bearing his name, adapted to the decimal division of the circumference of the circle. Services like these have worthily secured the gratitude of his country, or rather of European practical science.—Borda undertook several voyages with a view to important results. He visited and surveyed the Canary islands; he served as a naval officer under D'Estaing in 1777 and 1778; and he afterwards joined the squadron of De Grasse as commander of the frigate *Solitaire*. It is suspected that Borda was not quite so accurate when narrating naval exploits, as while measuring the pendulum. He avers, that having separated by accident from his squadron, he found himself, on a mist clearing away, in the very heart of the English fleet. The *Solitaire* must have been a favourite with her commander, for his narrative of her obsequies bears, that she singly stood a combined attack for *three hours*, and then surrendered only because she was a complete wreck. The despatch of the English admiral does not quite coincide with Borda's. It seems the French ship was surprised, and that, on endeavouring to escape, she was pursued by the *Ruby* of 60 guns. The *Ruby* being the best sailer, an engagement ensued, and after a fight of forty-one minutes the *Solitaire* felt it necessary to surrender, on account of her disabled state. The Admiral claims no honour, the force of the *Ruby* being the superior; nor does he more than allude to the incident. Alas! for the uncertainties of history! But, in this instance, the laws of probability pronounce strongly, and with small courtesy, against our excellent Borda!—J. P. N.

BORDA, SIRO, an Italian physician, and professor of materia

medica at Pavia; born in that town in 1761; died in 1824. His reputation as a practitioner brought him crowds of patients even from Lombardy and Piedmont. He maintained the doctrine of Rasori with respect to the division of medicines into stimulant and depressing; but shortly before his death ordered his dissertations on that subject to be burned, as inconclusive if not erroneous.—J. S., G.

BORDAZAR DE ARTARU, ANTONIO, a learned Spanish printer, born at Valencia in 1671; died in 1744. Author of works on Spanish orthography, &c.—J. G.

BORDE, ANDREW, a native of Pevensey, Sussex, was educated at Oxford, and became a Carthusian monk in the convent of that order in London, but quitted the monastic life, and adopted the study of medicine. To gratify his "rambling head and inconstant mind," says Anthony A'Wood, he travelled through Christendom, and even penetrated into Africa, an arduous undertaking in the sixteenth century. In 1532 we find him settled at the university of Montpellier in France, where he took the degree of doctor of physic. Returning to England, he settled first at Pevensey, and afterwards at Winchester, where he practised with such success as to be appointed one of the court physicians. He also enjoyed the favour of the king's vicar-general, Cromwell. His "inconstant" mind, however, involved him in pecuniary difficulties, and he died a prisoner in the Fleet in 1549. To a considerable share of learning, professional and general, Dr. Borde added the austerities of a monk, and the wit and humour of a buffoon. He was a voluminous author, considering the age in which he lived. Amongst his works of a medical character, may be named his "Breviarie of Helthe," "Compendyouse Regimete, or Dietary of Helthe," and a treatise on "Urines;" whilst those of a non-professional kind include "The Principles of Astronomical Prognostications," "The Boke of the introduction of Knowledge," "The Mylner of Abingdon"—probably based upon one of Chaucer's tales—and "The Merry Tales of the wise men of Gotham." The "Boke of Knowledge" has been reprinted in modern times as a literary curiosity. It is in black letter, adorned with rude but spirited cuts. It is dedicated to the Princess (afterwards Queen) Mary, and professes "to teache a man to speake parte of all maner of languages, and to knowe the usage and fashion of all maner of countreys, and to knowe for the most parte all maner of coyne of money," &c. By perambulating the country, and attending at the fairs and popular revels, he gained the soubriquet of "merry-andrew"—a name which has since become a "household word" in the English language. The "Merry Tales of the Wise Men of Gotham" are said to have been written to ridicule the proceedings of Lord Daere, the abbot of Lewes, and another ecclesiastic, at a meeting held at Gotham, one of that nobleman's manor-houses near Pevensey. The "Tales" have been appropriated, in recent times, to the village of Gotham in Nottinghamshire; and no less an authority than Mr. J. O. Halliwell has given countenance to that supposition, which is proved to be erroneous by the internal evidence of the stories—which point to a maritime, and not an inland village, as their birthplace—and also by the local traditions of Pevensey.—E. W.

BORDE, CHARLES, a French poet and literateur, born at Lyons in 1711; died in 1781. On coming to Paris he became intimate with Rousseau, whose paradoxes he afterwards ridiculed. It is no doubt to his connection with Voltaire that we are to attribute the infidel productions that he subsequently regretted having written.

BORDE, JEAN BENJAMIN, sometimes written DE LA BORDE, a musical essayist and composer, was born at Paris in 1734, where he was guillotined, July 22, 1794. He was a pupil of Rameau for composition, and of Dauvergne for the violin. He was born of a rich family, to which circumstance, and to his boundless self-confidence, he owed opportunities and preferences that he would never have gained by his talent. He was appointed first valet to Louis XV., which office he lost on the death of the king. He was a great speculator, and almost as great a loser; but it was his boast, that whatever embarrassments threatened him at night, his wit would help him to means to meet them before morning. On the breaking out of the Revolution he retired to Normandy; but, imprudently returning to Paris, he was seized as a royalist and suffered accordingly. He produced several comic operas, more remarkable for their success than for their merit, the first of which, "Gilles Garçon Peintre," was written in 1758. He is still better known by his "Essai sur la Musique

ancienne et moderne," and some other didactic works, cited by Burney, which are, however, little to be commended.—G. A. M.

BORDENAVE, TOUSSAINT, a French surgeon, born at Paris in 1728. In 1746 he passed through a campaign in Flanders; and on his return became professor of physiology in the college of surgery, and member of several learned societies; he was also appointed director of the Royal Academy of Surgery, and sheriff of the city of Paris. He died in 1782. Of his writings, the principal is his "Essai sur la Physiologie," Paris, 1756, of which new editions appeared in 1764 and 1787. Bordenave also published a translation of Haller's Elements of Physiology, and communicated numerous memoirs to the Royal Academy of Surgery, among which those relating to the diseases of the maxillary sinus are especially deserving of notice.—W. S. D.

BORDER. See PETITOT.

BORDESSOULLE, ETIENNE TARDIF, comte de, a French general, born at Luzeret (Indre) 4th April, 1771; died 4th October, 1837. He commenced a military career of extraordinary brilliancy at the age of eighteen in the second regiment of *chasseurs à cheval*, served under the most renowned French generals, and took part in innumerable battles and sieges, in all of which he distinguished himself by his energy, courage, and conduct. After the restoration he became as devoted to the new regime as he had been to that of Napoleon. He attained gradually to the highest military rank, and was elevated to the peerage, 9th October, 1823. He died of diseases occasioned by the numerous wounds he had received on various occasions on the field of battle.—G. M.

BORDEU, THIÉOPHILE DE, a distinguished French physician of the eighteenth century, the eldest son of Antoine de Bordeu, who also practised medicine with some reputation, was born at Iseste in Béarn, on the 22d February, 1722. He studied medicine at Montpellier, where he took his degree as doctor in 1743. In 1744 he became demonstrator of anatomy at Pau, but returned to Montpellier within a year, and there taught anatomy and midwifery. In 1746 he visited Paris, where he attended the lectures of the most celebrated men of his day, and studied the practice of medicine in the hospitals. During his stay in Paris he published some letters, which obtained him the title of intendant of the mineral waters of Aquitaine, and in this capacity he left Paris for Pau in 1749. In 1752 we find him again in Paris, where he published his "Recherches Anatomiques sur les différentes positions des glandes et sur leur action," in this year. In this remarkable work Bordeu first showed his power; and as he not only attacked the principles held by the faculty of Paris, but displayed a great command of raillery it is not astonishing that he made both friends and enemies by its publication. In 1754 Bordeu was appointed physician to the Hôpital de la Charité, and advanced rapidly towards the high position due to his assiduity and talents. In 1786 he published his "Recherches sur le Pouls," a work which placed him in the first rank of French physicians, but at the same time gave a great impetus to the intrigues which were set on foot for his injury. These were of a most scandalous nature, consisting of attacks upon his private character, wholly unsupported by any reliable evidence, and continued with disgraceful malignity, especially by Bouvart, for three or four years. The question was then put an end to by a decree of the parliament, acquitting him of all charges, and suppressing all the memoirs written against him. A second decree of the 6th August, 1764, reinstated him in his rights and prerogatives, of which the faculty of Paris had deprived him. During all this period, notwithstanding the war of words that was incessantly raging round him, and the disgraceful means adopted to bring about his ruin, Bordeu was constantly engaged in study, and even published some valuable memoirs in the *Journal de Médecine*. In 1767, he published his "Recherches sur le tissu muqueux et l'organe cellulaire," which is said to have given Bichat the idea of his *Anatomic Générale*; and in 1775 he brought out the first volume of his "Recherches sur les maladies Chroniques," a fine and valuable work, of which the second volume was published, with a life of the author, by Roussel, in the year 1801 (vii.), Bordeu having died in 1776. The services rendered by Bordeu to the progress of medical science were very great. Shaking off the trammels of the systems at that time almost universally adopted by medical men, most of which were of an absurd nature, he gives us in his various works the results of numerous observations, collected with rare assiduity, during a constant attendance alike upon

the rich and the poor. His physiological views were also far in advance of his age, and his writings upon the structure and functions of the glands contain ideas which have since been developed by other authors for the advantage of their own reputation.—W. S. D.

**BORDING, ANDERS**, a Danish poet, son of Christian Bording, physician to Prince Christian V., was born at Ribe, 21st January, 1619. He took his degree at the academy of Sorø in 1653, and in 1664 became lector theologie at Ribe. Resigning this post in 1666 he removed to Copenhagen, where, under the royal command, he published the *Danish Mercury*, a monthly newspaper, which he continued till his death in 1677. His poems contained in the *Mercury*, together with his other poetical works, were collected and published by Rostgaard, with an introduction by Gram, at Copenhagen in 1733.—M. H.

\* **BORDOGNI, MARCO**, a teacher of singing, was born at Bergamo, about 1788, and now resides at Paris. He was a pupil of S. Mayer and appeared as a tenor singer at Milan in 1813. In 1819 he was engaged at the Italian opera in Paris, where his admirable vocalization compensated for his weak voice and want of dramatic energy. In 1820 he was appointed professor of singing in the conservatoire, which office he still holds, though in 1823 he retired from it for a short time, in consequence of the fatigues of the theatre. He quitted the stage shortly after this, since when he has exclusively applied himself to tuition. His celebrated solfeggios are some of the best vocal exercises extant.—G. A. M.

**BORDONE, PARIS**, an eminent Venetian painter, born at Treviso in 1513. He was of a noble family, and at eight years of age was led to Venice to be carefully educated in the art for which he showed strong predilections. While still quite a boy he was placed in the school of Titian, under whom he did not long continue, as he found that his master was jealous of his pupils, and kept his secrets even from them. However, in spite of these checks, the young noble of Treviso grew so fast, that, at eighteen, he painted a grand wall picture in the church of St. Nicholas; and, before he was twenty, a "Meleager" and "Holy Family" for the Tiretta palace. He imitated the grand simplicity of Giorgione, his fellow-pupil, and adopted a certain rosy colour, which he carried sometimes to effeminacy and affectation. His portraits, too, are excellent, and not inferior to Titian's. His female portraits (we have seen a delicious one of Mary Stuart) are sweet, peachy, and graceful, but not very intellectual. His "Venus" was the lower and earth Venus, as might be expected from a court painter at the Louvre of that long-nosed satyr, Francis I., who lost his honour at Paris and his freedom at Pavia. Bordone's most ambitious work was the dome of the church of St. Vicenza at Treviso. He also adorned Venice, Milan, Genoa, and Florence with his wonders, laying indeed, as we may say, his talents at Christ's altar by the consecration of his art and genius. But the crowning glory of his life was a successful competition with his old master. A gallery at Vicenza had been frescoed by Titian, who chose the judgment of Solomon for his subject, but the work had fallen into decay. Bordone being called in, chose for his display the "History of Noah and his Sons." Kugler, always curt and judicious, thus sums up the merits of Bordone—"Like Pordenone he is unimportant in large compositions; his altarpieces, chiefly madonnas with saints, have something of the spirited excitement of Correggio, only without his naïveté; his heads are excellent." Two pictures of this description are in the Berlin museum. His most celebrated picture is in the academy of Venice, and alludes to the Tempest by Giorgione. Here the fisherman, who was present when the saint stilled the tempest, presents a ring to the doge which he had received from St. Mark as a pledge of the patron saint's gracious disposition towards Venice. The picture is rich in figures, simple, but of no great power. The splendid execution, however, gives it the aid of truth, to which the view of the grand Venetian buildings much contributes. The most magnificent picture of Bordone is perhaps his "Sibyl." An altar is still burning on which Augustus offered up his fruitless sacrifices, while the sibyl, a female of the most beautiful Titian type, stands before him and his followers, pointing in the distance to the new-born Saviour. In colouring also, this picture is one of the master's chef-d'œuvres. His celebrated "Paradise," also in the academy, formerly in the church of Ognissanti at Treviso, is very feeble. His small pictures in the Manfrini palace, and a "Riposo" during the flight into Egypt, in the Pitti palace, are

more pleasing. Another representation of this subject is in the Bridgewater gallery. Bordone died at Venice in 1588.—(Kugler's *Handbook of Painting*, vol. ii., p. 459.)—W. T.

\* **BOREAU, VICTOR**, contemporary French author. He began his literary career by the publication of a volume of poems in 1829, since which time he seems to have devoted his attention to works of history, having given to the world histories of France and England, and of ancient and modern times, testifying to no ordinary industry.—J. F. C.

\* **BORELLI, PIERRE**, a French journalist and litterateur, born at Lyons in 1809. An ardent admirer of the romantic school, his writings are characterized by a mixture of the happiest inspiration and extravagant bizarrerie.

**BORELLI, GIOVANNI ALFONSO**, an eminent physician, anatomist, and mathematician, and founder of the theory of the mechanical action of the limbs, was born at Naples on the 28th of January, 1608. He occupied at one period of his life a professorship of mathematics at Pisa, and afterwards one of medicine at Florence. About 1670 he lived for a short time at Messina. In his old age he retired to a religious house at Rome, where he died on the 31st December, 1679. Borelli published many and voluminous works on anatomy, physiology, medicine, astronomy, mathematics, and mechanics. Those which have most contributed to his reputation in the present age are two—"Theorie Medicarum Planetarum," Florence, 1661, an essay on the movements of Jupiter's satellites, which contains some foreshadowings of the law of gravitation. This is a characteristic of the works of many of Newton's predecessors and contemporaries, above whom Newton distinguished himself by discovering the exact law, of which they had only vague anticipation. "De Motu Animalium," a posthumous work, first published at Rome in 1680 and 1681, and afterwards republished at different times, and in many places. The first part of this treatise is deservedly celebrated as the earliest work in which the true principles of the mechanical action of the limbs of animals—now familiar to every student of mechanics—were demonstrated and applied. The second part, in which the author attempts to establish a mechanical theory of the actions of internal organs, is hypothetical, and destitute of useful results.—W. J. M. R.

**BORELLI, JEAN-ALEXIS**, a French litterateur, born at Salernes in 1738; died in 1810 at Berlin. After having studied in his native country he went to Prussia, where he was patronized by Frederick II., and became intimate with the learned men at his court. Author of several works on legislation, the fine arts, philology, &c., and editor of two works by Frederick II.

**BORGANI, FRANCESCO**, a Mantuan painter, taught by Domenico Feti, whose style he abandoned for that of Parmegiano. His clever works adorn the churches of his native city.—W. T.

**BORGHESE, GIOVANNI VENTURA**, a painter, born at Citta da Castello, and disciple and assistant of Pietro da Cortona, some of whose works at Rome he afterwards put the postscripts to and finished. Some fine altarpieces wrought by him, single-handed, exist in the eternal city.—W. T.

\* **BORGHESI, BARTOLOMEO**, a contemporary Italian antiquarian of great celebrity, to whose learning in numismatics and inscriptions the literary world is indebted for many an important discovery concerning Roman archæology and history. He was born in the year 1781 at Savignano, a small town in the Romagna, near Ravenna; and was early led to the study of antiquity by the example and care of his father, who also enjoyed a well-deserved reputation as a man of learning, and was in possession of a rich collection of ancient coins. Through the impulse which had been given in those days to the illustration of mediæval antiquity by men like Muratori, Fumagalli, Fantuzzi, &c., the young Borghesi felt himself called at first to follow in their track. Having finished his studies in the Collegio dei Nobili at Bologna, he returned home, and commenced his antiquarian investigations about mediæval monuments and records in the archives of Romagna; but owing to the weakness of his eyes, he was obliged to desist from the task of deciphering mediæval manuscripts, and in 1802 he went to Rome, and turned all his attention to ancient archæology, under the guidance of the illustrious Marini. He soon became possessed of an extensive knowledge of Greek and Latin literature, and was enabled both by his learning and by his natural acuteness and sound criticism, to explain with admirable success the most obscure and difficult points in ancient coins and inscriptions. His "Osservazioni Numismatiche,"

which were published at first in a series of articles in the *Giornale Arcadico*, and afterwards in a separate volume at Rome in 1821, are full of accurate remarks on the private and public history of the Roman families. To the same class of writings belongs a very learned dissertation bearing the title—“Della Gente Arria Romana e di un nuovo denaro di Marco Arrio Secondo,” edited at Milan in 1817 by his friend, the distinguished antiquarian Giovanni Labus. But the monumental work by which the name of Borghesi is chiefly recommended, is the illustration of the “Fasti Consolari Capitolini,” to which, ever since the discovery of the new fragments of the consular tables in the Foro Romano in 1816–17, he has constantly devoted his attention, and all the resources of his learning. He himself narrates in the introduction to the “Fasti Consolari,” how, as soon as the first news of the discovery reached him in his native place, he felt himself irresistibly attracted again to Rome; how he assisted there with feverish expectation at the progress of the excavations; how he welcomed with enthusiasm every new fragment of marble, every broken name or inscription dugged out of the ground.—(V. Nuovi fram. dei Fasti Cons. Capit., Milano, 1818: Parte Prima.)

Borghesi has proved throughout his life as good a citizen as he has shown himself a superior man in science. In the intervals of his residence in his native province, he unceasingly promoted public instruction and education. He founded the *Accademia Savignanesa*, and the small town which gave him birth became for a time a noble centre of literature. Monti, Perticari, and other like men, used to meet there with Borghesi, and to adorn the place with all the graces of intellectual and domestic refinement. After the revolution of 1821, and the fall of Italian hopes in those days, Borghesi sought for a tranquil abode in the republic of San Marino, and has ever since resided there, daily enriching with his liberal contributions the patrimony of antiquarian knowledge. Though famous throughout Europe, and often invited to fill chairs and other posts of distinction in Italy and abroad, he never allowed himself to be removed from his modest station in the small republic; and he has served it as a magistrate with the same devotion which he bestowed on the pursuits of learning. Many of his writings are to be found, besides the above-quoted publications, in the records of the scientific Academy of Turin, in the annals of the *Institut Archæologique*, in those of the Roman Academy of Archæology, and in the Neapolitan *Bulletin*. The military, religious, municipal, and political institutions of the Romans, were, through these labours, cleared from many obscurities, and the science of archæology brought to bear on the improvement of historical truth. In his conversation, as well as in his writings, he often excited the greatest admiration by his display of accurate and vivid knowledge concerning every detail of ancient life. A man of exquisite virtue and modesty, faithful in his friendships, generous towards all, and born to be a great citizen, had heaven granted him the blessing of a free country, still, in spite of his private and humble condition, a living testimony of what genius and goodness, happily combined together, may do even in adverse times for the improvement of the noblest gifts of mankind.—A. S., O.

BORGHESI, DIOMEDE, born of a patrician family at Siena, towards the middle of the fifteenth century. His buoyant spirits and restless disposition drew on him the animadversion of powerful enemies, who succeeded in having him expelled from his native place. For more than twenty years, as appears from his familiar letters, he wandered about from place to place through Lombardy. Whilst he was in Mantua he studied philosophy under Scipione, afterwards Cardinal Gonzaga. Many of his works have been published at Padua, in which city he lived for many years. It seems, however, that in 1573, through the intercession of Elena Boccali, a lady with whom he corresponded on literary and scientific matters, he obtained leave to return to Siena, where he was inscribed on the rolls of the academy of *Gl'Intronati* under the name of “Lo Svegliato.” Soon after he left Siena, and revisited many cities of Lombardy and Rome. The grand duke of Tuscany appointed him to a newly-erected professorship of Italian language and literature in the city of Siena, where he published the third part of his “*Lettere Discorsive*,” in which he gives sound instructions on style and language, showing a consummate knowledge of philology, and displaying a wonderful classic erudition. He published also five volumes of rhymes, many orations, and a treatise

on the Tuscan language. He was considered a very elegant orator, and, according to Girolamo Gigli, he contributed many articles to the first edition of the celebrated dictionary of La Crusca, published many years after Borghesi's death, which happened at Siena in 1598.—A. C. M.

BORGHESI, IPPOLITO, a Neapolitan painter, and scholar of Francesco Curia. His most considerable work was an “Assumption of the Virgin” for an altarpiece at Perugia.—W. T.

BORGHINI, RAFFAELLO, a dramatic author who flourished towards the middle of the sixteenth century. Having resolved to abandon the muses, he was dissuaded from that determination by Baccio Valois, a literary man of great merit, and he therefore continued his literary pursuits, applying himself particularly to the dramatic art. He is the author of many sonnets and canzones, and of plays, both in verse and prose; amongst which “*La Diana Pietosa*,” a pastoral play in verse, is highly appreciated. The date of his death is not recorded by any of his numerous biographers.—A. C. M.

BORGHINI, VINCENZO, was born of a noble family at Florence in 1515. He entered the Benedictine convent of Santa Maria in the year 1531, and was instructed in philosophy by the celebrated Francesco Varini the elder. He also applied himself to the study of Greek and Latin, and in 1538 was appointed professor of grammar. In a very short time he reached the highest dignities of his order, and was honoured with many distinctions by the duke of Tuscany, Cosimo de Medici, who elected him prior of the hospital of Santa Maria degl' Innocenti in Florence. Unwilling to abandon the care of the poor, whom he daily visited and relieved in the hospital, he refused the archbishoprics of Florence and Pisa, offered him by Cosimo and Alexander de Medici. His reputation for learning was so universally admitted, that by order of Alexander de Medici his likeness was painted in one of the galleries of the ducal palace, amongst the most conspicuous men of Florence. He has left two volumes of dissertations on the ancient history of Tuscany and its antiquities, so much esteemed that Tiraboschi says, that “Florence got more information about its antiquities and history from Borghini than from any other of its numerous historiographers.” A skilful architect and draughtsman, he was appointed by Cosimo director of the Florentine drawing academy, and furnished many designs, still preserved in the ducal library. He refused the highest dignities of the church, and devoted most of his time to works of charity. He died on the 15th of August, 1580.—A. C. M.

BORGIA, CÆSAR, an Italian prelate and warrior, died 12th March, 1507. He was the second of five children, whom Cardinal Rodrigo, afterwards Pope Alexander VI., had by his mistress Vanozza. He was at first destined for the church, and, while yet a child, was nominated archbishop of Pampeluna. He was then sent to Pisa to pursue those studies which were thought necessary to qualify him for his future career. He laboured diligently for a time, and manifested great energy in the pursuit of knowledge, and a rare ability and taste in the composition of the theological theses which were assigned to him. His father having soon after been called to the papal chair under the title of Alexander VI., Cæsar was made archbishop of Valencia, and subsequently, in 1493, was advanced to the rank of cardinal. The ambition of Cæsar, however, lay in another direction, and was not to be satisfied with ecclesiastical preferments and dignified inactivity. He envied the secular honours bestowed on his elder brother, the duke of Gandia, whom he now resolved to put to death, in order to open up to himself the much-coveted succession. Another motive for this horrible crime has been attributed to him by historians. It is said that the duke was his rival in an incestuous amour with their sister Lucrezia; and one evening, on retiring together from her house, the duke was assassinated, and his dead body thrown into the Tiber, where it was found next morning. Public opinion, which persistently attributed this murder to Cæsar, was corroborated by the suspicious interference of the pope to prevent investigation. Cæsar now hastened to divest himself of the purple; and his father entering into his views, agreed to his being secularized, and conferred on him the duchies of Candia and Benevento, and the counties of Terracina and Pontecorvo. His ambitious views continuing to expand, he contemplated the erection of these territories into a kingdom, and for this purpose sought the hand of one of the daughters of the king of Naples. Her father, however, refused to sanction this

alliance, the object of which he had the sagacity to discover; and Alexander and his son thus baffled, sought to promote their designs through the influence of Louis XII., king of France. An opportunity soon occurred. Louis, desirous of espousing Anne of Brittany, applied to the pope for a deed of dispensation, authorizing him to separate from his wife Jeanne de France, sister of Charles VIII., and to marry the object of his new attachment. This was readily obtained, and Cæsar was artfully chosen as the bearer of the pontifical dispensation. In return for this gratification Louis created him duke of Valentinois, conferred on him a large pension, married him to the daughter of Jean d'Albret, king of Navarre, and promised him effectual assistance in his contemplated invasion of Italy. The pope, who entered warmly into the ambitious projects of his son, now formed the design of founding a principality for him in Romagna, and in consequence Cæsar, in 1499, entered Italy at the head of 8000 men, and laid siege to Imola and Forlì, which surrendered. He subsequently subjugated Pesaro, Rinnini, and Faenza; and in 1501 was created duke of Romagna. From that period he commenced a career of conquest and usurpation, attended by deeds of treachery and cruelty, that have stamped his name with undying infamy. At length a confederacy was formed against him among the Italian states, but he had the address to bring about its dissolution. Contriving under pretext of holding a conference to allure three of the leaders to Senigaglia, he caused them to be strangled, and Cardinal Ursini, another of the confederates, even after he had signed an order for delivering up to Cæsar all the places held by his family, was treacherously poisoned. But the hour of retribution, both for him and his father, who co-operated with him in all these atrocities, was now at hand. They had formed the design of poisoning Cardinal Corneto at a banquet, but through some mistake had themselves swallowed the poison that had been prepared for their intended victim. Alexander was immediately taken ill and died, and Cæsar narrowly escaped sharing the same well-merited fate. Quitting the French party he now joined himself to that of Spain, by whom he was less powerfully supported. The Venetians recovered many of the towns of Romagna, and Cæsar was imprisoned by Julius II. to compel him to give up the remainder. He, however, escaped to Naples, whence he was, by order of King Ferdinand, sent to Spain, where he was condemned to imprisonment for life. He contrived a second time to make his escape, but soon after accompanying his brother-in-law Jean d'Albret, king of Navarre, in an expedition against some of his revolted subjects, the stroke of a lance under the walls of Pampeluna did good service to the world by ridding it of a monster who had long been a disgrace to human nature.—G. M.

**BORGIA, GERONIMO**, an Italian poet of Spanish extraction, died about 1549. He went to Rome in the time of Alexander VI.; became bishop of Massa, and was patronized by Lucrezia Borgia for his poetic talent. He wrote a history of his times, in 20 volumes.

**BORGIA, LUCREZIA**, daughter of Pope Alexander VI., and sister of Cæsar Borgia, infamous as the paramour of both. She was married in 1493 to Giovanni Sforza, lord of Pesaro, but was divorced from him in 1497, and next year united to a natural son of Charles II. of Naples, Alfonso, duke of Beseglia, who, becoming obnoxious to Cæsar Borgia, was shortly afterwards assassinated. She was next received into the noble family of Este, being espoused in 1501 by Alfonso, son of Hercules, duke of Ferrara. Her conduct subsequently was such as to justify the suspicions with which, on other grounds, Roscoe and other historians are disposed to treat the hideous imputation on her memory; that imputation which, in spite of the honour and respect that her patronage of letters, her talents, and her beauty received among such contemporaries as Bembo, has rendered her name a symbol of infamy hardly less black and fearful than that of Cæsar Borgia.—J. S., G.

**BORGIA, STEFANO**, cardinal, born at Veletri in 1731. At an early age he exhibited a singular enthusiasm for antiquarian studies, and before leaving the residence of his uncle, in whose family he was educated, had collected a number of rare medals, manuscripts, and other curiosities, with the design—which in the midst of various distractions, and with serious detriment to his fortunes, was afterwards realized—of forming an extensive museum. After filling with remarkable credit the post of governor of Benevento, and that of secretary to the congregation De Propaganda, he was created a cardinal by Pius VI.; and Rome

being threatened in 1797 by the French army, along with two other cardinals he was appointed by the pontiff to manage the defence of the city. On the proclamation of the republic in the following year he was arrested, but recovered his liberty after the lapse of a month, and repaired to Valencia to organize in presence of the exiled pope a new Propaganda. In 1800 Pius VII. called him to the head of his council, and the following year appointed him rector of the college of Rome. His death occurred in 1804 at Lyons, whither he had followed the pontiff journeying to Paris to crown Napoleon.—J. S., G.

**BORGIA or BORJA, FRANCISCO**, a Spanish poet, died in 1658. He was great-grandson of the famous Pope Alexander VI., descended by his mother's side from Ferdinand, prince of Squillace. He was formerly considered the prince of Spanish poets; but posterity has not endorsed this judgment. He wrote, however, with elegance, taste, and facility.

**BORGIANNI, ORAZIO**, a painter and engraver, born at Rome in 1580. He was taught by his brother, surnamed Scalzo. The invitation of a nobleman, and the patronage bestowed on the arts by Philip II., led him to Spain, where he worked in the Escorial, and painted many pictures for the principal grandees, his works being held in great estimation. On the death of his wife, having no longer a tie to the parched land of the cork-tree and the orange, he returned to Rome, and painted some colossal historical subjects with indifferent success, the figures being splay, ill-drawn, and all abroad. The Spanish ambassador, however, employed him, and he clambered about altar scaffolds in various churches and convents, acquiring honour and living in affluence. He died at last in 1630 of vain vexation at the malice of a rival much his inferior, one Celio. Borgianni etched some prints, and fifty-two Bible histories, called Raphael's Bible, in a bold, free, and, for an amateur, finished way.—W. T.

**BORGO or BORGUS, PIETRO BATTISTA**, an Italian historian, lived at Genoa in the first half of the seventeenth century. He entered the service of Sweden, and distinguished himself by his valour in the Thirty Years' war, of which he has written a history entitled, "Commentarii de Bello Suecico."

**BORGOGNONE**. See **CORTESE**.

**BÖRJESON, JOHAN**, a Swedish poet and clergyman, born in 1790, author of "Skapelsen i Sanger," published at Upsala in 1820.—M. H.

**BORKHAUSEN, MORITZ BALTHASAR**, a German naturalist, was born at Giessen in 1760, and died at Darmstadt in 1806. He was employed as director of forests and waters, was a dual counsellor, and in his domain of Arheilgen devoted himself to the study of zoology and botany. He wrote several works in both these departments of science. Among others, a "History of the Butterflies of Europe;" "Zoological Terminology;" "Description of Forest Trees;" "An Arrangement of German Plants;" "A Botanical Dictionary;" and a "German Fauna."—J. H. B.

**BORLASE, EDMOND**, a physician who practised with great reputation at Chester, son of Sir John Borlase; died in 1682. He left the following works—"The Reduction of Ireland to the Crown of England, with the Governors since the Conquest by Henry II. in 1172, and some passages in their government;" "A Brief Account of the Rebellion of 1641;" "The Origin of the University of Dublin and the College of Physicians," London, 1675; and "The History of the Execrable Irish Rebellion, traced from many preceding acts to the grand eruption, October 23rd, 1641, and thence pursued to the Act of Settlement in 1661," London, 1680.—J. S., G.

**BORLASE or BORLACE, WILLIAM**, a distinguished English antiquary and naturalist, was born at Pendeen in Cornwall in 1696, and educated at Exeter college, Oxford, where he took his degree as master of arts in 1719, and took orders in the same year. In 1722 he obtained the living of Ludgvan in Cornwall, and in 1732 the chancellor presented him to the living of Saint Just, his native parish. While residing at Ludgvan he commenced the study of the natural history of his native county, by collecting specimens of the minerals and fossils brought to light by the neighbouring copper works, belonging to the earl of Godolphin. From these he advanced to other kindred subjects, until at last, he engaged zealously in the investigation of the natural history and antiquities of Cornwall. The first results of his labours (with the exception of one or two essays, read before the Royal Society) appeared in 1754, under the title of "The History and Antiquities of Cornwall." In 1758 appeared the well-known

'Natural History of Cornwall," a valuable and still interesting work; and in 1766, having presented his collections to the Ashmolean museum at Oxford, Borlase received the honorary degree of doctor of laws. He died in 1772. Besides the works above referred to, Borlase published several papers in the "Philosophical Transactions," and also prepared paraphrases of Job and the books of Solomon, but rather for his own amusement than with a view to publication. He also maintained an extensive correspondence with many of the scientific and literary men of his time, including the poet Pope, whom he furnished with the greater part of the materials for his celebrated grotto at Twickenham.—W. S. D.

BORN, BERTRAN or BERTRAND DE, born at the chateau of Hautefort in Perigord. The precise date of his birth is not known; but he appears as an important actor in the political history of France and England towards the close of the twelfth century. In 1185, when Henry, the youngest son of Henry II. of England, was contending with Richard Cœur de Lion for the duchy of Aquitaine, Bertran supported the claims of Henry, and a spirited *servente* of his remains, in which he seeks to animate to action Henry's supporters. Richard is victorious in the contest, and Bertran is the last to yield. Hautefort is besieged and taken, but the same power of song which led

"The great Emathian conqueror to spare  
The house of Pindarus, when temple and tower  
Went to the ground,"

now saved the troubadour, and requited Richard. A *servente* records his generosity. Prince Henry dies, and we have another and a very beautiful poem from Bertran. Immediately after his son's funeral, King Henry II. visited with his vengeance the people of Aquitaine. He besieged Hautefort, Bertran's chateau, which he took, and thought to have razed to the ground. The father remembered Bertran's love for his son, and relented. The crusades were now the subject of every man's thoughts, and such excitement as Bertran's strains could supply was not wanting, but in a tone which seems slightly satirical. The poet says he cannot think of going to the wars himself, as he sees that counts, dukes, and kings, have always something to interfere with their going. The poet, too, has his excuses for delay, one of the best of which is a lady, "belle et blonde," whom he cannot leave. The wars in France between Philip Auguste and Cœur de Lion were a source of delight to Bertran, who loved war, and especially war when kings were the parties engaged. Till Richard's death he had this enjoyment, and his *serventes* were regarded as among the things which rendered peace impossible. On Richard's death, and the accession of John to the throne of England, we lose sight of Bertran. He is said to have become a Cistercian monk. When or where he died is not recorded; but there is a record of his son having performed homage for his castle of Hautefort to the king of France in the year 1212. This has been regarded, perhaps too hastily, as a proof of the father's natural death before the time of such ceremony. If the fate of Bertran de Born on earth be doubtful, we have the indisputable authority of a poet for his fortunes in the other world. Dante, we are told in the twenty-eighth canto of the Inferno, passing into the gulf where the authors of heresies and the sowers of discord are punished, sees a headless trunk pacing sadly onward—one of a group, of which Mahomet was the chief. The trunk held in his hand his severed head, which served as a lantern to light his steps as he came towards Dante. He thrust the head near enough for the poet to be told by it, that this was his (Bertran's) punishment for seeking to disunite the children of Henry II. from their father. It was just retribution, the poet tells us, that head and trunk should, in his own person, be dissevered.—J. A., D.

BORN, FERDINAND GOTTLÖB, born in 1785 at Leipzig, where he afterwards became professor of philosophy, author of several philosophical treatises, but best known by his Latin translation of Kant's works, 3 vols. 8vo; Leipzig, 1796-98.

BORN, IGNAZ VON, one of the greatest mineralogists of any age, a contemporary of Werner, was born at Karlsburg in Siebenbürgen, on the 26th December, 1742, and received his early education in Hermannstadt and Vienna. For sixteen months he was attached to the jesuits; but the spirit of the order soon becoming obnoxious to him, he quitted the society and studied law in Prague. He then travelled through Germany, Holland, the Netherlands, and France, and on his return to his native country devoted the whole powers of his

mind to the study of mineralogy, natural history, and the science of mining. In June 1770 having become an assessor in the mining council at Prague, he undertook a mineralogical journey through Hungary and Siebenbürgen, in which he was nearly becoming a sacrifice to his desire of knowledge. By remaining too long in the lead mines of Banijo he contracted a chronic complaint which troubled him for the rest of his life. The results of this journey were given in a letter to the celebrated mineralogist, J. J. Ferber, and published by him in 1774. Soon after his return he received the post of mining councillor; but this his illness compelled him to relinquish, and he passed the next four years of his life in pain on his hereditary estate of Alt Jedlitzsch. Even during this period, however, the activity of his mind was by no means impaired. His works prepared at this time placed him in the first rank of European mineralogists. We may mention especially his "Lithophylacium Bornianum, seu index fossilium, quae collegit, in classes et ordines digessit Ign. de Born," Prague, 1772-75, in two volumes, containing a description of his mineralogical cabinet, with many new species, arranged in accordance with Cronstedt's method. On the publication of this work von Born was elected a member of several foreign academies. On his return to Prague, after his partial recovery, he became one of the founders of the society for the advancement of mathematics, and natural and natural history, and in 1776 was called to Vienna by the command of the Empress Maria Theresa to arrange the imperial cabinets of natural history. The result of his labours in the imperial museum was his great work, entitled "Index rerum naturalium Musei Cæs. Vindobonæ," P. I. published at Vienna in 1778, and reprinted in 1780, under the title of "Testacea Musei Cæs. Vindob., quae jussu Mariæ Theresiæ disposuit et descripsit Ign. a Born." This fine work obtained for its author the appointment of councillor of state in Vienna; and as he had now his permanent residence in that city, he was soon surrounded by a society of men of the highest qualifications. His hereditary property gradually melted away in the expenses of scientific investigations, or in assisting others in their endeavours, and at his death on the 24th July, 1791, his family were left with nothing. Of the improvements introduced by Born in mining operations, the most important was his new method of amalgamation, which was immediately introduced into all the Austrian states, by the command of the Emperor Joseph II. Of his scientific writings, we may mention, besides those already referred to, a treatise, "Ueber das anquicken der gold und silberhaltigen Erze," &c., published at Vienna in 1786; his "Bergbaukunde," Leipzig, 1789, edited in conjunction with von Trebra; and "Catalogue méthodique et raisonné de la collection de Fossiles de Mademoiselle Eleonore de Raab," published at Vienna in 1790. Ignaz von Born was also celebrated for his wit, and some of his humorous writings have enjoyed a great reputation. Amongst these is a satirical tale, called the "Staats-Perücke," published at Vienna in 1772 without his name or sanction; and he was also one of the authors of the celebrated "Monachologia, or natural history of monks," originally published at Vienna in Latin in 1783, and subsequently translated into many languages.—W. S. D.

BOROWSKI, LUDWIG ERNST VON, a German divine, was born at Königsberg, June 17, 1740, and died November 10, 1831. He attained to the highest honours that were ever conferred upon a German protestant divine. In 1816 he was nominated evangelical bishop, and in 1829 archbishop of Prussia Proper. He even received the highest Prussian order, that of the black eagle. His writings were few, and of slight importance.—K. E.

\* BORRER, WILLIAM, F.R.S., F.L.S., of Henfield, Sussex, a celebrated English botanist, has devoted much attention to lichens and other cryptogamic plants. Along with Dawson Turner, he printed a work on British lichens, and he has contributed many botanical papers to the Linnæan Society.—J. H. B.

BORRI, in Latin BURRUS, GIUSEPPE FRANCESCO, an Italian chemist, quack, and heretic, born at Milan in 1627. He was educated at Rome in a seminary of the jesuits, and while holding some office in the Vatican was a diligent student of medicine and chemistry; but his debaucheries having brought him into trouble with the authorities of the city, he was obliged to retire into an ecclesiastical establishment, where he exchanged his profligate habits, and began to disseminate new views touching the mystery of the Trinity, &c., for those of a devotee. Not-

withstanding that one of his tenets was that the time was at hand when there should be but one sheepfold on the earth, whereof the pope should be the only shepherd, his general doctrine was considered so dangerous by the inquisition at Rome, that proceedings were taken against him, which obliged him to retreat to Milan. Here he organized a formidable confederacy, which might have even served his purpose of usurping the government of the city, if its existence had not been prematurely betrayed to the authorities. On the failure of this audacious scheme, of which the Roman inquisition exhibited its detestation by burning him in effigy, Borri declaring, it is said, that he never felt so cold as on the occasion of his being burnt, fled to Strasburg, afterwards to Amsterdam, and then to Hamburg. His subsequent career was partly that of a vulgar thief, and partly that of an alchemist of the Cagliostro school. He was at length delivered to the Austrian emperor, who made a gift of him to the pope. He was sentenced to perpetual confinement. His death occurred in the castle of St. Angelo in 1695. Some letters and medical tracts are attributed to his pen.

**BORRICH** or **BORCH**, **OLAF**, more generally known under the Latin name of **OLAUS BORRICHUS**, the founder of the college of medicine in Copenhagen which bears his name, was born at Borch, in Jutland, 7th April, 1626. He was professor of chemistry and botany at Copenhagen, where he also acquired for himself great celebrity as a physician. From 1661 to 1667 he spent in travelling through Italy, France, Holland, and England, and thus became acquainted with the most distinguished men, to whom his great learning made him welcome. In 1681 he was elected royal physician and librarian of the university, besides which, other public offices of trust and honour were held by him. He died in 1696. According to the custom of the age, he also occupied himself with alchemy, and as he became, from a poor student, a very rich man, many believed he had solved the mystery of the philosopher's stone. According to another story, he cured a princess of the house of Medici, whilst in Italy, of a dangerous sickness, and hence obtained wealth; nay, even, it was said that the princess would have married him, could he have been induced to join the catholic church. He left his great wealth for the founding of the college which bears his name. His works are very numerous, but antiquated.—M. H.

**BORROMEO**, **ANTONIO MARIA**.—This nobleman was born at Padua in 1724. Having studied under the direction of the most eminent men of the time, such as Lazzarini, Somaschi, Colza, and Volpi, he began early to appreciate the classic writers of Italy, and successfully imitated them. He was considered both a good poet and an excellent prose writer, although, perhaps, his language to an impartial critic might appear at once redundant and too fastidious Tuscan. He is the author of many novels still unedited, except some which he published with notes in his "Novellieri." This publication met with such general approbation, that eleven years after he republished it, with a large addition of novels and biographical notices, under the title of "Catalogo de' Novellieri." After a life spent in continual literary pursuits, this veteran writer died on the 23d of January, 1813.—A. C. M.

**BORROMEO**, **CARLO**, saint and cardinal, one of the most illustrious names in the history of the Romish church. The father of this distinguished ecclesiastic, Count Gilbert Borromeo, possessed the castle of Arona in the Milanese. There Carlo was born in 1538. His mother was a sister of Pope Pius IV., who, on his accession to the pontificate in 1559, called his nephew to Rome, and invested him with the dignities of cardinal, archbishop of Milan, grand penitentiary, legate of Bologna, Romagna, and the March of Ancona, and protector of three crowns and several religious orders. In return for these honours, Carlo supplied the vigour which the distracted circumstances of the church demanded from the papal throne, and which its occupant was too old to exhibit. To his hands were committed the most important affairs, both ecclesiastical and civil. At the age of twenty-two he was virtually pope. His zeal for the interests of the church, his discretion in the management of affairs, his generosity, piety, and learning, were the qualities of a good pope, and he was esteemed accordingly. As at Milan and Pavia, where he passed the period of his studies, he exhibited in the Vatican a magnificence in his tastes which, in the eye of the Romans, contrasted admirably with the humility and courtesy of his demeanour. His dress was costly, and his retinue that of a prince. But a general council was demanded, to settle the affairs of the church; the council of

Trent, after vexatious delays, met, and pronounced the rich dresses of the dignitaries of the church a reproach and a scandal. On this point Carlo was the first to defer to the authority of the council; he discarded his habiliments of silk, and with these his retinue. By talent and scholarly renown, no less than by birth and station, he was a patron of letters. He assembled frequently at the Vatican the learned men of Rome, laymen as well as ecclesiastics. Their intercourse he directed to profitable ends, by engaging them in literary discussion. In 1565, after the death of his uncle, he retired to Milan. The affairs of this diocese, in consequence of the neglect of his predecessors and of his own absence, had fallen into the utmost confusion. His clergy, for the most part, were ignorant and dissolute. The diocese boasted but few schools—teachers and catechists had been degraded or starved out. Discipline was a thing unknown in the churches. Carlo began the laborious work of reformation by providing for the education of the clergy, and the enforcement of discipline. He converted his palace into a seminary for bishops. In every district he founded a school and an hospital; he remodelled the monasteries; and, by the operation of provincial councils, everywhere restored decency and order. During the ravages of the plague he dispensed his charities with his own hand in the houses of the sick. Like his predecessor, Ambrose, he preached constantly to the people, and visited every corner of his diocese. Worn out by labours and austerities, he died at the age of forty-seven, in 1584. Pope Paul V. canonized him in 1610. His works were printed at Milan in 1747, in 5 vols., folio.—J. S., G.

**BORRON**, **BOIRON**, **BOURON**, **BERON**, **BOSRON**, or **BURONS**, **ROBERT** and **HELIS**, two English writers of the twelfth century, probably brothers, who were employed by Henry II. to execute prose versions of several of the romances known as the Collection of the Round Table. Their works no longer exist, except in a modernized shape; hardly a word of the Saint Graal, the Lancelot, and the Histoire de Merlin, as they appear in the editions of the fifteenth and sixteenth centuries, being in use in the times of these two writers.—J. S., G.

**BORRONI**, **GIOVANNI ANGELO**, a painter, born at Cremona in 1684. He was a pupil of Massarotti and Le Louge, and then became painter to the Crivelli family, painting occasionally in the Milan and Cremona churches. The duke of Milan knighted him. He died in 1772. His best picture is that of "St. Benedict interceding for Milan."—W. T.

\* **BORROW**, **GEORGE**, whose works and adventures are unique in the British literature and biography of the nineteenth century, was born about 1804 at East Dereham in Norfolk, the burial-town of the poet Cowper. His father, a cadet of a Cornish family, was a militia officer, of note enough to attract the attention of the duke of York; his mother was a Norwich lady of French protestant extraction. The young Borrow's earlier years, like many of his later, were years of constant migration. Captain Borrow's circumstances did not admit of two establishments, so his wife and their two sons, of whom George was the younger, accompanied him as he marched with his regiment from town to town. The perpetual change of residence was not favourable to a solid education, and the only systematic teaching which the young Borrow received was during his parents' stay in or near Edinburgh, where he became for a brief period an alumnus of its celebrated High School. But the very change of scene contributed to the variety of his information: thus, when quite a child, and when his father was stationed at Clonmel, he acquired, at the school to which he was sent, a colloquial knowledge of Irish, the first-fruits of his native turn for philology. He has described himself as a shy boy, of rather tardy intellectual development, first roused by the perusal of Robinson Crusoe, and delighting in lonely rambles. Shyness among equals is very frequently accompanied by forwardness with inferiors; and his parents did not suspect that, during his frequent absences from home, their bashful little recluse of a son was consorting familiarly with gipsies, and other social nomads, picking up the jargon, and curiously eyeing the ways of the singular vagrants, of whom he was afterwards to be the interpreter to the civilized world. These tendencies were fostered when, at the peace, his father settled down in Norwich, where the elder Borrow is still remembered as a man of cultivated mind and social habits. The neighbourhood of Norwich abounded in gipsies, and Borrow was their frequent and familiar visitor. He did not neglect, however, more useful, or at least more intellectual pursuits. Articled to the leading attorney of Norwich, the remarkably tall young man was

noted, not only for his pedestrian feats and athletic strength, but for his extensive knowledge of languages. On his desk, Ab Gwyllyon lay among his lawbooks; his early knowledge of spoken Irish had developed into an accurate acquaintance with the rarely-studied Celtic languages. In 1821 William Taylor wrote to his friend Southey: "A Norwich young man is constructing with me Schiller's William Tell, with the view of translating it for the press. His name is George Henry Borrow, and he has learned German with extraordinary rapidity. Indeed, he has the gift of tongues, and though not yet eighteen understands twelve languages—English, Welsh, Erse, Latin, Greek, Hebrew, German, Danish, French, Italian, Spanish, and Portuguese. He would like to get into the office for foreign affairs, but does not know how;" for in those days the "competitive system" had not come into force. William Taylor liked to be surrounded by young men, and to instil into them his own peculiar opinions. No doubt he endeavoured to teach his young protégé other things than German. It is not difficult to discern the traces of his influence in Mr. Borrow's earliest book, published anonymously, and not included by himself in any list of his acknowledged works—"Faustus, his Life, Death, and Descent into Hell," London, 1828, and professing to be translated from the German. Admirers of Mr. Borrow's writings will not linger over this wild crude work, which was succeeded in the following year by another much more creditable to its author—"Romantic Ballads, translated from the Danish," &c., Norwich, 1826. These have been highly praised by competent critics for their veracity as translations, not sacrificing the rude strength and harmony of the Norse originals to the modern demand for polish of expression and smoothness of rhythm.

The death of Captain Borrow seems to have occurred about this period, when his son's term of indenture, too, was on the point of expiring. With a knowledge of languages for his chief capital, Mr. Borrow, bidding adieu to Norwich and the law, repaired to the great metropolis to become an author by profession. He took with him an introduction from William Taylor to the once celebrated, but now almost forgotten, Sir Richard Philips, undoubtedly the original of the vegetarian publisher, sketched at the opening of the second volume of "Lavengro." Of Mr. Borrow's literary trials, sufferings, and achievements, of his desertion of London and literature, of his subsequent wanderings in England as tinker, gipsy, postillion, ostler, a half-authentic, half-fanciful account will be found in "Lavengro," and its continuation, "Rommany Rye." After the series of events recorded in the latter, began Mr. Borrow's continental wanderings. Mostly on foot, he traversed some of the chief countries of the continent—France, Italy, Austria, Russia. He was in Paris during "the three days," watching in the streets the overturn of the Bourbon dynasty. Two or three years later he is at St. Petersburg, presiding over the translation of the bible into Mandschu-Tartar, and dating his departure from the Russian capital by the publication of a little-known work—"Targum, or metrical translations from thirty languages and dialects," St. Petersburg, 1835. Scarcely returned from Russia to England, he accepted from the Bible Society a mission to the Iberian peninsula, which occupied him for five years, and is admirably described in his well-known work. On his return to England once more, he withdrew into a rural solitude, which was fruitful to him of fame. There he prepared, and thence in 1841 he launched "The Zineali, or an account of the Gipsies of Spain, with an original collection of their songs and poetry, and a copious dictionary of their language," which was followed two years later by the publication of "The Bible in Spain." "The Zineali," by its unique information respecting the language, habits, and origin of a race, which is to other races what Japan is to other countries of the earth; "The Bible in Spain," by its graphic pictures of life, high, middle, and low, in the byways as well as the highways of the land of Gil Blas; and both books, by their exhibition of the original and adventurous character of their author,—took the reading world by storm. They passed rapidly through several editions, and the raciness of their style, added to the interest of their contents, at once placed Mr. Borrow in the foremost rank among the popular writers of the age. Public expectation, wound up to a high pitch by repeated announcements, was, however, rather disappointed on the publication, in 1851, of "Lavengro, an autobiography," written principally in 1843, and completed so early as 1846. In this work, and in its sequel, "Rommany Rye," London, 1857, Mr. Borrow has interwoven, with a small portion

of his own early biography, too large a mass of disquisition and dialogue for the popular taste. More adventure and autobiography were anticipated, and a certain disappointment has been the result. Mr. Borrow's published works give but an imperfect notion of his literary activity. Apart from autobiography, he has at least seventeen volumes in readiness for the press, including treatises on Celtic poetry, the people and language of Wales and Cornwall, the literature of the Isle of Man, translations from the Cambrian British, from the old Norse, from the popular tales of Russia, and the jest-books of Turkey. Mr. Borrow is married to a Norfolk lady, and lives in studious retirement at Great Yarmouth in his native county; his tall form, crowned for many years with hair prematurely white, being occasionally seen in the metropolitan thoroughfares, and specially in the library of the British Museum.—(Works *passim*; Robert's *Memoirs of William Taylor of Norwich*, London, 1843; *Original Information*.)—F. E.

BORSUM, ADAM VAN, a Dutch painter, who painted animals with landscapes in the manner of Vanderneer and Paul Potter. "His colouring is natural," says Pilkington, "his touch firm and open." He lived about 1666.—W. T.

BORU, BRIAN, one of the most distinguished of the native monarchs of Ireland, was born in the year 926. He was a younger son of Kennedy, king of Munster, at whose death the sovereignty of that territory devolved upon Mahon, his eldest son. At this time Brian was thirty-four years of age; but he had long since attained a high reputation for valour and judgment, having signalized himself by his active and enterprising spirit, and by bold and adventurous exploits. He soon found himself at the head of the bravest youths of his native province, and with his little band of followers rendered many important services to his brother, especially against the hordes of plunderers that infested the forest retreats and mountain passes of Munster. The annals of the period do not always afford very clear or very reliable information; but some well-authenticated facts exist in proof of the valour and ability of Brian at this time. On one occasion, with his body of brave Dalcassians, he charged a strong detachment of Danes of Limerick with such rapid impetuosity that they were routed with the loss of half their number, a success which resulted in the total overthrow of the Danes, who lost 3000 men upon the field of battle, and fled to Limerick. Thither the victors followed them, and despoiled the city. Upon the death of Mahon, who was perfidiously decoyed and murdered by Maolmua, a neighbouring chief, Brian, who had been for some time chief of Thomond, ascended the throne of Munster. His first step was to revenge his brother; and, accordingly, collecting a large force, he followed Maolmua into the recesses of the mountain district, where he had withdrawn in the belief that his position was impregnable. But the caution, skill, and daring of Brian were superior to all obstacles. He first intercepted and defeated a strong body of Danes who were marching to the aid of his enemy, and then, rapidly turning his steps, he came unexpectedly on Maolmua, whom he surprised close to the spot where Mahon had been murdered; and there Morough, the son of Brian, avenged his uncle and won his first fame by slaying with his own hand the perfidious Maolmua. The enemy were totally routed with great slaughter. Brian's next achievement was against the Danes, who had taken possession of the island of Iniscathy in the Shannon. Landing with twelve hundred Dalcassians, he succeeded, after a fierce struggle, in clearing the island of the enemy, though assisted by a strong detachment of their countrymen from Limerick, and followed up his victory by expelling the Danes from their strongholds in the neighbouring islands. About the year 980 a strong confederacy was formed by the Danes of Decies, Cork, and Waterford, with the chief of Ossory, for the purpose of resisting a tribute which had been for some time levied by the kings of Munster. Brian, with his usual promptness and daring anticipated their measures, and invaded Leinster with an overwhelming force; he utterly routed the combined armies, devastated their territories, and carried away a large amount of spoil, and compelled them to give hostages for their future submission. Brian now indulged in a higher ambition than that of being a mere toparch. He entertained views of becoming the supreme sovereign of the kingdom. The throne of Ireland was at the time occupied by Malachy, who in the year 978 had distinguished himself by the splendid victory of Tara. This prince had invaded the Dalcassian territory on more than one occasion.

Brian calmly waited his opportunity, which was afforded by Malachy, who in 988 led a large body of troops against the Danes of Dublin. Brian invaded Leinster, which he laid waste and plundered, returning to his palace of Kinkora laden with the spoils of two provinces. Invasions and reprisals followed each other on both sides, only interrupted when they joined their forces against their common foe, the Danes. In the wars with these latter, Brian obtained additional strength and increased reputation. It was now plain that these two great rivals were committed to a struggle, whose issue should be the total defeat of either. Again Malachy made a predatory excursion into Leinster, whose prince had yielded allegiance to the kings of Munster. To avenge this, Brian collected a numerous force, and marched upon the royal seat of Tara. Malachy submitted to his rival and gave hostages. But the next year, A.D. 1001, Brian again descended upon Tara at the head of a large army, and it was evident the long contest was at an end. Malachy struck not a blow to retrieve the honour of his house, and Brian, "then in the palace of Ireland's ancient monarchs, received the homage of their last legitimate successor, the descendant of a series of fifty Hy-Nial kings, and was by him acknowledged supreme sovereign of all Ireland." Malachy accompanied Brian in his regal progress through his new dominions, which with a wise policy he made for some years. In these the wisdom, prudence, and vigour of the new king was conspicuously displayed. He scrutinized everything with the eye of a politician. His firmness controlled disaffection, his moderation conciliated submission, his wisdom prescribed wholesome laws, his power enforced obedience to them. The result was that his reign was the most prosperous and peaceful for Ireland that her annals record. Wise in council, able in administration, the invincible warrior became the beneficent ruler. He controlled the dissensions of the petty chiefs by a policy alert, vigilant, and pervading. He restored the ecclesiastical buildings and endowed their institutions; he repaired the highways, strengthened the fortifications, built bridges, and carried on other works of public utility; so that after making all allowance for the exaggerated accounts of historians, enough remains of well-authenticated truth to establish for Brian Boru a high reputation. But with all his vigour and valour Brian was not able to subdue the power of the Danes in Ireland. Possessed of the strongest fortifications in the island, superior in their naval and commercial resources, prudent, active, and indefatigable, and constantly recruited from the mother country, the Danes, though often defeated, were ever ready to renew the contest, and from their stronghold in Dublin to devastate the country. Combining with the natives of Leinster, the Danes made an incursion into Meath in 1013. Emboldened by a partial success, they made preparation for a great effort. In this they were joined by Maelmorda, who had usurped the kingdom of Leinster by their aid. We shall not here consider the truth of the different stories that are extant to account for the disaffection of the people of Leinster, but come to the result that brought the contending forces upon the plain of Clontarf near Dublin in the year 1014.

It was Good Friday, the 23d of April. Brian addressed his troops in a speech, which is still preserved, of singular power, concluding it with these words: "May the Almighty God, through his great mercy, give you strength and courage this day to put an end for ever to the Lochlunian tyranny in Ireland, and to revenge upon them their many perfidies, and their profanation of the sacred edifices dedicated to his worship—this day on which Jesus Christ himself suffered death for your redemption." So saying he raised the crucifix in his left hand, and his golden-hilted sword in his right, declaring he was willing to lose his life in such a cause. Being about to lead on his troops, the chiefs with one voice entreated the aged king, now near ninety years old, to retire from the field and leave it to his brave son Moragh. At sunrise the signal for battle was given, and the fight raged without intermission till dusk. But the valour of the Irish at length prevailed, and the Danes were utterly routed. In the flight, the Danish admiral Bruadair, with some of his people reached the tent where Brian was then engaged in prayer. The aged king, though totally unarmed, sprang up, and seizing his sword, awaited the approach of the Danes, who were clothed in armour from head to foot. As Bruadair rushed upon the king, the latter smote him with his sword, and cut off his left leg from the knee and the right from the ankle, but Bruadair's axe met the head of Brian and fractured it.

Brian, however, with all the fury of a dying warrior, beheaded Bruadair and killed a second Dane, and then expired. It is right to observe, that the Niala Saga, as given in Johnstone's Celto-Scandinavian Antiquities, has a different account of this transaction, namely, that the Danish admiral escaped after killing Brian, but being recaptured, he was disembowelled with horribly ingenious cruelty. The loss of the Irish in this battle, which, as a modern historian remarks, may fairly be reckoned amongst the decisive battles of the world, was considerable. Moragh and his two brothers, and many other chiefs, fell. The enemy's loss is computed to have exceeded six thousand, of whom four thousand were Danes. The body of Brian was conveyed according to his will to the cathedral of Armagh. On its progress it was received in state successively at the monasteries of Swords, St. Kieran's, and Louth, where it was met by the primate with his suffragans and clergy. For twelve days and nights it was watched by the clergy with continual prayer, and then interred with great pomp on the northern side of the altar of the great church. Thus ended the reign of this remarkable man. "Tradition and romance," says a modern writer, "have vied with one another in describing the glories of this reign. . . . But the historic fact remains, that by his just and vigorous policy he kept down the whole tribe of petty kings and toparchs, at once tyrants and rebels, whose barbarous conflicts kept the blood of the people flowing incessantly, and trampled on law and religion. He also awed into submission the Danish communities, who for several years made no attempt to disturb the general peace. For the first time in the history of Ireland there was a strong and upright central government."

On the whole, we are justified in placing this monarch, both as a general and a ruler, amongst those who are entitled to occupy the highest places in the world's history. Time, it is true, has thrown him far back in the annals of history, and the page that he fills is one which neither the classical reader of Greek and Roman story, nor the student of mediæval times desires to dwell upon, nay, scarcely cares to open. Yet the page is there notwithstanding, indelible, indestructible; and he who will peruse it, will see how great a warrior and how wise a statesman was Brian Boru. The old annalists represent Brian as "a man of fine figure, of large stature, of great strength of body, and of undaunted valour."—J. F. W.

BORY DE SAINT VINCENT, JEAN BAPTISTE GEORGE MARIE, a celebrated French naturalist, was born at Agen in 1780, and died on 23d September, 1846. At the early age of fifteen he attracted the attention of naturalists, by his memoir on the genera *Conferva* and *Bysus*. He exhibited a desire to travel in the cause of science. He visited the isle of France and the isle of Bourbon, and drew up a beautiful topographical map of the latter. He afterwards proceeded to St. Helena, and he prepared an excellent map of the island. In 1804 he published an account of his visit to the African islands. After this he was employed in the army, and followed the camp during the wars of Napoleon. He attained the rank of colonel. After the establishment of peace he resumed his literary and scientific studies. In 1823 he published an account of the cavern in the mountain near Mæstricht, under the title of "Voyage Souterrain." After residing for some time in Belgium, he returned to France in 1820 and was charged in 1829 with the command of a scientific expedition to the Morea. He published numerous papers in French natural history periodicals, and in the *Dictionnaire Classique d'Histoire Naturelle*. He also published a guide to the traveller in Spain, and an account of the physical geography of that country.—J. H. B.

BORZONE, LUCIANO, a Genoese painter, born in 1590, and a scholar of his uncle, Filippo Bertolotti. He painted history tolerably, and portraits well, and was not vain enough to be ashamed of doing the inferior thing, if it is inferior, best. His "Baptism of Christ" and "Presentation in the Temple" were lions that people, more curious than religious, visited Genoese churches to see. Borzone seems to have been a sociable, dillitante-sort of man, persons of taste, talent, and good-nature, gravitating to his house, which, like Rogers' and Dr. Johnson's, was the centre of a small solar system of wit, genius, and goodness. While he was rising, however, he fell—that is to say, from an ill-starred scaffolding in the church of Della Nunziata, in his own city. He left three painter sons,—Giovanni Battista, Francesco Maria, and Carlo. The last of these became a laud-

scape imitator of Claude and Gaspar Poussin. Borzone etched some plates from his own pictures; *i.e.* a portrait of Giustiniani, St. Peter delivered from prison, Prometheus devoured by the vulture, children playing, and a set of devout subjects.—W. T.

BOS, CORNELIUS. See BUS.

BOS, GASPAR VAN DEN, a Dutch sea painter, born at Hoorn in 1634. His pictures of storms, and calms, and brown sails furled and set, are highly finished and of a pleasant colour. He died in his prime, or, as he was a sea-painter, shall we say—"went down?" in 1666.—W. T.

BOS, LAMBERT, a Dutch philologist, born in Friesland in 1670; died in 1717. He gave himself up exclusively to the study of the Greek language, in which he made rapid progress, and succeeded Nicolas Blancard in the chair of Greek literature at Franeker. He is known chiefly by his work on Greek ellipses.

BOS, LEWIS JANSSEN, born at Bois-le-Duc in 1450. He painted enamel-finished flowers and fruits alive with bees and flies; also some insect-sized portraits. His snowdrops were perfect. Died in 1507.—W. T.

BOS or BOSCHE, JEROME, an eccentric Dutch painter and engraver, born at Bois-le-Duc about 1470. Stunned by the sight of some of Raphael's pictures at the Escorial, and certain of never equalling them, Bos determined to throw the reins on the neck of his own crochety and errant genius, and go whither it took him. Therefore, after painting the "Flight into Egypt," and "Christ bearing his Cross," for some Bois-le-Duc churches, he plunged into the jungle of his own odd fancy, followed by an army of glaring spectres, goblin devils, and conglomerate bird and beast monsters. He designed incantation scenes, witches' meetings, Judas attempting to escape with the ancient patriarchs liberated by Christ from hell, and hung by devils (from the beam out of his own eye) in the air. He loved to depict St. Anthony almost got the better of by devils, and St. Christopher fording through night rivers with the child Christ. His stiff gothic engravings are now scarce. He represents Christ girt by the eternal circles of light and glory. Seven of these are the capital sins, seven the sacraments. In one great allegorical picture, Bos is, indeed grotesquely sublime. He has mounted the carnal pleasures on a great chariot, which is dragged hellward by seven monsters, intended to represent the seven deadly sins; a lying blatant demon, disguised as Fame, precedes it with a herald's trumpet; a tumultuous rabble of monsters hurry after; and last of all comes Death, the mower of men, with his scythe wide as the world, shouting from a ghastly label the words of Isaiah—"Omnis caro fenum." Sometimes Bos's morbid imagination revels in terrible visions of martyrs torn by lions, or men lying murdered in wildernesses—the howling crowd of purgatory's lowest den—suicides rejoicing in death and self-inflicted torture. Although ranked in Germany and Spain as a man of singular virtue, Bos may be called "the first morbid painter"—the king of the Hell Breughel and Fuseli school. Of his strained, sickly, and extravagant fancies Kugler writes, vol. i, p. 96, "They are complete dreams, to the colouring of which, however, he imparts a remarkable glow." There is a representation of hell by him in the Berlin museum, in which the poor souls are tormented by horrible serpent-like monsters. It is a true laboratory of hell. With all its frantic horrors, one cannot but feel astonished at the invention displayed by the artist in the creation of these fabulous creatures—of humour, indeed, there is scarcely a trace. Like many of his contemporaries, Bos appears to have spent the greatest part of his life in Spain, where his pictures were much sought and imitated. It is asserted from tradition, that some of his pictures of infernal horrors placed in Basle, in which Philip II. of Spain died, received the last looks of the tyrant. Kugler goes on to say, that a great many of Bos's works were or are in Spain.—W. T.

BOSC, CLAUDE DE, a French engraver, known in England about 1712. He quarrelled with Dorigny about Raphael's cartoons, and illustrated Picart's religious ceremonies and Marlborough's battles. His drawing was bad, and his manner coarse and lumpy.—W. T.

BOSC, LOUIS AUGUSTUS GUILLAUME, a celebrated French naturalist, was born at Paris on 29th January, 1759, and died 10th July, 1828. He prosecuted his classical studies at the college of Dijon, and devoted himself early to the study of botany under Durande. He subsequently went to Paris, and became connected with the administration of the post-office, and afterwards with that of the prisons. At the time of the French

revolution he had to flee from Paris, and was long in concealment, subjected to great hardships and privations. After the death of Robespierre he returned to Paris. Some time afterwards he went to America, and spent two years in making natural history collections. On his return he placed the collections of animals and plants at the disposal of various naturalists, and thus contributed much to the advancement of science. He became administrator of prisons and hospitals, but he does not appear to have been able to make a livelihood, for in 1799 he was in great destitution. He then commenced a series of literary works, which have procured for him a high reputation. He published a dictionary of natural history, and one of agriculture, besides a complete theoretical and practical course of agriculture. He was one of the editors of the Annals of French Agriculture, and he was one of the editors of the last volumes of the Encyclopédie Méthodique. He became connected with various societies which had for their object the advancement of agriculture and horticulture, and he contributed papers to their Transactions. He published works on the culture of the vine, on the oaks of France, on the culture of trees, and the management of fruits. He made various excursions to different parts of France, as well as to Italy, in the prosecution of his natural history studies.—J. H. B.

BOSC, PIERRE THOMINES DU, a French protestant divine, famous as a preacher, born at Bayeux in 1623; died at Rotterdam in 1692. On the subject of one of Louis XIV.'s edicts against the Calvinists, he had a long interview with the king, at the conclusion of which Louis is said to have exclaimed to his courtiers, "I have just been listening to the finest speaker in my kingdom."—J. S., G.

BOSC D'ANTIC, PAUL, a learned Frenchman, born at Pierre-Ségade in Languedoc, in 1726; died in 1784. Author of a memoir on the manufacture of glass, that was crowned in 1760 by the Academy of Sciences at Paris. His works, in 2 vols. 12mo, are full of curious details connected with mineralogy, glass, and fictile manufacture.

BOSCAN, JUAN, a patrician of Barcelona, born towards the latter end of the fourteenth century, and well known as a poet in the language of Castile. Having become acquainted in 1524 with Navagiero, the Venetian ambassador to Charles V., he was induced by him to imitate in Spanish the sonnets, and other forms of verse used by good Italian authors. Boscán set himself to work, and having submitted a specimen of his composition to Garcilaso, he was encouraged by that celebrated writer to persevere in the new path opened to the Castilian Parnassus, and thus he became the founder of a new school. He was, for a short time, intrusted with the education of the duke of Alva, but he preferred retirement and study to the courtly honours he might have obtained under so powerful a patron. His knowledge of Greek and Latin transpires all through his works, his style and language always appearing robed in classic attire. He is the author of several good translations, such as of Euripides' tragedies and the Courtier of Balthasar Castiglione. His tale on the basis of the Hero and Leander of Musæus, written in blank verse after the example of Bernardo Tasso, contains many gentle and sweet passages, which even now can be read with pleasure. Nothing certain is known about his birth and death; but his widow having published his works in 1543, he may have died in that year.—A. C. M.

BOSCAWEN, EDWARD, admiral, second son of Hugh, Viscount Falmouth, born in 1711. His first command was that of the *Shorcham*, 20 guns, with which in 1740 he highly distinguished himself under Admiral Vernon at the taking of Porto Bello. In the following year he took a prominent part in the siege of Carthage, and after the attack of Bochachica, in which Lord Aubrey Beauclerk was killed, succeeded that gallant officer as commander of the *Prince Frederic* of 70 guns. In 1744, while in command of the *Dreadnought* of 60 guns, he took the *Medea*, a French man-of-war of 26 guns, commanded by M. Hoquart, an officer whom, strange to say, Boscawen on two subsequent occasions encountered and made prisoner. In 1746, being then captain of the *Namur*, 74 guns, he chased into Admiral Anson's fleet a French ship-of-war, the *Mercury*, 58 guns. The following year he distinguished himself in an engagement with the French fleet off Cape Finisterre, and was wounded in the shoulder by a musket ball. Having been named rear-admiral of the blue, and appointed commander-in-chief of an expedition to the East Indies, he set sail from St. Helen's, November 4, with six ships of the line, five frigates, and two

thousand soldiers. After reconnoitering the Mauritius, and finding the landing-place impracticable for an attack, he proceeded to Fort St. David's. By order of a council of war held at this place he assumed the command of the army, and marched against the French at Pondicherry, the siege of which, after two months of suffering and privation rather than of action, was raised October 6. In 1749 he lost his own ship the *Namur* and two more, but was himself providentially cast on shore. On his return home in the following year, he found that his services in the east had been recognized by his being named rear-admiral of the white. In 1751 he was appointed one of the lords commissioners of the admiralty. In 1755, having been appointed vice-admiral of the blue, he sailed from Spithead with a powerful fleet to intercept the French North American squadron. On his return he brought with him as prizes two ships of 64 guns each, and fifteen hundred prisoners. After some unimportant services as commander of the squadron in the Bay, he was named admiral of the blue, and appointed to head an expedition to Cape Breton. The important fortress of Louisburgh, the islands of Cape Breton and St. John, fell into his hands in July, 1758. On his return he received the thanks of the house of commons. In 1759 he was appointed to the command of a squadron, consisting of fourteen sail of the line and two frigates, ordered to cruise in the Mediterranean. With this force, surprising the French fleet commanded by De la Clue, who thought to elude the vigilance of the British admiral by departing from the port of Toulon while Boscawen was refitting his squadron at Gibraltar, he captured three sail of the line, and burned two in Lagos Bay. His prisoners amounted to two thousand. Later in the same year he was in command of the squadron in the Bay of Biscay. The "Brave Boscawen," as he was usually called, died at his seat at Hatchland, near Guildford, in 1761.—J. S., G.

BOSCH, BALTHASAR VAN DEN, a Flemish painter, born at Antwerp in 1675. He was taught by an unknown man named Thomas, whom he soon surpassed. The specialty of this Antwerpian was, like Poussin, the interior of saloons and rich renaissance saloons, filled with pictures, statues, and figures dressed in proper costume, but otherwise being mere doll furniture and characterless. Sometimes he would paint more for his own amusement a sculptor's or artist friend's studio, which were equally popular and in demand. His small portraits were so celebrated, that the duke of Marlborough (probably at somebody else's expense) sat to him on horseback—Peter Van Bloemen undertaking the horse, for Bosch would have made an ass of it. Bosch drew and coloured well, and his composition Bryan calls ingenious. Bosch died in 1715.—W. T.

BOSCH, BERNARD, born at Deventer in 1746, and died in 1803. He published political and patriotic tracts, in prose and verse, 3 vols. octavo.—J. A., D.

BOSCHAERT, NICHOLAS, a flower painter, whose reputation has faded like one of last year's roses. He was born at Antwerp in 1696. He was a scholar of Crepu's. He had a light airy touch, and shook his blossoms into a pretty enough confusion. He was frequently employed by his contemporaries.—W. T.

BOSCHI, FABRIZIO, a Florentine painter, born in 1576, and a disciple of Passignani. At the early age of nineteen, so soon he blossomed, he executed a fresco of the life of St. Bonaventure, which astonished and puzzled everybody. An "Assumption," and "Martyrdom of St. Peter and St. Paul," were good deeds of his. He died in 1642, after sixty years of painting, and having used canvass enough to serve a fleet.—W. T.

BOSCOLI, ANDREA, a Florentine painter, who flourished about 1580. He was a pupil of Santo de Titi, and acquired some reputation for history and portraits. He engraved nineteen plates, and then some unknown artist engraved the coffin-plate for Andrea Boscoli.—W. T.

BOSCOVICH, ROGER JOSEPH, mathematician, physicist, philosopher, and poet; born at Ragusa in 1711, died in 1787. Boscovich was a member of the Society of Jesus; his life was spent in study, in ease and honour; he appears to have received any office that he might covet; he was respected and pensioned; nor did he ever experience coldness or reverse except at the hands of D'Alembert and the encyclopedists, who were by no means disposed to hold a jesuit in unmerited or inordinate esteem. But his deserts were too great and too obvious to be affected by any slight; nor has posterity vindicated the singular hostility of Condorcet and D'Alembert. Boscovich had the good fortune to point out, first of all, the importance of the solar

spots as an index to the period of the sun's rotation; and amongst other services to science, he engaged with success in the earliest geodetical enterprise of merit, undertaken within the papal states. Not only was he a keen and intelligent supporter and expounder of the Newtonian doctrine of gravitation, but his enduring fame mainly rests on a daring extension of Newton's conception to the ultimate condition or constitution of Matter,—an extension which every subsequent and advancing step realized by physical speculation, has tended to elucidate and confirm. The theory alluded to, is laid down with greatest detail in the treatises, "De Continuitatis Lege," "Dissertationes de viribus viris," "Theoria philosophiæ naturalis reducta ad unam legem virium in natura existentium." In the main it is this—the ultimate elements of matter are indivisible points without extension, which are surrounded by spheres of force, alternating according to the distance from these points, up to a certain degree of remoteness: for instance, the sphere nearest to a point is one of repulsion, the intensity of which increases infinitely as the point is approached; beyond that distance, repulsion slides into attraction, and there is a sphere within which this influence exists and energizes; a sphere of repulsion again follows, and so on, until perceptible distances are reached, within which, in so far as at present known, attraction, or Newton's gravitation, alone prevails. The repulsive force in the neighbourhood of the point increasing *ad infinitum*, the quality of impenetrability is easily explained. If a body is so constituted that all its elements exist towards each other in the relation of attraction, the body will be compact or *solid*; if, on the other hand, its points or atoms are repellent, it must be gaseous; while if the distance between them is such that they neither attract nor repel, the body will be liquid. All ordinary phenomena are equally susceptible of explanation, on the ground of the conception of Boscovich: but it has a still larger amplitude, one that cannot be unwelcome to modern chemistry:—it shows *the possibility of transformation, without change of composition*. If, as explained above, the atoms of a body exist towards each other in the relation of attraction, the body is solid; but there are or may be many different degrees of distance equally compatible with such a relation, inasmuch as various spheres of attraction as well as repulsion may be supposed to exist. Change one sphere of attraction for another, and although the body continue solid, it will, to all intents and purposes, appear a new and distinct body, although no alteration of what is commonly called its chemical constitution, has been impressed upon it. Judging *à priori*, it seems far from unlikely that the relations between what (chemically speaking) are really simple and indecomposable elements, may receive elucidation from this idea of the accomplished jesuit.—Should Italy ever attain to peace and regain prosperity and repose, we shall expect, as one of the least of her achievements, a uniform and perfect edition of the works of Boscovich.—J. P. N.

BOSE, ERNST GOTTLIEB, a German physician and naturalist, was born at Leipzig on 30th April, 1723, and died there on 22d September, 1788. He distinguished himself in botany, and wrote treatises on the nodes of plants, the origin and direction of their roots, their secretions, and their circulation, besides several medical and surgical works.—J. H. B.

BOSELLI, ANTONIO, a Bergamo painter (circa 1500). He was a sculptor as well.—W. T.

BOSIO or BOSIUS, GIACOMO, an Italian historian, born either at Milan or at Chivas in Piedmont, lived in the second half of the sixteenth century. He was secretary and agent to the Maltese order, in the pontificate of Gregory XIII.

BOSON, a monk of Normandy, abbot of the monastery of Bec, born at Montevilliers in 1065; died in 1136. Before being appointed to that abbacy he had been in England with Anselm, and had represented that prelate at the council of Clermont, 1095.

BOSQUET, PIERRE-FRANÇOIS, Marshal of France, was born in 1810 at Pau, in the Pyrenees, and was educated at the college of that town. He entered the École Polytechnique in 1829, and in 1833 became a sub-lieutenant of artillery. In 1835 his regiment was ordered to Algeria, where he distinguished himself by his activity and enterprise. The following anecdote will show his military skill:—In an expedition undertaken by a small column of infantry, to which he was attached, with three or four guns, the little force was suddenly surrounded by a swarm of Arabs. The situation was critical, and the plan of operations was not calculated to meet and overcome such an unexpected danger. On receiving instructions from his commander as to

the use to be made of his guns, he ventured respectfully to oppose the plan, and to suggest a manœuvre by which the column could be extricated with very little loss. The plan was adopted, and the young lieutenant was charged with the movement. The result justified his calculations, and did honour to his military talent and judgment. The enemy was repulsed, and Bosquet thus laid the foundation of the high reputation which he ultimately enjoyed. Intended for the decoration of the legion of honour, his name was erased from the list proposed to the minister, and he did not receive the decoration. This flagrant injustice excited the generous indignation of his brother officers, who presented themselves in a body to the governor of Algeria, and demanded reparation. This energetic remonstrance succeeded, and Bosquet was decorated with the ribbon and star of the order by a special decision. Having attained the rank of a first lieutenant in 1836, and that of captain in 1839, he was appointed to the battalion of pontoons. Re-entering the artillery in 1841, he was soon afterwards promoted to the rank of chief of battalion of the native sharpshooters of Oran. In 1845 he attained the rank of lieutenant-colonel, and was appointed to the 15th light infantry. After some further changes, in 1848 we find him in command of the 16th regiment of the line; and having given his adhesion to the republican government then inaugurated, he was named general of brigade, and placed at the disposal of the governor of Algeria. He was present in most of the engagements which took place in Algeria during the last twenty years of the French occupation of that country. He was wounded in the battle of Sidi-Zaekhdar in 1841, and again on the 11th of April, 1851, in forcing the pass of Ménagel, at the head of his brigade. By this brilliant achievement he inaugurated the war against the Kabyles, in a manner which at once gave earnest of success. Of all the French generals, Bosquet was the best acquainted with Algeria, and the wild hordes which so long occupied the French arms. Intimately acquainted with Arabic, he made the manners of the people and the physical constitution of the country the subjects of profound study. His aim was to insure the continued submission of the fierce spirits opposed to him by moderation and justice, when he had subdued them by his energy and courage in the field. When he left Algeria, one of the native tribes which had submitted to French domination presented him with a pair of richly-damascened spurs, made in the European style, as a mark of their friendship and esteem. No greater proof can be desired of his moderation and uprightness in power. He was scarcely less deserving of notice, in fact, for his courage and capacity as a military commander, than for the inflexible rectitude and elevated sentiment of his character. In 1853 he became a general of division, and was sent by Marshal St. Arnaud in the following year, in command of the second division of the expeditionary army on the banks of the Danube, in spite of his well-known republican sentiments; for he was one of those who most strongly opposed the establishment of the imperial regime in France. He shared with St. Arnaud, Canrobert, and Pelissier, the dangers and trials of the Crimean campaign of 1854-55. He was foremost in forcing the passage of the Alma, and was one of the two generals (the other being General Macmahon) whose successful assault on the Malakoff forced the Russians to evacuate Sebastopol. His conduct at the battle of Inkermann drew forth from Lord Raglan the highest commendation, and was honoured with a special vote of thanks by the British parliament. Made G.C.B. in 1855, he was, in 1857, created Marshal of France. Bosquet died in 1861.—E.W.

**BOSQUILLON, EDOUARD FRANÇOIS MARIE**, born at Montdidier in 1744, and died in 1816. Educated first by his father, and afterwards at a jesuit establishment in Paris, he took a degree in medicine. In 1774 he was appointed professor of Greek at the college of France. Bosquillon possessed one of the most valuable medical libraries in the world, the catalogue of which fills four hundred closely-printed octavo pages. His translations, chiefly from English medical and surgical books, are highly prized. His notes often exceed the text in extent, and are said to render his translations of more value to a student than the originals. Bosquillon's benevolence makes his name remembered among the poor.—J. A., D.

**BOSSCHA, HERMAN**, born in 1775; died in 1819; conducted a Latin school for several years; and in this capacity moved from time to time from one Dutch city to another, finally occupying a chair as professor at Amsterdam. He published

some occasional poems in Dutch and in Latin. He translated into Dutch Blair's Lectures, and Plutarch's Lives. He wrote a history of the revolution of Holland in 1813, which is still referred to occasionally.—J. A., D.

**BOSSCHAERT, THOMAS WILLEBORTS**, a Dutch painter, born at Bergen-op-Zoom in 1613. He studied at Rome, and under Segers. His style much resembles Vandyck. In 1646 he was made director of the Antwerp academy, and died in 1656.

**BOSSE, ABRAHAM**, a French engraver, born at Tours about 1610. He imitated Callot in his more careless and ragged manner, worked chiefly from his own designs, and published a work on engraving, afterwards republished with additions by M. Cochin. He executed portraits of Cardinal Richelieu and Callot, and a scene of the marriage of Louis XIV.—W. T.

**BOSSECK, HEINRICH OTTO**, a German physician, was born at Leipzig on 27th October, 1726, and died 30th January, 1776. He prosecuted his medical studies in his native town, and then travelled in France. Besides some medical works, he has written dissertations on the stems of plants, the nodes of plants, and the anthers.—J. H. B.

\* **BOSSOLET, HIPPOLYTE**, a political writer, born at Paris in 1824. Although esteemed for his talents, he has not written any work by which to be fairly judged.—J. F. C.

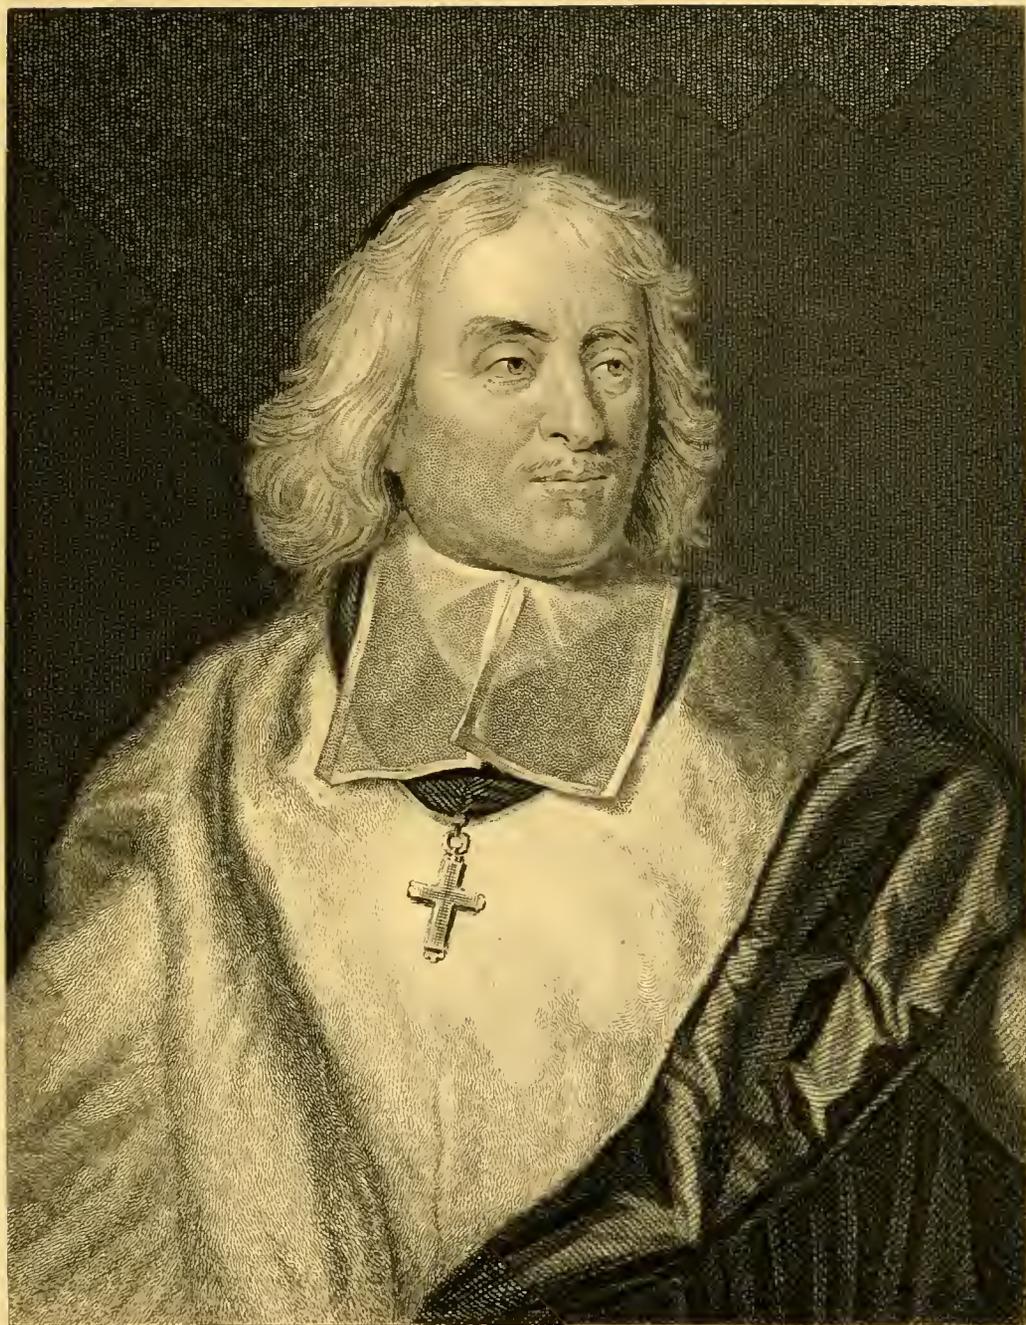

**BOSSI, GIUSEPPE**. This celebrated writer and artist was born at Busto Arsizio, near Milan, on the 11th of August, 1777. Having completed his classical education at the college of Monza, in which he highly distinguished himself, and unable to resist any longer his love for the fine arts, he went to the academy of Brera, and under the direction of Appiani and Traballesì he studied drawing and painting. So rapid was the progress made in those arts, that his masters urged on him the necessity of going to Rome, and studying there the chef-d'œuvres of the old masters. It was in Rome he met Canova, who took the promising youth by the hand, directed him in his studies, and soon conceived for him the warmest friendship, which was never interrupted during Bossi's life, unfortunately but too short. Bossi, Canova, and two or three other artists, represented then with honour, and even with eclat, the Italian school in the fine arts. On Bossi returning to Milan he was appointed secretary of the Academy of Painting, and his talents both as a painter and a poet won the admiration of Napoleon I., who created him a knight of the iron crown, and president of the academies of Milan, Venice, and Bologna. His fame as a writer commenced in 1810, when he published his great work in four books, entitled "Il Cenacolo di Leonardo da Vinci." This work has been eulogized by Giuseppe Maffei, who considers Bossi one of the greatest prose writers of Italy; and Goëthe proclaimed it a masterpiece of erudition and taste. Bossi was also one of the collaborators to the biography of Leonardo da Vinci, to which more than sixty literary men from all parts of Italy contributed their share of information. When resting from his artistic occupations, Bossi devoted many leisure hours to poetry, and some hymns, canzones, and sonnets from his muse, fertile in lyric beauties, have been published in various collections. His poem, written in the Milanese dialect on the marriage of Prince Eugene Beauharnais, has enhanced Bossi's fame as a poet. A marble bust by Canova, and a magnificent sarcophagus, have been erected in Milan by the numerous pupils and admirers of this eminent artist and distinguished writer. He died on the 15th of December, 1815.—A. C. M.

**BOSSI, GIUSEPPE CARLO AURELIO**, baron de. This celebrated diplomatist was born at Turin on the 15th of November, 1758. Having finished his collegiate education, he devoted himself to the study of the law, and attended for five years the lectures on jurisprudence delivered in the university of Turin by the celebrated historian, Carlo Denina, who became afterwards his warmest friend. Bossi was scarcely fifteen years of age when he published two tragedies, "Rea Silvia" and "I Cirassi," both of which met with general approbation. When Joseph II., emperor of Austria, published in 1781 his famous edict of forgiveness, Bossi composed for the occasion an ode full of philosophical ideas and liberal suggestions, quite at variance with the spirit of the subalpine government. Its author was requested to leave Turin, and Bossi chose Genoa as his retreat during his undeserved ostracism. After a residence of six months in that city, the portfolio of the home secretary being vacant, Bossi was appointed first secretary of legation, and then minister *ad interim*. It was during his summer vacations he composed the greater

part of his lyric poetry, and an epic poem on the unfortunate death of the prince of Brunswick, who was drowned on the 27th of April, 1785, whilst endeavouring to save several labourers who were in imminent danger. This poem, entitled "Elliot e L'Ollanda Pacificata," is a faithful account of all the historical facts and personages connected with Holland. When the French revolution broke out, Bossi was sent by his government to the camp of the king of Prussia, to consult with that sovereign on the perilous position of Piedmont, and to find out the conditions on which rested the Austro-Russian alliance. From thence he went to Russia as envoy extraordinary, and remained there for two years. The king of Sardinia having signed a treaty of alliance with France, Bossi was ordered by Paul I. to quit his dominions; and on his return to Turin he received as a reward for his ability and courage the embassy to Venice. That aristocratic republic having fallen in 1797, Bossi returned to Turin, whence he was deputed as an "alter ego" from the king of Sardinia to the general-in-chief of the French armies. From that moment Bossi always followed Napoleon, and rendered most important services to his king. After the treaty of Campo Formio in 1797, Bossi was sent as ambassador to Holland, where he became acquainted with General Joubert, whose friendship he enjoyed, and who gave him the most indisputable proofs of his unlimited confidence. Joubert having deprived King Emmanuel of his crown, requested Bossi to repair to Turin and assist him in laying the foundations for a new government more suitable to the wants of the time. Bossi had also the confidence of Talleyrand, who more than once profited by the consummate knowledge in politics that the Italian diplomatist had acquired in his travels, and during his long residence in Russia, Prussia, and Venice. It was in his daily intercourse with the French minister that Bossi discovered the real intentions of France towards Piedmont, and endeavoured by all means to avert from his country the impending catastrophe, by effecting a reconciliation between the two republics. The French army having been beaten by the Austrians and compelled to retreat, leaving Piedmont in the hands of the enemy, Bossi fled from Italy and came to Paris, where he devoted his time to literature. After the victory of Marengo and the dispersion of the Austro-Russian army, he returned to Italy, and was appointed by General Berthier minister plenipotentiary to the Ligurian republic. That appointment did not meet with the approbation of the first consul, who instituted a government commission, well known in Italy by the name of the government of the three Charleses, for its members were—Carlo Bossi, Carlo Giulio, and Carlo Botta. It was Bossi who advised Napoleon to join Piedmont to France, that territory being indispensable as a military station, of an immense strategical importance, and as a magazine for the French armies in Lombardy and Germany. Napoleon understood the purport of such a counsel and executed it, to the detriment of the nationality and independence of Italy. Bossi was accused of treason by his countrymen, and endeavoured to explain his conduct in a pamphlet, which was translated into French by the order of government, and circulated throughout the empire. From that time to 1805 Bossi lived in complete retirement from public affairs, and reappeared on the political stage at the request of Louis Napoleon, then king of Holland, who induced Bossi to accept the governorship of the department of Ain. In 1810 Bossi was created a baron of the empire, and sent with the same rank to the department of La Manche, where he remained till the year 1814. In 1815 he was made a knight of the legion of honour, and was presented with letters of naturalization by Louis XVIII., but soon after being suspected of leaning towards Napoleon, he was deprived of his governorship, although the most influential inhabitants memorialized the king in favour of their governor, and entreated that he should be left unmolested. This demonstration of affection and esteem determined Baron de Bossi to fix his residence in France; and it was only after thirty-five years of high diplomatic and political functions that he revisited his native country. Whilst he was governor of Ain he wrote a poem, entitled "Oromasia," the subject of which is the French revolution. His versification is noble and faultless, and under the assumed name of Albo Crisso, we can easily discover a scholar well acquainted with the prince of epic poets whom he successfully imitates. This extraordinary man, the principal events of whose life have been briefly registered here, died in Paris, regretted by a numerous circle of friends and admirers, on the 20th of January, 1823.—A. C. M.

BOSSO, MATTEO, born of a noble family at Verona in 1428. He was sent early by his parents to Milan, under the direction of Pietro Perleoni, an eminent rhetorician, whose school was then frequented by many foreigners. Having completed his studies, he obtained the direction of the chapter of canons at Fiesole—a dignity which introduced him to Lorenzo de Medici, through whose powerful recommendation he was elected a member of the Platonic Academy. Poliziano and Pico della Mirandola became his friends; and such was the esteem in which he was held by Lorenzo de Medici, that he was chosen as the fittest person to present the cardinal's hat and purple to his son Giovanni, afterwards Pope Leo X., an honour which is generally reserved for the most intimate friend of the family. Sixtus IV. many times wished to confer on him the episcopal dignity, which he always refused through christian humility. He was considered an accomplished orator and a sound philosopher, and has left many Latin works, which are considered by Poliziano of great literary merit. His collection of letters, under the title of "Epistolæ Familiæ et Secundæ," are full of moral and philosophical doctrines, and his orations are cited by Rosini and Bayle as models of sacred oratory. His work in eight books, "De Vero Sapientiae Cultu," was adopted by many Italian and foreign universities. His translation, with notes, of five of Cicero's orations, was interrupted by his death, which took place at Padua in 1502.—A. C. M.

BOSSUET, JACQUES BENIGNE, bishop of Meaux, the glory of the church of France in these later ages, was born at Dijon on the 27th September, 1627. His father, Benigne Bossuet, was descended from an ancient and honourable family in Burgundy, and was himself a councillor in the parliament of Metz. The duties of this function obliged him in 1633 to transfer his residence to Metz, leaving the young Bossuet under the care of his uncle Claude, a man in every respect worthy of the charge. The boy was designed from the first for the ecclesiastical state, and received the tonsure in his eighth year. At the age of thirteen he was nominated to a canonry in the cathedral of Metz. Soon after his father's removal to Metz, he was placed at the college of the jesuits at Dijon, where he remained about eight years. His punctual and faithful mode of working even then procured for him from his schoolfellows (punning on his name) the title of "bos suetus aratro." For a similar reason St. Thomas Aquinas, when studying at a college in Paris, was called by his companions "the great dumb ox," or "the Sicilian ox." The earliest trait recorded of him, which shows in a marked way the bent of his genius, is the impression made upon him at a very early age by reading some pages of a bible which he found one day on his father's desk, and obtained leave to take away with him. From that time he read and pondered on it incessantly, and with extraordinary devotion; and in his mortal illness, seventy years later, we shall find that the same book was still his darling resource, and his unfailling consolation. The jesuits, soon discovering the great abilities of their pupil, evinced a desire to attach him permanently to their society; but as this did not meet the wishes of the family, his uncle in 1642 sent him up to Paris, where he entered in the college of Navarre as a theological student. He remained at the college, with intervals, for ten years. On the day he entered Paris he saw Cardinal Richelieu, then sinking under a mortal disease, being carried in a litter into the city, and a few days after, he followed his body to the tomb. It was while at the college of Navarre that that extraordinary eloquence which afterwards spread his fame through Europe, found the first occasion to display itself. One evening at the hotel Rambouillet, the conversation turned on preaching, and M. de Feuquières, who had known Bossuet at Dijon, remarked to Mine. de Rambouillet (a member of the royal family), that he knew of a young student at the college of Navarre, who, if he was sent for at that moment, and if a text were given to him, and a few minutes allowed for preparation in a room by himself, would preach to them an eloquent discourse an hour long. This strange sort of wager was at once taken up; Bossuet was sent for, and after a short meditation, came forward and preached a sermon, the force and eloquence of which astonished all his hearers. The good bishop of Lisieux hearing this, and knowing already something of Bossuet, sent for him, and had the experiment repeated in the presence of himself and two other bishops. But when it was over, seeing all the danger to which such a talent in one so young (Bossuet was at the time only sixteen) exposed its possessor, M. de Lisieux, in a kind and paternal admonition, entreated the young prodigy

not to suffer himself to be withdrawn by the love of praise, or the persuasions of others, from that studious, humble, and retired life which was fitting for his age. Bossuet heard and heeded, and we hear of no more such displays of oratory.

In 1648 he took his bachelor's degree; after which he resided at Metz for two years, to be near his family, while studying for the theological license. In 1650 he commenced his license at the college of Navarre. During the Lent of 1652 he took priest's orders, having previously made a retreat at the college of St. Lazare, under the direction of St. Vincent de Paul. He conceived an earnest and affectionate admiration for his director, and nearly fifty years later, in 1700, took an active part in promoting his canonization at Rome. In May he obtained the license of doctor in theology, coming second on the list, the abbé de Rancé being the first. The founder of the austere order of La Trappe was at this time plunged in the vanities and dissipations of the world, and no tie of sympathy seemed possible between him and the serious studious Bossuet. But events were so strangely ruled, that the grave student came to be the trusted and familiar inmate of the most magnificent court of Europe, while the brilliant de Rancé, flying from his remorse to a frightful solitude, expiated for long years in penitential austerities the errors and follies of his youth. Under these altered circumstances, the two men met again, as we shall see.

At this period, when the formal preparation for life was completed, Bossuet had to decide what course to take. He was urged to stay in Paris; he had powerful friends and patrons at court; and such powers as his must insure a successful career. On the other hand, Cornet, the grand-master of the college of Navarre, wished to resign in his favour, and pressed Bossuet to consent to be nominated. But lastly, he was a canon, and now archdeacon, of the cathedral of Metz; and here a plain path of duty presented itself. Bossuet did not hesitate; he went to Metz, and resided there for six years. During this period he added largely to those stores of learning which he afterwards so ably employed. Among the fathers, St. Augustine was his great oracle; he read and re-read him, and completely penetrated himself with the modes of thought of the fervid African. But more than all he studied the New Testament, a copy of which he had always about him. He lived on friendly terms with the minister of the Calvinists at Metz, M. Paul Ferri, and it was with him that he commenced the long series of his controversial writings, by publishing, in 1654, a refutation of the catechism of Paul Ferri. The fame of his preaching gradually spread, and he was so often invited to preach in Paris, that at the end of 1658 he transferred his residence to the metropolis, taking up his abode at the deanery of St. Thomas du Louvre. For the next ten years he lived at Paris, preaching constantly, gaining the friendship of good men by his purity of life and uprightness of character, and causing the ascendancy of his genius to be daily more felt. In 1661 he preached for the first time before Louis XIV. In 1667 the great Turenne made to him his abjuration of protestantism, after reading the manuscript of his "Exposition de la foi Catholique." His recognized moderation and fairness of mind caused him to be employed by M. Péréfixe, archbishop of Paris, with much success as a mediator between Arnauld and the party of Port Royal, and their assailants. A great number of the sermons which he preached at this time are to be found in the collective editions of his works. In lucidity of arrangement and correctness he is said to yield to Bourdaloue, and in the musical flow of his periods to Massillon; the ruggedness as well as the fervour of St. Augustine hangs about his style; but for comprehensiveness of view, for grandeur of conception, for that enthusiastic eloquence which springs from deep personal conviction, Bossuet's sermons have perhaps never been equalled in modern times.

In September, 1669, he was nominated to the bishopric of Condom; and in the following year, the king, whose admiration and regard for him had gone on augmenting, appointed him preceptor to the dauphin. During the next ten years, therefore, Bossuet lived at court, for he resigned the bishopric of Condom a few months after receiving the above appointment. His labours during this period, whether in the field of controversy, or in that of biblical commentary, or of tutorial instruction, were unceasing. His famous conference with the minister Claude in 1678 we shall speak of presently. His commentaries on the Psalms were the result of a long series of conversational promenades in the Allée des Philosophes in the park at Versailles, where Bossuet

was of course the presiding genius, but which the greatest intellects of France—Fenelon, Fleury, Pelisson, La Bruyere, &c., delighted to attend, for theological, philosophical, and literary discussion. The MS. of the chief part of the commentaries produced at this time was never printed, and has unfortunately been lost. Those who were present at these meetings used always to dine with Bossuet, who gave, according to the abbé de Longue-rue, *fort mauvaise chère*. His pupil, the dauphin, was a youth of very ordinary abilities, and but little sympathy seems ever to have been established between him and Bossuet. It was for the instruction of this prince, nominally at least, that the celebrated delphin editions of the classics were composed, and that Bossuet wrote his "Discours sur l'Histoire Universelle," than which none of his works bears a clearer impress of his lofty mind. But we should do scanty justice to Bossuet's immense activity, did we suppose that his life at court was engrossed by literary pursuits, however varied. By him, in 1674, the weak purpose of Mme. de la Vallière, long struggling between her awakened conscience and her splendid temptations, was strengthened and sustained; and in the following year he preached one of his most celebrated sermons at her solemn profession in a Carmelite monastery. By him, in a great measure, in the same year, the guilty connection of Louis XIV. with madame de Montespan was for a time broken through. Turenne in 1675, and the duc de Rochefoucauld, author of the *Maximes*, in 1680, dying in his arms, received from him the last succours of religion. He wrote also at this period several letters to the king, while with the army in Flanders, in one of which he strongly urges him to exert himself to relieve the distress among the people. Bossuet's eagle eye detected the weak spot in the apparent greatness and magnificence of France; and had his advice been honestly followed, perhaps the revolutionary ruin of the succeeding century might have been averted. In 1680 the education of the dauphin being over, Bossuet was made first almoner to the dauphiness. For the space of a year he had no other definite employment, until in May, 1681, he was nominated by the king to the vacant see of Meaux. He was about to prepare himself for his new duties by a retreat at La Trappe, when his design was frustrated by the pressure of weighty business connected with the approaching assembly of the French clergy at Paris, to consider the question of the *régale*. Our limits will not permit us to attempt anything like a regular narrative of the proceedings of this celebrated assembly. Suffice it to say, that Bossuet was the life and soul of a body which contained all the most distinguished ornaments of the church of France—a church never at any time more richly adorned by the virtues and talents of her clergy than then. He was chosen to preach the opening sermon on the 9th November, 1681; and the line of conduct which he traced out in this discourse, was exactly that which by incredible labour and patience, and by the full exertion of all his matchless powers, he finally induced the entire assembly to pursue. After the affair of the *régale* was settled, the assembly proceeded to deliberate on the general questions of the relation of the spiritual to the temporal power, and of the papacy to the church. The result was the declaration of the Gallican church, dated March 19th, 1682, contained in four articles composed by Bossuet. The most important points of this declaration are, first, the assertion of the radical distinction between the spiritual and temporal powers, and of the independence of the latter on the former; secondly, the declaration, in conformity with the council of Constance, that the decision of a pope, even in questions of faith, is not irreformable, "*nisi ecclesie consensus accesserit*."

After the breaking up of the assembly in June, 1682, Bossuet immediately proceeded to Meaux, the see of which he administered for the remaining twenty-two years of his life; and at this point we shall collect together such notices as our space will permit us to record concerning his manner of life in his diocese, and in his own household. He now carried out his suspended project of visiting the monastery of La Trappe, the superior and founder of which, the abbot de Rancé, he cordially loved and admired. During this retreat, he edified the monks of that ascetic order by the strict fidelity with which he conformed to all the observances prescribed by the rule. He visited La Trappe eight different times in the course of his episcopate, and used to say that he was never happier than when there. Upon his return to Meaux, he zealously applied himself to the discharge of the duties of the episcopate, bringing to bear upon the guidance of the souls committed to him all the immense

energy and extraordinary powers of body and mind with which God had endowed him. With unremitting toil he thus devoted himself for more than twenty years to the pastoral charge, until, in the last year of his life, incessant pain and weakness disabled him from its continuance. He paid great attention to the proper regulation of the seminary in his diocese, especially urging upon the students who were in training for the priesthood, the importance of perfecting themselves in the art of speaking in public, so as to be able to preach constantly to their congregations. In conducting the controversy with protestants, he deemed this qualification to be one of paramount necessity. In all his relations with his clergy there was that blending of simplicity with dignity, and of frankness with firmness, which is distinctive of true moral greatness. In the clerical conferences which he held frequently in different parts of his diocese, it was his delight to discuss and resolve questions of practical difficulty bearing on the duties of pastors; and nothing was more remarkable than the way in which he knew how to adapt the level of his conversation, and even his manners, to that of the less refined and educated members of the priesthood whom he found in remote districts. He held a diocesan synod once a year; and these were the occasions which he always chose for delivering "canonical admonitions" to such of his clergy as might be liable to censure. This was a favourite plan with him, and succeeded admirably. He used to say, "A bishop should instruct, rather than institute proceedings. *Men do not appeal from the word of God.*" He preached regularly on Sundays and holidays in his cathedral, but after he came to Meaux he never wrote his sermons. Shortly before mass one Sunday, Fleury and the Abbé Ledié, his secretary, entering his study unannounced, saw him on his knees, with head bare and the gospel in his hand, absorbed in meditation; such was usually his sole preparation for preaching. In another department of pastoral duty, his astonishing labours must not be wholly passed over. There are extant more than seven hundred letters of advice and direction on religious matters addressed by him to nuns, especially to the widow Cornuan. In giving advice on such subjects, he took St. Francis de Sales for his model. They fill the eleventh and twelfth volumes of the Benedictine edition of his works. As a proof of his firmness and ability as a ruler, we may quote the celebrated case of the exemption of Jouarre. This monastery, which under the terms of an ancient papal brief, claimed exemption from the jurisdiction of the bishop of the diocese, had fallen into a state of great relaxation. The abbess, a princess of the house of Lorraine, resided for a few weeks in the year at Jouarre, and passed the rest of her time in the gay world of Paris. When all entreaty and admonition had failed, Bossuet, undeterred by the influence at court of the powerful relatives of the abbess, instituted a process in the grand chamber of the parliament of Paris, and obtained a decree annulling the exemption. But the inmates of the abbey still made a contumacious resistance to the actual exercise of the episcopal jurisdiction, and the narrative of the skill, patience, and firmness, with which Bossuet at last succeeded in overcoming this resistance, forms the best illustrative comment on his character.

Into the regulation of his domestic life Bossuet carried the same conscientiousness and resolution which distinguished him in his public career. The mass of work which he contrived to get through is something confounding to ordinary conceptions. "But," as his secretary, quoted by de Bausset, well observes, "a man accustomed to lose not a single moment, has time for all his duties; a man all whose pleasures, and even his very sleep, are a study, has years more extended, and a longer life than ordinary mortals." The one point on which he seems to have failed was household economy; he trusted his pecuniary affairs entirely to a steward, and they consequently became somewhat involved in the last years of his life. His country-house at Germigny, near Meaux, was the favourite resort of princes, nobles, and ecclesiastics—of all that was highest and best in France, and all the illustrious foreigners that visited Paris. The great Condé, Fleury the historian, the Abbé Renaudot, d'Herbelot the celebrated orientalist, and la Bruyère, author of the *Caractères*, were among his intimate friends. Boileau relates that he submitted to him in 1695 the MS. of his epistle *Sur l'amour de Dieu*, an attack upon the false casuists; and that Bossuet, after reading it twice or three times, honoured it with his hearty approbation. Similarly the *Athalie* of Racine was shown to and approved by him before publication. But to

give even a summary of the varied relations, all interesting and worthy of himself, in which this great man stood to the savans, the poets, and the general society of his age, would require a volume rather than an article. Before entering upon the closing scenes of Bossuet's life, it is necessary to say a few words, first, on his controversy with protestants; secondly, on his dispute with Fenelon; thirdly, on such of his works as will not have been mentioned in connection with the two previous heads. No notice of the life of Bossuet could be considered complete which did not give some historical account of the controversy which he waged for fifty years against protestantism; for a subject which took up so much of the time and thoughts of so great a man, and his writings on which created so great a sensation in Europe, could not fairly be left out of sight by an impartial biographer.

In 1654, when Bossuet published at Metz his first controversial work, the "*Refutation du Catechisme de M. Paul Ferri*," protestantism was still numerous and powerfully supported in France. At Metz, in particular, the Huguenots mustered very strong, and it was here that their annual synod of ministers was held. Thinking, as he became more deeply engaged in the controversy, that one principal cause of estrangement was the distorted view which many protestants had of the catholic doctrines, Bossuet conceived the idea of composing a short and clear exposition, showing both what these doctrines were and what they were not, to which he could refer an inquirer or an opponent. This was the origin of the "*Exposition de la foi Catholique*," the perusal of which is said to have converted Turenne. The work remained for many years in manuscript, and was published, at the urgent entreaty of Turenne himself, in 1671. In 1678, while Bossuet was at court, occurred his famous conference with Claude. It was brought about by Mdlle. Duras, a niece of Turenne, who had been educated as a protestant, but was now leaning to catholicism. Each of the disputants published a version of the conference, but with many discrepancies. When Bossuet went to Meaux in 1682, he found the protestants very numerous in the diocese. He organized a regular system of missions for their conversion, which was attended with considerable success. Like St. Augustine, he set his face against the employment of any other means for the attainment of religious uniformity but those of instruction and persuasion. He never once called for the interference of the civil power against the protestants; but, on the contrary, in the case of M. Seguier and others, succeeded, by appealing to the court, in checking the persecuting exercise of authority sanctioned by the marquis de Louvois. It is an ascertained fact that he was not consulted, and had no concern whatever, in the fatal measure of the revocation of the edict of Nantes. His fairness, kindness, and straightforwardness, were acknowledged by the protestants themselves, who never taxed one of his episcopal acts with injustice or severity. In 1688 appeared the famous work, announced many years before, known as the "*Histoire des Variations des Eglises Protestantes*." Burnet, who was roughly handled in it, and Jurieu, wrote replies, to which Bossuet responded in his "*Defence de l'Histoire*," &c., and his "*Avertissemens aux Protestans*," published in 1691 and 1689 respectively. From 1691 to 1701 an interesting correspondence was carried on between Bossuet and Leibnitz on the subject of a reunion between the catholic and Lutheran churches. Bossuet, who had the project much at heart, would have gone so far as to concede the cup to the laity of the Lutheran communion, if they desired it, and to relax the law of celibacy in favour of the existing Lutheran ministers, upon their becoming catholic priests. Leibnitz at first entered warmly into the scheme, but political considerations induced him after a time to moderate his zeal, and at last, in 1701, to break off the correspondence altogether. In that year, by the death of the duke of Gloucester, the princess Anne's only surviving child, the succession of the house of Hanover to the British throne became almost a certainty, and it would not do for a confidential servant of that house to continue a correspondence which might bring upon his patrons a suspicion of Rome-ward tendencies, and thus imperil their acceptability to protestant England. Writing to Fabricius in 1708, Leibnitz says—"All our rights over England are founded upon the exclusion and hatred of the Roman religion; therefore whatever acts might bring upon us the appearance of being lukewarm opponents of Rome, are deservedly to be avoided." It is possible, however, that this correspondence had a real effect upon the secret convictions of Leibnitz; for in his posthumous work, the *Systema*

Theologicum, his leaning towards the entire catholic system is manifest.

The celebrated controversy between Bossuet and Fenelon, on the subject of quietism—the one only transaction in the life of Bossuet which his biographer approaches with regret—extended over a period of five years, from 1694 to 1699. Some years before, Molinos, a Spanish monk, had published a work on the nature of true spiritual perfection, so redolent of delusion and false mysticism, as to have incurred the formal condemnation of the Holy See. Madame Guyon, about the year 1694, revived, both in her writings and in the conferences at which she enlightened her disciples, the principles of Molinos, though in a somewhat modified form. Fenelon, who was at that time preceptor of the dauphin, but was nominated in 1695 archbishop of Cambrai, was inclined, from a similarity of mental structure, to view with favour the rhapsodies of Madame Guyon; but others, particularly the bishop of Chartres, strongly disapproved of her proceedings, and at length prevailed upon Bossuet to take notice of them. He invited Madame Guyon to visit Meaux, where she resided for six months in a convent. During this period Bossuet examined all her writings, which she freely confided to him, and in frequent conversations with her explained the nature of the errors into which she had fallen, and counselled her respecting her future conduct. She was apparently all docility and submission, and Bossuet, on her leaving Meaux, gave her a certificate stating his belief in the perfect rectitude of her intentions. In the meantime took place the conferences at Issy (February, 1695), at which some important articles on the disinterested love of God were drawn up, and signed by Fenelon himself, to which we shall presently have occasion to refer. Mme. Guyon upon leaving Meaux, instead of remaining quietly in the country as she had promised, went up to Paris, and there circulated among her followers copies of Bossuet's certificate, as if it amounted to a complete justification of her conduct. An order was thereupon issued from the court, which Bossuet seems to have approved or obtained, that she should be arrested and placed in confinement. This measure was the commencement of the estrangement between Bossuet and Fenelon, which was widened shortly after by Fenelon's refusal of his approbation to a work which Bossuet had got ready for the press, entitled "Instructions on States of Prayer." Fenelon meantime was preparing his *Maximes des Saints*, which appeared in January, 1697. In this work, although approved by several censors, and although Fenelon prefixed to it a declaration of his entire adherence to the articles of Issy, the traces of a false mysticism and a spurious spirituality are indubitably present. It contains this assertion, that "a habitual state of love to God is possible, which excludes both the fear of punishment, and the desire of reward;" and it admits an hypothetical case, in which, so long as it retained the love of God, "a soul could consent to the absolute sacrifice of its salvation." Both these propositions were clearly inconsistent with the articles of Issy. Bossuet's work on states of prayer appeared six weeks after that of Fenelon. The feeling at court (see St. Simon's memoirs) set at first strongly against the work of the archbishop of Cambrai. Bossuet immediately set to work to examine the *Maximes des Saints*, and soon extracted from it a number of propositions which he judged to be deserving of condemnation. After many conferences he prevailed on the archbishop of Paris, and the bishop of Chartres, to join with him in a declaration which appeared in August, 1697, condemnatory of these propositions. But Fenelon had already sent his book to Rome, and submitted it to the judgment of the pope. Rome proceeded in the matter with her usual deliberation; and during the eighteen months which elapsed before her decision was promulgated, an incessant war of pamphlets was carried on between the two disputants. Each put forth his utmost powers; and while the brilliancy and force of the one never appeared to greater advantage, the calm argumentative dignity of the other caused him to have certainly not the worst in the strife. But it is painful to see, as the dispute proceeds, a gradual increase of bitterness on both sides, but particularly on that of Bossuet, and at last a recourse even to personalities. It must have been only in a moment of extreme irritation that Bossuet could commit to paper the comparison of Fenelon and Mme. Guyon to Montanus and Priscilla. At last, in March, 1699, arrived the brief of Innocent XII., condemning the *Maximes des Saints*, with twenty-three propositions extracted from it. Fenelon's prompt and edifying submission is well

known. It is consoling to know that Bossuet took steps before his death to bring about a reconciliation with Fenelon, which were baffled by a series of unfortunate *contre-temps*.

We can only devote a very few words to Bossuet's remaining works. His funeral orations—a kind of composition which, greatly as he excelled in it, he disliked—are a mine of profound and consoling thoughts—of vivid images—of inspiring exhortations. Among his devotional works are the "Meditations sur l'Evangile," and the "Elevations sur les Mystères." The "Paraphrase du Pseaume XXI." was written only two months before his death. But we cannot undertake to give even all the titles of his many works, but must refer the reader either to the Benedictine edition of them, or, for a general view of their contents, to the *Life* by de Bausset.

The time now drew near when this great man, who had been for fifty years the soul of France and the admiration of the catholic world, was to pay himself that last debt of nature which he had taught so many to contemplate with holy hope. In 1701 another assembly of the French clergy was held, in which, as in that of 1682, Bossuet's was still the master spirit, guiding all deliberations, and shaping all decisions. He obtained a formal censure by this assembly of a number of propositions involving a lax and pernicious casuistry, and especially of the monstrous doctrine of probabilism. In December of the same year he was visited by the first premonitory symptoms of the disease of which he died. The physicians upon examination declared it to be the stone. Lithotomy was at that time imperfectly understood, and as Bossuet himself shrank from the operation, the medical men confined themselves to administering such palliatives as their art could supply. He was at Meaux for three months in the spring of 1702, and preached for one hour in the cathedral with all his wonted fluency and power on the subject of frequent communion. The last words of this, his last sermon in that place, were as follows:—"I wish that you should remember that a certain bishop, your pastor, who professed to preach the truth and to uphold it without disguise, collected together in this one discourse the capital truths of your salvation." He returned to Paris to be near the physicians, but spent the end of the year 1702 at Meaux, leaving it for the last time early in 1703. The remainder of that year was spent in Paris or Versailles, the physicians not allowing him to return to Meaux. Prolonged and racking pains gradually attenuated and enfeebled his powerful frame; but except when at rare intervals physical agony caused a temporary suspension of the mental powers, his intellect retained its full strength, and his wonderful memory was as clear as ever. In the midst of his sufferings the slightest sign of impatience never escaped him; but he was often heard to murmur, "Lord, I am cast down, but not confounded; for I know on whom I have believed; Thy will be done." His chief consolation was in hearing the New Testament read to him, particularly the Gospel of St. John, which was thus read over to him more than sixty times during his illness. In March, 1704, he was constantly attended by his confessor, the abbé de St. André. Upon the abbé's expressing some surprise that Bossuet, so profound and experienced a theologian, should consult him so minutely upon questions of conscience, he replied—"Undeceive yourself; God only gives us light for the guidance of others; he often leaves us in darkness with respect to our own conduct." On the 8th April he received the last sacraments, making all the necessary responses with the humility and docility of a child. On the night of the 10th, when he was evidently sinking, the Abbé Ledieu, his secretary, entreated that he would sometimes think on those whom he had left behind him, who had been ever so devoted to his person and to his glory. At these words the dying bishop half raising himself up, said with a holy indignation—"Cessez ces discours. Priez pour moi pardon à Dieu de mes péchés." After a day of great suffering, he quietly expired in the night between the 11th and 12th of April, without agony or convulsion. When the body came to be opened, a stone was found as large as an egg.

Bossuet was tall and of a commanding presence; there was something remarkably noble about the expression of his head and face, and the effect was heightened in his old age by his long white hair. By a fortunate mistake his tomb escaped the iconoclastic fury of the Jacobins during the French revolution, and his relics still rest in the cathedral of Meaux. The above sketch has been chiefly compiled from the admirable *Life* by M. de Bausset (Paris, 1814), formerly bishop of Alais.—T. A.

BOSSUT, CHARLES, Abbé, a distinguished French mathe-

matician and writer on hydrostatics and hydrodynamics, was born at Tartaras, near St. Etienne, on the 11th of August, 1730, and was educated in the jesuits' college at Lyons. On the completion of his education, he addressed himself for advice as to his future course in life to Fontenelle, by whom he was introduced to Clairant and d'Alembert; and those philosophers, appreciating his talent for mathematics, encouraged him to persevere in cultivating that science, and assisted in obtaining him advancement. In 1752 he was elected a correspondent of the Academy of Sciences, to which body he continued during life to contribute many important memoirs. In the same year, by the recommendation of the eminent architect, Le Camus de Mézières, he obtained a professorship at the school of engineering at Mézières. In 1768, on the retirement of Le Camus from the office of examiner of students of engineering, the Abbé Bossut succeeded him, and became remarkable for the strictness and impartiality with which he conducted his examinations. In the same year he was elected a member of the Academy of Sciences. The Revolution deprived him for a time of his places, with their emoluments, and reduced him to temporary poverty; but on the establishment of the institute, he was chosen one of its members, and afterwards was appointed one of the examiners of the polytechnic school. From this situation, age and infirmity obliged him to retire with a pension in 1808. He died on the 14th of January, 1814, in his eighty-fourth year, as highly respected for his moral character, as he was admired for his scientific abilities. The sciences to the advancement of which Bossut contributed most were those relating to the equilibrium and motion of liquids; and in particular, the theory of the stability of ships may be said to have been founded by him—a theory whose practical application has been attended with most beneficial results to the art of ship-building. These advantages naturally fell, in the first instance, to the lot of the French navy, the superior sailing qualities of which, at the end of the last and beginning of the present century, are a matter of history. Subsequent authors have added to our knowledge of the theory of the stability of ships, but the greater part of it is still due to Bossut. His memoirs on this and on other mathematical subjects, which gained prizes offered by the Academy of Sciences, were collected in one volume, and published in 1812. He was the author, besides, of several other works, amongst which the most important were, a course of mathematics, very valuable in its time as a book of instruction and reference, but now superseded by more recent works, and a "History of Mathematics," published in 1810, a popular rather than a profound work, but excellent of its kind.—W. J. M. R.

**BOSSULUS, MATTHEW**, an eminent rhetorician of Paris, who in 1583 gave lessons in the college of Boncour in that city. He was a great master of his art, which he taught for some time at Valencia in Spain, where his reputation stood so high, that he was chosen tutor to Don Carlos, the son of Philip II. On one occasion he delivered an oration on oratory and orators, which made so deep an impression on one of his hearers, that although the discourse lasted for an hour and a half, he remembered and could repeat every word of it.—T. J.

**BOSTANAI** or **BOSTANI**, was Resh Gelutha (Prince of the Captivity), *i. e.* temporal head of the Jewish colony in Babylonia, at the time of the conquest of Persia by the Moslems in 1641. He was in favour, it is said, with the Caliph Ali, from whose hands he received the daughter of the last native king of Persia, Jezdegerd III. She was converted to Judaism and became Bostanai's wife. His life, which fell in an eventful time, became the theme of a legendary story, published in Venice, 1585, and elsewhere.—T. T.

**BOSTOCK, JOHN**, an English physician, born at Liverpool in 1774, practised first in his native town, where he also lectured on physiology. In 1817 he removed to London, and was appointed in 1822 chemical lecturer in the medical school attached to Guy's hospital. This position he continued to hold for many years. He died in 1846. Dr. Bostock's most important work is his "Elementary System of Physiology," London, 1827; of this a second edition appeared in 1837. He was the author of several articles in Brewster's Edinburgh Cyclopædia, in Nicholson's Journal, the Annals of Philosophy, &c., and also of an essay on respiration, published in 1804.—W. S. D.

**BOSTON, THE REV. THOMAS**, a Scotch pre-byterian divine of the established church, born at Dunse, Berwickshire, 17th March, 1676. His father, who belonged to the humbler ranks of life,

was a man of high respectability of character—a decided covenanter, and a sufferer in the cause. While in prison, whither he had been sent because unable or unwilling to pay the fines imposed upon him, his son Thomas, the youngest of seven children, then only entering on boyhood, was his constant companion—a circumstance which continued to live in his recollection, and exert an influence upon his character. After receiving some initiatory training at home, he was sent in his ninth year to the grammar school of his native parish, where, during the four years of his attendance, he made rapid progress in learning. While yet a youth he was brought to serious reflection by incidentally hearing two discourses preached by the Rev. Henry Erskine, father of the Erskines, founders of the secession church, while on a ministerial visit to Dunse. It was his design on leaving school to study for the ministry, but the death of his father about that time prevented him then, and for two years after, from carrying his purpose into execution. In the interim he was occasionally employed in the office of a public notary in the town, where he doubtlessly benefited by the knowledge of business and character which he acquired, but without receiving any salary, on which account he considered himself unjustly used. He entered the university of Edinburgh in 1691, and soon injured his health by the eager diligence with which he applied himself to study. This however, gained him the exhibition in the gift of the presbytery of Dunse, a trifle in its way, but very acceptable to the needy student. Having entered upon the study of theology, he endeavoured to increase his finances, between sessions, by teaching a school at Glencairn, where he resided with the minister of the parish, in whose family he found himself very uncomfortable in consequence of frequent dissensions amongst its members. After leaving this situation he obtained that of tutor to Mr. Andrew Fletcher of Aberlady, whose mother had then married Lieutenant Bruce of Kennet as her second husband, and taken her son with her to her new residence. Here he remained till entering upon his trials for license as a preacher, which he obtained in 1697. Mr. Boston began his probationary career as a terrorist—a style of preaching which he subsequently modified to some extent, but without approaching to that which has been described as "prophesying smooth things." This circumstance, together with his conscientious objection to patronage, hindered his obtaining a settlement till three years after license. The one he then obtained was in Simprin, a small barren parish in the lower merse of Berwickshire, containing at that time only ninety adult inhabitants, and subsequently united, on account of its insignificance, with the adjoining parish of Swinton. Here he was ordained in 1699, and remained till 1707, when he was translated to Ettrick, a parish in the south-west of Selkirkshire, where he found himself little better off in point of emolument, and in other respects a loser from change of place. The day on which he entered upon his new sphere of labour was that on which the union between England and Scotland legally took effect—1st May, 1707—an event which excited political animosities in that remote, as in more central places, from which it was impossible the minister, however temperate and discreet, could escape. The government had shortly before imposed the oath of abjuration on all persons holding public and official stations, whether in church or state. The refusal to take this oath exposed the nonjurors to the penalty of £500, besides loss of office. Most of the Scotch clergy took the oath. The minority, among whom was Mr. Boston, refused on various grounds. Those on which he demurred were conscientious scruples respecting the lawfulness of swearing at all. He was decidedly opposed to the Pretender, against whose adherents the oath was chiefly if not solely aimed, and as decidedly attached to the existing government. Even this discriminate loyalty towards the ruling powers was construed into sycophancy and time-serving, and a number of persons withdrew from his ministry.

Several favourable opportunities offered themselves for removing from Ettrick to more eligible places; but in despite of the treatment he received, he continued there till his death, which took place on the 20th March, 1732, in the fifty-seventh year of his age, and thirty-third of his ministry. Had he survived till the end of the following year, he no doubt would have taken part with the seceders who then withdrew from the established church, and with whom he had co-operated in most of their preliminary doings. A simple stone raised to his memory in the burial-ground of Ettrick has been superseded of late years by a more handsome one raised by public subscription.

Mr. Boston's published writings are very numerous, and to them much of the intelligence and theological acquirements which distinguished the Scottish peasantry at the end of the last and beginning of the present century are to be ascribed. Those now best known are his "Body of Divinity;" his "Crook in the Lot;" and his "Fourfold State of Man." A copy of this last book was at one time to be found in almost every cottage in Scotland, and it is now impossible to specify the number of editions through which it has passed. All his works are intensely Calvinistic, with nothing in their style to commend them save their perspicuity and terseness. They are nevertheless highly judicious, contain just exhibitions of divine truth, close and pungent appeals to the conscience, and will be read by Calvinists with pleasure and profit. The best edition is that edited by the Rev. Samuel M'Millan, Aberdeen, in 12 vols. 8vo, and published by T. Tegg, London, 1853.—W. M'K.

BOSWELL, SIR ALEXANDER, Bart., eldest son of James Boswell, the biographer of Samuel Johnson, was born October 9, 1775, and succeeded to the paternal estate of Auchinleck, Ayrshire, on the death of his father in 1795. He was possessed of excellent abilities, and attained considerable success in the composition of humorous and satirical songs. He published anonymously in 1803 a small volume, entitled "Songs, chiefly in the Scottish Dialect." This was followed by "The Spirit of Tintoc, or Johnnie Bell and the Kelpie;" "Edinburgh, or the Ancient Royalty," which contains some curious reminiscences of the manners of the citizens of Edinburgh during the eighteenth century; "Sir Allan;" "Skeldon Haughs, or the Sow is Flitted;" "The Woo Creel, or the Bull of Bashan;" "The Tyrant's Fall," a poem on the battle of Waterloo; and "Clan Alpine's Vow," founded on the horrible murder of Drummond-Ernich by the Macgregors, referred to in Sir Walter Scott's Legend of Montrose. The greater part of these poems have fallen into oblivion; but some of Sir Alexander's humorous songs, such as "Auld Gudeman, ye're a drucken earle," "Jenny's Bawbee," and "Jenny dang the Weaver," have secured a permanent place in the lyrical poetry of Scotland. Boswell had a decided taste for antiquarian pursuits, which was fostered by his possession of a valuable family collection of old manuscripts and books, among which was the celebrated romance of Sir Tristram, published by Sir Walter Scott in 1804. Sir Alexander established a private printing-press at Auchinleck, from which issued a black-letter facsimile of the very rare disputation between John Knox and Quinten Kennedy, the abbot of Crossraguel, at Maybole in 1562, the original of which was found in the Auchinleck library. In 1821 Sir Alexander was created a baronet, an honour which had long been the chief object of his ambition. Political strife ran high at this period, and as member for the county of Ayr, and a writer of pungent satirical verses, he took a prominent part in supporting the government and assailing its opponents. He contributed several *jeux d'esprit* to a notorious Edinburgh newspaper, called the *Beacon*, and, after its suppression, to another journal of the same character which appeared in Glasgow, under the name of the *Sentinel*. Some of these poetical contributions, containing coarse and virulent attacks upon James Stuart, Esq. of Duncarn, were traced to their author, and led to a duel between him and Mr. Stuart, March 26, 1822, near the village of Auchtertool in Fife. Sir Alexander was mortally wounded in this unhappy affair, and died next day at Balmuto, the ancient seat of the family of Boswell. Mr. Stuart was tried for this offence before the high court of justiciary, but unanimously acquitted. "Boswell was able and literary," says Lord Cockburn, "and when in the humour of being quiet, he was agreeable and kind; but in general he was boisterous and overbearing, and addicted to coarse personal ridicule. With many respectable friends his natural place was at the head of a jovial board, when every one laughed at his exhaustless spirits, but each trembled lest he should be the subject of the next story or song. It is curious that it was he who introduced, or at least took charge of, and carried the act which abolished our two old Scotch statutes against fighting a duel or sending a challenge; by the former of which the mere fighting without any result was punishable with death. This was his solitary piece of legislation."—J. T.

BOSWELL, JAMES, was born at Edinburgh in 1740, and was the only son of Alexander Boswell, Esq., advocate, who, upon being made a lord of session in 1754, assumed the title of Lord Auchinleck (or Affleck), from his family estate in Ayrshire.

The Boswells, or Bosvilles, are said to have been originally an English family established in the West Riding of Yorkshire. They first settled in Scotland in the fifteenth century, on the estate of Balmuto in Fife, which one of them obtained by marriage with the daughter of a Sir John Glen. Affleck, forfeited by the Afflecks of that ilk, was acquired not long after. Boswell's mother was a Miss Erskine, a descendant of the earls of Mar.

The young man was intended by his father for his own profession, but he was himself in no haste to enter upon the serious business of life. After studying both at Edinburgh and Glasgow, he made in 1760 his first visit to London; in 1762 appeared as one of the contributors to a collection of original poems by Scottish gentlemen, published that year at Edinburgh; in 1763 astonished the world by a singular volume which he sent to the press, consisting of a correspondence upon all sorts of subjects, public and private, which had passed between himself and his friend, the Hon. Andrew Erskine (brother of Thomas, the musical earl of Kellie); and in 1763, after making the acquaintance of Dr. Johnson as he passed through London, set out on a continental tour, in the course of which, after passing a winter at Utrecht, where he attended the law classes, he travelled over great part of the Netherlands, Germany, Switzerland, Italy, and France, and having sought out, and introduced himself to many of the chief celebrities of the time—among others to both Voltaire and Rousseau—finished by attaching himself with extraordinary ardour to the famous chief of the Corsican insurgents, General Paoli, whom he had gone to Corsica to make acquaintance with. He did not return home till 1766, and he passed as advocate in July of that year. At this date, and for some time after, he was commonly known by the name of Paoli Boswell. He seems to have at first proposed to follow his profession, and he made a fair commencement by the publication of a pamphlet, entitled "The Essence of the Douglas Cause," in defence of the claimant who called himself the son of Lady Jane Douglas, and who was ultimately recognized as such by the decision of the house of lords. But his heart was still in quite another subject. His next publication was "An Account of Corsica, with memoirs of General Paoli," which appeared in Glasgow in 1768, and that was followed the next year by a volume, printed at London, of "British Essays in favour of the brave Corsicans, by several hands." In this year, 1769, also, he married.

His only other professional publication was a report, in 1774, of the speeches of the lords of session in a cause in which he had been engaged as counsel—the well-known one, involving the question of literary property, in which Donaldson and other Edinburgh printers and publishers were defendants. Nothing else is stated to have been produced by him about this period, except a series of papers, entitled "The Hypochondriac," which he contributed to the *London Magazine* from 1777 to 1782. He had already lost all taste for Scottish law, and for everything Scottish; and in 1782, on succeeding to the family estate by the death of his father, he transferred himself to London, and made preparations for being called to the English bar. Not, however, probably, that he had any serious intention of having much more to do with the law of either country. For a time he appears to have looked to politics as a field that would suit him better. In 1784 and 1785 he published two political letters to the people of Scotland; the first in support of the new minister, Pitt; the second against the proposition for diminishing the number of the lords of session. This ambition led him also to make various attempts to get into parliament, and was not finally quenched till his defeat at the general election in 1790, after an expensive contest, when he stood for the county of Ayr.

But what has immortalized Boswell is his connection with Samuel Johnson. They first met, as has been stated, in 1763. In 1773 they made their tour together to the Western Islands. Johnson died in 1784, and the next year Boswell gave to the world his journal of their tour to the Hebrides, in an octavo volume published in Edinburgh. It is the richest and most reckless portion of his Johnsonian revelations, and is the more remarkable as having been in great part read in the manuscript by the sage himself. His great work, "The Life of Johnson," followed in 1790, in two volumes, 4to., published at London. He died on the 19th of May, 1795, leaving, besides three daughters, two sons, of whom the eldest was Sir Alexander Boswell, who fell in the memorable duel fought with the late Mr. James Stuart of Duncarn, Fifeshire, in 1822; the younger,

the late Mr. James Boswell, Malone's coadjutor in preparing his last edition of Shakspeare. Ever since his life of Johnson appeared, Boswell's name has been a household-word with all English readers. As a mere biography, his work stands alone in our literature, and probably in the literature of the world. In what other have we anything like such a complete and living picture of a man and an age? It is more like a visible, moving representation, than a mere narrative. This excellence of the work, and the author's complete achievement of his purpose, are universally acknowledged; but there has been some uncertainty or difference of opinion as to what it is to which he mainly owes his success. It is assuredly not the mere literal accuracy of his reporting, as has been sometimes said. Perhaps it has not been in general sufficiently adverted to or perceived, that Boswell is a true artist, and as such necessarily puts into whatever he gives us something of his own mind and peculiar nature, as well as his subject—the only way of breathing a living soul either into writing or any other kind of representation. He was a most extraordinary compound of strongly contrasted qualities and tendencies; with all his absurdity, which it would not be easy to exaggerate, he was not only unmistakably a man of genius, but even of eminent shrewdness, sagacity, and practical talent in a limited way; and, in like manner, with all his moral bluntness or worse, there were in him, as Mr. Carlyle has well pointed out, some high and noble elements, such as are rarely to be met with.

A new interest has recently been excited about Boswell by some letters which have been recovered by a singular chance, and given to the world—"Letters of James Boswell to the Rev. W. J. Temple, now first published from the original MSS., with an Introduction and Notes," Nov. 1857. From the preface to this volume, and from subsequent statements which have appeared elsewhere, we learn that the letters were obtained some years ago at Boulogne by a Major Stone of the East India Company's service, in the shop of a Madame Noel, who had purchased them from a hawker accustomed to pass through Boulogne once or twice a year, to supply the shops with waste paper. Of their authenticity there can be no doubt. They are very curious as additional illustrations of Boswell's remarkable character; but they only bring out into stronger light what was known before. The Rev. William Johnson Temple, to whom most of the letters are addressed, was an early friend of his, and a person not unknown in the literature of his day. There has also been lately printed for the Photobibliion Society, under the editorship of Mr. Monckton Milnes, a curious tract relating to Boswell, with the title of *Boswelliana*. An account of both the Letters and the *Boswelliana*, is given in an article in the *Edinburgh Review* for April, 1857.—G. L. C.

**BOSWELL, JAMES**, the younger son of the biographer of Johnson, was a fellow of Brazenose college, and a person of superior talents, and of eminent classical scholarship. As literary executor of Malone, he took charge of the publication of his enlarged edition of Shakspeare, to which he contributed a memoir of Malone, and an essay on the metre and phraseology of Shakspeare. Mr. Boswell was remarkable for his conversational powers and the warmth of his friendship. Like his father, he had an intense fondness for the society of the metropolis, and spent his life almost entirely in the Middle Temple. He died February 24, 1822, in his forty-third year, only a few weeks before his brother.—J. T.

**BOTAREL, RABBI MOSHE**, a native of Spain, lived in the beginning of the fifteenth century. He was deeply versed in the Cabbala, the theosophy of the Jews. In the year 1409, he wrote for the use of Maestro Juan, a Christian scholar, a copious commentary on the cabbalistical book *Yezirah*, in which he quotes many works no longer extant. Dr. Julius Fürst (*Bibl. Hebr.*, part i., p. 128) attributes to Botarel a translation from Latin into Hebrew, of an astrological work by the famous Nostradamus; but as Michel Nostradamus was born, according to the best authorities, in 1503, it is not easy to admit Fürst's statement.—T. T.

**BOTH, JOHN and ANDREW**, Dutch painters, brothers by birth, and in reality. John was born at Utrecht in 1610, the son of a glass painter, and was a pupil of Bloemaert, in whose studio Andrew was also a patient learner. Together, hand in hand, they went to Rome, and resided there many years. John took to landscape, making Claude, the wonderful pastry-cook, his model. Andrew followed Bamboccio, and learned with kind humility to adorn his brother's landscapes with figures, in exquisite taste, and with imagination all compact. Descamps and

Sandrart differ as to the death of the two brothers; but from other evidence it would appear, that in the very full summer of their mutual amity, fame, and happiness, John was drowned in a canal at Venice. Andrew, though loaded with employment, was so affected by this sudden blow, that he only survived a few years, and died in 1656. There is, however, still a slight mystery and doubt as to whether it was not Andrew who was drowned, and John who returned to Utrecht to moodily paint, employing Polemburg to paint his figures, instead of his drowned brother. Andrew painted some independent pictures of noisy merry-makings and bustling fairs; and John the quack doctors. The brothers executed some etchings of landscapes, praying saints, beggars, and revellers. John Both's pictures are remarkable for their warm, glowing, Italian sunsets, too often for their tawny or saffron atmosphere, mannered colour, and laborious and finical execution. In his time he was considered a rival of Claude, with his warm deep skies, "fine receding sweet distances," sunny mornings breaking out from behind woods and hills, or sundowns with a rose-tinged evening cloud still growing fainter, less and less. He was named "The Both of Italy" for what the old amateurs that stubborn Hogarth laughed at, called "his admirable gracious handling, his free, light, sweet pencil, and his extraordinary readiness of hand." His pictures were generally between two and five feet long, the smaller notes of exquisite neat finish, but Houbraken mentions a "Mercury and Argus," a masterpiece, six feet high. Andrew's card parties and open air feasts had their day. The imitators of John Both, Italian Both, were clever and numerous:—1. His pupil William de Hensch: his skies are faint, and his touch delicate, but not so sharp, true, and angular. 2. Jacob de Hensch, nephew of No. 1. 3. John Wils, an imitator of Berghem and Both. 4. William van Swanenburg. 5. Frederick Moncheron, fond of olive colour. 6. Isaac Moncheron. 7. Henry Ferschuring. We subjoin a list of some of John Both's more favourite subjects, by which the reader can make a good guess at the bent and aim of his genius:—artist studying from nature near a mountain cataract; travellers with ox waggons and loaded mules; a ferry-boat at sunset; traveller reposing at noonday; the judgment of Paris; cavalcade and muleteers; male with casks; nymphs bathing; the flight into Egypt; travellers halting under trees; mountain pass, with muleteer and guitar; a cascade; watering beasts at a fountain; banditti with prisoners near the lake of Bolseno; boys bathing; sketching from nature; cavalcade at a ford; herdsman piping; Philip and the eunuch; peasants playing at racket on a summer evening; nuns of a convent; gentlemen on horseback saluting, (said to be the two brothers parting); Abraham and Hagar; hermits; river scene; wood waggons; fishermen with nets; halberdier with prisoners; Mercury and Bacchus; travellers attacked by robbers; people talking on a bridge. Such were the varied scenes, generally with Italian sunrise and sunset, woods, rivers, and hills, that John Both loved to deal in.—W. T.

**BOTHWELL, FRANCIS**, Earl of. See STEWART.

**BOTHWELL, JAMES**, Earl of. See HEPBURN.

**BOTHWIDI, JOHN**, a Swedish theologian, died in 1635. He was attached as preacher to the court of Gustavus Adolphus, and followed that prince through all his campaigns. He became bishop of Linköping in 1630, was recalled to Germany the following year, and charged by the king with the direction of ecclesiastical affairs. He left among other works "*Utrum Moscovitæ sint Christiani*," 1620.

**BOTIN, ANDREA**, a Swedish historian, was born in 1724, and died in 1790. His principal work is his "*Utkast til Svenska Folkets Historia*," or Sketch of the History of the Swedish Nation. A new edition of this work published at Stockholm, 1789-92, contains many additions, but extends only to the thirteenth century. He wrote also "*Om Svenska Hemman*," being a historical description of the territorial domain of Sweden, Stockholm, 1757; a "*Life of Bürger*;" and "*Observations on the Swedish Language*." Botin received, in consequence of his works, many honorary titles: he was counsellor of the king, chevalier of the order of the polish star, a member of the Swedish Academy at Stockholm, and of the academies of sciences and belles-lettres, as well as of various foreign societies.—M. H.

**BOTON, ABRAHAM DR**, rabbi, lived at Saloniki, and died in 1625. His valuable commentary on the *Yad Hachezakah*, by Maimonides, and 230 dissertations on Talmudical subjects, have gained Boton a high name in Jewish literature.—T. T.

**BOTSCHILD, SAMUEL**, a painter and engraver, born at Sangerhausen in Saxony, 1640. He was a respectable commonplace man, who, not being ambitious, got on and escaped envy. He became court painter of history to a court that had no history, and keeper of the Dresden electoral gallery. He established an academy—that supposed hotbed of genius, where, indeed, genius is too often overlaid. He died in 1707.—W. T.

**BOTT, THOMAS**, an English divine, born at Derby in 1688, was educated among the dissenters, and for some time held a presbyterian charge at Spalding, but latterly joined the church of England, and obtained three benefices in Norfolk. He was a noted controversialist, and, among other works of theological criticism, published "Remarks on Bishop Butler's Doctrine of Necessity," and "An Answer to the first volume of Warburton's Divine Legation." Died at Norwich in 1754.—J. S., G.

**BOTTA, CARLO GIUSEPPE GUGLIELMO**, born at San Giorgio in Piedmont in the year 1768, is reputed one of the first historiographers of this century. At the breaking out of the French revolution he was practising as a physician in Turin. Having dared to express publicly his sympathy for the French nation struggling against despotism, he was, by order of the king of Sardinia, arrested in 1792, and thrown into a dungeon, where he was kept for two years. Recovering his liberty, he crossed over to France, entered the army as a physician, and went all through the Italian campaign. Having been employed on a scientific expedition to the Ionian islands, and to the east, he wrote an elaborate account of it, which was published in Paris by order of the government. His zeal and devotedness to the French interests in Italy won for him the friendship of General Joubert, who appointed him a member of the provisional government of Piedmont, in which capacity he contributed to the fusion of that country with France. After the battle of Marengo, Botta was appointed one of the privy council, and attached to the general administration of the 17th division of the army. In the year 1803 he came to Paris, where he was elected a member of the legislative body, and became its president in the year 1808. Had he not been disliked by Napoleon on account of his well-known republican principles, he would have reached the highest dignities in the state. During the hundred days of the first restoration, he was appointed president of the college of Nancy, and soon after he was transferred to that of Ronen, which appointment he lost at the second restoration. Wearing of public life, he fixed his residence in Paris, living on a moderate income, although he might have accumulated a large fortune. There he wrote the "History of the War and Independence of the United States of America," and continued the history of Italy from where Guicciardini had left it up to the year 1814. His style is considered terse, thoroughly Italian, and at times lofty. Gioberti considers this writer one of the reformers of the Italian language. Being an eminent French scholar, he has also left many works written in French, amongst which the following are the principal—"Souvenirs d'un voyage en Dalmatie;" "Precis historique de la Maison de Savoie;" "Memoire sur la nature des sons, et des tons." In his youth Botta was a suitor of the muses, and his sonnets and odes have eminently contributed to increase the fame which, as a historian, he has won for himself. This celebrated champion of liberty died at Paris in 1837.—A. C. M.

**BOTTA, PAUL EMILE**, son of the eminent historian, was born in 1800. Being appointed French consul at Mosul, he, in 1843, began those remarkable excavations which led to the discovery of Assyrian antiquities, since followed up by Mr. Layard, and of which the Paris Louvre and the British Museum afford such remarkable specimens. M. Botta had dwelt long in the East having previously been consul at Alexandria, and journeyed through Egypt and Arabia. His attention was first drawn to a mound on the opposite bank of the Tigris, which, according to tradition, marked a portion of the site of ancient Nineveh. While excavating in this direction, his notice was called to a village named Khorsabad, about fourteen miles distant, where pieces of sculpture such as he had already turned up, were said to have also been found. His labours at Khorsabad proved more fruitful than he could have expected, for he found that a wall which he had reached opened into a part of an Assyrian palace, containing those bulls with human heads, and those statues and sculptured slabs, and cruciform inscriptions with which the collection in the British Museum has made visitors to that institution familiar. The French government, with laudable zeal, not only aided M.

Botta with money, but sent that admirable artist, Eugene Flaudin, to make illustrations on the spot, and the result is a splendid work, their joint production, upon the monuments of Nineveh. We must add, however, that the assertion as to the actual site of Nineveh having been discovered, and that the monuments in question are remains of the Assyrian capital, is not generally accepted.—J. F. C.

**BOTTALA, GIOVANNI MARIA**, a painter, born at Savara, near Genoa, in 1613. He came to Rome, studied under Pietro da Cortona, and was patronized by Cardinal Sachetti, for whom he painted pictures—enduring the foolish criticism of an ignorantly wise patron, just knowing enough to be more troublesome than one who knew nothing. He remained always an imitator, but was called "Raffaellino." "The meeting of Jacob and Esau" was one of his great tableaux. The other shreds of his life are in the churches of Genoa and Naples. He died at Milan, 1644.—W. T.

**BOTTANI, GIUSEPPE**, a painter, born at Cremona in 1717. He studied at Rome under Agostino Masucci. He settled at Mantua, painting (O noble shopmanship!) Poussin landscapes and Maratti figures. He was made director of the Academy at Mantua—a sure proof of incompetence—and died 1784.—W. T.

**BOTTAZZI, FRANCESCO**, an Italian poet, born about the year 1770. His prodigious memory enabled him to learn by heart the whole of Virgil; but although he is considered an eminent Latin poet, yet he has left nothing original, his ideas and conceptions being for the most part taken from Virgil. His translation in Latin hexameters of Monti's celebrated poem—*Il Bardo della selva nera*—is reputed very superior, and shows classic learning and a consummate knowledge of the Latin language and versification. This translation was so highly appreciated by Prince Eugene, then viceroy of Italy, that he ordered that a costly edition should be brought out at the expense of government, and presented Bottazzi with the professorship of logic in the college of Brera, the first seat of learning in the kingdom of Lombardy. The duties, however, of his office interfering with his favourite studies, he sent in his resignation, and accepted a clerkship in the financial department of the state. On the abdication of Napoleon in 1814, Bottazzi lost his situation, and retired to his native city. His death has not been recorded.—A. C. M.

\* **BÖTTGER, ADOLF**, a voluminous German poet and translator, was born at Leipzig, May 21, 1815, and devoted himself to the study of philology and modern literature in his native town. He wrote—"Gedichte," 1846, 6th ed., 1850; "Agnes Bernauer," a tragedy, 3d ed., 1850; "Die Pilgerfahrt der Blumengeister," an epic poem; "Habana, epischlyrische Dichtung;" "Gedichte, neue Sammlung," 1854, &c. He translated the poetical works of Byron, Pope, Milton, Ossian, &c.—K. E.

**BOTTICELLI, SANDRO**, surnamed **FILIFEPI**, a Florentine painter, born in 1447, a disciple and imitator of Filippo Lippi. He painted mythology at Rome and Florence, under pontifical patronage. He filled his works with figures and details; a type of his prodigal drift of mind, for he lived extravagantly, and died poor in 1515. Baldini engraved nineteen plates for Dante's *Inferno* from Botticelli's designs. He also engraved a set of twelve Silyls and seven Planets. This was a long time thought to be the first book in which metal plates for engraving were used. Botticelli had much of Filippo Lippi's rough ardour and impetuous energy, modified by a fanciful conception and a more ideal mind. His Virgin's heads are from the same beautiful type. In one of his Nativities all is ardour. The angels kneel on the roof of the cow-shed—others crown the approaching shepherds or vehemently embrace them. In his myths and allegories, Botticelli runs wilder, in spite of the late flaming outbreak of Savonarola. Besides Squarcione, our friend was the only painter who treated such pretty vaguenesses with feeling. In one of his works there is a naked Venus floating on a shell, driven in a shower of roses towards the shore, where, under a laurel bush, a richly-dressed attendant holds a red mantle to receive her beautiful form. He is often, however, mannered: his naked Venus at Berlin is indeed, Kugler says, ugly and insipid. These small allegorical pictures are often neatly finished. The miracles of St. Zendid and the allegory of Calumny (after Apelles) are of this kind. About 1474 Sandro was chosen, with Ghirlandajo, Pietro Perugino, and Rosselli, to paint frescos in the Vatican chapel, built by Baecio Pintelli for Pope Sixtus IV. Those of Perugino over the altar were after-

wards destroyed, to make room for the conquering Last Judgment of Michel Angelo. On one side were the deeds of Moses; on the other those of Christ. Sandro painted twenty-eight figures of popes, to set between the windows, "Moses killing the Egyptian," "the Rebellion of Korah," and "the Temptation of Christ." Rosselli covered his with gold, and the pope, like a child, fancied them the best. Lippi's son was Sandro's pupil.—W. T.

**BÖTTIGER, KARL AUGUST**, a distinguished German antiquarian and miscellaneous writer, was born at Reichenbach in Saxony, June 8, 1760. Having completed his education at the university of Leipzig, he became teacher at various schools until 1791, when he was appointed head-master of the gymnasium at Weimar. Here he lived in friendly intercourse with Herder, Schiller, Göthe, and Wieland, and largely contributed to the periodical press of the day. In 1804 he was appointed to a head-mastership at Dresden, where in 1814 he became keeper of the museum of antiquities. He died November 17, 1835. Among his numerous works deserve to be mentioned—"Sabina, oder Morgenscenen einer reichen Römerin;" "Die Aldobrandinische Hochzeit;" "Vorträge über die Dresdener Antikengalerie;" "Amalthea, oder Museum der Kunstmythologie und Bildenden Alterthumskunde;" "Ideen zur Kunstmythologie;" "Literarische Zustände und Zeitgenossen," 2 vols., &c.—(See K. W. Böttiger, *K. Aug. Böttiger, eine Biographische Skizze*, Leipzig, 1837.)—K. E.

\* **BÖTTIGER, KARL WILHELM**, son of the preceding, a German historian, was born at Bautzen, Aug. 15, 1790. He studied at Leipzig and Göttingen under Heeren, and successively became professor at the universities of Leipzig and Erlangen. His principal works are—"Allgemeine Geschichte," 12th ed., 1856; "Deutsche Geschichte," 5th ed., 1855; "Geschichte Baierns;" "Geschichte des Kurstaats und Königreichs Sachsen;" "Weltgeschichte in Biographien," &c.—K. E.

\* **BÖTTISER, KARL WILHELM**, one of the most admired of the modern school of Swedish poets, was born at Westeros on 15th May, 1807. On the completion of his studies in 1833, he received at Upsala the degree of doctor of philosophy. In 1835 he made a journey through Germany, Italy, France, and Holland, but being seized with asthma was compelled to return the following year. In order to ameliorate his complaint, he went again to Italy, at the expense of government, in the summer of 1838. He twice received the prize at the Swedish academy for poetry. In 1830 Böttiger published at Upsala a collection of poems under the title of "Ungdoms Minne fran Sangens Stunder," which has passed through many editions. A second collection of his poems, containing his admirable translation of Uhland's ballads, was also published; in 1837 a third collection, and in 1847 an "Almanack of the Muses." He has published also a translation of Tasso's *Gerusalemme Liberata*. He is a professor of the university of Upsala, and son-in-law to the greatest of the Swedish poets, Tegnér, whose life he has written.—M. H.

\* **BOTTISINI, GIOVANNI**, the most distinguished contrabassist that has yet lived, was born at Crema in Lombardy in December, 1821. His adoption of the instrument by which he has gained his world-wide celebrity was the result of a mere accident. The conservatorio of Milan gives gratuitous instruction to a certain number of students in each department. Bottisini applied, in 1835, for admission as a singer, but finding no vacancy in the vocal class, he sought successively to be received in each of the others, and was, at last, allowed to enter that for the double bass, which was the only one unfilled at the time. His talent for singing was amply proved during the early days of his pupilage, when the students gave a performance of Rossini's *Italiana in Algeri*, in which he (still a boy) represented the heroine with great applause. Bottisini's master for the double bass was Luigi Rossi. He no sooner entered upon the study to which destiny had devoted him, than he began to manifest his perfectly individual talent for it, and in two years acquired nearly all his present unprecedented facility upon his most unwieldy instrument. Vaccaj, the principal of the conservatorio, was his master for composition. After leaving the conservatorio Bottisini visited the principal towns of Italy, giving concerts with his fellow-student Arditì, a violinist, recently conductor of Her Majesty's theatre, London. With him he went, at the close of 1846, to Havannah, where both were engaged at the Italian opera, Bottisini in the capacity of conductor. In the summers of 1847 and 1848, during the recess of the Havannah season, these two visited New York. In 1849 Bottisini first came to

London, where his extraordinary powers were at once duly appreciated. Here his solo performances were an attraction at every class or concert, and for one season he played in the Philharmonic and Royal Italian opera orchestras, together with Piatti, the violonecellist, who had been his companion in the conservatorio. When M. Jullien visited America in 1853, Bottisini accompanied him. He reappeared in London in 1855. In the season of 1856-57, he conducted the Italian opera at Paris, where he produced with considerable success his opera of "Nerone." He had previously written another work of the same class—"L'Assedio di Firenze," which, if ever performed, must have been given in Havannah. He again visited London, has since appeared at Berlin, and is at present in Naples, where his concerts have been singularly lucrative, and where he is engaged as conductor to the teatro di S. Carlo.

His compositions are characterized by fluency and melodious grace, and those for his instrument especially, prove a fertility of invention without which he could not have produced his great effects as an executant. Bottisini, as a player, is conspicuous for the extraordinary compass he gives to the double bass, by his perfect command of the tenor and higher notes, which were unemphatically by his predecessors, and by means of which he makes it agreeable for the first time as a solo instrument—for the rich sweetness of his tone, particularly in the tenor register—for the rapidity and lightness of his execution—and for his exquisite cantabile style: thus much is due to him as a soloist, while, as an orchestra player, he is not less to be praised for his precision, point, and power.—G. A. M.

**BOTTRIGARI, CHEVALIER ERCOLE**, was born at Bologna in 1531. He was a man of rank, fortune, and erudition, who seems to have spent the greater part of his life in the study of music, and in musical controversy. His prejudices seem to have been in favour of ancient music, but in his attempts to bring the chromatic genus into practice, he succeeded no better than Vincentino, and others on the same side of the question. His Italian version of "Boethius de Musica" received great praise. He died September 30, 1612, leaving a large and valuable library of music, and a rich cabinet of curiosities. The latter excited the admiration of the Emperor Ferdinand II. A complete list of Bottrigari's publications is given by Fetis.—E. F. R.

**BOTZARIS**, the name of a Grecian family long celebrated among the Suliotcs. Among its members the two following were the most remarkable:—

**BOTZARIS, GEORGE**, a military leader, held the chief command of the different tribes when they first appeared in arms against Ali Pacha. His successes were equal to his great ability and courage; but his ambition having led him to aim at supreme power, the country was, in consequence, long disturbed by internal dissensions.

**BOTZARIS, MARK**, son of the preceding, born about 1790, died in 1823. He acted a conspicuous part in the Greek war of independence, and throughout the whole of his career was distinguished by his military skill, his heroic daring, and his disinterested patriotism. At the early age of sixteen he took part in an insurrection in favour of Russia, which was then at war with the Porte; but after the treaty of Tilsit, which put an end to all hope of the immediate liberation of Greece, he entered into the service of France as a subordinate officer in a regiment of Albanians. In 1815 he retired to the Ionian islands, where he remained until 1820, when the disturbed condition of the Ottoman empire once more revived the hopes of the Greeks. Mark, now issuing from his retirement, hastened to join his countrymen in a fresh insurrection, which speedily became general, and from that period until his death was actively engaged in hostilities against the Turks, by whom his country had been long oppressed. He fell mortally wounded almost in the moment of a signal victory, which his brother avenged his death by completing. The Turks fled in confusion from the field, leaving behind them their standards and an immense quantity of miscellaneous booty.—G. M.

\* **BOUBÉE, NÉRÉE**, a living professor of geology in Paris, born at Toulouse in 1806. His writings consist principally of numerous memoirs in the *Bulletin de Société Geol. de la France*, and some elementary works, of which the principal are his "Éléments de Géologie," Paris, 1837, and "Cours complet d'études Géologiques," of which the second edition appeared in 1839.—W. S. D.

**BOUCHARD, ALAIN**, born some time in the fifteenth cen-

tury. The dates of his birth and death are not known, but he was living in 1513. He was a native of Bretagne, and practised as an avocat there. We find him afterwards conseiller and maître des requêtes à l'extraordinaire under Duke Francis II. He assisted in preparing the book called "La très Ancienne Coutume de Bretagne," 1485. Bretagne was not yet united with the kingdom, and a brother of Bouchard's, associated with him in preparing the book we have mentioned, is described as having taken an active part in resisting a French invasion. Alain Buchard published in 1514 his "Grandes Chroniques de Bretagne." He is accused of having mixed up with what is called true history the legends of the district. We regard the work as rendered by this circumstance more valuable. The style is said to be animated and picturesque.—J. A., D.

BOUCHAUD, MATHIEU ANTOINE, born at Paris in 1719, and died in 1804. In 1747 he became a member of the faculty of law at Paris, and published in the *Encyclopédie* several articles on juridical subjects. Whatever reputation he acquired by being associated with Diderot and D'Alembert, was more than counterbalanced by its effect on his fortunes, as it lost him an appointment to a professorship for which he was singularly well qualified. He published in the *Memoirs of the Academy of Inscriptions* several papers, chiefly on Roman law and antiquities. In 1774 he was given a professorship of law at the college de France, and in 1785 was named conseiller d'état. A treatise by him on the law of the twelve tables, is regarded as of some value.—J. A., D.

BOUCHER, FRANCIS, a French effeminate and wanton artist, was born at Paris in 1704. He studied under Le Moine, and then hastened to Rome. On his return he became court painter to the king, and was loaded with the intoxicating sweets of patronage. The brilliant, the pretty, the meretricious, were his strong points. He painted luxurious opera figures of coquettes, cupids, dancers, and nymphs. Reynolds, sturdy and conscientious, found him at work on a large picture without any drawings or models. When he painted carefully, there was grace, beauty, and skill in his compositions, but always misguided by bad taste, and followed by miserable imitators. Kugler calls him pre-eminently the fit painter of Dubarrydom. Gault, the German, laughs at the French for admiring a painter without truth, modesty, or delicacy, and for giving 9800 livres for his "Rising and Setting of the Sun" at madame de Pompadour's sale. Boucher, with his glib pencil at nineteen, carried off the first prize for painting. He died in 1768. Even Diderot, the shameless, says, that his debasement of morals was followed by a debasement of taste, colour, composition, character, expression, and drawing. His goddesses were strumpets, his shepherdesses ballet girls. He paints for young profligates, and is not graceful, but affected. Even if his figures are naked, you see the rouge and patches, and all the gewgaw and tinsel of the toilette. Delicacy, purity, innocence, and simplicity were unknown to him. His best pupils were Bandonin, Juliard, Leprince, Deshayes, and Fragonard. Bandonin and Deshayes married his daughters. The latter was a promising painter, who died young. His "Infant Jesus" is a bit of flimsy religion; his "Shepherd sleeping on the knees of his Shepherdess" has merit; his landscapes are false, but playful. The best works of this French Anacreon were the "Muses," the "Four Seasons," a "Hunt of Tigers," and some pastoral designs for tapestry. Boucher left a few slight etchings. His brother John was also a painter and engraver, but not above mediocrity. "Never," says M. Watelet, "was there an artist that so misused a brilliant disposition, an extreme facility."—W. T.

BOUCHER, JEAN, a French divine, famous, according to the expression of Bayle, as a trumpet of sedition in the reigns of Henry III. and Henry IV., born in Paris in 1548; died at Tournay in 1644. He was successively professor of philosophy at Rheims, doctor of the Sorbonne, and curé of the church of St. Benedict in Paris.

BOUCHER, Rev. JONATHAN. This eminent scholar and divine was born on the 1st March, 1737-38, at Blencogo in the parish of Bromfield and county of Cumberland, and was educated at a little free school in his native parish. At the early age of sixteen, he had commenced a small school of thirty-two boys, at 10s. per annum each, and out of this scanty sum he was enabled to spare one-fourth for his parents. He was shortly after engaged by the Rev. Dr. James, the head of St. Bees' school, to assist in the duties of that establishment, and there he continued two years. At the close of that period he was recommended as a

private tutor in a gentleman's family in Virginia, and accordingly in 1759 he proceeded to America. In 1762 he came to England for the purpose of procuring holy orders, and again returned to his adopted country, where he obtained considerable preferment, which he continued to hold till the unhappy disturbances in that country once more drove him back to England. We wish that our limits would permit the insertion of Mr. Boucher's own narrative of those stirring days. His influential position, his intimate acquaintance with General Washington, and his own personal adventures, give a peculiar and graphic vividness to the record he has left of that period. In 1775, Mr. Boucher finally quitted America, compelled to leave behind him the accumulated savings and property of many years. Shortly after his return to this country, he was appointed to the curacy of Paddington, and was nominated assistant-secretary of the Society for the Propagation of the Gospel; and in 1785 was presented to the vicarage of Epsom in the county of Surrey, where, on the 27th of April, 1804, he closed his eventful life. Mr. Boucher published "A View of the Causes and Consequences of the American Revolution," in one vol., 8vo, and was an ample contributor to Hutchinson's History of Cumberland. But his great and chief work, the preparations for which occupied the last fourteen years of his life, was "An Archæological and Provincial Dictionary," intended to be completed in 2 vols., 4to. His researches were continued with an activity and perseverance that promised a speedy termination, and he had reached the letter T when death arrested his labours—thus almost on the very threshold of completion. The introductory "Essay on the Origin and History of the English Language," and two numbers of the work—reaching, however, only to BLA—have been published, and fully justify the expectations that the literary world had anticipated from the known learning, deep research, and patient investigation of their author, and the regret so widely felt that the labours of so many years were prematurely brought to an end.—B. B.

BOUCHER, NICOLAS, a French prelate, bishop of Verdun, born of poor parents at Cernai in 1528, was professor of philosophy at Rheims, and afterwards rector of the university. After his elevation to the episcopate he joined the party of the League. He left "Caroli Lotharingii cardinalis et Francisci ducis Guisii Litteræ et Arma," 1577.

BOUCHER DE LA RICHARDERIE, GILLES, born at St. Germain-en-Laye in 1733, and died at Paris in 1810; received as avocat in the parliament of Paris in 1759, in which profession he continued to practise, in one capacity or other, for the greater part of his life. He was the principal editor of the *Journal General de la Littérature de France*. He published several tracts on the Roman law, but is most known by his "Bibliothèque Universelle des Voyages," Paris, 1808; 6 tomes, 8vo.

\* BOUCHERIE, A., a French medical man, has devoted much attention to the preservation of timber, and has patented a process by which wood is made to absorb various solutions, such as pyrolignite of iron, sulphate of copper, and other salts, which preserve it from decay. Railway sleepers are prepared by this process by the Permanent Way Company in London.—J. H. B.

BOUCHET, CLAUDE-ANTOINE, a French surgeon, was born in 1785 at Lyons, where his father, Pierre Bouchet, had attained some distinction as a surgeon. C. A. Bouchet studied at Paris; and while still very young was appointed to the post of surgeon-in-chief to the Hôtel-Dieu at Lyons. He was the first to introduce into surgery the method of healing by first intention after amputation. He died at Lyons in 1839.—W. S. D.

BOUCHET, GUILLAUME, a French litterateur and bookseller, born at Poitiers in 1526; died in 1606. Little is known of his life, which was passed entirely among men of business. He is best known by his "Serées," a work intended for after-dinner amusement, and which the author praises as some of the best stuff in his shop. Miserable stuff, indeed, though perhaps a faithful picture of the manners of his age; full of the most indecent pleasantries and revolting obscenity, for which its curious and erudite details but poorly compensate.—J. G.

BOUCHET, JEAN, born at Poitiers in 1476, and died in 1550. He practised in some department of the law at Poitiers, and published a number of poems, chiefly allegorical. He also published "Annals of Aquitaine," still referred to occasionally.—J. A., D.

\* BOUCHITTÉ, LOUIS FIRMIN HERVÉ, professor of history at Versailles, born at Paris in 1795. The once gorgeous town of Versailles, which is now as quiet as a monastery, can yet boast

the presence of some highly cultivated men, chiefly connected with the college. The erudite works of M. Bouchitté are such as might be expected from the Benedictines of the place. They are all philosophical, and connected with the profound problem as to the existence of God. In one work—"Histoire des preuves de l'existence de Dieu depuis les temps les plus reculés jusqu'au Monologium d'Anselme de Cantorbéry," 1841—he has carefully reduced to their first principles all demonstrations of this mighty truth offered previous to the time of Anselm; and in another—"Le Rationalisme chrétien à la fin du XI<sup>e</sup> siècle, ou Monologium et Proslogium de Saint Anselme, traduits et précédés d'une Introduction," 1842—he analyses the Monologium, and treats generally of christian rationalism. He has also published "Mémoire sur la notion de Dieu dans ses rapports avec l'imagination et la sensibilité et de la Persistance de la personnalité après la mort."—(*Mémoires de l'Académie des Sciences*, tom. ii.) The student of the highest metaphysics will find much to instruct and guide him in these very interesting works.—J. P. N.

**BOUCHON DUBOURNIEL, HENRI**, born at Toul in 1749. While incarcerated during the Reign of Terror, a time when imprisonment and death were almost synonymous, this singular man began a translation of Don Quixote, which he lived to finish. It was while in Spain, to which he had been invited as an engineer, that he discovered at Cadiz the remains of the Roman canal for conveying the waters of the Tempal through twenty leagues of mountainous country to the town. The country of Don Quixote turned his brain, for he ruined himself by Quixotic projects. In order at length to obtain cash, he induced some young men to accept employment at his hands, they lodging security-money, which, as he could not return, charges of swindling were brought against him. At his trial, he being eighty years old, and very deaf, was attended by a young girl, supposed to be his daughter, whose touching endeavours to let him know what was said, so wrought on the judges, that they acquitted him. He died in 1828 in great distress.—J. F. C.

**BOUCHOTTE, JEAN BAPTISTE NOEL**, minister of war under the republican government of France, born at Metz 25th December, 1754; died in his native town in June, 1840. At the age of sixteen he entered on a military career, and had attained the rank of captain of cavalry at the time of the outbreak of the Revolution. He was shortly after promoted to the grade of colonel, and in 1793 was named minister of war by a unanimous vote of the convention. He held this office during a most trying and difficult, though brief period, and exercised its functions with firmness and ability.—G. M.

**BOUCQUET, VICTOR**, a historical and portrait painter, born at Furnes in Flanders in 1619. He studied under his father, a poor artist, and afterwards went to Rome. The churches of Flanders abound with his well-coloured, well-composed works. At Nieuport there is a "Judgment of Cambyses" and "Death of St. Francis" by him, and at Ostend a "Descent from the Cross." He died about 1660.—W. T.

**BOUDET, JEAN, Comte**, a French general, born at Bordeaux 19th February, 1769, died 14th September, 1809. At an early age he entered the army as a sub-lieutenant, but retired in 1788. No sooner had the Revolution broken out than he again entered the service, in which he was destined to act a most distinguished part during many years of the troubled and eventful period which followed. He rose gradually to the highest rank in the army, and was named by Napoleon on the field of battle grand officer of the legion of honour.—G. M.

\* **BOUÉ, AMI**, a distinguished French physician and geologist, formerly president of the Geological Society of France, now residing at Vienna, was born at Hamburg in 1794. His geological writings include an "Essai Géologique sur l'Écosse," Paris, 1820; "Geognostische Gemälde von Deutschland," &c., Frankfurt, 1829; and a treatise entitled "Der ganze Zweck und die hohe Nutzen der Geologie," &c., Vienna, 1851. Besides these, and several other independent works, and numerous memoirs on geological subjects, published in different periodicals, Boué is the author of an account of "La Turquie en Europe, ou Observations sur la géographie, la géologie, l'histoire naturelle, &c., de cet empire," published at Paris in four volumes in the year 1840. The geological portion of this work was published separately in the same year.—W. S. D.

**BOUELLES** or **BOUILLES**, in Latin **BOVILLUS**, **CHARLES DE**, a French philologist, born at Sancour in Picardy about 1470; died about 1553. Among his works we may mention his

"Geometry," the first work on the subject written in French; and "Proverborum Vulgarium libri tres." This is the most interesting of the writings of Bouelles, an explanation in Latin of several proverbs in use in France in the sixteenth century. It is not to be confounded with another volume entitled, "Proverbes et Dicts sententieux, avec l'interprétation de ceux, par Charles de Bouelles," Paris, 1557.

**BOUFLERS**, the name of an ancient and influential family of Picardy, which came into notice early in the twelfth century, and continued to occupy a more or less prominent position in France till the beginning of the seventeenth. **WILLIAM DE BOUFLERS** attained considerable distinction in the war which led to the conquest of the kingdom of Naples and Sicily by Charles of Anjou in 1266; his son, **ALEAMNE DE BOUFLERS**, fought in the army of Philip the Fair; and his two grandsons, **JOHN** and **WILLIAM DE BOUFLERS**, rendered themselves celebrated in the wars between England and France, the one supporting the claims of the king of England, and the other those of the French monarch. In 1415 we find one of the family taken prisoner at Agincourt, and another, **ADRIAN DE BOUFLERS**, was engaged in the battle of Pavia in 1525. In the beginning of the seventeenth century, a son of the last mentioned, bearing the same name, rose to eminence in the world of letters, as the author of two works which obtained a considerable amount of popularity.—W. M.

**BOUFLERS, LOUIS-FRANCIS**, marquis, and afterwards duke of, a French general of celebrity, was born on the 10th January, 1644, and entered the army in 1662, as a cadet in the regiment of guards. After serving under the duke of Beaufort in Flanders, and under Marshal Crequi in Lorraine, he was sent to Holland, under Turenne, in 1672. During the campaigns in Holland, he distinguished himself on several occasions, and very high opinions were formed of his courage and capacity. In 1675, when a retreat was determined upon by the French, Bouflers was intrusted with the command of the rear-guard, and the success with which his operations were attended, greatly increased his reputation as a military commander. Step by step he rose in his profession, till in 1681 he was promoted to the rank of lieutenant-general. In 1690 he commanded the French forces on the Moselle, and took part, under the duke of Luxemburg, in the battle of Fleurus. In the following year he was present at the siege of Mons. In 1692 he held a high command at the siege of Namur, and it was in a great measure to his promptitude and sagacity that the French owed their victory at Steinkirk. He was now appointed marshal of France, and in the course of a few years he was elevated from the rank of marquis to that of duke. In 1695, when Namur was besieged by the allies, Bouflers succeeded in throwing into the town a large body of troops, and held out for a time against all the attacks of the besiegers. When he was at last forced to capitulate, he was arrested and detained as a prisoner of war, on account of the violation by the French of an agreement which had been entered into relative to the exchange of prisoners. He soon, however, regained his liberty, and resumed his military duties. In 1697 a series of conferences took place between Bouflers and the earl of Portland, and the principal points of the treaty of Ryswick were then agreed on. A few years afterwards he fought against Opdam at Eckeren, and in 1707 he defended the town of Lisle against the allies under Prince Eugene and the duke of Marlborough. The siege was obstinately contested, and lasted upwards of four months, but it terminated in January, 1708, in favour of the allies. In that year Bouflers was created a peer of France, and in 1709 he volunteered to serve under Marshal Villars, and commanded the right wing of the French at the battle of Malplaquet. This was his last battle. The remainder of his life was spent at Fontainebleau, where he died on the 22d of August, 1711, in the sixty-eighth year of his age.—W. M.

**BOUFLERS, MARIE-FRANÇOISE-CATHERINE DE BEAUVAU-CRAOW**, marchioness de, was one of the greatest ornaments of the court of Stanislas at Lunéville, after his formal abdication of the throne of Poland, and was regarded as one of the most accomplished women of the age in which she lived.

**BOUFLERS-ROUVREL, MARIE CHARLOTTE HIPPOLYTE**, countess de, a lady of high repute in the literary circles of Paris in the latter part of the eighteenth century. She was born in Paris in 1724, and during the early part of her life she was attached to the household of the duchess d'Orleans in the capacity of demoiselle de compagnie. Her duties in this situation were of a literary nature, consisting chiefly in reading aloud for

the amusement of the duchess and her friends, when engaged in the then fashionable occupation of embroidery. After her marriage with the count de Boufflers-Rouvrel, she spent her life in intercourse with the most celebrated literary characters of the time, by whom she was highly esteemed for the refinement of her taste, the elegance of her manners, and the amiability of her disposition. Shé lived on terms of intimacy with Rousseau, who makes frequent allusion to her in more than one of his writings; and she carried on a correspondence for a time with David Hume. She died in 1800.—W. M.

**BOUGAINVILLE, LOUIS ANTOINE DE**, was celebrated both as a military commander and as a navigator. He was born in Paris in 1729, and was destined by his parents for the bar; but finding a military life more congenial to his taste, he entered the army in 1754. He served throughout the war in America, and took an active part under Montcalm in the defence of Quebec. He remained in the army till 1763, and it was in that year that he first turned his attention to navigation. After making a voyage to the Falkland Islands, in order to plant a French colony among them, he was intrusted with the command of an expedition fitted out by the government at Paris for the purpose of circumnavigating the globe. On his return he published, under the title of "Voyage autour du Monde," a full account of his voyage, and of the discoveries made in it. During the war of independence in America, Bougainville commanded a division of the French navy. On the re-establishment of peace, he returned to Paris, when he was elected an associate of the Academy of Sciences in 1796. His death took place in 1811.—W. M.

**BOUGEANT, GUILLAUME-HYACINTHE**, a French historian, born at Quimper in 1690; died in 1743. He entered the jesuit order, and became professor of humanity at Caen and Nevers. He afterwards came to the college of Louis-le-Grand, Paris, and left it only for a short temporary exile in Flèche, occasioned by his work entitled "Amusement philosophique sur le langage des betes." This work, addressed to a lady, and interspersed with madrigals, gave offence to the religious world, and proved that the author was versed as well in the language of gallantry as in that of beasts. He published a great number of historical and other works.—J. G.

**BOUGUER, PIERRE**, a distinguished French physicist, born in Lower Brittany in 1694; died in 1758. Bouguer devoted himself to perfecting the practical portions of science, especially of astronomy. He wrote much on the application of that science to the purposes of navigation; and he took part in the famous expedition sent by the French government to Peru, with a view to aid, by the measurement of a degree in these regions, in determining the figure of the Earth. His account of that expedition is interesting, although inferior to La Condamine's.—Bouguer also assisted to advance our knowledge of optics. He determined much more accurately than had ever been done before, the relations between *light incident* and *light reflected*, in so far as these are dependent on the angle of incidence. We owe likewise to this physicist the first conception of the *Heliometer*.—J. P. N.

**BOUHIER, JEAN**, a French lawyer and litterateur, president au mortier to the parliament of Dijon, member of the French Academy, born at Dijon in 1673; died in 1746. In his youth he acquired, besides the classical languages, an acquaintance with several modern tongues. Such was his reputation for science and erudition, that in 1727 he was called to the office of president of the academy, left vacant by the death of Malezieu. He has been eulogized by Voltaire, his successor, and the Abbé Olivet; nor have their praises been unmerited. Jurisprudence, philology, criticism, ancient and modern history, literary history, translations, eloquence, poetry, all were within the grasp of his capacious intellect, and have, most of them, been illustrated by his own writings, which are voluminous and important.—J. G.

**BOUHOURS, DOMINIQUE**, born at Paris in 1628, and died in 1702. At sixteen he entered into the order of jesuits. He taught Latin at Paris and rhetoric at Tours. He became tutor of the young princes of Longueville. He published several works on the French language, one of which led to a controversy with Ménage. When Bouhours was on his deathbed, he is reported to have said—"Je vais ou je vas mourir, car l'un et l'autre se disent." He published several professional works, and translated the New Testament from the Vulgate into French.

\* **BOUILLAUD, JEAN BAPTISTE**, clinical professor to the faculty of Paris, and a distinguished medical writer, born at Angoulême in 1796. His principal works are—"Traité clinique

et physiologique de l'encephalite et de ses suites," 1825; "Traité clinique et experimental des fièvres pretendues essentielles," 1826; "Dissertation sur les generalités de la clinique medicale, et sur le plan et la methode à suivre dans l'enseignement de cette science," 1831; "Nouvelles recherches sur le rhumatisme articulaire aigu en general," 1835; and "Traité clinique du rhumatisme articulaire, et de la loi de coincidence des inflammations du cœur avec cette maladie," 1840.—J. S., G.

**BOUILLAUD, ISMAEL**, born in London in 1605; died in Paris in 1694; a very laborious and useful writer on astronomical and mathematical subjects. He was a learned man, skilled in ancient science, and therefore well fitted to promote the reception of the Copernican system. He is the author also of a few historical and topographical treatises that are now forgotten. His scientific works are still useful to the student of the annals of Astronomy, and of the phenomena attending the reception by mankind of the cardinal truths proclaimed at the epoch of its reformation.—J. P. N.

**BOUILLÉ, FRANCOIS CLAUDE AMOUR**, marquis de, a French general, was born in 1739. He is well known for his connection with the massacre of the garrison of Nancy at the commencement of the Revolution, and for the exertions he made at a later date on behalf of the royal cause. He was privy to the king's unsuccessful attempt at flight; and one of the charges brought against the king at his trial was, that he remitted money to Bouillé and others to be used in order to bring about the restoration of the old state of affairs. Bouillé died in England in 1800.—W. M.

**BOUILLET, JEAN**, a French physician, born at Servian, near Béziers, on the 14th May, 1690, became surgeon to the hospital, and permanent secretary to the Academy of Béziers, where he died on the 13th August, 1777. His principal work is a "Mémoire sur l'huile de pétrole et les eaux minérales de Gabian," published at Béziers in 1752; and he was also the author of some scattered papers, principally connected with physics.—W. S. D.

\* **BOUILLET, JEAN BAPTISTE**, a living French geologist, born at Cluny in 1799. He is now a banker at Clermont-Ferrand, where he has formed an extensive collection of the minerals and terrestrial and fluviatile shells of the Auvergne. He has published numerous important memoirs and independent works upon the geology of his district, and especially upon the interesting volcanic group of the Puy-de-Dôme.—W. S. D.

**BOUILLON, EMANUEL-THÉODOSE DE LA TOUR D'AUVERGNE**, cardinal de, was born in 1644. He was the son of Frederic-Maurice, duke of Bouillon. He was at first a great favourite at the court of Louis XII., who secured his nomination to the rank of cardinal in 1669; but he appears gradually to have forfeited the regard of that king. Cardinal Bouillon was French ambassador at the court of Rome at the time of the celebrated controversy between Fenelon and Bossuet; and notwithstanding the instructions he received to do all in his power to secure the condemnation of Fenelon, he favoured his cause rather than that of Bossuet. In 1710 he was obliged to leave France on account of the disclosure of his correspondence with the duke of Marlborough and others. He died at Rome in 1715.—W. M.

**BOUILLON, FREDERIC MAURICE DE LA TOUR D'AUVERGNE**, duc de, son of Henri by his marriage with Elizabeth of Orange, was born at Sedan in 1605. In 1629 he joined the army of the prince of Orange in Holland, and fought with success against the Spaniards on more than one occasion. He afterwards entered the French service, and in 1642 he commanded the French troops in Italy. He was arrested at the time of the Cinq-Mars conspiracy on a charge of being privy to it, but the exertions of the duchess of Bouillon speedily procured his restoration to liberty. In the civil war of the Fronde, he was one of the leaders of the rebel party; and a proclamation was issued, declaring him a traitor, and confiscating all his property in France. In 1651 he entered into an agreement with the French government, by which the principality of Sedan and Raucourt was ceded to France, and several duchies were given up to him in exchange. He died in 1652.—W. M.

**BOUILLON, HENRI DE LA TOUR D'AUVERGNE**, duc de, marshal of France, was born towards the end of the year 1555. After serving for some time under the duke of Anjou, he embraced the reformed faith, and became one of the most distinguished of the protestant leaders. In this capacity he is better

known as viscount de Turenne, his title of duke of Bouillon not having been assumed till his marriage with the heiress of the estates of Bouillon in 1591. During the war of the League he was lieutenant-general of the armies of Henry of Navarre, during whose reign in France he might have attained great influence, had he not, by his restlessness and ambition, lost the favour of the king. The latter part of his life was spent in a series of intrigues, entered upon with a view to self-aggrandisement, by which the whole of France was frequently thrown into disturbance. He died in 1623.—W. M.

BOUILLON, ROBERT DE LA MARCK, due de, was born in 1492, and became a marshal of France in 1547. He served for a time under Charles V., but considering himself injured by a decree of the Aulic council, he afterwards entered into friendly relations with France, and declared war against the emperor. Notwithstanding the indirect assistance which Bouillon received from France, Charles invaded his territories with a large division of his army, and possessed himself of every position of importance, with the single exception of Sedan. Bouillon did not recover possession of his duchy till 1532. In the following year he defended Hesdin against the imperialists, commanded by Emanuel-Philibert, duke of Savoy; and in the assault by which the city was taken, he fell into the hands of the besiegers. He was kept prisoner till 1556. In that year he obtained his release, but before he could return to France his death took place.—W. M.

BOUILLON-LAGRANGE, EDMÉ-JEAN-BAPTISTE, a distinguished French physician and chemist, was born on the 12th July, 1767, at Paris, where he early commenced the study of chemistry and pharmacy; and after passing several years at the head of one of the principal pharmaceutical establishments in that capital, was appointed apothecary to the household of the Emperor Napoleon. In this position he made the campaigns of Austria and Prussia. After his return to Paris he devoted himself with great zeal to the improvement of the process for the manufacture of sugar from the beet root, and in 1813 published a report upon this subject, under the auspices of the minister of the interior. Subsequently he became professor of chemistry at the school of pharmacy in Paris, and died in that city on the 24th August, 1844. His works, which are rather numerous, relate for the most part to pharmaceutical chemistry; they are of considerable value.—W. S. D.

BOUILLOT, JEAN BAPTISTE JOSEPH, born at Philippeville, 3d March, 1750, author of "Biographical accounts of Eminent Persons born in that province of the Ardennes," the name of which sounds musical in the ears of all those who have followed the melancholy Jacques into its old romantic forest. As an enthusiast regarding the same locality, the name of Bouillot merits favour. He was one of those priests who accompanied Gobel, archbishop of Paris, to the bar of the national convention, and joined the frightened apostate in his renunciation of christianity. Upon the return of more tranquil times, Bouillot repented of his criminal weakness, and was received back into the church. He still followed his literary taste by contributions to biographical publications, in which he was still engaged at the time of his death in 1833.—J. F. C.

BOUILLY, JEAN NICOLAS, born at Tours in 1763; originally a member of the bar, he, when the Revolution broke out, joined the party of Mirabeau, of Barnave, and of those who, while ardent friends of liberty, wished well to the king. Appointed public prosecutor in his own native department, he executed his difficult and dangerous duties with all possible moderation. A few years afterwards he quitted his profession for the drama, and wrote a number of plays which, although well received at the time, are not sufficiently stirring and vivacious for the taste of the present day. Bouilly was emphatically a man of sentiment. He found his true vein when he began those studies of the female heart, to which he declares that he devoted many years of his life. His writings upon female education, embracing the four stages of existence, according to his own classification, raised him to a sort of authority, for he tells with evident satisfaction of the numerous applications that were made to him for advice. He became a sort of lay director, whose infallible counsels would be trustingly sought in nice cases of conduct. His successful treatment of "pains of the heart," and his delicate guidance through critical positions had, as he boasts in the fulness of his satisfaction, made him feel young at seventy. His ideal of a happy close of existence would be to find his steps guided by a "fair young girl lending her ear to the old story

teller." This amiable being lived to a good round age. He died in April, 1842.—J. F. C.

BOUJAS, DON JUAN ANTONIO, a Spanish painter, born at Santiago in 1672. He studied under Giordano at Madrid, but was driven home by the wars of succession.—W. T.

BOUJAS, JUAN ANTONIO, a Spanish historical painter, born at Santiago about 1672. He was a pupil, at Madrid, of Luca Jordano, and died about 1726.—W. T.

BOULAINVILLIERS, HENRI DE, born at Saint-Saire in Normandy in 1658, and died in 1722; son of Francis, comte de Boulainvilliers. He first thought of a military life, and made a campaign or two with distinguished success. His father died and left his affairs in so ruinous a condition that the young officer was obliged to retire from the army, and occupied himself with the study of French history. It is not easy to study earnestly without seeking to bring facts into a sort of unity by theory of one kind or other, and Boulainvilliers persuaded himself that the feudal system was the chef-d'œuvre of the human intellect. His theory yielded to one of Montesquieu's, and that in its turn has lost ground. Boulainvilliers wrote a great many books on French history, several of which were printed after his death. Some are said to remain still in manuscript.—J. A., D.

BOULANGER, JEAN, a French painter, born at Troyes in 1606. He went young to Bologna, and entered Guido's school. He afterwards became court painter to the duke of Modena, and established an academy. Died in 1660.—W. T.

BOULARD, ANTOINE MARIE HENRI, born 5th September, 1754, in Champagne, a man whose name deserves to be held in remembrance by all who love literature. His own contributions to letters consisted chiefly of translations from the English. During the Reign of Terror he concealed in his house La Harpe and some other persecuted writers, at great risk to his own safety. His benevolence, ever of the highest kind, assumed a peculiar turn. It became fixed upon the venders of old second-hand books. Many a time has he purchased the whole stock-in-trade of a poor bookseller, and a lawker of odd volumes was sure to open his easily accessible heart. He was, in fact, the Mæcenas of the book stalls. Successively a member of the corps legislatif and of the senate, he availed himself of his position to mark his veneration for great literary reputations. He it was who caused to be restored the tombs of Boileau, of Descartes, of Montfavein, and of Mabilion. His library, at his death, which took place on 6th of May, 1820, numbered half a million of volumes, the greater part of which had been purchased at stalls for the sake of helping humble traders in a business which was, to him, a sign of liberal mind.—J. F. C.

BOULARD, MICHEL, a Parisian upholsterer, famous for his extensive charities. He was brought up at the hospital of La Pitié, his father having died when he was only four years of age. Apprenticed to an upholsterer, he became a skillful workman; received from Marie Antoinette an appointment to superintend the furniture of the palace; was afterwards similarly employed by the emperor, and notwithstanding the inroads which his liberality to workmen and persons in distress made on the yearly returns of his business, amassed a large fortune, the whole of which, with the exception of small sums to his relatives, he bequeathed to charitable institutions. Died in 1825.—J. S., G.

\* BOULAY-PATY, EVARESTE FELIX CYPRIEN, born at Donges in 1804. His poems, crowned by the French Academy at a time when the opposition of that body to what they denounced as the ideas and fancies of the romantic school attached peculiar significance to their approbation, drew marked attention to M. Boulay-Paty. The duke of Orleans made him his private secretary. His works are not numerous, though esteemed.—J. F. C.

\* BOULE, a loose dramatic writer, only known for his participation in compositions for the stage.—J. F. C.

BOULE, ANDRÉ CHARLES, a celebrated French cabinet-maker, specimens of whose elegant designs and surpassing workmanship were to be found in every court in Europe in the seventeenth century, was born at Paris in 1642, and died in 1732. He was engraver in ordinary to Louis XIV., and held a patent for that office, in which he was designated architect, painter, and sculptor in mosaic. His style of work was highly ornate.

BOULGARIN. See BULGARIN.

BOULLANGER, ANDRÉ, celebrated as a preacher under the title of *petit père André*, an Augustine monk, born at Paris in 1578; died in 1657. In his sermons, according to the manner of the age, he mingled an occasional pleasantry with his doctrine

His works remain in MS., with the exception of "Oraison funèbre de Marie de Lorraine, abbesse de Chelles," published at Paris in 1627.—J. S., G.

**BOULLEMIER, CHARLES**, a French historian, born at Dijon in 1725; died in 1803. After having for some time pursued a military career, he entered the church. He wrote a great number of works connected with the history of Burgundy, some of which have been inserted in the collections of the Academy of Dijon.—J. G.

**BOULLIER, DAVID RENAUD**, a Dutch protestant theologian of French extraction, successively pastor at Amsterdam and in London, born at Utrecht in 1699; died in London in 1759. His principal works are—"Essai Philosophique sur l'Âme des bêtes," 1727; "Apologie de la métaphysique, à l'occasion du Discours préliminaire de l'Encyclopédie," 1753; and "Lettres critiques sur les Lettres philosophiques de Voltaire," 1754.—J. S., G.

**BOULLONGNE, LOUIS**, a French religious painter, and founder of a family of reasonably good artists. He became senior painter to the king, professor of the Royal Academy at Paris, and a celebrated copyist, so skilful as to deceive the best judges. His most celebrated imitation was the Parnassus of Perino del Oaja, for the banker Jabach. No picture of Louis' is in the Louvre. He left three or four etchings, and three great religious pictures in Notre Dame—"St. Paul at Ephesus," "St. Paul's Martyrdom," and the "Presentation in the Temple." His eldest son, **BOU**, was born in 1649, and was also a great copyist. He went to Rome, stayed five years, and returned to Paris to enter the academy of which he became professor. He drew and coloured well, but was often mannered and inflated. He executed frescos for the chapel of the Invalides, some church pictures, and some etchings. At Versailles, under Lebrun, he painted nine of the chapel panels. He also painted a "Holy Family," and "Christ at the Pool of Bethesda," and died in 1717. His younger brother, **LOUIS**, was born for the good cause in 1654. At eighteen, like his brother, he carried off the prize in the academy, and went to Rome to copy Raphael with such success that some of his drawings were afterwards used for the Gobelin tapestries. In 1680 he became an academician, and by meritorious work in the Invalides and Notre Dame obtained a pension and the order of St. Michael, so that afterwards he was generally called the Chevalier. After the death of Coypel, the king loaded him with honours. He became the court painter, and received an indelible patent of nobility. He was chosen designer of medals to the Academy of Inscriptions, and, lastly, director of the Painting Academy. His two sisters, **MAGDELAINE** and **GENEVIEVE**, painted flowers and fruits.—W. T.

**BOULOGNE, ETIENNE ANTOINE DE**, a French prelate, born at Avignon in 1747; died in 1825. In 1771, when he had hardly attained canonical age, he was ordained priest, and commenced his ministrations at Avignon, with a reputation derived from considerable talent and academical success. He removed to Paris in 1774, and three years afterwards had the honour of being selected to preach before the aunts of Louis XVI. A misunderstanding which arose between him and the archbishop of the city, resulted in his being subjected to an interdict, which suspended him from his functions for a considerable period. After having filled the office of vicar-general under the bishop of Chalons-sur-Marne, he returned to Paris, and in 1783 preached before the royal family. In 1784 he was again at Chalons, in quality of archdeacon and canon; in 1788 was named by Talleyrand to the abbaye of Tonnay-Charente, and in 1789 deputed to one of the public courts of Paris. During the Revolution, having declared himself a nonjuror, he was three times arrested, but contrived to escape banishment, with which he was threatened. Under the empire he was successively bishop of Acqui and of Troyes; but from the latter see he was deposed by Napoleon, and despatched to Vincennes, for having opposed the imperial will in the council of 1811. He was restored in 1814, and in 1817 promoted to the archbishopric of Vienne. His works were collected at Paris shortly after his death.—J. S., G.

**BOULTER, HUGH**, a laborious and philanthropic prelate, appointed by George I. to the primacy of Ireland, born in or near London in 1671, was educated at Merchant Taylors' school and at Christ church, Oxford. He was a contemporary of Addison at Magdalen college, of which they were both elected demy shortly after the Revolution. Having attained a fellowship, he resided at that college till 1700, when he became

chaplain to Sir Charles Hedges, secretary of state, from whose household he subsequently removed to that of Archbishop Tenison. In 1719, having previously been named by Tenison to the rectory of St. Olave's, Southwark, and to the archdeaconry of Surrey, he accompanied George I. to Hanover, as king's chaplain, and tutor to Prince Frederic, for whom he drew up a set of instructions which so pleased the king that he made him dean of Christ church, and bishop of Bristol. After presiding in this latter see with great credit for four years and a half, he was nominated to the primacy of Ireland, and arrived in that country in 1724. To the duties of this responsible position he brought such energy, intelligence, and philanthropy, as practically brought the direction of the government within his power; while his extensive charities, and laborious endeavours to foster native industry, commanded for him the respect of all classes of the people. He died in London in 1742. Besides his occasional sermons, and a few of his charges to the clergy of Ireland, two volumes of his "Letters to Ministers of State," illustrative of Irish history from 1724 to 1738, have been published.—J. S., G.

**BOULTON, MATTHEW**, an English engineer, famous as the partner of the more celebrated James Watt, was born at Birmingham on 3d September, 1728. He early showed an aptitude for mechanical work, and when only seventeen, designed and executed improvements on some of the smaller articles of Birmingham manufacture. Succeeding to some property on the death of his father, and finding his premises inadequate for his experiments and improvements, he purchased in 1762 a lease of the Soho, a barren heath about two miles from Birmingham, where he proceeded to establish the works afterwards so famous. He showed great taste in the manner in which the buildings were designed and the ground laid out, and spared no expense in seeking to bring the different departments of his business to greater perfection than had ever been attained before. The ornaments which were made at the Soho from the designs of artists employed on the works soon became famous over Europe, and the demands of a rapidly-increasing business made Mr. Boulton feel that the mills which supplied the motive power were quite inadequate. He had therefore recourse to the newly-discovered power of steam. Mr. James Watt obtained in 1769 a patent for improvements on the steam-engine. In that year Mr. Boulton entered into negotiations with the great engineer, and induced him to remove to Soho and become his partner. An extension of the patent for twenty-five years was procured in 1775, and the partners entered on an extensive manufactory of the improved engines, which were soon carried to all parts of the country. But Mr. Boulton did not forget his original purpose in securing the co-operation of Mr. Watt. He proceeded to apply the engine, and with very great success, to the various departments of labour in the works. So perfect were the arrangements of the coining machine, that the power of one engine could turn off from 30,000 to 40,000 coins in an hour. Mr. Boulton died 17th August, 1809, in his eighty-first year. Though not possessed of such genius as his partner, he held no mean place as a mechanic, and as long as Mr. Watt's achievements are recorded, the sympathy and friendly aid of Mr. Boulton will be remembered. He liberally expended £47,000 in the experiments of the steam-engine before the improvements were effected, or could secure any return. It is no slight praise that Watt should thus speak of him—"To his friendly encouragement, to his partiality for scientific improvements, to his intimate knowledge of business and manufactures, and to his extended views and liberal spirit, may in a great measure be ascribed what ever success may have attended my exertions."—J. B.

**BOUQUET, DOM MARTIN**, a celebrated Benedictine, born at Amiens in 1685; died in 1754. He undertook a history of the Gauls and Franks, the idea of which work had been conceived by Colbert in 1676. Of this work he lived to complete the eighth volume in 1752, and had commenced the ninth when death closed his labours. This important work has been continued by several learned Benedictines, under the title of "Rerum Gallicarum et Francicarum Scriptores," or "Recueil des historiens des Gaules et de la France." Bouquet was associated with the learned Montfauçon in several of his works.—J. G.

**BOUQUIER, GABRIEL**, a French litterateur, born in Perigord about 1750; died in 1811. He was member of the convention for the department of Dordogne, and was a man of strong revolutionary opinions. He voted for the death of Louis XVI., but took no part in the struggle between the Montag-

nards and the Girondists; was member of the committee of public instruction, president of the Society of Jacobins, and in 1794 was elected secretary to the convention. At the close of the convention he retired to his property, and divided his time between music and painting. He wrote, in conjunction with Moline, a five-act piece, entitled "Inauguration de la république française, sans culotide," that was frequently represented.—J. G.

**BOURBON.** The first six dukes of this house we notice together; the other distinguished persons who bore the name follow in alphabetical order:—**LOUIS I.**, count of Clermont, and duke of Bourbon, son of Robert of Clermont, and grandson of St. Louis, born in 1279, succeeded his mother Beatrix, 1310, in the lordship of Bourbon. He bore arms in the Flemish wars of Phillippe le Bel, particularly distinguishing himself on the fatal field of Courtray in 1302. In 1308 he was appointed grand chamberlain to the king—a dignity which was enjoyed by his descendants till the revolt of the constable of Bourbon. In 1312 he purchased for an enormous price from Eudes, duke of Burgundy, the title of prince of Thessalonica, consoling himself with an eastern signiory for the ill success of his attempt to organize a crusade. For his exploits in the English wars of the reign of Charles le Bel, his signiory of Bourbon was erected into a duchy. He took part with Phillip of Valois in his struggle for the throne, and was sent by that prince to Edward III., whom he persuaded to do homage to the king of France. In the three years preceding his death in 1341, he was again engaged in the French wars in Flanders.—**PIERRE I.**, son of the preceding, born in 1310, a brave soldier and prodigal prince, distinguished in the English wars, and also in the records of the chancery of Rome, where he figured as an excommunicated bankrupt. He was wounded at Cressy, and killed at Poitiers in 1356. One of his daughters was married to Charles V., and another to Peter the Cruel.—**LOUIS II.**, son of the preceding, born 1337, honourably distinguished for his efforts to arrest the discord which prevailed among the members of the family of Charles V., and to quell the popular tumults of that reign. Until the peace of 1374 he fought valorously against the English, whom, as the son of one of the proud princes who fell at Poitiers, he excelled in hating. In 1380, after the death of the king, he was appointed guardian of the young duke of Orleans, brother of Charles VI. In 1398 he undertook a crusade against the pirates of Tunis. This was one of the most brilliant as well as one of the most honourable exploits of the age. He not only forced the king of Tunis to liberate all his christian captives, but obliged him to become tributary to Genoa. Died in 1410.—**JEAN I.**, son of the preceding, born in 1381. About the time of the murder of the duke of Orleans he was a leader of the Armagnac party, and an active enemy of the Burgundian. He repulsed Jean Sans Peur from before Bourges, and in 1414 took from him the town of Compiègne. The year preceding, with the aid of some troops from Paris, he repressed brigandage in the provinces of Touraine, Anjou, &c. In 1415 he and sixteen other persons, knights or squires, published a cartel in which it was set forth, that each would wear in honour of his lady, and in defiance of all the world, a fetter of gold or silver for the space of two years. Having been made prisoner at the battle of Agincourt, he was carried to London, where, although his ransom was paid no fewer than three times, he was kept in confinement till his death, 1434.—**CHARLES I.**, son of the preceding, born in 1401, bore, during his father's lifetime, the title of count of Clermont. In 1418 he was seized in Paris by Jean Sans Peur, duke of Burgundy, and compelled to renounce his marriage with Catherine of France. This was preliminary to his being required to espouse the duke's daughter, whom, after the murder of her father, he dismissed into Burgundy. He bore arms for the dauphin, afterwards Charles VII., and in reward for numerous important services, was raised to the command of two provinces, Languedoc and Guyenne. In 1428 he was engaged in the defence of Orleans, against the English, and the year following, took part in the battle of the Herrings. On the marriage of his sister to Phillip the Good of Burgundy, hostilities ceased between the two houses, and it was Jean I. who negotiated the treaty of peace between Phillip and Charles VII., which, to the great joy of the king, was ratified in 1435. He died in 1456.—**JEAN II.**, constable of France, son of the preceding, born about 1426, distinguished under the title of count of Clermont for his exploits against the English in Guyenne. He was a prominent leader of the party who in the time of Louis XI., formed, with such poor success,

the league called du Bien Public. After the treaty of Conflans, where Louis and his rebellious barons were once more reconciled, he was taken into favour by the crafty monarch, and finally raised to the post of constable. He died in 1488.

The seventh duke of Bourbon was Charles II., Cardinal de Bourbon, noticed below; the eighth was Pierre II., Sire de Beaujeu, noticed under that title.—J. S., G.

**BOURBON, ALEXANDRE DE**, natural son of Jean I., duke of Bourbon, at first distinguished as a brave officer under Charles VII., then as a brigand, and afterwards as one of the leaders of the Praguerie. He was taken at Bar-sur-Aube in 1440, sown in a sack, on which were inscribed the words—"laissez passer le justice du roi," and thrown into the river.—J. S., G.

**BOURBON, ANTOINE DE**, king of Navarre. See ANTOINE.

**BOURBON, CHARLES**, cardinal de, second son of Charles I., fifth duke of Bourbon, was created archbishop of Lyons in 1446, and raised to the purple in 1477. He was one of the chiefs of the Ligue du Bien Public, but latterly figured at the court of Louis XI., who frequently employed him both in war and diplomacy. When the cunning Louis invited Edward III. to Paris to see the dames of the French court, he recommended to the English monarch the Cardinal de Bourbon as an amiable and not too austere confessor. On the death of his father, the title, but not the estates of the family, came into his hands, the latter being claimed by his elder brother, the Sire de Beaujeu, son-in-law to the king.—J. S., G.

**BOURBON, CHARLES**, cardinal de, of the Vendôme branch of the family, brother of Antoine de Bourbon, king of Navarre, born in 1520. His revenues from the church were enormous—he was archbishop, bishop, and abbot of ten rich houses. Under Charles IX. and Henry III. he was chief of the privy council. His interests, however, were with the party of the League, and he became their chief, afterwards their king. In order to forestall his nephew, the king of Navarre, afterwards Henry IV., he had himself crowned under the title of Charles X. His principal supporters were the duke and cardinal of Guise, whose mother he had married. After the assassination of these two princes he was taken prisoner, and shut up in the castle of Fontenay-le-Comte. From that place, two months before his death, 1590, he wrote to his nephew, Henry IV. recognizing him as his sovereign.—J. S., G.

**BOURBON, CHARLES**, cardinal de, grandnephew of the preceding, and the fourth son of Louis I., prince of Condé, born in 1560, inherited from his granduncle the archbishopric of Rouen, and several abbeys. He renewed the pretensions of his branch of the family to the throne of France, and was not cured of the folly, bequeathed to him by his granduncle, without causing considerable trouble to Henry IV. He died in 1594.

**BOURBON, CHARLES**, duc de, the famous constable, count of Montpensier and la Marche, and dauphin of Auvergne, born 1490, was the second son of Gilbert de Bourbon, count of Montpensier, viceroy of the kingdom of Naples. By the death of his elder brother, and his marriage with Suzanne de Bourbon, heiress of Pierre II., duke of Bourbon, the honours of the two great branches of the family fell to him at an age when his natural love of magnificent display, and his ambition of warlike fame, fostered almost into vices by the retainers of his father and his uncle, were in the full bloom of youthful passions. His skill in military science, and his prowess in the field and the tournament, had answered all the expectations of the veteran warriors to whom the task of fitting him for his high station had been intrusted. No less austere in his personal habits than magnificent in the character of a prince, while his presence at court commanded more deference than love, he was the idol of the soldiery, and the boast of his titled compeers. Louis XII. and his successor, Francis I., were jealous of a subject who rivalled the sovereign in wealth, if not in power. He never travelled without a retinue, which, comprising most of the nobles of his duchies of Bourbon and Auvergne, and of his various counties, was more like an emperor's than a duke's. When on the death of Gaston de Foix, the army of Italy, with which he had served by the side of Bayard in the last campaign of Louis XII., demanded Bourbon for chief, the king refused to comply with its wishes, saying of the duke, "I would like to see in him a little more gaiety and less reserve—nothing is worse than water that sleeps." Francis, indeed, immediately after his accession, appointed Bourbon constable in 1515, and the following year

rewarded the skill and valour which had gained the victory of Marignano, by leaving him in command of Lombardy; but as was to be shown not long after, he too disliked the taciturnity of his redoubtable lieutenant. While in Lombardy, Bourbon proposed to the court to undertake the conquest of Naples, and so effective had been his measures for disciplining the army under his command, that the subjugation of that kingdom would have cost Francis but little exertion, if he had been at all disposed to add to the power of a lieutenant whose designs he feared as much as he respected his talents. Bourbon was still engaged in preparations for an invasion of the Neapolitan territories, when his attention was directed to another quarter of Italy by the movements of the Emperor Maximilian, who had entered the Milanese with a large army. This irruption promised to be as disastrous as it was unexpected, but the mutinous conduct of the Swiss mercenaries, who formed the staple of each army, brought it to a sudden termination; not, however, before the constable had drawn on his personal credit for supplies which should have been furnished by the king. In 1521 the constable's wife, Suzanne de Bourbon, died, and now began the open hostility between Francis and Bourbon which was to end so fatally for both. Louise of Savoy, the mother of Francis, had long entertained a violent passion for Bourbon, which, not being nice in her morality, she hardly concealed in the lifetime of his wife, and now avowed in such a manner, that the constable was irritated into expressing his contempt for the princess, and his scorn of the woman. This Francis resented by refusing to pay the sums which Bourbon had borrowed in order to save the Milanese, and the breach between them daily widened. To satisfy the king, who wanted money, and his mother, who thirsted for revenge, the courts of law proceeded to despoil the constable of his estates, the greater part of which they declared belonged to the queen-mother, as the next of kin to Suzanne de Bourbon. In this way the constable lost first his county of La Marche, which was given to Louise, then another and another county, and, finally, his duchies. By a still more summary process, he was deprived of the emoluments of his office. Sternly refusing to make his peace with the court by accepting the hand of a profligate woman, he determined to accept the proffered amity of the enemies of his country, Charles V. and Henry VIII. With these princes he concluded a league of friendship, the terms of which were, that he should have Dauphiny and Provence, in addition to his duchies, and his allies the rest of France. Francis I. was on his way to Italy, when, in conformity with this treaty, Bourbon prepared to join the imperialists in Lombardy. He was soon aware of the treason of the constable, but fear, which as much as hatred had all along guided his policy towards his formidable subject, kept him for awhile from attempting to lay violent hands on a traitor, who, in the event of a battle, ran a good chance of changing places with his master. At length, however, Bourbon had to depart the kingdom, and without an army. The fugitive, somewhat to conceal his plight from his imperial ally, surrounded himself in Germany with 6000 lansquenets, whom his reputation, and the expectations of plunder founded thereon, rather than regular pay, attracted to his standard. His first service in the ranks of the imperialist army was that pursuit of the French across the Sesia in 1524, in which the illustrious companion of his campaigns in Italy, Bayard, fell by a ball from a Spanish arquebuss.—(See BAYARD.) Charles V. was chary of his confidence to a prince who had promised to come to him with a powerful army, and had with difficulty escaped hanging in the attempt to leave his country; and, although assured by the constable that he had only to enter France to be received with open arms in all the great cities of the kingdom, he would only consent to a slight demonstration in Provence, which proving unsuccessful, he ordered his forces beyond the Alps. The battle of Pavia, where, with the title of lieutenant-general, he commanded a body of about 19,000 Germans, certainly afforded him ample revenge for the wrongs he had received from Francis I., but after that great victory, mainly owing, be it said, to his skill and valour, he was as little trusted—his interests were as little regarded—by the emperor as before. In the temper of mind induced by this neglect, he resolved on a daring scheme to settle his accounts with fortune, the attempt to execute which ranks him with the boldest, as he was certainly one of the most respectable, of brigands. Allured by the immense wealth of the city of the Cæsars, he proposed to the turbulent mercenaries under his command, an immediate advance

on Rome, which, under the false security of a truce with Charles V., little expected another invasion of the northern barbarians. In vain the Romans appealed to the soldiery of Charles V. to respect the treaty of peace their master had entered into with the Holy See—their pay was in arrears—their chief had prepared a chain of gold in which to hang the pope—and nothing would arrest their march. On the 6th May, 1527, the assault began—Bourbon was the first to mount the walls, and the first who fell. A priest, it was said, fired the fatal shot.—J. S., G.

**BOURBON, HECTOR DE**, natural son of Louis II., duke of Bourbon, killed while rallying the Armagnacs at the siege of Soissons in 1414; a doughty warrior whose deeds were affectionately rehearsed long after the termination of his short but brilliant career. He perished at the age of twenty-three.

**BOURBON, JEAN DE**, archbishop of Lyons, and natural son of Jean I., duke of Bourbon, distinguished as one of the most munificent prelates of his age. He was lieutenant of several provinces. Died in 1485.

**BOURBON, JEAN DE**, natural son of Pierre I., duke of Bourbon, chamberlain of John of France, and lieutenant of Languedoc, was wounded and made prisoner at the battle of Poitiers.

**BOURBON, LOUIS**, count of Rousillon and Ligny, admiral of France, a natural son of Charles I., duke of Bourbon, married Jeanne de France, natural daughter of Louis XI. He was marshal and seneschal of his brother's estates, and was legitimized in 1463.

**BOURBON, LOUIS**, cardinal de, archbishop of Sens and legate of Savoy, fourth son of François de Bourbon, count of Vendôme; born in 1493; took part in the Milanese campaign of Francis I.; in 1527 was commissioned to offer that prince, in the name of the clergy of France, a gift of 1,300,000 livres; and in 1552 was appointed governor of Paris by Henry II. Died in 1556.

**BOURBON, LUIS ANTONIO JACOBO DE**, infanta of Spain, born 1727, son of Phillip V., and brother of Charles III. Compelled by his father to enter the church, he was made a cardinal, and appointed archbishop of Toledo, but as soon as the death of Phillip V. left him at liberty to engage in the more congenial duties of his secular rank, he threw down his pastoral staff, returned his cardinal's hat, and to mark his contempt for the dignities he quitted, exchanged the scanty cape of his clerical habiliments for one of outrageous dimensions. His marriage with Maria Theresa de Valabriga Bosas, gave such offence to Charles III., that he was forbidden to approach the court except when specially invited. He died in 1785.

**BOURBON, LOUIS HENRI**, duke of, and of Enghien, son of Louis, duke of Bourbon-Condé, born in 1692. After the death of Louis XIV., he was appointed president of a council of regency. The spirit of the next reign, which was plunder, he entered into with all his heart; as first minister of the king, scheming away immense sums; but as duke of Bourbon, always increasing his treasures. He was supplanted in 1726 by the cardinal de Fleury, who neglected no opportunity of harassing his predecessor. Died in 1740.

**BOURBON, LOUIS HENRI JOSEPH**, duke of, and prince de Condé, father of the duke d'Enghien, so wantonly murdered by Napoleon, was born in 1756. After the Revolution, he established himself in the territory of Liege, where, his fellow-emigrants being in great numbers, he was able to organize a considerable force, which, under his command, earned distinction in various encounters with the armies of the republic. He was in England when he learned the atrocious crime which deprived him of his son. During the Hundred Days he was active on behalf of Louis XVIII. in La Vendée, but without effect. The government of the Restoration rewarded his fidelity to the chief of his house, by appointing him grand-master of the royal household. His death, which occurred in 1830, was not without some circumstances fitted to awaken suspicions of foul play. He was found suspended by a handkerchief in his chamber at the castle of Saint Leu. The duke d'Aumale, fourth son of Louis Philippe, inherited his property.—His wife, **LOUISE MARIE THERÈSE BATHILDE D'ORLEANS**, was a daughter of Louis Philippe, duke of Orleans, grandson of the regent. After the birth of their son, the duke d'Enghien, the spouses separated; Madame, after suffering a two years' imprisonment during the revolutionary period, being ordered to retire into Spain, where, in the enjoyment of an ample pension, she devoted herself to converse and correspondence with a number of mystical pietists, and what was

of more service to her reputation, to works of charity. In spite of her continual entreaties, she was not allowed to return to France till 1814. She died in 1822.

**BOURBON, LOUIS DE**, bishop of Liege, brother of Charles cardinal and duke de Bourbon, a prelate of loose and violent habits, assassinated in 1482. His son, Pierre, was the founder of the family of Bourbon-Busset.

**BOURBON, LUIS MARIA DE**, Prince, son of Luis Antonio, infanta of Spain, born at Cadahalso in 1777, became cardinal and primate. In 1808 he wrote to Napoleon in a strain of fervent loyalty, and the following year took the oath of fidelity to King Joseph, but this subserviency to the French lasted only till the outbreak of the insurrection, when he assumed the responsibilities of president of the regency of Cadiz. On the restoration of Ferdinand VII., he was commissioned to exact from the king the oath of fidelity to the constitution of 1812. This commission lost him the favour of his cousin, who took from him the archbishopric of Seville. The revolution of 1820 again placed him at the head of affairs. He died in 1823.

**BOURBON, MATTHIEU**, known as le Grand Batard de, son of John II., duke of Bourbon, distinguished in the wars of Louis XI. against Maximilian of Austria. Charles VIII., to whom he was counsellor and chamberlain, lavished on him the highest honours of the court and the camp; among others, that of attending him into Italy as the first of the nine knights of renown, whom, in imitation of Charlemagne, he chose for his companions in arms. He was made prisoner at the battle of Fornovo in 1495; died in 1505.—J. S., G.

**BOURBON, NICOLAS**, a Latin poet, born at Vandœuvre in 1503; died in 1550. He was tutor to the mother of Henry IV. His poetry has been ridiculed by Scaliger, but has been highly commended by Erasmus and others scholars of note. His collection of poems, entitled "Nugæ," has drawn on him the following epigram of Joachim de Bellay:—

"Paule, tuum inscribis Nugarum nomine librum:  
In toto libro nil melius titulo."

—J. G.

**BOURBON-CONDÉ, LOUIS**, duke de, son of Henri Jules, prince of Condé, and of Anne of Bavaria, born in 1668, a brave and sagacious soldier, but most unamiable prince. He distinguished himself at the siege of Mons and Namur. His character has been depicted by Saint Simon in colours which might have gone to a portrait of the adversary of mankind. Died in 1710.

**BOURCET, PIERRE-JOSEPH**, a learned tactician, born at Yseaux in 1700; died in 1780; author of "Historical Memoirs of the War in Germany, from 1757 to 1762;" "Carte Topographique du haut Dauphiné;" "Memoires Militaires sur les Frontières de la France, du Piémont, de la Savoie, depuis l'embouchure du Var jusqu'au lac de Geneve."

**BOURCHENU, JEAN-PIERRE MORET DE**, marquis de Valbonnais, a French historian, born at Grenoble in 1651; died in 1730. After spending a youth of adventure, he became successively counsellor to the parliament of Grenoble and councillor of state. His works bear chiefly on the history of Dauphiné.

**BOURCHIER, JOHN**, Lord Berners, grandson of Sir John Bouchier, fourth son of William, earl of Eux, in Normandy, was born in 1469; died at Calais in 1532. He was educated at Baliol college, Oxford, and after quitting the university travelled abroad for the purpose of completing his education. His success in suppressing an insurrection which broke out in Devonshire and Cornwall about the year 1495, gained him the favour of Henry VII. He served at the siege of Thérouanne under Henry VIII., in the capacity of captain of the pioneers, and obtained from that monarch the government of Calais, and the post of chancellor of the exchequer for life. He conducted the Princess Mary, the king's sister, to France, on the occasion of her marriage with Louis XII. Lord Berners was the author of a tract, "On the Duties of the Inhabitants of Calais," and a comedy called "Ite in Vineam Meam;" but his fame rests mainly on his translations of "The History of the most Noble and Vaylant Knight, Arthur of Lytell Brytagne;" "The Famous Exploits of Hugh of Bourdeaux;" "The Castle of Love," a romance from the Spanish; "The Golden Boke of Marcus Aurelius;" and especially his translation of Froissart, published in London in 1523.—J. T.

**BOURCHIER, THOMAS**, archbishop of Canterbury, son of Sir William Bouchier, earl of Eux, was educated at Neville's Inn, Oxford. His first ecclesiastical preferment was to the

deanery of St. Martin's, London. In 1433 he was advanced to the see of Worcester. In the same year he was appointed chancellor of the university of Oxford, an office which he held for four years. He was chosen bishop of Ely in 1434, but it was not until 1443 that the consent of the king was given to his translation. In 1454 he was elected archbishop of Canterbury, and in the year following was made lord-chancellor, an office which he retained only for a few months. He held the primacy of the English church during thirty-two years, from the thirty-second year of Henry VI. to the second year of Henry VII., and was a good deal mixed up with the political events of that stormy period. He died at Knowle, then an archiepiscopal residence, in 1486. Archbishop Bouchier was undoubtedly a man of ability and learning, but he deserves to be remembered mainly for the service he did this country in promoting the introduction of printing. It was he who persuaded Henry VI. to send Turnour and Caxton to the continent in the guise of merchants, with the view of acquiring a knowledge of this art, which was then practised with the greatest secrecy. With great difficulty they accomplished their purpose, and persuaded one of the compositors to carry off a set of types and accompany them to England.—J. T.

**BOURCIER, JEAN LEONARD**, baron de Montureux, celebrated as the principal author of the code of laws known as that of Prince Leopold, which, till lately, regulated the administration of justice in Lorraine, was born at Verclise in 1649, and died in 1726. After its submission to Louis XIV., he became procurator-general of the province of Luxembourg, and in the course of the ten or twelve years he held that dignity, accomplished for Luxembourg a triumph of legal skill and industry similar to that which afterwards shed lustre on the government of Lorraine. The peace of Ryswick having restored Duke Leopold to his estates, Bourcier was immediately invested with the same dignity in his native province, which he had worn with such advantage to the new subjects of France in Luxembourg. As was inevitable, in a province which for more than half a century had been the prey of successive conquerors, the administration of justice in Lorraine, at the time of Leopold's restoration in 1698, was in the utmost confusion. To remedy this Bourcier prepared, in the space of three years, a complete system of jurisprudence, civil and criminal, which had the rare fortune to meet with general approval in the duchy. It touched, however, on some nice points of public morality, which at least one prelate of Lorraine was determined should not be too distinctly guarded, and in consequence of the representations to the papal chair of this officious churchman, a part of Bourcier's code was subjected to pontifical censure. Bourcier published a reply to the bishop, which was also condemned at Rome. The courts of law decided the dispute by adopting the whole code. In 1711 Bourcier received the commands of Leopold to repair to the congress of Utrecht. On his return, the duke compelled him to accept the title of baron, a dignity to which, at his advanced age, he would have preferred an honourable dismissal from the cares of office. This accomplished and laborious jurist published a number of historical works, chiefly relating to Lorraine.—J. S., G.

**BOURCIER, JEAN LOUIS**, count de Montureux, son of the preceding, born in 1687, succeeded his father as procurator-general of Lorraine in 1724. He was employed by Leopold in one or two missions of importance, and under the successor of that prince, Francis afterwards emperor, he was admitted to an important share in the management of public affairs. Francis, on his marriage with the Archduchess Maria Theresa, summoned him to Vienna, where he conducted the opposition of his master to the treaty (called of Vienna), which deprived the prince of his duchy of Lorraine. He published a work of considerable interest both to the legislator and the historian—"Recueil des edits, &c., du regne de Leopold." Died in 1737.—J. S., G.

**BOURDALOUE, LOUIS**, the celebrated French preacher, one of the greatest of orators, and one of the most exemplary of christian teachers, was born at Bourges in 1632. He entered the Society of Jesuits in 1648, and after a brilliant career as student and professor in the seminaries of that order, was sent forth as a preacher. In the provinces, where his first sermons were delivered, as afterwards in the metropolis, crowds attended him wherever he went. In 1669 his superiors called him to Paris to occupy for a year the pulpit of St. Louis. His success speedily ranked him in popular talk with Corneille, Racine, and the other glories of the most brilliant period of the French

monarchy. He became the idol of the court and of the masses. The former tolerated, while the latter applauded his uncompromising reprobation of vice, whether courtly or vulgar; and all paid homage to his unrivalled eloquence, his piety, and zeal. He found the pulpit in Paris, as has been said, a place for buffoons and pedants; by the influence of a saintly character and splendid talents, he commanded for it all proper respect in his own lifetime, and left it a goodly reversion to men who resembled him both in piety and in genius. Louis XIV. wished him to preach ten successive Lenten sermons in the royal chapel, remarking, that an old sermon of his was better than a new one of anybody else. On the revocation of the edict of Nantes, the king sent him into Languedoc to confirm the new converts from the protestant faith; and in this mission he had extraordinary success. Until the infirmities of age rendered him unequal to the extraordinary efforts by which he had achieved unparalleled fame as a preacher, he continued to minister from the pulpit, and then with undiminished zeal turned to the more private duties of his calling, often, it is said, sitting five or six hours in the confessional after he had accomplished his daily task of visiting all the sick, and they were many, who requested his attentions. For good works the last days of this admirable man were as remarkable as were his earlier years for the triumphs of genius. He died at Paris in 1704. Two editions of his sermons were published by his friend, Father Bretonneau, the first in 16 vols. 8vo, 1706, and the second in 18 vols. 12mo. The most recent edition of his works is that of Firmin Didot, 3 vols., 1840.—J. S., G.

BOURDELOT, PIERRE, the author of a work entitled "L'Histoire de la Musique et de ses Effets, depuis son origine jusqu'à présent," was born at Sens in 1610. He devoted himself first to the study of medicine, being created doctor in 1642, and afterwards to the service of the church. In 1651 he visited Stockholm, to attend Christina of Sweden in a dangerous illness; and, returning to France, was rewarded with an abbacy. He died in 1685, leaving his MSS. on music to his nephews, MM. Pierre and Jacques Bonnet. The "Histoire de la Musique" was first printed in 1715, and afterwards, with considerable additions by the editors, in 1725 and 1743. The first edition is in one small volume. The editorial appendices are in four volumes 12mo.—E. F. R.

BOURDIC-VIOT, MARIE ANNE HENRIETTE DE, born at Dresden in 1746, a poetess whose works show great cultivation of mind, and are the results of calm reflection rather than of inventive imagination. Married at 13, a widow at 16, she again married baron de Bourdic, like her first husband, a Frenchman; and although of ordinary appearance she was married a third time to M. Viot. She used pleasantly to say of herself that the Architect had neglected the exterior of the building, and in saying so implied that, like some Arabian buildings, the marvellous decorations of the interior compensated for the sobriety of the outside. Her acquaintance with living languages was extensive, and in philosophy she followed the easy elastic scepticism of the tolerant Montaigne. Voltaire and La Harpe have each borne testimony to the remarkable qualities of this accomplished woman. She died in 1802.—J. F. C.

BOURDIN, GILLES, a learned Frenchman, born at Paris in 1515; died in 1570. He became advocate-general to the parliament of Paris in 1555, and procureur-general in 1558. His best work is entitled "Egidii Bordini Paraphrasis in Constitutiones Regias anno 1539 editas." This work was translated into French by Fontanon in 1606.—J. G.

BOURDIN, JACQUES, lord of Vilaines, a statesman of the reign of Henri II., François II., and Charles IX., died in 1567. He drew up for the council of Trent an elaborate defence of the rights of the Gallican church, parts of which are preserved in Dupuy's collection. He figured in the most important negotiations of his time, particularly those with England in 1553, and with Germany in 1553-66. He was suspected of inclining to the opinions of the German reformers.—J. S., G.

BOURDOIS DE LA MOTHE, EDMÉ JOACHIM, successively physician to the king of Rome, Louis XVIII., and Charles X., born at Joigny in 1754, is the author of a "Dissertation sur les effets de l'extrait de ratanhia dans les hemorrhagies," 1808. Died in 1830.

BOURDOISE, ADRIEN, a French ecclesiastic, contemporary with St. Vincent de Paul and the abbé Ollier, born in the diocese of Chartres in 1584; died in 1655. He was a zealous catechist and missionary, and besides instituting the community of

priests of the order of St. Nicolas du Chardonnet, is said to have drawn up the code of rules observed by the Miramiones, or nuns of St. Genevieve. He left a work entitled "Idée d'un bon Ecclésiastique."

\* BOURDON, ISIDORE, a distinguished French physician, born at Merry in 1796. His works, which are numerous, rank among the most valuable contributions to medical science of the present century. They are equally admirable in style and matter. Besides a host of dissertations in various journals he has published "Principes de Physiologie Médicale," Paris, 1828; "Principes de Physiologie comparée, ou Histoire des phénomènes de la vie dans tous les êtres qui en sont doués, depuis les plantes jusqu'aux animaux les plus complexes," 1830; and "La Physionomie et la Phrenologie, . . . examen critique du système d'Aristote, de Porta, de Camper," &c., 1842.—J. S., G.

BOURDON M., a modern French mathematician, author of several very useful works. The "Algèbre" and "Mécanique" of Bourdon rank among the foremost class of treatises intended for the advanced student.—J. P. N.

BOURDON, SEBASTIAN, a French painter, born at Montpellier in 1616. His father was a glass-painter, and the son grew up a sort of restless artisan, almost self-educated. At the age of fourteen he painted a ceiling in a nobleman's house near Bourdeaux, a sufficient proof of his being an ambitious and precocious workman. Then in a fit of impatience at such mean employment, we may suppose, he went to Toulouse and enlisted. His captain finding a genius carrying a pike when he should have been holding a brush, gave him his discharge, and sent him to study, where he met and imitated Claude Lorraine.—W. T.

BOURDON DE LA CROSNIERE, LEONARD JEAN JOSEPH, deputy to the convention from the department of Loiret, born in 1758, a furious Jacobin. He was twice despatched by the assembly to Orleans, with power to chastise the royalists. On the second occasion he narrowly escaped death at the hands of the populace. He became secretary of the convention, and president of the Jacobins. His share in the arrest of Robespierre should almost have spared him the reproaches which till the close of his life continued to be showered upon him as one of the bloodiest of the Jacobins.—J. S., G.

BOURDON DE VATRY, MARC ANTOINE, baron, minister of marine under the directory and the consulate, born in 1761; died in 1828. He served with the French forces in America until the close of the war of independence. While minister of marine under the directory, one of his numerous projects was a descent on the English coast. Napoleon, to whom it was communicated in detail on his election to the consulate, treated it with ridicule, and two years afterwards made it his own. Bourdon's subsequent projects were more worthy of his intelligence. In the various prefectures which he held after his secession from the ministry, he undertook many public works,—bridges, and the like—the execution of which, in the midst of the most serious difficulties, drew upon him universal esteem.—J. S., G.

BOURDOT DE RICHEBOURG, CHARLES ANTOINE, a French jurist, born at Paris in 1685, famous as the editor of the following work—"Nouveau Coutumier general, ou Corps des Coutumes generales et particulières de France et de ses provinces connues sous le nom des Gaules, vérifié sur les originaux," &c., Paris, 1724, 4 vols., 4to. This elaborate collection of legal forms is enriched with notes which entitle the author to the praise of minute as well as extensive erudition.—J. S., G.

BOURETTE, CHARLOTTE, born in 1714; died in 1784; surnamed LA MUSE LIMONADIÈRE. She was for thirty-six years mistress of a café in the Rue Croix-des-Petits-Champs. A number of distinguished literary men were in the habit of frequenting this house, and their conversation, no doubt, tended to develop the germs of poetry that were implanted by nature in her heart. Literary discussions were relieved by theatrical representations, in which the most illustrious personages took part. Madame Bourette published a collection of her works in verse and prose. Her comedy, "The Coquette Punished," played at the Théâtre Français in 1779, had considerable success.

BOURG, ANNE DU, nephew of a chancellor of France, born in Auvergne, 1521; executed as a heretic at Paris in 1559. After taking orders, he abandoned his intention of following the clerical profession, and adopted that of law. In 1559, when Henry II. commanded the parliament of Paris to take measures for the suppression of the protestant religion, Du Bourg, then an officer of the legislature, defended in presence of the king the

doctrines and conduct of the reformers, boldly declaring that treason and murder went unpunished, and that the whole terrors of the state were reserved for a religious sect whose members were the most orderly and loyal of all the subjects of the crown. For this courageous defence of his coreligionists, he was brought before the metropolitan court, and after some delay, caused by the demise of Henry II., condemned to the scaffold.—J. S., G.

\* **BOURGADE, FRANÇOIS**, a French missionary who, since his return from Algeria, where he spent a number of years in benevolent enterprises, has given to the world a number of interesting works, of which the following are the most important—"Soirées de Carthage, ou Dialogues entre un prêtre catholique, un *muphti* et un *cadi*," 1852; and "Memoires sur trois tombeaux trouvés à Tunis," 1852.

**BOURGEAT, LOUIS-ALEXANDER-MARGUERITE**, a French litterateur, born at Grenoble in 1747; died in 1814. The feebleness of his health compelled him to renounce the bar, and he devoted himself to literature and science. After travelling some time in Dauphiné he came to Paris, where he was employed in periodical works and other literary labours, and obtained in 1813 the prize of the Academy of Grenoble for a history of the Allobroges. After all his labours, he died, it is said, in misery and despair.—J. G.

\* **BOURGEAU, A.**, a French botanical collector, who has visited Spain and other parts of the continent of Europe, as well as Teneriffe, and has made valuable contributions to the Herbaria of Europe. He is now engaged in an expedition to North America, under Mr. Palliser and Dr. Hector.—J. H. B.

\* **BOURGEOIS, ANICET**, a dramatic writer, known to the present age as the author of various farces, melodramas, and fairy pieces, all very clever; but he has not, as yet, attached his name to any regular play of a high order.—J. F. C.

**BOURGEOIS, FRANCIS**, a second-rate landscape painter, remembered by his charitable heroisms, but not by his good works. He was born in London of Swiss parents in 1756. He was intended for the army under his father's patron, the brave defender of Gibraltar that Reynolds painted, Lord Heathfield, who, in the Vernon gallery, with perennial vigour, is still seen amid the Spanish fire and flame grasping his keys. Evincing a taste for art, he was placed under Louthembourg, the pupil of Van Loo, the first inventor of the diorama. Bourgeois adopted his style in land and sea pieces. In 1776 he went to Italy, and returned to shine at the academy. He was born, like most mediocre, courteous, dull men, for honours. In 1791 the king of Poland knighted him, and made him his painter. In 1794 George III. selected him as court landscape painter, and he became a royal academician. Some time before his death Sir Francis did the best thing he ever did; he left a noble collection of pictures, bequeathed to him by Mr. Noel Desenfans, to the Dulwich college, where they still remain, perpetual educators, warners, and guides. He gave £10,000 to keep them in preservation, £2000 for the repairs of the gallery, and £1000 to the masters and fellows of St. Martin's charity. He died in 1811, and was buried beside Desenfans in Dulwich college. He was a mannered, feeble artist.—W. T.

**BOURGEOIS, N.**, a French historian, born at Rochelle in 1710; died in 1776. His historical researches, which were numerous and minute, were devoted chiefly to the history of Poitou. He resided for a long time in America, during which he composed his poem of "Christopher Columbus." It would appear that his manuscripts have been unfortunately long since lost.—J. G.

**BOURGOING, FRANÇOIS**, a French ecclesiastic, contemporary of St. Vincent de Paul, to whom he resigned his first cure, that of Clichy, and friend of Berulle, whom he assisted in founding the congregation of the oratory, born in 1585; died in 1662. In 1641, after the death of Berulle and of his successor Condren, he became superior-general of the congregation. That office he held twenty years, in great repute for learning and piety; but in ill odour with some of his inferiors on account of a too zealous concern about his own dignity and authority. A year before his death he resigned it, partly in disgust and partly on account of increasing infirmities.—J. S., G.

**BOURMONT, LOUIS AUGUSTE VICTOR**, count de Ghaisne, marshal of France, born 2nd September, 1773; died 27th October, 1846. At the age of sixteen he became an officer of the French guards, which were disbanded at the Revolution. He then joined the count of Artois at Coblenz about the close of

1791, and fought on the side of the royalists against the revolutionary party. He took a prominent part in the civil war in La Vendée, and was for a time one of the chiefs of the Vendean peasantry. After the final pacification of that province in 1799 he visited Paris, and was solicited by the first consul to accept the rank of general of brigade. The refusal provoked Bonaparte, who, after the attempt upon his life by the infernal machine, caused Bourmont to be cast into the Temple prison, and afterwards transferred to Besançon. About the end of 1804 he contrived to escape from prison, and took refuge in Portugal. When the French army, which seized on that country in flagrant violation of justice and liberty, was reduced to great straits by the British forces under Wellington, Bourmont quitted his retreat and offered his services to Junot, which were gratefully accepted. After the convention of Cintra he embarked for France with his family, but on his arrival he was thrown into prison at Nantes. Junot obtained his release, but in order to avoid exile he was compelled to accept a commission in the army of Italy. He acquired great distinction in the Russian campaign, and in the campaign of 1813 in Germany he contributed greatly to the victory of Lutzen. Before Leipzig, and throughout the subsequent retreat of the French army, General Bourmont displayed both great military skill and bravery; and when the allies entered France he distinguished himself by his heroic defence of Nogent. On the abdication of Napoleon, Bourmont was appointed commander of the sixth military division. During the Hundred Days he at first joined Napoleon, though evidently by no means hearty in his cause; but on the opening of the campaign he went over to the enemy before Charleroi. After the final overthrow of Bonaparte, General Bourmont was appointed commander of the second division of the royal guard. He took an active part in the invasion of Spain by the French under the duke d'Angoulême, and on his return was appointed a peer. In 1829 he was appointed minister-of-war, and in the following year he was made commander-in-chief of the army sent to invade Algeria, and was created a marshal of France; but on the breaking out of the revolution in 1830 he was superseded by General Clausel. In consequence of his refusal to take the oath of allegiance to Louis Philippe, he was deprived of his employments. He accompanied the duchess de Berri to La Vendée, and afterwards repaired to Portugal for the purpose of supporting the cause of Don Miguel. In 1846 he availed himself of the amnesty proclaimed in 1840 to return to France, but survived only three months.—J. T.

**BOURGUET, LOUIS**, a French mineralogist of the first half of the eighteenth century, was born at Nismes on the 23d April, 1678. On the revocation of the edict of Nantes his father emigrated to Zurich, where he became a merchant, and in this profession was followed by his son. After travelling frequently into Italy, Bourguet was appointed professor of philosophy and mathematics in Neufchatel, where he died on the 31st December, 1742. Of his writings the principal are—"Lettres Philosophiques sur la formation des sels et des cristaux," &c., published at Amsterdam in 1729; and "Traité des Pétrifications," published at Paris and the Hague in 1742.—W. S. D.

**BOURLIER, JEAN BAPTISTE**, a French prelate, born at Dijon in 1731. In 1789 he lost several benefices which he had enjoyed previous to the outbreak of the Revolution, and in the following two or three years was several times subjected to prosecution. In 1802 he was created bishop of Evreux, and subsequently baron and count of the empire. After her divorce Josephine retired to the diocese of this prelate, who became her almoner. Having enjoyed the rank of senator under the empire, and made submission in proper time to the Bourbons, he was raised to the peerage in 1814.—J. S., G.

**BOURNE, HUGH**, founder of the primitive methodist connection in England, was born near Stoke-upon-Trent, Staffordshire, in 1772. He became a zealous preacher in connection with the Wesleyan communion, in which he remained till about his thirtieth year. He then associated himself with William Clowes, and some other Wesleyan preachers, in a movement to revive a custom which had been common in the time of the Wesleys, but which had fallen into disuse in England, though carried out to a great extent in America—this, namely, of holding large open air or camp meetings for worship and preaching. The subject came before the Wesleyan conference, and a deliverance was given, pronouncing such meetings to be improper, and likely to be productive of mischief. This led to the secession of

Bourne and Clowes, who formed themselves into a new sect, called the Primitive Methodist Connection, which was organized at Standley in Staffordshire in 1810. This sect, though thus small in its beginning, has very largely increased in numbers and influence. The principal distinction between the Primitive Methodists and the Wesleyans now is, that laymen are freely admitted to the conference of the former body. Mr. Bourne travelled into Scotland and Ireland, and formed a number of religious societies in connection with the new denomination, and in 1844 visited America, where his preaching attracted great crowds. He died at Bemmersley in Staffordshire in 1852.—J. B.

BOURNE, VINCENT, a scholar and poet who lived in the early part of last century. He was fellow of Trinity college, Cambridge, and afterwards usher of Westminster school, an office which he held till his death in 1747. His works consist of a number of small pieces on light and serious themes, in Latin verse, which are among the most perfect specimens we possess of that sort of composition. They were collected and published under the title of "Poemata" in 1734. Another edition appeared in 1750, and one in 4to in 1772. Bourne's translations—mainly from English verses of inferior consequence—render the sense with remarkable fidelity, and generally surpass the originals in grace and poetic feeling. His verse has that simplicity and ease never attained except by those who write in a language they have made their own, and which most rarely belongs to modern imitations of ancient poetry. Bourne has been justly complimented as the "most classical and at the same time most English of the Latinists." The poet Cowper, who translated some of his lighter pieces, says in one of his letters, that he prefers him to Tibullus. The "Epitaphium in Canem" is familiar to most readers through the praises of Elia.—J. N.

BOURNE, WILLIAM STURGES, Right Hon., son of the Rev. Dr. Sturges, chancellor of Winchester, was born in 1769. Having been educated at Winchester and at Christ Church, Oxford, he was called to the bar, and practised at the king's bench and on the western circuit, but retired from his profession, and took the name of Bourne, on inheriting the property of a relative on his mother's side. In 1798 he was elected M.P. for Hastings, and continued to represent that borough, or Christ Church, Bandon, Ashburton, and Milborne Port, in various parliaments, down to the dissolution in December, 1832, when he retired from public life, in disgust at the passing of the reform bill. He was joint secretary to the treasury from 1804 till 1806, and a lord of the treasury from 1807 till 1809; in 1814 was sworn a privy councillor, and appointed one of the commissioners on Indian affairs, and continued to have a seat at the board of control down to 1821. In 1827 he was secretary of state for the home department, under Mr. Canning, and succeeded Lord Carlisle as first commissioner of woods and forests under the short-lived administration of Lord Goderich, now earl of Ripon. He continued to hold a seat in the cabinet of the duke of Wellington, with a nominal and honorary office. His name is best remembered as the author and introducer of the well-known statute regulating parochial vestries, which is called "Sturges Bourne's Act." Having spent the last twenty-two years of his life in retirement at his seat in Hampshire, he died there Feb. 1, 1845, in his seventy-seventh year.—E. W.

BOURNON, JACQUES-LOUIS DE, a French mineralogist, born at Metz on the 21st January, 1751, early exhibited a strong tendency to the study of mineralogy, probably induced by the large collection possessed by his father. At the Revolution Bournon emigrated with his family, and joined the royalist army under Condé; on the dissolution of which he visited England, and appears to have supported himself by forming and arranging collections of minerals for several Englishmen of rank and fortune. He was elected a fellow of the Royal and Geological Societies; and in 1808 Cuvier spoke of his attainments in high terms, in a report presented to the Emperor Napoleon. At the restoration of the Bourbons, Bournon returned to France, when his loyalty was rewarded by Louis XVIII. with the post of general director of his cabinet of mineralogical specimens. This position he continued to hold until his death, which took place at Versailles on the 24th August, 1825. The writings of Bournon are numerous, and most of them of considerable value. The most important is his "Traité complet de la chaux carbonatée," published in 1808 at London, in three quarto volumes, one of which consists entirely of plates. The number of crystalline forms assumed by car-

bonate of lime, described in this book, was four times that previously known to exist, and M. Bendaud states (Quérard, *La France Littéraire*) that Bournon had prepared a new edition, in which the number of distinct forms amounted to more than 1200.—W. S. D.

\* BOURNONVILLE, ANT. AUG., a Danish composer of ballets, and author of various theatrical works, was born in 1805 at Copenhagen, where his father was ballet-master at the theatre royal. His education, commenced by his father, was completed by the celebrated Vestris. He made his debut at Paris in 1826, where he took rank as premier sujet of the Royal Academy of Music. In 1830 he returned to Copenhagen, and was appointed director of the Dancing Academy, and, in 1836, ballet-master. Amongst the ballets composed by him may be mentioned "Waldemar," "Eric Meued," "Faust," "La Fete d'Albano," "Le Toréador," "Napoléon," "Raphael," "Le Kermesse de Bruges," "La Conservatoire," "Les Noces," "Hardanger en Norvege." He also published "Nytaarsgave for Dandse-Yndere" (A New-Year's Gift for Lovers of Dancing), Copenhagen, 1829; "Mit Theaterliv" (My Dramatic Life), Copenhagen, 1848; "Det Kongelige Theater" (The Theatre Royal), Copenhagen, 1849; "Vort Theatervasen" (Our Theatrical Character), Copenhagen, 1850; "Et Nyt Skuespilhus" (A New Theatre), 1851.—M. H.

BOURNOUF, EUGENE, born in Paris, August, 1801, a distinguished orientalist, who devoted his not very long life to researches into the ancient language and literature of the Indian peninsula. His first work, published when he was only twenty-five years of age, was an "Essay upon the sacred language in use amongst the dwellers beyond the Ganges," which work was a mere preliminary indication of the direction taken by a mind preparing itself for greater efforts. It was afterwards, when Bournouf held up the key of the Zende language, that a great discoverer was recognized and acknowledged. The translator of the Zend Avesta, M. Auguet Duperron, had not worked upon the original and sacred language, of which the key had been lost, but upon the popular idioms into which the sacred book of the Persians had passed. Duperron had, however, obtained possession of the original sheets which he deposited in the Royal Library of Paris. Bournouf, after much patient labour, guided by genius, succeeded in deciphering the three books of Zoroaster, the Vendidad, Zechaé, and Vispered. As a reward for his services to oriental literature, the Academy of Inscriptions and Belles-Lettres elected him to the place vacant by the death of the younger Champollion, thus associating his name with one that had become illustrious in the same walk. The same year he was appointed professor of Sanscrit in the college of France. In 1834 he published his first volume of "Commentaries on the Yaçna," one of the books which contains the dogma of Zoroaster, and in the language of the founder of the religion of the Persians. His next translation was that of the "Bhâgavata Purana, or Poetic History of Krichna, with Sanscrit text," followed by an "Essay on Cunéiform Inscriptions." Hearing that the British Museum contained a number of Indian manuscripts, collected by Mr. Brian Broughton Hodgson during a long residence at Nepaul, Bournouf examined them, and the result was an "Introduction to the History of Buddhism," in 2 vols., published in 1845. He was engaged in the publication of a translation of one of the canonical books of the Buddhists, when the hand of death arrested his labours. He died May, 1852.—J. F. C.

BOURRIENNE, L. A. FAUVELET DE, a French diplomatist and biographer of Napoleon, born in 1769; died in 1834. He was educated along with Napoleon at Brienne, where they were upon terms of peculiar intimacy. They quitted this school together in 1785, and two years later Bourrienne removed to Vienna, and afterwards entered one of the universities to study public law and foreign languages. The breaking out of the French revolution caused him to return to Paris in 1792, where he renewed his intimacy with his former comrade. When Bonaparte was appointed commander-in-chief of the army of Italy, after the defeat of General Schêrer, Bourrienne was employed by him to revise the treaty of Campo-Fornio along with General Clarke. Bourrienne accompanied his old friend to Egypt as his private secretary, an office which he retained during the consulship. On his election to the imperial throne, Napoleon appointed Bourrienne in 1804 his ambassador to Hamburg. He returned to France in the end of 1813 and received the office of post-master, and in the following year was made prefect of police.

He did not, however, follow the fortunes of Napoleon in his adversity, for during the Hundred Days he accompanied Louis XVIII. to Ghent. On the final overthrow of the empire, Bourrienne accepted office under Louis XVIII. He was elected a deputy in 1815, and retained his seat till 1830. The revolution of that year, and the consequent loss of his fortune, impaired his reason, and he spent the two last years of his life in a lunatic asylum at Caen. The "Memoirs of Bourrienne," written by himself, and published in 1829-1831 in 10 vols., contain many interesting particulars respecting the private life of Napoleon, and have had a wide circulation in this country as well as in France, though the accuracy of many of the author's statements has been called in question by the partisans of Bonaparte. The mistakes of the "Memoirs" were exposed in a work, entitled "Bourrienne et ses erreurs volontaires et involontaires," Paris, 1830, 2 vols. 8vo. Bourrienne was also the author of a drama, entitled "The Unknown," and of some political pamphlets.—J. T.

BOURRIT, MARC THÉODORE, a Swiss naturalist, was born at Geneva in 1739, and died at a country house in the vicinity of that city on the 7th October, 1819. He was early distinguished as a painter in enamel; but feeling an irresistible desire to explore the Alps, he obtained a place as chorister in the cathedral of Geneva, and afterwards divided his time between the duties of this position and numerous excursions in all parts of the mountains. In 1774 he published his "Description des glaciers de Savoie," which was dedicated to Victor-Amadeo, king of Sardinia. In 1781, having visited Paris, and been presented by Buffon to Louis XVI., he dedicated his "Description des Alpes Pennines et Rhétiennes" to that king, for which he was rewarded by a pension. In 1783 and 1785 Bourrit and Saussure attempted in vain to reach the summit of Mont Blanc, in which they only succeeded in 1787. On the breaking out of the French revolution Bourrit of course lost his pension. He is described as having exhibited much kindness to the royalist emigrants who passed through Geneva. For this he was rewarded, on the restoration of the Bourbons, by the continuance of his pension by Louis XVIII. The writings of Bourrit consist almost entirely of descriptions of the Alps and their glaciers. Of the second work mentioned above a new and greatly enlarged edition was published in 1787 in three volumes octavo.—W. S. D.

BOURRU, EDMÉ CLAUDE, a French physician, librarian and lecturer on pharmacy to the faculty of Paris, and latterly vice-president of the Academy of Medicine, born at Paris in 1737; died in 1823. He published, besides a number of translations from the English, "Des Moyens les plus propres à éteindre les maladies vénériennes;" and "Eloge funèbre de Guillotin."

BOURSAULT, EDMÉ, born at Musci-l'Evêque in Burgundy in 1638, and died in 1701. He came to Paris in 1651, and at this time he could only speak the patois of his native district. He, however, wrote a tract which flattered and pleased Louis XIV., and he would have been appointed tutor to the dauphin if he had known any Latin. As it was, he was given a pension for conducting a gazette, written in humorous verse. This went on very well till he began to satirize the Franciscans and the capuchins, and found how dangerous it was to quiz the clergy. He was silenced, the gazette was suppressed, his pension withdrawn, and our poor hero threatened with the Bastille. He was author of several successful theatrical pieces, of some romances, and of fables, which the French critics hesitate to dispraise, but in a tone of courtesy say have not the naïvete of La Fontaine or the precision of Phædrus.—J. A., D.

BOURSIER, LAURENT-FRANÇOIS, born in 1679, died in 1749, was a doctor of the Sorbonne, and, as one of the chiefs of the Jansenist party, took an active part in the religious controversies of the time.—J. D. E.

BOURSIER, LOUISE BOURGEOIS, a French matron who attended Mary of Medicis, wife of Henry IV., in her accouchements, and published "Recit véritable de la naissance de messeigneurs et dames les enfants de France," 1625. Her "Observations sur la Sterilité" were translated into Latin, German, and Dutch.

BOUSSINGAULT, JEAN-BAPTISTE-JOSEPH-DIEUDONNÉ, an acute and enterprising physicist and chemist, born in Paris in 1802. Boussingault had the advantage of a residence of several years in the equatorial parts of America, whither he had proceeded under the auspices of an English mining company. Many of the grander telluric phenomena being especially manifested

in those regions, he was enabled to survey them with unusual care; and he has given us accordingly, excellent notices and ingenious speculations on the causes of earthquakes, on matter ejected by volcanoes, &c. We farther owe him important contributions to meteorology, some of which consist of observations, others are speculative, and a few practical, such as his method of determining the mean temperature. As a chemist he wrought along with Dumas. His papers determine accurately the proportions of the constituent elements of our atmosphere; and he has written much that is valuable on the relations between the organic and inorganic worlds—a subject of which, his favourite one, rural economy, forms a minor although an essential part. See the *Annales de Chimie* and the *Comptes Rendus*, passim.—J. P. N.

BOUSYRY, CIHEREF-EDDIN-ABOU-ABDALLAH-MOHAMED, an Arabian poet, born in Upper Egypt in 1211; died in 1294 or 1296. He composed several poems in honour of Mahomet, of which the most celebrated is entitled "Bordah." Manuscript copies of this poem are preserved in the libraries of Paris, Leyden, and Oxford.

BOUTARD, FRANÇOIS, a French litterateur, born at Troyes in 1664; died in 1729. Horace was the model he set up for himself in his Latin verses; and he flattered himself that he resembled the Latin poet not only in his writings, but in his stature, face, and personal appearance. But whatever may have been the degree of personal or intellectual similarity between him and the Venusian bard, it is certain that Bossuet was the Mæcenas to whom he owed his elevation.—J. G.

BOUTATS, FREDERICK, a Flemish engraver, born at Antwerp about 1620. He produced great portraits of Oliver Cromwell and Christina of Sweden. GASPAR, his younger brother, worked for the booksellers, and produced some antipapal massacres of St. Bartholomew. GERARD was another brother, and PHILIBERT, Frederick's son, also followed the old trade.—W. T.

BOUTERWEK, FRIEDRICH, author of an elaborate "History of Poetry and Eloquence from the close of the thirteenth century," was born at Okr, near Goslar, in Lower Saxony, April 15, 1766. In early life he devoted himself almost entirely to the reading of poetry and works of imagination; and it was not until he had passed through a course of study at the Carolinum in Brunswick, that his mind took a direction towards more solid and serious pursuits. He first turned his attention to jurisprudence, but in the second year of his academic career he relinquished that study, at the suggestion of some friends, who recommended him to cultivate his taste for poetry and poetical composition. He now wrote some poems, and a romance entitled "Graf Donemar." The latter was published at Göttingen in 1791. He had already quitted Göttingen, but neither in Hanover nor in Berlin, whither he went with a recommendation from Gleim, did he meet with the success which he anticipated. Returning to his old place of residence, and having become convinced of the misdirection of his efforts up to this time, he turned his thoughts to philosophy and the historic study of literature—subjects which he prosecuted thenceforward with untiring zeal. His active mind led him to take an interest in all questions of a philosophic cast, and he became an enthusiastic disciple of Kant, on whose system he lectured at Göttingen in 1791. In 1802 he was appointed ordinary professor of philosophy in the university of that city, and four years later obtained the title of court counsellor. Bouterwek's philosophical speculations may be said to have commenced with Kant, and ended with Jacobi. His work, entitled "Ideen zu einem allgemeinen apodiktik," was superseded by his "Lehrbuch der Philosophischen Wissenschaften," and his "Religion der Vernunft." These works, together with his "Ästhetik," raised against him a host of formidable adversaries. The work, however, by which he is best known is his "Geschichte des neueren Poesie und Beredsamkeit," or Literary History of Poetry and Eloquence from the close of the thirteenth century, in which he takes a historical and critical survey of the literature of the principal nations of Europe. The work consists of twelve volumes, published at Göttingen at different times. The first volume appeared in 1805, and the last, which contains an elaborate index to the whole, in 1819. Sismondi, in his *Littérature du Midi de l'Europe*, implicitly adopts the opinions of Bouterwek on Spanish and Portuguese literature; and, indeed, on that subject he says little of importance that is not borrowed directly from the German critic. Bouterwek's work, as a whole, is marked by great perspicuity and precision, and a most indefatigable zeal

in the work of research, and seeks the causes of the events which he has to describe in the structure of society, the habits of the various peoples, and the influence of events. That portion of the work which relates to Spain has been translated into English by Miss Thomasina Ross. It is perhaps right to state here that Bouterwek's history, extensive as is its scope, forms only a part of a more extended work, namely, a history of arts and learning from their restoration down to the end of the eighteenth century, by different learned foreigners, forming a complete encyclopædia of the subject. Bouterwek died in Germany, August 9th, 1828.—E. W.

**BOUTEUX, PIERRE LE**, an indifferent French painter, born at Paris in 1692. He professed history, and died professing it, in 1750, having wasted much paint.—W. T.

**BOUTEVILLE, FRANÇOIS DE MONTMORENCY**, seigneur de, sovereign count of Suxe in Navarre, the famous duellist, born in 1600. He was the son of Vice-Admiral Louis de Montmorency, distinguished for valour in the wars of the League. In these wars the younger Bouteville was also creditably known. At the siege of Montauban he narrowly escaped death from the explosion of a mine, being with difficulty extricated from the ruins. His love of adventure afterwards carried him to Holland, where he assisted a prince of Nassau in defending Breda against the Spaniards. On his return to France, he took part in the expedition of his cousin, the duke de Montmorency, against Rochelle. His passion for fighting, however, was not to be satisfied with the excitement of a campaign. He betook himself to the duel with a gusto which has rendered his name proverbial. It was his kingdom, and within it he would brook no rival. For any one to have a reputation for courage was enough provocation for this desperate swordsman. In defiance of arrests and decrees of banishment, he was incessantly at work with his sword and poniard. From Brussels, where he had taken refuge from the vengeance of parliament after dispatching two of his friends, the count de Thorigny, and the marquis de la Fiette, he went back to Paris to meet the marquis de Beuvron in the Place-Royale. On this occasion fortune deserted him—he could make nothing of his opponent. The by-play of their seconds, however, was not without result—one of the four was killed, and another dangerously hurt. Bouteville and his friend, the count des Chapelles, attempting to escape into Lorraine, were seized at Vitry, and brought back to Paris. In vain the pathetic voices of the dames of the court, Pompadour among the number, were raised on his behalf. The king's conscience would not allow him to listen. He was beheaded with des Chapelles, in June, 1627.—J. S., G.

**BOUTILLIER, MAXIMILIEN-JEAN**, a French dramatic author, born at Paris in 1745; died in 1811. Employed, as his father was, as doorkeeper at the opera, he manifested at an early period a lively taste for dramatic poetry, and in 1766 succeeded in bringing his own works before the public. He wrote a great number of comedies, lyric dramas, &c., but appears to have passed his latter days in indigence.—J. G.

**BOUVARD, CHARLES**, first physician to Louis XIII., born at Montoire in 1572; died in 1658. He indulged his somewhat shrewish temper at the expense of the faculty of Paris, who had occasionally to resent his interference with their privileges; and also, it would almost appear, at the expense of his master, whom he is said to have bled forty-seven times, and dosed with upwards of two hundred potions in the space of a year. It is a question of some interest whether Richelieu entertained a favourable opinion of so severe a regimén.—J. S., G.

**BOUVART, ALEXIS**, born in 1767; died in June, 1843; one of the assistants at the Observatory of Paris; member of the French Board of Longitude and of the Academy of Sciences. Bouvart's labours were various and most important, although mainly confined within the sphere of calculating or practical astronomy. Laplace abandoned to him all researches of detail connected with his immortal work, the *Mécanique Celeste*. We owe him the determination of the parabolic orbits of eight comets, discovered by himself. He published in 1821 a quarto volume of astronomical tables, containing his tables of Jupiter, Saturn, and Uranus. His labours on this last planet will ever be memorable. Uranus was discovered by Sir William Herschel in 1781. Upon the ground of forty years' observations, which gave the places of the planet for nearly the half of one of its revolutions, Bouvart succeeded in constructing a normal elliptic orbit, apparently adequate to the phenomena; and he subsequently ascertained, at first with great satisfaction, that Uranus

had been seen several times previous to 1781, and its places determined, although it was mistaken for a fixed star. In the hope that these previous observations would confirm his views as to the normal orbit, Bouvart applied his elements; but to his astonishment and vexation these proved wholly incompatible—the orbit satisfying the modern observations seemed to have no relation whatsoever with the ancient ones; nor could any orbit, capable of comprehending the ancient observations, be forced into conformity with the places determined since 1781. With the most conscientious care, he tested every hypothesis likely to solve the enigma; but he was compelled to the conclusion, that under the knowledge then existing of the solar system, it was inexplicable. Too sound an observer to indulge in new chimeras, he nevertheless ventured to suggest that we might not know the entire system, or that *some other planet, yet undiscovered, might exist*, the disturbing influence of which would explain the irregularities apparently attending the motions of Uranus. The instructed reader need not be reminded of that very brilliant recent achievement, by Adams and Leverrier, which has confirmed the guess of Bouvart. But Bouvart did more to forward the discovery of Neptune. The processes of the eminent geometers who determined Neptune's place, and so guided the telescope to that planet's retreat, required as their ground the elaborate calculations and tables of our Astronomer; and although Leverrier undertook the trouble of verifying these, it is no overstatement to allege, that Bouvart was his necessary precursor. His name, indeed, can never be dissociated from the labours that issued in a triumph so signal and rare.—Bouvart was long a collaborateur in editing the *Annuaire du Bureau des Longitudes*, in which he inserted valuable tables; and we owe him besides very instructive notes to the translation by Caussin, of the work of the Arabian astronomer, Ibn-Junis.—J. P. N.

**BOUVART, MICHEL PHILLIPPE**, a celebrated French physician, born at Chartres in 1717; died in 1787. Coming to Paris in 1736, he was appointed professor of physiology by the Faculty in 1747; and in the same year succeeded Burette in the chair of medicine in the college of France. In 1756 he resigned this last appointment, and declining the post of first physician to the king, which was offered him on the death of Senac, sought to divide his time between the demands of an extensive practice, and the education of his children. His manners were rough, and some of his colleagues in the faculty, who had occasionally suffered from his talent for sarcasm, accused him of professional spleen, and even malice; but the popular idea of his character was more flattering, and probably more correct. It was founded on such anecdotes of him as the following:—Being somewhat puzzled with the case of a banker, he was led to inquire if the ailments of his patient could be traced to any emotional cause, and discovering that they dated from some pecuniary embarrassments, he deposited a note for thirty thousand francs on the mantelpiece of the sick man's chamber, remarking—"This time I am sure of my remedy." His principal works are—"Consultations contre la légitimité des naissances prétendues tardives," 1764; "De dignitate Medicinæ;" "De Experimentiæ et Studii Necessitate in Medicina;" and an abridgment of his lectures at the college of France, entitled "De Recondita febrium intermitentium, tum remittentium Natura."—J. S., G.

**BOUVENOT, LOUIS PIERRE**, a French theologian and physician, born at Arbois in 1756. Renouncing the military profession for the ecclesiastical, he became one of the grandvicars of the bishopric of Est, where he resided until deprived of his functions under the reign of terror. He then, on the advice of his friend, Corvisart, turned his attention to medicine, in which science he made rapid progress, and obtained the degree of doctor. His death occurred in 1830, at Sens, where he had practised as a physician for a number of years.

**BOUVET DE CRESSÉ, AUGUSTE JEAN BAPTISTE**, born at Provins in 1772; died at Paris in 1839; first served in the army, then in the navy, where he distinguished himself, particularly in the engagement of the 1st June, 1794, between the French fleet commanded by Villaret Joyeuse and Howe's English squadron. On the peace of Amiens he fixed in Paris, where he set up a school. He published a good many books, mostly adapted for educational purposes, the names of which there is no object in recording. Among them was a Latin poem on the birth of the king of Rome (Napoléon II.)—J. A., D.

**BOUVET, JOACHIM**, a French jesuit, one of the six missionaries whom Louvois, successor of Colbert, sent to China in

1687 for the purpose of forming commercial relations with that empire, as well as of satisfying the curiosity of the learned academicians of France with respect to its geography and productions; born at Mans in 1682; died at Pekin in 1732. After a comfortable term of residence in the capital of the empire, during which, along with another missionary, he fulfilled the duties of mathematical master at court, Bouvet returned to Europe in 1677, bringing with him as a present to Louis XIV. forty-nine Chinese volumes. Louis acknowledged the gratification he derived from this courtesy by sending back the missionary with a magnificently-bound volume of engravings which he was charged to deliver to the emperor. "An Account of China," Paris, 1697; "A Historical Portrait of the Emperor," translated into Latin by Leibnitz, 1699; and some notices of the empire, inserted in various collections of letters, are the principal performances of Bouvet.—J. S., G.

BOUVIER, ANDRÉ MARIE JOSEPH, a French physician, born at Dôle in 1746; died in 1827. Under the empire he was physician to the empress-mother. At the restoration he obtained some appointments, which he retained till an advanced age. He was at one time an enthusiastic musician, and latterly an agriculturist. He wrote "Experiences et Observations sur la Culture et l'Usage de la Spergale," 1798; and "Extrait d'un Memoire sur l'Hydropisie aiguë des Ventricules du Cerveau."

BOUYS, ANDREW, a French artist, born in Provence in 1681. He studied under Francis de Troy, and became a well-known portrait painter in Paris. He engraved in mezzotint portraits of the marquis de Bellay, his old master, and Massillon, and died about 1730.—W. T.

BOUZONNET, ANTONY, a second-rate French painter, born at Lyons in 1694. He studied under his uncle, Stella, and died unsuccessful in 1682.—W. T.

BOVADILLA. See BOBADILLA.

BOVET, FRANÇOIS DE, a French prelate, born in 1745; died at Paris in 1838. He was consecrated bishop of Sisteron in 1789, but the troubles of the Revolution prevented him from occupying that see, and on his return to France, after an exile of some years, he was named archbishop of Toulouse. He took possession of that see in 1819, but on account of ill health was obliged to resign it in the following year. His works—"Des Dynasties Egyptiennes," and "L'Histoire des derniers Pharaons et des premiers rois de Perse, tirées des livres prophetiques et du livre d'Esther," are valuable and interesting.

BOVINI, FRANCESCO, a Ferrara artist, who painted the well-known altarpieces in Andrew's city—"The Wise Men's offering," and "The Immaculate Conception"—and having made those two marks, died otherwise unknown.—W. T.

BOWDICH, THOMAS EDWARD, a celebrated English traveller on the west coast of Africa, was born at Bristol in 1793. After he had completed his studies at Oxford, his father, who was a manufacturer in an extensive way of business, took him into his factory; but the young man having a great desire for travelling, soon entered the service of the African company, who sent him to Cape Coast Castle. From Cape Coast Castle he undertook an embassy to the king of Ashantee; after which, in 1818, he returned to England, where he published the account of his mission to Ashantee in 1819. This exceedingly interesting book raised him powerful enemies. He had freely exposed in it the misdeeds of the African company, and the latter in revenge refused to pay him the stipulated price for his services. His application to the government for the means of making a new voyage of discovery into the interior of Africa, was also defeated by the same influence; and thus, thrown upon his own resources, he visited Paris, where he studied the natural sciences, and devoted himself to literature with so much zeal, that, as early as 1822, he had got together a sufficient sum to carry out his plan. He accordingly embarked at Havre with his wife and two children; but his great exertions had so weakened his constitution that he fell ill just as he was on the point of ascending the Niger, and died in his thirty-first year, as a martyr to his zeal for science, in January, 1824. Mrs. Sarah Bowdich (afterwards married to a Mr. Lee) accompanied her husband on both his voyages, and assisted him in his natural history studies by her ready pencil; she is well known as the author of numerous books for the young, principally on subjects connected with zoology.—W. S. D.

BOWDITCH, NATHANIEL, an eminent American mathematician and man of science, was born at Salem, Massachusetts,

March 26, 1773; died at Boston, March 16, 1833. The poverty of his parents obliged him to leave school when he was but twelve years old; and he was then placed in a ship-chandler's shop, where he continued nine years. But he was an eager student during his leisure hours; and he made himself a good mathematician, performing all the calculations for an almanac complete, when he was but fifteen years of age. He afterwards studied Latin by himself, so as to be able to read Newton's *Principia* in the original; and he subsequently acquired Spanish, German, and Italian enough to read scientific books in those languages, all without an instructor. His zeal and success in the pursuit of knowledge attracting notice, private libraries were opened to him; and a fortunate accident brought within his reach a good collection of works on science. At the age of twenty-one he began a seafaring life, which he continued for nine years—first as captain's clerk, then as supercargo, and lastly as master. He made several voyages to the East Indies, in which his great delight was to obtain the ship's place from lunar observations; instructing the other officers, and many even of the crew, to do the same, and effecting many improvements in the processes of computation. In 1800 he published his "Practical Navigator," based on J. H. Moore's work on the same subject, which he issued at first only in a revised edition; but made so many corrections and improvements in it, that it was finally deemed proper that it should appear under his own name. All the tables were calculated anew, and were nearly doubled in number. The new work came immediately into universal use in the American marine, was republished in London, and was largely used in the English and French service. Quitting nautical life in 1803, Bowditch became president of an insurance company in Salem, a post which he held for twenty years, when he removed to Boston, to become the actuary of the Hospital Life Insurance Company, the largest institution of the kind in the United States. In this office he continued for the rest of his life, though he was successively offered a professorship of mathematics in Harvard college, in the university of Virginia, and in the national military academy at West Point. He was long a member of the American Academy of Arts and Sciences, was its president for some years, and contributed many mathematical and astronomical papers to its Transactions, while he also wrote on similar topics for other journals. But the great work of his life was the translation, with a commentary, of Laplace's *Mécanique Céleste*, in four quarto volumes of over a thousand pages each, the annotations occupying even more space than the text. He commenced the work in 1815; the first volume appeared in 1829; the second in 1832; the third in 1834; and death interrupted him when he was correcting the proof-sheet of the 1000th page of the fourth. This work met with the most flattering reception both in Europe and America: it presents many important corrections and improvements of the original, which, without Bowditch's commentary, would be a sealed book to all but a few highly-gifted mathematicians. Dr. Bowditch was a member of the Royal Societies of London, Edinburgh, and Dublin, and of many other scientific associations. He was a fellow of Harvard college during the last twelve years of his life, and thus had a decisive voice in the control of its affairs. Many other literary and scientific bodies in New England are indebted to him either for their organization or for great improvements in their means of usefulness. The closing scenes of his life were happy, as his mind remained unclouded to the last, though his bodily frame was wasted by protracted disease. He achieved an honourable reputation by his scientific labours, and his life and character appear, even to the severest scrutiny, without a stain.

BOWDOIN, JAMES, LL.D., F.R.S., was born at Boston, Massachusetts, on the 7th of August, 1726. His father was a wealthy merchant of that town, and a member of the colonial council of Massachusetts. He was the younger of two brothers, and had just attained to his majority when his father died. He entered at first into mercantile business, but soon found more congenial employment in philosophical and political pursuits. Two or three years after he left college, he made the acquaintance of the celebrated Benjamin Franklin, then in the maturity of his powers, and immediately occupied with his great electrical discoveries. Franklin, though twenty years older than Bowdoin, seems to have been impressed with a peculiar regard and respect for him, sent him all his papers on electricity to examine, and invited his opinion on them. A correspondence between Franklin at Philadelphia, and Bowdoin at Boston, was thus established,

on purely philosophical subjects, which secured no little distinction for Bowdoin at home and abroad. Their letters were transmitted to London, and read together at the Royal Society, of which Franklin was soon made a fellow. The correspondence was afterwards published; and at a later day Bowdoin himself was elected a fellow of the society. But it was as a politician and statesman that Bowdoin was most distinguished in his own day, and will be longest remembered in American history. He entered political life in the year 1753, as a representative of Boston in the provincial legislature; and was a leading advocate of that great plan of a "union of the colonies" against the encroachments of France, and for the regulation of trade, which Franklin proposed at the Albany convention in 1754. In 1757 Bowdoin was transferred to the higher branch of the provincial legislature, historically known as the council; and there he served with signal ability and zeal for sixteen years. Thomas Pownall was the provincial governor when Bowdoin entered the council; and with him Bowdoin maintained the most amicable and even affectionate relations. But Sir Francis Bernard, his successor, was another sort of person; and from his accession in 1760, down to the very last day on which British rule was exercised in America, there was a continued conflict between the legislative and executive authorities. Bowdoin was, by all acknowledgment, the leader of the Massachusetts council, in their opposition to that ill-advised and arbitrary policy of Governors Bernard and Hutchinson, which ultimately led to the American revolution; and he finally had the distinction of being negatived by Governor Gage, and set aside from the list of councillors in 1774, "by express orders from his majesty." He was thereupon elected to head the delegates to the congress which declared the independence of the colonies; but circumstances compelled him to decline a journey to Philadelphia. John Hancock was chosen in his place, and became the president of that memorable assembly. Bowdoin remained at home, however, to render most important services to his country as president of the council elected to exercise the supreme executive authority of the colony after hostilities with the mother country had broken out. In this capacity he was brought into immediate relations with General Washington, who had just assumed the command of the American army encamped around Boston; and an intimate and enduring friendship was formed between them.

In 1780 Bowdoin presided over the convention which framed the constitution of Massachusetts, and took an active part in the preparations of an instrument which was justly regarded as a model of free government. Under that constitution Bowdoin became governor of the commonwealth in 1785, and held the office for two years. The second of these years was the most momentous year in the history of Massachusetts. Heavy taxes had been necessarily laid to sustain the public credit. An insurrection broke out against the legal processes of collection. Had "Shay's Rebellion" (as it is called from the name of Daniel Shay, its leader), been successful, the whole American republican systems would have been in danger, and the British colonies in North America might have vied with the Spanish colonies in South America, in their proverbial liability to political convulsions and revolutions. But by the vigilant and vigorous exercise of the whole civil and military power of the state, Governor Bowdoin succeeded in arresting and extinguishing the insurrection, and he will go down to posterity, in company with his distinguished military friend, General Lincoln (to whom he assigned the chief command in the field), as having accomplished the first great vindication of law and order within the limits of the American republic. Governor Bowdoin was among the very earliest proposers and advocates of the constitution of the United States, and was a leading member of the convention of Massachusetts which ratified that constitution. He lived to see the government organized under it, and to welcome, beneath his own roof, his illustrious friend, Washington, on his visit to Boston in 1789, as the first president of the United States. With Franklin, too, his correspondence continued, both on political and philosophical subjects, to the last year of their lives; and their last letters contained a playful, but, as it proved, a prophetic proposition for an excursion together among the stars. Both died in 1790; Franklin on the 17th of April, at the age of eighty-four; Bowdoin on the 6th of November, at the age of sixty-four.

In private life he was no less estimable than in public. He has left it upon record, that Butler's Analogy was of the greatest service to him in satisfying his mind as to the truths of christianity.

"From the time of my reading that book," said he, "I have been a humble follower of the blessed Jesus." Governor Bowdoin was early married to Elizabeth Erving (of the same old stock of the Irvines of Drum), a lady of most estimable qualities. By her he had two children.

\* BOWEN, FRANCIS, born in 1811 in Charlestown, Massachusetts; graduated at Harvard college in 1833. From 1835 to 1839 he was an instructor in this college, in the department of mental philosophy and political economy. Since 1841 he has resided in Cambridge, Mass., engaged in literary and academical pursuits. In 1842 he published a volume of "Critical Essays on the History and Present Condition of Speculative Philosophy;" and in the same year an octavo edition of "Virgil, with English Notes, prepared for the use of Schools and Colleges." In January, 1843, he became the editor and proprietor of the *North American Review*, and it continued under his exclusive management till January, 1854; nearly one-fourth part of the contents of this work during these eleven years being written by him. In 1849 he published an octavo volume of "Lowell Lectures on the Application of Metaphysical and Ethical Science to the Evidences of Religion, delivered before the Lowell Institute in Boston in the winters of 1848-49." This work passed to a second edition in 1855, when it was revised and enlarged, with notes. In 1856 he published an octavo volume, entitled the "Principles of Political Economy applied to the Condition, the Resources, and the Institutions of the American People." These last two works have been in use ever since their publication, as text-books of instruction at Harvard and some other American colleges. In 1854 he abridged and edited, with critical and explanatory notes, Dugald Stewart's Elements of the Philosophy of the Human Mind; and in the same year he published "Documents of the Constitution of England and America, from Magna Charta to the Federal Constitution of 1789, compiled and edited with Notes." In 1853 he was appointed to the chair he now holds in the same institution, the Alford professorship of natural religion, moral philosophy, and civil polity, and was confirmed by the overseers by a nearly unanimous vote.

BOWER, ARCHIBALD, was born at or near Dundee in 1686. He was sent to the Scotch college at Douay, whence in 1706 he proceeded to Rome, and entered as a novice in the order of the jesuits. After completing his novitiate, he held various employments, having been, according to his own account, public professor of rhetoric, history, and philosophy, in the universities of Rome and Fermo, until in 1723 he was appointed to a professorship in the university of Macerata. At the end of three years, something happened which caused his removal from Macerata. His own statement is, that his feelings were harrowed to such a degree by witnessing the cruelties practised by the inquisition, to which he was counsellor, that he could no longer remain at his post. His enemies assert that he was removed on the ground of incontinence. He went to Perugia, whence he escaped secretly soon after, and after various adventures, reached England. Introduced to Dr. Clarke and Bishop Berkeley, he became convinced that the Roman church was in error, and accordingly abandoned its communion. After six years of doubt or scepticism, he conformed to the church of England, as being, in his judgment, the farthest removed of all the protestant bodies from the errors of popery, and the one least tinged, on the other hand, with enthusiasm or fanaticism. He was warmly patronized by Lord Aylmer and Lord Lyttleton; the former of whom intrusted him with the education of his two sons. He supported himself partly by tuition, partly by writing for the booksellers, by whom he was employed in compiling, jointly with Psalmanazar, the *Universal History*. Having thus amassed a considerable sum of money, he entered into a secret negotiation with a Mr. Hill, a jesuit, by which it was arranged that he should place his money in the hands of the society, receiving interest for it at the rate of seven per cent., and be readmitted into the order. He was accordingly readmitted in the year 1744. But he broke with the society again before long, and withdrew his money. In 1747, and following years, he published his "History of the Popes," a work conceived and written in a spirit of extreme hostility to the papacy and the hierarchy. It naturally called forth rejoinders from the catholic body, and now the whole story of his correspondence with the jesuits came out. He defended himself vigorously, but did not succeed in clearing his character in the eyes of the public. All his former friends abandoned him with

the exception of Lord Lyttleton. The reputation of his history declined with his own, and he seems to have become weary of the task himself, for the period between the years 1600 and 1758 is compressed into twenty-six pages. Previously to this, he had married a niece of Bishop Nicholson, a widow with a handsome fortune. He died in 1766 at the age of eighty. His style has a certain vigour, but is destitute of elevation either of thought or language.—T. A.

**BOWER, EDWARD**, an English portrait painter in the great Vandyck age of Charles I. He painted likenesses of Pym and Fairfax, which were engraved by Hollar.—W. T.

**BOWER, WALTER**, a Scottish historian, was born at Haddington in 1385. He assumed a religious habit at the age of eighteen, and subsequently prosecuted his studies at Paris. After his return to his native country he was elected abbot of St. Cohn in the year 1418. Fordun, the author of the *Scotichronicon*, had left that work unfinished at his death, and Bower agreed at the request of Sir David Stewart of Rosyth to undertake the completion of the narrative. His continuation was composed partly from the notes which Fordun had collected, and which he committed to Bower when he found himself too infirm to carry on his work, partly from the papers communicated to Bower by Sir David Stewart, and partly from the additional information which his own researches had discovered. From these various sources Bower brought down the narrative from the death of David I. in 1153, to the murder of James I. in 1437. The style, both of Fordun and his continuator, is scholastic and barbarous, but their joint production is exceedingly valuable.—(See *FORDUN*.)—J. T.

**BOWLES, CAROLINE ANNE**, the second wife of the laureate Southey, will not be forgotten amid the cluster of female poets that adorned the early part of this century. Her first production, "Ellen Fitzarthur," appeared in 1820; it was followed by "The Widow's Tale," "Solitary Hours," and a series of ballads, domestic tales, and lyrics, which are marked by genuine pathos and simplicity of thought, with an unusual grace and harmony of versification. The poems of Miss Bowles are free from any taint of affectation; their defect is occasionally a want of strength. Many of her tales, as that of "The Young Grey Head," and songs, such as "The Dying Mother to her Infant," have secured a lasting and deserved popularity. She was born in 1786; married Southey in 1839; died in 1854.—J. N.

**BOWLES, GEORGE**, of Chisselhurst in Kent, distinguished himself by his examinations of plants. He spent some time in Wales, and appears to have advanced the knowledge of British plants.—J. H. B.

**BOWLES, WILLIAM**, an Irish mineralogist, who became a mining councillor in Spain, and died in that country in 1780. His "Introduction to the Natural History and Physical Geography of Spain," published in Spanish at Madrid in 1775 (third edition, 1781), and subsequently translated into several languages, with his smaller memoirs upon German and Spanish mines, were of considerable value. He also prepared a "Monograph of the Locusts," published at Madrid in 1781. Ruiz and Pavon called a genus of Peruvian plants *Bowlesia* in his honour.—W. S. D.

**BOWLES, WILLIAM LISLE**, born at King's Sutton, Northamptonshire, in 1762, was a distinguished pupil of Winchester school, and afterwards became a scholar of Trinity college, Oxford. He obtained the prize for a Latin poem at that university in 1783, and took his degree in 1792. Previous to this, in 1789, he had made his first appearance as an author, by the publication of fourteen miscellaneous sonnets, many of which were suggested by his early travels. Their unexpected success encouraged the author to obey his poetic impulse, and twenty-one were issued in a second edition. This fell into the hands of Coleridge, then a youth of seventeen, and called forth from him, both in prose and verse, expressions of the warmest admiration. In 1798 Mr. Bowles published "Coombe-Allen," and from that year till 1850, when he died, continued to produce, with remarkable fecundity, poems of various length and merit. Among the latest of those were "St. John in Patmos," 1833, and a collection of hymns and minor pieces, entitled "The Village Verse-Book." His outward career was a smooth one. Shortly after leaving the university he took orders, and became curate of Donhead, Wilts. In 1804 he was promoted to the rectory of Breamhill in the same county, where he resided in amiable seclusion till the close of his life. In 1797 he married a

daughter of the Rev. C. Wake, who died a few years before her husband. They left no family. Favourable critics of Bowles have thought it necessary to defend his position as a classic in our poetic literature—a position which must be assigned him with a certain reserve; for none of his poetry is of the highest order. But in the paths which fit his genius he moves most gracefully. Although others have transcended him even there, he was the first in a new field, and shares with Cowper the honour of having led the reaction against the formalism which pervaded English poetry throughout the greater part of last century. Coleridge read his verses, and traced to their influence part of his own inspiration, when Wordsworth was unknown, and Southey had only written a single epic. It is unfair to estimate an author who strikes on a fresh vein of thought by comparison with his successors who have wrought it more perfectly, and Bowles is entitled to precedence in order of time among the more recent poets of nature in England. There are some of his sonnets, as "St. Michael's Mount," "Dover Cliffs," "Netley Abbey," "The Bells, Ostend," to which we still recur with pleasure. "The Monody at Matlock," "Coombe-Allen," "Hope," and "The Messiah," are excellent specimens of meditative verse. Still higher, perhaps, are the lines addressed to "Chantry's Sleeping Children." He equally wants passion and power; his dramatic attempts are unsuccessful, and his long poems, as the "Spirit of Discovery" and the "Missionary," are only redeemed from tediousness by passages of fine description. His verse has that smooth flow and cadence which is best suited to convey pensive thought and the impressions of the picturesque. Where he tries to "awake a louder and loftier strain," he fails; but he is a master of gentle music. Bowles is known among antiquarians by his "Parochial History of Breamhill," 1828; "Hermes Britannicus," and the "Life of Bishop Ken." Among critics, by the famous controversy arising out of his edition of Pope, published in 1807, when the severity of his strictures on the great satirist brought upon their author the animadversion of Byron, Campbell, and the *Quarterly Review*. "Impar congressus," Bowles conducted the warfare with considerable spirit, and with the more show of success from the fact, that many of the arguments of his opponents were unconsciously directed against the main conditions of their own celebrity.—J. N.

**BOWMAN, JOHN EDDOWER**, an English naturalist, was born at Nantwich in Cheshire on 30th October, 1785, and died on 4th December, 1841. In early life he was confined to business, but he contrived to gratify a taste for botany. He became a manager of a bank at Welch Pool, and in 1824 became partner in a banking establishment at Wrexham. From this he retired in 1830, and did not again return to business. In 1837 he went to reside in Manchester, and there passed the remainder of his life. He became a fellow of the Linnæan Society in 1828. To that society's Transactions he contributed papers on a new Fungus, and on the parasitic nature of *Lathraea squamaria*. He has also written "On the longevity of the Yew," "On the Silurian rocks of North Wales," "On the origin of Coal," "On fossil trees discovered on the line of the Bolton Railway," "On the natural terraces on the Eildon Hills," and on the question of the existence of glaciers in North Wales.—J. H. B.

\* **BOWRING, SIR JOHN**, Knight, LL.D., F.R.S., is the eldest son of the late Charles Bowring, Esq. of Larkbear, near Exeter (whose ancestors had for many generations been engaged in the woollen trade of Devon), and was born at Exeter on the 17th October, 1792. "He learned English," says one of his biographers, "without precisely knowing how or when." Some slight tincture of the classics he received from a dissenting minister at Moreton Hampstead; of mathematics, from the master of the presbyterian charity school at Exeter; in which city he attended, too, the lectures of the well-known unitarian, Dr. Lant Carpenter, receiving from them, no doubt, an early and decisive bias. French he learned from a refugee priest; otherwise, his wonderful knowledge of modern languages was acquired "without a master." Himself desirous of being a preacher, he was placed by his friends, at the age of fifteen, in the office of a merchant at Exeter, where he continued for three years, laying the foundation, at odd hours, of his solid and extensive linguistic acquirements. Colloquial Italian he picked up from the vagrant venders and repairers of barometers; Spanish and German, Portuguese and Dutch, were added to French and Italian, partly through conversation with old merchants of Exeter, whose libraries of foreign books were placed at his disposal; the young

Bowring was a student of literatures as well as languages. Removed to London at the age of eighteen, he found himself in the employment of a commercial house which did a large business in the way of furnishing supplies to the British army in the Peninsula, then the scene of a terrible war. In 1813, he was sent as the representative of his house to Spain and Portugal, where he led a wandering life, shifting from place to place, as the movements of armies determined. In the midst of his commercial occupations, he studied the literature and social life of the Peninsula, and formed a friendship with its leading liberals. It was this knowledge of Spain, and sympathy with its liberalism, that in 1820 introduced him to the notice of Jeremy Bentham, of whom he became the friend and disciple, whose eyes he closed, and who appointed him his executor. After the peace of 1815, Bowring started in business for himself, with varying success; and in the course of his subsequent commercial career (which did not close until 1828), he visited most of the countries of Europe, uniting to commercial activity a keen study of the language and literature of each country visited. In 1821 he began with the publication of his "Specimens of the Russian Poets," that remarkable series of works which has interpreted for the English mind the popular sentiment and fancy of almost every European race. To the "Specimens of the Russian Poets," succeeded (often with valuable introductions) the "Ancient Poetry and Romances of Spain;" "Servian Popular Poetry;" and "Bohemian Anthology" (all three published in 1824); the "Specimens of the Polish Poets," 1827; the "Poetry of the Magyars," 1830; of the "Poets of Holland;" and the "Ceslovakian Anthology," 1832. Shortly after the commencement of his acquaintance with Bentham, he edited from the MSS. of the utilitarian sage, a work expository of "Free Trade Principles," published in 1822. It was in this year that his intimacy with some French liberals led to his arbitrary arrest at Calais, from which he was released by the prompt interposition of Mr. Canning. To the same period belongs his publication of "Matins and Vespers," devotional poems, original and translated, which have gone through several editions. In 1824 Jeremy Bentham founded the *Westminster Review* to be the quarterly organ of utilitarian radicalism, and Bowring was its first political editor. The duke of Wellington thwarted the wish of the conservative chancellor of the exchequer, Mr. Herries, to adopt in 1828 the recommendation of a select committee of the house of commons, and make Dr. Bowring one of the commissioners for the reform of the public accounts. But meanwhile he was sent to Holland to report on the Dutch system of keeping accounts, and the illustrator of Holland's popular poetry became also the expositor of its national bookkeeping. With the accession of the liberals to power, and of his friend, Mr. Poulett Thompson, afterwards Lord Sydenham, to the Board of Trade, began Dr. Bowring's famous commercial missions on the continent and to the East, 1831-39, the results of which he embodied in a series of valuable reports. It was on his return from a commercial mission to the East in the September of 1838, that at a dinner given to him at Manchester, was originated the anti-corn-law association, which before long became the anti-corn-law league. Dr. Bowring had represented Kilmarnock from 1835 to 1837, and Bolton from 1841 to 1849, actively advocating commercial and general liberalism in the house of commons, when, in the last-named year he was appointed British consul at Canton. Subsequently he became acting plenipotentiary in China, and was knighted in February, 1854, on being appointed governor of Hong Kong, and superintendent of trade in China. His later official career belongs to the domain of contemporary politics. Since the affair of the *Arrow*, Sir John Bowring has returned home, and is about to add to his interesting work, "The kingdom and people of Siam" (London, 1857), an account, similarly based on recent personal observation, of the Philippine islands. Sir John Bowring edited the Works of Jeremy Bentham, which with memoirs and the correspondence of their author, were published in Edinburgh in 1838-41. He has also contributed some volumes of "Minor Morals" to juvenile literature. The decimalization of the coinage and the reform of the quarantine laws are among the many objects which have been advocated by this indefatigable worker, who, it should be added, derives his title of LL.D. from the Dutch university of Groningen.—F. E.

BOWYER, WILLIAM, a celebrated English printer greatly distinguished for scholarship, was born 19th December, 1699, in Whitefriars, London. His father was an eminent printer, and

after William had completed his education at Cambridge, he entered into partnership with him in 1721, and took the superintendence of the literary and critical department of the business. He soon won distinction for the Bowyer press, by the accuracy and erudition he displayed when correcting for the press the numerous learned works which passed through his hands. He did not content himself with typographical accuracy, but took advantage of his extensive scholarship to supply critical notes, emendations, prefaces, and indices, which greatly enhanced the value of many of the works which he published. In printing Lyttleton's Latin Dictionary, the Greek Lexicon of Schrevelius, the Hebrew Lexicon of Buxtorf, and Barclay's English Dictionary, he supplied numerous corrections, and added many words which he had met with in the course of his own reading. A collection of his numerous papers, written in connection with the publications he superintended, and displaying great research, especially in classical archaeology, was published in 1785 by his biographer, Mr. Nichols, under the title of "Miscellaneous Tracts, by the late William Bowyer." But the works in connection with which he is best remembered are—"The Origin of Printing," consisting of—1st, Dr. Middleton's dissertation on its origin in England; and 2nd, Meerman's account of its invention at Haarlem, with numerous notes and corrections, published by Bowyer in 1766; and his "Critical Conjectures and Observations on the New Testament," prepared in connection with an excellent edition of the Greek text, which he issued in 1763. This work received the highest commendations from the most eminent Greek scholars, and was translated into German by Dr. Schulz, professor of theology and of oriental languages at Leipzig. The fourth and best edition appeared in 1812. Mr. Bowyer held several lucrative appointments, such as official printer of parliamentary papers, and printer to several learned societies. He died 18th November, 1777, in his 78th year, greatly beloved and revered by a large number of men eminent in literature, with whom he had long been on terms of intimate friendship. A complete list of the valuable works which issued from the Bowyer press, and were enriched by the emendations and additions made by this "last of the learned printers," will be found in a work entitled *Literary Anecdotes of the Eighteenth Century*, comprising *Memoirs of William Bowyer, printer, F.S.A.*, and many of his learned friends, by John Nichols, F.S.A., in 9 vols. 8vo.—J. B.

BOXER, EDWARD, C.B., a rear-admiral in the navy, was a native of Dover, and was born in 1784. He entered the navy in 1798, and served under Lord Collingwood on the Mediterranean station, and commanded a detachment of seamen, who were landed to co-operate with the army in Egypt in 1801. In 1809 he captured three French frigates, a store ship, and seven merchantmen, in the bay of Rosas. He afterwards served on the Halifax and other stations, and in 1840 was employed in taking the soundings off the coast of Syria, previous to the bombardment of the fortress of St. Jean d'Acre. He went out with the Black Sea fleet in 1854, and was appointed by Lord Raglan and Sir E. (afterwards Lord) Lyons to superintend the harbour of Balaklava. Many severe criticisms were made in the newspapers at the time, as to the way in which he discharged the duties of this post; but Lord Raglan, in the despatch announcing his death, bears testimony to the essential services which he rendered the army by improving the landing-places and wharfs at that port. He died of cholera on board H.M.S. *Jason*, in the harbour of Balaklava, June 4, 1855, leaving a widow and eleven children.—(*Hardwicke's Annual Biography for 1856*).—E. W.

BOXHORN, MARCUS ZUERIUS, a Dutch critic, born at Bergen-op-Zoom in 1612; died in 1653. He was professor of eloquence at Leyden before his twentieth year; and, after the death of Daniel Heinsius, succeeded to the chair of history and politics. He published a universal history, and editions of several of the Latin classics.—J. G.

BOYCE, WILLIAM, Mus. Doc., the son of a respectable citizen of London, was born in the year 1710. A fine voice, and an early propensity to the study of music, induced his father to place him under the tuition of Charles King, master of the children of St. Paul's cathedral, into the choir of which, when prepared by the routine of the music-school, he was admitted. At the usual age he quitted the station of a singing-boy, and became an articulated pupil of Dr. Greene, then organist of that church. Endowed with genius, and fortunate in the qualifications of his tutor, he made rapid progress both in theory and practice; and at the expiration of his pupilage was unanimously

ected organist of Vere Street chapel, Cavendish Square, and commenced his profession as a teacher of music. Anxious to extend the theoretical knowledge which he had acquired under Dr. Greene, he became a constant attendant at the scientific lectures of the learned Dr. Pepusch; studying with deep attention the philosophical principles of music, and at the same time becoming intimately acquainted with the works of the early Flemish and Italian composers, as well as those of our own country. In 1736 he relinquished his situation at Vere Street chapel, on being chosen organist of St. Michael's, Cornhill—a place vacated by Kelway, who was chosen to fill a similar situation at St. Martin's-in-the-Fields; and upon the decease of John Weldon in the same year, he was appointed one of the composers to his majesty's chapels royal. In 1740, upon the erection of an organ in the church of the united parishes of Allhallows, the great and the less, in one of which he was born, he was so earnestly entreated by the parishioners to become their organist, that he yielded to their solicitations, notwithstanding his other various engagements. In 1749, at the installation of the duke of Newcastle as chancellor of the university of Cambridge, he set to music an ode written for the occasion by Mason, the poet—likewise an anthem—both of which were publicly performed. As an acknowledgment of the merits of these compositions, the university conferred upon him, unsolicited, the degree of doctor in his faculty. On the death of Dr. Greene in 1755, he was nominated to the office of master of the royal band of musicians, and in 1758, upon Travers' death, one of the organists of the chapels royal. He died February 7, 1779, and was buried in the crypt of St. Paul's cathedral. Besides numerous odes, songs, concertos, sonatas, and trios, Dr. Boyce was the author of the music to Lord Lansdowne's "Peleus and Thetis," a masque; "David's Lamentation over Saul and Jonathan," an oratorio; "Solomon," a serenata; "The Chaplet," and "The Shepherd's Lottery," two dramatic productions, &c.—all of which works possess various degrees of excellence. But his chief merit lies in his compositions for the church. For instance, his noble anthems—"By the waters of Babylon;" "If we believe that Jesus died;" "O where shall wisdom be found?" and a host of others that could be named, which fully entitle him to rank amongst the inspired musicians. Dr. Boyce is entitled to the lasting gratitude of the church and nation for the publication of the splendid collection of cathedral music, in three large folio volumes, 1760, in which are preserved the finest productions of our best church composers, from the Reformation to the middle of the eighteenth century.—E. F. R.

BOYD, the name of a Scottish noble family, at one time possessed of great power and wealth. The first of the house conspicuous in the history of Scotland was Robert, who was called to parliament as Baron Boyd of Kilmarnock. He was an able and ambitious man, and gained the favour of James II. by his great qualifications for business. In 1459 he was employed with other distinguished persons in negotiating the prolongation of a truce with England. Upon the death of James in the following year, Lord Boyd was made high justiciary of the kingdom. Aided by the address of his brother, Sir Alexander Boyd of Duchal, he acquired great influence over the young James III.; and on the death of good Bishop Kennedy in 1466, he violently seized the person of the sovereign while presiding in a session of the exchequer court at Linlithgow, and carried him off to Edinburgh. At the next meeting of parliament he obtained indemnity for this treasonable act, and a formal pardon was made out under the great seal. He was also appointed by the parliament governor of the king and his two brothers. Shortly after he was invested with the office of lord chamberlain, and put the copestone on his family honours by marrying his eldest son and heir, who was created earl of Arran, to the Princess Mary, the king's eldest sister. Such a sudden acquisition of rank and power of course excited the jealousy of the other nobles, and the ambition and arrogance of the Boyds contributed greatly to increase their unpopularity. Their fall was as rapid as their rise. In 1469 the earl of Arran was sent with other commissioners to Denmark, to negotiate a marriage between James and the king of Denmark's daughter, and during his absence a combination was formed amongst the nobles against the overgrown power of the Boyds. On the arrival of the earl in the Frith of Forth with the royal bride, he did not venture to land, but warned by his wife, the Princess Mary, he escaped with her to the continent. His aged father, after an unsuccessful attempt to maintain

his ground by arms, took refuge in England, where he died in 1470. Sir Alexander Boyd, brother of the justiciar, was brought to trial for his share in the seizure of the king's person at Linlithgow, and beheaded. The earl of Arran seems to have acquired considerable distinction in the service of the duke of Burgundy; but he died at Antwerp in 1474, of grief, it is said, for the loss of his wife, who was recalled by her brother from the continent, compelled to submit to a divorce, and remarried to Lord Hamilton, whose descendants became by this alliance the nearest heirs to the Scottish throne. The Boyds never completely recovered from this blow, but a branch of this family was afterwards ennobled under the title of earls of Kilmarnock. William, the fourth earl, was involved in the Jacobite rebellion of 1745. After the battle of Culloden he fell into the hands of the duke of Cumberland, and was brought to trial upon a charge of high treason, condemned, and beheaded on Towerhill, August 18, 1746, in his forty-second year. His eldest son James, Lord Boyd, who fought for King George at Culloden, afterwards succeeded to the earldom of Errol, which his descendants still enjoy.—J. T.

BOYD, REV. HENRY, A.M., a native of Ireland, who wrote several poetical pieces, chiefly dramatic. He is better known as the translator of the *Inferno* of Dante, and of Vincenzo Monti's poem on the death of Ilugo Basseville, the envoy from the French republic. He also translated the *Trionfi* of Petrarch. Boyd's works were published in Dublin, 1793. He died in 1832.—J. F. W.

BOYD, HUGH, a political writer of the eighteenth century, was born in the county of Antrim in Ireland, and intended by his father for the bar, for which purpose he received a good education and graduated in Trinity college, Dublin. He did not, however, follow the profession, but addicted himself to political subjects. It was insisted by some persons that he was the author of the celebrated letters of Junius, but the attempt was unsuccessful, and the idea has been long since exploded. Boyd made an advantageous marriage and went to the East, having procured a post there under Lord Macartney. He died in 1791. His writings were collected and published in 1798.—J. F. W.

BOYD, MARK ALEXANDER, a Scottish scholar and writer of Latin poetry, was born 13th January, 1562. He was the son of Robert Boyd of Pinkhill in Ayrshire, and nephew of James Boyd, the unpopular archbishop of Glasgow, under whose care he was educated, having been early left an orphan. He cared little in his early years for academical pursuits; and having tried unsuccessfully to push his fortune at court, he was induced to follow the military profession, and betook himself to France. At Paris he was attracted to the studies he had despised at home, and having attended the academical lectures there, he passed to the university of Orleans, to study civil law. Thence he went in succession to Bourges, Lyons, and Toulouse, famed everywhere for his elegant scholarship. He seems to have done little service as a soldier, though we find him in 1587 attached to a body of troops sent from Auvergne to support Henry III. In this expedition he was slightly wounded. When resident at Toulouse he was a sufferer for his adherence to the royal cause, being cast into prison by the insurrectionists, who had taken possession of the town in name of the League. After obtaining his release he settled near Poictou, where he devoted himself to study. At length he returned to Scotland, and died in April, 1601, at the paternal seat of Pinkhill. Of his numerous productions in prose and verse, displaying a very perfect acquaintance with both Latin and Greek, only his "Epistolæ Hervidum" and "Hymni" are now known. They are published in the *Deliciæ Poetarum Scotorum*, 1627.—J. T.

BOYD, JOHN P., brigadier-general in the American army in the war of 1812. His early military career was in India, where he commanded an irregular mercenary corps, which he raised, paid, and equipped himself, and with which he served any of the native princes who would pay him best. Once he was in the pay of Halkar, and afterwards in the Peshwa's service. Finding at length no lucrative employment, he sold out his force to a Neapolitan partisan, and came to Paris in 1808, whence he returned to America. Receiving a commission in the army, he served under General Wilkinson in the abortive attempt of that officer in 1813 to advance against Montreal. On coming to the great rapid in the St. Lawrence river, just below Ogdensburgh, Boyd, with the rear-guard, consisting of 2000 men, was ordered to cross to the Canada side and attack the British force who

were hanging on the rear. A confused action, known as the battle of Chrystler's Farm, resulted in the loss of General Covington and 319 men, killed or wounded. The British, though decidedly inferior in numbers, after yielding a little, maintained their ground; but meanwhile the passage of the rapid was safely accomplished. The main expedition was soon abandoned, however, owing to a want of co-operation by another body of troops, and much dispute and recrimination resulted from the failure. Boyd was subsequently appointed naval officer for the port of Boston; and in 1816 published a book containing facts and documents relative to the conduct of the war. He died at Boston, October 4, 1830, aged sixty-two.

BOYD, ROBERT, of Trochrig, a Scotch divine, born in 1578. His father, James Boyd, was the "tulchan" archbishop of Glasgow. He prosecuted his studies for some time at the university of Edinburgh, and afterwards in France. In 1604 he was ordained pastor of the protestant church at Verteuil; and, two years later, was appointed one of the professors at the university of Saumur. He also discharged the duties of the ministerial office in the same town; and, having married a French lady, seemed to have abandoned all intention of returning to his native country. But his reputation for ability and learning attracted the attention of James VI., who conferred on him the principalship of the university of Glasgow. He discharged the duties of this office with great assiduity; and, besides teaching theology, Hebrew, and Syriac alternately, he preached in the church of Govan, the temporalities of the rectory and vicarage of this parish having been annexed to the principalship on this condition. Mr. Boyd, however, refused to countenance King James' attempts to introduce episcopacy into Scotland, and was therefore obliged to resign his office, and retire to his estate in Ayrshire. He was soon after appointed principal of the university of Edinburgh, and one of the ministers of that city. But owing to his refusal to comply with the five articles of Perth, he was compelled to leave the capital, and was ordered by the king to confine himself within the bounds of Carrick in Ayrshire. This restriction was ultimately removed, and Mr. Boyd was appointed minister of Paisley, but his situation there was rendered uncomfortable, through the opposition of the earl of Abercorn's widow, who had lately joined the Romish church. Mr. Boyd died soon after at Edinburgh, 5th January, 1627, in the forty-ninth year of his age. His largest and best known work is his Latin "Commentary on the Epistle to the Ephesians," which has been highly commended for the elegance of its style. It was not printed until 1652. Another treatise, entitled "Monita de Filii Sui Primogeniti Institutione," was published in 1701. Two of Mr. Boyd's Latin poems appeared in the *Deliciae Poetarum Sctorum*; and a laudatory ode on King James was printed in Adamson's *Muses' Welcome*. His life has been written by Wodrow.—J. T.

BOYD, ZACHARY, a Scottish divine and writer of verse, who was born towards the close of the sixteenth century. He was descended from the Boyds of Pinkhill, in Ayrshire, and received his education in the university of Glasgow. He subsequently prosecuted his studies at Saumur in France, and in 1611 was appointed a regent in this college. After spending sixteen years in France, he was compelled to leave it in consequence of the persecution of the protestants. On his return to his native land he was domestic chaplain successively to Sir William Scott of Elie and to the marquis of Hamilton. In 1623 he was appointed minister of the Barony parish, Glasgow, and passed the remainder of his life in this charge. The congregation to which he ministered at that time worshipped in the crypts beneath the cathedral church, so strikingly described by Sir Walter Scott in his novel of *Rob Roy*. In 1629 was published Mr. Boyd's principal prose work, "The Last Battell of the Soull in Death," a treatise cast in the form of a dialogue, in which Pastour, Sicke Man, Spiritual Friend, Satan, Michael, &c., express their opinions with considerable spirit and dramatic effect. Zachary appears to have been a staunch loyalist at this period, for the first volume of his work is dedicated to Charles I. and his queen; and when that unfortunate monarch visited Scotland in 1633 for the purpose of being crowned, Zachary waited on him the day after the ceremony, and addressed him in a highly eulogistic Latin oration. When the ill-judged attempt of Charles and Laud to impose episcopacy upon the Scotch, led to the formation of a national league in support of the religious rights of the people, Mr. Boyd and the other professors of Glasgow college at

first refused to subscribe the covenant, but were afterwards obliged to conform. He continued a faithful adherent of the covenanting party throughout all the changes of that stormy period. When Cromwell visited Glasgow, after the battle of Dunbar, September 3, 1650, the magistrates and ministers quitted the city in a body, but the undaunted Zachary remained at his post, and, according to Baillie, railed on the English secretaries to their very face in the High Church. The passage which he expounded on this occasion was the eighth chapter of Daniel, and it is said that one of Cromwell's officers was so indignant at the statements of the plain-spoken preacher, that he whispered into the ear of the general a request for permission "to pistol the scoundrel." Cromwell replied, "No, no; we will manage him in another way." At the close of the sermon he asked Mr. Boyd to dine with him, and their religious conversation and devotional exercises were protracted till a late hour. Zachary died about the end of the year 1653 or the beginning of 1654, leaving behind him the reputation of a pious, learned man, of strong sense, mingled with considerable humour and of great shrewdness and sagacity, but withal very eccentric. He published during his lifetime no less than nineteen works, chiefly devotional and religious, and left a very large number of treatises in manuscript, apparently prepared for the press. The most celebrated of these are two volumes, entitled "Zion's Flowers, or Christian Poems, for Spiritual Edification," which are usually designated Zachary Boyd's bible. They consist of a collection of poems on Jephtha, David, Goliath, Jonah, and other persons mentioned in scripture history, cast in a dramatic form, and bearing a considerable resemblance to the ancient "mysteries," or sacred dramas of the thirteenth and fourteenth centuries. They form a strange mixture of passages conceived in a fine strain of devotional feeling, with descriptions of the most grotesque and ludicrous character, in the homeliest style of versification. Mr. Boyd also prepared a poetical version of the Book of Psalms for the use of the church, but the version of Rous was preferred by the General Assembly. Mr. Boyd was a liberal benefactor to the university of Glasgow, and to his munificence it is indebted for the present college buildings. In gratitude for the legacy which he bequeathed to his Alma Mater, a bust of Zachary was erected on the gateway within the court of the college, with an appropriate inscription. It is a vulgar error that he made any stipulation as to the publication of any portion of his writings.—J. T.

BOYDELL, JOHN, a public-spirited engraver, born at Dorrington in 1719, and who became lord mayor of London. He was the son of a land surveyor, and followed the chain till the age of twenty, when the sight of Baddeley's Views of English Country Seats set him to learn engraving. He came to London, and was apprenticed to a Mr. Toms, and at the end of six years produced a book of views near London, and afterwards some other topographical works. He now threw his whole energies into reviving the neglected art of engraving, and preventing the necessity of our importing our prints from the continent. To encourage painting he started his illustrated Shakspeare and Shakspeare gallery. The latter he would have left to the nation, but his losses from the French revolution compelled him to obtain an act of parliament to allow him to dispose of it by lottery. In 1774 Boydell became alderman of his ward, and in 1791 lord mayor. He died an old man in 1804, respected and revered by every one.—W. T.

BOYDELL, JOSIAH, the nephew and successor of the enthusiastic dilettante alderman, John Boydell, who founded the Shakspeare gallery. He was born at Stanton in Shropshire, in 1750. When Boydell was bribing avaricious Reynolds with a retainer of 500 guineas to paint for him *Robin Goodfellow*, *Macbeth* and the *Witches*, and the *Death of Cardinal Beaufort*, and was projecting a grand illustrated edition of his favourite poet, the young Shropshire artist was sent for to London to learn engraving, and Fuseli, West, Romney, and Hayley joined in the work. While Fuseli executed eight works, of which *Hamlet* and the *Ghost* were the most wonderful, Boydell turned out a blank, painted some feeble pictures, became alderman of Cheap, resigned the gown in 1807, and died at Halliford in 1817.—W. T.

\* BOYE or BOJE, CASPAR JOHANNES, a Danish poet, born on 27th December, 1791, at Konigsberg, where his father was pastor. Whilst a child he removed with his family to Trondjem. As a youth he was for two years a tutor in Norway, after which, until 1810, he studied at the university of Copenhagen. He also gave lessons in Copenhagen, whilst he studied first law,

then theology, during which time he also wrote and published many poems. In 1818 he and some others established the seminary for teachers at Jonstrup, where he found sufficient leisure for his literary pursuits, principally dramatic works, which were acted with considerable applause. Being soon after called to assume the duties of parish priest, he laboured assiduously at a new and improved version of the psalms for the use of the Danish church. In 1835 he was appointed pastor of St. Olaf's in Elsinore; in 1840 he was made knight of Dannebrog, and is now minister of the Garrison church, Copenhagen. In 1818 he married the daughter of Michael Gottlob Birkner. His tragedies are "Svend Grethe;" "Kong Sigurd;" "Dronning Jutta of Danmark;" and "Erik den Syvende." He published a number of the psalms translated from the Hebrew, under the title of "The Harp of David," in 1827; and "Spiritual Poems and Songs," 1833-36; and a new collection in 1840. The hymns of Boje are found in every collection, and are remarkable for their spirit of simple, genuine piety. He is well known as the translator of the principal of Sir Walter Scott's romances, and as the editor of Baggessin's Danish works.—M. H.

BOYER, ABEL, a French lexicographer and historian, born at Castres in 1664; died at Chelsea in England in 1729. He was obliged to quit his country in consequence of the revocation of the edict of Nantes. His principal works are his grammar and dictionary, the latter of which long enjoyed an extensive popularity.—J. G.

BOYER, ALEXIS. This celebrated surgeon, the son of a poor tailor of Uzerches, a small town in Limousin, was born in 1757. He was taken from school as soon as he had learned to read and write, and placed in the office of a notary. While in this uncongenial employment he made the acquaintance of a barber-surgeon, who indulged his curiosity in physiological matters, and then of a surgeon, who advised him to go to Paris and study medicine. That advice it would have been easy to follow, if the young Boyer had known whence to derive the means for a prolonged residence in Paris; and as it was, with seventy francs in his pocket, he set out for the great metropolis. By good luck he came into the hands of a barber, who, on the recommendation of his having formerly acquainted himself with the duties of an apprentice, took him into his employment; and not only kept him from starving, but with a rare spirit of generosity, allowed him to indulge his medical tastes by frequenting the halls of dissection and anatomical museums which abounded in the neighbourhood. In these places Boyer made himself useful in various ways to the students with whom his daily visits brought him into contact, and by and by acquired so much skill as an operator, that his young friends were glad to pay him for an occasional lesson in surgery. He now entered into an arrangement with his employer by which he was required to handle the razor only on Sundays and holidays, and the rest of his time allowed to busy himself with his scalpel. At his lodgings in the house of the honest washer-woman, whose daughter he afterwards married, he began to entertain his friends, who, hearing of his success, flocked to him from all quarters; and, what with his gains at the hospitals, and his prizes at the practical schools, seemed at length to have gained the road to fortune. In 1787, after a competitive examination, he was appointed *gagnant maîtrise* at the hospital of la Charité—an institution which was to derive advantage and lustre from his labours almost until the close of his life. The Revolution advanced the fortunes of Boyer beyond expectation—that event deprived him of a prize which the Royal Academy, then abolished, was about to award him; but rewarded him for his disappointment by bringing about his elevation to the post of second surgeon in the hospital. Previously to the year 1793, when in virtue of his having been *gagnant maîtrise* for a period of six years he became master in surgery, he had commenced at la Charité a course of lectures on anatomy, the descriptive parts of which, for clearness and exactitude, were unmatched in the lectures of any other Parisian professor. From this period his reputation and his emoluments increased at a rate which, even his great talents considered, must be thought extraordinary. He was named professor of the practice of medicine, and second surgeon at the Hotel Dieu. In 1797-99, after commencing a course of lectures on external pathology, he published his "Traité d'Anatomie," 4 vols., a resumé of his course on that branch of science derived in great part from the note-books of his students. In 1803 Napoleon named him his first surgeon, and after the campaign of 1806-7, in which Boyer attended him, the emperor

gave him the cross of the legion of honour, the title of baron of the empire, and a dotation of 25,000 francs. In 1814 appeared the results of the extensive researches he had undertaken for his course of external pathology in the first volumes of his "Traité des Maladies Chirurgicales." The last volumes of that work were given to the world in 1826. The downfall of his imperial patron in 1814 he bore with the equanimity of a man who needed no patron. In 1817 the new government had taken him into confidence; in 1823 he was named consulting surgeon to Louis XVIII. Two more sovereigns of France were to enjoy the benefit of his professional counsel—Charles X. and Louis Philippe. In 1825, on the death of Deschamps, he reached the highest attainable eminence in his profession, by being named surgeon-in-chief at la Charité, and member of the Institute. The death of his wife in 1832 threw him into a profound melancholy, which, more than his still arduous labours, hastened his end: he survived her only a year, dying November 25, 1833. In his lectures he was methodical, pains-taking, almost mechanical, singularly clear and exact; in his works, which are but his lectures revised, we find the same qualities.—J. S., G.

BOYER, CLAUDE, a French poet and preacher, born at Alby in 1618; died in 1698. Boursault and Chapelain have eulogized his dramatic works; indeed, the latter considers him inferior only to Corneille; but Boileau, Racine, and others, have overwhelmed him with ridicule. Nor was he more happy in his sermons, for, according to Furetière, those compositions had not even attained the fame of being good soporifics for want of patients on whom to try their narcotic influence. He wrote a number of tragedies, pastorals, tragi-comedies, operas, sermons, &c.—J. G.

BOYER, JEAN BAPTISTE NICOLAS, a French surgeon, who devoted himself to the treatment of epidemics and epizootics, and left a number of works on that class of diseases, the principal of which are—"Relation Historique de la Peste de Marseilles," 1721, and "Methode à suivre dans le traitement des différentes maladies épidémiques qui regnent le plus ordinairement dans la généralité de Paris," 1761. He was born at Marseilles in 1693. His labours in that city, whither he was sent by the regent from Paris in 1720, during the prevalence of the pest, were rewarded with the title of physician-in-ordinary to the king. Died in 1768.—J. S., G.

BOYER, JEAN PIERRE, a mulatto, president of the republic of Hayti (St. Domingo), born at Port-au-Prince in 1776. He bore arms in the revolution of the French part of St. Domingo in 1792; distinguished himself in the following year in the struggles of the negroes to rid themselves of the tyranny of the planters; and after a short residence in France, whither he was obliged to fly with Petion and others, on their party succumbing to that of the negroes, held a command in the expedition of Leclerc in 1801. The French forces landed at the Cape, February, 1802; in May, Toussaint Louverture was made prisoner, and the party of the negroes dispersed. In 1804 another insurrection against the French resulted in a declaration of independence; Dessalines was elected chief of the republic of Hayti, and somewhat later, emperor. In 1806, Petion, to whom Boyer was attached, on the death of Dessalines, declared a republic at Port-au-Prince, and commenced war on Christophe, the successor of Dessalines. Against the emperor of the north Boyer defended successfully the capital of the republic of the south. In 1818, on the death of Petion, he was elected president, and Christophe being disposed of by violence in 1820, became master both of the empire and the republic. St. Domingo, the capital of the Spanish part of the island, having declared itself an independent republic in 1821, Boyer attacked it next year, and reduced it without difficulty. These successes alarmed the French government, and an effort was made in 1822 to recover St. Domingo, the queen of the Antilles, as it was called at Paris, but without success. Boyer, however, began to undermine his own authority by indulging in occasional acts of tyranny and bloodshed, and by persevering in the ruinous policy of excluding European enterprise from the territories of the republic. In 1825 Charles X. succeeded in compelling the senate of Hayti, secretly summoned for that purpose by the president of the republic, to acknowledge the suzerain rights of the French crown, and to vote an indemnity of 150 millions of francs for losses of the French party since 1792. But when the question of payment came before the Dominican legislature, it was unanimously resolved that as there was no surplus revenue in the hands of the

government, the French must delay making their demands till a period that could not, in the circumstances, be exactly specified. Boyer after this made desperate efforts to increase his resources, and by his measures for that purpose precipitated his ruin. An insurrection, originating in the south of the island, obliged him to take refuge in Jamaica in 1842, whence in 1848 he passed to France. He died at Paris in 1850.—J. S., G.

**BOYER, JOHN BAPTIST**, marquis d'Aiguilles, a French noble patron of art, procurator-general of the parliament of Aix. A love of art led him to Italy with the sculptor Puget. He formed a great collection of paintings and sculptures, and published the prints in two volumes; some of them were by his own hand. He also painted and scraped mezzotints. With nothing a year he might have proved a genius—this marquis.—W. T.

**BOYER, PIERRE DENIS**, a French prelate, eminent as a controversialist, born at Caissac in 1766; died in 1842. After completing his curriculum at the college of Rodez, where he was the friend and companion of Frayssinous, he took priest's orders in 1790, and about the commencement of the Reign of Terror began preaching in a small church in the mountainous district of Rouergue. There his reputation with the better classes, as well as with the common people, whom he addressed in the patois of the district, procured him the unenviable notice of the terrorists, and he was conducted to prison, but by a stratagem of one of his friends soon after released. He went to Paris in 1800; in 1802 attracted the favourable notice of the first consul by his publication entitled "Duel jugé au tribunal de la raison et de l'honneur," and, shortly afterwards, Frayssinous having vacated the chair of dogmatic theology in the seminary of St. Sulpice, was appointed his successor. From 1818, when he published his "Examen du pouvoir législatif de l'Eglise sur le mariage," during the twenty years in which he was employed in missionary labour, he continued also to busy himself in matters of controversy, maintaining the doctrines of the church or her rights, as either chanced to be made the subject of attack, with considerable vigour and no little warmth.—J. S., G.

**BOYER DE NICE, WILLIAM**, an Italian troubadour, born at Nice; lived in the fourteenth century. The only one of his pieces that has come down to us, is that which he composed for Marie, the wife of Charles, duke of Calabria; but it gives us no high opinion of his powers. He was, however, much esteemed by contemporaries, who published many of their pieces under his name.—J. G.

**BOYERMANS, THEODORE**, a Flemish painter, born at Antwerp, and pupil and imitator of the robust Rubens. He was a good medium man, a fair designer, and excellent colourist. He filled a good many churches with his good works, and then went, we hope, to heaven to learn to do better. One of his best was a picture of the good St. Xavier, the jesuit, converting the ancestors of our Sepoy friends, executed for the church of St. Xavier's order at Ypres.—W. T.

**BOYLE, DAVID**, an eminent Scottish judge, was born at Irvine on 26th July, 1772. His father, the hon. Patrick Boyle, was the third son of John, second earl of Glasgow. In 1793 he was called to the Scottish bar, and in 1807 was made solicitor-general, and was returned as member of parliament for the county of Ayr. He remained in parliament, taking, however, almost no part in its proceedings, till 1811. He was then raised to be a judge in the court of session. At the close of the same year he was promoted to the office of lord-justice-clerk. Although possessed neither of brilliant talent nor of extensive learning, he had many of the qualities of an excellent judge. He had strong good sense, unwearied zeal in the discharge of his duty, and the requisite patience, courage, honesty, and self-dependence, to enable him to discharge it with thorough impartiality. A commanding figure, good voice, and an earnest, impressive, though not eloquent mode of speaking, lent dignity to his office. His decisions remain of the highest authority in nearly every department of Scottish law, as careful and sensible applications of existing principles. He was made a privy councillor in 1820. In 1841, upon the resignation of the right hon. Charles Hope, he was appointed lord-president of the court of session. This office he continued to fill with almost unabated energy and ability till 1852, when he retired. He died soon after, at his country seat of Stewarton in Ayrshire, on the 4th of February, 1853. A statue of him in white marble has been executed by Steele, and is intended to be placed in the parliament house of Edinburgh.—J. D W

**BOYLE, RICHARD**, first earl of Cork, and known as "the great earl of Cork," was born in the city of Canterbury on the 3d October, 1566. He was descended from a family of great antiquity and distinction, the earliest records tracing it to the time of Henry III. In the reign of Henry VI. Ludovic Boyle of Bidney in Herefordshire left two sons, the second of whom, Roger, left four sons, one of whom, Michael, was afterwards bishop of Waterford, and another, Roger, was father to the subject of this memoir. Having received his academical education at St. Bennet's college, Cambridge, and studied law in the middle temple, Richard Boyle, upon the death of his father, resolved to travel, and accordingly went to Ireland, arriving in Dublin on the 23d of June, 1588, all his wealth being, as he states in his memoirs, twenty-seven pounds three shillings. Young Boyle's address and learning procured him the hand of a rich heiress in Limerick, who died shortly after their marriage, leaving him the possession of £500 a year. He soon purchased largely in Ireland, and incurred the suspicion and jealousy, as well for his rising importance as for his abilities, of Sir Henry Wallop, the treasurer, as of other leading men in Ireland, who misrepresented him to the queen. He immediately prepared to go over to England to refute their accusations, when the rebellion broke out in Munster, and he lost all his property. He escaped, however, and arrived in London. Through the machinations of Wallop he was committed to prison; but having at last obtained an audience of the queen, he defended himself with so much ability before the council, that the queen exclaimed, with characteristic impetuosity, "By God's death! all these are but inventions against this young man, and all his sufferings are for being able to do us service, and those complaints urged to forestall him therein; but we find him to be a man fit to be employed by ourselves, and will employ him in our service." Boyle was accordingly set free, and appointed clerk of the council of Munster, and returned to Ireland. Here he was present with Sir George Carey, the lord-president, at the siege of Kinsale, and was sent by him to London with the tidings of the victory obtained over the Spaniards and Tyrone. He accomplished the journey with great expedition, and was received by Elizabeth with great marks of condescension. On his return to Ireland he found the lord-president about to besiege Beahaven, which being taken, Boyle was again despatched to England, and his steady friend Lord Carey recommended him to Sir Walter Raleigh as a purchaser for the lands that the latter possessed in Munster and was then about to sell. These Boyle purchased, and their income, which at the time was very inconsiderable, became soon so large, that when the Irish war was ended, they were "a very noble estate." Once more returning to Ireland, he married Catherine, the daughter of Sir Jeffery Fenton, principal secretary of state and privy councillor in that kingdom, and was knighted by the lord-deputy. The origin of Boyle's attachment to his wife, as stated by Budgell, is somewhat romantic, being said to have occurred when she was but two years old, when he first jestingly and then seriously told her father he would wait till she should attain a proper age, and would marry her if Sir Jeffery would give his consent, which being promised, both parties fulfilled the engagement. The story is told on hearsay; and though the main statements may be true, yet the girl could not be so young at the time of the arrangement, as Boyle's first wife did not die till 1599, and his second marriage took place in 1603. That the marriage was a happy one, we learn on the authority of Boyle himself, who says—"I never demanded any marriage-portion, neither had promise of any, it not being in my consideration; yet her father after my marriage gave me one thousand pounds in gold with her, but the gift of his daughter unto me I must ever thankfully acknowledge as the crown of all his blessings; for she was a most religious, virtuous, loving, and obedient wife unto me all the days of her life, and the happy mother of all my hopeful children whom, with their posterity, I beseech God to bless." The countess died in 1629. The reputation of Boyle as a man of ability and wisdom was daily increasing, so that he was sworn a privy-councillor in 1606, first for the province of Munster and afterwards for the whole kingdom; and after other additions to his honour and fortune, he was on 6th September, 1616, created Lord Boyle, baron of Youghal, in consideration not only of his military services, but "for the judicious erection of forts and castles, and the establishment of colonies at his own cost." Within four years after he was advanced to the dignities

of Viscount Dungarvan and earl of Cork. In 1629 he was sworn in lord-justice, with Lord Loftus his son-in-law, and in 1631 he was appointed lord high-treasurer of Ireland, and continued in the government till the arrival of Lord Strafford. Though the principles of Lord Strafford's policy in Ireland were in the main just and comprehensive, it cannot be denied that he was often harsh and unjust towards individuals. To the earl of Cork his conduct was insolent, oppressive, and illegal. Strafford ordered him to call in his writs in a suit which the latter had instituted, adding, "If you will not, I will clap you in the castle, for I tell you I will not have my orders disputed by law nor lawyers;" but it is remarkable that this act of tyranny was brought forward against Strafford when tried for his life, and the earl of Cork was summoned over to England to give his testimony. When the rebellion broke out in 1641, the care and skill of the earl of Cork and the liberal and wise spirit shown by him in his extensive plantations, retarded for awhile the miseries of war, and ultimately tended to its suppression. He fortified his castle of Lismore and garrisoned it with one hundred foot and as many horse, under the command of his son, Lord Broghill. He placed the same number of troops under his son, Lord Kinalmeaky, in Bandon Bridge, a town built by himself and fortified at the cost of fourteen thousand pounds, while at the earnest request of the viceroy he took upon himself the defence of Youghal, aided by his son, Lord Dungarvon, a troop of cavalry, and two hundred of his own tenants. The hardships and straits which the earl of Cork and his loyal sons sustained are stated in various correspondences of the times, and especially in the letters of these nobles; and ere the rebellion was crushed Lord Kinalmeaky was slain at the head of his troops in the battle of Lisscarrol. In 1642 the earl was commissioned to try the rebels for high treason. The earl had, in the course of these two years, exhausted his means and reduced himself to the lowest condition of distress by his liberal contributions towards the expenses of the war. His estates were nevertheless the most thriving in the kingdom; his improvements were the most extensive, costly, judicious, and useful, consisting of churches, hospitals, schools, bridges, castles, and towers. So surprised was Cromwell on seeing what he had done that he remarked, "If there had been an earl of Cork in every province, it would have been impossible for the Irish to have raised a rebellion."

The earl did not long survive these troubles, or live to see the end of this long and disastrous war. He died at Youghal in September, 1643, having nearly attained the age of seventy-seven years, and was interred in the parish church.

Richard Boyle may fairly be pronounced to have been an able and a good man, and the cognomen bestowed upon him of "the great earl of Cork" was not unmerited. Borlase, in his *Reduction of Ireland*, writes of him, "He was a person, for his abilities and knowledge in the affairs of the world, eminently observable, inasmuch as (though he was no peer of England) yet he was permitted to sit upon the woolsack as *Consiliarius*. And for all the estate he arrived at (which was the greatest in the memory of the last age), none ever taxed him with exorbitancies, but such as thought princes had too little, and religious men not enough."—J. F. W.

BOYLE, RICHARD, son of the first earl of Cork, succeeded to the title on the death of his father in 1643. He was born at Youghal in Ireland on the 28th October, 1612. He was remarkable for his loyalty to Charles I., whom he assisted and supplied with money. In consideration of his services, he was created Lord Clifford of Lanesborough, and afterwards earl of Burlington. He was also appointed lord-lieutenant of the West Riding of Yorkshire and *custos rotulorum* of the city of York, which posts he held till the time of James II., when he resigned them rather than accommodate himself to the designs of that monarch. He died on the 15th January, 1697-98, in his eighty-sixth year.—J. F. W.

BOYLE, ROGER, fifth son of the first earl of Cork, was born on the 26th of April, 1621. When in his fifth year he was created Baron Broghill, and at fifteen he was sent to Trinity college, Dublin, where he soon acquired the reputation of being a good scholar. After leaving the university he went to travel through France and Italy, and upon his return he went to London, where he attracted the notice of the earl of Northumberland, who gave him the command of his own troop of horse. Having married Lady Margaret Howard, sister to the earl of Suffolk, Lord Broghill went to Ireland, where he arrived on the day the rebel-

lion broke out, and proceeded to Lismore, the residence of his father. Lord Broghill at once took the command of a troop of horse raised by his father, and proceeded to join the lord-president, St. Leger, displaying during the rebellion great zeal and loyalty. Upon the death of Charles I. Broghill left Ireland, looking upon it and his estates there as utterly lost, and retired to his seat in Somersetshire, where he lived in retirement till 1649. Here he formed the design of going secretly to Charles II., for the purpose of obtaining a commission to raise troops in Ireland, and attempt the restoration of that monarch and the recovery of his own estates. His object was, however, discovered by the committee of state, and before he could leave the kingdom he received a message from Cromwell, whose sagacity enabled him to see in the loyalist noble one whose talents and knowledge of Ireland would be of great use to him in that country, desiring that he would wait upon him. While Broghill was pondering over this strange mandate, Cromwell entered his room, and told him that his designs were discovered, and that the committee were determined to make an example of him, if he himself had not diverted them from that resolution. On Broghill's denying the charge, Cromwell produced documents that left the former no course but to confess; whereupon Cromwell offered him the command of a general officer if he would serve in the war in Ireland, adding that he should have no oaths or engagements imposed upon him, nor be obliged to draw his sword against any but the Irish rebels. Finding that a refusal would but endanger his life, and that the terms offered were such as he could accept with honour, Broghill acquiesced, and at once repaired to Ireland where his personal influence soon placed him at the head of a regiment of 1500 men, and a troop of horse, consisting of gentlemen, who gladly repaired to him. With these he joined Cromwell at Wexford, who had speedily followed Broghill from England with an army of 12,000 men. The valour and ability of Lord Broghill were frequently put to the proof during the Irish war, and he entirely justified the estimate Cromwell had formed of him. While Broghill was subduing the rebels in the west, Cromwell, having taken Drogheda by storm, proceeded, though in the depth of winter, to invest Clonmel. Disease and some partial defeats thinned the ranks of Cromwell, so that he wrote to Broghill conjuring him by all the ties of friendship and duty to come to his aid without delay, as he should otherwise be obliged to raise the siege. To this Broghill replied—"That by the blessing of God he had just defeated the enemy, and would not fail to be with him in five days." He was as good as his word; and when he appeared at the camp the whole army, by Cromwell's command, welcomed him with the cry of—"A Broghill! a Broghill!" and Cromwell himself ran forward and embraced him. With this reinforcement the parliamentary troops took Clonmel in a few days after. Upon the return of Cromwell he left Ireton his deputy, intrusting to Lord Broghill a flying camp in Munster, and his gallantry, success, and great popularity, are said to have even excited the jealousy of Ireton. When this last was besieging Limerick, he ordered Lord Broghill to intercept the earl of Muskerry who was coming to its relief with 1000 horse and 2000 foot. Though the force of Broghill amounted but to 600 foot and 400 horse, he did not hesitate a moment, but, coming up with great expedition, he fell upon Muskerry, and after a desperate contest, in which he behaved with great personal gallantry, and narrowly escaped being slain, he completely routed the enemy. On the termination of the war in Ireland, Cromwell being now protector, made Broghill a privy-councillor, and shortly after sent him over to preside in Scotland, a task which he accepted unwillingly, and on the terms of being recalled after a year. After the death of Cromwell, his son Richard chose Lord Broghill as one of his cabinet council, being also a member of his parliament. In both positions Lord Broghill showed as much address and political ability as he had heretofore exhibited military talents; and he succeeded on more than one occasion in supporting Richard, and extricating him from serious difficulties. But Richard Cromwell was not made to sway the republican leaders of those stirring times, and so he laid down, to use his own words, "that greatness which was but a burthen" to him. Thus Broghill being absolved from all duty to the family of the great captain under whom he had fought, looked anxiously to the restoration of the king as the surest means of saving the nation. For this purpose he repaired to Ireland, not without incurring the suspicions of the commissioners sent thither, who were instructed "to have

a particular eye on Lord Broghill, and if possible to take some occasion to confine him." But the wariness and discretion of Broghill saved him from a trap laid by the commissioners, and he at length secured all Munster in favour of Charles. Next he induced Sir Charles Coote, who had great influence in the north, to enter into his designs; and, all being ripe, he despatched his brother, Lord Shannon, with letters to the king, inviting him to Ireland, and also communicated with Monk. Shortly after this Broghill and Sir Charles declared openly for the king, and secured Ireland for his majesty. Notwithstanding an attempt of Coote's to injure Broghill in the estimation of the king, the latter was convinced of his loyalty and good services, and raised him to the dignity of earl of Orrery, making him a cabinet councillor, one of the lords-justices of Ireland, and lord-president of Munster. Lord Orrery now devoted himself to literature and politics. In the former he seems not to have attained to a high position. He wrote plays which are long since forgotten, and poems which, though they are not without some merit, will not take much hold of those who are familiar with his contemporaries, Dryden, Cowley, and Waller. He was, however, something better than a writer of mediocrity—a liberal patron of merit, and the friend of the most eminent men of learning of his day. As a politician he took an active part in opposing the petition of the Irish Roman Catholics for a restoration of their estates forfeited in the rebellion, and was mainly instrumental in having it dismissed. He also drew up the act of settlement, not only providing for the protestant interest, but also for the restoration to their estates of such Roman Catholics, as by their good conduct seemed to merit that grace. Upon the appointment of the duke of Ormond as lord-lieutenant of Ireland, Lord Orrery retired to his presidency in Munster, and his administration of justice there was so able and satisfactory that, it is said, he was offered the seals both by the king and duke of York after the fall of the earl of Clarendon, but declined the honour by reason of his failing health. At length, after suffering from repeated attacks of gout, he died on the 16th October, 1679, in his fifty-ninth year. As a soldier he was brave, active, prompt, and skilful; as a politician he was sagacious, prudent, and possessed of address and quickness; and, as a man of letters, he had good parts, well cultivated, and he was not deficient either in wit or taste. Upon the whole he must be looked upon as one of the leading men of his times.—J. F. W.

BOYLE, ROBERT, the Honourable, was the seventh and youngest son of the great earl of Cork, and was born at Lismore in Ireland on the 25th of January, 1626. From the very dawn of reason his life seems to have been eventful, and his mind reflective. At three years of age he lost his mother, and the active and various pursuits in which his father was engaged deprived him almost entirely of the presence of this remaining parent, and left him exposed to many casualties and dangers; so that ere he had reached his seventh year he had twice narrowly escaped being killed—first, from being drowned by the fall of the horse on which he was carried across a brook swollen with rains; and secondly, by the fall of the ceiling of the chamber in which he slept. Sir Henry Wotton, his father's friend, being provost of Eton, thither the child was sent when only three years old, having the good fortune to be placed under the care of a Mr. Harrison, who seems to have watched him with great assiduity and care, and to have discovered, even then, the singular capacity of his pupil's mind, and to have directed and developed it with great judgment. Here he made much progress in classical learning, and attained a considerable intimacy with the best writers of antiquity. Being attacked by ague, he was obliged to intermit for a considerable time the application to study, and was allowed to occupy his mind with the perusal of romances and works of fiction. The effect of this upon an organization such as the boy possessed was to make him a castle-builder and a dreamer; and he has himself remarked, in his autobiography, upon the misfortune of allowing a mind of an active habit to be without fitting employment for its energies. But even at this early age, for he was not yet nine, the intellect of the boy could appreciate and even resist this intoxicating evil. He had the strength and resolution to shake off this disease of the spirit, by applying himself to the study of mathematics, no doubt at the suggestion of his instructors; and such was his industry that he soon mastered all the elementary parts of algebra, in which he became a forward student. Thus, even at this age, did Boyle give evidence of that eminently

practical and earnest nature, and conscientious sense of duty, which so remarkably distinguished him throughout life. Leaving Eton, he came to his father's seat at Stalbridge, and was transferred to the care of a native of Geneva, a M. Marcombe, under whom he prosecuted his studies diligently. Of this gentleman he speaks in terms of high consideration, and attributes much of his moral improvement to the care and influence of the preceptor. When he had attained his eleventh year he set out on his travels through the continent, under the charge of M. Marcombe, in company with his brother Francis. Visiting Paris and Lyons, they proceeded to Geneva, and resided there for three years, during which time Boyle acquired such a knowledge of the French language that he was afterwards able to pass as a Frenchman in Rome. In 1641 he went to Italy, staying a short time in Venice, and spending the winter in Florence. Here he occupied himself with the sciences and the study of the Italian language, and became acquainted with the New Paradoxes of Galileo, who died the same winter; thence he went to Rome, where he contrived to evade the vigilance of the law prohibiting protestants to remain in the city. Leaving Rome, on his route homewards, he returned to Florence, and visited Pisa, Leghorn, Genoa, and Marseilles. Here being disappointed in the expectation of receiving funds from England, he was forced to return to Geneva; and after encountering many difficulties and embarrassments from want of money, he finally reached England in 1644.

The earl of Cork had died the previous year, leaving by his will the manor of Stalbridge, and considerable estates in Ireland, to his son Robert; but the disturbed state of that kingdom prevented his going there, and he took up his abode for a short time with his sister, Lady Ranelagh. The influence of this most accomplished and pious woman upon the young man was most salutary. Though Boyle was himself seriously impressed with religious feelings, and deeply attached to philosophic studies, yet his views were unsettled, and his temper and disposition—warm, excitable, imaginative, and romantic—exposed him to the temptations and tendencies which surround the young, especially if they are wealthy and highly-born; and he had formed the intention of entering the army. But his intercourse with this noble and good woman fixed his mind, and confirmed him in the right; thenceforth there was no wavering, and the rest of Boyle's life was spent in the cultivation and diffusion of knowledge, and the exercise of virtue and piety. Some time was unavoidably spent in the arrangement of his affairs, and obtaining the protection of parliament for his estates; after which Boyle retired to his house at Stalbridge in his eighteenth year, and spent the following four years in close and studious application. The range of his investigations was most extensive; ethics, mechanics, every department of natural philosophy, and chemistry were all investigated with an intensity and ardour that enabled him to accumulate that extraordinary amount of knowledge which distinguished him in afterlife. His seclusion was, however, not unbroken, nor his mind without the relaxation of occasional visits to London, Oxford, Paris, and Holland, and in correspondence with most of the distinguished men of the times, whose esteem and friendship he engaged even then. It will be remembered that it was just at this time that the nucleus of the Royal Society was formed, by the meeting of a few of the most eminent men of genius and learning, at first in London, and afterwards in Oxford. Amongst these men, mature in age and wisdom—the followers of Bacon and the precursors of Newton—Robert Boyle, ere he had attained the years of manhood, was included; and this connection no doubt conduced to increase his assiduity and mature his knowledge. He even added anatomy to his other studies, and obtained a competent knowledge of the construction and physiology of the human frame. "I satisfied myself," he writes, "of the circulation of the blood, and have seen more of the variety and contrivances of nature, and the majesty and wisdom of her Author, than all the books I ever read in my life could give me notions of." In quoting this remark of Boyle, one of his biographers makes the following just reflections:—"It is delightful to trace, as we proceed, the genuine character of the philosophic mind, seizing in its expansion those comprehensive truths which the sciolist, entangled in the first elements, so often rejects, because his sagacity fails to reach them. With precipitate quickness of parts, shrewd and acute, but limited, he mistakes operations for essential powers, and rashly idolizes nature, though he will hardly admit of God. It is equally pleasing to watch the peculiar impressibility of Mr. Boyle in all things, modifying the growth of his mind and, while it helped to excite

his powers, casting at the same time an elevated moral beauty over his character."

The health of Boyle was never robust, and the intensity of his study greatly impaired it, and he was forced to adopt at an early age, and throughout life to adhere to, a strict regimen in diet, which alone enabled him to persevere in his arduous labours. Upon his return from Ireland in 1654 he retired to Oxford, carrying out an intention long previously formed of fixing his abode amongst those learned men whom the troubled times had driven to this seat of learning. It was their custom to meet at each other's apartments, for the discussion of philosophical subjects. Amongst them Boyle took a prominent and efficient part; and when Wilkins, a leading member, was made provost of Trinity college, Cambridge, the sittings were held at Mr. Boyle's chambers. He was early impressed with the importance of the views and discoveries of the Florentine academicians, and applied himself to follow out and confirm their investigations. The result was a considerable improvement effected by him in the air-pump, shortly before this invented by Otto de Guericke, a burgomaster of Magdeburg, and publicly exhibited by him to the emperor at the imperial diet at Ratisbon in 1654. Boyle suggested and instituted a variety of experiments upon air, and discovered its elasticity and other important properties. In these he was assisted in the mechanical arrangements by the celebrated Dr. Robert Hooke.

But while ardently prosecuting these investigations in natural philosophy, the conscientious, earnest, and enlightened spirit of Boyle did not neglect the more momentous inquiries into sacred things. For this the docile and cautious habits of his mind well fitted him. He had, while yet a boy, expressed himself determined "to be seriously inquisitive of the very fundamentals of christianity, and to hear what both Jews and Greeks, and the chief sects of christians, could allege for their opinions; that so, though he believed more than he could comprehend, he might not believe more than he could prove, and not owe the steadfastness of his faith to so poor an excuse as ignorance of what might be said against it." He now accordingly applied himself to the acquisition of the oriental tongues, and to a critical study of the sacred writings, and his proficiency was such that he composed an "Essay on the Scriptures," which was published in 1652, and pronounced by the best judges to be a work of great learning and critical merit. So zealous was Boyle in religion that he appropriated the entire revenues of certain lands granted to him by the crown in 1662 to the purposes of the maintenance and extension of christianity; and he accepted the presidentship of the Society for the Propagation of the Gospel in New England. The estimation in which he was held at this time for piety, will be understood from the fact that Clarendon, then lord chancellor, urged him to enter into holy orders, which Boyle declined, alleging that his support of divine truth would be more efficacious coming from a layman, who could have no personal interest in its maintenance. The provostship of Eton college was shortly after offered to him by the king; but Boyle had no ambition for rank or station, and he had the moderation and good sense to refuse a gift which would withdraw him from his favourite pursuits. Still devoting himself to science, he published in 1664, in the Transactions of the Royal Society, many important experiments. Not to speak of several on the phenomena of heat and cold, and also on hydrostatics, his essay containing "Considerations and Experiments concerning Colours" is well known as probably not without their share in leading Newton, then about twenty years of age, to his more decisive discoveries in relation to the composition of light. We shall but allude to a circumstance here as showing the public estimation in which Boyle was held as a philosopher. A Waterford gentleman of the name of Greatrakes was said to possess miraculous powers of healing, somewhat similar to those put forward by the animal magnetizers of our own day. Boyle was publicly called upon to investigate the subject, in which he was aided by the Royal Society, and all parties looked to him as the arbiter. The result of his investigation is given in a letter which is remarkable for the wide compass of its learning, as well as for the cautious and sagacious spirit of inquiry which, while seeking for the causes of phenomena, does not reject as untrue all that we cannot understand. In 1667 Boyle took a prominent part in the memorable attack upon the Royal Society. It was in reality the era of a great revolution in the intellectual world—the conflict between the darkness of the scholastic age and the light of the Newtonian day now dawning upon the world. The nominal advocates,

but not the true followers of the Aristotelian philosophy, assailed the new school and its supporters with the charge of impiety. The same thing has happened often, and will happen again and again, as in the case of chemistry and astronomy, and more recently of geology. It will happen as often as men, mistaking the language and spirit of holy writ, appeal to it as an accurate philosophical declaration of physical science or natural philosophy, and not, what it in reality is, a medium of conveying, in the ordinary language of mankind, and adapted to the knowledge of the time in which it was written, a popular statement of the phenomena of nature. In this controversy, accordingly, where reason failed, the sacred writings were called in to aid, for the great fact was not yet fully recognized "that the truths of God need no veil of consecrated error, and that his word stands aloof and undefiled by the rashness of theories or the fanaticism of schools." Throughout this controversy the character of Boyle was respected by his antagonists; and to his philosophical labours and pure life the most honourable testimony was borne. A leading writer in the controversy admits "that in his writings are to be found the greatest strength and the sweetest modesty, the noblest discoveries and the most generous self-denial, the profoundest insight into philosophy and nature, and the most devout and affectionate sense of God and religion."

Boyle left Oxford in the year 1668, and settled in London with his sister, Lady Ranelagh, continuing his studies with unabated ardour, and publishing the results from time to time, notwithstanding a severe shock of paralysis which he suffered in 1671. Amongst his papers we must not omit to notice one read before the Royal Society in 1674, "On Quicksilver growing hot with Gold." It would seem that Boyle had not altogether abandoned some of the notions of the alchemists, and the paper drew from Newton a letter cautioning him against any premature disclosure on a fact apparently so favourable to that science. But this life of incessant labour and study began so seriously to affect his health, notwithstanding the great caution and temperance with which he lived, that he was obliged to resign some of his public employments, and to restrict himself exclusively to science. In furtherance of this object, and for the economization of his time, which he ever looked upon as a most precious thing, he publicly declined the numerous visits to which his great celebrity exposed him, and dedicated two mornings and two evenings in each week to the reception of those whom he could not refuse to see. And so this great man persevered till the summer of 1691, when his physical powers began rapidly to fail. In July he executed his will, convinced that the end of life was not far distant. On the 23rd of December, 1691, she who had been the dearest companion of his latter years preceded him to the grave, and on the 30th he followed this beloved sister. They were buried side by side at the upper end of the south side of the chancel of St. Martin's-in-the-Fields, Westminster, and their funeral sermon was preached by Dr. Burnet.

Boyle was in person tall and slight, his face was pale and thin, but strongly expressive of the character of his mind; penetrating and slightly ascetic in its cast, but calm, mild, and solemn. He was remarkable for the peculiar grace of his manner, and for the interest and variety of his conversation. By the wits he was admired as a wit; but his pure taste and elevated morality rejected the free and licentious tone of the period, and it was chiefly in female society that the whole charms of his rich and graceful mind were suffered to appear. Too gifted and too humble for affectation, and too open-hearted for reserve, on these occasions his conversation was so singularly effective and brilliant, that Cowley, whose infirmity was too much wit, thought him superior to the first pretenders of this witty age. His liberality was large; and to every christian institution he was bountiful. He gave £300 for the propagation of the gospel in America, and £700 for the translation of the bible into Irish; and in his will he left a sum of £50 for ever, to found a lectureship in London for the defence of revealed religion. Boyle's christian spirit was the most beautiful feature of a moral character eminently lovely. To a mind simple, earnest, and conscientious, religion was an intense reality. The name of the Deity brought with it a host of solemn and affecting truths, and, as Burnet testifies, "his veneration for the name of God was so profound that he never pronounced it without a discernible pause;" and the high importance to which this feeling elevated, in his estimation, things that to the thoughtless were but commonplace, exposed him to the raillery and satire of the wits of the day. A thorough indifference to worldly

honours was another trait that harmonized finely with the preceding. While princes sought to be numbered amongst his correspondents, and his own sovereign more than once pressed upon him the dignity of the peerage, conferred so liberally on all the other members of his family, Robert Boyle, with a wise humility, ever refused such distinctions. He did well! The name of Robert Boyle would shine the less brightly were its lustre lacquered over with a title.

It is not an easy task to arrive at a just estimate of Boyle as a philosopher. To do so we must endeavour to place ourselves in juxtaposition with the age in which he lived, and examine his claims by the light which the knowledge of that age emits. To a forgetfulness of this may be attributed the fact that some modern writers have undervalued him quite as much as his own contemporaries overrated him. Let us remember that his time was that of a transition from the scholastic to the experimental schools—of emergence from the old philosophy, and the following of a new school under the illustrious Bacon. Of this great man, Robert Boyle is justly entitled to be considered the first follower, while he is the predecessor of many great men in the same path—Priestley, Newton, and others; and it is not too much to say that Boyle's discoveries and conjectures gave some light to guide them in the obscure track which they were destined to illuminate with the full effulgence of their genius. The extent, variety, and soundness of Boyle's investigations ranked him amongst the foremost experimental philosophers of his day, and placed natural philosophy on a firm and broad foundation, whereon aftercoming labourers have raised so noble a superstructure. Budgell, the biographer of his family, though often too partial to be taken as a safe guide, says of Robert Boyle, that "he animated philosophy, and put into action what was before little better than speculative science. He lays before us the operations of nature herself, shows the productions of foreign countries, the virtues of plants, ores, and minerals, and all the changes produced in them by different climates. His observations and discoveries in the animal world are no less curious. He has rescued chemistry from the censures it has long lain under, and has shown of what infinite use it is to philosophy when kept within due bounds. He has destroyed several errors in philosophy, and banished the notion of substantial forms by showing the true origin of qualities in bodies." The language of Burnet is not less eulogistic of Boyle as a philosopher, while it places him in a high position as a christian and a scholar. While such may be deemed as expressing the estimate formed of Boyle by his contemporaries, modern philosophers, both at home and abroad, accord to him high praise. Of these we shall name but two: Mr. Sikes, who in his *History of the Progress of Physics* justly says—"that it is impossible to follow Boyle through his labours without being astonished at the immensity of his resources for wresting her secrets from nature." This testimony to the physicist may be placed beside Dugald Stuart's observations on the metaphysician and theologian, in speaking of two of Boyle's works—the "Inquiry into the vulgar notion of Human Error," and "Whether and how a Naturalist should consider first Causes." "Both these tracts," he says, "display powers which might have placed their author on a level with Descartes and Locke, had not his taste and inclination determined him more strongly to other pursuits. I am inclined to think that neither of them is so well known as were to be wished. I do not even recollect to have seen it anywhere noticed, that some of the most striking and beautiful instances in the order of the material world which occur in the sermons preached at Boyle's lecture, are borrowed from the works of the founder." The works which Boyle has left after him are very numerous, though many others were lost in various ways, and amongst them, as he himself states, by the surreptitious depredations committed on his manuscripts by visitors. A full list of them will be found in Moreri. An abridged edition was published by Dr. Shaw in 3 vols. 4to. In 1777 an imperfect edition was published in Geneva; but in 1744 Dr. Birch superintended the first complete edition in 5 vols. folio, London, to which he prefixed a *Life of Boyle*. A second edition appeared in 1772.—J. F. W.

BOYLE, CHARLES, second surviving son of the second earl of Orrery and the Lady Mary Sackville, and grandson of the first earl, was born at Chelsea in 1676. He received his early education in English schools, after which he was entered a student in Christ Church, Oxford, at the age of fifteen, having for his tutors the celebrated Dr. Atterbury and the Rev. Dr. Friend,

afterwards master of Westminster school. Notwithstanding his rank, young Boyle applied himself with extraordinary diligence to his studies, so that he attracted the notice and gained the esteem of Dr. Aldrich, the head of the college, who is said to have drawn up his *Compendium of Logic* for the lad's use, and in his dedication of it to Boyle, he calls him "*magnum ædis nostræ ornamentum*"—a compliment which, we suspect, was paid to his birth as well as to his talents. While yet a student, his ambition for literary authorship displayed itself in a translation of Plutarch's *Life of Lysander*, which he published. This was probably undertaken at the suggestion of Dr. Aldrich. In his nineteenth year he edited the *Letters of Phalaris*, under the patronage of Christ Church, and at the suggestion of Aldrich. The work was undertaken in consequence of Sir William Temple, in his *Essay on Ancient Learning*, published shortly before, having pronounced them to be superior to any other production of the kind, ancient or modern. There was much reason to believe that these epistles were forgeries, and at all events they are quite unworthy of the extravagant commendation bestowed upon them by Temple, who, it must be confessed, was ill qualified to pronounce upon their genuineness, and dogmatized upon subjects he did not understand. The epistles themselves, and Boyle's edition of them, would probably be long since forgotten, but for the celebrated controversy to which they gave rise, known in literary annals as "*Boyle against Bentley*." In preparing his work for the press, Boyle was desirous of collating his text with a manuscript in the king's library in London, of which the celebrated Bentley was librarian. As Boyle alleged in the preface to his work, and indeed he is corroborated by the testimony of three others, Bentley refused to leave the manuscript sufficiently long in the hands of the printer for the purposes of collation, and of this Boyle complained somewhat sharply. This brought a contradiction from Bentley, and a rejoinder from Boyle. The question at issue, though itself of little importance, gave rise to one more serious. Bentley quietly waited till the proper time for his revenge arrived. He examined, with all the ability and critical acumen for which he is so deservedly celebrated, these epistles; and having satisfied himself that they were forgeries, he exposed them in a dissertation which he prefixed to the second edition of his friend Dr. Watson's *Reflections*, published in 1697. Not content with demolishing their authenticity, he assailed the compositions in terms of undeserved depreciation, asserting "that they were nothing more than a farle of common places, and such a heap of insipid lifeless stuff, that no man of sense and learning would have troubled the world with a new edition of them," and he did not fail to repeat his denial with regard to the manuscript, adding that the edition published by Boyle was a faulty and a foolish one. Bentley's dissertation convinced all impartial readers, but amongst those, of course, Boyle and his friends were not to be found. A rejoinder was published in the name of Boyle, but which was in a great measure the work of Atterbury, Smalridge, the two Friends, and other Oxford men. If this dissertation was deficient in argument, it did not want smartness, sarcasm, and spirit. All the weak points of Bentley are attacked vigorously. Quotations from the epistles are adduced to prove that they are not such stuff as the great Cambridge critic pronounced them to be, but it must be admitted, that in the very outset Boyle betrays his own apprehensions of the untenableness of his position. "I have not," he says in his preface, "anywhere in my book asserted that the epistles which carry Phalaris's name, are genuine; so neither have I, with a decisive and assuming air, pronounced 'em spurious. I expressed myself with caution and reserve in this matter, which I thought became a young writer, who was sensible that the best and ablest judges were divided in their opinions about it, and I thought it would be a very indecent part in me to make myself a judge between 'em." Dr. Garth, too, came to the aid of Boyle, and in his *Dispensary* paid him a compliment, which is as ludicrous in its gross adulation of Boyle as it is unjust to Bentley:—

"So diamonds take a lustre from their foil,  
And to a Bentley 'tis we owe a Boyle."

And, in fine, the bitter and keen genius of Swift lent his aid in "*The Battle of the Books*." All this wit and satire and smartness did not fail in its effects, and the mass of readers, who could better appreciate brilliant repartees than sound arguments, extolled this production, and thus the current of popular opinion ran in favour of the Oxonians and against Cambridge and Bentley, and the former indulged in a triumph which must have

added to their subsequent mortification. In the following year, 1699, Bentley came out with his final reply, which for ever silenced his opponents, and placed him at the height of his fame as a scholastic critic.

On leaving Christ Church, Boyle was returned for Huntingdon, not however without opposition, and a duel, in which he had a narrow escape with his life. In 1703 he succeeded his eldest brother, Lionel, in the earldom of Orrery, of whom nothing more worthy of note can be recorded by the family biographer, than that "he was a pleasant companion, drank hard, and died without issue." He shortly after married the daughter of the earl of Exeter, and in the same year he was appointed to a colonelcy in a regiment of foot, and two years after was elected a knight of the order of the thistle. Having been made a general, he went out as envoy to Flanders, and in 1712 served there under the duke of Ormond. On his return he was made a privy councillor and a British peer, as Baron Boyle of Marston. Lord Orrery maintained for a time his position under George I., but though clever and dexterous, he was neither sagacious nor profound; and while endeavouring to stand well with all parties, he lost favour at court, and either lost, or was obliged to resign, several of his posts, and retired into a comparatively private sphere. In 1720 he was implicated in the conspiracy in favour of the Pretender, in conjunction with the earl of Arran, Atterbury, and others; and this being discovered, Orrery and the duke of Norfolk were sent to the tower in 1722, from which he was released on bail in consequence of the state of his health. From this period he took no very active part in public affairs, though he attended in his place in the house of lords, and after a short illness he died on the 28th August, 1731, in the fifty-seventh year of his age. Lord Orrery was a man of no small genius and considerable accomplishments, though both were overrated in his own times. Mechanics were a favourite study, and he has given his name to a piece of mechanism representing the revolution of the planets, though the invention of a person of the name of Graham. He also wrote a comedy and some verses. He bequeathed his fine library to Christ Church college, Oxford.—J. F. W.

BOYLE, RICHARD, third earl of Burlington and fourth earl of Cork, was born on the 25th April, 1695. After receiving his early education in England, he prosecuted an extensive course of travel on the continent of Europe, especially in Italy, where he indulged his taste for architecture, and subsequently became one of the most distinguished amateur architects of his day. He erected a mansion at Chiswick after the design of the Villa Capra of Palladio, which, though inconveniently small, was nevertheless admired for its beauty. He also designed the front of Burlington house in Piccadilly, as well as the house of the duke of Richmond at Whitevale. His best work is said to be the assembly-room at York. Lord Burlington was a generous patron of the arts, and was the friend of Pope and Berkeley, and published at his own expense one of Palladio's works. In 1721 he married one of the daughters of the marquis of Halifax, and in 1730 the honour of the garter was conferred on him. Having retired from public life, he occupied himself principally in improving his seat at Chiswick, and died in 1753, when the title of Burlington became extinct.—J. F. W.

BOYLE, JOHN, earl of Cork and Orrery, son of Charles, earl of Orrery, was born in 1707. He received his early education from Elijah Fenton, and after spending some time at Westminster he entered Christ Church, Oxford. On the death of his father in 1731 he succeeded to the earldom of Orrery, and on the death of Lord Burlington to that of Cork. Though he took some part in politics, he was chiefly devoted to literary pursuits, and was an intimate acquaintance of Swift. He edited the dramas and state papers of his ancestor, Roger, earl of Orrery, and wrote some essays and translations himself. He died in 1762, aged fifty-six.—J. F. W.

BOYLE, HON. HENRY, son of Charles Lord Clifford, and nephew of Robert Boyle, devoted himself from an early age to politics, in which he took an active part during the reigns of William III., Anne, and George I. He was a member of the house of commons, where he distinguished himself so much, that he was made chancellor of the exchequer by King William, with whom he was much in favour. This post he occupied till 1707-8, when he was made one of the principal secretaries of state by Queen Anne. Upon the accession of George I., Boyle was created Lord Carleton, and was shortly after made lord-president of the council. He died on the 14th March, 1724-25.

Boyle was a man of respectable ability, of great judgment, and well versed in business. Though not an eloquent speaker, he was remarkable for his prudence and address; and it is said of him, that he was never known to say an imprudent thing in a public debate, or to hurt the cause he engaged in.—J. F. W.

BOYLE, RIGHT HON. HENRY, speaker of the Irish house of commons, was son of Colonel Henry Boyle, and grandson of Roger Lord Broghill. He was born at Castle Martyr in the county of Cork. He was returned to parliament for his native county, and soon became a leading and influential member, so that upon the death of the speaker, Sir Ralph Gore, in 1732, he was elected as his successor. In his new office Boyle conducted himself with ability and integrity. He appears to have possessed great influence in the house, and was called by Sir Robert Walpole, "the king of the Irish Commons." He was subsequently made a privy councillor. When the struggle took place between the Irish commons and the British cabinet in 1753, relative to the assent of the crown to the appropriations by the house of surplus revenues—a right which the commons denied—Boyle's influence was exerted against the ministers. The dispute continued till 1756, when the government found it necessary to put Boyle out of their way. He was accordingly raised to the peerage as earl of Shannon, with a pension of £2000 a-year. He died in 1764. Plowden describes him as a deep politician. The simplicity and unaffected ease of his address, and a natural politeness of manner, rendered him amiable even to his opponents. In appearance he was most open, in reality most reserved. He had the art of extracting the secrets of others, and of preserving his own, without any show of art or constraint. He had been raised to the chair and supported in it by the people, at least without the assistance of, if not in opposition to, the government. He had shown much firmness in resisting attacks upon him while carrying measures through the house, and had the uncommon address of preserving his popularity even in supporting unpopular acts.—J. F. W.

BOYLEAU, BOYLEAUX, or BOILESVE, ESTIENNE, provost of Paris under St. Louis, famous as the author of a collection of statutes relating to the military, administrative, and judicial affairs then under the cognizance of the first magistrate of Paris; born probably about the year 1200. He was of noble parentage, and accompanied St. Louis in the crusade of 1248. His Statutes, an excellent edition of which was published at Paris in 1837, form a curious monument of the state of trades, manners, and legislation in Paris, in the thirteenth century. He appears to have been superseded in 1270, about which date it was remarked, to the credit of his judicial labours, that vagabondism had less scope in the city than in any preceding period of its history.—J. S., G.

BOYLSTON, ZABDIEL, a physician of much eminence in New England, who introduced the practice of inoculation for the small-pox into America, was born at Brookline, Massachusetts, in 1680. After receiving a thorough education, he began the practice of physic in Boston, where he was very successful, and accumulated a large fortune. The small-pox appeared there in 1721, and caused great terror, as on two previous occasions it had destroyed many lives. Dr. Cotton Mather, a clergyman, who had read in the Philosophical Transactions an account of the successful practice of inoculation at Smyrna and Constantinople, called the attention of the medical faculty to the subject, but could make no convert amongst them except Dr. Boylston. He was a man of great resolution as well as sagacity and skill; and having satisfied his own mind upon the subject, he proceeded, in spite of a vehement outcry from his brethren of the faculty, to inoculate his own son, six years old, and two of his servants. The experiment was successful, and before the end of the year he inoculated 247 persons, of whom less than three per cent. died; while out of 5759 who, during the same time, took the disease the natural way, it was fatal to over fourteen per cent. Dr. Boylston visited England in 1725, where he was received with great attention, and made a member of the Royal Society, being the second American upon whom that honour had been conferred. He died at Boston in 1766, at the age of eighty-six.

BOYNE, GUSTAVUS HAMILTON, Viscount, born in 1639, was the youngest son of Sir Frederick Hamilton, a descendant of the Scottish Hamiltons, and a distinguished soldier under Gustavus Adolphus, after whom his son was named. He settled in Ireland, and Gustavus held a commission in the Irish army under Charles II., and was a privy councillor in the following reign.

When James II. attempted to overthrow the constitution, Gustavus Hamilton transferred his allegiance to the house of Orange. He was made governor of Enniskillen, and commanded and organized those brave troops which afterwards took so conspicuous a part in the civil war in Ireland. After exhibiting high proofs of bravery and skill in the defence of Coleraine, he commanded a regiment at the battle of the Boyne, where he distinguished himself by his usual valour, having his horse killed under him, and narrowly escaping death. At the storming of Athlone, shortly after, he waded the Shannon at the head of his regiment, and took the town, of which he was made governor. He was present and took a prominent part at all the principal battles fought by De Ginkle. On the reduction of the country he was made one of the privy council, promoted to the rank of brigadier-general, and received grants of forfeited lands. In the reign of Queen Anne he was farther raised to the rank of major-general, and represented the county of Donegal in parliament till created a peer. At the siege of Vigo he commanded a regiment, and made himself so useful on the occasion that he was presented with a service of plate by the queen. In 1714 George I. advanced him to the dignity of Baron Hamilton of Stackaller. The same king granted him a military pension, and promoted him to the title of Viscount Boyne by patent dated 1717. He died in September, 1723, in the 84th year of his age.—J. F. W.

BOYSE, BOYS or BOIS, JOHN, an English divine, one of the translators of the bible, and a member of the committee intrusted with the revision of the work, born at Nettlestead, Suffolk, in 1560; died in 1643. He succeeded his father-in-law in the curacy of Boxworth in 1596, and in 1615 was presented to a prebend in the cathedral of Ely. He left an immense quantity of MSS., and a work entitled "*Johannis Boissii veteris interpretis cum Beza allisque recentioribus Collatio, in IV. Evangelii et Actis Apostolorum,*" 1655.—J. S., G.

BOYSEN, FRIEDRICH EBERHARD, a German historian, born at Halberstadt in 1720; died in 1800; author of a translation of the Koran, with notes; "*A Universal History;*" "*Theological Letters,*" in German, and other works.—J. G.

BOYSSIÈRES, JEAN DE, born at Clermont-Ferrand in 1555. The date of his death is unknown. He was educated for the bar, but abandoned all regular occupations for the purpose of giving himself exclusively to literary pursuits. In 1573 he published his "*Premières Œuvres Amoureuses,*" consisting of odes, chansons, plaints, tears, despairs, &c., amatory, allegorical, devotional, intermixed with some which could scarcely be read aloud, and which seem to refuse the veil of allegory. We have "*Des Humeurs de la Femme,*" in which the ladies are attacked with malignant pleasantries; and we have "*Les Perfections Célestes de la Femme,*" in which idealised woman is almost a subject of worship. He published in 1584 a poem which he calls "*La Croisade,*" which he seems to have intended for an epic poem. It was never completed. Moréri, who probably did not see any essential distinction between French poetry and prose, took it for a historical account of the crusades, and another biographer calls it a translation of Tasso's *Jerusalem Delivered*. This mistake probably arose from De Boyssières having translated some cantos of Ariosto.—J. A., D.

BOZE, CLAUDE GROS DE, a French antiquary, born in 1680; died in 1753. In 1705 he was nominated a scholar of the Academy of Inscriptions, and, in spite of his youth, he was in the following year elected secretary. In 1715 he was offered and declined the office of subpreceptor to Louis XV., and was admitted a member of the French Academy as the successor of Fenelon. In 1719 he was appointed keeper of the cabinet of antiquities, which in 1741 was transferred from Versailles to Paris. De Boze rendered important services to those branches of science with which he was conversant. He edited the first fifteen volumes of the *Memoirs of the Academy of Inscriptions*, and wrote all the eloges to be found in them except the first six. He also published a second edition, with a continuation, of the *Medallic History of Louis XIV.*, a treatise on the Jewish jubilee, a dissertation on the Janus of the ancients, and some other works of less importance.—J. T.

BOZZOLI, GIUSEPPE, born at Mantua in 1724; died towards the close of the eighteenth century; successively professor of physics and of canon law and ecclesiastical history at Rome, and subsequently professor of oriental languages at the university of Mantua; author of a translation of Homer and Virgil, in Italian verse.—J. G.

BRABANT, DUKES OF. The following are the more distinguished of these princes—they boasted descent from Charlemagne:—HENRI LE GUERROYEUR, the first duke of Brabant (his predecessor bore the title of count), died in 1235.—HENRI II. LE MAGNANIME, an amiable and virtuous prince, died in 1248.—HENRI III. LE DEBONNAIRE, beloved for his mild government, and renowned for his French songs, died in 1261.—JEAN I. LE VICTORIEUX, married in 1269 Marguerite de France, daughter of St. Louis. When his sister, Marie de Brabant, queen of France, was accused of having poisoned her stepson, Prince Louis, he disguised himself as a cordelier, and went to Paris to interrogate her. Convinced of her innocence he challenged to the combat all her accusers. In 1292 the Emperor Adolphus constituted him supreme judge of the provinces between the sea and the Moselle. He was killed in a tournament in 1294.—JEAN II. LE PACIFIQUE, granted to his subjects a bill of rights; and by a charter, called the charter of Cortenberg, instituted a supreme council in his duchy. He died in 1312. JEAN III. LE TRIOMPHANT, maintained successfully various wars with the princes of Germany. Died in 1355.—JEANNE, duchess of Brabant, succeeding Jean III. in 1356, married Weneelas of Luxemburg, who, in a war with the duke of Juliers, was made prisoner, and only released on condition of ceding a portion of his estates. She died in 1406.—ANTOINE, killed in the service of France at the battle of Agincourt in 1415, was the son of Phillip the Hardy, duke of Burgundy, and inherited the duchy through his mother, who was heiress to the preceding.—JEAN IV., the last who wore the title of duke of Brabant, married in 1418 his cousin Jacqueline, countess of Holland and Hainault. This princess, having been divorced from her husband by the antipope, Benedict XIII., married Duke Humphrey of Gloucester, who, after defeating the Flemings and Burgundians, whom the duke of Brabant had called to his assistance, left her at Mons to return to England. The inhabitants of that town delivered her into the hands of Phillip the Good, by whom she was conducted to Ghent. From that place she escaped in disguise into Holland. In 1425 Jean IV. was proclaimed count of Holland. He died childless in 1427. His successor was the Count St. Pol, who also left no posterity. The estates of Brabant now constitute a province of Belgium.—J. S., G.

BRABAZON, SIR WILLIAM, eminent for his steadiness, bravery, and the important services which he rendered the English government in Ireland. In 1534 he was appointed treasurer and receiver-general of that kingdom; and in 1535 distinguished himself by his resistance to Lord Thomas Fitzgerald, and the following year by his defeating O'Conor Faly in Kildare. In 1539 he was appointed commissioner for receiving the surrender of abbeys. On the accession of Edward VI. he was made a privy councillor, and suggested and carried out important improvements in the defence of the country. He attacked and defeated Charles Kavanagh M'Art in 1549, compelling him to submit to the English government. He died at Carriekfergus in 1552, and his body was buried in St. Catherine's church, Dublin, his heart having been conveyed to England.—J. F. W.

BRACCAN, SAINT, an Irish ecclesiastic who lived in the seventh century. His prophecies, chiefly in verse, were, according to Ware, collected and published by Walter de Islip in the year 1317.—J. F. W.

BRACCIOLINI, better known by his christian name POGGIO, was born at Terra Nuova, a small town near Florence, in the year 1380. Very few literary men have met with so many changes of fortune as Poggio did. Having been the pupil of the two greatest classic scholars of that age, John of Ravenna, and Emanuel Crisolora, he was enabled, at the age of twenty-one, to partake of the reputation of his preceptors, and was considered an eminent classic scholar. Boniface IX. created him his apostolic secretary, an office which he filled under seven successive popes. Leonardo Bruni d'Arrezzo, and Nicoló Nicoli were his most intimate friends, and partook of his literary renown, by encouraging and helping him in his literary researches. Although approaching the throne, he did not hesitate often to state the truth, even when against his own interest, and he loudly disapproved of the judgment and execution of Jerome of Prague and John Huss. It was about that time, 1416, Poggio acquired indisputable claims to the gratitude of his country, by the discovery of a great number of precious manuscripts. We owe to him the twelve plays of Plautus, several discourses of Cicero, Aseanius Pedianus, Silus Italicus, Valerius Flaccus,

Ammianus Marcellinus, the three grammarians, Capro, Eutichius, and Probus, and, according to Ginguéné, Lucretius, Manilius, Frontinus, and Quintilian. During the disputes which distracted Italy and catholicity, respecting the succession of the popes, Poggio lost and recovered his lucrative office, and finally, under Martin V., fearing the resentment of that pontiff, against whose election he had spoken at the council of Constance, he fled to France, and from thence to Winchester, putting himself under the protection of Beaufort, the bishop of that diocese, who received him with the utmost courtesy. On his return to Italy, he spent his time in writing satires against the monks and preachers of that epoch, whether they were bishops or members of the sacred college. In 1434 Poggio resolved to revisit Tuscany, and after many vicissitudes, he fixed his residence in Florence, expecting the patronage of Cosimo de Medicis. This sovereign having been expelled from the Tuscan territory by his fellow-citizens, Poggio undertook to defend him against the attacks of Filelfo, the greatest Hellenist of that time. The dispute soon degenerated into mutual abuse, and the correspondence of these two illustrious scholars remains only to show how far Italy was in their day from possessing that spirit of politeness which distinguished the wise and sober criticism of the sixteenth and seventeenth centuries. Cosimo having been reinstated, Filelfo fled to Sienna, whither a satire from the pen of Poggio, the severest ever dictated by hatred and vengeance, followed the fugitive. This unfortunate and unmanly war lasted for several years, and engaged both Poggio and Filelfo in many disputes, by which, however, literature gained some exquisite poetical satires from two of the greatest classics of that age. Poggio having disposed of a copy of Titus Livius at a very high price, he bought with the proceeds a very handsome villa, near Florence, ornamented it with the rarest archaeological antiquities, and wearied of a bachelor's life, he married at the age of fifty-five a very young lady called Selvaggia Buondelmonti, by whom he had a very numerous family. It is supposed that to this circumstance the literary world owes his work, entitled "An senio sit uxor ducenda," which he wrote in answer to many attacks from his numerous enemies. In 1437 Poggio published a collection of letters, by which his reputation as a writer was vastly increased. This collection was dedicated to his friend Nicolò Nicoli, who died soon after, and whose death induced Poggio to write a funeral oration, which has been handed down to posterity as a model of elegance and eloquence. This eminent man wrote many funeral orations in praise of one Lorenzo de Medicis, of Cardinal Albergato di Santa Croce, of Leonardo Bruni Aretino. These compositions, and the answers to the severe and often unjust criticism of the implacable Filelfo, kept him busy from 1440 to 1447, the year in which his friend Tomaso di Sarzana, a literary man of great merit, was elected pope under the name of Nicholas V. This pontiff recalled Poggio to Rome, and restored him to his former rank and office of apostolic secretary, a favour which he felt so deeply that he wrote and dedicated to that sovereign, in token of gratitude, his treatise on the "Misfortunes of Princes." He wrote also three books on the vicissitudes of fortune. At the suggestion of this pope, Poggio translated into Latin the first five books of Diodorus Siculus, and Xenophon's *Cyropædia*. In 1450 the plague having desolated the Roman estates, and Rome itself being threatened, Poggio left the eternal city and retired to Terra Nuova, where, in imitation of Boccaccio, he wrote many jocose, and very often most obscene tales, taken from ancient manuscripts, and afterwards reproduced by La Fontaine. A more useful work issued from his pen, the fruit of his many conversations with eminent personages, entitled "Historia Disceptativa Convivalis," perhaps a parody of Dante's *Convito*. His reputation, now at its zenith, and the favour and friendship of the Medicis family, incontestably proclaimed him the worthy successor of Carlo Aretino, the chancellor of Tuscany. His irascible nature, however, hurried him into an unworthy warfare with that eminent latinist, Lorenzo Valla, and curious to say, Filelfo, who had been lately reconciled with Poggio, smoothed the path to a friendly meeting between these two personages, and succeeded in removing all obstacles to their final reconciliation. To this circumstance we owe the publication of Poggio's philosophical dissertation, entitled "De Miseria Humanæ Conditionis," soon followed by a translation in Latin of Lucian's *Λόβυλιος ἢ ὄνος* (Lucius sive asinus). Finally, profiting by the free access he had to all the archives of the state, and having in his long public career acquired a thorough

knowledge of things and men, he wrote in Latin the "History of Florence." This work, which the author intended to review and enlarge, has remained very imperfect, on account of his death, which carried him off at the age of seventy-nine, on the 30th of October, 1450. All biographers agree that Poggio's sincerity was very remarkable, and that he contributed more than any other writer to the literary progress of the fifteenth century. Florence put an imperishable seal on his fame, by erecting a splendid tomb to his memory in the church of Santa Croce, the pantheon of Italy.—A. C. M.

BRACCIOLI, GIOVANNI FRANCESCO, born at Ferrara in 1698. He studied under Parolini and Crespi. He painted for churches. His best works are a "Flagellation," and "Christ Crowned with Thorns." He died in 1762.—W. T.

BRACCIOLINI, FRANCESCO, a celebrated Italian poet, was born of a noble family at Pistoja in 1566. While yet in his youth, he was admitted a member of the Academy of Florence, where his talents gained him a great number of friends, although his sordid avarice annihilated almost all his better qualities. Cardinal Barberini, afterwards Urban VIII., appointed him secretary to his brother, Cardinal Antonio Barberini, who brought him to France, where he was admitted a member of various literary academies. Anxious to surpass Tasso and Tassoni, he wrote two poems—a heroic one, entitled "La Croce Racquistata," in thirty-five books, and the other in imitation of La Secchia Rapita, entitled "Lo Scherno degli Dei." Tiraboschi admits that although both these productions are by far inferior to the two inimitable models, yet they are until now the next in merit. He wrote also many other poems, such as one at the election of Pope Urban VIII., in twenty-three cantos, so much thought of by that sovereign, that he allowed Bracciolini to add to his family escutcheon the arms of Barberini's family, and to style himself henceforth, Bracciolini dalle Api. "L'Assedio della Rocella," an heroic poem in twenty cantos, was written by Bracciolini whilst sojourning in France with Cardinal Antonio Barberini, and many passages are cited by Dell' Ongaro as models of poetry. The versatility of his genius is exhibited in some fables and tragedies, but these are not his best compositions. On the death of Urban VIII. he retired to his native place, where he died in 1645.—A. C. M.

BRACELLI, GIACOMO, was born towards the end of the fourteenth century at Sarzana in Tuscany, then under the dominion of Genoa. Nicholas V., his countryman, called him to Rome, and offered him many honours; but he preferred the protection of the Ligurian republic, of which he became chancellor. He wrote the history of Genoa from 1412 to 1444. A classic reader will easily perceive in that history, written in Latin, a studied and not unsuccessful imitation of the style of Caesar's Commentaries. It has gone through many editions. He is also the author of "De Clavis Genuensibus Libellis;" "Descriptio Liguria;" "De Præcipuis Genuensis Urbis Familiis," &c. The date of this illustrious man's death is not certain, although Monnoye, a French author, has fixed that event in 1447.—A. C. M.

BRACELLI, GIOVANNI BATTISTA, an Italian painter and engraver, born at Genoa. He was a pupil of Paggi, and painted history in his manner. He engraved plates for Borozzio's architectural work in a neat stiff style, and died in 1609.—W. T.

BRACON, HENRY DE, the earliest writer on English law, lived in the thirteenth century. He was most probably a native of Devonshire. He studied at Oxford, and took the degree of doctor of laws. He rose to great eminence as a lawyer, and in 1244 Henry III. appointed him one of the judges itinerant. His great work, "De legibus et consuetudinibus Angliæ," was first printed in 1569. A very carefully prepared edition, collated from various MSS., was issued in 1640. The treatise is divided into four parts. The author displays a very full acquaintance with the Roman lawyers and canonists. So manifestly, indeed, is his style influenced by these writers, that he has been accused of a want of fidelity as an exponent of the English code. But, notwithstanding the attempts that have been made to detract from his merit, there can be no doubt that, as far down as the days of Coke, Bracton was justly looked on as the chief source of legal knowledge.—J. B.

BRADÉ, WILLIAM, an English musician, resident at Hamburg at the commencement of the seventeenth century. He was a proficient on the viol, and published "Paduanen, Galliarden, Canzonetten," &c., Hamburg, 1609, in 4to; "Neue Paduanen

und Gagliarden met stimmen," Hamburg, 1614, in 4to; "Neue lustige Volten, Couranten, Balletin, &c., met 5 stimmen," Frankfurt, 1621, in 4to. These publications are highly interesting, as containing many once popular English airs. Brade died at Frankfurt in 1647.—E. F. R.

**BRADEL, JOHN BAPTIST**, a neat-handed French engraver, born about 1750. He executed portraits of Paoli, Crebillon, John Bart, two popes, and the chevalier d'Eon.—W. T.

**BRADFORD, ALDEN**, an American historian, was born at Duxbury, Massachusetts, in 1760; died at Boston in 1843; graduated at Harvard college in 1786, studied for the ministry, and for eight years was pastor of a church at Wiscasset, Maine. Ill health obliged him to leave the profession, and he came to Boston, first to be a bookseller, and afterwards a politician and an author. He was secretary of state in Massachusetts from 1812 to 1824. He was an active member of the Massachusetts Historical Society, wrote frequently for periodicals, and published several works on history and biography. The most considerable of his works were a "History of Massachusetts from 1764 to 1820," 3 vols. 8vo, being a continuation of Hutchinson's History; "American Biography;" "Memoir of Dr. Jonathan Mayhew;" "Evangelical History, or the Books of the New Testament, with a General Introduction and Notes;" and a "Biography of Caleb Strong."

**BRADFORD, JOHN**, an eminent English martyr, born shortly after the accession of Henry VIII., was a native of Manchester. Being of a highly respectable family he received a liberal education, but with a view to his following commercial or political, rather than professional pursuits. At an early age he was appointed clerk or secretary to Sir John Harrington, paymaster of the English forces in France. This situation offered peculiar temptations to what was then the very common sin of peculation, and to these he unfortunately succumbed, acting a principal or a secondary part (it is not clearly ascertained which) in the abstraction of a sum of £500 from the exchequer of his office. The money was restored, and Bradford appears to have been in no danger of losing his place; but his conscience troubled him sadly, especially, it is said, after hearing a sermon of Latimer's, and he determined on dismissing himself the service of the state. In 1547 he began to study law in the temple, but finding his inclination to the church always on the increase, he removed next year to Clare hall, Cambridge, where after a residence of little more than twelve months, he was admitted to the degree of M.A. Ordained deacon in 1550, he rapidly acquired celebrity as a preacher; was presented to a stall in St. Paul's by his patron, Bishop Ridley, and shortly after appointed one of the royal chaplains. From the accession of Mary his doom was sealed. Bold and zealous, as well as eloquent, in the defence of protestant doctrine, he could not be overlooked by the conclave of bishops who directed the counsels of the sovereign. He was one of the first victims of her bloody reign. Gilbert Bourn preached a sermon at St. Paul's cross, which had the effect of inspiring his hearers with a violent desire to tear him in pieces. Bradford, who was passing, interfered to save the Romish orator from his infuriated audience, and for this service to a champion of the church, the story being properly perverted, he was condemned to imprisonment in the tower. In 1554, when he had been eighteen months in confinement, it was thought proper to examine him again, touching his heresies, and accordingly he was removed to Southwark, and placed at the bar of a court over which presided Gardiner, bishop of Winchester, and Bonner, bishop of London. Sentence of death was immediately passed on him; but in order to give him leisure to consider well the offers of place and power with which he was assailed by the minions of his judges, execution was delayed till 1st July, 1555, when this incorrigible heretic and illustrious martyr, in company with a youth, named John Lyefe, was brought to the stake at Smithfield. His writings consist chiefly of sermons, tracts, letters, meditations, and prayers. They have recently been printed in 12mo by the Religious Tract Society.—J. S., G.

**BRADFORD, WILLIAM**, the first printer in Pennsylvania, was born in Leicester, England, in 1659. He became the son-in-law of Andrew Sowles, a wealthy printer in London, and a friend of William Penn, by whose invitation, and in company with whom, Bradford went to America in 1682, and landed where Philadelphia was afterwards built. The first book he printed "near Philadelphia," was Leed's Almanac for 1687. In 1689, some dissensions having arisen as to the rights of the

settlers, Bradford printed the Charter, or Frame of Government of the Province, with some remarks by Joseph Growden; but anticipating trouble, put no imprint upon the tract. But as it was known to have come from his press, he was arrested and brought before the council; and we learn from the records, both of his examination and that of Growden, that the proprietor, William Penn, had given "particular order for the suppressing of printing" in his province. (See the Forum by David Paul Brown, Philadelphia, 1856, vol. i. p. 275.) But Bradford stood up manfully for the freedom of the press on this, and on a subsequent occasion in 1692, when, having printed a pamphlet by George Keith, on a question partly civil and partly religious, between the magistrates and the people, his press was seized, and he was brought before the justices, charged with having published a seditious libel. When the jury were told that they were only to try whether he printed it or not, Bradford interposed, saying, "they are to find also whether this be a seditious paper or not," "for the jury are judges in the law, as well as in the matter of fact." (Ibid. p. 280.) In asserting this principle, he anticipated, by nearly a century, Lord Camden and Mr. Erskine. Bradford removed the next year to New York, printed the laws of that colony, and in 1725 started the *New York Gazette*, the first newspaper in that city. He also established a mill for the manufacture of paper, said to be the first in America, as early as 1687. He became rich, and died in New York, May 23, 1752, aged 93. His son and grandson were Philadelphia printers after him.

**BRADFORD, WILLIAM**, great-grandson of the preceding, second attorney-general of the United States under President Washington, was born at Philadelphia, September 14, 1755. In August, 1780, he was made attorney-general of Pennsylvania. Eleven years afterwards, he was promoted to the bench of the supreme court of that state. In 1793, at the request of the governor, he drew up a very able report to the legislature, showing that the punishment of death might safely be abolished in all cases, except murder and high treason; and an act was immediately passed in conformity with his suggestions. The next year Washington appointed him attorney-general of the United States, in which capacity he was sent to confer with the agitators and leaders of the western insurrection of 1794. He reported that the laws could not be enforced by the ordinary processes of the civil authorities, and an adequate military force was therefore called out, which soon quelled the rebellion.

**BRADFORD, WILLIAM**, governor of Plymouth in New England, was born in 1589 at Austerfield, Nottinghamshire. At the death of his parents, while he was yet a child, Bradford inherited a small property. His religious opinions and course were determined when he became an attendant on the preaching of Richard Clifton and John Robinson, pastor and teacher of the separatist congregation at Scrooby. Archbishop Bancroft's officers found out the humble flock, and as there was no hope of continuance there, it was resolved to go into the Low Countries. After several unsuccessful attempts the scattered flock was, in the autumn of 1608, collected at Amsterdam, where were already two congregations of English separatists. After a year they resolved to remove to Leyden, but the experiment of a few years there, disposed them to think of another removal; and the congregation, after considering various plans, determined to attempt a separate plantation in what was then called Virginia in America, and resolved to send out a portion of their number at once as pioneers. In order to obtain the means requisite, an agreement was made with some merchants in London, by which, in consideration of supplies, those who should emigrate bound themselves to work, trade, and fish for a term of seven years, for the benefit of a partnership, to consist of themselves and the merchants, the profits to be then divided in proportions, which were agreed upon. These matters being understood, the emigrants, after an affectionate parting with their friends, accompanied by religious services, went on board a little vessel, the *Speedwell*, which lay awaiting them at Delfhaven. At Southampton, whither they were conveyed, they found the *Mayflower*, which had come round from London, with some persons who were to join their company. The two vessels sailed for America with about a hundred and twenty passengers, but twice were compelled to return by the unseaworthy condition of the *Speedwell*. After the second attempt she was left in port, and the *Mayflower* proceeded with a hundred and two passengers. After a passage of nine weeks, she came to anchor off Cape Cod on the 9th of November. John

Carver was chosen governor. On the 11th of December (old style), the place since called Plymouth, was fixed on for the site of a town. Twenty huts were erected and occupied. A fatal sickness soon set in, the consequence of bad food and exposure to the weather. Of the hundred and two persons who composed the company, forty-four died before the first of April. At one time during the winter, only six or seven had strength left to nurse the dying and bury the dead. The first week in April Carver died, and Bradford was chosen governor in his place. From that time his history, more than any other man's, is the history of the colony of Plymouth, the oldest English colony, after that of Virginia, on the American continent. Till the third harvest there was at times great distress for want of food, and this exigency divided the governor's attention with the cares of guarding the colony against plots of the Indians, and struggles to meet the approbation of the London partners. The scheme of a community of property was found to work ill for both parties; and at the beginning of the third year, the governor had ventured so far to deviate from it, as to assign to each family the cultivation and profit of a small separate parcel of land; an arrangement which, on observing its favourable operation, he extended in the following year. As the prospect brightened, the emigrants began to hope to be soon joined by their beloved pastor, and their other friends who had remained at Leyden. But there were persons among the London partners who had no sympathy with them in this wish, and who in various ways took care to obstruct its accomplishment. As the inconveniences of the partnership to all concerned were made manifest by trial, negotiations were prosecuted to effect its dissolution. In 1626, Isaac Atherton, one of the principal emigrants, who had been sent to England for the purpose, succeeded in purchasing for the colonists the whole property of the partnership for £1800, payable in nine equal annual instalments—an arrangement speedily followed by another, by which Bradford and four associates, on consideration of conducting the whole trade of the colony for six years and receiving its profits, agreed to pay the debt of the London partners, and perform certain other obligations. This settlement of their affairs enabled them to execute a long-cherished design. Many of their former associates were brought from Holland and settled with them at their expense. Their affairs were assuming a most prosperous shape, and now the larger emigration to Massachusetts commenced. In 1629, Robinson, their spiritual guide, having died shortly before, Bradford went to Salem to assist in the formation of a church, of principles and constitution like those of the church in Plymouth. Governor Winthrop cultivated the same good understanding with his neighbours; and in 1632, the second year after his arrival, made a journey through the woods from Boston to visit Bradford at the older settlement. Notwithstanding Bradford's wish repeatedly expressed to be released from public office, he was chosen governor by annual election for thirty-one years out of the thirty-six years between his arrival and his death; the last twelve years without a single intermission. He died May 9th, 1657, having lengthened out a wise, religious, and heroic life nearly to the limit of threescore years and ten. Though without early advantages for study, and always leading a busy life, he loved learning and found time for study. He spoke French and Dutch, and read Latin, Greek, and Hebrew. He wrote a full history of "Plymouth Plantation from the beginning of the proceedings which led to that enterprise, down to the end of the year 1646." This volume, which, remaining in manuscript, had been used and referred to by historians of Plymouth at different times down to the year 1767, had since that period disappeared. In 1846, Bishop Wilberforce, in his History of the Protestant Episcopal Church in America, made references in foot-notes to a manuscript history of the plantation of Plymouth in the Fulham library. The language of these references was found to coincide with that of passages which had been published by old historians of New England, as extracts from Bradford's history. An application being made to the late bishop of London, his lordship promptly allowed an examination to be made of the manuscript. By marks which had been described in detail by the writers who had formerly used it, it was incontrovertibly proved to be the long-lost autograph of Bradford. It was known to have belonged in 1758 to the New England library, kept in the tower of the Old South church in Boston. In 1755 that church was converted into a riding-school for a force of British cavalry; and there can be little doubt, that at that time the manuscript was abstracted, to find its way event-

ually, by means not now to be traced, to the library of the bishop of London. Dr. Bloomfield permitted a copy of it to be taken, and the Massachusetts Historical Society published it in 1856, with valuable notes from the hand of Mr. Charles Deane of Cambridge.

BRADLEY, JAMES, born at Sherborn in Gloucestershire in 1692; died at Chalford in 1762: the most exact observer of former times in England, the man who, through the rare combination of scientific knowledge and generalizing power, with that fineness of sense and delicacy of touch which are indispensable to a practical astronomer, is entitled to have his name inscribed third on the roll, that, reckoning in the order of time, begins with Hipparchus, and presents us next with Tycho. Newton very early designated Bradley as the "first astronomer of Europe;" nor can his estimate be charged with exaggeration. If we except La-Caille, the lamented Bessel, and two or three others whose names we may not mention, because, happily for science, the men who wear them still survive, Bradley up to this day has had no rival.—The position in Astronomy occupied by this remarkable person is very peculiar. To his general exactness and sagacity no greater tribute could be paid than that in which Bessel has been sustained by the concurrence of the whole scientific world. Desirous to fix with every attainable accuracy the most important constants of Astronomy, the great observer of Königsberg fixed upon the catalogue of Bradley; and he has emphatically recorded the degree of esteem in which he held him, by the labour so willingly bestowed on the reduction of that catalogue, and which resulted in his invaluable *Fundamenta Astronomicæ*. But we have said Bradley's position is altogether peculiar, and his fame does not rest merely on his general exactness. It has long been known that the crude observation of the apparent place of a star, in no ways suffices to indicate its true place in the heavens. The apparent place differs from the true place, because of the circumstances in which the observer is placed—circumstances which cause him to see an object external to the earth's atmosphere, as if it were in a position different from the one it really occupies. Until these disarranging influences are understood, and their amount made subject of calculation, there can be no accurate observation; and what is termed Stellar Astronomy could never reach the character of reliability. One of these influences is atmospherical Refraction. Any distant body viewed through the earth's atmosphere appears higher than it really is in the sky; and the amount of displacement varies with the apparent height of the object. This effect of refraction was known before, and Tycho rudely and erroneously allowed for its value. The nature of the true formula was one of the conquests of Bradley. In so far as its structure is concerned, this formula has never been altered. New terms have been added, and the constants Bradley employed somewhat modified; but the correction due to these recent refinements does not exceed half a second of space.—But, besides Refraction, there are other causes of disturbance, the existence as well as the amount of which was discovered by the English astronomer. The *first* is technically named **ABERRATION**. Bradley had been puzzled by the existence of small irregularities in the annual position of the fixed stars, of which no previous observation had taken any account. Stars in the plane of the ecliptic seemed to oscillate backwards and forwards by a small quantity in the course of the year; and in every other place in the sky they appeared to describe small ellipses. Dr. Robison of Edinburgh has recorded in his article *Seamanship*, a curious anecdote as to the mode in which Bradley reached the secret of the phenomenon, and we find it given as follows by Dr. Thomson in his History of the Royal Society:—"When he despaired of being able to account for the phenomena which he had observed, a satisfactory explanation of it occurred to him all at once when he was not in search of it. He accompanied a pleasure party in a sail upon the river Thames. The boat in which they were was provided with a mast, which had a vane upon the top of it. It blew a moderate wind, and the party sailed up and down the river for a considerable time. Dr. Bradley remarked that every time the boat put about, the vane at the top of the boat's mast shifted a little, as if there had been a slight change in the direction of the wind. He observed this three or four times without speaking; at last he mentioned it to the sailors, and expressed his surprise that the wind should shift so regularly every time they put about. The sailors told him that the wind had not shifted, but that the apparent change was owing to the change in

the direction of the boat, and assured him that the same thing invariably happened in all cases." No great or cardinal discovery ever results from an accident. Accident is a simple indication of law, as indeed the whole world is: it is the Intellect capable of generalizing, that alone can extract the secret. Previous to this time Römer had discovered that light has a definite although a marvellous velocity, the velocity, viz., of nearly 200,000 miles in a second of time. But the Earth moves in its orbit at a rate of about eighteen miles in a second; and just as the motion of the boat affected the apparent direction of the wind, so must this motion of our globe necessarily affect the apparent direction of the rays of light entering the eye. Every star must therefore undergo an amount of displacement, inasmuch as we infer the place of objects from the apparent direction of the ray emanating from them. The amount of this displacement could be theoretically determined,—depending on the proportion of those two velocities: and Bradley found that the irregularities which so puzzled him, received here their complete solution. It is farther of importance to remark, that this discovery constitutes our earliest physical demonstration of the *reality* of the orbital motion of the Earth.—*Secondly*, There are other displacements caused by the instability of the pole or axis around which our globe rotates. We refer all stars to the pole of the heavens, that is, to the point opposite the pole of the earth. Were that point steadfast, determinations of polar distance made at one epoch would be the same for every epoch. But if that point varies, determinations made at different times would not be comparable. So long ago as Hipparchus, that great motion of the pole, manifested by its describing a circle in the heavens every 25,000 years—a motion that is termed *Precession*—was known and estimated. But the pole does not describe a regular circle; on the contrary, it moves through a waving line, thus originating other and important although minor irregularities, which Bradley was the first to comprehend. The irregularity we now speak of is termed *Nutation*. Bradley detected the connection of the period of Nutation with the revolution of the Moon's Nodes; and subsequent researches, partly theoretical, partly by observation, have traced the physical cause of the change to its remotest consequences, and finally removed this last ground of uncertainty from among the obstacles to the conquests of Astronomy.—Concerning the private life of a man to whom the most imposing of the sciences owes so much, it is not unnatural that a certain curiosity should be felt. But Bradley's existence was a very quiet one. He married a niece of the astronomer Pound, to whom he was earnestly recommended by Halley. After a brief excursion into the fields of Theology he resigned his ecclesiastical appointments, and became Savilian professor of astronomy at Oxford. He observed chiefly at Kew and Wanstead, until he was selected to the office of Astronomer Royal by Sir Robert Walpole, on the eve of his retirement. Bradley's nomination was probably the last official act of patronage by that great, but in many respects somewhat unsatisfactory Minister.—Bradley's observations were published in three volumes folio (superseded in great measure by the *Fundamenta Astronomiæ*) by the university he adorned; and to whose well-known and considerate munificence we have recently been indebted for an account of his life and a collection of his papers, in a quarto volume, edited by Professor Rigaud.—J. P. N.

BRADLEY, RALPH, an English conveyancing lawyer, was born in 1717 at Greatham in the county of Durham, and died and was there buried in 1788. His parentage was humble, and his education self-acquired. His name is not associated with that of any patron or friend; and the attainment of provincial eminence almost unrivalled as a property counsel was due to his own judgment and exertions. He was called to the bar at Gray's inn, but his place of business was Stockton-upon-Tees, the neighbour town to Greatham; and his practice ruled over near half a century. Among his pupils were Ritson, an eccentric genius, and Holliday, C. Butler's master. His style of expressing opinions and drawing instruments was chargeable with the vices of tautology and diffusiveness. Bradley was never married. He possessed social qualities to a great degree; and the ultimate disposition of his property denotes the benevolence of his heart, although its frustration by the chancellor, Thurlow, proved the fallibility of its author's legal judgment. Having no near relations, he by his will directed that the income (except £500 a year for twenty years, and £1000 a year afterwards) of the bulk of his property should accumulate for seventy years.

VOL. I.

The income of the principal and its accumulations was then, and the £500 a year and the £1000 a year were in the meantime, to be from time to time for ever applied in the purchasing of such books as might have a tendency to promote the interests of virtue and religion and the happiness of mankind. This charitable purpose to be carried out by the court of chancery. When application was made to establish this charity, Lord Thurlow, ignoring the existence of the Society for Promoting Christian Knowledge, said he did not know what books had a tendency to promote the happiness of mankind, and set aside the bequest in favour of the next of kin. In 7 ves. 50 n. the charitable trusts are set forth at length. They are characteristic of the style of their author. If he had described more fully the main purpose and elaborated less the details of the scheme, a different result might have been expected. To commemorate his bounty, a suitable inscription had, on the occasion of his burial, been put upon his tomb in Greatham churchyard, and after the decree his relations annexed to this inscription a few words to show how his intentions had miscarried.—S. H. G.

BRADLEY, RICHARD, a popular writer on gardening and agriculture, lived in the early part of the 18th century. He made himself known at first by papers on the nature of the sap in vegetables, and on the quick growth of Mouldiness on Melons, which were published in the Philosophical Transactions. He became a fellow of the Royal Society, and was chosen professor of botany at Cambridge in 1724, but he does not appear to have conducted himself well, and Dr. Martyn was appointed to lecture for him. He published a treatise on husbandry and gardening, a gardener's calendar, a philosophical account of the works of nature, a "Botanical Dictionary," and a history of succulent plants. He lectured on materia medica in London in 1729. This course of lectures was published. Died in 1732.—J. H. B.

BRADSHAW, JOHN, an English barrister, better known as President Bradshaw, because he presided in the court which condemned Charles I. He was born in 1586 of an old Lancashire family, and became a student at Gray's inn. He was warmly attached to the parliamentary party, and obtained among them a considerable amount of chamber practice. He was one of the commissioners to whom the custody of the great seal was intrusted by the house of commons in 1646, and in the following year he was appointed chief justice of Chester by a vote of both houses. In 1648 he was raised to the rank of serjeant. When the republican party had resolved to put King Charles to death under colour of judicial forms, Bradshaw's name was inserted in the record or revised list of commissioners for trying the king, and he was by them chosen president of the court. He displayed considerable self-possession throughout that memorable trial; but treated the unfortunate monarch in an exceedingly insolent and unfeeling manner. His party seem to have been satisfied with his behaviour, for they rewarded him with a gratuity of £5000, a town house, and country seat, the gift of Lord Cottington's estate in Wiltshire, and other landed property, yielding in all a rental of £1000 a year, and made him chancellor of the duchy of Lancaster. Bradshaw was a sincere republican, and, therefore, opposed the ambitious designs of Cromwell, who deprived him of the office of chief justice of Chester. After the death of the protector, Bradshaw was elected president of the council. He died November 22, 1659, and was buried with great pomp in Westminster abbey; but after the Restoration his body was disinterred, and exposed on a gibbet along with the bodies of Cromwell and Ireton. Clarendon describes him with apparent truth as a man of some ability, but insolent and ambitious.—J. T.

BRADSHAW, WILLIAM, an English puritan, born at Market Bosworth, Leicestershire, in 1571. He was educated at Emanuel college, Cambridge, after leaving which, through the influence of Dr. Laurence Chasterton, he became in succession tutor to the family of Sir Thomas Leighton, and fellow of Sidney Sussex college. Having obtained orders in a way which indulged his scruples on the subject of ordination, he was for some time employed as lecturer in the churches of Abington and Steeple Morden, near Cambridge, and afterwards at Chatham in Kent. From Chatham, on occasion of a dispute with his ordinary, he removed to London, and was appointed lecturer of Christ Church, Newgate Street. A treatise of his on some litigated points of ecclesiastical rule caused his demission from this office, and he retired to his native county, where he died in 1618. He is chiefly remarkable as the author of a small treatise, entitled

4 Z

"English Puritanism," 1605, an abstract of which is to be found in Neal's History of the Puritans. Besides that work he wrote a "Treatise on Justification," and "A Plaine and Pithy Exposition of the Second Epistle to the Thessalonians."—J. S., G.

BRADSTREET, SIMON, one of the early governors of the colony of Massachusetts, was born at Horbling, a small village near Folkingham, Lincolnshire, England, in March, 1603. His father, a nonconformist minister, was a fellow of Emanuel college, and much esteemed for his piety and learning. In several positions which he occupied, the son was thrown much into the company of those who were then proposing to emigrate to New England, and, after marrying Anne Dudley in 1628, he decided to join them. He arrived at Salem, in Winthrop's company, in June, 1630, was present at the first general court held at Charleston, in August of the same year, and was there elected an assistant and secretary of the colony, which office he held for fourteen years. When the New England colonies formed their memorable confederation for mutual defence in 1643, Mr. Bradstreet was appointed one of the two commissioners on the part of Massachusetts, and took an active part in all their proceedings. After the Restoration, when the colony were in a fever of apprehension lest Charles II. should take away their charter and their privileges, he drew up the address and report defending both, and was sent to England, with Mr. Norton, to make the best terms they could with the monarch. He showed much prudence and address in this delicate office, and brought back a letter from the king, which he maintained was really favourable to Massachusetts, though the more resolute puritans were dissatisfied with it, and censured his conduct as compromising the honour and rights of the colony. Also, when the royal commissioners arrived in 1665, he advised a quiet compliance with their demands, instead of the stiff-necked course actually adopted. In 1673 he was chosen deputy-governor, and was re-elected for six successive years. Then, in 1679, at the age of seventy-six he was first chosen governor, having previously served as an assistant for fifty successive years. To this high office he was annually re-elected till May, 1686, when the charter was dissolved; and then, though nominated first of the seventeen councillors who were to act under Dudley, the first royal president, he nobly refused to serve. The tyranny of Audros followed, grievous but short; and when, on the news arriving of the revolution of 1688, the people of Boston and the vicinity, without waiting for authority from England, rose in arms, and required Audros immediately to give up the government and the fortifications; the venerable Bradstreet was at their head, and Massachusetts once more coming together in general court, chose him governor again. And "the Nestor of New England," as he was fitly termed, was annually re-elected to this office till May, 1692, when Sir William Phips arrived with a new charter, which no longer allowed the people to choose their own chief magistrate. Still he was nominated as senior councillor under the new government; but he refused to serve, and retired to Salem to await the long-deferred summons to meet the Master whom he had so long served on earth. He died at Salem, March 27, 1697, in the ninety-fifth year of his age.

BRADWARDIN or BREDWARDINE, THOMAS, surnamed the PROFOUND DOCTOR, an eminent English schoolman, born in the diocese of Chichester of an ancient family, deriving its name from Bredwardine, a village or camp on the river Wye. The date of his birth is uncertain, but as he was proctor in the university of Oxford in 1325, it could not have been later than the middle of the reign of Edward I. At Merton college where he graduated, he became professor of divinity, holding in conjunction with that office the chancellorship of the university. Resigning both these dignities, he was appointed chaplain to the famous bishop of Durham, Richard de Bury, and subsequently became chancellor of the diocese of London, prebendary of Lincoln, and chaplain and confessor to Edward III. This victorious monarch he attended in his French wars, influencing his councils to a remarkable degree by the candid exercise of the functions which belonged to a confessor in the times of chivalry, if not, as is pretended by contemporary writers, directly influencing his fortunes by virtues and piety, which could not belong to the chaplain without prospering the king. On the death of Stratford, archbishop of Canterbury, he was elevated to that see; but the king refused to ratify the election, observing that "he could very ill spare so worthy a man to be from him, and he never could perceive that he himself wished to be spared." The see

being again vacant within the year, however, Bradwardin was consecrated at Avignon in 1349. Shortly after his return to England he fell a victim to the plague. The work which procured for him from the reigning pope the appellation of the Profound Doctor, is his "De Causa Dei," a digest of his lectures at Oxford, edited by Sir Henry Savile in 1618. It is directed against the Pelagians. His other published works are—"Geometria Speculativa," &c., Paris, 1495; "De Proportionibus," Paris, 1495; "De Quadratura Circuli," Paris, 1495.—J. S., G.

BRADY, NICHOLAS, D.D., an Irish divine, who, in connection with his fellow-countryman, Nahum Tate, composed the metrical version of the psalms now in use in the church of England. He was the son of Major Nicholas Brady, a descendant of Hugh Brady, first protestant bishop of Meath, and was born at Bandon, in the county of Cork, on the 28th October, 1659. He received his early education in England, but obtained his degrees in Trinity college, Dublin. He obtained preferments in Ireland, and being a firm adherent of the Orange party, he was sent with an address to William III. on his accession to the throne. Remaining in London, he obtained some good livings, and became successively chaplain to the king and queen, Queen Anne, and the prince of Wales; and though he was in receipt of a large income, he contrived to spend it, and was obliged to keep school at Richmond to eke out his means. He died on the 20th May, 1726. He translated the Æneid of Virgil, a performance now neither read nor known; published some volumes of heavy sermons, of which the same may be said; and wrote some dramas and a tragedy which were not devoid of merit, and had reasonable success, though the subject and its treatment were rather strange for a divine. Brady and his works would have long passed from the memory of mankind, but for the happy chances that have floated them down the stream of time in the poor composition to be found appended to the book of Common Prayer.—J. F. W.

BRADY, REV. PHILIP, a clergyman of the county Cavan in Ireland. He lived in the beginning of the eighteenth century, and was a man of great wit, a good scholar, and particularly versed in the language of his country. He composed several poems, and translated some English works into the Irish language.—J. F. W.

BRAGANZA, the dukes of, took their title from Braganza, the chief town of the Portuguese province of Traz-os-Montes. The following are the more remarkable of these princes:—ALFONSO, illegitimate son of John I., king of Portugal, created duke of Braganza in 1442 during the minority of Alfonso V. His brother, Peter, duke of Coimbra, regent of the kingdom, led by his arts into a quarrel with the young king, fell by the hand of his sovereign in 1449. Died in 1461.—FERDINAND II., third duke, decapitated as a traitor in 1483 by his brother-in-law, King John II.—JAMES, fourth duke, eldest son of the preceding, was restored to the dukedom by King Emmanuel; and, as a further proof of his sovereign's favour, in 1489 nominated his successor.—J. S., G.

BRAGANZA, JOHN I. and JOHN IV. of. See JOHN.

BRAHAM, JOHN, the celebrated singer, was born in London of Jewish parents in 1774. He was left an orphan at an early age, and in such humble circumstances that it is said he sold pencils about the streets. However, he was still very young when he became the pupil of Leoni, an Italian singer of celebrity; and his first appearance on the public stage was at the Theatre Royal, Covent Garden, April 21, 1787, for the benefit of his master. In the bill it is announced—"At the end of Act i., 'The Soldier Tired of War's Alarms,' by Master Braham, being his first appearance on any stage." When the well-known John Palmer opened the Royalty theatre, at the close of the same year, Master Braham formed part of his corps, and performed in a burletta composed by John Carter, the author of "Oh, Nanny!" "Stand to your Guns," &c., and entitled "the Birthday, or the Arcadian Conquest." The locale of his debut was not the most favourable to rising musical talent: neither the titled patron nor the accomplished virtuoso frequented the *ultima Thule* of Wellelose Square. Nevertheless the fame of the wonderful boy who was singing at the Royalty, the astonishing pupil of Leoni, spread itself even into the western regions, and drew many gentle auditors from their usual routine to the humbler scenes of his surprising efforts. About the period when young Braham's voice broke, his master Leoni was compelled, through pecuniary embarrassment, to quit England, and leave the young

orphan entirely dependent upon his own resources, at a moment when the most valuable of those resources had, for a time at least, failed him. Fortune, however, soon raised him up patrons in the powerful and wealthy family of the Goldsmids, under whose protection and auspices he acquired considerable practice as a teacher of the pianoforte. But although the pianoforte became for an interval his immediate profession, the cultivation of the returning powers of his voice formed the great object of his hopes and his ambition. It was already settling into a tenor, remarkable alike for tone, flexibility, and compass; and he omitted no opportunity of polishing it by study, or strengthening it by practice. In one of the many musical societies which he frequented, Braham became acquainted with Ashe, the celebrated flute-player, who, struck with the beauty of his voice, proposed to him an engagement for the following season at Bath, which was immediately and gladly accepted; and in 1794 he made his first appearance as a tenor singer at the concerts in that city. In the conductor of these concerts, Signor Ranzini, the debutant found all that was wanting to give high finish to a voice which nature had formed in one of her most prodigal moulds; an instructor to whom all the rules of art were familiar, and in whom all the delicacies of the highest refinement of that art were personified. In Braham, Signor Ranzini recognized a pupil on whom it was a pleasure to lavish all the resources of which time and study, learning and taste, had rendered him master. To the last hour of his life he boasted of his famous pupil, and Braham never failed to acknowledge his obligations to his talented instructor. The fame of the new singer soon extended to London, where it was first carried by J. P. Salomon, who, from the moment he heard Braham at Bath, pronounced him to be the finest tenor singer in Europe. In the spring of 1796, an engagement for a limited number of nights was offered to him by the managers of Drury Lane, and the genius of Storace expended its last efforts in the composition of the songs which were to exhibit the extent and variety of his powers. The early and lamented death of the composer delayed, for a short time, the production of his last opera, but the difficulties were at length overcome; the parts left unfinished were completed by Kelly, and on the 30th of April, 1796, "Mahmoud" was performed for the benefit of his widow and family; and Braham, then only twenty-two years old, at once took the rank in which, for upwards of a quarter of a century, he had no competitor. Before the year of his debut had closed, Braham achieved another professional triumph of the highest class, in being engaged as a principal tenor at the Italian opera; and here again it is impossible to repress a feeling of wonder at the talent and industry which qualified so young a man to burst forth at once as leader in styles so different, and perform not only in his native, but in a foreign language. His first appearance on the opera stage was on the 26th November, 1796, in the character of Azor, in Gretry's opera, "Zemira e Azore." He was highly applauded, and one of his airs encored; afterwards he performed with Banti in Sacchini's serious opera, "Evelina," and continued to sing until the end of the season. In the same year he was engaged at the oratorios, and established his reputation as a singer of sacred music by his delivery of some of Handel's *chef-d'œuvres*. Braham now determined to increase his knowledge of the mechanical resources of his art, by studying the best models which Italy afforded. He accordingly embarked for the continent in the autumn of 1797, and proceeded in the first instance to Paris, not contemplating a stay of more than a week in that city; but some concerts which he gave (at the first of which Bonaparte and Josephine were present) turned out so successful, and so lucrative, that he remained there eight months. A plan was organized for the performance of Italian operas, and a permanent engagement offered to Braham. Italy, however, was his object, and declining all overtures for remaining in Paris, he continued his journey southward, and in the autumn of 1798, appeared as primo tenore at the Teatro Pergola in Florence, as Ulysses, in an opera of that name composed by Basili; and as Orestes in "Le Furie d'Oreste" of Moneta. He was next engaged for the succeeding carnival—an unheard of honour for an Englishman—and appeared at the Scala (Milan), with his gifted countryman, Billington. The opera in which they performed was composed by Nasolini, and entitled "Il Trionfo di Clelia." Rome and Naples now contended for the English tenor; but Braham's success at Milan led to a renewed engagement there for the following year; and when he left the capital of northern Italy he

proceeded to Genoa, where he devoted much time to the study of composition, under the able instructions of the maestro Isola, and had an opportunity of singing with the celebrated musico, Marchesi. From Genoa he returned to Milan, and went thence, in 1799, to Venice. Here he assisted at the funeral obsequies of Cimarosa, and performed in the serious opera of "Artemisia." His next engagement was at Trieste, where he performed in Martin's opera, "La Cosa Rara," a work from which Storace took a great part of the music of his "Siege of Belgrade," and which Braham, five or six years afterwards, introduced with such success at the opera-house in London. Whilst remaining at Trieste, our great tenor received invitations from Lisbon, Naples, Milan, Vienna, and England. That from Vienna he accepted, reserving to himself the liberty of singing one year in England, previous to making his debut in the Austrian capital. Following this plan, he proceeded across Germany, *via* Hamburg, to his native country, where the unanimous and enthusiastic applause he met with, made him forget or forego his German engagements. On the 9th of December, 1801, Braham made his reappearance before an English audience at Covent Garden theatre, in an opera called "Chains of the Heart"—the joint composition of Mazzinghi and Reeve. The music, however, was so feeble in the serious, and so commonplace and vulgar in the comic parts, that, notwithstanding it was supported by such talents as Braham's and Madame Storace's, it lived only a short time, and was succeeded in February following by "the Cabinet." In this opera Braham was the composer of all the music of his own part, a custom to which he continued for several years pretty closely to adhere, and seldom has any music been more universally popular. Among these operas we name "Family Quarrels," 1802; "the English Fleet," 1802; "Thirty Thousand," 1804; "Out of Place," 1805; "False Alarms," 1807; "Kais, or Love in a Desert," 1808; and the "Devil's Bridge," 1812. To follow Braham through all his engagements would exceed the limits of this notice; it is sufficient to say, that in the theatre, the concert-room, or the church, he had scarcely a rival. *Non ce in Italia tenore come Braham*, was the frequent exclamation of foreigners who heard him. During the seasons of 1804-6, he was engaged as principal tenor at the Italian opera, singing with Mrs. Billington in "Il Trionfo dell' amor fraterno;" "Gl'Orazi e Curiazi;" and *La Clemenza di Tito*." In 1816 he again appeared at the opera, as Guglielmo, in the "Cosi fan Tutte" of Mozart; and in 1826 acquired fresh laurels in the arduous part of Sir Huon, in Weber's wondrous opera of "Oberon, or the Elf King's Oath." Down to the present time everything which Braham undertook prospered; but in 1831 the tide of fortune changed. In this year he purchased, jointly with Yates, the building known as the Colosseum, in the Regent's Park, for which the large sum of £40,000 was paid. Five years afterwards he opened the St. James' theatre, which he had erected at a cost of £26,000. The large fortune which his genius and energy had once gained him was lost by these unfortunate speculations; but his declining years were passed in the most cheerful comfort, secured to him by the affectionate care of his daughter. He died in February 17, 1856, at the advanced age of eighty-two. In energy and pathos of style, Braham stood unrivalled as a public singer, and his powers in this respect were especially conspicuous in accompanied recitative, which generally expresses strong passion; thus "Deeper and deeper still," of Handel, was the *chef-d'œuvre* of his declamatory and pathetic manner, describing, as it does, Jephthah in the agony of his rash vow. As a composer, Braham completely attained the object he aimed at, in his numerous songs, duets, &c., many of which attained the highest degree of popularity. As a national song, his "Death of Nelson" has pleased, and continues to please, a vast majority of the inhabitants of the British isles; it has therefore accomplished its purpose. Braham's private character was marked by kindness and urbanity, and he was never known to treat the public, in a single instance, with levity or caprice. In matters of business he was remarkably honourable; and it was the common remark of those who knew him long and well, that he was never known to speak disrespectfully of any public singer—declining to censure where he could not in justice applaud, but cheerfully bestowing praise whenever truth permitted. The only spot upon Braham's character was his *liaison* with Signora Storace, but this, we believe, has been much misrepresented. He left five sons and one daughter. The eldest son (by Signora Storace) is now a clergyman of the church of England. The other members of

his family are the fruits of his marriage with Miss Bolton of Ardwick, near Manchester, in 1816. One son is, we believe, in the army. The other three, Hamilton, Charles, and Augustus, are rising members of their father's profession. His daughter married, first, John James Henry Waldegrave, Esq.; secondly, in 1840, George Edward, seventh earl of Waldegrave; and, thirdly, in 1847, George Granville Vernon Harcourt, Esq., eldest son of the late archbishop of York.—E. F. R.

**BRAHE TYCHO.** See **TYCHO.**

**BRAINERD, DAVID**, a celebrated American missionary to the Indians, was born at Haddam in Connecticut, April 20, 1718. His parents died when he was quite young, and until the age of nineteen, he expected to spend his life as a farmer. But he possessed by nature a thoughtful, conscientious disposition, and the strong religious cast of his mind made him very desirous to prepare himself for the clerical profession. In 1738 he went to reside with Mr. Fisher, the minister of his native town, and in 1739 he entered Yale college. About this time, Whitfield came to New England, and most of the students were greatly excited by his preaching. Brainerd's feelings were strongly roused, and in his zeal he made use of some rash expressions against one of the college officers, which caused his expulsion. This, however, did not interfere with his preparation for the ministry, and in 1742 he was ordained, and immediately commenced his labours as a missionary among the Indians. His services were engaged by an association in New York, and he was first sent to the settlement of Kanaumek, between Stockbridge and Albany, and here he laboured most conscientiously in the midst of privations and sufferings. His health had never been good, and amid the sufferings of his Indian life, it often gave way altogether. He was a rigid Calvinist, and subject to the most distressing fits of religious depression; but notwithstanding this distress of body and mind, he pursued his work indefatigably, until he found that he might be more useful elsewhere; and in 1774 he left Kanaumek, and removed to Crossweeksung, at the Forks of the Delaware. His duties were now of the most arduous description. Notwithstanding his ill health, he spent a life of unremitting activity, making frequent journeys from one place to another, and devoting all his energies to the advancement of civilization and religion. For a long time his labours seemed almost entirely without success; he had no time to learn the Indian language, and his preaching lost much of its effect when communicated to his hearers through an interpreter, who himself only partially understood the true import of what was said. Finally, however, he achieved a great success. The Indians listened with attention, and many were not only converted to Christianity, but made considerable progress in civilization; he baptized seventy-eight savages in one year. Meantime his health suffered fearfully. He was obliged to sleep in smoky cabins, or else in the open air, protected only by a few boughs; the symptoms of consumption increased, and it was with the greatest difficulty that he continued his duties. He struggled on, however, for several months, when it became evident that he must abandon his labours for a time, if not for ever. In April, 1747, he set out for New England, and was received at Northampton into the family of Dr. Jonathan Edwards, where he was told by the physicians that his case was hopeless; he lingered a few months, a daughter of Dr. Edwards attending him devotedly as his nurse. His death took place at Northampton, October 9, 1747, in the thirtieth year of his age. Dr. Edwards published a memoir of him, composed chiefly of extracts from a diary which he kept with great minuteness throughout his career. It is a deeply affecting record of spiritual experience, of the hardships of his life, increased by the morbid tenderness of his conscience, and the enthusiastic zeal with which he pursued his Master's work in sickness and solitude. John Wesley abridged the work, and published it in England. In 1822 the original, with additional extracts from Brainerd's diary, was published at New Haven by Sereno E. Dwight.

**BRAITHWAITE, JOHN**, a member of the British embassy at Morocco at the period of the Emperor Muley Ishmael's death. He wrote an account of the political movements of 1727 and 1728, following that event. The work was published in London in 1729, and was translated into several continental languages, and is interesting for its details concerning the history and condition of Morocco.—J. B.

**BRAITHWAITE, WILLIAM**, one of the forty-seven divines appointed by James I. to prepare the version of the Bible at

present in use, born about the middle of the sixteenth century, was fellow of Emanuel college, Cambridge, and afterwards master of Gonville and Cains college.

**BRAKEL, G. A.**, a Swedish poet, born in 1782, author of "Oden i Svithiod," a tragedy, published in 1826, and "Wäinmöinen," a lyrical drama, 1829.—M. H.

**BRAKEL, JAN VAN**, a Dutch naval officer, born in 1618, began his gallant career under the famous De Ruyter. For distinguished service in the engagement between the Dutch and English fleets, August 4, 1666, he was raised to the command of a ship in the squadron despatched by the states of Holland against Chatham. In this expedition, having forced his way up the river in the face of a tremendous fire, he succeeded in destroying a part of the English fleet. His most gallant exploit, however, was his boarding the leading ship of the enemy in an action between the Dutch and the combined fleets of Great Britain and France in 1672. The earl of Sandwich, his opponent, fought with the most determined bravery, and having the advantage of a larger ship, would have sunk that of Brakel, but the encounter, one of the most desperate in the annals of naval history, unexpectedly terminated in favour of the Dutch, through the accident of the English flag-ship taking fire. Brakel was killed in an engagement with the French in 1690.—J. S., G.

**BRAKENBERG, RENIER**, a Dutch painter, born at Haerlem in 1649. He first studied under Mommers, and then under Schendel, whom he imitated with all Brouwer's dissolute riot and coarse repulsive fun. Sometimes the drinking-bout merry-makings of Ostade were his models. His figures are mannered and badly drawn, and he painted with a careless facility which only simulated finish. His chiaro-scuro is cleverly balanced, neither light nor dark having too much their own way. His later pictures betray negligence in the drawing of hands and feet. His earlier pictures are ingeniously varied in subject, the colouring strong and natural, the touch vigorous and firm. He died at Haerlem in 1702.—W. T.

**BRAMAH, JOSEPH**, whose name is known in connection with numerous mechanical improvements, was born at Stainborough, Yorkshire, in 1749. He was apprenticed to a carpenter in his native place, and having served his apprenticeship, he removed to London, and ere long began business as a cabinet-maker. Having shown great aptitude for mechanical invention, by some improvements which he effected in the construction of water-closets, he devoted himself to that branch of labour. His next invention, which he patented in 1784, was an improvement on the construction of the lock, rendering it more inviolable. Perhaps his most important achievement was the construction of a hydraulic press, acting on the principle of the hydrostatic paradox, which produced great force, and could be conveniently applied to many useful purposes. Its power was tested in Holt Forest, Hampshire, where 300 of the largest trees were raised from the ground by its means, managed by only two men. Bramah erected at Woolwich arsenal a machine for planing timber, moved by this power, which acted with great rapidity and exactness. In 1807 he invented, for the bank of England, a machine for numbering and dating their notes, which effected a great saving of time and labour. He died in 1814, in consequence of cold caught in Holt Forest, while superintending his experiments there. Mr. Bramah left "A Dissertation on the Construction of Locks," and "A Letter on the subject of an alleged Violation of Patents."—J. B.

**BRAMANTE.** So little is recorded of the origin of this great Italian architect, that his name and birthplace are equally unknown. He is called **DONATO BRAMANTE**, and **BRAMANTE LAZZARI**—the former is probably the correct name—and he was, according to Vasari, born at Castel Durante, or, according to another account, Monte Asdrualdo, both in the duchy of Urbino, in 1444. He was brought up as a painter, and studied from the works of Fra Bartolommeo of Urbino, called Fra Carnovale, a painter of reputation in his time; but Bramante's real disposition was for architecture, and from 1474 he travelled throughout the north of Italy in search of occupation accordingly, until he settled, about 1480, in Milan, where he found patrons in Gian Galeazzo Visconti, and in Lodovico il Moro. He was finally appointed, in 1491, engineer of the cathedral. He had already furnished plans for the cathedrals of Foligno and Faenza. Bramante was also the architect of the new cathedral of Pavia, of which the first stone was laid by Cardinal Ascanio Sforza, June 29, 1488; and he superintended the works while he resided in Milan.

About 1499, or more probably a few years earlier, he left Milan, and established himself in Rome. Though Bramante was now advanced in life, his great influence on modern art commenced in Rome; he followed the steps of Brunelleschi, who died within a year of the time that Bramante was born. The classic revival had commenced, the Gothic and Byzantine were superseded, and the round arch in its turn supplanted the pointed. Bramante took advantage of the opportunities afforded by the ancient ruins of Rome, of perfecting his knowledge of classical art, and qualified himself for the high position as an architect which he shortly attained. The art of Bramante, however, was not classical, but the classical applied to the uses of modern society—it was the Italian renaissance in a grand and simple form. One of the noblest examples of Bramante's style, is the Cancellaria Apostolica, formerly known as the Palazzo San Giorgio, a magnificent and spacious palace built as the private residence of Raphael Riario, cardinal of San Giorgio, in the pontificate of Alexander VI. It bears the date 1495, and besides being one of the earliest, is one of the most important monuments of the renaissance in Rome. The principal front on the Campo Fiore, presenting above a basement, a double row of Corinthian pilasters, comprising three upper stories, extends to about 275 feet in length; but the great feature of the building is the inner court, surrounded on all four sides by a double colonnade. This palace was confiscated to the papal government in the time of Leo X., in consequence of the participation of the Cardinal Riario in the conspiracy of Cardinal Petrucci against that pope. Bramante executed many works in the pontificate of Alexander VI., but Julius II. was his principal patron, and the Vatican was the great arena of his glories. Here he carried out vast works for that pope. He first joined the Belvedere villa to the old palace of the Vatican, and enlarged and embellished the palace by the addition of the court of San Damaso, and the famous Loggie, containing the celebrated arabesques of Raphael, with many other improvements. Raphael himself, the fellow-townsmen of this architect, was invited to Rome through the representations of Bramante. In 1506 he commenced his immense undertaking—the rebuilding of the Basilica of St. Peter. Julius II. laid the first stone on the 18th of April of that year; but Bramante, though the maestro architetto for eight years, did not carry the building much beyond the four great piers of the dome; but these were the key to the whole, and the work was necessarily continued with corresponding magnificence of proportions by his successors, but upwards of a century elapsed before its completion.

Bramante died on the 11th March, 1515, and was buried beneath the church of St. Peter, in the so-called Grotte Vaticane. He was frate del piombo, or keeper of the leaden seals. The duty of this officer is to attach the leaden seals to the papal bulls. After Bramante's death, Raphael was, by the express desire of the architect, appointed his successor by Leo X. He had for assistants, Giuliano da San Gallo and Fra Giocondo da Verona, who had been also the assistants of Bramante. After Raphael's death in 1520, the work was carried on by Baldassare Peruzzi. In 1536 Antonio da San Gallo, the nephew of Giuliano, succeeded Peruzzi and considerably altered the original plan. Michelangelo succeeded San Gallo in 1546, and superintended the work to the completion of the dome in 1564. The continuation was then undertaken by Vignola, aided by Pirro Ligorio, under the express condition that they were to adhere to the plan of Michelangelo; and as Ligorio wished to change the design, Pius V. removed him. After the death of Vignola in 1573, Giacomo della Porta assumed the direction of the works, and with the assistance of Domenico Fontana, completed the cupola, and fixed the cross above it in 1590 in the pontificate of Gregory XIV. Giacomo della Porta died in 1604, and the work was finally carried to completion by Carlo Maderno and Giovanni Fontana, and consecrated by Urban VIII. in the year 1626, one hundred and twenty years after the laying of the first stone by Bramante and Julius II.—(Pungileoni, *Memoria intorno alla vita ed alle opere di Donato Bramante*, 1836; Vasari, *Vite dei Pittori*, &c., Ed. Le Monnier; Platner and Bunsen, *Beschreibung der Stadt Rom*, &c.)—R. N. W.

BRAMBILLA, GIOVANNI BATTISTA, a Piedmontese artist, who studied under Delfino. He became renowned at Turin, and executed there his best work, "The Death of St. Dalmatius." He flourished about 1772.—W. T.

BRAMER, LEONARD, a Dutch painter, born at Delft in 1596.

He learned in Rembrandt's school, and tried to imitate him in little. He went to Italy at eighteen, and resided chiefly at Florence and Venice, where his works were much esteemed. He seems to have devoted his life to the impossible and foolish attempt of forgetting Flemish art, in which he would have been original, and imitating Italian art, in which he was compelled to be a poor mean copyist. He excelled in painting towns on fire at night, and caverns with light pouring in from above, the poetry in fact of firelit rooms and grating-lit cellars turned into flaming Sodoms and dungeons of Ugolino. His mannerism was the introduction of gold and silver vases into his pictures; these he painted bright, lustrous, and bold, with a fine rich relieve. He drew his shadows very thin and transparent. Pilkington says he had a good taste in design, noble and commendable expression, a delicate pencil, and a bright full tone. His best pictures were a small "Pyramus and Thisbe" on copper; a "Denial of St. Peter;" and a "Raising of Lazarus." The palace at Ryswick had or has some of Bramer's pictures. He died at Delft, year unknown.—W. T.

BRAMPTON, WILLIAM DE, one of the four justiciars of England in the reign of Edward I., 1274–1307. In 1288 he was accused and found guilty of breach of trust and of peculation, and, along with three accomplices, was condemned to pay the enormous fine of forty thousand marks, and to be confined in the Fleet prison. The celebrated Latin treatise on the entire body of the English law, called *Fleta*, from the place where it was written, is supposed by some to have been compiled by de Brampton, or by one of his colleagues, Thomas de Weyland, J. de Lovetot, and Adam de Strutton. This excellent work was first published by Seldon in 1635.—J. T.

BRAND, JOHN, celebrated for his research as an antiquary, was born at Newcastle-upon-Tyne in 1743. He was apprenticed to a shoemaker, but found means to prosecute his studies, and at last to reach Oxford, where he took his bachelor's degree, and where he published a poem named "Illicit Love; written among the ruins of Godstow nunnery," his mind having been attracted by the memories of the fair Rosamond and her royal lover. In 1774 he was presented to the curacy of Cramlington, Newcastle, and ten years later to the church of St. Mary-hill, London. On his removal to London he was chosen secretary to the Society of Antiquaries, having become distinguished by the publication of a work called "Observations on Popular Antiquities," including Bourne's *Antiquitates Vulgares*, with addenda to every chapter. In 1789 he published "The History and Antiquities" of his native town and county. He died in 1806.—J. B.

BRAND, JOHN CHRISTIAN, a German artist, born at Vienna in 1723. He became a celebrated landscape painter, and professor in the Imperial Academy. He studied under Schmutzer, engraved several plates, and died in 1793. His brother, FREDERICK AUGUSTUS, became also a landscape painter and engraver.—W. T.

\* BRANDE, WILLIAM THOMAS, who for nearly half a century has occupied a distinguished position among British chemists, was born in 1788, in Arlington Street, St. James', London. He was educated first at a private school at Kensington, and afterwards at the Westminster school, which he left in 1802. In 1803 he was sent to Hanover, but Bonaparte's threatened invasion obliged him to escape to Hamburg, and thence he returned home, having, however, during his residence abroad, perfected his knowledge of the French and German languages. On his return he was entered as a pupil at St. George's hospital, where he attended the medical lectures, and worked hard in the dissecting room. He communicated occasional papers to *Nicholson's Journal*, and in 1805 he drew up a short account of some experiments on guaiacum, which were read before the Royal Society, and published in the *Philosophical Transactions* for 1806. In 1808 he made a chemical examination of the calculi in the Hunterian museum, and in the winter of the same year he delivered a course of lectures on pharmaceutical chemistry at Dr. Hooper's medical theatre in Cork Street. He afterwards joined the newly-established medical school in Windmill Street, and thus became fairly embarked as a teacher and demonstrator of chemistry. In 1809 he was elected a fellow of the Royal Society, and in 1813 he received the Copley medal; three years afterwards, on the resignation of Dr. Wollaston, he was elected senior secretary of the Royal Society, an office which he held till 1826. In 1812 Sir H. Davy recommended him as his successor to the professorship of chemistry in the Royal Institution, to which office, after

a probationary course, he was elected in June, 1813. The chemical classes of St. George's hospital and of the Windmill Street medical school were soon afterwards transferred to the Royal Institution, so that, in addition to the weekly lectures in the theatre of the institution, Mr. Brande gave an extended course of lectures and demonstrations in the laboratory of that establishment. In 1820 Mr. Faraday became associated with Mr. Brande in this course of lectures, which for many years were justly regarded as the best on the subject in London. Mr. Brande now devoted himself entirely to lecturing and chemical pursuits. Having, in 1812, been requested to report upon the laboratories belonging to the Society of Apothecaries in London, he was shortly afterwards appointed professor of chemistry and materia medica to that corporation; and in 1851 he became master of the company. He edited, conjointly with Mr. Faraday, the *Quarterly Journal of Science and Arts*, from its commencement in 1816 till 1836. In 1825 he was appointed to the office of superintendent of the die department in the Royal Mint, and was also intrusted with the supervision of the machinery of that establishment. In 1836 he was named one of the original fellows of the university of London, and a member of the senate of that body; and in 1846 he became one of their examiners, an office which he resigned in 1858. On the installation of Lord Derby as chancellor of the university of Oxford, Mr. Brande received the honorary degree of doctor of civil laws in that university. He is a fellow of the Royal Society of Edinburgh, and a member of several other British and foreign societies. He is the author of a dictionary of pharmacy and materia medica, and in 1842 he undertook the editorship of the Dictionary of Science, Literature, and Art. But the most important work he has published is his "Manual of Chemistry," which contains a faithful digest of the facts and discoveries of the science up to the date of publication, and an explicit exposition of its fundamental principles and laws. It has passed through six editions, and been translated into French, German, and Italian, and deservedly ranks as one of the best treatises on chemistry in the English language. As a lucid expositor of science Mr. Brande has been eminently distinguished. Few scientific men have enjoyed so prolonged and so successful a career. He may be regarded as a connecting link between the brilliant period of Davy, Wollaston, and Hope, when inorganic chemistry was most zealously cultivated, and that of Faraday and Graham, when the physical department was most fertile in discovery; while his vigorous intellect still keeps pace with those extensive researches in the domain of organic chemistry, which have recently changed the aspect of the science, and yielded a rich harvest of results from the products of animal and vegetable life.—F. P.

**BRANDAO, ALEXANDER**, a Portuguese historian of the second half of the seventeenth century; wrote "Istoria delle guerre di Portogallo," &c., 1689.

**BRANDAO, ANTONIO**, a celebrated historian, was born in Portugal on the 25th of April, 1584. He entered the order of St. Bernard, and was appointed to teach sacred history at Coimbra, where he became abbot of Alcobaça. He continued the History of Portugal by Bernardo di Brito, and was appointed royal historiographer. Died in 1637.—A. C. M.

**BRANDENBURG, ELECTORS OF**. The margraviate of Brandenburg in the time of Cæsar was inhabited by the Suevi, one of the most warlike of the German races. They claimed the whole territory between the Baltic and the Rhine and Danube. Somewhat later, the two Marks, the Old and the Middle Mark, into which this extensive region was divided, were known to the Romans as respectively peopled by the Langobardi and the Suevi. Both nations subsequently following the stream of northern rapacity into Italy, their deserted homes were taken possession of by the Vandals or Slavonians, who, with an interval of a hundred years or more, in which they were under subjection to the Franks, held the Middle Mark till 789, when they fell under the sway of Charlemagne. They were not completely subdued, however, till the reign of Henry I., who in 931 finally established the authority of the counts whom he had appointed to guard the Saxon borders. These were the margraves of Lower Saxony, called also from their patrimony margraves of Stade. On the extinction of the line of Stade, Lotharius gave the North Mark and the Salzwedel Mark to Albert the Bear (see that name), who was the first to assume the title of margrave of Brandenburg. His successors increased their patrimony by the addition of the New Mark, Lower Lusatia, and other

districts; but their line terminating in the Margrave Henry, who died in 1320, Brandenburg passed, as a lapsed fief of the empire, into the hands of Lewis of Bavaria, who confirmed it on his eldest son, Lewis. Lewis was succeeded by his brother Otho, who in 1373 was superseded, in what had then become the electorate of Brandenburg, by Wenzel, eldest son of Charles IV. From Sigismund, Wenzel's successor, the electoral Mark passed to his cousins, Jobst and Procopius, princes of Moravia, and in 1417 to Frederic, margrave of Nurnberg. This illustrious prince was succeeded in 1440 by Frederic II., who redeemed from the hands of the Teutonic knights the New Mark, which they had held in pawn for sums advanced to Sigismund, and otherwise greatly extended the electoral territory. He was succeeded in 1471 by his brother, Albert Achilles (see that name), who resigned the electoral dignity in 1486 to his son, John Cicero. Joachim I., the persecutor of the Jews, son of John Cicero, succeeded in 1499, and was followed by that patron of learning and the reformed religion, Joachim II., who became lord-paramount over the duchy of Prussia. In 1571 John George, who inherited the New Mark and the principality of Crossen from his uncle, succeeded to the electoral dignity. His son, Joachim Frederic, succeeded in 1598, and reigned till 1608, when, together with the electoral possessions, there fell to his son, John Sigismund, the domains of Juliers, Cleves, and Berg, and the duchy of Prussia. His son, George William, who succeeded in 1619, bequeathed his immense patrimony to his son, the "great elector," Frederic-William. (See **FREDERIC-WILLIAM OF Prussia**.) The son of this illustrious prince became king of Prussia under the title of Frederic I. in 1701.—J. S., G.

**BRANDES, JOHANN CHRISTIAN**, a German actor and dramatic writer, was born at Stettin in 1735, and died in 1799. He led an adventurous life as apprentice, shopkeeper, quack, serving-man, secretary, actor, and manager. His dramas were for a long time highly popular. He published an interesting autobiography.

**BRANDI, GIACINTO**, a scholar of Lanfranco, born at Poli, near Rome, in 1623. He also studied under Sementi of Bologna. He acquired much reputation in the churches and palaces of Rome; but getting fond of pleasure, extravagant, and needy, he painted too fast and roughly, and lost both fame and credit. Brandi died in 1691. He was head of the St. Luke academy, and knight of the order of Christ.—W. T.

\* **BRANDIS, CHRISTIAN AUGUST**, a German philosopher, son of Joachim Dietrich, born in 1790, author of commentaries on Aristotle; "Rheinisches Museum für Philologie," &c.; and "Handbuch der Geschichte der griechisch-römischen Philosophie."

**BRANDIS, JOACHIM DIETRICH**, conference-raad, and physician to the king of Denmark, was born in 1762. He received his doctor's degree at Kiel, where afterwards, in 1786, he became professor of medicine, and whence he was summoned to Copenhagen as royal physician. As a practical physician he attained to the highest celebrity in Denmark.—M. H.

**BRANDMULLER, GREGORY**, a Swiss artist, born at Basle in 1661. His father's collection of prints led him to art, and he studied under Gaspar Meyer. At seventeen he went to Le Brun, at Paris, and worked with him at Versailles. The hardy Swiss carried off the Royal Academy prize, and was at last driven home by the envy of his fellow-students. On his return to Switzerland, Brandmuller was invited to the courts of Wirtemberg and Baden Dourlach. His best work is a "Descent from the Cross," at the Capuchin church in the latter place. He excelled in history and portraits, the latter always like, and enriched with analogous and historical attributes. He had nobility of feeling, spirit, and fire for an eclectic. His designs and expression are true and animated; his sentiment grand and elevated. He laid on his colours pure, and did not torture or blend them. He would have been a great painter, but death stepped in just as he was thirty, broke his palette, and pushed him into the grave he had not observed at the foot of his easel.—W. T.

**BRANDOLINI, AURELIO**, one of the best orators and poets of the fifteenth century, and an eminent theologian, philosopher, and musician. Mathias Corvinus, king of Hungary, induced him to accept the professorship of oratory in the university of Buda. The suavity of his manners and his profound erudition won for him the affection of both the king and queen, who consulted him in all important matters, and bestowed on him riches and honours. His celebrated works, "De humanæ vitæ conditione, et toleranda corporis ægritudine," and "De comparatione reipublicæ et regni," were dedicated to that sovereign, on whose

death he returned to Florence, and entered the order of St. Augustine. He afterwards journeyed through Italy, where he was universally acknowledged the first of sacred orators. He also translated into Latin verse Pliny's Natural History, and was the tutor of Pope Julius III. He died of the plague at Rome in 1497.—A. C. M.

BRANDOLINI, RAFFAELE, a brother or cousin of Aurelio, born at Florence towards the middle of the fifteenth century, a nobleman of singular talents, who, although deprived of sight whilst yet an infant, could compose impromptu the most elaborate Latin poems on any given subject. Mazzucchelli relates of him, that having recited an oration before King Ferdinand, and being desired by that monarch to turn it into verse, he did so without the least hesitation; whereupon the king exclaimed—"Magnus orator, summus poeta!" After the death of Aurelio, his near relation, he went to Rome, where he contracted the closest friendship with the famous Marone and Pontano. With their assistance he published many of Aurelio's posthumous works, which he dedicated to Cardinal Giovanni de Medicis, who, when on the papal throne, under the name of Leo X., assigned to his protégé splendid apartments in the Vatican. Although blind, every one considered and called him "Oculus pontificis." Only three of his splendid orations, some treatises, and a few letters written in classic Latin, have been preserved. Brandolini died at the beginning of the sixteenth century.—A. C. M.

BRANDT (in Latin, TITIO), SEBASTIAN, a celebrated German poet, was born at Strasburg in 1458, and died May 10, 1520. He studied law at Basle, where he became professor in the university, and afterwards was appointed by the Emperor Maximilian to high civic offices in his native town. He is the author of the renowned satirical poem, "Das Narrenschiff" (the Fools' Ship, or the New Ship of Narragonia), in which he satirizes the vices and follies of his age, and sends all fools by shiploads into their own country, called Narragonia. Less for its poetical merit, than for its high moral tendency, this poem enjoyed so universal a popularity, that it was translated into almost all European languages (into English by Alexander Barklay, 1509), and that the well-known Geiler von Kaisersberg even selected the texts for his sermons from its pages. He also published a volume of Latin poetry and other works. The best editions of the "Narrenschiff" are by A. W. Strobel, Quedlinburg, 1838, and by Fr. Zarncke, 1854.—K. E.

BRANKER, THOMAS, an English mathematician of the middle of the seventeenth century, author of a translation of the Algebra of Rhonius, and of a treatise on the doctrine of the Sphere.

BRANT, JOSEPH, a celebrated Indian chieftain of the Mohawk tribe, the head of the Iroquois Confederacy, or "Six Nations," as they were called, in the state of New York. Thayendanegea was his Indian name; whether he was of pure or mixed blood is a disputed point. He was born on the banks of the Ohio river about 1742, and when only fourteen years old, was sent by Sir William Johnson to Dr. Wheelock's Indian charity school in Connecticut, where he received a good education. In 1762 he was employed as an interpreter by the Rev. Charles J. Smith, a missionary to the Mohawks; he appears to have befriended the missionaries, and to have exerted himself for the religious instruction of his Indian brethren. He published the Book of Common Prayer and the Gospel of St. Mark, translated by himself into the Mohawk language, in London in 1787; and he proposed to write a history of the Six Nations, but never fulfilled this intention. When the Revolution broke out, the influence of the Johnsons, the agents of government with the Six Nations, inclined him to adopt the royalist side; and this inclination was strengthened during a visit which he made to England in the winter and spring of 1776. He was received in London with flattering attentions; the earl of Warwick engaged Romney to paint his portrait, and James Boswell in a characteristic manner gloried in forming an intimacy with him. He returned to America in April, 1776, having previously pledged himself to take the field in the royal cause, with 3000 warriors of his race. He fulfilled his promise as far as he could, not bringing so many of his tribe with him as he had expected, but still affording essential aid to the king's arms. After the peace, he visited England again, to adjust the claims of the loyal Mohawks upon the crown, for indemnification of their losses and sacrifices during the war. He was received even with greater attention than before, being quite a lion in fashionable

society; all his claims were satisfied, and he returned to his native land in high good humour. A tract of land for the residence of his tribe was assigned to them upon Grand River, on the north side of Lake Erie. The remainder of Brant's life was spent at the handsome seat which he owned in Upper Canada, at the head of Lake Ontario, where he died November 24th, 1807, aged 65. Two of his sons were educated at Moor's Indian school, connected with Dartmouth college. His daughter married William J. Kerr, Esq., of Niagara, in 1824.

BRANTOME, PIERRE DE BOURDEILLES, born about 1540; died in 1614. He was the third son of Francis, vicomte de Bourdeilles, and of Anne de Vivonne de la Chataigneau—by both his parents of the best blood of Bretagne. He lived in a day when the distinction of birth was everything in France. His early years were past at the court of Margaret de Valois, sister of Francois I., and queen of Navarre, to whom the mother of Pierre was *dame de corps*. The romance of real life which he witnessed here impressed the boy more than his royal mistress's lively novels, amusing as they are. On the death of "la reine spirituelle" in 1549, he commenced his studies at Paris, and completed them—to use the language of his day—at Poitiers, 1555. Bourdeilles, from which the family took one of its titles, as well as the name by which Pierre is often styled, is about three leagues from Périgueux, the ancient capital of the province of Périgord. But they were also the owners of the district round Brantôme in the same province. At Brantôme there was an abbaye, the gift of which it would appear was in the crown, and this in 1556 was given to Pierre by Henry II., in recompense of some services rendered by his brother, Seigneur d'Ardelay. The abbaye was held by Pierre sometimes in his own name, sometimes in that of others but for his use, for the rest of his life; and, from this circumstance, he was more often known by the name of the abbaye than his own. The character and pursuits of the abbé, which we chiefly know through his own writings, are not calculated to suggest the notion of a churchman; nor does his receiving the means of support from church property seem to have had annexed to it any inconvenient condition. It certainly imposed no restriction on his courting pleasure in any of the courses which suggest themselves to the mere layman. It did not interfere with his pursuing military life as a profession; and we have him everywhere, like a knight-errant in search of adventures, running over Europe wherever he found employment for his long sword, saddle, and bridle. We cannot speak much for the modesty of his pretensions; still nothing very great is claimed for him by himself or others on the score of his martial achievements. They are not performed "en capitaine, capable de se faire un nom parmi les grands guerriers contemporains mais en vaillant soldat, en homme qui savait manier avec adresse une longue épée ou une dague." Brantôme was observant, and was active—very much of a gossip—very shrewd—very credulous—never seeing more than the surface of things—and seeming never to suspect that much of what great men say and do in public, is for the purpose of misleading inquisitive spirits like his. Of his strange credulity it is scarce possible to imagine a stronger proof than what he says of the Emperor Charles V. He tells us that he made efforts to be elected pope; that failing in this, he still indulged the ecclesiastical passion which suggested his strange ambition of becoming a monk. Brantôme made his way wherever a battle was to be fought, and he behaved in the field gallantly. In the festivities after victory, in the camp, or during truces, he was sure to be as far as possible with "captains and colonels, and knights in arms," learning all he could of what led to the fortune of the day; and even when little else could be had in such communications, learning that for which he is now chiefly consulted, and for which he is indeed an indispensable authority to students of French history—the characters of the persons with whom he was thus brought in contact.

Brantôme, though always holding some appointment at court, or with the duke of Alençon, whose chamberlain he was for some time, complains of the neglect of the great—tells of disappointments with respect to offices which he wished for, and which others obtained. On the death of Charles IX. he finally retired from public life, and employed himself in the management of a sister-in-law's property, and the education of a brother's children, whom he adopted. It was impossible that such occupations should be sufficient to satisfy Brantôme's restless and discontented spirit. His imagination still carried him back to the scenes which he had

quitted with regret, and it peopled the solitude in which he lived with the brilliant phantoms of the stirring life in which he had so long mingled. The earnestness with which he reacts some of the old scenes of his life; the desire he has to set things right which he thinks the world has misapprehended, and to substitute his own view for another—one often too much more probably true—which he thinks it his interest to disprove; remind us more of the character of some of Napoleon's conversations at St. Helena, than of anything else with which they can be compared. The books, however, of Napoleon's secretaries are as dull compared with Brantôme's as Napoleon himself was superior to most of the worthies of whom Brantôme writes. Brantôme's "Dames Gallantes," if great allowances are not made for the period in which he wrote, is a book which leaves a sad stain on his memory. It is as bad, and that is saying a good deal, as anything written by his old mistress, Margaret of Navarre. Brantôme's books are in some respects very curious. He seems not to have thought of writing till his retirement, and he writes very much from recollections of his own, not confirmed or aided by notes taken at the time of the occurrences; though he does not reject from his narratives anything that he heard at a later period from good authority. The books are gossiping books, yet the gossip is one who seems talking only to himself, and writing with no other view than to amuse and occupy himself. Yet he anticipated the reputation which his writings would acquire, and had some fear lest his books should be ascribed to some other than the true author. He orders his representatives to print his works after his death. He describes the manuscript volumes—"Lesquels on trouvera couverts de velours tant noir que verd et bleu, et un grand volume, qui est celui des dames, couvert de velours verd, curieusement gardés et très bien corrigés." Brantôme complains, with but little justice, of the caprices of fortune and the neglect of courts. He appears at all times to have been received with favour and attention. Charles IX. gave him a pension of 10,000 livres. He had, besides, the abbaye of Brantôme.—J. A. D.

**BRARD, CYPRIEN-PROSPER**, a French mineralogist, born at l'Aigle in 1786, became director of the mines of Savoy in Saxony, engineer-in-chief of the mines of Alais, and engineer of the school of mines in Paris, and died at Lardin on the 28th of November, 1838. Brard was the author of several valuable elementary works on mineralogy and mining, the most important of which are his "Nouveaux éléments de minéralogie, ou manuel du minéralogiste voyageur," published at Paris in 1838 (this is the third edition of a work which appeared under its second title in 1803); and his "Éléments pratiques d'exploitation," &c., published at Strasburg in 1829. He also published a "Minéralogie populaire," Paris, 1826, which was frequently reprinted, and some other popular works on mineralogy, chemistry, physics, and natural history.—W. S. D.

**BRASK, SAMUEL P.**, a Swedish poet of the seventeenth century, and pastor of Clara. He wrote a "Comœdia om den forlorade Son," 1645. He died in 1668.—M. H.

**BRASSAC, JEAN GALLARD DE BEARN**, comte de, a statesman and ambassador of the reign of Louis XIII., superintendent of the queen's household, born of noble parentage in the province of Saintonge in 1579; died at Paris in 1645. He began public life as king's lieutenant at Saint Jean d'Angely, where, although professing to be of their party, he made himself hated as an oppressor of the protestants. The better to make his way in the world, he latterly recanted the heresies of the reformers, and under the pontificate of Urban VIII. was ambassador at Rome.—J. S., G.

**BRASSICANUS, JOHANN ALEXANDER**, a poet and philologist, born at Wirtemberg in 1500; died at Vienna in 1539.

**BRATHWAITE or BRAITHWAYTE, RICHARD**, a pastoral poet of the reign of James I., born of a respectable family in Westmoreland in 1588. After spending a number of years at Oxford and Cambridge, where, according to Wood, "he avoided as much as he could the rough paths of logic and philosophy, and traced those smooth ones of poetry and Roman history, in which at length he did excel, he settled in his native county, on an estate given him by his father." He latterly resided at Appleton in Yorkshire, and died there in 1673. A list of his productions, the best of which are his pastoral pieces, is given by Wood.

\* **BRAUN, ALEXANDER**, a famous German botanist, who has done much to advance physiology. He has written monographs of the North American species of Equisetum, Isoetes, and

Marsilea, and notices of Charæ. He has published valuable papers on "The Plant Individual," and on the "Rejuvenescence of Plants."—J. H. B.

**BRAUN, AUGUST EMIL**, a German archæologist, was born at Gotha in 1809, studied at Göttingen and Munich, and afterwards was appointed librarian and secretary to the Archæological Institute at Rome. He published many valuable works and treatises on archæological subjects, some of which have been translated into English. We mention his "Antike Marmorwerke;" "Griechische Mythologie;" "Vorschnle zur Kunstmythologie," &c. He first employed the galvano-plastic process for multiplying works of art, and died at Rome in 1856.—K. E.

\* **BRAUN, WILHELM VON**, a Swedish lieutenant and poet. His poems, which are descriptive of every-day life, are witty but coarse. Two volumes were published in 1827-28.—M. H.

\* **BRAVAIS, AUGUSTE**, born in 1811; an exceedingly ingenious and industrious French physician, from whom science expects many farther and valuable contributions. Bravais was a leading member of the great scientific expedition to Scandinavia. In the report of the *voyage*, his memoirs on the aurora borealis, and on various magnetical and meteorological points, are very valuable. He is the author of many separate memoirs in the *Annales de Physique et Chimie*, and we owe chiefly to him and M. Charles Martins, those four volumes of the *Annuaire Meteorologique*.—J. P. N.

**BRAVAIS, LOUIS F.**, a French naturalist, has written valuable memoirs on the geometrical arrangement of the leaves and inflorescence of plants.—J. H. B.

\* **BRAVO, NICHOLAS**, a Mexican general, one of the leaders in the war of independence, born about the year 1780. From the commencement of the insurrection which separated Mexico from Spain, till the forced abdication of Iturbide in 1823, he was constantly in arms, contributing greatly to the success of the movement by various brilliant exploits, particularly his victory over the Spanish general Musitra. After the downfall of Iturbide, along with Vittoria and Negrette, he came into power; and notwithstanding that the monarchical party, of which he was the chief, was at the moment the weaker of the two which divided the republic, he was named vice-president in 1824. This post he retained till 1827, when his party having determined to oust the government of Vittoria, which was pledged to republican principles, he joined the rebel Manuel Montano, and being defeated by Guerroiro was taken prisoner, and sentenced to six years' banishment. Before the expiry of his sentence he was recalled in 1829, on the election of Bustamente to the presidency. He has since been revenged on his adversary, Guerroiro, who was shot as a rebel in 1831, and had been once more defeated in the field by Vittoria in 1833. He is said to be living in retirement in a village of the United States.—J. S., G.

**BRAWE, JOACHIM WILHELM FREIHERR VON**, a young German poet of great promise, was born at Weissenfels, February 4, 1738, and died at Dresden, April 7, 1758. He wrote two tragedies, "Der Freigeist" and "Brutus"—the first German drama in blank verse—which were edited after his death by Lessing, Berlin, 1768.—K. E.

**BRAXFIELD, ROBERT MACQUEEN**, Lord, a Scottish judge of eminence; born on the 4th of May, 1722. His father was proprietor of the estate of Braxfield in Lanarkshire. Lord Braxfield was educated partly at the grammar school of the county town, and partly at the university of Edinburgh. After this he completed an apprenticeship with the view of becoming a writer to the signet, but finally devoted himself to the more ambitious career of the bar. He passed advocate in 1744. He made himself well acquainted with the intricacies of feudal law, and was employed by the crown in the numerous disputes which arose in regard to the estates forfeited in the rebellion of 1745. This gave him an opportunity of making his talents known, and he speedily became possessed of very extensive practice. His position at the bar, and his social qualities, which were of a kind suited to the times, brought him into intimacy with Dundas, the president of the court, and with his brother, the then lord-advocate, afterwards Lord Melville. His intimacy with them is said to have continued throughout life. Although at a great sacrifice of professional income, they prevailed upon him to accept, in 1766, a seat upon the bench, when, in the way customary in Scotland, he assumed the title of Lord Braxfield, from the estate which he had inherited from his father. In 1780 he obtained a judgeship in the criminal court also. Seven years afterwards

he was elevated to the office of lord-justice-clerk in Scotland, which gave him the second position in the supreme civil court, and made him the ordinary president of the supreme criminal court. In this capacity he is best remembered as having presided at the trials of Muir, Palmer, and others, for sedition, in 1793 and 1794. He died on the 30th of May, 1799.—It is difficult now to form an accurate estimate of Braxfield's character. His political friends represent him as able and honest; his political opponents, as coarse and unprincipled. That he possessed great intellectual energy, and was clear, vigorous, and logical, within his own domain of feudal and civil law, is admitted by all. That he was honest, there seems no reason to call in question, though he appears to have adopted his political opinions without examination, and to have adhered to them with but little knowledge of their bearing. The late Lord-President Hope describes him in private as "a kind-hearted man, and a warm and steady friend." With these qualities, and with a fearless discharge of what he believed to be his duty, his virtues end. The rough humour of the times degenerated with him into excessive coarseness. His boldness and strength of mind, unchecked by serious opposition either from his brother judges or from the bar, or by public opinion, rendered him on the bench too often insolent and overbearing. Strongly built, with heavy overhanging eyebrows, clear piercing eyes, and large firmly-marked features, his aspect made him appear more violent than he was. It is in relation to his conduct in the sedition trials already mentioned, that the severest charges against his memory rest. The numerous anecdotes are not to be trusted, but in the trials, as reported by Howell—State Trials, vol. xxiii.—there is much to justify severe condemnation.—J. D. W.

BRAY, ANNA ELIZA, born KEMPE, an eminent English novelist, was born in the county of Surrey towards the end of last century. Her early passion for the stage being happily converted into an enthusiasm for art, she received lessons in painting from Thomas Stothard, and in 1818 married the son of that artist, Charles Alfred, famous for his illuminations, and for his drawings of antiquities. In company with her husband, she made a tour through Normandy and Brittany, and published on her return in 1820, a series of descriptive letters, illustrated by designs from her own pencil and her husband's. The melancholy death of Charles Stothard in the following year, threw on her the task, the artist's last and fatal task, of illustrating the account of Derbyshire in Lyson's *Magna Britannia*. At this period she recovered from one overwhelming grief only to be subjected to another. She lost in succession her father and her only child, and, to crown her sorrows, she was seized with temporary blindness. In 1823 she published the "Memoirs of Charles Stothard." Two years later she married Mr. E. A. Bray, curate of Tavistock, London, and author of several theological works. Mr. Bray died in 1857. Mrs. Bray's novels are of two classes, historical and legendary. She has been thought to excel chiefly in the former; but both are characterized by considerable vigour and by healthy moral sentiment, and have been extensively popular. We mention—"Courtenay of Walreddon." "Gaston de Foix;" "Protestant;" "Talba;" "Trials of Domestic Life;" and "White Hoods."

BRAY, THOMAS, an eminent English divine, memorable in connection with various missionary enterprises of the beginning of the eighteenth century, was born at Marton, Shropshire, in 1656, and received his early education at the school of Oswestry. After graduating at Hart hall, Oxford, he obtained, through the influence of Lord Digby, the vicarage of Over-Whitacre and the rectory of Sheldon. His catechetical lectures, which were published while he held these preferments, having attracted the favourable notice of Bishop Compton, that learned prelate selected him as his commissary to Maryland. In this responsible position his talents and missionary zeal were so usefully exercised as to command for him general favour in the church. The missionaries he employed were selected with the greatest care, and instructed thoroughly in their duties. To aid them in their labours, he took pains to provide for them parochial libraries, giving thus the first hint of an institution, which, under the authority of parliament, was afterwards adopted throughout England and Wales. He sailed from England in December, 1699, and remained in Maryland two years, pursuing with untiring energy his schemes for the settlement of the church in that province. On his return in 1701 he published his "Circular Letters to the Clergy of Maryland," for which he received the

thanks of the Society for the Propagation of the Gospel, an association which he had been mainly instrumental in forming, and was publicly eulogized by the most eminent churchmen, particularly the bishop of London and the archbishop of Canterbury. Having been appointed to the living of St. Botolph, Aldgate, in 1706, he continued in that preferment till his death in 1730. The impulse which he communicated to missionary enterprise in this country deserved, as it attracted, the notice of his sovereign and of parliament, and the reputation for piety which he left behind him was justified by the records of a long and laborious life devoted to the ends of christian philanthropy. Besides the publication above mentioned, Dr. Bray gave to the world, "Proposals for the Encouragement and Promoting of Religion and Learning in the Foreign Plantations," and "An Account of the Present State of Maryland."—J. S., G.

BRAY, WILLIAM, F.S.A., a noted antiquarian, was born in 1736, and received his early education at Rugby. He was articled to a solicitor at Guildford, but subsequently became a clerk in the board of green cloth, through the interest of the Evelyn family. He was the author of a "Tour in Derbyshire and Yorkshire," completed Manning's History of Surrey, and was a frequent contributor to the *Archæologia*, &c. He catalogued and edited the MSS. of John Evelyn (*Sylva*), and published his Memoirs when already eighty years of age. He died in December, 1832, aged ninety-six.—E. W.

BREA, LODOVICO, an old Italian painter, born at Nizza. He flourished from 1483 to 1513. He was the founder of the Ligurian school, and Genoa has many of his works. His heads are fine, his drapery graceful, his grouping good. He painted small, and among his best works were a "Massacre of the Infants," and a "St. John."—W. T.

BREBEUF, GUILLAUME DE, born at Thorigny in Lower Normandy in 1618, and died at Venois, near Caen, in 1661. He enjoyed considerable reputation for poetry and poetical translations. His first publications were of the character which is described by the name of burlesque, and travesties of parts of Lucan and Virgil attracted attention, and afforded amusement to idle readers. Topics of the day were the subject of these extravaganzas, and scandals of Brebeuf's own time were daily related pleasantly under the disguise of ancient names and manners. Brebeuf was fitted for something better than this, and he published a translation of Lucan, which had many of the faults which are ascribed to Lucan himself. It would seem almost as if Brebeuf's own taste was adulterated by that of his author; for in his earlier days Horace is said to have been the only classical author he admired, and it would not be easy to imagine a stronger contrast than between Horace and Lucan. The style of Lucan is tumid, and his translator in this outdid his author; still the work is conceived in the spirit of one worthy the task in which he engaged, and one who was certainly possessed of much poetical fervour. In the preface to his work, which is deserving of perusal by persons who may not care to look farther, he tells us that his object being to render his author easily intelligible, he has at times abridged, at times expanded the language, seeking thus to express the thought more truly than if he servilely pursued the mere words. We have read parts of this translation with great pleasure. Brebeuf had expectations from Cardinal Mazarin, which were disappointed by Mazarin's death. Soon after this he went to reside at Caen. His health was at all times feeble, and he describes himself as suffering from what he calls a long and obstinate fever of twenty years, in the more acute attacks of which, he says, his verses were chiefly composed. He published some religious poetry, under the title of "Entretiens Solitaires," dedicated to Cardinal Mazarin. After Brebeuf's death, a collection of what were called his "Œuvres Diverses" appeared, in which are a series of 150 epigrams, written for a wager against a lady who wore rouge, of which a few are very amusing.—J. A., D.

BRÉCOURT, GUILLAUME MARCOUREAU. The date of Brécourt's birth has not been recorded. He died in 1685. The family is said to have come from Holland. He was an actor, and he wrote pieces for the theatre. His first appearance on the stage was as one of Moliere's company. He afterwards passed into that of the Hotel de Bourgoyne, and when these companies were united he remained in the "joint troupe." At a boar-hunt he killed the animal, and Louis XIV. praised his dexterity. This is recounted as though the royal compliment was more than a patent of immortality.—J. A., D.

BREBIETTE, PIERRE, a French artist, whose works are forgotten, born at Marne on the Seine in 1596. He engraved many religious and classical pictures.—W. T.

BREDA, JOHN VAN, a Flemish landscape painter, born at Antwerp in 1683. He was instructed by his father, Alexander, who painted Italian views, fairs, and cattle markets. Breda studied Breughel in the great De Witt gallery. He became celebrated for his exact copies, forgeries, almost twins and undistinguishable. He visited London with Rysbrack the sculptor, who executed the monuments of Prior, Sir Isaac Newton, and the duke of Marlborough, and was patronized by the rich and tasteful, particularly the unfortunate Jacobite earl of Derwentwater. On his return to Antwerp, Louis XV. visited his studio, and purchased two landscapes and two scriptural pieces. Breda was a mixture of Wouvermans and Breughel. His skies and distances were thought too blue and gaudy, but his touch was clear, firm, and good, and his colour pure. Some think him equal in fire to Breughel, but Bryan calls him a poor undisguised imitator of Wouvermans. His pictures were generally conversations, fairs, and skirmishes. He died in 1750.—W. T.

BREDAEL, PETER VAN, a Flemish artist, born at Antwerp in 1630. His landscapes were from nature, and his figures were correctly drawn, his trees and water clearly painted, and well handled. He decorated views, and made up scenes with Roman fountains, bas reliefs, and monuments. His style resembles John Breughel, but is inferior. He went to Spain, and was there much patronized. He died in 1681, director of the Antwerp academy, a sure proof he had not too much talent.—W. T.

BREDAL, NIELS KROG, a Danish poet, was born at Trondhjem in 1733. His father, also a poet, was the son of Bishop Gr. Bredal, and his mother the niece of Bishop Niels Krog. Breda commenced his studies in 1749. In 1761 he was borge-mester of Trondhjem, and ten years later rector of the theatre of Copenhagen. He died in 1778. He was the author of various theatrical works, the most noted of which was "The Royal Succession of Sidon" (Tronfølgen i Sidon), which, brought on the stage soon after Nordahl Brun's *Zarine*, led to a theatrical war, whence resulted a sounder literary taste in the nation.—M. H.

BREDOW, GABRIEL GOTTFRIED, a German historian, was born at Berlin, December 14, 1773, and died at Breslau, September 5, 1814. He was successively professor at the universities of Helmstedt, Frankfort, and Breslau, and wrote a number of valuable popular and educational works on history and geography. We quote—"Handbuch der alten Geschichte, Geographie und Chronologie," and "Merkwürdige Begebenheiten aus der allgemeinen Weltgeschichte," 21st ed., 1838.—(*Kunisch Bredow's Leben und Schriften*, Berlin, 1816.)—K. E.

BREDSORFF, JACOB HORNEMANN, a Danish philologist and naturalist, born at Skjerninge in Zealand in 1790. In 1818 and 1819 he travelled, at the expense of the Danish government, through Germany, Switzerland, Italy, and France; and after assisting in the societies for the advancement of physical science and of rural economy, he became in 1823 lecturer on mineralogy in the university of Copenhagen, and in 1828 professor of botany and mineralogy in the academy of Soroe. He died in 1841. Of his works we notice his "Elements of Geognosy," 1827, and "Handbook for Botanical Excursions," 1834. To his memoir "On the European Mountain-Systems" the prize was awarded by the Geographical Society of Paris in 1825.—W. S. D.

BREEMBERG, BARTHOLEMEW, a Flemish landscape painter, born at Utrecht in 1620. He studied at Rome, where the Bentvogels named him "Bartolomeo." He studied nature at the old pumped-dry sources of Tivoli and Frascati, and stuffed his landscapes with composite ruins—with what good old Pilkington calls "an elegant and charming taste." His animals were spirited, his figures well composed. His smaller pictures are his best. His first manner is black, his second abounds in ultramarine. In expression his figures are sensible and lively. He died in 1660. There are extant some forty of his etchings of Roman antiquities.—W. T.

BREGUET, ABRAHAM LOUIS, born in 1747 at Neufchatel; died in 1823. Breguet was one of the nicest, the most exact, and most ingenious mechanics that France ever produced. After serving some time with his father-in-law, a watchmaker at Neufchatel, young Breguet removed to Paris, and entered on a career of success only interrupted for a time by the troubles of the Revolution. His workmanship has never been surpassed, and his genius, aided by a store of sound mathematical and physical

knowledge, enabled him to introduce improvements and invent instruments, of value so great, that his name became renowned through Europe. The French government did not overlook the services of Breguet: he became chronometer-maker to the marine, member of the Bureau des Longitudes, and subsequently member of the Academy of Sciences. Certainly reward has rarely been better merited, for his labours achieved for navigation, for astronomy, for physics, instruments the most accurate, ingenious, and durable; and his taste as an artist was such, that the richness and beauty of his ornamentation was a fit accompaniment of that more permanent and essential excellence which characterized everything issuing from his hands. His specific inventions and improvements are so numerous, that one would almost write a treatise on horology in attempting to enumerate them and to render them appreciated. Breguet early effected what was never done before—the construction of repeaters hermetically sealed, and therefore protected from all dust. He vastly improved the escapement; invented the sympathetic pendulum, the military reckoner or timepiece, the astronomical reckoner, &c. &c. Need we refer to those exquisite watches of so small a diameter, and yet with a double box, that became the envy and ambition of fashionable ladies?—One contribution of Breguet's to physics demands especial mention, viz., the metallic thermometer. This exquisite instrument acts through the enlarging or contracting of a spiral, composed of two or three strips of metals of different moduli of expansion. Its expense prevents its use for ordinary purposes; but in delicacy it immeasurably surpasses all other modes of measuring heat, with the exception of the thermo-multiplier.—Breguet and our horologist Arnold were fast friends.—J. P. N.

BREHM, CHRISTIAN LUDWIG, a distinguished German ornithologist, was born at Schönau in 1787. He made a large collection of European birds, of which he is said to have had more than 5000 specimens. Wrote "Text-Book of the Natural History of the Birds of Europe," Jena, 1823 and 1824.—W. S. D.

BREISLAK, SCIPIONE, a celebrated geologist, born at Rome in 1748 of German parents. He obtained the professorship of physics and mathematics in Ragusa, and afterwards a professorship at the Collegio Nazareno in Rome. He travelled to Naples and Paris, and made the acquaintance of many eminent French naturalists. While director of an alum factory, near Naples, he had the opportunity of making numerous geological investigations, and in 1811 he published at Milan his "Introduzione alla geologia." He became teacher of physics in the military school at Naples, and afterwards resided in Rome, until the political troubles of his country disturbing him in his studies, he removed to Paris, where he remained until Napoleon appointed him inspector of the manufacture of saltpetre and gunpowder throughout Italy. From this time he resided principally at Milan. He died at Turin in 1826, when his celebrated cabinet of minerals passed to the Borromeo family. His system of geology maintains the singular view that the globe of our earth was originally a fluid mass, which has cooled from within outwards.—W. S. D.

\* BREITHAUPT, JOHANN FRIEDRICH AUGUST, one of the greatest German mineralogists of the present century, was born at Probstzelle, near Saalfeld, in 1791. At Freiberg he studied geology under the celebrated Werner, who obtained him in 1813 the position of inspector of the collections of the academy at Freiberg, and assistant teacher; and in 1827 that of professor of oryctognosy. In his greatest work, "Vollständigs Handbuch der Mineralogie," of which the first volume appeared at Dresden in 1836, he proposes a new system, founded indifferently upon external chemical characters. He wrote several other works on mineralogy and the topography of Freiberg.—W. S. D.

BREITHAUPT, JOACHIM JUSTUS, one of the most distinguished theologians of the school of Spener and Francke, was born in 1658 at Nordheim in Hanover, where his father was pastor and superintendent. He studied for the ministry of the Lutheran church, at Helmstadt, and early manifested an earnest and devout spirit. After being for some time co-rector in Wolfenbüttel, and professor of theology in Kiel, he removed to a chair in the university of Erfurt, where in 1690 he became intimately associated with Francke, who in that year was appointed pastor of the Augustinian church in Erfurt. In 1691 he was appointed, on the recommendation of Spener, professor of theology in the newly founded college of Halle, in which office he became the first representative of that peculiar religious and theological tendency which gave to the school of Halle, in its earlier period, so important and beneficial an influence upon the

whole protestant church of Germany. Along with his professorship, Breithaupt held other important ecclesiastical offices in Halle and Magdeburg, between which two places his time and labours were divided. He was never married. He died at Kloster-bergen, near Magdeburg, 16th March, 1732. His published sermons, disputations, programmes, and polemical pieces were numerous. His principal work was the "Institutiones Theologicae," Halle, 1694, 2 vols.; to which was added in 1732, "Institutiones Theologiae Moralis," in which the doctrine of the Lutheran confession was orthodoxly expounded, but in a biblical form and a practical spirit, without unfruitful speculations, and with constant application of the truth to the heart and life. He was a man of deep devotion and humility, and of great simplicity of life and manners. "Let him alone," exclaimed the elector of Mainz on one occasion when loud complaints were made against him by his opponents; "he may be a very good man after all: he prays for us."—P. L.

BREITINGER, JOHN JAMES, a Swiss protestant divine and ecclesiastical historian, born at Zurich in 1575; died in 1645. In 1618 he headed the Swiss deputation to the synod of Dort, and in that assembly maintained powerfully the tenets of Zwingle. An account of the proceedings of the synod, and a translation of the New Testament into German, are the performances by which he is best known. The rest of his writings remain in MS. in the library of Zurich.—J. S., G.

BREITINGER, JOHANN JACOB, a German scholar, was born at Zurich in 1701, and died in 1776. He was professor of Greek and Hebrew in his native town, and by his critical writings, greatly contributed towards the improvement of German literature. Besides his "Kritische Dichtkunst," 1740, 2 vols., he published also a valuable edition of the Septuagint, 1731-32, 4 vols., and other works.—K. E.

BREITKOPF, JOHANN GOTTLÖB IMMANUEL, an eminent German printer and publisher, was born at Leipzig, November 23, 1719, and died January 28, 1794. After having completed his education at the university of his native town, he entered the printing and publishing business of his father, which he gradually enlarged, and brought to a highly flourishing state. He introduced numerous improvements into the art of printing; he gave his letters a clearness and elegance never before attained in Germany; printed notes and maps with movable types; and greatly improved the construction of the press. He also wrote some valuable works on the origin of printing, but was unable to complete his "History of the Art of Printing," for which he had been collecting materials during the greater part of his life.—His son, CHRISTOPH GOTTLÖB, born 1763, died 1800, continued his father's business in company with Gottfried Christoph Härtel, and originated the first musical gazette in Germany.—K. E.

BREKELENKAMP, a Dutch painter and disciple of the microscope-eyed Gerard Douw. He followed Rembrandt's manner, and painted spirited cottage scenes and conversations. He flourished, hoped, and despaired about 1650.—W. T.

BREMBATI, ISOTTA, a celebrated poetess of the latter half of the sixteenth century. She was considered one of the greatest linguists of the time, and Mazzucchelli asserts that her attempts in Spanish verse were much superior to those of the best Spanish poets. Her writings are—a collection of letters, some of which have been inserted by Sansovino in his Secretario, and a great number of sonnets and canzones. She died in 1586.—A. C. M.

BREMER, FREDRIKA, the well-known Swedish novelist, whose works have created throughout the civilized world an interest for her native North, was born in 1802 at or near Abo, in Finland. At that time Finland formed part of the kingdom of Sweden, but on its cession to Russia her father sold his estates there, and removed with his family to Stockholm. In the slight biographical sketch furnished by Miss Bremer to the German translation of her works published at Leipzig, she says—"I was born on the banks of the Aura, a river which flows through Abo, and several of the learned men of that university were my god-fathers. Whilst very young I was removed with my family from my native Finland. Of this part of my life I have retained but one single memory. This memory is a word, a mighty name, which in the depths of paganism was pronounced by the Finnish people with fear and love, and is still so pronounced, though in these days perfected by christianity. I still fancy that I hear this word spoken aloud over the trembling earth by the thunder of Thor, or by the gentle winds which bring to it refreshment and consolation. That word is *Jumala*, the Finnish name for

God, both in pagan and christian times." According to the same account, her father's family passed their winters in Stockholm, where the daughters received instruction, played on the piano, sung ballads, read novels, drew in black chalk, and looked forward to the future, "when they hoped to see and do wonderful things." In the summer they removed to their country residence, where German was studied, and the German poets read, especially Schiller, whose Don Carlos made a deep impression on the susceptible mind of the young authoress, who even now occupied herself with literary composition. Nay, indeed, according to her own account, this had long been the case, for she says—"I began to write in my eighth year;" and continues—"I wrote during the greater part of my youth under the impulse of restless youthful feelings; afterwards under that of another emotion, I wrote that which I had read." At what period in Miss Bremer's life she lived with the Countess Sonnehjelm in Norway, and also as a teacher in a ladies' school at Stockholm, does not appear; but be it when it might, she obtained there, like the authoress of Jane Eyre, much useful experience from a hard and painful life wherewith to enrich her after writings. Nor does Miss Bremer's earlier life appear by any means to have been happy. "A dark cloud," to use her own words, "came over the splendour of her youthful dreams"—for she writes of herself in the third person.—"Like early evening it came over the path of the young pilgrim of life, and earnestly, but in vain, she endeavoured to escape it. The air was dimmed as by a heavy fall of snow; darkness increased, and it became night. And in the depth of that endless winter's night she heard lamenting voices from the east and from the west, from plant and animal, from dying nature and despairing inhumanity; she saw life with all its beauty, its love, its throbbing heart, buried alive beneath a chill covering of ice. . . . All was dead, all was dying, except pain." . . . Looking at her a few years later, it will be seen that a great change has taken place. "Her eyes have long been filled with tears of unspeakable joy; she is like one who has arisen from the grave to a new life. What has caused this change? . . . The illusions of youth are past, the season of youth is over, and yet she is again young, for there is freedom in the depth of her soul, and, 'Let there be light!' has been spoken above its dark chaos."

Arsta, the residence of the Bremer family, is described as being remarkable in a historical point of view. The house, which is of stone, was built during the Thirty Years' war, with large and lofty apartments, overlooking the meadow where Gustavus Adolphus reviewed the army at the head of which he marched into protestant Germany as its deliverer. It is surrounded with magnificent trees, commanding a fine view of the Baltic. Here, when the spring and summer of life were over, a happy season dawned upon our authoress. "Here," she says, "standing on the verge of the autumn of my life, I still see the same objects which surrounded me in the early days of my spring, and I am so happy as out of many dear ones still to possess a beloved mother and sister." At Arsta Miss Bremer wrote many of her most celebrated works; and here, in companionship with her mother and sister, she lived till the time of leaving Europe for America, whence she returned, after two years, to find that death had removed her best-beloved friend and sister, and that Arsta had ceased to be that home of the heart which it had been for years.

In 1828, when in her twenty-sixth year, Miss Bremer published in Stockholm her "Teckningar ur Hvardagslifort" (Sketches of Everyday Life). These consisted of Axel and Anna, the Twins, and other stories and sketches, which, though greatly inferior to her after works, attracted immediate attention, and awoke a lively interest. It was not, however, until the publication of the "H. Family," a work which still retains a great share of public favour in Sweden, though decidedly one of the less pleasing of her novels, that the public recognized an author of unquestionably original talents; and the decision thus arrived at was fully confirmed by her after works, which followed in rapid succession. These were—"The President's Daughters;" "Nina;" "The Neighbours;" "The Home;" "Strife and Peace," the scenery of which is laid in Norway. Of these "The Neighbours" is the work which, more immediately than any of the others, gained her a popularity out of her own country. In 1841 these works were translated into German, and published by Brockhaus of Leipzig, and spread from one end of that vast intelligent country to the other, finding everywhere a response in the national heart. In 1842, William and Mary Howitt, then residing in Germany, and students of Scandinavian literature, recognizing the domestic element of

these works as a sentiment native to the English heart, resolved also upon introducing them, by translation, to the British public. At that time very little, comparatively speaking, was known of northern literature, and the works of Miss Bremer therefore were not only warmly welcomed from their own intrinsic qualities, but because they led, as it were, into other realms of mind. A translation of "The Neighbours" was first published, by the Messrs. Longman, which was quickly followed by "The Home," "The President's Daughters," and the remainder of the "Sketches of Everyday Life," by the same translators; nor was the reception of these works in England less enthusiastic than it had been in Germany. From England the Howitts' translations instantly passed over to America, where from one end of the Union to the other they soon became household property. They were also translated about the same time into French; but being naturally less kindred to the domestic heart there than among the Teutonic races, they were less generally read. It is hardly necessary to particularize the characteristics of these excellent works. It is sufficient to say that all are remarkable, whatever may be their various degrees of literary merit, for the same attractive peculiarities, great womanly purity, clearness of judgment, the most thorough good temper, with a not unfrequent touch of humour (which, however, never degenerates into jest), a keen perception of the truth in life, great knowledge of human nature, a lucid and often eloquent style, and great powers of description. With all these qualities of the successful novelist, the stories themselves are often of the simplest construction, dependent rather upon their fidelity to nature and the soundness of their principles, than on the intricacy of their plot, for attracting the universal reader. The eagerness with which these works were received, and the place which they at once established for themselves in the affections of the public, are a cheering proof of sound moral life in the heart of the age. The peculiar sphere in which Fredrika Bremer exercises her greatest power, and where she is most valuable as a writer, is that of domestic life. Home, and all its joys and sorrows, its repose and its anxiety, its light and its shadow, its fair daughters and its hopeful sons, its drawing-room festivities, its active duties of the kitchen, its servants, its very animals—all have their place in her pages, and are interpreted by her.

After Fredrika Bremer had attained to this wide celebrity, she published "The Diary," "Life in Dalecarlia," "Brothers and Sisters," and "The Midnight Sun." Another little work also, though bearing an earlier date of authorship, was translated about the same time by the Howitts, "The Morning Watch, or a Confession of Faith," intended to counteract the writings of Strauss, and in which the authoress avows her entire faith in Jesus as the Saviour.

In the autumn of 1840 Miss Bremer, induced by the solicitations of her numerous friends in America, and also by her own desire to study life under what appeared to her its most favourable circumstances, as exhibited in the New World, paid a visit, entirely alone, to America, where she remained for two years, studying the social, moral, and religious life of that great republic, from the north to the south. The result of these two years' observation and study was afterwards given to the public in 1853 in 3 vols., translated by Mary Howitt, under the title of "The Homes of the New World." A severe blow, as has been already stated, met Miss Bremer on her return home, in the death of her beloved sister, which she then learned for the first time. To this sister, an invalid for many years, and to whom frequent affectionate reference is made in many of Miss Bremer's works, her letters from America had been addressed. Two years afterwards she also lost her mother; after which she removed from the old family home at Arsta to Stockholm, whence she gave the world, in 1856, her last-published romance, called "Hertha," perhaps the least popular of her works, but the one probably of which the purport was the most deeply studied, and which aimed at the highest results—the alteration of the laws of Sweden as regards the property of women. These laws are extremely oppressive and unjust, and the effect of them is represented by no strained or unnatural means as operating upon Hertha, no merely imaginary character, as we are assured; there being many living Herthas in Sweden. But the subject was painful, and the picture presented by the story disheartening; and the ordinary reading public, which had loved its home more, and cherished its home affections more proudly in consequence of Fredrika Bremer's former works, was disappointed that she could still show another side to the picture. Still her labour, we are assured, has not been in vain, for the sad and

unpleasing story of Hertha has, together with other causes, led thinking men to a deliberate consideration of these antique but oppressive laws, with a view to their amendment. In 1857, Miss Bremer left home for Switzerland and Italy, and in the latter country completed her "Father and Daughter," which was published in 1858. The result of her travels appeared, in 1860, in two volumes entitled "Two years in Switzerland and Italy." She next visited the Holy Land, Turkey, and Greece, and in 1861 commenced the publication of her observations on these countries. All the above works have been translated into English by Mary Howitt. Miss Bremer died at Arsta on the 31st of December, 1865.

Miss Bremer, like her countrywoman Jenny Lind, was actively benevolent, and spent a considerable portion of her income in benevolent purposes. In times of extraordinary distress, as in the cholera at Stockholm, and after the Danish war in Holstein, she was active at Copenhagen for the establishment of refuges and schools for destitute orphans. During a remarkable season, also, when the poor of Stockholm suffered much from cold and hunger, hundreds owed their lives to her exertions.—M. H.

\* BREMIKER, KARL, of Berlin, one of the many able astronomical calculators of the continent. He has recently produced our best modern tables of logarithms of numbers and trigonometrical fractions to every tenth second; Berlin, 1852.—J. P. N.

BREMOND. The name of several noble families of France, the most distinguished of whom were the lords of Ars in Perigord.—PIERRE DE BREMOND D'ARS, knighted by Charles VII. in 1442 for his services in expelling the English from the district of Saintonge and the Angoumois, died in 1456.—CHARLES DE BREMOND D'ARS, known under the name of Baron des Chateliers, a brave and loyal soldier of the reign of Henry III. He played a prominent part as lieutenant of Saintonge, &c., in the religious wars of the period.—JOSIAS BREMOND D'ARS, son of the preceding, also distinguished in the religious wars of the reign of Henry III., but more particularly in those of the reign of Louis XIII., died in 1651, leaving a reputation for bravery earned by military service extending over a period of seventy-five years, in the course of which he had seen twenty battles and eighteen sieges.—PIERRE-RENÉ-AUGUSTE, COMTE DE BREMOND D'ARS, born at Saintes in 1759, deputy to the states-general in 1789, voted in that assembly against revolutionary measures, took refuge in Holland after the death of the king, and returning to France in 1800, lived retired and undistinguished near his birthplace. Died in 1842.—CHARLES DE BREMOND, marquis d'Ars, a French naval commander, killed in an engagement with the English in 1771. In 1760, while in command of the frigate *L'Opaille*, he captured from the English a ship of the line, and a frigate of twenty-four guns.—LOUIS BREMOND D'ARSES or ARS, a French commander of the first half of the sixteenth century, born in the district of Saintonge. As lieutenant of Louis of Luxemburg, count of Ligny, he fought with distinction at Fornovo, the Chevalier Bayard being of his company. Under Louis XII. his exploits were numerous and brilliant. At the battle of Novara he encountered hand to hand the famous Ludovico Sforza. He took part in the reduction of Naples and the siege of Canosa, was wounded at Cerignole in 1503, and after the death of the count of Ligny, succeeded him in the command of the district of Apulia. In 1511, with Bayard for one of his lieutenants, he fought at the battle of Ravenna.

BREMOND, GABRIEL DE. Of the precise dates of the birth and death of Gabriel de Bremond, little or nothing is known. He is first known as, towards the close of the seventeenth century, supporting himself by writing novels for the Dutch booksellers, and is spoken of as a French refugee, whom religious or political causes drove from his country. In his new country he again gave cause for suspicion, and was thrown into prison for some political intrigue. While in prison, he recast and abridged Chapelain's translation of Guzman d'Alfarche, and not only did this, but sought to make a French scoundrel of the Spanish rogue. This mode of dealing with works of foreign literature is never very successful, but the insertion of some stories having the interest of local and temporary scandal did something for the book. Bremond's own adventures led him to dwell with some severity on all persons engaged in the administration of the law. His book is by no means unamusing. It was printed first at Amsterdam in 1695, and in the same year at Paris. Le Sage's book has, of course, had the effect of throwing the older book out of circulation, but

it is worth looking at. When Bremond got out of prison, he made his way to the Levant, and no more is heard of him.

The publication of memoirs under the name of remarkable persons, has been at all times the disgrace of French literature, and we find our poor bookmaker in the way of his trade thus employed. Some Guzman d'Alfarache of the press had published what he called the *Memoires of Madame Mancini*, an impudent forgery, but which sold, or seemed likely to sell; and straight-way Gabriel de Bremond is in the field with the "*Veritables Memoires de Madame Mancini, connétable de Colonna, écrits par elle-meme.*" Our hero's was the more popular book, probably because it was the more skilful forgery. The scandal of Charles II.'s court supplied him with the subject of a novel which told—under feigned names, to which, however, a key was soon supplied—the loves of the English king and Lady Castlemain. He published several other novels, but there seems no object in recording the names, though some of them are still in request with the collectors of rare books.—J. A. D.

BREMSER, JOHANN GOTTFRIED, a distinguished German physician and naturalist, born at Wertheim-on-the-Maine in 1767. In 1801 he exerted himself greatly to promote the introduction of vaccination into Austria, and published an essay on the subject, followed in 1806 by a memoir entitled "Vaccination considered in its relation to the interests of the State." From 1806 Bremser devoted himself principally to the study of the entozoa or intestinal worms, and his reputation rests principally upon the works published by him on this curious and interesting branch of zoology. Of these the most important is his "*Zoological and Physiological Treatise on the Intestinal Worms of Man,*" Vienna, 1819. This work is still of considerable value, both to the physician and naturalist; but it will probably soon become only historically important, as great advances have lately been made in our knowledge of the natural history of the entozoa. In 1824 Bremser also published "*Icones hilminthum, systema Rudolphi entozoologicum illustrantes.*" Died in 1827.—W. S. D.

BRENDAN, SAINT, of Clonfert, patron of Kerry. There are few names connected with the ancient ecclesiastical history of Ireland more celebrated throughout Europe than that of Saint Brendan—the legend of whose marvellous seven years' voyage in the Atlantic, for a long period superseded the more classical wanderings of Ulysses, and was the wonder and delight of many generations of men. If another, perhaps still more celebrated Irish legend—that of St. Patrick's purgatory—has been made memorable by the magnificent and immortal transformation it underwent in the first and greatest of christian epics—the *Purgatorio* of Dante, as well as the more direct use made of it by Calderon in his *El Purgatorio de San Patricio*—the Legend of St. Brendan may boast of a more enduring interest, and a more unflinching belief; since we read in Spanish history of an expedition being fitted out so late as the year 1721, and despatched from the Canaries in search of the island supposed to have been discovered by the Irish saint in the first half of the sixth century. Indeed, so strong was the belief in the actual existence of this shadowy region entertained alike by Spaniards and Portuguese, in the beginning of the sixteenth century, that the treaty by which the crown of Portugal ceded to that of Castile its right to the conquest of the Canaries, included among the number, the island of St. Brendan, to which it gives the very appropriate name of the *Unreached*. Each country, in its adoption of the legend, added, as might be expected, something of its own peculiar traditions to the story; the Spaniards believing for a long period that the island of San Borondon, as they called it, was the place whither Don Roderic retired after the fatal battle of the Guadalete; the Portuguese assigning it as the asylum of their king, Don Sebastian, and on their first discovery of the Indies, believing that region to be the island of St. Brendan they had so long sought for in vain.

The wide diffusion of this legend, and the important influence it has had in keeping alive the spirit of adventure and inquiry in the maritime countries of Western Europe, entitle it to mention in a work like this. A farther investigation of its details would be out of place, as possessing an interest peculiarly antiquarian and ecclesiastical. The main facts of the legend are considered by many cautious writers to have some historical foundation. It is supposed that, whether from the tradition preserved from the earliest period throughout Europe of the existence of a great western region—an Atlantis, as Plato calls it—or from some other and more mysterious cause, St. Brendan pro-

vided for a longer voyage than was usual at that remote period with sea-faring people of the west and south of Ireland—that he journeyed thus several days, perhaps weeks, until falling in with the gulf-stream, his little bark was wafted to the coast of the New England states, thus anticipating by about five centuries the supposed discovery of America by the Welsh prince, Madoc, in 1169. St. Brendan, after his return from his wonderful voyage, founded various monastic and educational establishments, particularly his great monastery of Clonfert. He also founded the nunnery of Annadown, over which he placed his sister Briga. It was in this establishment he died, in the ninety-fourth year of his age, on the 16th of May, 577—the day on which his festival is still observed by the dioceses of Kerry and of Clonfert.

In Ireland, at least in modern times, the island of St. Brendan is better known under its poetical name of Hy-Brasail, than under the venerable name of its supposed discoverer. It is under this latter aspect it is alluded to in the poems of Moore, Griffin, and others. A living writer has endeavoured to revive an interest in the more ancient and authentic legend, by his poem entitled the *Voyage of St. Brendan*, which is based upon this story. MS. copies of the original Latin legend are to be found in the principal British and continental libraries—the Imperial library of Paris alone possessing eleven or twelve of them, each differing in some slight degree from the other. One of these with a prose, as well as a metrical translation in the Romance language, has been published in Paris, as mentioned below. A picturesque version, in old English, is given in Caxton's *Golden Legende*, London, 1483. There are also versions in Irish, Spanish, Portuguese, German, and most of the continental languages. To those who take an interest in the subject, the following list of books, &c., may be useful—"La Legende Latine de S. Brandaines, avec une traduction en prose, et en poesie Romanes," publiée par Achille Jubinal, Paris, 1836; "The Lyfe of Saynt Brandon," in Caxton's *Golden Legende*, London, 1483, a copy of which is in the British museum. A transcript of this life of Saint Brendan was made by Mr. M'Carthy (the author of the poem above mentioned), and published by him in the *Dublin University Magazine* for May, 1852. The Codex Kilkeniensis (so called) in Marsh's library, Dublin, contains a curious but imperfect version of the Latin legend. The *Voyage of St. Brendan*, in M'Carthy's poems, Dublin, 1850; London, 1857; Dublin, 1858. Some interesting remarks on the legend will be found in the late Rev. Cæsar Otway's *Sketches in Erris and Tyrawley*, published in Dublin.—D. F. M.

BRENNAN, JOHN, M.D., was born at Ballahide in the county of Carlow, of a respectable family, but impaired fortune. He was educated to the medical profession, in which he acquired a reputation not only in England but abroad, as the first person who brought into practice the use of turpentine in puerperal disorders. Previously to 1812 he was a contributor to the *Irish Magazine*, conducted by the notorious Walter Cox, with whom he then quarrelled, and set up a rival periodical under the title of the *Milesian Magazine*, which lived under the auspices of the government till 1825. He struck out for himself a new line in satire and censoriousness—a warfare of ridicule on the Roman catholic leaders of the day, and a ludicrous scurrility on the members of his own profession. Dr. Brennan was an excellent classical scholar, a man of considerable talents and much caustic humour, and his bon-mots were long current in society. It is to be regretted that he turned these powers, natural and acquired, to very unworthy uses. He died in Dublin on the 29th July, 1830, in the sixty-second year of his age.—J. F. W.

BRENNER, ELIAS, a Swedish antiquary, born in 1647; died in 1717; author of "*Thes. numm. Sueco-Gothicorum.*"

BRENNER, HENRY, a Swedish historian, who formed part of the embassy which Charles XI. sent into Persia; author of an "*Account of the Persian Expedition of Peter the Great.*"

BRENNER, SOFIA ELIZABETH, born at Weber in 1659, the earliest Swedish authoress, and a greatly-admired poetess of her time. She married Assessor Elias Brenner, and was the mother of fifteen children. Her works were published in 2 vols., 1713-32. She died in 1730.—M. H.

BRENNUS, a celebrated chief of the Senonian Gauls, settled in the north of Italy, who is said to have flourished about 389 B.C. On the invitation of Aruns, a citizen of Clusium, who had some private feud to avenge, he wasted the country around Clusium, and laid siege to the city itself. The inhabitants

implored succour from the Romans, and the senate sent an embassy to Brennus to remonstrate with him on his unprovoked attack upon the allies of the Roman state. When asked what business the Gauls had in Etruria, the haughty chief replied that "might is right," and that "everything belongs to the brave." The Roman deputies took part in the conflict which followed, and the Gauls, indignant at this violation of international law, marched against Rome sixty thousand strong. They encountered a Roman army of forty thousand men near the confluence of the Allia with the Tiber, who fled without striking a blow. On reaching the city, the Gauls found it deserted and the gates standing open. After some hesitation they entered, and perceived a number of aged senators seated each at his own door, arrayed in their robes of office, and calmly awaiting their fate. The ferocious invaders massacred the whole, and then set fire to the city. They next endeavoured, but without success, to storm the capitol, into which a handful of the Romans had thrown themselves, with the determination to defend it to the last extremity. An attempt to surprise it by night was equally unsuccessful. Some geese that were kept in the temple of Juno gave the alarm, while the Gauls were silently scrambling up an unguarded part of the rock on which the capitol stood, and aroused the garrison, who killed a great number of the assailants, and put the rest to flight. After a siege of seven months, the defenders were reduced to such extremities by famine that they were obliged to capitulate, and to pay to Brennus, by way of ransom, the enormous sum of one thousand pounds' weight of gold. The tribune Sulpicius complained that the weights used by the Gauls were not correct, on which Brennus threw his sword into the scale, and exclaimed, in words which have become proverbial—"Alas for the vanquished." On their return homewards, the victorious Gauls, according to Diodorus, were waylaid by the people of Cære, and cut off to a man. Livy, however, states that Camillus, the dictator, refused to ratify the capitulation made with Brennus by the garrison of the capitol, and attacked and destroyed nearly the whole army of the Gauls; but this is generally regarded as a fiction, invented by the Romans to conceal their defeat.—(*Titus Livius*, lib. v., cap. 34-49.)

There was another Gallic leader of this name who invaded Macedonia and Greece about 280 B.C., and plundered and laid waste the country, inflicting every species of outrage upon the inhabitants. He met with a severe defeat at Delphi, and ultimately destroyed himself by drinking, to drown his feelings of shame at the ruin of his enterprise.—J. T.

BRENT, NATHANIEL, the translator into English and Latin of the Italian history of the council of Trent by Paul Sarpi, was born at Little Woolford, Warwickshire, in 1573. He studied at Merton college, Oxford, took his master's degree in 1598, and entered on the study of law. He married the niece of Dr. Abbott, archbishop of Canterbury, by whom he was sent to Venice to procure a copy of the history which he afterwards translated, and to whom he owed his preferments as a lawyer. He was at first an adherent of Charles I., by whom he was knighted in 1629, but he afterwards sided with Abbott and the puritans against Laud and his party. He died in 1652.—J. B.

BRENTANA, SIMONE, a Venetian historical painter, born about 1656. He resided chiefly at the great amphitheatred city Verona. He imitated the fire and whirlwind of Tintoretto, mixing it with a little of the sobering dignity of the more tranquil Roman school. His pictures are scarce, being painted chiefly for palaces and churches. His finest work was a "St. Sebastian being crowned by an Angel."—W. T.

BRENTIUS, BRENTZEN, or BRENTZ, a German reformer of the age of Luther, born at Weil in Suabia in 1499; died at Stuttgart in 1570. Adopting the reformed doctrines after a perusal of some of Luther's writings, he took his doctor's degree in his eighteenth year, and five years afterwards became pastor at Halle. In 1530 he took part in the proceedings of the diet of Augsburg, and four years later, on the invitation of Ulric, prince of Wirtemberg, undertook, conjointly with Camerarius, the direction of the university of Tubingen. In 1547 Charles V. threatened to destroy the town of Halle if the reformer were not given up to him; but he effected his escape in disguise, and wandering about as a fugitive from place to place, derived, as he afterwards related, a consolation from the psalms, which only one in his circumstances could have experienced. In 1553 the successor of Ulric gave him an asylum at

Stuttgart, where he drew up the "Confession of Wirtemberg." He attended the diet of Worms in 1557. His works, the doctrinal system of which nearly coincides with that of Luther, were published at Tubingen in 1576-90, in 8 vols. fol.—J. S., G.

BREQUIGNY, LOUIS-GEORGE OUDARD-FEUDRIX DE, a French historian and antiquary, born at Granville in 1716, and died at Paris in 1795. As the result of three years' labour in deciphering and arranging the documents relative to the history of France in the tower of London, and of the toil of a quarter of a century in interpreting and illustrating them, he published in 1791, "Diplomata, Chartæ, Epistolæ, et alia Monumenta ad res Francicas spectantia." He continued also, in conjunction with Villevaut, the "Collection des lois et ordonnances des rois de la troisieme race," and, in conjunction with Mouchet, published in three volumes a "Table Chronique," of public titles, charters, and other documents referred to by historians, but not previously printed. In conjunction with the same Mouchet, he added to these enormous labours that of continuing the "Memoires sur les Chinois" of Amiot, Bourgeois, &c. 1776-89.—J. S., G.

BRERA, VALERIANO LUIGI, a celebrated Italian surgeon and writer, born at Pavia on the 15th December, 1772. His medical writings are very numerous, and many of them of great importance. Amongst them we may mention his "Sylloge opusculorum select. ad praxin, præcipue medicam, spectantium," Pavia, 1797-1811; his "Annotazioni medico-pratiche sulle diverse malattie, trattate nella clinica med. dell'univ. di Pavia dell'anno 1796-98," Pavia, 1798; "Legioni med. prat. sopra i principali vermi del carpo umano," published at Cremona in 1802, and since translated into several languages; and "Memorie fisico-med." on the same subject, at Cremona in 1811; *Giornale di Medicina*, of which twelve volumes appeared at Padua in the years 1812-17, and which has since been continued by Brera in conjunction with Caldani and Bruggieri, under the title of "Nuovi comment. di medic. e di chirurg.," and "Commentarie Clinico per la cura della idrofobia."—W. S. D.

BREREWOOD, EDWARD, a mathematician and antiquary born at Chester in 1565. Having been educated at Oxford, he was in 1596 chosen first professor of astronomy in Gresham college, which office he held till his death in 1613. His works were published after his death. Of these we mention—"De ponderibus et pretiis veterum nummorum, eorumque cum recentioribus collatione;" "Enquiries touching the Diversity of Languages and Religious Thoughts in the chief parts of the World;" "Tractatus duo, quorum primus est de meteoris, secundus de oculo;" "Commentarii in Ethica Aristotelis," written when the author was only twenty-one years of age.—J. B.

BRÈS, JEAN PIERRE, the name of two French physicians, uncle and nephew, who enjoyed some little literary celebrity in the first half of the current century—the first a novelist, whose pretentious works have passed into total oblivion, and the second a miscellaneous writer, whose style still finds admirers. The uncle died in 1816, and the nephew in 1832.

BRESCIA, GIOVANNI MARTA DA, a painter, born at Brescia about 1460. He was originally a goldsmith, and then a painter and engraver. After thus running the whole cycle of the arts, he became a Carmelite, and painted under the quiet shadow of his monastery, where he slept in 1510. His frescos were stories of Elias and Elisha; his plates frail compounds of Marc Antonio and Andrea Mantegna. His brother, GIOVANNI ANTONIO, studied engraving in Mantegna's school, finished well, but drew badly. LEONARDO, of a different family, flourished at Ferrara about 1530.—W. T.

BRESSANI, GREGORIO, born at Treviso in 1703, was educated among the fathers of the congregation, and afterwards at Padova, where he took the degree of LL.D. The bent of his mind was towards metaphysical rather than theological studies. He preferred the philosophical systems of Plato and Aristotle to that of modern philosophers, Galileo not excepted. In defence of this preference he wrote a treatise, in which he compares Galileo's doctrines with those of the two ancient philosophers. Bressani's principal works are, "Il modo di filosofare introdotto dal Galileo," and "Discorsi sopra le obiezioni fatte dal Galileo alla dottrina d'Aristotile." He died at Padova in 1771.—A. C. M.

BRETAGNE, kings and dukes of. A few of the more ancient and less-known sovereigns of Bretagne are here noticed. The rest will be found under their respective names of Jean, Arthur, &c.—AUDREN or AUDRAN, fourth king of Bretagne, son of Salomon I., succeeded to the throne in 445, and died in 461; 2

doughty warrior, who repulsed the Romans under Littorius Celcus, and extended his conquests as far as Orleans.—**ALAIN I.**, born in 560; died in 594; son of Hoel II.—**ALAIN II.**, born in 630, the last of eleven kings of Bretagne from 383 till 690, succeeded his father, Judicael, in his eighth year.—**ARASTAGNUS**, proclaimed king by the Bretons in the latter half of the eighth century, followed Charlemagne in his expedition into Spain, and was killed in the famous battle of Roncesvalles in 778.—**ALAIN III.**, duke of Bretagne, called "the Great," famous for his encounters with the Normans, sixteen thousand of whom he all but annihilated in one engagement in the neighbourhood of Vannes; died in 907.—**ALAIN IV.**, called "Barbe-torte," duke, grandson of Alain le Grand, came from England about the year 936 with a host of his countrymen, and expelling the Normans from Bretagne, was proclaimed duke.—**ALAIN V.**, duke, succeeded his father, Geoffrey I., in 1008. He resisted successfully the seigniorial pretensions of Robert II. of Normandy, father of William the Conqueror, and latterly was on terms of cordial friendship with the Norman duke, who, in his last illness at Nice in Bithynia, appointed him guardian of his son. He was poisoned while engaged in subduing a rebellion in Normandy.—**ALAIN VI.**, called "Fergent," son of Duke Hoel, accompanied William the Conqueror into England at the head of 5000 Bretons, and for his services in the subjugation of the kingdom, obtained the county of Richmond. When the Norman duke attempted afterwards to put Bretagne under tribute, Alain stoutly maintained the independence of his duchy, and by one decisive battle compelled the Conqueror to sue for peace. He took part in the first crusade, and in 1106 played an important part on the side of Henry I. of England in the victory of Tinchebray. Died in 1119.—J. S., G.

**BRETAGNE, ANNE DE.** See ANNE.

**BRETAGNE, ARTHUR DE.** See ARTHUR.

**BRETEUIL, LOUIS AUGUSTE LE TONNELIER**, baron de, was born in 1733 at Preuilly in Touraine, of a noble family. Distinguished during the reign of Louis XV. by his diplomatic skill, he was sent successively as ambassador to the elector of Cologne, to Russia, Sweden, Holland, Naples, and the court of Vienna. On his return to France he became minister of state to Louis XVI.; and next to Colbert, the French acknowledge that he was most conspicuous among his countrymen in patronizing art and science, and in improving the capital. In the celebrated affair of the diamond necklace, he exhibited more vindictiveness than truth. When the French revolution broke out, he retired first to Soleure, and afterwards to the neighbourhood of Hamburg. Died at Paris in 1807.—T. J.

\* **BRETON, FRANÇOIS PIERRE HIPPOLYTE**, born in Paris, October, 1812. At once a painter and a writer, Breton belongs to a school which must necessarily be circumscribed, for art is too absorbing a pursuit to allow much attention to be given to authorship. When both pursuits are combined, they cannot be so in equal degrees. Either art must sink into simple illustration, or literature wait on art as a graceful exponent of fine principles, and an attendant teacher and critic, according to the examples afforded by Hogarth and Sir Joshua Reynolds, and others of our own day. Breton, after he had exhibited some landscapes of merit, adopted the line of writing in art periodicals with accompanying illustrations, which is as much in vogue in France as in this country. By way of proof how such a mode of production may be raised and dignified, we may mention the work which, undertaken in 1838 with M. Jouffroy, called "Monumens de tous les peuples," constitutes a brief but complete history of the architectural monuments of all countries.—J. F. C.

**BRETON, GUILLAUME (GULIELMUS BRETO-ARMORICUS)**, born about the middle of the twelfth century at St. Pol-de-Leon in Bretagne, and died in 1226. He was educated at Nantes and at Paris, was chaplain at the court of Philip Augustus, and sent to Rome on negotiations by this monarch frequently between the years 1193 and 1201. He left two historical works relating to the period in which he lived, both published in Duchesne's *Scriptores Rerum Francicarum*. One, the "Philippiad," a sort of epic poem in Latin hexameters, divided into the proper number of twelve books. The "Philippiad" has been translated into prose, and forms part of the eleventh volume of M. Guizot's *Mémoires relatifs à l'histoire de France*. The other is a prose narrative, which is also published by Duchesne and by Guizot. Gulielmus is a lively writer, and was an eye-witness of many of the scenes which he records.—J. A., D.

**BRETON, NICHOLAS**, a sonneteer and pastoral poet of the reign of Elizabeth, born, it is supposed, in Staffordshire. He published an interlude entitled "An Old Man's Lesson and a Young Man's Love," noticed by Dr. Percy, and a variety of little pieces in prose and verse, all remarkable for elegant simplicity. Percy has reprinted a charming little ballad by this author—*Phyllida and Corydon*.

**BRETONNAYAU, RENÉ**, a French surgeon, who turned his talents for verse to the account of his art by the publication of a poem, or rather extracts from a poem, in which, almost without offence to the dignity of the muses, he enters into the most curious details of physiology and pathology. It appeared at Paris in 1583, under the title of "La generation de l'homme," &c.

**BRETONNIERE, FRANÇOIS DE LA**, a French Benedictine of the seventeenth century, who is said, but on very doubtful authority, to have been the author of the famous libel "Le Cochon Mitré," and to have expiated his offence by a thirty years' confinement in the iron cage of the Mont St. Michel.—J. S., G.

**BRETSCHNEIDER, CHARLES GOTTLIEB**, an eminent German theologian of the present century, was born at Gersdorf in the territory of Schönburg, 11th Feb., 1776. After the death of his father, a learned Lutheran divine, he was sent to the Lyceum at Chemnitz, and in 1794 he entered the university of Leipzig as a student of theology. He settled at Wittemberg in 1804 as an academic teacher, and delivered lectures as a *Privat Docent*, in philosophy and theology. But the war of 1806 obliging him to leave Wittemberg, he accepted in 1807 a ministerial charge in Schneeberg, and in 1808 was appointed superintendent in Annaberg. In 1816 he was chosen general-superintendent in Gotha, and in that office he continued till his death on the 22nd of February, 1848. His autobiography published by his son in 1851, reveals the fact that it was from no inward impulse of religious feeling that he made choice of the theological calling in the first instance, and that the influence of personal spiritual life had little to do afterwards with the formation of his theological system. He had imbibed at the university of Leipzig much of the rationalistic spirit which then predominated in its theological faculty. Still he was not an extreme rationalist. He was the principal representative of the so-called "rational supernaturalism," which endeavoured to hold a middle position between church orthodoxy and free-thinking. His literary activity was indefatigable, and his published writings in various departments of scientific theology are very numerous. In philology his principal work was one of great value, the "Lexicon Manuale Græco-Latinum in libros Novi Testamenti," Leipzig, 1824-29-40. In dogmatic theology, his "Handbuch der Dogmatik der Evangelisch Lutherischen Kirche," Leipzig, 1814, reached a fourth edition in 1838; and his "Systematische Entwicklung aller in der Dogmatik Vorkommenden Begriffe," &c., Leipzig, 1805-19-25-41, is particularly rich in the exhibition of the literature of the subject, and is still considered in Germany an indispensable help to the scientific student. But of all his works the most valuable and important is the "Corpus Reformatorum," bearing also the title "Philippi Melancthonis Opera quæ supersunt omnia, vol. i.-xv. 4to, Hal. Sax. 1834-48. Of this laborious work he edited the first fifteen volumes, and the undertaking is still in progress under the editorship of Professor Bindseil of Halle. The first eleven volumes, containing Melancthon's *Epistolæ, Præfationes, Consilia, Judicia, &c.*, are of inestimable value, and furnish the most authentic and ample materials for the life of Melancthon, and the history of the German Reformation.—P. L.

**BREUGHEL.** The name of several Flemish painters, of whom the most distinguished are PIETER, and his two sons, PIETER and JAN BREUGHEL.

**BREUGHEL, PIETER**, called OLD BREUGHEL, was born at Breughel, near Breda, about 1525, and became the scholar of Pieter Kock, whose daughter he afterwards married. Having studied some years in Italy, he settled about 1555 in Antwerp, but removed after his marriage to Brussels. He was in Rome in 1553; he had, however, been already admitted a member of the Academy of Antwerp in 1551. The date of his death is unknown; some accounts fix it as late as 1590. He painted landscapes with figures, chiefly village feasts and merry-makings, but occasionally also more serious subjects. There are a few etchings by him.

**BREUGHEL, PIETER**, the younger, called also HELL BREUGHEL, from his love of painting diabolical monsters and

other fantastic devices representing the horrors of hell, was born at Brussels about 1568, and was the pupil of Giles Van Koningsloo. He became a member of the academy in 1609. There is a remarkable specimen of his painting in the gallery at the Hague.

BREUGHEL, JAN, called also VELVET BREUGHEL, from his winter dress of that material, was born at Brussels about 1569, and was taught painting by Pieter Goekindt, an amateur. Jan first painted fruit and flowers; he then visited Italy, and devoted himself chiefly to landscapes with figures, which he finished with great delicacy and extraordinary minuteness of detail, but with an unpleasant prevalence of blue in his colouring, especially in the distance. He became a member of the Antwerp Academy of St. Luke, of which he was one of the deans in 1602. According to some accounts he died young, leaving two daughters, whom Rubens took under his charge. He painted several pictures in which Rubens painted the figures; "Adam and Eve in Paradise" is the most celebrated of these joint productions. Many fine examples of his work are in the Pinacothek at Munich. Jan is said to have died January 13, 1625; other accounts prolong his life to 1642, but this is incompatible with the story of Rubens having taken charge of the education of his daughters after their father's death. There seems to be no accurate record of the dates of the birth or death of any of this family of painters.—(*Van Mander; Immerzeel.*)—R. N. W.

BREVINT, DANIEL, born at Jersey in 1616. He studied logic and philosophy among the protestants at Saumur in France, and on the foundation of three fellowships in the colleges of Pembroke, Exeter, and Jesus at Oxford, by Charles I., for natives of Jersey and Guernsey alternately, was elected to the latter college, and incorporated M.A. as he had stood at Saumur. Being ejected from his fellowship by the parliament visitors for refusing to take the covenant, he retired to Jersey and afterwards to Normandy, where he became pastor to a protestant congregation. During his residence on the continent he gained the notice of the viscount de Turenne, who made him his chaplain, and of Charles II., who, after the Restoration, gave him a prebend in the cathedral of Lincoln. In 1681 he was promoted to the deanery of that town. Died in 1695. His works, Latin and English, principally turn on points of controversy.—J. S., G.

BREWER, ANTHONY, a dramatic writer of the reign of James I., only known as a favourite with the wits of that time, and as the author of a play entitled "Lingua," in a representation of which, it is said, Oliver Cromwell played the part of one ambitious for a crown, and thus for the first time became conscious of his destiny. The story, as Chalmers observes, is doubtful on two grounds—that Brewer wrote "Lingua" is doubtful, and that Cromwell played in it is very doubtful.—J. S., G.

BREWER, SAMUEL, a botanist, born at the end of the seventeenth century, was a native of Trowbridge in Wiltshire, where he had a small estate. He was at first engaged in the woollen manufactory of that place, but subsequently devoted his attention to science. He assisted Dillenius, professor of botany at Cambridge. In 1726 he accompanied the professor into Wales, Anglesea, and the Isle of Man. He afterwards examined the botany of Wales, making excursions to Snowdon and other places, with the Rev. Mr. Green and Mr. William Jones. He was fond of cryptogamic botany, and assisted Dillenius in his History of Mosses. In 1728 he went to Yorkshire, and took up his residence at Bradford. He died in 1743.—J. H. B.

BREWER, THOMAS, a musician, educated at Christ's hospital, London, and brought up to the practice of the viol. He flourished in the time of Charles I., the Protectorate, and part of the reign of Charles II. He composed several excellent fantasias for the viol, and was the author of many rounds and catches inserted in Hilton's "Catch that Catch Can," 1652. He was also the composer of the pretty three-part song, "Turn, Amaryllis, to thy Swain," printed in Playford's "Musical Companion." In the Harleian MS., No. 6395, entitled "Merry Passages and Jests," compiled by Sir Nicholas Lestrange, is the following anecdote:—"Thom. Brewer, my musical servant, through his proneness to good fellowship, having attained to a very rich and rubicund nose, being reprov'd by a friend for his too frequent use of strong drinks and sacke, as very pernicious to that distemper and inflammation in his nose—'Nay, faith,' says he, 'if it will not endure sacke, it is no nose for me.'"—E. F. R.

BREWSTER, SIR DAVID, D.C.L., LL.D., Knight of the Guelphic order, and of the United Kingdom; principal of the

university of Edinburgh; one of the most distinguished physical inquirers of his day: there have been few men in Scotland of whom their country has more reason to be proud. The life of Sir David Brewster was one of untiring industry, issuing in signal success. Ever occupied by trains of thought leading to capital discovery, he also, in no ordinary degree, benefitted the practical arts; and his literary enterprises were so various and important, that they alone might have filled up the lives of several ordinary men. In many things he may have had worthy rivals, but we believe it can be said of Brewster alone, that without patrimony, and, until a comparatively late period of his life, without aid from public institutions or scientific endowments, he succeeded through effect of integrity, of prudence, and of labour that never flagged, in achieving and maintaining during long years a position of distinguished ease, and personal and social independence.—We shall glance rapidly at the incidents of Sir David's life, the character of his leading discoveries, and the extent of his literary labours.

I. The subject of our memoir was born at Jedburgh in Roxburghshire, on 11th December, 1781. His father, the esteemed rector of the grammar school of that town—himself zealously attached to the church of Scotland—intended his four sons for the clerical profession. Sir David's three brothers entered the church, and obtained livings in it. Two of them, Dr. Brewster of Craig and Dr. Brewster of Scoonie, died comparatively recently, distinguished for piety, superior intelligence, and fidelity to their important charge. The third brother, Patrick, who occupied for many years the respectable and responsible position of minister of the abbey church of Paisley, died in 1859. Of this very able family, Sir David was the second in order of birth, but he abandoned what may be termed the family profession, avowedly through considerations of health, although, perhaps, also because of inclinations drawing him irresistibly towards the cultivation of science. He began his career of experiment so early as 1799 and 1800, while still considerably under twenty years of age; and these early investigations on the inflection of light were a worthy first-fruit of his services to a branch of science to which he attached himself through life, and wherein he earned so wide and permanent a renown. In 1806 Sir David projected and began that most laborious work, the Edinburgh Encyclopædia, of which he continued editor until its completion in 1830. In 1813 he published his "Treatise on New Philosophical Instruments;" and essays and memoirs were continually issuing from his pen, advancing our knowledge of Light, along those new and strange directions, which, unknown to him (intercourse being prevented by the unhappy French war) were also absorbing the attention of the great physicists of the Continent. It was most pleasing to find—when the commerce and blessings of peace returned—that no one of these distinguished men had left Brewster behind him. In 1819 Sir David started the *Edinburgh Philosophical Journal*, in conjunction with Professor Jameson; and he afterwards carried it on alone for a good many years, under the title of the *Edinburgh Journal of Science*. He had thus the merit of establishing our first regular Scottish scientific review. Among other services in this direction, the merit cannot be withheld from him of pressing towards realization, if not of suggesting the idea of those annual scientific congresses, now so well known and everywhere so warmly welcomed, under the name of the "British Association."—It is grateful to record that to activity thus marked, and desert thus unquestionable, social as well as scientific honours were not slow in being awarded. Brewster obtained from the learned societies more medals and prizes, we believe, than any other living inquirer. He received an important prize from the French Institute; the Copley and Rumford medal from the Royal Society; also, Royal medals; and twice the Keith medals from the Royal Society of Edinburgh—all for distinctive discoveries. These and many similar associations hastened to enrol him among their members. The Institute of France elected him corresponding member in 1825, and in 1849 he had the honour to succeed the illustrious Berzelius as its Associate. Nor were his services overlooked by the British State. In 1830 he received the decoration of the Guelphic order, and in 1832 he was knighted by King William IV. In 1855 the Emperor Napoleon conferred on him the cross of the Legion of Honour. He was nominated in 1838 principal of the united college of St. Salvador and St. Leonards, St. Andrews, and in 1859, on the death of Principal Lee, was transferred to Edinburgh.

II. But the true life of a man of science or literature is not constituted by its outward incidents; it is made up of the deeds he has done; *i.e.*, of the powers of thought he has manifested, and the results they have evolved. Sir David Brewster's acts are of two descriptions. To the first, which have offered in so many directions benefit to the arts, and which may be termed his "Inventions"—we have no space to allude except in the most cursory manner. Many now living must recollect the sensation originally produced by the ingenious and beautiful kaleidoscope; and many of these must have joined in the then universal regret, that through defects of our miserable and incongruous law of *Patents*, that benefit was withheld from the discoverer, which is due to every one whose genius augments through material forms the comforts or pleasures of society. Multitudes innumerable of these kaleidoscopes were made and run after in Great Britain and through Europe; but the ingenuity of Sir David Brewster received little or no pecuniary reward. Next in order we might refer to the lenticular stereoscope. The discovery of the principle of the stereoscope is due to Wheatstone; but to Sir David is unquestionably due the claim, that in his hands—chiefly through the skillful application of semi-lenses—it started into an applicable instrument. Higher than these in pure scientific merit, are his improvements of microscopes and telescopes; his initiation of the Bude light; and highest of all, that early proposal for the use of dioptric lenses, and of zones in lighthouses. Fresnel subsequently appropriated this discovery without knowing that he did our countryman a wrong; but the verdict of the scientific world has been just.—We hasten, however, from details whose very superabundance oppresses one, to those discoveries of loftier reach, and of primary theoretic bearing, with which Sir David enriched Optical science. Here, too, one might easily lose oneself as in a wilderness. No one had ever a quicker eye towards the *new*, than this acute Inquirer. It is an attribute belonging only to a rare class of exercised minds, which detects and separates novelty from amidst the common, and discerns at once the presence of something unexplained. Eminently possessed of this peculiar gift, Brewster, throughout his whole life, followed memoir by memoir, demanding attention to facts as yet unexplained by theory; and in this way he became instrumental in obtaining the correction of too general conclusions, and so of aiding the progress even of theories he had not seen reason to accept, to an extent which, amid our scientific contests, has failed to be recognized and adequately acknowledged. An impartial history of science—written when our times can be calmly surveyed—will not overlook such benefits; but no history, wherever and whenever written, can fail to record and appreciate the achievements to which we shall now advert.—Previous to the beginning of this century, Newton's Optics contained nearly all we knew concerning light, with the exception of those signal discoveries of Huyghens. But new and comparatively evanescent qualities of the energy producing that sensation, came to be discerned. We shall not speak of *inflection*—that subject which, not having escaped Newton, was yet of so fresh an interest, that it provoked the attention of Brougham, and the early efforts of Brewster. More subtle and strange than that, light was found to be affected by modifications, scarcely recognized, and never investigated until after the first decade of this century. Nor are these modifications accidental. On the contrary, they are found to enter as prime essentials among the elements of any theory of light. These modifications are chiefly two: *first*, a ray of light is variously and apparently fantastically turned out of its path, by some action on the part of a class of diaphanous bodies into which it enters; and, *secondly*, the ray so disturbed, as also when *reflected* in a certain manner, acquires peculiar characteristics. With regard to the *first* order of subjects, we claim for Sir David Brewster the merit of having completely surveyed all the great phenomena, and laid down their general laws. The fact of ordinary refraction had indeed long been known; and Snell gave the formula that indicates the new course of the ray. As to double refraction, as produced by a certain class of crystals, Huyghens had announced a formula giving the direction of both rays: but in neither case had any connection been established between the phenomena and the nature of the body producing them. Although not earliest in order of time, we mention first in the course of our narrative, Sir David's discovery of the effects of pressure, traction, &c., in producing

the double-refracting power. This series of facts, now no longer isolated, distinctly points, as the cause of such irregularity in refraction, to internal molecular irregularities in the body producing it; and our countryman completed the theory of the subject in several masterly memoirs, in which he connects all these phenomena with the mathematical form of crystals: their refracting qualities depending on the question, whether, like the cube, they have *three* mathematical axes; *one*, as in the case of the rhombohedral and pyramidal systems; or, *two*, as with all prismatic systems. The paper in which he unfolds the law of double refraction in the latter class of crystals, is as fine a specimen of generalization as modern inquiry has brought forth.—The triumphs of our countryman, in reference to the *second* great class of new optical phenomena, have been quite as great. The phenomena in question are the aspects and conditions of what is called *Polarized* light. We do not and cannot refer here to the multitude of unlooked-for facts detected by Brewster, in illustration of this most brilliant portion of modern experimental science. They are so numerous, and they came upon him and on the world so rapidly, that, as already stated, their real importance was often overlooked, because of the feeling of distraction occasioned by their variety. But it is necessary to remark that here, too, we owe to Sir David our first statement of fundamental laws. When Malus discovered the phenomenon of polarization, he deemed it isolated, or unconnected with known properties of the substances occasioning it. This isolation disappeared in Brewster's hands; and his first achievement was the statement of the formal laws of polarization, alike by reflection and refraction. No sooner had the undulatory theory of light begun to yield consequences, than these formal laws were explained by it; and the fortunate deduction went very far to place that theory in credit. But still more; these laws after all were only general approximations,—something akin to the theorem of the elliptical orbits of the planets. They, too, were found subject to minute "*perturbations*," which did not long escape the keen eye of Brewster; and he did much to track out the inquiry recently perfected by Jamin—an inquiry productive of results demanding those serious modifications in the old formulæ and processes of Theory, which were obtained from the subtle analysis of Cauchy.—It were needless to pursue our narrative, for, in the best form in which we can put it, it must be incomplete. One general remark, however, must be made. The speciality of Brewster's genius, viewing him as a Philosopher and not as a mere Observer, consisted in his power to detect and deal with that class of laws which are termed *Empirical*—laws which express the general and formal relations of multitudes of determinate facts. More than any other man perhaps of his day, he was entitled to be held the KEPLER of physical optics. The achievements we have been illustrating, and others akin to them, stand towards an ultimate and absolute theory of Light, precisely as the three laws of the great German are related to the final discovery of Newton. Has the Newton of physical optics yet arrived? Does a theory already exist in that science worthy of a place analogous to that of Gravitation? Sir David doubted it: nor need it be concealed that his successes in his own direction, and the special aptitude of his faculties for the accomplishment of his peculiar task, may have rendered him at times insensible to the actual and surprising grasp of the doctrine of Undulations. But on such remote matters, and the speculations connected with them, we have no disposition to dwell. Whatever new phases optical science may yet assume, Brewster's name will ever be proudly associated with its history.

III. On glancing over what we have written, we feel keenly its utter inadequacy. Of some of Brewster's brilliant discoveries even in Optics we have said nothing;—*e.g.*, those elaborate investigations concerning *absorption*, &c. Nor have we been able to refer to his services to practical meteorology, or to his contributions towards the cosmical theory of the Temperature of the globe. Space equally fails us as we touch the literary labours of this most active spirit. His writings would fill a multitude of volumes. Witness that arduous work the Encyclopædia, and the dissertations in it that proceeded from his own pen. Witness those editorial labours concerned with our Scottish scientific journal,—the edition of Fergusson,—the treatises on "New Philosophical Instruments," on Optics, on the Kaleidoscope, the Stereoscope, &c. &c. Witness the most interesting "Life of Newton;" the "Martyrs of Science;" the "Treatise on Natural Magic;" and the "More Worlds than One." To the close,

indeed, of his earthly career he ceased not to pursue steadily those investigations to which his life had been devoted. Within a few weeks of his end he sent various papers to the Royal Society of Edinburgh, of which he had for a considerable period been the president, and to whose Transactions he had so largely contributed. His last appearance in public was at the meeting of the British Association in Dundee, in 1867, when with all his wonted energy, and with triumphant success, he set himself to vindicate Newton from the last of the groundless charges brought against him. He died on the 10th of February, 1868.—J. P. N.

BREWSTER, WILLIAM, one of the founders of the colony of Plymouth in North America, was born probably at Scrooby in Nottinghamshire, about 1563. He was for some years in the service of Davison, secretary of state to Queen Elizabeth, and visited the Low Countries in the train of his patron when he went as royal ambassador. We afterwards hear of him as postmaster at Scrooby, where he was connected with the separatist congregation to which Governor Bradford belonged. (See BRADFORD, WILLIAM.) Brewster accompanied the little flock in their wanderings to Amsterdam, Leyden, and at last to their new settlement of Plymouth in North America. He was, during the severe trials to which the settlers were exposed, one of those whose patience and energy bore up the most steadily against discouragement. In the distribution of functions, the office of religious instruction fell to him, and he never filled any place in the magistracy; but his counsel was sought on all occasions with an earnestness prompted by implicit confidence in his rectitude and wisdom. Having never been formally inducted into the sacred office, he had scruples about administering the ordinances, and from time to time during his life other ministers were brought from England. But the experiments were not successful, while his ministrations never failed to edify. "He would labour with his hands in the fields as long as he was able, yet, when the church had no other minister, he taught twice every Sabbath, and that both powerfully and profitably, to the great contentment of the hearers, and many were brought to God by his ministry." He loved books and found time to enjoy them. He left at his death a library consisting of 275 volumes, 60 or 70 of them being in the learned languages. "He was near fourscore years of age, if not all out, when he died," which was on the 16th April, 1643. Brewster's history of the time previous to his emigration with the Scrooby congregation has but recently been recovered, through some researches of that learned antiquary, the Rev. Joseph Hunter, of her majesty's record office.—Y. G. P.

BREYDEL, CHARLES, a landscape painter, born at Antwerp in 1677. He was a pupil of Rysbrack, and then travelled, and with his brother, Francis, entered the service of the court of Hesse-Cassel. He next went to Amsterdam, and studied the Rhenish views of Griffier, afterwards comparing them with nature. He then settled at Ghent, earning money like a miser, and spending it like the prodigal son, painting flimsy, hasty pictures to meet his wants. Latterly gout fell on him, scourging him for the sins of his youth, and he painted with less spirit, finish, and firmness. He died in 1744. His early Griffier pictures of Rhenish boats, fishermen, and vine-dressers, are well designed, and neatly wrought out, and neatly executed; but his second or Velvet Breughel pictures of battles, sieges, and encampments, are not so good, though they earned him the name of the "Chevalier." From Vandermeulen he also took figures as well as whole designs, and afterwards got into a habit of inventing after his manner. His style was either careless and laboured, or full of harmony. FRANCIS, his brother, was born at Antwerp in 1678. He was, it is supposed, a scholar of Rysbrack, and painted conversations, feasts, assemblies, and carnivals, particularly the last. Leaving these he came to England, and stayed there several years with his friend, Vandermyne. His pictures have nature, truth, spirit, and variety. He died in 1750.—W. T.

BREYN, JAKOB, a German botanist, was born at Dantzic, 1637, and died there, 1697. He acquired his first lessons on botany from Meutzler, and afterwards prosecuted his studies at Leyden. He has published various botanical works. Among them are descriptions of exotic plants, and of rarer species cultivated in the Dutch gardens.—J. H. B.

BREYN, JOHANN PHILIP, a German physician and botanist, was born at Dantzic in 1690, and died in 1764. He published various scientific papers in the Transactions of the Societas Naturæ Curiosorum, as well as of the Royal Society of London.

He also wrote on the ginseng root, on officinal fungi, on aspidium barometz, on species of coccus, on echini, and on various testaceous animals.—J. H. B.

BREZ, JACQUES, a Piedmontese botanist and historian, was born in the valleys of Piedmont in 1771, and died at Middleburg in 1798. He published a work on the plants upon which insects feed, and on the study of insects, as well as a history of the Waldenses.—J. H. B.

BREZIN, MICHEL, a French mechanic and capitalist, famous as the founder of the Hospice de la Reconnaissance in Paris, was born 1758, and died 1828. In the course of a long and honourable career, first as a mechanic, and latterly as an ironmaster, he amassed a large fortune, which by his will was consecrated to the erection of the hospital above named. The charity is limited to aged members of the four trades successively pursued by its founder, namely, to locksmiths, mechanics, foundrymen, and the employés of iron masters.—J. S., G.

BRIAL, DOM MICHEL-JEAN-JOSEPH, a French Benedictine, born at Perpignan in 1743; died at Paris in 1828. From 1771 till the commencement of the Revolution he was occupied with Dom Clement in continuing the "Recueil des historiens de France," the twelfth and thirteenth volumes of which were published under their conjoint superintendence. Brial afterwards added to the collection five volumes. In 1805 he was admitted into the Academy of Inscriptions, and charged with three of his colleagues to continue Rivet's Hist. Litt. de la France.

BRIDAINE or BRYDAINE, JACQUES, the celebrated French preacher, born at Chuslan in 1701; died at Roquemaure near Avignon, in 1767. Unfortunately for his fame, his splendid talents were too early enlisted in the work to which his life was consecrated; and after the fame of his labours as a missionary had spread far beyond the limits of his native country, Massillon, himself a man nobly endowed as well as a miracle of accomplishments, had to say of him that he was not the first of orators only because a fortunate culture had not developed to the full his natural powers. More qualified, but still magnificent eulogies, his wonderful gifts drew from La Harpe, Madame Necker, and Maury. The chapter of Chartres struck a medal in his honour. Pope Benedict XIII., with a munificence which would have made the recipient ridiculous if he had not been all but the first of orators, gave him the whole of christendom as a field for his missionary labours; and, what was at once the best evidence of his powers and the amplest reward of his indefatigable zeal, wherever he went (and he journeyed with apostolic diligence), crowds attended him with an enthusiasm which justified the almost incredible accounts current in the church of the number of conversions effected by his preaching.

BRIDEL-BRIDERI, SAMUEL ELISÉE, a Swiss poet and botanist, was born at Crassier in the Canton de Vaud in 1761, and died near Gotha on 7th January, 1828. He was the son of a protestant minister; and after completing his studies he became tutor to the two princes, Augustus and Frederick of Saxe Gotha. He afterwards became private secretary and librarian of the hereditary prince. He devoted much attention to botany, and published several important works on mosses. He also gave attention to literature, to antiquities, and to various departments of science, contributing papers to several journals.—J. H. B.

BRIDGE, RICHARD, a celebrated organ-builder of the last century. It is to be regretted that nothing is known of his biography. According to an advertisement in the *General Advertiser* for February 20, 1748, "Bridges, organ-builder," probably the same person, then resided in Hand Court, Holborn. We learn incidentally, from a note in Burney's History of Music, that he died before 1776. His principal organs are the following—St. Bartholomew the Great, 1729; Christ Church, Spitalfields, 1730; St. Paul's, Deptford, 1730; St. George's-in-the-East, 1733; St. Anne's, Limehouse, 1741; St. Leonard's, Shoreditch, 1757; Enfield church, Middlesex, 1758; Eltham church, Kent; Spa Fields' chapel; St. James', Clerkenwell; Paddington Parish church.—(Rimbault and Hopkins' *History of the Organ*.)—E. F. R.

BRIDGEMAN, ORLANDO, a lord-keeper of the great seal in the reign of Charles II. His father was bishop of Chester; he was educated at Cambridge, entered of the inner temple, and in 1632 called to the bar. Of high prerogative principles, he served the king's (Charles I.) cause in the house of commons, and at the seat of his father's see, which he by arms defended against the puritans. That assembly retaliated by expelling him from the house. On the decline of the royal cause, and during

the Commonwealth, he lived in retirement, practising only as chamber counsel and conveyancer. It is to the meditations of him and other lawyers under like conditions, that the composition of the forces of common law (seizin and terms of years), statute law (uses), and chancery law (trusts), pressed into a family settlement, by which so intractable a subject as land is subdivided into a variety of interests without destroying its integrity, was matured.—(See BOOTH, JAMES.) His forms long continued in repute, and were printed in a collection still found in law-book catalogues. At the Restoration he was rewarded with the office of lord chief-baron of the exchequer. He presided at the trial of the regicides, the shedding of whose blood he, with the acrimony of the times, urged on the jury as a proper expiatory sacrifice. Next he was made a baronet, and chief-justice of the common pleas, where he showed himself a good lawyer. He had acted as deputy or occasional speaker of the house of lords; and in 1667, on the great seal being taken from Lord Clarendon, it was given to him. This was intended to be a mere temporary arrangement, but he held the office five years. In this post, according to a contemporary witness (R. North), alike narrow in his observations and mind, he did not increase his fame. He was inapt, timid, trimming to suitors and counsel, and not sufficiently servile to the king. Upon that illegal act of the cabal ministry, the shutting up the exchequer, he could not be persuaded to grant injunctions to restrain suits against the bankers who had their customers' money locked up there; and whilst he "boggled," a successor deemed less scrupulous, Lord Shaftesbury, slipped in. He died in 1674. The earldom of Bradford is held by his descendants.—S. H. G.

BRIDGET, St., of Sweden, otherwise called BIRGIT or BIRGITTA, was born in the year 1302. She was of royal blood, being the daughter of Birger, legislator of Upland, and Ingeburgis, a lady descended from the Gothic kings. When very young, she was given in marriage to Ulpho, prince of Nericia, by whom she had eight children. From her earliest years, Bridget had striven to walk in the paths of christian perfection, and she found in her husband a willing partner, both in her frequent prayers and meditations, and in her unceasing works of charity. About the year 1343 they both went on a pilgrimage to the tomb of St. James, at Compostella, and shortly after their return Ulpho died. Bridget divided her husband's estates among her children, and devoted herself, for the rest of her life, to labours connected with religion. She founded, soon after her husband's death, the double monastery of Wastein in the diocese of Linkopen in Sweden, under the rule of St. Augustine, with certain particular constitutions. The nuns were called Brigitines, and many monasteries of them still subsist in different parts of Europe. After spending two years at Wastein, Bridget repaired to Rome, according to a practice common in that age, to visit the tombs of the apostles. Like a more celebrated Swedish princess of a later age—Christina, daughter of Gustavus Adolphus—Bridget seems to have been so powerfully attracted by the Eternal City, as to be induced to make it her permanent dwelling-place for the chief part of her afterlife. She employed herself in ascetical practices of devotion, and in various works of mercy among the sick and poor. We read in Fleury of a remarkable prediction made by her to Pope Urban V., whom she visited at Montefiascone in 1370, to obtain the confirmation of the rule she had given to her new order. The pope was about to return to Avignon, and St. Bridget, after in vain endeavouring to shake his resolution, predicted to Alfonso, bishop of Jaen, that if the pope returned to Avignon he would die immediately, and would have to give account to God for his conduct. Fleury proceeds to say, that nevertheless the pope left Italy, reached Avignon about the end of September, and died on the 9th December following. After obtaining the confirmation of her rule, Bridget visited Naples and Sicily, and soon after went on a pilgrimage to the holy places in Palestine. Being returned to Rome, she lived there one year longer, during which she was a martyr to disease. Feeling her death-hour approach, she summoned to her side her son, Birger, and her daughter, St. Catharine of Sweden, and after giving them her last counsels and instructions, being laid on sackcloth, she breathed her last on the 23d July, 1373. Her body was buried in a convent of Poor Clares at Rome, but was translated to her monastery of Wastein in the following year. She was canonized by Boniface IX. in 1391, during the time of the great schism in the papacy. At the council of Constance in February, 1415, the ambassadors

of the kingdoms of Sweden, Denmark, and Norway, fearing lest a process carried on during the schism should upon any pretext be set aside, appeared before the assembled fathers, and demanded that St. Bridget should be enrolled among the saints. Her canonization was then solemnly recognized and confirmed. The works of St. Bridget consist of—Prayers on the sufferings and love of Christ, several of which still retain a place in manuals of devotion; her Rule; her Revelations (approved as profitable for instruction, but no further, by the council of Basle); and a treatise "On the Excellencies of the Blessed Virgin."—(Butler; Fleury.)—T. A.

BRIDGET or BRIDGID, SAINT, an Irish virgin, eminent for her piety, was born at Feughart, near Dundalk, in the county of Louth, about the year 453, according to the Usher Colgan and Lanigan, while others place her birth as far back as 439. Her father, Dubhthach, was a man of rank. Colgan says he was a prince of the Hermonians of Leinster; Bale calls him a nobleman; and the Book of Howth says he was a captain of Leinster. It is possible each statement is correct. While yet an infant, she was committed to the care of a bard, who watched over her with paternal care, instructing her in all the knowledge of the age. She soon became distinguished for her extraordinary learning, wisdom, and piety; and, embracing a life of celibacy, she received the veil from Macaille, bishop of Usneach in Westmeath, in the sixteenth or seventeenth year of her age. About the year 480, according to Ware, or 487, as Lanigan asserts, she founded the famous monastery of Kildare, for nuns, and the institution was largely endowed by the kings of Leinster. Colgan says the place was called Kile Dara, or the Church of the Oak, from having been erected near a great oak-tree. St. Bridget travelled all over Ireland, and founded numerous establishments of the order of Brigidine nuns, which were celebrated through the country for many ages. The various acts of her life are collected by her numerous biographers, and though there is much of what is true, yet the truth is so interwoven with palpable fiction, that it would be a hopeless task to attempt to separate the one from the other. But it is beyond doubt that she was a very wise as well as a very holy person, and so highly was she esteemed by the bishops and clergy, not only of Ireland, but of Britain, that they frequently consulted her on the regulation of religious matters; and it is said, that on one occasion her advice was held to have been authoritative in a synod of Dublin. After a life of piety and charity (and the performance, as it is said, of many miracles), she died February 1, 525, being about seventy years of age. She was buried at Kildare, near the great altar, and her monument was ornamented with gold, silver, and precious stones, but when the Danes devastated that district in the ninth century, the remains of the saint, and the rich shrine in which they were contained, were removed to Downpatrick, and interred there in the same sepulchre as Saint Patrick and Saint Columkille. The memory of the saint has ever been held in veneration, especially in Ireland and Scotland, and numerous churches were dedicated to her. Several biographies of Saint Bridget were collected by Colgan, and published in his great work, "Trias than Mathurga."—J. F. W.

BRIDGEWATER, FRANCIS EGERTON, third and last duke of, left, it has been well said, his biography engraved in intaglio on the face of the country he helped to civilize and enrich. Pity that, in comparison with his great services, the materials for his written life should be so scanty and insufficient. He was born on the 21st May, 1736 (the birthyear of James Watt), the eighth child of Scroop, fourth earl and first duke of Bridgewater. In his twelfth year he succeeded to the dukedom, on the death of his elder brother, John (who died unmarried), having, three years before, been left an orphan by the death of his father, the first duke. In less than a twelvemonth after the death of her husband, the widowed duchess of Bridgewater was married again, to Sir Richard Lyttelton, a brother of the well-known literary lord of that name. Francis was a sickly boy, and it seemed unlikely that he would survive the four brothers who, at his father's death, stood between him and the dukedom. Happy in her second marriage, the duchess, it is hinted, ill-treated her youngest child. So far as she was concerned his education was neglected; and, according to family tradition, it was even contemplated to have him set aside at one time, on the score of mental deficiency. Little prepared to enjoy the classical associations and artistic treasures of the continent, he was sent in his eighteenth year by his guardians,

the duke of Bedford and Lord Trentham, to make the grand tour under the tutorship of Robert Wood, the Irish scholar and archæologist, who had just returned from the East with the materials for his well-known works on Palmyra and Balbeck. The pair were ill-suited as companions, and it was with difficulty that Wood was persuaded to continue the connection. The marbles and tables of Egyptian granite which, under this archæological control, were purchased at Rome by the young duke, remained in the original packing-cases till after their owner's death! But it is just possible that this continental tour exerted a most important, and at the time, little suspected, influence on the mind and career of the duke of Bridgewater. He *may* have inspected the Milan canal, or the much grander works of the same kind executed in the south of France, under the auspices of Louis XIV.; and, during this tour, the idea of his future enterprises *may* have occurred to him. Of direct evidence to this effect, however, there is not a tittle. On his return to England, he bought race-horses, and sometimes rode them himself, for the bulky man of after years was "a feather weight" when young. On attaining his majority, he took his seat in the house of peers, but neither then nor afterwards did he play any conspicuous part in politics. Had it not been for an accident, he might very possibly have passed through life as undistinguished as the majority of his contemporary fellow-peers whom oblivion has overtaken. Several versions are extant of the circumstances which drove the duke of Bridgewater from the dissipation of London and the sports of Newmarket, to the comparative solitude of his old manor-house at Worsley. The most authentic version is the following:—When the duke attained his majority, of the two celebrated English belles of the middle of the eighteenth century, the beautiful sisters Gunning, one was married to Lord Coventry, the other was the widow of the duke of Hamilton. To the lovely widow the enamoured duke offered another ducal coronet, and the offer was accepted. The preliminaries of the marriage were being adjusted, when the duke himself interposed an obstacle. Rumour had been busy with the fair fame of Lady Coventry, and the duke of Bridgewater insisted on a discontinuance of the natural intimacy between his intended bride and her sister. The duchess of Hamilton refused; the duke of Bridgewater broke off the match; and soon afterwards the rejected fair one married the heir to the dukedom of Argyle, and became, in due time, its duchess. The uneducated, horse-racing duke, felt like the poetic and sensitive hero of a modern novel. The result of his disappointment, however, was peculiar. He not only abandoned society, forsook the company of the fair sex, and betook himself to his Lancashire estates, but he devoted himself for life to the most useful, but most un sentimental occupation of canal-making. Just when the duchess of Hamilton was married to Colonel Campbell, the duke of Bridgewater's first canal act received the royal assent, March, 1759. It is an epoch in the history of the great expansion of British industrialism in the eighteenth century. It preceded by ten years the grant of Arkwright's first patent, and by more than a year Watt's earliest experiments on the force of steam. The canal system of Great Britain, the precursor of its railway system, owes its prime development to the pride or sisterly affection of a beautiful duchess.

The engineering peculiarities and difficulties connected with the duke of Bridgewater's parent canal, will fall more properly to be considered in the biography of his great assistant.—(See BRINDLEY.) But no estimate, however high, of the genius, energy, and perseverance of Brindley, can detract from the merits of the duke of Bridgewater, as the planner of the first English canal, and upholder of the novel enterprise amid the most trying difficulties. An attempt has been made to deprive the duke of the credit of originating the first English canal, on the strength of an act of parliament, obtained by his father and others in 1737, for rendering Worsley brook navigable, and on the ground that the Sankey navigation act was obtained in 1755, and carried out by 1760. The conversion of an unnavigable into a navigable stream is not the construction of a canal, and the claim put forth on behalf of the first duke of Bridgewater is clearly untenable. In the case of the Sankey navigation, the so-called canal ran parallel with the bed of the stream which fed it, and as closely as possible to which it was constructed. Very different was the duke of Bridgewater's first canal from Worsley to Manchester, cut not only through the dry land, and not parallel to the course of any stream, but actually carried

over the navigable Irwell by the famous Barton aqueduct. The duke's sole coadjutors were his steward, John Gilbert (brother to the founder of the Gilbert unions), and Brindley, who, in all probability, was introduced by Gilbert to the duke. The act was obtained in 1759; the Barton aqueduct was opened in 1761—a seemingly short interval of two years, but one of trying difficulty to the projector. Lancashire looked with incredulity on the whole enterprise, and at one time the duke's credit was so low that he could not get his bill for £500 cashed in Liverpool;—Gilbert had to ride about in the neighbouring districts and borrow from the farmers such small sums as they would lend. The duke's estates were extensive but encumbered, and his Worsley establishment was reduced to the very lowest scale. He lived to reap his reward even in a pecuniary sense. He constructed thirty-six miles of successful and lucrative canals. The despised projector of the Liverpool financiers could afterwards subscribe £100,000 to the loyalty loan, and return his income to the property-tax commissioners at £110,000 per annum. Nor must it be supposed that his share in the great enterprise was confined to the supply of capital and to the encouragement of others. In some curious pieces printed by Francis, last earl of Bridgewater (the testator of the Bridgewater Treatises), there are related several authentic anecdotes, which prove that the duke, even in matters of detail, occasionally over-ruled Brindley, and that his suggested alterations were successful. More than twenty years after Brindley's death, between 1796 and 1799, and in his own latest years, the duke is represented as indefatigable in improving, or trying to improve, a system with the actual results of which he might well have been content. During the period referred to, and before Bell and Fulton had applied the steam paddle-wheel to navigation, the duke of Bridgewater, at considerable expense of time, trouble, and money, tried (but unsuccessfully) the experiment of the steam-tug on the Worsley canal. He died of a cold, which had deepened into influenza, on the 8th of March, 1803, in his sixty-eighth year, at his mansion in London, on the site of which now stands the magnificent Bridgewater house, built by the late earl of Ellesmere, the duke's principal heir. In person the duke of Bridgewater was, latterly, large and unwieldy, indifferent to his dress, which was uniformly a suit of brown, somewhat similar to that of Dr. Johnson. In his habits he was simple and economical, smoking much but drinking little. His talk was chiefly of canals, and he had a marked aversion to the use of the pen. By his dependents, in spite of his rough exterior and abrupt manners, he was much liked for his familiarity of intercourse and generosity of conduct. It is somewhat singular, that though he displayed a marked aversion to the ornamental when divorced from the useful, and once reproved a labourer who, during his absence from Worsley, had planted some flowers, which he rooted up with his stick, yet he amassed the splendid collection of pictures now preserved in Bridgewater house, and valued, when he died, at £150,000.—(*Quarterly Review* for March, 1844: Art., "Aqueducts and Canals," reprinted in "Essays by the late Earl of Ellesmere," London, 1858; *Letters of the Hon. Francis Egerton*, afterwards Earl of Bridgewater, Paris, 1819; *Gentleman's Magazine* and *Annual Register* for 1803, &c.)—F. E.

BRIDGEWATER, JOHN. See AQUAPONTANUS.

BRIE, JEAN DE, a shepherd of Brie in France, who composed, by order of Charles V., a work entitled "Le vray regimé et gouvernement des bergers et bergères," &c., 1542.

BRIENNE, the name of an ancient and illustrious French family, the following members of which deserve mention:—JEAN, count of Brienne, married in 1209, Marie, daughter of Conrad of Montferrat, and was crowned king of Jerusalem. For awhile he made war successfully against the Saracens, but was at length obliged to place himself for protection in the hands of the Emperor Frederic II., to whom he gave his daughter in marriage. In the quarrels of the emperor with the pope, he took part with the latter. In 1229 the French barons conferred on him the crown of Constantinople, which, in spite of repeated invasions of Greeks and Bulgarians, he wore till his death in 1237.—RAOUL DE BRIENNE, count of Eu, constable of France, and a distinguished warrior under Phillip of Valois, killed at a tournament at Paris in 1344. In 1340 he successfully defended Tournay against an army of 20,000 English.—RAOUL II. DE BRIENNE, count of Eu, succeeded to the post of constable on the death of his father. He served in the English wars, especially in Normandy, where, having allowed himself to be drawn into an

engagement with superior numbers, he was taken prisoner. He was executed as a traitor in 1350.—GAUTHIER DE BRIENNE, duke of Athenes, constable of France under John II., killed at the battle of Poitiers in 1356. He was brought up at the court of Robert, king of Naples, who in 1326 sent him to Florence under the title of vicar of the duke of Calabria. Here he so ingratiated himself with the people, that, on the breaking out of the war with the Pisans in 1342, they raised him to the command of the city. But his popularity was of short duration; an insurrection of the populace in 1343 obliged him to take refuge in France.—J. S., G.

BRIERE DE BOISMONT, A., a French physician, was born at Rouen about the year 1796, and took his degree of doctor at Paris in 1825. He devoted much attention to mental diseases and the nerves, and wrote an elementary work on botany, in which he particularly considers plants in their relation to medicine and in their economical uses. He was aided in this work by Pottier of Rouen.—J. H. B.

BRIELE, RABBI YCHUDAH BEN ELIEZER, presided over the Jewish congregation of Mantua, in the early part of the eighteenth century. The fame of his talmudical "Responses" spread all over Italy, says Azulai (Vaad, part 2): he has also written on grammar, and he took an active part in the controversy against Nehemiah Chayún, the propagator of Shabbatai-Zebi's cabbalistical doctrines (Wolf, v. 3, No. 702). Rossi possessed several MSS. by Briele on the Jewish-Christian controversy—an evidence of the extensive range of Rabbi Briele's studies.—T. T.

BRIFAUT, CHARLES, born at Dijon in 1781. Brifaut was one of those writers whose works, having at one time enjoyed popularity, occasioned by chiming in with a fleeting taste, or because of particular circumstances, are only referred to by after-generations as historically illustrative of the incidents of former days. Because the jealous censors of Napoleon interfered in 1807 with the representation of Brifaut's tragedy of "Lady Jane Grey," the public hastened to applaud it, when produced upon the return of the Bourbons in 1814, and gave a triumph at the same time to the sonorous versification of another tragedy, "Ninus." Elected a member of the academy in 1826, his position kept his name alive, while his agreeable manners insured him a welcome place in society. He died at Paris in 1857.—J. F. C.

BRIGANTI, VINCENZO, an Italian botanist, wrote a work on the sexual system of Linnæus, which was published at Naples in 1804; also treatises on a new species of pimpinella, on the fungi, and the rarer plants of the kingdom of Naples, and on the use of the bark of *Loranthus europæus*.—J. H. B.

BRIGGS, HENRY, one of the greatest mathematicians of the seventeenth century, was born at Warley Wood, near Halifax, Yorkshire, about the year 1560. He studied at St. John's college, Cambridge, became M.A. in 1585, and in 1596 was chosen the first reader in geometry at Gresham college, London. In 1609 he attracted the notice of Dr. James Usher, afterwards archbishop of Armagh, and they became intimate friends. The question of a northwest passage through the straits of North America, began now to excite attention, and he wrote upon it with much skill and discrimination. Having lectured at Gresham college with success for twenty-three years, he was invited by Sir Henry Savile to accept his lecture on geometry at Oxford, with a better stipend. He removed to Oxford in 1619, and was incorporated as M.A., Oxon., in the same year. In 1620 he published in London the six first books of Euclid, restored according to the old MSS., with Fred. Commandine's version corrected. He did not give his name in this edition. In 1624 he issued his "Arithmetica Logarithmica," London, fol. He died at Merton college, Jan. 26, 1630-31.—T. J.

BRIGGS, WILLIAM, a celebrated English physician, was born at Norwich about 1650. He studied at Cambridge, and afterwards travelled into France, where he attended the lectures of Vienssens at Montpellier, and on his return to England in 1676, published a work on ophthalmic surgery, entitled "Ophthalmographia," &c. In the following year, 1677, he took his doctor's degree, was admitted into the College of Physicians, and elected a fellow of the Royal Society. In 1683 he became one of the physicians of St. Thomas' hospital, and after the revolution of 1688 was appointed physician-in-ordinary to William III. He died at Town-Malling in Kent in 1704. The structure of the eye, and the diseases to which that delicate organ is subject, constituted his principal study. He inserted a paper on the

theory of vision in the Philosophical Transactions, and Sir Isaac Newton corresponded with him, and esteemed him an authority in all matters connected with the visual organs. Besides the above, Briggs had a second paper in the Philosophical Transactions, and before his death he had announced other works on the eye, never published.—W. S. D.

\* BRIGHT, JOHN, a democratic politician of note, was born on the 16th of November, 1811, at Greenbank, in the immediate vicinity of Rochdale, still the seat of the manufacturing operations of the firm in which he is a partner. His father, who died at an advanced age, and in possession of considerable wealth, six or seven years ago, had raised himself from the ranks to the position of an opulent master cotton-spinner, and enjoyed, in his own locality, a well-earned reputation for shrewdness and energy. Mr. Bright was the second of ten children, the eldest of whom died young, and in earlier years his own feeble health was a source of constant anxiety to his parents. He received his first education at a school in Rochdale, whence he was removed to one at Ackworth in Yorkshire, supported by the Society of Friends, to which his parents belonged, and of which Mr. Bright himself is still ostensibly a member. After a further removal to York, his health being still found unsatisfactory, he was placed under the charge of a tutor at Newton in Bolland, and, invigorated by rambles upon its breezy uplands, he returned home to take a part in his father's manufacturing industry, and to be initiated into the mysteries of buying cotton, and selling cotton-yarn on Manchester 'Change, operations which, in later years, he has allowed to devolve on younger brothers. Mr. Bright's first appearance as a politician, dates from the local agitation which preceded and accompanied the reform bill of 1831-32. Rochdale was one of the populous boroughs, until then unrepresented, to which the reform bill proposed to assign the right to return a member to parliament. Mr. Bright's voice was of course heard on the popular side, but he was then only a youth of twenty, and beyond the fact that he did address his townsmen in favour of the reform bill, no information has been preserved of his first appearance in the political arena. It is recorded, however, that when, two years later, he and some other young townsmen resolved to hold a meeting for the discussion of the temperance question (Mr. Bright has been for many years a teetotaler), they selected, for the scene of the discussion, a hamlet some miles from Rochdale, so modest was their estimate of their own powers, so unpopular the theme of debate, and so great their fear of ridicule!

The time was, however, at hand, when Mr. Bright was to become first locally, and then nationally prominent. In 1835 he made a tour on the continent and to Palestine. It was the year of Mr. Cobden's continental travels, which resulted in the pamphlets by a Manchester Manufacturer, and the first acquaintance formed by Mr. Cobden with the name of his future fellow-labourer—personally they did not then meet—was at Athens, which Mr. Bright had quitted before the arrival of Mr. Cobden. On his return home, Mr. Bright began to lecture at a literary institution in Rochdale, which he had helped to found. His first subjects were his recent experiences of travel, and thence, by an easy transition, he passed to lectures on subjects connected with industrialism and political economy. It was about this time, too, that he threw himself into one of those violent church-rate contests, for which Rochdale had long been celebrated, and replaced the usual passive resistance of his sect by an active and energetic opposition. The name of "John Bright" was now well-known as that of a sturdy and combative Rochdale radical, when, suddenly, a question arose which led to his exchanging a local for a general notoriety. The Manchester Anti-corn-law association was formed in the autumn of 1838, and Mr. Bright's name appears in the list of its first committee. Early in 1839 this purely local association became the famous Anti-corn-law league; and in the course of the same year Mr. Cobden paid a missionary visit to Rochdale. It was on this occasion that the two free-trade leaders first made each other's personal acquaintance, and Mr. Cobden was so struck by the force and fire of Mr. Bright's oratory, that he insisted on pressing him into the service of the league, of which Mr. Bright became, before long, a most successful and an indispensable champion. Mr. Cobden's lucid and logical advocacy of free-trade was supplemented by the much more vigorous and impassioned rhetoric of Mr. Bright. The calmer friends of the cause might be startled, and its enemies be shocked by the personali-

ties and all but revolutionary declamation of Mr. Bright. But the fiery tone of his addresses was well-suited to public and miscellaneous meetings. Mr. Bright was soon recognized as only second to Mr. Cobden in the effective advocacy of the objects of the league, while the more ardent spirits of the party predicted his eventual supremacy. The history of Mr. Bright's connection with the Anti-corn-law league, involves the history of the league itself, which does not fall to be written here. Suffice it to indicate, as prominent events of this section of Mr. Bright's career, his metropolitan exertions in 1843 to secure the return of Mr. Patterson, the free-trade candidate, for the city of London, and his appearance at a great meeting of the Anti-Slavery Society in Exeter hall, during the course of 1844, when he advocated the application of free trade even to the sugar question, and opposed the imposition of a prohibitory or protective duty on slave-grown sugar. As a proof of his unremitting perseverance, it may be mentioned, that when he accompanied to Leamington his first and dying wife (Elizabeth, eldest daughter of Jonathan Priestman, Esq., of Newcastle-on-Tyne, whom he married in 1839, and whom he lost in 1841), he delivered anti-corn-law lectures in the neighbourhood, and endeavoured to win over the Warwickshire farmers to a conviction of the agricultural benefits of free trade.

Mr. Bright first entered parliament in 1843, two years after the return of Mr. Cobden for Stockport. In the spring of that year a vacancy occurred in the representation of Durham, and Lord Dungannon was selected as the conservative candidate. In accordance with the tactics of the league, to offer a free-trade candidate whenever there was a vacancy, and whether success was probable or improbable, Colonel (now Major-general) Thompson was put forward as the free-trade candidate, and Mr. Bright was despatched to Durham to advocate his claims and to forward his canvass. From some cause or other Colonel Thompson withdrew from the contest at the eleventh hour. There was no time to lose: Mr. Bright was on the spot; and the day before the election he issued his address as a candidate. He was defeated by a majority of 101. The return of Lord Dungannon, however, was petitioned against, and he was unseated for bribery. The contest was renewed, and in July, 1843, Mr. Bright was returned for Durham by a majority of 78. The spectacle of a radical quaker sitting for the cathedral and conservative city of Durham was a strange one, and would seem marvellous even now, were it not understood that the then marquis of Londonderry refused to throw his overwhelming influence into the scale of his natural ally, the conservative candidate. Mr. Bright's first speech in the house of commons was made towards the end of a session, and in a thin house, on the 7th of August, 1843. It was in support of a motion of Mr. Ewart's for the reduction of import duties, and its delivery betrayed a certain nervousness which often characterizes Mr. Bright's parliamentary oratory, and which must surprise those who have only heard him speak to miscellaneous, excited, and altogether friendly audiences. From this period onward to the repeal of the corn laws, Mr. Bright was active in and out of parliament; but both with the public as a whole, and with the house of commons, Mr. Cobden was still the favourite. In his celebrated peroration, when proposing the repeal of the corn laws, the late Sir Robert Peel ascribed the whole glory of the free-trade triumph to Mr. Cobden. The Bright testimonial, subscribed for after the dissolution of the Anti-corn-law league, was very much inferior in amount to that raised for Mr. Cobden, although it furnished the recipient with an excellent library. Unconnected directly with the free-trade movement, two items of Mr. Bright's house of commons activity in the parliament of 1841-47, deserve to be noticed. One is the appointment procured by him in 1845, of a game law committee, which printed its evidence without a report, in 1846; and an abridgment of the evidence, with an address by Mr. Bright to the Tenant Farmers of Great Britain, was published, at his expense, the same year. The other was the appointment, also at his instance, of a select committee on the cotton cultivation of India: its labours issued in a huge blue book, frequently referred to in discussions on this interesting question.

The general election of 1847, which followed the repeal of the corn laws, and the overthrow of the Peel ministry, placed Mr. Bright in a higher position than any he had yet aspired to. Mr. Mark Philips retired from the representation of Manchester, and the friends of Mr. Bright wished to see him the colleague of Mr. Milner Gibson in the representation of that important consti-

tuency. The liberal party of Manchester was divided. The old whigs disliked Mr. Bright's radicalism, and wished to throw off the thralldom of the league, the local leaders of which were favourable to the claims of Mr. Bright. Mr. Cobden was invited to stand, but he refused. Lord Lincoln (now duke of Newcastle) was then persuaded to become a candidate, but dissatisfied with his chances of success, he withdrew, after his committee had been formed, and Mr. Bright was returned without opposition. The ensuing six years of Mr. Bright's life, public and parliamentary, were active and busy. "Out of doors," he co-operated no longer as a subordinate, but as an equal with Mr. Cobden, in various agitations for financial and parliamentary reform, but not with the marked success which had attended the free-trade movement. In parliament, Mr. Bright spoke with increasing frequency, and succeeded gradually in the difficult enterprise, which is termed "gaining the ear of the house." It was remarked that, if still narrow in his tone, his scope was wider. Besides urging the ordinary views of a radical politician, he produced a marked effect by his treatment of the Irish and Indian questions in 1848 and 1850. After the formation of the first Derby ministry, and the consequent dissolution of parliament, his return for Manchester was opposed, but the cause of free-trade was thought to be once more in danger, and moderate liberals themselves, though disagreeing with many of his views, refused to countenance the attempt to oust him from the representation of Manchester at such a crisis. After a contest, he was again returned by a large majority. His violent opposition to the Russian war, however, united against him a majority of his constituents, many of whom, moreover, were perhaps still influenced by a jealousy of the local power of the Anti-corn-law league, which, though nominally dissolved, still kept up in Manchester a considerable organization. Soon after the formation of Lord Palmerston's ministry, Mr. Bright was compelled, by ill-health, to withdraw from attendance in parliament, and to seek repose and change of scene on the continent. The general election of 1857 found him abroad, and in his absence, Manchester rejected him as its representative. On the death of Mr. Muntz, he was elected in August, 1857, one of the members for Birmingham, and has since resumed his parliamentary duties. In 1847 Mr. Bright married a second time, a daughter of Mr. Leatham of Wakefield, by whom he has several children, in addition to one by his first marriage.—(Alexander Somerville, *Free-Trade and the League*, Manchester, 1853, &c.)—F. E.

BRIGHT, RICHARD, M.D., an eminent physician, was born in Bristol in the year 1789. He matriculated as a student at the university of Edinburgh in the year 1808, and graduated in medicine in 1812. After spending some time at Cambridge, he proceeded to the continent, and was one of the many physicians and surgeons who thronged to Brussels after the battle of Waterloo, with the double object of acquiring professional knowledge and of assisting the overtasked military surgeons in the care and treatment of the sick and wounded. Dr. Bright afterwards commenced the practice of his profession in London, and in 1820 was appointed assistant-physician to Guy's hospital—the high reputation of which, as a medical school, he did much to establish and maintain. As an author, Dr. Bright occupies the foremost position in English medical literature. His "Original researches into the Pathology of Diseases of the Kidney" have been universally acknowledged as among the most valuable discoveries in pathology; and over the whole world "Bright's disease" is recognized and described. It may be sufficient to indicate here that his discovery lay in the identification of the coexistence of an albuminous state of the urine with certain morbid changes in the structure of the kidney. On other subjects connected with pathology and practical medicine, Dr. Bright has been a copious and able writer. As a practitioner he attained great celebrity, more especially in dropsical cases, and he was one of the physicians extraordinary to the queen. Dr. Bright died in December, 1858, in the 70th year of his age.—J. B. C.

BRIGHT, TIMOTHY, an eminent English physician and divine, took his degree of doctor of medicine at Cambridge, and in 1591 became rector of Methley in Yorkshire. His most celebrated production is his "Treatise of Melancholy." His medical works exhibit a remarkable acquaintance with the doctrines of the early Greek writers. He died in 1615.

BRILL, PAUL, one of the earliest of the Flemish landscape painters, was born at Antwerp about 1556. After receiving some instruction from an obscure painter of the name of Oortel-

man, he executed small pictures for the cabinetmakers; but finding little business in his own country, he tried his fortunes in France, especially at Lyons. From Lyons he went to Italy, and joined his elder brother Matthew at Rome, who was then much employed in decorating the walls of the Vatican with processions and landscapes in fresco for Pope Gregory XIII. After the death of Matthew (in his thirty-fifth year) in 1584, Paul completed his brother's works, and continued the same class of decorations in various churches and palaces for Sixtus V., Clement VIII., and Paul V., turning his attention more especially to landscape painting; representing scenes from the lives of the martyrs, and views of the grand monastic institutions of the Roman states. These large wall paintings were executed in fresco; but Paul Brill also became distinguished for his small easel pictures in oil, which, though essentially landscapes, are generally enlivened by some figure subject. He imitated the style of Titian in his backgrounds, and also the landscapes of Annibale Caracci, but his colouring is generally considered too green. His success was great, his lowest price for a landscape being one hundred scudi, about twenty guineas; many of these being purchased by Flemish merchants and sold in the Low Countries. Several good examples are now in the Louvre. He occasionally had recourse to the assistance of other painters for the figures in his landscapes. Engravings after his works are numerous, and he etched a few plates himself. He died at Rome, October 7th, 1626, and was buried in the church of the Madonna dell' Anima. There is a portrait of him by Vandyck.—(*Baglione; Le Vite dei Pittori, &c.*)—R. N. W.

BRILLON, PIERRE JACQUES, born at Paris in 1671, and died at Paris in 1736. His father was a wealthy silk merchant, and hoped to see his son a prosperous avocat; but the demon of rhyme seized him early, and Peter James gave himself to what is called literature. He wrote imitations of La Bruyere, who felt flattered, and said they were not bad—no one said that they were good—and our poet and moralist, after some interlunary periods of verse-writing, reappeared as jurist and juriconsult.

BRINDLEY, JAMES, a celebrated engineer, who shares with Francis Egerton, duke of Bridgewater, the honour of having founded the system of canals in England, was born at Tunstead in Derbyshire in 1716, of poor parents, by whom his education was so neglected as to give rise to the allegation, that he continued all his life without the knowledge of reading, or of writing beyond the signing of his name; but there is reason to believe that this statement is exaggerated. At the age of seventeen he was bound apprentice to a millwright of Macclesfield, of the name of Bennet, and in due time began to practise that business on his own account. His ingenuity and skill in practical mechanics were so great that he soon acquired a high reputation throughout the kingdom, and was employed to make some of the most important pieces of machinery which were executed at that period in England. It was about 1754 that he first became connected with those works of inland navigation which have made his name famous. At that time the duke of Bridgewater, possessing at Worsley, seven miles from Manchester, a rich and extensive coal-field, the advantages of which were withheld from him by the want of means of conveyance to a suitable market, formed the project of connecting it with Manchester by means of a canal—a kind of conveyance which, although it had existed in France for upwards of a century, in Italy and Holland for five centuries, and in China from time immemorial, was at that time new to England. On this project the duke of Bridgewater consulted Brindley, who approved of it, and planned the works by which it was to be carried into effect. An act of parliament authorizing the execution of this project was obtained, but not without much difficulty; for, like most new enterprises, it had to encounter a storm of opposition and ridicule from those who considered its novelty as implying impracticability, and who regarded as non-existent all previous works of the same kind out of England. In overcoming obstacles of this kind, Brindley laboured under peculiar disadvantages from his want of education, which disabled him from clearly explaining to others, and especially to the ignorant and prejudiced, his ideas, however sound; and it is much to the honour of the projector of the canal that he possessed a mind capable of discerning the genius of the engineer through his rough exterior, and of placing implicit confidence in the genius so discerned. The duke of Bridgewater, limiting his personal expenses to £400 a year, placed the rest of his income at the disposal of Brindley for the execution

of his canal, which was successfully carried forward, and completed in 1761. Great additional expense in earthwork and masonry was incurred by the determination to make this canal without locks, which are always a serious impediment to navigation; and amongst other works so rendered necessary, was an aqueduct over the river Irwell, thirty-nine feet high above the level of the stream, which was then considered a gigantic undertaking, and, until its completion, denounced as the most visionary part of the scheme. Between 1761 and 1766, Brindley planned and executed, for the duke of Bridgewater, a branch or extension of his canal twenty-nine miles in length, terminating by a junction with the estuary of the Mersey. The whole undertaking soon became profitable, and continues to the present time to be one of the most useful and successful of the British canals, of which it was the first. The success of the duke of Bridgewater's canal induced various other capitalists to project works of the same class, most of which were intrusted to Brindley while he lived; one of the most important being the Trent and Mersey or Grand Trunk canal, which effects a connection between the Irish sea and the German ocean, and comprises a formidable work, the Harecastle-hill tunnel. Exhausted by excessive labour, Brindley died on the 27th of September, 1772, at the early age of fifty-six; but he had already lived to see the commencement of that British system of inland navigation which, commencing with the canal that he planned and made, has since extended itself in one connected network over England from Kendal to Portsmouth, with the addition of detached works, some of which, like the Forth and Clyde and Caledonian canals, exceed the rest in magnitude. Amongst the anecdotes which are related of Brindley, it is said, that being obliged to supply the want of education by intense thought, he was in the habit, when he had any important work to design, of going to bed, where he would remain for days together until his plans were matured in his mind; and that his zeal for his favourite mode of conveyance was such, that having been asked before a parliamentary committee, for what purpose he thought rivers were created, he answered, "to feed canals."—W. J. M. R.

BRINK, HANS JEN, born at Amsterdam; and educated by Richee van Ommeren, he acquired a taste for classical literature. He passed from van Ommeren's care to the university of Leyden, and devoted part of his time to the study of theology, a condition enforced upon him to enable him to hold an exhibition or "bourse," as it is there called, which nearly defrayed the expenses of his education. He was for a while a patriot, and made political speeches which it is easier to praise than to read. He grew older, sadder, and wiser, and began to teach Greek and Latin at the academy of Harderwyk; afterwards set up a school of his own, and in 1814, or soon after, was appointed professor of ancient literature at the academy of Groningen. He published Dutch translations of Sallust and parts of Cicero, also of Xenophon's Cyropædia, and of the Medea of Euripides. In 1815 he printed a political pamphlet, ridiculing the allies for refusing to treat with Bonaparte.—J. A. D.

BRINKLEY, JOHN, LL.D., bishop of Cloyne, professor of astronomy in Trinity college, Dublin; born in 1763, died in 1835; an eminent mathematician and observer. Brinkley's career at Trinity college was so remarkable, that the chair of astronomy was easily secured for him in 1792; and this involved his being in charge of the observatory at Dunsink. He had the good fortune to obtain possession of one of Ramsden's great circles, similar to the instrument made by the same mechanician for Piazzi at Palermo. This circle is not of the construction now usually employed; it resembles rather the *great circle* of Ertel of Munich. It has a motion in azimuth, and may be reversed by that motion; while, at present, the favourite construction rests on the opinion that all such circles ought to be fixed in the meridian. Brinkley's instrument, however, was perhaps the best existing in his time, and he employed it well. Many excellent results were obtained by him, and he had a strong impression that he had obtained the parallax of  $\alpha$  Lyra. This was vigorously contested by Pond; and a debate on the delicate point was kept up by the two observers for several years. In the end it became rather hot; so that no one regretted its termination. The decision has gone against Brinkley; professor Airy being judge. It is quite certain that he was not in a position to determine so small a quantity; and more recent investigations, conducted chiefly by Struvé, show that the parallax of that star (should any parallax be sensible) is much smaller than the Irish

observer imagined. Brinkley wrote a text-book, entitled "Elements of Astronomy." This work is still extensively used, although it cannot be doubted that better ones exist. His chief writings, however, and those that show his powers, appeared as memoirs in the Transactions of our learned societies. The subject of parallax seems to have engaged him much. He wrote frequently also on refraction, and we owe him improvements in our tables. He published an interesting and instructive essay on the solutions of Kepler's problem; and he sent to the Transactions of the Royal Academy of Ireland, a curious memoir on the shape of the orbits that would be assumed by bodies revolving around a centre, in obedience to an attractive energy decreasing according, not to the square, but to any power whatsoever of the distance. This last essay has not had, and probably never will have, any practical relations; but its execution is very creditable to Brinkley. The life of this inquirer seems to have been an undisturbed one, and marked by no accident apart from his scientific labours. It has been said that he wrought with Paley while the latter was producing his interesting treatise on Natural Theology. His episcopal duties were, no doubt, fairly performed; and as a man, he bore himself with honour, and was thereupon held by those who knew him, in corresponding esteem. His successor in the chair of astronomy, is a well-known geometer, of whom we shall speak again—Sir William Hamilton.—J. P. N.

BRINKMAN, KARL GUSTAVUS, Baron von, a Swedish statesman and poet, born 24th February, 1764, at his paternal estate in the parish of Brannkyrka and district of Stockholm. He studied at Upsala, and afterwards at the universities of Halle, Leipzig, and Jena, at the first of which he formed a strong friendship with Schleiermacher. In 1792 he was appointed secretary to the Swedish legation in Dresden, and six years afterwards consul at Paris. In 1801 he was sent to Berlin in the same capacity, where, with a slight interruption in his office, he remained till 1806, when he fled from the capital with the Prussian court. In 1807 he came as ambassador to London, whence he was recalled in 1810, and afterwards remained at home for many years, an active member of the administrative government. In 1829 he was nominated a member of the Swedish Academy, and in 1835 made over to the university of Upsala his large library of 10,000 volumes. Four years afterwards he was elevated by the king to the rank of the nobility. Brinkman was remarkable for his great learning and knowledge of languages; he was also a poet of some reputation. He published two volumes of poems while at Leipzig in 1789, which appeared under the name of Selmar; also a small volume for private circulation at Paris; and his "Philosophical Views and Poems," at Berlin in 1801, which also was published anonymously. His poem, "The World of Genius," received the first prize at the Royal Academy of Sweden in 1821. He published in 1828 his "Tankbilder" (Thought-Pictures), in the fourteenth volume of *Svea*, a Swedish periodical. He kept up for many years a lively correspondence with madame de Stael.—M. H.

BRINSLEY, JOHN, M.A., of Emanuel college, Cambridge, was born at Ashby-de-la-Zouch in Leicestershire in 1600. By his father, who was master of the grammar school at Ashby, and a man of considerable learning, he was carefully trained in letters and religion, and so profited by his opportunities that, while only in his seventeenth year, he accompanied his maternal uncle, Dr. Hall, afterwards the famous Bishop Hall, as his amanuensis to the synod of Dort. After finishing his studies at Cambridge, he officiated for some time as a preacher at Preston, near Chelmsford, and subsequently sustained the ministerial office successively at Somerleyton and Yarmouth. At the latter town he spent the greater part of his life, first as minister of the parish, and subsequently as a private inhabitant, after his ejection on "the fatal Bartholomew," when so many pious and useful pastors were cast out of their places for conscience' sake. During his later years he occupied himself chiefly in study, and in preparing for the press occasional sermons and treatises of a practical and, in one or two instances, of a controversial character. He was a steadfast presbyterian, but not so wedded to his peculiar views that he could not hold fellowship with christians of other opinions on such points. He died on the 22nd January, 1665. "He was a man," says Calamy, "of even temper, rarely ruffled with passion, and seldom warm, unless the cause of God and goodness required it." His writings show him to have been a sound scholar, a vigorous reasoner, and an earnest preacher.—W. L. A.

BRINVILLIERS, MARIE-MARGUERITE D'AUBRAY, Marquise de, the notorious poisoner, daughter of Dreux d'Aubray, a municipal lieutenant of Paris. She married the marquis de Brinvilliers in 1651; separated from him to live with her paramour Sainte Croix; and learning from that accomplished villain the use of a poison, which is now supposed to have been common arsenic, began a career of crime which is almost without parallel. To secure for herself and her lover the property of her family, she poisoned her father and her two brothers, having previously proved the efficacy of the drug with which she accomplished these atrocities, by destroying a number of poor people in the public hospitals. These crimes and others of the heartless pair were brought to light at the death of Sainte Croix, who fell a victim to his abominable trade, having let fall, while preparing a deadly volatile poison, the mask which protected his face. She fled to a convent of Liege, but by the arts of an officer of police, who made her acquaintance in the guise of an abbé, was brought back to Paris, and after being subjected to various tortures, executed with all possible indignities in 1676.—J. S., G.

BRIQUANT, JACQUES LE, born at Pontreux in 1720, and died at Tréquier in 1804. He was educated as a lawyer, but misled from professional studies and pursuits by some delusive phantom of philology or etymology. In every language he caught the lineaments of the Celtic, and insisted with wearisome zeal upon inflicting his theory on all his friends. On his seal he had the words engraved "Celticâ negatâ, negatur orbis." He addressed memoirs to all the academies and scientific bodies likely to have secretaries employed in correspondence on such topics, and printed a good many books all illustrative of what he called "la langue des Celtes Gomerites ou Bretons." A good many Tracts of his on these subjects are still in manuscript. Briquant was a mineralogist as well as a linguist, and did something to bring the marble of Bretagne into use. Five of his sons died in the armies of France—one, who proposed to remain with his father, was claimed by the conscription. It is related of Latour d'Auvergne, that he served in the young man's stead to enable him to take care of the old man, whose intellect had become impaired.

BRISBANE, SIR THOMAS MAKDOUGALL, Bart., G.C.B., G.C.H.; D.C.L.; LL.D.; F.R.S.; corresponding member of the Institute of France, &c. &c., equally distinguished as a soldier and a man of science, was born at Bishopton in July, 1773, and died, 28th January, 1860. His life was one continued wise and practical offering in the service of his country and of astronomical science. He was the son of Thomas Brisbane, Esq. of Brisbane, by Miss Bruce, daughter of Sir M. Bruce of Stenhouse. He entered the army in 1789, and having joined the duke of York in Flanders at the beginning of the war, was present in every engagement, with the exception of that of the 23rd May, 1793, at which date he was suffering from a wound received in a previous action. In 1796 he went to the West Indies with Sir Ralph Abercromby, and was present at the taking of St. Lucia, St. Vincent, Trinidad, Porto Rico, &c. In 1812 he joined Wellington in the peninsula, where, in six general actions, he commanded a brigade, fought in fourteen battles and twenty-three serious affrays, and took part in eight sieges. In all these engagements his skill and bravery were equally conspicuous. The intimacy which he had contracted with Wellington in Ireland, his conduct in the peninsula ripened into a personal attachment on the side of the commander-in-chief; and Sir Thomas, in the reminiscences which he printed for private circulation shortly before his death, has recorded, among numerous interesting anecdotes of the duke, some which exhibit the relations between the two soldiers as having been of the most friendly and familiar character. For his services in Spain, Brisbane obtained the gold cross and a clasp for Vittoria; the silver war medal and a clasp for the Nive; and he was among the general officers who received the thanks of parliament in 1813. Marked out by his promptitude and courage, exhibited on critical occasions, he was selected by the British ministry as governor, first of Jamaica, next of the island of St. Vincent, and finally of New South Wales. In 1826 he obtained the colonelcy of the 34th regiment of foot; in 1836, having been previously knighted by the duke at Paris, he was created a baronet by William IV.; in the same year he was offered but declined the command of the forces in Canada, and in 1838 the post of commander-in-chief in India. Throughout his career Sir Thomas unceasingly manifested his interest in the promotion of practical astronomy, especially in its relations to navigation, and his own ability to

advance it by personal labours; of his deserts, in this respect, he has given evident and permanent proofs. The memoirs due to his pen which are inserted in the Transactions of the Royal Society of Edinburgh, are distinguished by clearness of conception and expression, and the directness with which they bear on important practical points. But these memoirs, however interesting, are but a poor representation of what astronomers and other cognate inquirers owe to him. When governor of New South Wales, Sir Thomas established an observatory at Paramatta at his own expense, associating with himself Mr. Runker and Mr. Dunlop. The catalogue of southern stars furnished by it is well known, and is the more valuable as being one of the very few records yet attainable of the condition of the Southern skies. The observatory of Paramatta, was, with a liberality as rare as estimable, presented by its founder to the British government. On Sir Thomas's return to this country, he built another observatory at his seat, Makerstoun on the banks of the Tweed; and with due regard to the wants of the moment, he furnished it with special reference to the pursuit of magnetical and meteorological research. Ably seconded by his assistant Mr. Broun, he produced several volumes of most valuable observations, by means of which (although the circumstance has been overlooked) the existence of a magnetic irregularity dependent on the periods of the moon, was established unquestionably for the first time. His interest in the progress of knowledge never wavered or diminished; appealed to on behalf of any good and attainable object, he was ever ready to aid by his purse and by his influence. He long occupied the chair of the Royal Society of Edinburgh, and worthily fulfilled a varied life, whose long and honourable course was never approached by the shadow of a stain. He married, in 1819, Anna, daughter and heiress of Sir Henry Makdougall. At his death he was the third senior general on the army list.—J. P. N.

**BRISSAC, LOUIS-HERCULE-TIMOLEON DE COSSE**, duc de, peer of France, governor of Paris; born Feb. 14, 1734; was nominated in 1791 commandant-general of the king's constitutional guard, and massacred at Versailles during the revolutionary horrors of September, 1792. He defended himself bravely against his assassins. He was a loyal and devoted servant of Louis XVI. Delille has celebrated his virtues and his death in the *Poème de la Pitié*.

**BRISSEAU, PIERRE**, a French physician of the seventeenth century, born at Paris in 1631; died in 1717. His most important work is a "*Traité de la cataracte et du glaucoma*," Tournay, 1704 and 1708; Paris, 1709; in which he proves that the seat of cataract is in the crystalline lens. It was published a year before the work of Antoine Maitre-Jean, who is generally stated to be the discoverer of the cause of this disease.

**BRISSON, BARNABÉ**, a French magistrate and jurist, reputed one of the most learned men of his time, born in 1531; was successively advocate-general and president à mortier of the parliament of Paris in the reign of Henry III. He was latterly raised to the dignity of privy councillor, and intrusted with several important embassies, particularly to the English court. On the institution of the commission called the Chamber Royal, for the hearing of cases of treason so common in the reign of Henry III., he was named president by the king, who took occasion to say of him, that no prince in Europe could boast of so learned a subject as Brisson. After the famous day of the Barricades, Brisson fell under the power of the party of the League, and either deliberately, or of necessity, turned traitor to the king. He shortly afterwards, however, became suspected by the tyrannical club called the Sixteen, who arrested him one morning at nine o'clock, as he was going to the palace, had him confessed at ten, and hung at eleven (1591). Brisson is the author of the collection of statutes called the Code of Henry III., of "*De Regio Persarum Principatu*," and of "*Observationum divini et humani juris liber*."—J. S., G.

**BRISSON, MATTURIN JACQUES**, a distinguished French naturalist and physicist, was born in 1723 at Fontenay le Peuple in Poitou. He was a pupil of Réaumur, whom he assisted in his investigations, and his connection with that great philosopher soon obtained him the position of professor of physics at the college of Navarre in Paris, where he was instrumental in introducing the use of the lightning-conductor, then a new invention. In 1795 he was appointed professor of physics in the central schools, and at the Bonaparte lyceum. He died in 1806 at Broissi, near Versailles. Of the writings of Brisson, those on physics, although of great importance in his day, are now but

little valued. His reputation rests principally on his natural history writings, especially his "*Ornithologia, sive synopsis methodica sistens avium divisionem in ordines*," &c., Paris, 1760, in six volumes, illustrated with 26 coloured plates. In this work Brisson describes about 1500 species of birds, arranged according to a modification of the system of Linnæus. His "*Règne animal divisé en neuf classes*," 1756, contains only the quadrupeds and cetacea, so that the "*Ornithologia*" may be regarded as a continuation of it. Brisson's arrangement of animals into nine classes, is in many respects far in advance of the sixth edition of the *Systema Naturæ* of Linnæus; and it is not improbable that, in his later editions, the great Swedish naturalist borrowed some ideas of classification from the French writer. Brisson's nine classes are—I. Quadrupeds; II. Cetacea (of these animals, since more correctly placed in the same order with the quadrupeds, Brisson appears to have been the first to perceive the true nature); III. Birds; IV. Reptiles; V. Cartilaginous Fishes; VI. True (or bony) Fishes; VII. Crustacea; VIII. Insects; and IX. Worms. The character of his orders of quadrupeds, eighteen in all, is determined principally by the number and arrangement of the teeth.—W. S. D.

**BRISSOT DE WARVILLE, JEAN PIERRE**, the celebrated Girondist politician during the French revolution, was born at Ouarville, near Chartres, January 1, 1764. His father was a wealthy inn-keeper. He manifested early a taste for literature, and with a view to intellectual improvement, travelled in many foreign countries. He became one of the editors of the *Courier de l'Europe*, printed at Boulogne, the publication of which having been summarily stopped by the government, he removed to England. In 1780 he published "*Théorie des Lois Criminelles*," 2 vols. 8vo; and in 1782-86, ten volumes of the "*Bibliothèque philosophique du législateur, du politique, du jurisconsulte, sur les lois criminelles*;" while he took a prominent part in various discussions, having for their object the amelioration of the criminal law. About the same time he issued a work on metaphysics, entitled "*De la Verité, ou méditations sur les moyens de parvenir à la vérité dans toutes les connaissances humaines*," 8vo, 1782, in which he adopts the opinions of Locke and Condillac. This, and a work on India, and on the state of art and science in England, he prepared while residing in London. Returning to France, his numerous writings, and his indefatigable zeal in the cause of liberalism, made him odious to the government. Some anonymous pamphlets, of which he was not the author, were attributed to his pen, and he was committed to the bastille. His innocence being demonstrated, he was set at liberty. This imprisonment did not conciliate his temper. His "*Lettres à Joseph II. sur le droit d'émigration, et sur le loi d'insurrection*," published in 1785, maintained the right of insurrection against governments, where the mere good pleasure of the sovereign constitutes the law of the subject. In 1786 appeared his "*Lettres Philosophiques sur l'histoire d'Angleterre*," 2 vols. 8vo. At this time he was the partisan of a limited monarchy, to which he had become attached in his admiration for the English constitution. But he soon became an equally ardent republican, when America presented to him the spectacle of a democratic and federal government. In 1787 he wrote a book, entitled "*De la France et des États-Unis, ou de l'importance de la Révolution de l'Amérique pour le bonheur de la France*," 1 vol. 8vo. A new anonymous work, attributed to him, now exposed him to a lettre de cachet. He was warned in time, and sought an asylum in England, from which he speedily removed to the United States. The French revolution recalled him to Europe, and he addressed to the members of the states-general a "*Plan of policy for the Deputies of the People*;" while he conducted a fierce journal, entitled *Le Patriote Français*. As a reward for his zeal in the cause of democracy, he was nominated one of the first municipal council of Paris; and it was as a member of this body that he received from the destroyers of the bastille, on the memorable 14th of July, the keys of the prison in which he had been formerly confined. Meanwhile, his short sojourn in America had increased his republican fanaticism. Sent to the legislative assembly by the electors of Paris, he became the determined foe of royalty and the court. He was the acknowledged head, counsellor, and guide of that deputation from the Gironde, which the eloquence of Vergniaud, the beauty of Madame Roland, and the calculations of Condorcet, first made famous, and afterwards its crimes and its misfortunes. In the question of the loyalist emigration, Brissot drew a distinction

between the men who quietly left their country, and those who marched out that they might augment the ranks of its enemies. On his suggestion, the latter were denounced with strong penalties. It is inconsistent with the limits of this article, to narrate the adventures of the Girondists through the stormy period which preceded and followed the death of Louis XVI.—a crime which they opposed in vain. Brissot was evidently shocked at the frightful excesses of a democracy coarser than his own, and began to oppose a force of resistance to the jacobin faction equal to the impulse which he had formerly given to the republican opinions. As the natural consequence, a breach arose between the Jacobins and Girondists, which daily grew wider and wider. On the 10th of April, 1793, Robespierre accused Vergniaud, Gensonné, Gaudet, Brissot, &c., of conspiring against the unity and indivisibility of the republic, and being the accomplices of the enemies of their country. This charge was the prelude of what occurred on the 31st of May. On this day the commissaries of thirty-five sections of Paris demanded of the convention the expulsion of twenty-two deputies, at the head of which was placed the name of Brissot. Two days afterwards, a majority of the convention handed them over to the vengeance of their opponents. Brissot fled to Chartres, his birthplace, which he soon left alone on foot, and in disguise. He was recognized and arrested at Moulins, brought back to Paris, and, in company with his friends, thrown into prison. On the 22d October their "acte d'accusation" was read to them, and their trial began on the 26th. Brissot entered the "salle d'audience" last but one of the party—a man of middle age, small stature, and wan features, lighted up by intelligence, and full of intrepidity. Clad with affected simplicity, his threadbare black coat was but a piece of cloth cut mathematically to cover the limbs of a man. The trial lasted a week. All the accused were declared guilty. Brissot inclined his head on his breast when he heard the fatal sentence, and remained silent. His memory survived the calumnies heaped upon it, and his widow, soon after his death, received from the nation a pension of 2000 livres. His writings, not enumerated in this memoir, were very numerous. He died as poor after three years of prominence as when he began his public career. He dwelt in an apartment on the fourth story, which was almost unfurnished, surrounded by his books and the cradles of his children. Destitute of the outside power of eloquence, he made speeches in his writings, and his burning words contributed not a little to influence the ideas and progress of the Revolution.—T. J.

BRISSOT, PIERRE, a celebrated French surgeon of the sixteenth century, was born at Fontenay-le-Comte in 1478, took his doctor's degree at Paris in 1514, and died at Evora in 1522. He is particularly distinguished from his having, by reviving the method of plentiful bloodletting in pleurisy recommended by Hippocrates, given rise to a most rancorous dispute on this subject; the practice up to his time, derived from Arabian physicians and their followers, being to bleed in very small quantity, and at the greatest possible distance from the part affected. The treatises and pamphlets published in connection with this dispute fill sixty-three thick volumes, of which about half are folios. Brissot was compelled to leave Paris, and take refuge at first in Spain, and afterwards in Portugal; in both which countries he continued to operate with success, and to meet with obstinate opponents. In Spain the government attempted to root out this new heresy by force, and in Portugal, Dionys, the royal surgeon, endeavoured to crush it under a thick folio. In answer to the latter, Brissot wrote his excellent "Apologetica. disceptatio de vena secunda in pleuritide," which was published at Paris in 1525, three years after the death of its author.—W. S. D.

BRITANNICUS, son of the Emperor Claudius, and of his third wife, Messalina, born A.D. 42, a few days after his father's accession. The name by which he was first known, Tiberius Claudius Germanicus, was changed in honour of the Roman conquests in Britain, the son of Messalina, until her death, being regarded as the heir-presumptive to the throne of the Cæsars. On the marriage of Claudius with his niece, Agrippina, Octavia, sister of Britannicus, was given in marriage to Lucius Domitius, son of Agrippina by a former marriage, and afterwards emperor, under the title of Nero. After the death of Claudius, Britannicus, by the arts of his stepmother, who had taken all proper precautions for that purpose, was set aside, and Nero elected to the imperial dignity. His popularity, and still more, the frequent and threatening references which Agrippina, in her quarrels

with her son, made to his being of the true stock of the Cæsars, rendered him an object of suspicion to the emperor, and ere long it was resolved to put him to death. At a banquet in presence of Agrippina, Octavia, and the future emperor, Titus, he was poisoned by command of Nero A.D. 55.—J. S., G.

BRITO or BRITTO, BERNARDO DE, a Portuguese historian, born at Almeida in 1569. He was scarcely of age when he entered the order of the Cistercians at Alcobaca. His singular accomplishments as a linguist enabled him to travel through various countries of Europe, preaching in their several tongues. Whilst so occupied, he conceived the plan of writing the general history of Lusitania, from the earliest times to his own days. Portugal was yet without a history when Brito published his, and it was, therefore, received with universal approbation. Philip III. appointed him royal historiographer. His other works are, "Monarquia Lusitana" and "La Geografia Lusitania." Many valuable manuscripts of his, such as "Tratado da antiga republica da Lusitania," are still unpublished. He died at Almeida in 1617.—A. C. M.

BRITO FREIRE, FRANCISCO DE, was born at the beginning of the seventeenth century, at Villa de Coruche in Portugal. At an early age he entered the army, and obtained a captainship in a cavalry regiment. Having been sent to Brazil as admiral of the Portuguese fleet, he compelled the Dutch garrison to relinquish their establishment at Arnumbuco in 1654. His biographers are unanimous in claiming for him the honours of a patriot. Brito was married to a daughter of Pedro Alvarez Cabral, and had a son who died governor-general of Rio Janeiro. A lengthened relation of his voyage to Brazil with his fleet in 1655, and a book on the wars of Holland, are his best works. This intrepid navigator and trustworthy writer died at Lisbon in 1692.—A. C. M.

BRITTON, JOHN, the well-known writer on topography and architecture, was born of humble parentage at the village of Kington in Wiltshire in 1771, and received a scanty education at the neighbouring town of Chippenham. In his sixteenth year he was apprenticed to a wine-merchant in London, in whose employment he continued for four years and a half, lightening as he best could the dismal routine of his life by voracious reading, mostly of antiquated works which, with a forecast of his future taste for the "antiquarian trade," he had picked up at old bookstalls. Towards the termination of his apprenticeship, he made the acquaintance of Mr. Brayley, also famous as an archaeologist, and took part with him in the publication of a satirical ballad, entitled "The Guinea-Pig," which had an immense popularity. Britton afterwards was employed as cellarman at the London Tavern and at a spirit store in Smithfield, and then as clerk to an attorney in Grays' Inn, in whose service he remained three years. His evenings during this period he passed in the clubs and taverns, where he formed many interesting friendships, the recollections of which furnish several amusing chapters to an autobiography, rich in amusement as well as instruction. He thought of the stage for a profession, and at one time indeed turned his dramatic talents to account in various ways; but literature finally became his vocation, and in this he was destined soon to achieve eminent success. His first production in the department of letters, with which his name is so honourably connected, was the result of a tour in Wiltshire, undertaken in 1798; it was entitled "Beauties of Wiltshire," and appeared in 1801 in two volumes. A third volume of this work was published after an interval of twenty-four years. In 1814 Britton wrote an admirable account of his native county for the fifteenth volume of the "Beauties of England and Wales,"—a work projected by him and Brayley. His subsequent contributions to topography and the literature of architecture, surprise us by their number and research, more than the labours of almost any recent English author. A descriptive account of them has been published by his professional assistant, Mr. T. E. Jones, and to that document we must refer the reader for the long and wonderful chapter in bibliography which he might expect to find in this place, but which our limits forbid us to present. We will mention only, in addition to the autobiography above alluded to (it was published by subscription), the two great national works, "The Architectural Antiquities of Great Britain," and "The Cathedral Antiquities of England." Mr. Britton died on January 1, 1857.—(*Gent's Mag.*, 1857.)

BRITTON, THOMAS, commonly called the "musical small-coal man," was born at or near Higham-Ferrers in Northamp-

tonshire about the year 1651; from whence he came to London, and was bound apprentice to a dealer in small-coal, in St. John Street, Clerkenwell. After he had served his time of seven years, his master gave him a sum of money not to oppose him in his calling. On this he returned into Northamptonshire; but after spending the money, he revisited London, and, forgetting his agreement, set up in business. He hired a stable in Aylesbury Street, Clerkenwell, which he converted into a dwelling-house. Some time after he had been settled here, he became acquainted with his neighbour, Dr. Garenciers, through whose instructions and assistance he obtained an extensive knowledge of chemistry. He likewise attained a great degree of skill, both in the theoretical and practical parts of music, which obtained for him the name of the "musical small-coal man." He was also a great admirer and collector of old books, chiefly on the occult sciences, which he sold during his lifetime for a considerable sum; and he claims to have been the first person who established weekly concerts in London, an account of which has been left us by his facetious neighbour Ned Ward, the author of the *London Spy*. At their first institution, Britton's concerts were held in his own house. "On the ground floor there was a repository for small-coal, and over that was the concert room, which was very long and narrow, and had a ceiling so low that a tall man could but just stand upright in it. The stairs to this room were from the outside of the house, and could scarcely be ascended without crawling. The house itself was very old and low-built, and in every respect so mean as to be a fit habitation for only a very poor man." Notwithstanding all these disagreeable circumstances, this mansion had such attraction as occasionally to draw together even the genteel admirers. The principal performers at these concerts were Handel (who presided at the harpsichord), Dr. Pepusch, John Banister, Henry Needler of the excise office, John Hughes, author of the *Siege of Damascus*, Woolaston the painter, Philip Hart, Henry Symonds, Abel Whichello, Obadiah Shuttleworth, and many other artists and amateurs of eminence. The singularity of his conduct, the course of his studies, and the collections he made, induced suspicions that Britton was not the character he seemed to be. Some persons fancied his musical assembly was only a cover for seditious meetings, others for purposes of magic; and he was himself taken, by different persons, for an atheist, a presbyterian, and a jesuit. These, however, were all ill-grounded conjectures; for Britton was a plain, simple, honest man, perfectly inoffensive, and highly esteemed by all who knew him. The circumstances of Britton's death are not less remarkable than those of his life. A person named Honeyman, a blacksmith by trade, was celebrated at the beginning of the eighteenth century for his powers in ventriloquism. This man was secretly introduced into Britton's apartment for the purpose of terrifying him, and he succeeded but too seriously. Honeyman, without moving his lips or seeming to speak, announced, from a distant part of the room, the death of poor Britton within a few hours, unless, to avert the doom, he would fall on his knees immediately and repeat the Lord's prayer. The poor man did as he was told, but it did not answer the purpose. His nerves were so much shaken that he died within a few days afterwards. This event took place in September, 1714. He was interred in the churchyard of Clerkenwell, attended by a great concourse of people, particularly of the attendants of his musical club. His wife survived him, but he left very little property besides his books, his collection of manuscripts and printed music, and his musical instruments, all of which were afterwards sold by auction.—(Ward's *London Spy*; Hawkins' *History of Music*; Hearne's *Hemingi Chartularii Ecclesie Wygorniensis*, appendix.)—E. F. R.

BRIZE, CORNELIUS, a Dutch artist, who excelled in representing ivory-bellied kites, yellow rooks, mirror shields, and bas-reliefs, highly-finished and elegantly grouped. In a picture by Gettes, at the old man's hospital at Amsterdam—the subject, Old Age persecuted by Poverty—the still life, which is even in Dutchmen's eyes wonderful, is by Brize. He died in 1679.

\* BRIZEUX, JULIEN AUGUSTE PELAGE, born at Lorient, September, 1806. The Bretons are looked upon by the French of other provinces as a peculiar people, and Brizeux is essentially a Breton. Like other families of the purely Celtic race, they are fondly attached to time-honoured traditions, loving story, poetry, and song. It has been remarked of the soldiers drawn by the conscription from Brittany, that many of them pine away in regret for home, and not a few fall victims to nostalgia. It is

necessary to bear these peculiarities in mind to understand and appreciate Brizeux. Shortly after the revolution of 1830, in the height of the combat between the fresh young giants of the romantic school, and the sturdy adherents of the classic, a sensation was created by the appearance in literary saloons of a Breton peasant with a poem in his hands, the style and subject of which contrasted strangely with the author's behaviour and manner. As much as the man looked rustic and uncivilized, his poem, simply called "Marie," was polished and refined, almost to effeminacy—sentiments pure, gentle, and true, breathed through versification unusually soft and harmonious. The romanticists were enchanted. However eccentric some of their own forms were of presenting nature, in opposition to cold artificiality, yet had they inscribed "Nature" on their banners; and here was Brizeux, with his wood notes wild—here was an unspoiled peasant, who had, he knew not how, sung out of the fullness of an inspired heart. When "Marie" was published it became popular at once. Brizeux was, of course, turned into a lion. He was made put off his sabots and put on kid gloves, and turn gentleman. He was even sent to Italy to finish his education. Of course he translated Dante. After making all necessary sacrifices to the exigencies of his patrons, and becoming, as a matter of course, spoiled, Brizeux, happily yielding to the old native impulse, gave up Italian translation, and returned to the poetic traditions of his own land, which it was his mission to interpret. His poem, entitled "The Bretons," was in 1846 crowned by the French Academy. Since then he has been engaged in writing poems in his native dialect, with all good wishes for success in a path he need fear no rival.—J. F. C.

BRIZIO, FRANCESCO, an Italian painter and engraver, born at Bologna in 1574. He studied first under Passerotti, then in the Caracci school, excelling in architecture and perspective. His prints are badly drawn. His son, FILIPPO, was a scholar of Guido's, and painted several Bologna altarpieces.—W. T.

BROADWOOD, JOHN, the founder of the celebrated house of Broadwood & Sons, the wide-world pianoforte makers, was born in Scotland in the year 1731; and when about twenty years of age, travelled up on foot from that country in search of employment in the great metropolis. He was a carpenter or joiner by trade, and entered the house of Tschudi, an eminent harpsichord-maker. Here he ingratiated himself so completely with his master, that he became in time his son-in-law, partner, and successor. The earliest notice of a pianoforte of the square form in Messrs. Broadwood's books is dated 1771; the earliest of the grand form is 1781. In 1783 the books of the great seal patent office contains an entry of a grant (July 18th), "To John Broadwood, of Great Pulteney Street, Golden Square, pianoforte maker, for his new-constructed pianoforte, which is far superior to any instrument of the kind hitherto made." This ingenious artist and worthy man died in 1812, at the advanced age of eighty-one. There is an excellent folio mezzotint engraving of him by Messrs. Harrison & Say. Between 1771 and 1851 the eminent firm of Broadwood & Sons made no fewer than 103,750 pianofortes. All the really important improvements in the pianoforte, during this period, have emanated from their house.—E. F. R.

BROCCHI, GIOVANNI BATTISTA, a celebrated Italian naturalist, was born at Bassano in 1772. Sent to Pisa to study law, he acquired a taste for natural history, and having abandoned the uncongenial pursuit, he betook himself to Rome, where he resolved to devote his time to his favourite study. From Rome he visited Venice, where he made his first appearance in the literary world, by the publication of treatises on ecclesiastical sculpture in 1792, and on garden plants in 1796; and of "Letters to a lady on Dante" in 1797. In 1801 Brocchi became lecturer on natural history in Brescia. In 1808 the attention of the French government, then ruling Italy, was called to his qualifications by the publication of "Trattato mineralogico e chimico sulle miniere di ferro del dipartimento del Mella," &c., he was appointed a councillor of mines, and commissioned to investigate the mineral treasures of the country. In 1811 he published his "Memoria sulla valle di Fassa," and in the same year carried out his plan of investigating the fossil shells of the Apennines by travelling from Modena by way of Saffualo, Barigazzo, &c., to Rome, where he arrived in September, went to Naples in November, observed the celebrated eruption of Vesuvius on the 1st January, 1812, and returned to Modena at the end of May in the same year. A second journey with the same object was made

in 1813, and the results of the two were published at Milan in 1814 in two quarto volumes, under the title of "Trattato di Conchiliologia fossile Subapennina." This is Brocchi's chief work, and the one on which his reputation must rest. With the fall of the French empire, Brocchi's official position in Milan also came to an end, and his tendencies were too much in favour of democratic forms of government to lead him to expect anything from the Austrians; he accordingly lived in a private station for several years, occupying himself principally with mineralogical investigations in various parts of Italy, and occasionally publishing his results in the *Bibliotheca Italiana*, and other journals. One of his most important works published at this period is his memoir "Dello stato fisico del suolo di Roma," 1820. In 1821 he was recommended to the viceroy of Egypt as director of mines, and after obtaining the requisite practical knowledge by a journey through Carinthia, he sailed for Alexandria in September, 1822. He arrived in Cairo on the 1st December in this year, and left it again on the 30th of that month, with a large caravan, to make an exploration of the southern parts of the kingdom, from which he only returned to Cairo in May, 1824. In 1825 he made a second expedition into Abyssinia, travelling through the most fearful heat, and returned in June, 1826, but only as far as Chartum, where he and several others of his party were carried off by fever and dysentery. His papers and valuable collections of minerals, &c., were left by him to the library of his native town of Bassano; but they were lost when already within the harbour of Trieste, and thus the results of his laborious African expeditions, from which, considering the quality of his previous works, much valuable information might have been expected, have been almost totally lost to science.—W. S. D.

**BROCHANT DE VILLIERS, ANDRÉ-JEAN-MARIE**, a distinguished French mineralogist, born at Villiers, near Nantes, in 1774. He studied mineralogy under Werner at Freiberg in 1797 and 1798. In 1804 he became professor of mineralogy in Pegai, and in 1815 in Paris. He died in the latter city in 1840. His best work is his "Traité élémentaire de minéralogie suivant les principes de Werner," Paris, 1801 and 1802.—W. S. D.

**BROCK, DANIEL DE LISLE**, chief magistrate of Guernsey, born in 1762, deserves honourable mention for the intelligence and zeal with which, in the long period of his public life, he promoted all measures calculated to develop the industry and resources of the island. He was successful in obtaining from government redress of commercial grievances weighing heavily on local enterprise, and in maintaining against an arbitrary decision of Lord-Chief-Justice Tenterden the right of his countrymen to be tried in the local courts. He died in 1842.

**BROCKES, BARTHOLOMÄUS HEINRICH**, a German poet, was born at Hamburg in 1680, and died in 1747. He studied law at Halle, travelled in Switzerland, Italy, and Holland, and afterwards held several important offices in his native town. By his celebrated work, "Irdisches Vergnügen in Gott," Hamburg, 1721-48, 9 vols., he gave a religious turn to German poetry, and may be considered as a forerunner of Klopstock and Kleist. He also wrote the text of a highly-successful oratorio, and published a classical translation of Thomson's Seasons.—K. E.

**BROCKMANN, JOHANN FRANZ HIERONYMUS**, an eminent German actor, was born at Gratz, Styria, in 1745, and died at Vienna in 1812. His father was unable to give him an education, but bound him apprentice to a barber. The boy, however, ran away, and joined a band of rope-dancers, and afterwards another of strolling players, till 1771, when he was engaged at the Hamburg theatre by the celebrated Schröder. Under Schröder's guidance he gradually became a favourite of the public, and so accomplished a tragedian, that he was compared to Lekain and Garrick. Perhaps his most brilliant part was Hamlet, which in 1778 he performed during twelve successive nights at Berlin, with such an unparalleled success, that a medal was struck in his honour. (See "*Schink* Über Brockmann's Hamlet," Berlin, 1778.) In the same year he was permanently engaged at the Vienna Burgtheater, of which he afterwards was appointed manager. He has also written several dramatic pieces.—K. E.

\* **BRODHEAD, JOHN ROMEYN**, an American historian, born at Philadelphia, January 2, 1814. In 1839 the legislature of New York authorized the appointment of an agent to procure and transcribe documents in Europe relating to the history of the state; and Mr. Brodhead was appointed to this agency. He employed three years in searching the government

archives of Holland, France, and England, and brought home the fruits of his researches in 1844. The valuable papers have been printed, under the authority of the New York legislature, in ten large quarto volumes. From 1846 to 1849 Mr. Brodhead was secretary of legation under Mr. Bancroft, then American minister to England. On his return to America, he began the work which had long occupied his thoughts, "A History of the State of New York," the first volume of which, embracing the Dutch period from 1609 to 1664, was published in 1853. It is intended to bring down the history to the present day.

**BRODIE, SIR BENJAMIN COLLINS**, Bart., F.R.S. and D.C.L., serjeant-surgeon to the queen, was born at Wiltshire in 1783. Having devoted himself earnestly to the study of practical surgery, he was at a comparatively early period appointed surgeon to St. George's hospital; and since the death of Sir Astley Cooper, who was his friend as well as his rival, he occupied the first position as a consulting surgeon in London. His practice for many years prior to his death was extremely lucrative. Sir B. Brodie's reputation does not rest so much upon his operative skill as upon his powers of diagnosis, and upon his knowledge of the advantageous effects of constitutional treatment in surgical affections. He was a prolific writer. Early in his career he made a series of most interesting and valuable observations on the action of poisons, and he published various works on surgical science, all of which are of high authority. Prominent among them stands his "Treatise on Diseases of the Joints," which will in all time coming be a standard authority. At an after period he turned his attention to psychological science, and his essays on that subject display a powerful mind. Sir Benjamin had the rare honour of being serjeant-surgeon to three British monarchs. He died on the 21st of October, 1862.—J. B. C.

**BRODIE, GEORGE**, advocate, the author of "A History of the British Empire, from the accession of Charles I. to the Revolution," including a particular examination of Hume's statement relative to the English government. This work, published in Edinburgh in the year 1822, was written professedly to expose grave faults in Hume's brilliant history of the Stuart dynasty. The charges preferred against the historian range themselves under three categories—malversation and misprision of facts; laxity of habit in research; and servility to royalistic prejudices. Mr. Brodie has adduced voluminous evidence, obtained upon personal examination of records in the Advocates' library, Edinburgh, in the Lambeth and Bodleian libraries, and in the British museum. The work contains a mass of historical information collated with scrupulous care and some judgment from reliable sources.—G. H. P.

**BRODIE, PETER BELLINGER**, born in Wiltshire in 1778; died in 1854; the elder brother of Sir B. Brodie, Bart. This learned and accurate conveyancer was a pupil of C. Butler, and was called to the bar at the inner temple in 1815, having begun practice, as was usual at that period, under the bar, some years before. He was one of the real property commissioners of 1828, in which capacity he prepared the bill for abolishing fines and recoveries, the ancient expedients of the courts to get rid of entails on landed property, and to pass the freehold interests therein of married women. A fine was the accommodation of a suit concerning land brought on an imaginary title anterior to the interest to be displaced. The compromise was recognized by the court, and the sanctity of its records precluded challenge of their truth. A recovery was in like manner a fictitious suit originally brought on a supposed disposition with warranty of title, by the tenant in tail, who in his turn alleged warranty to himself by another (the crier of the court), who, when called to prove title, undertook, but failed to do so. Upon this, judgment was given against the tenant in tail, and for him over against the crier; and for the nominal recompense thus obtained the estate in tail was done away, and a new fee-simple asserted. The scheme of assurances substituted for these solemn mockeries, was in case of a fine, to have a deed executed by the husband and wife. As in the case of a fine, there was a form of private examination of the latter by the court or courts to ascertain her freedom of action in the transaction; so the substitute is required to be acknowledged by her before commissioners after a like examination. For the recovery was substituted a deed of disposition by the tenant in tail enrolled in chancery. And as a tenant in tail whose enjoyment in possession of his estate was suspended by a prior estate for life in another, could not alone have suffered a recovery; so to insure the like duration to the entail, the

tenant for life, as "protector of the settlement," was invested with a discretion to give or withhold his consent to the proposed bar of the entail. Opinions are divided as to the merits of the scheme, some considering the innovation too great, and others that too close an analogy to the ancient fables was preserved. Unquestionably, if the measure had been divided into two acts, the one for the abolition of the old forms and other matter merely transitory, and the other for establishing the new assurances which are calculated long to endure, the reform would have been characterized by more breadth and foresight. The technical execution of so difficult a scheme has, however, received great and general commendation.—S. H. G.

**BROECK, CRISPIN VANDEN**, an artist, born at Antwerp about 1530. He studied under Floris, painted history, and was an architect and engraver in wood and copper. He engraved sixteen plates of the Creation, and nineteen of the Virgin's life. His daughter, **BARBARA**, born 1516, turned engraver, imitating Rota's style, and working from her father's designs. **ELIAS**, a scion of the same family, was born in 1657, and studied under Stuken and Mignon, painting fruit, flowers, frogs, and snakes in a loose, careless, natural, enjoyable way, something in De Heem's manner of handling. He grew and fed his models in his own garden, so that he might be always observing them. He died in 1711 at Amsterdam.—W. T.

**BROERS**, ———, a Dutch artist, who excelled in living, natural scenes of low humour. He delighted in the unclean, tipsy, revelling boor, and was clever in his grouping and backgrounds.—W. T.

**BROEKHUISEN, JAN VAN**, better known as Janus Broukhusius, a Dutch poet, born at Amsterdam in 1649; died in 1707. Although an adventurous soldier for the greater part of his life, he found leisure to write abundance of Latin verses, and to edit the works of a number of his classic models.

\* **BROFFERIO, ANGELO**, advocate, a distinguished Italian historical and dramatic writer, and the present leader of the opposition in the Piedmontese chamber, born on the 24th December, 1802, at Castelnuovo Calcea, a little village in the province of Asti, Piedmont. Brofferio studied philosophy and law in the university of Turin, where he took his degree as doctor of laws; but his tastes were literary, and he devoted himself for many years to dramatic composition, and was for some time a member of a dramatic company. His plays and comedies, though well written and much admired, appear to have brought him less pecuniary profit than applause, and he at length abandoned the drama, and devoting himself earnestly to his legal duties, became the most distinguished advocate in Turin. Imprisoned in 1831 on suspicion of being concerned in political conspiracies, he was only released on the accession of Charles Albert to the throne of Piedmont. Brofferio took an active part in the agitations which wrung from the king the constitution of 1848, and was immediately elected deputy by the electoral college of Caraglio. The unwearied opponent of the wavering policy of Charles Albert, and the minister Gioberti, Brofferio was soon acknowledged to be the most eloquent orator in the Piedmontese chamber—a reputation he still retains. In 1853 he was returned for the city of Genoa, and has maintained with equal zeal and talent his career as leader of the left during the ministry of Count Cavour. On the last election in 1857, he was chosen to represent the seventh electoral college of Turin. The election of so well-known a republican as Brofferio in the stronghold of the Piedmontese aristocracy was considered a great triumph of the democratic party in Italy, marking the progress of the idea of national unity even in the capital of Piedmont itself. Brofferio's principal dramatic writings are—"Salmor;" "The Forest of Phantoms;" "The Corsair;" "The Two Provincials at Turin;" "Kenilworth Castle;" "The Return of the Proscrit;" "The Druids of Sigisfeld;" "Endosin;" "My Cousin;" "All for the Best;" "Salvator Rosa," &c. Besides other works of minor importance, he has lately published an excellent history of Piedmont, very remarkable for the boldness with which he has narrated the faults and errors of the late king during the reign of his son. He has also written a volume of popular songs in the Piedmontese dialect.—E. A. H.

**BROGLIE**, House of. The founder of the three branches of this family known in history, was Simon de Broglia, who died towards the end of the fourteenth century. It was originally of Quiers in Piedmont.

**BROGLIE, FRANÇOIS MARIE DE**, count of Revel in Pied-

mont, distinguished for a long period in the service of Maurice of Savoy, and afterwards lieutenant-general under Louis XIII.; born about 1600. Killed at Valenz on the Po, 1656. The name of this gallant soldier is inscribed on the bronze tablets of the palace of Versailles.

**BROGLIE, VICTOR MAURICE**, comte de, marquis of Brezolles and Sennhes and marshal of France, eldest son of the preceding, born 1647; died 1727. He was especially distinguished in the French wars of Louis XIV.

**BROGLIE, FRANÇOIS MARIE**, duc de, third son of the preceding, also a distinguished soldier of the reign of Louis XIV. He was ambassador to England in 1724, was created marshal 1734, and duke 1742. Died 1745.

**BROGLIE, VICTOR FRANÇOIS**, duc de, born 19th October, 1718, first distinguished himself under the marshal de Coigny, who, to mark his sense of the young officer's gallantry at the battle of Guastalla, sent him with news of the victory to the king, Louis XV., who gave him the Luxemburg regiment of infantry. He was in 1742 raised to the rank of general-of-brigade, in reward for the share he took in the attacks on Prague. After further distinguished services, he was promoted in 1748 to a lieutenant-generalship, and in 1757 assisted at the battle of Hastenbech under Marshal d'Estrées. It was his misfortune to have shared in the famous defeat of Rosbach. Fortune turned in his favour at Sonderhausen, where he defeated the Prussians; and he shared in the victory of Lutzelberg. Succeeding to Marshal Contade after the loss of the battle of Minden, he was raised to the rank of marshal, in reward for the skill he displayed in covering the retreat of the army. In 1760 he won Corbach, but being present with Soubise at the battle of Villinghausen, he incurred a full share of the odium cast upon his colleague for that great defeat. The two unlucky marshals charging the blame one upon the other, the council of state instituted an inquiry, and De Broglie was exiled. His merits proved sufficient to re-establish his reputation, and in 1764 he was recalled and placed at the head of the army of Metz, and in the memorable year 1789 was made minister of war. His next appearance in the field was at the head of a body of Emigrés, who, in alliance with his old antagonists, the Prussians, attempted an invasion of France in support of Louis XVIII., and how fruitlessly need not be said. Died in 1804.—J. F. C.

**BROGLIE, MAURICE JEAN MADELEINE DE**, bishop of Acqui in Piedmont, and afterwards of Ghent, born at the Chateau de Broglie 1766; died 1821. Returning to France from his asylum in Poland, after the Revolution, he became almoner to the emperor, but his opposition to the imperial will in the council of 1811, caused his degradation from that post, and finally led to his incarceration.

**BROGLIE, CLAUDE VICTOR**, prince de, son of Victor François, born 1757, deputy to the states-general, an active member, and for a short period president, of the national assembly; was guillotined for anti-revolutionary reclamations, 1794.

**BROGLIE, ALBERTINE IDA GUSTAVINE**, duchess de, born in Paris, 1797. A daughter of madame de Stael must make no ordinary claims upon public attention. There is no inquiry more eagerly entered into than that concerning the influence exercised by a woman of genius upon her own offspring. Hath she, while aiming at instructing mankind, neglected the imperative claims of her children upon her first duties to them? Happily, in the case of madame de Stael, perhaps the greatest genius of her time, such inquiries can only tend to enhance her reputation, by showing that her moral and intellectual qualities sustained and illustrated each other. In 1816 the virtuous and accomplished mademoiselle de Stael was married to the duc de Broglie, a man destined to fill the highest offices in the state, even that of prime minister. The religious principles of her mother and grandfather, the famous Necker, had struck deep root in her convictions, and she remained through life a zealous protestant. To her is due an association of ladies for spreading a knowledge of the scriptures. It was the duchess of Broglie who drew up the rules and regulations of the society, and for some years wrote the annual reports, which having been lately collected, along with essays of a religious nature, offer some means for appreciating her talents and character. The duchess de Broglie gave great attention to the education of her son and daughter. The former has already figured with marked success as a historian. His history of the house of Lorraine is considered a standard work. The daughter is married to the count d'Haussonville, and he is a

distinguished writer. After an honoured life, the duchess de Broglie died in 1838, and her remains were borne to Coppet, to be laid beside those of her illustrious mother.—J. F. C.

**BROGLIE, ACHILLE LEONCE VICTOR CHARLES**, duc de, son of Prince Claude Victor de Broglie, who, for having, while serving as *marechal-de-camp* on the Rhine, refused to recognize the decree depriving the king of his rights, was guillotined in 1794. His son was born 28th November, 1785, and consequently only nine years of age when his father perished on the scaffold. His mother was at the same time a prisoner at Vesoul, but having providentially escaped the fate of her husband, she married the marquis d'Argenson, who took charge of his stepson's education. Upon the return of the Bourbons, the duc de Broglie, raised to the peerage, made his entry into public life, one of his first acts being to vote for the acquittal of Marshal Ney. In 1816 he married the daughter of the illustrious Madame De Stael. Throughout the government of the elder branch of the Bourbons, his conduct in the chamber of peers was marked by constant advocacy of generous principles and decided opposition to the unpopular course of the court. He combated a pretended act of amnesty, which, under cover of promised pardon, preserved, and as it were ratified, a long list of proscriptions; and when the slave-trade question was brought forward in 1822 he took a foremost part in the cause of emancipation. With such antecedents his place in the government of July, 1830, seemed marked. Louis Philippe named him minister of public instruction, which he held not more than three months. In October, 1832, he was nominated to the post of foreign minister, which he held until the 4th April, 1834, when terminated the public and official life, but not the political influence, of this distinguished personage. As the animating principle of Louis Philippe's foreign policy was to preserve the *status quo*, and to keep out of differences with foreign powers, he made repeated attempts to induce the duc de Broglie to return to a post in which he had proved how perfectly he could fill it to the king's satisfaction. His majesty wanted a minister who, while little inclined for hardy adventures, could yet impose, by the hauteur of his manners, upon the representatives of powers disposed to take prudence for weakness. To all appeals from the monarch the unambitious duke would plead the resolution he had formed, to devote his whole attention to the education of his children. He himself loved the cultivation of letters, and to him turned for advice in all questions of difficulty, that semi-political, semi-philosophical sect called the *Doctrinaires*. Whatever opinion may be entertained of the political conduct of M. Guizot, must apply to the duc de Broglie, who, although avoiding the responsibilities of office, secretly supported the views of his friend. After the revolution of 1848, and as soon as the republican government had made apparent its equitable intentions not to molest the old servants of the monarchy, as long as they conformed to the new state of things, the duc de Broglie, like many others, presented himself as a candidate for popular suffrages, and was elected member for the department of the Eure, and as such took his seat in the legislative assembly. His voice was never heard in any debate, but he voted invariably with that party of order, which, divided amongst themselves on some grave questions of principle, yet agreed in hostility to republican government. The duke, consulted occasionally, along with Count Molé and others, by the prince-president Louis Napoleon (afterwards emperor), gave support to a ruler, believed capable only of removing difficulties out of the way of a monarchical restoration. Discovering his mistake too late, he, with admirable fidelity to his old friend, M. Guizot, allowed the latter to lead him into that curious combination called the *fusion*—a party whose object was to reconcile the house of Bourbon and that of Orleans, at the price of the latter's surrender of prior right to future hypothetical succession. In 1861 he prosecuted the prefect of police for having illegally published a work of his entitled "Considerations on the Government of France," but which was not designed for publication; and succeeded in recovering most of the copies which had been seized in the hands of his printer. The duke's resolution to keep from public life for the sake of his children's education has, it must be acknowledged, been deservedly rewarded. His son, Prince Albert de Broglie, has distinguished himself as a thoughtful philosophical historian. The duc de Broglie was a member of the French Academy. He died in February, 1870.—J. F. C.

**BROME, ALEXANDER**, born in 1630; died in 1666. Brome was an attorney. He was faithful to the royal cause through the

civil wars and the protectorate. His songs, almost numberless, were in the highest degree popular with his party. Walton, the author of the *Complete Angler* and the *Lives of Donne*, George Herbert, &c., speaks of them as

"Those cheerful songs which we  
Have sung with mirth and merry glee,  
As we have marched to fight the cause  
Of God's anointed and his laws."

Of the "Songs and other Poems" there have been several editions—the earliest is that of 1660. Alexander Chalmers has reprinted them in the *English Poets*, vexatiously omitting "a few of" what he calls "his inferior pieces." This kind of discretion cannot be too severely condemned, and goes far to render any collection where it is exercised worthless for the purpose of a student. He wrote a comedy called "The Cunning Lovers," and published in the last year of his life a translation of Horace, by himself and others. Brome's love of wine and song gave him among the cavaliers the name of the English Anacreon. We have a poem addressed to him by Cotton, in which he is called upon to join in the festivities for the king's return:—

"Anacreon come, and touch thy jolly lyre,  
And bring in Horace to the choir."

He edited the plays of Richard Brome, whom Ellis calls his brother, but who is said by other biographers not to have been related to him.—J. A., D.

**BROME, JAMES**, an English traveller of the eighteenth century, author of "Travels in England, Scotland, and Wales," London, 1700; and "Travels through Portugal, Spain, and Italy," London, 1712.

**BROME, RICHARD**. The date of his birth is unknown. In the title of a copy of verses addressed to him by Ben Jonson, the old poet speaks of him as "my faithful servant, and by his continued virtue my loving friend;" and in the poem describes him as having learned the art of dramatic writing in an apprenticeship of many years. From this poem it is inferred, perhaps rightly, that Brome was Jonson's menial servant; yet we should think it more probable that clerk or amanuensis was meant. Brome wrote several comedies, fifteen of which remain. His plots are said to be well conceived, and his own. Most of his plays were successful on their first appearance. One of them, "The Jovial Crew," printed in Dodsley's Collection, was revived in 1731, and, aided by Arne's music, then and in succeeding seasons brought crowded houses. The comedy of "The Northern Lass, or a Nest of Fools," is one of his best pieces. When it was first published (1632), it was accompanied, according to the fashion of the period, with commendatory poems, among which the most remarkable is that of his old master. Ben ascribes the success of the new aspirant to the long apprenticeship which he had served under him. He speaks of Brome's

"Observation of those comic laws,  
Which I, your master, first did teach the stage."

Fifteen comedies of Richard Brome's remain, ten of which were published by Alexander Brome in two volumes. Some of them are amusing, but have the fault of grossness, from which few of the dramatic pieces of the age in which Brome lived are free. Brome assisted Heywood in his comedies of the *Lancashire Witches*; the *Life and Death of Sir Martyn Skink*, with the *warres of the Low Countries*; and the *Apprentice's Prize*.—J. A., D.

**BROMEL, OLAF**, a Swedish physician and botanist, was born in 1639 in the province of Nericia, and practised in Stockholm, where he died in 1705. He was much attached to the study of botany, but published nothing upon that science with the exception of a small work entitled "*Chloris Gothica*," Gothemburg, 1694. Nevertheless, Plumier applied his name to a genus of plants—*Bromelia*—which includes the pine-apple.—His son, **BROMEL, MAGNUS VON**—born 1678; died 1751—was distinguished as a physician.—W. S. D.

**BROMFIELD, WILLIAM ARNOLD**, a physician and botanist, was the son of a clergyman, formerly fellow of new college, Oxford, and was born at Boldre in the New Forest, Hants, in the year 1801. He attended school at Tunbridge and Ealing, and subsequently prosecuted his studies at the university of Glasgow. He showed at that time a great taste for botany. He graduated at the university of Glasgow in 1826. He then visited the continent, and after travelling through France, Germany, and Italy, returned to England in 1830. He resided first at Hastings, then at Southampton, and finally took up his

residence at Ryde, in the Isle of Wight. His circumstances were such as to render him independent of medical practice, and he devoted his attention to natural science, more especially to botany. In 1830 he became a fellow of the Linnæan Society. He examined the flora of Hampshire, and especially that of the Isle of Wight, and he contributed many papers on the subject to the *Phytologist*. His researches into the flora of the Isle of Wight were carried on with assiduity and vigour. In 1842 he botanized in the south and west of Ireland, and in 1844 he went to the West Indies, and passed six months in Trinidad and Jamaica. In 1846 he spent a year in Canada and the United States. In September, 1850, he left England for Egypt, and ascended the Nile as far as Khartoum, returning to Cairo after an absence of seven months. He then proceeded to Syria, and visited Jerusalem and other parts of Palestine. On his arrival at Damascus, he was seized with typhus fever, and he died on the 9th October, 1851, at the age of fifty-one. Since his death Sir William Hooker and Dr. Bell Salter have edited his "Flora Vectensis, or Botany of the Isle of Wight," which is accompanied by a botanico-typographical map of the island. His letters from Syria have also been printed.—J. H. R.

**BROMHEAD, SIR EDWARD THOMAS FRENCH**, the second baronet of the family, was born in Dublin on 26th March, 1789, and succeeded to the title on the death of his father in 1822. He was a member of Gonville and Caius college, and was called to the bar in 1813. He has published various sketches of natural classification, both botanical and zoological. He devoted attention to ecclesiastical architecture. He was a master of arts, and a fellow of the Royal Societies of London and Edinburgh, and of the Turin Society. For some years he was afflicted with blindness. He died at Thurlby Hall, Newark, in Lincolnshire, on 14th March, 1855, at the age of sixty-six. Within a few weeks of his death he distributed a corrected edition of his views of classification.—J. H. B.

**BROMLEY, SIR THOMAS**, was born in 1530 at Bromley, Shropshire, where his ancestors, bearing the same name, had resided through many generations. He became a student of the inner temple, where he was distinguished for good conduct and assiduity. His rise to eminence at the bar was rapid. In 1566 he was appointed recorder of London and in 1570, solicitor-general, through the aid of Sir Nicholas Bacon, then lord-keeper of the privy seal, on whose demise in 1579, he succeeded to that high office, with the title of lord chancellor. His pliant disposition and versatile talent rendered him a fitting instrument in the hands of a despotic queen, for working out her vindictive designs against the hapless Mary queen of Scots, and her warm adherent the duke of Norfolk, and others who incurred Elizabeth's displeasure. But for this, there would probably have been little in the career of Bromley to save from oblivion his somewhat unhallowed memory. In his character of solicitor-general, he made his first official appearance on the trial of Norfolk for high treason, displaying unmitigated zeal to procure the duke's conviction. Norfolk fell a victim to the charge chiefly on account of the warmth with which he had espoused the cause of Mary. After his death, Bromley was deputed, with several others, to obtain an audience and negotiate with her, but his eloquence proved unavailing. Mary firmly refused to acquiesce in anything which could peril the independence of Scotland, tarnish the honour of her race, or compromise the interests of her religion. Doubt and hesitation marked the counsels of Elizabeth's advisers. Whilst the earl of Leicester recommended poison as the safer mode of disposing of the object of royal jealousy, Burghley, supported by the lord chancellor, Bromley, thought it better to proceed by parliamentary sanction, and a mock court of justice. In the parliament, summoned in November, 1585, Bromley broached the subject in his opening speech, and a bill was brought in and carried for the trial of Mary. The lord chancellor and forty-five others, consisting of peers, privy councillors, and judges, were constituted a court for the purpose, and Bromley, at the head of these commissioners, proceeded to Fotheringay, to take command of the castle in which the royal captive was incarcerated. The base stratagems by which she was at last inveigled into an acknowledgment of their jurisdiction, need not here be detailed. After the execution of her rival, although chiefly of Bromley's devising, Elizabeth, true to the hypocritical part she had resolved to play, assumed an air of indignant resentment against the very tools who had furthered her views, and so well did she dissemble that soon

Bromley himself, apprehensive of consequences, suffered so much from alarm and agitation that he fell suddenly ill, took to his bed, and within six weeks after Mary's death, Bromley was no more. He died on the 12th of April, 1587, and was buried with much pomp at Westminster abbey, where a splendid monument was raised to his memory. As a lawyer he was far above mediocrity. As an equity judge he gave such general satisfaction that no unfavourable comparisons appear to have been drawn between him and his distinguished predecessor, Sir Nicholas Bacon; whilst his loss was long deplored in the legal arena of Westminster hall.—F. J. H.

**BROMPTON, JOHN**, a Cistercian monk, abbot of Jorevall or Jerevall in Richmondshire. The "Chronicon," which goes under his name, appears to have been procured for his monastery by the abbot, but not, as is sometimes asserted, written by him. It is an account of the years 588–1198, beginning with the arrival of Augustine the monk, and ending with the death of Richard I., and will be found in the *Decem Script. Hist. Angliæ*, London, 1652, fol.—J. S., G.

**BROMPTON, ROBERT**, an English artist, a pupil of poor, classical, red-nosed Wilson. In Italy he studied under Mengs. He accompanied Lord Northampton, the English ambassador, to Venice, and painted the portraits of the duke of York and many of our nobility. In 1767 he returned and exhibited his pictures at rooms in Spring Gardens. Finding no encouragement, he went to St. Petersburg, and there died in 1790—a bitter life and a sorry end.—W. T.

**BROMS, OLOF**, a Swedish poet and domestic chaplain. Born in 1673; died in 1722.—M. H.

**BRONCHORST, JOHN**, an early water-colour painter, born at Leyden in 1648. He seems to have been self-instructed and a discoverer. He painted birds and animals of all kinds, wild and free, after nature, with force and expression. He became a piece of still life in 1723.—W. T.

\* **BRONGNIART, ADOLPHE THEOPHILE**, a distinguished French botanist, son of Alexander Brongniart, an eminent chemist and geologist, was born at Paris on 14th January, 1801. He became doctor of medicine in 1826, and devoted his special attention to botany. His name is celebrated in connection with fossil botany, and he has published one of the ablest works on this subject. In 1834 he became a member of the Academy of Sciences in Paris, and he succeeded Desfontaines as professor of botany in the Jardin des Plantes. He has published many valuable botanical works, and has contributed important articles to scientific journals, and to the Transactions of societies. Among his other works may be noticed a "History and Classification of Fossil Plants;" "Classification of Fungi;" "Memoir on the Rhamneæ;" "Remarks on the Development of the Embryo, and on the Structure and Functions of Leaves;" "Enumeration of Plants cultivated in the Botanic Garden at Paris;" "Description of the Phanerogamous Plants of Captain Duperrey's Voyage round the World."—J. H. B.

**BRONGNIART, ALEXANDER THEODORE**, son of a Paris physician, born February 15, 1739; died June 7, 1813. His family wished him to cultivate the science of medicine, but he soon abandoned it for that of architecture. In 1773 he began to construct the edifices which have placed him in the first rank of his countrymen. The military school, the hotel of the minister of foreign affairs, and a vast number of public buildings, avenues, &c., in the French capital, attest his skill. His last and greatest work was the beautiful Bourse, which was not completed until after his death.—T. J.

**BRONIKOWSKI, ALEXANDER AUGUST FERDINAND VON OPELN**, a German novelist, born in 1783; died in 1834; author of a history of Poland, "Poland in the Eleventh Century," and "Poland in the Seventeenth Century."—J. S., G.

**BRONKHORST, JOHN VAN**, a Utrecht painter, born in 1603. He was apprenticed to John Verburg, a glass painter, and afterwards studied in Brabant under Peter Mattys. He returned home, though much employed, still disgusted with his own results. Meeting at this juncture with Poelenberg, he devoted himself bravely but foolishly, at the thirty-sixth year of his age, to the imitation of a second-rate man—a very miserable ambition. Forgetting his flower-leaf windows in Amsterdam churches, he became renowned for neatness and high finish, and he also etched some of his own and his master's landscapes. The new church at Amsterdam, in whose choir are Bronkhorst's windows, displays also on the folding doors of its organ an "Anointing of

Saul;" a "Triumph of David over Goliath;" and the "Attempt of Saul to slay David"—all "fetisly ywrought."—W. T.

BRONKHORST, PETER VAN, a Delft artist, born in 1588. He excelled in painting church interiors, which he filled with small historical subjects. The town-house at Delft has two pictures by him—"Solomon pronouncing judgment in the Temple," and "Our Saviour driving out the discounting money-changers." He died in 1661.—W. T.

BRONNER, FRANZ XAVER, a German author, was born of poor parents at Höchstadt, Suabia, December 23, 1758, and after a troublesome and eventful life, died at Aargau, August 17, 1850. After the model of Gesner, he wrote pastorals in prose, in which he describes the tranquil and happy life of fishermen—"Fischergedichte und Erzählungen," Zürich, 1787-97, 4 vols.; "Fahrten ins Idyllenland," 1833, 2 vols. He also published an autobiography, a description of the district of Aargau, 1844, 2 vols., Berne, &c.—K. E.

BRÖNSTED, PETER OLUF, a distinguished Danish archaeological and philological scholar, was born 17th November, 1781, at Horsens in Jutland, where his father was pastor. He studied at Copenhagen. In 1806 he went with his friend Koes to Paris, whence, after two years' residence, he proceeded to Italy. Here, associating himself with the architect Haller von Hallerstein of Nuremberg, Linckh from Wurtemberg, and von Stackberg from Estland, he proceeded to Greece, where, by digging up the buried treasures of art, they greatly aided the study of classical antiquity. In 1813 he returned to Copenhagen, and received the appointment of professor of Greek philology in the university of that city. In order to enable him to bring out the great work which his researches required, and which he believed could not be satisfactorily produced in Denmark, he was appointed by his own government their agent at the papal court, whither he went in 1818. He spent the years 1820 and 1821 in visiting the Ionian Isles and Sicily, after which, by permission of the Danish government, he removed to Paris, to superintend the printing and illustration of his works. From Paris, in 1826, he made a journey to England, and the following year paid a visit to his native land, where he was appointed privy councillor of legation. In the year 1832 he finally returned to Denmark, where he found occupation as director of the royal cabinet of antiquities, and professor of classical philology and archæology in the university. He died in June, 1842, in consequence of a fall from his horse, being at that time rector of the university. His principal work is "Travels and researches in Greece, together with descriptions and explanations of many newly-discovered monuments of Grecian art," 2 vols. 4to., Paris, 1826-30, which appeared simultaneously in French. The publication of this work led to an attack of the author in the thirty-second volume of *Hermes*, charging him with having unwarrantably made use of Villoison's manuscripts in the royal library of Paris, especially as referred to the island of Ceos, without acknowledgment. Brönsted defended himself by a reply published at Paris in 1830, whilst Hage had already done the same the year before in Copenhagen. Besides other lesser archæological works, as for example, "An Account of some Greek Vases found near Vulci," London, 1832; and "The Bronzes of Siris," Copenhagen, 1837, Brönsted published valuable contributions to the History of Denmark, from the manuscripts of North France, 2 vols., Copenhagen, 1817-18; also "Memorable Events in Greece during the years 1827-28," derived from the papers of the late Major Frederick Müller of Altdorf, Paris, 1833.—M. H.

BRONTË, CHARLOTTE, born at Thornton, near Bradford, in April, 1816; died at Haworth parsonage, March, 1855. When Charlotte Brontë was four years of age, her father, the Rev. Patrick Brontë, removed to Haworth, a small village not far from Keighley, situated in the heart of one of the bleakest regions in Yorkshire. Mrs. Brontë died after a year's residence at Haworth, and an aunt took charge of her six children. In July, 1825, Charlotte and Emily went to Cowan Bridge (the Lowood of *Jane Eyre*), where two elder sisters had already been boarded. When, twelve months after her sisters' deaths, Charlotte left this establishment, she spent two years at Roehead, under the more favourable auspices of Miss Wooler. In consequence of the unfortunate irregularities of their brother, the Misses Brontë were much thrown upon their own resources in preparing for the struggle of life. After some futile attempts to open a school at the parsonage, Anne and Charlotte obtained situations as governesses. Neither were fortunate in this capacity,

and Anne's health gave way; when, therefore, in 1841 an opportunity presented itself for two of the girls to obtain teaching abroad, she remained at home, while Emily and Charlotte went to Brussels. They were recalled at the close of the year to attend their aunt, and after her death, Miss Brontë returned to Brussels alone for other six months. Early in 1846 the sisters published jointly a small volume of poems, under the assumed names of Ellis, Acton, and Currer Bell. It met with little success, but they resolved to venture with a prose tale. "Wuthering Heights," "Agnes Grey," and "The Professor," sought acceptance from various firms in London. Charlotte's unsuccessfully; but she received encouragement to attempt a more elaborate work. In the midst of harassing domestic circumstances she began "*Jane Eyre*," and its publication was followed by a success beyond her hopes. "Wuthering Heights" and "Agnes Grey" stole out in December, 1847, but at first attracted little notice. The following winter was a dark one at Haworth. Branwell and Emily Brontë died within a few weeks of each other. Charlotte was prostrate with a fever; and Anne, always delicate, grew rapidly worse. The two went together to Scarborough in the succeeding spring. There the younger sister died, and the other returned to her desolate home. "Shirley," which had been in progress before Emily's death, was now resumed, and continued as steadily as Charlotte's own health would permit. It was published in October, 1849, and its frequent references to Yorkshire people and scenery, led to the discovery of the authoress. During this winter she visited London, and formed the acquaintance of several literary men. In the autumn of 1850 she commenced "*Villette*," and brought it to a conclusion in the November of the succeeding year. In June, 1854, she became the wife of Mr. Nicholls, one of her father's curates. Nine months followed of calm happiness—months of respite and of rest. It was the sunshine of sunset. During the next winter she was confined to a sickbed, from which she never rose. She died, after a long and weary illness, bravely as she had lived. The career of Charlotte Brontë is one of the most beautiful and one of the saddest on record. In little things, as in great, we recognize her stern submission to the law of duty. Constitutionally delicate, her nervous temperament rendered her unusually sensitive to criticism. Yet she never shrunk from it, and showed a wise discretion in the selection of advice. She had none of the selfishness of genius. During the height of her renown as an authoress, she was the same obedient daughter as when a girl at school. Her life from first to last is an example of courage, patience, and devotion. Miss Brontë's writings have indubitably placed her in the highest rank of female novelists. She has attained very closely to the ideal of a work of fiction. Her plots possess the merit of rare interest; her characters, however eccentric, stand out as unmistakable realities. Even in "*Jane Eyre*" there is little that is either impossible or unnatural. "Shirley" and "Villette" are still more remarkable for simplicity of outline. "*Jane Eyre*" is perhaps the most dramatic, and therefore the most interesting of her works; but, in artistic beauty, "*Villette*" must take pre-eminence; nor has the authoress elsewhere equalled the eloquence and graphic description which mark the closing scenes of that wonderful tale. Her heroes and heroines may sometimes be weak or morbid—her books are all vigorous and healthy. If we except "Shirley," perhaps the greatest defect is a want of humour. Miss Brontë's style is powerful and concise. She is peculiarly felicitous in her choice of words, and we seldom desire either to contract or expand a single sentence. A detailed life has been written by Mrs. Gaskell. It is a work of much interest, and partakes of merit; but has the fault of mixing up with Miss Brontë's history private incidents which had been better forgotten.—A. J. N.

BRONTË, EMILY, born in 1819; died in 1848: ANNE, born in 1822; died in 1849—sisters of Charlotte. They shared the vicissitudes of her life, became companions of her authorship, and exhibited opposite phases of her character. We have few distinctive memorials of Anne's life. She leant on those around her for guidance, and in turn fulfilled the offices of kindness. Emily seems to have lived somewhat apart, even in the narrow circle of her isolated family. If the incidents in her career are few, they are emphatic, and impress us with a sort of wonder that such a stern spirit could be found in one of the softer sex. Anne's death was in accordance with her whole life; her spirit passed in a bright morning in May, quietly as the breath of an infant. Emily, too, died as she had lived—proudly

almost selfishly, refusing the aid and comfort of those nearest and dearest—sternly in the bleak December, in the bleak parsonage she would never leave. Anne's claim to memory rests on a novel, "Wildfell Hall," a short tale, and a few verses. The former cannot be called successful. The subject was alien to her genius, and the grace of its style does not remove a feeling of the distaste the authoress herself must have had in the composition. "Agnes Grey" is a quiet romance of her own experience. Emily has left behind her "Wuthering Heights," which with all its imperfections is one of the most wonderful creations of female genius. It is a rude, but colossal monument of power; a terrible transcript of some of the strangest of the strange scenes which the manners and traditions of that wild country had made familiar to her mind. The tale itself is of thrilling interest; if it has a too pervading power, it is full also of touches of exquisite simplicity. The characters are vivid, and if we may hope they are singular, we also feel that they are real. The style is abrupt but vigorous, and it has words that cling to our memory. Some one has well said—"Let the critic lay down the book in what mood he will, there are some things in it he can lay down no more." It impresses us with a remembrance of grandeur, like a "granite block on a solitary moor." The poems written by Ellis Bell display more grace and melody than her sister's verses. Some of them ought not to be forgotten. That entitled "Remembrance" is perhaps the finest, and may well be associated with the whole tragedy of the Brontës.—A. J. N.

BRONZINO, AGNOLO, a Florentine painter, born in 1511. He studied under Pontorno, and learned to imitate his brush with apish exactness, although Caracci was morose and kept his finishing tricks a secret. The industry and good-nature of Bronzino, however, softened the millstone, and made him beloved by his master. He imitated Michel Angelo in his draperies, though certainly that great prophet's mantle did not fall on Bronzino's shoulders, for he painted leaden and chalk flesh, and used rouge instead of the life-blood of Titian's carnations. Kugler praises his "Descent of Christ into Hell," which, though cold, is carefully painted and not over-mannered. He is known too as a friend of earnest, chatty Vasari, the pleasantest of all art chroniclers. On the death of Pontorno, Bronzino was employed to finish the chapel of St. Lorenzo in Florence. He also painted for Francis I. a Venus embracing Cupid, surrounded by jealousy, fraud, and other allegorical nonentities. A Nativity of his was also much praised. He excelled greatly in portraits. His pencil was neat and free, but his figures are stalty and stilted.—W. T.

BROOKE, CHARLOTTE, was the first to collate the scattered poems in the Celtic language, and translating them into English verse, in the year 1787 published them, together with the originals, in a volume entitled "Reliques of Irish Poetry." She was the last surviving child of Henry Brooke, the poet, and was born at his house of Rantavan, in the county of Cavan. She had much of her father's turn in poetry—some brightness and pathos, side by side with the inflation of the day. At one time she was enthusiastically attached to the drama—a hereditary inconsistency—and wrote "Belisarius," a tragedy, the MS. of which her friends accuse John Kemble of having pirated. Died in Dublin in 1793.—R. S. B.

BROOKE, HENRY, poet, politician, dramatist, novelist, and divine, was born in 1706, at his father's house of Rantavan, in the county of Cavan. His family came from Cheshire, where the name is still found among the oldest gentry, and settled in Ulster in the time of Elizabeth. His father, the Rev. William Brooke, was a scholar of Trinity college, Dublin, and rector of the large union of Killinkere, &c., in Cavan. His mother was Lettice, daughter to Simon Digby, bishop of Elphin. From his father he inherited his love of study; from his mother—one of the handsome Digbys, whose features are immortalized by Vandyck—he had a royal descent, and probably his good looks; and no doubt he derived a strain of talent from the Sheridans, who were his near cousins. While yet a boy, Swift had in his father's house prophesied his future eminence, while deprecating his predilection for poetry, which the dean designated "a beggarly calling." He was educated by Dr. Sheridan, and at the age of eighteen we find him in London at the temple; and noticed and caressed by Lord Lyttleton and Pope, he seems to have won his own way into society by the engaging sweetness of his manner, his vivacity, his truthfulness, and his genius. We have this record of him:—"Mr. Brooke was young, fresh-looking, slenderly

formed, and exceedingly graceful. He had an oval face, ruddy complexion, and large soft eyes, full of fire. He was of great personal courage, yet never known to offend any man. He was an excellent swordsman, and could dance with much grace." With these attractions, and at the imprudent age of twenty, Brooke wooed and wed his first cousin, Catherine Meares, before she had left school, or attained her fifteenth year; and the result of these precocious hymeneals was fifty years of unbroken happiness, and a family of twenty-two children, all of whom died young, except Charlotte the poetess, and Arthur a captain in the army. From 1728 to 1740 Brooke spent much time in London literary life. He had been called to the bar, and practised as a chamber counsel, but loved rhyme better than law, and in 1735 published his "Universal Beauty," under the auspices of Pope; and being introduced by Lord Chatham to Frederick, prince of Wales, he became warmly attached to the company as well as to the cause of his royal patron, who repaid his devotion by "caressing him with great familiarity." When "Gustavus Vasa" was forbidden to be acted in 1739, because of its reflections upon the prime minister, Walpole, Brooke published it by subscription. Lord Chesterfield had 40 copies, the prince took 400; and so popular was the play between its own merit and the political heat of the times, that Brooke netted 1000 guineas from its sale, and Dr. Samuel Johnson honoured him by publishing his "Complete Vindication"—a sarcastic brochure, which, while it enlized his tragedy, keenly satirized the government, which had prohibited its representation. In 1740 Brooke, through ill health, retired to his property at Rantavan, whence he corresponded with his kind patron and prince. A letter from Mr. Pope to him is to be found in the second volume of Brookiana—a little work full of gossip and sparkle, published in London in 1804, author unknown. Here, in rural leisure, he flung from his pen poetical tales, translations from the Italian, tragedies, comedies, and tracts, political and agricultural. In 1745 appeared his "Farmer's Letters," which drew from Garrick the well-known Address to Mr. Brooke, beginning "Oh thou, whose artless, free-born genius charms." In 1766 he published "The Fool of Quality," which in one year ran through three editions in the London press. With many faults, it has rare beauties of style and incident. It is thoroughly original, and written in the purest English. In these latter days, John Wesley published an edition of it, and spoiled it. Southey styled its author "a man of undoubted genius." Charlotte Bronte made it the study of her youth, and the Rev. Charles Kingsley, in his Two Years Ago, pronounces the mind of the man who wrote it as a hundred years in advance of his time in political and religious questions. Brooke died in 1783, full of piety and years. His judgment was below his genius, and thus he made mistakes in life; but his walk was so pure and so noble, and his temper so engaging, that the love of his friends amounted almost to a vain idolatry. His works were published in 4 vols. octavo, in 1792, by his daughter.—R. S. B.

BROOKE, SIR JAMES, rajah of Sarawak and governor of Labuan, was born in 1803. His father held an appointment in the Indian civil service, and was thus enabled to procure for his son a cadetship. At the age of sixteen he went to India, and had obtained considerable distinction in the first Burmese war, when he received a wound in the lungs of so serious a nature as to necessitate his return home. He spent the subsequent ten years in travelling, which so far restored his strength as to permit him to re-embark for India in 1829. The vessel in which he sailed was wrecked on the Isle of Wight, and, in consequence of the delay, his furlough had expired ere he reached his destination. It was on the homeward voyage that he first saw Borneo; its fertility and beauty impressed him deeply; he read and inquired, and became more and more convinced of the practicability of the suppression of piracy and the overthrow of the slave trade. Looking back on his career, on the great work he began in 1839, and the conquests he achieved, can we regard that shipwreck as nothing more than a chance detention? His father does not appear to have believed in his adaptation for the mighty enterprise; but in a mother's sympathy he found that support which has so often been the foundation of a son's greatness. After his father's death had left him possessed of a considerable fortune, finding his appeals to government for aid fruitless, he resolved to try what one man could do. In a spirit of adventure, worthy of the old discoverers, he purchased and manned the yacht *Royalist*, and set sail with a picked crew from Devon-

shire in December, 1838. Arriving at Singapore six months afterwards, he rested there some time in order to procure minute information before proceeding to Borneo. Previous to his leaving England he had written out a statement of his views of the present condition of the Malayan archipelago, and its probable future value; an abstract of this appeared in the journal of the Geological Society, but it was first published as a whole among his "Private Letters" in 1853. He speaks of the degrading effects of Dutch rule in Java and Sumatra; deplores the timidity and ignorance of government in refusing to support Sir Stamford Raffles in his energetic and successful sway, and urges his countrymen not to reject a fresh opportunity of restoring civilization and peace. "Java," he says, "exhausted and rebellious, submits, but remembers the period of British possession. The wild Battas of Sumatra successfully repel the efforts of the Dutch to reduce them. The Chinese of the southern part of Borneo are eager to cast off the yoke of masters who debar them every advantage. The Dutch are strong enough to defy any native power directed against them; but their doubtful tenure would render the downfall of their rule in the archipelago certain and easy before the establishment of a liberal government and conciliatory policy." Mr. Brooke did not advocate conquest, or any imperfect mere missionary scheme. He wished that Britain should use and extend her possessions by influencing—not subduing the natives—by leading them gradually to order and freedom, and teaching the benefits of industry and education, by making them sharers in them. Remaining but a short time at Singapore he proceeded to Borneo, and anchored in the Sarawak river. The Rajah Muda Hassim, uncle to the sultan of Borneo, and governor of Sarawak, received the strangers kindly, and granted them permission to go into the interior of the island. A rebellion among the natives prevented Mr. Brooke from penetrating far, and he found the country distracted by internal warfare, carried on by the Sarebas and Sakarran dyaks, piratical and fierce tribes, speaking a different dialect, and having no resemblance to those peaceful dyaks whom they treated as slaves. The report of his expedition preceded his return to Singapore; the merchants presented him with congratulatory addresses, but the governor received him coldly. "He," says Brooke, in writing to his friend Templar, "would fain have me lay aside all politics; but whilst I see such treachery and baseness on one part, and such weakness, imbecility, and indifference on the other, I will continue to upraise my voice at fitting seasons—I will not leave my native friends to be betrayed by either white nation, and I will speak bold truths to native ears, convinced that it is the best means of preserving the independence of the Malay states. Don't think, however, that I would intrude, or force opinion or advice. Until asked, I am silent." He had not long to wait this invitation. At his next visit Muda Hassim was still struggling to repress the rebellion; he urged Mr. Brooke to remain and assist him in quelling it. He consented, and in three months accomplished what the rajah had failed to do in four years. He also succeeded in gaining the lives of the rebels who surrendered—a task rendered difficult by Muda Hassim's conviction that they had forfeited all title to mercy. Feeling that without this opportune assistance his country had been lost, and, despairing of governing it alone, he besought Mr. Brooke to accept it under him, on payment of a stipulated sum to be given yearly to the sultan. Mr. Brooke consented, on condition that the rajah should give him "his sincere support and assistance in saving the lower classes from oppression and pillage." From the spring of this year, 1841, we may therefore date the commencement of Mr. Brooke's beneficent rule; but he had much to contend with before coming to a final and satisfactory arrangement with the rajah. There were debates about the taxes, abolition of forced labour, and warfare against piracy. Muda Hassim promised fairly, but acted treacherously, allowing pirates to invade his own country, and withholding the promised right of working the antimony ore.

During Muda Hassim's absence from Borneo proper, Pangeran Usop—another uncle of the sultan's—a clever and designing man, had striven to undermine his authority. The sultan, a weak prince, too readily gave ear to Usop's crafty designs; and but for Mr. Brooke's exertions, Muda Hassim's power would have been limited to the province of Sarawak. Some time after, Mr. Brooke accompanied him to Borneo, re-established his influence there, and, by so doing, gained both his goodwill and that of the people. Muda's friendship with the English remained

henceforth unbroken; and fidelity to his promise of assisting in the destruction of pirates, was too surely the cause of his violent death.—In a paper written during this winter, the new rajah's plan of government is clearly unfolded. "I wish it therefore to be understood," he says, "that it is on public grounds I request the support of government, or the assistance of the commercial community; that my objects are to call into existence the resources of one of the richest and most extensive islands of the globe; to relieve an industrious people from oppression, and to check—if possible to suppress—*piracy* and the *slave trade*, which are openly carried on within a short distance of three European settlements, on a scale and system revolting to humanity." Acting on these principles, he began his reign, unaided and alone, devoting his whole energy to the elevation of his people. A small duty on rice was the only one imposed; but, as he could not carry on government without means, having already expended £10,000 of his private fortune, and received no encouragement from home, he was forced to retain a monopoly of the antimony ore. The pirates continued most formidable enemies; but in a few years he was so far successful in repelling their attacks, that the labouring dyaks began to come down from the interior, and settle near Sarawak, happy and industrious under the protection of their "Tuan Besar," or "Great Man." In 1843 he wrote:—"You must not fancy that I say little about the country, for the truth is I have nothing to say, as we are living in a state of profound quiet. When the stores of the *Samarang* lay exposed in every direction—and they were tempting—there was not a case of complaint against a native. The dyaks, the poor oppressed dyaks, are really quite fat and happy-looking, and yearly improving." A short extract from a letter of Mrs. Douglass, the missionary's wife, shows the love and admiration Brooke's devotion inspired:—"The rajah was in England in 1848, but Pa Jenna, a reclaimed pirate, coming into my room, spied his picture hanging against the wall. I was much struck with the expression of involuntary respect which both the face and attitude of this untutored savage assumed. He raised the handkerchief from his head, and saluting the picture with a bow, such as a Roman catholic would make at his patron saint's altar, he whispered to himself—"Our great rajah." During the seven years between his settlement at Sarawak, and his visit to England in 1847, several of her majesty's ships had from time to time visited the island; the *Samarang*, with the especial purpose of investigating the island of Labuan, where Mr. Brooke was desirous of an English station being established. Meanwhile—for want of a single war-ship—he had been forced to allow poor Muda Hassim to fall a victim to the jealousy of his own kindred. His adherence to his compact against piracy excited their hatred to such a pitch, that he and all his family, except one son, were cruelly murdered by their nearest relatives. Captain Keppel, who had assisted Mr. Brooke in fighting the pirates in 1844, returned to England, and published a diary of Brooke's, by means of which the public were made acquainted with the principal events of his career. When he came to London, he found himself famous; he had really become a hero and was feted and lionized. The knighthood of the bath was conferred on him; he was created governor of Labuan, and commissioner and consul to the native states of Borneo. After a short stay, he set sail for the scene of his new government in February, 1848.—With no slight humiliation and surprise, we turn from this brief survey of his actual accomplishments, to the history of the persecution which followed. It is a history which places the name of Sir James Brooke in illustrious, though unfortunate similitudes; but never were calumny and injustice more bravely met, false charges more clearly exposed, and truth and equity more faithfully maintained. Mr. Hume had the unenviable distinction of leading the persecution; but the inquiry seems to have arisen at the instigation of Mr. Henry Wise, Sir James' agent, and long his confidant and friend. A complete detail of the charges brought against him, along with their able refutation, may be found in three interesting volumes of the "Rajah's Private Correspondence," edited by Templar, and which were published in 1853. In a letter addressed to Henry Drummond, M.P., Sir James thus recapitulated his presumed offences:—"The first grave charge which Mr. Hume advanced was to the effect that I had massacred innocent people, falsely asserting them to be pirates. Next he endeavoured to prove that I was a merchant whilst engaged in the public service. He asserted that an unnecessary loss of life had been inflicted in

the action of July, 1849; he cavilled at the title by which I hold Sarawak; he has accused me of cold-blooded murders; he has denounced me for neglect of public duty, for abuse of official power; for impeding the progress of commercial enterprise; and for establishing a trading monopoly." This frightful list of offences was privately printed and privately circulated, with letters of approval from Mr. Hume, after the evidence upon which they were founded had been twice weighed by parliament, and twice found insufficient. The piratical character of the Malays of the archipelago had never been disputed; it was regarding the Sarebas and Sakarran dyaks that the question was raised. To disprove the first charge, it was only necessary to show that these tribes were not prosecuting mere intertribal feuds, when they burst upon their peaceable neighbours, burnt their dwellings, stole their goods, and carried "women and children into captivity, with the heads of their decapitated husbands and fathers." Sir James produced a list of twenty-one names, in support of his averment, among which were—Monsieur Cornet de Groot, 1839, secretary-general to the Netherland colonial minister; Captain Keppel, 1843-44; the Rajah Muda Hassim; Mr. Church, resident-councillor of Singapore; Colonel Butterworth, governor of Singapore; Admiral Sir Thomas Cochrane; and lastly, the decision of the court of admiralty in Singapore. As he most justly remarks—"A fact cannot be more than proved;" if this array of evidence is insufficient, further argument were hopeless. On the next charge he says—"If by a merchant be meant a person who buys and sells for his own profit, then I have never been a merchant at all. In the year 1845 I was the unpaid agent of the English government; in 1847 I was appointed commissioner and consul-general; and in 1848 became governor of Labuan." During the first years of his residence at Sarawak, Sir James states that he "was obliged to resort to trade to obtain the means of carrying on government;" but no personal benefit accrued to him, as even "so late as 1851 there was an excess of expenditure over receipts, which I willingly made good from my private fortune." The anxiety occasioned by business was distasteful to Sir James; and anxious to place the revenue on a more permanent basis, he, in 1846, leased the antimony ore and opium farm for five years to the Eastern Archipelago Company. Then began Mr. Wise's endeavours to induce Brooke to enter into speculations which would have made him one of the richest commoners in England. His refusal to "risk the welfare of this people for any motives, whether of cupidity or ambition," seems to have excited a feeling of jealousy on Mr. Wise's part towards the man whose disinterestedness he could not understand, and which a subsequent mistake about some letters only served to increase. But Mr. Wise's transactions have been sufficiently exposed. The dealings of the Eastern Archipelago Company have also been laid bare, and the publication of their forgeries and slanders casts an irredeemable blot on the man, who, with every means of investigation in his power, raised the hue and cry against his great countryman on no surer foundation. We have already given the detail of the events by which Sir James was installed as governor at Sarawak. We do not envy any one who, after reading the correspondence with his mother and Mr. Templar on that subject, could accuse him of mean or unworthy motives. The simplicity and beautiful confidence running through all those "private" letters ought to disarm suspicion. Muda Hassim's concession was afterwards officially confirmed by the sultan. It is unnecessary to enter here into a detailed refutation of the remaining charges; but if we have succeeded in giving any idea of his devoted and philanthropic character, and of the love and veneration in which he was held at Sarawak, the designations of "murderer" and "thief," as applied to him, will not receive an *imprimatur* from our readers. Yet these charges were repeated year after year, during his absence, and again while in London during 1852, with undiminished acrimony. Even then, however, the "great heart of the world was just;" in April, 1852, a public dinner was given him by a large and influential body of men, who were proud to call Sir James Brooke "countryman." Subsequently the fullest justice was appropriately done him at Manchester, by an assembly of its greatest and most enlightened merchants. When hostilities broke out between Great Britain and China, Sir James was at Sarawak, which first set the example of rising against the English. In the course of the outbreak his house, mines, a valuable library, and other property belonging to him, were seized by the insurgents; and escaping for his life, he

came to England in 1858. At a public meeting held in London a large sum of money was subscribed to indemnify him for his loss, and in 1860 he went back to Borneo. Before leaving this country, however, he had an attack of paralysis, which greatly weakened him, and from which he never recovered. Having again returned to England, he died on the 11th of June, 1868. We conclude this notice by an extract from a critic not usually given to over-praise:—"Contemplating and judging the work and the man with entire impartiality—without the slightest bias one way or another in his case—being utter strangers to him and all his connections, his friends and his enemies—being in possession of the entire material for a study of his life and acts—and having really and truly studied both—our final conviction is, that James Brooke is one of nature's princes—a man of genius to begin with, and of that high order of genius which can act in any direction; that he has the devout pertinacity of a Columbus, grounded upon a similar sagacity; the gay magnanimity of a Raleigh; the adventurousness of a Cortez; the administrative ability of a Penn; the joyful devotedness of a Père d'Estévan; the moral courage and good sense of a Wellington; the domestic affections of a Collingwood; the robust purity of a hero whose energies are occupied with adequate aims; and the simplicity which is always supposed, when genius is described"—A. J. N.

**BROOKES, JOSUUA**, an English anatomist and physiologist, was born 24th November, 1761. Having received his diploma, he visited Paris, where he practised for some time at the Hôtel Dieu. On his return to London, he began to study anatomy, and to form a museum. He was well known as a dissector, and succeeded in making a preparation for preserving his subjects from decay, the composition of which he communicated to the Royal Society, of which he was elected a fellow. He taught anatomy and physiology during forty years, to more than 5000 pupils in all. He published some small papers on subjects connected with his favourite science, and died in 1833.—J. B.

**BROOKES, RICHARD**, an English physician, lived about the middle of the eighteenth century, and published works on chocolate, on the natural history of vegetables, on systems of natural history, also an "Introduction to Physic and Surgery," and a "History of China and Tartary."—J. H. B.

**BROOKING**, an ingenious but unhappy artist, born about 1720. He had a situation in Deptford dockyard, and, suiting his art to his opportunities, "he rose," Pilkington says, "to an eminence little inferior to Vandervelve or Backhuysen." He lived forgotten, and died unknown in 1759.—W. T.

**BROOKS, COLONEL JOHN, LL.D.**, a distinguished American officer in the revolutionary army, afterwards governor of Massachusetts, was born at Medford, Massachusetts, June 6, 1752. He served throughout the war with a high reputation as a brave, discreet, and patriotic officer; and when peace was at hand and disaffection pervaded the army, as manifested in the celebrated Newburgh Letters, he was one of those who most actively seconded the exertions of Washington in preventing the officers and troops from taking the redress of their grievances into their own hands. Then he went back to private life, and resumed the medical profession, for which he had been educated. In 1816, on the withdrawal of Governor Strong, he was chosen governor of Massachusetts, and held that office by successive re-elections for seven years, when his advanced age induced him to refuse any longer service. He died, March 1, 1825, leaving a highly-honoured name, untarnished by a single spot either in his public or private career. He published a few orations and discourses, and one medical tract.

**BROOKS, MARIA**, an American poetess of minor fame, born at Medford, Massachusetts, about 1795; died in Cuba, November 11, 1845. Her maiden name was Gowan or Gowen, her *nom de plume* "Maria dell' Occidente." She wrote "Judith, Esther, and other poems," 1820; "Zophiel, or the Bride of Seven," a poem of six cantos; and a pure romance, telling the story of her own life, and named "Idomen, or the Vale of Yumuri." In 1830 she accompanied a brother to Paris, and spent the spring of 1831 at Keswick with Southey, who prepared an edition of "Zophiel" for the press. The Doctor pronounced her "the most impassioned and most imaginative of all poetesses;" and Longfellow, in Kavanagh, quotes some "tender, melancholy lines," from her poem on "Marriage."

**BROOME, WILLIAM**, born in Cheshire; died at Bath in 1745; the date of his birth is not known; educated on the foundation

at Eton, and afterwards at St. John's, Cambridge. Broome translated some books of the Iliad into prose, which were printed in the book called Ozell's Homer. He was soon afterwards employed by Pope in making extracts from Eustathius for the notes to his translation of the Iliad; and when he undertook the Odyssey, he abridged his labours by getting Broome and Fenton to translate a considerable part of it. Broome translated the second, sixth, eighth, eleventh, twelfth, sixteenth, eighteenth, and twenty-third books: he wrote all the notes.

Pope came off clean with Homer, but they say—  
Broom went before, and kindly swept the way.

The alliance produced no cordiality. In the Art of Sinking, Broome is reckoned as one of "the parrots who repeat another's words in such a hoarse odd tone as makes them seem their own;" and in the Dunciad we have the couplet—

"Hibernian politics, O Swift, thy doom;  
And mine, translating ten whole years with Broome."

Broome was rector of Starston in Suffolk, where he married a wealthy widow. In 1728 he became doctor of laws. He afterwards obtained some crown livings. In 1739 he published a collection of poems, among which was a part of the eleventh book of the Iliad in what he calls the style of Milton. It is curious that both he and Fenton, Pope's other assistant in the Odyssey, should both have left specimens of translations of the Iliad into blank verse, as if they had proposed to themselves the task reserved for Cowper.—J. A., D.

**BROSAMER, JOHN or HANS**, an old German engraver, one of the "little masters;" born at Fulda about 1506. He worked on wood and copper in the style of Aldegrever. He executed portraits of Luther and Paracelsus, and seven sheets of a great procession by christian and pagan heroes on horseback.—W. T.

\* **BROSEN**, an astronomical observer of much merit at Kiel. We owe him the discovery of several comets, especially the periodical one whose period round the sun is 5581 years.

**BROSCI, CARLO**.—See **FARINELLI**.

**BROSSES, CHARLES DE**, born at Dijon in 1709, and died at Paris in 1777. He was a magistrate at Dijon, and, in addition to the performance of his public duties, cultivated letters with great zeal. He became president of the parliament of Dijon, and in 1746 was nominated a member of the Academy of Inscriptions. He was the first person to write a description of the ruins of Herculaneum. He published in 1760 a dissertation, in which he sought to identify the modern African fetichism with the old Egyptian religions. He had before this, at the suggestion of Buffon, published "L'Histoire des Navigations aux terres Australes," and he has the honour of being the first to use the names of Australasia and Polynesia. He wrote a treatise "On the Mechanism of Language," a work of some character. A work on which he expended considerable time, was the "Histoire du Septième Siècle de la République Romaine," in three volumes. It is a piece of skilful mosaic, in which such fragments as he found useful to his purpose are worked into a consistent whole. De Brosses died before he had completed his work; and a fourth volume which he had left in manuscript, containing the texts of Sallust and other writers whom he relied on as authorities, has never been printed. He printed a good many memoirs in the Academy of Inscriptions and in the Dictionnaire Encyclopédique. "Letters from Italy, Historical and Critical," have been published under his name. The book is of doubtful authenticity.—J. A., D.

**BROSSETTE, CLAUDE**, lord of Varennes-Rappetour, a learned Frenchman, born at Lyons in 1671; died in 1743. He published, with historical illustrations, the works of Regnier and Boileau, with the latter of whom he maintained a long correspondence.

**BROTERO, FELIX DE AVELLAR**, a celebrated Portuguese botanist, was born at Santo-Antão de Tojah, near Lisbon, on 25th November, 1744, and died on 4th August, 1828. He was deprived in early life of his parents, and his education was intrusted to a paternal uncle, and his maternal grandfather. He studied in a college founded by the monks of Mafra. He appears to have been in very poor circumstances, and in 1763 we find him engaged as a singer in the cathedral at Lisbon. He devoted himself, however, with ardour to his studies, and acquired a good knowledge of Latin and Greek. He was offered the chair of Greek at Bahia in Brazil, but he declined it. He went to Paris, and remained there for twelve years. There he took the name of Brotero, derived from the Greek words mean-

ing mortal love. In Paris he became acquainted with Daubenton, Vieq d'Azyr, Brisson, Laurent de Jussieu, Condorcet, Cuvier, and Lamarek. He prosecuted natural history studies, and particularly gave his attention to botany—a science in which he afterwards attained great celebrity. At the time of the French revolution he had to leave Paris, and in 1790 he returned to Portugal. In 1791 he was appointed to the chair of botany and agriculture at Coimbra. Subsequently he became director of the royal museum and the botanic garden at Lisbon. Brotero's scientific studies were interrupted by the French invasion, and he had to take refuge in a faubourg of Lisbon, where he might have died from want had it not been for the kind intervention of Geoffrey St. Hilaire, who got the French government to give assistance. In 1811 he became professor in the university of Lisbon, and he continued to give regular courses of lectures on botany and natural history for more than twenty years. In 1821 he was elected a member of cortes for the province of Estramadura, but he did not long retain this appointment. He retired finally from active life, and quietly pursued his natural history studies. He died at Acolnade-Belem, at the age of eighty-four. Among his published works are the following—"Account of the rare plants of Spain, as well as a Flora Lusitania;" "A Botanical Compendium;" and Principles of Philosophical Agriculture." He also contributed papers to the Linnæan Society, and to the Academy of Sciences of Lisbon.—J. H. B.

**BROTIER, ANDRÉ CHARLES**, the nephew of Gabriel, born at Taunay in 1751. Before the French revolution he took orders; but like many ecclesiastics of that age, he chiefly applied his mind to mathematics, botany, and literature. In 1791 he was one of the principal conductors of the *Journal Général de France*. A royalist by conviction, he plotted against the republic, and after many adventures was transported to Cayenne, where he died a victim to the climate in his sixty-ninth year. He published a new edition of the Theatre of the Greeks in 1783, which contains his own translation of Aristophanes.—T. J.

**BROUGHAM, HENRY**, Lord, was born in Edinburgh on the 19th September, 1778. He was the eldest son of Henry Brougham, Esq., of Brougham Hall, and Eleanor Syme, only child of the Rev. James Syme, by Mary, sister of Dr. Robertson the historian. He was educated at the High school of Edinburgh along with Sir Walter Scott and Lord Jeffrey, and in 1793 he was sent to the university of Edinburgh, where he pursued his studies under Dugald Stewart, Professor Robison, Dr. Black, and Professor Playfair, then professors of moral philosophy, natural philosophy, chemistry, and mathematics, in that institution. Although he took a high place in all the classes which he attended, yet mathematics and natural philosophy particularly fixed his attention. In the year 1795, when he was only seventeen years of age, he devoted himself to the study of the inflexion, reflexion, and colours of light, and communicated the results which he obtained to the Royal Society of London, in a paper entitled "Experiments and Observations on the Inflexion, Reflexion, and Colours of Light" (Phil. Trans., 1796, pp. 227-277). In the following year he communicated another paper to the society, entitled "Farther Experiments and Observations on the Affections and Properties of Light" (Phil. Trans., 1797, pp. 352-385); and in 1798 he transmitted to the same body a mathematical paper, entitled "General Theorems, chiefly Porisms" (Phil. Trans., 1798, pp. 378-397). The two papers on light evince much ingenuity and knowledge of optics, and were sufficiently important to call forth a discussion of some of the more important points by Professor Prévost of Geneva (Phil. Trans., 1798, pp. 311-332); but the key which Dr. Thomas Young subsequently discovered to the class of phenomena discussed by Mr. Brougham and Professor Prévost, was required to determine the laws that regulate the influence which bodies exercise upon the light which passes by them. In the year 1800 Mr. Brougham was admitted to the Scottish bar, and was then one of the members of the Speculative Society, where so many distinguished Scotsmen acquired the habit of public speaking. When the *Edinburgh Review* was established in 1802, Mr. Brougham became one of its most active contributors, and exhibited a variety and extent of knowledge, seldom possessed by the same individual. These qualities were equally conspicuous in his "Inquiry into the Colonial Policy of the European Powers," a work which appeared in Edinburgh in 1803, and made him favourably known in the political world. In 1807, when he was pleading a case of appeal in the house of lords, he resolved to qua-

WILLIAM PITT THE ELDER

lily himself for the English bar, and in 1808 he began to practise in the court of queen's bench and on the northern circuit. The eloquence and talent which he exhibited at the Scottish bar, found in the metropolis a nobler field for their development, and a year had hardly elapsed before he was returned to the house of commons for the burgh of Camelford. His maiden speech on the 5th March, 1810, when Mr. Whitbread brought forward his motion against the earl of Chatham, though able and eloquent, did not call forth his gigantic powers of debate; but they gradually unfolded themselves, and he soon became the rival of George Canning, and his most powerful opponent in the great political questions which then agitated the country. On the dissolution of parliament in 1812, Mr. Brougham failed in contesting with Mr. Canning the representation of Liverpool, and he was thus excluded from the house of commons during the long period of five years. In 1816, however, he was returned for Winchelsea, a borough which he represented till 1830, when he resigned it on account of some difference of opinion with its patron, the earl of Darlington. He was, however, immediately returned for Knaresborough; and on the death of George IV. he successfully contested the county of York, and thus occupied a position which added the influence of a great constituency to that which he already possessed in parliament. Mr. Brougham now stood forth the champion of parliamentary reform, and the house of commons had no sooner met than he announced, for the 16th November, his intention to bring in a bill embracing a comprehensive measure of reform—the enfranchisement of large towns—the reduction of rotten boroughs—the curtailment of the English and Irish representation—and the grant of the franchise to copyholders, leaseholders, and all householders whatever. A ministerial crisis, however, supervened. The duke of Wellington having been defeated on a government measure, resigned, and the formation of a new government under Earl Grey, including Lord Brougham and Vaux as lord chancellor of England, who had not previously filled any of the subordinate law offices of the crown, placed in the hands of the ministry the great question of parliamentary reform. But though no longer a representative of the people, and personally relieved from the charge of the reform bill, his best powers were called forth in support of it; and his speech on the 7th October, 1831, when the bill was read a second time in the house of lords, was a display of eloquence of the highest order. While Lord Brougham occupied the woollen-sack, from 1830 to 1834, he availed himself of his high position to perform services to his country which posterity alone can duly appreciate. As the only British minister who devoted his powers and used his influence in the promotion of national and general education—in the instruction of the working classes—in the establishment of unfettered universities—in the diffusion of useful knowledge by popular publications—in the improvement of the patent laws—and in obtaining for the higher classes of literary and scientific men the honours and emoluments so long and so unjustly withheld from them, his name will shine in the future history of learning with a brighter lustre than that of the Richelieus and Colberts of former days. [“In my opinion, the teachers of the age of George III. covered it with still greater glory than it drew from the statesmen and warriors that ruled its affairs.”—*Works*, vol. i.] Nor did these various duties, when performed during his occupation of the woollen-sack, interfere with the onerous functions of his office. His activity as a judge was unexampled. In the course of a few months he decided 120 cases of appeal; and upon quitting office in 1836, he “did not leave a single case unheard or a single letter unanswered.” As one of the most successful reformers and improvers of our laws, both civil and criminal, Lord Brougham earned the gratitude of his country. His bill for the establishment of law courts, and his exertions in abolishing imprisonment for debt, amending the criminal code, putting an end to capital punishment for various classes of crimes, and thus humanizing the bloody laws of his country, have justly endeared his name to the philanthropists of every clime. Wherever oppression, under the form of English law, struck at an individual or crushed a race, the heart and head of Mr. Brougham were combined to defend and relieve them. His defence in 1824 of Mr. Smith, a Wesleyan missionary, against the slaveholders of Demerara, and in 1825 of another missionary expelled from Barbadoes, had a salutary influence far beyond the localities of the oppression. His exertions, too, in the abolition of colonial slavery, and in suppressing the slave trade, which the rapacity of civilized nations so long permitted to

exist, will ever be one of the brightest leaves in his chaplet. The same indomitable hatred of illegal power, whether exercised against the high or the low, was exhibited in 1820 and 1821 in his defence of Queen Caroline, when she laid claim to the honours of queen-consort on the accession of George IV. to the throne. As her attorney-general he pled her cause in the house of lords in the trial for her divorce, and before the privy council for her right to coronation, and by these two remarkable displays of forensic eloquence, his reputation and popularity were greatly extended. The labours of Mr. Brougham in promoting the various social and political reforms effected during the first half of the present century, can hardly be enumerated in the brief space allotted in our pages—his inquiry, through a commission, into the nineteen thousand charitable trusts in Great Britain; his labours in procuring catholic emancipation; in improving our municipal jurisprudence; in the complete reforms of the Scottish municipal corporations; in the settlement of the bank charter; in the radical reform of the poor-laws; in the partial reform of the Irish church by the suppression of ten bishoprics; and in the removal of the monopoly of the East India company and the opening of the East India trade.

In the year 1834, the reform government, under which Lord Brougham had done so much for his country, quitted office, and was succeeded by the short-lived ministry of Sir Robert Peel. In 1835 the whigs again returned to power, with Lord Melbourne as premier, and Lord John Russell as home secretary; but, from causes yet to be explained, and much to be deplored, Lord Brougham was excluded from the cabinet. The ties which bound him to the whigs as a party being now dissolved, he was at liberty to take an independent course in parliament, when he criticised the acts of both parties, and sometimes brought forward measures of his own. His conduct, in this respect, has been very unjustly blamed, and he has been charged with abandoning the whig principles which he maintained while in office. In political life, a member of a party, whether in or out of power, is sometimes obliged to support measures which he does not wholly approve; but when he has assumed an independent position, and thrown himself loose from all party ties, he may honestly oppose measures to which he formerly consented, and originate others to which he could not previously obtain the assent of his friends. When the conduct of public men shall be judged calmly, and uninfluenced by personal and party feeling, we have no doubt that Lord Brougham will be regarded as a consistent statesman, who occasionally modified his opinions when he was called to express them under altered circumstances and new conditions.

As a relief from his severe parliamentary duties, Lord Brougham purchased an estate about a mile to the east of Cannes, in Provence, where he built the beautiful chateau of Eleonore Louise, commanding a charming view of the Mediterranean, the Lerin isles of St. Marguerite and St. Honorat, and the grand range of the Esterel mountains, which terminate on the coast between Cannes and Frejus. In this delightful retreat, beloved by the French and English residents in his neighbourhood, Lord Brougham spent a portion of every year, pursuing undisturbed his literary and scientific studies, and adding to his high reputation as an orator and a statesman the more European fame of an author and a philosopher. Under the clear sky of Provence, and with a fine apparatus constructed by the late M. Soleil of Paris, he resumed his early researches on the inflexion and diffraction of light, and made some important discoveries which he communicated to the Academy of Sciences at Paris, and to the Royal Society of London, in whose memoirs and transactions they are published. (A brief notice of them will be found in Sir David Brewster's *Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton*, vol. i., pp. 208–210.)

Lord Brougham was elected a fellow of the Royal Society of London on the 3d March, 1803. In 1825 he was appointed lord rector of the university of Glasgow. In 1833 he was chosen one of the five foreign associates of the Academy of Moral and Political Sciences in the Institute of France, and more recently a member of the Royal Academy of Sciences at Naples. His lordship was also president, and may be regarded as the founder, of University college, London. In 1819 he married Mary Anne, daughter of Thomas, son of Sir John Eden, bart., of Windleston, by whom he had two daughters, one of whom died in 1820, the other in 1839: Lady Brougham died 12th January, 1865.

Besides his work on the “Colonial Policy of the European

Powers," already mentioned, Lord Brougham published, in 1839, in connection with Sir Charles Bell, an edition in 2 vols. of Paley's Natural Theology, with dissertations on subjects of Science connected with Natural Theology, a work which has gone through many editions.

In 1838, "a collected edition of his speeches," up to that date, was published in four volumes. In 1839-1843, appeared his "Historic Sketches of Statesmen who flourished in the time of George III." In 1845 he published his "Lives of Men of Art and Science who flourished in the time of George III." In 1849 he published a letter to the marquis of Lansdowne on "The late Revolution in France," which went through five or six editions. In 1855 he published, conjointly with E. J. Routh, an "Analytical view of Sir Isaac Newton's Principia," which is now used in Cambridge. (This work was first published in 1839, omitting the *second* and part of the *third* books, defects which have been supplied in the new edition.) In 1857 he collected and published his contributions to the *Edinburgh Review* in 3 vols., 8vo. An edition of Lord Brougham's writings, entitled "The Critical, Historical, and Miscellaneous Works of Henry Lord Brougham, F.R.S., Member of the National Institute of France, and of the Royal Academy of Naples," was published by Messrs. Richard Griffin & Co., in 10 vols., 1855-1858. So recently as the 17th and 31st of May, 1858, Lord Brougham read to the Academy of Science a very interesting paper on the structure of the cells of bees, which was published in the *Comptes Rendus*, &c., tom. xlv., p. 1024, under the title of "Recherches analytiques et experimentales sur les alveoles des Abeilles." In October, 1859, his lordship was elected chancellor of the university of Edinburgh, and was entertained at a public banquet by the city. The chancellorship he retained till his death, which occurred on the 7th of May, 1868.—D. B.

**BROUGHTON, ARTHUR**, an English botanist who lived towards the end of the 18th century. He resided in Jamaica, and published in 1794 a catalogue of the more valuable and rare plants growing in the public botanic garden in the mountains of Liguanea, in the island of Jamaica; also of medicinal and other plants growing in North and South America.—J. H. B.

**BROUGHTON, HUGH**, an eminent Hebrew and rabbinical scholar, was born in 1549 at Oldbury in Shropshire. Being the child of poor parents, he received his education at the school which had been founded, and was sustained, by the excellent Bernard Gilpin at Houghton in the county of Durham. By the same benevolent man he was supported at Cambridge, where he became a student, and afterwards a fellow of Christ's college. From an early period he devoted himself to Hebrew literature, and being a close student, he acquired unusual proficiency not only in the biblical, but also in the later Hebrew, as well as in some of the cognate tongues. Unfortunately, he conceived at the same time such an inordinate sense of his own superiority, that he was constantly afterwards involving himself in disputes and difficulties. In London, where he first appeared after leaving Cambridge, he sought notoriety by attacking others both in the pulpit and from the press. Having published a book on scripture chronology and genealogy, he was allowed to deliver lectures in defence of his system in St. Paul's cathedral. At this time he ranked with the puritans, but having quarrelled with them he set up a conventicle for himself. In 1589 he left England in disgust, and travelled for some time in Germany, where his great scholarship procured him the favour of several eminent persons, but where his arrogance and pugnacity exposed him to the same disagreeable consequences as had caused him to leave England. He officiated for some time as pastor of the English church at Middleburg in Zealand, and whilst here he came into collision with Henry Ainsworth, and had that violent dispute with him, to which reference is made in the life of the latter. (See **AINSWORTH, H.**) He returned to England in 1611, and died at Tottenham High Cross in the following year. His principal works were collected and published by the learned Dr. Lightfoot, with the following title—"The Works of the Great Albonian Divine, renowned in many nations for rare skill in Salem's and Athens' tongues, and familiar acquaintance with all Rabbinical learning, Mr. Hugh Broughton," folio, 1662. Some of these writings are in Hebrew, and all of them indicate large acquaintance with Jewish learning. The style, however, is very bad, "curt, harsh, and obscure," as his editor admits, and they are disfigured by constant outbursts of petulance and dogmatism. Broughton is frequently referred to by Ben Jonson.—W. L. A.

**BROUGHTON, RICHARD**, an ecclesiastical historian, born at Great Stukely in Huntingdonshire, was educated at the English college of Rheims. After taking priest's orders in 1593, he returned to England and began his labours as a missionary, which he pursued quietly but zealously for the space of forty-two years. Died in 1634. His principal works are—"An Ecclesiastical History of Great Britain from the Nativity to the Conversion of the Saxons," Douay, 1633; "A True Memorial of the Ancient, most Holy, and Religious State of Great Britain, &c., in the Time of the Britons and Primitive Church of the Saxons," 1650; and "Monasticon Britannicum," 1655.—J. S., G.

**BROUGHTON, THOMAS**, a learned divine and miscellaneous writer, one of the original authors of the *Biographia Britannica*, born in London in 1704, was educated at Eton and at Gonville and Caius college, Cambridge, where he graduated M.A. in 1728. After taking priest's orders he became curate of Offley in Hertfordshire, and in 1739, on the presentation of John, duke of Bedford, was instituted to the rectory of Stepington or Stibington, Huntingdonshire. Having been chosen reader to the Temple he became known to Bishop Sherlock, then master, who gave him the vicarage of Bedminster, near Bristol, and a prebend of Salisbury. Died at Bristol in 1774. His enthusiasm for ancient music led to his making the acquaintance of Handel, whom he furnished with words for many of his compositions. Shortly after his death a volume of his sermons was given to the world by his son. His principal works are the following—"Christianity distinct from the Religion of Nature, in three parts, in Answer to Christianity as Old as the Creation;" part of the New Edition of Bayle's Dictionary, in English, corrected, with a Translation of the Latin and other quotations; "Original Poems and Translations, by John Dryden, Esq., now first collected and published together," 2 vols.; "A Translation of some of the Orations of Demosthenes;" "Hercules," a musical drama; and "Bibliotheca Historico-Sacra, an Historical Dictionary of all Religions from the Creation of the World to the Present Time," 1756, 2 vols. fol.—J. S., G.

**BROUGHTON, WILLIAM GRANT, D.D.**, first bishop of Australia, 1835-53, was born at Canterbury in 1789. While a curate at Hartley Westpall, in Hampshire, he became known to the great duke of Wellington, who, when it was determined in 1829 to send an archdeacon to preside over the church in Australia, selected Mr. Broughton for the office. There was much need for an energetic and judicious man; the colony was full of convicts, but neither for them nor for the settlers had any care been taken to provide the means of religious instruction. The archdeacon laboured diligently, and not without success, till 1835, when he came to England to plead the cause of his people; and the result was that the see of Australia was founded, and he returned, with a large increase of clergy, to be the first bishop. He soon afterwards offered to resign half his income, that the diocese might be divided, "and, when this might not be, made over a fourth part." That which was then the diocese of Australia, now comprises the sees of Sydney, Melbourne, Adelaide, Newcastle, Perth, Tasmania, New Zealand, Christ Church, Wellington, Nelson, and Waiapu. For seventeen years Bishop Broughton never quitted his post. In the autumn of 1852 he came home to make arrangements with others of the home and colonial bishops, for the more effective government of the church. The vessel in which he returned to England was the *La Plata*, on board which the yellow fever broke out with great virulence, and, in the words of Archdeacon Harrison in his funeral sermon, "his christian pastoral zeal impelled him to supply with assiduous care to the sick and dying the sacred ministrations of religion; and when now, on the shores of England, leave was given to those who had escaped the pestilence, to quit the ship and go on shore, the bishop, faithful to his sense of duty, would not leave. The effects of these trying scenes he never recovered; he died in 1853, and was buried in Canterbury cathedral.—T. S. P.

**BROUNCKER** or **BROUNKER, WILLIAM**, viscount of Castle-Lyons in Ireland, first president of the Royal Society, born about 1620. He studied at the university of Oxford, where he took the degree of doctor of physic in 1646. From its incorporation in the reign of Charles II., he was president of the Royal Society during the long period of fifteen years, his lease of the dignity being renewed annually. A few scientific papers are extant under his name. He also held some offices about court. He died in 1684.—J. S., G.

**BROUSSAIS, FRANÇOIS VICTOR JOSEPH**, a celebrated

French physician, who enjoyed an almost romantic but very brief popularity as the founder of the so-called physiological school of medical theorists, was born at St. Malo, 1772, and died 1838.

**BROUSSIER, JEAN BAPTISTE**, Count, a French general, born in 1766; died in 1814. In 1798, after some brilliant services as a volunteer, he was sent to Italy in command of a small force, with which, having drawn a body of Austrians, 10,000 strong, into an ambuscade near Benevento, he cut them in pieces almost without the loss of a man. For his share in the taking of Naples, and his exploits in the province of Apulia, where, with a handful of men, he annihilated the army of Cardinal Ruffo, he was rewarded by the directory with a sword of honour. In 1804 he was commandant in Paris; in 1805 named general of division; in 1806 again sent to Italy, where he revived the memory of his former successes, by manœuvring his division with equal skill and intrepidity, in the face of three armies, for the period of a month, and in spite of fearful odds occasionally giving battle; "one against ten" was inscribed on the colours of one of his regiments by order of Napoleon, who wished to perpetuate the remembrance of his general's audacity. At Wagram, according to Napoleon, he covered himself with glory. He was created count of the empire for his services in that engagement. After subduing the Tyrol, he took part in the march to Moscow, increased his reputation, and returned broken in health to witness the ruin of the empire.—J. S., G.

**BROUWER** or **BRAUWER, ADRIAN**. This dissolute rollicking boor, and the best painter of boors perhaps that ever lived, was born at Haerlem in 1608, the flat country folk receiving him at his birth without, as we have ever heard, any very peculiar honours. His parents were very poor, miserably poor, and his mother lived by selling to the peasants bonnets and handkerchiefs and simple lace work, on which her child Adrian painted rude flowers and birds. The great Franc Hals, Vandyck's friend, on passing the cabin one day, saw the boy at work, watched him, and was surprised at the facility and taste with which he drew. More from greediness than kindness, old Hunx Hals offered to take him as apprentice, and off, delighted, goes Adrian. Soon he beats all his companions, and is declared a genius. Hunx liking such a milch-cow, locks him up in a garret to paint all day, like a slave, small pictures, which Hals sold for large prices. He flogs, he starves the milch-cow, and milch-cow not having got her full horns, does not gore him, but moans bitterly, and wishes for the butcher, death. One day a head peeps into the garret—it is Ostade's, his old friend, who tells him, with kindling eye, how cruel and unjust Hunx is—lets him out, and sets him off, God speeding, on the Amsterdam road, much to Hunx's dismay when he comes up for his next pail of milk. Horses and after him; he is found in a church and dragged back again, when the old crusty returns; he escapes, and getting to Amsterdam, to his astonishment finds himself in a sort of Dutch paradise—his pictures in the windows—his name up. He paints some boors fighting; the innkeeper or printseller where he lodges brings him back for it a hundred ducatoons—more money than he had ever seen. Now the old swine's blood breaks out; he spends it all in ten days, and thanks God he is free of it, and once more able to work. Brouwer should have lived at Portsmouth, and painted and drank with sailors. This Brouwer was the Dutch Morland. He went on—now drinking, and working, and burning pictures for which he could not get his price; then longing for new honour, and knowing that Rubens admired his works, he set out for Antwerp, at a time when the states-general are at war with Spain. Careless, and taking no passport, he is arrested as a spy and thrown into the citadel prison, where the duke d'Artemberg was then confined. The prisoner laughs at Brouwer; the duke gets interested, and sends to Rubens for brushes and paints, to try the supposed cheat or madman. The prisoner sets calmly and confidently to work, and paints some soldiers playing at cards under the window. Rubens' eyes sparkle when he sees it: he cries out—"This is Brouwer." He offers the duke 600 guilders for it; the duke will not part with it, but rewards Brouwer largely. Rubens obtains his release, and takes him to his own house; but the rules and dignity of that great mansion do not please the pothouse man. He leaves Rubens, wanders about France, returns a vagabond, is struck with fever, and dies in 1640 in the hospital. Again the princely Fleming steps in, and the body of the poor swinish genius is buried with kingly ceremonies in the church of the Carmelites, and a superb monument erected to the son of the Haerlem bonnetmaker. For

finish, transparency, and colour, Brouwer is inestimable; several of his designs were etched by himself. In humorous expression he anticipated Hogarth. His subjects were—droll conversations; tavern rows; drunken frays; boor card-players; surgeons dressing wounds; monkeys smoking; peasants dancing; flageolet-playing; women making cakes; in fact, "what he saw not, what he did not see," as Keyler says of him. He never falls into the mannerism of Teniers, nor the common-place want of meaning which may sometimes be observed in Ostade. When he caricatures, which he often does, it is always without effort, and the exaggeration only consists in a higher degree of merriment or animation, or of suffering under the hands of the village barber. In one picture we see the most delightful expression of stupid gravity in the face of a boor, who is lighting his pipe; in another, it is a singer, who cannot forbear to chant his accustomed strain in all the smoke of the alehouse; or a fellow who endeavours, in the most ridiculous manner, to conceal his pain, whilst the doctor takes the plaster from his arm. Brouwer's native country possesses few of his pictures, but in the German galleries they are not rare—that of Munich, in particular, contains a great number of them. Joseph Craesbecke, a baker, is said to have been the companion of Brouwer in his dissolute courses, and to have received instruction from him in painting. The pictures ascribed to him in the Schleissheim gallery resemble Brouwer's, but are less spirited. In the Imperial gallery of the Belvedere, and the Lichtenstien gallery of Vienna, there are some pictures under his name of less vulgar subjects, treated in the manner of Rembrandt's school.—W. T.

**BROWALL** or **BROWALLIUS, JEAN**, a Swedish theologian and naturalist, was born at Westras on 30th August, 1707, and died 25th July, 1755. He studied theology at Upsal, and in 1737 was elected professor of natural history at Abo. He finally became bishop of Abo, and a member of the Academy of Sciences of Stockholm. He wrote many works on natural history and botany. Among others, an examination and defence of the Linnæan system, remarks on the transmutation of species, and on the fructification of plants as compared with animal generation. Linnæus dedicated the genus *Browallia* to him.—J. H. B.

**BROWN, CHARLES BROCKDEN**, an American novelist and man of letters, born at Philadelphia, January 17, 1771; died February 22, 1810. He was of a highly respectable family, of Quaker descent. Soon after he was sixteen, he devoted himself to the composition of three unpublished epic poems on the discovery of America, and the conquests of Peru and Mexico. He studied law with great ardour, but took a disgust to the practice of the profession, and abandoned it for literature. His first publication was "Alcuin, a Dialogue on the Rights of Women," which appeared in 1797; followed in 1798 by "Wieland, or the Transformation," a novel; and in 1799 by "Ormond, or the Secret Witness." In 1798 he established himself in the city of New York; and when the yellow fever broke out there, Brown refused to forsake his friends and neighbours; and after performing the last offices of affection for one of them, a young physician, was himself attacked by the pestilence. His conceptions of the disease he embodied in his next work, "Arthur Mervyn, or Memoirs of the Year 1793." Soon after he became editor of the *Monthly Magazine and American Review*, a periodical which came to an end in the course of the ensuing twelvemonth. The publication of "Arthur Mervyn" was quickly succeeded by that of "Edgar Huntly, or the Adventures of a Sleep Walker." The second part of "Arthur Mervyn" appeared in 1800; and "Clara Howard" in 1801; and in 1804 the series of his romances was closed with "Jane Talbot," first printed in England. In 1801 he returned to Philadelphia, and soon undertook the management of the *Literary Magazine and American Register*. In 1804 he married Elizabeth, daughter of Dr. William Linn, a presbyterian divine of New York. He projected the plan of an *Annual Register*, the first work of the kind in the United States, and edited the first volume of it in 1806. To the pages of the two last-named periodicals, as well as to those of the *Portfolio*, his contributions were large and various. Between 1803 and 1809 he published three political pamphlets, which excited general attention. His health gave way, and a voyage to Europe was recommended; but he could not make up his mind to leave his family for any length of time, and tried only a short excursion into New Jersey and New York in the summer of 1809. Finding this was of no effect, he agreed to go abroad in the following spring, which he did not

live to see. Brown's life was blameless, and his disposition full of benevolence; his manners were gentle and unaffected; and his conversational resources considerable, though he was somewhat silent in large or mixed companies. His reading, though desultory, was very extensive; and his facility in writing only too great, as it induced him to compose story after story, trusting apparently to luck for the disentanglement of his plots. He threw off three romances in one year, "with the printer's devil literally at his elbows." His style was often deficient in ease and simplicity; and he was apt to stop short in the midst of his most exciting narrations to philosophize upon them; but his romances were much admired in his time, and are still read with interest. He had a powerful but somewhat morbid imagination, considerable descriptive power, and much intensity of conception.

BROWN, DAVID, formerly provost of Fort-William college, Calcutta, and senior chaplain of the Bengal presidency, was born in the year 1763. His father was a respectable farmer in the East Riding of Yorkshire; but through the kindness of a clergyman, who took an interest in the boy, he was able to give his son a good education. From the grammar-school of Hull he passed, about the age of twenty-one, to the university of Cambridge, and was entered at Magdalene college. Here, though much interrupted by illness, he prosecuted the usual studies; but from which he was called off by an unforeseen and remarkable offer of a position in India—viz., that of chaplain to an orphan asylum near Calcutta. Having obtained full orders from the then bishop of Llandaff, Dr. Watson—Mr. Brown, together with his newly-married wife, sailed in November, 1785, and reached Calcutta in June of the following year. Soon after his arrival, he was appointed to the chaplaincy of the sixth battalion, residing at Calcutta. This post he held in conjunction with his duties as head of the asylum, till, about a year and a half after, he resigned the latter establishment, in order that he might be able to take under his ministerial charge the "old mission" church, which belonged to the Society for Promoting Christian Knowledge, but was just then vacated by its missionaries, and must have been shut up, had not Mr. Brown taken it under his care. For the space of more than twenty years he never ceased to minister to the large and influential congregation attending this place of worship, till death put a period to all his labours. From the year 1799 he enjoyed the benefit of the able help and counsel of his friend Dr. C. Buchanan, alike as presidency chaplain and minister of the mission church. On the college of Fort-William being founded in 1800, by the marquis of Wellesley, then governor-general of India, such was the high estimation in which that distinguished nobleman held Mr. Brown, that he appointed him its first provost; and for the six years that he occupied this useful position, it may be seen, from various accredited reports, with what fidelity, ability, and usefulness, he laboured here also. Freed, however, by an order of the court of directors, from this engagement, he was able to give the more personal attention to the education of his own large family; and also to an object which, if possible, was still dearer to his heart—viz., the translation of the inspired volume into India's various languages. In 1806, therefore, he became corresponding secretary to the then newly-formed British and Foreign Bible Society; and with all the help which it could supply, together with the aid of native translators and transcribers, he laboured for the last years of his life, to aid the accomplishment of this great design. It was, as he himself expresses it, his "dreaming thought in the night, and his waking idea in the day." Whether Mr. Brown is viewed in his endeavours to diffuse the charm of his own personal piety, and sound christian principles, amongst the young civilians in the college of Fort-William—his able preaching in the church of Calcutta, of which for twenty-four years he was the head chaplain—the esteem and affection entertained for him by all classes of the community, from successive governor-generals downwards—it must be confessed that few persons have rendered more benefit to the native and European population of British India than the lamented subject of this brief sketch. He died at the age of forty-nine, and was buried in Calcutta, within the church in which he had so long officiated, and over which is inscribed a just tribute of affection and esteem. See his Life, with a selection of his sermons; London, 1816.—J. W. D.

BROWN, SIR GEORGE, G.C.B., General, the third son of Provost George Brown of Linkwood, near Elgin, N.B., was born in Scotland in 1790. He was educated at the Royal Military

college at Great Marlow and High Wycombe, and entered the army in 1806, as ensign in a foot regiment. In the following year he was present at the siege of Copenhagen, and subsequently served with distinction through the greater part of the Peninsular campaigns. He was severely wounded at Talavera. From 1824 to 1842 he commanded a battalion of the rifle brigade. In the latter year he was appointed deputy-adjutant-general, and subsequently adjutant-general of the forces. On the outbreak of the Russian war in 1854, he was appointed to the command of the light division in the East, and took part in the Crimean campaign; he was in the thickest of the fight at the passage of the Alma, and was severely wounded at the battle of Inkermann. In 1855 he was nominated a knight grand cross of the bath, and colonel of a battalion of the rifle brigade, and made full general in the army in reward of his services in the Crimea, for which also he subsequently received the grand cross of the legion of honour from the emperor of the French in 1856. In 1860 he obtained the chief command of the forces in Ireland. He died at Linkwood on the 27th of August, 1865.—E. W.

BROWN, JAMES, an eminent American publisher and bookseller, died at his seat in Watertown, near Boston, March 10, 1855, aged fifty-five. The son of a farmer in very humble circumstances, in Acton, Mass., he raised himself by his shrewdness, sagacity, and enterprise to be the head of one of the largest and most successful firms in the book-trade in America. Their publications were standard works of a high character; and Mr. Brown's fine taste and patriotic pride were gratified by so far improving the mechanical execution of them—the paper, print, and binding—that they rivalled the handsomest productions of the English and Scotch press. Mr. Brown also made large purchases of English and Scotch publications, often importing a whole edition of a standard work, and fearlessly putting it into the market to contend against a cheap and inferior American reprint. Very rarely were his excellent judgment and instinctive anticipation of the public taste deceived in these gigantic speculations. He was himself well acquainted with bibliography, his shop was a favourite resort of all the literati of New England, and he never forgot the name of a book once inquired for, or the well-considered judgment of a competent person upon its merits. The fortune which he had fairly won was munificently used in numerous liberal benefactions.—F. B.

BROWN, JOHN, a weak-stamina'd Scotch artist, the son of an Edinburgh watchmaker, and born in 1752. In 1771 he went to Italy and stopped there ten years, which was his ruin, copying Michel Angelo, and trying to think other men's thoughts. The result of this tarry in Capua was that he drew well, but was afraid to colour. Titian and Murillo made him tremble and despair. Still hunting about, he accompanied Mr. Townley (marble Townley) and Sir William Young to Sicily, and made some beautiful drawings. On his return home he went to him in Edinburgh, where the eccentric Lord Monboddo showed him kindness. In 1786 the magnetism of the south drew him to the black Babylon, and, compelled to stow away his great ideals and hopes as unsaleable lumber, he took to painting small graceful black-lead portraits with very indifferent success. Soon death brought him the best and only real balm for breaking hearts, and he died of consumption in Scotland in 1787. Mr. Brown was a mild, clever man, too general in his tastes and too varied in his occupations. He was acquainted with painting, sculpture, and music, and left a posthumous work, called "Letters on the Poetry and Music of the Italian Opera," 1789.—W. T.

BROWN, Colonel JOHN, an officer in the American army during the Revolution, was born in Sandisfield, Mass., in 1744, graduated at Yale college in 1771, and commenced the practice of law at Caghawaga, New York, where he was appointed king's attorney. But he soon returned to Pittsfield, in his native state, and took an active share in the patriot movements at the opening of the Revolution. He was sent on a secret mission to Canada in 1774, to ascertain if the inhabitants of that province were disposed to unite with the people of New England in their measures of opposition to the British ministry. He made two of these hazardous visits, and returned safely, but without encouraging intelligence. In May, 1775, he served under Allen and Arnold in their successful expedition against Ticonderoga and Crown Point, and was sent as special messenger to the congress at Philadelphia with the news of their success. When Ethan Allen, in September of the same year, made his wild

attempt to surprise Montreal, Brown co-operated with him, but was fortunate enough to escape, while his leader was captured. The next December, Major Brown joined Arnold and Montgomery before Quebec. While leading a party of them up the Mohawk to the relief of General Schuyler in 1780, he fell into an ambuscade of loyalists and Indians, was defeated and slain.—F. B.

BROWN, REV. JOHN, a Scotch divine, compiler of several works of a highly useful kind, was born at Carpow in the parish of Abernethy, Perthshire, in 1720. He lost both his parents while young, and with the exception of one month at Latin, he never received instruction in the learned languages from any master; yet, besides becoming a proficient in that tongue, he acquired a critical knowledge of Greek and Hebrew, could read and translate French, Italian, Dutch, and German, and understood Arabic, Persian, Syriac, and Ethiopic. His reading was most extensive, particularly in history and divinity. He joined the Secession church, which had then recently come into existence; and after a brief attendance at the divinity hall of that denomination, obtained license as a preacher. The year following he accepted an invitation from a congregation in Haddington to become their pastor, and in 1768 became professor of divinity to the Secession church. He continued to hold conjointly the offices of minister and professor till his death, which took place in 1787, in the sixty-fifth year of his age. The works by which he is best known are his "Dictionary of the Bible," and his "Self-Interpreting Bible." This last has had a most extensive sale, and is still in great demand both in this country and in America. He left an autobiography, from which most of the notices of him which have appeared have been compiled. An enlarged and well-written memoir of him by his son, William Brown, M.D., was published by Oliphant & Sons, Edinburgh, 1857.—W. M'K.

BROWN, JOHN, M.D., the founder of the "Brunonian" system, was born at Dunse in Berwickshire in 1737. His reputation, such as it was, belongs to the past. He divided, in his famous system, all diseases into sthenic and asthenic; in the first of these, the *excitability*, which he considered the source of life, was increased, while in the second, it was diminished. The treatment to be adopted for the cure of all, except the simple sthenic affections, was to stimulate. Accordingly he prescribed rich diet, wine, and spirits in large quantities; and, as the physicians of that day probably erred in the opposite direction, it is not strange that, for a while, Brown obtained with the public, always too credulous in medical matters, a high reputation. Although decried by the profession, there can be no doubt that at one period the Brunonian system was popular in Scotland. Towards the end of last century, it had extended its influence over the whole continent of Europe, and in Germany its author was designated the "Medical Luther." A close examination of its claims to confidence, only shows how utterly baseless the fabric was on which a man like Brown succeeded for a while in building up a spurious fame. His private life was most unhappy. Indebted to the celebrated Cullen for rescue from starvation, he abused and vilified his best friend, and it seems certain that he was finally compelled to leave Edinburgh under circumstances which present his moral perceptions in a very unfavourable point of view. He removed to London, where he died in 1788. No one who attentively studies the Brunonian system can come to any other conclusion than that it was an ingeniously-contrived scheme of quackery, and the medical biographer of the present day is compelled to class its author with Paracelsus and Hahnemann. At the same time it cannot be denied that Brown possessed talents, which, if properly directed, might have raised him to an honourable position in his profession. It need hardly be added, that the system which bears his name has long been without a follower.—J. B. C.

BROWN, JOHN, D.D., an eminent Scottish preacher and biblical expositor, grandson of John Brown of Haddington, was born in 1785 at Longridge, near Whitburn, where his father was minister of a congregation belonging to one of the dissenting communions, which subsequently associated to form the United Presbyterian church of Scotland. Having studied at Glasgow university, and afterwards at the divinity hall at Selkirk, he was settled minister at Biggar, whence, after labouring for twenty years, he was transferred to Edinburgh, where he officiated for more than thirty years as minister, first of Rose Street, and afterwards of Broughton Place church. During that long period he was known as a peculiarly gifted preacher. His clearness as an expositor, his fervour as a speaker, and his earnestness as a

minister, combined with a peculiarly noble personal appearance, made him universally popular. But his fame must rest on his labours in connection with the science of scriptural exegesis. In 1835 he was appointed one of the professors in the theological seminary of the denomination to which he belonged, and in that position he did much to influence Scottish preaching, by introducing a taste for the study of biblical criticism. He has enriched the literature of exposition by many valuable works; but the influence he exerted on younger men, which is already to be traced in the increasing fame of some of our latest commentators, is of more account than anything he has written. Dr. Brown died on the 13th October, 1858, leaving behind him no common reputation for widely-extended benevolence, immense erudition, and rare diligence in that peculiar walk of literature which he adorned. His works are very numerous. We notice the following—"The Law of Christ respecting Civil Obedience, especially in the Payment of Tribute;" "Discourses and Sayings of our Lord Illustrated;" "Exposition of our Lord's Intercessory Prayer;" "The Resurrection of Life;" "Expository Discourses on the Epistles of Peter, and on the Epistles to the Galatians and Romans;" and a very large number of separate sermons and pamphlets.—J. B.

\* BROUN, JOHN ALLAN, an industrious and very successful meteorological and magnetic observer. He conducted for several years, the work at the observatory of Sir Thomas Makdougall Brisbane at Makerston, detecting there clear traces of the connection between lunar periods and magnetic variations. The results are published in several quarto volumes issued from the press of Neill & Company, Edinburgh. Mr. Broun has recently been placed at the head of the observatory at Travancore.—J. P. N.

BROWN, NICHOLAS, an eminent American merchant, was born in Providence, April 4, 1769. His character was one of singular excellence, and his great services in the cause of humanity entitle him to the highest honour. His most munificent pecuniary gifts were bestowed on the college of his native state, which his father and uncles had aided in founding, and which, in memory of his munificence, received the name of Brown University. The whole amount of his benefactions to this university is not less than 160,000 dollars, or £32,000. He died in 1841.—W. G.

BROWN, PETER, bishop of Cork and Ross, contemporary with Locke, whom he opposed in three works, published at London, 1728-33. It was against one of these, entitled "The Procedure, Extent, and Limits of Human Understanding," that Berkeley's *Alciphron* was directed.—J. D. E.

BROWN, ROBERT, one of the most distinguished botanists that Britain ever produced, was the son of a Scottish episcopalian clergyman, and was born at Montrose in 1773. He was educated at Marischal college, Aberdeen, and afterwards prosecuted his medical studies at Edinburgh, attending the lectures of Dr. Rutherford, at that time professor of botany in the university. He passed his examination at the College of Surgeons, and was appointed assistant-surgeon and ensign to a regiment of Scotch fencibles stationed in the north of Ireland, where he remained till the end of 1800, prosecuting his botanical studies with great zeal and success. About this time he became known to that great patron of science, Sir Joseph Banks, by whom Brown was recommended as naturalist to the expedition sent out by the admiralty to explore the coast of Australia. Accompanying Captain Matthew Flinders in the ship *Investigator*, he proceeded to New Holland in 1801. In the same ship Mr. Ferdinand Bauer was sent as botanical draughtsman, and Mr. Good as gardener; and among the parties in the expedition were the eminent painter, William Westall, and Sir John Franklin, who was a midshipman at the time. The vessel reached King George's Sound, on the south-west of Australia, in 1802. During a residence of three weeks at this place, Brown collected 500 species of plants belonging to a peculiar local flora. He afterwards visited Port-Jackson, and botanized there for some time. In July, 1802, the survey of other parts of New Holland was commenced, more particularly the northern and north-eastern shores, the gulf of Carpentaria, and the Pelew, Wellesley, and Wessel's islands. The state of the ship, and the ill health of the crew, compelled the captain to proceed to Timor for provisions. The party then proceeded along the west and south coasts of Australia, and reached Port-Jackson on June 9, 1803, when the ship was condemned as not being sea-worthy. There had been a considerable mortality amongst the crew. While Cap-

tain Flinders departed on his return to Britain, Brown, Bauer, and others remained in Australia, and examined the botany of the Blue Mountains and other parts of New South Wales, as well as Tasmania and the islands in Bass' Straits. Captain Flinders had intended to return and carry on the survey, but in consequence of being wrecked, and subsequently made prisoner by the French governor of the Mauritius, he was unable to accomplish his design. In consequence of his non-arrival, Brown and his companions returned to Britain in 1805. Brown brought with him a collection of 4000 species of plants. Soon after this he succeeded Dr. Dryander as librarian to Sir Joseph Banks, and was subsequently appointed librarian of the Linnaean Society. He was now enabled to enter on the examination of his collections, and he elaborated those views which finally placed him in the highest rank as a botanist. He gave the results of his researches in 1810, in his "Prodrômus Floræ Novæ Hollandiæ," a truly philosophical work, which showed the author's thorough knowledge of the principles of natural classification, and was the first British work on botany which treated of plant-arrangement in a truly philosophical spirit. This work only extended to one volume, although it appears that a second was contemplated by Brown. Part of his researches was also given in the appendix to the narrative of Captain Flinders' voyage, published in 1814, under the title, "General Remarks, Geographical and Systematical, on the Botany of Terra Australis." He continued to read a number of most profound and original botanical papers before the Linnaean Society, which have appeared in their Transactions. One of his earliest papers was published in the Transactions of the Wernerian Society of Edinburgh, on the plants called by him *asclepiadaceæ*, and which formed the basis of the elaborate papers on that interesting order of plants which he afterwards contributed to the Linnaean Society. In 1823 Brown became possessed of the library and herbarium of Sir Joseph Banks, who bequeathed them to him for his life. The collection of plants was offered by Brown to the British museum, and he was appointed, in 1827, keeper of the botanical department, an office which he continued to fill till his death. In 1811 he became a fellow of the Royal Society; in 1832 he received the degree of D.C.L. from the university of Oxford; and in 1833 he was elected one of the foreign associates of the French Academy of Sciences. In 1839 the Copley medal was awarded to him by the Royal Society for his researches on vegetable impregnation. In 1849 he was elected president of the Linnaean Society, and this office he resigned in 1853. He received from Sir Robert Peel a pension of £200 a year for his scientific merits. He died in London in June, 1858.

Brown was a botanist of the highest stamp. He possessed singular acumen, and was denominated by Humboldt "botanicorum facile princeps." He made great and important contributions to our knowledge of botany, structural and physiological, and contributed most valuable papers to the Transactions of the Linnaean and other societies. He described the plants of many collections, such as Horsfield's Java plants, Salt's Abyssinian species, the African collections of Oudney, Clapperton, and Captain Tuckey, and the arctic collections of Ross, Parry, Richardson, and others. Among his other works may be noticed his remarks on the natural order *proteaceæ*, on *asclepiadaceæ*, on woodsia, on *compositæ*, on *orchidiæ*, on *rafflesia*, on *kingia*, on *cephalotus*; on the organs and modes of fecundation in *orchidiæ* and *asclepiadaceæ*, a paper of the highest merit, as giving important new views on the subject of vegetable reproduction; on *cyrtandraceæ*, on the embryos and seeds of *coniferæ*, &c. All his writings display a wonderful power of botanical analysis, and an enlarged view of vegetable affinities. His name is known wherever botany is cultivated as a science, and his researches have promoted the advancement of botany during the long period of nearly half a century. As a private friend he was loved and respected. He was admired by a large circle of attached friends for the soundness of his judgment, the simplicity of his habits, and the kindness of his disposition.—J. H. B.

BROWN, SAMUEL, M.D., born at Haddington on 23d February, 1817; died in Edinburgh in 1856. This young and singularly able man was the fourth son of Dr. Samuel Brown of Haddington—the founder of itinerating libraries, and grandson of Dr. John Brown, author of the universally known *Self-interpreting Bible* and the *Dictionary of the Bible*. Few persons living in Edinburgh of recent years gave such promise of highest eminence as the subject of this brief notice, or bound around

them so many affectionate friends. If the promise was not fully realized, it is because his life was so short, and its later years were consumed in hopeless contest with a most painful malady. Samuel Brown's peculiar position in reference to abstract science was defined by his extension of Bosovich's theory, and his assertion that chemical elements, usually known as simple, could be transmuted into each other. Of his thoughts and labours in this direction, the only authentic account is in the "Critical Lectures" delivered by him in Edinburgh in 1843. These have appeared since his death at the head of two volumes of his collected essays. Dr. Brown's speculations, however, were not confined within the sphere of abstract science. A sympathetic student of the development of thought in every main direction—interested especially in literature and art—multitudes of occasional essays flowed from his pen, adorning our best reviews and other periodicals. A selection from these was published in Edinburgh in 1858, in two handsome volumes. Very few more interesting ones have recently issued from the press.—J. P. N.

BROWN, THOMAS, or more properly (for the vulgar diminutive suits his genius) TOM BROWN, poet, was the son of a Shropshire farmer, living near Shifnal. He entered Christ Church, Oxford, and soon became notorious for his wit and his irregularities. Being obliged to leave the university, he went to Kingston in Surrey, and commenced teaching, but speedily growing tired of this monotonous occupation, he betook himself to London, where his audacious lampoons, his wit, and his conversational powers, gained him abundance of notoriety. He died in 1704. His writings have been collected into 4 volumes, 12mo.

BROWN, THOMAS, the celebrated Scotch metaphysician, was the son of the Rev. Samuel Brown, minister of Kirkmabreck in the stewartry of Kirkcudbright, at which place he was born, Jan. 9, 1778. The father died soon after the birth of his son, and the family removed to Edinburgh, where he received the rudiments of his education from his mother. In his seventh year he was sent to London, under the protection of his maternal uncle, Captain Smith, and attended, successively, schools at Camberwell, Chiswick, and Kensington. Shortly after the death of his uncle in 1792, he returned to Edinburgh, and resided with his mother and sisters. For several years Brown attended the usual classes, literary and scientific, in Edinburgh. As he read Darwin's *Zoonomia*, a plausible but superficial work, which was at that time exciting a great degree of interest in the literary world, he began to write notes and observations on the views advocated, and this ripened into his "Observations on Darwin's *Zoonomia*," which was written before he was nineteen years of age, and published in 1798, when he was twenty. In this work, which is an extraordinary instance of precocity of intellectual power, almost all the favourite ideas which he developed in his future philosophical works are to be found. While attending college, he took an active part in the proceedings of the Academy of Physic, which numbered among its members Erskine, Brougham, Reddie, Birkbeck, Leyden, Horner, Jeffrey, Smith, and others, who rose to distinction; and which discussed all sorts of subjects, literary and philosophical. Out of this society rose the *Edinburgh Review*, to which Brown contributed several articles—in particular, an article on Kant, in the second number. In 1796 he began the study of law, which, however, he abandoned for medicine, which he studied from 1798 till 1803. A short time after receiving his degree, he published two volumes of poems. His next publication was his "Essay on Cause and Effect," occasioned by the controversy which arose about the appointment of Leslie to the chair of mathematics. According to Brown, the relation of cause and effect is an irresistible intuitive belief, a doctrine by which he attached himself to the Scottish school, and saved himself from the scepticism of Hume. In 1806 he was associated in partnership with the famous Dr. Gregory in the medical profession. Dugald Stewart being in a declining state of health, Brown lectured for him during a part of the sessions 1808-9 and 1809-10; and in the summer of 1810 Mr. Stewart having signified a desire to this effect, Brown was chosen his colleague, and from that time discharged the whole duties of the office. When the college opened, he had only the few lectures which he delivered the previous sessions; but such was the fervour of his genius, and the readiness of his pen, that he was able to deliver, continuously, one of the most brilliant, and perhaps the most effective courses of lectures ever heard in the university of Edinburgh. He generally commenced the composition of the lecture after tea, and had it ready for delivery

next day at twelve o'clock. The ingenuity of his speculations, the subtlety of his analysis, and the poetical glow of his sentiments and language, together with his fine recitation, threw the young men who hung on his lips into raptures; they declared that he had for ever superseded Reid and Stewart, and that he was the greatest philosopher that ever lived. For some years after his appointment to the chair, he had little leisure for engaging in any literary undertaking. In 1814 he published the "Paradise of Coquettes" anonymously; and in succeeding years there appeared the "Wanderer in Norway," 1815; "The War-Fiend," 1816; "Bower of Spring," 1817; "Agnes," 1818; and "Emily," 1819. His poetry has never been generally relished; it is beautifully and artistically written, but it wants true nature and genuine heart. In 1819 he prepared his "Physiology of the Mind," as a text-book for his students, and put it into the press the following winter. By the Christmas of that year he was rather unwell; in spring he removed for the benefit of his health to London, and died at Brompton on April 2nd, 1820. His remains were deposited in the churchyard of Kirkmabreck. We have an admirable biography of him by his pupil and friend, Dr. Welsh, in his Account of the Life and Writings of Thomas Brown, M.D., 1825. He was never married; he lived with his mother and his sisters, to whom he was tenderly attached. In his dispositions there was great gentleness, with a tendency to sensitiveness and sentimentality. His manner and address were somewhat fastidious, and appeared a little finical. He was about the middle size, his features were regular, and his expression had a fine combination of sweetness and calm reflection. His lectures were published shortly after his death, and had a popularity in Britain and in the United States, such as no book on mental science had ever attained before. His philosophy has never been much appreciated on the continent, where the transcendentalists find fault with him for not going sufficiently far in one direction, and the sensationalists for not advancing in another. The intellectual qualities which stand forth with greatest prominence in Brown's Lectures are—fondness of analysis, ingenuity in maintaining his positions, clearness in arrangement, felicity of illustration, with a fervid and refined eloquence. As a philosopher, he may be regarded as a sort of combination of the Scottish school of Reid and Stewart, and of the French sensational school. Among the excellencies of his system may be mentioned—his high views of man's nature as a spiritual being; his adherence to the Scottish school in maintaining that man has certain intuitive beliefs, such as that which leads us to believe in cause and effect, and personal identity; his skilful separation of the muscular sense from the sense of touch proper; his happy and acute manner of illustrating the succession of our mental states, and the coexistence of different thoughts and emotions; his classification of the relations which the mind can discover, which is worthy of being looked at; his eloquent exposition of the emotions; and the purity of the moral sentiments inculcated by him. Over against these excellencies we have to place certain glaring defects which have been too frequently pointed out to require particular mention.—J. M'C.

\* BROWN, WILLIAM, merchant, Liverpool, was born at Ballymena, county Antrim, Ireland, in 1784, and educated at Catterick in Yorkshire. About the year 1800, his father, Alexander Brown, removed with his family from Ballymena, where he was engaged in the linen trade, to Baltimore, United States, where he began a similar business. At this time, when about sixteen years of age, William Brown, entered his father's counting-house as a clerk, and a few years afterwards he joined his father and elder brother as a partner in their business. In 1809 he returned to Europe for the purpose of opening a branch establishment in Liverpool, where he married soon after, and has ever since resided. No longer confined to the linen trade, but engaged in general commerce, the branch establishment in England, under Mr. Brown's able management, speedily attained a high position, and the house of Brown, Shipley, & Co., has long been recognized as the leading firm in the American trade. Soon after his settlement in Liverpool, Mr. Brown became extensively engaged in banking transactions, which he also managed with much credit and advantage. Active, public-spirited, and liberal in his views, Mr. Brown has ever been most ready to lend his assistance to every enterprise calculated either to develop industry, or to extend commerce; while his purse has always been open where money could be judiciously applied, either in mitigating the sufferings or extending the privileges of his fellows.

In 1825 Mr. Brown took an active share in the reform of the dock estate, a question of vital importance to the town and trade of Liverpool. An earnest and intelligent free trader, Mr. Brown was elected to represent the southern division of Lancashire in that interest in 1845, and he has ever since retained his seat unopposed by any party. With nothing imposing in his manner, and with no pretensions to oratorical talent, the vast mercantile experience and eminent sagacity which recommended him as friend and adviser on commercial affairs to two of the most remarkable statesmen of his time, Huskisson and Peel, secure for Mr. Brown's opinion, on all practical questions, the highest consideration of the house of commons. His parliamentary career has been chiefly distinguished by his zealous advocacy of a system of decimal money, weights, and measures. He moved for and became chairman of a committee on decimal coinage, which issued a conclusive report on that subject in 1853, a report which must, ere long, produce its due effect.—Mr. Brown's charities have been numerous and munificent, but that by which his name will be chiefly remembered, is the gift of a building for a free library and museum for the town and people of Liverpool. This noble building, it is estimated, will cost Mr. Brown not less than from £50,000 to £60,000; a gift truly worthy of a merchant prince. Mr. Brown is now the senior partner of the firm of Brown, Shipley, & Co., Liverpool; member of parliament and deputy-lieutenant for the county of Lancashire, magistrate for the same county, and also for the borough of Liverpool.—W. N.

BROWNE, ALEXANDER, an English surgeon and botanist, lived in the seventeenth century, after whom a genus, *Brownia*, was named by Linnæus.—J. H. B.

BROWNE, EDWARD, M.D., son of Sir Thomas Browne, born at Norwich in 1644, entered Trinity college, Cambridge, in 1663, and graduated in medicine at Oxford in 1667. In 1668 he visited Germany, and in the following year made an excursion into Austria, Hungary, and Thessaly. He afterwards spent some time in Italy, and published his travels, which are often referred to for his accounts of mines and metallurgy. The life of Themistocles and that of Sersorius were translated by him, and published in the book known by the name of Dryden's Plutarch. He was physician to Charles II., and was with him at his death. He attended Rochester in his last illness. In 1705 he was chosen president of the College of Physicians. He died in 1708. King Charles said of him—"He was as learned as any of the college, and as well bred as any of the court."—J. A., D.

BROWNE, GEORGE, count de, an Irish soldier of fortune, was born on 15th June, 1698. He entered the service of the elector palatine, from which, in 1730, he passed into that of Russia. Here he rapidly advanced, and was engaged against the Poles, the French, and the Turks. His life was one of adventure. He was taken prisoner and sold thrice as a slave. On obtaining his liberty he returned to St. Petersburg, and was promoted to the rank of major-general, and afterwards to that of field-marshal under Peter III. The government of Livonia was next given him, which he held till his death in 1792.

BROWNE, ROBERT, from whom the separatists, or early English independents, were for some time called Brownists, born in 1549, was the son of Anthony Browne of Toleshorpe in the county of Rutland. He was educated at Cambridge, and whilst yet a young man became head master of the free school, St. Olave's, Southwark, and chaplain to the duke of Norfolk. Having embraced puritanic views, he was, along with several other leading puritans, cited to appear in June, 1571, before the archbishop of Canterbury (Parker) to answer for his opinions; and though his patron, the duke of Norfolk, and his family connections, saved him for this time, the archbishop gave the duke to understand that his influence would not always avail for such a purpose. Subsequently Browne relinquished the middle views of the puritans for those of the separatists. We have his own authority, as reported by Fuller, for stating, that "for preaching against bishops and their courts, the ordaining of priests and the ceremonies, he had been committed to thirty-two prisons, in some of which he could not see his hand at noon." In 1580 we find him at Norwich preaching to a Dutch congregation in that city; but shortly after he found it prudent to pass over to Holland, where he and several who accompanied him settled at Middleburg in Zealand. Whilst here he wrote his work on "The Life and Manners of True Christians," in which he advances statements wherein the ecclesiastical

opinions of presbyterians and independents are somewhat rudely mixed. In 1584 he visited Scotland, landing at Dundee, and proceeding thence to St. Andrews, where he was received by Andrew Melville, who gave him letters of recommendation to ministers in Edinburgh. Here, as usual, he began to attack the opinions and usages of those around him; and having, "after an arrogant manner," offered to set "the session of the kirk of Edinburgh" right on some points of doctrine and practice, these worthies soon taught him they were not men to be trifled with or attacked with impunity, and "he was committed to waird a night or two till his opinions were tried." His views having, for some reason, found favour at the Scottish court, he received protection from the king and returned to England, but not before he had to some extent disseminated his opinions; or, as James afterwards expressed it, "sown his popple" among the people. On his return to England he was again exposed to the persecution of the prelates, and again experienced the benefit of having "a loving friend and cousin," who "pitied the poor man," in the great Burghley. He was allowed to retire for some time to his father's house at Tolethorpe, where every means were used by his father and others to bring him to a reconciliation with the church. For some time these failed, but at last, in some undiscovered way, the heresiarch was induced to forsake, at least outwardly, his peculiar views, and to accept of the wealthy living of Achurch, near Oundle, in Northamptonshire. From this time he was silent; he never officiated at Achurch, but contented himself with consuming his tithes as the price of conformity. He died, it is said, in prison in 1630. His private life in later years seems not to have been without reproach. He beat his wife, Pagit tells us, and when reproved for it, said "that he did not beat her as his wife, but as a curst old woman."—W. L. A.

**BROWNE, SIMON**, a man of extraordinary parts and learning, but even more remarkable on account of a strange frenzy, which clouded the greater part of his life—was born at Shepton-Mallet in Somersetshire in 1680, and died in 1732. He was educated for the dissenting ministry; and, after labouring for some years at Portsmouth, accepted the charge of the congregation of protestant dissenters in the Old Jewry, London. This was in the year 1716. Seven years afterwards, in consequence, it is supposed, of severe domestic affliction, he fell into a profound melancholy; resigned his ministerial functions; and in the strange belief that the Almighty had, "by a singular instance of his divine power, annihilated in him the thinking substance, and utterly divested him of consciousness;" retired to his native place to pass the rest of his days in the obscurity that befitted what he deemed his sad condition. A more singular frenzy is not on record, for, after it took possession of him, he wrote several works in which his talents and learning appear to greater advantage than in any he had formerly published. It was, during the last two years of his life, that he published "A Fit Rebuke to a Ludicrous Infidel," &c. (Woolston); and a "Defence of the Religion of Nature," &c., against Tindal's Christianity as Old as the Creation.—J. S., G.

**BROWNE, THOMAS**, a learned English divine, born in the county of Middlesex in 1604, graduated at Christ Church in 1627, and became domestic chaplain to Archbishop Laud. On the breaking out of the rebellion he was canon of Windsor, and held the rectories of St. Mary Aldermary, London, and Oddington, Oxfordshire. Having been deprived of these benefices, he followed the fortunes of the king, to whom he became chaplain at Oxford. He afterwards fled to the continent, and found an asylum with Mary, princess of Orange, who appointed him her chaplain. After the Restoration he was restored to his preferments. Died in 1673.—J. S., G.

**BROWNE, SIR THOMAS**, an English physician and author, was born in London, October 19, 1605. On leaving the university of Oxford he practised physic during a brief period, and then travelled through Ireland, France, Italy, and Holland, taking his degree of M.D. at Leyden. Returning to England, he settled as physician at Shipden Hall, near Halifax, but soon removed to Norwich, where he gained considerable professional eminence. In 1642 he published the "Religio Medici," a work which at once bestowed upon his quiet unostentatious life a European fame. The remarkable character of the book was at once perceived. It provoked numerous discussions, and was very greedily translated into Latin, Dutch, and German. The "Religio Medici," indeed, held up to the age, in the mirror of a personal character, some of the great

general tendencies of its speculative thought. It revealed a mind which had learned to investigate everything, but had not abandoned the calm repose of unquestioning reliance upon the wisdom of the past—which delighted in antiquity, but did not therefore refuse to behold the achievements of the hour—which revelled in glorious imaginings, but apprehended the worth of a fact—and which, therefore, was capable of receiving simultaneously (although not capable of welding into a perfectly symmetrical whole) the most divergent principles of philosophical thought. Hence did it happen that the "Religio Medici" was condemned in the most contradictory directions. By one translator its author was pronounced a catholic at heart, who would openly declare himself did he not fear persecution; but at Rome it was actually placed in the Index Expurgatorius; while in England, some accepted it as protestant, others denounced it as atheistical, and one member of the Society of Friends entertained strong hopes of Dr. Browne's conversion to his own opinions! The nobler students of the age deeply sympathized with the many-sided character of the work, and the cause of its condemnation was the seal of its popularity. Men could repudiate no longer the Baconian method of investigation; and yet they feared to lose the rich glories of the faery land of their scientific childhood. They discerned the birth of a hard, matter-of-fact spirit, capable of acknowledging only the visible and the tangible, and dreaded lest the young child, grown into a giant, should strangle their heavenly faith; and, therefore, they rejoiced in a mind like that manifested in the "Religio Medici," which seemed to them to gather up within itself the highest glories alike of the past and the present. Moreover, the "Religio Medici" appeared in that distracted year when civil war broke out in England, and its calm and meditative beauty furnished to troubled hearts a retreat, where for a moment they could renew their inward peace. While sometimes fantastic in expression, it often rises into the noblest poetry; and when we read "that this world is but a picture of the invisible," and that "there is a general beauty in the works of God, and, therefore, no deformity in any kind or species of creature whatever," we recognize the special principles of that modern poetical development of which Wordsworth is the great representative. In 1646 Sir Thomas Browne published the "Pseudodoxia Epidemica; or Inquiries into Vulgar and Common Errors." The errors inquired into are strange enough to modern ears, and many admitted facts have been proved sufficiently baseless; but, nevertheless, the influence of this great work on scientific progress must not be lightly judged. The age needed not simply teachers who could destroy accredited absurdities with withering scorn, but also teachers possessed of sufficient poetical sympathy with the faith of the multitude, not to give it too wide a shock; of sufficient gentleness to condescend to notice small arguments and petty objections; and of sufficient enlightenment to inculcate a true method of research even when the actual error was left unanswered. Among scientific teachers thus adapted to their age, Sir Thomas Browne holds a high place. He takes an interest in everything, and the truth or falsehood of the smallest matters is of eager importance to him. He does abounding justice to the grossest absurdities, inventing in their defence every possible plea ingenuity can devise, and troubling himself to give a solemn answer to it. In this respect his own personal character is strongly manifested. He is by nature far more inclined to believe than to doubt, and only parts with an absurdity after keeping it in his mind so long as he can give it decent entertainment, and finally conducting it to the door with due ceremony, and giving it a polite bow on its departure. Even when we examine his own particular delusions, we can discern that they are but shadows cast by the very light of the truth he held. He had, for example, a firm belief in witchcraft, and gave evidence at Bury St. Edmund's, which assisted in procuring the condemnation of two unfortunate victims. The secret of his belief in witchcraft and kindred matters, however, was not so much his want of scientific accuracy, as his faith in the wide range of spiritual agencies. To him the outward world was something more than an aggregate of material atoms—it was sustained and pervaded by the powers of a world invisible. He was a philosopher, who, by study of the tangible and definite, gained but deeper faith in the intangible and infinite.—In 1658 Browne published his "Hydriotaphia; or a Discourse of the Sepulchral Urns lately found in Norfolk," a work treating, with abundant learning, on the funeral ceremonies of various

nations, and containing high and noble thoughts concerning death, oblivion, and immortality. A speculator of rich, infinite ingenuity, constantly striving to penetrate the dark land surrounding the realm of mortal light, could not but have a vein of melancholy in his composition, which gave calm solemnity to his learning; while his meditative and oftentimes humorous imagination, touched this sadness with the light of an ideal beauty. About the same time appeared the "Garden of Cyrus, or Quincunxial Lozenge," in which profound learning is strangely blended with whimsical fancy. Browne published no other works during his lifetime, but, upon his death, many papers designed for the press were found and given to the world, the most important among which is a "Treatise on Christian Morals," to which Dr. Johnson prefixed a life of the author. A complete edition of Browne's works was published at London, 1836 (Pickering), by Simon Wilkin. During the course of the literary history we have sketched, Browne pursued his professional avocations with great success, while his inexhaustible curiosity accumulated that minute information which his poetic imagination idealized for its own delight. Among his friends he numbered Evelyn and Sir William Dugdale, as well as Sir Kenelm Digby, and certain alchemists; thus combining in his friendships those who could satisfy both his delight in strictly scientific pursuits, and his love for fantastic speculation, and thereby representing in his own single life the varied tendencies of a transition age. In 1664 the Royal College of Physicians elected him a member, and in 1671 he was knighted by Charles II. He had a large family, and his eldest son, Edward, achieved a considerable medical reputation. His general disposition is described as even and cheerful, not transported with mirth, or dejected with sadness. He was liberal in his charity, modest, and free from loquacity; evidently a man who kept a quiet heart in a troubled time; and beneath the shadow of the sword of civil war, calmly discharged the special duties for which he was constitutionally fitted. He died at Norwich upon the anniversary of his birth, 1682. "I visited him," says the Rev. J. Whitefoot, M.A., the author of the earliest biographical sketch of his friend, "near his end, when he had not strength to hear or speak much; the last words I heard from him were, besides some expressions of dearness, that he did freely submit to the will of God, being without fear."

**BROWNE, ULYSSES MAXIMILIAN**, born at Basle in 1705, the son of an Irish officer in the Austrian service, a colonel of cavalry in the same service. He distinguished himself both by his personal courage and his literary knowledge. He gained a high reputation as a soldier in the war against the Turks, and was ultimately promoted to the rank of field-marshal. He died in 1757, from the effects of his wounds, at the battle of Prague. Browne was accounted one of the greatest soldiers of his day, and especially esteemed by Frederick II.—J. F. W.

**BROWNE, WILLIAM**, an English botanist, was born in 1628, and died in 1678. He published a catalogue of the plants cultivated in the botanic garden of Oxford.—J. H. B.

**BROWNE, WILLIAM LAURENCE**, professor of the law of nature and of nations at Utrecht, and afterwards principal of Marischal college, Aberdeen, born at the former city in 1755. At twelve years of age he was admitted a student of the university of St. Andrews, and, notwithstanding his extreme youth, greatly distinguished himself in his various classes. After studying divinity for a year or two he removed to Utrecht, where he became minister of the English church. While in this living he wrote "An Essay on the Origin of Evil," and "An Essay on the Natural Equality of Men," &c. In 1793 he was appointed to the chair of moral philosophy and ecclesiastical history in the university. He returned to Scotland in 1795. The chair of divinity in the university of Aberdeen being vacant in that year, Dr. Browne was appointed to it, and shortly after named principal of Marischal college. Died in 1830. His principal works are—"An Essay on the Existence of the Supreme Creator," which obtained Burnet's first prize of £1250, the second being awarded to Dr. Sumner, archbishop of Canterbury, and "A Comparative View of Christianity," &c., 1826.—J. S., G.

**BROWNING, ELIZABETH BARRETT**, a poetess and wife of a poet, was born in 1809 at Hoop End, near Ledbury, Herefordshire, the country seat of her father, an opulent West India merchant. She participated in the classical education given to her brothers by a very able tutor, and at the age of fourteen wrote her first published poem, "The Battle of Marathon," a few

copies of which were printed for private circulation. Proofs of rare reading and reflection abound in her first volume of verse, published in 1826, "An Essay on Mind, and other poems." Her next literary enterprise was a daring one—a version of one of the greatest and most difficult masterpieces of classical antiquity. In 1833 appeared, still anonymously, "Prometheus Bound, translated from the Greek of Æschylus, and miscellaneous poems." This spirited translation Mrs. Browning afterwards entirely recast. In the interval between the publication of this and of her next volume of verse—"The Seraphim, and other poems," London, 1838—Mrs. Browning contributed occasionally to various periodicals, notably, the *New Monthly Magazine* and the *Athenæum*; in the latter there appeared from her pen a very remarkable series of papers on the "Greek Christian Poets." About the time of the publication of "The Seraphim," a melancholy incident occurred, which all but irretrievably shattered the constitution, naturally delicate, of the poetess. She had broken a blood-vessel in her lungs, but happily no symptoms of consumption supervened. Repairing on the approach of winter to Torquay, she was accompanied by her eldest brother, to whom she was devotedly attached. In a boating excursion, he and some young friends were drowned; nor could even their bodies be recovered. The event was nearly fatal to Mrs. Browning, and it cast a funereal pall over her mind and heart. "During that whole winter," as she herself described it, "the sounds of the waves rang in my ears like the moans of the dying." When eventually removed to London and her father's house in Wimpole Street, she entered upon a life, which continued for many years, of invalid imprisonment and inaction. She never stirred from her room, to which only a few favoured friends and relatives were admitted. It was during six or seven years of this existence that she composed or completed the most striking of those poems, published in two volumes in 1844, which first procured her decided recognition as a poetess of genius, and one of which, it is said, "Lady Geraldine's Courtship," was the means of introducing her to her future husband. Her marriage with Mr. Browning (see the following article) occurred in 1847. With marriage came Mrs. Browning's welcome restoration to comparative health and activity. The poet-pair took up their residence in Italy, whence Mrs. Browning issued in 1851 her poem "Casa Guidi Windows," Italian in scenery and sentiment. Her latest poem, "Aurora Leigh," published in 1856, received the honour of a second edition, with a rapidity which proved the wide circle of her readers. The poetess had one child. She died on the 29th of June, 1861.—F. E.

\* **BROWNING, ROBERT**, the poet, and husband of the poetess the subject of the preceding memoir, was born at Camberwell in 1812. His father occupied a high position in the bank of England, and the poet himself has never followed any profession. Noted during youth and early manhood for intellectual promise and a passionate devotion to music, Mr. Browning made his debut in literature by the publication in 1835 of "Paracelsus," perhaps the most generally attractive of all his works, a poem, dramatic in its form, and full of solemn and beautiful musings on human life and the destiny of genius. His next attempt was "Strafford; a historical tragedy," performed at Covent Garden on the 1st of May, 1837. Its author himself rightly said of it, that it exhibited "action in character" rather than "character in action;" and although Macready played Strafford; Vandenhoff, Pym; and Helen Faucit, Lady Carlisle; it was unsuccessful. In 1840 appeared "Sordello;" in 1842 began the publication of "Bells and Pomegranates," a series of dramas and dramatic lyrics; one of the former, "The Blot in the Scutcheon," was brought out at Drury-Lane in 1843, but proved, like "Strafford," a failure. In 1849, two years after his marriage to Miss Barrett, as mentioned in the preceding memoir, Mr. Browning issued a collective edition of his poems and other pieces, with the omission of "Sordello." In 1850 appeared "Christmas Eve and Easter Day," remarkable for its religious significance. In 1852 he furnished an introduction to the spurious letters of P. B. Shelley, which appeared under the auspices of his publisher, the late Mr. Moxon. With "Men and Women," two volumes of minor poems published in 1855, we complete the catalogue of Mr. Browning's avowed writings. Studiedly obscure, as well as odd in expression, Mr. Browning's poems have still to meet with the appreciation which the real genius displayed in them merits.—F. E.

**BROWNRIG or BROWNRIE, RALPH**, bishop of Exeter, born

at Ipswich in 1592. He became successively scholar and fellow of Pembroke hall, Cambridge. Dr. Felton, bishop of Ely, gave him the rectory of Barley, and in 1621 a prebend in the church of that town. Afterwards he was successively appointed to a prebend at Litchfield and to one at Durham, became archdeacon of Coventry in 1631, was for some time master of Catherine hall, Cambridge, and on the translation of Dr. Hall to the bishopric of Norwich, was raised to the see of Exeter. On the breaking out of the rebellion, although related to Pym and other chiefs of the presbyterian party, he was deprived of the revenues of his bishopric, and appears to have retired for some time to the house of a friend in Berkshire. He is represented to have had the boldness to counsel the Protector to restore Charles II. Shortly before his death, which occurred in 1659, he was chosen preacher at the Temple.—J. S., G.

\* BROWNSON, ORESTES A., a vigorous and voluminous American writer upon controverted topics in philosophy, theology, and politics, was born in Vermont about 1808. His works have always commanded attention, and some have been even popular, chiefly on account of his felicitous style, which is as clear, forcible, and precise, as that of William Cobbett, though not so easy and idiomatic. Educated a presbyterian, he has been successively a sceptic, a universalist, a unitarian, an episcopalian, a Newmanite, and an earnest Roman catholic of the ultramontane school. For ten years he was an open and thorough radical and socialist; and now, for ten years more, he has preached and advocated such conservatism and such doctrines respecting society and government as Hobbes or Sir Robert Filmer might have envied. His earliest separate publication, 1836, entitled "New Views of Christian Society and the Church," was written while he was minister of a peculiar congregation at Boston, collected by himself, called the Society for Christian Union and Progress. His next work, "Charles Ellwood, or the Infidel Converted," 1840, is a novel in form, but in fact an autobiography and a philosophical essay. From 1838 to 1842 he published five annual volumes, mostly written by himself, entitled the *Boston Quarterly Review*. Finally, in 1844, he established the periodical which he has continued to the present day, called *Brownson's Quarterly Review*, and which also has been filled, in great part, by the products of his own pen.—F. B.

BRUAT, Admiral, was born at Colmar in 1796, entered the naval school at Brest in 1811, and having obtained a commission in the French navy, rose through all the intermediate grades of his profession until he became rear-admiral in 1846, vice-admiral in 1852, and full admiral in 1855. In 1853 he took command of the French channel squadron, and in the year following became second in command in the Black Sea. On the return to France of Admiral Hamelin, Admiral Bruat succeeded to the entire command, and co-operated very efficiently with Admiral Sir E. (afterwards Lord) Lyons. He died at sea, Nov. 25, 1855.

BRUCE, the name of a famous Scottish family of Norman origin. Robert de Brus or Bruys, came over to England with William the Conqueror, and was rewarded for his services by a grant of land in Yorkshire. Robert, his son, was the companion in arms of David I. of Scotland at the court of Henry I. of England; and when the Scottish prince succeeded to the throne of his ancestors, in accordance with the enlightened policy which made him encourage the settlement of Normans and Saxons in his new dominions, he bestowed the lordship of Annandale upon his early friend, Robert de Brus. The eldest son of the second Robert carried on the English line of the family, while his younger son became the proper founder of the Scottish branch. His great-grandson married Isabel, second daughter of David, earl of Huntingdon, brother of William the Lion; and their eldest son was ROBERT DE BRUCE, the competitor with Baliol for the Scottish throne. (See BALIOL, JOHN.) His son, also named Robert, married in singular and romantic circumstances, a young and beautiful widow, only child of Nigel, earl of Carrick, and Margaret, a daughter of Walter, the High-Steward of Scotland, and thus added largely to the estates and feudal influence of the family. Of this union—

BRUCE, ROBERT, the restorer of Scottish independence, was the first-fruit. He was born on the 21st of March, 1274—the year in which Edward I. of England was crowned. His early years were, in all probability, passed at the castle of Turnberry, the residence of his mother; but his father afterwards placed him at the English court, and he was trained

by Edward himself in the exercises of war and chivalry. After the contest for the Scottish crown was decided in favour of Baliol, the elder Bruce and his son, the earl of Carrick, indignantly refused to do homage to the new monarch. The grandson of the competitor for the throne, then a youth of eighteen, was therefore invested with the family estates in Annandale, and the title of earl of Carrick, and did homage to John Baliol as his lawful sovereign. The elder Bruce died at his castle of Lochmaben in 1295; his son survived till 1304, and on his death the immense English estates of the family were inherited by the earl of Carrick, who had then attained the age of thirty. The career of Bruce had hitherto displayed nothing either of lofty principle or of pure patriotism. In 1296, indeed, he joined Wallace and the few patriotic barons who were in arms for the independence of their country; and in 1299, after Wallace had resigned the regency, he and John Comyn of Badenoch, and Lamberton, bishop of Glasgow, were elected joint-regents of the kingdom. But the attempt to reconcile the rival factions of Bruce and Baliol proved unsuccessful, and some time previous to the battle of Roslin, which was fought in 1302, Bruce made his peace with Edward, and throughout the remainder of the struggle continued faithful to the English party, and appears to have been treated with great confidence by Edward. At this period Bruce, though he had by no means relinquished his pretensions to the Scottish throne, could not urge his claims with any hope of success. Scotland lay completely prostrate under the power of the English monarch, and the patriotic cause seemed utterly ruined. Wallace and his associates were strenuous supporters of the claims of Baliol, and after the submission of that luckless prince, the hopes of his party and friends centered in John Comyn, his nephew, who, by the decision of Edward, had in succession a clear right to the Scottish crown. The families of Bruce and Comyn were, therefore, with the exception of one brief interval, ranged on opposite sides; and the movements of both during the earlier part of the war of independence were regulated rather by a regard to their selfish interests than to the good of the country. At the close of the struggle in 1304, Comyn, who had continued his resistance for some time after Bruce's submission, fell under the deep displeasure of the English king, and was punished by a heavy fine, while Bruce stood high in favour with Edward, and was regarded as the most powerful man in Scotland. His sole reward, however, for his submission to the English monarch was to be employed as a commissioner, along with Wishart, bishop of Glasgow, and Sir John de Mowbray, in framing regulations for the future government of that kingdom which he had hoped to obtain for himself.

Disappointed in his long-cherished expectations, Bruce at this juncture resolved to adopt other measures for the vindication of his own rights, and the restoration of his country's freedom. He now entered, 11th June, 1305, into a secret bond with William de Lamberton, bishop of St. Andrews, by which they bound themselves to make common cause in resisting the enemies of their country. This league was joined by the earl of Strathearn, the bishop of Moray, and various other barons and prelates, and ultimately Bruce revealed the conspiracy to his rival, Comyn, and sought to secure his services in achieving the independence of Scotland. With the view of adjusting their rival claims and combining their strength, Bruce offered to support the title of Comyn to the crown on receiving as the reward of his aid the extensive estates of that noble, or, as an alternative, proposed to make over all his possessions to Comyn, on condition that he would bind himself to support Bruce's claim to the throne. To this last alternative Comyn readily assented, and the contract was secretly and solemnly ratified, each party retaining a copy of the bond. But Comyn, who hated Bruce, resolved to avail himself of this opportunity to ruin his rival, and transmitted to Edward information respecting the conspiracy, together with certain letters which afforded decisive evidence of Bruce's guilt. The earl of Carrick, unsuspecting of danger, was residing at the English court, and without hesitation attended a parliament which Edward at that time convoked. On being shown the bond which Comyn had transmitted, and asked if he knew the seal, he at once denounced the deed as a forgery, and offered to prove this if allowed sufficient time to send for his real seal. Edward, either staggered by Bruce's coolness and air of injured innocence, or desirous to get into his power the other members of his family, acceded to his request, and allowed him to leave the parliament for the purpose of procuring the materials for his

exculpation. But that very night Bruce was warned by his kinsman, the earl of Gloucester, of a design to seize his person, and accompanied by a single attendant, he fled into Scotland. He was still ignorant of the person who had betrayed him, though his suspicions must have been directed towards Comyn; but on his way to the north he met a person whom he recognized as a servant of that baron, and who, on being searched, proved to be the bearer of letters from his master to Edward, urging the immediate imprisonment of his rival. The messenger was immediately slain, and his letters seized. With these documents in his possession, Bruce continued his flight, and after halting for a brief space at Lochmaben, he proceeded to Dumfries, where Comyn, along with the other barons of the district, was in attendance upon the English justiciaries, who, at that time, were holding their sittings in the town. The two rivals met in the church of the Greyfriars, 10th February, 1305-6. A warm altercation took place, in the course of which Bruce reproached his associate for his treachery. "It is a falsehood you utter," retorted Comyn; on which Bruce instantly stabbed him with his dagger on the steps of the high altar; and appalled at his deed, he hurried out of the sanctuary in a state of the greatest excitement. The wounded noble was immediately dispatched by two of Bruce's followers, Lindsay and Kirkpatrick, and his uncle, Sir Robert Comyn, and some of his adherents shared his fate. This atrocious deed cut off all hope of reconciliation with the English king, and Bruce felt that he must either assert at once his right to the crown, or sink into the condition of an outlaw and a fugitive, excommunicated by the church, and a price set upon his head. His decision was speedily taken. Summoning hastily to his assistance the friends and adherents of his family, with a few nobles who were known to be favourable to the cause of Scottish independence, he rode to Scone, and was there solemnly crowned on the 27th of March, 1306. As the regalia of the kingdom had been carried off by Edward, a small circlet of gold, probably borrowed from the brow of some virgin or martyr, was substituted for the royal crown, and the coronation robes were supplied from his own wardrobe by Wishart, bishop of Glasgow. Two days later, Isabella, countess of Buchan, and sister of Duncan, earl of Fife, appeared at Scone, and (in the absence of her brother, who with her husband was in the English interest) claimed the hereditary privilege of her family, who since the days of Malcolm Canmore had enjoyed the distinction of placing the Scottish kings on the celebrated Stone of Destiny. Bruce at once complied, and on the 29th of March he was a second time placed upon the throne by the countess, who was afterwards cruelly punished by Edward for her adventurous and patriotic act.

When the news of this insurrection reached the English king, in spite of his age and infirmities, he took immediate measures to avert the dangers which threatened his northern conquests. The earl of Pembroke was appointed guardian of Scotland, and despatched in all haste to his post; and the pope was induced, by the solicitation of Edward, to pronounce sentence of excommunication against Bruce and his adherents; but the Scottish ecclesiastics, who were strenuous defenders of their country's rights, paid no respect to the mandates of the pontiff. Pembroke, on reaching Scotland, took possession of the important town of Perth with a powerful army. Bruce, who had in the meantime been visiting different parts of the country favourable to his interests, appeared before that town, and though his forces were greatly outnumbered by those of his adversary, in the chivalrous spirit of the age he challenged the earl to fight him in the open field. Pembroke having answered that he would meet him on the morrow, Bruce drew off his men, in full reliance on this solemn promise, which, according to the usages of chivalry it was held dishonourable to violate, and encamped in the wood of Methven, about six miles distant from Perth. Pembroke, however, led out his troops that same evening (18th June), and fell upon the Scots, who were completely taken at unawares, one-third of them having been sent out in search of forage. After a desperate resistance, they were ultimately routed with great slaughter, and Bruce, who was thrice unhorsed in the action, with considerable difficulty effected his escape into the wilds of Athol with the small remnant of his force, amounting to about five hundred men. Driven from Athol by the want of provisions, he descended into the low country of Aberdeenshire, where he was joined by his queen and other ladies, determined to share in the dangers and privations of their husbands

and fathers. On the approach of a superior force of the enemy, this small band of fugitives withdrew to the mountains of Breadalbane, where they subsisted for some time on wild berries and the produce of fishing and the chase. Retreating by the head of Loch Tay, they now approached the shire of Argyle, the country of the M'Dougals of Lorn, whose chief was allied by marriage to the Red Comyn, and was eager to avenge his murder. On receiving intelligence of the approach of Bruce and his adherents, this powerful chieftain collected his vassals, and attacked the little band of fugitives in a narrow defile at Dalry, near Teyndrum, in Strathfillan, and after a severe engagement, in which Bruce performed prodigies of valour, compelled them to retreat. This repulse greatly aggravated the difficulties under which the patriots already laboured. The approach of winter rendered it impossible for the ladies any longer to subsist amid those barren wilds, and they were accordingly sent to the castle of Kildrummie in Aberdeenshire, under the escort of the earl of Athol, and of Nigel Bruce, the king's brother. Bruce himself and a few of his adherents, after encountering great difficulties and dangers, found means to pass over to the small island of Raehrin, on the northern coast of Ireland, where he lurked in concealment during the winter of 1306.

In the meantime, ruin fell upon the greater part of his friends and adherents. His queen and daughter were forcibly taken from the sanctuary of St. Duthae at Tain, and committed to close confinement in England. The heroic countess of Buchan, who had placed the king upon the coronation chair, was immured in a cage in one of the outer turrets of the castle of Berwick. One of Bruce's sisters was confined in a similar cage in Roxburgh castle, the other was shut up in a convent. Nigel Bruce, a beautiful and accomplished youth, after a gallant defence, was compelled to surrender the castle of Kildrummie, and being sent in irons to Berwick, was there executed as a traitor. Sir Christopher Seton, the king's brother-in-law, was put to death at Dumfries, and his brother John at Newcastle. The earl of Athol and the brave Sir Simon Fraser, the last friend and companion of Wallace, were executed at London with circumstances of shocking barbarity, as were also many other barons and knights. The bishops of St. Andrews and Glasgow, and the abbot of Scone, were put in irons and conveyed to prison in England. A formal sentence of excommunication was at this time pronounced by the papal legate against the Scottish king and his adherents, and their estates were confiscated and bestowed on different English nobles.

On the approach of spring, Bruce quitted his retreat in Raehrin, and passed over to the isle of Arran. He now meditated an attempt to wrest his ancestral domains in Carriek from the hands of the English, and accordingly effected a landing on the headland beneath Turnberry Castle, which was occupied by a strong garrison, commanded by Lord Percy. Under cover of night he attacked the English troops quartered in careless security in the hamlet of Turnberry, and put most of them to the sword. A rich booty fell into the hands of the assailants, who, after this exploit withdrew to the mountainous parts of the surrounding country. Percy soon after evacuated Turnberry castle and retreated into England. This success was counterbalanced by a grievous disaster which at this juncture befell two of Bruce's brothers, Thomas and Alexander, who had been despatched to Ireland for the purpose of collecting reinforcements in that country. On their return, having landed at Loch Ryan in Galloway with a force of seven hundred men, they were attacked and routed by Macdowall, a powerful chief of that country, who was in the English interest. The two brothers, along with Sir Reginald Crawford, who were all severely wounded, were taken prisoners, and carried to the English king at Carlisle. With his habitual inhumanity, he ordered them to be instantly executed. For some time after this disaster Bruce was in a very critical situation, and on several occasions narrowly escaped being taken prisoner, as he skulked from one hiding-place to another among his native mountains. His enemies hunted him like a beast of prey, and even had the baseness to lay plots for his assassination. From these perils, however, he succeeded in extricating himself by his indomitable courage, and his skill in the use of his weapons; and gaining ground step by step, he at length succeeded in expelling the English from the whole of Ayrshire. In the beginning of May, 1307, his old antagonist, the earl of Pembroke, advanced into this district with a body of three thousand cavalry, and challenged the king to give him battle. Bruce.

though at the head of only six hundred spearmen, agreed to meet him at Loudon hill; and, owing to his admirable dispositions, the English were completely defeated. This conflict, which was a kind of miniature of Bannockburn, may be regarded as the turning-point of Bruce's fortune, for his career from this time to his great crowning victory in 1314, presented an almost unbroken series of successes.

The English monarch was greatly incensed at the reverses which his troops had met with, and though worn out with age and disease, he resolved to march against the Scots, and to inflict signal punishment upon them for their insubordination. He had been detained at Carlisle during the winter by a wasting illness; but now, under the excitement caused by Bruce's successes, he put himself at the head of his army, and proceeded towards Scotland, though he was so weak that he required to be supported in the saddle. But in four days he advanced only six miles, and on the 7th of July he expired at the small village of Burgh-upon-Sands in Cumberland, within sight of that country which, in spite of all his efforts to add it to his dominions, was now on the eve of achieving its independence.

Fortunately for Scotland, Edward II., who now ascended the English throne, had neither the ability nor inclination to carry out the ambitious plans of his predecessor. After spending three weeks at Cunnock in Ayrshire, he made his way back into England, without having performed a single act of importance. He sent the earl of Richmond, however, into Scotland at the head of a formidable army; and Bruce, unable to make head against a force so much superior to his own, prudently retreated to the north of Scotland. In the course of this march he was attacked by a wasting distemper, which Fordun attributes to cold and hunger, and the hardships which he had been subjected to in his contests with the English. While lying at Inverury he was attacked by Comyn, earl of Buchan, and his own nephew, Sir David de Brechin, who having received intelligence of Bruce's situation, made a hasty march towards his encampment, and drove in his outposts, and even slew some of the soldiers who guarded his litter. Enraged at this military affront, as he reckoned it, the king instantly rose from his litter and mounted his horse, and although so weak that he was obliged to be supported in the saddle, he led on his troops in person, and entirely defeated the enemy with great slaughter. The efforts of Bruce were now directed to the capture of the strongholds of his kingdom, by means of which the English were enabled to retain their hold upon the country. His success in these efforts was uniform and steady. The citizens of Aberdeen declared in his favour, stormed the castle which commanded the town, and levelled the fortifications with the ground. The castle of Forfar was next taken by Philip, the forester of Plateau, who put the garrison to the sword. Bruce himself captured the fortresses of Dumfries; Dalswinton, a stronghold of the Comyns; and Butel in Galloway, a seat of the Baliols. The strong castle of Linlithgow was surprised by a brave husbandman named Binnock or Binney. Sir James Douglas captured Roxburgh, one of the most important fortresses in the kingdom; and Randolph, earl of Moray, stimulated by this exploit of his companion in arms, carried the castle of Edinburgh—one of the most desperate adventures, says Barbour, that was ever achieved. While the English garrisons were thus expelled from the country, various districts were, at the same time, recovered out of the hands of those Scottish barons who had embraced the service of the enemy.

The measures of the English king were characterized by weakness and vacillation. No fewer than four expeditions into Scotland were successively undertaken, two of them headed by Edward in person, but without producing any permanent result. Bruce displayed admirable judgment in his mode of resisting these invasions. He cautiously avoided a general engagement, and contented himself with harassing the invaders on their march, cutting off their provisions, driving the flocks and herds into remote fastnesses, and laying waste the country as the enemy advanced. As soon as the scarcity of provisions, or the severity of the weather, compelled the invaders to retrace their steps, the Scots issued from the mountains and woods in which they had lurked, hung on their rear, and cut them off in detail. And, not contented with defending his own dominions, the Scottish king made several incursions into the northern counties of England, which he plundered and ravaged with merciless severity, and led back his army in triumph, laden with spoil. Bruce next made a descent upon the Isle of Man, to which his inveterate

enemies, the Macdowalls, had retreated. He defeated the governor in battle, took the castle of Russin by storm, and subdued the whole island. While the king was absent on this expedition, his brother Edward expelled the English from Galloway and Nithsdale, and demolished the fortresses in these districts. He then made himself master of the castles of Rutherglen and Dundee, and proceeded to lay siege to Stirling castle, almost the only considerable fortress that still remained in the hands of the English. The governor, Sir Philip Mowbray, made a brave defence; but at length, provisions having become scarce, he offered to surrender the fortress if not relieved before the feast of St. John the Baptist—24th June—in the following year. Edward Bruce most imprudently consented to this proposal, all the advantages of which were on the side of the besieged. King Robert expressed the strongest displeasure when the terms of the truce were made known to him. He had every inducement to violate the engagement; and Edward had set him the example by compelling the governor of Dundee, only a few months before, to violate an agreement made under precisely similar circumstances. Bruce himself, in his earlier days, had by no means been distinguished for scrupulous adherence to his engagements. But the stern, though wholesome discipline of adversity, had now purified and strengthened his moral character, and he honourably determined, at all hazards, to abide by the treaty which his brother had made.

So far did the chivalrous generosity of King Robert extend, that he allowed Sir Philip de Mowbray to go in person to London, that he might make known to Edward and his council the terms of the truce which he had entered into with the Scots. The king and his barons at once felt that they could not without dishonour abandon Stirling to its fate, and immense preparations were accordingly made for the relief of the beleaguered fortress. The whole military array of the kingdom was summoned to meet at Berwick on the 11th of June. Auxiliaries were brought from Ireland, and a powerful fleet was equipped for the transportation of provisions and warlike stores for the use of the army. On the appointed day there assembled at the place of rendezvous the most magnificent army that England had ever sent forth, amounting in all to upwards of a hundred thousand men, including fifty thousand archers, and forty thousand cavalry. At the head of this formidable array Edward crossed the border and advanced towards Stirling. King Robert meanwhile had mustered his forces in the Torwood, midway between Stirling and Falkirk. They amounted to little more than thirty thousand, of whom only five hundred were cavalry. But his well-disciplined infantry were armed with long spears, and carefully trained to form in line, or squares, or circles, as the nature of the ground or of the fight might require; and he had the sagacity to perceive, what was satisfactorily proved at Bannockburn, as well as at Waterloo, that such a body was capable of offering an effective resistance to the charge of the best-equipped cavalry, though greatly superior in numbers. The place which he selected for the field of action was about two miles from Stirling, and was admirably adapted to the number and character of his troops. It was protected on either flank by defences, partly natural, partly artificial, and was so narrow in front as, in a great measure, to deprive the enemy of their immense superiority in numbers. The Scottish line of battle faced the south-east, from which direction the English were approaching. The right wing was protected by the steep and rugged banks of the rivulet called Bannockburn, and by a dangerous morass. The left, which extended to the village of St. Ninians, and was the most vulnerable part of Bruce's position, was defended against the assaults of cavalry by rows of pits about three feet deep with sharp stakes fixed in them, and covered with brushwood and green sods. The right wing was commanded by Edward Bruce, the centre by Thomas Randolph, earl of Moray, and the left wing by Douglas and the young Steward of Scotland. The king himself commanded the reserve, which was composed of his own vassals of Carriek, and of the men of Argyle, Cantire, and the isles. The camp-followers were stationed with the baggage behind an eminence in the rear, still called the Gillies' (*i. e.* the Servants') hill.

On the morning of June 23rd, the Scottish army heard mass, and made their shrift "full devoutly," says Barbour, like men who were resolved to free their country or to die in the field. King Robert then proceeded to arrange his men under their different banners, and to assign to them their proper positions;

and their arrangements were scarcely completed when the vast host of the enemy was descried covering the whole country far and wide, and forming a magnificent spectacle of martial pomp and splendour. On approaching Stirling, the English king detached Sir Robert Clifford with a chosen body of eight hundred horse, directing them to make a circuit round the left flank of the Scottish army, and to throw himself into the beleaguered fortress. But this movement did not escape the eagle eye of Bruce; and Randolph, whom he had enjoined to be vigilant in preventing any such attempt, hastened with five hundred spearmen to intercept the succours before they could reach the castle. After a brief but stubborn conflict the English were completely routed, and fled in disorder to the main body of the army.

While this affair was undecided, the English vanguard came within sight of the Scottish army. King Robert was, at the moment, riding along the front of his line marshalling the ranks of his host. He was mounted on a small palfrey, but was clad in complete armour, and carried a battle-axe in his hand. He was easily recognized, both by his position, and by a golden coronet which he wore on his helmet. Sir Henry de Bohun, "a wycht knight and a hardy," who rode in front of the English vanguard, armed at all points and mounted on a strong war-horse, perceiving Bruce thus engaged, couched his lance, and spurring his charger rode furiously against the king with the evident expectation that he would easily bear him to the earth, and end the war at a single blow. The contest was most unequal, but, to the surprise of the spectators, Bruce calmly awaited the onset. Just as they were about to close, however, he suddenly turned his palfrey to one side, so that de Bohun missed his aim, and, as he passed in his rapid career, Bruce, rising in his stirrups, with one blow of his battle-axe dashed helmet and head to pieces, and laid his assailant dead at his feet. The English vanguard, intimidated by the result of this personal encounter, retreated in confusion, and were pursued for some distance by the Scottish spearmen. After a spirit-stirring address from the king to his assembled generals, they repaired to their respective positions, and the troops passed the night in arms upon the field.

Early next morning—Monday, 24th June—the Scottish army heard mass, which was performed by the abbot of Inchaffray upon an eminence in front of their line. They then took breakfast and arranged themselves in their appointed divisions. The vanguard of the English, under the command of the earls of Gloucester and Hereford, now drew near. The king himself brought up the main body, consisting of nine divisions, but compressed by the narrowness of the ground into one immense column. At this moment the abbot of Inchaffray, bareheaded and barefooted, walked along the Scottish line, and holding up a crucifix exhorted the soldiers to fight bravely for their rights and liberties. As he passed the whole army knelt down, and "made a short prayer to God to help them in their fight." "See!" cried Edward, "they are kneeling to ask mercy." "They do," replied Sir Ingram de Umfraville, who rode beside him; "but it is from God, not from you. Trust me, yon men will win or die." "Be it so," said the king, and immediately commanded the charge to be sounded. The English van advanced at full gallop on the right wing of the Scots, commanded by Edward Bruce, but was unable to produce any serious impression on the serried ranks of the Scottish spearmen. The centre and left wing of the Scots were soon after led up, so that the battle became general along the whole line. The English cavalry attempted, like the French cuirassiers at Waterloo, by repeated and desperate charges, to break through the phalanx of the Scottish infantry, but were repulsed with great slaughter in every attack. The English archers, however, began to do considerable execution on the close ranks of the spearmen, but were taken in flank and completely routed by Sir Robert Keith, marshal of Scotland, at the head of five hundred horsemen, whom Bruce had kept in reserve for that purpose. The battle continued to rage with great fury, but King Robert, perceiving that the English were becoming exhausted and dispirited, brought up his reserve, and pressed with redoubled vigour upon the wavering ranks of the enemy. At this critical period, the attendants on the Scottish camp, whether acting on the impulse of the moment or from previous orders it is impossible to say, suddenly appeared on the Gillies'-hill, in the view of the army; and having hastily laid hold of such arms as were at hand, and fastened

blankets and sheets upon tent poles for banners, presented the appearance of a new army advancing to the assistance of the Scots. The English, dismayed at this unexpected sight, began to give way, and King Robert, seizing the favourable moment, shouted his war-cry, and made a furious assault on the main body of the enemy, by which they were completely broken. This well-timed charge decided the fate of the day. The English fled in all directions, and were pursued with immense slaughter. Thirty thousand were left dead upon the field, among whom were twenty-seven barons, two hundred knights, and seven hundred esquires. Twenty-two barons and baronets, and sixty knights, with an immense quantity of spoil, fell into the hands of the victors, and, according to the monk of Malmesbury, "the chariots, waggons, and wheeled carriages, which were loaded with the baggage and military stores, would, if drawn up in a line, have extended for twenty leagues." The English king himself escaped with difficulty from this fatal field, and after a continuous flight of sixty miles, during which he was closely pursued by Douglas, he at length found refuge in the castle of Dunbar, from which he escaped in a fishing skiff to Bamborough castle.

Such was the memorable battle of Bannockburn, which, both in its immediate consequences and its more remote effects, must be regarded as one of the most important events in the history of Scotland. It virtually secured at once the freedom and independence of the country. It showed the English monarchs the hopelessness of their iniquitous attempts to reduce it permanently to the condition of a conquered province, and taught the Scottish people never to regard their cause as desperate even in the last extremity. There cannot be a doubt that they were greatly encouraged during their subsequent struggles for civil and religious liberty by the recollection of the victory of Bannockburn, and that the proud position which Scotland now occupies is in no small degree owing to the great deliverance achieved by King Robert and his gallant compatriots.

Deeply as Bruce had been injured by the English, he made no attempt to retaliate upon the prisoners who had fallen into his hands. He treated them with so much courtesy and humanity that, according to the testimony of an English historian, he "wonderfully changed the hearts of many of the English from enmity to admiration and esteem." So far was his success at Bannockburn from rendering him presumptuous, that he immediately followed it up with a proposal for peace. Commissioners were appointed for that purpose, but as the English refused to abandon their claims to feudal superiority over Scotland, the negotiations at once fell to the ground. The war was instantly resumed, and was continued for fourteen years, with almost uninterrupted success on the part of the Scots. During this interval England was twelve times invaded by them, and frequently wasted as far as the gates of York. The northern provinces abandoned to their fate, in consequence of the fickleness and incapacity of the English king and the fierce factions among his nobles, were compelled to purchase exemption from plunder by the payment of a heavy tribute, and many of the inhabitants even tendered their allegiance to King Robert, that they might escape from ruin and captivity. On the 26th of April, 1315, the Scottish parliament, in a meeting held at Ayr, solemnly ratified an act of settlement, regulating the succession of the crown. It was determined, with the consent of Marjory, his only child, that if King Robert should die without male issue his brother Edward should ascend the throne, and that failing Edward and his heirs male, Marjory and her heirs should be next in succession. This important arrangement, equally wise and patriotic on the part of Bruce, was speedily followed by the marriage of Marjory with Walter the hereditary High-Steward of Scotland. From this auspicious union sprung a race of sovereigns, under whom the two kingdoms were at length happily united, and their descendant wears at this moment the British crown.

About this period, a party of Irish chiefs, eager to throw off the oppressive yoke of England, sent messages to Bruce, imploring his aid in the attempt to expel their oppressors, and offering in return to bestow the crown of Ireland on his brother Edward. Though the chances of success must have seemed both remote and doubtful, the king ultimately complied, and within a month after the passing of the act of settlement, Edward Bruce embarked for Ireland with six thousand soldiers, and landed near Carrickfergus on the 25th of May, 1315.

After a series of brilliant victories over the English settlers and their partisans, he was crowned king of Ireland on the 2nd of May, 1316. Repeated reinforcements were sent over from Scotland, and at length the king resolved to go in person to the aid of his brother. Their united forces overran a great part of Ireland, and inflicted several severe defeats upon the English, but without gaining any permanent footing in the country. King Robert was soon obliged to return to his own dominions; and after his departure his brother Edward for some time maintained a precarious authority in Ulster; but at length, having rashly encountered, near Dundalk, an Anglo-Irish army ten times more numerous than his own, he was defeated and slain.

During the absence of the Scottish king in Ireland, various attempts were made by the English to disturb the tranquillity of his dominions; but their incursions were as often repelled by the activity and courage of the Steward and Douglas, to whom Robert had intrusted the government of the country. The pope, too (John XXII., a man alike venal and servile), favoured the English side, and was induced by a large bribe to issue a bull commanding a two years' truce between England and Scotland. But as the pontiff withheld from Bruce the title of king, the Scottish monarch refused to receive the papal letters, or to admit the legates to an interview; and when the truce was proclaimed by their messengers, he refused to pay any regard to it. Meanwhile, the death of Edward Bruce, and of the Princess Marjory, who expired immediately after giving birth to a son, March 2nd, 1316, having rendered some new regulations necessary regarding the succession to the crown, a parliament was held at Scone on December, 1318, in which Robert, the infant son of the Princess Marjory, was recognized as heir to the throne, in the event of the king's death without male issue. On the 28th of March, 1318, the important town of Berwick, the key of the eastern marches, fell into the hands of the Scots; and Robert, well aware of the vast importance of this acquisition, strengthened the fortifications of the place, caused it to be victualled and strongly garrisoned, and committed the keeping of it to his gallant son-in-law, the Steward. In the summer of the following year, King Edward, at the head of a formidable army, made a vigorous but unsuccessful effort to recover the town. With the view of compelling the besiegers to abandon the siege, Bruce sent Randolph and Douglas, at the head of fifteen thousand men, to invade England. Advancing into Yorkshire, they encountered at Mitton a numerous but undisciplined force under the archbishop of York and the bishop of Ely, and defeated them with great slaughter. The news of this disaster caused the English to raise the siege of Berwick, and in December following a truce for two years was concluded between the kingdoms. Strange to say, this was the moment selected by Edward's old ally the pope to renew the sentence of excommunication against the Scottish king and his adherents; and, apparently provoked at the contempt with which his former censures had been treated, he commanded the archbishop of York and the bishops of London and Carlisle to repeat the ceremony on every Sabbath and festival day throughout the year. This unfair exercise of authority excited great indignation among the people of Scotland; and in a parliament held at Aberbrothock on the 6th of April, 1320, the barons and freeholders of the realm, in the name of the whole community of Scotland, addressed a spirited memorial to the pope in vindication of themselves and their sovereign, which, together with the representations of two ambassadors, whom Bruce shortly after sent to the papal court, had such an effect upon the mind of the pontiff, that he was induced to suspend for some time the publication of the sentence of excommunication, and earnestly to recommend the English king to conclude peace with Scotland. Commissioners on both sides were accordingly appointed for this purpose, and a meeting took place at Carlisle with the view of negotiating the terms of peace, but it led to no satisfactory result. About this period a formidable conspiracy against the life of King Robert was brought to light by the confession of the countess of Strathearn, who had been made privy to the plot. William de Soulis, hereditary butler of Scotland, and grandson of one of the competitors for the crown, and David de Brechin, the king's nephew, both of whom were in the pay of the English monarch, were the ringleaders of this conspiracy, which seems to have had for its object the death of the king, and the elevation of de Soulis to the throne. The conspirators were brought to trial before the parliament in August, 1320, and de Brechin and

three of his accomplices were condemned to death and executed, while de Soulis and the countess of Strathearn were punished by perpetual imprisonment. Strange to say, in spite of the atrocity of their crime, the punishment of these traitors excited strong dissatisfaction in the community, and the parliament by which they were condemned was long remembered in Scotland by the name of the Black Parliament.

Shortly after this, Edward resolved to undertake another invasion of Scotland, and wrote to the pope, informing him that he was about to establish a peace by force of arms. Before his preparations could be completed, however, the Scots twice invaded the northern provinces of England, and after laying waste the country, returned home laden with spoil. The expedition which Edward undertook against Scotland, at the head of a hundred thousand men, proved utterly abortive; all the cattle and provisions, and every article of value, were carefully removed by the inhabitants to places of safety, and the invaders found themselves traversing a silent desert. They penetrated as far as Edinburgh without having seen an enemy; many of the soldiers perished from famine; and, in order to save his army from destruction, Edward found it necessary to retrace his steps with all haste, grievously harassed by Randolph and Douglas, who hung on the rear of the retreating army, and cut off their stragglers. Bruce immediately retaliated, by leading his forces into the north of England, and by a forced march penetrated into Yorkshire, and suddenly attacked the remains of the English army, which lay encamped at Biland abbey, near Malton. Although they were drawn up in a position of great strength, the masterly dispositions of Bruce speedily determined the victory in his favour. Edward with difficulty escaped to York, leaving an immense booty and many prisoners in the hands of the Scots, who, after plundering and devastating the whole country north of the Humber, returned in safety to their own country. These successive disasters, together with the divided state of his kingdom, and the treachery of many of his nobles, made the English king anxious for peace; and soon after, a thirteen years' truce was concluded by the mediation of Henry de Sully, grand butler of France, who had been taken prisoner at the battle of Biland. Soon after, the pope was induced, by the dexterous management of Randolph, to address a bull to Bruce, with the title of king. At this period, too, a son was born to Robert—5th March, 1323—who afterwards succeeded his father under the title of David II. But the national joy at this event was speedily overclouded by the untimely death of the king's son-in-law, the High-Steward of Scotland, which caused deep and universal lamentation.

In the year following this event, 1327, the weak and unfortunate Edward II. was deposed and murdered, and his son, Edward III., a youth of fourteen, was called to the throne. The council of regency, who carried on the government during the minority of the king, roused the indignation of Bruce by repeated instances of bad faith, and at length both sides prepared for war. The young king assembled a magnificent host at York for the invasion of Scotland; but before he could put his forces in motion the Scottish army crossed the border, and laid waste the northern counties with fire and sword. Edward pursued the invaders for several weeks, tracing their march by the desolation which they spread on all sides, but without success. (See DOUGLAS, SIR JAMES.) At length the Scots regained their own country in safety, laden with the plunder which they had collected during their successful inroad. The English were now at length convinced that all attempts to conquer Scotland must prove abortive, and the disastrous issue of the recent expedition, the impoverishment of the public exchequer, and the desolated condition of their own country, made them at length sincerely desirous of peace. Commissioners were accordingly sent with full powers to conclude a permanent treaty between the kingdoms. The preliminaries were settled in a parliament held at York on the 1st of March, 1328. It was stipulated that the English king should renounce fully and for ever all claims of dominion and supremacy over Scotland, and that there should be a perpetual peace between the two kingdoms, for the confirmation of which it was agreed that a marriage should take place between David, son and heir of Robert Bruce, and Joanna, sister to the king of England. This treaty was finally concluded at Edinburgh on the 17th of March, 1327, and ratified in a parliament held at Northampton, the 4th of May, 1328.

This termination of the war of independence, which had lasted

for thirty-two years, was not long survived by him to whom, under God, this successful result was chiefly due. Robert, whose constitution had been broken by the fatigues and hardships of his early struggle, began to droop soon after; he saw the independence of his country established on a permanent basis, and was attacked by a "heavy malady," which, in these days, was termed a leprosy. He spent the last two years of his life at Cardross, near Dumbarton; and when his health permitted he appears to have been much occupied in shipbuilding and gardening, in enlarging his rural palace, and especially in sailing on the beautiful estuary of the Clyde. He died at Cardross on the 7th of June, 1329, in the fifty-fifth year of his age. His body was buried in the abbey church of Dunfermline before the high altar. His heart was taken out and embalmed, and delivered to Sir James Douglas, who, in obedience to the dying commands of the king, proceeded to carry it to Jerusalem for the purpose of interring it in the church of the Holy Sepulchre. Douglas, however, was killed at Seville on his journey in an engagement with the Moors—(see DOUGLAS, SIR JAMES)—and his companions brought back the heart of Bruce, which was finally buried in Melrose abbey. At the time of his death all classes, says the venerable Barbour, made "great lamentation over his untimely decease, and strong-bearded men wept full sore," regretting his worthy bounty, his wit, his strength, his bravery, and above all his kindness and courtesy—

"And ages after he was laid in earth.

'The Good King Robert' was the name he bore."

—(Barbour's *Bruce*; Fordun; Rymer's *Fœdera*; M. Malmesbury.)—J. T.

BRUCE, EDWARD, second son of Robert, earl of Carrick, and brother of King Robert Bruce, was distinguished for his indomitable courage, which, however, often degenerated into recklessness; but was deficient in the judgment and prudence necessary to constitute a great commander. His thoughtless impetuosity repeatedly exposed himself and his brother to imminent danger, and he at last lost his life in an engagement with an enemy of vastly superior numbers, whom he insisted on fighting, in opposition to the earnest advice of his principal officers, 5th October, 1318. He was killed by John Maupas, who was himself found lying dead upon the body of his enemy. Notwithstanding the generous conduct of King Robert at the battle of Bannockburn, the English, to their great disgrace, treated the dead body of Edward Bruce with revolting indignity. It was quartered, and exposed in four different places in Ireland as a public spectacle, and the head was carried over by the English general as an acceptable present to King Edward. —(Barbour's *Bruce*.)—J. T.

BRUCE, DAVID, only son of King Robert Bruce, ascended the throne in 1329, when he was little more than five years of age. His reign began amid circumstances highly auspicious, but in no long time the kingdom began to suffer both from intestine treason and foreign aggression. The celebrated Randolph, earl of Moray, the regent, died at this juncture—20th July, 1332—there is reason to believe of poison, administered by the English faction; and his successor, Donald, earl of Mar, nephew to King Robert Bruce, appears to have been utterly unfitted for a situation so arduous and important. This unfortunate appointment had scarcely been made when the kingdom was invaded by Edward Baliol, the son of the dethroned king, assisted by several powerful English nobles, who laid claim to certain estates in Scotland on the ground of lineal succession. The total overthrow of the Scottish army at Dupplin, through the incompetency of the regent—the coronation of Baliol at Scone (see BALIOL, EDWARD)—the invasion of Scotland by Edward III., who now threw off the mask which he had at first worn—the defeat of the Scots with great slaughter at Halidon-hill, and the almost entire submission of the kingdom to the English monarch followed in rapid succession, and it was found necessary, in order to provide for the safety of the young king and his consort, to send them to France, where they were kindly received by Philip VI. The repeated invasions of the English, combined with factious dissensions among the nobles, had reduced the country to great extremity, when, fortunately for the cause of Scottish freedom, Edward laid claim to the crown of France, and declared war against that country, 7th October, 1337. This step proved the salvation of Scotland. In 1341 David, then in his eighteenth year, was recalled from France, and enthusiastically welcomed by all classes of his subjects. Great expectations had

been formed of him; but his headstrong temper, violent passions, and immoderate fondness for pleasure, the result probably of his education at the court of France, rendered him quite unfit for the government of a country like Scotland, and speedily alienated the affections of his people.

The war with England was still carried on with savage ferocity; large tracts of country were left uncultivated, and a terrible famine in consequence broke out, and continued for several years. Pestilence, the natural consequence of famine, followed, and swept away many thousands of the enfeebled inhabitants. A two years' truce was at length concluded, which was to terminate at Martinmas, 1346. It was broken by the Scots, at the instigation of the French king, and David invaded England at the head of a powerful army, plundering and devastating the whole country. Marching through the bishopric of Durham, he encamped at a place called Beaurepair, near the city of Durham, where, on the 17th of October, he was unexpectedly attacked by a formidable army under Percy, Neville, and other northern barons. After an obstinate struggle the Scots were completely routed, with the loss of fifteen thousand men, and the king himself was taken prisoner, along with upwards of fifty barons and knights. This calamitous defeat brought the nation to the very brink of ruin. The High-Steward, however, who was now appointed guardian of the kingdom, exerted himself to maintain the national independence with a courage and prudence worthy of his illustrious descent; and Edward finding the conquest of Scotland as remote as ever, was obliged to conclude a truce with the regent, which was renewed from time to time for six years. Meanwhile negotiations for the liberation of the captive king were repeatedly begun and broken off; but at length they were, in 1357, brought to a successful termination. The ransom finally agreed on was a hundred thousand pounds, equivalent to twelve hundred thousand pounds sterling of modern money. The payment of this enormous sum continued for many years to be an oppressive burden on the resources of the exhausted country, and repeatedly brought it to the brink of insolvency. The last instalment was not paid till the seventh year of Richard II.

David now returned to his kingdom, after a captivity of eleven years, and was enthusiastically welcomed by his subjects. It soon appeared, however, that his character had not been improved by his long residence in England, and his headstrong and selfish behaviour, particularly in attempting to set aside the right of the Steward to the Scottish crown, in favour of Lionel, third son of the English king, completely alienated the affections of his people. Some time after 1363, Joanna, David's consort, died at Hertford castle in England, and the headstrong and imprudent monarch speedily contracted a marriage with Margaret Logie, a young woman of remarkable beauty but inferior birth, a step which gave great offence to his proud nobles, and seems to have caused an open rupture between David and the Steward. Margaret enjoyed her honours, however, only till 1369, when she was divorced by the fickle king. David seems never to have relinquished his base design to barter the independence of his kingdom for paltry and personal advantages; but, in the midst of his nefarious intrigues for this purpose, he was seized with a mortal illness, and died in the castle of Edinburgh, 22nd February, 1370, in the forty-seventh year of his age. This worthless prince presented a marked contrast to his father in everything, except in personal courage, and in his courteous and affable manners. It is a melancholy consideration, it has been justly said, that the death of the only son of Robert Bruce, must have been regarded by his subjects as a national deliverance.—(Wyntown's *Chronicle*; Fordun; Rymer's *Fœdera*; Hailes' *Annals*.)—J. T.

BRUCE, REV. ARCHIBALD, professor of theology to the General Associate Synod, was born near Bannockburn, towards the middle of the last century. He studied at the university of Glasgow, and was ordained at Whitburn in 1769. His principal publications were—"Free Thoughts on the Toleration of Popery;" "A Dissertation on the Supremacy of the Civil Powers in matters of Religion;" "A Translation of Pietet's Discourses, with Memoir of his Life and Writings;" "A Critical Account of Morus, with a Translation of some of his Discourses." Mr. Bruce died suddenly in 1816.—W. B.

BRUCE, JAMES, a celebrated traveller, was born at Kinnaird, in the county of Stirling, December 14, 1730. He was descended on the female side from that noble Norman family of Bruce which in the fourteenth century produced the restorer of Scot-

tish independence—his grandfather, David Hay, a cadet of the Errol family, having married Helen Bruce, the heiress of Kinnaird. Bruce was educated first at Harrow, and afterwards in the university of Edinburgh, where he studied law, in order to prepare himself for the profession of an advocate. He abandoned this pursuit, however, and in 1754 married a Miss Allan, daughter of a deceased wine merchant in London, and at the same time agreed to carry on the business left by her father. The death of his wife a few months after their marriage alienated him from this employment, and he endeavoured to dispel the grief that had settled on his mind by the study of the Spanish and Portuguese languages, and by a lengthened tour through Spain, Portugal, Holland, and Germany.

On the death of his father in 1758, Bruce returned to England to take possession of the family estate, and spent three years in retirement, principally in studying the Arabic language. A project for making a descent upon Spain, which Bruce laid before the elder Pitt, brought him into contact with the government. Lord Halifax, another of the ministers, proposed to him to visit the coast of Barbary, which had as yet been but partially explored, and it was a casual reference made by his lordship to the unknown source of the Nile, which first suggested to the enterprising mind of Bruce that he should attempt "this great discovery," which "for the last two thousand years had been a defiance to all travellers, and an opprobrium to geography."

With the view of affording Bruce a favourable opportunity of exploring the African coast, Lord Halifax conferred on him the office of consul at Algiers. After a preliminary tour in Italy, where he spent several months in exploring the works of art in Rome, Naples, and Florence, Bruce proceeded to Algiers, which he reached on the 15th of March, 1763. He spent two years there in acquiring a thorough knowledge of Arabic, and of the rudiments of surgery. In August, 1765, Bruce quitted Algiers, and entered on his proposed expedition. He spent upwards of a year in the prosecution of his discoveries along the African coast, during which he was exposed to considerable danger and suffering from shipwreck and severe illness. He then proceeded to Asia Minor, where he visited Baalbec and Palmyra, and made careful drawings of these celebrated ruins, which were ultimately presented by him to the royal library at Kew. At length, in June, 1768, he sailed for Alexandria, resolved no longer to delay the execution of his long-cherished design, to explore the sources of the Nile. From Alexandria he proceeded to Cairo, and having obtained a number of recommendatory letters from the bey, whom he had cured of an illness, and from a Greek patriarch, he at length embarked on the Nile, December 12th, 1768, and sailed up the river as far as Syene; then leaving the Nile, he crossed the desert to Cosseir, a fort on the Red Sea, whence he sailed for Jeddah in April, 1769. He remained for several months in Arabia Felix, employing himself in making observations upon the coasts of the Red Sea. On the 3d of September he sailed for Loheia, and on the 19th landed at Masuah, the port of Abyssinia, where he encountered great danger and difficulty, and was detained for two months by the treachery and avarice of the nayib, a governor of that place. It was not till the 15th of November that he was permitted to resume his journey. He endured severe sufferings in crossing the Tarenta mountains, but at length, after a perilous journey of ninety-five days from Masuah, he reached Gondar, the capital of Abyssinia, about the middle of February, 1770. By his medical skill and his graceful manners, Bruce speedily ingratiated himself with the most considerable persons belonging to the court, and was treated with special favour by the king and his chief minister, Ras Michael. Towards the end of October, 1770, he set out upon the last stage of his journey for the sources of the Bahr el Azrek, or Blue Nile, which was then supposed to be the main stream of the Nile—though this honour is now generally assigned to the Bahr el Abiad, or White Nile—and on the 14th of Nov. he succeeded in accomplishing the great object of his ambition. After spending a few days in the neighbourhood of this memorable spot, he retraced his steps to Gondar, which he reached on the 17th of November. Having accomplished his arduous undertaking, Bruce was now anxious to return home; but he found it no easy matter to obtain leave of the king, who was engaged in suppressing an insurrection in his kingdom, and was desirous to secure the assistance of so able an auxiliary. The traveller was therefore obliged, in order to clear his way homewards, to take part in three successive engagements, May, 1771,

between the royal forces and the rebels, and rendered such signal services to the cause of the government, that the king presented him with a massive gold chain, and at length gave him permission to depart. It was not till the 20th of December, thirteen months after his return from the source of the Nile, and two years after he had entered the country, that he was enabled to set out on his homeward journey. In order to avoid coming in contact with the treacherous nayib of Masuah, he resolved to return through the great desert of Nubia, instead of following the more easy and direct road by which he entered Abyssinia. On the 23d of March, after undergoing a series of the most dreadful hardships, he reached Teawa, the capital of Abbara, where he found the sheikh quite as rapacious as the ruler of Masuah; by his intrepidity and presence of mind, however, he completely cowed the petty tyrant, and was allowed to depart unmolested. On the 29th of April he reached Sennaar, the capital of Nubia, where he was detained upwards of four months by the villany of those who had undertaken to supply him with money, and was reduced to such straits that he was obliged to dispose of nearly the whole of his gold chain. At length, on the 5th of September, he was enabled to begin his journey across the great Nubian desert, the most difficult and dangerous part of his route. For twelve weeks he and his party toiled through the desert, enduring the most frightful hardships; their provisions failed, and they were in constant danger of being swallowed up by the moving sands, or robbed and murdered by the roving bands of Arabs. His camels and one of his attendants perished; he was compelled to abandon his instruments and papers, and it was not until after the last remaining meal had been served out to his men, that they reached the town of Assouan, upon the Nile, where their necessities were liberally supplied. After a few days' rest at this place, he rode back into the desert, and recovered his baggage and instruments, among which was a valuable quadrant of three feet radius, presented to him by Louis XV. He then sailed down the Nile to Cairo, which he reached on the 10th of January, 1773, after an absence of four years from civilized society. In March, 1773, he embarked for Marseilles, and on reaching France was received with marked attention by Count Buffon and other distinguished French savans. In the summer of 1774 he returned to England, after an absence of twelve years. He was treated with great distinction by his countrymen, and was introduced at court, and received in a very flattering manner by the king, to whom he presented the drawings of Palmyra and Baalbec, which his majesty had requested him to execute; but his anecdotes respecting the customs of the Abyssinian and Nubian tribes were listened to with incredulity, and were severely ridiculed by the Grub Street writers of the day. Keenly resenting this treatment, Bruce retired to his estate, where he busied himself in the arrangement of his affairs, which had become disordered during his long absence. In 1776 he married Miss Dundas of Fingask, by whom he had three children. She died in 1785, and as a means of diverting his thoughts from his bereavement, he, in compliance with the advice of his friends, applied himself assiduously to the preparation of his journals for the press. They appeared in 1790, in five vols. 4to, embellished with plates and charts. The whole of the first edition was immediately disposed of, and it was in the same year translated into French and German. The work was violently assailed by a portion of the periodical press, and a host of petty enemies levelled the shafts of envy, malice, and ridicule at the devoted head of the author; but his great merits have been fully acknowledged by posterity, and the accuracy of his most startling statements has been confirmed by the researches of later travellers. He was preparing a second edition of his work, when his death prevented the execution of his design. On the 26th April, 1794, he was escorting a lady to her carriage, when his foot slipped, and he fell headlong down stairs; he was taken up in a state of insensibility, and expired next morning in the sixty-fifth year of his age. A second edition of "Bruce's Travels," accompanied by a life of the author, was published in 1806 by Dr. Alexander Murray, the celebrated oriental scholar.—J. T.

BRUCE, JAMES DANIEL, Count, a Russian officer of Scotch extraction, born at Moscow in 1670; died in 1735. He entered the artillery, and was named governor of Novogorod. In 1709 he commanded the artillery at the battle of Pultowa, and two years later was appointed grand master of this branch of the Russian forces, which he organized on an excellent footing. Later, he

instituted a school of military engineering, and in 1721 was nominated one of the commissioners to negotiate the peace of Nystadt.

BRUCE, JOHN, a Scottish philosopher, was born in 1744, and died in 1826. He for some time held the office of professor of moral philosophy in the university of Edinburgh, and was afterwards member of parliament for the borough of Ilchester. He was the author of "First Principles of Philosophy;" "Elements of the Science of Ethics;" and of several works on the history and government of British India.—J. T.

BRUCE, MICHAEL, a Scotch poet, whose short and painful career has added much interest to his productions. He was born in 1746, of poor parents, in Kinneswood, Kinross-shire, and received a scanty education at the parish school. For six successive summers he herded cattle on the hills overlooking his native village, and his poem of "Lochleven" is made up of his reminiscences of this period of his life, and ought to be regarded by the reader as the impressions of the shepherd boy, clothed in the language of the student and the scholar. It was his father's wish to educate him for the ministry, but he despaired of being able to raise the funds requisite for so expensive an undertaking. But the son set all difficulties at defiance, and entered upon the course without knowing how the next step in it should be taken. Having acquired some knowledge of Latin at the parish school, he set out for Edinburgh university, where he was enabled to complete a course of arts, supported by a small sum of money left by a relative, and by what his father could spare from his slender income. Insufficient diet and too hard study, however, greatly impaired his health. In 1766 he was admitted a student of the theological seminary of the Secession church, and at the end of the session was appointed to a school at Forrest Mill. Soon after symptoms of pulmonary consumption began to show themselves, and became every day more marked. After composing his poem of "Lochleven," he was compelled to relinquish his school and seek repose at home. Shortly after he composed his "Ode to Spring," which, for touching allusions and exquisite pathos, is unsurpassed in the English language. He expired on 5th July, 1767.

Some time after Bruce's death, one of his college friends, Mr. John Logan, published a volume of his friend's poems, omitting several of his pieces, and inserting others which belonged to neither the editor nor the poet, under the plea of furnishing an attractive miscellany, the profits of which would go to Bruce's aged and then widowed mother. This seemed generous enough, but the person for whose benefit the publication was proposed never derived any advantage from it, while the editor subsequently claimed and published the best of the pieces as his own. Among these was the celebrated "Ode to the Cuckoo," and some hymns, which latter have since obtained a place among the paraphrases sung in the Scotch churches. Logan was allowed to retain the reputation thus acquired till within these few years, when the Rev. Dr. Mackelvie of Balgedie published a new edition of Bruce's works, accompanied with a memoir, in which he establishes, on what seems to us unquestionable evidence, the claims of Bruce to the authorship of the "Ode" and the hymns.—W. M'K.

BRUCE, ROBERT, one of the most influential Scottish clergymen of the seventeenth century, was born about the year 1554. He was the second son of Sir Alexander Bruce of Airth, by Janet, daughter of Alexander, fifth Lord Livingston. It was intended by his father that he should follow the profession of the law, and with this view he was sent to study at Paris, and afterwards at Edinburgh. On completing his education he began to practise before the court of session. But he soon removed to St. Andrews, and commenced the study of theology under the famous Andrew Melville. In 1587 he was invited to succeed Mr. Laurie, the successor of Knox, in the church of Edinburgh. The reputation of Bruce for ability and learning advanced so rapidly, that he was soon regarded as one of the most influential leaders of the church. King James both respected and feared him, and in 1589, when he sailed for Denmark to bring home his queen, he appointed Bruce a member of the privy council, and gave him special charge to preserve order among the people during the absence of the sovereign. James, however, did not long remain on good terms with his powerful subject. His temporizing policy regarding the Roman catholic nobles, and his various infringements of the rights of the church, led to frequent and angry disputes; and the doubts which Bruce expressed respecting the Gowrie conspiracy, brought matters to a crisis. He was at last induced

to express his belief of the guilt of Gowrie and his brother, but he peremptorily refused to preach upon it in the manner prescribed by the king, declaring that his conscience would not allow him to submit to human dictation respecting what he should preach. The king was so incensed at this refusal, that he deprived Bruce of his benefice, and banished him to France. In the following year he was permitted to return to Scotland, but the enmity of the king was by no means abated; and in 1605 Bruce was formally deposed and banished to Inverness, where he remained for eight years. In 1613 he was permitted to return to his seat at Kinnaird, on condition that he would confine himself to the place; but in 1621 he was committed to Edinburgh castle for some months, and then banished again to Inverness. On the death of King James in 1625, Bruce obtained permission to reside at his own house. He repaired the parish church of Larter, which the bishop had left in ruins and without a minister, and preached there every sabbath-day to a numerous and deeply-interested audience. One of his converts was the famous Alexander Henderson, the restorer of presbytery in Scotland.

Robert Bruce died on the 13th of August, 1631, worn out with his labours and the infirmities of age. He was undoubtedly one of the most remarkable men that the church of Scotland has produced; and in indomitable courage, independence, and spotless integrity, was a worthy successor of Knox and Melville. In person he was tall and dignified, and of a majestic countenance—qualities which seem to have been hereditary in his family. He was the ancestor of Bruce, the Abyssinian traveller, in whom much both of his person and character seems to have revived.—J. T.

\* BRUCH, —, an eminent German botanist of the present day, has devoted special attention to cryptogamic botany, and has published, at Stuttgart, along with Schimper, a very valuable illustrated work, entitled "Bryologia Europæa; or Descriptions of the Genera of European Mosses." It is the most important work on this subject at the present day, and is a standard book of reference.—J. H. B.

\* BRUCK, CARL LEWIS, baron von, an eminent Austrian statesman, famous as the founder and chief director of the Austrian Lloyds, was born in 1798 in the duchy of Berg. At Trieste, where he married the daughter of a wealthy merchant, he earned his first honours as an expert financier, in the position of secretary to a maritime assurance company, the failure of which led to a combination of all the assurance companies of the place, which was at first called the Trieste Lloyds, but is now universally known as the Austrian Lloyds. The success of this important association has been mainly, if not entirely, owing to the activity, enterprise, and financial skill of Bruck, who continued to manage its affairs till 1848. In that year he was deputed by his fellow-citizens to the national assembly at Frankfort, and was on his way to that city when he received from the imperial government of Vienna the appointment of plenipotentiary to the lieutenant of the Germanic empire. After the revolution of October, 1848, he was named minister of trade, a position in which his talents were exercised to the inestimable advantage of the commerce of the empire. In 1851 he resigned his portfolio; but in the following year was recalled to the imperial service, and in 1853 appointed to the dignified and momentous post of internuncio at Constantinople. In this position he exerted himself strenuously to avert the rupture between Russia and the Porte. In 1855 he became minister of finance.—J. S., G.

BRÜCK, MOSES, a modern Jewish writer, in German, on the religious ceremonies of the Jews. His "Pharisäische Volks sitten und Ritualien" (Popular usages and ritual observances of the Pharisees), and his "Rabinische Ceremonialgebräuche" (Rabbinical ceremonials), give evidence of extensive rabbinical reading, but occasionally, too, of a spirit of levity not in character with the subject.—T. T.

BRÜCKER, JOHN JAMES, the celebrated historian of philosophy, was born at Augsburg in 1696. His father was a wealthy burgher of the city, and he enjoyed from the first the advantages of a good education. On leaving school he proceeded to the university of Jena, where he studied for the Lutheran church; and having finished his college course, became in 1724 rector of Kaufbeuren. At Jena he distinguished himself as a scholar, and before leaving the university, had already planned the great work to which his life was devoted. He may be said, indeed, to have actually commenced it before his college course

was closed. For, as early as the year 1719, he published at Jena a tract entitled "Tentamen Introductionis in Historiam Doctrinæ de Ideis;" four years after he published at Augsburg his mature work on the same subject, his "History of the Doctrine of Ideas," which is still a valuable book of reference. Having attracted the attention of the learned, and acquired considerable fame, by these and other literary labours, he was in 1731 elected a member of the Academy of Sciences at Berlin. Having been early distinguished, however, not only as a scholar, but as a preacher, and his reputation as a student and divine having reached his native city, he was called to its chief protestant church, St. Ulric's, of which he soon became the senior pastor, holding the office till his death in 1770. His great work, "Historia Critica Philosophiæ," was first published in four vols. 4to, and afterwards, with great additions and improvements, in six vols. 4to, in 1767. By this learned and comprehensive work, Brucker justly ranks as the father of the history of philosophy. Before his day nothing had been done to any purpose in this direction. The science of history in general is comparatively a recent one, and that of philosophy one of its newest branches. No such thing as a history of philosophy was known in antiquity. Brucker's work embraces the whole range of philosophy, modern as well as ancient, and is a minute history of philosophic systems and opinions, as well as a biography of the thinkers who held and taught them. In both respects, but especially in the latter, it is entitled to considerable praise. Brucker was a sound scholar, an indefatigable reader, a most laborious and conscientious workman; in everything requiring simply scholarship and research, he is a trustworthy guide. The biographical part of his work is thus peculiarly valuable. He arranges his materials geographically and chronologically, but not scientifically; showing clearly enough how one system arose after another, but not sufficiently illustrating the connection of their root ideas, or pointing out how the one was the natural development of the other. To write the history of philosophy efficiently, a man must be himself a philosopher, a thinker of the first order, able to appreciate and interpret the whole progress of philosophic thought in every phase of its development. But Brucker was hardly, in any true sense, a philosopher at all. He was a scholar, gifted with a diligent inquiring mind, a sound orderly brain; but he had no faculty for higher speculation, and little sympathy with its results. Nevertheless, his work is not simply a compilation. The expositions are his own, and his criticisms, if generally of a rather heavy mechanical kind, and sometimes altogether erroneous, are always independent, and often just. With all its faults, the critical history remains as a standard work, and subsequent historians of philosophy have been largely indebted to its learned author. A useful English abridgment of Brucker's work was published by Doctor Enfield in 1791. The original edition was in two vols. 4to, but it has since been republished in a single octavo volume.—T. S. B.

BRUCKMANN, FRANZ ERNST, a German physician and naturalist, was born at Marienthal, near Helmstädt, in 1697, and died at Wolfenbüttel in 1753. He practised medicine, but at the same time devoted his attention to natural science. He made large collections both of plants and minerals, and published numerous works, among which are the following—"A Treatise on Subterranean Fungi;" "A Treatise on Asbestos, and on various other Minerals;" and "Bibliotheca Animalis."—J. H. B.

BRUDENELL, SIR ROBERT, an eminent lawyer, descendant of William de Bredenell or Brudenell, who held large landed property in Oxfordshire and Northamptonshire; was constituted one of the judges of the king's bench in the twenty-second year of Henry VII.; in 1509 he was removed to the common pleas, of which court he was made lord chief-justice in 1520. He died about the year 1535, leaving behind him a reputation inferior to none of his time for ability, learning, and integrity. He was the ancestor of the Brudenells, earls of Cardigan, the fourth of which line was raised by George II. to the dukedom of Montagu.—E. W.

BRUEYS D'AIGALLIERS, FRANÇOIS-PAUL, a distinguished French admiral, born at Uzès in 1758, was descended from a noble family long settled in Languedoc. He entered the navy at the age of thirteen. In 1780 he was appointed a lieutenant, and took part under count de Grasse in five general engagements against the English. In 1796 he was promoted to the rank of

rear-admiral, and six sail of the line and three frigates were placed under his orders. With this force he took possession of the Ionian isles, and discharged the duties intrusted to him greatly to the satisfaction of General Bonaparte. In 1798 he was nominated vice-admiral, and was appointed to the command of the Toulon fleet which conveyed to Egypt the powerful army destined for the invasion of that country, 19th May, 1798. After landing the troops, Admiral Brueys anchored his fleet in Aboukir bay, and in accordance with the advice of a council of war, consisting of all the flag officers and captains of his fleet, resolved to remain at anchor in the event of being attacked. On the 1st of August the English fleet under Nelson came in sight, and immediately prepared for battle. (For an account of the fight, see NELSON.) Through the masterly tactics of the British admiral the French ships were placed between two fires, and were overpowered and beaten in detail. They made a vigorous defence, but in the end most of them were disabled, and compelled to surrender. Admiral Brueys, who had hoisted his flag in the *Orient* of 120 guns, was killed by a cannon shot. He refused to be carried below, saying—"A French admiral should die on his quarter-deck." The *Orient* caught fire just as he was killed, and soon after blew up with most of her crew.—J. T.

BRUGMAN or BRUGMANS, JOHN, a celebrated Flemish preacher of the Franciscan order of monks, flourished in the fifteenth century. Such was his reputation with the masses of the people, whom he delighted as well as instructed, by a style of eloquence which abounded in the aptest and often the most humorous illustrations, that "to speak like Brugman," "Brugman runs after souls and I after money," and other such compliments to the powers and enthusiasm of the preacher, were by-words among his countrymen. He was professor of theology at St. Omer, and afterwards provincial of his order.—J. S., G.

BRUGMANS, SÉBALD JUSTIN, a Dutch naturalist, was born at Franeker in 1763, and died at Leyden, 22d July, 1819. He studied at Groningen and Leyden, and at the age of eighteen became doctor of philosophy. He devoted himself assiduously to natural history, and more particularly to physiological botany. In 1786 he became professor of botany at Leyden. Subsequently he superintended the publication of the Dutch pharmacopœia, and became general sanitary commissioner for Holland. He wrote upon the use of the knowledge of indigenous plants, on the growth of trees, and on the mode of destroying useless and poisonous plants in meadows.—J. H. B.

BRULOFF, CHARLES, the greatest Russian painter, born at St. Petersburg in 1800. Bruloff studied his art in Rome, and acquired a European celebrity by his famous picture, "The Last Day of Pompeii," the subject taken from the description given by Pliny. The emperor of Russia named him court painter, and president of the Academy of St. Petersburg. He was also elected member of the academies of Bologna and Milan. He is considered greatest in colour and composition; in design he is occasionally incorrect. He died on the 22d June, 1852, at Maresano near Rome, and a monument was erected in his honour by the Russian sculptor Chschouzipoff.—M. Q.

BRUMOY, PIERRE, a jesuit, born at Rouen in 1688. He was the teacher of the prince of Talmont. His publications are very numerous, and show how deeply his mind was imbued with the love of classical literature, over the decline of which he mourned in his "Thoughts on the decline of Latin Poetry." It was to spread a taste for Greek tragedy, the superiority of which was with him a dogma, that he published his translations of Æschylus, Sophocles, and Euripides. In some instances, indeed, he contented himself with a close analysis and spirited outline, accompanied by observations of emphatic admiration. After various miscellaneous publications he was engaged on a history of the Anglican church, the twelfth and last volume of which he had nearly completed when he died, April, 1762.—J. F. C.

BRUN, GABRIEL LE, a brother of the great Le Brun, the French eclectic, born at Paris about 1625. He was a poor painter and an indifferent engraver. He engraved several of his greater brother's designs, and an allegory on the peace of that wily Italian, Mazarin.—F. BRUN, was a neat French engraver, of probably the same family.—MADAME VIGÉE LE BRUN, a lady of some talent, and member of the Academy of Painting. She died in 1842.—W. T.

BRUN, JOHAN NORDAHL, a Norwegian poet, and bishop of Bergen, was born in 1744, near Drontheim, of peasant parents. He was induced to study, entirely against his will, by an elder

brother. His first literary attempt, "Zarine," a worthless tragedy in imitation of Voltaire, was remarkable not only as being the first Danish tragedy ever presented on the stage, and which was at first received with much enthusiasm, but for the violent literary warfare to which it led. His second tragedy, "Einer Tambeskjelver," though unsuccessful as a play, procured for him from Guldberg, the minister at that time, 1773, a small living, to which he retired; after which he married, and rose in the church, until in 1804 he became bishop of Bergen. Brun was in his place as a preacher of the gospel. In the pulpit he was not only powerful, persuasive, and original, but the spirit of an old apostle seemed to animate him. He has also left behind him an honoured name as a patriot, and two national songs, "Norges Herlighed," and "Norges Skaal," which have taken deep root in the literature and the heart of the people. His collected poems appeared in a second edition at Christiania in 1816, the year of his death.—M. H.

BRUN, SOPHIE CHRISTIANE FREDERIKA, a well-known German-Danish writer of prose and poetry, was born June 3rd, 1765, at Tonna in Gotha, where her father, Balthasar Münter, was a distinguished preacher. When she was scarcely five weeks old her father removed to Copenhagen, as chief minister of the German congregation of St. Peter's church in that city. Educated at home, under the guidance of her father, she early exhibited poetical talent. In 1783 she married Johan Christian Constantin Brun, royal administrator of the West Indian trade, afterwards conference-raad and knight of the order of Dannebrog. Shortly after her marriage she accompanied her husband to St. Petersburg, and for some months she enjoyed daily intercourse with Klopstock at Hamburg. During the severe winter of 1788-89 she suddenly lost the sense of hearing, which she never regained. She now devoted herself with increased energy to poetry and the acquisition of knowledge, finding in them a compensation for her great loss. From 1790 she spent the following twenty years in travel and foreign residence. An account of her first journey to the south of Europe was published in the first two volumes of her prose works, Zurich, 1799-1801, whilst her two last volumes of the same works contain her residence in Rome, and a winter spent at the sulphur baths of Ischia. In 1801 she made another journey through south Germany, Switzerland, and Italy, spending the winter near Coppet, where she enjoyed the society of madame de Stael and her father. After this period she returned to Copenhagen, where she remained till her death. Her first poems were published in 1795, and passed through four editions. In 1812 was published a volume of "New Poems," and "Latest Poems" in 1820. Her last work, published in 1824, "Truth in Morning Dreams, and Ida's Æsthetic Development," is said to contain, in part, an account of her own youthful life. She died in 1835; and her husband in 1836.—M. H.

BRUNCK, RICHARD FRANZ PHILIPP, an eminent Hellenist, was born at Strasburg, December 30, 1729, and carefully educated by the jesuits. He devoted himself in his native town to the study of the Greek authors, and to the critical emendation of their works. His most renowned editions are those of Anacreon, Apollonius Rhodius, Aristophanes, 1781-83, 3 vols., the Poetæ Gnomici, and above all, that of Sophocles, for which he was granted a royal pension of 2000 francs. He also edited Plautus and Terentius, and died in his native town, June 12, 1803.—K. E.

BRUNELAUT, the famous queen of Metz or Austrasia, daughter of Athanagildas, king of the Spanish Visigoths, born in 534; espoused in 568 Siegbert, king of Austrasia. About the same time Chilperic, king of Neustria, brother of Siegbert, married her younger sister, Galswintha. This prince having put his wife to death, and invaded Austrasia while Siegbert was engaged in repelling an invasion of the Huns, Brunelaut urged her husband to retaliate by a war in Neustria, in the course of which Siegbert was assassinated, and Brunelaut herself taken prisoner. On her escape from Rouen, after her marriage with Meroveus, son of the king of Neustria, she returned to Metz, and combating successfully the opposition of the nobles, wielded the royal authority during the minority of her son Childebert. After the death of that prince, and the accession of her grandsons, Thierry and Theodebert, the nobles of Austrasia compelled her to fly into Burgundy. These two princes having quarrelled, she took part with Thierry, who put his brother to death in 612. Thierry dying in the following year, she again assumed the authority of regent; but being attacked by her ancient enemy,

Fredegonda, second wife of Chilperic I., she was betrayed by her nobles into the hands of the Neustrians, and, as some historians report, delivered during three days into the hands of a brutal soldiery, drawn at the tail of a wild horse, and finally burned piecemeal. Her character and government have been the source of endless controversy—one class of historians representing her as the most virtuous of women, and the most illustrious of sovereigns, and another abusing her memory as an infamous woman and a bloody usurper. Gregory of Tours, her contemporary, is in the former class; and in the latter there is found no author of an earlier date than a century after her death. Tradition, which attributes to her the foundation of numerous hospitals, and the credit of repairing the Roman roads through Burgundy, Picardy, and Flanders, is all in favour of her blameless character and excellent government.—J. S., G.

BRUNEL, SIR MARC ISAMBARD, a civil engineer of consummate ability and originality. He was born at Hocqueville in Normandy in the year 1769. His father, a gentleman of ancient lineage and some landed property, with the living of his parish at his disposal, destined the younger Brunel for the church. But no exertion on the part of his teachers at St. Nicain in Rouen—no punishment threatened or inflicted at home, could secure progress. An instinctive predilection for mechanical contrivances, together with a marked inaptitude for literary studies, was early exhibited: nor was the latter defect ever overcome—a residence of half a century in England having been insufficient to secure Brunel a correct knowledge of the language, while it robbed him of the power of using his own with facility. The carpenter's shop and the wheelwright's yard had alone interest for the future engineer. At length, in something like despair, steps were taken to place the incorrigible idler in the navy. To this end it was necessary that some knowledge of numbers and of mathematics should be obtained. Euclid was devoured with avidity—read, as Sir Isambard has been often heard to say, with all the interest usually excited by a novel. No proposition ever required to be perused twice. Upon his first introduction to the naval officer under whose charge he was about to be placed, he observed upon the table a quadrant. With the principle of its action he was acquainted, but before this visit he had never seen the instrument; nor did he then venture to touch it: yet, by a careful examination of it, as he walked round the table, he was enabled to construct an instrument which he used exclusively during his service in the navy. Drawing was his pleasure—penmanship his delight. In both his excellence was remarkable; and, at a late period of life, he could describe a circle with his hand alone, and determine the centre with mathematical precision. To his mind, lines accurately represented forces, and of their relative value and position he would always satisfy himself, before accepting any numerical calculation. Hence the immense importance which he attached to drawing; always considering it the true alphabet of the engineer, without which he believed no complete idea of construction could ever be realized. To his penmanship he was once indebted for liberty, and perhaps for life. Upon the evening of the day—17th January, 1793—that the assembly voted the death of Louis XVI., Brunel expressed himself in such strong condemnatory language of the proceeding, in one of the cafés in Paris, that he became a marked man, and narrowly escaped the guillotine. With difficulty a passport for America was procured for him. In his haste the passport was forgotten, and he embarked without one. The vessel had not been long at sea when she was boarded, and passports demanded. This event young Brunel had anticipated; but such good use had he made of his time in imitating the passport of a fellow voyager, that he did not hesitate to submit the cheat to official inspection. He escaped. During the voyage he formed the acquaintance of a gentleman engaged by the state of New York to make surveys of some of the principal tributaries of the Hudson. From this gentleman he gladly accepted the situation of assistant. During the connection he had many opportunities of exhibiting his genius in overcoming the natural difficulties with which such an undertaking was necessarily beset in a wild and savage country—rapids to be passed, forests to be penetrated. Upon Brunel's return to New York, he soon found employment, and was engaged as engineer and architect in the construction of machinery of various kinds, and in the erection of public buildings. To him is due some of the important improvements in the printing-press, and the application of machinery to the boring of ordnance.

The first theatre at New York (subsequently burned down) was erected by him, and it has been described as a masterpiece of symmetry and elegance.

But a new field of constructive engineering opened to him. With the drawings and working model of machinery for the manufacture of blocks, he found his way to England in 1800, impelled thither not only by respect for the liberal institutions and nautical character of the country, but by an attachment which he had early formed for Miss Kingdom, an English lady, while she was at school in Rouen. The patent of Mr. Walter Taylor of Southampton had come into operation in 1781; contracts had been made, to disturb which was held to be impossible. After many vexations and disappointments, Brunel was installed at Portsmouth in 1804; but it was not until 1808 that the whole system was, by the ingenious and indefatigable inventor, considered complete. From that time to the present, during a period of the most unprecedented advancement in the mechanical arts, no improvement has been either made, or even suggested, in the block machinery at Portsmouth; and it may be further added, that to the mechanical appliances then first introduced, is the mechanical world indebted for much of its present precision and economy. It is computed that, to complete the shells of blocks, four men can now accomplish what required fifty men by the old method; that to prepare the sheaves, six men can now do the work of sixty; and thus, that ten men can with ease, uniformity, and celerity, do that which demanded the uncertain labour of one hundred and ten. As a remuneration for his success in this unparalleled work, Brunel asked the saving of one year, £20,000. He received two-thirds. Besides the circular saw, Brunel now introduced the circular knife, increasing thereby many fold the economy of veneer-cutting. But he met here with most violent and successful opposition from the trade. Amongst other works of a less striking character, yet sufficient to have raised any other man to the highest position in his profession, may be enumerated a suspension bridge, so admirably constructed as to resist the hurricanes of the east; the application of condensed carbonic acid gas as a moving power; the construction of an arch of large span without centering; the introduction of those strong, light, and economical roofs now common at our railway stations; and the masterly arrangement at Chatham for the preparation of timber for the construction and repair of shipping. This beautiful arrangement displays in a remarkable manner that singular comprehensiveness and simplicity of design, with elaborateness of detail, which so strongly characterize all Brunel's labours. It may be noted, that so confident was he in the completeness of his instructions and in his resident engineer, Mr. Elcum, that he scarcely visited the works until they were to be reported upon as finished. The first double-acting marine steam-engine was Brunel's invention—an engine which gave such umbrage to the good people of Margate in 1816, upon the occasion of the first trial trip, that common civility was denied to all connected with the vessel, and a night's lodging absolutely refused to the ingenious inventor at the hotel. Of all his labours, however, the one which has most excited the attention, not only of this country, but of civilized Europe, is the Thames tunnel. The project for connecting the shores of the Thames below London bridge, so as to avoid any interference with the navigation, had long been considered an important commercial desideratum. A company was formed in 1825, and the works were commenced by sinking a shaft fifty feet in diameter, from whence the horizontal excavation was opened by means of a shield in iron of singular and beautiful construction, thirty-six feet wide and twenty-two feet high, allowing a double arched roadway to follow, in brick and Roman cement. In the spring of 1843 this work, which thirty-four years before, had been pronounced by the highest scientific and practical authorities impracticable, was completed. The history of the Thames tunnel—the last, and, as its gifted architect always considered it, the greatest of his mechanical conceptions, and to which he devoted the latter years of his valuable and fruitful life—has yet to be written. In its progress an unusual variety of engineering resources were developed; an amount of energy, courage, and endurance exhibited, never before demanded in the execution of any work of peace.

In his person Brunel was below the middle size, more actively than strongly formed, and of a nervous lymphatic temperament. His countenance and head were striking; the latter of unusual development both in the reflective and knowing faculties. In

his disposition he was peculiarly social and unaffected; less remarkable for dignity, perhaps, than for amiability: had he not been a great mechanist, he would probably have proved a distinguished philanthropist. Strongly attached to free institutions, Brunel resisted every temptation held out by other governments, and more particularly by that of Russia, to increase his wealth at the sacrifice of his independence. He died in London on the 12th December, 1849, in his eighty-first year, vice-president of the Royal Society, and corresponding member of the Institute of France, leaving two daughters and one son.—R. B.

BRUNEL, ISAMBARD KINGDOM, C.E., F.R.S., son of Sir Marc Isambard Brunel, and, like his father, one of the most eminent engineers of the present century, was born in 1806 at Portsmouth, where Sir Marc was then engaged in erecting the famous block-factory. The bent of his mind towards the same pursuits as the elder Brunel had followed with European renown, was marked at an early age by the intelligent interest which he manifested in all his father's plans and occupations; by his enthusiastic love of drawing; and by the ease and rapidity with which he mastered difficult problems in mechanical science. Art from the period of his boyhood was a passion with him, and to the last he had the keenest relish for everything connected with it. When he was about fourteen years of age he was sent to Paris, and after going through a course of preparatory studies under the care of M. Masson, was placed for two years in the college of Henri Quatre. This discipline, following upon the anxious tutelage of his father, who was no doubt his best as well as his earliest instructor, qualified him for taking an important part in the great undertakings of Sir Marc; and on his return to England he entered his father's office, to be immediately engaged in such works as the Thames tunnel (see preceding memoir). This magnificent enterprise was commenced in 1825, when the younger Brunel was in his twentieth year. By this time his great capabilities as an engineer were manifest to all with whom he came in contact. At the foundation of these, it was observed, lay his determination to master completely the details of whatever subject engrossed his attention. Drawing, modelling, and description of plans, were all easy to him, because his plans were the offspring of a mind which no labour or difficulty daunted, and which could only rest in the most thorough conception and mastery of any given problem. It is said that if he had failed in the pursuits he had chosen, he would have had no lack of chances of pre-eminent distinction as a workman. And while his skill in mechanical science was gradually obtaining the recognition it merited, he was giving abundant proof that his energy and enterprise were inferior only, and perhaps not inferior, to those of his father. Throughout the period in which Sir Marc was employed in the construction of the Thames tunnel, the younger Brunel underwent, in connection with the work, an amount of fatigue and anxiety which seriously impaired his health for the rest of his life. From such difficulties as attended its execution, men of only ordinary physical and mental energy would have shrunk, but both father and son had in them a Norman hardihood of disposition, which in the face of difficulties rose into a kind of heroism, and would not be balked of its purpose. In 1828, when an irruption of the river put a period temporarily to the works under the Thames, the younger Brunel undertook the construction of docks at Sunderland and Bristol. These, and works of a similar kind at various seaports, are among the best monuments of his genius. About the same period he offered a design for a bridge across the Avon at Clifton, which Telford recommended should be adopted; but the work was not completed. In consequence, however, of the merit of this design, Brunel's name became favourably known in Bristol; and, on its being proposed to form a railway between London and that city, Brunel was appointed engineer. By this appointment, and his former connection with iron roads, as engineer to the Bristol and Gloucestershire and the Merthyr and Cardiff tramways, his attention was powerfully directed to the construction of railways, and the results were such as to bring his name before the public in the most prominent manner. As engineer of the Great Western Railway Company, it is well known that he introduced, in the face of much uncivil opposition, what is popularly called the broad gauge. The controversy to which it gave rise has still an interest for the professional man, but this is not the place to enter into details. Apart, however, from this feature of the Great Western, its construction was such as to enhance prodigiously the fame of Brunel. The viaduct at Han-

well, the Maidenhead bridge, and the Box tunnel, still remain objects of great interest to the professional student, as well as to the ordinary sight-seer. As a railway engineer, if not always successful in carrying out his magnificent schemes, Brunel was at least fortunate in the recurrence of great opportunities. In the construction of the South Devon and Cornish railways, no less than in that of the Great Western, the range and amplitude of his resources were abundantly tested. The sea wall of the former railway, the bridge over the Tamar, called the Albert bridge, and the bridge over the Wye at Chepstow, show that it was with no inglorious result. On the South Devon railway Brunel tried, but without success, the plan previously adopted on the London and Croydon line, of propelling the carriages by atmospheric pressure. As is well known, it was his connection with the Great Western railway that led Brunel into another department of his art, viz. shipbuilding. The Great Western, the power and tonnage of which was double that of the largest ship afloat at the time of her construction, was built under the supervision of Brunel, to run between England and America. The Great Britain, which was double the tonnage of the Great Western, and twice the size of the largest iron vessel afloat, came next. When this magnificent ship was wrecked upon the rocks in Dunder Bay, Brunel's views of her superiority in point of strength to any vessel constructed of wood, were signally confirmed, and he had eventually the satisfaction of seeing her again afloat. It must be recorded to the honour of this great engineer, that he was among the first of his profession to recognize the advantages of the screw as a propeller. He adopted it in the Great Britain, and the first ship in the British navy which was furnished with a screw was fitted with it at the instigation and under the direction of Brunel. In 1851 and 1852, Brunel's mind was much occupied with the idea that, to make long voyages economically and speedily by steam, vessels must be made large enough to carry coal for the entire voyage outwards, and in the case of the outpost being ill supplied with fuel, for the return voyage also. With this idea originated that of the Great Eastern. And with the completion of this "Leviathan" of steam ships closed the career of Brunel. He died on the 14th September, 1859, having been carried home a few days before from the deck of the Great Eastern—the scene of anxieties greater than his impaired health could bear, and, it need not be added, of a triumph that links his name with the progress of British enterprise in arts and commerce.—J. S., G.

BRUNELLESCHI, FILIPPO, sculptor and architect, whose name is inscribed by Florence in the roll of her greatest men. In the age of Brunelleschi, Gothic architecture had almost supreme sway; but in his mind the living genius of Greece again found a dwelling-place, and his works were rather fresh creations of the ancient spirit, than servile imitations of its external forms. He was born at Florence in 1377. His father, a man of some note, wished him to be either a notary or a physician; but, yielding to his son's delight in ingenious questions of mechanism and art, he placed him at last in the guild of goldsmiths—in an age when working in gold was an independent art, and not the mere servant of fashion. Brunelleschi soon distinguished himself by the elegance of his works in the precious metals, and the curious ingenuity of his mechanical contrivances. Adopting architecture rather than sculptor as his profession, he journeyed to Rome, and studied so minutely the mechanism and the grace of its stately ruins, that he was said to be capable of reconstructing the city in his imagination, and of discerning Rome as she had been before her desolation. A great and worthy ambition gave deeper intensity to his studies, Amalfo di Lippo had left unfinished his great work—the church of Santa Maria del Fiore at Florence; and a conference of architects and engineers was held to consult upon its completion. The four branches of the cross forming the church were finished; but it was necessary to unite them by means of a cupola. The supports of the cupola formed an octagon of large diameter; and there were great difficulties involved in its adaptation to that form, on the immense scale required by the proportions of the church. His studies at Rome, particularly of the temple of Minerva Medica, came to his aid, and he proposed that there should be a double cupola, turned in the manner of the pointed arch, the one vaulting within and the other without, in such sort that a passage should be formed between the two; the form of the pointed arch adjusting itself to the walls of the base, and rapidly ascending to a magnificent height, while a lantern, crowning the whole, would help each part to give sta-

bility to the other. Nothing similar had been attempted before, and the proposal was received with derision. But by the construction of models, Brunelleschi proved that the laws of nature were on his side; and he was finally commissioned to execute the work, the successful completion of which constitutes an epoch in architectural history. Brunelleschi, however, laboured under the imputation of attempting an impossible task. Unfortunately he died before his great task was finally completed, and his successors did not accurately carry out his instructions with respect to the lantern of the dome, giving it proportions which contrast disagreeably with the rest of the building, while they omitted one part of a gallery he designed.—Brunelleschi erected many other buildings—amongst others, the churches of San Lorenzo and of the Holy Spirit at Florence; the abbey of the canons regular at Fiesole; an arch in the sacristy of the canons at Duomo; the chapter-house of Santa Croce for the Florentine family of the Pazzi; with the front elevation of the palace of the Pitti, and several smaller palaces. He revived the use of antique cornices, and restored the various ancient orders of architecture to their primitive forms. In his works there is uniformly the grandeur of a noble simplicity, although, perhaps, one finds less harmony in the details than in the masses, and more of general vigour than of minutely delicate elaboration. He died in 1446.—L. L. P.

BRUNFELS, OTTO, a German physician and botanist, was born about the year 1464, in the neighbourhood of Mayence, and died at Berne on 23d November, 1534.—J. H. B.

BRUNI, LEONARDO. See ARETINO.

BRUNO, founder of the order of Carthusians, born at Cologne about the year 1030, was descended from an ancient and honourable family. Educated at Paris, and then at Rheims, he had earned such a reputation for learning and piety in the course of his academical career, that, about the time when he should have quitted the latter university, he was raised to the office of scholasticus, or director of studies in all the great schools of the diocese. This situation he filled with great credit for a number of years. In 1077 he formed the resolution of retiring to a place of solitude, and accompanied by six clerks of the church at Rheims, repaired first to Saisse Fontaine in the diocese of Langres, and then to the desert of Chartreuse in the diocese of Grenoble. Here in 1084 he founded his celebrated order. Each of his companions had a separate cell, in which, practising the austerities of the rule of St. Benedict, they passed six days of the week in unbroken silence, assembling only on Sundays. He had passed six years in this solitude when Urban II., who had been his pupil, summoned him to Rome. The pope received him with every mark of respect and confidence, and pressed him to accept the bishopric of Reggio. Refusing that dignity, he asked permission to retire into the district of Calabria, where, having founded a second Carthusian house named La Torre, he died in 1101. He was interred in the church of the monastery. Leo X. canonized him in 1514.—J. S., G.

BRUNO, GIORDANO, born at Nola in the kingdom of Naples, about the middle of the sixteenth century—the precise date of his birth cannot be ascertained—called also IL NOLANO from the name of his native place. The events of his early life are enveloped in obscurity. Attracted, when yet a boy, by the love of study to what was then considered the most suitable refuge for such a calling—namely, the monastic solitude—he entered a Dominican convent in his native land. But no sooner had he drunk at the sources of Hellenic poetry and philosophy, than he felt the incompatibility of his classical aspirations with the monkish life. Forswearing, therefore, his vows, he left the cell of the friar to wander, as a knight-errant of philosophy, on the highways of the world. He went first to Geneva when still very young—perhaps at the age of twenty-five—in 1580; but Calvinism seemed to offer no better welcome to his opinions, or satisfaction to his intellectual wants, than Romanism had done. Thus, after a sojourn of two years at Geneva, we find him in Paris, then in England, subsequently in Germany, challenging everywhere the Peripatetics, teaching, delivering lectures, disputing with masters of arts and supercilious rectors of universities, and publishing philosophical books in Latin and Italian, in prose and verse, with the main object in view of showing the fallacies of the current philosophy.

Bruno was possessed, for the furtherance of his task, of a staunch consciousness of the truths which had flashed on his mental insight, of a large amount of original learning derived

from Greek and Latin sources, of an extensive knowledge of mathematics, of astronomy, and natural sciences, according to the degree of development these had reached at that time. But he also united to such acquirements an unbridled imagination, a fanciful disposition to trace out ungrounded connections and superficial analogies, and a vain relish to play with high sounding words over unfathomed mysteries, rather than to expound methodically the part of truth he had realized.

Relying on the spirit of independence occasionally opposed by the republic of Venice to popish persecutions, he returned in an ill-advised moment to Italy, and established himself as a private teacher at Padua, where, at the request of the inquisition, the Venetian government caused him to be arrested in 1595, and given up a prey to the Roman tribunals. Having been kept for two years in the prisons of the holy office at Rome, and vainly urged to recant, he was doomed at last to be burned alive as a heretic and apostate, the sentence ending by these remarkable words, "ut quam clementissime et citra sanguinis effusionem puniretur," such being the cruelly ironical formula by which the inquisition was used to design the death at the stake. Bruno, unflinching to the last, listened fearlessly to the reading of the sentence, and boldly replied to his judges—"Majori forsitan cum timore sententiam in me dicitis, quam ego accipiam." He was executed at Rome in Campofiore on the 17th of February, 1600. A detailed account of his trial and death is to be found in a letter of Scioppius to Curr. Rittershusio (see J. Brukeri *Hist. Phil., cap. de Jordano Bruno Nolano*).

We cannot attempt to give here a complete outline of the philosophical system of Bruno, and must limit ourselves to some of the principal features of it. The leading spirit which pervades the whole of his works is a deep feeling of the unity and inward reality of the universe: a comprehensive conception of the two elements of philosophy—spirit and matter, God and the world—as intimately *one*. The blind followers of Aristotle, misunderstanding their own master, had, according to Bruno, lost hold of the true principle of philosophy, having no idea of the supreme unity of all things and of the organism of life in the universe. Matter is not in his conception a dead aggregate of atoms passively waiting for an external act of vivification, but it is the very implement and condition of life, or rather the organic process and manifestation of its evolution, which has no end. With this metaphysical theory the other one of the infinity of the universe and of the worlds is strictly connected—(see the dialogue "Dell' Infinito, Universo e Mondi," l. c.)—a subject which he treats with great acuteness against the Aristotelian and Ptolemaic assumption of the world being placed in a definite locality. Having diligently studied the system of Copernicus, Bruno embraced with enthusiasm the new doctrine, and defended it against the Peripatetics with a truly heroic devotion.

There is an intimate connection between Bruno's ontology and his moral philosophy. God being at the same time a perfect *Form*, a rational *Cause*, and an infinitely good *Will*, the same attributes are to be found, in due proportion, in the phenomena of the world. There is consequently, beauty and order, rationality and final tendency towards perfection in every stage of being. The soul of man is, through the same reason, a free, conscious power called upon to fulfil its own law of development in the universe. Evil and deformity, as well as death, are not real entities, or self-grounded ideas—"in aliena specie cognoscuntur, non in propria, quæ nulla est." (*De umbris idearum*).

The psychology of Bruno is an emanation from his ontology. There is an inner affinity between the *object* and *subject*, between the work of God in the universe and the understanding of man. But the reflection of divine reality in the human intellect is comparatively shadowy. Man cannot reach absolute truth. He must be satisfied with images more or less imbued with the reflected light of it—*umbra idearum*. The effusion of light from the central fount of being—*actus primus lucis*—through the substance of the universe—*materia prima*—and its accidental modifications, gradually weakens as it spreads farther and farther from its source.

Besides his works on metaphysical and scientific subjects, Bruno wrote moral satires, generally in the form of dialogues, and one comedy, "Il Candelajo," against the corruption of his times. Among these, the "Spaccio della Bestia trionfante," and "La Cabala del Cavallo Pegaseo," deserve special mention. But the most important, perhaps, among the moral writings of Bruno is that which he rightly inscribed, under the title of "Gli Eroiici

Furori," to his generous friend and patron in England, the great Philip Sydney—a work in which he gave vent to his highest aspirations towards divine beauty and perfection, tracing out the noble struggles of the intellect in its conquest of truth and goodness, and the efficiency of the *will* in this militant mission.—For a complete catalogue of the writings of Bruno, see, besides Bruker and Buhle, the preface to the edition of his Italian works, by Wagner.—A. S., O.

\* BRUNOFF or BRUNOW, BARON PHILIP, one of the most distinguished living statesmen of Russia, born at Dresden in 1794; he entered the Russian service in 1818, at the time of the congress of Aix la Chapelle. Count Capo d'Istria immediately formed a high opinion of his capacity, and intrusted to him and Counsellor Sturdza the task of compiling a civil code to be applied to the government of the Roumane population of Bessarabia, then a recent conquest. He assisted at the various congresses of Troppau, Laybach, and Verona, in the quality of secretary to the embassy. Count Nesselrode appreciated his talents, and placed him at the head of his own chancellerie. The celebrated answer of the Russian cabinet to the Anglo-French remonstrance at the treaty of Unkiar-Skelessi in 1832, has always been attributed to Brunoff. From 1840 to 1854 he acted as Russian plenipotentiary in England, and began the exercise of his functions in that capacity with the masterly treaty of the 15th July, 1840, which, on the eastern question, united England, Russia, Prussia, and Austria, against France. The honour of that achievement is universally allowed to belong to Brunoff. He exerted himself to prevent that interruption of diplomatic relations between England and Russia which preceded the Crimean war. At the close of the war Brunoff was sent as ambassador to Berlin, and in 1857 was again nominated ambassador to London.—M. Q.

BRUNSWICK, House of, an ancient German family of princely rank, descended from ALBERT AZO I., margrave of Este in Italy, who died in 964. GUELPHI, great-great-grandson of this prince, inherited from his mother, daughter of Guelph II., the duchy of Bavaria, and founded the junior house of Guelph, from which the Brunswick family sprung. One of his descendants, named OTHO, was invested with the province of Brunswick as a fief of the empire in 1235, and was recognized as the first duke of Brunswick. Several branches soon diverged from the parent stem. ERNEST, the Confessor, a staunch supporter of the protestant cause—born in 1497; died in 1546—was the founder of both branches of the existing dynasty—Brunswick-Wolfenbüttel and Brunswick-Lüneburg. One of his descendants, ERNEST AUGUSTUS of Brunswick-Lüneburg, joined the allies in the great war against Louis XIV. of France, and was rewarded with the long-desired title of elector of Hanover, which was procured for him through the exertions of King William III. of England. (See HANOVER.) GEORGE, a son of the elector, succeeded to the crown of Great Britain on the death of Queen Anne in 1714. Duke AUGUSTUS, who died in 1666, was distinguished for his literary tastes, and wrote several works under the designation of Gustavus Selenus. On his decease, the youngest of his three sons became duke of Bevern, and founded the line of that name. The two elder, RODOLPH AUGUSTUS and ANTHONY ULRICH, became joint rulers of Brunswick-Wolfenbüttel. The latter published a number of novels, in 6 vols. 4to, and in 1710 renounced the hereditary faith of his family, and joined the Romish church. (See Carlyle's *Life of Frederick the Great*, vol. ii., p. 376.) His great-grandson married, in 1739, Anne, duchess of Mecklenburg, heiress of all the Russias. Iwan, the son and heir of this couple, was murdered in 1764, and they were exiled to Siberia. As the sons of Anthony Ulrich died without male issue, FERDINAND ALBERT, of the line of Bevern, succeeded to the dukedom in 1735. One of his sons was the celebrated PRINCE FERDINAND, "a cheerful, singularly polite, modest, and well-conditioned man withal," who entered the Prussian service, acquired great reputation as a soldier in the Thirty Years' war, and in 1757 gained the battles of Crefeld and Minden, and drove the French out of Westphalia, Lower Saxony, and Hesse-Cassel. Another son, LEWIS ERNEST, was long captain-general of the United Provinces, but was expelled by the popular party in 1787. After a reign of a few months, Ferdinand Albert died in 1735, and was succeeded by his son, CHARLES, who in 1754 transferred the seat of government to Brunswick, and there founded the celebrated Collegium Carolinum. He was succeeded in 1780 by his son, CHARLES

**WILLIAM FERDINAND**, the most celebrated, but also one of the most unfortunate princes of his house: born, 1735; killed, 1806. He devoted himself to the military profession, and, at the head of the Brunswick auxiliaries, distinguished himself in the Seven Years' war—rendering signal service to his uncle, Frederick the Great. In 1764 he married Augusta, princess of Wales, and on the return of peace, devoted himself to the improvement of his ancestral dominions, which he governed with great wisdom. On the breaking out of the French revolution, he was appointed in 1792 to the command of the Prussian and Austrian armies, which invaded France for the purpose of re-establishing the old constitution of that kingdom. But in two successive campaigns he was foiled by the revolutionary generals; and, disgusted with his ill-success and the conduct of his Austrian allies, he resigned his command, and withdrew to his own territories. In 1806, when Prussia declared war against France, the duke was summoned from his retirement to take the command of the Prussian forces. But borne down by years, ignorant of the new system of warfare which the French had introduced, and at the head of an army morally disorganized and physically inferior to the enemy, the aged duke was altogether unfit to contend against Napoleon. He was first outmanœuvred, and then signally defeated, at the battles of Jena and Auerstadt, fought on the same day, October 14. The unfortunate prince died of his wounds at Ottensee, near Hamburg, on the 10th of November, and his duchy was seized by Napoleon, and incorporated with the new kingdom of Westphalia. His son, **WILLIAM FREDERICK**, recovered possession of his ancestral dominions when the French were driven out of Germany in 1813. He had served with considerable distinction under his father in the campaigns of 1792, 1793, and 1806; and on the renewal of hostilities with France after the return of Napoleon from Elba, the duke joined the allied forces in Belgium with his black Brunswickers, and was killed fighting bravely at their head in the battle of Quatre Bras, 16th June, 1815, in the forty-fourth year of his age. (See Byron's *Childe Harold*, canto iv.) His eldest son, **CHARLES**, then a minor, succeeded him; but his mismanagement of the affairs of his duchy so exasperated his subjects, that they rose in insurrection against him, September, 1830, and compelled him to seek safety in flight. On the 2nd of December following, the Germanic confederation resolved that the sovereignty of Brunswick should be transferred to his brother, **WILLIAM**, prince of Oels, who accordingly assumed the government on the 25th of April, 1831.—J. T.

**BRUNTON, MRS. MARY**, authoress of "Self Control" and "Discipline," two novels which long enjoyed a remarkable popularity, and are still esteemed as among the best specimens of the moral tale, was born in the island of Barra in Orkney in 1778. Her father, Colonel Thomas Balfour, was a cadet of one of the most respectable families in Orkney, and her mother a niece of the earl of Ligonier. The greater part of her education, which at an early period of her life included an acquaintance with French and Italian, she owed to her mother, who appears to have been a woman of rare gifts and accomplishments. In her twentieth year she married the Rev. Alexander Brunton, minister of the parish of Bolton in East Lothian, afterwards professor of oriental languages in the university of Edinburgh. Her first work, "Self Control," was published in 1811. It was followed by "Discipline," which sustained, but did not increase her popularity. She was engaged on a third tale, "Emmeline," when, to the great grief of her numerous circle of friends, she died at Edinburgh in 1818. "Emmeline" was published at a subsequent period by her husband, with an accompanying prefatory memoir.—J. S. G.

**BRUSASORCI**. See **RICCIO**.

**BRUTO** or **BRUTI, GIOVANNI MICHELE**, a Venetian historian, was born towards 1515. A consummate scholar, Stephens Battori invited him to Transylvania, and commissioned him to write the history of that country. Having followed that prince to the court of Vienna, he was appointed by two successive emperors, Rodolphus II. and Maximilian, imperial historiographer of Austria. His "History of Florence," down to the death of Lorenzo de Medici in 1492, although incomplete, is considered one of the best literary productions of that age. The "Life of Callymachus Experiens," the academical name of Filippo Bonaccorsi, written in the choicest Latin, is also from his pen. He died in Transylvania, in a state almost bordering on indigence, towards the end of the sixteenth century.—A. C. M.

**BRUTUS**, the name of a family belonging to the plebeian house of the Junii, the most distinguished members of which are—

**L. JUNIUS BRUTUS**, the supposed founder of the family. He belongs rather to poetry than to real history. He was the son of M. Junius and Tarquinia, the sister of the last of the Tarquins. His elder brother, after his father's death, was put to death by the tyrant, his uncle, in order that he might possess himself of his wealth; and Lucius only saved his life by the affectation of semi-idiotcy—whence his name of Brutus. When Titus and Aruns, two of the sons of Tarquinius, were sent by their father to Delphi to consult the oracle respecting a terrific prodigy that had appeared to him, Brutus accompanied them. Soon after this, while the king was besieging Ardea, occurred the outrage by Sextus, the third son of the tyrant, on the chaste Lucretia. After she had summoned her husband and her father, with other friends, to her presence at Collatia, and, having revealed to them her dishonour, had plunged a knife into her breast, Brutus, while the rest stood speechless, drawing it forth from the wound, swore, and called upon all the bystanders to swear, to pursue to destruction by fire and sword, Tarquinius and all his impious race. All took the oath, and led by Brutus, after placing the body of Lucretia upon a bier, they brought it into the forum. When he had sufficiently roused the passions of the men of Collatia, Brutus led a large body of them to Rome. In the commotion that followed the monarchy fell, 244 years after the founding of the city; and Brutus was chosen one of the two new officers, named consuls, on whom the supreme government of the state devolved. Soon after this, a conspiracy to restore the exiled king was detected, in which the two sons of Brutus had the principal share. The story of the stern father ordering and himself presiding over the execution of his sons is too well known to require recapitulation. When Tarquinius, having obtained the aid of the Veientes, invaded the Roman territory, Brutus led an army to meet him, and engaging in single combat before the battle with Aruns Tarquinius, lost his own life after killing his antagonist.

**DECIMUS JUNIUS BRUTUS ALBINUS**, one of the assassins of Julius Cæsar. He had served under Cæsar in the civil war, and had been nominated by him, shortly before his assassination, to the command of the province of Cisalpine Gaul. After the ides of March, Decimus Brutus, finding that nothing was to be done at Rome, repaired to his province. Unable to cope with Antony, who was shortly after appointed to supersede him, and mistrusting Octavius, he sought the assistance of Plancus in Gaul. But before long, Plancus joined Antony; and Brutus, being deserted by his soldiers, and betrayed by a Gaulish chief in whom he had trusted, was put to death by Antony's orders.

**M. JUNIUS BRUTUS**, son of M. Brutus, an officer in the army of Lepidus, born in the year B.C. 85. In the civil war between Cæsar and Pompey, Brutus was actively engaged on the side of Pompey, and did good service in the operations about Dyrrachium. At Pharsalia, Cæsar gave special orders to his soldiers to save the life of Brutus. To this he was probably moved by Servilia, the mother of Brutus, with whom he is said to have intrigued. After the battle Brutus fled to Larissa, and there gave himself up. He immediately accepted employment from the conqueror, while his uncle, Cato, a man of sterner mould, after a fruitless campaign in Africa, killed himself rather than yield. He was greatly honoured and trusted by Cæsar, being appointed, successively, proconsul of Cisalpine Gaul and prætor urbanus. At the beginning of the year 44, he entered into the famous conspiracy to kill the dictator. The morose and envious Cassius seems to have originated the plot, and to have worked upon the vanity of Brutus, by appealing to the example of his namesake, who delivered Rome from the tyranny of the Tarquins. The assassination took place on the ides of March. Cæsar, according to Plutarch, ceased to resist when he saw Brutus coming against him with his drawn sword, but, veiling his face, submitted to his doom. After the murder, an act of oblivion for all concerned was at first passed by the senate. But distrusting the temper of the people, and still more that of the old soldiers of Cæsar, who began to flock up to Rome, Brutus and Cassius retired to their estates in the country, where they remained for several months inactive. When, however, the senate had assigned provinces in Asia to Brutus and Cassius as out-going prætors—to Brutus Crete, and to Cassius Cyrenaica, foreseeing that they would have to enter upon a struggle for their very existence, they gladly left Italy. Brutus arrived in Asia in the

autumn of 44. Instead of confining himself to the province assigned to him he went to Athens; ingratiated himself with the Romans of high family whom he found there; persuaded Apuleius to deliver to him a large sum of public money which he was taking up to Rome, and Q. Hortensius to hand over to him, instead of to C. Antonius, the lawful proconsul, the province of Macedonia; tampered successfully with the troops of Dolabella and other officers; and, by these and similar means, made himself master of Achaia, Macedonia, and Illyricum, and of an army of seven legions. Yet the senate, on the motion of Cicero, ratified without hesitation all his measures! After the sanguinary proscription at Rome in 43, by Octavius, Antony, and Lepidus, many of the aristocratical party fled to Brutus for protection. At the end of the year Brutus and Cassius met at Sardis, and arranged a plan of operations against the triumvirs. But their dilatory and vacillating measures showed that they were no match for Antony, a soldier trained in the school of Cæsar. In the autumn of 42 the armies met at Philippi, with such result as might have been anticipated. The first action, which might have been a victory, was changed by the weak and premature despair of Cassius into a defeat. In the second action Brutus was completely defeated; and, being cut off from his camp, fled with some of his friends to a narrow lonely glen not far from the field of battle. We must refer to Plutarch for the striking story of his behaviour during his last hours, till the moment when he fell on Strato's sword. Brutus was twice married—to Claudia, whom he divorced, and to Porcia, the daughter of Cato.—T. A.

BRUYÈRE, JEAN DE LA. See LA BRUYÈRE.

BRUYN, JOHN DE, professor of natural philosophy and mathematics at Utrecht, was born at Gorcum in 1620. After having applied himself closely to study in various places, he settled at Utrecht, and became the pupil of Professor Ravensberg, whom he succeeded as professor of natural philosophy and mathematics. He wrote "De Vi Altrice;" "De Corporum Gravitate et Levitate;" "De Cognitione Dei Naturali;" and "De Lucis Causis et Origine." He died in 1675.—T. J.

BRY, JOHANN DIETERICH (THEODORUS) DE, a celebrated engraver of the 16th century, has executed many valuable works on botany, containing delineations of plants. His works are entitled "Florilegium" and "Anthologia."—J. H. B.

BRY or BRIE, THEODORE DE, an eminent German engraver and great worker, born at Liege in 1528. He set up at Frankfurt as printseller and bookseller, studying the works of Sebald Beham. He preferred street processions and parties of shaved and feathered men, working with his graver in a neat, free style, drawing the heads especially with peculiar spirit and expression. Brie died in 1598.—His two sons, JOHN THEODORE and JOHN ISRAEL, both became engravers. They executed a "Triumph of Death," &c., and a portrait of Mercator.—W. T.

BRYAN or BRYANT, SIR FRANCIS, an English statesman and man of letters of the sixteenth century. After his education at Oxford, and some years spent in travel, we hear of him in 1522 attending on the earl of Surrey in the expedition to the coast of Brittany, and leading successfully the troops sent against the town of Morlaix, for which service he was knighted. He was afterwards sent on several diplomatic errands to Spain, France, and Rome, and was gentleman of the privy chamber to Henry VIII. and his son. In the reign of the latter, he joined an expedition into Scotland, and distinguished himself at the battle of Musselburgh. He was sent to Ireland in 1549 as lord-chief-justice, and died there in the following year. He wrote some pieces which are found, with the productions of Wyatt and Surrey, in a collection of poems by uncertain authors, printed in 1565.—J. B.

BRYAN, GEORGE, an American jurist and politician of the revolutionary period, descended from an old and respectable family, was born in Dublin about 1730, emigrated to America at an early age, and lived in Pennsylvania over forty years. In 1776 he was named vice-president, and in 1778 became acting president of the supreme executive council of Pennsylvania. While a member of the legislature in 1779, he projected and procured the enactment of a law for the gradual abolition of slavery. In 1780 he was appointed a judge of the supreme court of Pennsylvania, which office he held till his death in January, 1791. He was a conspicuous opponent of the adoption of the federal constitution.—F. B.

BRYAN, MICHAEL, author of the celebrated "Biographical and Critical Dictionary of Painters and Engravers," was born at

Newcastle in 1757. He resided in Flanders from 1781 till 1790, and on his return became known as an accomplished connoisseur of paintings. He was employed to introduce to the British public the well-known Orleans collection. His dictionary, the fruit of many years' research and study, was published in 1812, and still retains its place as a standard work.—J. B.

BRYANT, CHARLES, an English botanist of the eighteenth century, published a history of esculent plants, a dictionary of the ornamental trees, shrubs, and plants cultivated in Great Britain, and an account of two species of lycoperdon.—J. H. B.

\* BRYANT, WILLIAM CULLEN, an eminent American poet and man of letters, was born November 3, 1794, at Cummington in western Massachusetts. When he was but thirteen years old he wrote "The Embargo, or Sketches of the Times, a satire," and the "Spanish Revolution and other Poems," Boston, 1808. The youthful poet was entered at Williams college in 1810, but left it before graduation, to begin the study of law. He was admitted to the bar in 1815, and was engaged in legal practice for ten years, mostly at Great Berrington, Mass. In 1825 he finally quitted the profession, and went to reside in the city of New York, where he has since exclusively devoted himself to literary pursuits. "Thanatopsis," the unrivalled production of a youth only eighteen years old, was published by him in the *North American Review* in 1816. In 1821 Bryant published at Cambridge a volume containing "The Ages," "Thanatopsis," and a few other of his finest productions. The book established his position in the front rank of English poets. All the pieces in it are polished to the last degree of nicety, but they cannot be said to betray labour, for theirs is the highest art that conceals art. The forms of expression, the imagery, and the general turn of thought, are perfectly simple and natural. The first outbreak of Bryant's genius was the most rich and abundant. Since the appearance of "The Ages," he has published only short poems, and at considerable intervals. The whole of his published poetry, the production of a full half century, is contained in a single volume of very moderate size. Several of Bryant's poems appeared first in the *New York Review*, which he edited in 1825-27. In 1826 he became the editor of the *Evening Post*, one of the oldest and most influential newspapers in the United States, with which he has ever since been connected. Bryant has always been a generous and uncompromising advocate of free soil and free institutions. He has also laboured effectually to diffuse a taste for the fine arts in America, has been president of several associations for this purpose, and has always shown himself a kind and judicious friend to young artists. As a prose writer, his style is pure, easy, and idiomatic. Few who have been compelled by circumstances to write so much, have written so uniformly well. He has twice visited Europe, travelling over the British isles and a large portion of the continent. Mr. Bryant resides at Roslyn, a beautiful village on the Sound, at a short distance from New York.—F. B.

BRYDGES, SIR SAMUEL EGERTON, Bart., a well-known and highly-gifted writer, was born at Wootton, county of Kent, in 1762. He was educated first at the grammar school at Maidstone, then at the King's school, Canterbury, and in October, 1780, entered Queen's college, Cambridge, where he remained two years. He was called to the bar in November, 1789, but never practised. In 1790, after the death of the last duke of Chandos, his elder brother, the Rev. E. T. Brydges, was induced by his persuasion to prefer a claim to the barony of Chandos; but in June, 1803, the house of lords rejected the claim. This result was deeply mortifying to Sir Samuel, and coloured the remainder of his life. He complained bitterly, and through every possible channel, of the injustice of the decision, and used to add to the signature of his name—"Per legem Terræ Baron Chandos of Sudeley." The best authorities, however, believe his pretensions to be utterly unfounded. In 1808 he received the order of St. Joachim of Sweden, and in 1814 was created a baronet. He represented Maidstone from 1812 to 1818. On the loss of his seat he quitted England, and spent the remainder of his long life on the continent. He died September 8, 1837, at Champagne Gros Jean, near Geneva, in his seventy-fifth year. Sir Egerton is a very voluminous author. His most important works are a volume of sonnets and other poems, which possess great merit; "Censura Literaria," a curious and valuable bibliographical work in ten volumes 8vo; "Memoirs of the Peers of England during the reign of James I.;" "Res Literariæ," three volumes; "Letters from the Continent;" "Letters on Lord

Byron; "Recollections of Foreign Travel;" "Stemmata illustria, præcipue regia;" his own "Autobiography, Times, Opinions, and Contemporaries," in two volumes 8vo; an edition of Collins' Peerage, in nine volumes 8vo; a number of poems, novels, works on politics and political economy, &c. &c. He established a private printing-press at Lee Priory, from which a number of valuable and curious works issued. Sir Egerton was undoubtedly a man of real genius, and of high accomplishments of a certain class; but both his usefulness and happiness were sadly marred by his inordinate pride and ambition, and by his eccentricities and unsteadiness of purpose.—(*Gent. Mag.*, vol. viii.)—J. T.

BRYDONE, PATRICK, known as the author of a "Tour through Sicily and Malta," was a native of Scotland, where he was born in 1743. As a travelling tutor, he made several excursions to the continent, visiting Sicily and Malta in 1770. His book appeared in 1773, and attracted considerable attention, especially on account of some speculations, borrowed from Recupero, which he introduced with regard to the age of the earth, as calculated from the number of eruptions of Mount Etna, shown by the strata of the lava. Brydone was made comptroller of the stamp-office. He found time to devote himself to experiments on electricity, which won him honour in the Royal Society. His later years were spent in retirement at Lennel house, near Coldstream, where he died in 1818. He is the "reverend pilgrim" in the stanzas of Marmion descriptive of the hero's halt at "Lennel's convent."—J. B.

BRYNE or BRYAN, ALBERT, organist of St. Paul's cathedral at the time of the great fire of London in 1666. He was a pupil of John Tomkins, and succeeded Dr. Christopher Gibbons as organist of Westminster abbey in 1667. Many of his services and anthems exist in the books of the various cathedrals. He died in the reign of Charles II., and was buried in the cloisters of Westminster abbey.—E. F. R.

BUAT, CHEVALIER DU, knight of the order of St. John of Jerusalem, of the order of St. Louis, and colonel of the royal engineers of France. He published a first work on hydraulics in 1779, founded on the experiments of previous authors; but seeing the necessity of further experimental knowledge on many points, he obtained an annual grant from the government for that purpose, which he applied in the most judicious manner for four years, making experiments—chiefly on the resistance of fluids, and on their flow in tubes and channels, and through orifices—which formed the foundation not only of his own mathematical researches, but of most of those of subsequent writers on hydraulics down to the present time. In conducting those investigations, Du Buat may be said to have invented a new mode of combining theoretical reasoning with experiment, peculiarly suited to branches of science in that imperfect and provisional state in which hydraulics then was and still continues. His experiments, with the theoretical conclusions founded on them, were published in two octavo volumes in 1786, under the title of "Principes d'Hydraulique," forming a work which will always be held in the highest esteem by those who appreciate the right method of inquiry in physico-mathematical science. The most important of Du Buat's discoveries, and that which forms the key to all the rest, is the law that the friction of a mass of fluid (which either directly or indirectly is the only cause of resistance to its motion, or to that of a solid body through it) is independent of the pressure, and is proportional to the density of the fluid, to the extent of the surface of contact between the fluid and the body along which it glides, and *very nearly* to the square of their relative velocity.—W. J. M. R.

BUCER, MARTIN, a celebrated reformer, was born at Schlettstadt in Alsace in 1491. When not quite fifteen years of age he entered the Dominican order, and repaired to Heidelberg, and entered on the study of Hebrew, Greek, and theology. Having listened to a conference between Luther and some scholastic doctors, he was deeply impressed with many of the reformer's opinions, admiring, as he phrases it, "his Pauline clearness and comprehensive Biblical knowledge." On his formally espousing the new doctrines, he was bitterly persecuted, but was received by the Palsgrave Frederick, who made him his court-chaplain in 1521. In the following year he resigned this situation and married a nun. Changing his residence more than once, he was reduced to extreme poverty, and betook himself to Strasburg. Catholicism had been considerably shaken in that city already, and Bucer willingly and energetically threw himself into the movement, and was unanimously chosen minister in

1524. The sacramentarian controversy had begun to divide the reformers, and Bucer was anxious to adopt healing measures. His own opinions on the eucharist were, at this period, fully nearer those of Zuingli than those of Luther. But his efforts with both parties were to no purpose, and Luther and he exchanged some hard and unworthy words. At a famous consultation at Marburg, Bucer took part with the Swiss, holding to the notion of "Christ being ever present, *by his Spirit*, in the sacrament." Bucer took a part in many other attempts at mediation between the conflicting parties, but these attempts were vain, and he only earned the title of a time-server. Such was Bucer's love of peace, that he entered into a conference with the catholics, doing so, however, at the command of the emperor. But he would not subscribe to the Augsburg *Interim*; and as his firmness involved him in no little danger, he accepted the invitation of Archbishop Cranmer, and landed in England in April, 1549. The king appointed him professor of theology at Cambridge, and the university conferred upon him the title of D.D. King Edward had a great respect for him, and on one occasion sent him a hundred crowns to buy a German stove. But his constitution had been shattered, and the return of a previous ailment cut him off on the 28th of February, 1551. He was buried with great pomp. During the reign of Mary in 1554, his tomb was broken into, and his bones disinterred and burnt. Queen Elizabeth rebuilt his monument in 1560.

Bucer was a man in whom the spiritual had the ascendancy over the intellectual portion of his nature. He was fond of peace at almost any price, but compromise served no purpose in that keen polemical age. He must have been reckoned a man of tact, but his pacific enterprises usually failed. He could not create the current, but he nobly strove to direct it. His works are numerous, and indicate talent and industry. They are distinguished, not by any original power, but by facility of illustration and promptitude of argument, and are enriched with a vigorous piety, and a hearty desire to secure the progress of truth and the peace of the church. Some of Bucer's commentaries are not without value in the present day. As a reformer, he had neither Luther's courage, Melancthon's erudition, nor Calvin's logical faculty; his action was confined to a subordinate sphere; strong partisans suspected him, but his toils and sufferings prove his integrity. His character was so pure, that it was never assailed, even in those days of unscrupulous calumny and satire.—J. E.

BUCH, LEOPOLD VON, one of the greatest of modern geologists, born in Uckermark, on the banks of the Oder, in 1774; died in the spring of 1853. His labours constitute an epoch in the science of his predilection. The life of Von Buch was essentially a life of transition: he began as the disciple of Werner; when his labours closed, no doubt could rest in any candid mind, that he had destroyed the authority of that great master. The early progress of rational geology evolved the conflict of two systems, that soon became two conflicting *schools*. At the head of one was Von Buch's teacher, Werner of Freyberg. It was the fixed opinion of Werner, who lived and wrought mainly among the stratified rocks, that all rocks now existing have been laid down by the action of water—some in the way of the mere subsidence of materials suspended for a time in the primal ocean—others in a crystalline form, because of the slow separation of materials originally held in solution by that ocean. Fortunately, Von Buch had the genius of the traveller, as well as the acuteness and sternness of the explorer; and the conclusion he finally reached was deduced from inspection of the most striking and spacious aspects of Nature within range of our European continent. At Perugia, and in presence of Vesuvius, he learned that the volcanic forces could not be exceptional disturbances, and lightly dismissed as such. His letters from these regions are written under a pervading sense of the wonderful. In search of farther insight, he turned his steps towards Auvergne. In 1751, the Frenchman Guettard first penetrated the character of this remote and mysterious region; and, twelve years later, Desmarests traced through it a long chain of extinct volcanoes, associated with countless and gigantic masses of basalts, or "giants' causeways," mingling apparently with fresher lavas and ashes still more recent. This, and much more than Desmarests could see, burst upon the full although only half-opened eye of Von Buch. Gazing on the long chain of Puyes that stretch away down from Mont Doré, he saw, as if by pre-sentiment, that he was surely looking on more than a group of independent volcanoes—that the entire mass of Mont Doré might

have been elevated by subterranean forces, of which the numberless craters covering the plateau were but individual and subordinate outlets! Vesuvius, even, and Etna, and all these extinct but at one time blazing Puys, thus shrunk into mere isolated vents, communicating with the seat of some mighty igneous force, far down below the surface of the globe. Our geologist could of course be a Wernerian no longer; but something was still wanting to the solidity and sufficiency of the basis of an edifice like that imagined by the pioneers of the Plutonic school. Volcanoes—even those masses of Auvergne—are, if compared with the regions occupied by the crystalline or granitic rocks, trifling in extent, and poorly representative of energies that could have given birth to our stupendous primitive mountains. Von Buch next looked towards the Scandinavian peninsula. His Neptunism received its deathblow there; and the blow resounded through the scientific world. In the environs of Christiania, and elsewhere in a great number of places, he found mountains of porphyry resting on limestone, and enormous masses of granite leaning on stratified beds full of petrifications. The system of Werner could be sustained no longer;—Von Buch's early faith was conclusively done for!—But still larger views soon broke on our geologist. What he had seen dimly indicated in the soil of Auvergne, became matter of demonstration in Sweden. For more than half a century previous to Von Buch's visit, the inhabitants of the sea-coast of that country had marked a gradual retirement of the ocean. Satisfying himself that the fact is rigorously true, the inquirer exclaims—"How strange a phenomenon, and to how many problems does it give rise!...We can reach no other result than that a slow and general rising of Sweden is taking place—from Frederichshall to Abo, and probably to St. Petersburg." It was years before Von Buch traced all the consequences of this astonishing result; but he succeeded in the end in laying, through means of it, the sure foundations of the rational *dynamics* of geology. Farther instructed, and confirmed by his subsequent voyage to the Canaries, of which he has left so pleasing a record, he bequeathed as fixed points of all future science—(1) the doctrine of the elevation alike of mountains and continents; (2) an analysis of the mechanism of the formation of volcanoes; (3) the theory of the shifting of the beds of oceans, in connection with the elevation of mountains; and (4) the determinate and marvellous significance of the *unconformity* of strata—a phenomenon never before interpreted, but which is nothing else than a key to the periods and comparative ages of the great revolutions of our globe. Truths like these could be reached only by a master-mind. They are, indeed, only inductions: would that many which have succeeded them were as pure! His separate contributions on specific points are numerous and invaluable. His manner of existence was simple and retiring—affected, in a certain degree, by a racy peculiarity. He was the true working geologist; never shrinking from toil, and able to endure it.—His friends were the most distinguished men in Europe. Alexander Humboldt left, in a few words of affection, the confession how much he loved him, and how deeply he felt that science should deplore his loss.

BUCHAN, DAVID, a skilful and accomplished officer belonging to the royal navy of Britain, is entitled to notice mainly from his connection with enterprise in the arctic seas. In 1818 he was intrusted with the charge of the *Dorothea* and *Trent*, two vessels fitted out by the British government for the purpose of seeking a passage from the Atlantic ocean into the Pacific, through Behring Strait, by way of the pole. Lieutenant (afterward Sir John) Franklin, in command of the *Trent*, was Buchan's companion on this enterprise. For a narrative of this remarkable voyage we are indebted to the pen of Captain Beechey, who bore a share in it. (See BEECHEY, F. W.) Buchan was subsequently employed upon the Newfoundland station, and held for several years the office of high-sheriff of Newfoundland, to which he was appointed in 1825.—W. H.

BUCHAN, DAVID STEWART ERSKINE, earl of. See ERSKINE.

BUCHAN, ELSPITH, a crazy Scottish matron, whom, as the leader of a small but enthusiastic sect of fanatics, it would have been proper to call an impostor, if her impositions had only been a little more successful. She was born at Fitney-Can, between Banff and Portroy, in 1738. Shortly after her marriage with Robert Buchan, a potter in Glasgow, she assumed those high but undefined pretensions to an apostolic character, which her

name but too ludicrously recalls; and having persuaded a certain Mr. Hugh Whyte, a relief clergyman of Irvine, to undertake the promulgation of her evangel, she soon found herself surrounded by a score or two of adherents, some of whom, strange to say, had neither the excuse of ignorance nor idiocy. Irvine was at first the head-quarters of the Buchanites; but in 1784, having been subjected to some annoyances by their fellow-townsmen, they migrated, to the number of forty-six persons, to a farmhouse two miles south from Thornhill, and thirteen from Dumfries. In 1791 Mrs. Buchan had still a few followers, to whom her last injunctions were communicated with the same confidence as those she had laid on her first apostle. They were to understand that she was in reality the Virgin Mary; that she would only sleep a little as if she were dead, and return to conduct them to the New Jerusalem; and they were to keep all that as an inviolable secret. She died in May, 1791. Her deluded votaries, among whom still figured the unfortunate clergyman, would not bury her, but built up the coffin in a corner of the barn, expecting her speedy resurrection. To conclude this strange tale of imposture, some country people who pitied its victims as much as they abhorred the memory of its heroine, consigned her bones to the dust, also expecting a resurrection, but not in haste.—J. S., G.

BUCHAN, JOHN STEWART, earl of, second son of Robert, duke of Albany, regent of Scotland, and grandson of Robert II. of Scotland; born in 1380; died in 1450. In 1420 Buchan passed over to France at the head of 6000 Scotch troops to the assistance of the dauphin, afterwards Charles VII., then hard pressed by the English; and on the 22nd of March, 1421, gained a signal victory at Beaugé in Anjou over an English army under the duke of Clarence, brother of Henry V., who was slain in a personal encounter with the earl. For this service the dauphin rewarded Buchan with the office of constable of France. He was killed at the battle of Verneuil, 17th August, 1424, which was lost by the imprudence of the count of Narbonne, who disobeyed the orders given by the constable.—J. T.

BUCHAN, WILLIAM, M.D., author of the popular work named "Domestic Medicine," was born at Ancrum, Roxburghshire, in 1729. His father intended him for the church, but his taste for medical study, which had been very early displayed, thwarted the paternal purpose; for though entered at the university of Edinburgh as a student of divinity he devoted his time to mathematics, botany, and the usual branches of a medical course. Having been nine years at the university, he began practice in Yorkshire, and was soon appointed physician to the Ackworth Foundling hospital, a position in which he learned much that was of service to him in writing his well-known book. Parliament having withdrawn the grant for the support of the Ackworth institution, Dr. Buchan removed to Sheffield, where he practised till about 1766, when he returned to Edinburgh. His practice there was not extensive. He devoted himself mainly to the preparation of the "Domestic Medicine," which was published in 1769. Its nature can be best described by quoting the title in full—"Domestic Medicine; or, the Family Physician—being an attempt to render the medical art more generally useful, by showing people what is in their own power, both with respect to the prevention and cure of diseases: chiefly calculated to recommend a proper attention to regimen and simple medicines." The work was prepared on a plan similar to Tissot's *Avis au Peuple*, and was received with extraordinary popular favour. It was said, that for nearly forty years, the publisher realized £700 annually for its sale, that being the exact sum which the author had received for the copyright. Dr. Buchan's book was soon translated into almost every language of Europe, and its author received congratulatory letters from all quarters. His great fame induced him to remove to London, where he enjoyed a lucrative practice till his death on the 25th February, 1805. He left a considerable number of medical works, but his fame must rest on the "Domestic Medicine," which is still found in many a family library, especially in rural districts.—J. B.

BUCHANAN, Dr. CLAUDIUS, vice-provost of the college of Fort-William, Bengal, the able and scholarly author of the "Christian Researches," was born at Cambuslang, near Glasgow, in 1756. In 1787, having completed his curriculum at the university, he conceived the romantic idea of making the tour of Europe on foot, in the character of a fiddler! but had only reached North Shields, when he abandoned the project as too

formidable, and with difficulty obtained the situation of clerk to an attorney. In this capacity, with a salary of £40, he managed to subsist nearly a year, all which time he pretended in his letters to his parents to date from Florence. In 1789 he made the acquaintance of the admirable John Newton, and through him of an influential and wealthy gentleman, who immediately conceived so high an opinion of the young man, that he sent him to Cambridge at his own expense, to prepare for the church. Having been ordained by the bishop of London, he became the curate of his tried and loved friend, Mr. Newton, but had only been in that position a few months, when the offer of a chaplaincy in India was made to him, which he immediately accepted (1794). His station was at Barrackpore, near Calcutta, where he remained, although much dissatisfied with his position, till 1801, when he was made vice-provost of the newly-founded college of Fort-William. The success of this institution, not a little of which was owing to the energy of the vice-provost, excited immediate and universal interest. An account of the benefits accruing to the population of India from its foundation should be looked for in Mr. Buchanan's "Primitiæ Orientales." In 1806 he set out on a tour through the Madras and Bombay presidencies and Ceylon; the result of which was the admirable work by which he is best known, as it is a work by which he will be long remembered—"The Christian Researches." The university of Glasgow conferred on the author the degree of D.D. Dr. Buchanan returned to England in 1808, when the East India Company's charter was about to be renewed. To his efforts at that critical moment was mainly owing the foundation of an ecclesiastical establishment in India. He died in 1815, while engaged in preparing a Syriac edition of the New Testament.—J. W. D.

BUCHANAN, GEORGE, the third son of Thomas Buchanan and Agnes Heriot, was born in a farmhouse called the Moss, near Killearn, Stirlingshire, about the beginning of February, 1506. The family of Buchanan was ancient but poor, *magis vetusta quam opulenta*, as George himself styles it in his brief autobiography. His father died at an early age, and at this trying period his grandfather became insolvent. But in the midst of such adversity his mother struggled hard for her numerous family, consisting of five sons and three daughters. George received his first education at the parish school of Killearn, but his uncle, James Heriot, sent him in 1520 to prosecute his studies at Paris, and here he first gave himself to the composition of poetry. Two years afterwards this uncle died, and the young Scottish student, left in destitution and disease, immediately came back to Scotland, and in a short time enrolled himself among the troops of the duke of Albany, not from the love of adventure only, but, as himself confesses, to learn something of the military art. About the age of eighteen, he entered the university of St. Andrews, and on the 3rd of October, 1525, he took his degree of B.A., having been ranked as a pauper. John Mair's prelections made St. Salvador's famous. Buchanan, whatever his opinions of his preceptor at this period, afterwards, in a famous epigram, saluted him with the wicked pun—"Solo cognomine Major." But in 1527 he followed Mair into France, entered the Scottish college, and became master of arts in March, 1528. In the meanwhile he adopted Lutheran opinions, and two years after his degree he became a regent or professor in the college of St. Barbe. Here he taught grammar for three years, and the misery he suffered from inadequate remuneration he has immortalized in one of his poems. His acquaintance with Gilbert Kennedy, earl of Cassilis, began at this epoch; and his first work, a Latin translation of Linant's Latin Grammar, on being published was dedicated to his pupil, Lord Cassilis, "a youth of the most promising talents." The date is Paris, 1533. Five years afterwards, in company with his pupil, he returned to Scotland, and sojourned for a brief period at the baronial residence in Ayrshire. Here he composed his "Somnium," a satire on the vices of ecclesiastics, and the inconsistencies, hypocrisy, and indolence of a monastic life. In this dream St. Francis appears to the poet, and endeavours, by describing the character and pleasures of the order, to induce him to enter it. One of his enemies gave him, in revenge, the title of "Bacchicus histrio et atheus poeta." King James then retained him as tutor for one of his natural sons, so that the rage of the Franciscans did not hinder his preferment. Then, at the royal request, he published his "Franciscanus," a scourge not of whips but of scorpions. The poem is one of the most felicitous of

satires: the wit and the scorn are clothed in a style of racy magnificence—now flashing into humour, and now darkening into fulmination. The rancour of his adversaries broke out at once upon him; Cardinal Beaton offered a price for his head; but though he was arrested he contrived to escape, and fled, as might have been expected, through many dangers to London. Applications for pecuniary assistance to the starving satirist were made in vain to Thomas Cromwell and King Henry; and it seems that, when he was necessitated to beg, he made his Latin muse his intercessor. Turning his footsteps to France, Buchanan learned that Cardinal Beaton was there as ambassador, but, on the invitation of Andrew Govea, he found refuge in Bourdeaux, became a professor of Latin in the college of Guienne recently established, and in this capacity presented a Latin poem to Charles V. on his entry into the city. There he composed his earliest drama, the "Baptistes," and wrote a Latin version of the Medea of Euripides. Both tragedies were well received; then came the original drama of "Jephthes," and a translation of the Alcestis. These tragedies, both original and translated, show a wondrous command over the Latin language, unequalled since the period of its native bards. The "Baptistes" and the "Jephthes" abound rather in noble sentiments than in rich or crowded imagery. Buchanan could picture what was terrible far better than delineate what was touching or pathetic—could more easily stir the indignation or horror of his readers than excite them to tears. Honour, courage, liberty, and patriotism are his favourite themes, as his lines roll on in sonorous declamation. There is nothing mawkish or meretricious—no glitter or false pomp—none of the fustian that apes the sublime, or of the sentimental that often passes for tenderness. Michel de Montaigne and the elder Scaliger were among Buchanan's cherished friends in the south of France.

After residing at Bourdeaux for three years, he returned to Paris, and was appointed a teacher in the college of cardinal le Moine, and had among others, Turnebus and Muretus for his colleagues. In 1547 Buchanan and Govea sailed for Portugal, the native country of the latter, and settled, with other distinguished men, at the new university of Coimbra. After the death of Govea, Buchanan and his coadjutors became the victims of Portuguese bigotry. Buchanan was confined for several months, and during this incarceration, he began his famous Latin version of the Psalms. When set at liberty, he longed to be again at Paris, and sighed his regret in his "Desiderium Lutetiæ," but he finally embarked at Lisbon for England. About 1553 he returned to France, a nation admired and loved by him, for what he calls its *summa humanitas*. He was first appointed a regent in the college of Boncourt, and two years afterwards he became tutor to the son of the comte de Brissac. The following year appeared the first specimen of his translation of the Psalms. Like the Consolations of Boethius, the Evidences of Grotius, the History of Raleigh, the Henriade of Voltaire, and the Pilgrim of Bunyan, this work of Buchanan's had been projected and commenced in a dungeon. Immediately after 1560 he returned to Scotland, and in a short time became classical tutor to the young queen, who read with him every afternoon a portion of Livy, and gave him in compensation the temporalities of Crossraguel abbey, worth nearly 500 pounds Scots. Publicly avowing his attachment to the doctrines of the Reformation, he was, by the earl of Moray, nominated principal of St. Leonard's college in 1566. This year appeared the second edition of his Psalms, dedicated tersely but gracefully to his royal pupil, whose marriage he had celebrated in his spirited and beautiful "Epithalamium." A second edition of the "Franciscanus" appeared at this time, dedicated to the earl of Moray. Another of his satires, "Fratres Fraterrimi," was also prepared during these months, and there followed others of his lighter pieces, such as his "Elegiæ," "Silvæ," "Hendecasyllabi." The high estimation in which Buchanan was held is seen in the fact, that after being a member of various assemblies of the Scottish church, and one of a commission to revise the Book of Discipline, he was chosen moderator when the high ecclesiastical court met in June, 1567. The conduct of Queen Mary had produced a complete alienation from her in Buchanan's mind, and he became the earl of Moray's coadjutor before Elizabeth's commissioners at York and Westminster, and his "Detectio," not his "Actio contra Marianam," was published in 1571. In 1570 he published, in his own vernacular, another political tract, called the "Chameleon"—a satire directed against the laird of Liddingtone.

In 1571 Buchanan was appointed preceptor to the young king, who was only four years of age. The aged tutor tried to make his royal pupil a scholar; but his erudition, poured in merciless profusion into a weak mind, at once degenerated into pedantry. In his delicate task he was assisted by Patrick Young and the abbots of Cambuskenneth and Dryburgh, cadets of the noble house of Marr. There was some distinction between the functions of Young and Buchanan, as James Melville, in his diary, calls the one the "master" and the other the "preceptor." Young was very lenient towards his royal pupil, but the sternness of Buchanan made such lasting impression on his mind, that long after he had ascended the throne of England he professed his terror at the person and approach of one of his courtiers, because they reminded him so much of his pedagogue. Lest the person of the prince should be degraded by corporeal punishment, a boy was procured to suffer the penalty in his room; and many a time his vicarious cries and sobs taught James what he was thought to deserve for his mistakes in cases and conjugations, parts of speech and prosody. But Buchanan, not content with such polite substitution, occasionally exempted the "whipping-boy," and flogged the original transgressor. Severely provoked in one instance by his pupil's noisy petulance, and by words that sounded like a challenge to touch him, Buchanan laid hold of his birch, unrobed his youthful majesty, and did not spare him for his cries. At this time Buchanan was made director of the chancery, and also privy-seal. The treatise "*De Jure Regni apud Scotos*" appeared at Edinburgh in 1579, and is dated Stirling, 10th January. The tractate is in the form of a dialogue between the author and Thomas Maitland, and contains an eloquent defence of popular government and its great charter, that liberty should be guarded by law, and not be dependent on the pleasure of the king; that there can be no inherited right of property in man; that sovereigns must be bound by the conditions on which they have received the crown; and that if the occupant of the throne transgress such a paction, he may be resisted and brought to condign punishment. Buchanan's book was immediately assailed by such men as Blackwood, Winzet, Barclay, Lang, and Mackenzie. In 1584, two years after its author's death, it was condemned by parliament; and every person who had a copy of it was ordered, under a penalty of a hundred pounds, to surrender it in forty days. In 1664 the privy council issued a more stringent enactment; and in 1684 the university of Oxford sent it and the political tracts of Milton to the flames. But the "*De Jure*" will ever remain a noble monument of its author's integrity and acuteness, and of his mental and moral superiority. For while many of his compeers were fettered by misinterpretations of scripture and decisions of early councils, and enslaved by an unworthy and almost superstitious reverence for the existing powers, he maintained in his imperious style the rights of our common humanity, and the theories which modern times and experience have everywhere sanctioned. He argued for liberty in an age of bondage, declaimed against tyrants in an age of tyranny, and laid down those grand principles which now form the basis of constitutional administration.

Buchanan's "*Rerum Scotticarum Historia*" was published in 1582. It is certainly a very unequal production; its earlier chapters are a mixture of erudition and fable; the latter copied from Boece. The transactions of his own times occupy a large portion of the work, and he chronicles affairs as he felt them, not in all cases precisely as they happened. He was too near them, and too much mixed up with them, to view them with a dispassionate eye. But the style is pure and dignified; the narrative is lucid and full of interest—the whole, as Hallam says, being "redolent of an antique air." When he rebukes, it is with freedom, and when he moralizes, it is with a wisdom that lifts him beyond commonplaces, and with a courage that never forgets the rights, liberties, elevation, and advancement of his species. George Buchanan died 28th September, 1582, aged seventy-six, and was buried in the Greyfriars' churchyard. The scenes of his deathbed are exceedingly characteristic, as given in James Melville's Diary, published by the Wodrow Society. Buchanan was buried at the public expense, and his funeral was attended "by a great company of the faithful."

No Latin scholar has risen among us like George Buchanan. We willingly contest the palm for him with all competitors, especially in Latin poetry, with Beza, Andrew Melville, Boyd of Trochrigg, Rollock, Arthur Jonston, Scott of Scotstarvet, Kerr, Eaglesim, Henrison, Pitcairne, or Barclay, with Vida, Passerat,

or Saint Marthe, or any writer found in Gruter's collection, published in three volumes, under the names of *Deliciae Poetarum, Gallorum, Belgarum, Italorum*. (See *Poetarum Scotorum Musæ Sacræ*; Edin. apud. Tho. et Wal. Ruddimannos, 1739.) He had made the Latin tongue his own. His style is no affected imitation of any favourite author, such as Erasmus in his Cicero-nianus, and other satirists, were wont to castigate. It is wonderfully free from mannerisms, though it is sometimes discursive with the air of Livy, and sometimes compact with a resemblance to Tacitus. But it always fits into his thought without any apparent struggle or awkwardness. His poetry is occasionally heavy and rugged, and his hosts of epigrams, while they are always clever, do not always sparkle. His poem "On the Sphere," or in ridicule of the Pythagorean philosophy, which Mr. Hallam thinks one of his best, does not appear to us to deserve so high a place. Its reasonings are lucid, and its exposure of absurdities is telling; but its strokes have more hardness than dexterity, while its wit is ponderous—rather like the gambols of an elephant than the frisking of a squirrel. The Psalms are in every variety of metre, and those Hebrew lyrics, though often diluted and paraphrased, were never clothed in a strange language with less injury to their tenderness, beauty, and devotion. The version of the 104th psalm has often been admired for its spirit and majesty—its magnificent imagery, and musical cadences. The version of the 137th psalm has also been often quoted and eulogized, and so has his ode to May—"Maia Calendæ." Had George Buchanan worn a cowl and lived in a cell, no higher scholarship could have been expected of him. But he was a poor wanderer for the greater part of his life—often in want, and as often in danger. Nay more, in his later days he was engrossed by public business, and his love of country was stronger than his love of the Muses. But he never made learned retirement a pretext for neglecting the duties of a patriot and a statesman. So far from being a dreaming pedant, he was a shrewd and indefatigable man of business. In his preface to his "*Baptistes*," he warns the young king against the effects of flattery and wicked counsellors, and writes more like an experienced statesman than a scholarly recluse. His satirical poems must have greatly aided the Reformation in Scotland, as was similarly done in Germany by the genius of Erasmus. Beza loved the Scottish scholar, and heaped many a compliment upon him; and the learned men of the continent, Thuanus, Le Clerc, Grotius, Scaliger, and Henry Stephens, the giants of those days, were forward in their admiration and esteem. Buchanan was apparently somewhat grim and irritable, and could utter severe and cutting sarcasms. His enemies were treated by him with considerable asperity, but, like all men of his temperament, he lavished his heart upon his friends. His Scottish roughness was not wholly polished away by his French sojourns—the keenness of the northern blast cuts in many of his tirades. Tradition speaks of his wit, and we do not doubt its accuracy; for the flavour and pungency of the Attic salt still exhilarate his readers. His youthful poems are certainly not free from those blemishes which are found in the juvenile productions of Beza; but the coarse and vulgar extravagances ascribed to him as the king's fool or jester, and which are yet current among us, are apocryphal—the most of them being the production of Dougal Graham, the bellman of Glasgow, who, between 1750 and 1779, composed, printed, and published a rare variety of "chap books," such as—George Buchanan; John Cheap the Chapman; Leper the Tailor; Paddy from Cork, &c. These pieces were carried by shoals of pedlars through all the country, and saturated the common mind with their grossness and indecency. (*Strang's Clubs of Glasgow*, page 92.) A monument has been erected at Killearn to George Buchanan's memory, and a brief Latin poem in honour of the event was composed by the most learned of Scottish schoolmasters, the late Dr. Doig of Stirling. The poem is short, but it is equal in merit to any of the elegies composed at Buchanan's death by Beza, the two Scaligers, Andrew Melville, and others. Buchanan's works are found in two editions, one by Ruddiman, Edinburgh, two vols. folio, 1715, and the other by Burmann, Lugduni Batavorum, two vols. 4to, 1725.—(*Irving's Life of Buchanan*, second edition, Edinburgh, 1817.)—J. E.

BUCHANAN, JAMES, president of the United States of America, was born in Franklin county, Pennsylvania, April 13, 1791. After completing his education at Dickenson college he studied law, and was a successful practitioner during the short

portions of his life which have not been devoted to politics. He began his political career as a federalist, and as such was a member of the Pennsylvania legislature in 1814-15. After an interval he was chosen to the lower house of congress in 1821, and was continued a member by successive re-elections for ten years. As soon as the democratic party was formed upon its new basis by the adherents of General Jackson, Mr. Buchanan became a prominent and active member of it, and has shared its honours and its good or evil fortune for over thirty years. In May, 1831, he was appointed minister plenipotentiary to Russia, as successor to the celebrated John Randolph, and he held this post for three years. Immediately after his return he was elected a senator of the United States, and continued so till 1843, a period of eight years. When the Polk administration began in 1845, Mr. Buchanan was appointed secretary of state, and retained that office till the whigs came into power under General Taylor four years afterwards. Then there was an interval of four years, after which Mr. Buchanan was appointed minister to Britain in 1853, where he continued till the prospect of his elevation to a still higher post tempted him to resign and return home. In the autumn of 1856 he was chosen president of the United States by 174 electoral votes, against 114 which were cast for Colonel Fremont, and 8 for Mr. Fillmore. His death occurred in June, 1868.—F. B.

BUCHEZ, PHILIPPE-JOSEPH-BENJAMIN, born in the department of Ardennes in 1796, a noted French politician and publicist. Buchez was a politician through almost his entire life; and his course was shaped by attachments to the old Directory and Robespierre. This statement, however, must be guarded. Buchez was a man of unsullied life and sterling humanity and honour; he merely chimed in with the fantastic theories of the *parti exalté*. He was, of course, a bitter foe to the Restoration, and we find him closely connected with the secret societies which swarmed at that time in France. He afterwards connected himself with the *Producteur*—a St. Simonian publication, founded by Bazard, Eafantin, and Rodriguez—all men of considerable ability and much fervour. On the occurrence of the Revolution of 1848, Buchez stood side by side with the men of the Republic; and the solidity and trustworthiness of his character obtained for him positions of responsibility. He was for a short period mayor of Paris, and afterwards president of the Assembly. Unfortunately, he fell on the fatal 15th of May, and his feebleness ruined his cause. Buchez was eminent, however, as a literary and philosophical writer, and made a special philosophy of man, of society, and humanity as a whole. Fair and even sound conceptions, betokening high aspirations and a good heart, run through all Buchez's scheme; but, however logical, it is not workable, and cannot pretend to solid foundation. Like De Bonald, he begins with abstract speculations concerning the nature of the human intellect; nor are the speculations of the two writers dissimilar, although De Bonald takes refuge in despotism, while Buchez steers his bark fearlessly out amid the tumults and uncertainties of democracy. Compared with reveries so dream-like as those of Buchez, there is comparatively little that is visionary in Jean-Jacques-Rousseau. Along with M. Roux, Buchez edited and published the parliamentary history of the early periods of the first and great French Revolution. He died in 1865.

BUCHHOLZ, PAUL FERDINAND FRIEDRICH, a German historian, was born at Altruppin in 1768, and died at Berlin in 1843. His writings are very numerous, but of very unequal merit. We mention—"Darstellung eines neuen Gravitationsgesetzes für die moralische Welt;" "Der neue Mæchia'vell;" "Theorie der moralischen Welt;" "Theorie der politischen Welt;" "Geschichte der Europäischen Staaten seit dem Frieden von Wien;" and "Geschichte Napoleon Bonapartes," &c.—K. E.

BUCHOZ, PIERRE JOSEPH, a French naturalist, was born at Metz in 1731, and died at Paris in 1807. He was a most laborious compiler.

BUCKERIDGE, JOHN, an eminent prelate, born near Marlborough in Wiltshire; after leaving the university of Oxford was appointed to some preferments in Essex; in 1604 became vicar of St. Giles', Cripplegate, and shortly after chaplain to King James; in 1606 was one of the four episcopalians appointed to preach before the king at Hampton Court, on the occasion of his giving an audience to the two Melvilles and other presbyterians of Scotland; and in 1611 was promoted to the see of Rochester. He was afterwards, in succession, bishop of Bath and Wells, and

of Ely, where he died in 1631. His principal work is "De Potestate Papæ in Rebus Temporalibus."—J. S., G.

BUCKINGHAM, DUKES OF. A title of great notoriety, and intimately connected with English history. It were needless to attempt to trace here a continuity, which in all probability does not exist. The title was first borne by the great house of STAFFORD, the last of whom was beheaded by Richard III.; then by the VILLIERS and SHEFFIELDS; and, lastly, by the GRENVILLES, the present dukes.

BUCKINGHAM, GEORGE VILLIERS, duke of, occupies a curious place in history. In many respects he was the lord and master of two English kings, and during a few troubled years virtual sovereign of the empire. He was the younger son of Sir G. Villiers of Rookesly, Leicestershire, though the eldest son of his father's second marriage, and was educated in all the fashionable elegancies of the day. As a youth he was pre-eminently graceful in person, in dress, in manner, in riding, in dancing, in speech; and from his earliest years he had the position of one of those arrogant favourites who win easy pardon for every caprice. He was sent to France for two or three years, during which he devoted himself to the arts and charms of "la haute politesse," and returned to England at the age of twenty-one. Presenting himself at court, he attracted the notice of James I. A few days after his appearance young Villiers was made cup-bearer, and in a few weeks succeeded Somerset as chief favourite. Offices and honours were showered upon him in profusion. He was knighted, and made gentleman of the bedchamber and knight of the garter; and he became by rapid strides a baron, a viscount, an earl, a marquis, lord high admiral of England, master of the horse, and entire disposer of the favours of the king. He had learnt that in dealing with a weak monarch, abounding arrogance is victory. Called to guide the grave affairs of a kingdom, through his influence with James, Villiers treated events which determine the destinies of nations as though they were intrigues to gratify personal pride and passion. The famous journey of Prince Charles to Spain for the purpose of seeing his intended bride, the Infanta, was planned by Villiers. During his absence upon this journey he was created duke of Buckingham. In Spain, Buckingham's gay and independent familiarity astonished the formal courtiers. The preliminaries of the marriage were arranged, but afterwards broken off by James under the influence of Buckingham, guided as much probably by personal hatred to Olivarez as by motives of state policy. On the death of James, the duke's position at court was unchanged; as heretofore the patronage alike in church and state was at his disposal, but his general popularity was on the wane. He resented his increasing unpopularity with a proud and indignant scorn, and to save him from impeachment, parliament was hastily dissolved, although no adequate supplies had been granted for the Spanish war. Buckingham was shortly after despatched to Paris to conduct the princess Henrietta to England, as the bride of Charles I.; and it is said that he ventured to address the French queen, not as an ambassador, but a lover. Threatened with assassination if he dared to repeat such insolence, he swore that he "would see and speak with that lady, in spite of the strength and power of France," and rumour went that he did not break his wild oath. But not being able to obtain permission to return to the French court, he openly espoused the cause of the Huguenots. The duke himself went as admiral and general of the expedition against France, which terminated in the disaster at the Isle of Rhé; and, subsequently, made preparations for a new expedition in favour of Rochelle, then hotly pressed by the royal forces. His popularity was now at its ebb. The commons impeached him as the one source of national misfortunes. Sarcastic ballads were freely sung among the people, threatening some terrible catastrophe. Buckingham was willing to stake all upon the expedition to relieve Rochelle. He spent threescore thousand pounds of his own money upon the fleet; and declared that he would be the first man who should set his foot upon the dyke before Rochelle, "to die or do the work." But his end was near. On August 23, 1628, he was assassinated by John Felton, a lieutenant, whose claims to preferment he had overlooked. His son—

BUCKINGHAM, GEORGE VILLIERS, second duke of, was born 30th January, 1627, about a year and a half before his father's death. He was the *Zimri* of Dryden's famous satire of Absalom and Achitophel. Judging Buckingham by a true and rigid standard, history must pass a stern sentence upon him.

He gained his monarch's favour by meeting every royal whim with a higher and cleverer manifestation of that whim; and as a politician he managed the changeful circumstances of the time by an equally changeful variety of resources and dispositions within himself. Buckingham especially possessed a keen sense and power of satire, which at times furnished the salt whereby his deeds were preserved from utter corruption, and enabled him to scorn the very vices he indulged in. Buckingham went through a course of study at Cambridge, and then was sent abroad with his only brother, Lord Francis Villiers, under the care of one Mr. Aylesbury. When the young men returned to England the civil war had already broken out, and they at once attached themselves to the royal cause. They joined the force assembled by Lord Holland, who made the duke master of the horse. Surprised by Colonel Rich at Kingston, Lord Francis was slain in the confusion, while Buckingham escaped first to London, and afterwards to Holland, where Prince Charles welcomed him with favour. Subsequently, he accompanied the prince in his expedition to Scotland, being the only Englishman of quality allowed to remain about the royal person in that country. When the battle of Worcester rendered an immediate restoration hopeless, Buckingham withdrew to France, soon rejoining the exiled prince, by whom he was made knight of the garter for his fidelity. About this period parliament bestowed on Fairfax some of the Buckingham family estates, a large portion of which, however, that general generously restored to the mother of the duke. Buckingham ventured to visit England privately, and married the daughter and sole heiress of Thomas, Lord Fairfax. During an excursion made to visit his sister, he was arrested and cast into the tower; but at the Restoration recovered his liberty, and was made one of the lords of the bedchamber, called to the privy council, and appointed lord-lieutenant of Yorkshire and master of the horse. In 1666 he entered into a plot against Clarendon, and held correspondence with parties disaffected to the king. This was detected, and he was struck out of all his commissions. Restored in the following year, and, after discharging an embassy to France, he finally succeeded in overthrowing Clarendon and forming the famous ministry of the cabal, so called from the initial letters of the names of its principal members, viz., Clifford, Arlington, Buckingham, Ashley, and Lauderdale. Of this cabal the duke of Buckingham was president, and virtual prime-minister of England. Charles abandoned Buckingham, however, when he was assailed by the house of commons, and accused of carrying on a correspondence with the king's foes. He then joined Shaftesbury and the opposition; and on one occasion was committed to the tower in consequence of an offensive speech concerning the dissolution of parliament. After the death of Charles, Buckingham retired to his manor of Helmsley in Yorkshire, where he employed his time in receiving his friends, in literature, and hunting. His principal literary work is the comedy of the "Rehearsal," written in ridicule of the mock-heroic style of tragedy then popular, and to which even the genius of Dryden at times condescended to pander. Buckingham also wrote a farce, called the "Battle of Sedgemour," and adapted from Beaumont and Fletcher the comedy of the Chances. He produced in addition some religious tracts, in which he advocated a true and perfect liberty of conscience, and argued against popery with clear though coarse satire. Buckingham died April 16, 1688, of an ague and fever, arising from a cold caught by sitting on the ground after fox-hunting. Pope's description of the miserable deathbed of this worthless and profligate nobleman is well known, but it is inaccurate in some of its details. A complete edition of his works was published in two volumes, 1775.—L. L. P.

BUCKINGHAM, JAMES SILK, a prolific writer, was born in 1786. His career was marked by extraordinary vicissitudes and adventures. He was at first bred to the sea, and then became successively a printer, a bookseller, the captain of a trading vessel, a shipowner and merchant, the proprietor and editor of a newspaper and of two literary journals, and finally an author and public lecturer. He travelled extensively in Egypt, Syria, Mesopotamia, and Persia, repeatedly visited India, and in 1816 established a journal in Calcutta, which, by the boldness of its attacks upon the maladministration of Indian affairs, led to his expulsion from the presidency of Bengal, and the seizure of his printing-presses. On his return to England,

he established the *Oriental Herald*, and the *Athenæum*, and published his "Travels in Palestine, Arabia, Mesopotamia," &c. He afterwards made several tours through various parts of Europe and North America, of which he published a very lengthened account. Mr. Buckingham sat in the house of commons as member for Sheffield from 1832 to 1837. He took a deep interest in social reforms, and delivered a great number of popular lectures in various parts of the country. He published two volumes of his "Autobiography," but died before the work was completed, 20th June, 1855.—J. T.

BUCKINGHAMSHIRE, JOHN SHEFFIELD, duke of, son of Lord Mulgrave, was born in 1649. He served as a volunteer with the earl of Ossory in the second Dutch war, and so distinguished himself by his gallantry at the naval battle of Solebay, that, although a mere youth, he was appointed to the command of the *Royal Catherine*, second-rate man-of-war. He entered the French service, in order to learn war from Turenne, and commanded the forces defending Tangier against the Moors, writing, during the expedition, a poem called "The Vision." He was made by James II. governor of Hull and lord-chamberlain, and often risked the royal displeasure by plain and sensible advice. He was opposed to the Revolution, although he submitted to it, and at first refused to hold any office; but at the end of King William's reign he was advanced to many dignities, which were increased on the accession of Queen Anne, whose lover he was said to have been. He was sworn lord of the privy seal, and created duke of Buckinghamshire. He was an active friend of the tory party, and brought into its service a certain skill for intrigue. He was president of council, and one of the lords-justices in Great Britain; but on the accession of George I. threw himself into active opposition to the court. He died 24th February, 1720, and was interred in Westminster abbey. Dryden is said to have revised his "Essay on Satire," while his "Essay on Poetry" was applauded by both Dryden and Pope.

BUCKLAND, RALPH, a noted English Romanist, born at West Harptre, Somersetshire, in 1564; educated at Rheims, and afterwards at Rome. The last twenty years of his life were spent in missionary labours in his native country. He died in 1601. One of his works, entitled "Seven Sparks of the Enkindled Flame," &c., has some passages which, according to a sermon of Archbishop Usher's preached in 1640, were best interpreted by the gunpowder plot.

BUCKLAND, WILLIAM, D.D., F.R.S., a distinguished geologist, eldest son of the Rev. Charles Buckland, was born, March 12, 1784, and received his early education at the grammar school of Tiverton, and at Winchester college. In 1801 he entered Corpus Christi college, Oxford, as a scholar on the Exeter foundation.—It was during the early boyhood of the subject of our memoir that two happy generalizations were arrived at by eminent scientific men. Werner had shown that the rocky strata which form the earth's crust, are arranged in a certain determinate order, which is never interrupted; and William Smith, that the fossiliferous strata can be identified at great distances by their organic remains, and can be classed by means of these in the order of their relative antiquity. An extraordinary interest was thus excited in the study of fossils, especially in the south of England, where the scene of Smith's labours chiefly lay, and where organic remains are very abundant, and easily obtained from the strata in a perfect state. Such facilities were afforded by Axminster, the birthplace of Dr. Buckland; and here, when a mere child, he made his first collection of fossils from the lias quarries of the neighbourhood. Afterwards, when a schoolboy at Winchester, which is situated in the chalk district, other opportunities were afforded of gratifying this taste. He attended the mineralogical lectures of Dr. Kidd, and in company with friends at Oxford, who had drawn their knowledge of fossils from William Smith, he made frequent excursions in the neighbourhood. The fruits of these formed the nucleus of the magnificent collection afterwards placed by him in the Oxford museum. He took the degree of B.A. in 1804, and five years after was elected a fellow of his college. During the four or five following years, his geological researches were directed to the verification of Smith's views, as regarded the south-west of England, so as accurately to group the fossils in the various strata, and to obtain correct sections of the beds in the order of their superposition. Of robust frame, active habits, and a buoyant temperament, Dr. Buckland took great delight in these excursions, which were usually performed on horseback. In 1813

he was appointed to the chair of mineralogy, resigned by Dr. Kidd. Like Dr. Kidd he embraced geology in his course of lectures; and in these, from the intimate acquaintance with the English strata and their fossils, which he had gained in his numerous excursions, he was enabled to give to the illustrations of general truths a freshness and interest which were very captivating. Geology became popular in the university; it had been firmly established as a new science by the two generalizations to which we have already referred; it was now publicly recognized as such at Oxford, by the endowment, at the instigation of the Prince Regent, of a "Readership in Geology." In 1819 Dr. Buckland received the appointment, and delivered his inaugural address on the 15th of May in that year. This, his first work, was afterwards published under the title of "Vindiciæ Geologicæ." In the position which he now occupied, Dr. Buckland powerfully influenced the progress of geology. A rich imagination and playful humour, a philosophic turn of mind leading to profound reflections, a wondrous sagacity in detecting the adaptations of organic structure in fossils to the purposes of life, an extraordinary flow of language, a fine voice, and "good presence," formed a union of qualities well fitted to give matchless force and directness to his scientific expositions, and unequalled graphic effect to his illustrations. His numerous papers, contributed chiefly to the Geological Society, were not less influential in consolidating the new science, and enlarging its boundaries. This society was founded in 1807; he joined it in 1813, and continued for upwards of thirty years a zealous contributor on every branch of the subject. Dr. Buckland's separate works were the "Reliquiæ Diluvianæ," published in 1823, and the "Bridge-water Treatise," published in 1836. This latter is a work of singular eloquence and power, and on it, perhaps, his future fame will chiefly rest. The subject was admirably adapted to his genius, and he executed the task assigned him with extraordinary ability. In 1818 Dr. Buckland was elected a fellow of the Royal Society; in 1821 he joined the Linnæan Society, and in 1847 was named a trustee of the British Museum. He was a most active promoter of every scientific object, and the British Association owed much in its first years to his untiring energy and sound judgment. He was its president at Oxford in 1832, and for several years president of the Geological Society. In 1825 he was made a canon of Christ Church, and doctor of divinity, and having resigned his fellowship, received the living of Stoke Charity in Hampshire. In 1845 Dr. Buckland was appointed to the deanery of Westminster, on the recommendation of Sir Robert Peel. His death took place on the 26th August, 1856.

BUCKLE, HENRY THOMAS, historian, was the son of a wealthy merchant in London, and was born on the 24th of November, 1822. He first became known to the world by his "History of Civilization," of which two volumes were published, one in 1858, and the other in 1861. The work, which displays wide research and is elaborately written, created considerable sensation at the time of its appearance by the bold and paradoxical speculations in which the author occasionally indulges. The execution of the entire plan was prevented by Mr. Buckle's death, which occurred on the 29th of May, 1862. He also wrote an essay "On Liberty," and one "On the Influence of Women."—J. D.

BUDE, GUILLAUME (BUDÆUS), born at Paris in 1467; died in 1540. Budé's father made him study jurisprudence, but he shrunk from the duties of professional life. His father died in 1500, leaving twelve children, but so well provided for that Guillaume was enabled to retire from practice as an avocat. About this time he married a lady, who, if not as learned as himself, was yet the partner of his studies. Budé was for a while secretary of Charles VIII. He was regarded by Francis I. as one of the men of letters of France who did most honour to the country, was given the care of his library, and was appointed by him ambassador at the court of Leo X. The foundation of the college royal by this prince is ascribed to the influence of Budé. Some jealousy which Cardinal Duprat felt towards him led to his retirement from court. It would have been well for him had this been permanent, for he loved study, and probably was never more happy than at this period; but on Poyet becoming chancellor, Budé was recalled. In a visit which the court made to Normandy, Budé, now no longer young, suffered from fatigue and heat, and caught his death-illness. Budé directed that he should be buried as privately as possible.

There can be little doubt that this arose from humility of mind, but it was referred at the time to other causes. It was said that though he never formally united himself with the reformers, that his feelings were with them, and that he shrunk in imagination from the thought of being in death the object of the splendid ceremonial services of the church. Budé was present at the interviews of the monarchs of England and France on the Field of the Cloth of Gold, and we have a description of it from him. Budé has the great merit of having been one of the first judicious commentators on the pandects, and in fact, commencing the school which has taken its name from Cujas. His treatise on the Roman coinage is still referred to.—J. A., D.

BUDGELL, EUSTACE, born at St. Thomas, near Exeter, in 1685; died in 1736. Educated at Christ church, Oxford; thence going to London, entered the middle temple as a law student; he does not, however, appear at any time to have studied law. Addison, to whom he was related, on being appointed secretary to the lord-lieutenant of Ireland, gave Budgell a clerkship in his office. His connection with Addison led to his writing in the Tatler, and afterwards in the Spectator. His papers in the Spectator are signed X. In 1717, on Addison's becoming secretary in England, he made his friend accountant and comptroller-general of the revenue in Ireland. In 1718 the duke of Bolton was lord-lieutenant; Budgell fell out with his secretary, and compromised both him and the duke. He was deprived of his offices, and published pamphlets detailing his grievances, in spite of Addison's dissuasion. In 1733 he issued a weekly pamphlet called the "Bee," which ran to about a hundred numbers. He was now left two thousand pounds by Dr. Tindal, in whose work, Christianity as Old as the Creation, he had probably in some way assisted. Budgell was not a relative of Tindal, and the public gave him the credit of having forged the will. To this Pope alludes—

"Let Budgell charge low Grub Street on my quill,  
And write whatever he please—except my will."

He got entangled in litigation, and attending the courts as a client led him to remember his old profession, and he resumed the long-abandoned wig and gown; but it was too late. He now determined on suicide, and taking a boat at Somerset stairs he ordered the waterman to shoot the bridge, and as the boat was passing under it threw himself into the river. On his table was found a slip of paper with the words—"What Cato did, and Addison approved, cannot be wrong." Insanity had been distinctly exhibited for some days before his death.—J. A., D.

BUDGETT, SAMUEL, of Kingswood Hill, an English merchant, remarkable for his enterprise, benevolence, and success, was born at Wrington, Somersetshire, in 1794. His parents were poor, and he received but a scanty education. When fourteen years old, he was apprenticed to an elder brother who kept a retail grocery shop at Kingswood, near Bristol, with whom, in the course of ten years he became partner. Thus admitted to a share in the business, he applied himself strenuously to its extension, and such were his perseverance and energy, that ere many years the establishment of Messrs. Budgett had a connection extending over the greater part of England, and was known as one of the wealthiest houses in the "provision" trade. Mr. Budgett was no less distinguished for his great benevolence and unwearied labours for the elevation of the poor in his neighbourhood, than for his uprightness as a merchant, and his desire to spread the principles of just commerce. He died in 1851, and his life has been written under the title of "The Successful Merchant."—J. B.

BUFFIER, CLAUDE, a grammarian, historian, and metaphysician of deserved celebrity, was born in Poland, of French parents, on the 25th of May, 1661. Soon after his birth his family returned to France, and settled at Rouen, where Claude's early years were spent. He was educated at the jesuits' college there, and having much distinguished himself as a student, entered their order at the age of nineteen. A few years afterwards, in consequence of certain theological differences with Colbert, archbishop of Rouen, he went to Rome, and on his return settled at Paris in the jesuits' college. Here he spent the remainder of his life, occupied in study and tuition, and producing from time to time philosophic and literary treatises of remarkable shrewdness and originality. He commenced his literary labours in Paris, by taking part in the editorship of the *Journal de Trevoux*, but soon relinquished this, in order to prepare for publication the results of his own studies in history

and the moral sciences. He published at intervals a number of historic essays, among others, one on the "History of Spain;" another on the "Origin of the Kingdom of Sicily and Naples;" a "Chronological History of the Seventeenth Century;" and an "Introduction to the History of the Royal Families of Europe." During these years, however, he was diligently engaged in college tuition for which he was admirably fitted, having a clear and happy faculty both of analysis and exposition. His "French Grammar, on a new plan," sufficiently illustrates this, the arrangement being clear and philosophic, the definitions full and precise, and the detailed expositions throughout lucid and original. In addition to its clearness, however, there is an animation in his style, which gives to these writings a peculiar charm; for Buffier was not only a priest, tutor, and grammarian, but a poet, a man of letters and of the world, conversant with men as well as books, and expert in the use of language as an instrument of thought. Far more justice has been done to Buffier's philosophic writings in this country than in France. By the Scotch school in particular, his power as a shrewd and independent thinker was early recognized and acknowledged. Reid and Stewart have spoken of his "Treatise on Primary Truths" in terms of the highest praise. Among his own countrymen, till quite recently, Buffier has been unaccountably neglected. Voltaire, indeed, speaks of him as the only jesuit that had written sensibly on philosophy, and some of the ideologists refer to him in terms of praise. But, with these exceptions, his name seems to have fallen into oblivion, and his philosophic works to have been almost forgotten for nearly a century after his death. Now, however, in the revived philosophical activity, his writings are studied anew, and tardy justice awarded to his merits as an original thinker.

Buffier's chief philosophical works, those which contain the results of his own speculation, are his "Traite des Premieres Vérités," published in 1717; and his "Elemens de Metaphysiques," in 1724. In these works he reflects, in an improved and original form, the best philosophical tendencies of his time. He sums up the past, and anticipates the future, being at once the disciple of Descartes and Locke, and the herald of the Scotch philosophy. His philosophic position is thus striking and peculiar. Though a jesuit, he could admire Descartes, sympathize with Malebranche, and receive instructions from the Port-royalists. From Descartes he learned to look for principles native to the mind itself—the necessary foundation of all its reasonings. He accepted, in a modified form, his doctrine of innate ideas, adopted his criterion, and followed his method. From Locke he learned to reduce metaphysical speculation within the sphere of experience, to convert philosophy into psychology, by limiting its inquiries to the observation and analysis of the human understanding. By thus accepting the teaching of both masters, he avoided the opposite extremes of error into which their disciples severally fell. The most original and important part of Buffier's philosophy is his doctrine of first truths or primitive principles expounded in each of the treatises above referred to—in the first, as a detailed scientific analysis; in the second, as an outline of processes and results in the form of a dialogue. He died in 1737. An English translation of his most important essay appeared in 1760, with an elaborate preface, in which the translator endeavours to show, but without success, that Reid, and the Scotch writers generally, had both stolen and spoiled the doctrines of Buffier.—T. S. B.

BUFFON, COUNT DE, originally GEORGE LOUIS LECLERC; son of Benjamin Leclerc, councillor in the parliament of Dijon, and of a mother from whom he inherited high intellectual and especially distinguished moral powers; born at Montbar in Burgundy, on 7th September, 1707; died at Paris on 16th April, 1788. The life of Buffon thus extended over the century which bore Voltaire, Montesquieu, and Rousseau—three of the greatest masters of the French tongue, and in their several lines nearly the greatest and most productive thinkers of modern times. Buffon, in many respects, stood apart: he was not an encyclopædist, neither was he a politician; yet there is no figure in French literature so stately, if we except the majestic Bossuet. The "Epoques de la Nature" have a sweep and swell recalling the flow of the Discours sur l'Histoire Universelle; nor is either surpassed in such attributes by the superb periods of our own BACON. David Hume wrote thus of Buffon—"In his figure and air and deportment, he answers your ideas of a marshal of France, rather than that of a philosopher." But he was a phi-

losopher also; his mode and style were not the results of artifices; they belonged to the native stateliness of the man.—We spare no room for narratives of the circumstances under which the directorship of the Jardin du Roi escaped from the position of a sinecure belonging to the king's physician, and, after the brief but spirited interregnum of Dufay, fell in 1739 to Buffon. But it is important to note the kind of preparation constituted by his previous life for an office which he soon rendered illustrious. At the age of thirty-two Buffon indeed had gained no repute as a naturalist, nor had his studies largely gone in that direction. Of respectable fortune and parentage, and distinguished by his personal manners and ability, he had mingled favourably with the world. He had travelled in France, Italy, and England in the companionship of a son of the earl of Kingston; he had exercised his powers of observation, and thrown himself on several subjects of interest and difficulty that then engaged the attention of the learned. He had translated into French Hales' Statics of Vegetables, and Newton's Fluxions, prefacing them very ably; and he had published besides various and unconnected, although rather striking memoirs, on matters pertaining to geometry, physics, and agriculture. When he obtained, indeed, his most auspicious appointment, Buffon's mind was in nowise a magazine of special knowledge; it was rather a magazine of force,—faculties that had never slept, sharpened by various exercise, and brought through practical intercourse with men and things, into that harmony which is at the root of a possession or power as rare as it is essential to greatness—the power of *good sense*. Many men can never acquire this power, but Buffon was of the class to whom wisdom is possible; and when he entered the Jardin du Roi he brought along with him, wisdom as well as energy—a genius capable of anything, and sound intellectual culture in its train. His triumph need never have been doubted. Sustained by a fine ambition, he ruled his domain *en prince*. Those mean Jardins du Roi grew under his eye until they were unmatched in Europe, which then signified "the world." Natural history, revived so recently by the immortal LINNÆUS, rose in his hands from a collection of formal and arid classifications, to be the sphere of ideas conversant with the order and majesty of the universe: And where the limit to the sway of a Style—spacious as an undisturbed river—which, at the command of one who loved them, described the habits, forms, and qualities of the creatures, with a minuteness, a reality, and an affection never reached by the greatest painter?—Alas! that France should have her visitations of madness,—then forgetting gratitude, and treading under foot her glories! She repents, indeed, and changes; but, although she changes, the scythe has swept her prairies. The only son of this superb son of hers died a colonel of cavalry, at the age of twenty-nine, on a scaffold of the Revolution. It is said that, in quietest dignity, he exclaimed at that supreme hour—"Citoyens, je me nomme BUFFON."

Buffon's fitness for his position in the Jardin du Roi was at first gravely and acrimoniously questioned; nor did what was called "The Society of Naturalists" in Paris fail to write of him injuriously. Long afterwards even, he was termed by such men not a naturalist, but a mere edition of Bernardin St. Pierre; and this very partial view of his services and richly endowed nature has not ceased even with the completion and the completed fame of a monument that will endure as long as the French tongue. Within the brief space at our command, we shall endeavour to discriminate as to his qualities and defects.

The energy and sphere of that vast and creative power usually termed "Imagination," in reference to philosophical or even strictly scientific investigation, are for the most part sadly misunderstood. That Buffon himself had not fallen into one form of the prevalent error is manifest enough, the following being his own considerate words—"Comment ose-t-on se flatter de dévoiler ces mystères sans autre guide que son Imagination, et comment fait-on oublier que l'effet est le seul moyen de connaître la cause? C'est par des expériences fines, raisonnées et suivies que l'on force la Nature à découvrir son secret: toutes les autres méthodes n'ont jamais réussi, et les vrais physiciens ne peuvent s'empêcher de regarder les anciennes systèmes comme d'anciennes reveries, et sont réduits à lire la plupart des nouveaux, comme on lit les romans." The truth seems to be this:—of great minds there are *two* classes, or rather *three*, the third being the rarest. The third is rarest necessarily, containing and expressing the harmony of the other two. In the *first* class the faculties chiefly incline to discern the *resemblances* or analogies of things; in the

1750

second the tendency is to rest rather on *differences*. A mind perfectly adapted to the pursuit of any great subject must, of course, have both sets of faculties at its disposal, especially in the case of natural history,—seeing that all true classification rests essentially on *binary* terms, one term expressing how near the object is to other objects, and the second term how far, through its individuality, it stands apart. The faculty to discern differences is, when isolated, a microscopic one, implying no exercise of imagination or of any generalizing power; neither, if we consider the vast and various work it has to do, ought it perhaps to be regretted that the men who possess it in greater or less perfection, are comparatively the most numerous of inquirers. Buffon's nature failed here, and the weakness (confirmed in so far by his poor eyesight) had not been removed by an adequate education. But he learned the existence of his weakness, and took means to secure that the edifice he conceived should not be inharmonious through effect of the imperfection of its architect. He early associated with him, and inspired by the influence of his genius, the acute and painstaking Daubenton, whose contributions to the anatomy of zoology are and ever will be a constituent element of the "Histoire Naturelle." Offended by one of those acts which, however right and just, are singularly apt to be misconceived by an assistant, Daubenton dissolved the association; and Buffon, for the reason aforesaid, then resorted to the counsels of the assiduous and affectionate Gueneau de Montbelliard, and the Abbé Bexon. But as years advanced, and his labours grew towards their consummation, the architect himself increased in skill, and rose superior to defects. It is in the early volumes only of his enterprise that we find those ill-judged, because ill-informed references to the immortal Linnæus—Buffon's only compeer in that age: for, when he has reached the department of Birds, he has departed wholly from the idea that the creatures should be classified according to their usefulness and interest to man, and given practical effect to premonitions, strewn through his writings from the first, to the effect that there is a unity throughout nature and all its departments, and therefore a positive ground *in the structure of every class of beings*, for an arrangement or grouping deeper than even Linnæus had dreamt of. The "naturalists" of the time could not discern his progress, or were unwilling to acknowledge it. They estimated defects, but they failed to estimate in hints scattered through various separate notices—such as those on the Ass and the Zebra—that an intellect and a genius had arisen capable of repeating, enlarging, and adorning the enterprises of an Aristotle and a Pliny. One other fact they failed to see. The title of Buffon's immortal work is "Histoire Naturelle GENERALE et PARTICULIERE," and Buffon felt rightly, and from first to last wrote under the conviction, that general treatment and undivided attention to general theorems obscure our eyesight as to things, and had gone far to destroy all true interest in the "creatures." By whom else has the nature of an animal been ever so thoroughly realized? By whom presented so affectionately and so faithfully? A single picture of our LANDSEER is, in this respect, worth tons of disquisitions, and while they rot, it will be immortal. The illustrious Swede felt this as deeply as any man: "Venit, venit hirundo, pulchra adducens tempora et pulchros annos!" Who but Buffon could have written of the stag that Landseer has so often painted! "Le cerf paraît avoir l'œil bon, l'odorat exquis, et l'oreille excellente. Lorsqu'il veut écouter, il lève la tête, dresse les oreilles, et alors il entend de fort loin: lorsqu'il sort dans un petit talis ou dans quelque autre endroit à demi découvert, il s'arrête pour regarder de tous côtés et cherche ensuite le dessous du vent pour sentir s'il n'y a pas quelqu'un que puisse l'inquiéter!"

Thus even the limitations of Buffon's mind were counteracted, in so far as they could seriously impede his efforts, or mar his immortal work. But that very excess of the intellectual faculty which threatened to injure the inquirer, was really the cause of much of his grandeur, and the peculiarity that enabled him to impress so ineffaceably an influence on the future. It is not requisite to fall back here on the obscure and questionable doctrine of *Geoffrey St. Hilaire*, on what he calls the "Theory of Necessary Ideas;"—Buffon's influence and power can be explained quite otherwise. The predominance of the element "imagination" impelled him irresistibly to seek for analogies, and inspired him with a conviction, fixed as that in his own existence, that unity and harmony underlie the whole variety and seeming disorders of the universe. Such a conviction, so rooted, has one

inevitable result in its action on a mind struggling through the narrow ways of imperfect knowledge: it constrains it to frame "*systems*" or *hypotheses*. These systems, as Buffon himself says, are the means by which alone the inquirer can put his whole thought and soul into his subject. It is only needful that he hold them at their true value; or that he always feel disposed to write thus—"Nous nous refusons d'autant moins à publier ce que nous avons pensé sur cette matière que nous espérons par la mettre le lecteur plus en état de prononcer sur la grande différence qu'il y a entre une hypothèse où il n'entre que des possibilités, et une théorie fondée sur les faits,—entre un système tel que nous allons en donner un dans cet article sur la formation et le premier état de la terre, et une histoire physique de son état actuel, telle que nous venons de la donner dans le discours précédent." The systems or hypotheses of a man of genius, are in reality the expression of his philosophic power, and of his faculty of discovery,—they are his *gropings*. Living in more advanced times, and under the light of established generalizations, we are apt to forget what science and the course of thought owe to those majestic "Theorie de la Fevre," and "Epoques de la Nature." Buffon did not imagine that the process he has described so loftily, was the course actually pursued by the Creator. But persuaded irrevocably that the present hangs by a long past, and that out of the present the future must be unfolded, he cast aside the cataclysmal vagaries of his predecessors, and with a few hints from Leibnitz, and perhaps Woodward, alone ventured to suggest that by some such process—by some such constant and orderly action of cosmical laws, has the existing order, with all its bewildering variety, been evolved. Take up Burnet or Whiston—not as to their systems, which are simply absurd, but as to the *spirit* of their systems—is it possible for any inquirer to mistake the genius or underrate the value of the impulse given by the Frenchman? Nay, CUVIER himself, with all his greatness, ranks here immeasurably below Buffon. He, too, propounded a system without fully recognizing that it was only a system. But the spirit of Cuvier's system is in contrast exceedingly disadvantageous with that of the "Epoques de la Nature." Like Burnet and Whiston, he accepts the doctrine of *cataclysms*—a doctrine which, wherever and under whatever form it appears, is simply an abnegation of all true or attainable philosophy, and which Buffon, first of all among our modern greatest men, had the courage and the honour to discredit and expel from within the demesne of rational inquiry. Had we space or leisure to analyse the "Epoques de la Nature," we might indicate remarkable forecastings as to the largest generalizations of our existing geology. Passing from such, however, let us search a few of the positive and universally acknowledged debts of science to the "inventive" or lofty generalizing power of Buffon. He has bequeathed a few theorems, as indisputable as the famous one of Pythagoras, and which go far to form the bases of scientific natural history. It is to this remarkable thinker that we owe our first clear and practical connection of the *distribution of animals with the geography of the globe*. Previous to Buffon's labours, natural history had, in this respect, no light whatsoever; the animals had no recognized relationship with their habitats, or—to speak more correctly—no natural habitat at all; each one appearing to live indifferently where it could or where it listed, or where it had been originally set down. The proclamation of a geographical distribution or arrangement, depending inevitably on climate and a few other natural conditions, was an epoch in science. Occasioning not unnaturally much surprise, and exciting vast alarm and bitter hostility at the time, it has not only grown into an accepted and indubitable truth, but is the clue by whose aid inquirers are now striving to thread the labyrinth of the organized world. Then, for the first time, were the forms of organization brought into clear relationship with the grand physical forces and their arrangements. Closely connected with the paramount law referred to, is Buffon's important generalization regarding the unity of the human species, notwithstanding diversity in colour and less essential features. The great debt, however, owing to him as to this order of truths, is his discovery of the test, or "general term," of a species. Earliest among naturalists, he laid that down to be *fecundity*, or the power to continue itself. But while drawing an ineffaceable line between an actual species, and all mere anomalies, he guards himself from a philosophical error of the gravest description that is still prevalent, and into which also the great Cuvier fell, or rather rushed head-

long. That variety of form and character which we now behold—those innumerable species—are yet but fragments from an immense past; they no more constitute a whole or a harmony, in so far as we see them, than the distribution and forms of our continents and islands. The latter are a simple phase of an immense history—unintelligible by themselves, and not yet to be understood. But grand laws have produced them; and even these laws, mighty and remote though they are, are gradually approaching the sphere of distinct vision. Shall we then, simply because we cannot yet discern their relationship, consider all those multitudinous species as fixed and independent entities! Do those fragments belong to no majestic whole? Cuvier shut up the inquiry; he thought the prosecution of it, if not illegitimate, at least hopeless. Buffon did not. He ventured to pronounce the word "*mutability*" in reference to species; and he did so because he bowed before the energies of Nature, exercised through an unfathomable past.—Enough as to Buffon, unless, in powerful although partial support of the estimate ventured on above, we subjoin the words of his most illustrious successor:—"On the other hand, he gave by these very hypotheses an immense impulse to geology. First of all, he caused it to be felt that the actual state of the globe is the result of a succession of changes, the traces of which may be discerned; and thereby he turned the attention of observers to such phenomena as seemed likely to enable them to reach back to those changes. By his own observations, also, he advanced the science of Man and the Animals. His ideas as to the influence exercised by the delicacy and development of each organ on the nature of the different species, are conceptions of genius, which form the basis of all philosophical Natural History, and which have rendered services to *Method* so high, that their author may well be pardoned for the harsh words he has written concerning that art. Buffon's views of the degeneration of animals, and the limits which climates, mountains, and oceans assign to each species, are imperishable discoveries that are daily confirmed more and more, and they have given to the researches of travellers that fixed basis which previously was wholly wanting. Finally, Buffon has rendered to his country one of the greatest services that could be rendered; he popularized science by his writings, interested the great and powerful, who from that time have aided its advance, and so produced effects that have come down to our times, and will be of incalculable value through the future. A few errors ought not to induce us to withhold our just tribute of admiration, of respect, and above all of gratitude; for men have long owed him those gentle pleasures flowing to minds still young from their first glance over nature, and those consolations experienced during the fatigues of life, when our thoughts rest on the spectacle of that immensity of beings peacefully obedient to eternal and necessary laws."—(*Cuvier*.)

The "*Histoire Naturelle*" is one of those works which astonish by their spaciousness. Beginning with a cosmogony, which Buffon afterwards corrected and completed in the "*Epoques de la Nature*," he passes to a philosophical review of the general phenomena of Animated Nature. Treating then of Man, the Quadrupeds, and very strikingly of the Apes, he enters next on perhaps the most superb portion of the work—that extensive treatise on the Birds; and an elaborate account of the Mineral Kingdom terminates his labours. The several portions of this vast undertaking are unequal in merit—the section on Minerals being least worthy of consideration now. The deficiencies of Buffon's plan need not be pointed out; they have been supplied recently, in a way worthy of the subject, by a magnificent publication "*Suites a Buffon*."

The "*Histoire Naturelle*" has had many editors. The great edition, however, is still Buffon's own—the original quarto. It is impossible to speak with too much contempt of the productions by Castel and Sonnini. Had these men edited the grand Hebrew Lyrics, they would have changed the metre to some modern sing-song, and probably added stanzas of their own! Buffon has truly said, "*le style est l'homme*." Certainly his works are the history of his mind and its growth. Naturalists, in their own systematic treatises, may take advantage of his discoveries, but let them leave these works and their author alone! The edition by Lamouroux is a good one; but the only really unexceptionable work is that by *Flourens*, in twelve large and handsome volumes. Still we rejoice in Buffon's own volumes, and welcome them with infinite pleasure in any library.

Of Buffon, personally, little is known beyond what we have

indicated. Some abbé has alleged recently that there are private letters of his, doing no credit either to his sentiments or his heart. It might seem a primal moral law, that neither charges nor insinuations ought ever to be made, unless they are on the eve of being substantiated. The abbé should have published these letters or been silent. All we know at present is, that the abbé did not like Buffon. He was, as we have said, a stately man, living, generally in full dress, either in the Garden of Plants, or as a retired student at Montbar.—J. P. N.

BUGEAUD DE LA PICONNERIE, THOMAS ROBERT, duc d'Isly, marshal of France, born at Limoges, 15th October, 1784; died at Paris, 10th June, 1849. In June, 1804, he entered the army as a private in the grenadier corps. At Austerlitz, where he evinced great bravery, he was promoted to the rank of corporal; and in the following year he was named sub-lieutenant in the 64th regiment of the line. He took part in the campaigns of Prussia and Poland, and was wounded at Pultusk in November, 1806. He was afterwards sent to Spain with the rank of lieutenant adjutant-major, and remained there with the army of Aragon until 1814. In 1811 he was made lieutenant-colonel, and placed at the head of the 14th regiment of the line; and on his return to France promoted to a colonelcy. At the first restoration he seemed favourable to the cause of the ancient dynasty, but during the Hundred Days he followed the emperor. In 1831 he was appointed a member of the chamber of deputies, and was named field-marshal. He was afterwards sent to Africa, where he signalized himself in a campaign against the Arabs. In 1837, when public opinion was strongly in favour of a partial occupation of Algeria, Bugeaud was intrusted with an important mission to the province of Oran, where he concluded the celebrated treaty of Tafna. In 1840 he was appointed governor-general of the French possessions in Africa, and had not long held this office when he recommended the government to adopt measures for the absolute conquest of Algeria. In three years that project was realized; the whole territory, from the frontiers of Tunis to those of Morocco, was subjugated to France. In May, 1844, hostilities commenced between Bugeaud, as governor of Algeria, and the emperor of Morocco; and in the following July, Bugeaud having completely routed the army of the emperor at Isly, was rewarded with the title of duc d'Isly. In 1847 he was superseded by the duc d'Aumale; and on the memorable 24th February, 1848, was named by Barrot and Thiers to the command of the army and of the national guard of Paris. The president, M. Louis Napoleon Bonaparte, afterwards intrusted him with the command of the army of the Alps. He fell a victim to Asiatic cholera in 1849.—G. M.

BUGGE, THOMAS, a very able Danish geographer, and second only to Tycho Brahe as an astronomer, was born 12th October, 1740, at Copenhagen, where his father was clerk in a victualling office. His first studies were theological, but he afterwards devoted himself to mathematics, astronomy, physics, and especially mensuration. In 1761 he was sent to Trondheim to make observations on the transit of Venus; in 1777 became professor of astronomy and mathematics in the university of Copenhagen, and in the following year was appointed keeper of the observatory of the Round Tower, of which, in fact, he might be regarded as the restorer. In 1798 he was sent by government to Paris to concert with the directors of the National Institute a uniformity of weights and measures, and soon after he was admitted a member of the Institute. His self-forgetting earnestness to preserve the scientific treasures committed to his care, during the bombardment of his native city in 1807, was rewarded by the office of councillor of state. He was also made knight of the most noble order of Dannebrog, and died 15th of June, 1815. Bugge's labours were unremitting and valuable. The extreme accuracy of the excellent charts of Denmark published by the Academy of Sciences, is mainly owing to him; but still more useful was he in the geographical knowledge which he imparted to young men. The extreme accuracy of his trigonometrical surveys was not alone beneficial to his native Denmark; but by the careful indication of every coast, harbour, island, rock, and sandbank in both Belts and the Cattegat, the navigation of the Danish waters is rendered much more safe. Of his numerous works, all important and highly valuable, may be briefly mentioned—"De forste Grunde til den Sphæriske og theoretiske Astronomie samt den Mathematisk Geographie," Copenh. 1796; "De forste Grunde til den rene eller abstracte Mathematik" 3 vols., 1813-14. His

"Beskrivelse over den Opmaalingsmaade som bruges ved de danske geographiske Karter," published in 1779, is a handbook of mensuration. His autobiography is contained in the Wormske Lexicon, 3rd vol.—M. H.

**BUGENHAGEN, JOHANN**, surnamed **POMERANUS**, one of the most celebrated of the German reformers; born in 1485; died in 1558. While rector of the academy of Treptow he wrote, by command of Boleslas X., a history of Pomerania, which was published two centuries later by Balthasar. He was not one of the earliest, but he became one of the staunchest of the supporters of Luther. At Wittemberg, where he removed as soon as he had determined to share the labours and the dangers of the reformers, he expounded the Psalms to large audiences, which were not unfrequently graced by the presence of Melancthon. The zeal and ability with which he aided Luther in all his movements, recommended Bugenhagen to the favour of Christian II. of Denmark, who employed him in the organization of the ecclesiastical establishments of the kingdom, and at the conclusion of his labours offered him a bishopric, which, however, he was too zealous a Lutheran to accept. Although the duties of his charge at Wittemberg were of the most onerous description, he found time to assist Luther in his translation of the scriptures, to prepare a version of the sacred books in Low German, and to publish a great number of theological works, which, although little read at the present day, are in a historical point of view—so great was their influence on the progress of the Reformation—only less interesting than those of Luther and Melancthon.—J. S., G.

**BUGIARDINI, GIULIANO**, a Florentine artist, born in 1481. He imitated the milder and weaker qualities of Leonardo. He was instructed by Bertoldo, a sculptor, and was educated and much beloved by Michel Angelo. His taste in design and composition were imperfect; he drew badly, his colour was dry, and his anatomy overdone. He died in 1556.—W. T.

**BULGARIN, THADDEUS**, born in Lithuania in 1789. Although by birth a pole, Bulgarin may be numbered among the distinguished writers of Russia, as his politics were Russian, and his best works are written in the Russian language. His career was in some respects that of an adventurer. He served in a Russian regiment of lancers from 1805 to 1808, when he joined the army of Napoleon in Spain; and in 1814 we find him at the head of a body of volunteers. In 1818 he removed to St. Petersburg, where he remained till his death. He there commenced editing *l'Abeille du Nord* (the *Northern Bee*), a journal which is still in existence. Gifted with great facility of composition, Bulgarin published many critical works, besides various novels and romances, amongst others "Ivan Vigighin;" "Roslawieff;" "Dmitri;" and "Mazepa." As a critic Bulgarin was clever, but too often satirical and unjust. His last important production is entitled "Russia under its Historical, Literary, and Geographical Aspects."—M. Q.

**BULGARIS, EUGENIUS**, a very learned Greek prelate, born at Corfu in 1716; died at St. Petersburg in 1805. He was an admirable linguist, and wrote largely on philosophy, mathematics, and astronomy. The modern Greeks regard him as one of their best writers, and his style is held as a model at the courts of the hospodars of Moldavia and Wallachia. He is commonly known by the name Eugenius.

**BULL, GEORGE, D.D.**, bishop of St. David's, 1705–1710; born in Wells in 1634; educated at Tiverton grammar school, and afterwards at Exeter college, Oxford. In 1655 he was ordained deacon and priest by Dr. Skinner, the ejected bishop of Oxford, who dispensed with the canonical rules, on account of Bull's "peculiar fitness for the ministry and the necessities of the times." In 1658 he was presented to the rectory of Siddington St. Mary, near Cirencester, and in 1662 the vicarage of Siddington St. Peter was united to it—the joint income being less than £100 per annum. Here he employed himself for twenty-seven years in the diligent discharge of pastoral duties, in preaching and catechising, and in composing his admirable works of practical and controversial divinity. In 1685 he became rector of Avening; in 1686 the degree of D.D. was conferred on him by the university of Oxford; in 1678 a prebend of Gloucester; in 1686 the archdeaconry of Llandaff, by Archbishop Sancroft; and in 1705, at the advanced age of seventy-one, he was made bishop of St. David's, the duties of which see he discharged with much zeal and diligence till 1710, when he died at Brecknoek.—T. S. P.

**BULL, JOHN**, Mus. Doc., was born in Somersetshire about

the year 1563, and, as it is said, was a descendant from the Somerset family. He was educated in music under Blitheman, an organist of the chapel royal in the reign of Elizabeth. At the age of twenty-three he was admitted to the degree of bachelor of music at Oxford; and six years afterwards to that of doctor. On the death of Blitheman in 1591, he received the appointment of organist to the royal chapel; and Wood says of him, that he had "a most prodigious hand on the organ." Shortly afterwards, at the express desire of the queen, he was nominated the first professor of music in Gresham college. In 1601 he went abroad for the recovery of his health, which for some time had been greatly impaired. Upon the accession of James I. he retained all his previous appointments, and was nominated one of the chamber musicians to the king; in which capacity he had the honour of instructing Prince Henry. Stow tells us in his *Chronicles*, that he was selected to entertain the king and the prince with his performance on the organ at Merchant-Taylors' Hall, July 16th, 1607, the election-day of the master and wardens. Upon this occasion he is said to have composed the national anthem "God Save the King;" the authorship of which has so long been the subject of dispute. In 1841, the late Mr. Richard Clark, one of the lay-vicars of Westminster abbey, announced for publication "The Manuscript Compositions of John Bull;" but, we are sorry to say, the announcement received so little support, that the promised volume never appeared. The claims of Dr. Bull to the gratitude of his countrymen are thus set forth in Mr. Clark's prospectus:—"Dr. Bull's reputation as a composer and as an organist extended during his lifetime to the capitals of Holland, France, and Germany, and he may justly be considered the Henry Purcell of the latter half of the sixteenth century. It is presumed the publication of this interesting manuscript will tend to throw a new light on the extraordinary genius and acquirements of one of the earliest, and most celebrated musicians of which this country can boast; and it will materially assist in demonstrating that in the reign of Elizabeth there first appeared those great harmonies and combinations of notes, which it has been the habit of many professors to attribute to the later period of Henry Purcell, and the still later one of Sebastian Bach. . . . It also exhibits another, and, if possible, still more interesting claim on the attention and patronage of the musical public, as it contains the national air of "God Save the King," composed in four parts. This is written in three-two time, and the melody is, with one or two exceptions, precisely the same as is now in use; and it is but justice to the memory of Dr. Bull, its composer, to state that his reputation may be considered to have suffered from the claims which have unjustly been made for various persons as the composer, and from the slight alteration which has arisen from the lapse of time, and the want of an authentic copy as a reference. . . . In addition to this great curiosity, there are twenty-seven other compositions, including many fugues, canons, and variations on the fine old Gregorian hymns, Gloria tibi Trinitas, Salvator Mundi Domine, Felice namque offertorium," &c. &c. In 1613, as we learn from the old cheque-book of the chapel royal, "John Bull, doctor of music, went beyond the seas without license, and was admitted into the archduke's service, and entered into pay there about Michaelmas." Wood says that he died at Hamburg; others assert that this event took place at Lubeck; but recent researches have enabled us to set the matter beyond doubt. Bull visited Antwerp in 1615, and was appointed organist of the church of Notre Dame in that city in 1617. He died on the 12th or 13th of March, 1628, and was buried in the cathedral of which he was organist. There is a picture of him yet remaining in the music school at Oxford. It is painted on board, and represents him in his habit of bachelor of music. (Wood's *Athenæ*; Ward's *Gresham Professors*; *Archives of Antwerp*, &c.)—E. F. R.

**BULLER, CHARLES**, a liberal politician, who promised to be a statesman, was born at Calcutta in 1806. He was the younger son of a younger son—the latter, then a member of the Bengal civil service, afterwards succeeding an elder brother in the representation of West Looe, a borough disfranchised by the reform bill, and in which the Buller family had influence. He received his early education at Harrow, which he quitted with the highest honours. He studied subsequently at Edinburgh, and there had for one of his tutors Mr. Thomas Carlyle. His education was completed at Cambridge, where he distinguished himself less in the academic studies of the place, than as a fluent,

vigorous, and witty orator—always on the liberal side—at the famed debating society, the “Union.” He was content with a B.A. degree, which he took in 1828; and destined for the law, he was called to the bar in June, 1831. Sent to the house of commons on the eve of the reform bill (for which, of course, he voted), as member for West Looe, he delivered his maiden speech in 1830; and after the disfranchisement of West Looe, he sat until his death for Liskeard, where also his family had influence. In the first reformed parliament, he was conspicuous as a young and promising radical, more a follower of Lord Durham than of Lord John Russell; more a philosophical than a democratic radical: witness the vigorous pamphlet published by him in 1831, and in which, despite its title—“On the Necessity for a Radical Reform”—the unfitness, in the writer’s view, of “the lower orders,” as he called them, for the reception of the franchise, was emphatically indicated. Mr. Buller’s first notable parliamentary achievement was, however, scarcely a political one, though it involved a great public benefit. On the 18th of February, 1836, in a speech received with great applause, full of wit, as well as sense and knowledge, he moved the appointment of a select committee to investigate the affairs of the record commission. Its issue need not be recorded. Some two years afterwards, Lord Durham, on his appointment to the governor-generalship of Canada, took Mr. Buller with him as his civil secretary. In 1841 he had a short term of office as secretary of the board of control, from which post he was speedily removed by the accession of Sir Robert Peel’s second administration. But with his return from Canada, he began to practise as a counsel in appeal cases before the privy council, and to occupy himself energetically in parliament, and out of it, with the question of national emigration. His speech on “Systematic Colonization,” calling for a royal commission to investigate the subject, was delivered in April, 1843. Out of the house as in it, though busy in many ways, colonization and colonial questions constituted his most prominent sphere of activity, and he was a leading man in the establishment and development of the New Zealand company. In the house of commons he was rising rapidly, by the freshness of his style, the lucidity of his statements, his general candour and originality as a speaker, and last, not least, by his airy sparkling wit, which relieved his treatment of the driest and most hackneyed subjects. If others rose with him “to catch the speaker’s eye,” the cry was generally for “Buller!” On the formation of Lord John Russell’s ministry, he was appointed to the modest post of judge-advocate-general; but in July, 1847, having been appointed a queen’s counsel the previous November, he was made a privy councillor. In 1848, when the poor-law commission broke down beneath the weight of public obloquy, Mr. Buller, at a considerable sacrifice of income, accepted the presidency of the new and remodelled commission; during his short occupancy of what had become a very responsible post, he suggested many, and carried several important improvements. But his career was prematurely closed; he died of typhus fever on the 28th of November, 1848. In the high social circles which he adorned, his loss was severely felt, and politicians of every party mourned one whose wit had never made an enemy, whose talents were admired, and whose purity of public and private character was respected by all.—F. E.

**BULLEYN, WILLIAM**, an English physician and botanist, was born in the Isle of Ely in the early part of the reign of Henry VIII. He was educated chiefly at Cambridge. In June, 1550, he was appointed rector of Blaxhall in Suffolk, but he resigned this office in 1552. He afterwards took the degree of doctor of medicine, and practised as a physician in Durham. Finally, he removed to London, and became a fellow of the College of Physicians in 1560. He wrote a book of simples, being a herbal in the form of a dialogue, at the end of which are some woodcuts of plants.—J. H. B.

**BULLIARD, PIERRE**, a French botanist, was born at Aubepierre, near Langres, about 1742, and died at Paris in 1793. He was an excellent artist, and gave beautiful delineations of plants. Among his published works are the following—“Flora of the neighbourhood of Paris;” “History of Poisonous Plants;” “History of the French Fungi, with beautiful figures;” “Elementary Dictionary of Botany;” and “French Flora.” Bulliard invented the art of printing natural history plates in colours, and he employed this in his works.—J. H. B.

**BULLINGER, HENRY**, the celebrated Swiss reformer, was born in 1504, at Bremgarten, a small town near Zurich, of

which his father was parish priest and dean. In 1519 he entered the university of Cologne, where he read Luther, and declared himself a protestant. In 1523 he was invited by Wolfgang Joner, Cistercian abbot of Cappel, to become lecturer on divinity in that monastery. There he remained six years, and composed many of his works. There also he became intimate with Zuinglius and other reformers. In 1527 he attended for some months the lectures of Zuinglius at Zurich, and in December of that year was deputed by the senate of Zurich to accompany him to the disputation at Berne. In June, 1528, he undertook the pastoral office, and preached for some time at Bremgarten, his father having renounced popery. After the battle of Cappel, October 11, 1531, Bullinger removed to Zurich for safety, and there succeeded Zuinglius as preacher in the cathedral, which office he held till his death. He preached daily, often twice: in pastoral labours he was incessant; and his house was always open to shelter and protect refugees from countries where religious persecution prevailed. He assisted in drawing up the first Helvetic confession of faith at Basle in 1536. With Calvin and Farell he drew up an agreement, on the subject of the Lord’s Supper, between the churches of Geneva and Zurich. After suffering some years from the stone, he died at Zurich in 1575. His sermons, in five decades, have been lately published at Cambridge by the Parker Society. Bullinger appears to have been one of the most moderate of the continental reformers—a man of much eloquence, of deep piety, and christian amiability, well worthy of the general esteem in which he was held by his contemporaries.—T. S. P.

**BULOW**. An ancient German family, originally belonging to Mecklenburg, but long established in Prussia. The following are its most distinguished members:—

**BÜLOW, FRIEDRICH WILHELM**, count von Dennewitz, a celebrated Prussian general, born in 1755. He entered the army at the age of fourteen. In 1792 he was made a captain, and appointed governor to the young prince, Lewis Ferdinand of Prussia. He served with great distinction in the campaign of the Rhine, and in 1808 was made general of brigade. He distinguished himself under Blucher at Eylau, Friedland, and Tilsit, and on the 5th of April, 1813, gained an important victory over the French at Möckern. On the 10th of June following, by a skilful movement, he saved Berlin, then menaced by the French; a second time, on the 23rd of August, by the victory of Gross-Börn; and a third time, on the 6th of September, by totally routing Marshal Ney at Dennewitz. This gallant action gained him the title of Count Dennewitz. He took a prominent part in the battle of Leipzig, and afterwards served with great distinction in Westphalia, Holland, and Belgium, and throughout the campaign of 1814, especially at Soissons. On the conclusion of peace, Bulow was appointed commander-in-chief of the Prussian infantry, and governor of Lithuania and eastern Prussia. On the return of Napoleon from Elba, he once more took the field under Blucher, and rendered signal service to the allies at Ligny and Wavre. By great exertions he arrived with his division on the field of Waterloo, in time to assist in the total overthrow and dispersion of the French army. After the final downfall of Napoleon, Bulow returned to his post at Königsberg as governor of the eastern provinces of Prussia, and died there on the 25th of February, 1816, leaving behind him a high reputation for courage and professional skill, winning manners, and knowledge of the fine arts.

**BÜLOW, HENRICH WILHELM**, baron von, brother of the preceding, was born in 1760. He was educated for the military service, which he entered at the age of fifteen, but soon became disgusted with this life, and tried various other professions without success. He visited South America, and afterwards spent some time in France, and in London, where he ruined himself by a newspaper speculation, and was confined in the King’s Bench prison. He published a treatise entitled “The Spirit of the Modern System of War;” a “History of the Campaign of 1800;” a “Life of Prince Henry of Prussia;” several treatises on military tactics, and a work entitled “The Campaign of 1805,” which gave great offence to the court of St. Petersburg, and led to his imprisonment at Riga, where he died in 1807. Bulow was an ardent disciple of Swedenborg, and wrote a treatise upon his tenets, entitled “A View of the Doctrine of the New Christian Church.”

**BÜLOW, LEWIS FRIEDRICH VICTOR JOHANN**, count von, born in Brunswick in 1774. He was indebted to his cousin Har-

denberg for promotion in the Prussian civil service; and after occupying various important offices, he was in 1813 nominated minister of finance, and subsequently minister of commerce. He died in 1828. His brother-in-law, AUGUSTUS FRIEDRICH WILHELM (born 1762; died 1817), was secretary-general of administration, and chief of Prussian police at Dresden, and afterwards at Berlin, and wrote a treatise on "Jurisprudence," and a work on "The State of the Protestant Church in Germany."

BÜLOW, HEINRICH, baron von, a distinguished Prussian diplomatist and statesman, born in 1790. His enthusiastic patriotism made him abandon his studies at Heidelberg in 1813, and take up arms against the oppressors of Germany. He distinguished himself in various engagements under General Walmoden. On the downfall of Napoleon, he was employed in various diplomatic services. In 1817 he became secretary of embassy in London, and in 1827 was elevated to the office of Prussian ambassador at the English court, and took part in several important negotiations. In 1842 he received the portfolio of foreign affairs, but his administration was unpopular, and he resigned his office in 1844. His death took place at Berlin in 1846.—J. T.

\* BÜLOW, KARL EDUARD VON, a German novelist, was born near Eilenburg, November 17, 1803. He established his literary fame at once by his "Novellenbuch," 1834-36, 4 vols., a collection of one hundred translations of old Italian, Spanish, French, and other novels. His own "Novellen" appeared from 1846-48 in 3 vols.—K. E.

BULWER LYTTON, SIR EDWARD. See LYTTON.

\* BULWER, SIR HENRY LYTTON, G.C.B., the Right Hon., is the second son of the late Brigadier-general William Earle Bulwer, of Heydon and Woodalling, county of Norfolk, by Elizabeth Barbara, only daughter and heiress of R. W. Lytton, Esq. of Knebworth, Herts. He is consequently elder brother of Sir Edward Bulwer Lytton, Bart.—(See LYTTON.) He was born in the year 1804, and entered the diplomatic service in 1827. From November, 1832, he was attached to the embassy at Paris down to November, 1835, when he was appointed secretary of legation at Brussels; two years later he was sent in the same capacity to Constantinople, where he negotiated and concluded a treaty, which is the foundation of our present commercial system in the East. In November, 1843, he was appointed envoy extraordinary and minister plenipotentiary to the court of Madrid, in which capacity he negotiated the peace between Spain and Morocco. In 1848, however, he was dismissed from his post by the fickle ministry of that country, and returned to England. His able administration of affairs at Madrid, however, had already secured the addition of his name to the list of her majesty's privy council, and his subsequent diplomatic acts were rewarded with the honours of the highest decorations of the order of the Bath. In April, 1849, he was nominated British minister at Washington, from whence he was transferred, in the same capacity, to the court of Tuscany in 1852. In America and Italy alike his diplomatic career was attended with success. In 1856 he was nominated by Lord Palmerston commissioner at Bucharest, for investigating the state of the Danubian principalities. As British commissioner he elicited from every minister and every government concerned, the warmest expressions of approval, and all concurred in recommending him for the post of ambassador to the Ottoman Porte on the return of Lord Stratford de Redcliffe (see that name) in the spring of 1858. Sir H. L. Bulwer is married to a sister of Earl Cowley, our ambassador at Paris.—E. W.

BÜNAU, HEINRICH GRAF VON, the well-known patron of Winkelmann, was born at Weissenfels, June 2, 1697, and died at his estate of Osmanstädt, April 7, 1762. He studied at Leipzig, and soon rose to high honours in the administrative service of Saxony, but resigned his offices, and some years after entered the service of the Emperor Charles VII., after whose death he was appointed regent and afterwards prime minister of the duchy of Weimar and Eisenach. He stood in general esteem for his integrity as a statesman, as well as for his liberality as a patron of learning and literature.—K. E.

BUNBURY, HENRY WILLIAM, an amateur caricaturist, who now seems to us rather gross and dull. He was the younger son of Sir William Bunbury of Mildenhall, Suffolk, and was educated in Westminster school and Catherine Hall, Cambridge. His "Directions to Bad Horsemen" are smart and spirited, but not subtle or refined. Sir Joshua Reynolds, who was not fond of praising men equal to himself said these riding plates excelled

everything of the kind. Mr. Bunbury died in 1811, near Kerwick. Many a barber's boy and countryman still rejoices in the broad fun of Bunbury.—W. T.

\* BUNGE, ALEXANDER VON, a Russian botanist and traveller, was born at Kiew on 24th September, 1803. He took his degree of doctor at the university of Dorpat in 1825. He travelled with Ledebour into Siberia, and visited the Altai mountains. In 1830 he was sent by the Russian government as naturalist with the mission to Peking, where he remained for eight months. He made a large collection of plants. He again visited the Altai mountains at the request of the Russian government. He came to Petersburg in 1833, and was subsequently appointed professor of botany at Casan, and, finally, in 1836, he succeeded Ledebour as professor of botany and director of the botanic garden of Dorpat. His chief works are—"Conceptus of the genus Gentian;" a "Treatise on the Natural System;" "Enumeration of Chinese Plants;" and "Catalogue of Altai Plants."—J. H. B.

BUNSEN, CHRISTIAN-CHARLES-JOSIAH, Baron, scholar, theologian, and diplomatist, one of the most distinguished men and finely-balanced characters of the present age. He was born at Korbach in the year 1791, and died in 1860. He studied first at Marburg, but afterwards, from 1809 to 1813, at Göttingen, under the celebrated philologist Heyne. His first publication was a treatise on Attic law—early indicating the grand combination of ancient learning with the business of life for which his future career became so characteristic. In 1813 he left Göttingen; unwilling, as a true German, to accept office under the imperial sovereignty of Jerome Bonaparte, then tottering to its fall. In Holland and Denmark, to which he next proceeded, he enjoyed the instructions of Finn Magnussen, while prosecuting those profound studies in the old German and Icelandic dialects, which he had already commenced under Benecke and Lachmann. In 1815 he went to Berlin, and made the acquaintance of Niebuhr. In 1816 he studied Persian and Arabic under the famous Sylvester de Sacy, at Paris; and in the same year went to Rome, where, through Niebuhr's influence, then Prussian plenipotentiary to the papal court, he in 1818 received the appointment of secretary to the embassy. About this time Bunsen married an English lady; a circumstance prophetic of his future intimate connection with this country. In 1827, after Niebuhr's removal to Bonn, Bunsen succeeded to his office as Prussian minister in Rome. Besides Roman topography and archæology, we find him at this period engaged in ethnological studies of a far-reaching character, in the study of Platonic philosophy; and again occupied with profound researches on biblical criticism, church history, and liturgical formulas. His attention was directed to Egyptian antiquities by the visit of Champollion to Rome in the year 1826. To the importance of the great discovery made by this extraordinary genius, his eyes were immediately opened; and in his great work on Egypt he has done ample justice to the genius of the great Frenchman. In 1839 we find him again in the Prussian diplomatic service as ambassador at Bern. In 1841 he was called to Berlin to arrange the affairs of a new English-German bishopric, to be created in Jerusalem. For this purpose he was despatched to England; when shortly afterwards he was made Prussian ambassador in this country, as successor to Baron Bulow. This important situation he filled for fourteen years; and the fruits of his residence were of great political consequence, both to England and Germany. He took an active part in all public questions. In 1848 he defended vigorously the rights of the German element, in the duchy of Holstein, against the king of Denmark, who was supported by Lord Palmerston and the English government. In 1854, on occasion of the Russo-Turkish war, he used equal independence of judgment, and an eye no less clear, for the true interests of Germany; but as the Russian party were yet too strong in Berlin for such decidedly English sympathies as Bunsen exhibited in the movements which led to the Crimean expedition to be officially tolerated, he demitted his post in London, and subsequently lived as a private man in Heidelberg, prosecuting to a triumphant close that long course of historical and theological study which he had never for a single day remitted during his long course of public life in the busy metropolis of the British empire. He, however, never ceased, by stirring pamphlets and otherwise, to let his voice be heard on important public questions, which deeply interested him as a German and as a Christian; and he,

moreover, always maintained his firm hold of the affections of the monarch, who at an early period discerned his worth. Of this, the most remarkable proof was the high honour conferred on him by the king of Prussia, in creating him a Freiherr or baron, with a place in the Prussian upper house, under circumstances and conditions alike honourable to the constant favour of the royal bestower, and the dignified consistency of the man on whom so great a distinction was conferred.

The extraordinary activity of Bunsen's mind will be best illustrated by an enumeration of the various works—some of them of immense compass—which he contrived to publish, amid the various occupations of public life. The following is a list of his principal works—"De Jure Atheniensium Hæreditario," Göttingen, 1813; "Beschreibung der Stadt Rom," 3 Bde., Stuttgart, 1830-43 (of this work he is only part author); Allgemeine evangelisches Geang und Gebetbuchs," Hamburg, 1846; "Elizabeth Fry, an die christlichen Frauen und Jungfrauen Deutschlands," Hamburg, 1843; "Die heilige Leidensgeschichte und die stille Woche," Hamburg, 1841; "Die Verfassung der Kirche der Zukunft," Hamburg, 1845--English, London, 1845; "Ignatius von Antiochien und seine Zeit," Hamburg, 1847; "Die drei echten und die vier unechten Briefe des Ignatius von Antiochien," Hamburg, 1847; "Die Basiliken des christlichen Roms," Munich, 1843; "Christianity and Mankind," Jena, 1854, in 7 vols. "Die Zeichen der Zeit," Leipzig, 1855--English, 1856; "Ægyptens Stelle in der Weltgeschichte," vols. i. and ii., Hamburg, 1845; vols. iii., iv., and v., Perthes, 1856-7; "Gott in der Geschichte," Leipzig, 1857; and the great "Bibelwerk," meant to be the author's crowning work, but which had to be finished by friends after his death.—J. S. B.

\* BUNSEN, ROBERT-WILHELM EBERHARD, a celebrated German chemist, born at Göttingen in 1811, was educated at the university of that town, and at Holzminden, whence he returned to Göttingen to study natural philosophy and chemistry. After an extended course of travel, he was appointed in 1841 titular professor of chemistry and physics at the university of Marburg, and in 1851 was called to occupy the same position at Breslau. Besides a vast number of valuable memoirs on chemical and mineralogical subjects in Liebig's Annals of Chemistry, he has published "Descriptio Hygrometrorum," 1830, and "Eisenoxydhydrat das Gegengift des weissen Arseniks und der arsenigen Säure," 1837.—J. S., G.

BUNTING, EDWARD, a distinguished Irish musician, was born at Armagh in 1773. His first collection of "Irish Airs" was published in 1796; his second in 1809; and his third and last in 1840. Bunting did not live to carry out his plan of republishing his first two collections uniform with the third. He died 21st December, 1843, aged seventy.—E. F. R.

BUNTING, JABEZ, D.D., a distinguished minister among the Wesleyan methodists, and four times president of the conference, was born in Manchester in 1779. He is generally regarded as the most distinguished successor of John Wesley. Known to the world as an eloquent preacher and speaker, and, by his services to the cause of religion and philanthropy, his abilities as an administrator of ecclesiastical affairs were of essential use to his own denomination, and contributed mainly to its consolidation, improvement, and prosperity, both in this country and in its foreign missions. His published writings were few, consisting principally of sermons; but his influence upon the literature of methodism and of christianity will be permanent, since he was successful in raising among his brethren a high standard of professional attainment, and in thus promoting the education, without diminishing the zeal, of the people of their charge. He retired from official life in 1857, with every token of affection and respect from the churches he had so long and so faithfully served, and in 1858 was followed to his grave, near the City Road chapel, London, by multitudes of good men of all parties, who admired his talents, and revered him for his long, consistent, and useful career.—E. B.

BUNYAN, JOHN, to whose genius we are indebted for the "Pilgrim's Progress," was born at Elstow, in the neighbourhood of Bedford, in the year 1628. He was of humble parentage, belonging, as he himself expresses it, to "a low and inconsiderable generation," for his father was a tinker or worker in brass, and perhaps a gipsy. Some countenance at least is lent to this supposition, by Bunyan's telling us that, on one occasion, he was led to ask his father whether they were of the seed of Israel. The son was brought up to follow the paternal craft. His

education, however, in the simplest branches, was not neglected; for he tells us gratefully how his parents were careful to send him to school, where he acquired, in a humble way, the arts of reading and writing, to be speedily lost indeed, but recovered by his own efforts afterwards. His boyhood was profane and godless. He describes himself as having few equals at his years "for cursing, swearing, lying, and blaspheming the name of God." He was a ringleader in all juvenile mischief; a reckless little dare-devil, throwing the wild energy of his nature into the practice of all boyish vices. Not without checks of conscience, however, which met him in the characteristic form of fearful dreams, in which evil spirits in monstrous forms appeared to him, threatening to drag him to the pit; or the day of judgment, with its flaming heavens and trump of terror seemed come; or Tophet disclosed its jaws beside him, belching out horrors, while a circle of fire began to close him round. His boyhood passed into such a youth of open ungodliness as left him no equal in his native district. Not that he was a profligate in the ordinary sense of the term. He was neither drunkard nor libertine. But he was "a blasphemer, and injurious," corrupting youth of less hardihood and energy, and counted by the neighbours a vicious pest. Athletic sports and pastimes he followed with a passionate avidity; bell-ringing and dancing were his choice amusements, and it was his wont, especially, to "solace himself" with them on the sabbath-day. At an early age, led by love of adventure or driven by poverty, he entered the army; but it is matter of dispute whether he joined the royalist or the republican ranks. But whether kingsman or parliamentarian, Bunyan was doubtless at this time gathering, though unconsciously, materials for the illustration of his "Holy War," and finding in cavalier trooper and roundhead officer models for the mystic warriors who figure in the annals of beleaguered Mansoul. At the siege of Leicester, he had been ordered to a particular service, when a comrade requested to be allowed to go in his place; Bunyan consented, and the substitute was shot dead at his post. Returning home shortly afterwards, he entered, while yet a youth, into the married state. His bride brought with her, apparently as her entire portion, two volumes of practical religion, in which she prevailed with her husband frequently to read with her. The perusal of these, together with his wife's talk of the piety of her deceased father, wrought a marked change in the spirit of Bunyan, and by and by the profane "blackguard," as Southey has called him, became a pharisee. He went to church twice a-day, began to "adore" in abject superstition every thing connected with the consecrated edifice, and was ready if he met a priest, though ever so indifferent a character, to lie down at his feet and worship him as the minister of God. At the same time, however, he spent his Sabbath afternoons in cursing among his godless compeers. But one day the parson preached on the desecration of the Lord's day, and appeared to Bunyan as if he had prepared the sermon expressly to meet his case; so that when he went to the playground as usual, he thought his game interrupted by a voice from heaven, presenting to him, in direct question, the alternative of *leaving* his sins and being saved, or *having* them and being damned. For a little he stood stunned by the inquiry, but ultimately resolving to *have* his sins, and thinking that, perdition being inevitable, he might as well go to hell for many sins as few, he plunged anew into his course of godless pleasure with a desperate greediness. His grudge was that he could not get his fill of sin as rapidly as he wished, and his fear that he would die before he should be satiated. But standing on one occasion beside a neighbour's window "playing the madman," as was his custom, the woman of the house, herself an ungodly creature, came out and rebuked him as a corrupter of youth and the most blasphemous wretch in the town. The shaft reached his heart. From that time he laid aside his profane vocabulary. In course of time he was wondered at as a prodigy of piety. Proud of his godliness, he left off his sports as inconsistent with a profession like his; first becoming simply an onlooker at the ringing of the bells, then in fear of death from the fall of the bell or the tower, forsaking the scene altogether. In the same gradual way, though it cost him hard, he abandoned dancing, and thought that now "no man in England could please God better" than himself. But the pharisee was soon to be stripped of his poor cloak, and made a true penitent. His way to peace lay through protracted and fiery conflicts. Joining one day a little circle of poor women,

as they sat at the door of their cottages conversing of their religious experiences, he was led to mistrust his own state, as knowing nothing of what he heard them so pleasantly describe. He often afterwards frequented their society; his heart failed him under their applications of scripture, and he went from their company to meditate incessantly on what he had heard. He shook off a swearing comrade, to whom his heart had before been knit; betook himself to prayer for divine direction, and began to have a new relish for the word of God, still crying, as he pored over its pages, for light from heaven. With that vividness of conception which projected all his thoughts into the region of the visible and audible, making them voices and sights, he now in a kind of vision saw the poor women of Bedford up on a sunny mountain-side, basking in radiant warmth, while he himself shivered aloof amid frost and snow. A wall girdled the happy region round, which he found could only be passed by a little doorway, very strait and narrow; through which, however, after long struggling, he was able to force his way, and went and sat down in the midst of the company, comforted with light and heat, and "exceeding glad." The vision and its interpretation dwelt on his spirit, and vehement prayer rose from his heart wherever he was, at home or abroad, in the house or the field. But then came the dark questions—Was he among the elected? and what if his day of grace were gone? and through long and grievous buffetings he struggled onwards to the light, his help coming still from the word of God. It was now the dullness, insensibility, and unbelief of his soul that grieved him: his conscience as to outward sinning was tender and scrupulous, but he thought inward vileness like his could never be cleansed. Still he fought the battle, and still helpful texts of scripture came to him, as voices from the skies. On one occasion, after a hand had in this way been stretched to him with healing leaves, he describes his happiness as so intense that he felt as if he could talk of God's love to him to the "very crows that sat upon the ploughed lands" before him. The clouds, however, returned again; a voice seemed to sound in his ears—"Simon, Simon, Satan hath desired to have you," so loudly sometimes that he turned his head to see who stood behind him, and once so startlingly that it seemed to come to him from half a mile's distance. Troops of blasphemous suggestions anon entered his mind; gloomy questionings as to the being of God and of the Saviour, doubts of the truth of the scriptures, temptations to utter some horrible curse against God, to blaspheme the Holy Ghost, and fall down to worship the devil, till he began to think himself possessed, and in his agony would hold his mouth with his hand, lest it should open to utter the unpardonable blasphemy. This lasted for about a year, at the end of which time he became somewhat composed in mind, through the reading of Luther's Commentary on the Galatians, and yet more through the counsels of Mr. Gifford, a baptist clergyman of Bedford. The darkest wave of all in this billowy sea of trial, however, was yet behind. He began to be haunted with an inward suggestion to sell the Saviour. "Sell him, sell him," said the horrid voice, "sell him for this, for that, for anything;" till, like miserable patients in cases of optical derangement, who cannot look in any direction without seeing the hideous or fantastic shape which haunts them, he could not pick up a pin, or chop a stick, but the hateful whisper was in his ear. "Sell him, sell him," it went on; till one day he felt as if he were answering—"Let him go if he will;" and then came blank despair. He was in the iron cage now. He was Judas; he was Cain, with a brand on him; he was Esau, shut out, as he interpreted the text, from repentance; he was worse than all the great sinners of the Bible who had found mercy—David, Solomon, Manasseh, Peter; he was a new Francis Spira, whose miserable groanings he re-echoed as he read. At length, however, after months of agony, the tempest began to pass away; the thunder, as he says, got beyond him, and only some small drops remained; with many a scripture text as his staff he had struggled through the deep waters, and now stood on dry ground. By such stormy conflicts, in which the strength of the ideal faculty gave body and action to vivid thoughts, was Bunyan being prepared to serve his Lord as a preacher and an author.

In the year 1653, the year in which Cromwell was made lord-protector of England, Bunyan became a member of Mr. Gifford's church. His doubts and fears, after a season, returned upon him, aggravated by failure of his health; but he again battled through

them triumphantly. Within two years of his baptism, he was formally invited to engage in the work of the ministry. He consented, and officiated as a preacher, at first somewhat privately, then with all publicity. For two years, preaching from the smart of his own spirit, he cried out against sin and proclaimed its perils, but ultimately taught the way of God more perfectly; he "altered," as he says, his mode, and laboured "to hold forth the Lord Jesus Christ." His services—as was to be expected from the ministrations of one who tells us that he preached with such conviction of the truth, that he felt as if he could say he was more than sure of it—proved singularly acceptable and powerful. The interest occasioned by his preaching is attested by the persecution it excited; "the doctors and priests of the country did open against" him, and he was indicted to appear at the Bedford assizes, within a year of his beginning his labours. The process somehow failing, his enemies appear to have had recourse to all sorts of absurd calumny, which Bunyan, strong in innocence, accepted as a badge of true christian discipleship.

On the 12th of November, 1660, five months after the Restoration, Bunyan had undertaken to preach at a place named Sawsel, near Harlington, in Bedfordshire. Though warned that a warrant had been issued for his apprehension, the intrepid preacher would not be held back from fulfilling his engagement. He was accordingly arrested, and committed to Bedford jail, where he remained, with intervals of partial liberation, for a period of twelve years. Seven weeks after his incarceration he was brought up at the quarter sessions in Bedford, with a bill of indictment preferred against him, as "a common upholder of unlawful meetings and conventicles;" and as neither arguments, nor threats, nor cajolery, nor ridicule, which were all tried, could prevail on him to promise that he would desist from preaching, he was convicted and sentenced to imprisonment, with certification that if he would not conform, he should be banished the kingdom. At the coronation of Charles II. in 1661, a proclamation was issued, allowing convicts twelve months to sue out a pardon; and had Bunyan, at that time, felt it consistent with his views of duty to petition for freedom, he might probably have been discharged. At the assizes of that year, his wife—a true heroine—after having travelled to London with a petition to the house of lords, appeared several times before the judges to plead her husband's cause. This she did with such a weight of argument, such prudence and modest intrepidity, as touched the heart of the upright Hale, but could not move his coarse and bigoted fellow-justices. "I am sorry, woman," said the kindly judge, "that I can do thee no good."

In prison Bunyan had to do something to provide for his family. He had four children—one of them blind and dearly loved—by his first wife (for his heroic advocate before the justices was a second spouse, but a true mother to his little ones); and these were looking to him for bread. So he set himself to work for them as he might, making tagged bootlaces, an art which he acquired in jail. Meanwhile he was laying the foundations of an imperishable fame. His "Pilgrim's Progress" was, at least, planned in jail, and probably the first part was written there. His "Grace Abounding," "Holy City," "Resurrection of the Dead," together with other treatises and tracts, were also composed in "the den." Persecution had filled the jail with many prisoners of congenial character, with whom he enjoyed many pleasant hours of religious conversation. He was in favour from the first with the jailor, who nearly lost his place for permitting him on one occasion to go as far as London. Years of stricter confinement followed, but at last he was often allowed to visit his family, and remain with them over night. A remarkable incident in connection with this indulgence is related. Bunyan had received the usual liberty, but at a very late hour felt resistlessly impressed with the propriety of returning to the prison. He arrived after the keeper had shut up for the night, much to the official's surprise. But his impatience at being untimeously disturbed was changed to thankfulness, when a little after a messenger came from a neighbouring clerical magistrate to see that the prisoner was safe, and the custodian was able to produce him. "You may go out now when you will," said the jailor; "for you know better than I can tell you when to come in again." In the later years of his incarceration he was allowed to attend the meetings of the church, and to officiate as a preacher. He was still nominally a prisoner, although subject to little restraint, when he was elected pastor of the church in

Bedford, of which he had long been a member. He obtained his full release through the intervention of the Quakers, and his name is included in the "general pardon" passed by the king in council, in behalf of the prisoners of that persuasion, bearing date September 13, 1672.

After his discharge from prison his popularity as a preacher widened rapidly. Crowds flocked to hear him. His place of worship had to be enlarged. On his frequent visits to London, when he delivered his week-day addresses, the large chapel in Southwark was invariably thronged with eager worshippers. He was not wholly unmolested, but always escaped his persecutors' search. When the act of indulgence was passed in the reign of James II., Bunyan did not hesitate to avail himself of its provisions, although he desisted and denounced the insidious design of the measure. Next year came the Revolution and the toleration act. But Bunyan did not live to see the happy day of England's riddance from the house of Stuart. His last illness was superinduced by exposure to wet, while engaged on an errand of kindly intercession on behalf of a youth who had offended his father. He had succeeded in his object, and was returning home by way of London, when he was caught in a drenching rain, and arrived in an exhausted condition at the house of his friend, Mr. Strudwick, near Holborn bridge. Here he was seized with fever, and after ten days' illness, which his frame, weakened by a previous attack of the mysterious sweating distemper of the day, was less able to resist, he died in peace on the 31st of August, 1688, in the sixtieth year of his age. His last words were full of christian hope. His remains were interred in Bunhill burying-ground, where his tomb may still be seen.

Bunyan will always hold rank as one of the first among practical religious writers in the English language. His Saxon sagacity, his good sense, wonderful genius, and profound acquaintance with the bible and the human heart, fitted him for his work, without the aid of scholarship. He had studied but two great volumes—the scriptures and his own experience; but the latter was such as few men ever had access to, and he had made himself master beyond most, of the treasures of the inspired book. His want of learning and of exact training made him, indeed, defective as a textuary; but no man ever drew from the bible more thoroughly the great principles of faith and practice. He wrote much, in varied forms, in prose and rhyme, and always with power. His very verses, doggerel as they must be admitted to be, have a rough vigour in them that disclose the man. His practical and experimental treatises are admirable, full of passages glowing with the light of a splendid imagination. He wields the controversial pen with a sturdy hand, and has a formidable power of logic, though not borrowed from the schools. His great charm lies in the clear pithy style, and the dramatic vivacity of his writings. His words are direct, strong, and unmistakable. He questions, answers, exclaims, apostrophizes, personifies; individualizes his readers, and takes them by the hand, so that his pages are never dull, and his words never wasted. The fame of John Bunyan, however, rests most securely on his allegorical writings. Thousands that have scarcely known him as a writer of practical treatises, or have heard only of his "Grace Abounding," have studied him in the pages of the "Pilgrim's Progress." His "Holy War," though more elaborately ingenious, has always been less popular, except perhaps with such boy-readers as think the sixth book of Milton's *Paradise Lost* the gem of the immortal epic. The "Pilgrim" has been, indeed, the book of the people. Who has not heard of it, and who that has ever opened a religious volume, has not read it? There is no book, we believe, the bible alone excepted, that has been translated into so many languages; few that have been read by so many classes. It pleases the child by the resistless charm of its simple pictorial story—it instructs, by its rich theology, the mature christian—its genius captivates the man of letters. It has passed through numberless editions—editions small and large, with comment and without—editions annotated, illustrated, illuminated—editions that have been laid as ornaments on the drawing-room table—editions that have lain well-thumbed upon the cottage window-sill. It has been imitated, supplemented, modernized, turned into rhyme—it has been read, referred to, quoted, analysed, lectured from, till the characters and incidents of its story, are as familiar to us as those of the bible narratives, and its language, like that of scripture, has woven itself into

the texture of religious discourse. The pilgrimage described in it has been mapped out with its stations, as if it were a real journey; and its shadowy personages have become almost as real to our conceptions as the heroes of history. Bunyan himself is hardly more veritable than his Christian.

It has been remarked, that Bunyan's treatises were as numerous as his years. The following are his principal works, with the dates of publication, as given in Charles Doe's Catalogue-Table, circulated in 1691. The dates in parentheses are supplied by George Offor, Esq., one of Bunyan's most recent and enthusiastic editors. "Gospel Truths Opened," 1656; "Sighs from Hell," (1650); "The Holy City; or, The New Jerusalem," 1665; "Grace Abounding to the Chief of Sinners," (1666); "Justification by Jesus Christ," 1671; "The Pilgrim's Progress," 1678; "Come and Welcome to Jesus Christ;" "The Holy War," 1682; "The Barren Fig-tree," 1683; "The Second Part of the Pilgrim's Progress," (1684); "The Life and Death of Mr. Badman," (1680); "The Pharisee and Publican," 1685; "The Jerusalem Sinner Saved," 1688; "Solomon's Temple Spiritualized," 1688. He wrote also "Defence of the Doctrine of Justification," 1672, against Mr. (afterwards Bishop) Fowler; and "Differences about Water-Baptism no bar to Communion," 1673.—J. Ed.

\* BUOL-SCHAUENSTEIN, Count, chief minister of Austria, born in Switzerland, where his father was Austrian minister, in 1797. Count Buol commenced his political career as chargé d'affaires at the Hague; was afterwards envoy extraordinary at Basle; presided at the diet of Ratisbonne, and in 1815, after a long retirement from public life, represented Austria at the diet of Frankfort. In 1822, when he resigned the dignity of president of the Germanic diet, he returned to Vienna, but took no part in public affairs till 1847, when he went to Turin with the title of ambassador. In 1852 he was summoned from England, on the death of Prince Schwarzenberg, to assume the high office which he now holds. The reform policy of his predecessor is believed to be that to which Count Buol inclines. His name is well known in this country from his participation in recent negotiations connected with the affairs of the East.

BUONACORSI. See VAGA.

BUONAMICI, CASTRUCCIO, one of the most elegant Latin writers of the last century, author of "Commentaria de Bello Italico," born at Lucca in 1710; died in 1761. In 1754 the knights of Malta presented him with the cross of their order, and granted him an annual pension.—A. C. M.

BUONAMICI, LAZZARO, an eminent Italian Latinist was born of poor parentage at Bassano in 1479; died in 1552.

BUONANNI, FILIPPO. See BONANNI.

BUONAPARTE. See BONAPARTE.

BUONARROTTI, FILIPPO, a celebrated Italian republican, born at Pisa in November, 1761, and descended from Michel Angelo Buonarrotti. He was already a conspirator when the French revolution broke out. Buonarrotti hailed that event with enthusiasm, and entered the ranks of those who conspired in favour of French rule in Tuscany. Obligated to fly to Corsica for safety, he there published a journal called the *Friend of Italian Liberty*, and was the constant associate and friend of the young Napoleon Bonaparte. On the proclamation of the French republic, Buonarrotti hastened to Paris, joined the Société des Amis du Peuple, and became an intimate friend of Robespierre. He was created a French citizen, and sent to Corsica to enforce the recognition of the authority of the republic. In 1795, he became a member of the jacobin society called the Société du Pantheon, where was hatched a conspiracy against the directory, for his share in which Buonarrotti suffered three years' imprisonment at Cherbourg. The first consul offered him a brilliant position under his government, but Buonarrotti was too severe a republican to serve under one whom he already regarded as a tyrant. He afterwards conspired against Napoleon with General Mallet, and, on the failure of the conspiracy, retired to Geneva. On the revolution of 1830 he again went to Paris, and was united in intimate friendship with many distinguished members of the democratic party, especially Godfroy, Cavaignac, and Guinard. He was in constant communication with Italian republicans in France and elsewhere. He organized a secret association called the Society of all True Italians, about the same time that Mazzini founded the association of Young Italy. Buonarrotti was so faithful to his principles, that though by birth a noble and rich, he refused to avail himself of either of these advantages.

He supported himself in honest poverty, chiefly by copying music, until his death, which happened in 1837. Buonarrotti published a "Histoire de la Conspiration de Babœuf."—E. A. H.

**BUONARROTTI.** See MICHEL ANGELO.

**BUONI, BUONO DE,** a Neapolitan painter, who flourished about 1430. He was a patient disciple of Colantino del Fiore, and assisted him in religiously adorning several of the Neapolitan churches. He died about 1465, after decorating the Restituta church with a St. Francis ecstatically receiving the stigmata.—**SILVESTRO,** his son, was the scholar of Solario, surnamed El Zingaro. He died in 1480.—W. T.

**BUONMATTEI, BENEDETTO,** born at Florence in 1581; died in 1647. His fame rests principally on his grammar of the Italian language, and other philological works. Maffei and Gioberti both consider him the best grammarian of his age.

**BUONTALENTI, BERNARDO,** surnamed GIRANDOLE, a Florentine artist, born in 1556. His parents, ruined by a sudden inundation of the Arno, gave their boy into the protection of Duke Cosmo I. Salviati and Bronzino taught him painting; Buonarrotti, sculpture; George Vasari, architecture; and Giulio Clovio, miniature painting. He became also an engineer, mechanic, and mathematician. As an artist his madonnas have dignity and colour. He died in 1606.—W. T.

**BURAGNA, CARLO,** author of "Il Canzoniere," born at Algeira, a town of Sardinia, in 1632. Died in 1671.

**BURCHARD,** bishop of Halberstadt in the middle of the eleventh century. He was sent to Rome by Henry IV. in 1060, and in the following year charged to decide, on the part of the emperor, the claims of the two rivals for the papal throne—Alexander II. and Honorius II.

**BURCHARD, SAINT,** first bishop of Wurtzburg, born in England; died in 752. He repaired to Germany about the time that Boniface began to preach the gospel in that country, and gave him his zealous assistance.

**BURCKHARD, JOHN CHARLES,** born at Leipzig in 1773; died at Paris in 1825. His tastes impelled him to the calculating department of the science of astronomy, in which he became so distinguished that, on the recommendation of Baron Zach and La Lande, he received letters of naturalization in France, and was put in charge of the observatory of the Ecole Militaire, after the death of the latter astronomer. Burckhard's chief works are his Treatise on the remarkable Comet of 1770; his Tables of the Moon, adopted by the Board of Longitude, and in the hands of almost every astronomer; and his excellent and most convenient auxiliary Tables. While yet a young man, he translated the first two volumes of the Mekanique Celeste into his native tongue.—J. P. N.

**BURCKHARDT, JOHANN LUDWIG,** a celebrated traveller, was born at Lausanne in 1784, and studied at Leipzig and Göttingen, where he was held in general esteem for his talents and assiduity. In 1808 he went to England, and in 1809 was sent on an exploring expedition to Africa by the African Society. He first repaired to Aleppo, where, during a residence of three years, he metamorphosed both his outward and inward man into a true Mussulman; an operation which he performed with so much success, that afterwards, when a doubt had been raised as to his creed, he was examined by two ulemas, and by them declared not only a true, but a deeply-learned Moslem. In 1812 he travelled through Egypt, up the Nile to Nubia, through the Nubian desert and across the Red Sea to Mecca, in order to study Mahometanism at its fountain-head. Thence he joined in a pilgrimage to Mount Ararat, by which he acquired the title of hadji, *i.e.*, pilgrim. In 1815 he returned to Cairo, and made preparations for his long-intended journey into Fezzan; when, however, the caravan was just about to start, he died of a fever, October 17, 1817, and was honourably buried in the Mahometan cemetery. All his Oriental MSS., 350 in number, he bequeathed to the Cambridge library. His journals were published after his death at London (a German edition appeared at Weimar); for truth, accuracy, and minute observation they are hardly to be excelled. His "Notes on the Bedouins and Wahabys," London, 1830; and his "Arabic Proverbs," London, 1831, are also highly valuable works.—K. E.

**BURDETT, SIR FRANCIS, Bart.,** third son of Francis Burdett, Esq., and grandson of Sir Robert Burdett, fourth baronet of Bramcote, in the county of Warwick, was born in 1770. He received his early education at Westminster school, and afterwards at Christ church, Oxford. In 1794 he entered the house

of commons as member for Boroughbridge. In 1797 he succeeded to his grandfather's title, his father having predeceased him. About this time he became intimate with the late Mr. Horne Tooke, the celebrated author of Diversions of Purley (see **TOOKE, J. H.**), by whom he soon became imbued with strong notions of the necessity of a reform in the electoral representation of the kingdom, although the subject was then in its infancy, and indeed had awakened as yet no public interest. Sir Francis Burdett, with great penetration, foresaw that there would come a time when it would force itself upon the consideration of both houses of the legislature, and he laboured hard, both in and out of parliament, to hasten on that period. He was returned in 1807 for the city of Westminster, which he continued to represent without interruption for thirty years. During the early part of this period his opposition to the governments of Lord Sidmouth and Mr. Percival was of the most formidable character. On April 7th he was committed to the tower for a breach of privilege, but was released on the following 22nd of June. On February 23, 1813, Sir F. Burdett proposed a new regency bill, but without success, though he recommended it by a speech of singular ability. In 1819 he addressed to his constituents a letter on the subject of the recent riots in Manchester; for this letter he was prosecuted by the attorney-general, and being found guilty of a libel, was fined £1000, and sentenced to three months' imprisonment in the king's bench. In 1837 he avowed that a total change had come over his views—that he was satisfied with the progress already made in the cause of reform; and that he had witnessed too many atrocities committed in the cause of reform in the neighbouring nation of France, to wish to see his own country placed in a like predicament. Impressed with this dread of revolution, in July, 1837, he declined to be put in nomination by his old constituents at Westminster, and was returned for North Wilts as a conservative and supporter of the late Sir Robert Peel. He was re-chosen at the general election of 1841; and died in 1844. He was a warm-hearted and benevolent man, a sincere friend, and a perfect specimen of the old English gentleman.—E. W.

**BURET, EUGENE,** author of "De la misère des classes laborieuses en France et en Angleterre," a thoughtful and earnest work, which grew out of a prize offered by the Academy of Moral Sciences of Paris about 1836, was born at Troyes in 1811, and died in 1842.

**BURETTE, PIERRE JEAN,** a writer upon ancient music, was born at Paris in 1665, where he died in 1747. His father, Claude Burette, was a musician; finding the boy's health too delicate to allow of his being sent to school, he taught him his own art as a recreation. Pierre made such rapid progress that at eight years old he played on the spinet before Louis XIV., and two years afterwards assisted his father in giving lessons on this instrument and on the harp. Notwithstanding this precocious manifestation of musical talent, his predilection was for the study of medicine, and he accordingly entered the college of Harcourt, where he took the degree of doctor at the age of twenty-five. He became also distinguished for his knowledge of the dead languages, as well as those of modern Europe. In 1692 he was appointed physician to the hospital la Charité; in 1698 he was instituted professor of materia medica; in 1701 he was made Latin professor of chirurgery; and in 1710 he was raised to the chair of medicine in the royal college of Paris. His early familiarity with music made this a favourite subject with him in his classical researches, and he accordingly published thirteen works illustrative of the music of the Greeks, including a translation of Plutarch's treatise on music, with an examination of its principles, and copious remarks upon them.—G. A. M.

**BURG, JOHN TOBIAS,** an astronomer of high merit, born at Treves in 1766; died near Clagenfurt in 1834. Having early shown his inclination towards physical research, and a rare industry, he was attached as assistant astronomer to an observatory at Clagenfurt in 1792. He published an ephemeris of considerable value, but his name is chiefly distinguished by his labours on the motions of the moon. In 1798 the Institute proposed a subject of a prize, "To determine, by means of a great number of lunar observations (five hundred at least), both ancient and modern, the mean height of the apogee, and of the ascending node of the moon's orbit." Burg undertook the very difficult and laborious problem, and deduced the desired results from *three thousand* observations, by a method as original as exact. His only competitor was Alexander Bouvard. The

judges. Lagrange, Laplace, Delambre, Legendre, and Mechain, divided the prize, awarding to Burg two-thirds of it; but Napoleon, aware of the importance of the achievement, doubled its value. The emperor of Austria, proud of his subject, decorated him with the cross of Leopold. To Burg we owe the first lunar tables that can be said to approach to exactitude. He introduced large corrections into the tables of T. Mayer; nor have his labours been improved until quite recent times, when our knowledge of the lunar inequalities received, apparently, its last perfection from *Hansen (q. v.)*—J. P. N.

BÜRGER, GOTTFRIED AUGUST, one of the most popular poets of Germany, was born at Molmerswende in 1748. After studying theology for some time at Halle, he went to Göttingen in order to devote himself to the law. In 1772 he was appointed bailiff of Altengleichen, a village near Göttingen; an inferior situation with a beggarly income. By the faithlessness of a friend, and an unsuccessful attempt at farming, he had become involved in pecuniary embarrassments. He resigned his office and began lecturing at Göttingen, where in 1789 he was appointed professor extraordinary, but without a salary, and was therefore obliged to write for the support of himself and children. He died, after a protracted illness, June 8, 1794. Bürger's great strength as a poet lies in his ballads, a great many of which are imitations or paraphrases of old English and Scotch originals. He may well be said to have revived the taste for ballad poetry in Germany, and to have led the way to a more natural style of composition. Among his original poems, the celebrated "Leonore" takes the highest rank; it has been repeatedly translated into English. His lyrics, though sometimes rhetorical rather than poetical productions, are distinguished by noble manliness, great fire, and depth of feeling. Among his prose works, "The Travels and Adventures of Baron Munchausen," which were announced as translated from the English, stand highest. The complete works of Bürger were first edited by Karl von Reinhard, Göttingen, 1796-98, 4 vols. His life was written by Althoff and Döring.—K. E.

BURGH, WALTER HUSSEY—the name of Burgh having been taken in addition to the original name of Hussey—an Irishman, distinguished as a scholar, a patriot, and a lawyer, occupied a considerable place in Irish history during the time of Flood and Grattan. He was born in 1743, and educated for the bar, at which he gradually rose to an eminent position. In 1768 he took a conspicuous part in the Irish house of commons, of which he was a member, in opposition to Lord Townshend's government. In 1779 he was member for the university of Dublin. He was shortly after made chief baron of the exchequer, and died at the premature age of forty in 1783. Burgh was distinguished for his classical learning and poetic taste. As an orator his style, though at the commencement of his public career too ornate, was by mature experience improved and refined, till he acquired the reputation of the most elegant debater of his day. Both Flood and Grattan highly eulogized him. "He did not live," said the former, "to be ennobled by patent; he was ennobled by nature."—J. F. W.

BURGH, DE, an ancient and highly distinguished family which settled in Ireland in the twelfth century and still, under the cognate designations of De Burgho, De Burgh, and Burke, has continued to represent nobility, genius, and power:—

BURGH, RICHARD DE, who succeeded to the greater part of Connaught, forfeited by O'Connor, king of that province, and granted by John. His great power made him an object of suspicion to Henry III., and for a time he was placed in a position of hostility to the English government; but he soon was restored to favour, receiving only a gentle remonstrance from the king. Nevertheless, he quickly found or made occasion, with the aid of the lord-justice, to invade the territory of Feidlim O'Connor, king of Connaught, and made himself master of large tracts, which he continued to hold against all the complaints of Feidlim and the orders of Henry. In 1232 he built the castle of Galway, and in 1236 that of Lough Rea, and affected the state of a provincial king, keeping a train of barons, knights, and gentlemen in his service; and having gone in 1242, with a splendid suite, to meet the king at Bordeaux, he died in France in the following year.

BURGH, WALTER DE, son of the former, was eminent for power and enterprise, and the active part which he took in the events of that dark period of Irish history. The contest with the O'Conors, bequeathed by his father, was continued by Walter.

He died in 1271 at his castle in Galway. By his marriage with the heiress of De Lacy he acquired the earldom of Ulster.

BURGH, RICHARD DE, son of the preceding, and second earl of Ulster, called from his complexion the RED EARL, was educated at the court of Henry III., and was the most powerful subject in Ireland. In 1273 he pursued the Scots, who had invaded Ireland, into Scotland, and committed great slaughter and took much spoil, and was in consequence made general of the Irish forces in Ireland, Scotland, Wales, and Gascoigne. So high was his position that his name was placed before that of the lord-lieutenant in all public documents. Richard founded many monasteries and castles, amongst them that of Castle Connel on the Shannon, near Limerick, which is still held by a descendant of the name of De Burgho. In 1326, he retired to the monastery of Athasil, the foundation and burial-place of his family, where he died the same year.

BURGH, WILLIAM DE, earl of Ulster. Through his daughter who married Lionel, duke of Clarence, third son of Edward III., the titles of Ulster and Connaught were added to those of the royal family. He was murdered by his own servants in June, 1333, in the twenty-first year of his age, and his death was avenged by the people of Ulster, who rose in large masses, and pursuing the murderers killed 300 of them. From this period the power of the De Burgho family was divided, and began to decline.—J. F. W.

BURGMAIR, HANS or JOHN, a German painter and engraver, disciple and friend of Albert Durer, born in 1474. His pictures, preserved in the Diet city, have merit. His wood engravings are wrought with fire and the vigour of a robust, struggling, reforming age. Some of the early De Keyserberg prints are supposed to be his, for they are marked—"1510, J. B."—W. T.

BURGOS, PAULUS DE SANCTA MARIA, bishop of Burgos. Having relinquished Judaism, and along with it his wife and his children, he went to Paris, where he graduated; hence he repaired to Avignon, at that time a dependency of Rome: his eloquence and piety gained him high patronage, through whose influence he was successively preferred to the sees of Carthage and of Burgos, became first chancellor of the kingdom of Castile, and was intrusted with the education of the youthful king, John II. He died at the advanced age of eighty-five, in the year 1435. His high literary fame rests on the learning and zeal for the catholic doctrines, displayed in his work "Scrutinium Scripturarum" against Judaism.—T. T.

BURGOYNE, JOHN, English general and dramatist, was the natural son of Lord Bingley, and entered the army at an early age. Rapidly rising to the rank of general, through the powerful patronage of his aristocratic friends, he held a command in Portugal during its defence in 1762. In the course of the campaign, which terminated in the retreat of the Spaniards within their now territory, he gained considerable distinction both for skill and daring, and was successful in surprising a large reserve at Valencia de Alcantara. Subsequently he was elected member of parliament for Preston, and was ultimately called to, what he himself terms, "the unsolicited and unwelcome service in America." In 1775 he joined General Gye at Boston, in company with large English reinforcements, and witnessed, from one of the batteries in that city, the famous battle of Bunker's Hill, of which he has left an animated description. After proceeding to Canada as governor, he returned to England, but in 1777 was despatched to take command of that expedition from Canada against the United States, the failure of which so largely contributed to the establishment of American freedom. Few battles, indeed, have achieved, in their ultimate influence, results so great as the surrender of Burgoyne with 3500 fighting men, well provided with artillery, at Saratoga, to the army of General Gates. It gave heart to the colonists, and confirmed them in their resistance. It decided the somewhat wavering sympathies of the French government; and in England greatly strengthened those opposed to a continuance of the struggle. General Burgoyne, on his return home, was received by the king with marked disfavour. He defended himself with eloquence, and demanded an inquiry. The inquiry was commenced, but summarily stopped by a prorogation of parliament. Although Burgoyne did not possess the genius of a great general, and was in many respects utterly inadequate to the tasks imposed upon him, yet no one can read the work published in his defence—"State of the Expedition from Canada," London, 1780—without acknowledging his courage, and detecting qualities which, in a less

exalted station, might have been of service to his country, Disgusted with his treatment by the government, he withdrew from the army, and having married the daughter of Earl Derby, enjoyed considerable social ease. During his parliamentary career, he obtained a committee of inquiry upon Indian affairs, and moved a vote of censure upon Clive, May, 1773. He employed his leisure in literary pursuits, and was the author of the following dramas, which are occasionally elegant although without power—"The Maid of the Oaks;" "The Lord of the Manor;" "The Heiress;" and "Richard Cœur de Lion." The best of these plays is "The Heiress," which was composed at Knowsley, the seat of the earl of Derby, and was successful upon the stage. Burgoyne died on August 4, 1792.

\* **BURGOYNE, SIR JOHN FOX, G.C.B.**, lieutenant-general and inspector-general of fortifications. This very distinguished officer entered the corps of royal engineers in the year 1798. He served in the Mediterranean, with Sir John Moore in Sweden and Portugal, and afterwards with Wellington in Spain. In subsequent years we find him employed in America; and in 1845, after other services, he was appointed inspector-general of fortifications. It was to Sir John that our illustrious duke wrote his celebrated letter on the defenceless state of Great Britain—a letter that commenced a reaction against a narrow and suicidal policy, which, under the name of the public economy, had gone far to reduce our naval and military services to a state of comparative powerlessness. Sir John took part in all the great actions occurring during the Crimean war: he had the chief direction of the siege operations against Sebastopol. Very able papers, arising out of that siege, on the relative merits of fortification by stone or earth-works, are attributed to Sir John Burgoyne.—J. P. N.

**BURGDORF, FRIEDRICH AUGUST LUDWIG VON**, a German naturalist, was born at Leipzig on 23d March, 1727, and died at Berlin on 19th June, 1802. He devoted much attention to arboriculture. He was a member of the Academy of Sciences of Berlin, and was director of the Brandenburg forests. His works are—"History of Trees, and directions as to their choice and cultivation;" "Forester's Manual;" "Introduction to Dendrology," &c.—J. H. B.

**BURIDAN, JEAN**, a famous nominalist philosopher of the fourteenth century, rector of the university of Paris in the year 1347, was a native of Bethune in Artois. His end is reported to have been tragical; the wife of Philippe le Bel, or one of his three daughters-in-law, having, it is said, gratified her spleen at the philosopher, who interfered with her royal license for sinning, by throwing him into the Seine. Buridan is remembered not only by his scholastic treatises, which were of singular reputation in their day, but by a sophism called that of "Buridan's Ass," which, although it is not a settled point whether the inventor of it was Buridan, or one of Buridan's philosophical adversaries, has, to the advantage of his fame alone, been a subject of discussion among all the historians of the schools. It will be found at length in Bayle.—J. S., G.

**BURKARD WALDIS**, a German poet of the sixteenth century, was probably born at Altendorf on the Werra, and died at Abterode, electorate of Hessa. From a bigoted monk, he became a zealous defender of the reformed doctrine; and travelled in Holland, Italy, and Portugal. His principal works are his fables and comic tales, partly from Æsop and other old fabulists, partly original, which first appeared at Frankfort, 1548. A great number of them have repeatedly been modernized.—K. E.

\* **BURKE, SIR BERNARD**, Ulster king-of-arms, son of John Burke, was born in London. After receiving his early education in the metropolis, he was sent to the college of Caen in Normandy, where he soon distinguished himself both in the sciences and classics. Here he remained till his education was completed, when, returning to London, he was called to the bar. He did not, however, seek general practice, but devoted himself, under the guidance of his father, to the study of genealogy and history, and took his share in the production of those works—especially "The History of the Landed Gentry of Great Britain and Ireland"—which have become the standard authorities in genealogy, and conferred on the authors a high and extensive reputation. Upon the retirement of his father in 1846, the sole labour of these works devolved upon Bernard, who, in addition, continued with unremitting industry and ability to bring out volume after volume upon genealogical and heraldic subjects, each of which won public favour, and increased his reputation. Meanwhile he did

not confine himself solely to genealogy, but wrote in various periodicals of the day, and mainly conducted the *Patrician*, and the *St. James' Magazine*. The death of Sir William Betham in October, 1853, made a vacancy in the office of Ulster king-of-arms, and the high qualifications of Burke at once secured him the succession, to which he was appointed in the following month, and received the honour of knighthood early in the year 1854. A happier or more popular selection for the high and important office which Sir Bernard Burke fills could not have been made. In addition to his competency as a herald and genealogist, he unites the polish of the scholar and the courtliness of the gentleman, with a frankness, good nature, and affability, that gain him the respect of all who have official intercourse with him, and the esteem of all who know him.—J. F. W.

**BURKE, EDMUND**, the Right Hon., was born in Dublin on the 1st of January, 1730, and was the son of a respectable attorney, whose family came from the south of Ireland. While yet a child, he was sent to his grandfather's at Castletown-Roche in the county of Cork, near Kilkoman, the residence of the poet Spenser, receiving his first lessons from a man of the name of O'Hallaren; and in his twelfth year he was placed at the school of Ballytore, kept by a Quaker of the name of Abraham Shackleton, of whom Burke afterwards said that "he was an honour to his sect, though that sect was considered one of the purest." Here he already displayed those traits of character which ultimately made him one of the greatest of men. He had remarkable quickness of apprehension and great tenacity of memory, and was extremely fond of reading; delighting in acquiring stores of knowledge from every source and of every description. While his habits were reflective, reserved, and almost solitary, he was gentle, good-natured, and obliging, with warm affections, and disposed to form strong friendships. In the spring of 1744 he entered the university of Dublin as a pensioner under Dr. Pelisier. To his college studies he was not inattentive, as is proved by the fact of his having obtained at least one prize in his senior freshman year, and a scholarship in due course; but his comprehensive mind took a far wider range of human knowledge than that prescribed by the university; and while devoting to his course only so much study as was necessary for a creditable progress, he abandoned himself to metaphysics, history, oratory, and poetry with ardour, and was noted as at once a brilliant and copious speaker, and a profound and vigorous thinker; and had already written several essays of ability, and a translation of part of the second Georgic of Virgil, which a competent critic does not hesitate to pronounce to be equal to Dryden's best execution in the same line. Burke took his degree in February, 1748, and being designed for the profession of the law, he shortly after proceeded to London, to keep his terms in the middle temple, and in 1751 he took his degree of master of arts. His health at this period was but indifferent, and he spent much of his time between 1750 and 1753 in travelling through England, in the society of men of letters, and in desultory reading. He seems to have abandoned all intention of being called to the bar, as we find him in the latter year an unsuccessful candidate for the chair of logic in Glasgow. For two years Burke continued in London, writing occasionally in periodicals, associating with Murphy, Macklin, and Garrick, with the latter of whom he formed a lasting friendship. In 1756 he published anonymously his "Vindication of Natural Society," an able essay, that attracted considerable notice, in which he exposed the infidel opinions of the time by following them out to their extreme results. The celebrated "Essay on the Sublime and Beautiful" followed soon after. No work of the day so suddenly sprang into popularity; it obtained for its author the most unqualified admiration, and the unknown young man became a literary celebrity. The great and the learned sought his acquaintance; and amongst his friends he reckoned, ere long, Reynolds, Soame Jenyns, Lord Littleton, Warburton, Hume, and above all, Dr. Johnson. Chary as the latter was of his praise in general, he was liberal of it in the case of Burke, declaring that he was "the only man whose common conversation corresponds with the general fame which he has in the world;" and he often repeated that "no man of sense would meet Mr. Burke by accident under a gateway without being convinced that he was the first man in England." Burke had devoted a vast deal of time and thought to this work, which, indeed, he had commenced in his eighteenth year, and his health was now far from robust from the effects of over mental exertion. In this state he put himself under the

care of Dr. Nugent, who was equally distinguished as a physician and a scholar, and a cordial friendship grew up between them. Burke became an inmate of the doctor's house, and ultimately the husband of his daughter, a union which was productive of the greatest happiness throughout life to both. Notwithstanding the great reputation which he had acquired, Burke had still to struggle slowly upwards. For three years he was occupied with occasional writing, with editing a "History of the European Settlements in America," and with a History of England, which, though prosecuted as far as eight sheets, was never completed, and with the establishment, in conjunction with his publisher, Dodsley, of the *Annual Register*. He had now directed his attention chiefly to political subjects, and there is no doubt he was anxiously casting about for the means of coming forward in that course, for which he was by intellect and education so eminently fitted. That opportunity was afforded him by the earl of Charlemont, who introduced him to Mr. W. G. Hamilton (better known as "Single-speech Hamilton"), then secretary for Ireland, and this gentleman appointed Burke to the office of his private secretary in 1761, and with him he returned to his native land. In this office he continued for two years, rendering great services to the administration, and a pension of £300 a year was bestowed upon him, charged on the Irish establishment. The conduct of Mr. Hamilton, however, towards him, though it has never been fully explained, was such that a man of Burke's independent spirit could no longer act with him. He therefore broke off all connection with Hamilton, relinquished his pension, and in 1763 again returned to England. But in returning to London, Burke found that his character for political knowledge had preceded him, and he was looked upon as a man whose future position was sure to be a high one. Two years after his return the marquis of Rockingham was appointed prime minister: he chose Burke as his private secretary, and upon the opening of parliament in January, 1766, he took his seat as member for Wendover. Upon the first night that he sat an opportunity was afforded him for the display of his great abilities. He spoke upon American affairs in such a manner as to astonish the house, and draw from Mr. Pitt, who followed him, a panegyric as unusual from the latter as it was honourable to the subject of it. The Rockingham administration was dissolved in July, 1766, and Mr. Burke retired to Ireland with the reputation of being "the first man in the commons." On his return to London an offer was made to him by Mr. Pitt, which he refused, and he appeared as the leader of the most powerful section of the opposition to the new ministry. In the next parliament he was again returned for Wendover, and purchased an estate in Buckinghamshire. His first avowed political pamphlet was published in the year 1769, being observations upon a pamphlet written either by Mr. Fox or Mr. Grenville—On the Present State of the Nation. Burke's "Observations" were characterized by powerful argumentation and force of expression, and were extremely well received; and it is a proof of the high estimation in which he was held, both as a politician and a writer, that the celebrated Letters of Junius, which appeared about that time, were attributed to him. In the following year appeared his celebrated pamphlet "On the Cause of the Present Discontents," which, for its merit as a literary composition and for the profound and comprehensive knowledge which it exhibits, may be placed beside the best productions of its author.

From this period we find Burke actively engaged in all the political questions of those momentous times. In the contest with the colonies he took a conspicuous part on behalf of the Americans, and he was appointed agent for New York in 1771. In the conflict which arose at this period between the house of commons and the city of London upon the arrest of the printers, Burke espoused the cause of the latter: he also took part in the debates on the affairs of India in the following year. In 1773 he went to France, the social state of which was then such as to make a profound impression on his mind. In the meantime the position of our relations with America was becoming daily more critical, and on the 19th of April, 1774, a motion was brought on for the repeal of the duty on tea. On this occasion Burke rose to reply to a violent speech of Mr. Cornwall, and though the house had been wearied of the debate, and most of the members had left, such was the power of his eloquence, the force of his reasoning, and the readiness with which he replied on the moment to the arguments of the government, that the house became filled with admiring listeners; and even the auditors in the galleries could

scarcely be restrained from breaking out into applause. At the conclusion of one of those splendid bursts with which he electrified the house, Lord John Townshend exclaimed—"Good heavens! what a man is this! where could he have found such transcendent powers?" On the dissolution of parliament Burke stood for Malton, on the Rockingham interest, and was successful; but immediately after consented to be put in nomination for Bristol, where he was returned, free of expense, 3rd November. The following year Burke came forward with his thirteen resolutions for quieting America, which he introduced in a speech no less celebrated than that of the previous year, and of which Lord Chatham and Mr. Fox spoke in terms of the highest commendation. On the 11th February, 1780, he brought forward his motion for economical retrenchment in a speech which is a repertory of political wisdom and general knowledge, and which added to his popularity. Burke's advocacy of the Roman Catholic claims, as well as his support of the acts for opening the trade of Ireland, diminished his popularity with the electors of Bristol, so that when he went to stand again for that town, after the dissolution in 1780, he found that the populace were disfavoured to him, though the enlightened and higher portion of the constituency publicly expressed their continued confidence. He therefore declined to contest the representation, and was returned for Malton, which he continued to represent during the rest of his political life. In 1782 Lord Rockingham again became prime minister. Burke was not admitted into the cabinet, to which his merits entitled him, but he was made privy councillor and paymaster of the forces. In this last office he gave evidence of a scrupulous and severe integrity unexampled in public men. The interest of the money lying in bank in the paymaster's name amounted to about £25,000 a year, which was always considered the fair perquisite of the office. Of this sum Burke refused to appropriate one penny, though his private circumstances were very straitened; and he brought in a bill by which he effected a saving in the public expenditure of £72,000 yearly. The Rockingham administration terminated by the death of that nobleman in 1782, when Lord Shelbourne succeeded, and Burke retired from office. The famous coalition of Fox and Lord North put out the Shelbourne administration in 1783, and Burke resumed his old office, and on the second reading of the East India bill, December 1, 1783, made one of his magnificent speeches, displaying the vast amount of his knowledge and the great resources of his mind—a speech that now remains only as a monument of superb abilities misapplied. The bill was carried in the house of commons, but lost in that of the lords, and on its defeat the ministry went out, Mr. Pitt coming in as premier, and henceforth Burke was to be found in the ranks of the opposition. The state of India was now a most engrossing subject, and Burke applied all the energies of his mind to it. For years had Burke been engaged in deep and laborious investigations in relation to the wrongs of India. In 1780 and 1781 two committees had been appointed upon Indian affairs, and of those Burke was a most laborious member; and their report charged Warren Hastings, the governor-general of Bengal, and William Hornby, the president of the council at Bombay, with having "in sundry instances acted in a manner repugnant to the honour and policy of this nation, and thereby brought great calamity on India;" and declared that it was the duty of the directors to remove them from office. Hastings was recalled, and returned to England in 1785. In February of the following year Burke brought forward his specific charges against Hastings, upon the motion for papers, which was followed by his going into the detail of these charges successively, which occupied the house at intervals during that and the following year; and during the progress of these proceedings Burke displayed all the powers of his intellect, and the vigour and industry of one who put his soul to the work that he felt called upon to prosecute. On the 10th of May, 1787, Burke accused Hastings at the bar of the house of lords in the name of the commons of England, and on the 13th February, 1788, the trial commenced in Westminster Hall, in the most august form in which English justice has ever appeared. The king, with the house of lords, spiritual and temporal, sat on the tribunal; the commons of England stood at the bar. After the articles of impeachment were read, Burke, on the third day, opened the case in a statement which occupied four days. Whether viewed as a piece of forcible reasoning, or looking to the momentous importance and vastness of the sub-

ject, and the entire command and knowledge displayed of it, or to the novel aspect in which he presented questions already so thoroughly discussed and familiar—this statement may be pronounced to be unparalleled in its power and effect, unsurpassed as a masterpiece of commanding oratory. Its effect on Burke himself was, on one occasion, to deprive him of the power of articulation, while some of the terrible details caused others to faint. This extraordinary trial was not concluded for nearly ten years, during which Burke's energy never failed or flagged, commencing his closing speech on the 28th May, 1794, which occupied nine days, and on 23d April, 1796, Hastings was acquitted by a large majority of the peers. Upon the conduct and motives of Burke in this prosecution there has always been, and will be, a diversity of opinion. While, on the one hand, personal causes for animosity are suggested, which the extreme severity and almost savageness of Burke's language and demeanour would seem to confirm—on the other hand, the well-known purity of his life, the kindness of his nature, and his hatred to all corruption and oppression, as well as the profound interest which he had for years taken in the affairs of India, justify us in doubting that this one act was at variance in principle from the whole course of his life, and constrain us to believe that he was compelled to this painful undertaking by a sense of duty that overpowered all feeling of danger. During these proceedings Burke took part in most of the public questions of the time. In 1786 he visited Ireland, and in the following year was elected a member of the Royal Irish academy. The regency question, consequent on the illness of the king, which occurred the following year, occupied a great portion of Burke's attention, and the principal part of the opposition was thrown upon him by the illness of Fox. The progress of revolutionary feeling in France had now developed itself so plainly, that it was impossible for one of Burke's constitutional principles and political wisdom to remain longer silent. An occasion soon forced him to speak out. In his debate on the army estimates in February, 1790, Fox pronounced an eulogium on the revolt of the French guards. This sentiment was met by a storm of reprobation from the house; and on the renewal of the debate, Burke deprecated such opinions being advanced on the authority of so great a name, and delivered those immortal sentiments which excited the admiration of all who heard him, and enlisted the sympathies of the whole nation; declaring that he "would quit his best friends and join his most avowed enemies, to oppose the least influence of such a spirit in England." This declaration was received with loud applause, in which Pitt joined. Fox replied with moderation, and Burke was disposed to accept his concessions. Unfortunately the petulance of Sheridan made a breach inevitable, by charging Burke with "deserting from the camp, with assaulting the principles of freedom, and defending despotism." Burke now separated from his former colleagues, and produced the memorable "Reflections on the Revolution of France," a work which has had no equal in knowledge, eloquence, or insight into the tortuous spirit of party; in that "foreseeing and vigorous conception of the revolutionary career, which makes the whole amount to the most magnificent political prophecy ever given to the world." Within the year 19,000 copies were sold in England, and 13,000 in France. This work produced an effect such as no other political essay ever had, whether for extent or for permanent importance. It arrested the violent progress of the revolutionary spirit in England, and gave the first and most decisive check to the disorganizing influences which were rapidly spreading through Europe. Honour and commendation poured in upon him from every quarter. The university of Dublin conferred on him the degree of doctor of laws; the graduates of Oxford presented him with an address, through Mr. Windham; the bishop of Aix, and the expatriated French clergy, acknowledged their obligations in the most ardent language; while in England the whole body of established literature was loud in his praise. The views propounded tended, too, to introduce a schism in the whig party, and to endanger the prospects of Mr. Fox, and thus it led to the final breach between these two great men. Upon the debate on the Quebec bill on the 6th of May, 1791, Burke, in reply to a speech of Fox, declared that "their friendship was at an end." This statement touched Fox to the heart, and when he rose to reply the tears streamed from his eyes, and his emotion prevented him for some time from addressing the house. Burke now formally withdrew from the whigs, and stood alone, for he did not join the opposition party. Thus excluded from any effective line of

parliamentary conduct, he occupied himself in political writing. He drew up a paper entitled "Thoughts on French Affairs," which he offered to the consideration of government, but which was not published till after his death. About this time the Roman catholic party in Ireland solicited him to support their claims in parliament, to which he assented, and his efforts in their behalf were attended with considerable success. He also took part in several questions which were then agitating the country, and drew up his "Heads for Consideration on the Present State of Affairs."

Burke was now anxious to retire from parliamentary life, and had made arrangements for his son, then thirty-five years of age, succeeding him in the representation of Malton. One of his undertakings remained incomplete, and for this only he postponed his retirement: judgment had not yet been given in the case of Warren Hastings. On the 25th of June, 1794, Burke appeared for the last time in the house of commons, to receive their thanks for the faithful discharge of the duties reposed in him, and shortly after accepted the Chiltern Hundreds. But the heaviest affliction of his life was now impending. He had already secured a bright opening for his son, as secretary to Lord Fitzwilliam, then about to go to Ireland as viceroy; but consumption had already showed itself in this promising and most amiable young man, and its rapid progress could not be stayed. He died on the 2nd of August, a few days after his election for Malton. From the effects of this blow Burke never recovered; and he might be said to be visibly approaching the grave from the moment of his son's death. He was, to use his own words, "a desolate old man." "I am alone," he writes to a friend; "I have none to meet my enemies in the gate: desolate at home, stripped of my boast, my hope, my consolation, my helper, my counsellor, and my pride." Burke was to have been promoted to a peerage—such an honour would have been now valueless, almost a mockery. When the violence of the shock had somewhat abated, Burke betook himself once more to the resources of his former life, and from time to time published several letters and papers on the great political events of the time. In the scarcity of corn in 1795–96, Burke erected a mill, and retailed corn at a reduced price, at great private sacrifice. In 1795 pensions to the amount of £3700 a year were granted to him by the government, at the express desire of the king. This act of gratitude, so well deserved, did not escape party censure. The duke of Bedford and Lord Lauderdale attacked in parliament the retired veteran, but were crushed by an able and manly reply from Lord Grenville, and their demolition completed by Burke himself in his "Letter to a noble Lord." To the last day of his life Burke devoted himself to public good, and to acts of private and extensive charities. Though exhausted in body, his mind lost none of its vigour or clearness; and the last production of his pen, "Thoughts on a Regicide Peace," gives proofs that he had still the same masterly and powerful intellect. But he was now rapidly sinking. On Friday the 7th of July, 1797, being conscious of his approaching end, he set himself to review the conduct of his past life, vindicating his intentions, regretting any petulance of manner or severity of rebuke which might have given pain; leaving it as an earnest assurance that he never designed to give offence. He then gave himself entirely to the consolations of religion. The following morning, feeling weariness, he expressed a wish to be carried into another room; and as Mr. Nagle and some of the servants were bearing him in their arms, he faintly said—"God bless you," and died. It was proposed by Mr. Fox that he should be honoured by a public funeral, and interred in Westminster abbey; but by his own desire, expressed in his will, he was buried in Beaconfield church, without pomp or expense, beside the remains of his beloved son. He was in his sixty-eighth year.

The respect and admiration which was awarded to this great man by his contemporaries has been fully affirmed by posterity. One who knew him well, calls him "the prodigy of nature and acquisition. He read everything, he saw everything, he foresaw everything." His biographer, Dr. Croly, gives us this forcible and elegant estimate:—"The rank of Burke as a writer of consummate eloquence had been decided from the beginning of his career; the progress of the Revolution placed him in equal eminence as a statesman, and every year since has added to his renown as a prophet. With the most palpable powers for reaching the loftiest heights of speculation, he is the least abstract of all speculators. With the poetic fancy which so

strongly tempts its possessor to spurn the ground, and with an opulence of language that, like the tissues thrown on the road of an oriental prince, covered the wild and thorny way before him with richness and beauty, he never suffers himself to forget the value of *things*. The application of reason to the purposes of life, the study of the sources of moral strength, the inquiry into that true 'wealth of nations' which makes men safer from the shocks of society, are his perpetual objects. He pours his river through the moral landscape, not to astonish by its rapidity and volume, or delight by its picturesque windings, but to carry fertility on its surface, and gold in its sands." In an age eminent for intellectual distinction Burke secured the admiration of Europe. He possessed an understanding admirably fitted for the investigation of truth—an understanding stronger than that of any statesman, active or speculative, of the eighteenth century. He owed nothing to birth, riches, or official station. He rose without them to the highest elevation in public esteem. His virtue stood the trial alike of assault and temptation. "Burke grew purer and more powerful for good to his latest moment; he constantly rose more and more above the influence of party, until at last the politician was elevated into the philosopher; and in that loftier atmosphere from which he looked down on the cloudy and turbulent contests of the time, he soared upwards calmly in the light of truth, and became more splendid at every wave of his wing." Whether we consider the large space he occupied in the public eye, his genius, his learning, his multiform powers, natural and acquired, or, finally, his political connection with all the great events of his day, the name of Edmund Burke is assuredly that which will most frequently attract and most deeply interest the reader of our political history of the past age. In person Burke was about five feet ten inches high; his figure was athletic and symmetrical; his appearance was graceful and dignified, and his countenance is described as handsome, noble, and prepossessing. A collected edition of his works, in quarto, was completed in 1827.—J. F. W.

BURKE, JOHN, an eminent genealogist, born in Ireland on the 29th of November, 1786, was descended from the Burkes of Meelick, and collaterally from the noble house of Clanricarde. He received a good classical education, and removed early in life to London to devote himself to literary pursuits. In these he soon succeeded, writing for the *Examiner* and other journals, as well as in the periodicals of the day, both on political subjects and general literature. His first avowed publication was a volume of poetry, which had a rapid and large sale; and this was followed by an edition of Hume and Smollet's History of England, with a continuation by himself. The works, however, by which he is best known are those on genealogy, which he commenced by that on "The Peerage and Baronetage," published in 1826. The success of this book was as complete as it was immediate, and it has gone through numerous editions with increasing favour. Other publications in the same department followed at intervals, in which Mr. Burke was assisted by his son, Bernard, and their united labours produced the "History of the Landed Gentry," the "General Armoury," and the "Extinct Peerages and Baronetages," works of great value to the historian and genealogist. Upon the death of his wife in 1846, Mr. Burke retired to the continent, resigning to his son the further prosecution of those literary labours which have given them both high reputation, and died rather suddenly at Aix-la-Chapelle in 1848.—J. F. W.

\* BURKE, PETER, barrister-at-law and queen's counsel for the county palatine of Lancaster, brother of Sir Bernard, a writer on law, especially the law of copyright and patents, and a biographer of Edmund Burke, educated at the college royal of Caen, where he gained the prix d'honneur for the best essay in the French language. In presenting the medal the *prefet* said—"Nous sommes vaincus par nos propres armes."—J. F. W.

\* BÜRKNER, HUGO, a distinguished German wood engraver, and professor of wood engraving at the Dresden academy, was born at Dessau in 1818. He has greatly contributed to re-establish the genuine style of wood engraving, and practises his art in the true spirit of the old German masters.—K. E.

BURLAMAQUI, JEAN JACQUES, was born in 1694 at Geneva, where he filled for many years the chair of natural jurisprudence, till failing health compelled him to renounce it. He became a member of the council of the republic, and acted a prominent part in that assembly until his death in 1748. He was an intimate friend of Barbeyrac, and their united labours did much for the advancement of the science. He justly regards

the natural state of man as an approximation to that which it is the aim of civil law to establish, this aim being to secure to the members of the society the greatest amount of happiness, and to which law, order, and authority are essential. Working from this starting-point, he deduces the necessity for an inviolable and irresponsible sovereign, but allows to the people in extreme cases the right of deposing him. All Burlamaqui's writings are characterized by clearness and precision.—J. D. E.

BURLEIGH. See CECIL.

\* BURLEIGH, CHARLES CALLISTUS, one of the earliest, most resolute, and indefatigable of the American abolitionists, born in Plainfield, Connecticut, in 1810. He was educated for the law; but the question of slavery, in which from his earliest years he had felt a peculiar interest, absorbed his attention. He is the author of a very able essay, entitled "Thoughts on the Death Penalty;" of a tract, entitled "The Sabbath Question;" and another, "Slavery and the North."—S. M.

BURLEY, WALTER, a celebrated scholastic philosopher and divine, born at Oxford in 1275. At Paris, where he long resided, he was the head of the nominalists of the period, and the chief opponent of the Scotists. He was employed in the education of Edward III., and in 1327 was sent by that monarch to Rome on a mission of some importance. Besides immense and forgotten commentaries on Aristotle, he published "De Vita et Moribus Philosophorum," 1472.

BURLINGTON, Earl of. See BOYLE, RICHARD.

BURMANN, JOHANN, a Dutch botanist, was born in 1707, and died in 1779. He was professor of botany at Amsterdam, and was a friend of Linnaeus, who dedicated to him the genus *Burmannia*. He devoted attention to Eastern botany, and published the following works—"Thesaurus Zeylonicus, an account of Ceylon Plants;" "Catalogue of African Plants observed by Hermann;" "Flora Malabarica, or Index to the Hortus Malabaricus;" a translation into Latin of Rumphius' Herbarium; and Fasciculi of American plants.—J. H. B.

BURMANN, NICOLAUS LORENZ, the son of Johann Burmann, and also a Dutch botanist, was born at Amsterdam in 1734, and died in 1793. He took his degree of doctor of medicine at Leyden. He published a "Flora Indica, with a Prodromus of the Plants of the Cape of Good Hope;" also a treatise on geraniums, and a "Flora of Corsica."—J. H. B.

BURN, RICHARD, born at Kirby-Stephen, near Winton in Westmoreland; died in 1789. Educated at Queen's college, Oxford, he obtained the honorary degree of D.C.L. from Oxford in 1762; in 1763 took holy orders, and was given the living of Orton in Westmoreland, which he enjoyed for forty-nine years. He was chancellor of the diocese of Carlisle. He published some useful law books for popular use, one of which, "A Digest of the Ecclesiastical Law," is still found convenient. In conjunction with Nicholson, he published a history of the antiquities of Cumberland and Westmoreland.—J. A., D.

BURNEL, ROBERT, the distinguished lord chancellor and keeper of the privy seal of Edward I., was the son of Robert de Burnel; born at their ancient ancestral seat of Acton Burnel. He distinguished himself in civil, ecclesiastical, and common law, took holy orders, and also practised as an advocate in the courts at Westminster. The young prince, Edward, became warmly attached to him, appointed him his chaplain and private secretary, and took him on his expedition to the Holy Land. On the return of Edward, who, on the demise of his father during his absence, had been proclaimed king, Burnel, then archdeacon of York, was on the 21st Sept., 1274, appointed lord chancellor, and shortly afterwards bishop of Bath and Wells. He did much towards introducing English institutions and advancing civilization in Wales, and prepared the code under which it continued to be governed until the reign of Henry VIII., when it was permitted to send members to parliament, and fully received into the pale of the English constitution. Edward honoured his chancellor by visiting him at his castle of Acton Burnel, where in 1283 he held a parliament, memorable for that excellent law for recovery of debts called the "statute *de Mercatoribus*." The laws passed during Burnel's long official career exhibited the true spirit of wise legislation. Nor was the lord chancellor unmindful of the due administration of the law. In 1290 he prosecuted to conviction several of the judicial functionaries for taking bribes and tampering with the records. The chancellor again signalized himself in 1290-91, by his adjustment of the disputed succession of the crown of Scotland.

upon which he gave judgment in favour of Baliol to the exclusion of Bruce. Burnel was lord chancellor for eighteen successive years. He died at Berwick in 1292, and was buried in the cathedral of his own see of Wells. He was one of the most enlightened statesmen and lawgivers of his age.—F. J. H.

BURNES, SIR ALEXANDER, was born at Montrose in 1805. After being educated in that city, he proceeded to India when sixteen years of age; where distinguishing himself both as a linguist and topographer, he was soon appointed assistant political agent at Cutch. Possessed of an eager and enterprising disposition, he volunteered to explore the north-western frontier of India, and descend the Indus to the sea. After reaching Jaysulmeer, he was overtaken by an express from the supreme government, desiring him to return, since it was deemed inexpedient to incur the hazard of exciting the alarm of the rulers of Scinde. In the following year, however, presents came from the British sovereign to Runjeet Singh, ruler of Lahore, and Burnes was appointed to convey them to their destination. Soon after Burnes' return, he was despatched upon a second expedition to Central Asia, during the course of which he travelled across the Punjab to the Indus, and proceeded through Peshawur to Cabool, where he was well received by Dost Mahomed. He perceived, thus early, the general superiority of that monarch, as to integrity, justice, and ability, to his rival Shah-Soojah, afterwards so unfortunately placed on the throne by the British government. From Cabool, Burnes journeyed over the Hindoo Coosh to Koondosy, Balkh, and Bokhara; and thence passed westward to the Persian frontier, returning through Teheran, Ispahan, and Shiraz to Bushire, where he embarked for India. He was shortly despatched to England with the information he had so acquired. By his success in this expedition, our traveller at once became famous. He had retraced the greater part of the route of Alexander, surveyed the kingdoms of Porus and Taxiles, sailed on the Hydaspes, crossed the Indian Caucasus, beheld the scenes of the inroads of Jengis, and Timour, and Baber; but more than this, he had detected a new pathway by which India might be invaded. Returning to Bombay, he again served in Cutch, but was soon appointed to the charge of a (so-called) "commercial" mission to Afghanistan. On his arrival at Cabool, however, this pretext for the mission was laid aside; and Burnes plunged with the avidity of a spirit taking natural delight in the intricacies of diplomacy and the management of affairs, into the complications of Affghan politics. Dost Mahomed was evidently not simply desirous to cultivate the British alliance, but eager to secure it. Burnes himself understood the advantages of an alliance with that ruler, whose influence he saw the means of extending and consolidating over a vast and important region. Other counsels, however, prevailed with the supreme government, and Burnes' mission at Cabool came to an end; but not before the cloud of the approaching terrible war broke upon the sky. The official correspondence professedly narrating these transactions, was garbled in its publication by the British government, for the express purpose of justifying their proceedings. The history of state-craft hardly contains any instance of more glaring and deliberate falsehood. War was declared against Dost Mahomed, and the expedition started on the fatal mission to depose the rulers of Cabool and Candahar, and enthrone Shah Soojah. After terrible sufferings, alike from heat and cold, the army seemed to succeed. Our protegé entered Cabool 7th August, 1839, and Dost Mahomed surrendered shortly afterwards. Burnes remained in Cabool, filling what he termed "the most nondescript of situations;" possessed of a large salary, but desirous of a more active and commanding influence over the affairs of the country. Soon, however, the desolating sword of Affghan vengeance was uplifted, and Burnes fell, one of the first victims in an outbreak that terminated in the almost complete destruction of a British army. The chief envoy, Macnaghten, was about to surrender office, and Burnes hoped to attain it, when, on November 3, 1841, a mob of insurgents attacked his house, and he was cut to pieces as he endeavoured to make his escape in disguise. There is no doubt that the character of Sir A. Burnes, as described in official despatches, has been grievously wronged. Mistaken as might have been the policy of entering into Affghan politics at all, yet—these affairs being interfered with—Burnes indicated a course which would have saved the government from many disasters.—Burnes' Travels were published in three volumes, and his garbled despatches have been privately printed in their integrity.—L. L. P.

BURNET, GILBERT, bishop of Salisbury, and a justly celebrated writer on history and divinity, was born at Edinburgh, September, 1643. He was of a very ancient family in the shire of Aberdeen, where his father practised as a lawyer. When only ten years of age, he entered the college of Aberdeen, and obtained the degree of A.M. when only fourteen. He applied himself to the study of civil law, with the intention of following his father's profession; but after the lapse of a year, changed his mind, and determined to enter the ministry of the episcopal church. At the age of eighteen he was licensed as a preacher, and shortly after offered a living in the shire of Aberdeen, but this he conscientiously declined on the ground of youth and inexperience. His father, who, after the Restoration, had been appointed by Charles II. a lord of session, with the title of Lord Cromont, soon after this died. Dr. Leighton, then archbishop of Glasgow, and Mr. Nairn, the eloquent and excellent minister of the Abbey church of Edinburgh, took a deep interest in young Burnet; and under their guidance for two years he studied theology. In 1663, in his twentieth year, he visited Oxford, Cambridge, and London, and was introduced to some of the greatest celebrities in theology and science. In 1664 he went to Amsterdam, where he perfected himself in Hebrew, under the instruction of a learned rabbi, and afterwards to Paris, where he received marked attention from Lord Holles, then British ambassador in France. At the close of this year, as he was returning to Scotland by way of London, he was introduced to the president of the Royal Society, and elected a member. Accepting now the living of Saltoun, which had long before been offered him by Sir Robert Fletcher, he was ordained to the office of deacon and priest by the bishop of Edinburgh, Dr. Wiseheart. Nothing could exceed the fidelity, ability, and enlightened piety with which Mr. Burnet laboured in this charge for five years; and during this period he gained the affections of all classes, not excepting the presbyterians. The government of Scotland being at this time in the hands of moderate men, the minister of Saltoun was often consulted in important affairs, and it is even suspected that it was he who advised that the more moderate presbyterians should be placed in the vacated livings. In 1669 he accepted the chair of divinity at Glasgow, and for four years and a half discharged the duties of professor with remarkable credit. After resigning his charge at Saltoun, he published his "Modest and Free Conference between a Conformist and Nonconformist," which consisted of seven dialogues, and met with general approbation. The important papers of the house of Hamilton being put into Burnet's hands, he made a visit to London to consult with the duke of Lauderdale respecting their publication, and while thus occupied was offered a Scottish bishopric, which he declined. On his return to Glasgow he married Lady Margaret Kennedy, daughter to Lord Cassilis. In 1672 he published "A Vindication of the Authority, Constitution, and Laws of the Church and State of Scotland." He was once more offered a bishopric, which was again declined. Although personally agreeable to the court, he had a bitter enemy in Lauderdale, who at length persuaded Charles to strike his name out of the list of chaplains-in-ordinary, &c. Being shortly after obliged to vacate his chair, he went to London to defend himself in person. Whilst in the metropolis, being now about thirty years of age, he was offered by the dean and chapter of St. Paul's the living of St. Giles, Cripplegate; but this, in a way very honourable to himself, he declined. He was now called to the bar of the house of commons, to give evidence as to the suspected perfidy of Lauderdale, some damaging facts of whose administration he was most reluctantly obliged to state. In 1676 he published his "Memoirs of the Dukes of Hamilton." Apprehensive of the designs of the papists at this time, he published the first volume of his "History of the Reformation in England," for which he received the thanks of both houses of parliament. In the years 1681 and 1715, respectively, he issued his second and third volumes, together with a very valuable supplement. This work was so justly esteemed that it was translated into various European languages. In 1680 he published "The Life and Death of the Earl of Rochester," whom he had been the instrument of reclaiming from infidelity and gross profligacy. After the publication of his "Life of Sir Matthew Hale," and "Bedell, Bishop of Kilmore, Ireland," and sundry other valuable works, he deemed it prudent to retire to the continent, and await the issue of the ecclesiastical measures adopted by James II. He

was induced by the flattering invitation of Prince William and Princess Mary to settle at the Hague. Here, having some time before lost his first wife, he married a Dutch lady of the name of Scott, a descendant of the house of Buccleuch, and of considerable wealth. This connection making him a free citizen of the Hague, prevented his being forcibly ejected, as a letter from the king of England had a little before demanded. With William he entered England, and in the year following was appointed bishop of Salisbury, a diocese over which he presided till his death in 1715. In parliament he was the advocate of moderate measures towards the non-jurors, and the act of toleration. By his clergy he was regarded as the most able and conscientious of prelates. His "Exposition on the Articles of the Church of England," came out in 1699, and has ever since been esteemed a standard work. But his most important work, and that on which his fame must rest, is his "History of His Own Time, from the Restoration of Charles II. to the Conclusion of the Treaty of Peace at Utrecht, in the Reign of Queen Anne."—J. W. D.

BURNETT, GILBERT T., an eminent English botanist of the present century, and formerly professor of botany at King's college, London, contributed to the promotion of botanical science by his outlines of botany, which contain an introduction to the study, along with a classification of plants, and a full account of the properties and uses of plants. He promulgated some original views on botany, and made interesting physiological observations on the respiration of plants. He died young.—J. H. B.

BURNET, JACOB, an American judge, senator, and one of the pioneer settlers of that portion of the north-western territory which is now the state of Ohio, with a population of more than two millions, was born at Newark, New Jersey, February 22, 1770. He was graduated at Princeton college in 1791, was admitted to the bar in 1796, and immediately removed to Cincinnati, where he ever afterwards resided. When he came there it was a small village of log-cabins, containing perhaps 500 inhabitants. When he died the city numbered 130,000 inhabitants. Mr. Burnet frequently served in the legislature both of the territory and the state; and was elected to the senate of the United States, where he sat from 1828 to 1831. In 1847 he published "Notes on the Early Settlement of the North-western Territory." He died at Cincinnati in 1853.—F. B.

BURNETT, JAMES, Lord Monboddo, an eminent Scottish judge, and ardent defender of the literature and philosophy of the ancients, was descended from an ancient family in Kincardineshire. He was born at the family seat of Monboddo, near Fordoun, in 1714. He received the rudiments of his education at the parish school of Laurencekirk, studied the usual branches of literature and science at King's college, Aberdeen, and civil law at Groningen. In 1738 he was admitted to the Scotch bar, where he rose to eminence, and particularly distinguished himself in the famous Douglas case, in which he was on the side of the Douglas family, which gained the suit. In 1767 he was promoted to the bench. As a lawyer he was upright and painstaking, and his decisions were sound, and supported by great learning and acuteness. In 1745, when the rebellion interrupted the business of the law courts, he proceeded to London, where he mingled with the eminent literary men of the age. In 1773 appeared his volumes "On the Origin and Progress of Language," a work in which great learning is combined with numberless paradoxes and eccentricities. His grand aim in this treatise is to assert the superiority of ancient above modern literature. His "Ancient Metaphysics," in which he maintains the superiority of ancient philosophy, is in six quarto volumes, published at various periods from 1779 to 1799. The first two volumes and the last are full of erudition, to which there was nothing equal in Scotland in that age. His greatest absurdities appear in his view of the history of man and of language. He maintains that man at first walked on all fours; that he then learned to walk upright, as may be seen in the orang-outang, which he declared to be of the human race; and in due time made use of his hands, and acquired the art of swimming. At his country seat he acted the farmer, and lived on terms of great familiarity with the people on his estate. It was at this place that he received Samuel Johnson on his tour through Scotland. In Boswell's graphic account of the intercourse of the two, Lord Monboddo appears in by no means a disadvantageous light. He died in 1799.—J. M'C.

BURNET, THOMAS, D.D., born at Croft, near Darlington,

about the year 1635; died at the Charter-house in September, 1715. Although Burnet is now best known as a geologist, or rather as a dashing cosmogonist, it were the height of injustice, should the briefest biography of him omit a tribute to his independence, alike in action and thought. The sensation occasioned by his extraordinary "Theoria Telluris Sacra," has thrown unworthily into the background those rare and solid qualities, which enabled him, when master of the Charter-house, to offer the first formal opposition made in England to that assumption by King James II. of the famous "dispensing power," which ultimately cost him a throne; nor is it always remembered that Burnet subsequently surrendered the high office of clerk of the closet to King William III., rather than retract something accounted heretical in a curious treatise—"Archæologiæ Philosophicæ, sive Doctrina Antiqua de Rerum Originibus." Undoubtedly, however, the chief interest attaching to his name, is connected with his "Sacred Theory of the Earth." The theory itself, of course, as its title may indicate, is abundantly untenable. Burnet assumes that the few abrupt and imperfect notices in the early portion of the book of Genesis, are necessarily and strictly interpretable by physical science; and thereupon he constructs a scheme of the earth's early physical history, which he intends shall be the starting-point of all geological investigation. It were useless to detain the reader with an analysis of his notions concerning the events which preceded the existing order of nature, and launched the world upon its long history, the fractured shattered thing that the outward eye sees in it: but reflections of a general nature, and of consummate importance, are so strongly suggested by the "Theoria," and so essential at the same time to a correct appreciation of the place due to speculators like Burnet, that we must request for them a brief space. 1. It never seems to have occurred to Burnet, and the multitudes who have more or less followed in his path, that a vital preliminary inquiry has escaped them; viz., whether it is possible to establish a sound *critique*, capable of determining *à priori* the nature of the relations between these few sentences in Genesis, and physical facts and their natural evolutions; and if so, what are the principles and results of such a *critique*? Tentatives towards the establishment of a capable critique have, indeed, been made in modern times; they are far from complete, and certainly they have not been universally welcomed: but when Burnet lived, the logical necessity and essential *priority* of such a task had never been dreamt of; nor can it be said, that even now, a large amount of toil and intellect is not wasted, because of the same fatal oversight. The time has indeed long gone by, in which any investigator could think of attempting to evolve the earth's physical history from intimations so insufficient and obscure. Nay, we have even passed through and escaped from a *second* phase of error: it would be accounted altogether disreputable amongst us, were any one pretending to the position of a man of science, to twist, or incline to twist, any fact established by careful and approved investigation, so that it might seem to quadrate with cosmogonies based on arbitrary conceptions regarding Genesis. But we have not yet got beyond a *third* phase: talent unquestionable, and an equally unquestionable earnestness, may be, and still are, occupied without necessary discredit, in ingeniously twisting the terms and clearest meaning of the sacred books, so that they quadrate, or appear to quadrate, with physical facts. The results are altogether to be deplored: persons professing to hold, and really holding these sacred books in supremest reverence, are—for the sake of an hypothesis, or, to say the least, because they have not acknowledged the necessary priority of a sane and comprehensive critique—treating these very books with a philological, or rather an unphilological and unprincipled license, which no scholar of the present day dares to apply to Herodotus or Homer. 2. Burnet's book, however, manifests in excess another error, which also is by no means in disrepute even in our—certainly improved—modern days. When contemplating any of those grander phenomena or aspects of the material universe, where large developments occupy periods reducing sublunary history to a simple tick of the clock, inquiry at its beginning uniformly forgets the element of *Time*. With Burnet, and very many of our elder scientific geologists, the aspects of the earth presented the idea of sudden convulsions; nor are illustrations rare, in the writings of our most recent inquirers, of a tendency to attribute effects which may be the result of the operation of actions occupying ages, to some start

or revolution in nature.—Burnet has farther claims. His ingenuity and mental energy were undoubted; and he was a consummate master of style. His paragraphs are often as spacious as Bacon's: they are the adequate expression of majestic thought.—J. P. N.

BURNET, WILLIAM, royal governor, first of New York and New Jersey, and subsequently of Massachusetts and New Hampshire, was the eldest son of the celebrated Bishop Burnet, and was born at the Hague in March, 1688. In 1720 he was appointed governor of New York and New Jersey, and in September of that year, arrived at New York and assumed the government, which he held for eight years, his administration in the main being popular and prosperous. He obtained from the Mohawk Indians a grant of a strip of land; established in 1722 an English trading post at Oswego, building a small fort for its protection at his own expense; and thus got possession of the south shore of Lake Ontario for his government, being the first to erect the English flag upon the great lakes. He was involved in a quarrel with the assembly, because they refused to grant the standing revenue for a longer period than three years, and in consequence was removed from his office, the government of Massachusetts and New Hampshire being given him in exchange. In consequence of an early quarrel with the general court, his position at Boston was most uncomfortable. He died in 1729.

BURNETTUS or BRUNETTUS, LATINUS, a native of Florence, died in 1295. He was the master of Dante, who is said to allude to him in the 15th canto of the *Inferno*.—T. J.

BURNEY, CHARLES, Mus. D., was born of respectable parents in the city of Shrewsbury, on the 7th April, 1726. The first part of his education he received at the free school of that city, and was subsequently removed to the public school at Chester, where he also commenced his musical studies under Mr. Baker, the organist of the cathedral, and a pupil of the celebrated Dr. Blow. When about fifteen years of age, he returned to his native town, and for three years longer pursued the study of music, as a future profession, under his elder brother of the half blood, Mr. James Burney, organist of St. Mary's, Shrewsbury; when, by the advice of Dr. Arne, he was sent to London, and placed under that celebrated master for another term of three years. In 1749 he was elected organist of St. Dionis-Back-church in Fenchurch Street, and, in the winter of the same year, engaged to preside at the harpsichord in a subscription concert, then recently established at the King's Arms in Cornhill. In the season of 1749-50, he also composed for Drury Lane theatre the music of three dramas, namely, Mallet's tragedy of Alfred, Mendez's Robin Hood, and Queen Mab. Being threatened with consumption, however, he could not continue these exertions, and, in 1751, accepted the situation of organist at King's Lynn in Norfolk, where he remained for the succeeding nine years. In this retreat he formed the design, and laid the foundation of his future great work, the "General History of Music." In 1760, his health being completely re-established, Burney returned to London, and entered upon the exercise of his profession with increased profit and reputation. He had by this time a large young family, and his eldest daughter, about eight years of age, obtained great celebrity in the musical world by her surprising performances on the harpsichord. Soon after his arrival in London, Burney published several concertos which were much admired. In 1766 he brought out at Drury Lane, with considerable success, a musical piece entitled "The Cunning Man," founded upon, and adapted to the music of J. J. Rousseau's *Devin du Village*. It was a playful and spirited free translation, not a mere version, of the original, and was highly praised by contemporary critics. On the 23rd of June, 1769, the university of Oxford conferred on Mr. Burney the degrees of bachelor and doctor of music, on which occasion he performed an exercise consisting of an anthem of considerable length, with an overture, solos, recitatives, and choruses, which continued long to be a favourite at the Oxford music meetings, and was frequently performed in Germany under the direction of the doctor's friend, Emanuel Bach. In the meantime, neither the assiduous pursuit of his profession, nor the multiplied engagements to which musical men are liable, had interrupted Dr. Burney's collections for his "General History of Music." He had now exhausted all the information that books could afford him; but these, as he remarks in the introduction to his travels, are in general such faithful copies of each other, that he who reads two or three has the substance of as many

hundreds, and were far from furnishing all the information he wanted. Even if the past history of the art could have been accurately and completely detailed by a digest of previous publications, its actual and present state could be ascertained only by personal investigation and familiar converse with the most celebrated performers in foreign countries as well as in his own. For this purpose he resolved to make the tour of Italy, France, and Germany, determined to hear with his own ears, and see with his own eyes; and, if possible, to hear and see *nothing but music*. He accordingly quitted London in the beginning of June, 1770, furnished by the earl of Sandwich (a distinguished amateur of music) with recommendatory letters in his own handwriting, to every English nobleman and gentleman who resided as a public character at the several cities through which he intended to pass. Proceeding first to Paris, he spent several days in that city; and then went by the route of Lyons and Geneva (where he had an accidental interview with Voltaire), to Turin, and visited, in succession, Milan, Padua, Venice, Bologna, Florence, Rome, and Naples, consulting everywhere the libraries and the learned; hearing the best music and most celebrated, both sacred and secular; and receiving everywhere the most cheerful and liberal assistance toward the accomplishment of his object. On his return to England, Dr. Burney published an account of his tour, in one volume, which was exceedingly well received, and deemed by the best judges so good a model for travellers who were inclined to give a description of what they had seen or observed, that Dr. Johnson professedly imitated it in his own *Tour to the Hebrides*, saying, "I had that clever dog Burney's musical tour in my eye." In July, 1772, in order to complete his original plan, Dr. Burney again embarked for the continent, to make the tour of Germany and the Netherlands, of which, on his return, he also published an account in two volumes. At Vienna he had the good fortune to make the intimate acquaintance of the celebrated poet Metastasio—a circumstance the more honourable to Dr. Burney, as Metastasio was then at an age when new friendships are not frequently formed, and was, besides, remarkably difficult of access to strangers, and averse alike to new persons and new things. Here he also found two of the greatest musicians of that age, Hasse and Gluck. From Vienna he proceeded through Prague, Dresden, and Berlin, to Hamburg, and thence by the way of Holland to England, where he immediately devoted himself to the arranging the invaluable mass of materials which his laborious and expensive travels had enabled him to collect. In 1773 Dr. Burney was elected a fellow of the Royal Society; and in 1776 he published the first volume of his "General History of Music," in quarto. In the same year, the complete work of Sir John Hawkins appeared. The subsequent volumes of Burney's work were published at unequal intervals, the fourth and last appearing in 1789. Between the two rival histories, the public decision was loud and immediate in favour of Dr. Burney. Time has modified this opinion, and brought the merits of each work to their fair and proper level—adjudging to Burney the palm of style, arrangement, and amusing narrative, and to Hawkins the credit of minuter accuracy and deeper research, more particularly in parts interesting to the antiquary, and to the literary world in general. Burney's first volume, which treats of the music and poetry of the ancient Greeks, the music of the Hebrews, Egyptians, &c., is a masterpiece of profound learning and critical acumen. The second and third volumes are admirable in the materials and their arrangement, comprising all that was then known of the biographies of the great musicians of the fifteenth, sixteenth, and seventeenth centuries. The fourth volume is perhaps less entitled to praise. Whole pages are given to long-forgotten and worthless Italian operas, whilst the great works of Handel and Sebastian Bach remain unchronicled. When the extraordinary musical precocity of the infant Crotch (afterwards Dr. Crotch) first excited the attention, not only of the musical profession, but of the scientific world, Burney at the request of Sir John Pringle, drew up an account of the infant phenomenon, which was read at a meeting of the Royal Society in 1779, and published in the *Philosophical Transactions* of that year. The commemoration of Handel in 1784 again called forth the literary talents of the historian of music; his account of those magnificent performances, published in quarto for the benefit of the musical fund, is well-known to every musical reader; and the "Life of Handel," by which it is prefaced, still holds a distinguished rank in English biography. The author received for this

work £100, which was undertaken at the instigation of his friend the earl of Sandwich. Dr. Burney also wrote "An Essay towards the History of Comets," 1769; "A Plan for a Music School," 1774; and the "Life and Letters of Metastasio," 3 vols. 8vo, 1796. His last literary labour was as a contributor to Rees' Cyclopædia, for which work he furnished all the musical articles, except those of a philosophical and mathematical kind. His remuneration for this assistance was £1000, and as most of the matter was extracted without alteration from his history of music, the price was large for the service rendered. During a long life, Dr. Burney enjoyed the intimate acquaintance of almost every contemporary who was distinguished either in literature or the arts; with Dr. Johnson, he was in habits of friendship; and it is known, that soon after Johnson's death, he had serious thoughts of becoming his biographer; a task which, to judge by his other productions of a similar nature, it is perhaps to be regretted he was diverted from; but the subject was so overwhelmed with various publications, that he withdrew from the crowded competition, and relinquished his design. During many years, Dr. Burney lived at St. Martin's Street, Leicester Fields, in a house which had once been the residence of Sir Isaac Newton, and is still standing; but about the year 1789, on being appointed organist to Chelsea college, he removed to a commodious suite of apartments in that building, where he spent the last twenty-five years of his life in the enjoyment of a handsome independence, and the contemplation not only of his own well-earned fame, but the established reputation of a family, each individual of which (thanks to their parents' early care and example) had attained high distinction in some walk of literature or science. "In all the relations of private life," says one of his biographers, "as a father, a husband, or a friend, his character was exemplary, and his happiness such as that character deserved and insured. His manners were peculiarly easy, spirited, and gentlemanlike; he possessed all the suavity of the Chesterfield school, without its stiffness—all its graces, unalloyed by its laxity of moral principle." At length full of years, and rich in all that should accompany old age, he breathed his last on the 12th April, 1814, at his apartments in Chelsea college. His remains were deposited, on the 20th of the same month, in the burying-ground of that institution, attended not only by the several members of his own family (of which he had lived to see the fourth generation), but by the governor, deputy-governor, and chief officers of the college, and many other individuals distinguished for rank and talent. As a composer, Dr. Burney's principal works, in addition to those already mentioned, are "Sonatas for Two Violins and a Base," two sets; "Six Cornet Pieces, with Introduction and Fugue for the Organ," a cantata and song; "Twelve Canzonetti a due voci in canone, poesie dell' abate Metastasio;" "Six Duets for German States;" "Six Concertos for Violin, &c., in eight parts;" "Two Sonatas for Pianoforte, Violin, and Violoncello;" and "Six Harpsichord Lessons."—(*Gentleman's Magazine; The Harmonicon; Madame D'Arblay's Memoirs of Dr. Burney, &c. &c.*)—E. F. R.

BURNEY, CHARLES, D.D., son of the preceding, was born at Lynn, Norfolk, on the 4th of December, 1757. He was distinguished as a Greek scholar, and wrote in the *Monthly Review*, to which he was a constant contributor, learned articles which won for him immense reputation among the scholars of his day. He was able to collect a library of singular value, containing two very important MSS., one of Homer, and the other of the minor Greek orators. After his death in 1817, the collection was purchased by parliament for £13,500, and is preserved in the British museum.—J. B.

BURNEY, FRANCES. See ARBLAY, MADAME D'.

BURNEY, JAMES, eldest son of Dr. Burney the historian of music. He early went to sea, and was one of Cook's companions in his second and third voyages, succeeding him in the command of the *Discovery*, and conducting the vessel home after the captain's tragic death. He afterwards commanded the ship *Bristol* on the East India station, and at last attained the rank of rear-admiral. He published several works connected with nautical discovery, but his fame rests on his "History of Voyages and Discoveries in the Southern Ocean," 5 vols., 4to.—J. B.

\* BURNOUF, J. L., professor of rhetoric in the college of Louis-le-Grand, Paris, and member of the Asiatic Society of Paris, has published "Méthode pour étudier la Langue Grecque," Paris, 1825, 14th edition. He has also issued a Sallust, 1822, 1 vol., 8vo; "Examen du système perfectionné de la con-

jugaison Grecque," 1824, 8vo; and edited several of Cicero's works. His knowledge of Sanscrit is profound.—E. BURNOUF, his son, is distinguished as an Orientalist, and has published "Analyse et Extrait du Devi Mahatmyam, fragment du Markandéya Pourana," 8vo, 1823.—T. J.

BURNS, JOHN, C.M., M.D., and regius professor of surgery in the university of Glasgow, son of the Rev. Dr. Burns, minister of the Barony parish of Glasgow, was born in Glasgow in the year 1775. He commenced his professional career as a general practitioner in his native city towards the close of the last century. Although still a very young man, his fine natural talents, untiring industry, strict integrity, and polished manners, soon placed him at the head of his profession in the west of Scotland, and secured him public confidence and private esteem, to a degree rarely equalled. About the year 1805 he commenced a course of lectures on his favourite science of anatomy, and afterwards a similar course on midwifery, which he continued till the year 1815, when he was appointed regius professor of surgery in the university of Glasgow, a chair which he filled with distinguished credit till his death. For many years his classroom was filled to overflowing, and few who have listened to him will forget the lucid, and even eloquent diction, the sharp satire, and well-timed anecdote by which his prelections were enforced and enlivened. As an author, Dr. Burns stands deservedly high. His first work, "On the Gravid Uterus," appeared in 1799, and his latest, his "System of Surgery," in 1828-38. But by far the most popular of his writings, that which gained for him a "world-wide" reputation, was his "Principles of Midwifery," a work which passed through ten editions, and was translated into several foreign languages. The death of this eminent man was a melancholy one. About the middle of June, 1850, he was in Liverpool on his return from Bath; and finding his favourite steam-ship, the *Orion*, about to sail for Glasgow, he waited for it, and embarked on the doomed vessel on the 17th. Early next morning the shipwreck occurred. Dr. Burns made no effort to save himself, but falling on his knees on deck, and uttering a fervent prayer, he met his end with characteristic resignation.—J. A. L.

BURNS, ROBERT, the poet of Scotland and the greatest lyric of modern times, was born in a cottage, about two miles from the town of Ayr, on the 25th January, 1759. His father, William Burness—for so William spelt the family name—had migrated to Ayrshire from the north, where his father, the poet's grandfather, Robert Burnes—another variation of the name—occupied the farm of Cloekenhill in Kincardineshire, under the Earls Marischal. A family tradition averred that the Burnesses had been "out for the Stuarts," and although the particulars have never been correctly ascertained, the tradition was believed by the poet, and may account for his Jacobite tendencies which could have no birthplace in the covenanting county of Ayr. It may, perhaps, also have influenced the migration of Robert's father, who, on his arrival in Ayrshire, was employed as a gardener, first by the laird of Fairlie, and afterwards by Mr. Crawford of Doonside. He then, on the banks of the Doon, rented seven acres of land for a nursery ground, and there, with his own hands, he built the cottage in which Robert was ushered into his feverish and unrequited life. The poet's mother, Agnes, daughter of Gilbert Brown of Craighton in Carrick, had little education beyond that of being able to read her Bible; but the poet's father was a man of hard-headed intelligence, and encouraged learning according to his ability; sent Robert to a little school at Alloway-mill, and took the principal part in establishing a young dominie, John Murdoch, from whom Robert learned to read. William was a worthy specimen of the class that Scotland, for the last fifty years, has been so industriously engaged in expatriating—the Scottish peasant—a man who wrought hard, believed his faith, practised integrity, had the fear of God before him, and wished to bring up his children well—indulged in speculative theology, and fought his battle of life unflinchingly. He never threw; yet, with adverse wind and tide, he held his face ever firm towards the blast, and in a very limited sphere exhibited qualities that had the elements of greatness. When Robert was seven years of age, his father removed to the farm of Mount Oliphant, and there Robert wrought his daily work, as was the custom of the farmer's son. At fifteen he could do the work of a man. His form was robust; yet overtaken by labour before the frame was knit, the nervous constitution, though it did not give way, received a strain,

from which there was no after recovery. The melancholy of later times, and perhaps, moreover, the strong temptation to excitement, may have originated in the excessive labours of youth. The muscular fibre remained, but the nervous fibre was overstrung, and never afterwards acquired the faculty of repose. Few men could have entered on life under less favourable circumstances. On the one hand, he had the arctic regions of a frozen theology, with iceberg formalisms as the limiting boundaries of his desire. On the other, he had the torrid impulses of his own inspiration urging onward, to clothe the world of his thought with a thousand rays of gorgeous colouring. When lit by love, by genius, and by passion, the peasant poet rushed into a tumult of fitful, fiery existence, throwing around the coruscations of his meteoric nature—not living, but burning out a life, with flame and smoke swaying hither and thither till the fire burnt out, and the ashes of a noble nature alone remained marking the funeral place of grand endowments. The marvel is not that his course was in some sense irregular, but that he lived to accomplish, with untiring industry, his wondrous treasure-store of song—that the warbling wood-note wild had not been quenched in the revelries that brought for a time forgetfulness of pain; and that, under the hostility of all surrounding influences, he could still pour forth such matchless gems of lyric beauty. Burns commenced his poetic career, as a matter of course, by a love song—*Handsome Nell*—“Oh! once I lo’ed a bonnie lass;” and plainly enough this doggerel was only the expression of his calf-love, when he thought he ought to be in love, but was not. In 1777 his father removed to the farm of Lochlea in the parish of Tarbolton, where William made a bad bargain, by taking 130 acres of bad land at twenty shillings an acre. From this place Robert went to Kirkoswald to school, and by his own account learned many more things than mensuration and surveying. “I made,” he says in the fragment of his autobiography, “a greater progress in the knowledge of mankind. The contraband trade was at that time very successful, and it sometimes happened to me to fall in with those who carried it on. Scenes of swaggering riot and roaring dissipation were till this time new to me, but I was no enemy to social life. Here, though I learnt to fill my glass, and to mix without fear in a drunken squabble, yet I went on with a high hand with my geometry, till the sun entered Virgo, a month which is always a carnival in my bosom, when a charming *flette*, who lived next door to the school, upset my trigonometry, and set me off at a tangent from the sphere of my studies.” The peculiarity of Burns’ zodiac seems to have been, that all its signs were signs of Virgo. He was always in love, or in something like it. His first articulate utterance in song was “writ with a plume from Cupid’s wing;” his last, seven days before the final delirium, told the same tale—“No love but thine my heart shall know.” Up to his twenty-third year Burns held on the same course. “Vive l’amour, et vive la bagatelle,” were, he says, his principles of action, not knowing that he was making an utter mistranslation of his feelings. Nothing in his eyes was a bagatelle. He adds indeed, in sufficient contradiction—“My passions, when once lighted up, raged like so many devils, till they got vent in rhyme.” He had the strong impulses of a man who had a future, but up to his twenty-third year he lived an irreproachable life of homely industry, as the eldest and most aiding son of a small farmer. Men of similar stamp, though not of similar genius, still grow in Ayrshire, their number rapidly diminishing before the march of the modern change of manners, and the exigencies of agricultural improvement. About this time he appears to have composed his first song of note, “My Nannie O!” “Behind yon hill where Stinechar flows,” the name of the river being, with contemptible affectation, changed to Stinsiar. Even Burns was prevailed upon to substitute “Lugar.” The vale of Stinechar is one of the most beautiful in Scotland, well worthy of an Ayrshire poet’s celebration.

“My twenty-third year,” says Burns, “was to me an important era. Partly through whim, and partly that I wished to set about doing something in life” (most probably with a view to marriage), “I joined a flax-dresser in the neighbouring town of Irvine. This was an unlucky affair. . . . As we were giving a welcome carousal to the new year, the shop took fire, and burned to ashes, and I was left, like a true poet, not worth a sixpence. I was obliged to give up this scheme. The clouds of misfortune were gathering thick round my father’s head, and what was worst of all, he was visibly far gone in

consumption; and to crown my distresses, a *belle fille*, whom I adored, and who had pledged her soul to meet me in the field of matrimony, jilted me with peculiar circumstances of mortification. The finishing evil, that brought up the rear of this infernal pile, was my constitutional melancholy being increased to such a degree, that for three months I was in a state of mind scarcely to be envied by the hopeless wretches who have got their mittimus.” At Irvine Burns learned something of a town life, and formed a friendship with a young fellow, “a very noble character,” whose knowledge of the world was vastly superior to his own, and who was the only man he ever saw who was a greater fool than himself, where woman was the presiding star; “but he spoke of illicit love with the levity of a sailor, which hitherto I had regarded with horror. Here his friendship did me a mischief, and the consequence was that soon after I resumed the plough, and wrote “The Poet’s Welcome.”

Burns remained at Lochlea, in the performance of his ordinary farm work, until he was twenty-five years of age. He had there written “Poor Mailie,” “John Barleycorn,” “Mary Morrison,” and some other pieces. At Lochlea his father died, on the 13th February, 1784, not without presentiments that the future course of Robert’s life would be in the wandering bypaths from which, with puritan fortitude, he had so carefully preserved his own footsteps. The old man pointed out that there was one of his family for whom he feared. Robert turned to the window, and with a smothered sob and a scalding tear acknowledged that he knew the meaning of the reproof. He seems also to have made some serious resolutions of amendment, which he kept for a time. The old man was buried in Alloway kirk-yard, and on the headstone of his grave the poet son paid the following tribute to the puritan father:—

“Oh ye whose cheek the tear of pity stains,  
Draw near with pious reverence and attend!  
Here lie the loving husband’s dear remains,  
The tender father, and the generous friend;  
The pitying heart that felt for human woe,  
The dauntless heart that feared no human pride;  
The friend of man, to vice alone a foe,  
‘For even his failings leaned to virtue’s side.’”

Whatever Robert may have been at Lochlea, it is tolerably certain that he had not learned to join extravagance to his other accomplishments. His brother Gilbert—a dogged, stolid sort of a character, stupidly wise—kept the family accounts, and knew the outgoings. Robert received as wages—not an unusual thing in Scottish farming families—the munificent sum of seven pounds sterling per annum; and this sum Worldly-Wiseman Gilbert assures us he did not exceed. He was frugal, temperate, and “everything that could be wished.” In the spring of 1784, the family removed to the farm of Mossiel, in the parish of Mauchline; the sons and daughters of William Burness having, by ranking as creditors for arrears of wages, saved from the clutches of Scotch law a small amount of stock to begin the new adventure. Here Robert commenced his intended reformation,—read farming books, calculated crops, attended markets, and believed that, “in spite of the world, the flesh, and the devil, he would be a wise man.” But the first year, unfortunately, he bought bad seed, and the second he lost half his crops by a late harvest. The fates were adverse, or at least unpropitious, and he solaced himself with verse, producing a grand prayer, some psalms, “Green grow the rushes, O,” and “A big-bellied bottle’s the whole of my care”—a combination of theology, licentiousness, and drink, than which nothing can possibly be more expressive of the Scottish rural life of Burns’ day. He suffered much from constitutional melancholy, and kept a barrel of water at his bedside, into which he plunged when attacked by fainting fits. He struggled on, however, attended a free-mason lodge, and learnt that sort of sociality. He also made acquaintance with Jean Armour—

“A dancin’, sweet, young, handsome quean,  
O’ guileless heart!”—

to whom, after the fashion of Scotland, he was in every sense of the word married, but who, at the instigation of her father, thought proper still to consider herself a single woman. The father—Armour, a stone mason—reckoned Burns too poor to marry his daughter, and, notwithstanding the accident of a prospective baby, calculated that she might still make a better match—a species of caution which approaches the horrible; but,

poor man! the morals of his district taught him no better, and the church was satisfied if transgressors in this department went through the formality of public censure. Burns, in fact, had to do his penance, and to stand a rebuke before the congregation of Mauchline, 6th August, 1786, being indulged in the liberty "of standing in my own seat," instead of on the stool of repentance, profanely called "cuttie." Jean, however, after bearing twins a second time to the poet, ultimately became Mrs. Burns, and was publicly acknowledged to be his wedded wife, August 5, 1788. It would be out of place to speak of Burns' interminable amours; but it is worthy of remark, to show the nature of the man, that in the spring before the autumn when Jean's first children were born, Burns was pledging his faith in bibles to Highland Mary; and in the year when Jean's second children were born, he was writing his celebrated letters to Clarinda. Whatever may have been his poetic genius, his moral nature was ruined by licentiousness.

We have now shortly to trace Burns' literary career. This he explains in a few words in the fragment of his autobiography. "The first eminent composition that I recollect taking pleasure in was the Vision of Mirza, and a hymn of Addison's. . . . The two first books I ever read in private, and which gave me more pleasure than any two books I ever read since, were the Life of Hannibal, and the History of Sir William Wallace. . . . Polemical divinity, about this time, was putting the country half mad, and I, ambitious of shining in conversation parties on Sundays between sermons, at funerals, &c., used, a few years afterwards, to puzzle Calvinism with so much heat and indiscretion, that I raised a hue and cry of heresy against me, which has not ceased to this hour." He here condenses his literary life into the smallest possible compass—poetry, patriotism, and opposition to the ecclesiastical system which prevailed in his time, and which, by the concurrent opinion of all present authorities, was sufficiently deplorable. He was a poet, a patriot, and "a heretic." But he tells us, also, that when he was a boy, an old woman resided in the family who had an extraordinary collection of tales and songs concerning devils, ghosts, fairies, brownies, witches, warlocks, &c. To poetry, patriotism, and "heresy," therefore, must be added the popular demonology of his youth. "But far beyond all other impulses of my heart," says Burns, "was *un penchant à l'adorable moitié du genre humain*. My heart was completely tinder, and was eternally lighted up by some goddess or other." Add to these a passionate love of nature, and the marvellous power of description with which he could convey his appreciation of nature's loveliness, and we see at once the origin of all that Burns ever wrote, and how it was that the author of the "Cotter's Saturday Night" should also be the author of the merciless, but truthful satire, "The Holy Fair;" how the hand that could write verses "To a Mouse," or "To a Mountain Daisy," could pen also "Scots wha hae;" how the wonderful epic, "Tam o' Shanter," sprang from the witch and warlock teachings of the old woman who dwelt in his father's house, and how, above all, his first song and his last were devoted to beauty, to woman, and to love.

At Lochlea Burns had not written much. It was at Mossiel in 1784, 1785, and 1786, that he laid the foundation of his fame, and resolved to publish his first volume. The publication fell out in this wise. When Jean jilted him in 1786, he resolved to go to the West Indies, and actually accepted the office of bookkeeper on a slave estate. But he was poor—that being the reason that Jean did jilt him. He therefore applied to his landlord, who advised him to publish his poems by subscription, and Burns, acting on this advice, had subscription papers thrown off, and circulated among his friends, whose fancy had probably been more tickled by his satires than attracted by his poetic powers. All this he tells us in his own concise way—"I have tried often to forget her; I have run into all kinds of dissipation and riots, mason meetings, drinking matches, and other mischief, to drive her out of my head, but all in vain. And now for a grand cure; the ship is on her way home that is to take me out to Jamaica; and then, farewell dear old Scotland, and farewell dear ungrateful Jean, for never, never will I see you more. You (the correspondent to whom he is writing) will have heard that I am going to commence poet in print, and to-morrow, June 13, 1786, my works go to the press. I expect it will be a volume of about two hundred pages; it is just the last foolish action I intend to do, and then turn a wise man as fast as possible." At this time Highland Mary had gone home to her friends to

make preparations for her marriage with Burns; one of his songs being, "Will ye go to the Indies, my Mary." A bookseller in Kilmarnock, afterwards the founder of the *Ayr Advertiser*, undertook the business of publication, and the volume appeared in July, under the title, "Poems, chiefly in the Scottish Dialect, by Robert Burns," with the motto—

"The simple bard, unbroke to rules of art,  
He pours the wild effusions of the heart;  
And if inspired, 'tis nature's powers inspire—  
Hers all the melting thrill, and hers the kindling fire."

It contained "The Twa Dogs," "Scotch Drink," "The Author's earnest Cry and Prayer," "The Holy Fair," "Address to the Deil," "Mailie," "To T. S.," "A Dream," "The Vision," "Halloween," "The Auld Farmer's New Year Morning's Salutation," "The Cotter's Saturday Night," "To a Mouse," "Epistle to Davie," "The Lament," "Despondency, an Ode," "Man was made to Mourn," "Winter," "A Prayer in prospect of Death," "To a Mountain Daisy," "To Ruin," "Epistle to a Young Friend," "On a Scotch Bard gone to the West Indies," "A Dedication to G. H., Esq.," "To a Louse," "Epistle to J. L.," "To the same," "Epistle to W. S.," "Epistle to J. R.," Song—"It was upon a Lammas Night," Song—"Now Westlin' Winds," Song—"From thee, Eliza, I must go," "Farewell to the Brethren of St. James' Lodge, Tarbolton," "Epitaphs and Epigrams, and a Bard's Epitaph." The speculation produced twenty pounds of profit to the poet, and immediate popularity. "Even ploughboys and maid-servants would have gladly bestowed the wages they earned most hardly, and which they required to purchase necessary clothing, if they might but procure the works of Burns."

But not only did "ploughboys and maid-servants" discover that there was merit in the "Poems, chiefly in the Scottish Dialect." A copy had reached Edinburgh, and had elicited the favourable criticism of those who, at that time, were supposed capable of judging. Within three months of the publication of the volume at Kilmarnock, Burns resolved to go to Edinburgh, and try his fortune there with a second edition, instead of going to the West Indies, although it appears that his passage was actually taken. He went to Edinburgh, and was received into society—was feasted, admired, and, above all, patronized. He saw the aristocracy of the land, and the aristocracy saw him—Robert Burns, the ploughman from Ayrshire, whose name will still be familiar as a household-word, when all with whom he came in contact will be consigned to oblivion, or only remembered as having been once seen in the presence of the Scottish bard who sung the requiem of lowland Scotland. Scotland, which has the most unlimited faith in its own opinions, has little or no confidence in its own judgment, and seldom ventures to form an opinion, except in theology, and even that was borrowed from a Frenchman. When once the opinion is formed, however, be it begged, borrowed, or stolen, it will be adhered to, to the death. Thus, no man recognized Burns as a *great* poet. Thoughts the most exquisite, clothed in inimitable language, poetry in fact of the highest order, was thrown down before the literary people of Edinburgh; but neither man nor woman could see that the gems were of the first water, or that there had been born to Scotland such a poet as Scotland had never seen before, and never can see again. Nor does it appear that any Scotsman during Burns' lifetime ever recognized his true rank. That, in fact, was reserved for an Englishman, William Pitt, who, on reading Burns, named Shakespeare. But, nevertheless, Burns was feasted and patronized, "glowered at," and thought a wonder of some kind, but of what particular kind the ladies and gentlemen with whom he came in contact were not particularly certain. He was a "phenomenon," and as a phenomenon he was treated and was lionized accordingly, and in that manner. His appearance in Edinburgh is the most melancholy part of his career. His country life, with all its errors and all its sufferings, was at least natural. It belonged to the man himself, like the gnarls upon the oak. But his Edinburgh life was unnatural; it was the oak cut into the upholstery of life. His wild revelry and unbridled passions were, at least, human, when the man was at home; they were conventional and artificial when he drank with gentlemen, or attempted to persuade himself that he was in love with an indifferent specimen of a modern fine lady. However he may have preserved the independence of his bearing, he was false to the integrity of his own nature; and, accordingly, we find him writing verses to be placed below an earl's portrait, epistles to

Mr. Graham of Fintry, prologue at Mr. Wood's benefit, letters to Clarinda, and much similar matter, which might well be forgotten had it not been written by him. One noble thing he did, however, which shows him in the light of a true man—he placed a stone and an epitaph on the grave of Robert Ferguson, poet, and this, be it remembered, before publishing a second time, or receiving the proceeds of a second edition of his works. The Edinburgh edition came out in April, 1787, no less than two thousand eight hundred copies being subscribed for, the Caledonian Hunt taking a hundred copies at a guinea apiece. By this edition Burns made about four hundred pounds, including one hundred pounds received for the copyright.

From Edinburgh he made an excursion through the south of Scotland and into England, as far as Newcastle. He visited Dunse, Coldstream, Kelso, Jedburgh, Innerleithen, Traquair, Berwick, Eyemouth, Dunbar, Alnwick, Newcastle, Carlisle, and Dumfries, and returned to Mauchline; from which place he again set out on a trip to the west Highlands, where "I have lately been rambling over by Dumbarton and Inverary, and running a drunken race on the side of Lochlomond with a wild Highlandman. His horse, which had never known the ornament of iron or leather, zig-zagged across my old spavined hunter, whose name is Jenny Geddes, and down came the Highlandman, horse and all, and down came Jenny and my bardship; so I have got such a skinful of bruises and wounds, that I shall be at least four weeks before I dare venture on my journey to Edinburgh." He reached Edinburgh in August, and before the end of the month set out on his principal Highland tour, passing by Falkirk, Carron, Stirling, Bannockburn, Blair-Athole, Inverness, Banff, Aberdeen, Stonehaven, Montrose, Perth, Lochleven, Dumfermline, and back to Edinburgh, near the end of October. In Edinburgh he remained till February, writing the Clarinda letters, then made a short run through to Ayrshire; during which he concluded a bargain for the farm of Ellisland, on the banks of the Nith, about five or six miles above the town of Dumfries. He made another short visit to Edinburgh, and left that city apparently on the 24th March, 1788. The above places visited by Burns we have enumerated, because these journeyings not only form the subject of many of his letters, but because traces of them have been left in his poems. He returned again to Ayrshire for a time, and in June, 1788, took up his residence at his new farm of Ellisland, where, among other things he wrote the wonderful song, "Auld Langsyne," which, from that day to this, has moved the heart of Scotland; and the, perhaps, more wonderful "Tam o' Shanter," in its construction and in its marvellous power of narration the most perfect of all hobgoblin epics.

In the autumn of 1789 Burns, moved by an increasing family, applied to Mr. Graham of Fintry to procure him an appointment as excise officer of the district. The appointment was granted, and Ellisland being as bad a bargain as usually fell to the lot of the poet, he thought that he had been "extremely lucky in getting an additional income of £50 a-year, while at the same time the appointment will not cost me above £10 or £12 per annum of expenses more than I must have eventually incurred." It had its drawbacks, however—"the worst circumstance is that the excise division which I have got is so extensive—no less than ten parishes to ride over—and it abounds, besides, with so much business that I can scarcely steal a spare moment." He had to ride from a hundred and fifty to two hundred miles a week, and for this he received a salary of £50 a year. This was his national reward. Genius was cheap in those days.

At Ellisland we catch a glimpse of him. "In the summer of 1791 two English gentlemen, who had before met him in Edinburgh, paid a visit to him at Ellisland. On calling at the house they were informed that he had walked out on the banks of the river; and, dismounting from their horses, they proceeded in search of him. On a rock that projected into the stream they saw a man employed in angling, of a singular appearance. He had a cap made of fox's skin on his head, a loose greatcoat fixed round him by a belt, from which depended an enormous Highland broadsword. It was Burns." Ellisland, however, was a bad, or, perhaps, rather an unprofitable farm, and Mr. Graham of Fintry once more exerted his influence to procure for Burns another appointment—that of exciseman at Dumfries, with a salary of £70. To Dumfries, therefore, Burns removed in Dec., 1791, leaving nothing at Ellisland but a putting-stone and £300 of his money. At Dumfries he remained in the performance of

his duties till September, 1792, when he received a communication from Edinburgh, requesting him to contribute to the work afterwards published as the "Melodies of Scotland, with symphonies and accompaniments for the pianoforte, violin, &c. The poetry chiefly by Burns. The whole collected by George Thomson, F.A.S.E. In 5 vols. London: T. Preston; and Edinburgh, G. Thomson." To this work Burns contributed a hundred songs, for which he received £5, a shawl for his wife, and a picture by David Allan, representing the Cotter's Saturday Night. He did not return the money, as that "would savour of affectation; but as to any more traffic of that debtor and creditor kind, I swear by that HONOUR, which crowns the upright statue of Robert Burns' integrity, on the least motion of it I will indignantly spurn the by-past transaction, and from that moment commence entire stranger to you." He would not write for money, which Mr. Robert Chambers, a publisher who has printed an edition of Burns' poems and letters, describes as a "sentiment highly honourable to him." Possibly.

From 1791 Burns remained at Dumfries, writing his many songs. He was an exciseman—ochone the day—and could reach no higher in social life, having no patronage, on account of his sympathies with the revolutionary movements of France; arising, in his case, from an intense love of liberty, and utter detestation of tyranny. He was soured. He saw that his fate was decided. Ambition died out of him, even though the spirit of poetry lingered to the last, with wreath in hand, to crown the grave, if it could not crown the poet. The dark shadows were closing around the great heart that had sung so nobly, and so well. Never having mastered himself, he had not been able to master fortune. He could not

"On reason build resolve,  
That column of true majesty in man,"

He took to the tavern, and wasted his heaven-born talents upon drunken boors. He came in contact with none who were worthy of him; but this, indeed, was the fate of his whole life. His lot was cast in an evil, small-souled generation. Of all who saw him, there is not one worthy of remembrance in connection with his story.

As early as December, 1794, when Burns was nearly thirty-six years of age, he began to feel that life was fading. "What a transient business is life. Very lately I was a boy; but t'other day I was a young man, and I already begin to feel the rigid fibre and stiffening joints of old age coming fast o'er my frame." A year later we find him with his health shattered. "His appetite," says Dr. Currie, "now began to fail, his hand shook, and his voice faltered on any exertion or emotion. His pulse became weaker and more rapid, and pain in the larger joints, and in the hands and feet, deprived him of the enjoyment of refreshing sleep. Too much dejected in his spirits, and too well aware of his real situation to entertain hopes of recovery, he was ever musing on the approaching desolation of his family, and his spirits sunk into a uniform gloom." In April, 1796, "I fear it will be some time before I tune my lyre again. By Babel's streams I have sat and wept. I have only known existence by the pressure of the heavy hand of sickness, and have counted time by the repercussions of pain. Rheumatism, cold, and fever have formed to me a terrible combination. I close my eyes in misery, and open them without hope. I look on the vernal day, and say with poor Ferguson—

"Say, wherefore has an all-indulgent heaven,  
Light to the comfortless and wretched given."

On the 4th of July, for the benefit of his health, he went to Brow, a sea-bathing village on the Solway. "I was struck," says a lady who visited him there, "with his appearance on entering the room. The stamp of death was imprinted on his features. He seemed already touching the brink of eternity."

On the 12th he wrote thus to his cousin, Mr. James Burns, in Montrose—"When you offered me money assistance, little did I think I should want it so soon. A rascal of a haberdasher, to whom I owe a considerable bill" (£7. 4s. for patriotic volunteering uniform), "taking it into his head that I am dying, has commenced a process against me, and will infallibly put my emaciated body in jail. Will you be so good as to accommodate me, and that by return of post, with ten pounds? Oh, James! did you know the pride of my heart, you would feel doubly for me. Alas! I am not used to beg."

## LAST LETTER OF THE POET.

"To Mr. James Armour, Mauchline.

"DUMFRIES, 18th July, 1796.

"MY DEAR SIR—Do, for heaven's sake, send Mrs. Armour here immediately. My wife is hourly expecting to be put to bed. Good God! what a situation for her to be in, poor girl (not yet thirty), without a friend. I returned from sea-bathing quarters to-day, and my medical friends would almost persuade me that I am better; but I think and feel that my strength is so gone, that the disorder will prove fatal to me. Your son-in-law,  
R. B."

The 19th and 20th pass over. The 21st comes and brings delirium. The children are sent for and stand round the bed. Last word—a curse on the law agent who had written for payment of volunteer uniform. On the 21st July, 1796, Robert Burns is no more. On the 25th he is buried with local honours—idiot volunteers firing three volleys over the grave—and the poet's wife bearing a son on the day of the funeral.

To understand the position of Burns as a poet, he must be placed in relation to the history of his country. He belonged to lowland Scotland and rustic Scotland. He sang the song, therefore, of lowland and rustic Scottish life. But it was the death-song. Lowland Scotland, as a distinct nationality unmingled with extraneous elements, came in with two warriors and went out with two bards. It came in with William Wallace and Robert Bruce, and went out with Robert Burns and Walter Scott. The two first made the history; the two last told the story and sung the song.

As the modern history of England commences at the Norman conquest, so the modern history of Scotland commences at the war which determined whether the Norman conquest should or should not extend to the kingdom of Scotland—that is, at the war carried on by the Anglo-Norman Edwards. On the part of Scotland, that war was maintained by two historic men, the one representing the people, the other the aristocracy; the one representing the Scottish element, properly so called, the other representing the Scoto-Norman element which assumed the reins of power and became predominant. Wallace was a Scotsman, Bruce was a Scoto-Norman. When the Anglo-Norman attempt to conquer the kingdom of Scotland was rolled back by Wallace and Bruce, Scotland entered on a national life distinct from that of England, and in this national life were the two elements of rustic or Saxon Scotland, and aristocratic Scotland. At the Reformation the Saxon element came once more to the surface, and the Norman fashion of things underwent a change. In the parliamentary wars the two parties are pitched against other—the covenanters representing rustic or Saxon Scotland, and the cavaliers representing aristocratic or Norman Scotland. Time flowed, and a union with England came about. The two countries were to merge into one on equal terms, and the distinct and separate life of Scotland was to be merged into a common kingdom. Nominally, the union took place in 1707, but the real admixture and solving of the two countries was little more than commenced at the end of the last century. Before Scotland could disappear, however, she must have her bards, and these appeared not unworthily in Robert Burns and Walter Scott—Burns taking the rustic life and the rustic language; Scott taking the aristocratic life, and, except in dialogue, the aristocratic language. Burns was therefore the national poet of Scotland, exclusive of the Norman element. Knighthood was the theme of Scott—manhood the theme of Burns. With poetic justice both fell victims—Burns to passion, Scott to pride.

For this purpose, and to be the type of Scottish lowland and lowly life, no man ever possessed such qualifications as Burns. He had a vast intellect and a burning nature—the sensibility of a woman and the strength of a giant. Had he chosen the path of duty instead of indulgence, it is impossible to say what he might not have achieved. With regard to intellectual endowment, he has no compeer in the history of his country. His intellect has the flash of intense electric light. He searches out the quintessence of feeling, and distils it off into expressions so concise and admirable, that they burn their way into the innermost existence of those who have the ears to hear. In four lines he paints a drama—

"Had we never loved sae kindly,  
Had we never loved sae blindly,  
Never met—or never parted,  
We had ne'er been broken-hearted."

In one line he sums up the highest and most universal form of all democracy—

"A man's a man for a' that."

In a single verse he prophesies the reign of merit and the advent of human brotherhood—

"Then let us pray that come it may,  
As come it will, for a' that,  
That sense and worth, o'er a' the earth,  
May bear the gree and a' that.  
For a' that and a' that,  
It's coming yet for a' that,  
That man to man, the world o'er,  
Shall brothers be for a' that."

Tam o' Shanter, short as it is, is a complete epic, with beginning, middle, end, and moral—a small picture, which, like one of Rembrandt's engravings, exhibits power condensed into the smallest compass.

Burns' language was the lowland Scottish dialect, and in that he wrote naturally. English was, if not a foreign, at least an acquired dialect, and he used it with far less success than his own. And so true is it that Burns wrote the requiem of lowland Scotland, that since his time his very dialect has almost died away. There are very few in the present generation who can read Burns without a glossary, and in the next generation he will be almost as strange to Scotsmen as to Englishmen. His Scottish dialect must ever be a barrier to that universal popularity which he might have attained in a language more widely diffused; but if genius have the inheritance of fame, Robert Burns will never disappear from the literature of the world. To a Scottish ear, his pathos, his power, his inimitable satire, his floods of native feeling, poured forth in words that seem to have been coined expressly for his use; his manly independence, his reverential awe, and the solemn majesty of his religious thought—enshrine him for ever as the poet of his country. But the moral of his life is dark and sad—too dark and too sad to be touched on without the deepest and most serious reflection on the vanity of human genius when severed from moral resolution.

The following description of Burns' personal appearance is from Dr. Currie—"Burns was nearly five feet ten inches in height, and of a form that indicated agility as well as strength. His well-raised forehead, shaded with black curling hair, indicated extensive capacity. His eyes were large, dark, full of ardour and intelligence. His face was well formed, and his countenance uncommonly interesting and expressive. His mode of dressing, which was often slovenly, and a certain fullness and bend of his shoulders, characteristic of his original profession, disguised in some degree the natural symmetry and elegance of his form. The external appearance of Burns was most strikingly indicative of the character of his mind. On a first view his physiognomy had a certain air of coarseness, mingled, however, with an expression of deep penetration, and of calm thoughtfulness, approaching to melancholy. There appeared in his first manner and address perfect ease and self-possession, but a stern and almost supercilious elevation, not indeed incompatible with openness and affability, which, however, bespoke a mind conscious of superior talents. Strangers who supposed themselves approaching an Ayrshire peasant who could make rhymes, and to whom their notice was an honour, found themselves speedily overawed by the presence of a man who bore himself with dignity, and who possessed a singular power of correcting forwardness and of repelling intrusion."

Upwards of a hundred editions of the works of Burns have been published. In addition to the first, published at Kilmarnock by John Wilson in 1786, and the second published in Edinburgh in 1787 by William Creech, the following may be mentioned—The Scots Musical Museum, six vols. 8vo, published between 1787 and 1803 by James Johnson, engraver, Edinburgh; in this are included one hundred and eighty-four songs, written or corrected by Burns. The Works of Robert Burns, with an Account of his Life, Liverpool, 1800, Dr. Currie's first edition; Cromek's Reliques of Burns, 1808; Life of Burns by J. G. Lockhart, Edinburgh, 1828. (The *Edinburgh Review*, No. 96, for December, 1828, contains a critique on Lockhart's Life of Burns by Thomas Carlyle, the only man who could ever have written a life of Burns with insight both into the man, and into the whole circumstances of Scottish rural life. Properly speaking, Burns' life has not yet been written, and in fifty years it will be impossible.) Works and Life by Allan Cunningham, eight vols., London, 1834; Works, edited by the Ettrick Shepherd and William Motherwell, five vols., Glasgow, 1834; the Correspondence between Burns and Clarinda, with a Memoir of Mrs. M'Lehose (Clarinda), by her Grandson, Edinburgh, 1843; Life

and Works, by Robert Chambers, Edinburgh, 1852. In America many editions have of course appeared, and the French and Germans have tried the rather difficult task of rendering Burns in other languages. The French edition is entitled "Poesies complètes de Robert Burns, traduites de l'Écossais par M. Leon de Wailly," Paris, 1843.—P. E. D.

BURR, AARON, president of New Jersey college, memorable for the success of his efforts to extend the usefulness of that institution, was born in Fairfield, Connecticut, in 1716. He died in 1757, leaving a high and unblemished reputation both as a scholar and a divine.—F. B.

BURR, AARON, son of the preceding; a conspicuous actor in the early history of the republic of the United States, though of more than equivocal fame, was born at Newark, New Jersey, February, 1756. At the outbreak of hostilities in 1775, he joined the army at Cambridge, and having taken part in various expeditions, he retired from the service in 1780. Entering upon the profession of the law at Albany in 1782, he shortly afterwards removed to New York, where politics began to divide with law his ambition, and he was elected to the senate. He espoused at once the opposition party. His severance from Washington's military family imbued his mind with a strong dislike to the head of the administration, and to the last he never ceased to undervalue him. Two or three years later, the democratic party, who owed him much, secured for him the vice-presidency, after a hard contest; but when, three years later, they strove to gain for him the governor's chair of New York, the design was baffled mainly by the activity of Hamilton. The duel with Hamilton which followed this defeat, was the turning-point in Burr's history. He was henceforward to be an adventurer; and life seldom showed to him any other face but that of a hard and dark experience. In 1807 his lawless designs on the Spanish provinces of South America led to his arrest. He was indicted for high treason at Richmond; but such had been the eagerness for his ruin, that time had not been left him for an overt act, and his acquittal followed. He sailed not long after for England, from which, being obliged to depart, he crossed the channel to gain, if possible, the ear of the French emperor—but in vain. In 1812 he ventured with fear and trembling, partly from his many private debts, and partly from the jealousy of those in power, and the aversion of the public at large, to return to his native land. His subsequent history is told in a line, as only that of penury, obscurity, and neglect. He died in 1836. Hardly more as a demagogue than as a debauchee, his name has passed into a proverb. His life has been twice written—by his companion, Matthew L. Davis, and by J. Parton of New York.—J. P. D.

\* BURRIT, ELIUS, an American, commonly known as "the learned blacksmith," and as the earnest advocate of peace or "the universal brotherhood" of nations, was born at New Britain, Connecticut, December 8, 1811. His father was a shoemaker. On his father's death he was apprenticed to a blacksmith, after he had received but a very limited education in a common school. He worked at his trade for several years in Worcester, Massachusetts, where the library of the Antiquarian Society supplied him with books. An early fancy for the study of languages was developed by unremitting application, not only during his leisure hours, but while he was at work hammering iron, as he contrived to have a grammar open before him, and could catch glimpses enough of the printed page to keep his thoughts busy, while his muscles were strained at their proper work. In this way he gained a good knowledge of a few, and a smattering of very many tongues. Offers were made to give him a college education, but he preferred this combination of physical and mental labour, and declined them. But he was gradually weaned from the forge by the ambition of teaching his fellow-men, and otherwise improving their condition. He began his career as a philanthropist by editing some periodicals, and contributing to others. War and intemperance are the evils against which his labours have been chiefly directed, and he has attracted more notice by lecturing than by writing against them. In June, 1846, he came to Europe, and was warmly welcomed by the band of reformers who are interested in his favourite projects. In England, and on the continent, he has laboured zealously to commend his scheme of a great peace league to public favour, though with no very encouraging prospects of success. One of his latest publications is entitled "Thoughts and Things at Home and Abroad."—F. B.

BURROUGH, EDWARD, one of the earliest preachers and

writers among the Quakers, born about the year 1634, near Kendal, Westmoreland, was brought over to the Society of Friends by personal intercourse with George Fox. About the year 1654, when he was twenty years of age, he went to London, and began preaching. At that time the Society of Friends appears to have possessed no meeting-house in the metropolis; but this was no disadvantage to a preacher of the ready eloquence of Burrough. Crowds of people attended on his ministration—many regularly and with profit. While in Ireland for a short period he wrote "The Trumpet of the Lord sounded out of Zion, which sounds forth the controversy of the Lord of Hosts." In 1662-63, while preaching at a meeting of his brethren, he was seized by a party of soldiers, and committed to Newgate. After eight months' confinement he died of fever. His works, of which the one above-noted is the most important, were collected in one volume, folio, 1672.—J. S., G.

BURROUGH, STEPHEN, an English navigator of the sixteenth century, sailed in 1553 as master of Richard Chancellor's ship, the *Edward Bonaventure*, in the expedition fitted out under the command of Sir Hugh Willoughby, in search of a north-eastern passage to Cathay (or China); that is, by way of the arctic coasts of Europe and Asia. This expedition, disastrous as regarded its gallant leader and his immediate companions, was attended by results highly important in a commercial point of view. The merchant-adventurers of London were eager to prosecute the cause of north-eastern discovery, and three years later, in 1556, Burrough was despatched on an enterprise of the like description; a small vessel, the *Searchthrift* pinnace, being fitted out for the purpose, and placed under his command. Burrough sailed from Gravesend on April 29th of that year. Entering the small river Kola in Russian Lapland, on the way, he and his companions proceeded along the coast to the eastward as far as the island of Waygatz in lat. 70° 29', long. 59° 10'. In the following year he returned to England, and is stated to have been subsequently made comptroller of the royal navy. The narrative of his voyage is given in Hakluyt.—W. H.

BURROW, SIR JOHN, born in 1701; died in 1782. In 1724 he was made master of the crown office, which he held till his death. On West's death, he filled the chair of president of the Royal Society till the regular time for the next election, when Sir John Pringle succeeded. In the interval, on the presentation of an address from the society to the king, Burrow was knighted. Burrow's claim, however, to be remembered, arises from his having published reports of Lord Mansfield's decisions. The reports extend from 26 George II. to 12 George III.—J. A., D.

BURROUGHES, JEREMIAH, a puritan divine, born in 1596, educated at Cambridge, was obliged to quit that university for nonconformity. He was for some time minister of an English church at Rotterdam, and after his return to England in 1642 officiated to two of the largest congregations in London—Stepney and Cripplegate. He was a man of eminent learning and piety. His works include an "Exposition of Hosea," 3 vols.

BURROWES, PETER, born at Portarlinton in Queen's county, Ireland, in 1753; entered Trinity college, Dublin, in 1774; obtained a scholarship in 1777. In the year 1784 Burrowes, then a law student at the middle temple, published a pamphlet on the subject of admitting the Roman Catholics of Ireland to the elective franchise, which led to an acquaintance with Flood, who ultimately secured his return for the borough of Seaford. In 1785 he was called to the Irish bar, and soon got a good deal of employment, chiefly in election cases. In 1794 he was engaged in a duel, the particulars of which exhibit a strange picture of the manners of that day. Lord Mountgarret had lawsuits—as the story is told by Mr. Burrowes' biographer—with refractory tenants. It would appear that at every assizes of the county town cases between his lordship and his tenants were sure to come, and that he was generally the loser in these contests. Under these circumstances he posted a notice, insisting that the members of the bar should decline holding briefs against him, or if not, he offered the alternative of fighting him. The extraordinary thing is that duels did follow. The litigation, it would appear, survived his lordship. Burrowes had the luck to hold a brief in one of the records arising from the management of the Mountgarret lands, and he found himself under the necessity of sending a challenge to the Honourable Somerset Butler. Burrowes fell, as everyone thought, mortally wounded, and a strange escape he had. The ball struck against a penny-piece, part of some change accidentally in his waistcoat pocket. In

1799 Burrowes became a member of the Irish parliament for the borough of Enniscorthy. He opposed the measure of union. When "all the talents" came into power, Fox obtained for him the lucrative office of first counsel to the commissioners of the revenue, from which he was displaced when that ministry broke up. In 1821, under Lord Sidmouth's administration, he was appointed commissioner of the first court for the relief of insolvent debtors, established in Ireland. On resigning this office in 1835, he was given a pension of £1600 a year. His death occurred in 1842. Few men seem to have been more loved than Burrowes was by his friends.—J. A., D.

BURSER, JOACHIM, a German physician and botanist, was born in Lusatia in 1603, and died in 1689. He devoted himself to botany. After an extensive course of travel he became professor of medicine at Sora. He bequeathed his herbarium to the university of Upsal. A genus of plants is named *Bursera* after him. His published works are chiefly medical.—J. H. B.

BURTON, HENRY, born at Birsall in Yorkshire about 1579. After leaving Oxford, where he took the degrees of M.A. and M.D., he became tutor to the son of Lord Carey of Lepington, and subsequently clerk of the closet to Prince Henry. For publishing his two sermons, entitled "For God and the King," he was committed to the Fleet prison, and proceeded against in the Star-chamber. To the information which was filed against him he prepared an elaborate reply; but this his judges refused him permission to read in court. Along with Prynne and Bastwick, his fellow-prisoners, he was sentenced to pay a fine of £5000, to be set on the pillory and have his ears cut off, and to be placed in solitary confinement in Lancaster castle. An order of council in 1637 transferred him to Cornet castle, in the isle of Guernsey, where he remained three years. In 1640, upon his wife's petitioning the house of commons to reconsider his sentence, he was brought to the bar of the house, freed from fine and imprisonment, restored to his academical degrees and to his benefice, and awarded £10,000 as a compensation for the loss of his ears. He died in 1648. His works, like the course of his life, exhibit rather a violent temper than a great intellect.

BURTON, ROBERT, author of the famous book, "The Anatomy of Melancholy," by Democritus Junior, was born at Lindley, Leicestershire, February 8th, 1576. He was educated at the grammar school of Sutton Colfield, Warwickshire, whence he proceeded to Brazenose college, Oxford, and afterwards was elected student of Christ church. He received the vicarage of St. Thomas, Oxford, and also the rectory of Scgrave, Leicestershire—the former being presented to him by the dean and canons of Christ church, and the latter by Lord Berkeley. He retained both "with much ado" (to use the expression of Anthony Wood in his *Athenæ Oxonienses*) to his dying day, his residence being principally at Oxford. He lived a silent, sedentary, solitary life, for the most part confining himself to his study. Possessed of a fantastic humour he read an infinite number of books, seeking "to have an oar in every man's boat, to taste of every dish, and sip of every cup," while his delight in any subject was almost proportioned to its quaintness and its oddity. He likens himself to a ranging spaniel that barks at every bird he sees, leaving his game, and following all save that which he should. Wood states that Burton was an "exact mathematician, a curious calculator of nativities, a general read scholar, a thorough pac'd philologist, and one that understood the surveying of lands well." He appears to have devoted himself to the composition of his great work, for the purpose of avoiding melancholy, by being busy. He says that he had a kind of imposthume in his head which he was very desirous to be unladen of, and could imagine no fitter evacuation than his book, and urges that he could not well refrain from dissecting melancholy, for *ubi dolor ibi digitus*. "The Anatomy of Melancholy" was first printed in 1621, and passed through several large editions, to the great good fortune of the bookseller, who got an estate by it. It is probably the most curious repertory of apt quotations,—evincing the quaintest possible learning the world of literature contains—and has often been found exactly the book to furnish scholastic discourse "to gentles who have lost their time, and are put to a push for invention." It contains manifest indications of that peculiarly clear moral insight into social hypocrisies which characterizes those in whom humour and honesty are blended—their humour being honest, while their honesty is humorous. The style of this book is rough, the author declaring himself one who respects matter and not words, calling a spade

a spade, and quoting Seneca to prove that "a fellow careful about his words" has no solidity in him. At the same time, Burton's mind was not without poetical grace, as is evidenced by some very sweet introductory verses, which are not unlike passages in Milton's *Il Penseroso*, both in music and in thought. The "Anatomy," although popular for half a century, and now again well known, was, during the intermediate period, a mine of wealth to plagiarists. Sterne borrowed largely from it. Burton died at Oxford, either at or very near the time which he had for some years foretold from the calculation of his own nativity: upon which it was whispered among the students that he had committed suicide, rather than that there should be a mistake in the calculation—a tale which, although entirely unauthenticated, yet indicates the quaintness of his character as impressed upon his friends. He was buried at Christ church, Oxford, January 27th, 1639. On the monument erected over his grave, was inscribed his nativity, with its mystic signs, and an inscription (also drawn up by himself) declaring that to Melancholy he was indebted both for life and death.—L. L. P.

\* BURTON, JOHN HILL, advocate, author of some valuable historical and biographical works, was born at Aberdeen in 1809. He lost his father, who was an officer in the 94th regiment, in early youth, and owed his education at Marischal college to the prudence with which his mother managed her somewhat scanty resources. Having taken the degree of M.A., he was apprenticed to a legal practitioner in his native city, and in 1831 became a member of the Scottish bar. The leisure which a young advocate usually enjoys he devoted to the study of law, history, and political economy, contributing articles on these subjects to the *Westminster Review*, and afterwards to the *Edinburgh Review*. He is the author of "Life and Correspondence of David Hume;" "Political and Social Economy;" "A Manual of the Law of Scotland;" and a "History of Scotland, from the Revolution to the Extinction of the last Jacobite Insurrection."—J. S., G.

\* BURTON, RICHARD FRANCIS, Captain, an eminent African traveller, was born at Tuam, Galway, in 1821. Entering the Indian army in 1842, he served five years in Scinde under Sir Charles J. Napier. In 1855 he acted as military secretary under General Beatson; after which he commenced those travels in Africa which have rendered his name famous. (See *SPEKE*.) For his important discoveries in that country, Captain Burton obtained the gold medals of the French and English Geographical Societies, and in 1861 was made British consul at Fernando Po. His work, "The Lake Regions of Central Africa," is well known.—J. D.

BUSBY, RICHARD, a celebrated English pedagogue, born at Luton, 22nd September, 1606. After receiving his education as a king's scholar at Westminster, he was elected student of Christ Church, Oxford. He was so poor at this time that the parish of St. Margaret, Westminster, paid his fees for the degrees of B.A. and M.A., a kindness which he repaid by a liberal bequest to the parish at his death. Having entered into holy orders, he became first rector of Cudworth, and a prebendary of Wells, and then, in 1640, head master of Westminster school, an office which he held for fifty-five years. In 1660 he obtained a prebendal stall in Westminster, and became canon residentiary and treasurer of Wells. He died 6th April, 1695. He was distinguished for his learning and success as a teacher.—J. T.

BUSBY, THOMAS, Mus. Doc., was born at Westminster, Dec., 1755, and died at Islington in 1838. He was for five years an articled pupil of Jonathan Battishill; in 1780 he was engaged as organist at St. Mary's, Newington, and about twenty years later received the same appointment at the church of St. Mary, Woolnoth. In 1800 he obtained his degree at Cambridge, his exercise for which was an ode on the victories of the British navy. He produced an oratorio called "The Prophecy," in 1799, which had no success; he wrote some other works of the same class, some dramatic pieces, and some detached songs. The only one of all these compositions that has overlived the time when it was written, is the music in a Tale of Mystery, notable as being the first melodrama given on the English stage, which was first performed at Covent Garden theatre in 1802. Busby had a classical education, and distinguished himself more by his literary than by his musical works. He published "The Age of Genius," a poem, 1785; a translation of Lucretius; "Arguments and Facts proving that the Letters of Junius were written by J. L. de Lolme," 1816; a musical dictionary, often reprinted; a musical grammar, which also has been reprinted under various

titles; "A History of Music, compiled from Burney and Hawkins," but continuing their account down to the date of its publication; "Concert Room Anecdotes," and many articles in the *Monthly Magazine* and the *Monthly Review*. He was also the author of one of the real rejected addresses for the opening of Drury Lane theatre, after the fire of 1810; and thinking injustice was done to his poem by the preference of Byron's, he made his son climb upon the stage from the pit, to recite it, but the audience would not hear more than the first couplet.—G. A. M.

BUSCHETTO, an architect of the eleventh century, whose one work, the cathedral of Pisa, has rendered his name immortal. That magnificent structure was commenced in 1063.

BÜSCHING, ANTON FRIEDRICH, a prolific German writer, was born at Stadthagen, September 27, 1724, and died at Berlin, May 22, 1793. He ultimately became ecclesiastical councillor and head master of the Graue Kloster at Berlin. His "Erdbeschreibung," Hamburg, was the first geographical work in Germany that could lay claim to scientific value and completeness, and Büsching may well be ranked among the founders of modern geography. Among his works, his "Magazin für Historie und Geographic," and his "Beiträge zur Lebensgeschichte merkwürdiger Personen," deserve to be noticed.—His son, JOHANN GUSTAV GOTTLIEB, born 1783; died 1829. He published an astonishing number of valuable works relating to the history and antiquities of Germany.—K. E.

BUSEL, AUGUSTUS LUDOVIC, astronomer, was born at Dantzig in 1804. His family, from being in affluent circumstances, were reduced to poverty by the bombardment of that city by the French in 1813. In 1831 he became assistant to Bessel at Eichendorff, and his labours in that capacity are known to all readers of the "Königsberg Observations," and the "Astronomische Nachrichten." In 1833 Busel undertook the reduction of Bradley's Observations with the zenith sector, and the results were published in 1838. In 1849 he was appointed to succeed Bessel in the directorship of the observatory of Königsberg. He died in 1855.—E. W.

\* BUSH, GEORGE, an American theologian, was born at Norwich, Vermont, in 1796, graduated at Dartmouth college, and studied for the ministry at Princeton. In 1824 he went as a missionary to the west, and became pastor of a presbyterian church at Indianapolis. In 1829 he returned, and two years afterwards was appointed professor of Hebrew and oriental literature in the university of the city of New York. His career as an author began with the publication of a "Life of Mohammed" in Harper's Family Library in 1832. A "Treatise on the Millennium" appeared the same year, and this was followed by a volume of "Scripture Illustrations," compiled from the works of oriental tourists, archæologists, and commentators. He has also published a Hebrew grammar, and a series of notes on the books of the Old Testament, now extending to seven volumes, which have been very popular, and have had a wide circulation. Of late years the writings of Dr. Bush have been devoted to an exposition and defence of the doctrines of Emanuel Swedenborg, to which he has become a decided and zealous convert.—F. B.

BUSH, PAUL, first bishop of Bristol, was raised to that see in 1542 by Henry VIII., to whom had been reported "his great knowledge in divinity and physic." Died in 1558.

BUSHE, CHARLES KENDAL, the Right Hon., born in 1767; died in 1843. He was the eldest son of the Rev. Thomas Bushe, who, at the time of his son's birth, resided at Kilmurry in the county of Kilkenny. In 1782 he entered Trinity college, Dublin, was distinguished for classical scholarship, and exhibited great talents for public speaking, in a society founded by the students. Grattan, in reference to his early speeches in the Historical Society—such was the title of the society—says—"He spoke with the lips of an angel." Bushe was called to the Irish bar. His success is said not to have been rapid, and his biographers speak of his having found it difficult to maintain his proper position in society, from inadequacy of pecuniary means. On coming of age he paid or secured the payment of some heavy debts of his father. He married early; and the struggle for support is said to have been a difficult one. The Irish parliament may be described as almost in the agonies of dissolution when Bushe, a barrister of some five or six years' standing, became a member. He does not appear to have spoken often, but his speeches are among the best we have of that assembly. In 1805 he was appointed solicitor-general, with Plunket as attorney; during the administration of "the talents" both retained their

places. At the breaking up of that ministry Plunket retired, and Bushe, Saurin being now attorney-general, retained his place as solicitor, till in 1822 he became chief-justice of the king's bench. To law students, we know no books of the same value as the series of reports of judgments of the court of king's bench in Ireland, during the period in which Bushe presided. Our recollection of many of Bushe's charges satisfies us that good service would be done to the country by collecting them for publication. Of Bushe's speeches, while he yet practised at the bar, or acted for the crown as solicitor-general, several are also reported. The case of the King against O'Grady, as reported by Baron Greene, it is impossible to read without great admiration of the powers displayed in its conduct at each side by the master minds of the Irish bar. Equal to the highest of them—though Plunket was one—or, if inferior to any, inferior to Burton alone, whose argument appears to be unsurpassed by anything we have in legal literature, was Bushe on this great occasion. Injustice is done to Bushe by thinking of him as a mere lawyer. It is probable, that eminent as was his success, he regretted the necessity for the professional exertions which made him eminent. In retiring from the bench—which he did "while his eyes were not yet dim, nor his natural vigour abated," though at the age of seventy-four or seventy-five—he probably contemplated passing a long sabbath of comparative rest; and had plans of living as a country gentleman, as a neighbour and friend, on his paternal estate of Kilmurry. The friends of Bushe began to feel some alarm for his health from some excitement connected with the circumstances of his retirement from the bench, and from their perceiving an increasing failure of memory. He and they were spared any lengthened suffering. A surgical operation for a slight local affection was followed by erysipelas. He died 10th July, 1843. He is interred at Harold's Cross, near Dublin. In the reprint of Mr. Curran's Sketches of the Irish Bar is an appendix, which gives an account of some interesting conversations with Bushe in 1826, during a visit to Kilmurry; which conversations, and Dr. Wills' narrative, in his Lives of Illustrious Irishmen, give the best picture of Bushe in domestic life.—J. A., D.

BUSSY D'ANTOINE, LOUIS DE CLERMONT DE, a profligate favourite of the duc d'Anjou, brother of Henry III. of France, who lived about the middle of the sixteenth century. He was as notorious for his crimes as he was celebrated for his courage. He was assassinated in 1579. "The whole province," says De Thou, "was delighted at his death."—J. T.

BUSSY-RABUTIN, ROGER, comte de, born in 1618; died in 1693. Early introduced into military life, he was at eighteen a colonel. He had the character of being a brave officer; but in some idle fit of high spirits, he gave offence to his superior officers, and had to quit the army. He found his way to the court, there wrote epigrams offensive to the king or the royal mistress, and had to retire. His "Histoire Amoureuse des Gaules" is often reprinted, and is more amusing than if it were altogether true.—J. A., D.

BUTE, JOHN STUART, third earl of, was born in 1713, and died on 19th March, 1792. He studied at Eton. He entered upon public life about 1737, when he was elected one of the representative peers of Scotland. Subsequently he was made a knight of the thistle, and one of the lords of the bedchamber to the prince of Wales. He had charge in part of the education of George III., and on his accession in 1760, Lord Bute was sworn a member of the privy council, and made groom of the stole. In 1761 he became one of the secretaries of state, and in 1762 he was made knight of the garter. Lord Bute occupied for some time a very important place in the government, and was very unpopular. His want of popularity and support led him to resign office in 1763. He was fond of science, and devoted himself to botany. He printed at his own expense an illustrated work of British plants in nine volumes quarto. Only twelve copies were printed, and the expense is stated to have been £10,000. He was a patron of science as well as of literature and art.—J. H. B.

BUTTNER, CHRISTIAN WILHELM, an eminent philologist, was born at Wolfenbüttel in 1716. He travelled much, and in every country that he visited, he acquired, not only its general language, but the most minute peculiarities of its provincial dialects. His library and museum were extensive and valuable, though formed from the savings of his slender income; contenting himself, during the greater part of his life, with a single meal a

day, at a cost which never exceeded a silbergroschen, about three halfpence. His services as a scientific philologist, were of great value. He was the first to observe and cultivate the true relations of the monosyllabic languages of Southern Asia, and to place them at the head of his scheme of the Asiatic and European languages. He may be looked upon also as the founder of the theory of the geographical distribution of languages, and the science of glossography. He was the first to systematize and trace the origin and affiliations of the various alphabetical characters, and his researches in the history of the palæography of the Semitic languages may be said to have exhausted the subject. He died at Jena on the 8th October, 1801.—J. F. W.

BUTLER, ALBAN, second son of Simon Butler, Esq. of Appletree, county of Northampton, was born about the year 1710, and educated at the English college, Douay, where he became professor of philosophy. His first publication was a series of letters on "The History of the Popes." Having been ordained a priest, he travelled through France and Italy with the earl of Shrewsbury, and was appointed to the pastoral charge of a mission in Staffordshire, and subsequently became chaplain to the duke of Norfolk. He went abroad as tutor to the duke's nephew and heir-presumptive, and whilst resident in that capacity at Paris he completed his "Lives of the Fathers, Martyrs, and other Saints," arranged for every day throughout the year. This work is still of standard authority among the Roman catholic communion, and earned the praise of Bishop Lowth, and even of Gibbon. He afterwards became president of the English college at St. Omer's, and vicar-general to the bishops of Arras, Ypres, St. Omer's, and Boulogne. He died at his college May 15th, 1773, aged sixty-three.—E. W.

BUTLER, CHARLES, an eminent scholar, grammarian, and writer on music, was born at Wycomb in Buckinghamshire in 1559. He entered a student of Magdalen hall, Oxford, in 1579, and shortly afterwards took the degree of M.A. Upon leaving the university he became master of the free school at Basingstoke, Hants, and subsequently vicar of Wootton St. Lawrence, in the same county—"A poor preferment, God wot," says honest Anthony Wood, "for such a worthy scholar." In his retirement, Butler devoted his leisure to study, and was the author of the following works—"Rhetoricæ Libri duo, quorum prior de Tropis et Figuris, posterior de Voce et Gestu præcipit," &c., Oxford, 1600, 16mo; "The Feminine Monarchy; or a Treatise of Bees," Oxford, 1609, 8vo; "De Propinquitate Matrimonium impediende regula generalis," Oxford, 1625, 4to; "Oratoricæ Libri duo," Oxford, 1633, 4to; "English Grammar," Oxford, 1634, 4to; and "The Principles of Musick," London, 1636, 4to. He died in 1647, and was buried in the chancel of the church of which he had been vicar forty-eight years. Butler was evidently a man of great learning and ingenuity; but his English works are disfigured by a peculiar orthography, partly of his own invention, and partly borrowed from the Saxon alphabet. Nevertheless, his "English Grammar" is a work of considerable merit, and has been highly praised by Dr. Johnson. "The Principles of Musick" is a useful and judicious supplement to Morley's Introduction.—E. F. R.

BUTLER, CHARLES, a distinguished property lawyer and jurist, and polemical writer, was born in London in 1750, and died in 1832. He belonged to a Roman catholic family, and was educated at the English college at Douay. He was the first Roman catholic called to the bar subsequent to the period of the Revolution. This was in 1791, under the act 31 Geo. iii. cap. 32, dispensing with papists taking the oath of supremacy. After the passing of the relief act in 1832, he was made king's counsel during Lord Brougham's chancellorship. His principal law works are—the completion of an edition of Coke on Littleton, of which about one-half had been done by Hargrave, and an edition of *Fearne on Contingent Remainders*. In general jurisprudence he published "*Horæ juridicæ subsecivæ*," and "Short Biographical Notices of Chancellors d'Aguesseau and l'Hopital." His "*Horæ Biblicæ*," is a work of much merit. His general works were collected in five volumes in 1827.—S. H. G.

BUTLER, JAMES, one of the Irish family of Ormonde, who, with his brother, emigrated to Germany in the commencement of the seventeenth century, and entered into the imperial service, where they soon obtained the command of regiments, and served under John de Tscerclai, the Count Tilly, and Wallenstein, in most of the battles of the Thirty Years' war. James Butler was a brave soldier, in the main an honourable man, and faithful

to his adopted sovereign, even to an unscrupulous extent. Of this latter quality he gave a memorable proof, in accomplishing the death of the great Wallenstein at the wish of the emperor. Without communicating with his brother Walter, he, in concert with some Scottish officers in the emperor's service, arranged the plot, and finally determined to slay the great general, after disposing of his followers at a banquet to which they were invited. The friends, having got rid of Captain Devereux, with a body of soldiers rushed to the apartment of Wallenstein, Butler remaining below. The incidents of the tragedy will be found elsewhere, in their proper place. (See WALLENSTEIN.) After the assassination, James hastened to Vienna, where the emperor, Ferdinand II., fastened round his neck a magnificent chain, giving him, at the same time, his blessing and a gold medal, saying—"Wear this, Colonel Butler, in memory of an emperor you have saved from ruin." He was also created a count of the holy Roman empire, and given the golden key of the bedchamber, as well as large estates in Bohemia. He died the following year, 1634, at Wirtemberg, leaving a large bequest to found a college of Irish Franciscans in Prague, which still continues. The family still exists in Bohemia.—J. F. W.

BUTLER, COLONEL JOHN, was an emigrant from Connecticut, New England, who settled on land grants of that colony, within the Pennsylvania limit, however, and of which the vale of Wyoming was a part. With no better claim to any record, the massacre of Wyoming has made his name infamous for ever. In July, 1778, with a force 1600 in number, he made a descent upon this beautiful valley, whose four slenderly garrisoned forts, Lackawana, Exeter, Kingston, and Wilkesbarre, could offer but a temporary resistance. Successively they fell before the assault, and for those not happy enough to escape, there was no hope of quarter at the hands of this savage butcher. The genius of Campbell, in whose verse this paradise is made to bloom anew, has gracefully veiled the horrors of that time. For a long period the reproach rested upon the head of the Indian, Brant; how wrongfully, has since been made clear. The poet, who in his first edition of *Gertrude* fell into the common error, has in later ones been generously earnest to remedy that injustice.—J. P. D.

BUTLER, JOSEPH, one of the most distinguished of British moralists and theologians, was born at Wantage in Berkshire, on the 18th May, 1692. His father, Thomas Butler, had spent most part of his life as a respectable shopkeeper in this place, and was a presbyterian dissenter. Before the birth of Joseph, who was the youngest of eight sons, he had retired from business, and resided in the neighbourhood. Butler was destined for the ministry among the body of dissenters to which his father belonged, and after receiving the rudiments of his education in the grammar school of his native place, he was transferred to a dissenting academy, first kept at Gloucester, and then at Tewksbury, by a Mr. Jones. It was while a student at Tewksbury that Butler engaged in his remarkable correspondence with Dr. Samuel Clarke. The latter had just published his *Demonstration of the Being and Attributes of God*. This was the very kind of work to stimulate and interest an aspiring theologian like Butler. He had long made it his business, he says, to find such an argument, but without success. He hailed Clarke's attempt, accordingly, but not feeling satisfied with several points in it, he was led to address him on the subject.

Butler's studies at Tewksbury had the effect of unsettling his presbyterian principles. His father became alarmed, and called in the advice and assistance of several clergymen. This, however, it may be imagined, was not a likely means of influencing the young inquirer. He remained firm in his intention to conform to the church of England, and at length, with his father's consent, entered as a commoner of Oriel college, Oxford, in March, 1714. At Oxford, Butler formed the friendship of Mr. Edward Talbot, the second son of the bishop of Durham, a friendship to which he was more indebted for his advancement in the church than to any other cause. Little seems to be known of his career at the university. By the year 1717 he must have taken orders, as he is found about this time occasionally supplying the place of his friend Talbot at Hendred, the name of a living held by the latter near Butler's native town. In the following year, 1718, he was appointed preacher at the Rolls, an appointment which he owed to the mutual kind offices of his college friend, and his old correspondent, Dr. Clarke, then rector of St. James'. About this time Butler lost his friend Mr. Talbot. On his deathbed, however, he had commended both Butler and Secker

to his father's patronage; and the result of this recommendation soon appeared on the appointment of the former to the living of Houghton, near Darlington, and of Secker to that of Houghton-le-Spring. This was three years after Butler's nomination as preacher at the Rolls; and henceforth for some time he divided his residence between the Rolls and his parochial benefice. Four years later he received, through the representation, it is said, of Secker, the living of Stanhope, one of the richest and the best in England, and hereupon, soon afterwards, he resigned his preachingship at the Rolls, and went to reside in the country. Shortly before this he published his celebrated fifteen sermons. The first three of these sermons especially, contain those ethical views with which his name has been so prominently associated; and there are few facts more remarkable than the powerful influence exerted by these brief and unsystematic compositions on the course of ethical inquiry in this country. They appear, with the others, to have been preached in the regular course of his ministry at the Rolls. They are written obviously on a preconceived and definite plan of thought, but without any great elaboration, or strict consecutiveness of reasoning. They are really sermons, in short, and not treatises, and this is always to be borne in mind in judging them as a whole, and in relation to a connected theory of morals. It is plain, moreover, that they were meant to have a polemical bearing, although, as is Butler's habit, this bearing is very indirectly expressed. It is in the notes, and not in the text that it appears. The allusions in the former to the views of Hobbes, show that Butler had these views before him, and that he aimed to meet them from a higher and more comprehensive study of human nature. Whatever may be the absolute value of the theory of morals implied in Butler's sermons, there are few who will be disposed to deny their success as directed against the selfish system of Hobbes. Taking his stand on the facts of human nature, he clearly proves that these facts are at variance with such a system. It neither exhausts them, nor so far rightly interprets them. Self-love is indeed a true element of human nature; but so also is benevolence. There is a principle in man which just as directly seeks the good of his fellow-creatures, as there is a principle in him which seeks his own good. To endeavour to resolve the former principle into any phase of the latter—the love of power for example—as Hobbes had done, does not in the least embrace or explain the facts of the case. But further, there is a definitely moral principle in man. This he finds and establishes by the same process of induction, and it is in the assertion of this principle of *conscience*, that his chief distinction as a moralist has been supposed to consist. It is here also, however, in the constructive part of his theory, that he has most exposed himself to criticism and objection. The reality of conscience, as an element of human nature, he has strongly seized, and set on a firm and immovable basis. He claims primarily, and above all, for human nature, a moral character. *Law* and *duty* are its highest expressions—and this by no means merely in the spirit of the ancient stoicism which denied any force to the lower and more obviously natural principles. Nature and spirit, duty and self, are not opposed with him. Each element is recognized in his broad survey, and he finds the complete idea of *human nature* only in the harmonious adjustment and right relation of the several elements. Beyond the breadth and thoroughness of his analysis, however, Butler cannot be said to have given us any adequate view of moral science. Various defects appear as soon as we begin to exalt his hints into a philosophy, and inquire more particularly what is the nature of conscience—what is its exact relation to self-love—distinct, and in some senses opposed to it, and which it yet, in its highest sense, embraces? What is, further, the relation of conscience to reason and education, and what the source of that peculiar attribute of power, that he has so strongly claimed for it? Is it in any sense autonomous, as Kant has maintained, and as everything that Butler has said on the subject might leave it to be inferred? And if not, what is its character in regard to a higher will and eternal law of duty? It cannot be said that Butler has met any of these questions. To him remains the credit, however, of having vindicated on a clear basis of fact, and in a powerfully original and effective manner, an interpretation of human nature which, in its comprehensiveness, destroys every system of mere selfishness. Shaftesbury somewhat before him, and Hutcheson contemporary with him, put forth the claims of the moral sense as opposed to the perversions of Hobbism, and the caricaturists of Locke;

but neither of them did so with such a width and penetration of view, or with such a simplicity and depth of ethical insight as Butler.

Butler continued in the quiet retirement of Stanhope for seven years, during which he conceived, and probably composed, the chief part of his great work, "The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature." He was drawn from his retirement in 1733, being nominated by Lord Chancellor Talbot his chaplain in that year, and then, in 1736, a prebendary of Rochester. In the same year he received the distinction of being appointed clerk of the bedchamber to Queen Caroline, in which capacity his duties were to attend her majesty every evening from seven to nine o'clock.

The "Analogy" appeared in 1736. It is conjectured that the substance had formed part of the series of sermons delivered by Butler while preacher at the Rolls—a conjecture supported by Butler's own statement, that the selection of the fifteen sermons was very much determined by accidental circumstances. The conjecture is not improbable; and the idea of the "Analogy" may therefore have been present to the mind of Butler when he retired to Stanhope. It was undoubtedly worked out in thought, if not actually completed, during his rural retirement. In fairly judging the "Analogy," it is of great importance to keep in view the circumstances in which it appeared, and the state of mind in regard to christianity which it was intended to meet. It has been greatly misjudged from inattention to these facts, not less by men who have greatly admired it, than by those who have severely censured it. Butler evidently never designed his work to be an absolute and adequate proof of the truth of christianity. He designed it expressly to remove difficulties—to show, in his own language, in which we may, as in many other places, discover a deep irony, that it is "not so clear a case as many suppose, that there is nothing in christianity." The deistical spirit had been busy in England for more than half a century. Without descending into the vulgar arena of controversy which was crowded on all sides of him by pamphlets and brochures which have perished, save in the pages of Leland, it was undoubtedly the intention of Butler to take part in the great struggle going on around him. His habits of mind did not fit him for any sharp-shooting. He does not, therefore, enter into direct conflict with any of the deistical productions which had recently appeared; although, as Mr. Fitzgerald has remarked, the influence of Tindal's *Christianity as Old as the Creation*, which was first published in 1730, may be distinctly traced in many passages of the "Analogy." But, advancing from the deistical position, he aims to find a general train of argument which should carry unprejudiced and discerning minds along with him. Much had been said of nature, and the comparative excellence of its course of action and government. There was no dispute as to its divine authorship, and this, accordingly, Butler makes the starting-point and fruitful principle of his whole argument. Admitting the course and constitution of nature to be divine, he maintains that all the characteristic facts and principles of religion, natural and revealed, are in strict analogy therewith. There is a parallelism throughout—a correspondence of plan and issue, of type and result; and if the lower be divine, the higher must, therefore, be no less so. Being of the same make, they must have the same author. We do not mean to say that this positive aspect of Butler's argument is very strongly turned upon us by himself. He undoubtedly sets forth more obviously and distinctly its polemical and refutatory aspect, showing that whatever is difficult and apparently objectionable in christianity, has its counterpart in nature; and at particular length pointing out (part i. chap. vii., and part ii. chap. iv.) the grounds on which all our conclusions as to the divine government must be held to be necessarily imperfect in the one case as in the other. But while his more direct object is thus negative, and according to the statement with which he starts; the higher positive and constructive meaning is everywhere implied, and plainly gives a higher value and force to the argument, especially in the face of much of the criticism that has been directed against it.

After the death of Queen Caroline in 1737, Butler's merits, which she had strongly commended to her husband on her death-bed, were not forgotten. He was appointed to the see of Bristol in the year following; and in 1740 to the valuable deanery of St. Paul's, on which occasion he resigned his rectory. The means supplied him by his deanery enabled him to carry out at Bristol a favourite fancy which he had for building and

decoration. He is said to have expended upwards of £4000 on the episcopal palace, and the adornment of his chapel greatly interested him. He was transferred to the bishopric of Durham in 1750. Shortly afterwards his health began to decline. He sought restoratives from the waters at Bath, attended by his faithful chaplain and friend, Dr. Forster, whose letters to Secker, now archbishop, give a minute and painful account of his illness. All efforts failed to rally him. He died on the morning of June 16, 1752, and was buried in the cathedral of Bristol.

All that we know of Butler gives us the impression of a character pure and elevated, candid and unostentatious; simple, yet with a touch of reserve; practical and active, yet with a tinge of melancholy. His works are comprised in two volumes, published at the Oxford University Press, 1850. There are besides numerous editions of his "Sermons" and "Analogy;" the best of the latter being that of Dr. Fitzgerald, bishop of Cork (Dublin, 1849), to whose interesting memoir we have been much indebted in the above sketch.—T.

BUTLER, SAMUEL, born at Vigorn in the parish of Strensham, Worcestershire; died in London in 1680. The accounts of Butler's early life are conflicting. He is represented as educated at the grammar school of Worcester, and from that sent to Cambridge, which, according to one narrative, he had almost immediately to leave from want of money, and where, according to another, he remained for seven years. Another account sends him to Oxford, but no particular college of either university is specified, nor is any document, public or private, referred to by his biographers. We lean to think the university education an ornamental fiction. He is first met in anything that looks like authentic narrative, as clerk to a justice of the peace in his native county. His occupations left him leisure for music and painting, of both of which he was fond. He was afterwards employed as clerk by Selden, at that time steward to the countess of Kent. He next passes into the service of Sir Samuel Luke, one of Cromwell's officers, and his study of his master's character led to the creation of "Hudibras." Sir Samuel Luke's name is made jingle into an odd rhyme, but there can be no doubt that a hundred whimsical peculiarities of different individuals, and as many as the poet's imagination could conjure up, either from reading or reflection, united to build up the personality of the immortal hero. The Sir Hudibras or Huddibras of the Faery Queen gave him his name.

Butler is said to have studied the common law, but he never practised it. The earl of Carbury, president of the principality of Wales, on the king's return made him his secretary, and gave him the stewardship of Ludlow castle. Butler married: his wife was supposed to have some property, but her money was lent on bad securities. In 1663 the first part of "Hudibras" was published, and in the next year the second. The poem was admired and quoted by the king, and was the great armoury from which the royal party were supplied with abundant and irresistible weapons of ridicule against puritan and presbyterian, but the author was wholly neglected. In 1678—Butler was now sixty-six—he published the third part, and within two years he died. Sixty years after his death the monument in Westminster abbey was put up by John Barber, lord mayor of London. "Hudibras"—inimitable, as the fact that there has been no successful imitation has shown it to be—called up a host of imitators. There was the Dutch Hudibras, the Scotch Hudibras, the Irish Hudibras, there was Butler's Ghost, and the Occasional Hypocrite. The author of a spurious second part of "Hudibras" was punished severely by Butler, when the genuine second part appeared, in which he figures as Whackum. Butler's distress appears to have been overstated. The language on Barber's monument to him, and Samuel Wesley's epigram—

"He asked for bread, and he received a stone,"

have led to the belief that he was in a state of entire destitution, which does not appear to have ever been the case. The story of "Hudibras" is unfinished, and through what further scenes he was to have been carried it would be hazardous to conjecture. There seems, however, strong reason to believe, as Mr. Gillfillan has suggested in his Life of Butler, that the satirist was preparing for an attack on the dissolute court of Charles II. If the poem called "Hudibras at Court," printed in "the Remains," be Butler's, there can be little doubt that such was his purpose. We are inclined to believe that "Hudibras at Court" was Butler's, though not acknowledged as such by Thyer

or later editors. The king's admiration of Butler made him disliked and envied by the persons about the court. His was the misfortune which Spenser before him had endured in the court of Elizabeth—"To have thy prince's grace, but want his peers'." He suffered injuries and injustice, and, at the close of his career, seems not to have been indisposed to retaliate. Butler—we quote Aubray—"was of a middle stature, strong-set, high-coloured, with a head of sorrel hair, a good fellow, and latterly much troubled with the gout."—J. A., D.

BUTLER, SAMUEL, bishop of Litchfield, born at Kenilworth in Warwickshire in 1774, was educated at Rugby school, and at St. John's college, Cambridge. His career at the university was in the highest degree successful. In 1797 he was elected fellow of St. John's college, and the following year he accepted the mastership of the Royal Free Grammar school at Shrewsbury. About the same time he was selected by the syndics of the university press to prepare a new edition of Æschylus, with the text and notes of Stanley. This task he accomplished in 4 vols. 4to, 1809–1816. In 1802 he was presented to the vicarage of his native town; in 1822 created archdeacon of Derby, and in 1836, on the recommendation of Viscount Melbourne, raised to the episcopal bench. During the last four years of his life, according to one of his biographers, he knew no day of health, scarcely an hour free from suffering. He died in 1839. Besides his edition of Æschylus, above noticed, Dr. Butler published "M. Masuri Carmen in Platonem;" "Is. Casauboni in Josephum Scaligerum Ode; accedunt Poemata et Exercitationes utriusque Linguae," 8vo, 1797; "A Praxis on the Latin Prepositions," and a few sermons. He was much beloved for the benevolence and sincerity of his character, and admired for his multifarious learning and brilliant talents.—J. S., G.

BUTLER, WALTER, younger brother of James Butler, as already stated, entered the imperial service. In 1631, his battalion of Irish musketeers formed part of the garrison which defended Frankfort-on-the-Oder against Gustavus, and to him was assigned the post of greatest danger. So sturdy was the resistance of Butler and his Irish musketeers, that Gustavus drew off his forces from the point they defended, and carried the town through another quarter. Butler at length fell wounded, and with the remnant of his gallant Irish surrendered; the other generals having fled and reported that the town was betrayed by Butler to Gustavus. At a banquet that evening, Gustavus said—"Cavaliers, I will not eat a morsel until I have seen this brave Irishman of whom we hear so much; and yet I have that to say to him which he may not be pleased to hear." Butler thereupon was brought into his presence on a litter. "Sir," said the king with stern anger, "art thou the elder or the younger Butler?" "May it please your majesty, I am but the younger." "God be praised," said Gustavus; "thou art a brave fellow. Hadst thou been the elder I meant to run my sword through thy body." As soon as Butler was able to travel, Gustavus set him at liberty. Returning to the army he took possession of Prague, and rose high in the favour of Wallenstein. Of the conspiracy formed by his brother James, Walter was kept in complete ignorance, and the news of it filled him with horror and dismay. He was at the siege of Nordlingen in 1634, where his valour and example decided the victory in favour of the imperialists. He died shortly afterwards.—J. F. W.

BUTLER, WEEDEN, an English divine, well known from his connection with the celebrated Dr. Dodd, whom he assisted in preparing for the press his Commentary on the Holy Bible, and in editing the *Christian Magazine*; born in 1742 at Margate; died in 1823. He succeeded Dodd as preacher at Charlotte chapel, Pimlico, and afterwards kept a classical school at Chelsea. Dodd mentions him with respect in his Thoughts in Prison.

BUTLER, REV. WILLIAM ARCHER, professor of moral philosophy in the university of Dublin, was born at Annerville, near Clonmel, in Ireland, in the year 1814, or perhaps a year or two earlier. At the age of nine he was sent to the endowed school at Clonmel, whose able master, the Rev. Dr. Bell, sent many eminent scholars into the world. Here Butler gave his mind full scope. He perused the classics with the ardour of a poet. Oratory too attracted him, and he soon distinguished himself as a speaker. He read discursively as well as deeply, and while every branch of the belles-lettres captivated him, the profounder subjects of philosophy and metaphysics engaged his serious attention. Butler's mother was a Roman catholic, and in that religion he was brought up most strictly. About his

sixteenth year, however, he examined the controversy for himself, and the result was that he became a protestant. Two years after this Butler entered Trinity college, Dublin. In 1832 he obtained a scholarship. While still in his undergraduate course he contributed largely to the periodical literature of the day. The *Dublin University Magazine* was just then launched, and round it the genius and the learning of the young Irish spirits clustered with loving industry. Among the ablest was Butler. His poetical contributions attracted notice, and helped to give that periodical the high reputation for poetry which it has ever since retained. His refined taste in criticism and his elegance of diction made him an able and popular reviewer, and some of his essays on history and philosophy still rank high in the estimation of scholars. In November, 1835, Butler obtained the first ethical moderatorship at his degree examination—a prize then for the first time instituted. Just at the time his scholarship determined, Dr. Lloyd, the provost of Trinity college, estimating the extraordinary abilities of Butler, succeeded in founding a professorship of moral philosophy, and he who was the first to gain an ethical moderatorship in the college, was also the first to fill the professor's chair. The young professor was now upon a field worthy his endowments. His lectures were as remarkable for their eloquence, as for their profound philosophy. The living of Clondehorka in the county of Donegal was presented to him with the chair of moral philosophy. This preferment he held till 1842, discharging with zeal and faithfulness the duties of a parish priest, in a wild and poor district. In the last-mentioned year he was re-elected to the professorship, and promoted to the rectory of Raymoghly in the diocese of Raphoe, where he spent a large portion of the rest of his life in unwearied parochial ministrations, and in literary, religious, and philosophic study. During the year 1845 the Roman catholic controversy deeply engaged his attention, the result of which was his "Letters on Mr. Newman's Theory of Development," which were pronounced by the most eminent divines to be "models and masterpieces of polemical composition." In 1848 he was employed on a work on Faith, and in collecting materials for it, he was engaged during the short period of his life that remained. On Trinity Sunday, 1848, he preached with his usual power the ordination sermon for the bishop of Derry at Dunboe. On his return home the following Friday, he was seized with fever, induced by a chill after being heated with walking. The progress of the malady was rapid and fatal, and he died on the 5th of July, ere he had reached the age of thirty-six.

As a poet he was tender, imaginative, refined, and classical, and won the commendation of so severe a judge as Professor Wilson. As a preacher his eloquence was of the highest order—passionate without rant, affluent in all the grace of figure and illustration, yet comprehensible to the most ordinary intelligence. As an ethical philosopher, he attained to a deservedly high repute, considering the few years he was permitted to devote to so arduous a study; and the lectures which he delivered and the essays which he has left are characterized as well by the soundness of their views and brilliancy of their rhetoric, as by the elegance and classicality of a style which is nevertheless eminently practical and often thoroughly simple.—J. F. W.

BUTRET, CHARLES, baron de, a French horticulturist, died at Strasburg in 1805. He belonged to a noble family, and devoted himself in a great measure to agricultural pursuits. In 1794 he published a work entitled "Taille raisonnée des arbres fruitiers." He established at Strasburg a large horticultural garden, which he intended as a model school for the culture of forest trees. The French revolution interrupted his labours, and compelled him to emigrate. He found an asylum in the court of the elector palatine, who intrusted to him the direction of his gardens.—J. H. B.

BUTTMANN, PHILIP KARL, a distinguished German philologist, was born at Frankfort-on-the-Maine, December 7, 1764, and died at Berlin, June 21, 1829. He devoted himself to the study of ancient languages at the university of Göttingen, and in 1796 obtained an appointment as secretary, and afterwards sub-librarian at the royal library at Berlin. At the same time he discharged the duties of professor of the Greek language in the Joachimsthal'sche Gymnasium in 1808; and edited the *Haude und Spener'sche Zeitung* from 1803–11. Among his works, the "Griechische Grammatik;" the "Ausführliche Griechische Sprachlehre;" and the "Lexilogus oder Beiträge zur Griechischen Worterklärung," &c., take the highest rank, and for

exactness and nicety of observation and treatment will always be held in high esteem. No less praise is due to his editions of Plato's *Dialogi Quatuor*, of Demosthenes' *Midiana*, and Aratus' *Phænomena et Diosemia*. His contributions to Wolf's *Museum der Alterthumswissenschaft*, and other learned periodicals, were collected under the title "Mythologus."—K. E.

BUTTNER, DAVID SIGISMUND AUGUST, a German botanist, was born in 1724, and died in 1768. He succeeded Haller in the chair of botany at Göttingen. His name is kept up in the genus *Buttneria* or *Byttneria*. He devoted his attention specially to the classification of plants and the arrangements of the natural orders. In 1750 he published at Amsterdam a methodical enumeration of plants.—J. H. B.

BUTTON, THOMAS, an English navigator of skill and experience, acquired considerable reputation in the service of Prince Henry, the eldest son of King James I. Scarcely anything, however, appears to be known of him beyond his connection with the search after a north-west passage from the Atlantic to the Pacific ocean, and the conduct of a voyage which he undertook for its discovery. This voyage was made a year after that of the unfortunate Henry Hudson. The merchant adventurers of London fitted out two ships, the *Resolution* and the *Adventure*, for the further prosecution of discovery in this quarter, and placed them under Captain Button's command. They sailed in May, 1612, steering their course through Hudson Strait, and thence to the westward. Button was the first navigator who crossed the entire extent of Hudson Bay from east to west. He reached the mainland on the west side of the bay, in latitude 60° 40', at a spot to which he gave the name of Hopes Checked; and proceeding thence to the southward, discovered the mouth of Nelson river, (upon which the chief station of the Hudson Bay Company was afterwards formed), where he wintered. Upon leaving their winter quarters, the ships proceeded as far to the northward as lat. 65°, along the west side of Southampton island, when, seeing no opening which afforded the means of a passage to the west, though with undiminished confidence in the existence of such a passage on Button's own part, they repassed Hudson Strait, and returned to England in the autumn of 1613. Button was knighted on his return.—W. H.

BUTTURA, ANTONIO, was born at Malcesina, on the lake of Garda, in 1771. He studied at Verona, where he made himself favourably known by the publication of a collection of sonnets and odes. In the stormy times of the Revolution he was one of its most enthusiastic advocates, and declaring himself strongly for French rule in Italy, attracted the attention of Napoleon, who appointed him secretary to the congress of Venice. Having been appointed first secretary to the minister of foreign affairs, he left Italy for Paris, where he remained till his death in 1832. He published very accurate and elegant editions of many of the best Italian writers, particularly poets; translations from the French of Boileau and Racine; an "Essay on the History of Venice;" and an "Italian and French Dictionary."—A. C. M.

BUTURLIN, DEMETRIUS, a celebrated Russian writer on military science and history, born at St. Petersburg in 1790. He served in the campaigns of 1812–14, and in 1819 he rose to the rank of major-general. The greater number of the military writings of Buturlin are in French; those most widely known are "The History of the Italian Campaign of 1799;" a "Sketch of the German Campaign of 1813;" and a "History of Napoleon's Russian Campaign." He died, October 21, 1850.—M. Q.

BUXBAUM, JOHANN CHRISTIAN, a German botanist, was born at Merseburg in 1694, and died in 1730. In 1724 he went to St. Petersburg, and became a professor in the university. He made botanical tours in various parts of Russia, visiting also Siberia and Astracan. In 1726 he went to Turkey, and examined the flora of that country. He died at the early age of thirty-six. A genus of mosses has been called *Buxbaumia*, and a species of veronica is denominated *Buxbaumii*. He published an enumeration of the plants of Halle, also an account of the plants in the Byzantine provinces.—J. H. B.

BÜXHOWDEN, COUNT FREDERICK WILLIAM, born in 1752 of a noble Livonian family at Magnusdal in the island of Moon, near Oesel. He entered the Russian service as a cadet, and served in the campaign of 1769. He rose to a generalship in 1790; defeated the Swedish generals Hamilton and Majenfeld, and liberated the fortress of Friedricksham, at Wiborg, from its besiegers. Catherine II. gave him the estate of Magnusdal. As general-of-division, in 1794, he distinguished himself at the

battle of Prague. Suwaroff made him governor of Varsovia, where, by his moderation, he deserved and obtained the lasting gratitude of the Poles. He commanded the left wing at the battle of Austerlitz, and in 1806 was nominated general-in-chief of the army sent against Napoleon. After the battle of Pultusk, the chief command was intrusted to Bennigsen, but Buxhowden resumed it after the battle of Friedland. In 1808 Buxhowden at the head of 18,000 men completed in two days the conquest of Friedland, and brought the campaign to a close on the banks of the Tornea, then the Russian frontier in Lapponia. He died at the castle of Lohden in Esthonia in 1811.—M. Q.

**BUXTEHUDE, DIETRICH**, a musician, was born most likely in 1635; he died at Lubeck, May 9, 1707. His father, Johann, was organist to the church of St. Olaus at Elsinore in Denmark, where, we may suppose, Dietrich was born. Some writers affirm that his father was his only musical instructor, but Hawkins states him to have been a pupil of Johann Thiel. In 1669 he was appointed organist to St. Mary's church, Lubeck, in the fulfilment of which office he gained his great celebrity as a player and composer. A comparatively small number only of his voluminous compositions have been published: these consist of several sacred cantatas; an ode on the independence of Lubeck; another on the death of the composer's father; seven suites de pieces, depicting the characters of the seven planets; fugues for the organ, and lighter pieces for voices as well as for instruments. The critics of near his own time speak of Buxtehude as the greatest organist and writer for his instrument that had ever existed, and eulogize his power of improvising on a *canto fermo* as marvellous. An interesting testimony of his extraordinary ability is the fact, that Bach walked from Anstadt to Lubeck, about the year 1705, to hear him play, and prolonged his stay for three months, for the sake of repeatedly witnessing his performance.—G. A. M.

**BUXTON, JEDEDIAH**, famous for his powers of calculation, was born in 1704 or 1705, at Elinton, near Chesterfield. Though his grandfather had been vicar, and his father schoolmaster of the parish, his education had been so completely neglected, that he was unable even to write. His general intellectual capacity, indeed, was of a very low order, but he could resolve with the greatest promptitude the most difficult arithmetical questions. It is said that on one occasion he was asked to state how many cubical eighths of an inch there are in a body whose three sides are respectively 23,145,789 yards, 5,642,732 yards, and 54,965 yards, and that amid all the distractions of the labours of 100 men, he gave the exact answer in little more than five hours. He walked up to London in 1754, for the purpose of gratifying a strong desire which he had to see the king, but unfortunately missed him. During his stay in the metropolis, he was taken to the Royal Society, and answered most satisfactorily various questions proposed to him by some of the members. He went to see Garrick in Richard III.; but during the performance he occupied himself entirely in counting the number of words spoken by each of the actors. He appears to have been either a small landowner or agricultural labourer. His death is supposed to have occurred when he was about sixty-two years of age.—J. T.

**BUXTON, SIR THOMAS FOWELL**, Bart., the successor of Wilberforce as leader of the antislavery party in the house of commons, was born in 1786 at Castle Hedingham in Essex. His father was high sheriff of the county. He received his early education at the school of Dr. Charles Burney of Greenwich, and returned home to Essex when he was fourteen, without having attained to any great proficiency in learning. About this time he became acquainted with the family of Mr. John Gurney of Earham Hall, near Norwich, father of the future philanthropist, Mrs. Elizabeth Fry. In 1803 Mr. Buxton entered as an undergraduate in Trinity college, Dublin, where he studied with great perseverance for four years, and highly distinguished himself. In May, 1807, he was married to Miss Hannah Gurney of Earham, a union productive of much happiness. In 1811 he became partner in the brewing establishment of Messrs. Truman, Hanbury, & Co., in which his uncles were partners, and for the next seven years devoted himself almost entirely to the business. Mr. Buxton's career as a public man dates from 1816, when he addressed a large meeting convened at the Mansion-house to procure relief for the Spitalfields weavers, who were reduced to the utmost distress by the reaction in their trade consequent upon the termination of the French war. The subject of prison discipline was the next that engaged Mr. Buxton's attention; he inspected

Newgate and other jails in conjunction with Mrs. Fry, Mr. Peter Bedford, and others, and published, as the result of his labours, an "Inquiry into Prison Discipline," a valuable work, full of facts carefully and clearly arranged, with shrewd and ingenious practical inferences. In 1818 Mr. Buxton was returned as member of parliament for Weymouth, after a contested election. As he was diligent in his attendance on his parliamentary duties, and though no orator, was clear in his arrangement of facts, always regarding his subject from a moral and religious point of view, he became a very influential member. In 1822, at the earnest solicitation of Mr. Wilberforce, he joined the abolition party, and became one of their secret committee. In 1825 the declining health of Mr. Wilberforce obliged him to retire from parliament, and the leadership of the antislavery party devolved upon Mr. Buxton, whose systematic energy and fearless pertinacity well fitted him for the eight years' struggle that was needed to complete the work of emancipation. In 1827 Mr. Buxton's exertions and anxieties brought on an attack of apoplexy, from which he slowly recovered, to return to his work with deepened religious feelings of devotion to it. From this time until the final passage of the bill for the "total abolition of colonial slavery" in August, 1833, Mr. Buxton's exertions were unwearied, and he consented to the "apprenticeship" and "compensation" clauses, contrary to the feelings of many of his coadjutors, in order to avert an insurrection in the colonies from any further delay of the long looked-for hour of freedom. In 1837 Mr. Buxton lost his seat in parliament, where, without possessing very shining or very profound abilities, he had ably and honestly laboured for nearly twenty years. In 1838 he devoted himself to the preparation of a work on "The Slave Trade and its Remedy." He spent the last few years of his life improving his estates and assisting the poor in the vicinity of Northrepps Hall, Norfolk, where he died in 1845.—R. M., S.

**BUXTORF, JOHN**, born at Camen in Westphalia in 1564; died in 1629. He was son of a Calvinist minister. After studying some time at Marburg and Herborn, the fame of Beza brought him to hear his lectures at Bâle, where, after a course of travel, he became professor of Hebrew. He was offered professorial chairs at Leyden and at Taumen; but his value was felt by Bâle, and they increased his appointments for the purpose of retaining him. Several works on Hebrew and Chaldaic learning were published by Buxtorf in German and in Latin, and he left several in manuscript, some of which were edited by his son, who pursued the same class of studies, and held a Hebrew professorship in the same university where his father had so long taught. The patriarch of the tribe left seven children—five sons and two daughters.—J. A., D.

**BUXTORF, JOHN (JEAN JACQUES)**, grandson of the preceding, born at Bâle in 1645; died in 1704. He succeeded his father in the chair of Hebrew at Bâle, and was distinguished for his knowledge of oriental languages. He published translations of several rabbinical works, and he also compiled a collection of proverbs and sententious maxims of morality from Jewish writers of all ages, which is entitled "Florilegium Hebraicum." He died of asthma, without following the example of his fathers in leaving a son to inherit his throne.—J. A., D.

**BUXTORF, JOHN**. The date of birth is not stated; he died in 1732. He succeeded his uncle, the preceding, in the Hebrew professorship at Bâle. Among his scholarly accomplishments, John the fourth had acquired the character of a skilful artisan in the fabrication of Latin verses.—J. A., D.

**BYLOT or BYLETH, ROBERT**, an English seaman, bore an active share in the efforts made for the discovery of a north-west passage to the Indies in the early years of the seventeenth century. He was one of the companions of Hudson on that unfortunate navigator's fourth and disastrous voyage in 1610, and accompanied Sir Thomas Button in his expedition of 1612. (See **BUTTON**.) Bylot was again employed, under Captain Gibbons, in the renewed effort of discovery made in the same direction in 1614; and in each of the two following years he acted as master of the vessel in which Baffin, in the capacity of pilot, made his important discoveries. These voyages of 1615 and 1616, made by Bylot and Baffin, are described elsewhere.—W. H.

**BYNG, GEORGE**, Viscount Torrington, a distinguished British admiral, was born in 1663. At the age of fifteen he entered the navy as a volunteer. After serving with distinction in various subordinate situations, and taking part in the battles of Beachy-Head and La Hogue, he was in 1703 made rear-admiral

of the red. In 1704 he assisted at the reduction of Gibraltar. His gallantry in the battle of Malaga, which followed soon afterwards, won for him the honour of knighthood, and his services to the house of Hanover were rewarded in 1715 with the dignity of a baronet. In 1718 he was made admiral and commander-in-chief of the fleet, and totally defeated a Spanish fleet off Messina—a blow which completed the destruction of the naval power of Spain, and compelled the Spanish court to accept the terms presented by the quadruple alliance. In 1721 Sir George was created Baron Byng of Southill and Viscount Torrington, and one of the knight's companions of the Bath. On the accession of George II. in 1727, he was appointed first lord of the admiralty—an office which he held till his death, in the seventieth year of his age, January 17, 1733.—J. T.

BYNG, JOHN, a British admiral, fourth son of the preceding, was born in 1704. At an early age he entered the navy, and passed rapidly through the various subordinate grades till in 1756 he was, unfortunately for himself, appointed to command the fleet sent to relieve Minorca, at that time threatened by the French. The British government had received ample notice of the preparations made by the French king, but utterly neglected the warning; and at length hastily despatched ten ships, so badly equipped that they had to put in at Gibraltar to obtain a supply of provisions and to refit. There Byng learned that the French had already landed 19,000 men in Minorca, supported by a powerful fleet, and that the whole island, except Fort St. Philip, was in their hands. A council of war was held, at which the major of artillery and the captain of engineers, who had been employed in the erection of the fortifications of Minorca, declared that it was impossible under these circumstances to relieve the island. Byng, however, made an attempt to open up a communication with the fort, but failed. An action followed with the French fleet, which ended in a drawn battle, and Fort St. Philip capitulated. A furious clamour immediately arose in England; and the ministry resolved to sacrifice Byng, in the hope of averting public attention from their own imbecility and gross negligence. He was accordingly superseded, and sent home under arrest. The government journals employed the vilest arts for the purpose of inflaming the minds of the populace against the unhappy admiral, and inducing them to clamour for his blood. He was tried before a court-martial, 28th December, 1756, and found guilty of not having done his utmost to destroy the French fleet, and sentenced to be shot, but unanimously recommended to mercy on the ground that he had failed solely from an error in judgment. Strong representations were made in his favour from various quarters, and even, at the instigation of Voltaire, from the French general, Marshal Richelieu; but in spite of the vigorous efforts made to save the life of the ill-fated admiral, the iniquitous sentence was carried into effect at Portsmouth, 17th March, 1757. He met his fate with the courage of a hero, and the resignation of a christian. Posterity has reversed the sentence of his accusers and judges, and done justice to his memory.—J. T.

BYRD, WILLIAM, or, as his name is sometimes spelt, BYRDE or BIRD, one of the most profound musicians of the sixteenth century, is supposed to have been the son of Thomas Byrd, a gentleman of Edward VI.'s chapel. It appears that he was brought up in the music-school of St. Paul's cathedral; and, according to Wood, received his musical education under the great master, Tallis. In the year 1554 he was senior chorister of St. Paul's, and his name occurs at the head of the school in a petition for the restitution of certain obits and benefactions, which had been seized under the act for the suppression of colleges and hospitals in the preceding reign. The precise date of his birth is unknown, but the fact of his being senior chorister in 1554, tends to fix it about 1538. In 1563 he was appointed organist of Lincoln cathedral, where he continued till 1569, when he was appointed gentleman of the chapel royal. The chief part of his ecclesiastical compositions being composed to Latin words, Byrd is supposed, notwithstanding the office he held, to have retained his predilection for the Romish communion. He continued to publish his works as late as the middle of the reign of James I.; it is, however, scarcely to be supposed that he composed any part of them at so advanced a period of life. In 1575, it appears by the title-page of the "Cantiones Sacræ," and the patent annexed to that work, that Byrd and Tallis were not only gentlemen of the chapel royal, but organists to her majesty, Queen Elizabeth. Byrd is thought to have derived very con-

siderable pecuniary advantages from a patent granted to him and Tallis by Queen Elizabeth, for the exclusive privilege of printing music and vending music-paper. Upon the decease of Tallis in 1585, the patent devolved wholly to Byrd, according to the conditions on which it had been granted. The following is a list of Byrd's works, printed and published under this patent—"Cantiones quæ ab argumento sacræ vocantur, quinque et sex partium. Authoribus Thoma Tallisio et Gulielmo Birdo Anglis, serenissimæ majestati à privato sacello generosis et organistis," 1575; "Psalms, Sonets, and Songs of Sadnes and Pictie, made into musicke of five parts," 1587; "Songs of Sundrie Natures, some of Gravitie and others of Myrth, fit for all Companies and Voyces," 1589; "Liber Primus Sacrarum Cantionum quinque vocum," 1589; "Liber Secundus Sacrarum Cantionum," &c., 1591; "Gradualia, ac Cantiones Sacræ, &c., Liber Primus," 1607; "Gradualia, &c., Liber Secundus," 1610; "Psalms, Songs, and Sonets, some solemne, others joyful, framed to the life of the words," &c., 1611. In addition to this list, Byrd published three masses (one of which has been reprinted by the Musical Antiquarian Society) without date or printer's name, and contributed largely to the works of Young, Watson, Leighton, &c. Of his compositions for the organ or virginals, a few specimens are printed in the "Parthenia, or the first Musick that ever was printed for the Virginals," 1611; the rest, to a considerable extent, may be seen in the MS. virginal books of Queen Elizabeth, Lady Nevil, &c. For his church music, the collections of Dr. Alldrich in Christ church, Oxford, and those of Dr. Tudway in the British Museum, may be consulted with advantage. Before closing this account of Byrd's compositions, it will be necessary to say a few words respecting his claim to the authorship of the celebrated canon "Non nobis, Domine." Dr. Pepusch, in his Treatise on Harmony printed in 1730, distinctly calls it "the famous canon by William Byrd," and Dr. Burney states that it is to be found, with Byrd's name, in Hilton's Catch that Catch can. The canon, it is true, may be found in this work, a copy of which is now before us; but the name of the author does not appear to it, at least in the edition of 1652. Dr. Tudway, in the MS. collection of music made for the earl of Oxford, 1715, and now in the British Museum, attributes it to Thomas Morley!—a mistake solely arising from the circumstance of Morley having given the first six bars as a canto fermo in his Introduction to Practicall Musick.

Byrd was an inhabitant of the parish of St. Helen's, Bishops-gate, and resided opposite to Crosby Hall, and adjoining the garden of Sir Thomas Gresham. We learn from the cheque-book of the chapel royal that he died July 4th, 1623. In the record of his death he is styled "the father of musick," in allusion, probably, to his great age. Of his family very little is known. He left a son named Thomas, who was educated in his own profession. In 1601 he acted as substitute for Dr. John Bull, then travelling abroad for the recovery of his health, and in that capacity read the music lecture at Gresham college.

Byrd's talents were highly appreciated by his countrymen and brother professors. Morley in his Introduction before quoted, first printed in 1597, speaks of him as "his loving master never without reverence to be named of musicians;" and Henry Peacham, in his Compleat Gentleman, says—"For motets and musicke of pietie and devotion, as well for the honour of our nation as the merit of the man, I preferre above all other our phoenix, Mr. William Byrd, whom in that kind I know not whether any may equal." Byrd lived on terms of the strictest intimacy with the elder Ferrabosco, and more than once was his rival in trials of skill and ingenuity in the intricacies of composition. Of Byrd's moral character and natural disposition, Burney remarks—"There can perhaps be no testimony more favourable, or less subject to suspicion, than those of rival professors, with whom he appears to have lived during a long life, with cordiality and friendship. And of the goodness of his heart it is to me no trivial proof, that he loved and was beloved by his master, Tallis, and scholar, Morley, who, from their intimate connexion with him, must have seen him *en robe de chambre*, and been spectators of all the operations of temper, in the opposite situations of subjection and dominion." An engraved portrait of Byrd (probably unique) is in the collection of the writer of this notice.—(Rimbault's *Life of Byrd, prefixed to a Mass for Five Voyces, printed by the Musical Antiquarian Society.*)—E. F. R.

BYROM, born in 1691 at Kersall, near Manchester; died in

1763; educated at Merchant Taylors' school, London, from which, at the age of sixteen, he was sent to Trinity college, Cambridge. While yet an undergraduate he published a pastoral poem, then greatly admired, and two letters on Dreams in the Spectator, under the name of John Shadow. In 1714 he became a fellow of his college, but within two years had to resign his fellowship, not having taken holy orders as the rule under which it was held required. He married a cousin; his father and hers both had money, but they would not give a shilling to the adventurous pair. Byrom passed the winters of each year in London, earning his support by teaching short-hand, while his family resided in Manchester. The system which he employed, and of which he was himself the inventor, is still found useful. He did what he could to keep the principle a secret. This was of course impossible, and an account of it is given in Rees' Cyclopædia. One of his pupils was Lord Chesterfield. In 1774 Byrom was elected fellow of the Royal Society. The death of a brother gave Byrom some property, and the evening of his life was passed in the house where he was born. Through his whole life he had the habit of throwing his thoughts into verse. It would seem that he almost thought in rhyme. In his verses there is a total absence of anything like poetry, but the style is pleasant and conversational, and one cannot read his volumes without feeling that he was a good and an amiable man. After his death such of his poems as could be collected were published. He had destroyed many during his last illness. Byrom, after resigning his fellowship, thought to have educated himself for the medical profession, and was, on this account, by his friends called Doctor. Some of Byrom's smaller poems have been ascribed to others, among them an epigram on Handel and Bononcini, to Swift, in whose works it is often printed. A journal of Byrom's, together with a great many letters to and from him, have been found in the houses where he resided in Manchester and at Kersall. Two volumes of these "Remains" have been printed by the Chetham Society, edited by the Rev. Dr. Parkinson, principal of St. Bees' college. The journal, so far as published, goes down to the year 1785. More volumes are promised.—J. A., D.

BYRON, GEORGE NOEL GORDON, Lord Byron of Rochdale, Lancashire, born in Holles Street, London, January 22d, 1788; descended from the Scandinavian Bioruns, one branch of which settled in Normandy, and came over to England with William the Conqueror. Another branch had migrated to Livonia, producing there the formidable Marshal de Buren, so notorious through the absolute power which he had grasped, and for a time wielded in Russia. Thus,—were one to repose confidently on the influence of *race*,—it would not be difficult to find in such antecedents the necessary ground of daring and tameless will as regards the subject of our memoir, but causes abundantly adequate to influence him in a similar direction, in so far as he could be influenced from without, form a main part of the story of his own brief life.—His mother, Miss Gordon of Gight, a Scotch heiress, was the second wife of the poet's father, Captain Byron. By a former marriage with Lady Carmarthen, Captain Byron had one daughter, the Honourable Augusta Byron, afterwards Mrs. Leigh. Between this sister and Lord Byron a most tender and enduring affection existed. Captain Byron and his wife lived unhappily together, and were soon separated. Mrs. Byron's fortune being entirely swallowed up by her husband's debts, she found herself, in two years after her marriage, possessed of only £150 per annum. She retired to Aberdeen, and her son, when nearly five years old, was sent to a day school there for one year, and afterwards to the school of a Mr. Ross, whose kindness he always remembered with gratitude. As soon as he was able to read, "his grand passion was Roman history." From Mr. Ross's he went to the Aberdeen grammar school. His schoolfellows agree in describing him as "a lively, warm-hearted, high-spirited boy, passionate and resentful, but affectionate and companionable: to a remarkable degree venturesome and fearless, and always more ready to give a blow than take one." He is also said to have been "more anxious to distinguish himself by prowess in all sports and exercises, than by advancement in learning." It belonged to Byron's nature to resolve to excel even in pursuits for which he seemed naturally the least fitted—a feature of character distinguishing him through life, and calling forth at once the greatness and much of the weakness of the man. His keen feeling, connected with the deformity of one of his feet (occasioned by an accident

at his birth), a feeling that seldom left him—induced him to engage eagerly on every suitable opportunity in violent physical exercises, and it is well known how he triumphed in his success. The disadvantage in question he had early surmounted to a great extent by dint of stern determination, for his school-mates say that "he excelled at 'bases,' a game requiring considerable swiftness of foot." In 1796 Mrs. Byron took her son to the Highlands, and the wild grandeur of the scenery made an indelible impression on his mind, even at that tender age. His love of nature, so intense that in her presence "he lived not in himself, but he became portion of that around him," was here first developed. In after years he commemorates his old enthusiasm for mountain grandeur, and attributes some of the delight he experienced in the sublimity of Alpine and classical scenery, to the charm of Scotch memories:

"The infant rapture still survived the boy,  
And Loch-na-gar with Ida looked on Troy."

Byron was an extremely sensitive and affectionate child. At the age of eight years, his attachment to his cousin, Mary Duff, seems to have deserved the name of love. In allusion to this he says somewhere—"I certainly had no sexual ideas for years afterwards, yet my misery and my love for that girl were so violent, that I sometimes doubt whether I have ever been really attached since." But this loving nature was rendered a source of suffering to him in childhood, by the violent unregulated temper of his mother, who, though she indulged him to excess, was subject to paroxysms of rage, in which she would throw the first missile that came to her hand at her son, and even call him "a lame brat." "He traced the first feelings of pain and humiliation he had ever known to the coldness with which his mother received his caresses in infancy, and the frequent taunts on his personal deformity, with which she had wounded him." The only gentle influence at work to relieve the harshness of these scenes, was that of his nurse, Mary Gray, whose kindness to him as a child he never forgot. "This woman, in common with all his nurses, tutors, &c., always spoke with tender remembrance of the 'mixture of affectionate sweetness and playfulness' in his disposition, by which it was impossible not to be attached, and which rendered him then, as he was in his riper years, easily manageable by those who loved and understood him." In 1799 Mrs. Byron removed to London, and in 1800 she sent Byron to Harrow. Dr. Drury, head master of Harrow, says of him—"His manner and temper soon convinced me that he might be led by a silken string to a point, rather than by a cable." In 1803, while passing the vacation in Notts, Byron first saw Mary, daughter of Mr. Chaworth of Annesley. His unrequited love for her cast its shadow over his whole future life. One of his most beautiful and touching poems, the "Dream," describes its effects upon him, as no words but his own could do. Miss Chaworth, though aware of his attachment, understood neither the deep heart nor the genius of her youthful lover. He has spoken in his journal of the intense suffering he endured on overhearing Miss Chaworth say to her maid—"Do you think I could care anything for that lame boy?" and given a painful account of his rushing wildly out of the house at night, he knew not whither, "in an agony of humiliation and grief." In 1805 he went to Cambridge, and there formed many ardent friendships, even the memory of which, sixteen years afterwards, could bring tears into his eyes. In 1806 his first volume of poems was printed for private circulation. The first copy was presented by him to a friend, who expostulated with him on the licentiousness of one poem in the volume. Byron frankly admitted the justice of the censure, and at once cancelled the whole edition. The poems were published in 1807, and sold rapidly. In 1808 he spent the vacation in London, courted and lionized by the *blasé* London world, and leading the thoughtless dissipated life too common among those of his age and rank. His inner life, however, appears to have been distressingly lonely. The unreasonable violence of his mother's temper estranged him from her, and "he had not," says Mr. Moore, "a single friend or relative to whom he could look up with respect." Injudicious praise, and equally injudicious blame, were all he met with from the criticism of the day. In 1808, the criticism on his "Hours of Idleness," which appeared in the *Edinburgh Review*, first kindled the true fire of his genius. In 1809 he answered it by publishing the celebrated satire—"English Bards and Scotch Reviewers." His coming of age was celebrated at Newstead Abbey early in the

same year, and in March, he took his seat in the house of lords. He was much pained by the coldness shown him by a relative, by whom he had expected to be introduced on that occasion; and Mr. Moore attributes his determination to leave England immediately after this, to the mortification he experienced at his lonely and friendless position, and the want of means suited to his rank. The bitter sadness which even then was creeping over his naturally vivacious and affectionate disposition, may be traced in the celebrated epitaph on his favourite dog, written in 1808; and the kindness of his heart in the eagerness and delicacy with which, notwithstanding his own pecuniary embarrassments, he gave liberal assistance to the family of Lord Falkland, when that gentleman was killed in a duel. His melancholy before starting was increased, and his sensitiveness much wounded by the refusal of a former schoolfellow, to whom he was deeply attached, to spend a farewell hour with him on the last day he passed in England, on plea of an engagement to go shopping. He left London in June, and visited Portugal, Spain, Greece, and Turkey. During this journey he composed the first and second cantos of "Childe Harold." He returned to England in 1811. Almost immediately on his arrival, he heard of his mother's severe illness, and hastened to Newstead Abbey, but arrived too late to see her alive. His grief at her death was such as to surprise those who were aware how little of a mother's tenderness he had ever known. In 1812 he published the two first cantos of "Childe Harold," which instantly placed him at the summit of popularity and fame. He gave the copyright of this and many later poems to a friend, having determined not to take money for his works, a resolution which he only reluctantly abandoned, in after years, from necessity. Mr. Hodgson says—"Were it possible to state *all* he has done for numerous friends, he would appear amiable indeed. For myself, I am bound to acknowledge, in the fullest and warmest manner, his generous and well-timed aid; and were my poor friend Bland alive, he would as gladly bear a like testimony." Even a man who had unworthily libelled him was relieved by Lord Byron's ever open hand. In 1813 he published the "Giaour," "Bride of Abydos," and "Corsair;" and in 1814, "Lara." In this year, yielding to the advice of friends, he made an offer of marriage to Miss Milbank, and was accepted. He was married on the 2nd of January, 1815. This marriage, entered into rather from the influence of others, than from deep affection, was a grave error. With feelings such as he has described in the "Dream," Byron had no right to marry; and, indeed, the friends who urged the step upon him appear to have been chiefly actuated by motives of conventional propriety and advantage, quite unworthy of the occasion. Yet Byron seems to have been really attached to his wife; his letters, written after marriage, speak of happiness; and he even playfully wrote to Moore, that "if marriage were to be upon lease, he would gladly renew his own for ninety-nine years." His daughter, Ada, was born on the 10th December, 1815. In January, 1816, Lady Byron left town on a visit to her father's house in Lancashire. "They had parted in the utmost kindness; she wrote him a letter full of playfulness and affection on the road; and, immediately on her arrival at Kirkby Mallory, her father wrote to acquaint Lord Byron that she would return to him no more. This unexpected shock fell upon him at a time when those pecuniary embarrassments, which had been fast gathering around him during the whole of the last year (there having been no less than eight or nine executions in the house during that period), had arrived at their utmost; and at a moment, when, to use his own strong expressions, he was 'standing alone on his hearth with all his household gods shivered round him,' he was also doomed to receive the startling intelligence, that the wife who had just parted from him in kindness, had parted from him for ever." The causes of this separation have never been explained. Lord Byron, though he spoke bitterly of his wife's parents, generously exculpated her; he was until the close of his life ever ready for a reconciliation, and though deeply attached to his child, he never attempted to withdraw her from her mother's care. In the memoirs he presented to Mr. Moore, with orders to publish them after his death, a detailed account was given of all the circumstances of his marriage and separation, "as frank as usual in his avowal of his own errors, and generously just towards Lady B." Mr. Moore, however, after Lord Byron's death, was induced to suppress these memoirs, and to accept a sum of money in compensation for his own loss—forgetful of the loss sustained by the public in the transaction. Lord Byron

had directed that the memoir should be shown to his wife before publication, "that she might have it in her power to mark anything mistaken or misstated."—The storm of calumny and abuse that now burst forth on all sides against his lordship was undoubtedly the chief cause of his again determining to leave England. He met, as he said, "condemnation without a charge, sentence without trial, and was exiled by ostracism." . . . "I was accused of every monstrous vice by public rumour and private rancour. My name, which had been a knightly and noble one since my fathers helped to conquer the kingdom for William the Conqueror, was tainted. I felt that if what was whispered and muttered were true, I was unfit for England; if false, England was unfit for me." "Such an outcry was now raised as perhaps, in no case of private life, was ever raised before. Hardly a word was spoken, certainly none was listened to, in his favour." Moore attributes the unexampled fury of the public to jealousy, and says that "those who had long sickened under the splendour of the poet, were now enabled, under the guise of champions for innocence, to wreak their vengeance on the man." Lord Byron professed himself unable to discover the secret of this hatred, and concluded that he must be "personally obnoxious," as "without at least a charge or accusation of some kind, actually expressed and substantiated," he could "hardly believe that the mere common and every-day occurrence, a separation between a man and his wife, would in itself produce so great a ferment." The true causes are in the very nature and character of Lord Byron's mind, which were "obnoxious" to so much of the spirit and temper of England in his own day, and still prevent him from being appreciated by a large portion of his countrymen. Madame de Stael saw further into the truth than his lordship, when she said to him—"You should not have warred with the world, it won't do;" but she did not comprehend that to war with the world that surrounded him was the mission of Lord Byron's genius, the source alike of his power and his pain. Nay, warfare in the abstract, was, in several senses, a condition of his nature: and much of his poetry sprang out of the friction of opposing principles in his own mind. Like very many great men, he lived largely in the midst of contradictions, as if he had been made up of two conflicting modes of being. Though naturally most generous, he could yet be selfish; he could be isolated, or social, affable, and ingenuous; and even in his most defiant moods, his happiness, quite as much as that of most men, depended on the approbation of those around him. He had mixed personally, and apparently not disapprovingly, with the follies he condemned. He never escaped from an overbearing and very painful self-consciousness. The self-possession which he so much admired, was perhaps the quality he was farthest from attaining: to the last, he was ruffled by little jealousies. Most strangely of all, while revolting utterly from the restraints of English society, and the limitations of English thought, he was yet an English peer of the nineteenth century. A large democratic spirit undoubtedly possessed him, and often, as if in spite of himself, his wide and strong sympathies led him far beyond the confines of the circle of fashionable society; but he owed to his liking for that society and his interest in it, much of his influence and power. By birth an aristocrat, and sharing in the prejudices as well as the nobler qualities of his class, he struck the severest blows at the principle of aristocracy. This perhaps is the source of the singular power, and the true inward and highest sense of his poems. He has been said to have summed up the era of Individuality, and to have cleared the way for one of Association, or of Humanity. Aristocracy, viewed from a philosophical point of view, is, in fact, the Individual separating itself from the Collective Life, and asserting some sort of vital distinction between itself and its fellows, claiming to work out an exclusive existence, and to draw nothing from the common sources of life. The isolated individual being incapable of realizing this fundamental idea of aristocracy, aristocracy became of necessity a caste, but its origin is nevertheless in the assertion of the principle of individuality. Byron's heroes are all types of this struggle of individuality against the associative tendency of the nineteenth century. They all manifest the impotence of the individual to live a normal, a happy, or even a truly great life, by separating his sympathies and aspirations from those of his human brethren. Manfred, the Corsair, Lara, &c., are all powerfully and peculiarly endowed individualities, who have withdrawn themselves from the common path, and set up in war with society

not for the sake of improving it, or in the worship of a new and higher principle, but in the mere assertion and worship of their own strength, by which alone they seek to crush while they dazzle the society they despise. They are themselves crushed by Fate; the ever-advancing surge of humanity overwhelms even them; and Byron, who has first fascinated us, as he was himself fascinated by these Titanic types, destroys them on a sudden, and inscribes upon their tomb a curse—the curse which hangs over exceptional gifts, when abused to the aggrandizement of the one, rather than used for the advancement of all. This instinct in Byron which finds its poetic expression (frequently, as we have said, unconsciously) in his heroes, reveals itself in a thousand ways in all his poetry, and is shown in the unceasing war he wages against aristocratic tendencies and prejudices in every shape. Passages like the following are of constant recurrence in his letters, journals, &c.:—"The newspapers will tell you all that is to be told of emperors, &c. They have dined, supped, and shown their flat faces in all thoroughfares, and several saloons. . . . News come! The powers mean to war with the peoples. . . . The king-times are fast finishing: there will be blood shed like water, and tears like mist, but the peoples will conquer in the end; I shall not live to see it, but I foresee it." It is this forecasting sympathy with the struggles in which they are still engaged, which causes him to be esteemed on the continent as the poet of a new era, and which makes him eminently the poet of the people, even in England. They do not, it is true, understand him; but they feel that he feels with them and for them, and they love him. This also explains the intense interest with which Byron watched the career of Napoleon; his upbraiding him, on his seizure of empire, as "the hero sunk into a king," shows that it was not merely the great military genius, but the revolutionary chief that he had hailed in him. To these popular sympathies, so powerfully and so boldly expressed, must be attributed the excessive and exaggerated rancour exhibited against him by whoever shared in or profited by privileges whose doom he prophesied. But, moreover, the long-sufferings and privations caused by the war, and the still recent crimes and excesses of the French revolution, had filled England with horror and disgust; save an enlightened minority, the English of Lord Byron's day regarded the struggle for freedom on the continent as a mere bloody chaos of anarchical passions, and such in truth it appeared. But Byron, with the prophetic instinct of genius, recognized in the storm of revolution that burst over Europe the finger of God; and while the majority of his countrymen, long accustomed to see the continent shrouded in the darkness of corruption-made law, viewed the comet-like career of Napoleon merely as a blighting scourge threatening even their own island, he saw in him an avenging thunderbolt which purified the infected atmosphere around the thrones it blasted on its passage. Sentiments so distasteful to the English mind go far to explain the obloquy with which our poet was assailed, although the secret was probably quite as unrecognized by his assailants as uncomprehended by him.—The gloomy and morbid scepticism into which Lord Byron occasionally fell, may be attributed in a great measure to the unjust hatred of his countrymen acting upon a spirit already deeply saddened by a desolate youth, unhappy attachment, and an ill-judged and ill-fated marriage. All who knew him intimately have testified to the natural gentleness and affectionateness of his disposition; but his very virtues appear from unfortunate circumstances to have been a source of suffering to him. The great Goethe has said of him that he was "inspired by the genius of Pain." "A disposition on his own side to form strong attachments, and a yearning after affection in return, were at once the feeling and the want that formed the dream and torment of his existence. We have seen with what passionate enthusiasm he threw himself into his boyish friendships. The all-absorbing and unsuccessful love that followed, was, if I may so say, the agony, without being the death of this unsated desire; disappointment of this feeling met him at the very threshold of life. . . . His mother either rudely repelled his affection, or capriciously trifled with it. . . . In all the relations of the heart his thirst after affection was thwarted," while even "in his first literary efforts disappointment and mortification awaited him." Then followed his unhappy marriage, and the burst of calumny and outrage which drove him into exile. He left England in April, 1816, not again to return. He could never quite forgive his

country, but neither could he forget her, nor while adapting himself to new circumstances, did he ever cast off his own nationality. He went by Flanders and the Rhine to Switzerland, and en route composed the "Third Canto of Childe Harold;" the "Prisoner of Chillon" was written at Ouchy, on the lake of Geneva. At Diodati, on the same lake, he wrote the "Dream," "Prometheus," &c.; it was here that he became acquainted with Shelley, and during a tour made at this time among the Bernese Alps, he commenced "Manfred." Writing of this journey, he says:—"In all this the recollection of bitterness, and more especially of recent and home desolation, which must accompany me through life, have preyed upon me here; and neither the music of the shepherd, nor the crashing of the avalanche, nor the torrent, the mountain, the glacier, the forest, nor the cloud, have for one moment lightened the weight upon my heart, nor enabled me to lose my own wretched identity in the majesty, and the power, and the glory, around, above, and beneath me." From Geneva he went to Venice, where—probably from the culpable weakness of endeavouring to drown this cry of despair and bitterness sounding from the depths of his wounded spirit—he sank for a time into a course of reckless dissipation, utterly unworthy his nature and his genius. "Manfred," which is the embodiment of anguish and despair, and "Beppo," the expression of his scorn of professed and hollow morality, were written during this period. "Don Juan," too, was commenced. But even here his better self did not quite forsake him; the fourth canto of "Childe Harold," with its magnificent curse of forgiveness, is also of this date. He seems to have been roused from subjection to various and degrading passions by his fixed attachment to the Countess Guiccioli, and by his entering heart and soul into the cause of the Italian Carbonari. He enrolled himself of their number, subscribed largely to their funds, concealed their arms in his house, and shared in every way their perils and their hopes. In 1819 he removed to Ravenna, where he wrote "The Prophecy of Dante," "Francesca da Rimini," &c. In 1820 the Countess Guiccioli was formally separated from her husband; from which period Lord Byron lived with her until his departure for Greece. He also continued in active sympathy with the Italian liberals, though well aware of the danger to which he thereby exposed himself. His letters and journals show how completely he had identified himself with their cause: "I sometimes think, if the Italians don't rise, of coming to England. . . . I have lived in the heart of their houses . . . have seen and become (*pars magna fui*) a portion of their hopes, and fears, and passions. . . . It is no great matter, supposing that Italy could be liberated, who or what is sacrificed. . . . It is a great object, the very poetry of politics: only think, a free Italy!!! . . . If this country could be freed, what could be too great for the accomplishment of that desire, for the extinction of the sighs of ages? . . . You neither know nor dream of the consequences of this war. It is a war of men with monarchs. . . . What it is with you English you do not know, for ye sleep. What it is with us here I know, for it is before, and around, and within us. . . . I am but as one of the many waves that must break and die upon the shore, before the tide they help to advance can reach its full mark. . . . What signifies self, if a single spark of that which would be worthy of the past can be bequeathed unquenched to the future," &c., &c. On the failure of the Italian insurrection of 1821, Lord Byron removed to Pisa. During this year he wrote "Cain," the "Vision of Judgment," "Heaven and Earth," &c., &c., besides continuing "Don Juan." In 1822 he went with the Countess Guiccioli and her brother to Genoa. The delight with which Byron hailed, in the Greek revolution, the awakening of the spirit he had so often invoked, may be inferred from the energy with which, when the continuance of the struggle had convinced him the Greeks were in earnest, he prepared to assist them. He sent help in medical stores and gunpowder; and after a severe struggle, occasioned by the pain of parting with the Countess Guiccioli, and the gloomiest forebodings that he should never return to her, he decided to start himself, and throw the weight of his personal influence, his counsels, and his whole fortune into the scale. The friends who knew him at Genoa agree in declaring, that he went to Greece as one fulfilling, at a great sacrifice, a solemn duty. "He was always saying," adds M<sup>me</sup>. Guiccioli, "that a man ought to do something more for society than write verses." On the 14th June he sailed from Genoa, and reached Argastoli in December. Everywhere he was hailed as a deliverer.

Every letter he wrote to his agents in England, urged upon them the necessity of making any sacrifice to obtain, by the sale of his estates, &c., money for the cause. The space allotted to this brief memoir renders it impossible to give any account of the revolution itself, but Mr. Moore thus describes the task Lord Byron undertook: "To convince the government and chiefs of the paralyzing effects of these dissensions,—to inculcate that spirit of union among themselves which alone could give strength against their enemies,—to endeavour to humanize the feelings of the belligerents on both sides, so as to take from the war its character of barbarism," &c. "Lord Byron," says Colonel Napier, "judged the Greeks fairly. He knew that half-civilized men are full of vices, and that great allowance must be made for emancipated slaves. He proceeded, therefore, bridle in hand, not thinking them good, but hoping to make them better." On the 5th of January he arrived at Missolonghi, and was appointed commander-in-chief of a proposed expedition against Lepanto. On the 22d he wrote the lines "On Completing his Thirty-sixth Year." The climate of Missolonghi, against which he had been most urgently warned, proved fatal to him. On February 15, he was seized with a convulsive fit, from the effects of which he never completely recovered. On the 9th of April he became seriously ill, and on the 12th he took to his bed, never to rise again. On the 14th he was urged to be bled, but refused, and only submitted on the 16th, and as it proved, too late. He was worse afterwards, and appearances of inflammation of the brain induced the medical men to let blood a second and third time without avail. His gentleness and kind thought for his attendants moved them to tears; he "feared they should be ill from sitting up day and night." Aware that he was dying, he attempted to send messages to his sister and Lady Byron, but was inarticulate. His last words, during his intervals of reason, were "Augusta," "Ada," and "Greece." At a quarter-past six on the morning of the 19th April he expired. All the public offices, even the tribunals, were closed for three days. A general mourning of twenty-one days was ordered by the Greek government, and prayers and a funeral service were offered in all the churches. His body was sent to England, and after a funeral ceremony performed in London, conveyed to Hucknall church, Notts, and buried near his mother in the vault of his ancestors. The tablet over the grave was placed by his beloved sister Augusta.—Not unfitting season, perhaps, at which a grand and stirring spirit should pass away;—the eve of a fierce and mighty struggle! Nevertheless, there was in Byron's death at such a juncture, a touch of profoundest tragedy. On the point of entering on a course of manly action, of taking the lead in momentous practical affairs, and being hailed by all men as a beneficent and practical power in Europe, how much of weakness, how much of imperfection might soon have been strengthened, perfected, and refined! Perhaps it is true, what Goethe said—"Byron could, in a certain sense, go no further. He had reached the summit of his creative power, and—whatever he might have done in the future—he would have been unable to exceed the boundaries of his talent." But there is a higher sense in which he might have gone much farther, and for which the opportunity seemed to have just come. If even now—notwithstanding the brilliancy of his genius—it is the life and character of the Man that chiefly rivets our attention and constrains our affections, what might Byron not have become to England and the World and all Time, had he been permitted through aid of that purifier—*Action*, to ascend from the stage of doubt, contradiction, and strife, to that of "self-reverence, self-knowledge, and self-control!" His course has been compared to that of a meteor: indeed it was fierce and fast. But when the intelligence of its close arrived, Europe felt that a Sun had set.

As a poet, Lord Byron will take rank with those second only to Shakspeare and Dante. The great critic of Germany indeed, recommended a student, on one occasion, to acquire English, mainly that he might read these wonderful writings. At the time of their publication they attained a popularity, and exerted an influence never surpassed, either in extent or intensity, by those of any writer retaining a place in the annals of literature; and if this influence has partly diminished, it is chiefly because the intellectual wants of England have changed. Byron possessed in a paramount degree many of the richest qualities of an immortal poet—a keen eye, a fine sense of harmony, an exquisite susceptibility, and the utmost

fluency of language; but the grand source of his power is that fullness of life which gave greatness to the Man. Instead, therefore, of being a mere artist, he felt that he was more than an artist, and flung out his verses carefully or carelessly as he listed. "Do you fancy," he said once to Trelawney, "that I am to subside into a poet?" Hence, these abundant verses will not bear to be taken to pieces, or his poems judged of line by line, as is pre-eminently the case with Keats, and to a certain extent with Shelley; they are by no means free from commonplace phrases, prosaic images, and other faults of detail; but who has surpassed their force and fire? Some one has remarked of Byron's head, that it gave him the impression of being at a higher temperature than that of other men:—the same might be said of his poetry. As a dramatist he cannot be called pre-eminent. His characters are selected from within a narrow range, and are too correct reflections of the moods of the writer to have an adequate individuality. The scenes are often stilted, and the plots cramped; but the majestic and gorgeous passages which abound in them will cause these plays to retain a higher place in general estimation than far more correct and artistic structures. The lyrics, especially those in "Manfred" and the "Deformed Transformed," are models almost inapproachable. The third and fourth cantos of "Childe Harold" alone, place their author in the foremost rank of descriptive writers; but it is as a satirist that he soars highest—above all the poets of our century. The genius of Byron, with its wonderful power to blend pathos, humour, wit, scorn, saturnine gloom, and exuberant vitality, is better represented in "Don Juan," than perhaps by all his other poems put together.—The tendency of his writings, and especially of this his last and greatest work, has been the subject of much dispute. The majority of critics have followed in the wake of Southey, Bowles, &c., and denounced him as an immoral and irreligious writer: but it is a question whether the accusation did not originate in great part in an incomplete appreciation of his writings as a whole, and of the age in which he lived. The immorality and scepticism which sully portions of Lord Byron's writings are not of his personal creation; they are the reproduction of what was the very atmosphere of the tainted society of his day: a society, which idolized the incarnation of its worst vices in the "First Gentleman in Europe," would readily cry anathema on the plain-spoken poet who snatched the mask from its brow, and held, as it were, the mirror up to its evil nature. Byron was born to overthrow, to pull down: and his mission of destruction was rendered sacred by the suffering of the destroyer. This may be said more or less of all his poems, but of none so truly as of "Don Juan." The offspring of reaction, and needlessly offensive to good taste as this poem too often is, it is not, if rightly read, immoral. It is a crusade against cant, fought with the weapon of a matchless irony. Cant in all its shapes—in religion, in morals, in politics—the poet flagellates with the stinging scourge of his pitiless wit.

"With or without offence to friends or foes,  
To sketch the world exactly as it goes,"

he finds "prolific of melancholy merriment." He laughs, but it is not the laugh of Voltaire; there is in it no enjoyment, only bitterness—

"And if I laugh at any mortal thing,  
'Tis that I may not weep."

And the cries of anguish that follow, redeem the poet; for, unlike the laugh that preceded them, they spring from the very depths of his heart. In the midst of the mocking scepticism by which it is disfigured, "Don Juan" abounds in noble passages, prophetic of, and aspiring ardently towards a coming era of truth and justice. An eminent continental writer has stated what English critics have too often overlooked—the European rôle given by Lord Byron to English literature, and the appreciation of English he induced upon the continent. "From him dates our continental study and knowledge of English literature, and to a great extent of England. His poetry, and his readiness to devote himself to the cause, first of Italian and then of Greek freedom, have made of him a sort of apostle of England in the countries through which he passed. Before he came amongst us, all we knew of English literature was the French translation of Shakspeare, and the anathema hurled by Voltaire against your 'intoxicated barbarian.' Since Byron we have learned to study Shakspeare, and all your poets and other writers. We felt what must be the land from which such a soul was sprung.

From him dates the sympathy of men of heart towards your land of liberty, whose vocation he so worthily represented among the oppressed of all countries. He led the genius of Britain as on a pilgrimage throughout all Europe."—There have been numberless editions of Lord Byron's works, but the best are those published by John Murray of Albemarle Street, London, who purchased the first copyright of nearly all his poems. The memoirs published of him have been nearly as numerous. The most trustworthy Life of Byron, rather because of its copious extracts from his own letters and journals, than on account of the author's appreciation of a man whom he was intellectually and morally incapable of understanding, is that written by Thomas Moore (Murray, Albermarle Street). The best portrait of Byron is the one painted by Phillips, now at Newstead abbey in the possession of Byron's schoolfellow, Colonel Wildman, who has preserved with affectionate and reverential care every relic of the abbey's former illustrious owner.—H... N.

BYRON, JOHN, a celebrated British admiral and circumnavigator, second son of William fourth Lord Byron, and grandfather of the poet, was born in 1723. At the age of seventeen he served as midshipman in the *Wager*, one of the vessels attached to the squadron under Commodore Anson, despatched against the Spanish settlements in the Pacific. The whole of the ships composing this expedition successively suffered shipwreck, and the *Wager*, on the 15th of May, struck on the western coast of America. In the end, the crew were compelled to abandon the ship, and to land upon an uninhabited island, to which they gave the name of Mount Misery. After residing for several months on this desolate spot, they embarked in the cutter and long-boat, and attempted to return home through the Straits of Magellan. The cutter was lost, but the long-boat in which Byron was, after a perilous voyage of upwards of a thousand leagues, at length reached the Portuguese settlements in Brazil. The survivors, after enduring the most fearful sufferings from cold, hunger, and sickness, ultimately succeeded in reaching Europe in 1745. Campbell, in his *Pleasures of Hope*, gives a striking description of the dreadful hardships endured by "the hardy Byron" on this voyage, of which Byron himself, on his return to England, published a singularly interesting narrative. On his arrival in England, he was raised to the rank of commander, and soon after to that of post-captain. In 1758-60 he was employed in the war against France, and distinguished himself by a brilliant exploit in destroying a French squadron in Chaleur Bay. On the return of peace in 1764, he was sent on a voyage of discovery to the South Sea, in command of the ships *Dolphin* and *Tamar*. He was absent two years, and though the voyage was not productive of many important discoveries, it deserves honourable mention in the history of nautical adventures. In 1769 Byron was appointed governor of Newfoundland. In 1778 he

commanded the fleet sent to watch the movements of Count D'Estaing in the West Indies. The French admiral was at the head of a greatly superior force, and an undecisive action was fought between him and Byron off Grenada in July, 1779. During the course of his lengthened service, Byron was regarded as so singularly unlucky in encountering adverse gales and dangerous storms, that the sailors aptly nicknamed him "Foul-weather Jack." He died in London, April 10, 1786, leaving behind him a high reputation for courage and professional skill. His son, GEORGE ANSON BYRON—born 1758; died 1793—was also a most meritorious and distinguished officer, and contributed materially to the glorious victory gained by Lord Rodney over the French fleet, 12th April, 1782.—J. T.

BYSTROM, JOSEPH NIKOLAUS, a celebrated Swedish sculptor, and professor of the academy of sculpture in Stockholm, was born 18th December, 1783, at Philippstadt in the province of Warmeland. He received his artistic education under Sergel in Stockholm, of whom he was a favourite pupil, and by whom he was especially led to the study of the antique. In 1810 he went to Rome, whence he returned to his native city in 1815. Having secretly executed a colossal statue of Karl Johann, at that time crown prince of Sweden, he thereby won so greatly the favour of that monarch, that the most valuable commissions were henceforth given to him. His works are for the greater part portrait-statues of distinguished men, and ideal figures from the old mythology; of these the female and youthful forms are greatly admired for their tender grace and lifelike freshness. Amongst the most admired of his works are—"Juno;" "Venus and Cupid;" "Harmonia;" "Victoria;" "Karl III.;" and the altar decorations of the cathedral of Linköping.—M. H.

BYTHNER, VICTORINUS, an admirable linguist, was a native of Poland. On arriving in England, where he passed the greater part of his life, he was appointed Hebrew lecturer in Christ church, Oxford, and while occupying this position, published a number of works for the use of his pupils, several of which (particularly his "Lyra Prophetica Davidis Regis," &c.) are still much esteemed. The work just named has been frequently reprinted, and is an invaluable aid to the study of the Psalms. Little is known with certainty respecting Bythner after his removal from Oxford, which he quitted during the revolutionary troubles, but it appears that about 1664 he commenced to practise as a physician in Cornwall.—J. S., G.

BYZANTIUS or FAUSTUS OF BYZANTIUM, author of a history of Armenia, was a native of Constantinople. He became bishop of the province of Sbanthouni in Upper Armenia. Of his work, which consisted of six divisions, four remain, which are occupied with the wars of the Persians and Romans. An edition of it appeared at Constantinople in 1730, and one at Venice in 1837. It bears the title of "Pouzanteran."—J. S., G.

CAB

**CABADES.** See **COBAD.**

**CABAKDJI** or **KABAKDJI-OGLOU**, a celebrated Turkish rebel, died in 1808. He was an officer in the corps of the Yamaks, and in 1807 was chosen by them as their commander. This body, being dissatisfied with certain military innovations introduced by the sultan Selim, marched, to the number of six hundred, with Cabakdji at their head, to Constantinople, where they massacred many of the high officers of the state, and other persons of distinction. They then accused the sultan of being the enemy of the janizaries; and having contrived to render him unpopular with his soldiers, succeeded in deposing him, and proclaimed as his successor the sultan Mustapha, son of Abdoul-Hamid. Cabakdji was surprised at Fanaraki, on the Bosphorus, and put to death.—G. M.

\* **CABALLERO**, **FERMIN AGOSTO**, a Spanish statesman, journalist, and geographer, was born in 1800. He first came into notice by a series of pamphlets which he published against Minano's Geographical Dictionary of the Peninsula. In 1843 he obtained a seat in the cabinet under Lopez, was expelled by Espartero, but resumed office for a short time after the fall of that minister. Of his works, which are chiefly geographical, we mention, "Manual Geografico administrativo de España," and a pamphlet on the geographical learning of Cervantes.—J. B.

**CABALLERO**, **JOSEPH ANTONY**, Marquis, a Spanish statesman, born in 1760. On the accession of Ferdinand VII. in 1808, he was made president of the council of finance; but having joined Murat's party, and become a firm adherent of Joseph Bonaparte, he was, on the downfall of Napoleon, compelled to retire to Bourdeaux. In 1818 he was sentenced by Ferdinand to perpetual banishment, but was recalled in 1820 by the constitutionalists. He died at Salamanca in 1821.—J. B.

**CABANE**, **FILIPPINA**, born in Catania, whence she is called Catanea, early in the sixteenth century. She was the wife of a fisherman; but being chosen nurse to Robert, afterwards king of Naples, she rose to a high place at court, married the high-steward to the king, and at length became governess to Giovanna, afterwards queen of Naples. When Andrew, Giovanna's husband, was murdered, the adventurer and her son were both arrested on suspicion, put to the torture, and died in 1545.—J. B.

**CABANIS**, **JEAN-BAPTISTE DE SALAGNAC**, a French lawyer and agriculturist, was born at Yssoudun in 1723, and died in 1786. He was at first educated for the law, and afterwards devoted himself to agriculture. He published a work on the art of grafting.—J. H. B.

**CABANIS**, **PIERRE-JEAN-GEORGES**, physician and philosopher, was born at Conac in 1757. He manifested an early taste for study; but an irritable temper was not well managed by the masters of the college of Brives, which he entered at the age of ten. Even under the discipline of the family he was rather intractable; and his father having carried him to Paris, left him very much to himself. His taste for study revived. He read Locke, and attended the course of Brisson. Having spent two or three years in filling up what was defective in his education, he took a journey to Poland in 1773. He returned to Paris at the age of eighteen, and sought the society of men of letters. His father having urged him to make choice of a profession, he decided in favour of medicine. He never became what is called a practitioner—for which the weakness of his health unfitted him—and his acquaintance with the last representatives of the philosophy of the eighteenth century gave a turn to his thoughts more in accordance with the theories and speculations of medical science than with its laborious duties. Having completed his professional studies, he retired from Paris to Auteuil, where he was admitted to the society of Madame Helvetius, and some of the most dis-

CAB

tinguished men of the day. There he met with Turgot, Diderot, d'Alembert, Condillac, &c. He had also seen Jefferson and Franklin; and when Voltaire came to Paris to have the tragedy of Irene represented, Cabanis submitted to him some portions of the Iliad which he had translated into verse—which were favourably received by the veteran litterateur. When the Revolution approached, Cabanis was intimately associated with Mirabeau, whose opinions he shared, and whose labours he assisted. He was also intimate with Condorcet, to whom, on the night of his arrest, he gave, at his own desire, the poison which was to save him from the scaffold. He collected the writings of Condorcet, and subsequently married his sister-in-law, Charlotte Grouchy, sister to the marshal of that name. During the horrors of the Revolution, Cabanis, seeking seclusion and safety, attached himself as medical officer to one of the hospitals, and in that capacity had the opportunity of saving many of those who had been proscribed. In 1795 he was named professor in the central school of health; in the following year he was elected member of the National Institute; and in 1798 he was chosen a representative of the people in the council of Five Hundred. But his health, which was precarious, gradually gave way; and about the beginning of 1807 he had an attack of apoplexy, which interrupted his intellectual labours. He left Auteuil to spend the summer at the residence of his father-in-law near Meulan; and during the winter he established himself in a house near the village of Rueil. But the greatest care and skill were unavailing, and he sank under a second attack of apoplexy on the 5th of May, 1808, in the fifty-second year of his age.

The writings of Cabanis, which are numerous, are either purely literary, as "Melanges de Litterature Allemande," 8vo, 1797; or medical, as "Observations sur les Hospitaux," 8vo, 1789; or philosophical, as "Traité du Physique et du Moral de l'homme." It is by this last work that he is now chiefly known. It was first published in 8vo, Paris, 1802. It next appeared in 1803, with an analytical table by M. Destutt de Tracy, and an alphabetical table by M. Sue. In 1815 it was published under the title of "Rapports du Physique et du Moral de l'Homme;" again in 1824, with a table and notes by M. Pariset, and in the same year in three volumes, 12mo, with a table and notice of the author by M. Boisseau. The starting-point of Cabanis is the philosophy of Condillac, which reduces all our faculties to sensibility, or the capacity of experiencing sensations. The nerves are the seat of this sensibility. The impressions made on them from without are passively received, being carried from the circumference to the centre; a reaction proceeds from the brain, sensation follows, and ideas are formed. Such was the theory common among the ideologists of his day. But Cabanis goes beyond them in noticing not only external but internal sensations; and by the latter he explains instinctive movements, as the consequence of some internal change in the nervous system. Still, all is sensation. Man is intelligent, active, and moral, because he possesses sensibility, and sensibility is the result of a nervous system; so that thought is a function of the brain, just as digestion is a function of the stomach; impressions reach the brain as food reaches the stomach; the brain digests these impressions, and organically secretes thought. As the food which enters the stomach is transfused throughout the body in new and different forms, so impressions which reach the brain isolated and incoherent are manufactured into new and consistent ideas. But while Cabanis thus materialized the mind, he spiritualized the principle of life. Among the physiologists of his day, some thought that the phenomena of the living frame may be explained by physical laws; others that they imply the existence of peculiar properties; and, a third class, that to

the material organization of a living body there is superadded an unknown entity or principle which they called life. Cabanis held this last view. About 1805 Mons. Fauriel, then a young man, visited Cabanis; and the discussions which ensued between them led to a modification of his views, not so much as to the principle of life, as with regard to the causes of intellectual phenomena. In short, his views came to coincide with those of Stahl, and he regarded the principle of life as not only organizing and animating the body, but as constituting the *ego*, and producing mental phenomena—as the cause of vitality and intelligence—immaterial and immortal. In extending his views to the phenomena of nature, he came at last to the conclusion that these cannot be explained by the properties of matter, and that the harmonious ongoings of the universe imply a conscious intelligence, and a voluntary activity. These views are contained in *Lettre posthume et inédite à M. F., sur les causes premières, avec des notes de F. Bérard*, 8vo, Paris, 1824. They are to be regarded not so much as a retraction, as the mature conclusions to which continued reflection and extended inquiry conducted an ardent and honest mind.—W. F.

CABARRUS, FRANCISCO, Count de, a celebrated Spanish financier, born in 1752; died in 1810. He was the son of a merchant of Bayonne, and for some time followed at Saragossa the profession of his father. In 1782 he became director of a bank called the Bank of Saint Charles. His great talents soon recommended him to public employment under the reign of Charles III., and afterwards under that of Charles IV. He was employed in various public missions, particularly to the congress of Rastadt, and was subsequently accredited as ambassador to the directory of the French republic. Under Joseph, the brother of Napoleon, he was appointed minister of finance—an office which he held until his death, a short time before the expulsion of the new dynasty.—G. M.

CABASSOLE, PHILIPPE DE, a French prelate, born in 1305. He was successively chancellor of Sicily and patriarch of Jerusalem. In 1369 Gregory XI. conferred on him the cardinal's hat, after which he was sent as legate to Perugia, where he died in 1372. He is chiefly memorable for his friendship with Petrarch.

CABEL, ADRIAN VANDER, a Dutch painter, born at Ryswick in 1631; died in 1695. He was a pupil of John van Goyen. He started for Italy *via* France, but staying at Lyons, he became so admired and rewarded, that he turned his tent into a house. He was a concrete of imitations, for he imitated sometimes Castiglione and Salvator Rosa; at other times Mola and the Caracci. He painted landscapes with *figures* (not men) and cattle, and a sort of Italian sea-port was his humour. His trees are well touched, his *figures* correct and spirited, his animals clever; his manner is "the grand Italian manner." His deep brown tones spoil everything. At first he studied from nature. His real name was Vander Town, but his master, Van Goyen, gave him the nick-name of Vander Cabel. He etched several of his own designs of hermits in mountainous landscapes.—W. T.

CABESTAING, GUILLAUME DE. The spelling of his name is unfixed. The date and place of birth of Guillaume de Cabestaing are uncertain. Millot says he was born at Roussillon. He lived in the twelfth century. He was in the service of Raymond de Castel-Roussillon, and his peculiar duty was that of *donzel* or squire to Marguerite, Raymond's wife. This, it would seem, was a dangerous office; for the lady and her donzel were soon in love with each other. Raymond took a deep and deadly revenge—he murdered the troubadour; and imitating what old story told of the feast of Atreus, had the minstrel's heart drest as food and placed before the lady, who ate of it without suspicion. When she was told the truth she refused food, and found the means of self-destruction. The story is told in several ballads and poems; it is also the subject of several prose romances. Boccaccio tells it in the *Decameron*. Of Cabestaing's poems seven are preserved in the *Bibliothèque Impériale*, five of which have been printed by Raynouard.—J. A., D.

CABET, ETIENNE, one of the leading members of the communistic party in France, born at Dijon, 2nd January, 1788. His father, who exercised the humble trade of a cooper, gave him a liberal education. He embraced the profession of law, and first practised at the bar of his native town. He subsequently went to Paris, where, disappointed in his expectation of rising to eminence at the bar, he devoted himself for some years to conducting the *Journal de Jurisprudence*. In 1830 he received from the first minister of justice, M. Dupont de l'Eure,

the appointment of procurator-general; but, considering the revolution as incomplete, he had the indiscretion publicly to avow sentiments adverse to the government of which he was one of the principal organs, and was, in consequence, deprived of his office the following year by the new minister of justice, M. Barthe. He was soon after elected member of the chamber of deputies; but having employed some expressions offensive to the king in his journal, *Le Populaire*, he was prosecuted by authority of the chambers, and having been found guilty by a jury, he was in February, 1834, condemned to two years' imprisonment and a heavy fine. Preferring exile to imprisonment he retired to England. Here he lighted on the work of a kindred spirit, an account of an imaginary utopia, with which he was so charmed, that he appropriated some of the leading ideas, and having adapted them to the taste of the French workmen, published them in March, 1842, in a little volume entitled "Voyage en Icarie." The establishment of a social republic appears after this to have become the leading idea of his life, and he had at last the happiness of securing a grant of land in Texas, whither he proceeded in 1848, with a considerable number of emigrants, anxious, like himself, to realize the daydream with which their imaginations had been delighted. After many hardships and difficulties, they succeeded in organizing themselves into a little community, over which Cabet presided. He died in 1856.—G. M.

CABEZA DE VACA, ALVAR-NUNEZ, a Spanish voyager of the sixteenth century. In 1539 he was appointed to explore La Plata; but, exceeding his orders, he marched into Paraguay and seized the government of Assumption. He was soon sent home in bonds to Spain, where he was condemned by the council of the Indies. He wrote the first account of Paraguay.

CABOCHE, SIMONET, one of the chiefs of the Cabochiens, a corporation of butchers at the beginning of the fifteenth century. They were partisans of the duke of Burgundy in his contests with the Armagnacs, and for a time, although inconsiderable in number, tyrannized over Paris. Their violence at last roused the city against them, and through the tact and energy of a carpenter named Guillaume Cirasse, their power was completely broken.

CABOOS, surnamed SHAMS AL-MAALA (the Sun in its Splendour), a prince of the house of Shamgur, famous for his virtues and misfortunes, succeeded to the government of Jorjan in 996. He protected the exiled Bouiyan prince, Fakir El-Dowlah, and submitted to be driven from his kingdom rather than surrender the fugitive. When the exile was restored to his dominion, he seized the territory of his benefactor, who did not regain his crown till the death of the Bouiyan king in 997. He was dethroned in 1012 by his courtiers, who were provoked at the severity with which he punished their licentiousness. He died in the fortress in which they imprisoned him. Caboos was the earliest patron of Avicenna, and was himself a poet and astronomer. He wrote a treatise on eloquence, named "Kemal-al-Belagat."—J. B.

CABOT, GEORGE, an American statesman, born at Salem, Massachusetts, and educated at Harvard college, which he entered with the class which is styled of 1770. In 1791 he became United States senator from Massachusetts, a post which he held for five years—a steadfast friend throughout of the Washington administration. He yielded essential aid to Hamilton in perfecting his financial system. In 1798 he had the tender made him from President Adams of being the first secretary of the navy, which honour, however, he declined. In 1814 he was chosen a delegate to the memorable Hartford convention, and was elected president of that assembly. He died in 1823. A high authority states, that long before the great work of Say on Political Economy appeared, its leading principles were familiar to Mr. Cabot.—F. B.

CABOT, CABOTTO, or GAVOTTA, JOHN. See CABOT, SEBASTIAN.

CABOT, SEBASTIAN, a great seaman of Venetian ancestry but of English birth, who discovered the American continent fourteen months before Columbus, and two years before Amerigo Vespucci had been west of the Canaries. Cabot was born about the year 1477. His history has been involved in obscurity in consequence of the corrupt text of Ramusis, the looseness with which Hakluyt has translated and quoted his authorities, and the carelessness of biographical bookmakers, who have expanded dubious phrases into positive sentences. The publication of original docu-

ments from the rolls, however (London, 1831), has established many facts before doubtful. Cabot told Eden, author of *Decades of the New World*, that he was born in Bristol, and that at three years old he was carried with his father to Venice, and so returned to England with his father after certain years—whence he was thought to have been born in Venice. He is described as a very gentle person, possessing a knowledge of the letters of humanity and the sphere, able to make “cardes for the sea” with his own hand, very expert and cunning in knowledge of the circuit of the world, and having in his heart “a great flame and desire to attempt some notable thing.” A patent was granted by Henry VII., 5th March, 1496, authorizing John Cabot and his three sons, Louis, Sebastian, and Sancius, to seek out whatsoever isles, countries, provinces, “which before this time have been unknown to all christians;” and to set up the royal banner in every place by them newly found. The king reserved one-fifth of the profit, while the privilege of exclusive traffic was secured to the patentees. It is very uncertain whether John Cabot ever sailed on this expedition. Hakluyt appears to have altered the name of Sebastian, originally given in Stow (*Annals*, page 804, edition 1605), to John; and this error has been followed by Campbell, Barrow, and others. The expedition, consisting of four or five ships, sailed from Bristol, May, 1497, and on 24th June, discovered “that land which no man before had attempted,” and which is described by the chroniclers as Terra Prima Vista, or Newfoundland, while the island of St. John is mentioned as discovered on the same day. The question is, Was this land, first seen by Cabot, our present Newfoundland, or was it the continent of America? We have no space to detail the evidence, but there seems no doubt that it was the great American continent itself, on which Cabot first gazed. The whole of the north region of America was designated Terra Nova in old maps, and the term Newfoundland was applied to the same district, while Ortelius (who had the map of Cabot before him) places an island of St. John, lat. 56°, on the east of Labrador, thus distinguishing the one seen by Cabot from the St. John in the gulf of St. Lawrence, so named long after (1534) by Cartier. Columbus was not acquainted with the continent of America until he coasted the isthmus of Darien during his last voyage, fourteen months after Cabot’s discovery. On February 3, 1498, a second patent was granted to John Cabot or his deputies, giving authority to conduct ships “to the lande and isles of late founde by the seid John, in oure name and by oure commandement.” About this time John Cabot, the father, died, while Sebastian, understanding, “by reason of the sphere,” that if he sailed by way of the north-west he would, “by a shorter tract, come into India,” undertook a second voyage. He had with him three hundred men with a view to colonization, and directed his course by the tract of land upon the cape of Labrador at 58°, where in the month of July there was “such cold and heaps of ice” that he durst pass no further, and turned his course to the westward. In another voyage, probably in 1517, Cabot reached W. lat. 67° 30’. Subsequently he became pilot-major in Spain in 1518, was made captain-general of a Spanish fleet to the Moluccas in 1526, and entered the Rio de la Plata. In 1548 he again fixed his residence in England, was pensioned by Edward VI., and assumed a general superintendence over maritime affairs, being consulted whenever nautical experience was required. He advised the expedition which opened a trading intercourse with Russia, and his instructions for its conduct are not only masterly in seamanship, but afford a pleasant revelation of the character of the man. He urges that the inhabitants of nations visited should not be provoked by disdain, laughing, or contempt, but treated “with all gentleness and curtesie,” and that their own laws and rights should be respected; while with simple and affectionate earnestness he inculcates upon every sailor personal purity, and remembrance of his oath, conscience, duty, and charge. Cabot received the office of governor “of the myserie and companie of the merchant adventurers for the discoverie of regions, dominions, isles, and places unknown.” He observed and explained to the king the variation of the needle, showing that it was different in different places, and the seamen he instructed were attentive to scientific facts. Many pleasant pictures of the great navigator occur in the history of his genial old age. When the *Searchthrift* was despatched to the north, “the good olde gentleman, Master Cabota, gave to the poor most liberal alms, wishing them to pray for its good fortune, and then he made great cheer,” says the captain, “and

for very joy that he had to see the towardness of our intended discovery he entered into the dance himself, which being ended, he and his friends departed, most gently commending us to the governance of Almighty God.” Cabot died about 1557, the time of his death and the place of his burial being uncertain. On his deathbed his mind wandered again over the ocean he loved with most pure and true and faithful passion; and he spoke, in moments of wandering fancy, of a divine revelation made unto him of a new and infallible method of finding the longitude, which he was not permitted to disclose to any mortal. Thus passed away one of the true sea-kings of old, as adventurous as wise, as courteous as bold, as gentle as daring, and no man knoweth where slumber the mortal remains of him who, first of Europeans, gazed on the mighty continent of the west.—L. L. P.

CABOT, VINCENT, a French publicist and jurist, born at Toulouse about the middle of the sixteenth century; died in his native town in 1621. His great reputation as a lawyer secured for him the appointment of professor of civil and canon law in the university of Orleans, whence he was recalled to Toulouse.—G. M.

CABRAL, PEDRO ALVAREZ, a celebrated Portuguese navigator, born in the second half of the fifteenth century; died about 1526. He is known to have belonged to a noble family, but very few circumstances of his early history have been left on record. He was a contemporary of Vasco da Gama, whose esteem he had acquired, and at whose recommendation he was intrusted, when yet very young, with the command of an expedition to Calicut, for the purpose of opening up commercial relations with the rajah of that place. On his voyage, from some cause unexplained, he stretched away towards the south-west, and touched on the coast of Brazil, which, ignoring the previous discovery of that country by the Spaniards, he complacently took possession of for the crown of Portugal. On reaching Calicut, Cabral obtained an interview with the rajah, concluded with him a commercial treaty, and was permitted to establish a Portuguese factory. This treaty proved subsequently of immense advantage to the commerce of Portugal. Setting out on his return home, his fleet was dispersed by a tempest; but, on his arrival at Lisbon, he had the satisfaction of finding there two of his vessels which he had supposed to be lost. He was received with distinguished honours, and rich rewards were heaped upon him; but of his subsequent career little or no account has been left. Even his tomb has only recently, and after much research, been discovered.—G. M.

\* CABRERA, DON RAMON, a Carlist chief, celebrated in the recent annals of Spain for his daring and military talent, and no less notorious for his sanguinary disposition, was born at Tortosa in 1809 or 1810. He was destined for the priesthood, but not by nature, for Latin proved an insuperable difficulty; and when in 1833, on the death of Ferdinand VII., he was expelled, along with other absolutists and malcontents, from his native town, he was only known as a youth of riotous and dissolute habits. The threat—for it was rather a threat than a prophecy with which he departed from Tortosa—“I swear I will make some noise in the world,” he fulfilled in no long time. The wild district of Maestrazgo was in open revolt for Don Carlos, and there Cabrera soon made himself a name; being appointed second in command of the insurgents, and on the death of Ramon Carnicer, commander-in-chief. This district for several years was the scene of his most brilliant exploits, and of his most wanton atrocities. When Gomez began his daring march through Andalusia, he was joined by Cabrera, who afterwards took Valencia, and would have taken Madrid but for the timid counsels of Don Carlos. For his great and unscrupulous services to the Carlist party he was created count of Morella. In 1840, at the conclusion of the civil war, he took refuge in France, where he was confined a short time in the fortress of Ham. Returning to Spain in 1848, with the hope of rekindling the civil war, he was defeated and severely wounded in an action fought at Pasteral in January, 1849. Since then he has been in exile in France; in England, where he married a young lady of fortune; and in the kingdom of the Two Sicilies, from which he was expelled in 1851.—J. S., G.

CABRILLO, JOAO or JUAN-RODRIGUEZ, a celebrated Portuguese navigator of the sixteenth century. He entered the Spanish service, and discovered the islands of Santo-Tomas, Santa-Cruz, Santa-Rosa, and San-Bernardo, on the last of which he died in 1543.

**CACCIA, GUGLIELMO**, a Piedmontese painter, born at Moncalvo in the duchy of Monferrato in 1568. He was surnamed **IL MONCALVO**, from his long residence there. He painted church pictures at Milan; afterwards lived for some time at Pavia, and was favourably known at Novara, Vercelli, and Turin. His chief work in oils is considered to be his "Descent from the Cross," in the church of S. Gaudenzio at Novara. His "Raising of Lazarus," and "Miracle of the Loaves," at Chieri, are also highly esteemed. As a painter of frescos, his reputation is considerable. The most remarkable is perhaps his "St. Antonio" in the church of that saint at Milan. His cupola of "St. Paul" at Novara is another valued production. In his fresco work, he was much aided by his two daughters, Orsola and Francesca—almost the only female professors of that art. Caccia died in 1625.—W. T.

**CACCIATORE, NICCOLO**, an Italian astronomer, born at Casteltermini in Sicily in 1780. He was professor at Girgenti in 1796, and of ancient geography at Palermo in 1797. In the following year he commenced his astronomical studies, and in 1803 published an astronomical catalogue, which, after a second publication in a revised and extended form, was crowned by the Institute of France. He reckoned the number of principal stars at 220. The directorship of the observatory at Palermo was held by him for a long period. His works are numerous and valuable.—J. D. E.

**CACCINI, GIULIO**, sometimes called **GIULIO ROMANO**, a musician, distinguished as a singer, and still more as one of the earliest composers of recitative. He was born at Rome about 1560, and died shortly before 1640. He was a pupil of Scipione Della Palla, of whom he learned to sing and play upon the lute. In 1578, being already an accomplished artist, he went to Florence, where, in the following year, he sang at the nuptials of Francesco di Medicis; and he became attached to the court of this prince as a singer in 1580. He became associated with Giovanni di Bardi, count di Vernio, Giacomo Corsi, Pietro Strozzi, and Vincenzo Galileo (the father of the famous philosopher), who, dissatisfied with the vague expression of music in the madrigal style, sought to restore to the art the declamatory character it held in the ancient Greek drama; to this end they purposed to limit performance to a single voice with instrumental accompaniments, to discard all repetition of words, and to dispense with all definite rhythm—in short, to originate recitative. The new form of composition was peculiarly congenial to Caccini, because, though he had great natural ability, he was wholly unlearned in counterpoint, and thus unable to write in the style which, at that time, had general prevalence. The first work he produced, according to the new principle, was a monodrama, entitled "Combattimento d'Apolline col serpente," which was represented in 1590 at the palace of the count di Vernio, who was the author of the poem. This is said to have been modelled upon *Il Satiro*, a somewhat similar composition of Amelio Cavaliere, but which, having been brought out in the same year, is quite as likely to have been founded upon Caccini's monodrama. After this the count quitted Florence, and the palace of Corsi then became the rendezvous of the musical reformers, where Caccini's second production, "Dafne," was represented in 1594. Rinuccini, who was the author of this poem, wrote a lyrical tragedy called *Euridice*, for the celebration of the marriage of Henri IV. with Maria di Medicis in 1600, for which Caccini wrote part of the music, the greater portion being by Jacopo Peri; but he subsequently reset the entire work, and this composition is spoken of by contemporaries as the best he produced. In 1600, also, he wrote, together with Peri, *Il Ratto di Cefale*, the poem of which was by the same author. Besides these dramatic compositions, Caccini wrote many songs of various character for a single voice, a collection of which was published at Venice in 1615, under the title of "Le Nuove Musiche."

The character of Caccini as a composer has been misrepresented by Burney, who even makes such errors in his account of the instruments employed in *Euridice*, that we may suppose this historian either to have been totally ignorant of the work, or to have wilfully given a false description of it. He has been followed in his account by Gerber, and later German writers, for all which, however, existing compositions corroborate the eulogies of the musician's contemporaries, and prove him to have had great power of expression in his recitatives, and graceful fluency in his melodies. The warmest praises of his singing are

to be found in tracts of several writers of his time; his excellence as a vocalist may, doubtless, be associated with the especial merit of his music, which formed a most important innovation in the progress of the art.—G. A. M.

**CADAHALSO** or **CADALSO, JOSÉ DE**, a Spanish poet, born at Cadiz in 1741. He was educated at Paris, and before he was twenty years of age had travelled in Italy, Germany, England, and Portugal. He embraced a military career, in which he attained the rank of colonel, and was intimate with all the best men of his day in all classes. Wherever his duty led him, and especially during a residence in Salamanca from 1771 to 1774, he found opportunities of prosecuting literary studies. He was killed at the siege of Gibraltar, 27th February, 1782. His principal works are a tragedy of no great merit entitled "Don Sancho Garcia," published in 1771 under the pseudonym of Juan de la Valle; a volume of poems entitled "Ocios de mi Juventud" "Eruditas a la Violeta," and "Moorish Letters," published after his death—a work after the model of the Turkish Spy, or the Citizen of the World, but more literary, and full of local allusions. In this last work he takes occasion to correct some of the errors of Montesquieu in the *Lettres Persannes*. He also wrote an imitation of Young's *Night Thoughts*, entitled "Noches Lugubres." There is an edition of the works of Cadahalso in 3 vols., Madrid, 1818.—F. M. W.

**CADALOUS, PIERRE**, or **HONORIUS II.** See **ALEXANDER II.**, Pope.

**CADA MOSTO, ALVISE** or **LUIGI DA**, one of the adventurers employed by Henry of Portugal in the fifteenth century to explore the African coast, was a native of Venice; born in 1432; died in 1480. In 1455, nominally under the command of a Portuguese captain, but really head of the expedition, he set out from Cape St. Vincent with a ship of ninety tons. Actuated less by love of gain than by an honourable ambition of discovery, in the course of a few months he visited Madeira, the Canaries, and the coast of Senegal, and, on being joined by another Italian voyager in the service of Henry, proceeded as far as the Gambia, everywhere collecting valuable information with respect to races, commercial depots, and subjects of geographical and natural science. On a second voyage he discovered the islands of Cape Green, passed Cape Roxo (the name he gave it), and entered the Rio Grande. About 1463 he published his journal of these voyages, which was reproduced in 1507 under the title, "La Prima Navigazione per l'Oceano alle terre de' negri della Bassa Etiopia."—J. S., G.

**CADAVAL, NUNHO-CETANO-ALVAREZ-PEREIRA DE MELLO**, Duke of, a Portuguese statesman, born in 1798. He was a member of the regency-council appointed on the abdication of Don Pedro; but, seduced by the nobles who represented the absolutist party, he abetted Don Miguel, first in his seizure of the regency, and then in his attempt on the crown. At last, when the battle of Almoater restored the constitutional power, he was abandoned by both parties. He died in Paris in 1838.

**CADDAH**, the surname of **ABDALLAH**, who, with his father, Maimun-Caddah, was a zealous propagator of the Ismaili sect among the Mohamedans in the third century from the Hegira. He founded numerous secret societies in Syria, Persia, and Northern Africa. The object of the sect, and of all the confederations for its advancement, was the establishment in the khalfate of one of the race of Ismail. While this was the political object of the Ismaili, they had also a set of hidden doctrines preserved by them in a work named *Meizan*, or the Balance, in which indifference to all rules of morality, and disbelief in all the tenets of religion, were inculcated. These doctrines bore ample fruit when the principles of the sect were openly avowed and practised by the Carmathians (see **CARMATHI**), the Ismaili khalfs of Egypt (see **CADER B'ILLAU**), and the assassins of Persia.—J. B.

**CADE, JOHN**, the leader of a popular insurrection in the reign of Henry VI. He was a native of Ireland, but claiming kindred with the house of York, and assuming the name of John Mortimer, he collected 20,000 followers, chiefly Kentish men, who in June, 1450, flocked to his standard, that they might claim redress for the grievances so widely felt, which were laid to the charge of the then fallen duke of Suffolk and other ministers of the crown. Cade defeated a detachment of the royal forces at Sevenoaks, and at length obtained possession of London, the king having retired to Kennilworth; but having put Lord Say cruelly to death, and laid aside the appearance of

moderation which he had at first assumed, the citizens rose against him and gave battle to his followers, who on the point of defeat dispersed, in terms of an offer of pardon. Cade afterwards tried to re-collect them, but in vain; and he was himself put to death in July, 1450, by Alexander Iden, "an esquire of Kent," as Shakspeare styles him in his Henry VI.—J. B.

CADENET, ELIAS, born about 1156; died, according to the account of Nostradamus, in 1280. He was a native of Provence, and a distinguished troubadour. His father is stated to have been killed in the siege of Cadenet in 1166. The orphan boy was adopted and educated by a nobleman of the district, Hunand de Lantur. He was taught all the fitting accomplishments of a chevalier of that period; and in the course of his apprenticeship to the "gay science," visited the courts of many princes and barons. Under what name he travelled during his wanderjahre, we have no means of knowing; but it was not till his return that he took the name of Cadenet, when all persons had forgotten the obscure orphan whose father had perished there. He now, in the manner of that day, and in the proper dialect of a troubadour, sighed for Marguerite, the wife of the seigneur de Riez, but sighed in vain. Raymond Langier of Deux-frères in the diocese of Nice, afterwards gives food and clothes to Cadenet, who was destined to go farther and fare worse. The accounts of Cadenet are inconsistent. He is said to have died in Palestine, warring against the infidels. Another account makes him pass the close of his life at St. Gilles, among the templars. His poems are not in any way distinguishable from those of the same class. They are on the usual subjects of love and religion, and in translation lose all interest. The amatory poems seem to us better than the religious.—J. A., D.

CADER B'ILLAH, ABU'L ABBAS AHMED, twenty-fifth of the Abbasside khalifs, came to the throne of Bagdad in 991. He is chiefly memorable from the fact that in 1011 he published a manifesto signed by the chiefs of the Fatimite family, denying the authenticity of the descent from Ali of the Ismaili or Fatimite khalifs of Egypt.—(See CADDAH.) Cader died in 1031, distinguished as a patron of learning.—J. B.

CADÉT-DE-GASSICOURT, CHARLES LOUIS, a French pharmacist, was born at Paris in 1769, and died in 1821. He studied at the colleges of Navarre and Mazarin, and passed as advocate in 1787. In 1789 he retired from the bar, and took an active part in suppressing the pillage and massacres which were taking place at that time in Paris. By his conduct he involved himself in trouble, and was condemned to death by a military council. He contrived to escape, and some time afterwards he got the sentence reversed. In 1801 he took up the subject of pharmacy, and in 1806 was elected general secretary of the council of health. During the Austrian campaign he was appointed chief pharmacist to the emperor. He wrote many literary and scientific treatises—among others, a work on domestic chemistry, a dictionary of chemistry, an essay on the use of tea, a dissertation on jalap, and on the wax plant of America.—J. B., G.

CADÉT-DE-VAUX, ANTOINE ALEXIS FRANÇOIS, a celebrated French chemist and pharmacist, was born at Paris in 1743, and died in 1828. Having lost his fortune, he entered the school of pharmacy, and having completed his studies there, he turned his attention in a special manner to chemistry in its application to rural and domestic economy. By the advice of Duhamel and Parmentier, he commenced in 1777 the *Journal de Paris*. He was instrumental in directing public notice to many important matters, such as destroying the noxious gases from sewers, the improper use of copper measures, the best mode of preparing bread, and of making wine, the preparation of gelatin from bones, and the economical manufacture of soap. He has also written upon the history and use of coffee, on the culture of tobacco, on the treatment of fruit trees, on the employment of fruits in domestic economy, on the saccharine matter of the apple and of the beet, and on the culture and use of the potato.—J. H. B.

CADÉT-GASSICOURT, LOUIS CLAUDE, a French pharmaceutical chemist, born in Paris in 1731; died in 1799. He held several important public situations in connection with his profession, among others, chief pharmacopologist to the armies of Spain and Portugal. In 1766 he became member of the academy of sciences. He was the author of several valuable discoveries in chemistry; and in the memoirs of the academy are many of his contributions to that science. In some of his

observations and experiments he was associated with Lavoisier, Macquer, and Darcot. To high ability as a scientific man, he united singular disinterestedness of character.—J. B., G.

CADMUS, according to ancient Greek tradition, was the leader of a colony of Phœnicians who settled at a very early date in Bœotia, and founded the city of Thebes. The Greeks attributed to him the introduction into their country of the sixteen simple alphabetical characters; and the close analogy in form between the Greek and Phœnician alphabets renders this account highly probable. The personal history of Cadmus is almost entirely fabulous.—W. M.

CADMUS OF MILETUS, spoken of by Strabo as the first Greek who wrote history in prose, lived probably about 540 B.C. His work was named "The Antiquities of Miletus and of all Ionia." Suidas speaks of another CADMUS, author of a "History of Athens," in sixteen books.

CADOC, SAINT, son of a South Welsh prince; died in 550. He founded the monastery of Llancarvan, and, according to Fuller, devoted a part of his estates to the support of three hundred poor widows, besides pilgrims and ecclesiastics.

CADOGAN, HENRY, a distinguished officer in the English army, grandnephew of William, Earl Cadogan, was born in 1780. He was lieutenant-colonel in the 71st, or Highland light infantry regiment, and distinguished himself in the most important engagements in the peninsular war. At Vittoria he was charged with the service of displacing the left wing of the French army from the heights of La Puebla, a previous attempt having been unsuccessful. Cadogan advanced with the 71st, and a battalion of General Walker's brigade, and at once carried the heights. He was mortally wounded in the charge, and having requested to be carried to a commanding position, he leant his back against a tree, and watched the progress of the battle with extraordinary enthusiasm till he expired. The duke of Wellington spoke of him in the very highest terms, both in his public despatches and private letters; and a monument depicting the scene of his death, was erected at the public expense in St. Paul's cathedral.—J. B.

CADOGAN, WILLIAM, Earl, one of Marlborough's famous generals, was the son of an Irish barrister. He early entered the army, and became quartermaster of the forces in 1701. Having joined Marlborough in the Low Countries, he was wounded at Schullenberg in 1704, and distinguished himself at Blenheim. After doing other important service, he was made lieutenant-general in 1709. On the disgrace of his leader he resigned all his offices, determined to share his misfortune, but on the accession of George I. he was sent against the Pretender, and rewarded with a peerage in 1716. He was next created general, and sent as ambassador to the Hague, where in 1720 he signed, in behalf of Britain, the treaty of the quadruple alliance. When Marlborough died in 1722, Lord, now Earl Cadogan, was appointed to succeed him as commander-in-chief. He died in 1726.—J. B.

CADOUDAL, GEORGES, a celebrated Chouan chief, was the son of a miller in Morbihan, a department of Brittany. In the protracted and sanguinary contests between the royalists and republicans during the French revolution, the Chouans and Vendéans were the most resolute of the supporters of the royal cause; and the energy and ability of Cadoudal soon raised him to an influential position among the adherents of the house of Bourbon. By his exertions a thoroughly organized, and, for a time, successful resistance was made to the republican troops, in which he displayed military talent of a very high order. At this time attempts were made by Napoleon to gain over Cadoudal to the cause of the republic, and a lieutenant-generalship in the army was offered as the price of his submission; but he firmly declined all these overtures, and continued a determined royalist during the whole of the war. He afterwards engaged, in conjunction with General Pichegru and others, in a conspiracy, having for its object the overthrow of the consular government and the restoration of the monarchy; and having been discovered and arrested, he suffered capital punishment along with others of the conspirators in 1804.—W. M.

CADOVIUS or MÜLLER, JOHN, a native of Friesland, born in 1650; died in 1725. His father, who had married while yet a schoolboy, wishing to conceal his paternity, gave him the name of Müller. He succeeded his father in the superintendency of East Friesland in 1679; and was, besides, a theologian, litterateur, and physician. His book, entitled "Memoriale Linguae Frisicæ Antiquæ," first brought into notice the ancient dialect of his native province.

**CADWALADER, JOHN**, an officer in the American army during the revolutionary war, was born in Philadelphia about 1743. As soon as active opposition to the measures of the British ministry began, he took a prominent part in the controversy on the popular side. He served in the state convention which met in July, 1776, and took the government of Pennsylvania into its own hands. But his services were chiefly military; and though he acted only as a volunteer, or in command of the militia, he earned the confidence and esteem of Washington. He commanded a volunteer corps at the outbreak of the war, was afterwards appointed colonel of one of the city battalions, and finally was made brigadier-general, with which rank he commanded the Pennsylvania militia in the winter campaign of 1776-77. He was present, and did good service in the battles of Princeton, Brandywine, Germantown, and Monmouth. He wounded in a duel General Conway, being provoked by his conduct as the leader of the cabal against the commander-in-chief. In 1778 congress appointed him general of cavalry, but he declined to accept the dignity. He afterwards became a member of the Maryland legislature. He died in 1786.—F. B.

**CADWALADYR**, king of Britain in 660. For his protection of the christians he was called one of the three blessed kings. This last king of the Britons died at Rome in 703, his dominions having been wrested from him by the Saxons.

**CADWALLON**, a Welsh prince of the seventh century. Defeated by Edwin in 622 he fled to Ireland. After his return he waged continual war with the Saxons. He was a patron of the Welsh bards, and received their praises.

**CADWGAN**, son of Bleddyn, a Welsh prince of the twelfth century. His son Owen having violated the wife of another prince, called Gerald, Cadwgan escaped to Ireland with the youth. At his return in 1110 he was murdered by a nephew of his own.

**CÆCILIUS, METELLUS**, for twenty-two years pontifex maximus at Rome. While holding that office he rescued the palladium from the burning temple of Vesta, 241 B.C., which achievement cost him his sight. He was consul in 251, and gained a great victory over Hasdrubal, the Carthaginian general. He was consul again in 249, and dictator in 224.

**CÆCILIUS or CECILIUS, STATIUS**, a native of Milan, according to St. Jerome and Aulus Gellius. His death is said to have occurred in or about the year 168 B.C. He was a slave. He is said to have died one year later than Ennius, and two years before the representation of Terence's *Andrian*, which had been read to him, and which he spoke of with great admiration. The names of forty dramas of Cæcilius are recorded, but of his works nothing remains except a few lines preserved by accidental quotations. Varro, comparing him with other comic poets, speaks of the skill with which his plots are constructed. Cicero calls him the first of comic poets; Horace's line is in every one's memory—

“Vincere Cæcilius gravitate, Terentius arte.”

It would appear that most of Cæcilius' comedies were formed from dramas of the Greek poets—chiefly Menander. A chapter of Aulus Gellius, in which he examines one of Cæcilius' plays, and quotes the corresponding passage of Menander, is worth looking at.—J. A., D.

**CÆDMON**, the famous Anglo-Saxon bard, was a native of Northumberland, and died in 676 or 680. His poetical talent lay hid till he had passed the midtime of his days. It is related, that if he chanced to be in a company where the guests were bound to sing each in his turn, he was wont, when he saw the harp approaching him, to retire, abashed by the feeling of his own inferiority. But a strange circumstance changed the whole course of his life: for it happened that one night, having thus slunk away from a banquet, he took refuge among the cattle. Falling asleep he dreamt that a stranger came and asked him to sing. Cædmon answered, it was because he could not sing that he had left the good company. But the stranger persisted, and gave him for a subject the creation; whereupon the sleeping herdsman poured forth an unstudied song, which was firmly imprinted on his memory when he awoke. He repeated his rude lines to the reeve, who introduced him into the abbey of St. Hilda, where a large auditory had assembled to test his newly-found talent. Cædmon was approved to be a true poet; and having become a monk, “exercised his gift” in versifying the bible. His learned brethren—for he himself could not read—taught him portions of sacred history, which he sang to them

again in alliterative Anglo-Saxon verses. In this way he paraphrased a great part of the scriptures. A fragment of his paraphrase has been preserved; and it is remarkable that his narrative of the fall contains passages which closely resemble some parts of *Paradise Lost*.—R. M., A.

**CÆLIUS, AURELIANUS**, a writer on medicine, supposed to have been born at Sicca in Africa, not earlier than the second century and not later than the fifth, belonging to the sect of the Methodici, so called from their adherence to the doctrine of Themison, which, on account of its simplicity as well as supposed excellence, was called the Method. This doctrine, which formed a sort of connecting link between that of the dogmatists, who held that the practice of physic must depend upon theory, and that of the empirics who relied upon experience, is described as having reduced all diseases to three kinds only, the *strictum*, the *laxum*, the *mixtum*, and as having rejected from the pharmacopœia both specifics and purgatives. The work of Cælius, which consists of eight books—three on acute and five on chronic diseases—is a very barbarous translation into Latin of the writings of Soranus, a Greek physician of the time of Hadrian. It was first published at Paris in 1529. The last complete edition is that of Haller, 1774.

**CÆSALPINUS, ANDREAS, or CÆSALPINO, ANDREA**, a celebrated Italian naturalist, was born at Arezzo in 1519, and died 23rd February, 1603. He studied medicine, and took the degree of doctor. He espoused the philosophical doctrine of Aristotle, and secured a great number of disciples, who listened eagerly to his prelections. His work, entitled “*Questiones Peripateticæ*,” published at Florence in 1569, acquired great celebrity, and was attacked by various parties, who wished to bring the author before the tribunal of the inquisition. They failed, however, in their attempt. It is said that he was the first to give hints in regard to the circulation of the blood. He devoted attention to botany, and endeavoured to free the science from the dogmata and errors of the schools. He became professor of botany at Pisa. He proposed a classification of plants according to the nature of the flower, fruit, and seeds, and initiated a new era in the science. He made interesting and valuable observations also on the structure of the seed, and on the growth of the plant. In his work, “*De Plantis*,” he divides the vegetable kingdom according to the duration of life, whether annual, biennial, or perennial, according to the situation of the radicle, the number of the seeds in the fruit, the form and nature of the root, and the absence of flowers and fruits. This system of Cæsalpinus, although imperfect, led the way in the advancement of botanical science. He devoted attention also to mineralogy, and proposed a system of classification of minerals. A genus of plants, *Cæsalpinia*, has been dedicated to him by Plumier; it is the type of one of the sections of *leguminosæ*. The herbarium of Cæsalpinus is preserved in the natural history museum of Florence.—J. H. B.

**CÆSAR**, a patrician family of the *gens Julia*. Sextus Julius Cæsar, (noticed under **CESAR**.) is the first of the Julii who is known to have borne the surname. “*Clarum et duraturum cum æternitate mundi nomen* ;”—its origin is unknown. In the list of the famous “twelve Cæsars,” more emperors are found who adopted it, than who held it of right. The family, indeed, went out with Nero. Notices of these emperors will be found under the appropriate heads of **AUGUSTUS**, **TIBERIUS**, **CLAUDIUS**, **CALIGULA**, &c. &c.; but we have conceived that a memoir of “the great JULIUS” ought to be placed under that surname, which his deeds and genius rendered immortal.

**CÆSAR, CAIUS JULIUS**, born B.C. 100, was just eighteen when Sulla became master of Rome. Though descended from one of the noblest families, whose pedigree reached up to the kings of Alba Longa and to the goddess Venus, he was by birth connected with the popular party. Marius had been married to his aunt Julia, and he himself married, at the age of seventeen, Cornelia, a daughter of Cinna. He showed his spirit by refusing to divorce his wife at the behest of the dictator. His name was put on the list of the proscribed; but at the request of the vestals, Sulla granted him a pardon, though he foresaw that in this one Cæsar were hidden many Marii. Cæsar was serving in Asia Minor, where he distinguished himself by his personal courage on several occasions, when the news of the death of Sulla, B.C. 78, gave the signal of new commotion. He immediately returned to Rome, and began his systematic opposition to the aristocracy, in which he persevered, without the slightest

deviation, all his life. But he met with little success, and thought it prudent to retire from Rome for a time. He went to Rhodes, ostensibly to study rhetoric in that great school of Greek philosophers and orators, where Cicero also had learned to round his periods. At that time the Mediterranean swarmed with pirates. Cæsar was captured by them, and kept a prisoner until he could procure the enormous ransom of fifty talents. He then manned a few ships in the port of Miletus, though he was not invested with any military authority, surprised the pirates, took them prisoners, and caused them to be strangled and crucified. After this incident, so characteristic of the insecurity and lawlessness of the time, he continued his journey to Rhodes, and devoted about a year to his peaceful pursuits. In the year B.C. 74, hostilities recommenced with Mithridates, king of Pontus. Cæsar, without any commission or authority, collected troops and joined in the war. But he felt that the proper place for him was Rome, the centre of political life. Pompey was at that time considered the greatest man in the state. As yet, the idea of a possible rival did not enter his mind. Pompey had already filled the highest commands; he had triumphed over Sertorius and Spartacus. Cæsar, on the contrary, did not succeed till B.C. 68 in obtaining the quæstorship, the lowest office in the scale that led to the consular dignity. Yet he gained ground steadily. He ingratiated himself with the people, who still enjoyed the much-abused right of bestowing the high offices of state. Above all, he showed affability and liberality. His own fortune was small and soon exhausted, but the money-lenders supplied him with fabulous sums, for they had confidence in his political abilities, and felt sure his time would come to govern a province, to fill his coffers and to repay them with interest.

Cæsar's alliance with Pompey became more intimate in B.C. 67, by his marriage with Pompeia, a near relative of the great political leader. Pompey, who was a good general in the field, and a very bad one in the arena of political and party warfare, longed again for a military command. The aristocracy had begun to be shy and afraid of him; he therefore availed himself of the assistance of the demagogues, and especially of Cæsar, to obtain by a decree of the people, first, the command in a war against the pirates, and, after its speedy termination, the management of the Mithridatic war in Asia. He was absent in the east four years. During this time Cæsar continued to agitate in the Roman senate and the forum. He was a perfect master of this art, for which his rival showed a puerile inaptitude. He was made ædile in B.C. 65, and in that office he exhausted his fertile ingenuity and the coffers of the money-lenders to provide bribes for the populace, in the shape of the most magnificent games ever exhibited before the fastidious eyes of the Roman people, bringing on one occasion no less than six hundred and forty gladiators into the market-place. At the same time he showed his boldness and his disregard of the laws enacted by the aristocracy in the hour of triumph, by restoring on the capitol the trophies of Marius, their most hated enemy. So loud was the applause of the populace, that the senate was obliged to submit to the affront. Emboldened by success, Cæsar continued his warfare without pause or truce. He endeavoured to bring to justice several of the partisans of the senate, who, after the fall of the Gracchi and of Marius, had been guilty of political murders. Though he failed to obtain his ostensible object he contrived to keep up the spirit of opposition, and to rise more and more in the favour of the people, who now began to look upon him as their chief patron and champion. This favour they showed by electing him, under the stimulus of enormous bribes, in the following year, to the high position of pontifex maximus.

The conspiracy of Catiline, which was discovered and punished in this year, revealed more than any other event the rottenness of the republic. Cæsar kept aloof from designs in every respect unworthy the leaders of a great party. He was charged with complicity, and it is certain that he had knowledge of the plot; but, whatever hopes he may have built upon the slight chance of their success, he was too prudent to make common cause with them. But when the conspiracy was discovered, and the senate discussed the measures of repression and punishment, Cæsar, who was then prætor elect, employed the whole power of his eloquence and position to incline the senate to milder measures. But Cato carried the senate with him by his uncompromising firmness and severity. The conspirators suffered death, and Cæsar narrowly escaped a similar fate.

Meanwhile Pompey had terminated the wars and the organization of the east. The troubles caused by the Catilinarian conspiracy seemed to offer a fair pretext for recalling Pompey from the east, and investing him with a military command in Italy. Accordingly one of his creatures, Q. Metellus Nepos, as tribune of the people, proposed a resolution to that effect. Cæsar supported it cordially, for as yet he was not prepared to venture upon a similar policy himself, and yet he wished to prepare the public mind for extraordinary military commands. This move was checkmated by the stubborn opposition of Cato, but not till after one of those armed struggles that so often disgraced the forum in the declining days of the republic.

Cæsar, on the expiration of his prætorship, left Rome to govern Spain as proprætor, just when Pompey returned from Asia. Pompey had dismissed his army, and returned into the rank of a private citizen. But far from conciliating the leaders of the senate, he was unable to obtain from them the confirmation of his measures for the regulation of affairs in Asia, or the agrarian law which he had promised to his soldiers. Under these circumstances he sought the alliance of Cæsar, who had returned from Spain with a claim to a triumph for some successes against the mountaineers of Lusitania and Gallæcia. He waived that claim, in order to become a candidate for the consulship of the year B.C. 59. Having obtained this object, he entered into a close alliance with Pompey and Crassus—an alliance known under the name of the first triumvirate. It was a private and secret compact, cemented by the marriage of Pompey to Julia, Cæsar's daughter; by it these three men bound themselves to co-operate with one another for obtaining the objects they respectively had in view. Crassus, the wealthiest man in Rome, was greedy for more wealth. Pompey desired the confirmation of his acts in Asia, and an agrarian law for his veterans. Cæsar required a military command which would enable him to form a large army. All these measures were successively carried. Cæsar, being invested with the highest office of state, and backed not only by his own supporters, but by the whole interest of Pompey and the wealth of Crassus, soon bore down with a high hand the opposition of the senatorial party. There was no chance of passing his resolutions in the senate. But the constitution of the republic had given into the hands of demagogues the power of superseding that body in legislative as well as administrative measures. The people were, therefore, called to ratify Cæsar's propositions. The constitutional resistance of his colleague Bibulus, and of some of the tribunes, was overcome with physical force; all his motions were declared to be legally carried, and Cæsar was enabled to pass not only the laws agreed upon with Pompey and Crassus, but several other enactments, in which he had not his party, but the welfare of the community at heart. He is sure of our approval for the regulation by which he gave publicity to the discussions in the senate, and for the law which enforced severer punishments for misgovernment and extortion in the provinces.—But the time for acting as legislator and as monarch was not yet come. To arm for the contest, Cæsar chose for his province the rich and populous Cisalpine Gaul, contiguous to Italy. The government of this province and Illyricum was given him by a decree of the people for five years. The senate, whether from fear or with the sinister view of implicating Cæsar in dangerous wars, added Transalpine Gaul. The wars which Cæsar waged for eight years in Gaul, B.C. 58–50, and in which he completely subdued that large country to the Rhine, the channel, and the ocean, are described by himself in a work which ranks among the most eminent productions of classical antiquity. But even Cæsar's pen has failed to give lasting interest to a series of expeditions, sieges, and battles with barbarians, who have no history of their own, and who appear in the page of general history only in their death struggle. There is no method, no plan, no unity of design in the wars of barbarians. The feuds of the Ædui and Sequani, the resistance of the Nervii, the Eburones, the Veneti, and Lexovii, can only possess an antiquarian interest. We shall, therefore, confine ourselves to stating that Cæsar succeeded in conquering the various tribes of Gaul in succession, rarely meeting with a combined and well-conducted resistance; that twice he crossed the Rhine into Germany, and twice the channel into Britain, without, however, making a lasting impression on these countries; that the net was thrown over the necks of the Gauls before they seemed fully aware of it; and that the only formidable combination and the only great man that encountered Cæsar, the heroic Vercingetorix at

the head of a general confederation, were finally overcome. Cæsar showed himself throughout a man equal to every occasion. His most striking characteristics are his bold strategy and his fertility in resources. No danger ever appalled, no novelty ever surprised or baffled him. For every emergency he had the proper measures in readiness. Whether a bridge was to be constructed to cross the rapid Rhine, or siege and earth works, or ships, or engines of war—his ingenuity solved the problem. His eminent talents for organization controlled the greatest and the smallest things, and especially the army, which he meant to be irresistible. All this time he had his watchful eye over Rome, and noted every move of the contending parties.—Pompey had undertaken, during Cæsar's absence in Gaul, to manage affairs in the interest of the triumvirate; but this was a task he was not equal to. Irresolute and yielding, he could not repress the opposition which, since Cæsar's absence, had attempted to rescind some of his enactments, especially his agrarian law. He could not even sway the elections. Low agitators like Clodius openly dared to beard and resist him. In B.C. 56, therefore, a meeting of the triumvirs and their friends was held at Luca, where their policy for the future was fixed. Cæsar consented to assist in conferring upon Pompey and Crassus the consulship for the following year; to give to Crassus the command in the east, and to Pompey the province of Spain for five years—stipulating for himself a continuation of his command in Gaul for a like period, pay from the public treasury for the legions which he had levied without authority, and the consulship for the year B.C. 48. The appointment of consuls for the year B.C. 55 was effected with the display of force which had now become usual in contested elections. All opposition was overcome—the laws giving the triumvirs the stipulated provinces, were moved and carried by the tribune Trebonius, one of their creatures, in an assembly of the people, without the concurrence of the senate. Crassus hastened to the east, where he met, B.C. 53, with overthrow and death. Pompey caused Spain to be governed by his legates, and remained in Italy under the pretext of watching over the supply of Rome with corn. He now discovered that he had been playing the game of Cæsar, and sought by degrees to conciliate the republican party. The death of Crassus removed the only man who could have prevented a collision between Pompey and Cæsar, by throwing all his weight on one side. In B.C. 54 Pompey lost his wife Julia, Cæsar's daughter, and with her another tie that bound him to his rival. Taking advantage of the disorders in which Clodius and Milo were chief actors, he caused himself to be elected consul without a colleague. He then made his peace with the senatorial party, and initiated or supported a series of measures calculated to deprive Cæsar of his province, his army, and the chance of obtaining the consulship. M. Claudius Marcellus, consul of B.C. 57, a most violent enemy of Cæsar, moved in the senate, though without effect, that Cæsar should be recalled. The same motion was repeated in the following year by the new consul, C. Marcellus, but again defeated; for Cæsar had not only bribed the second consul, L. Æmilius Paulus, but also the tribune, Curio, who approved the motion to deprive Cæsar of his command, adding, by way of amendment, that Pompey should be dealt with in a similar manner; both should either lay down their commands at the same time, or both retain them. Nothing could be more equitable than this proposal; yet it was not what Pompey and the aristocracy wanted. It was therefore not adopted for the present. Cæsar, pending these angry discussions, did, or at least appeared to do, everything to avoid an open rupture. The senatorial party ascribed his moderation to weakness. They had been informed and eagerly believed, that Cæsar's troops were disaffected, and would desert him in a war with the constituted authorities of the state. Therefore, though the majority of the senate trembled at the prospect of civil war, and gladly embraced at last the proposal of Curio, the violent minority, Cato and Marcellus at their head, disregarded this resolution, and insisted upon Cæsar's immediate and unconditional submission. Cæsar appeared to hesitate. He protested that he wished for a peaceful arrangement, he deprecated the horrors of civil war, and made a last proposal, the moderation of which creates a well-grounded doubt in his sincerity. He declared himself ready to give up Transalpine Gaul and his army, if he were allowed to retain, until he was appointed consul, the provinces of Cisalpine Gaul and Illyricum, or even Illyricum alone, with two legions. Curio submitted this ultimatum to the senate in January, B.C. 49. Stormy debates followed each other for several

days. At last the most violent party carried the day. The original resolution was confirmed—Cæsar was declared an enemy to his country unless he abdicated his command, and the consuls were invested with unlimited military authority. The die was cast. Cæsar had no choice but to accept the challenge of his opponents, and he did it without hesitation. The contest that now began was formidable, and it was not unequal. Pompey was in possession of the legitimate authority of the republic, the prestige of formal right was on his side, and all the resources of the empire were at his command. Cæsar appeared as an insubordinate viceroy, marching against his country to subvert the ancient order of things. The senatorial party had seven tried legions in Spain under able and experienced officers; in Italy they had the materials for ten legions; they had exclusive command of the sea, and were thus secure of easy communication on the immense battlefield over which the war was sure to extend. To this formidable army Cæsar had to oppose only nine legions, or about 50,000 foot, and a body of German cavalry; but this army was perfect in every respect, and Cæsar was its only master: whilst Pompey had to consult a great number of counsellors, whose conflicting wishes and opinions added to his natural hesitation. Cæsar received the news of the declaration of war at the head of only one legion of 5000 men and 300 horse. The remainder of his army was stationed in the north of Gaul. In consequence of the procrastination and supineness of Pompey, the senatorial party had scarcely begun to organize their forces. Cæsar, therefore, determined not to wait for the remainder of his troops, but with his natural boldness, bordering upon temerity, he rushed upon his enemies at once. The most complete success rewarded him. He crossed the small river Rubicon, which separated Cisalpine Gaul from Italy, and in rapid succession took one city after another on his march along the Adriatic. The troops and officers of Pompey were terror-struck, and dispersed at his approach. All the aristocratical leaders fled, and threatened with terrible vengeance those who should venture to remain and to make their peace with Cæsar. From Capua, where he had collected his forces, Pompey marched direct to Brundisium; for Italy was already lost, and he was obliged to secure a port to effect his retreat to Greece. Half of his army was already despatched when Cæsar arrived before the place and immediately began to blockade it, and to throw earthworks across the mouth of the harbour. But Pompey had the command of the sea; he baffled Cæsar's plans, embarked his remaining troops, and escaped with a trifling loss across the Adriatic. The want of a fleet prevented Cæsar from following. He was, therefore, obliged for the present to content himself with the conquest of Italy, which he had accomplished in two months. Turning to Rome, where he remained but a short time, he set out for Spain. On his way he laid siege to Massilia, a town strongly attached to the aristocratical party; but as it held out with great obstinacy, Cæsar left the siege to his lieutenants, and led his army across the Pyrenees. He met the Pompeian generals north of the Ebro, and after considerable difficulty defeated them. He generally pardoned his prisoners. This success decided the campaign in Spain. Varro and the remaining troops capitulated, and many of the Pompeian soldiers took service under Cæsar. When Cæsar arrived again before Massilia the inhabitants surrendered at discretion, and received at his hands that merciful treatment by which he knew so well to conciliate his enemies.

Cæsar now returned to Rome (autumn 49). He had caused himself to be nominated dictator, and as such, enacted a series of legislative measures, regulating the laws of debtors, giving the Roman franchise to the inhabitants of his old province of Gallia Cisalpina, and restoring to civil rights the sons of the victims of the Sullan proscriptions. Having accomplished this, and having presided over the election of consuls for the following year, he devoted the remainder of the year to preparations for the coming campaign. Hitherto he had been eminently successful. The only reverses that checkered his career of victory, he suffered through his subordinate officers. One of them, Curio, had succeeded in taking possession of Sicily; but he had crossed over into Africa, and there lost his life and army in a battle against the Pompeians and King Juba of Numidia: another, C. Antonius, after the loss of his ships, was blockaded in the island of Curicta in the Adriatic, and made prisoner with his whole force. Pompey had made good use of his time. He had raised a very considerable army, and accumulated supplies in Dyrrhachium and other places. About 200 of the senators, the

most influential of the body, reproduced in Thessalonica the image of the Roman curia. They elected the officers of state, and drew abundant resources of men and money from all the eastern provinces of the empire. Meanwhile, Cæsar concentrated his army of twelve legions and 1000 horse at Brundisium; and as, with all his exertions, he had not been able to procure sufficient transports, he crossed the sea with half his forces during the worst season of the year, when his enemies felt sure that he would not venture to sail. He seized rapidly the seaport towns of Oricum and Apollonia, and advanced upon Dyrrhachium. This bold stroke had succeeded; but until the remainder of his troops had joined Cæsar, he was not only unable to take the offensive against Pompey, but was in a very precarious position. He had left his faithful friend, M. Antony, in charge of the troops at Brundisium, but the Pompeian fleet was now on the alert, and kept a close watch of the coasts of Italy and Greece. Time wore on. Pompey had approached, and threatened to crush Cæsar. So dangerous was his position, that he would have crossed the stormy Adriatic to put himself at the head of his army, if he had found a fisherman bold enough to take him across. At length, however, M. Antony succeeded in stealing through the hostile cruisers. Soon after landing he effected a juncture with Cæsar. Now Cæsar resumed the offensive, endeavoured to cut Pompey off from his magazines in Dyrrhachium, and conceived even the strange idea of besieging him in his camp, which he tried to surround on the land side with two semicircular concentric trenches. It was an undertaking in which the strategy of Cæsar appears inferior to that of his rival. Pompey profited by Cæsar's mistake. He ordered an attack upon the trenches near the sea; the circumvallation was broken through; Cæsar was obliged to raise the siege, and he retired, fortunately unpursued, directing his retreat towards Thessaly. Near the ever memorable town of Pharsalus the two armies met on the 9th August, B.C. 48. Pompey had a force of eleven legions, or 47,000 foot and 7000 horse, to which Cæsar could only oppose eight very diminished legions, counting in all 22,000 men and 1000 horse. The senatorial party resolved upon giving battle. Their splendid cavalry advanced, dispersed the cavalry of Cæsar, and threatened to outflank his position. But they came suddenly and unexpectedly upon a reserve, consisting of Cæsar's best veterans. They were driven back, and in their wild retreat threw their own infantry into confusion. The Cæsarians now advanced in a body, and the fate of the day was decided. Pompey at once gave up everything for lost, and fled ignominiously from the field. His troops made a stand to defend their camp, but they were overpowered, and 15,000 were wounded or slain; 20,000 were made prisoners; their chief officers fled in every direction; the whole army was annihilated with one blow, and the whole war seemed terminated. Pompey fled to the nearest coast, took ship, and after wandering about for some time among the coasts and islands of the Ægean, sailed to Egypt, where he was treacherously murdered. Soon after Cæsar appeared before Alexandria at the head of only 3700 foot and 800 horse. We can understand that he should have wished to bring the war to a close by a relentless pursuit of his chief antagonist. But it seems hardly in keeping with his general conduct, that after ascertaining Pompey's death, he stopped in Egypt to settle a purely domestic squabble of the claimants to the Egyptian crown. He landed in Alexandria, and soon found himself involved in a most tedious, harassing, and dangerous conflict. The populace of that large and wealthy emporium, supported by the regular army of King Ptolemy Dionysus, besieged Cæsar and his small army in a quarter of the city; at length, upon the arrival of reinforcements from Asia, he prevailed over the obstinate resistance of the Egyptians. Cæsar regulated the succession in favour of Cleopatra and her younger brother. He was captivated by the charms of that artful beauty, who then stood just in the first bloom of youth. In her company he spent some precious time, which his opponents well knew how to make use of. In Italy he had not been heard of for many months. His friends began to despair, to blunder, or to waver, and his enemies looked up once more. After their great overthrow at Pharsalus, when the chief actors, Cæsar and Pompey, had so suddenly disappeared from the stage, the relics of the Pompeian army, and the secondary officers, had been rallied at Coreyra under the protection of the still intact Pompeian fleet. Thence they had proceeded to Africa, where their friend and ally, King Juba of Numidia, had annihilated the Cæsarian corps under Curio, and

seemed able to give such an accession of strength to the senatorial party, that victory might still be hoped for. Here the preparations for a second campaign were carried on with great vigour, especially under the indefatigable Cato. The command-in-chief was given to Metellus Scipio. Arms and supplies were accumulated. A strong Numidian cavalry, elephants, and light-armed slingers and spearmen under Juba, were added to the heavy Roman legions. At Utica a new senate was formed, to assist with its counsel the "legitimate" government. The civil war once more raised its hideous head. Meanwhile Cæsar leisurely ascended the Nile in company with the lovely Cleopatra, to explore the wonders of a bygone age: for Romans and Greeks looked up at the pyramids with hardly less of awe and admiration than does the modern traveller of our own day. Taking leave at length of Egypt and Egypt's queen, Cæsar, still regardless of the threatening danger in the west, undertook, as a sort of by-play, a campaign into Armenia against Pharnaces, the son of the great Mithridates. Cæsar plunged into this unnecessary war, and, with his usual good fortune, terminated it by the decisive victory at Zela in Pontus, which he reported to Rome in the celebrated bulletin—"I came, saw, and conquered." Whatever may have been the defects in Cæsar's plans, they were crowned with success; and he was at length enabled, after an absence of twenty months, to return to Rome in September, B.C. 47, and to finish at leisure the work that remained to be done. It was time, indeed, that he returned. Agitation and riot had begun to reappear in the capital, and what was more ominous by far, a mutiny had broken out in the army. Cæsar, indeed, soon reasserted his mastery, but these untoward circumstances delayed and partly weakened his expedition to Africa. At length, again in the season of storms, he crossed from Lilybæum in Sicily with an army of six legions, into the neighbourhood of Carthage. There was fought the sanguinary battle of Thapsus, 4th April, B.C. 46, in which Cæsar's furious soldiery, brutalized by the long continuance of the civil war, slaughtered 50,000 enemies, cutting down all their prisoners without mercy, in spite of Cæsar's commands, remonstrances, and entreaties. The senatorial party was now lost indeed. Metellus, Scipio, Afranius, Petreius, Juba, and Cato, fell by their own hands. At Utica the loss of the republic was sealed and ratified by the voluntary death of the last republican.

The African campaign had lasted about six months. Cæsar returned to Rome on the 26th of July, to celebrate his triumph. On four successive days he exhibited to the wondering gaze of the populace his trophies and prisoners from Gaul, Egypt, Asia, and Africa. His enemies were officially represented as foreign kings and nations—the Gauls, Ptolemy, Pharnaces, Juba. The triumph over Roman citizens was veiled under barbaric names. Lavish rewards to his veterans, and rich presents and feasts to the whole population of Rome, completed the satisfaction created by the great show. In addition to a large donative, the soldiers obtained allotments of land. By the two sons of Pompey, Cnæus and Sextus, Cæsar was interrupted in the midst of his most important legislative measures. He hastened to Spain, towards the end of B.C. 46; and with his usual impetuosity, and more than his usual courage, brought the war to a victorious issue in the most hard-fought of his battles, at Munda. With the battle of Thapsus the object of Cæsar, so far as it was destructive, was accomplished. This corrupt oligarchy which for a long time had been the curse of Rome, was completely and hopelessly crushed. The insurrection in Spain was merely a personal and local opposition, not based on any broad principles of conflicting political parties. But the work of destruction was only the preliminary part of the task which Cæsar had undertaken. The far more important and arduous duty remained—the gigantic work of reorganization. Cæsar could hardly hope to accomplish it entirely, even if his life should be prolonged to the extremest limit of human existence; for whereas destruction may be the work of a moment, organic growth is the result of time. The position of Cæsar had become difficult from the moment that victory in the field enabled him to drop the party leader, and to rise into the monarch. Like other rulers who have obtained power through a political convulsion, he found his own partisans hardly less troublesome than his old opponents. A great number of those who had followed the political heir of Marius were eager for confiscation, and for abolition of debts. Not a few were of the Catilinarian stamp, men ruined in purse and character, who would have hailed a bloody proscription. With such men Cæsar

parted company after Pharsalus. He wisely and generously threw into the fire the correspondence found in the tents of the Pompeian leaders, and thus quashed most effectually all hopes and fears of political prosecutions. Nothing was more foreign to his feelings than cruelty and vindictiveness. He took a pleasure in pardoning. At the beginning of the war he dismissed all captive officers; even after Pharsalus and Thapsus he pardoned freely those who submitted themselves. He shed tears at the sight of Pompey's head, and regretted that by Cato's suicide he had been denied the satisfaction of pardoning him also. When Pompey's statue was pulled down, he caused it to be re-erected, and persevered in this spirit of generous conciliation, though he met with disaffection from both parties, which, unable to attack him openly, found a vent in satires, placards, popular manifestations, and even conspiracies. Cæsar was, *de facto*, master of the state. His will was law; but it was necessary to find a constitutional form for the actual order of things. The most ready title was that of dictator. A dictator superseded all the republican magistrates, and swayed in his sole hand the whole power of the state. Cæsar took this title, first for a term of years, and at last for life; yet he considered it neither sufficient nor desirable. It was not wise to allow the idea to take root, that any of the republican offices had an existence and rights independent of the new ruler. At the establishment of the republic the royal prerogative had been broken up, and divided among the several republican magistrates. The most natural process, therefore, of restoring the royal authority, was to combine the several titles and functions, and to invest the monarch with them. Cæsar possessed already the highest religious office. As pontifex maximus he was the head of the state religion; he took the title of consul for five and then for ten years; the leadership in the senate he occupied by assuming the title of First of the senate; the power of the censorship, and with it the right of making and unmaking senators and knights, was given him as "præfectus morum;" the tribunician power also was joined to this accumulation of offices, so that he was in almost every respect the representative and bearer of the public authority, and of the majesty of the state. But all these offices were originally and essentially municipal offices of the city of Rome. The civil and military power over a province of the republic might be added by special enactments, but was inherent in none of them. This civil and military authority, comprised in the name "Imperium" Cæsar now took permanently for himself with the title "Imperator," prefixed to his name. From it were henceforth to emanate the delegated powers of the provincial governors appointed by him, and responsible to him alone. This last change was the greatest of all. It was by the oppression of the provinces that the Roman oligarchy had ruined their unhappy subjects, had corrupted the freedom of the Roman people, had depraved and degraded themselves, and had called up the avenger. In the Imperium, therefore, we justly find the cause, the essence, and the title of the Roman empire.

A necessary consequence of this change was the depression of the city of Rome, who, from being the mistress of the whole republic, became the first municipality of the empire. The crowds of the Roman forum were henceforth stripped of the privilege of sending forth governors into the provinces, and taxing them according to their will and pleasure. The popular elections of consuls, prætors, and other officers continued, indeed, under certain limitations, which obliged the electors to choose the candidates nominated by Cæsar; but these officers had no concurrent authority with the emperor; they were his legates and servants, not those of the Roman people. This was the most effectual stop that Cæsar could put to the intolerable violence with which the mob and hired gangs of desperadoes had, in the last years of the republic, disgraced and undermined what was once the liberty of the people. The forum and the field of Mars became peaceful, when influence, power, and wealth were no longer to be obtained there; the great Roman people, coaxed and flattered and bribed by all parties, not less by the unprincipled demagogue than by the virtuous Cato, became a despised and impotent rabble. When Cæsar ascended to power, the infamous practice of distributing corn gratis, or at a low or nominal price, at the expense of the provinces, had grown to such fearful dimensions that it swallowed up one-fifth of the whole revenue of the state. Nothing shows more clearly the altered position of Cæsar, than that he was enabled at one blow to strike off 170,000 from a list of 320,000 public pensioners, and to make

poverty the only claim of those who continued to receive a similar largess. He took care at the same time by establishing a broad system of emigration and colonization, to relieve the capital from the idle crowd that had flocked thither to participate in the many privileges of Roman citizens, and at the same time to restore new life to those ancient seats of industry, Carthage and Corinth.

But the wretchedness of the poor was not more ominous of decay than the mad extravagance of the rich. Cæsar, in the spirit of the time, vainly endeavoured to restrain this by severe sumptuary laws. He also tried to counteract the alarming increase of slaves, and the corresponding decrease of freemen. He ordered that of the herdsmen employed on the extensive Italian grazing farms, a proportion of at least one-third should be freemen. He attempted to restrict the hoarding of money, and by several other well-meant but fruitless laws, fondly hoped to restore an independent and healthy middle class. The most questionable perhaps of these, was one by which he cancelled a part of existing debts; he acted in this respect in the spirit of the old Roman democracy, which seemed to be justified by the ruinous and illegal rate of interest which the misfortunes of the times had in part produced. We are amazed at the activity he displayed as a legislator. No department of the state escaped his attention. He established the finances and the taxation on a sound and equitable footing; he issued the most comprehensive laws for the government of the provinces, the reform of the municipal towns, the administration of justice, the establishment of an effective police, the want of which had delivered the highways of Italy, and even the streets of Rome, into the hands of countless robbers and assassins. He contemplated, and in part executed public works, on an astounding scale of magnitude. Buildings, roads, canals, ports, works of drainage and irrigation, gave employment to crowds of impoverished workmen. The interests of science and literature were not forgotten by a man, who, if he had not been a statesman and a soldier, might have taken the highest place in several departments of learning. He founded the first public library at Rome, invited scholars by the offer of rewards and privileges to the capital, and with the assistance of the astronomer, Sosigenes, introduced the Egyptian solar year in place of the old Roman lunar year, which, through the ignorance of the "pontifices," and the meddling of political parties, had come to be nearly three months in advance of the real time. His genius rose even to contemplate a codification of the law, a work which his untimely death threw back for nearly six centuries, to be at last undertaken by far inferior hands.

In such an activity as this we must recognize and admire the extraordinary genius, worthy of the exalted position to which he had aspired, of regenerating his country. But he never succeeded in gaining the loyal affection of the aristocracy, which he had deprived of power. The senate, though decimated by the civil wars, and purged of the uncompromising opponents of monarchy, was still the centre of unconciliated animosity, though outwardly the loyalty of the nobility seemed to know no bounds. Their servile spirit had followed up Cæsar's victories with a succession of decrees in which their ingenuity was completely exhausted, to devise honours and titles for the new master. They called him the "Father of his country," they voted public thanksgivings for his victories, they changed the name of the month in which he was born from Quinctilis into Julius, erected his statues in the temples, and declared him a god. A laurel crown, a royal robe of state, an elevated gold throne were to mark him out as their lord and master; a body guard of senators was to watch for his safety. Nothing seemed left but to crown the king whom they had accepted. Whether it was Cæsar's wish to assume the title of Rex, may still be considered doubtful. He felt, on the one side, that he already possessed the reality of power, and that the title of king, from old time proscribed and odious to the Roman ear, might add to the difficulty of his position, without increasing his real strength. Yet he can hardly have been a stranger to the several devices by which his friends, especially M. Antony, evidently endeavoured to sound the public feeling on that subject. At the festival of Lupercales, M. Antony offered Cæsar a crown; but the people showed their displeasure, and Cæsar rejected the proffered gift. Rumours, however, were rife that Cæsar meditated to take the title of king in all countries out of Italy. He was making preparations for a war with Parthia, and the Sibylline books contained a prophecy that the Parthians could only be conquered by a king. These rumours, whether true or false, gave a colour of republican virtue to a number of men,

whom personal hatred of Cæsar had united in a conspiracy against his life. C. Cassius was the soul and leader of this plot. Besides M. Brutus, there was not one among them whose motives were not selfish and personal. They kept their secret well, though about sixty shared it. The blow was struck on the ever memorable Ides of March (15th March, B.C. 44). In the senate-house of Pompey, at the foot of the statue of his conquered rival, Cæsar fell, pierced by twenty-three wounds. His death plunged Rome again into the vortex of civil war, from which she emerged the hopeless slave of a man in every respect inferior to the great founder of the Empire.

Cæsar was only in his fifty-sixth year at the time of his death. Though he did not live to accomplish his great work, the stamp which his commanding genius left upon it never was obliterated as long as Roman Cæsars wore the imperial purple; and even now a breath of his spirit pervades the world, and a faint echo of his name. Rome in him produced her greatest man. Intellect and will were justly balanced in his great soul. No illusion, no enthusiasm, no ideals clouded his perception or perverted his judgment. A cool, calm, reflecting, prosaic Roman, he saw things as they were, not as he wished them to be. He accepted the facts of his position, and shaped his course of action accordingly. He judged men and institutions for what they were worth, and by the irresistible force of his will, pressed them into his service. He never wavered or hesitated in his whole life, and never lost sight of his final aim. What he had undertaken he carried out—not with the obstinacy of a narrow and stubborn mind, but without passion, with caution and courage combined. In war he was bold and daring, relying more upon rapidity of movement than upon numbers, and trusting much also to that good fortune which always favours the brave. He relied not upon rules and established usage, but upon the intuition of genius. He had no system, and no school; but, as if by inspiration, he always adopted the means which led to success. His starting-point in his career was not the field of battle, but the political arena. He was forty years old before he knew that he could command an army; and though the greatest of Roman generals, he was not so much a soldier as a statesman. But the universality of his genius fitted him for any career. He possessed that kind of natural, plain, and persuasive eloquence which disdains ponderous periods and pointed phrases. He was a perfect master of all the polite learning of his time. Every intellectual occupation had a charm for him, from the study of astronomy to that of the grammatical inflexions of his mother tongue. He fully enjoyed the pleasures of life, physical as well as intellectual. He drained the cup of pleasure to the dregs, but he never became a slave to his passions. He never had to deplore, like Alexander, a single rash act committed under the influence of low excitement. An admirer of the fair sex, he paid great attention to his personal appearance, which was handsome and imposing. His health, though naturally feeble, was strengthened by exercise and exposure. He was a master in every manly feat, and could set his soldiers an example in every military virtue. Such was the great Cæsar, by nature fitted to accomplish a work which, in the development of human affairs, had become imperative. He perceived his duty, he undertook and accomplished it; and if anything is wanted to engage our sympathies, not less than our admiration, for the greatest son of Rome, it is that he died a victim on her altar.—W. I.

**CÆSAR, CÆSARIANO**, an Italian architect, born at Milan about 1451. The work in connection with which his name is remembered, is a translation into Italian of the great work of Vitruvius, *De Architectura*, to which he added an extensive commentary.

**CÆSAR, SIR JULIUS**, a learned English lawyer, master of the Rolls from 1614–1636, born near Tottenham in Middlesex in 1557. He held some important appointments under Queen Elizabeth, and was knighted on James' accession. He was also appointed chancellor and under-treasurer of the exchequer, and in 1607 sworn into the privy council.

**CÆSARIUS**, an eminent French prelate, born at Châlons-sur-Saone in 470, succeeded Pomerius in 499 as abbot of the monastery of Arles. Two years later he became bishop of the diocese, and in the discharge of the duties of his office did much to restore discipline among the clergy. His strictness procured him enemies, and he was twice subjected to temporary banishment on fictitious charges of wishing to betray his country into the hands of the Burgundians. With the consent of the pope,

Cæsarius convoked and presided over several councils for settling points of discipline and doctrine. The most noteworthy of them was that of Orange in 529, at which Pelagianism was condemned. Cæsarius seems to have been a zealous disciple of St. Augustine. Several of his numerous homilies are to be found among the sermons of that father. Many of them are also preserved in Baluze's *Bibliotheca Patrum*. Cæsarius died in 544.—J. B.

**CAFFARELLI, FRANÇOIS-MARIE-AUGUSTE**, a French general, honoured on various state occasions with the friendship and confidence of Napoleon, born at Falga in 1766; died in 1849. He entered the army as a private soldier in a regiment of dragoons, and attained successively by merit in the field, particularly at Austerlitz, the grades of colonel, general of brigade, and general of division. In 1831 he was made a peer.

**CAFFARELLI DU FALGA, LOUIS-MARIE-JOSEPH-MAXIMILIEN**, a French general, and man of science, born at the Chateau-du-Falga in Upper Languedoc in 1756. He assisted, under the orders of Kleber, at the passage of the Rhine, near Dusseldorf, in September, 1795. He was subsequently attached, with the rank of general of brigade and chief of the engineers, to the expedition of Bonaparte into Egypt, where to the great grief both of his superior and the soldiery, he died, April, 1799, in consequence of a wound received at the siege of St. Jean d'Acre.

**CAFFARO**, the earliest historian of Genoa, born in 1080; died in 1166. In 1100 he joined the crusades, and fought at the siege of Cæsarea. Having returned to Genoa, he wrought at his history, which, though written in very bad Latin, is of great value as a source of authentic information. It is preserved in Muratori.

**CAGLIARI, BENEDETTO**. This painter was the brother of Paolo Veronese, and was born at Verona in 1538. He succeeded most in architectural compositions, with which he aided the works of Paolo. He painted also in the style of his brother, and his works in Venice are highly accounted. He died in 1598.—W. T.

**CAGLIARI, CARLETO**, the elder son of Paolo Veronese, and also his pupil. Carefully educated by his father, at the age of eighteen he had painted some pictures of remarkable promise, and acquired a considerable reputation. On the death of Paolo, Carletto was left with his brother to finish the many works left incomplete by their illustrious father. It has not been easy to distinguish the labours of the father and the sons and several works pass current as Veronese's in which there is little doubt he had no hand whatever. Carletto was born at Venice in 1570. He died at the early age of twenty-six.—W. T.

**CAGLIARI, GABRIELE**, was the younger son of Paolo Veronese. He painted at first with promise; but ultimately put out by the superior lights of his father, brother, and uncle, he abandoned art for commerce. He was born in 1568, and died in 1631.—W. T.

**CAGLIARI, PAOLO**. See **VERONESE, PAOLO**.

**CAGLIOSTRO, ALEXANDER**, commonly called Count de, a famous adventurer, born of respectable parentage at Palermo in 1745; died in 1795. He commenced his public career in a characteristic manner, by cheating a goldsmith of a large sum of money, and ended it, as could hardly have been prophesied, under the ban of the inquisition in the castle of St. Leo. On escaping from Palermo, the proceeds of his crime, or rather series of crimes (for the affair with the goldsmith was not the first of his felonies), enabled him to undertake a course of travel in the East, which he prosecuted under various aliases, but with uniform success; securing everywhere the protection of pashas and muftis, and pocketing what it was afterwards his splendid business to confer—immense riches. Returning to Europe, he married at Rome or Naples a beautiful woman of the name of Lorenza Feliciani, who played the part of countess de Cagliostro to admiration, and added the wages of prostitution to the gains of sorcery. At Strasbourg, where the adventurous pair settled about 1780, Cagliostro evoked the gratitude of the populace by benevolent attentions to the sick, at the same time that he filled his coffers by his trade in necromancy. Here he made the acquaintance of cardinal du Rohan, under whose protection he removed to Paris in 1785. In the capital of France, with a prince of the church for his protector, his success could not but be decided, for he brought with him the secret of Egyptian freemasonry, and by means of that the Parisians could have the pleasure at any time of seeing the ghosts of their departed relatives. He communicated immor-

tality in one elixir, and the power of making gold in another, and added prodigiously to his own store of the latter commodity. But his connection with Rohan, who was concerned in the famous affair of the diamond necklace, brought him into trouble. He shared the imprisonment and the exile of the cardinal. After spending two years in England, and performing another tour on the continent, in an evil hour he went to Rome, where he was pounced upon by the inquisition, which, making light of his elixirs, condemned him to death—a sentence which was commuted by the pope into perpetual imprisonment. The character in which he was to have suffered death, and in which he underwent captivity, was that of a freemason! His wife, who was shut up in a convent, survived him several years.—J. S., G.

**CAGNATI, GILBERT**, an Italian botanist, was a native of Nocera in the kingdom of Naples. He lived during the second half of the 16th century, and wrote a work on gardens, which was published at Basle in 1546.—J. H. B.

**CAGNATI, MARSILIUS**, an Italian physician, was born at Padua, and died about the year 1610. He studied medicine in his native town, and afterwards went to Rome. He has written various medical and botanical works. In his "Four Books of Observations," he has given remarks on the plants mentioned by Hippocrates and Theophrastus.—J. H. B.

**CAGNIARD, DE LA TOUR, CHARLES**, Baron, a celebrated French physicist, born at Paris in 1777. He distinguished himself greatly at the *ecole Polytechnique*; was afterwards attached to the council of state of the ministry of the interior; received the cross of honour in 1815, and the title of baron in 1818; succeeded Gay-Lussac as member of the Academy of Sciences in 1851. Cagniard de la Tour effected many valuable improvements in mechanical and chemical processes. His greatest achievement in engineering is the suspended aqueduct at Crouzol—a bold, original, and most successful work. We are indebted to him for the beautiful *sirene*, by which, for the first time, the number of vibrations producing the different notes of sound, could be accurately counted. His curious researches and useful inventions find a place in almost every scientific treatise on mechanics and physics.—J. P. N.

**CAGNOLA, LUIGI**, Marquis, an Italian architect, born at Milan in 1762; died in 1833. At Rome he received lessons from Tarquini, and soon attained high rank as an architect. Napoleon, for whom he constructed the triumphal arches of Marengo and the Simplon, made him a member of the council of the ancients.

**CAGNOLI, ANTONY**, an astronomer of Italian extraction, was born at Zante in 1743. His father, though residing at Zante, discharged the duties of chancellor to the republic of Verona. In 1772 young Cagnoli, in the character of secretary of legation, accompanied Marco Zeno to Madrid, and in 1776 he took up his residence at Paris. It is said that his purpose of devoting himself to astronomy, originated in a view which he obtained of Saturn's ring in the Paris observatory some time in 1780. Having commenced the study in good earnest, and procured the necessary instruments, he went to Verona, and established a kind of observatory at his house. When this town was taken by the French in 1797, he sold his instruments and removed, first to Bresa and then to Modena, where he filled the chair of mathematics in the military school. He subsequently retired to Verona, where he died in 1816. He was a member of nearly all the academies in Europe. His principal works are—"Trigonometria piana e sferica," Paris, 1786 and 1808; "Méthode pour calculer les longitudes géographiques d'après l'observation d'éclipses de soleil ou d'occultations d'étoiles;" "Almanacco con diverse notizie astronomiche, adattate all'uso comune," 1787-1801, 1805-6; "Osservazioni meteorologiche," 1788-96; "Notizie astronomiche, adattate all'uso comune," 1799-1802; "Sezioni coniche," Modena, 1801; "Catalogue de 501 étoiles, snivi des tables relatives d'observation et de mutation," Modena, 1818; "Compendio della Trigonometria piana, ad uso degli aspiranti alla scuola militare in Modena," 1807; numerous articles inserted in the *Transactions de la Société Italienne*; amongst them, "Nuovo e sicuro mezzo per riconoscere la figura della terra," in vol. vi. of the *Transactions*, which was reprinted in London by Baily, and noticed in the *Philosophical Magazine* for May, 1822; "Degli elementi spettanti alla teoria della rotazione solare e lunare," vol. viii. of the *Transactions*; "Problema sull'equazione dell'orbita e sulla eccentricità de' pianeti," Bologna, 1806.—J. D. E.

**CAHANA, R'C. BEN THACHLIFA**, was rector of the then flourishing rabbinical school at Punn-beditha in Babylonia, from 397 to 413. To him is attributed the composition of the "Pesiktha" (agadic, *i. e.* homiletic exposition of sections of the Pentateuch), frequently mentioned by writers as the *Pesiktha* of R' Cahana. With numerous additions and corrections, it became known in the ninth century by the name of "Pesiktha Rabbathi" (The Greater *Pesiktha*); the still existing fragments of which have been published and translated into Latin.—(Fürst, *Kultur und Lit. Gesch.*) Zunz, however, after a careful analysis of all the vestiges to be found of the above exposition in ancient authors, arrives at the conclusion that the later work is entirely independent of the older *Pesiktha*, of which nothing is extant save the fragmentary notices in the *Midrashim* and the *Aruch*.—(Zunz, *Gottesdienstl. Vortr.*, chap. 11 and 13.)—T. T.

**CAHEN, SAMUEL**, a French Hebraist and publicist, was born at Metz in 1796. He was educated for the rabbinical office, but, contrary to the wish of his parents, began life as a private teacher in Germany. Having returned to France, he taught some time in the country, and afterwards conducted the consistorial school of Paris from 1823 to 1836. He is the author of an "Easy Method of acquiring the Hebrew Tongue;" of a "Manual of Universal History," &c. But his greatest undertaking was a translation of the bible, and of the documents collaterally related to it. The twentieth and last volume was published in 1851.

**CAHER-B' ILLAH, MOHAMMED**, caliph of Bagdad, died in 950. In 929 a revolution placed him on his brother's throne. Three days after Moctader was restored, and reigned till 932, when Caher again ascended the throne. But the emirs soon grew tired of his crimes, and forced him a second time to abdicate. They put out his eyes to prevent his regaining the supreme power.

\* **CAHOIRS, AUGUSTE**, a noted French chemist, born in 1813, was educated at the polytechnic school of Paris. He has lectured on his favourite science successively in the central school of arts and in the polytechnic. Besides a great number of interesting memoirs inserted in the *Comptes Rendus*, he has published "Leçons de chimie generale elementaire," 1855-56.—J. S., G.

**CAHUSAC, LOUIS DE**, a dramatic writer, born of a noble family at Montauban, and died at Paris in 1759. He produced a considerable number of tragic and comic pieces. One of the latter, *Zénéide*, was for a long time a stock play. Cahusac was fortunate in having his operas set to music, and so rendered temporarily successful, by Rameau, the celebrated composer. He wrote some works of a different kind, among which was a "Treatise on Ancient and Modern Dancing." He also furnished to the *Encyclopédie* articles on the grand sights of Europe.

**CAIAPHAS (Receiver)**, the Jewish high-priest before whom Jesus Christ was tried and condemned ere he was taken before Pontius Pilate. He was created high-priest by Valerius Gratus, Pilate's predecessor, but was deposed by Vitellius, the governor of Syria.

**CAIET.** See **CAYET.**

**CAIGNIEZ, LOUIS CHARLES**, born at Arras, April, 1762. His celebrity as a dramatic writer was great in his day amongst the lower classes of the population of Paris, who delighted in the intense emotions excited by his stirring melodramas. From a drama of Caigniez was derived the "Maid and the Magpie," which in various shapes has found its way to every theatre in Europe, and is as a child's nursery tale to big people. He could also soar into such pretty realms of fancy as "The Sleeping Beauty in the Wood," which was the *Midsummer's Night Dream* of this Boulevard Shakspeare. Notwithstanding the immense popularity of his works, he died in indigence in 1842.—J. F. C.

**CAILHAVA, D'ESTENDEUX (JEAN FRANCIS)**, a dramatic writer, born near Toulouse in 1731. His genius was first stirred by the general joy excited by the escape of Louis XV. from the attempt on his life by Damiens. While the "well-beloved" Louis yet retained his ascendancy over his people, the news of Damiens' attempt reached the ears of the poetic Toulouse, famous for its floral games and jousts of amorous hards. Cailhava wrote a "Piece de Circonstance," which raised meridianal enthusiasm so high, and the author's self-opinion as well, that he set out for Paris with a head full of dramas. But he found that he had to deal with an audience more critical than emotional, and yet his failures were fairly balanced by success. For a while his dramatic career was interrupted by an unlucky

quarrel with the famous comedian Molé, who had influence enough to have the Theatre Française shut in his face. He next brought the leading critics on his back by essays against the false taste they encouraged, and from which he was saved by his love for Moliere, which amounted to adoration. The Emperor Napoleon rendered his old age easy, which was moreover sweetened by the devotedness of an excellent daughter, in whose arms the dramatist expired in 1813.—J. F. C.

CAILLARD, ANTOINE-BERNARD, born in 1737; died in 1807. In youth he became acquainted with Turgot, to whom he owed much of his success. Through his influence he accompanied the marquis de Vêrac in 1774, 1779, and 1784, as secretary of legation to Cassel, Copenhagen, and St. Petersburg. In 1786 he was sent to the Hague. After the Revolution the directory appointed him minister-plenipotentiary to the court of Berlin. In this mission he obtained the Prussian king's recognition of the left bank of the Rhine as the boundary of the republic; but the secret intrigues of Russia induced the directory to supersede him by Sieyes, whom they considered a more imposing ambassador. In 1801 Caillard received the portfolio of the foreign department in the absence of Talleyrand. His "Memoire sur la Revolution de Hollande en 1787," is highly praised.—R. M., A.

CAILLAU, JEAN-MARIE, a French physician, born at Gaillac in 1765; died in 1820. He did not study medicine till 1789. In 1794 he obtained an appointment as physician to the army of the Western Pyrenees. Having taken his degree in 1803, he commenced practising in Bordeaux, where he ultimately became vice-director, and at last director of the medical school.

CAILLE, DE LA. See LA CAILLE.

CAILLÉ, RENÉ, a celebrated French traveller in the close of the last century. Having resided in Senegal for a number of years to inure himself to the climate, and acquire familiarity with the native manners, he started from Sierra Leone, after a short visit to Paris, penetrated to Timbuctoo in the guise of an Egyptian who had been educated in France, and subsequently reached Tangier half dead from fatigue and hardships. He was awarded a prize of ten thousand francs by the Geographical Society of Paris, and published the journal of his travels in 1830.—W. B.

CAILLEMOTE, a gallant officer in the service of the prince of Orange, descended from a noble family of France. Coming to England with William in 1688, he was despatched to Ireland in the following year with a command in the expedition under the duke of Schomberg. After the reduction of Carrickfergus, the army, with the exception of La Caillemote's regiment and Cambon's, having gone into winter quarters, this brave officer had an opportunity of distinguishing himself in a most hazardous enterprise, an attempt against Charlemont Fort, which, although considered an almost impregnable position, he succeeded with extraordinary daring in damaging to such an extent, that it surrendered to the duke shortly after. Caillemote fell at the battle of the Boyne.—J. S., G.

CAILLET, GUILLAUME, known as JACQUES BONHOMME, a French peasant who lived in the fourteenth century. He was the leader of the Jacquerie or insurgent peasants, who, driven mad with hunger and wretchedness, in 1358 stormed the castles of the nobles and slaughtered their inmates. These poor peasants had been long ruthlessly plundered and degraded, and at last suddenly overwhelmed their oppressors with a terrible revenge. The nobles immediately declared against them, and Charles the Bad, king of Navarre, completed their destruction. The king of the Jacquerie was crowned with a red-hot iron trivet.

CAILLET, NICOLAS, a French lawyer of the sixteenth century. He studied under the famous Cujas, and has left a work entitled "Commentarii in leges Marchiæ Municipales."

CAILLIAUD, FREDERIC, a famous French traveller, born at Nantes in 1787. With a competent knowledge of natural science, especially of geology and mineralogy, acquired in Paris, he set out on his travels in 1814, and passing through Greece, Turkey in Europe, and Turkey in Asia, reached Egypt in the following year, where he was well received by the pasha, Mohammed Ali, who commissioned him to explore the deserts on both sides of the Nile. After acquainting himself with the monuments abounding in the vicinity of the two uppermost Nubian cataracts, he discovered by a fortunate chance at Mount Zabarah the famous emerald mines wrought under the Ptole-

mies, and since their day mines of wealth to the Arabic poets, but although still in working order, being even furnished with the necessary tools, long sacred from the hand of avaricious toil. A hardly less curious discovery, which he made shortly after in this region, was that of one of the ancient commercial routes through Egypt to India, which, by the account of some of the tribes among whom his inquiries were prosecuted, led through a city of great extent on the borders of the Red Sea, probably Berenice, the ruins of which are still visible. After spending nine months at Thebes, he returned to France in 1819, with a rich collection of antiquities, plans, inscriptions, &c., which M. Jomard, at the request of government, published in 1825, under the title of "Voyage à l'oasis de Thebes et dans les deserts situés à l'orient et à l'occident de la Thebaïde," &c. Returning to Egypt before the end of the year, he collected the materials for the "Voyage à l'oasis de Syouah," also published by M. Jomard in 1823. Joining the expedition of the pasha's son, Ishmail, into Upper Nubia, he gratified a cherished ambition by a visit to the supposed site of the ancient Meroe, of which, and of the region to the north, he published an account in 1826-27, under the title—"Voyage à Meroe, au fleuve Blanc, au delà de Fazogl, dans le midi du royaume de Sennâr, à Syouah et dans les cinq autres oasis," &c. In 1831 he published an interesting work on the arts and trades, the civil and domestic life of the ancient races of Egypt, Nubia, and Ethiopia, and the manners and customs of the modern inhabitants of these countries. Previous to the publication of this work he was appointed curator of the museum of his native town.—(*Nouv. Biog. Gen.*)—J. S., G.

CAIN (*Possession*), the eldest son of Adam and Eve; the story of his crime and punishment is recorded in Genesis, chapter iv.

\* CAIRD, REV. JOHN, a minister of the established church of Scotland, possessed of rare accomplishments as a pulpit orator, was born at Greenock in 1820. His first charge was at Newton, Ayr, whence in 1847 he was transferred to Lady Yester's, Edinburgh. His popularity in the city became so great that his strength was overtasked, and for the sake of his health he accepted in 1849 the country charge of Errol, near Perth. While there the power of the young preacher was not forgotten, and whenever he was induced to visit the larger towns his discourses were listened to by crowds such as no Scottish preacher has drawn since the days of Chalmers. In 1855 he preached before the queen in Crathie church, Balmoral, his sermon on "The Religion of Common Life," which being published by royal command, extended his fame far and wide, and obtained for him a reputation much higher than that of a mere popular preacher. In 1857 he accepted the pastorate of a newly-erected church in Glasgow. The year following he published a volume of sermons, which has been widely read and cordially eulogised. He is now professor of divinity in Glasgow college, and one of her majesty's chaplains for Scotland.—J. B.

CAIRELS, ELIAS, a Perigordian jongleur and troubadour, died about 1260. It was while working at his trade as a silversmith that the genius of poesy first visited him. After this he abandoned his craft, and betook himself to the courts of kings and princes. Montferrat was one of his patrons.

CAIRNES, DAVID, one of those names which is honourably associated with the gallant and memorable defence of Derry in 1689. The family settled in Ireland two centuries previously, having come from Scotland with the earl of Annandale, and claim kindred with some of the highest families, both in that country and in England. David was educated to the profession of the law, which he followed previously to the Revolution, and was possessed of considerable property and position. On the day that Lord Antrim led his troops to the gates of Derry, Cairnes arrived in the city, and by his influence and the weight of his character, he turned the scale of public opinion in favour of "the 'Prentice Boys," and succeeded in persuading the leading men to co-operate with them in defending the town. His exertions also induced the gentry in the surrounding counties to aid in the great struggle which was impending. During three days he superintended and suggested the plan of defence of Derry, and on the fourth day, the 11th December, he undertook the hazardous task of bearing letters to King William and the Irish Society from the citizens, representing the imminence of their position, and imploring speedy supplies of arms and ammunition. Returning, after a delay of three months, with a promise of succour, he was just in time to

countervail the treachery of Governor Lundy, and reassure the citizens; a council was immediately called, and a resolution was published declaring their determination to defend the city to the last. In the engagement which took place at Pennyburn Mill, Cairnes distinguished himself by his personal valour, as he had before by his zeal and ability in council; and being appointed lieutenant-colonel of horse, he signalized himself at Windmill Hill on the 1st of June, when Hamilton's army was routed. He was appointed recorder of Derry in 1707, and was promoted to the office of attorney-general. He served, too, in parliament for the city for thirty years, and was a zealous and faithful representative. His death occurred in 1772.—J. F. W.

**CAIRO, CAVALIERE FRANCESCO.** This artist was born at Milan in 1598, and studied under Morazzone. Without the vigour of style of his master, he excelled him in grace of composition and beauty of colour. On the invitation of Victor Amadeus, he visited the court of Savoy, received the honour of knighthood, a pension, and the hand of one of the ladies of the court. His portraits are stated to have many of the beauties of Titian. He died in 1674.—W. T.

**CAIT BEY,** the seventeenth sultan of the Circassian dynasty of Mamelukes in Egypt and Syria. From the rank of a slave he rose to the throne in 1467. He was involved in almost constant disputes with the Ottoman power, and at length a war ensued which lasted for six years, in the course of which a most signal victory was gained by the Mamelukes at Agadj-Tehair in Cilicia. Peace was concluded in 1491, and Cait Bey died in 1495, distinguished among the Mameluke sultans for the length and brilliancy of his reign.—J. B.

**CAIUS.** See **GAIUS.**

**CAIUS,** a disciple of Irenæus, consecrated bishop in 210. He is remembered as an opponent of the heresy of Cerinthus, and Photius ascribes to him a work named "The Book of the Universe," which has been sometimes attributed to Josephus.

**CAIUS, CÆSAR,** one of the sons of Marcus Vipsanius Agrippa and Julia, the daughter of Augustus, was, along with his brother Lucius, adopted by the emperor, and introduced at an early age into the service, and raised to the honours of the state. He held a command in the east at the beginning of the christian era, and received a wound there, from the effects of which he died in Lycia on his way home.—W. B.

**CAIUS, JOHN,** poet laureate to Edward IV., wrote a history of the siege of Rhodes.

**CAIUS, KEYE, or KAYE, JOHN, M.D.,** the co-founder of Caius and Gonvil college, Cambridge, was born at Norwich in 1510. He studied at Gonvil hall, of which he became a fellow, devoting himself chiefly to theology. Having travelled into Italy, he there became a student of medicine, and won great distinction. On his return to England he became physician successively to Edward VI., Mary, and Elizabeth. He was a fellow of the college of physicians in London, holding for many years positions of eminence in that learned body. In 1557 he obtained from Queen Mary a license for the incorporation of Gonvil hall, where he had been educated, which was thenceforth called Caius and Gonvil college, and endowed with estates purchased by Caius at the dissolution of the monasteries. He became the first master, and held the office till near the end of his life. He died in 1573. The learning of Dr. Caius was very extensive. Of his numerous works may be noted—"Hippocrates de Medicamentis," first discovered in MS. by him; "De Ephemeris Britannica"—an account of the sweating sickness then epidemic in England, in 1556—reprinted in 1721; and "History of the University of Cambridge," in which he asserted that this university was founded by Cantaber 394 years before Christ.—J. B.

**CAIUS, Sr.,** was a native of Dalmatia, and succeeded Euty-chian in the papal chair in 283. He died in 296.

**CAIUS, THOMAS,** master of University college, Oxford, where he died in 1572. He was the opponent of Dr. John Caius of Cambridge, in a dispute as to the antiquity of the sister universities. He translated Erasmus' paraphrase on St. Mark, and Aristotle's *De mirabilibus Mundi*, &c.

**CAIUS, VALGIUS,** a Roman physician, lived during the first century of the christian era. He was physician to the Emperor Augustus, and he is noticed by Pliny as having written a work on the medicinal properties and uses of plants.—J. H. B.

**CAJETAN, CARDINAL,** was born in 1469, and died in 1534. His real name was **THOMAS DE VIO**, but he took the name by

which he is best known from his birthplace, Cajeta in the kingdom of Naples. He was a distinguished member of the Dominican order, holding the office of general for ten years. Having written a work "On the Power of the Pope," a succession of preferments flowed in upon him. He was first made bishop of his native Cajeta, then archbishop of Palermo, and at length in 1517 was elevated to a place in the college of cardinals. In the year following he was sent into Germany to combat Luther, and it was in obedience to his summons that the reformer appeared at Augsburg. Cajetan wrote commentaries on the philosophy of Aristotle, and the theology of Thomas Aquinas, and undertook the task of preparing a literal translation of the whole bible, which he accomplished with the exception of Solomon's Song, the Prophets, and the Apocalypse. The characteristic of this work is the extreme care with which the author seeks to be literal, even at the sacrifice of a clear rendering of the meaning. The work is named "Commentaries on the Holy Scriptures," Lyons, 1639.—J. B.

**CAJETAN or CAETAN, ENRICO,** an Italian subject of the Spanish king, died in 1599. He was chosen cardinal in 1585, and is chiefly known for the part he played in Paris during the time of the League. He sided with the leaguers, and thus put himself in opposition to the king, as well as to Henry IV. and the Huguenots. The battle of Ivry considerably mitigated his orthodoxy, and he was only too glad of the opportunity which the death of the pope afforded him of returning to Italy.

**CAJOT, JEAN-JOSEPH,** a Benedictine antiquarian and critic, born in 1726; died in 1779. His first work was "Les Antiquités de Metz." In 1766 appeared his "Plagiats de M. J.-J. R. de Genève sur l'éducation," a somewhat unsuccessful attempt to show that the *Emile* of Rousseau is not a production possessing any claims to be considered as original, but is merely a compilation. He wrote various other works, which at the present day offer few points of much interest.

**CALADO, MANOEL,** a Portuguese historian, born at Villaviciosa about 1584; died in 1654. He became a monk, but soon quitted his monastic solitude among the mountains of Ossa for the more stirring scenes of Brazil, where he witnessed the chief events which followed the Dutch invasion. He published an account of the exploits of Fernandez Vieira.

**CALAMIS,** a Greek sculptor of the fifth century B.C., the contemporary of Phidias. The chief of his works are the Apollo of the Servilian gardens at Rome, of which Pliny speaks, and which is supposed to be the "Apollo Belvedere" of the Vatican, the "Apollo Alexikakos" seen by Pausanias at Athens, and a colossal Apollo for Apollonia in Illyricum.

**CALAMY, EDMUND,** an eminent nonconformist divine of the seventeenth century, was born in London in February, 1600. He was a distinguished student of Pembroke hall, Cambridge, and having attracted the notice of the bishop of Ely, he was appointed his domestic chaplain and vicar of Swaffham Prior, Cambridgeshire. In 1626 he removed to one of the lectureships of Bury St. Edmund's, where he officiated for ten years, and was all that time ranked as a conformist. When, however, Bishop Wren's Articles were published, and the reading of the Book of Sports enforced, he, with thirty other clergymen, publicly declared his protest, and left the diocese. Becoming known as a nonconformist, he was appointed by the earl of Essex to the living of Rochford in Essex. Compelled by the state of his health to leave that district, and having avowed his adherence to the presbyterian party, he was in 1639 chosen minister of St. Mary's, Aldermanbury, London, where he was long a popular preacher, and an active partisan in the controversies of the day. He was one of the authors of the work, famous in its time, named "Smectymnus," a reply to Bishop Hall's *Divine Right of Episcopacy*. He was one of the divines appointed by the house of lords in 1641, to confer concerning the differences in ecclesiastical discipline, and at the Savoy conference appeared in support of some alterations in the liturgy. He was never a friend of Cromwell's government, and took an active part in bringing about the Restoration. He went to Holland as one of the deputation sent to congratulate Charles II. On the king's return, Calamy became one of his majesty's chaplains, continuing to advance the presbyterian interest, till the passing of the act of uniformity compelled him to resign his living. He died October 29, 1666. Calamy was ranked as an able theologian. He published five sermons entitled "The Godly Man's Ark, or a City of Refuge in the Day of his Distress," and took part in pre-

paring several controversial documents drawn up by his party.—His eldest son, EDMUND, born in 1635; died in 1685; was, like his father, a zealous nonconformist.—On the other hand, his son BENJAMIN, who was in 1677 chosen minister of his father's church of St. Mary's, Aldermanbury, was an adherent of the high church party, and author of "A Discourse about a Scrupulous Conscience," which attracted considerable notice in the controversy.—EDMUND, born in 1671; died in 1732; son of the elder of these two brothers, followed his father and grandfather in a firm adherence to the nonconformist principles. He engaged in a lengthened controversy with Hoadly, afterwards bishop of Winchester, in which many books were published on both sides; but the works by which this writer is best remembered, are an "Abridgement of Baxter's History of his Life and Times," and "Lives of the Ministers ejected after the Restoration," intended as a continuation of Baxter's History.—J. B.

CALANCHA, FREY ANTONIO DE LA, a Peruvian ecclesiastic, born towards the end of the sixteenth century. Of an antiquarian turn, he visited the ruins and was a zealous collector of the ancient traditions of his country. Much of the information he thus gathered has been preserved in his work, entitled "Cronica Moralizada del orden de San Augustin en el Peru." This book was first published in Barcelona in 1639. Although diffuse in style, and running too much into detail, it has the rare merit of veracity. Calancha twice visited the ruins of the stupendous temple of Pachacamac.

CALANDRA, GIOVANNA BATTISTA, born in 1586, achieved a considerable fame as a mosaicist, and worked in the Vatican during the pontificate of Urban VIII. The pictures in St. Peter's being seriously injured by damp, they were replaced by copies in mosaic. The first copy made by Calandra was after the St. Michael of d'Arpino. Calandra died in 1644.

CALANDRELLI, GIUSEPPE, an Italian astronomer, born in 1749; died at Rome in 1827. Abandoning the study of law, he gave himself wholly to physical and natural science, and in 1774 succeeded the celebrated Jacquier in the mathematical chair at Rome. He had charge, besides, of the observatory founded by Cardinal Trelada, and was one of those whom Pius VII., incited by the example of the French, appointed to make astronomical observations. In 1824 he had to abandon the Roman college to the jesuits, and retired to that of Santo Appollinare.

CALANDRINI, JOHN LEWIS, a Swiss botanist and mathematician, was born at Geneva in 1703, and died 30th December, 1758. He prosecuted his studies at Lausanne and London. He became professor of mathematics in 1724, of philosophy in 1734, and councillor of state in 1750. He has written various mathematical and scientific papers; among others, an essay on the vegetation and generation of plants.—J. H. B.

CALANUS, an Indian gymnosophist who attached himself to Alexander the Great. At Pasargada in Persia he fell ill, and refusing all medical aid, requested to be burned, that his immortal part might be free of the pains of the body. Alexander combated the fanatical purpose in vain, and at length ordered a magnificent pile to be erected, round which the army was drawn up. When Calanus was about to ascend, he, it is related, said to Alexander, "I shall see you soon in Balylon." This was remembered when the conqueror died in that city not long after.

CALAS, JOHN, born in 1698, a protestant citizen of Toulouse, whose shocking murder, under the forms of law, has served to perpetuate his memory. He had been forty years established in business in Toulouse, and was highly respected for his piety, integrity, and industrious habits. His eldest son, Marc Antoine, a melancholy youth, whose spirits had been depressed by a professional disappointment, hanged himself in his father's shop one night in the month of October, 1761. It was immediately rumoured that young Calas had intended to turn Romanist, and had in consequence been murdered by his family. The charge was in the highest degree improbable, and was not supported by a particle of evidence. But it was at once credited by the Roman catholic authorities and inhabitants of Toulouse, who had long been notorious for their bigotry and fanaticism, and every effort was made by the clergy and the authorities to stir up the passions of the populace against the unfortunate family. The forms of law were perverted in the most shameful manner, and in the end the parliament of Toulouse, on the 8th of March, 1762, condemned John Calas to be tortured by rack and by water, and then to be broken on the wheel. This atrocious sentence was executed the following day. Calas endured the protracted agonies of his

sentence with astonishing fortitude, and to the last protested his innocence of the crime imputed to him. His wife and younger son were also tried as accomplices, along with La Vaisse, a friend who had supped with the family on the evening when the son committed suicide, and Jeanne Viguier, the maid-servant, who was a zealous Romanist. The son was sentenced to banishment, but the others were acquitted. Fortunately, the account of the judicial murder of Calas reached the ears of Voltaire, then residing at Ferney, and he spared neither time nor labour to procure a reversal of the sentence. The whole strength of the church was put forth to uphold the unjust deed, and it was powerfully aided by some of the ministers. But in the end truth and justice triumphed. The sentence of the parliament of Toulouse was annulled; a new trial was ordered, and terminated in completely establishing the innocence of the Calas family, 9th March, 1765. David de Beaudrigne, one of the "titular capitouls" of Toulouse, was deprived of his office, and committed suicide; but the other perpetrators of this atrocious murder were allowed to go unpunished.—(*Causes Célèbres*, vol. iv.; *Jean Calas et sa Famille*, &c., Par A. Coquerel Fils; Paris, 1858.)—J. T.

CALASIO, MARIO DE, a celebrated Hebraist, born in Abruzzo, near Aquila, in 1550. He entered the Franciscan order, and became Hebrew professor at Rome. He published a grammar and lexicon of his favourite language; but his great work, a Hebrew concordance of the Bible, the result of forty years' labour, was not published till 1621, the year after his death. An edition was published in London in 1747.—J. B.

CALATRAVA, JOSÉ-MARIA, a Spanish statesman, born at Merida in Estramadura in 1781; died in 1846. He was, in the outset of his career, a distinguished advocate at Badajoz, but was afterwards better known as a member of the cortes, to which he was three times elected deputy. In this capacity he showed himself an able and eloquent defender of public liberty. In 1823, and afterwards in 1837, he held for a brief period the portfolio of minister of justice. In 1843 he was raised to the dignity of senator.—G. M.

CALCAGNINI, CELIO, an astronomer, archæologist, and poet, born at Ferrara in 1479; died in 1541. He served some years in the armies of the Emperor Maximilian and Pope Julius II., and after fulfilling a diplomatic mission to Rome, was appointed professor of belles-lettres in the university of Ferrara. In one of his astronomical dissertations, headed "Quomodo cælum stet, terra moveatur," Calcagnini demonstrates with mathematical precision that the earth turns round the sun. His poetical compositions, in three books, are collected in the *Deliciæ Poetarum Italorum*. As an archæologist, and also as a miscellaneous prose writer, he holds a high place in Italian literature, although inferior to that assigned him as an astronomer and poet.

CALCAR or KALCKER, JOHN VAN, was born at Calcar in the duchy of Cleves in 1499. From whom this artist received instruction in his own country is not known, but subsequently at Venice, he studied in the school of Titian, whose chief scholar he became. In time he was enabled so successfully to imitate the manner of his master, as even to have deceived the eminent Goltzius. His imitations of Raffaele were almost as happy. His Venetian studies had completely ousted all traces of his original Flemish taste in art. His fame seems to be limited rather to his imitative talent. He was employed by Vasari on the portraits of the painters, &c., for his work. Rubens possessed a work by Calcar representing the Nativity, in which, it may be noted, that the light was made to emanate wholly from the child. This picture afterwards became the property of the Emperor Ferdinand. Calcar died in 1546.—W. T.

CALCEOLARI, CALZOLARIS, or CALCEOLARIUS, FRANCESCO, an Italian naturalist, lived about the middle of the sixteenth century. He studied pharmacy at Verona under Ghini, and prosecuted natural history with enthusiasm. He became intimately acquainted with Mathiolus and Aldrovandus. In 1554 and subsequent years he examined the botany of Mount Baldo, along with Anguillara and the Bauhins. His researches were afterwards published at Venice, under the title of "Iter Baldi Montis." The genus calceolaria was named by Feuillée in honour of him.—J. H. B.

CALCHI, TRISTRAM, an Italian historian, born at Milan in 1462; died in 1507 or 1516. On the death of his master, Giov. Merula, he was employed to continue his "History of the Visconti."—Calchi found the work so inaccurate that he had to rewrite it.

**CALDANI, LEOPOLD MARK ANTONY**, an Italian anatomist, born at Bologna in 1725. He was successively professor of anatomy at Bologna, and of theoretical medicine at Padua, where he succeeded Morgagni in the chair of anatomy. He published "Elements of Pathology," "Elements of Physiology," and an elementary work on anatomy. He continued till the very close of his life to prosecute his favourite study of anatomy, publishing, when seventy-six years of age, a series of anatomical plates. He died in 1813.—J. B.

**CALDARA, ANTONIO**, a musician, was born in Venice about 1671, where he died in 1763. He studied composition under his fellow-townsmen, Legrenzi; and in 1689 he produced, successfully, an opera called "Argene." This was followed by several works of the same class, the popularity of which led to his engagement at Rome in 1711, to write the opera "Ate-naide," for the display of the singer Amadora. He is said to have been appointed *mastro di capella* to the court of Mantua in 1714; but, since he produced no work there, this is very questionable. Two years later he went to Austria, produced an opera at Salzburg, and proceeded to Vienna, where in 1717 he brought out "Caio Mario," and no less than three other equally important dramatic works. His success and his remarkable fecundity so charmed the emperor, Charles VI., that he was engaged to teach this imperial dilettante free composition, and in 1718 was appointed vice-*kapellmeister* under the famous Fuchs, who was the monarch's instructor in counterpoint. In this capacity Caldara was furnished with poems by Zeno and Metastasio, who were resident in the Austrian capital, and was thus the original composer of many of their lyrical dramas, which have since been set again and again by other musicians. He wrote with the greatest rapidity, producing three, four, and even five operas in one year, until, in 1736, the failure of "Temistocle," his sixty-eighth work, so greatly depressed him, that he never again wrote for the stage. He resigned his appointment, and in 1738 returned to his native city, where he spent the remainder of his long life in repose. Besides his numerous operas and oratorios, he wrote some music for the church and some instrumental pieces.

The English historians appear greatly to exaggerate the merit of his works; fluency was his chief characteristic as a composer, with the natural grace that always accompanies it, but he had very little profundity. His style assumed greater earnestness from the time of his settlement in Vienna, and this is shown still more in his ecclesiastical than in his theatrical music.—G. A. M.

**CALDARO.** See CARAVAGGIO, POLIDORO DA.

**CALDARONE or CALDERONE, JOHN JAMES**, an Italian physician and chemist, was born at Palermo on the 1st Jan., 1651, and died in 1731. He prosecuted natural history, and particularly botany. He became first physician in Sicily, and was charged with the inspection of drugs. He has written letters on botany, which were published in 1673.—J. H. B.

**CALDAS, FRANCISCO JOSÉ DE**, a South American naturalist, born at Popayan in New Grenada about 1773, interesting as an example of a self-made savant. Without help from teachers, and with little from books, he attained to a respectable acquaintance with botany, physical geography, mechanics, and astronomy. To the explorer of New Grenada, Mutis, he rendered valuable assistance, and, among other independent services to science, determined the height of Chimborazo and other peaks. In 1805 or 1806 he was appointed director of the observatory of Santa Fé de Bogota. Having eagerly embraced the cause of independence he fell into the hands of Morillo, by whom he was put to death in 1806. Humboldt has recognized the merit of his scientific labours, the principal part of which is embodied in his "Semenario de la Nueva Granada," edited and published, with additions, at Paris in 1849.—J. S., G.

**CALDENBACH, CHRISTOPHER**, a German naturalist and poet, was born at Schwibus in Silesia on 11th August, 1613, and died on 16th July, 1698. He prosecuted his studies at Frankfort-on-the-Oder and at Königsberg. He has written several literary works and commentaries on the laurel, the olive, the palm, and the vine.—J. H. B.

**CALDER, ROBERT**, a zealous adherent of episcopacy in Scotland after the Revolution, was born at Elgin, Morayshire, in 1658. He had been appointed to the curacy of Newthorn, Berwickshire, before the Revolution, but lost his living in 1689, because he refused to read the proclamation of the new sovereign, and continued to pray for King James. We gather from one of

his works that in 1693 he was imprisoned at Edinburgh. After officiating for some time in Aberdeen and Elgin, from both of which he was expelled, he returned to Edinburgh, where he preached in a small chapel in High Street. He published a number of works, chiefly bearing on the controversy in which he took so prominent a part; of these we mention his "Priesthood of the Old and New Testament by Succession," and his "Scottish Presbyterian Eloquence."—J. B.

**CALDER, SIR ROBERT, Bart.**, a British admiral, fourth son of Sir James Calder of Muirton in Morayshire, was born in 1745. He entered the navy at the age of fourteen, and attained the rank of post-captain in 1780. In 1796 he was selected by Sir John Jervis to officiate as captain of the fleet, and in that capacity contributed to gain the glorious victory of Cape St. Vincent, 14th February, 1797, and was the bearer of the admiral's despatches home. In the following year he was created a baronet, and in 1799 attained the rank of rear-admiral. In 1801 he was despatched with a squadron in pursuit of a French force under Admiral Gantheaume which had contrived to escape from Brest, but did not succeed in coming up with them though he followed them to the West Indies. In 1805 he commanded for some time the squadron which blockaded the French ships in the port of Ferrol. He was next ordered to cruise off Cape Finisterre, for the purpose of intercepting the combined French and Spanish fleet under Villeneuve on its return from the West Indies. At noon on the 22nd of July this force, consisting of twenty ships of the line, a 50-gun ship, and seven frigates, was observed on the lee bow by the British fleet, which was composed of only fifteen ships of the line and two frigates. An engagement took place which lasted till nine o'clock p.m., and terminated in the capture of two of the enemy's ships. Admiral Calder was severely censured both for the alleged unskilful mode in which the attack was made, and for declining to renew the action next day, and permitting the enemy to retire unmolested. On his return to England he was tried by a court-martial, and found guilty of not having done his utmost to take and destroy the enemy's ships, owing to an error of judgment, and was adjudged to be severely reprimanded. After a time an impression began to prevail that Sir Robert had been harshly treated. In 1810 he was appointed port-admiral at Plymouth, an office which he held for three years, and died in 1818, aged seventy-four.—J. T.

**CALDERARI, OTTONE**, an Italian architect, born of a noble family at Vicenza in 1730; died in 1803. A moonlight view of the basilica of his native city, first gave him an enthusiasm for architecture. He adorned Vicenza and its neighbourhood with many noble buildings, and became known for various works in other Italian cities. He was elected by the French Institute as "foremost among the Italian architects of the day."

**CALDERINI, DORNIZIO**, born at Torri in Verona in 1446. When only twenty-four years of age he was appointed by Pope Paul II. professor of classical literature in the university of Rome, which chair he also filled under the pontificate of Sixtus IV. This pontiff raised him to the dignity of apostolic secretary, and employed him along with Cardinal della Rovere to treat with the citizens of Avignon on the occasion of a rebellion being declared against the papacy in that city. He left commentaries on Juvenal, Martial, Propertius, Virgil, Statius, and valuable manuscripts on Ovid's *Metamorphoses*, on Persius, &c. Giglio Gregorio Giraldi notes many poetical compositions of this author. Lucio Fostoro, one of the greatest Hellenists of that age, in a letter to Alexander Cortese, bishop of Segni, asserts, perhaps with some exaggeration, that the only three really elegant writers of that epoch were Lorenzo Valla, Calderini, and Poliziano. He died of the plague in 1478.—A. C. M.

**CALDERON DE LA BARCA, DON PEDRO**, the greatest of the Spanish dramatists, and one of the great national poets of Europe, was born at Madrid on the 17th of January, 1600. His father held the important office of secretary to the treasury board under Philip II. and Philip III. His mother was the descendant of a noble family long settled in Spain, which had originally come from the Low Countries; and in a work of authority connected with the literary history of Madrid, *Los Hijos de Madrid*, tom. iv. p. 218, they are both praised for the care they bestowed upon the religious and literary education of their four children. Of these, Don Pedro, the poet, was the youngest. Up to his ninth year, the elementary education which he could receive seems to have been given to him at

home, after which period he was transferred to the jesuits' college or seminary at Madrid. His poetical talents, the precocity of which was as remarkable as their undiminished vigour and duration, seem not to have been discouraged by his ecclesiastical instructions. A play, entitled *El Mejor Amigo el Muerte*, has come down to us, which, from internal evidence, must have been written before the end of the year 1610. To this play Calderon contributed the entire third act, although at that time he had not quite completed his eleventh year. Three years after this period he composed, without assistance, an entire play on the subject of Elias, called "The Chariot of Heaven." This, though seemingly in existence when Vera Tassis wrote, that is, in 1682, the year after Calderon's death, remains still unknown. On proceeding to the university of Salamanca, whither he was sent in his fourteenth year, he seems to have divided his time between cultivating his poetical talents and in applying himself to those scholastic and theological studies, the results of which are so apparent in many of his most celebrated dramas. Before leaving Salamanca, where he continued till his nineteenth year, he wrote among other plays, the names of which are only conjectured, the most famous and perhaps the most powerful of all his dramas, namely, "The Devotion of the Cross"—a work which may be put in comparison with any that has ever been produced at the same age by any other poet. This, which is probably the production of Calderon that is best known out of Spain, owing to the analysis given of it by Sismondi, which is, however, more than usually inaccurate and unfair, was originally called "La Cruz de la Sepultura," and was published at Huesca in 1634 with other Comedies, where it is erroneously attributed to Lope de Vega (*Hartzenbusch's edition of Calderon*, Madrid, 1850; *Notas e Ilustraciones*, tom. iv. p. 701). It contains some scenes or portions of scenes which do not appear in the edition of Vera Tassis, as if they were rejected by the maturer judgment of Calderon himself. Having left Salamanca in 1619, we find him at Madrid in the following year entering into friendly rivalry with older and better known poets in doing honour to the patron saint of that city, San Isidro, and receiving for his contribution on the occasion the praise of Lope de Vega. In 1622, two years later, he entered the lists with the great Lope himself, not indeed in the drama, in which he was destined to be his successor and superior, but in those poetical offerings at the shrine of the same newly-canonized saint, in which he gained the third prize, Lope having won the first, and Zarate the second. Notwithstanding Calderon's predilection for these poetical pursuits, in which he was destined to achieve such pre-eminent success, he was not indifferent to those other instincts which, as a hidalgo and a Spaniard, seemed to him at least equally natural; as we find that, in common with almost every great name in Spanish literature, his first active services were devoted to arms. In 1625 we read of him serving with the army in the Milanese, and in the course of the same year in Flanders. His play, "The Siege of Breda," which commemorates the surrender of that town to the Spaniards under Spinola on the 8th of June, 1625—in some portion of the ten months' siege that preceded it Calderon being supposed to have borne a part—was produced, it is thought from the temporary interest of the subject, towards the end of the same year. How long Calderon continued connected with the army is uncertain; but his dramas, though not produced during that period with the amazing fertility that characterized his genius a few years later, appeared in unbroken succession. From internal evidence his three well-known dramas, "The Garden of Falerina;" "'Tis hard to guard a House with two Doors;" and "The Fairy Lady," are supposed to have been written in 1629. On the same evidence his "Worse and Worse," and his "Better and Better," are given respectively to 1630 and 1631. In the former of these years Lope de Vega (*Laurel of Apollo*, Silva vii.) recognizes the sweetness and poetical elevation of his style—a recognition which was rendered still more emphatic two years later by Montalvan, who speaks not only of the works which Calderon had already produced, but of those which he was then engaged upon. The death of Lope in 1635 removed all impediment to Calderon's supremacy over the Spanish stage, a realm which he ruled with undivided sway and surpassing success until almost the day of his death, which took place on Whitsunday, 1681.

Between the date of his recognition as the legitimate successor of the great Lope and his death—a period almost of sixty years

—but few events of his life are recorded. It seems to have flowed on in one unruffled tide of outward prosperity and inward peace, occupied in the splendid creations of his fancy, and the more sacred duties of his priesthood—a state which he had embraced in 1651, and for which the purity of his life and writings, and the enthusiasm of his belief, had, as far as we are able to judge, so appropriately fitted him. With the exception of his residence at Salamanca, the period of his early service in Italy and Belgium, and his presence in Catalonia during the rebellion of 1640—whither he went, almost contrary to the wishes of the king, as a member of the military order of Santiago, of which he had been elected a knight in 1637—his life hitherto had been spent almost exclusively in Madrid, he having become not only an ornament, but almost a necessity at the splendid court of Philip IV. Two years after his entering the priesthood, however, some ecclesiastical appointment seemed due to his attainments and position, and he was accordingly nominated chaplain to the chapel of the New Kings at Toledo. The duties of this office calling him away from the capital, the king soon found that he could not dispense with the presence of his favourite. He in consequence appointed him one of his own chaplains of honour, thus securing his residence at Madrid. He received other important ecclesiastical promotions, in all of which, according to the testimony of one of his contemporaries, "he united by humility and prudence, the duties of an obedient child and a loving father." From his connection with the court and with the church, he was stimulated at the same time to exertions of very opposite kinds; but both of them remarkable, and each pre-eminently worthy of his genius. For the one he produced those marvellous and gorgeous spectacles (*Fiestas*), performed in the gardens, or on the lake adjoining the palace of the Buen Retiro, which combined a splendour of diction, fancy, and invention, with an ingenuity and prodigal outlay of expenditure as to machinery and decorations, never previously united, or ever likely to be united again. For the church he composed those still more wonderful and more original autos; pieces, many of them nearly as long as his full length plays, which have no parallel in the literature of any country but Spain, and none to equal them even in that for ideal beauty and sublime elevation. Besides upwards of one hundred secular dramas—many of these, however, being on religious subjects, such as "The Devotion of the Cross," which, by Bouterwek and others, has been mistaken for an auto—he has left over seventy of these surprising performances, which are not included in the ordinary editions of Calderon, and from the difficulty of translating which, even German enthusiasm and industry have almost entirely shrunk. They form six quarto volumes, Madrid, 1759. In a sketch like the present, it would be impossible to give an adequate idea either of the great variety and richness of his plays, or of the subtle and profound undermeanings of his autos. In the former—

"All thoughts, all passions, all delights,  
Whatever stirs this mortal frame,"

are chronicled and put before us in living action, by one who seems to have penetrated the mysteries of existence rather by the intuitions of genius than through the duller medium of experience. Dealing often with the warmest passions, and the most seductive crimes, he is pure without being cold, and terrible without that unconscious complicity in sin which we are forced to suspect in the delineations of similar horrors by other poets. He seems to have been in fact what Goethe was but in theory—above all the passions and weaknesses he describes; but still with a sympathy for all enjoyment that was innocent and natural in human life, such as we may suppose a guardian angel to feel for the being immediately under its protection. Those who seek for subtle delineations of character—those to whom the power of producing original individual creations is the test and result of dramatic power, will be disappointed if they expect to find such in Calderon. But, on the other hand, all who delight in the ingenious complications of a well-compact plot—all who relish the sweet and playful converse of women, who are worthy of companionship even with "Shakspeare's women"—all to whom the fresh and original reproduction of the famous myths of Grecian imagination, or the pastoral and tragic episodes of the Old Testament, are capable of affording instruction or amusement—all those, in fine, who wish to hear a never-ending hymn of rapture and of praise upon the beauty of external nature, sung in the noblest

and most harmonious of living languages—will find a never-failing source of wonder and delight in the ever brilliant pages of this great poet—a poet who seems to have been as much loved for the amiability of his character, as he was admired for the splendour of his genius.

To those who are not acquainted with the works of this great writer, the following list of editions and translations, as well in German as in English, may be of use:—

*In Spanish.*—“Las Comedias de Calderon,” per Keil, Leipsique, 1827–50, 4 vols. imp. oct. “Comedias de Calderon,” edited by Hartzenbusch, 4 vols. imp. oct., Madrid, 1848–50.

*In German.*—There are numerous German translations of the plays, and all generally very good. Those by Schlegel, Gries, Malsburg, Schumacher, Schmidt, Martin, and others, are excellent. Of the autos, but one has been published, that by Eichen-dorff; it gives ten of them, and is admirably executed.

*In English.*—Until very recently, Calderon served only as material for articles few and far between in the magazines and reviews. The first, and still the only complete translation of any of his plays that has appeared in English, is, *Dramas from the Spanish of Calderon*, by Denis Florence M'Carthy, 2 vols., London, 1853, giving unabridged translations of the following plays—“The Purgatory of St. Patrick;” “The Constant Prince;” “The Physician of his own Honour;” “The Scarf and the Flower;” “The Secret in Words;” “Love after Death.” Two additional dramas—“The Devotion of the Cross,” and “Love the Greatest Enchantment;” and one auto, “The Sorceries of Sin”—all strictly in the metre of the original—are announced for publication by the same translator. Six *Dramas of Calderon*—freely translated by Edward Fitzgerald, London, 1853—is very much admired for its idiomatic English. In 1856 a very charming little volume on Calderon was published by Richard Chenevix Trench, dean of Westminster. It contains translations of the principal scenes of “Life's a Dream,” and the greater portion of one of the autos—“The Great Theatre of the World.” The translations are remarkable for being the first attempt in English, as far as Calderon is concerned, to reproduce the peculiar asso-nant versification of the original.—D. F. M'C.

\* CALDERON, SERAFIN E. DE, a Spanish poet and novelist, born at Malaga in 1801. He studied law in the university of Grenada, and in 1822 was appointed to the chair of rhetoric and belles-lettres. He published about this time some verses which evince a mastery of language seldom equalled. Being unsuccessful at the bar, he returned to Malaga, where he published in 1830 some poems entitled “El Solitario” (The Recluse). Soon after appeared some letters on Andalusian customs—“Escenas Andaluzas por el Solitario,” Madrid—which have been much celebrated for their truth and piquancy. In 1833, by desire of the government, he wrote a series of memoirs on the principles of government. In 1834 he was appointed auditor-general of the army in the north, and in 1836, civil governor of Logrono. In the latter year he returned to Madrid, and published a novel entitled “Cristianos y Moriscos” (The Moors and the Christians), and began the labour of collecting the old cancioneros and romanceros. In 1837 he obtained the important post of civil governor of Seville, and in that city he commenced the accumulation of one of the noblest libraries and museums in Spain. The political events of 1838 compelled him to retire into private life. His attention has of late years been given to the study of Moorish literature.—F. M. W.

CALDERWOOD, DAVID, an eminent divine and historian of the church of Scotland, was born about 1575, and was settled about 1604 as minister of Crailing in the county of Roxburgh. He early showed himself a zealous defender of presbytery against the innovations of episcopacy. In 1617 James VI. came to Scotland and summoned a parliament, into which a bill was introduced to empower the king to arrange matters affecting the external polity of the church. A meeting of the clergy was being held simultaneously with the meeting of parliament, and Calderwood, with some other ministers, drew up a strong protest against the obnoxious measure, which had the effect of making the king lay it aside, even after it had received the assent of parliament, out which, nevertheless, involved the protesters in trouble. Calderwood was summoned to appear before the high commission court at St. Andrews, where the king attended. Adhering to the terms of the protest, and refusing to promise more than passive obedience to the measure, he was imprisoned, and only released on condition that he should leave the kingdom. He

went to Holland, where he remained from 1619 till James' death in 1625. During his exile he prepared and published a treatise entitled “*Altare Damascenum*,” in which he examines the principles of episcopacy, and denounces the attempt to obtrude it on the Scottish church. This book attracted great attention, and was the cause of much uneasiness to his royal opponent, who, it is said, instigated a certain Patrick Scott to publish a document purporting to be a recantation, from the pen of Mr. Calderwood, of all the opinions for which he had contended. This impudent forgery following a report of the death of Calderwood, had some success, which his reappearance in Scotland instantly checked. For several years after his return Mr. Calderwood lived in retirement at Edinburgh, and was occupied in collecting materials for his most important work—the history of the Scottish church, from the death of James V. to the death of James VI. This work has been published by the Wodrow Society from the original manuscript (six large folio volumes) in the library of Glasgow university. It has been of great service to Wodrow, M'Crice, and other writers on that period of Scottish ecclesiastical history. On the breaking out of the troubles in 1638, Mr. Calderwood again took part in various public measures. He was present at the Glasgow assembly, and though not a member of court, was of great service in promoting its designs. He afterwards became minister of Pencaitland in East Lothian, and in 1643 was one of the committee for drawing up the directory for public worship. He died at Jedburgh in 1651, when Cromwell's army occupied the Lothians.—J. B.

CALDWELL, CHARLES, an American physician, and a voluminous writer upon medical science and miscellaneous topics, was born in Orange county, North Carolina, in 1772. The means of education in that region were then very small, and in great part he educated himself. He afterwards studied medicine at Philadelphia. In 1795 he began his career as an author, by translating from the Latin, Blumenbach's *Elements of Physiology*. Ardent and impulsive in temperament, fond of novelties in science and practice, and wielding a facile pen, his publications soon became very numerous; and being chiefly of a controversial nature, engaged him in frequent disputes that obstructed his usefulness, but never slackened his industry or abated his self-esteem. In 1819 he removed to Kentucky, and became professor of the institutes of medicine in the medical department of the Transylvania university at Lexington. After eighteen years' zealous and useful labour in this university, circumstances led him to withdraw from it and attempt to found another medical school at Louisville. Twelve years more of his very active life were spent upon this project, and then, in 1849, he retired and devoted himself to writing his autobiography, which was published two years after his death. He died at Louisville in 1853. A catalogue of his publications embraces more than two hundred articles; many of them relate to physical education, the unity of the human race, the theory of animal heat, malaria, and especially phrenology, to which doctrine, in the latter part of his life, he was a decided and zealous convert.—F. B.
