CALDWELL, JOSEPH, D.D., first president of the university of North Carolina, born at Leamington, New Jersey, in 1773, graduated at Princeton college, with high honours, in 1791, and subsequently became a tutor in that institution. In 1796 he was appointed professor of mathematics, and acting head of the university of North Carolina, which had been established only six years before. With this institution he was connected for the remainder of his life—the arrangement of its internal concerns and its course of instruction, and the enlargement of its means of usefulness, being due in great part to his exertions. He was elected its president in 1804, and held that office, with a brief interval, till his death in 1835. In 1824 he visited Europe, in order to procure a philosophical apparatus, and select books for the library. Though he wrote much in the journals of the day to promote the cause of popular education and internal improvement in North Carolina, his only separate publication was a treatise on geometry, which he prepared for use in the university.—F. B.

CALEB, an Israelite of the tribe of Judah, who along with Joshua protested against the evil reports which the other spies, whom Moses sent into Canaan, brought of the land. He was, therefore, preserved through the years of wandering in the wilderness, and had an inheritance given him at Kirjath-arba.

CALED. See KHALED.

CALEF, ROBERT, a merchant of Boston in New England, honourably distinguished for the brave and active share which he took in opposing the witchcraft delusion of 1692. When Cotton Mather published his *Wonders of the Invisible World*, Calef replied to him in a book entitled "*More Wonders of the Invisible World*." It gave great offence, but Hutchinson says it contains a fair narrative of the facts. The book was printed in London, and Dr. Increase Mather, then president of Harvard college, caused a copy of it to be burnt in the college yard. Calef states that, during the delusion, about 200 persons were accused, 150 imprisoned, 28 condemned, 19 hanged, and one pressed to death because he refused to plead. Public opinion was not long in coming round to his side, and honouring him for opinions, the publication of which at the time was perilous. He died in Roxbury in 1719.—F. B.

CALENDARIO, FILIPPO, the Venetian architect of the fifteenth century who constructed the porticoes, supported by marble columns which surround the area of the square of St. Mark, and on which stands a range of buildings ornamented by bas-reliefs and paintings. He was liberally recompensed, and received the daughter of the doge, Martin Faletti, in marriage.

CALENTIUS or CALENZIO, ELYSIUS, an Italian writer, died in 1503. He left a number of elegies, epistles, epigrams, satires, and fables, which were published at his death, under the title of "*Opuscula*." This collection found a place in the *Index Expr.*, notwithstanding it was printed at Rome.

CALENUS, Q. FUFIUS, served under Cæsar in the civil war. After the battle of Pharsalia had vanquished the adherents of Pompey, Calenus led an army which took Megara and some other Grecian cities. In reward for his services he was made consul, B.C. 47. After the dictator's death he joined Antony, whose legions in the north of Italy he commanded. Calenus died at the close of the Perusinian war.—J. B.

CALEPINO, AMBROGIO, an Italian philologist, born at Calepio in Bergamo in 1435. His Latin dictionary, published in 1502, is of note as one of the earliest works of the kind, and so great was its fame, that books of a like nature were long called *calepines*. Passerat published it in 1609, under the title "*Dictionarium Octolingue*," giving the corresponding words in seven other languages. Of this work a new edition appeared at Padua in 1731, by Faccioliati, assisted by Forcellini, and was the foundation of Forcellini's *Totius Latinitatis Lexicon*, 4 vols. folio, which superseded all former Latin dictionaries. Calepino died in 1511, having been for some years blind.—J. B.

CALETTI, GIUSEPPE, called CREMONESE, was born at Ferrara about 1600. He was a successful imitator of Titian, especially in his lesser efforts of bacchanalian character. But the mind of the imitator could not keep pace with his hands. Lanzi, laughing, states that he placed wild boors on the sea, and dolphins on the land. That he was capable of better things, appears by his "*St. Mark*," and "*Four Doctors of the Church*," at Ferrara. He died in 1660.—W. T.

CALFHILL, CAWFIELD, or CALFED, JAMES, a Latin poet and learned divine, born in Shropshire in 1530. In 1562 he was proctor for the clergy of London, and chapter of Oxford in the convocation which drew up the Thirty-nine articles. He received various preferments in the church, and was about to be consecrated bishop of Worcester when he died in 1570. He wrote "*Querela Oxoniensis Academicæ*," &c., a Latin poem on the death of two sons of the duke of Suffolk; "*Answer to John Marshall's Treatise of the Cross*," and "*Pocmata Varia*."—J. B.

CALHOUN, JOHN CALDWELL, one of the most eminent American statesmen of the present century, was born in Abbeville district, South Carolina, March 18, 1782. His father, Patrick Calhoun, a native of Ireland, was one of the first residents in this district while it was a frontier settlement; took an active and patriotic part in Indian border warfare and in the revolutionary contest, and served during nearly the whole later part of his life in the state legislature. The son, after receiving his preparatory education under the care of his brother-in-law, Dr. Waddell of Georgia, was entered at Yale college in 1802, and graduated there with distinction in 1804. He pursued his professional studies at the law school in Litchfield, Connecticut, and was admitted to the bar of South Carolina in 1807. But he appears soon to have abandoned the practice of law for politics; and after serving for two sessions in the legislature of his native state, he was elected a representative to congress in 1811. From

that time until his death, a period of nearly forty years, he was seldom absent from Washington, being nearly the whole time in the public service, either in congress or in the cabinet. Few American statesmen have had so much experience in public affairs, or have preserved so high a reputation for ability and uprightness. Though an active party leader, and often engaged in the most exciting contests, not the slightest imputation was ever thrown upon his private character, or the sincerity and manliness of his public conduct. When he first entered congress, the difficulties with England were fast approaching actual hostilities, and Mr. Calhoun immediately took part with that section—the young democracy as they were termed—of the dominant party, whose object it was to drive the still reluctant administration into a declaration of war. They succeeded, and as a member of the committee on foreign relations, Mr. Calhoun reported a bill for declaring war, which was passed in June, 1812. He afterwards strenuously supported all the necessary measures for carrying on hostilities with vigour, especially that for chartering a national bank, to aid in providing the requisite funds, though the bill for this purpose could not be carried till 1816. At the same period he also supported bills for effecting internal improvements, and for encouraging domestic manufactures, by imposing protective duties—measures which his later policy strongly condemned. When Mr. Monroe formed his administration in 1817, Mr. Calhoun became secretary of war, a post which he filled with great ability for seven years, reducing the affairs of the department from a state of great confusion to simplicity and order. In 1825 he was chosen vice-president of the United States under John Q. Adams, and again in 1829 under General Jackson. With the latter, however, he did not long continue on amicable political relations, but entered into fierce opposition, when the president and a majority of congress determined to enforce submission to the law of 1828 imposing a heavy protective tariff. It was at this period that Mr. Calhoun broached his famous *nullification* doctrine, which is substantially that the union of the United States is not a union of the people, but a league or compact between sovereign states, any one of which has a right to judge when the compact is broken, and to pronounce any law to be null and void which violates its conditions. From this time forward, that is, for the last seventeen years of his public service, Mr. Calhoun hardly aspired to be considered as a *national* statesman, acting for the whole country. He was content, he was even proud to be viewed only as a *southern* statesman. Hence his advocacy of the extreme doctrine of state rights; his censure of the Missouri compromise, passed thirteen years before, when he was himself in the cabinet; his support of all measures tending to the extension of slave-holding territory; and, finally, his proposal to amend the constitution by abolishing the single office of the presidency, and creating two presidents, one for the North and the other for the South, to be in office at the same time. The place in which he advocated these doctrines was his own favourite arena, the floor of the United States senate, where he continued for the rest of his life, except for a short time at the close of Mr. Tyler's administration, when he accepted the office of secretary of state, in order to complete a favourite measure—the annexation of Texas. At this period of his life his policy respecting European affairs was pacific; and it should be remembered to his honour, that he probably prevented a war with England on the Oregon question. His death took place at Washington in 1850. The eloquence of Mr. Calhoun, as was well said by Mr. Webster, "was part of his intellectual character. It grew out of the qualities of his mind. It was plain, strong, terse, condensed, concise, sometimes impassioned, still always severe." The same great orator and statesman, the most frequent and formidable of Mr. Calhoun's opponents, paid the following noble tribute to the dignity and purity of his public character. "He had the basis, the indispensable basis of all high character; and that was unspotted integrity, unimpeached honour and character. If he had aspirations they were high, and honourable, and noble. There was nothing grovelling, or low, or meanly selfish, that came near the head or the heart of Mr. Calhoun. However he may have differed from others of us in his political opinions or his political principles, those principles and those opinions will now descend to posterity under the sanction of a great name. He has lived long enough, he has done enough, and he has done it so well, so successfully, so honourably, as to connect himself for all

time with the records of his country." Since his death the works of Mr. Calhoun have been published in six octavo volumes, the first being a posthumous publication of "A Disquisition upon Government," and "A Discourse on the Constitution and Government of the United States;" and the others being a republication of his speeches in congress, official reports, and other documents of which he was the author.—F. B.

CALIDASA, a celebrated Hindoo poet, who is supposed by some to have flourished about the middle of the century preceding the commencement of our era, by others about the close of the second century. He is the author of a great number of poems of unequal merit, but not a few of them are of a very high order. One of his dramas, entitled "Sacuntalâ, or the Fatal Ring," was translated by Sir William Jones (Calcutta, 1789, London, 1792), and was received with great admiration. It has since been repeatedly retranslated into French and German, and several attempts have been made on the continent to adapt it to the stage. A correct edition of the text of this celebrated drama, which had been greatly interpolated and corrupted, was published by Herman Brockhaus of Leipzig, and a free yet accurate English translation in prose and verse has since been published by Professor M. Williams. Câlîdâsa is also the author of "Vicramôrvasi," a dramatic poem in five acts; of a comedy called "Agnimitra and Mâlavirca;" the "Mêgha Dûta, or Cloud Messenger," a lyrical poem of one hundred and sixteen stanzas; an unfinished epic poem called "Cumâra Sambhava;" a narrative poem entitled "Raghu Vansa," &c. A number of these pieces have been translated by H. H. Wilson in his Hindoo Theatre.—J. T.

CALIGNON, SOFFREY DE, a French poet, born in 1550; died at Paris in 1606. He was chancellor of Navarre under Henry IV., and was engaged, along with de Thou, in framing the edict of Nantes. He wrote a poetical satire—"Le Mepris des Dames."

CALIGNY, JEAN-ANTENOR HUE DE, an eminent French engineer, one of four brothers to whom was intrusted the direction of a great number of the most important military works in France and the Low Countries: born in 1657; died in 1731.

CALIGULA, CAIUS CÆSAR, emperor of Rome from 37 to 41. He was the son of Germanicus, and obtained the surname of Caligula from his habit of wearing the *caliga* or military shoe. He succeeded his grandfather, Tiberius, under the most favourable circumstances for attaining popularity. The earlier measures of Caligula seem to have justified the expectations formed of him by the populace. He dismissed from the court the profligate favourites of Tiberius, remitted many of the taxes imposed in the previous reign, and set at liberty many prisoners. For the first eight months of his reign he continued, by measures such as these, to retain the affections of his subjects, who manifested in every possible way their satisfaction with his rule; but about that time he was seized with a severe and dangerous illness, which is supposed by many to have deranged his mental faculties. His character underwent a sudden and total change. He became cruel and tyrannical, and gave himself up to every species of debauchery and extravagance. He assumed divine honours, erected a temple for his own worship, and caused sacrifices to be offered to himself every day. His impiety was fully equalled by his prodigality. Even the immense taxes imposed upon the provinces proved inadequate to satisfy the demands of his lavish expenditure, and the wealthier class of citizens then became the victims of his rapacity. His favourite horse was kept in a stable of marble, and treated with every mark of respect; and it is said that death alone prevented the infatuated emperor from conferring the consulship upon it. The extravagance and profusion of his domestic arrangements have scarcely a parallel in history. His cruelties were so great as almost to transcend belief. To torture, and even to put to death innocent people, was with him a favourite amusement; and he is said to have maintained a large number of wild beasts, which were daily fed with human victims. In a moment of irritation he once expressed a wish that the Roman people had but one head, that he might strike it off at a blow. The slightest suspicion against any one he converted arbitrarily into a capital charge. The old and infirm were frequently destroyed by his orders, for no other reason than that they were useless to the state. In this way he continued to give himself up to the practice of every species of oppression and brutality, till, in the third year of his reign, he was seized with an ungovernable desire for military glory. Levies were made throughout the empire, and an

expedition was fitted out which he commanded in person, and with which he proposed to reduce to subjection all Germany and Britain. He contented himself, however, with marching his troops into France, on the coast of which he drew up the army in order of battle, and ordered each soldier to fill his helmet with sea-shells, which were carried to Rome, and paraded with much solemnity as the spoils of the ocean. A successful conspiracy at length put an end to the tyranny of Caligula. After a reign of about four years, he was assassinated during the celebration of the Palatine games by a band of conspirators, headed by Cassius Chærea, a tribune of the prætorian guards.—W. M.

CALIMANI, SIMEONE, rabbi at Venice during a considerable portion of the eighteenth century. He has left a grammar of the Hebrew language, with a dissertation on Hebrew poetry. The Hebrew-Italian lexicon which he intended to publish, was not completed when he died.—T. T.

CALIXTUS. See ALEXANDER III., Pope.

CALIXTUS I. (more properly CALLISTUS), a Roman by birth, succeeded Zephyrinus in the papacy, according to Fleury, in the year 217, and, after having sat five years, was put to death under Alexander Severus in 222. The chronology, however, is very uncertain. This pope is said by Platina to have instituted the fasts at the four seasons, called Quarter-tenses or Ember-days. Little authentic was known of him until the late discovery of one of the lost works of Hippolytus, bishop of Portus, in which statements are made respecting Callistus of the most unfavourable nature. A famous christian cemetery was named after him.—T. A.

CALIXTUS II. (GUIDO, archbishop of Vienne) was elected at Cluny in France in 1119, after the sudden death of Gelasius II.; but he would not assume the papal insignia until he had received tidings of the willing confirmation of his appointment by the rest of the cardinals at Rome. He was connected by birth with no less than three royal families. The struggle regarding the right of investiture, that is, the right of appointing to vacant sees and benefices, was now at its height. Paschal II. had in 1118 weakly conceded to the emperor, Henry V., the right of investiture "by ring and crosier," the well-known emblems of the *spiritual* jurisdiction of bishops. This concession was condemned by the nearly unanimous voice of the clergy all over Europe; and in a great council held at Rheims towards the close of 1119, in which the pope presided, Calixtus endeavoured to arrange the matter with the emperor. But the faithless conduct of Henry, who, while professing his willingness to abandon the right, was found to be manœuvring to get the pope into his hands, caused the negotiations to be broken off. After visiting Normandy, where he met the English king, Henry I., at Gisors, Calixtus proceeded to Italy. Soon after his arrival in Rome, the antipope, Burdinus, who had been set up by the emperor, was brought into the city a captive, and delivered up to him. Calixtus pardoned him, and confined him for the remainder of his life to the monastery of Cava. In 1122 the affair of investitures was arranged. The emperor concluded a concordat with the papal legates at Worms, by which he surrendered the right of investiture by ring and crosier, retaining only that of investing "by the sceptre," when he put bishops in possession of their *temporalities*. By the same treaty peace was established in Germany. The concordat was ratified by the great council of the Lateran (commonly called the ninth general council), convened by the pope at Rome in the following year. Calixtus died in 1124. Gibbon says of him, that "after giving peace to Europe, Calixtus II. alone had resolution and power to prohibit the use of private arms in the metropolis."—T. A.

CALIXTUS III. (ALPHONSUS BORGIA, a Spaniard) succeeded Nicholas V. in 1455. He bent all his energies to the task of recovering Constantinople, if possible, from the hands of the Turks, and renewed the proclamation made in 1453 for a general crusade, sending his legates into every country of Europe to preach the holy war. For this purpose he alienated many valuable jewels, and even manors, belonging to the Roman church. His otherwise unblemished character was tarnished by the grossness of his nepotism. Calixtus died in 1458.—T. A.

CALIXTUS, GEORGE, one of the most learned, liberal, and enlightened of the German theologians of the seventeenth century, was born on the 14th December, 1586, in a village of Schleswig of the name of Medelbye. His father, who was pastor of the village, had been one of the pupils of Melancthon in his last years, and had imbibed his moderate and conciliatory

spirit. He sought to train his son in the same views. He was himself accordingly his first teacher; afterwards he sent him to school at Flensburg, and then to the university at Helmstädt, the great seat of the more liberal and cultivated theology which Melancthon had represented. Here, from 1603 to 1609, young Calixtus spent his time in the study, first of philosophy and philology, and then chiefly, during the last two years, of theology. The Aristotelian philosophy especially engaged his attention, and he became a warm admirer of it. His theological studies took their direction more from an independent examination of patristic writings than from any special influence surrounding him; and the naturally free and comprehensive bias of his mind grew and flourished from communion with the early christian writers. After the completion of his university course, he travelled for four years throughout Belgium, France, and England, chiefly employed in examining into the state of religion in these countries; and there can be little doubt that these years of travel, and the cosmopolitan tastes and sympathies which they awakened, or perhaps only strengthened, served strongly to form him for his future mediatory career. The theology and practical working of the Roman catholic church excited his particular regard at this early period, and he remained a winter in Cologne with the view of studying them. His talents and activity gradually attracted attention, and his fame as a rising theologian reached its height in a victorious encounter with the jesuit Turrianns, in the year 1614. He was offered a professorship of theology in his own university, and here in the same year he settled, and for nearly half a century devoted his energies to the cultivation of a moderate and liberal theology, and the spread of a more catholic and tolerant spirit in the Lutheran church. He died in 1656.

It is of little consequence to record the several struggles in which his efforts at christian union and his various writings engaged Calixtus. His projects fell upon evil days, and met with even a harder fate than is usual in such cases. Reviled by the Lutherans, he failed to win the papists. He and his friends were called by the old Lutherans crypto-papists, and *syncretism* passed into a byword for every species of heresy. With the Calvinists he seems to have got on better perhaps than with any other of the contending religious parties, and his association with them on the occasion of a religious controversy at Thorn in 1646, was a subject of special indignation and accusation against him on the part of his Lutheran brethren. His efforts, unsuccessful as they were in their immediate object, made a deep impression on the German churches, and combined with the comprehensive and humanistic spirit of his theology, helped to prepare the way for a reaction against the barren dogmatism of Lutheranism in the seventeenth century. The writings of Calixtus were mainly of an occasional character—those at least published by himself. Even in his lifetime, however, there were published by others, several series of what appear to have been his theological lectures, viz., his "Expositiones Literales," upon most of the books of the Old Testament; and his "Concordia Evangeliorum." After his death there appeared "Orationes Selectæ," Helmstadt, 1660; and his general contributions to Old Testament exegesis were collected and published by his son in 1665, under the title "Lucubrationes ad quorundam V. T. librorum intelligentiam facientes." The student may consult Gass. G. Calixt. und der Syncretismus, 1846; or G. Calixtus und seine Zeit, by Henke, 1853.—T.

CALKON, JAN FREDERIK VAN BEEK, the most celebrated astronomer of the Netherlands, was born at Groningen in 1772. He was destined for the reformed church, of which his father was a minister, but turned aside to mathematics and astronomy. Visiting the German universities, he made many friends among the learned; and afterwards taught astronomy and mathematics at Leyden and Utrecht. He was elected a member of the Dutch National Institute, and died in 1811. He wrote a dissertation on the clocks of the ancients.

CALL, SIR JOHN, Bart., celebrated as a military engineer, was born in 1732. Having gone to India, he was made, ere he had reached his twentieth year, chief engineer at Fort St. David; a situation which he held till in 1757 he was made chief engineer at Madras, and soon after of all the Coromandel coast. Having accomplished the reduction of Pondicherry and Vellore, and distinguished himself in the war with Hyder Ali, he was advanced by the company, and was recommended by Clive to succeed to the government of Madras; but he chose rather to

return to England. He was in 1782 appointed one of a commission of inquiry into the state of crown lands, woods, and forests. He entered parliament in 1784, was made a baronet in 1791, and died in 1801.—J. B.

CALLACHAN, king of Cashel, and successor to Cormac, reigned in the earlier part of the tenth century. Uniformly the ally of the Danes, he was noted for his unremitting warfare against christianity. He pillaged the venerable monastery of Clonmacnoise, and the abbey of Clonleagh. The life of this fierce and sacrilegious prince stands out in black and odious contrast to that of the illustrious king and bishop, Cormac. At length, about the year 939, he was delivered up to Donagh, king of Ireland, with other captives and hostages. The only other notice we have of him is on the occasion of a victory obtained by him over Kennedy, king of Munster.—J. F. W.

CALLANAN, J. J., was born in the city of Cork in the year 1795, and was educated for the Roman catholic priesthood. Finding, however, that he had no vocation for the ecclesiastical state, he left the college of Maynooth in 1816, and two years after obtained the situation of tutor in a respectable family in his native city. The ill-requited duties of a tutor were as little congenial to his disposition as their reward was unsuitable to his wants, and he accordingly left Cork and entered Trinity college, Dublin, with the design of qualifying himself for the profession of the law. During his college course he wrote two prize poems, which secured for him the favourable judgment of the authorities. Unfortunately he abandoned his college studies after the second year, and having exhausted his resources, he enlisted privately in the Royal Irish regiment, then about to embark for Malta; but was, after a short time, discovered by his friends, who procured his release. Two more weary years of teaching followed. Then, after an interval of indolence and poetic musing, we find him at a school in 1823, which he soon left to ramble through the lovely scenery of his native county, collecting its legends and nursing his poetic tastes. Meantime he had contributed some pieces of high merit to Blackwood and Bolster's magazines. In failing health and reduced circumstances, he went in the end of the year 1827 to Lisbon, as tutor in a gentleman's family. During his stay in Portugal he acquired the language, and made several translations from its poetry, and was occupied in preparing his writings for publication. Meantime his health daily declined, and at last his illness assumed so alarming an aspect, that he determined on returning to die in his native land; but when on board the vessel he was unable to proceed, and returning to shore, he died a few days after on the 19th September, 1829, in the 34th year of his age, just at the time that his poems were published in his native city. Callanan was a true poet. Thoroughly acquainted with the romantic legends of his country, he was singularly happy in the graces and power of language, and the feeling and beauty of his sentiments. There is in his compositions little of that high classicality which marks the scholar; but they are full of exquisite simplicity and tenderness, and in his description of natural scenery he is unrivalled. His lines on "Gougane Barra" are known to every tourist that visits the romantic regions of the south of Ireland, and his longer poems possess great merit.—J. F. W.

CALLARD DE LA DUQUERIE, JEAN BAPTISTE, a French physician and botanist, was born in 1630, and died in 1746. He practised his profession at Caen, and subsequently became one of the professors of medicine in the university. He founded the botanic garden of that town. He published a "Universal Medical Lexicon."—J. H. B.

CALLCOTT, SIR AUGUSTUS WALL, was born in Kensington in 1779. He was a chorister as a boy, and officiated for some years at Westminster abbey under Dr. Cooke. But he took early to painting as a profession, and became the pupil of Hoppner, the distinguished portrait painter, Callcott himself, at first, following the same branch of the art. Callcott's talent was, however, for landscape painting, and he eventually attained such eminence in this department of painting, that he was called the English Claude. Some of Callcott's finest works are in the style of Claude, but without the hardness of that painter, and with a more skilful treatment of the foregrounds; his colouring is uniformly sober, and somewhat of the tone of the early works of Turner. But Callcott never erred on the side of extravagance, and was always free from manner in his landscapes. In the National Gallery are some remarkably fine examples of the works of this painter, both of his least pretentious, and of his

most important style, as the "Entrance to Pisa from Leghorn," painted in 1833—a grand landscape. Callcott was elected a member of the Royal Academy in 1810, and was for many years a constant and important contributor to its exhibitions. In 1837 he was knighted by the queen, and in this year he unfortunately forsook the line of art upon which he had founded his deserved reputation, and became a figure painter. His first attempt in this new province was a large picture of "Raphael and the Fornarina," exhibited in 1837, well known by the print from it by Lumb Stocks, A.R.A., which was distributed to the subscribers of the London Art Union in 1843. This picture was followed in 1840 by another work of like pretensions—"Milton and his Daughters;" but it was so far from maintaining the credit of his previous attempt, that it was generally admitted to have been a complete failure. It was a great injury to his reputation. It exhibited one of the first of living landscape painters as below mediocrity as a figure painter. From this time Sir Augustus did little more; his health rapidly failed him. In 1844 he was appointed conservator of the royal pictures, as successor to Mr. Sequier—an honourable office, but one of small remuneration, and which he held for a few months only. He died on the 25th of November the same year.—R. N. W.

CALLCOTT, LADY, was the daughter of Rear-admiral George Dundas, and was born in 1788. In 1809 she married Captain Graham, R.N., who died at sea in 1822. She was married to Sir Augustus Callcott in 1827. Lady Callcott was a great traveller, and spent several years in India and South America. She twice visited Italy, and published two works relating to it—"Three months in the environs of Rome," and "Memoirs of Poussin." She also published a "History of Spain," in 2 vols., "Little Arthur's History of England," "The Little Brackenburra's Essays towards the History of Painting," and a "Scripture Herbal," her last work. Lady Callcott, who was an invalid for eleven years, died 21st November, 1843. Her memory will long be affectionately remembered, not only for her talents and great acquirements, but for her generous, kind, and pious disposition.—J. T.

CALLCOTT, JOHN WALL, Mus. Doc., was born at Kensington in November, 1766, and died May 15, 1821. His father was a bricklayer and builder, and the musician, like his brother Sir Augustus, the painter, was the offspring of a second marriage, both bearing their mother's maiden name of Wall. John, as a schoolboy, showed an equal capacity and inclination for languages, which grew with his years. In course of time he became master of Latin, Greek, Hebrew, and other dead and oriental tongues, and he read French, Italian, and German, with the same fluency. He was intended for the profession of surgery, and evinced considerable aptitude for the study of anatomy; his feelings were so shocked, however, by witnessing an operation, that he fainted in the room, and could not be induced to apply himself further to the pursuit. His first interest in music was excited when he was twelve years old; his father was then engaged upon some repairs of Kensington church, during which young Callcott had occasionally to attend him, and thus had opportunities of hearing the organist practise, an accident that determined his ultimate destiny. In the year of his chirurgical probation, he made constant visits to the Kensington organist, whose warm encouragement stimulated his natural taste; and when, at thirteen, he abandoned the study of surgery, he had no difficulty in deciding upon that of music to replace it. It was at Christmas in 1780 that he made his first attempt at composition in writing music for a private play. When he was about sixteen he made the acquaintance of Dr. Arnold and Dr. Cooke, whose influential professional position enabled them greatly to assist Callcott's advancement. Among other advantages he obtained from these friends, was an introduction to the society called the Academy of Ancient Music, at whose concerts he played in the band, and also produced, with great credit, an anthem for two choirs and orchestra. In 1783 he succeeded Attwood as assistant organist to Reinhold at the church of St. George the Martyr, which appointment he held for two years. In 1789 he competed for the organ of St. Paul's, Covent Garden, when the interest of the electors was divided between him and Charles Evans, the glee writer; so these two friends agreed to accept the office jointly, and share its duties and its remuneration. When in 1795 the church was burned, Callcott played once in aid of the fund for its re-erection, at Ely chapel, Holborn, on which occa-

sion he was introduced to William Horsley, organist of the chapel, who subsequently became his son-in-law. He was also engaged as organist at the Female Orphans' Asylum from 1792 till 1802, when he was succeeded by Horsley, who had been his assistant. He wrote his first glee in 1784, for the prize given by the Catch Club; but he was this time an unsuccessful candidate. He made up for his ill-fortune in 1785, when he gained three of the four prizes for glees, canons, and catches, annually awarded by that society. He gave a rare example of industry in sending, two years later, a hundred compositions for the prizes; this inundation was so extraordinary as greatly to embarrass the regular proceedings of the club, and a law was consequently passed that no candidate should be allowed to offer more than three pieces for each of the four prizes. Though Callcott was made an honorary member of the club, he regarded the new statute as a personal affront, in resentment of which, in 1788, he refused to write for the prizes. In 1789, however, he was persuaded of his error, and, in compliance with the restriction, submitted twelve compositions; on this occasion he gained all the four medals, a success of which there has been no other example in the entire history of the Catch Club. Greatly interested in this class of composition, Callcott helped to promote its cultivation by organizing, in conjunction with Dr. Arnold, the Glee Club, which held its first meeting at the New Coffee-house, December 22, 1787. He was likewise one of the original members of the Conectores Sodales, another institution to encourage the writing of glees and canons, which was established in 1798. When Haydn visited England in 1790, Callcott placed himself under him for a course of lessons. With that master he especially studied orchestration, but, though he played several instruments, he never excelled in this branch of the art. He took his bachelor's degree at Cambridge, by invitation of Dr. P. Hayes, the professor, when he was scarcely nineteen, and set Wharton's Ode to Fancy for his exercise. He was made doctor of music at Oxford in 1800, when he obtained his testamen for a Latin anthem. A few years prior to this he became deeply interested in the investigation of the theory of music, to which he was strongly stimulated by Overend, an organist, who possessed the extensive manuscripts of Dr. Boyce on this subject. Callcott's classical attainments greatly facilitated his researches into the ancient systems, and his fluency in living languages enabled him to read all that had been written upon modern art. From 1797 his chief attention was spent upon the compilation of a musical dictionary, the collecting of materials for which became the hobby of the rest of his life. As after several years he felt himself in some respect compromised in not having fulfilled his announcement of this purposed work, he thought it necessary to produce something of a theoretical character, and accordingly wrote his "Grammar of Music," which occupied the leisure of 1804 and 1805. This book was, at the time when it appeared, the most comprehensive musical treatise that had been written in English, and, though later theories have superseded it, its merit is still acknowledged. He made some preparation for a biographical dictionary, but proceeded only for the first few letters. He published in 1801 a small educational book called "The Way to Speak Well," intended to have been the first of his series; but he did not carry out this design. In 1805 Dr. Callcott was appointed to succeed Dr. Crotch as lecturer at the Royal Institution, but was never able to enter upon the office; his constant habit of excessive application had for long undermined his health, and his reason now gave way under the ceaseless strain upon it. For five years he was an inmate of a lunatic asylum, during which time his lucid intervals were occupied with musical composition and religious exercises. He then returned to his friends, and resumed his avocation of teaching; but in three years his malady regained its power, and it became necessary to place him once more under restraint, and thus he remained until his death. He married in 1790, on which occasion he wrote his prize glee, "Triumphant Love." Of his several children, his son, William Hutchins Callcott, is known as a musician by his song, "The Last Man," and by his numerous pianoforte arrangements.

Dr. Callcott was the author of "Angel of Life," and some other esteemed songs; his reputation as a composer, however, rests chiefly upon his glees, canons, and catches, of which a large collection was edited by W. Horsley, and a far greater number remain unpublished. His glees may be divided into the

following classes—those taken from Ossian, the amatory, the descriptive, the moral, and the characteristic; of these, the last, comprising "The Red Cross Knight," and "When Arthur first," though least esteemed by genuine glee-lovers, are the most popular, the most spontaneous, and the most indicative of genius. The glee, for half a century the only type of an English school of music, gives place now to a higher order of composition; but the institutions founded for its cultivation continue to preserve it, and in all these Dr. Callcott's productions form the standard of excellence.—G. A. M.

**CALLEJA** or **CALLEJAS**, **DON FELIX DEL REY**, Count de Calderon, a Spanish general, born in 1750; died about 1820. From 1810 till 1817 he served in the insurrectionary wars of the Spanish Transatlantic settlements, particularly distinguishing himself by the dispersion of the army under Hidalgo. His fame was stained by numerous acts of horrid cruelty. In 1815 he superseded Venegas in the viceroyalty of Mexico, but was dismissed from that post in 1819, when he returned to Spain.

**CALLENBERG**, **GERARDT**, a Dutch admiral, born at Willemstadt in 1642. Callenberg distinguished himself on that fatal day on which Ruyter was mortally wounded. He commanded the Dutch fleet that assisted the English in the capture of Gibraltar; and died a simple burgomaster in 1722.

**CALLENBERG**, **JOHN HENRY**, a learned German orientalist and promoter of Jewish and Mohammedan missions, was born in the duchy of Gotha in 1694, and studied at Halle, where in 1727, 1735, and 1739, he became successively extraordinary and ordinary professor of philosophy, and ordinary professor of theology, in which last office he continued till his death in 1760. The Collegium Orientale Theologicum, instituted by O. H. Michaelis in Halle in 1702, of which Callenberg became a member, had great influence in determining his life-long studies and pursuits. His lectures in the theological chair had chiefly reference to the Hebrew language and to subjects connected with Judaism and Jewish antiquities. His published writings were of no great importance; the principal work of his life was the Callenberg Institute of Halle, which he commenced in 1728, and which continued in existence for thirty years after his death, till it was at length, in 1791, merged in the larger and more important Institute of Francke in the same city. The principal object of this institution was the conversion of the Jews, for which purpose missionaries were trained and sent forth to almost all the countries of Europe, and even to the East, and a printing-press was maintained for the preparation of works specially adapted to influence the Jewish mind.—P. L.

**CALLENDER**, **JAMES THOMPSON**, a native of Scotland, who gained some notoriety in America, whither his radical politics compelled him to emigrate about 1795. He had published, before leaving England, "The Political Progress of Britain, or an Impartial View of Abuses in the Government," and "The Political Register." His "Sketches of the History of America" appeared in 1798. For a political pamphlet, entitled "The Prospect before us," containing an assault upon the Washington and Adams administrations, he was tried and convicted under the sedition law; but the ready pardon of Mr. Jefferson, whose stipendiary he was, made the judgment of no effect. Mr. Jefferson attempts in his Correspondence to explain the circumstances of this connection. Callender was drowned in the James river, near Richmond, in 1803. He was the "obscure scribbler who," says Boswell (1782), "collected and published 'The Deformities of Johnson' in spiteful reply to 'The Beauties of the Doctor,'" then a recent book.—F. B.

**CALLENDER**, **REV. JOHN**, an eminent baptist clergyman of America, born in Boston, Massachusetts, in 1706, became pastor of a congregation at Newport, R. I. He is best known as the author of a centenary sermon on the purchase of Rhode Island by emigrants from Massachusetts in 1638, published in 1739. He died in 1748.—F. B.

**CALLIAS** and **HIPPONICUS**, a noble and wealthy Athenian family, hereditary torch-bearers at the Eleusinian mysteries. The names seem to have been borne by alternate heads of the family. One, named **CALLIAS**, fought at the battle of Marathon, was afterwards ambassador from Athens to Artaxerxes, and negotiated a peace with Persia, B.C. 449. His son, named **HIPPONICUS**, commanded at the battle of Delium in 424, where he was killed. He had a son named **CALLIAS**, who squandered all the ancestral wealth. The scene of Xenophon's *Banquet* and Plato's *Protagoras* is laid at his house.—J. B.

**CALLIAS**. Of those bearing this name, but unconnected with the family preceding, we notice—**CALLIAS**, who married Elpinice, sister of Cimon, son of the great Miltiades. He released Cimon from prison by paying a fine of fifty talents that had been imposed on his father.—**CALLIAS**, tyrant of Chalcis, in Eubœa, defeated B.C. 350, by the Athenians, with whom he afterwards formed an alliance.—**CALLIAS**, a comedian, flourished B.C. 412.—**CALLIAS** of Syracuse wrote a history of Sicily in twenty-two books, embracing the reign of Agathocles with whom he was contemporary.—J. B.

**CALLICRATES**, a Greek general, born at Leontium in Achaia; died at Rhodes in the year B.C. 149. Intrusted with various public embassies, and appointed general of the Achaian league, he took every opportunity, during a period of thirty years, of betraying the interests of his country to the Romans. His death was declared by Pausanias to be a fortunate event for all Greece.—G. M.

**CALLICRATES**, the architect who, with Ictinus, was employed by Pericles to construct the Parthenon at Athens.

**CALLICRATIDAS**, a Spartan general, died in the year B.C. 406. He was sent to Ephesus to supersede Lysander in the command of the fleet. He seized Delphinium in the isle of Chios, ravaged Teos, and took possession of Methymne. He was defeated and slain in a naval engagement with the Athenians near the Arginusæ.—G. M.

**CALLIÈRES**, **FRANÇOIS DE**, a French statesman and writer, born in 1645. He was employed in several embassies by Louis XIV., and died in 1717. He wrote some poetical pieces. His chief work, "De la manière de négocier avec les Souverains," 1716, has been translated into English, Italian, and German.

**CALLIERGUS**, **CALLIERGI**, or **CALLOERGI**, **ZACHARIAS**, a Greek philologist, born in Crete about the end of the fifth century. He studied at Venice, and afterwards conducted the printing establishment of Agostino Chigi at Rome. His editions of the Greek authors excelled all preceding ones in correctness and in beauty of type.

**CALLIMACHUS**, born at Cyrene in Lybia. The date of his birth has not been ascertained. His death is stated to have occurred about 270 years before our era. Apollonius Rhodius was a pupil of his, but it would appear that master and pupil had but little love for each other. The name of a poem against Apollonius, by Callimachus, is preserved—the poem itself has perished. The names of several narrative and lyric poems, of satires and of tragedies, by Callimachus, are preserved; but his hymns and some epigrams have alone survived to our times. Callimachus was imitated by Propertius, who said that his great ambition was to be called the Roman Callimachus; and Catullus translated one of his poems. Quintilian preferred him to any other of the Greek elegiac poets. The hymns of Callimachus have been frequently published. They are interesting to students of Greek mythology, and have been often well edited. The Italian translation by Salvini is spoken of with high praise. The phrase, "A great book is a great evil," is said to have originated with Callimachus.—J. A., D.

**CALLIMACHUS**, a Greek sculptor, who flourished probably about 400 B.C. Vitruvius speaks of him as the inventor of the Corinthian capital. He is said to have spoiled his works by excessive finish, whence he was named καλιζορευχος or "calumniator sui," as Pliny interprets the epithet.

**CALLIMACHUS**, an Athenian who lived about 490 B.C. He held the office of polemarch at the time of the battle of Marathon, where he fell, while commanding the right wing of the Athenians. His body was found in an erect posture, supported by arrows.

**CALLIMACHUS-EXPERIENS**, **FILIPPO**, born at Florence. The date of his birth is uncertain; he died at Cracow in 1496. He was of the family of Buonacorsi, but adopted the name of Callimachus at a period when it became fashionable with the Italian literati to assume classical designations. The academy to which he belonged found favour with Pius II., but was distrusted in the next pontificate, when its members were thought no better than conspirators, and had to fly for life. Callimachus escaped to Poland, where he found employment in educating the children of Casimir III. He was afterwards secretary to that monarch, and continued to hold the same office under his successor and till his own death. He was sent on several embassies, the object of which was to avert some meditated incursions of the Turks. While absent on one of those occasions

he had the misfortune of losing a valuable library by fire, by which also some of his own writings were destroyed. His principal works are—"Attila," or "De Gestis Attilæ," printed in Bonfini's *Decades Rerum Hungaricarum*, and some tracts on the relations of the Turks to christian Europe. Some works of his still remain in manuscript, among which are "Historia Peregrinationum Svarum" and "De Regibus Pannoniæ."

CALLINUS, a Greek orator, and the first it is said who invented elegiac poetry, B.C. 776. Some of his verses, which are of great excellence, are preserved in Stobæus.

CALLIPPUS, an Athenian tyrant of Syracuse, died in the year 351 B.C. He assassinated Dion, with whom he had been on terms of intimate friendship, and seized on the government of Syracuse in 353 B.C.

CALLIPPUS or CALIPPUS, a Greek astronomer, was born at Cyzicus about 350 B.C., and is chiefly distinguished for his reform of the calendar. Meton, in the preceding century, had discovered that nineteen years nearly correspond with 235 lunar months, and, assuming the correspondence to be exact, had instituted a calendar repeating itself every nineteen years, which came into general use in Greece. Callippus approximated more nearly to the truth by deducting one day in every fourth period, *i.e.*, in every seventy-six years, and his correction was adopted by the astronomers of the day. It appears from records left by Ptolemy, that the Callippic cycle commenced on the 18th of June, B.C. 330. The length of the year, according to the calendar of Callippus, would be almost exactly  $365\frac{1}{4}$  days.—J. D. E.

CALLISEN, HENRY, a Danish physician and surgeon, born in 1740. He was surgeon-in-chief of the Danish fleet, professor of surgery in the university of Copenhagen, took an active part in establishing the society of medicine in that city, and was in 1791 made professor of anatomy in the academy of surgery, of which he became director-general. He died in 1824. The most important of his numerous works is "Institutiones Chirurgiæ Hodiernæ," 1777.

CALLISTHENES, born at Olynthus about 365 B.C., was recommended by his relative and master, Aristotle, as the historian to attend Alexander in his Asiatic expedition, and write its history. He is said to have been bold in rebuking the conqueror for his pride and excesses, and to have on that account fallen into disfavour. He was accused of being privy to the conspiracy against the king headed by Hermolaus, was imprisoned for some months, and perished under the cruel treatment to which he was subjected. His account of Alexander's expedition has been lost, as well as his history of Greece and other works.—J. B.

CALLISTRATUS, a Roman jurist, of whose writings Justinian made use in compiling his Digest. He lived under Septimius Severus, who died in 211, and his son Antoninus.

CALLOIGNE, JEAN-ROBERT, a Flemish sculptor, born at Bruges in 1775. It was while apprentice to a potter that Calloigne resolved on becoming a sculptor. His father, pleased with the figures which he modelled in clay and wood, sent him to the academy, where he obtained a first prize. Soon after he gained a medal in a competition for the finest bust of Van Eyck. He died full of honours in 1830.—R. M., A.

CALLOT, JACQUES. This distinguished artist was born in 1593 at Nancy in Lorraine. His family was of Flemish origin, and Jean Callot, the father of Jacques, was king-at-arms of Lorraine. At the age of eight, Jacques was engaged in drawing armorial bearings and colouring escutcheons under the tuition of his father. But his fantastic genius refused to be trammelled by heraldic conventions; his free pencil played strange freaks with the genealogical papers. A difference with his parents probably ensuing, combined with an irrepressible longing to visit Rome, the head quarters of art, he quitted his father's roof, and joined a troop of gipsy mountebanks travelling southward. But at Turin he was arrested by some relatives, and sent back to Nancy—very wretched indeed at the failure of his project. Subsequently, however, moved by his son's entreaties, the father permitted his departure, and obtained for him an appointment in the embassy despatched to apprise the pontiff of the accession of Henry II. Jacques was then fifteen. He studied under many professors, especially with Giulio Parigi, but he was his own master, and formed his own style. Mind, eye, and hand, were ever restless—never idle. Soon he seems to have perceived that painting was not his forte. He threw away the palette, and seized the graver, working hard under Philip Thomassin, the old French engraver settled in Rome. Engraving had but

few professors, was just becoming the vogue, and Thomassin's respectable religious subjects had brought him a fortune. His young pupil's energy and fervid originality greatly swelled his gains. But the pupil tired of the graver, as he had wearied of the brush. He had not yet grasped the right art weapon for winning him renown. He found it at last in the etching needle. His connection with Thomassin ceased suddenly—the old artist was jealous of the pupil's attentions to the young and pretty Madame Thomassin. This love episode is the foundation of the well-known whimsical legend of *Le Tableau Parlant*. Callot made for Florence, and penniless and crestfallen, would have been utterly lost but for the genuine kindness of the grand duke, Cosmo II. He is stated to have occasionally resumed his brush at Florence, but with no marked success; while his etchings achieved for him a triumph, and he was rewarded with a gold medal and chain from the hands of the grand duke. He remained ten years at Florence, and received the patronage of Ferdinand, the successor of Cosmo. Subsequently he returned to Nancy, and was welcomed with ecstasy by his parents. He married a respectable widow, and received the protection of Henry, duke of Lorraine. In 1628 he proceeded to Paris to finish the engravings of the Rochelle expedition, which he had joined in the suite of Louis XIII. at the express command of the king. He returned to Nancy—his works completed. Afterwards his wrath was greatly excited by the fact of the king laying siege to Nancy; and being requested to commemorate the event by an etching, he answered indignantly—"Sire, I am a Lorrain. I would sooner cut off my thumb than perpetuate the disgrace of my country, or the dishonour of my king." The court awaited an explosion, and trembled as only courtiers can. "Monsieur Callot, your answer does you honour—I envy the duke of Lorraine such subjects," said the king benignly. After a prolonged illness, Callot expired on the 25th March, 1635, aged forty-two, and was buried in the cloister of the cordeliers, Nancy, in a magnificent tomb of black marble, by the side of the dukes of Lorraine. The works of Callot consist of nearly 1600 plates. Of these the least successful are his religious subjects. He worked with a wonderful facility—frequently finishing a plate in a single day. His drawing is singularly correct and elaborately finished, and yet without the slightest appearance of labour. The designs seem to have fallen from the point of the needle. In delicacy of workmanship he is almost unequalled. One of his critics states that many of his plates, but a crown piece in size, contain five or six leagues of country, and a multitude of figures, all in movement. His most renowned works are his "Temptation of St. Anthony;" "The Fair della Madonna Imprunetta;" "The Tortures;" "The Massacre of the Innocents;" and "The Horrors of War." But his fertile treatments of beggars, mountebanks, bullies, pierrots, and tatterdemalions of every description, have created his great fame. In these the grotesque and fanciful run riot. Rags are surrounded by diablerie that is wonderful in fascination and exhilarating influence; a beggar's carnival is celebrated, and raggamuffinism is dazzlingly rampant. Van Dyck exchanged portraits with Callot, as Raffaele had previously done with Albert Durer. Not so great as either, still Callot is a happy link—a very pleasant stepping-stone between Durer and Rembrandt. He has not the earnestness of Durer, but he has much of his sardonic grimness. If Rembrandt gloried in shadow, Callot was eminent in outline. His paintings are by no means so highly estimated as his etchings, and there is much dispute in regard to their authenticity. Some attributed to him have grace and delicacy, but are weak in colour—a water colour Jerburg-look haunts them.—W. T.

CALLY, PETER, the first in France who avowed his adherence to the Cartesian philosophy. In 1675 he became principal of the college of arts, and afterwards curate of St. Martin's parish in Caen, where he was specially popular among the protestants, for whom he wrote his "Durand Commenté," 1700. In 1674 he published an introduction to philosophy, which he greatly enlarged and republished in 1695 under the title "Universæ Philosophiæ Institutio."—J. B.

CALMET, AUGUSTINE, a learned French theologian and historian, was born near Commerci in Lorraine in 1672, and died in Paris in 1757. At an early age he assumed the habit of the Benedictines, and studied philosophy and theology in various abbeys of that learned order. In the abbey of Munster, a lucky accident threw in his way the Hebrew grammar of Buxtorf

and some other writings in that language, which had the important effect of giving him the first direction to those biblical studies which afterwards made him so extensively useful and so widely renowned. He got his first lessons in the reading and exegesis of the Old Testament from Faber, the protestant pastor of Munster. In 1698 he was appointed to the charge of instructing the young religieux of the abbey of Moyen Moutier in philosophy and theology. In 1704 he was made sub-prior of the abbey of Munster, and was put at the head of an academy of ten monks, who occupied themselves with the study of biblical literature. In both these positions he wrote copiously on subjects of sacred learning, in the form of commentaries and dissertations; but, unable to determine whether his writings were of sufficient importance to deserve publication, he went to Paris in 1706, to submit them to the judgment of Mabillon and other scholars, by whom he was encouraged to bring out his commentaries in French, which accordingly appeared in 23 vols., 4to, in 1707-16, and extended to all the books of the Old and New Testament. In 1715 he was made prior of Lay, near Nancy; in 1718 abbé of St. Leopold in Nancy; and in 1719 he was raised to the dignity of a visitor of the congregation of St. Vannes, to which he belonged. His last promotion was to the abbey of Senones in Lorraine in 1728, where he continued to reside and to prosecute his learned labours till his death, having declined the dignity of bishop, in order that he might retain leisure for his favourite pursuits. His writings and publications were exceedingly numerous, not only in biblical literature, but also in history, topography, genealogy, biography, and antiquities. The works by which he is best known are "Dictionnaire Historique et Critique de la Bible," Paris, 1730, 4 vols. folio, which has been translated into English, German, Italian, and Dutch; the English translation appeared in 1732, in 3 vols. folio, and a second edition of it in 1793, in 4to, with additions from more recent sources; "Dissertations, qui peuvent servir de Prolegomènes à l'Écriture Sainte," Paris, 2d edition, 1720; and augmented in the 3d edition, which bore the new title, "Trésor d'Antiquités Sacrées et Profanes," Paris, 1722, 3 vols. 4to. This work, which is in part a reproduction of the dissertations which the author had inserted in his commentaries, has been translated into English, Latin, Dutch, and German. The German edition is enriched with a preface and notes by Mosheim. The English edition was brought out by Samuel Parker at Oxford in 1726. As a biblical scholar, Calmet was more distinguished for erudition than for critical acumen, and he was deficient in the departments of rabbinical learning and oriental philology. But the two works named above have always been highly esteemed, not only in his own church, but also by protestant theologians.—P. L.

CALMO, ANDREA, a Venetian dramatist, born in 1510, was the son of a gondolier. His five comedies—"Il Travaglio;" "La Pozione;" "La Spugnola;" "La Saltuzza;" and "La Florina," particularly the last, had a success on the stage unequalled in the sixteenth century. This they owed to a humorous interweaving of various dialects, to considerable ingenuity of plot, and utter absence of decency. Calmo wrote eclogues and complimentary epistles, which were also successful. He died in 1571.—A. C. M.

CALO-JOHN, a Bulgarian chief of the thirteenth century, who adhered to the see of Rome, and received the title of king from Innocent III. He made war with Baldwin I., emperor of Constantinople, whom he subdued and imprisoned, and, it is supposed, put to death.—(See BALDWIN.) Leading on the Greeks and Corsicans who followed his standard, he carried on a devastating war till, while besieging Thessalonica in 1207, he was assassinated by one of his own officers.—J. B.

CALOGERA, ANGELO, born at Padua of a noble family of Greek origin in 1699. On the completion of his studies he entered the order of St. Benedict in the convent of St. Michael, an island between Venice and Murano. In this solitude, attracted to the study of literature, he soon became deeply versed both in ancient and modern classics. The want of a registry of the proceedings of literary and scientific associations was strongly felt all through Italy, and Calogera undertook the difficult task, publishing, with the help of Muratori and others, no fewer than fifty-one volumes. To this collection or registry of historical facts, and to Calogera's "Opusculi per servire alla Storia d'Italia," Balbo, Cantù, and many other of the historians of Italy, have been much indebted. Calogera also

translated Telemachus, and wrote many valuable biographies. His voluminous correspondence with the literati of his time is an inexhaustible source of useful information. He was official revisor of all publications in the Venetian territory from 1730 till his death in 1768.—A. C. M.

CALOMARDE, FRANCISCO TADEO, a well-known Spanish statesman, was born at Villed in Arragon in 1775. He was for several years the most influential minister of Ferdinand VII., and made it his great aim to re-establish absolutism in Spain. His parents were poor, and he was originally bred to the bar; but by his marriage to the daughter of Beltran, physician to Godoy, then the reigning favourite, he obtained an office at court, and exchanged the practice of law for politics. He subsequently became first secretary to Lardizabal, who, on the restoration of Ferdinand, was appointed minister of the Indies. On the death of the marquis of Casa Irujo in 1824, Calomarde was appointed minister of justice. He discharged the duties of his office with great severity, and it was under his administration (31st July, 1826) that a schoolmaster named Antonio Ripoll was burnt at Valencia for heresy—the only auto-da-fe that has taken place in Spain for the last thirty years. As the leader of the absolutist party, Calomarde lent himself to all the pernicious schemes of the apostolic junto, and, next to Ferdinand, he was mainly responsible for the many despotic and unjust measures of the Spanish court from 1824 to 1832. When Ferdinand was on his deathbed in September, 1833, he was induced, by the advice of Calomarde, secretly to revoke the deed by which he had set aside the claims of his brother, Don Carlos, to the crown, in favour of his daughter, and to add a codicil to his will restoring the male line of succession. But this step having become known through the indiscretion of the minister himself, the document was destroyed by the queen's sister in his presence, and he was compelled to provide for his safety by fleeing with the utmost haste into France, where he spent the remainder of his life in retirement and dejection, and died at Toulouse, 21st June, 1842.—J. T.

CALONIUS, MATTHIAS, a Finlantic jurist, born at Sarijärvi in the parish of Tavastland in Finland, 27th January, 1738. In the year 1771 he became secretary to the academy of Abo, and in 1778 professor of jurisprudence there. From 1793 to 1800 he was member of the supreme tribunal at Stockholm, and also of the committee who sat to frame a code of forest laws. After the conquest of Finland by Russia, Calonius sat in the Finlantic senate as statsraad procurator, which office he resigned in 1816, and on the 13th of September in the following year he died. Calonius is universally acknowledged to have possessed the most profound knowledge of jurisprudence of any Swedish lawyer of modern times; and whether as member of the Swedish supreme court, by his writings, or as member of the legal committees, he exercised an equally powerful and beneficial influence on the study of the law and the practice of justice in that country. His collected works, published at Stockholm by A. J. Arvidsson, 1829, consist in part of treatises and programmes, and in part decisions of the supreme tribunal, &c. As a proof of the uprightness of Calonius and his steadfast adherence to principle, it may be mentioned, that when every other corporation in Finland took the oath of allegiance to the Russian government, the consistorium of the academy of Abo, headed by him, dared to refuse obedience to its demands until Sweden had, by the treaty of peace, resigned all claim to the province.—M. H.

CALONNE, CHARLES ALEXANDER DE, was born at Douai, January 20th, 1734, his father being president of the parliament in that place. Having studied at Paris for the bar, he became advocate-general of the provincial council of Artois, and afterwards entered the parliament of Douai as procureur-general. He gained some celebrity by his reports upon certain disputes with the clergy, and was nominated intendant, first of Metz in 1768, and then of Lille. Having displayed considerable administrative abilities, and also having proved himself possessed of that insinuating gracefulness of speech and manner, together with that readiness of intriguing resource, which can render a man of business as popular in the boudoir as at the bureau, Calonne succeeded d'Ormesson as minister of finance, October 3, 1783. Nothing could be worse than the state of the exchequer when Calonne entered office; but with a boldness which, if not altogether wise, was brilliant and characteristic, he at once proceeded to act as though everything were prosperous. He disdained retrenchment; carried on great works at Cherbourg

and Paris; bought St. Cloud for the queen; sustained the stocks by secret advances; assured the credit of the *caisse d'escompte*, which shortly before his accession had stopped payment; and established a sinking fund for the redemption of the national debt upon a very judicious plan. For a time the country seemed saved, and the ladies of the court delighted to speak of Calonne as the enchanter. He was compelled, however, to adopt the usual system of loans, and at last, perceiving national bankruptcy inevitable without some great change, determined to attempt a new arrangement of taxes. His plan was at once just and daring. It involved the establishment of a land tax from which no class should be exempted, and a removal of restrictions on internal commerce. Calonne submitted his financial statement to the assembly of notables, 22nd February, 1787. He declared the deficiency to have been accumulating under Terray, Turgot, Clugny, and Neckar; and admitted that the annual deficit amounted to a hundred and fifteen million francs; and that since his accession (from 1783 to 1787), in three years and two months, three hundred and eighty million francs had been borrowed. He, therefore, called on the privileged classes to consent to taxation rather than impose additional burdens on the unprivileged people. The opposition was violent in the extreme. Neckar had declared when he left office a surplus of four million francs, and therefore opposed Calonne to justify himself; while the nobility, clergy, and magistrates made common cause against a scheme which would subject them to those public taxes from which they had been previously exempt. The court was frightened by the ferment, and abandoned Calonne, who was disgraced, and finally took refuge in London. Although Calonne was vehemently accused, by Mirabeau especially, of having exaggerated the deficiencies under his predecessors, for the purpose of concealing his own corruption, yet in fact he left office nearly destitute, and only restored his fortune by his marriage with madame d'Harvelay, the widow of a rich banker who had been his early friend. When the Revolution broke out, Calonne supported the cause of the noble refugees, whose only hope was in influencing foreign courts; journeying on their behalf from country to country, and freely spending for them the best of his means. He wrote several able pamphlets in defence of his policy, but finally abandoned political life, employing himself in the peaceful study of the fine arts until his death in Paris, October 29th, 1802. The judgment of his countrymen upon him is, that while he possessed high administrative ability, and could grasp broad plans and small details with admirable precision, yet that he had not the wisdom which matures thought, the prescience which divines obstacles, or the capacity to direct parties with that orderly discipline which prepares executive success; and thus, while he had power to raise the storm, he had no spell wherewith to lay it.—L. L. P.

**CALOVIVS, ABRAHAM**, a Lutheran divine and controversialist, born at Morungen in the duchy of Brunswick in 1612. In 1650 he became professor of divinity at Wittemberg, where he distinguished himself in a controversy with Calixtus. His party were named Calovians. He died in 1686, leaving numerous works, chiefly controversial. He is remembered as an able opponent of the Socinians.—J. B.

**CALPHURNIA**, the fourth wife of Cæsar. In consequence of a dream she had the previous night, she endeavoured to detain her husband at home on the fatal ides of March.

**CALPRENEDE, WALTER DE COSTES**, a dramatist and romance writer, born in Perigord in 1612. He held a position of honour at the French court. The tragedies of "Mithridates," and "The Earl of Essex," are the chief of his plays; but his fame rests upon his very voluminous romances of "Cassandra," "Cleopatra," and "Pharamond." He died in 1663.—J. B.

**CALPURNIVS, TRIVS**. Little is known of Calpurnius, except that he was born in Sicily, towards the end of the third century. A sort of biography has been made for him by assuming that everything he has stated of the imaginary characters of some eclogues—in which he has imitated Theocritus and Virgil—is true of himself. Of several of the eclogues themselves the authorship is doubtful. Gibbon makes use of a passage in one of them in proof of the character of the sports in the amphitheatre in the year 284 after Christ, as the evidence of an eyewitness.—J. A., D.

**CALUSO, THOMAS VALPERGO**, a celebrated Piedmontese author, born at Turin in 1737; died in 1815. He was educated

at the Nazareno college in Rome. After assuming a monkish habit, he was successively member of the council, director of the astronomical observatory, and professor of Greek and the oriental languages in the university of Turin. He presented to the library of that institution a large collection of Hebrew and Arabic MSS., and some valuable works of the fifteenth century. Caluso was member of the legion of honour, of the Academy of Turin, correspondent of the French Institute, &c. He wrote thirty-six works, which have been divided into three classes—poetry, mathematics, and oriental literature.—T. J.

**CALVART, DENIS**. This distinguished painter was born at Antwerp in 1555. His style was rather Bolognese than Flemish. He started as a landscape painter; but anxious to attain to the higher walks of his art, he proceeded to Bologna to study the figure in the school of Prospero Fontana. He copied carefully the works of Corregio and Parmegiano, and afterwards travelled to Rome with Lorenzo Sabbatini to perfect himself in architectural and anatomical drawing. Returning to Bologna, he opened an academy which earned a considerable fame. Albano, Guido, and Domenichino were among the pupils of Calvart. He was learned in his art, and watched over the studies of his pupils, and aided their progress with an untiring zeal. His own works are careful and pleasing, especially in the composition and draperies. The figures are something strained and mannered. "The Hermits," in the Palazzo Ranuzzi; "The Holy Family" in the church of St. Giuseppe; and "St. Michael" in the church of St. Petronio at Bologna, are among his best works. He died in 1619 at Bologna.—W. T.

**CALVEL, ETEENNE**, a French agriculturist, died in 1830. He devoted his attention to agriculture and horticulture, and published numerous works on these subjects. Among others, he wrote treatises on the cultivation of forest-trees and of fruit-trees, of melons, of beet-root, and of the white mulberry.—J. H. B.

**CALVERT, GEORGE and CECIL**. See BALTIMORE.

\* **CALVERT, GEORGE HENRY**, an American man of letters, was born in Baltimore, Maryland, in 1803. His grandfather, Benedict Calvert, a descendant of the Baltimore family, though a loyalist in the revolutionary contest, was an intimate friend of General Washington. Mr. Calvert graduated at Harvard college in 1823, and then went to Europe and studied at Göttingen, where he imbibed a taste for German literature, which coloured many of his subsequent productions. After his return to America he edited a newspaper for a while, and in 1832 published "Illustrations of Phrenology." Among his later writings are—a "Volume from the Life of Herbert Barclay," 1833; a translation of Schiller's *Don Carlos*, 1836; "Count Julian, a tragedy," 1840; a translation in part of the Goethe and Schiller Correspondence, 1845; "Scenes and Thoughts in Europe," first series in 1846 and a second in 1852. He was chosen mayor of Newport, Rhode Island, in 1853.—F. B.

**CALVERT, SIR HARRY**, General, a distinguished British officer who entered the army in 1778. Having served in America and Holland, he was created a baronet in 1818. He did much for the improvement of the army, took an active part in establishing the royal military colleges, and founded the royal military asylum at Chelsea. He died in 1826.

**CALVERT, LEONARD**, the first governor of Maryland in America, was the second son of George Calvert, first Lord Baltimore.—(See BALTIMORE.) He arrived in the colony at the head of two hundred emigrants in 1633 or 1634, commissioned to attempt the formation of an English barony on the shores of the Chesapeake, founded on the feudal principles both of rank and property. Several manorial grants were accordingly made to different settlers, but they at length all disappeared before the democratic spirit of the new settlement. The proprietary form of government remained till the American revolution; but the people gradually acquired the same rights and liberties as in the other colonies. The population increased but slowly, and the governor was in frequent trouble with the authorities of Virginia, who laid claims to a part of his territory; and after the breaking out of the civil war in England, he had much to suffer from the disaffection of a portion of the colonists. In 1643 he went to England to confer with his brother, the proprietary, and on his return in the following year, he found that the disaffection had been fomented in his absence by agitators from abroad. An insurrection soon after took place which obliged him to take refuge in Virginia for nearly two years. In 1646 he returned to St. Mary's with an armed force, and easily acquired possession

of the government, drove away the rebel leaders, and issued a general pardon to all who returned to their allegiance. He died in 1647.—W. G.

**CALVI, FORTUNATO**, a distinguished Italian republican, born at Padua in 1818. Calvi was educated at the military college of Gratz, and was an officer in the Austrian army at the outbreak of the Italian revolution in 1848. Calvi threw up his commission and eagerly flew to Venice, where he entered the republican forces as colonel, and greatly distinguished himself during the siege. On the fall of Venice he escaped to Piedmont. In 1853 the celebrated Orsini having undertaken to lead an insurrectionary movement in Lunigiana, Calvi was commissioned by Mazzini to head a simultaneous revolt in Cadore. On entering Lombardy he was betrayed by a Tyrolese guide, arrested, and taken in chains first to Inspruck, then to Verona, and then to Mantua, where he was tried by an exceptional tribunal. He answered the interrogatories of his judges with calm dignity, carefully avoiding every possibility of compromising his fellow-conspirators. He was then confined in the fortress of Mantua. At first he was well treated, but early in 1855 he was ordered into a solitary cell. On the 2nd July in that year he was again carried before the exceptional tribunal, and sentenced to be hung on the 4th. He listened calmly; and on being told that he might receive a pardon if he would implore the emperor's clemency, he replied—"Never! my hatred to Austria is stronger than my love of life."—E. A. H.

**CALVI, LAZZARO and PANTALEO**. These painters were the sons of Agostino Calvi, an old Genoese artist. Lazzaro was born in 1501. The brothers studied under Perino del Vaga. Pantaleo was the elder; but either from modesty, or from inferior talent, or what is most probable, from dread of the turbulent temper of his brother, he claimed little share in the success of the many works they executed in conjunction. The brothers painted at Genoa, Monaco, and Naples. Lanzi accounts very highly their façade of the palazzo Doria (now that of Spinola). Their "Continence of Scipio" in the palazzo Pallavicini at Zerbino, Mengs regards as equal in power to any production of their master. Envy or ambition carried Lazzaro to great excesses. He sought to build up his fame on the murdered bodies of his rivals. He poisoned, among others, Giacomo Bargone, an artist of great promise. By various villanous contrivances he sought to clear his path of other competitors. With a fertile list of crimes in his heart, however, he comfortably worked away at the "Birth of John the Baptist," in the chapel de Nobili Centurioni. Andra Semini and Lucia Cambiaso were likewise engaged on this picture. The labour of Cambiaso being preferred by Prince Doria, the successful artist obtained the commission to paint the frescos in the church of St. Matteo. Mad with rage and disappointment, Lazzaro flung away his art and went to sea. For twenty years he followed a sailor's life, then resumed the brush, and died a painter at the extreme age of 105. His last works, in the church of St. Caterina, betray his years.—W. T.

**CALVIN, CAUVIN, or CHAUVIN, JOHN**, the second son of Gerard Calvin and Joanne Lefranc, was born at Noyon in Picardy, 10th July, 1509. The elder Calvin, a notary apostolic and procureur-fiscal for the lordship of Noyon, was able to afford his son the means of a good education, and he was trained along with the children of the noble family of De Montmor. The boy's correctness, fidelity, and religious susceptibilities encouraged his father to set him apart for an ecclesiastical life. Calvin was thirteen years of age when he obtained a benefice in the chapelle de Notre Dame de la Gesinè, and was enabled by the income derived from this nominal situation to proceed to Paris and enter on a course of regular academical study. After a short period of attendance at the collège de la Marche, he removed to the collège Montaigu. At this period the grammatical and logical progress of Calvin was remarkable; acuteness and power characterized him no less than the habit of patient investigation and precise composition. At the age of nineteen he obtained the living of Martville, and two years afterwards he exchanged it for Pont-l'Évêque, a village near his birthplace. These preferments were irregular, and the unfledged incumbent was required only to take the tonsure and hold a disputation. Though never ordained, he is said to have preached several times. But Calvin was not destined to enter the priesthood. His father imagined that the study and practice of law would present a more lucrative field for the genius and industry of his son, and the young man seems for a season to have entertained a similar opinion.

He resigned his living, left Paris, and settled at Orleans, to study law under Pierre de l'Etoile, president of the parliament of Paris, and a famous teacher of the day. In this new sphere the energy and talent of the young juriconsult asserted themselves, and his subtle and yet laborious mind so fully mastered the science, that he not only often taught in room of his tutor, but on leaving Orleans received the title of doctor of laws without the usual fees. During his sojourn in this place, his spirit had been awakened to the study of the bible, and, in common with many anxious inquirers, he felt those impressions which soon ripened into enlightened, living, and masculine piety. On repairing to Bourges to prosecute the study of law under Alciato, he had the unspeakable advantage of learning Greek under Volnar. The doctrines of the Reformation were embraced by him, and were immediately also imparted by him to many listeners. His fervent and resolute nature could not hide convictions of such moment, and his great earnestness made itself felt in many circles, for he taught, as Beza says, not "with affected eloquence, but with solid gravity of style." There were with him no bursts of juvenile enthusiasm, none of those wondrous raptures with which many embrace and propound a religious novelty. His calm but animated soul in his earliest and somewhat reluctant efforts to teach the new views, chose weighty and well-weighed words as the fitting expression of what he deemed truths of the highest interest. In fact, he had passed through a severe and prolonged mental discipline, which, while it had made him proof against extravagance and declamation, had, as his first biographer justly surmises, seriously undermined his health.

At this period Calvin's father died, and after some months of unsettled life, the reformer fixed his abode in Paris, and frequently preached, having given himself without reserve to the study of the theology. The reformed doctrines were then lifting their head in the French capital. The thoughtful and pious were attracted towards them; those who longed for a simpler and purer creed; those who had been protesting in heart against clerical inconsistency and arrogance; and those who had been wearied with the lassitude or impressed with the vanity of ceremonial routine. Calvin's master-spirit gave him a speedy and unsought supremacy among the friends of the Reformation, and exposed him to the fury of its opponents. To soften the heart of Francis I. towards the evangelical party, he published in 1532 Seneca's two books *De Clementia*, accompanied with such notes and comments as might induce his majesty to adopt milder measures towards those whose only crime was a daring avowal of their religious convictions. In this work he confounds the two Senecas, father and son, and uniting both their ages, blunders so far as to say that the author of the work on *Clemency* died 115 years of age. In the title-page he latinized his name into Calvinus, which he afterwards retained. He prepared also an address for his friend Copp, which, as regent of the Sorbonne, he delivered on the festival of All Saints. The address was so free and ardent a vindication of the reformed tenets that the reciter of it was obliged to flee from Paris, while its author made his way with difficulty to the court of the queen of Navarre. He then retired to Saintonge, and afterwards to Nerac. Shortly after we find him in Paris again, challenging Servetus, refuting in his "Psychopannychia," published in 1534, the "soul-sleep" of the anabaptists—and maintaining the consciousness and intelligence of the disembodied spirit. Persecution, however, became so intense that Calvin found it necessary to leave France, and take up his residence in Basle, where he found solace and excitement in the society of several eminent scholars and truth-seekers, and set himself to the acquisition of Hebrew. Francis I. had alleged to the German princes, in vindication or apology for his persecution of the reformers, that his punishments lighted only on men guilty of sedition and political disorder. Calvin saw the hollow pretext—that it was "a trick of the court to excuse itself for shedding the blood of the saints;" and it was this, he says, that "moved me to publish my 'Institutes.'" There seems to have been an anonymous French edition of this immortal work published at Basle in 1535. But next year it was enlarged and published in Latin with the author's name; Basle, 1536. This work is a literary prodigy, whether we consider its style and form, its lucid and logical arrangements, or the influence which it has exerted on the age that produced it and on succeeding centuries. Written when Calvin was only twenty-five, and after but a few years of theological study, it is

marked by thoughts so developed and matured that its author, while he retouched and enlarged it, did not in any new edition of it, nor in any of his numerous subsequent publications retract or modify any of its primary tenets. The dedication to the king is a classic masterpiece in its style, and a noble and eloquent protest in its spirit. There were new editions in 1539-43-44-50-53-54-59; and it was translated by the author himself into French in 1541. This rare maturity of mind has struck many observers. "He never had occasion to recant," said Scaliger; and Bossuet admits that he had a better regulated mind than Luther, and that his doctrine appears to be more uniform than that of the German reformer. It may be added that he had a prodigious memory, which was tenacious without failure, and could recall without effort; and his mind was so calm, methodical, and self-poised, that after being obliged to suspend composition he could at once resume his argument without reading over what he had written before the interruption. Prior to the publication of the "Institutes," Calvin had gone to the court of the duchess of Ferrara to spend a brief period; then he went to his native place to arrange his affairs, with the resolution of returning to Basle. But the ordinary route being very dangerous, "he must needs pass through" Geneva. There he was unexpectedly discovered and arrested by the intrepid Farel, originally a French nobleman, who, after many a hard struggle, had won Geneva to the Reformation, and who boldly laid the curse of God upon Calvin if he would not on the spot become his coadjutor. The pale and youthful stranger would have passed on, but "necessity was laid upon him," and he who entered the city as a casual visitor was induced at the age of twenty-eight to make it his abode—an abode which, pregnant with immediate results, has also given it undying historic eminence.

Calvin and Farel began their work with an eagerness and a sweep which soon produced a reaction. They attempted to regulate dress and to control the fashions of private life. The fault lay in their identifying church with state, or in so incorporating them as to form a species of theocracy. The people in parties of ten swore to the reformed confession as citizens to a charter, and not as members of the church to a creed. Their orthodoxy did not amend their lives, or lead to that austere purity which their spiritual guides inculcated, expected, and exemplified. The people would not bend to the new authority, which in turn maintained its independence of all civil control. The council, without consulting Calvin and Farel, had accepted, through the influence of Berne, the resolutions of the Lausanne synod of 1537; and the pastors refused to administer the sacrament. The council resolved to prove its power, and a popular assembly convoked by its command ordered the preachers, on the 23d of April, 1538, to quit the city within two days. Calvin's brief stay in Geneva had already been signalized by the overthrow of the anabaptists, and his defeat of Caroli, a reckless opponent, who quibbled about words and forgot realities, and impugned the orthodoxy of the author of the "Institutes." Two smart tracts against popery had also been published by him.

The banished preachers retreated to Zürich, sojourning for a few weeks at Berne. They stated their case before a synod of Swiss pastors at Zürich, urged their willingness for a compromise in many things indifferent, such as the use of fonts and the observance of festivals, and obtained a favourable verdict; but the Bernese interfered, and a second edict of banishment was confirmed. Calvin next went to Basle and thence to Strasburg. He seemed to feel his banishment from Geneva as a kind of relief, since it gave him leisure for theological study. But Bucer prevailed upon him to engage in active service, and he became pastor of a congregation composed of French refugees, and occasionally lectured also in the academy. Here he put the finishing touch to the "Institutes," in a new edition published in 1539, published his elaborate "Commentary on Romans," the result of his academical prelections, and also a tract in French on the Lord's Supper. At this time he married a widow, Idelette de Bures. The portions of his correspondence in which her name occurs, his references to her, and his poignant sorrow at her death, prove that he was not, as is often supposed, a dry and callous recluse, or an incarnation of polemical dialectics; but that, amidst all his cares and labours, he was endued with many genial susceptibilities, though he was not forward to display them, and possessed not a few elements of tenderness and affection, though he was not addicted to a fond or frequent expression of them.

Though Calvin felt the treatment which he had received at the hands of the Genevese, he had not disdainfully forgotten them. He corresponded with them, and by his powerful letters frustrated the attempt of Cardinal Sadolet, bishop of Carpentras, to bring them back to the church of Rome. But disorders had multiplied in his absence; the fate of the four syndics who had procured his exile alarmed the popular mind; for one of them had fallen and broken his neck, another had been convicted of murder and been executed, and two had been banished under a charge of treason. In the summer of 1541 a pressing invitation from the repentant people was sent to the reformer, soliciting and urging his return. He received it at Worms, and at first refused to comply, saying, there is "no place in the world which I dread so much as Geneva." But Farel and Bucer prevailed upon him to yield, so that he writes—"I offer to God my slain heart in sacrifice." He returned in September, and was received with enthusiasm alike by magistrates and populace. The council presented him with a house, and gave him eight dollars to buy a piece of cloth for a new coat.

His labours now were incessant—preaching every day on alternate weeks, teaching theology three days every week, absorbed in literary work, engaged in an extensive correspondence, maintaining repeated controversies, and battling with fierce and vindictive opponents. The work of the day was often prolonged through a large portion of the night, so that he complained that he should soon not know the appearance of the sun, not having had time to look at it for many days. The rule which Calvin again established at Geneva was very rigorous, and there was often a recoil. It comprised all the citizens, not merely those who willingly and from conviction placed themselves under it. He had high ideas of church authority and spiritual independence. The state was in no way to control the church, though the church spread its own jurisdiction over the state. He did not subject the church to the civil power, but thought that the state should aid the church in the execution of its sentences. The populace often rebelled against the curb which was so forcibly laid upon them, but the stern reformer ultimately prevailed; the council also wished to have some elements of spiritual power in their hands, but they, too, were at length obliged to succumb. The anomaly lay in this—that the Genevese consistory did not, as it might, exercise its authority only on those who on a profession of faith were admitted to the church and promised submission to it, but stretched its sway over all the inhabitants, no matter what their theoretical opinions or their general character. Calvin's rule was an *imperium in imperio*—inconsistent alike with the rights of individual conscience, and the general liberties of the state. But the rule at least was impartial. The consistory, consisting of six city ministers and twelve elders, met every Thursday, and exercised its powerful and uncompromising jurisdiction. Men of all classes often became refractory, some for political reasons; but there were other "libertines" to whom the freedom for which they clamoured was a cloak for licentiousness. The theocratic power triumphed, and the rebels were forced to do penance in a variety of forms. Non-attendance at church was punished by a fine, and adultery was made punishable by death; sumptuary laws of the strictest kind were enacted; brides, unless of unblemished character, were not allowed to wear wreaths; idle talk was under the cognizance of the police; gamblers were put in the pillory, and the manufacture of cards was forbidden. Those who approached the Lord's Supper without obtaining permission were punished, and those who neglected the opportunity might be banished for a year. An edict was issued that every one confined to bed with sickness for three days should give notice to the pastors. Torture was in use, though not in the trial of heretics, and witches were to be burned.

Among the enemies which Calvin encountered was a man named Pighins, who violently attacked his views of predestination, but was brought over by the reformer's reasoning contained in his reply, published in 1543. In 1551 he had to defend the same doctrine against Bolsec, once a Carmelite monk, and now settled as a physician in Geneva. According to the custom of the times Bolsec was banished, and he finally returned to the popish church, writing as his recantation a romance of slanders, which he called the life of Calvin—*Histoire de la vie de Jean Calvin*. Two years afterwards happened the memorable contest with Servetus. Calvin's share in this business has often been blamed, and often misunderstood. Calvin's sin was the sin of the age, for there was nearly a unanimity of opinion that heresy should

be punished with death; nay, Servetus himself had advocated that opinion. It is, therefore, unfair to single out Calvin as if he had been solitary in his convictions and influence; for to blame him, as indeed he deserved, is only to say that he was not, on this subject, in advance of his age. Servetus had been already convicted and condemned by the popish authorities at Vienne, but had found means of escape. He had come to Geneva, and was about to leave for Zürich when he was discovered and apprehended. His accuser was Nicholas de Fontaine, but Calvin drew up thirty-eight articles of charge. At the second hearing Calvin attended. The council at Vienne demanded back their prisoner, but the poor Spaniard pleaded with tears that the Genevan syndics should retain him; for he was sure that he would be put to death at Vienne, while he had at least a chance of life at Geneva. The charge against him was now handed over to the attorney-general, and treason had as large a space in the accusation as heresy. The libertine party seemed to be growing in influence, and Servetus, rising in hope, craved that an indictment be preferred against Calvin; a document containing these memorable words—till the cause be decided for his death or mine, "pour mort de luy ou de moy." The Helvetic churches unanimously condemned Servetus, but differed as to the amount of the penalty to be inflicted upon him. Servetus was formally sentenced on the 26th of October to be burnt at the stake on the following day. (See *SERVETUS*.) Certainly Calvin thought and said that Servetus was worthy of death, and Servetus thought and said the same of him. But Calvin had little influence with the council during the latter portion of the trial. In the document which contains the sentence against Servetus, there is no mention of any assault made by the culprit upon Calvin or any of the Genevan clergy. Calvin acted very wrongly, but only as other good men thought and acted around him, for even Melancthon justified the barbarous execution. When Servetus was burnt at Geneva, five Genevise Calvinists were burned in France. John Knox and Peter Dens use the same argument and illustration for the capital punishment of heretics. Nay, Servetus, in his *Christianismi Restitutio*, the book for which he had been seized and tried, avers that blasphemy should be punished with death, *simpliciter*—without dispute. It was not understood in that age that man is responsible to God alone for his belief—that liberty of conscience is a universal birthright—that religious truth and error are beyond the cognizance of the civil magistrate—and that heresy cannot be extirpated by force. Antitrinitarian tenets grew up in Geneva as in the case of Blandrata, Alciat, and Ochino. Might is not right, and free thought can never be quenched in fire or blood. Truth is degraded and her nobleness shamed, when force is employed to punish her enemies, or guard herself from assault. Had Servetus been burned at Vienne, his name would scarcely have been heard of, but his execution in a protestant city has preserved the memory of his fate—a proof that men expected mental emancipation in a place which had won its eminence by free thought and inquiry. Servetus was a restless and daring spiritualist—or rather a pantheist with some tinge of fanaticism. His writings have frightful caricatures of divine things—such as calling the Trinity a Cerberus. It may show what a difference was between him and Calvin, that while Calvin could not bring himself to expound the Apocalypse, Servetus began with it. But yet, let his views and blasphemies be what they might, to the Master alone was he answerable, and not to any human tribunal, and the Place Champel where he was burned will remain a melancholy monument of the injustice and intolerance which the infancy of the reformed church in the theocratic city of Geneva had not been able to shake off.

Calvin was exceedingly anxious for the union of the reformed churches. But the sacramentarian controversy was raging, and his efforts seem only to have increased the fury. His own views were not unlike those of Melancthon, and on the point he would not have quarrelled with the language of the revised Augsburg confession. The simple Zuinglian theory he decidedly condemns, and in one instance, writing to Viret, he calls it "profane." The quarrel of Calvin with Castellio proceeded from excessive zeal, though Castellio's opinions, and some clauses of his biblical translation must have sorely provoked him. As to the question of toleration, involved in the fate of Servetus, the elegant scholar was right; but in questions of pure theology he was no match for the reformer, either in retort or argument.

The labours of Calvin up to the period of his death were incessant,

"in season and out of season." Such was his fame, that he had sometimes a thousand hearers in the Genevan academy, for Geneva had become the spiritual metropolis of the reformed churches. The reformer maintained an extensive correspondence on the continent, in Italy, and in England. All the while he lived in frugal simplicity, and was suffering under a terrible complication of maladies. Asthma, hemorrhoids, gont, stone, and fever tormented him. Frequent headaches led to as frequent fastings to relieve them; nocturnal study was carried on with the aid of a dim lamp suspended from a corner of the humble bed on which he lay—so that his frail body was wasted and worn away by the early part of the year 1564. He delivered his last discourse on the 6th of February in that year. Several months more he survived in agony and weakness, and his words and exercises on his deathbed betokened his fortitude and resignation. When the members of the council obeyed his summons and came into his room, he spoke to them of past mercies and jeopardies, and asking their pardon for the trouble he had given them, and for any outbreaks of hasty temper he had manifested among them, and then offering a fervent prayer for them, he solemnly gave his right hand to each of them as he said farewell. He died on the 27th of May, 1564, at the early age of fifty-five. No stone was set to mark his grave—such had been his request in his testament.

As Luther was the orator, and Melancthon the scholar, so Calvin was the divine and dialectician of the Reformation. He had not Luther's hearty eloquence which could move the popular masses as a storm heaves the forest, nor could he employ that style, the spell of which lies in its quaint and homely idiom—the vocabulary of every-day life. Nor had he, like the great German, the "merry heart which doeth good like a medicine," nor that glowing genius which gave outlet and language to its impulses in hymns and songs. Calvin's greatness was that of pure mind—one might almost say of pure spirit, so fully did his intellectual nature gain the mastery over its physical framework, as it revelled in sustained and serious thought which neither lost itself in speculation, nor faded away into mysticism. Yet he was not surly and repulsive, for he had all the courtly and gentle manners of a Frenchman, and ladies never shrank from conversing with him on theological subjects. Nay, he could now and then so far unbend as to play a game at la clef with the magistrates. But thinking was his element. He seldom diverges, but fixes at once on the knotty point of the argument, and discusses it. Extraneous matter is promptly brushed away, and the real merits of the case are eagerly seized and adjusted with a masterly hand, which never wearies through effort or trembles through indecision. His system of theology is compact and logical in all its parts—a powerful reproduction of the Augustinian theology. His numerous commentaries, though of unequal merit, display great acuteness and learning, excelling more in tracing the course and development of thought than in the analysis of idioms and phrases—and they are as concise and simple in style as they are clear, judicious, and discriminating in matter.

The character of Calvin has been variously judged, for he has been the object of fanatical hatred and extravagant eulogy. It is true that his language is not at all times courteous, but Servetus outdoes him in scurrility. Coarse epithets are sometimes heaped upon his antagonists, but his virulence scarcely approaches that of Luther. Only Calvin wrote in comparative calmness what Luther threw out in invectives and violent outbursts. Nor can it be denied that he was conscious of his position, for he was an oracle to Coligny, to the duchess of Ferrara, and to the young King Edward of England. No unworthy feeling of rivalry seems ever to have disturbed him, for he can write concerning Luther—"I have often said it, I would still acknowledge him for a servant of Christ, even though he should call me devil;" and he secured the publication of Melancthon's *Loci* in French, and wrote a eulogistic preface to it—it being the only book that could come into competition with his own "Institutes." "I leave it to you," says Scaliger, "to judge whether the man was great." Of his infirmities, which were in fact the excesses of his virtues, he was perfectly conscious; "of all conflicts with my faults," says he, "the hardest has been with my impatient temper." Firmness in a man so far before his age is apt to pass into obstinacy, and courage into overbearing zeal, while charity is forgotten in chivalrous devotion to truth. Yet there were elements of deep affection in Calvin's nature.

Melanethon would sometimes lay his weary head on his bosom and wish it to be his resting-place in death. The necessities of his station demanded a severity of tone, to which his nature was not wholly averse; perpetually assailed in his character and opinions, he was always doing battle, and failed to enjoy the mollifying influences of leisure and peace. As he was obliged ever to wear intellectual armour, he embraced his friends with his helmet on and his vizor down, or grasped them with mailed arms and gauntleted hand. Polemics, while they sharpened his mind, could not, however, dry up many springs of sweetness and cheerfulness in his heart. Like all great thinkers, he has left an impression behind him which is deepening as time rolls on; for it is the spirit of his theology that unlimited dependence upon God is the source and sustentation of all spiritual life and activity in man. With all drawbacks arising from an irritable temper, edged and embittered by a fragile and diseased constitution, and the sullen and intolerant opinions and practices of his age, which mistaken views of the rights of conscience fortified; the name of Calvin will ever hold a high place in the hearts of those who admire the spectacle of a great mind triumphing over bodily infirmity, growing in multiplied labours as life comes to a speedy close, and giving all its power with unselfish generosity to what it deemed, and what myriads more for three centuries since have deemed the welfare of humanity, the interests of truth, and the cause of God.

According to Beza's description, Calvin was not of large stature; his complexion was pale, inclining to brown, and his eyes were of peculiar brightness and penetration. He took little sleep, and often ate only one meal a day. He had amazing facility in recognizing people whom he had but once seen; and amidst great and serious enterprises, he never forgot the more trifling minutiae of daily business. Calvin's works have been often printed, at least many detached portions of them, both in French and Latin. His complete works appeared at Geneva, 1617, in twelve volumes folio, and another edition at Amsterdam, 1671. Jules Bonnet has recently edited four volumes of his letters, which have also been translated into English: Constable, Edinburgh. His Commentaries, Institutes, and Tracts, have been translated by the Calvin Society, Edinburgh. Tholuck has edited his Latin commentaries on the New Testament. Beza wrote his life, and in an augmented form it often stands as a preface to the exposition of Joshua. Portions of autobiography are found in the preface to his commentary on the Psalms. There is also an elaborate life of the reformer by Henry, *Das Leben J. Calvins*, 3 vols. 8vo, Hamburg, 1835-44. Stebbing has presented this work in English, and there are other biographies, one in French by Audin, and another in English by Dyer. The only trustworthy account of the trial of Servetus has been given by Rilliet de Candolle: *Relation du procès criminel intenté à Genève en 1553, contre Michel Servet, &c.*, Geneva, 1844.—(Bayle's *Dictionary*, article, Calvin; Herzog's *Dictionary*, article, Calvin.)—J. E.

CALVISIUS, SETHUS (so called in the Latin title-pages of all his works, his baptismal and family name being SETH KALWITZ), a musician, chronologer, astrologer, and a man of general learning, was born at Saachsenberg in Thuringia, February 21, 1556, and died at Leipzig, November 23, 1615. His father, Jacob, was a poor peasant; he sent Seth to the free school of Frankenhäusen, but after three years his slender means could no longer enable him to support him there. In this time the boy had made considerable progress as a scholar, and, besides showing great aptitude for music, he had developed so fine a soprano voice, that he obtained an appointment as a singer at Magdeburg, by means of which, and of his teaching the clavicin, he maintained himself. He successively studied at the universities of Helmstadt and Leipzig, still supporting himself by musical tuition, until he obtained the engagement of music director at the church of St. Pauline in the latter city. He resigned this for a similar appointment at the Schul-Pforte, the principal school of Upper Saxony, which after ten years he quitted, to return to Leipzig in the capacity of cantor at St. Thomas' school, when he was made a fellow of that college. He was next preferred to the office of music director in the same establishment—that which, a century later, was filled by S. Bach; and his inauguration into this, May 19, 1594, was celebrated by the performance of several of his compositions. His able discharge of the various duties of composer, organist, and instructor, involved in this appointment, gained him such general esteem, and drew around him such manifestations

of kindness, that he could never be persuaded to quit Leipzig, though he had offers of more lucrative engagements successively at Wittenberg and Frankfort-on-the-Maine. His implicit faith in astrology was confirmed by what he believed to be the fulfilment of one of his predictions. He had foretold, on the authority of his horoscope, that a great calamity would befall him on a certain day in the year 1602, to avert which he shut himself in his library, and, applying himself assiduously to study, supposed that no harm could reach him; implacable destiny, however, was not to be cheated; Calvisius dropping a knife with which he was mending a pen, it struck against his knee, and inflicted an injury which lamed him for life. He is chiefly known as a musician by his didactic works; these are, "Melopoia," a general dissertation upon music, with an exposition of the principles of counterpoints; "Compendium Musicæ Practicæ," an elementary book for beginners, which was several times printed during the author's life, with various titles and some modifications; and "Exercitationes Musicæ," in three parts, embodying the substance of lectures he delivered at his college. The historical and technical learning displayed in these productions is very great; the author's warm advocacy of a system of nomenclature for the notes, that had been recently invented by an anonymous Dutch musician, is remarkable. According to this the syllables Bo, Ce, Di, Ga, Lo, Ma, Ni, were the names of the seven notes, and its propriety is manifested when we consider that the ordinary solmization at that time contained but six syllables, the name of Si, for the seventh note, not having been added until afterwards. It is next to speak of the musical compositions of Calvisius, namely—"Harmonia Cantionum Ecclesiasticarum;" "Deutsche Tricinia;" "Bicinium;" some important pieces in *Der Psalter David's Gesangweis*, a work collected by the brothers Becker; and the 150th Psalm, set for twelve voices in three choirs, which he wrote in the year of his death, on the occasion of the wedding of his friend Anckelmann, a merchant of Hamburg. They are commended for purity of counterpoint and strictness of canonical imitation. His works on chronology held a high rank in their period—"Elenchus Calendarii Gregoriani" is an argument against the Gregorian calendar; and "Chronologia," which appeared not to have been printed until fourteen years after his death, is a comprehensive general treatise.—G. A. M.

CALVO, JEAN SAUVEUR DE, known as "the brave Calvo," was born at Barcelona in 1625. He first served in the Catalonian army against Philip IV., but having passed to the French service, he won great distinction, and rose to a high rank in the army of Louis XIV. He died in 1690.

CAM, DRIGO, a Portuguese navigator who lived in the latter half of the fifteenth century. He was sent to prosecute those explorations of the African coast which the great Prince Henry had so enthusiastically undertaken. He discovered Congo, and, at the request of the king of that country, took home with him some of the natives to learn the Christian faith. Martin Behaim is said to have accompanied him in his first voyage; and in his second he planted a stone pillar—a mark of the furthest stage of discovery—far beyond the kingdom of Congo.

CAMBACERES, JEAN JACQUES DE, a distinguished French senator, was born at Montpellier in 1753. He sprang from an old family which had produced several eminent lawyers, and he was brought up to the same profession. He soon distinguished himself as a lawyer, and in 1774 succeeded his father as counsellor of the audit office of Montpellier. When the Revolution broke out, he was chosen to represent the order of the nobles in the legislative assembly, and was afterwards elected a deputy to the convention. On the trial of Louis XVI. he gave a conditional vote for the condemnation of that monarch. During the reign of terror which followed, Cambaceres was on the side of moderation, and endeavoured, though cautiously, to check the illegal and arbitrary measures of the assembly. He was afterwards a member of the council of Five Hundred, and spent much time and labour in the classification of the civil laws; and in 1796 drew up a "Projet de Code Civil," which subsequently became the basis of the Napoleonic code, of which he was one of the compilers. About this period he was exposed to considerable danger in consequence of a suspicion that he had a leaning towards the royalist party, and proposed to retire into private life. But on the formation of the directory, he was induced to accept the office of minister of justice; he zealously promoted the views of Bonaparte in the revolution of the 18th

Brumaire, and accepted the office of second consul under him. From this period he became one of the most useful and faithful followers of that great chief, who highly appreciated the character and talents of Cambaceres, and bestowed on him his fullest confidence. When Napoleon became emperor, he elevated Cambaceres to the office of arch-chancellor, with the perpetual presidency of the senate, and bestowed on him the title of duke, with other high honours. His friends allege that he bore his prosperity with great moderation, and that while he remained to the last faithful to the emperor, he endeavoured to dissuade him from the murder of the duke d'Enghien, and other crimes which stain his memory. On the abdication of Napoleon in 1814, Cambaceres withdrew into private life; but on the return of the emperor from Elba, he prevailed upon his old and faithful servant to accept of his former office of minister of justice. After the final overthrow of Napoleon, Cambaceres was banished from France on the ground of his having voted for the death of Louis XVI., and in February, 1816, went to reside at Brussels. But in 1818 he was reinstated in all his civil and political rights, and permitted to return to Paris, where he died in 1824. Cambaceres was courteous in his manners, as well as sagacious and moderate in his views. He was famous for hospitality, and his table was in fact an important state-engine. One of the brothers of Cambaceres became archbishop of Rouen in 1802, was elevated to the dignity of a cardinal in 1803, and in 1815 obtained a seat in the chamber of peers, of which he was deprived on the return of Louis XVIII. He was by no means so faithful as his brother to the fortunes of Napoleon, to whom he was indebted for many marks of favour. Another brother followed the military profession, and attained the rank of general. He took part in the campaigns in Spain and on the Rhine, and fought at Austerlitz and Jena in 1806, and at Lutzen, Bantzen, and Dresden in 1814.—The **ABBÉ CAMBACERES**, uncle of the arch-chancellor—born in 1721; died in 1802—was a celebrated pulpit orator, and is the author of a panegyric on St. Louis, and of three volumes of sermons which have been greatly applauded.—J. T.

\* **CAMBACERES, MARIE J. P. H.**, Duc de, nephew of the arch-chancellor, was born in 1798. In 1812 he was nominated one of the pages of the emperor, and in 1815 accompanied him as first page in the campaign in Belgium, where he was taken prisoner on June 16th. After the restoration of the Bourbons, Cambaceres enrolled his name in the list of the advocates in the royal court of Paris, and on the death of his uncle in 1824, successfully resisted the attempt of the government to seize his papers. In 1830 he gave in his adhesion to the new dynasty, and in 1835 obtained a seat in the chamber of peers, and was made one of the secretaries of that chamber. In 1852 he was appointed grandmaster of ceremonies to Louis Napoleon, and one of the secretaries of the senate.—J. T.

**CAMBERT, ROBERT**, a musician, notable as the first composer of French operas, was born at Paris in 1628, and died in England in 1677. His master for the clavecin was Chambonière, from whom probably he learned the principles of composition. He held the office of organist at the collegiate church of St. Honoré. He was much patronized by the marquis de Sourdeac, to please whom, and to meet the growing taste for dramatic music in France, he set several dialogues, written for him by the Abbé Perrin. The success of these led to the construction of a work upon the model of Italian operas, that had been introduced in Paris by the Cardinal Mazarin, of which Perrin wrote the words, Cambert composed the music, and Sourdeac designed the decorations; this was entitled "La Pastorale, première comédie française en musique," and it was performed at the chateau d'Issy in April, 1659. Various rude attempts had been made in France to combine music with dramatic action, originating with Adam de la Hail in the thirteenth century; but this was the first production that assumed the character of a complete lyric drama. It created so great a sensation that Louis XIV. commanded its performance at Vincennes. Thus encouraged, the same author in 1661 produced "Ariane, ou le Mariage de Bacchus," a work of like construction, which, however, in consequence of the death of Cardinal Mazarin, was not performed. In 1666 Cambert received the appointment of superintendent de musique to the queen-mother. The king about this time granted to Perrin a patent for the performance of French operas, "after the manner of those of Italy, Germany, and England." The poet associated himself once more with Cambert and the marquis, and in fulfilment of his privilege opened the Académie Royale

de Musique, June 28, 1669. Here was produced in 1671 "Pomone," and in 1672 "Les Peines et les Plaisirs de l'amour," the two most important of Cambert's compositions. Perrin then quarrelled with Sourdeac, the consequence of which was that his patent was revoked, and another was granted to Lulli. This excluded Cambert and his compositions from the Académie. His more courteous manners than those of Lulli retained friends around him, but the superiority of his rival's talent at once eclipsed the popularity of Cambert's music. Annoyed by the neglect he now experienced, Cambert came in 1673 to England, and, probably in the following year, was engaged to replace Banister as master of the band of Charles II., known by the name of "the four-and-twenty fiddlers." It appears that Cambert reproduced here his opera of "Pomone," and perhaps also gave that of "Ariane;" but under what circumstances these were performed, and whether in French or in English, is not known. The Siege of Rhodes, the earliest English opera, was produced in 1656. This gave rise to a taste for the musical drama in London, which became very general by the time of Cambert's arrival; but the operas then in vogue consisted of spoken dialogue interspersed with music, whereas those performed in Paris were composed entirely of music. It may have been the difference in their construction which rendered the works of Cambert unacceptable here; but whether from this or any other cause they did not succeed, and he is said to have died from disappointment at their failure.—G. A. M.

**CAMBESSEDES, JACQUES**, an eminent French botanist of the present century. He has written a monograph of the genus spiræa; an account of the plants of the Balearic islands; memoirs on the natural orders of ternstroemiaceæ, guttiferæ, and sapindaceæ; and a synopsis of the Brazilian plants of the orders cruciferæ, caryophyllaceæ, paronychiaceæ, portulacaceæ, crassulaceæ, ficoideæ, and eunoniaceæ.—J. H. B.

**CAMBIASO or CANGIAGIO, LUDOVICO or LUCA**, and called also **LUCETTO DE GENOVA**. This distinguished painter was the son of Giovanni Cambiaso, also an artist, and was born at Moneglia, near Genoa, in 1527. He studied under his father, but soon distanced his preceptor. At the early age of fifteen he had produced works of an extraordinary promise. His rapidity of execution was only equalled by his fertility of invention. He worked with a wonderful facility, and yet with a most remarkable correctness. His power of foreshortening was very great. He visited Florence and Rome, and studied the productions of Raffaele and Michel Angelo. Cangiagio had three manners of painting. His earliest was daring to extravagance and gigantesque in size; his second was infinitely his best style. These were productions of extreme care, and are very highly esteemed. His third was a return to much of his old hasty execution. He became a hack picture-manufacturer, and painted as much as he could for the benefit of his family—not of art. His most prized works are his "Martyrdom of St. George," his "St. Benedetto," and "St. Giovanni Battista," at Rocchettini, and his "Rape of the Sabinæ," at Terralba, near Genoa. On the invitation of Philip II. he went to Madrid in 1583, and died there in 1585. He painted the ceiling of the choir in the Escorial. The work represents the assemblage of the blessed, and is of enormous size. His works are very numerous.—W. T.

**CAMBINI, GIOVANNI GIUSEPPE**, a musician, was born at Leghorn, February 13, 1746, and died in the hospital of Bicêtre at an extreme age. He began to study the violin very young; and though he never became eminent as a soloist, his general knowledge of music induced such admirable style in his performance, that Manfredi, Nardini, and Boccherini, the three most distinguished quartet players of the last century, each chose him to play the viola with him in music of this class. Cambini went in 1763 to Bologna, to study composition under the famous Padre Martini, with whom he remained till 1766, when he proceeded to Naples. Here he appears to have produced an unsuccessful opera, which was his first introduction into public life. At Naples he formed an attachment with a young lady of his native city, with whom he embarked to return to Leghorn, in order that they might be married; their vessel was, however, captured by a corsair commanded by a Spanish renegade, and they were carried to Barbary and sold for slaves. Cambini was purchased by a Venetian merchant named Zamboni, who gave him his liberty. In 1770 he went to Paris, where he made the acquaintance of Gossec, through whose interest some of his instrumental compositions were publicly

performed. These were of the lightest character, but probably on account of their very lightness, they met with remarkable success. Cambini, who had little artistic conscience, took advantage of the favourable reception of his music to produce as rapidly as he could find a sale for his works; accordingly, in a very few years, he wrote eighty symphonies, a hundred and forty-four violin quartets, and an immense number of concert-tanti pieces for various instruments, besides a vast amount of solfeggios and more important vocal music, an instruction book for the flute, and many other compositions. Added to these, he wrote the following works for the theatre—"Les Romans," a ballet, Paris, 1776; "Rose d'Anour et Carloman," an opera, Paris, 1779; "La Croisée;" "Cora;" "Les deux Frères;" and "Adèle et Edwin," all operas produced at Beaujolais, between 1788 and 1791; "Nantilde et Dagobert," an opera produced at the Louvois; and some operas that were never performed. His oratorio, "Le Sacrifice d'Abraham," was produced at the concert spirituel in 1780, which had been preceded by some motets at the performances of the same institution. The little that is known of this prodigious mass of music, is a proof of the littleness of its merit. Cambini was engaged as conductor of the opera at Beaujolais in 1788, and at Louvois in 1791. In 1800 he was commissioned by Pleyel to write some quartets and quintets in the style of Boccherini, which were published under the name of this composer, together with some works of his, not previously printed; and it was not until all interest in the original and the imitator had passed away that the fraud was made known. In 1804 Cambini wrote some articles in the *Musikalische Zeitung* of Leipzig; and in 1810 he joined M. de Garaudé in the editorship of the *Tablettes de Polymnie*, in which his criticisms, however musicianly, were noted for their bitterness. Having led a life of excessive dissipation, Cambini was by this time reduced to be a drudge of the music-sellers, and was content to undertake the most unworthy engagements to procure him the means of indulging his vices. In extreme indigence he was in 1815 received into the hospital, in which, after several years' residence, he died.—G. A. M.

CAMBON, JEAN-LOUIS-AUGUSTE-EMMANUEL, a French lawyer, born at Toulouse in 1737; died in 1807. In 1758 he became a councillor of the parliament of Toulouse, and in 1761 advocate (attorney) general. Whilst holding the latter office he procured a decision in the case of Stephen Sales, which established the validity of protestant marriages. In 1787 Louis XVI. named him first president of the assembly of notables; but after the abolition of parliaments he had to fly for his life.

CAMBON, JOSEPH, a French statesman, born in 1754; died in 1820. Having entered the legislative assembly in 1791, he zealously advocated democratic measures, denouncing priestly privilege, and once uttering the stern sentence—"War to the chateau; peace to the hut." He voted for the king's death, but opposed the setting-up of the revolutionary tribunal: at one time seemed to side with the mountain and the commune, and again denounced them; accused Robespierre, and after his death had to flee from the hostility of the Thermidorians. He was chosen president of the assembly in 1793. Cambon directed most of his attention to finance. He drew up nearly all the reports; and had, as Carlyle says, a wonderful "finance-talent for the printing of assignats."—R. M., A.

CAMBRAY, BAPTISTE, a French peasant of the thirteenth century, who invented the fine linen cloth still called *cambric*. Absolutely nothing is known of this ingenious peasant, although his invention has enriched his native province.

CAMBRAY-DIGNY, LOUIS-GUILLAUME DE, a French physicist naturalized at Florence, born in 1723; died in the same century. At the age of twenty-two he accompanied into Tuscany a band of Frenchmen, to whom the grand duke had farmed out part of his revenues. There his abilities soon procured him promotion to the office of minister of finance. It was only brief intervals of leisure that he could devote to his favourite pursuit. One of the fruits of these was a "machine à feu" for the salt-works at Castiglione—the first of its kind constructed south of the Alps. Cambray was an honorary member of several French and Italian institutes.

CAMBRIDGE, H.R.H. PRINCE ADOLPHUS FREDERICK, Duke of, the seventh son of George III., born in 1774; died in 1850. He entered the Hanoverian army in 1793, rose in 1798 to be lieutenant-general, and three years later was made a peer of the United Kingdom. In 1803 he was transferred to the

British service, and in 1813 rose to the rank of field-marshal. He was soon after appointed governor-general of Hanover, an office which he held till the accession of the duke of Cumberland in 1839. His administration there was mild and discreet, and on his return to England, he was popular and distinguished for his ready patronage of all charitable institutions.—J. B.

\* CAMBRIDGE, H.R.H. GEORGE WILLIAM FREDERICK CHARLES, Duke of, son of the preceding, and therefore first cousin to Queen Victoria, was born in Hanover in 1819, and succeeded to his father's title in 1850. He entered the army in 1837, and was in 1854 advanced to the rank of lieutenant-general, and sent to the Crimea to command the first division of the British army. He fought with distinction at Alma and Inkermann, but had to retire to Pera, and afterwards return to England on account of the state of his health. In 1856 he was made a general, and when Lord Hardinge resigned the chief command of the British army was appointed his successor.—J. B.

CAMBRIDGE, RICHARD, born in London in 1717; died in 1802. The family were originally from Gloucestershire. His father died early, and young Cambridge was brought up under the care of his mother and a maternal uncle. He was sent to Eton; then in 1734 to St. John's college, Oxford; and in 1737 to Lincoln's inn. He left Oxford without a degree, and he was soon called to the bar. In 1741 he married, and fixed his residence at his family seat of Whitminster in Gloucestershire. He was wealthy, and he occupied himself in improving the scenery round his seat. He rendered the river Stroud navigable for many miles; and is said to have introduced some valuable improvements in the construction of boats. In 1748 Cambridge succeeded to the property of an uncle, took the additional name of Owen, rented a house in London for a year or two, and then purchased a villa at Twickenham, where the rest of his life was passed. Cambridge was a water-drinker, was fond of horse exercise, and out-of-door amusements. He lived in unbroken health through the greater part of a life prolonged to eighty-five. Within the two last years of his life hearing and then sight failed, but his mental faculties are described as unimpaired. In 1751 Cambridge published his "Scribleriad," the poem by which he is chiefly known. To the periodical called the *World*, he contributed twenty-one papers. In 1761 he published a "History of the Coast of Coromandel." His works—with the exception of this volume—were collected by his son, the Rev. George Owen Cambridge. His best poem, "The Fakeer," is his shortest, and would be better could it be reduced to the two lines—

*Indian*—"I give to the poor and I lend to the rich."

*Fakeer*—"But how many nails do you run in your breech?"

The amusement of quietly laughing at his own pursuits probably led to the "Scribleriad." The hero is an antiquary. This is the basis of the character; and on this we find engrafted the pedant and the alchemist. The style throughout affects a mock gravity, which we think is too anxiously sustained. Some of the best passages are formal parodies of passages in Homer and Virgil, or rather in the translations of Pope and Dryden, whose manner is often happily imitated.—J. A., D.

CAMBRONNE, PIERRE-JACQUES-ÉTIENNE, Baron de, a French general, born in 1770. He entered the army at the Revolution, and served in most of Napoleon's campaigns. He commanded a division at Waterloo, and was left for dead on the field, but recovered, and lived till 1842.

CAMBYSES was a son of Cyrus, the great founder of the Persian monarchy, and his successor on the throne of that kingdom. His accession took place B.C. 529. As soon as Cambyses was settled on the throne of Persia, he turned his attention to the conquest of Egypt, which he invaded at the head of a large army. After defeating the Egyptians in battle, and capturing Psammenitus their king, he fixed his residence for a time in that country; but the severity of his rule, and the indignities he heaped upon the Egyptian religion, soon rendered him odious to the people, who took advantage of his temporary absence to rise in open rebellion. Before measures could be taken to suppress the revolt, an accidental wound caused the death of Cambyses, B.C. 522.—W. M.

CAMDEN, EARL, lord-high-chancellor of England. One of the most illustrious among the jurists and statesmen who adorned the close of the eighteenth century. Of the young men who, inheriting great paternal influence and celebrity in the English law, have been promoted to the highest judicial offices, the most

famous are Lord Bacon; Charles Yorke, the brilliant and unfortunate son of Lord Hardwicke; Charles Pratt, the third son of Sir John Pratt, chief-justice of the king's bench, and the subject of our present notice. He was descended from a respectable Devonshire family, who had their seat at Careswell Priory, near Collumpton; but his father was the first of the name who attained any high distinction. Charles Pratt was born in 1714—the closing year of Queen Anne's reign—shortly before his father's elevation to the bench. Accustomed in childhood to associate dignity and honour with the profession of the law, he early evinced a desire to enter on that line of life in which his own fame was destined to eclipse that of the chief-justice. In the tenth year of his age his father's death left him without the benefit of much wise counsel and experience, but with a demand on his self-reliance, and an additional stimulus to independent action. Pratt was sent to Eton in 1726, where he studied for five years. He read with successful diligence, and was a general favourite with his schoolmates; among these he had the fortune to make the acquaintance of several with historic names, as Lyttleton, Walpole, Cornwallis, and Pitt (afterwards Lord Chatham), whose friendship, now in the spring, by and by blossomed and bore substantial fruit. He was called to the bar at Trinity term, 1738. No one ever entered on a professional life with fairer prospects of success. On the western circuit, the fame of his father was still fresh in the memories of counsel and attorney. He was connected either by blood or friendship with some of the most talented and influential gentlemen in England. But so little did these adventitious favours of fortune contribute to success, that for fourteen years Pratt rode from Hampshire to Cornwall, with no loftier occupation than to mend pens and to show his wig. Like Lord Eldon he was on the point of retiring in disgust and disappointment. According to the etiquette of the bar, no counsel can leave his circuit without giving intimation of his purpose to the leader. With a deep sense of humiliation, he summoned courage to inform Mr. Henley (afterwards Lord Northampton) of his intention to relinquish law and apply for orders. He admitted that the case was discouraging, yet not desperate. Some of the greatest lawyers, with talents long uncredited, had risen to the most honoured offices in the state. Opportunity was everything. Let him try one circuit more, and stake his future upon this last cast. Riding on this forlorn-hope-circuit Pratt met with decided success. Was it a generous contrivance—or was it chance that brought him an important brief under the leader of the circuit? Pressure of business, we are told by some—an attack of gout, by others—compelled Mr. Henley to remain out of court when the trial came on for hearing; so the lead was unexpectedly cast upon the junior counsel. He opened the case with method and clearness, made a spirited reply, and obtained a verdict. Pratt had none of the brilliancy of his rival Yorke, nor was he in the highest sense an orator. In his greatest efforts—including his last memorable speech—he never had command of that rich imagery and passionate eloquence which characterize Erskine and Brougham; but his sound legal knowledge, familiarity with the details of business, quiet sustained dignity, and convincing address, gave sufficient assurance to the attorneys of his worth and ability, and the road to distinction now lay open before him. His first great triumph was in a libel case, *King v. Owen* (Howell's *State Trials*, vol. xviii., p. 120-23), in which Sir Dudley Ryder, then attorney-general, led the prosecution. In this remarkable trial, he enunciated, even against the authority of the bench, those opinions regarding the judicial rights of juries, which were eventually adopted by the legislature, and became the rule of law on that important question. In 1755 he put on his silk gown, and went over to the court of chancery. Two years after, when his schoolfellow, the "great commoner," ascended to power, he was elevated over his rival Yorke to the office of attorney-general. He had already been eight years in parliament as representative of the close borough of Downton; but although afterwards one of the most distinguished speakers in the upper house, he only once spoke in the house of commons, on the occasion of the *habeas corpus* bill of 1758. It was about this time, though not far from fifty, that he married Elizabeth, the daughter of Nicholas Jeffreys, Esq., Brecknock Priory, a lady dowered with a large fortune and many virtues. On the death of Chief-justice Willes, there was a general change of titles in the law. The attorney-general, on the 23d January, 1762, received his patent as lord chief-justice of the common pleas. During the four years he administered justice in the

common pleas, he gave three very important decisions, which made him next to the earl of Chatham the most popular man in England. In the case of *Leech v. Money*, the illegality of general warrants was declared. In *Doe v. Kersey*, he held against the judges of his court, and the unanimous decision of the king's bench, that attesting witnesses to a will must be disinterested at the time of attestation, and that it is not enough that their interest be removed before the proving of the will. The legislature afterwards confirmed his opinion. But by far the most celebrated trial over which he presided, was that of the famous or notorious John Wilkes. The secretary of state, Lord Halifax, had, in compliance with the wishes of the king, issued a sweeping warrant against the authors, printers and publishers of No. 45 of the *North Briton*, in accordance with which Wilkes was arrested and lodged in the Tower. A writ of *habeas corpus*, returnable immediately, was issued from the common pleas; and the chief-justice, after hearing the case, gave judgment against the arrest, concluding in the following words:—"We are all of opinion that a libel is not a breach of the peace; it tends to a breach of the peace, and that is the utmost. In the case of the seven bishops, Judge Powell, the only honest man of the four judges, dissented, and I am bound to be of his opinion, and to say that case is not law, but it shows the miserable condition to which the state was then reduced. Let Mr. Wilkes be discharged from his imprisonment." Close upon this came an action, on Wilkes' own part, on the ground of false imprisonment, in which the chief-justice denounced in language which has been censured as violent, the system of arrests under general warrants, and set forth his view of damages. "These are," he said, "designed not only as a satisfaction to the injured person, but likewise as a punishment to the guilty, and as proof of the detestation in which the wrongful act is held by the jury." Wilkes, as was to be expected, obtained a verdict with £1000 damages. The London rabble were enraptured with the triumph of their champion; he was carried through the streets, with shouts of Wilkes and liberty, and Pratt rose to the height of his popularity. Strangers came from a distance to see, among other sights, the great chief-justice. He received the freedom of Dublin, Bristol, Bath, Exeter, and Norwich; and Sir J. Reynolds was employed to prepare a fine portrait of the assertor of liberty for the Guildhall.

In 1765 the Rockingham ministry determined to grace their advent to power, by conferring a peerage on the favourite judge of the nation, with the title of "Baron Camden of Camden Place in the county of Kent." The following year Camden received the great seal, and was installed as chancellor on the 6th November, in which office he fully sustained his high legal reputation. Though he had not the learning of Nottingham and Hardwicke, the "fathers of equity," nor the sagacity of Kenyon, Littleale, and Holroyd, yet his unruffled calmness of temper, soundness of understanding, his memory singularly powerful and retentive, the patience and impartiality with which he sifted every case, and the clearness with which he pronounced judgment, conciliated the respect and good opinion of all parties. For three years and a half he was lord chancellor, and in every instance proved himself "*par negotiis*."

And now we come to the only stain on Lord Camden's public character. From the majority of his colleagues in the duke of Grafton's cabinet he differed on two vital questions, and yet for two years, from 1768 to 1770, he remained a member of the administration; sanctioned with his presence proceedings which, in his judgment, tended to a breach with the colonies; yielded, without remonstrance, to measures which he felt to be unconstitutional; submitted to be overpowered on questions of law; and followed a line of acquiescence, which in the present day would be pronounced a grave political delinquency. At last, in 1770, he made a bold avowal of his opinions, and surrendered the great seal. During the remaining twenty-four years of his life, as judge of appeal, as privy councillor, as member of the opposition and the cabinet, he was of signal service to the state. Throughout the American war, he held that England was the aggressor, that the enactments of the government were oppressive, and in one memorable speech declared that, if he were an American, he "should resist to the last such manifest exertions of tyranny, violence, and injustice." As judge of appeal, Camden's opinion always had great weight. In *Harrison v. Evans*, where the question was—"Whether a dissenter was liable to a fine for not serving a corporation office, which he was disquali-

fied from serving by the corporation act, he not having taken the sacrament of the Lord's Supper according to the rites of the church of England,"—he pronounced in favour of religious liberty, and the judgment of the lower court was reversed. In the celebrated Douglas case, which was an appeal from a decision of the court of session, in favour of the duke of Hamilton, Lord Camden delivered a most elaborate judgment in favour of the appellant, and the house, without a division, reversed the decision. Under his auspices the *nullum tempus* act, 9 Geo. III., c. 16, was passed, by which an adverse enjoyment of property for sixty years gives a good title against the crown. When England witnessed the unparalleled sight of a prime minister at the age of twenty-four, Lord Camden readily joined the cabinet of Pitt as president of the council. In his seventy-fifth year, he conducted with great learning and ability those remarkable debates on the constitutional questions which the malady of the king forced on the consideration of parliament. But his last appearance in the arena of political contest, was perhaps the grandest event in his life. On the 16th of May, 1792, the bill, improperly called Fox's libel bill, came up to the lords. There was a full attendance of peers. Thurlow, with his "tremendous white bushy eyebrows," sat savagely on the woolsack. Near him was the shabby Kenyon, lynx-eyed and law-armed. Bathurst was there, too, ready to follow the leader, and at least bark. Against the unanimous opposition of the law-lords, Camden rose in his place to defend the bill. Leaning upon his staff, and beginning in a low tremulous voice, he gradually warmed into the passionate enthusiasm of younger days:—"I ask your lordships to say who shall have the care of the liberty of the press—the judges or the people of England? The jury are the people of England. The judges are independent men! Be it so. But are they totally beyond the possibility of corruption from the crown? The truth is, they may be corrupted; juries never can. . . . If it is not law, it should be made law, that in prosecution for libel the jury shall decide upon the whole case. In the full catalogue of crimes, there is not one so fit to be determined by a jury as libel." The debate terminated with the following dialogue:—

*Thurlow*—"Will my Lord Camden agree to a clause to authorize the granting of a new trial, if the court should be dissatisfied with a verdict for the defendant?"

*Camden*—"What, after a verdict of acquittal?"

*Thurlow*—"Yes."

*Camden*—"No, I thank you."

These were his last words in the house. Two years after this, on the 13th of April, 1794, in the eighty-first year of his age, Lord Camden died full of years and honours, and was buried in the family vault in the parish church of Seal in Kent.—G. H. P.

CAMDEN, WILLIAM, called the "Strabo of England," was born in the Old Bailey, 2nd May, 1557, and died 9th November, 1623. Left an orphan and unprovided for, he received his early education at Christ's hospital and St. Paul's school. In his fifteenth year he entered Oxford as servitor at Magdalen's Hall; but being disappointed of a demi, removed to Pembroke college, where he won the favour and eventually the patronage of Dr. Thornton, the tutor of Sir Philip Sidney. After a residence of five years, without obtaining college honours, family affairs recalled him to London; and in 1575, through the kind offices of Mr. Goodman, dean of Westminster, he was appointed under-master of Westminster school. Being of studious habits and of a retiring disposition, he devoted his leisure hours and holidays to the study of antiquity. To qualify himself for deciphering ancient records and monumental inscriptions, he acquired Gaelic, Welsh, and old Saxon. After ten years' preparation, his first work, the "Britannia," was published in 1586, and received with applause. Thus brought into publicity, the bishop of Salisbury appointed him in 1588 prebend of Ilfracombe. Five years after he succeeded Grant as head-master of Westminster. In 1597 his "Greek Grammar" appeared, which was received in all the colleges, and passed through forty editions. This same year the office of clarencieux-at-arms falling vacant, Camden was raised to that sinecure; but so modest was his disposition that a short time afterwards he declined the honour of knighthood. He shared the remainder of his life between scientific pursuits and his official duties. To collect materials he made frequent exploratory visits to various parts of the kingdom. A Latin distich which appeared in his lifetime, hints that he explored England with two eyes, Scotland with

one, and Ireland with none. In 1613 he received the degree of M.A. His life closed when his popularity was in its zenith. A fond remembrance of his humble origin was with him to the last. To the guild of painters and members of the craft, by which his father had earned a scanty living, he bequeathed a sacramental goblet on which the donor's name was inscribed. The year before his death he founded the Camden professorship of history in Oxford. The work which made his name famous is "Britannia, or a Chorographical Description of England, Scotland, and Ireland." It is written in familiar and elegant Latin; and so accurately are places described, that, in many instances, notwithstanding the changes of time, they can even now be recognized. Professor Holland in 1610 translated it into English; but the best edition of this interesting work is that of Richard Gough, published in London in 1789. In 1838 a society was formed for the publication of early historical and literary remains, which, in recognition of the public worth of this author, was called the Camden Society. His "Anglica Normannica Cambria," &c., published in 1603, contains extensive selections from Asser, Walsingham, Thomas de la More, Giraldus Cambrensis, &c. The "Annales Rerum," &c., is a history of the reign of Elizabeth. Compelled to advert to contemporary events, his remarks aroused such personal hostility as to induce him to postpone the publication of the sequel until after his death. His minor productions are entitled "Reges, Reginae, Nobiles," &c.; "Actio in Henricum Gametum;" indifferent Latin verses, "Sylva Hybernia." The fullest account of his life is given in a book published in 1691 by T. Smith, "Gulielmi Camdeni Epistole." Camden possessed those great qualifications of an antiquarian—patience, assiduity, and enthusiasm. He died at the advanced age of seventy-two, and was buried with much solemnity in Westminster.—G. H. P.

CAMELLI or KAMEL, GEORGE JOSEPH, a German botanist of the seventeenth century, in honour of whom Linnæus has named a species of plant, growing in Japan, *Camellia*. He was a jesuit missionary to the Philippine islands.

CAMERARIUS, ELIAS, a German physician, second son of Elias Rudolf, and brother of Rudolf Jacob Camerarius, was born at Tubingen in 1673, and died there in 1734. He graduated as M.D. at Tubingen, and afterwards filled the chair of medicine in that university. He was first physician to the duke of Wurtemberg. He was elected a member of the society *Naturæ Curiosorum*. He adopted some peculiar views in regard to medicine and science, the publication of which called forth attacks from various quarters. He had a decided leaning to the marvellous, and believed the statements in regard to magic.—J. H. B.

CAMERARIUS, ELIAS RUDOLF, a German physician, was born at Tubingen in 1641, and died 7th June, 1695. He studied medicine, and became professor of medicine at Tubingen. He was also first physician to the duke of Wurtemberg, and a member of the academy *Naturæ Curiosorum*. He wrote medical works on palpitation of the heart, on pleurisy, on fracture, and ischuria; as well as a treatise on chicory.—J. H. B.

CAMERARIUS, JOACHIM, a German physician and botanist, was born at Nuremberg on 6th November, 1534, and died in that town on 11th October, 1598. He prosecuted his medical studies in Germany and Italy, and took his degree of doctor of medicine at Bologna in 1562. On his return to Nuremberg, he commenced the practice of medicine, and he was the means of founding an academy of medicine in his native city. He was elected dean of the medical faculty. Amidst the duties of professional life, he devoted attention in a special manner to chemistry and botany. He instituted a botanic garden at Nuremberg, and enriched it with specimens from Prosper Alpinus, Dalechamp, Clusius, and other eminent botanists. He became possessed of Gesner's botanical library, and of all his wood-cuts. He was physician to the electors of Saxony, and seems to have rendered them special services. Plumier has dedicated to him the genus *Cameraria*, one of the apocynaceæ.—J. H. B.

CAMERARIUS, JOACHIM, an eminent German scholar, whose original surname was LIEBIARD, was born at Bamberg, April 12, 1500. After having studied at the universities of Leipzig, Erfurt, and Wittenberg, he became classical master at the gymnasium of Nurnberg, and in 1530 was chosen deputy of this city to the diet of Augsburg, where, in company with Melancthon, he drew up the Augsburg Confession. Some years later he was called to Tubingen in order to reorganize the university, a task of which he acquitted himself so honourably,

that in 1541 he was invited to Leipzig for the same purpose. In 1555-56 he was again deputed to the diets held at Augsburg, Nurnberg, and Regensburg. He died at Leipzig, April 17, 1574. He has left upwards of 150 works, amongst which his "Life of Melancthon"—new edition by Strobel, Halle, 1777; his "Commentarii Linguae Græcæ et Latinæ," Basle, 1551; and his "Epistolæ Familiæres," which were published after his death, are the most renowned. By his numerous editions and translations of Greek and Roman classics, he greatly contributed to the revival of classical learning in Germany.—K. E.

CAMERARIUS, RUDOLF JACOB, a German physician and botanist, son of Elias Rudolf, was born at Tubingen in 1665, and died in 1721. He studied philosophy and natural history at Tubingen, and afterwards prosecuted medicine in Germany and Holland. At Leyden he became assistant demonstrator in the university. He afterwards visited Britain, and subsequently studied in the Hôpital de la Charité at Paris. After visiting Savoy and Italy, and spending much time at Venice and Rome, he returned to Tubingen through Switzerland. He received the degree of doctor of medicine at the university of Tubingen, and was appointed assistant to his father as professor of medicine and inspector of the botanic garden. He was subsequently elected successor to his father as primarius professor of medicine. His botanical works were edited by Mikan in 1797.—J. H. B.

CAMERON, the name of a powerful Highland clan, which had its original seat in Lochaber, and figured conspicuously in Scottish history. The most celebrated of the chiefs of this warlike tribe was—

CAMERON, SIR EWEN, of Lochiel, surnamed THE BLACK. He was born in 1629, and educated at Inverary castle under the guardianship of his kinsman and feudal superior, the marquis of Argyll, the leader of the Scottish covenanting party. At the age of eighteen he broke loose from the authority of his guardian, and took up arms in the royal cause. He joined the earl of Glencairn and General Middleton in 1652-54, and fought with distinguished bravery against Monk, Morgan, and other parliamentary generals. When the Restoration took place Lochiel was cordially welcomed at court, and received the honour of knighthood from King James. On the expulsion of that monarch, General Mackay attempted to gain over Lochiel to the side of King William by the offer of a title and a sum of money; but his attachment to the cause of James, and especially his hatred to the house of Argyll, induced him to reject these proposals and join the standard of Dundee. His judicious counsel and undaunted courage contributed greatly to the complete victory which the Highlanders gained at Killiecrankie over the royal forces under Mackay. He ultimately submitted to the government, and took the oath of allegiance to King William. The remainder of his life was spent in retirement. He died in 1719 at the age of ninety, leaving behind him a reputation for personal prowess, wisdom, and integrity, unrivalled among the Celtic chiefs. Macaulay terms Sir Ewen "the Ulysses of the Highlands."—(Macaulay's *History*, vol. iii., page 320; *Memoirs of Sir Ewen Cameron*, printed for the Abbotsford Club.)

CAMERON, DONALD, of Lochiel, the grandson of Sir Ewen, was the model of a Highland chieftain, and is still remembered by the title of "the gentle Lochiel." He took a conspicuous part in the rebellion of 1745, being the first to appear with his clan at the place of rendezvous in Glenfinnan; and there is every reason to believe that, but for his influence, the other Highland chiefs would not have joined that ill-fated enterprise. It was he who captured the city of Edinburgh without the loss of a single life. He was in the front of the battle of Prestonpans, which was mainly gained by his clan. At Culloden, where they suffered great loss, he was severely wounded in the legs, but was carried off the field by some of his faithful followers, and was concealed for some time in a cave on the side of a mountain called Bentalder, where, on the 30th of August, 1746, he was joined by the hapless prince himself. Ultimately they embarked together on board a French vessel, named *L'Heureux*, and on the 29th September landed in safety on the coast of Brittany. Lochiel was soon after appointed to the command of a regiment in the French service, but did not long survive, having died in 1748. His estates were of course forfeited, but were afterwards restored, and still remain in the possession of the family.

CAMERON, DR. ARCHIBALD, the brother of Lochiel, escaped with him to France, but revisited Scotland in 1749 and again in 1753. On this latter occasion he was apprehended, brought

to trial in London, condemned, and hanged at Tyburn—the last victim of the unhappy rebellion of "the Forty-five."

CAMERON, JOHN, Colonel, who fell at Quatre Bras at the head of his regiment, the 92nd Highlanders, was one of the most distinguished British officers who fought under Wellington. A baronetcy was bestowed upon his father, Sir Ewen Cameron, as an acknowledgment of the bravery and eminent services of his gallant son.—J. T.

CAMERON, SIR ALAN, K.C.B., distinguished in the British army as the leader of the Cameron Highlanders. He first served in the American war, and while making his escape from a two years' imprisonment at Philadelphia, received injuries from which he never completely recovered. In 1793 he raised at his own expense and in three months, from among the members of his clan, the 79th or Cameron Highlanders. At the head of this regiment he served in the Netherlands and West Indies, and when it was disbanded, he succeeded in raising it anew. He subsequently served in the Egyptian campaign, the descent upon Zealand, and under Sir John Moore in Sweden and the Peninsula, where he distinguished himself in several engagements. Having risen to the rank of lieutenant-general, he died in 1828.—J. B.

CAMERON, DAVID, a celebrated gardener, died in 1848, at the age of sixty-one. In 1827 he was head-gardener at Bury Hill, near Dorking, Surrey, and in 1831 was appointed curator of the recently-founded botanic garden at Birmingham. He was a successful cultivator, and contributed many articles to the *Gardener's Magazine* and to the *Phytologist*. He was particularly successful in the cultivation of orchidæ. He continued curator of the Birmingham garden till his death.—J. H. B.

CAMERON, JOHN, elected bishop of Glasgow in 1426, was lord-high-chancellor of Scotland from the fourth year of James I. to the third of James II. He attended the council of Basle in 1431 as representative from Scotland.

CAMERON, JOHN, one of the first biblical scholars whom Scotland has produced, was born at Glasgow about 1579. He was educated in his native city, where he also taught Greek in the university for about a year. In 1600 he went to France, and was cordially received by the protestant ministers of Bordeaux. Mr. Cameron acquired great reputation among them as a classical scholar. It is said that he could speak Greek as fluently as it was usual for the learned of that day to speak Latin. He was soon appointed to teach the classics in the college of Berberac, and ere long to the chair of philosophy at Sedan. He then, after visiting Paris, returned to Bordeaux, where in 1604 he was nominated one of the students of divinity, to be maintained for four years at the expense of the church. While he held this position he was also tutor to the two sons of Calignon, chancellor of Navarre, and in company with his pupils studied successively at Paris, Geneva, and Heidelberg. In 1608 he settled at Bordeaux as colleague to Dr. Primrose, and ten years later succeeded the celebrated Gomarus in the chair of divinity at Saumur. He had been there only two years when the civil war compelled him to seek refuge in England. After reading private lectures on divinity for some time in London, he was sent by King James in 1622 to assume the principalship of Glasgow university, in room of Robert Boyd of Trochrig, whose firm adherence to presbytery was offensive to the king. He retained the appointment only a year. Returning to France, he became in 1624 professor of divinity at Montauban. The civil commotions had not subsided, and his return to the scene of them cost him his life. He maintained the doctrine of passive obedience against the agents of the duc de Rohan, who were endeavouring to excite the inhabitants of Montauban to take arms. This offended the more zealous party, and Cameron was attacked on the street and wounded by some unknown assailant. He never recovered from the effects of this assault, but died at Montauban in 1625, when only forty-six years of age. His "Prælectiones in selectiora loca Novi Testamenti," were published at Saumur shortly after his death, with a sketch of the author's life and character by his pupil Capellus. A collection of his numerous theological works appeared at Geneva in 1642, under the editorial care of Frederick Spanheim. Cameron's position as a theologian is worthy of note. Dissatisfied with the doctrine of his church on the subject of predestination and freewill, he founded a system known as "hypothetic universalism," which was more fully developed by his pupil, Amyraut, and came from him to be called Amyraldism. It differed from Arminianism in holding the doctrine of uncon-

ditional election, and from Calvinism proper in asserting the universality of the atonement, and that man's will is moved by God only morally, or by the knowledge which he infuses, and which influences the judgment of the mind.—J. B.

CAMERON, RICHARD, one of those firm and faithful presbyterians who resisted the attempt to impose prelacy on Scotland in the seventeenth century. He was born at Falkland in Fife, taught for some time a public school there, and was afterwards private tutor and chaplain in the family of Sir William Scott of Harden, whose lady was a nonconformist. He was prevailed on by Welsh, grandson of John Knox, to accept of license to preach, and exercised his gifts in different quarters, but chiefly in Annandale, Ayrshire, and Galloway. Cameron refused the indulgence offered by Charles, because of the erastian and galling conditions with which it was clogged, of its tendency to betray the covenanting interests, and of its contrariety to the grand principles of presbyterianism. When called to account for the freedom of his strictures on this measure, he came under a promise of silence, which on mature consideration he found himself bound in conscience to recall. Having in this way lost his situation in the family of Sir William Scott, he went to Rotterdam, where he preached to certain persecuted exiles; and, after having been ordained by Messrs. M'Ward, Brown, and Roleman, he returned to Scotland in 1680. He was concerned, along with Cargill, Douglas, and others, in what was called the *Sanquhar Declaration*, in which they renounced the authority of Charles—a deed which may be censured as rash and premature, but which has this to be said for it, that it proceeded on the very same principles on which the whole nation, a short time afterwards, expelled Charles' successor from the kingdom. A price having been set on their heads, Cameron and his friends were obliged to betake to the fields, and defend themselves by arms. They were surprised at Airmoss, a wild morass in the parish of Auchinleck, by a troop of dragoons under Bruce of Earlsdale; but, after a gallant resistance, which even their enemies could not help applauding, they were overpowered, and several of them killed on the spot, amongst whom was Richard Cameron. His head and hands were cut off, and carried with heartless cruelty to his father, from whom the sight only drew an expression of pious resignation to the will of God. His death gave rise to many touching displays of sympathy and regret, and a monument still marks the spot where Cameron fell. It is from this individual that the Reformed Presbyterians of the present day derive the vulgar sobriquet of Cameronians.—(See *Scots Worthies*; *Wodrow's History*; *Walker's Biographia Presbyteriana*; and *Life of R. Cameron*, by G. M. Bell.)—W. S.

CAMERON, WILLIAM, a Scottish poet, born in 1751; died in 1811. He became minister of Kirk-Newton in the county of Midlothian in 1785. In 1790 he published a volume of poems, and about the same time assisted in preparing the collection of paraphrases which, sanctioned by the general assembly, are still used in public worship in the Scottish church. He is the author of the 14th, 17th, and 66th paraphrases, and of portions of the 32d, 40th and 49th.—C. R.

CAMERS, JOHN, a Franciscan monk and celebrated Greek scholar, was born at Camerino in 1448. He was professor of philosophy at Padua, and afterwards taught theology at Vienna. He did much toward the restoration of Greek learning, which had declined after Constantinople was taken by the Turks. He edited many of the classic authors, such as Claudian, Florus, Justin, and Lucian, and died either in 1546 or 1556.—J. B.

CAMILLA, sister of the three Horatii, who fought the three Albans or Curiatii, a combat famous in early Roman history. Camilla was betrothed to one of the Curiatii, and when the only surviving Horatius returned home, his sister reproached him with the murder of her lover, upon which the victor, mad with passion, killed her.

CAMILLUS, LUCIUS FURIUS, grandson of Marcus Furius Camillus, was appointed consul, B.C. 338. He commanded the Roman army in the Latin war, and after capturing Tibur (Tivoli) reduced the whole Latin country to subjection. He was again chosen consul in 325.

CAMILLUS, MARCUS FURIUS, a Roman general of celebrity, called, for his distinguished services to his country, the second founder of Rome. After holding several important offices in the state, the duties of which he uniformly discharged with the greatest fidelity, Camillus was appointed dictator in the tenth year of the siege of Veii, and took the command of the

troops which were besieging that city. His energetic measures soon resulted in the capture of the town, and he returned to Rome laden with spoil; but having incurred the hatred of the people by his opposition to a proposal which contemplated the establishment in Veii of part of the population of Rome, he found it necessary to retire for a time into exile. He reappeared when the city of Rome was in the hands of the Gauls under Brennus, and putting himself at the head of an army, succeeded in ridding the country of the barbarians. He afterwards lived at Rome, enjoying the highest offices of the state, till his death, B.C. 365.—W. M.

CAMINATZIN or CACUMAZIN, king of Tezcuco, was nephew of Montezuma, emperor of Mexico. He formed the design of freeing his country from the Spanish yoke, and was taking measures for the expulsion of Cortes and his associates, when he was treacherously seized by the emissaries of his uncle, and delivered up to the Spaniards, who put him into prison. He was liberated, however, by some Mexican insurgents, and is believed to have perished at the siege of Mexico in 1521.—J. T.

CAMINHA, PEDRO DE ANDRADE, a Portuguese poet, one of that school which immediately preceded the era of Camoens. He was *camareiro* (gentleman of the chamber) at the court of the Infante Dom Duarte, brother to King John III., and died in 1595. He wrote eulogues, epistles, elegies, and a host of epigrams, of which nineteen are "to an ugly face!" "In these," says Sismondi, "as in the rest of his works, we have the labours of the critic and the man of taste endeavouring to supply the want of genius and inspiration." The works of Caminha have been republished by the Portuguese Royal Society.—F. M. W.

CAMINHA, PEDRO VAZ DE, a Portuguese traveller. Caminha, who had formerly filled a situation at Calicut, sailed in the first expedition that touched the shores of Brazil. He wrote a letter to Emmanuel (it was not published till the present century), in which he felicitously records his first impressions of the new country. It is thought he perished in a Mahometan affray at Calicut.

CAMO, PIERRE, a native of Toulouse, who cultivated poetry, and was one of the seven troubadours of Toulouse, as a group of poets called themselves. In 1324 they announced a kind of tournament, in which poets were to contend for the prize of a golden violet; and they proposed to hold, at the same time, something in imitation of the comitia of a university, in which they were to confer degrees in what was styled the "gaie science." Sismondi, in his *Literature of the South*, gives some account of these fantastic amusements.—J. A., D.

CAMOENS, LUIZ DE, the only Portuguese poet who has acquired a European reputation. The time and place of his birth are matters of dispute; the balance of evidence, however, appears to be in favour of his having been born at Lisbon in 1524. The poet's family had been distinguished for several generations in different departments of the public service: his father, Simon Vas de Camoens, being shipwrecked on the coast of Goa, settled and died there soon after the birth of his son. At the age of twelve or thirteen, Luiz was sent to the university of Coimbra, where he could not fail to be influenced by the reviving taste for classical literature. Some amatory verses still extant are supposed to have been written at this period. At the age of twenty Camoens returned to Lisbon, and led the ordinary life of a courtier. Here it was that he conceived a passion which, proving even more unfortunate than the attachments of poets in general, influenced greatly the whole course of his life. The friends of the lady, on whom the affections of the poet were bestowed, Catarina de Atayde, the daughter of one of the favourites of John III., procured on some plea or other his banishment from Lisbon for two years. The place of his retreat was Santarem, and to this period of enforced leisure we may attribute three of his comedies—"El Rey Seleuco;" "Filodemo;" and the "Amphitruos;" likewise some sonnets, and, possibly, the first conception of the "Lusiad." But a longing for active life seems to have possessed him, and he returned to Lisbon in 1549. It would appear that before long he again found it necessary to leave the capital, for we find him embarking in the expedition which was despatched about this time against the Moors of Ceuta, under Antonio de Noronha—a firm friend throughout all his subsequent life, to whom several of his poems are addressed. In this expedition Camoens earned no little distinction. He lost his right eye in an engagement in the Straits of Gibraltar. His sonnet commencing "Brandas agoas

do Tejo" was written at the period of embarkation, and a second elegy also bears internal evidence of having been composed about this time. In 1552 we find him again in Lisbon, where, it is said, he had to mourn over the death of Dona Catarina; but this is probably an error, originating with some biographer, who has confounded the poet's mistress with a relative of his, Dona Catarina de Almayda, frequently alluded to in his poems. In March, 1553, still eager for adventure, Camoens embarked in the *São Benito*, the only one of four vessels, fitted out under the distinguished navigator Cabral, which escaped shipwreck. In one of his letters he tells us that, as he stepped on board the ship, he adopted the words of Scipio Africanus, *Ingrata patria, non mea possidebis*. When off the Cape of Good Hope, the *São Benito* experienced a violent storm, which perhaps suggested the vision of Adamastor, the supposed guardian of that terrible spot, in his great poem. Arriving at Goa in September, 1553, we find him, two months afterwards, engaged in an expedition against the king of Pimenta, in favour of the king of Cochin, who at that time was an ally of the Portuguese. Nearly all his companions perished, and he returned to Goa. He was next employed in an expedition against the Arabian corsairs of the Red Sea, who, in conjunction with the Venetians, still kept up a precarious traffic by the overland route with India, and were thus considered as rivals by the adventurers who had recently opened the route by the Cape of Good Hope. The expedition wintered in the island of Ormuz, and here he found time to exercise his poetical powers. Returning to Goa in 1555, he found a new governor in power, and satirized the abuses which surrounded this functionary in some verses entitled "Disparates na India" (Vagaries in India), which cost him a term of banishment in the island of Macao. These four years of exile form, perhaps, the most tranquil and productive epoch in the poet's life. Soon after his arrival, according to the most probable narration, he heard of the death of the lady to whom he had been so fondly attached, and perhaps it was to dissipate the grief thus occasioned that he undertook a voyage to the Moluccas. Returning to Macao, by the favour of a successor of the hostile governor at Goa, he obtained an office (administrator of the effects of deceased persons), which placed him above want during the remainder of his residence in the island. The grotto of Camoens, where the greater part of the "Lusiad" was composed, is still shown to visitors. In 1560 he was recalled to Goa, but suffered shipwreck on the coast of Cochin China, and barely escaped with his life by swimming, saving only his "Lusiad." Arrived at Goa, fresh troubles awaited him. He was thrown into prison on a charge of misconduct in his office, and, when this was disposed of, a claim for an alleged debt was set up, which detained him for some time longer in captivity. It was not till 1569 that Camoens again beheld the waters of the Tagus, nor was he even then permitted to touch the soil of his native land; for, owing to the great plague which then raged, all ingress was strictly forbidden. In 1570, however, he landed at Lisbon, and in 1572 was published his great work, "Os Lusíadas" (The Portuguese), with a manly dedication to the young King Sebastian, who was then but ten years of age. The poem reached a second edition within the year—a success then almost without precedent—and Tasso, who was then writing his *Jerusalem Delivered*, addressed a sonnet to the author. But court favour in those days was reserved for other than poetical merits, and beyond a pension equal to about £5 per annum (which perhaps he was entitled to on other grounds), no mark of royal or national gratitude seems to have been bestowed on him. Camoens had brought home only his "Lusiad" from the land whence so many had returned laden with wealth, and the remaining years of his life were spent in the most abject poverty. A poor Japanese slave, who had come to Europe with him, supported his master by begging in the streets, and when this faithful dependent died, Camoens was carried to a public hospital. Here he lingered long enough to hear of the battle of Alcacer-Quivir in 1578 in which the king fell, and with him the Portuguese monarchy. With a better feeling than he had manifested in earlier days, he wrote in one of his latest letters—"I have so loved my country, that I rejoice not only to die on her soil, but to die with her." He died in the beginning of 1579, and was buried in the church of Santa Anna. No stone marked the spot till 1593, when a generous Portuguese erected a simple tablet, recording that he, "the prince of poets, lived poor and miserable, and died so." The church itself was destroyed by the earthquake of 1755.

Fairly to appreciate the merits of the "Lusiad," we must remember that Camoens was not only the first in modern times to venture on an epic poem, and to execute it in the course of so chequered a life, but that he had the courage, despite the classical affectation then in vogue, to choose as his theme the history of his own country. The first lines of the poem will sufficiently indicate its scope, and the models which he proposed to follow:—

"Arms and the heroes, who from Lisbon's shore,  
Through seas where sail was never spread before;  
Beyond where Ceylon lifts her spicy breast,  
And waves her woods above the watery waste," &c.

It is an error to suppose that Camoens only intended to commemorate the achievements of the Portuguese navigators, with which the minds of his contemporaries were familiar. He aimed also to interweave with their lives the whole history of Portugal, by means of artifices which he could not fail to borrow from the classic poets, and which he has employed with perhaps not inferior skill. The groundwork of the poem is the voyage of Vasco de Gama; but from the first there is a confusion between the old pagan deities, under whose auspices the scene opens, and the newer faith of which the heroes of the poem were zealous propagators. If, however, the poem loses somewhat in artistic completeness by this intermingling of conflicting theologies, it may be said, on the other hand, that the achievements of Portuguese adventure could not have been rendered more romantic by being clothed in the drapery of a bygone age. The poem consists only of some 1100 rhymed octave stanzas in the metre of Ariosto. Vasco de Gama is introduced when cruising near the island of Mozambique, and arrives in safety at Melinda. The king receives him hospitably, and in answer to his inquiries, Gama proceeds to describe Europe, and his own country in particular, and next relates the history of Portugal from the earliest times down to his own day. The most remarkable episode—which is told with almost rigid historical accuracy—is the well known story of Inez de Castro.

If it were needful to add to the eulogies which Tasso, Calderon, Voltaire, and Schlegel have passed on the "Lusiad," we might allude to the fact that it has been translated not only into almost every modern language, but into the Hebrew. There are three translations into English; that of Sir R. Fanshawe in 1655; that of Mickle (perhaps the best for the ordinary reader), first published in 1771; and that of Sir T. Mitchell in 1854. Mr. John Adamson, the biographer of Camoens, has also edited another version of part of the work; and Lord Strangford is the author of some elegant translations of his minor poems. A splendid edition of the original work was published in Paris in 1817. The other poems of Camoens consist of nearly 300 sonnets, of which only a few are noteworthy, as bearing the impress of the poet's chequered life; several canzoni, after the model of Petrarch; a few lyrical songs, sweet and impassioned; a poetical version of the 137th psalm; and a number of eclogues, of which all but eight are lost. It deserves to be noted, that Camoens enriched his native tongue by the addition of above 2000 new words. In person (we are told by Antoni) he was of middle stature, the face full, the brow lowering, the nose long and raised in the middle; the hair, in his youth, so light as to be almost the colour of saffron. His life is perhaps more in harmony with his writings than that of most modern poets; and had not the political fortunes of Portugal, after his death, led to a disregard of her language and literature, we may safely say that the fame of Camoens would have been far more widely diffused.—F. M. W.

CAMPAGNOLA, DOMENICO, an Italian painter, surnamed DALLE GRECHE. He was the son of Giulio Campagnola a painter and engraver of some note. This artist flourished in the year 1543, and studied under Titian, with a success which is stated to have even excited the jealousy of his master. His best works in the Scuola del Santo, representing the "Evangelists," approximate very nearly to the grandeur of Titian, as Lanzi testifies. His drawings from the nude are described as daringly successful. As a landscape painter, of a Titianesque style, he also possessed great merit. He was a man of no limited means in art; for his repute as an engraver, on both metal and wood, is unquestionably good, though Ottley appears to hold that the wood works ascribed to him are mostly copies from his designs for the better material. Among his numerous etchings are representations of the "Adoration of the Magi;" "Dives and Lazarus;" "Christ and the Sick;" "The Holy Family;" "Venus;" and "Bacchanals."—W. T.

CAMPAGNOLI, BARTOLOMEO, a violinist, was born at Cento, near Bologna, September 10, 1751, and died either at Neustrelitz or at Hanover, November 6, 1827. His first master was Dall' Ocha, a pupil of Lolli, and he received further instruction on his instrument from Don Paolo Guastarobber, a pupil of Tartini. He went with Lamotta to Venice, and thence to Padua. In this place, where Tartini was reposing on the laurels of his long and honourable artistic career, Campagnoli played to the venerable master, and received his warm encouragement. In 1770 he visited Rome, with success. He next spent six months at Faenza, during which he pursued his study of the violin with the maestro di capella, Paolo Alberghi. Thence Campagnoli went to Florence, where Nardini was residing, whom he was so pleased to take as a model, that he remained at the Tuscan capital for five years, where also he made the friendship of Cherubini. At the end of 1775 he accepted the invitation of the prince bishop of Freisingen in Bavaria, to enter his chapel. In 1778 Campagnoli commenced a tour, in company with Reinert the fagotist, through Poland and the adjacent states. In 1783, if not earlier, he went to Dresden, where he was engaged by Carl, duke of Courland. This liberal patron gave him leave of absence to visit different cities for the display of his now famous skill as a violinist; accordingly, besides other places, he appeared at Stockholm, where he was created member of the Royal Academy of Music. His engagement continued until the duke's death in 1787, when Campagnoli was appointed concert master at Leipzig, with the direction of the Abonnement concerts. In 1801 he visited Paris, where he met once more his old friend Cherubini, and where his playing successfully stood the test of comparison with that of Rode, Krutzer, and the other eminent artists then resident in the French metropolis. In 1808 he brought out as a singer his second daughter, Albertina, then but thirteen years old, and, in 1810, her younger sister, Gianetta, also appeared as a vocalist. These ladies subsequently attained considerable distinction in their art, to extend their opportunities for which, in 1816, their father took them to Italy, and Mattei officiated as his deputy in Leipzig during his absence. He afterwards resigned his appointment in that city to accept the less arduous one of music director at Neustrelitz, which allowed him to spend much of his time with his daughters, who were permanently engaged at Hanover. Though he wrote extensively for his instrument, and naturally exhibited his specialities best in the performance of his own music, he was not less successful in playing the bravura pieces of other violin composers; and he added much to his reputation by his rendering of quartets, and similar chamber music. He was personally liked as much as he was artistically admired, and the extremely bad German he habitually spoke (for in his many years of residence in Germany he never mastered the language), gave drollery to all he said, which, combined with his natural good humour, made him a welcome companion wherever he appeared. His published works, which form but an inconsiderable portion of his productions, consist of pieces for the violin in all forms, from the study to the concerto, some compositions for the viola, and some for the flute. These have all passed away with their time, but his "Method for the Violin," with its numerous progressive exercises, is still held in esteem, and his "Exercises on the Seven Positions" is a work in the highest repute.—G. A. M.

CAMPAN, JEANNE-LOUISE-HENRIETTE GENEST, born at Paris in 1752. This lady, the strange vicissitudes of whose life she has herself described in her interesting memoirs, was the daughter of a gentleman who held a respectable situation in the office of the minister for foreign affairs under Louis XVI., and was noted for his literary tastes. Having enjoyed from childhood the combined advantages of courtly and literary society, she so well profited by these as to be thought worthy of being appointed reader to the royal princesses. After her marriage with M. Campan, son of the king's private secretary, the queen, Marie Antoinette, attached Madame Campan to her person by appointing her first femme de chambre. She, like her royal mistress, was surprised by the Revolution; and, having witnessed the dreadful scenes of the 10th August, was so little dismayed on her own account, that, with admirable fidelity, she offered to share the queen's imprisonment in the Temple. Her unconcealed attachment to her mistress exposed her to such danger that she was obliged to quit Paris. On her arrival at Combertain, the place of her retreat, she was met by the fearful tidings of her sister having been arrested, and of her having committed suicide.

As soon as the fall of Robespierre relieved her from apprehension for her personal safety, she opened school at St. Germain. When Josephine Beauharnais, about to be married to General Bonaparte, wanted to place her daughter Hortense at school, that of Madame Campan was selected. This naturally brought the ex-reader of the court of the unfortunate Louis XVI. under the notice of the future emperor of the French. Hortense, the destined wife of Louis Bonaparte, king of Holland, remained under Madame Campan's care, while her stepfather was running his marvellous career of glory in Italy. The hero on his return assisted at the representation of Racine's Esther by the female pupils of St. Germain, as Louis XIV. used to honour by his presence the performance of the same play by madame de Maintenon's protégées at St. Cyr. Shortly after Napoleon assumed the imperial purple, he appointed Madame Campan superintendent of the imperial school at Ecoeu, an institution erected for the daughters of officers of the legion of honour. From this situation she was ungenerously dismissed at the Restoration. To add to the mortification of dismissal, came sorrow for the death of her only son. A cancer declared itself, and, after lingering some time in suffering, she died at Mantes in 1822. Besides the memoirs alluded to, Madame Campan has left "Anecdotes of the courts of Louis XIV. and XV.," and some works on education.—J. F. C.

CAMPANA, ANTONIO FRANCESCO, an Italian physician, was born at Ferrara in 1751, and died in 1832. After prosecuting the study of medicine at Ferrara, he became physician to the hospital of Saint Mary at Florence. He subsequently devoted himself to natural science, and turned his attention to botany, agriculture, and chemistry. He filled a chair of physical science at Ferrara. His published works are, "A Catalogue of the Plants in the Botanic Garden of Ferrara;" "The Pharmacopœia of Ferrara;" and treatises on intermittent fevers.—J. H. B.

CAMPANAIO, LORENZO DI LUDOVICO, a Florentine sculptor and architect, born in 1491; died in 1541. At Rome he attracted the notice of Raphael, on whose recommendation he was intrusted with some important tombs and buildings.

CAMPANELLA, THOMAS, was born 5th Sept., 1568, at Stilo, a small town in Calabria. At five years old, it is said, he was distinguished for his extraordinary memory; at thirteen he read and made notes on all the Latin authors; at fifteen he embraced the monastic life, and joined the order of the Predicatori. The silence of the convent, where his studies and meditations were pursued with unflagging assiduity, seems to have favoured the rapid development of his mind; and, before he had attained the age of twenty-three, his name was already famous in the philosophical world. But his ardent and enterprising genius could not long brook the monotony of a cloister, nor could his intellectual energy long be limited to merely contemplative study, which, left to itself, must ever be devoid of practical result. It is a leading characteristic of the Italian race, that they strive ever to connect ideas with practice. Penetrating into the most abstruse regions of speculation, they seek continually to turn theory into life. Campanella is a striking instance of this tendency. He was led to embrace warmly the philosophical doctrines initiated by Bernardino Telesio, who sought to free the human mind from Aristotelian tyranny, and to substitute experience and induction for the barren *a priori* process. With the zeal of a convert, Campanella travelled all over Italy to spread the new emancipating ideas. His vast erudition, his profound conviction, gave to his fluent speech the force of eloquence, and he made numerous proselytes in Calabria, Bologna, Florence, and Padua. During his residence in Bologna, however, his manuscripts were seized and handed over to the inquisition at Rome; but no immediate consequences followed. At the close of this scientific pilgrimage, Campanella returned to Stilo in 1598. Passing through the kingdom of Naples on his way, he could not avoid seeing how that unhappy country was groaning under the Spanish yoke—the worst that has ever oppressed even Italy. The count de Lemoz, the stakes and gibbets of the holy office, the ignorant and haughty despotism of its rulers, had reduced this once smiling and fertile country, the birthplace of some of earth's mightiest intellects, to the lowest stage of degradation. Naturally enough Campanella, hitherto the apostle of the emancipation of thought, now became the apostle of political emancipation. The political tyranny of Philip III. was as injurious to intellectual freedom as was the intellectual despotism of Aristotle to political liberty. The one was the bulwark of the other, and in order to overthrow either, it was necessary

to combat both. So Campanella, following out his convictions into this new sphere, consecrated himself to the work of redeeming his country from slavery. In a short time the influence of his virtue and his genius enabled him to organize a powerful conspiracy, spreading over the greater part of the kingdom, the principal centres being Cerifalco, Catanzaro, Nicastro, Stilo, Tropea, Squillace, Sant Agata, Cosenza, Reggio, Cassano, Castrovillari, Satriano, and Terranova. But, a short time before the appointed outbreak, two of the conspirators, Giambattista Biblia and Fabio of Lauro, either through fear or cupidity, betrayed the preparations. The leaders were imprisoned, and among them Campanella. His imprisonment lasted twenty-seven years; and in the preface to one of his works, "Atheismus Triumphatus," he narrates that he was tortured seven times. After this he was thrown into a subterranean dungeon. But torture and the squalor of imprisonment only redoubled Campanella's activity, and sharpened his genius. It is probable that the feeling of his impotence to serve his country, the failure of all his plans, and the effect which the sepulchral silence of his prison must have had on his mind, may have persuaded him that a longer intellectual labour was necessary in order to give new life to his native land. Considering that the existing society was still ruled in a great degree by old ideas and prejudices, he resolved once more to enter the lists against Aristotelianism, and conceived the audacious design of reconstructing human science from its very foundations. In his earlier years he had published a work entitled "Philosophia Sensibus Demonstrata," Naples, 1591, in defence of the doctrines of Telesio; and this work constituted the foundation of his speculations, and determined their method. The foundation of all is the maxim, *Sentire est scire*—knowledge is derived from sensation: the method is that of ascending from the known to the unknown, in order to declare and prove it. It is, as we said, the philosophical method of Telesio, followed to such glorious results in later times by our own Bacon. But two conditions were requisite in order to reconstruct the edifice of human knowledge, according to the plan conceived by Campanella—"Prodomus Philosophiæ Instaurandæ," Frankfort, 1617. First, a theory of the absolute, or the cogitation of a system of metaphysics, which should form, so to speak, the skeleton. This he provided in two works—"Philosophiæ Rationalis partes quinque," Paris, 1638, in 4to; and "Universalis Philosophiæ, sive metaphysicarum rerum juxta propria dogmata, partes tres," Paris, 1638. In the second place, it was necessary to unite two things which, in the general opinion, were separated, namely, philosophy and religion; because life is a unity resulting from the harmony of all its manifestations. So he wrote "Monarchia Messiæ, ubi per philosophiam demonstrantur jura summi pontificis super universum orbem," Paris, Dubray, 1636, in 4to. But still more important was the conquest of unbelief by a refutation of its theories and arguments. With this view he wrote "Atheismus Triumphatus;" and in order to uphold the rules which are necessary, in order to enter with profit into the sanctuary of science, he wrote a didactic book, "De Rectâ Ratione Studendi." The foundation thus laid, he proceeded to build upon it all that can be known in the whole circle of arts and sciences, physics and politics. In order thus to complete the edifice, he wrote "Realis Philosophiæ partes quatuor, hoc est de rerum natura, hominum moribus, politica, œconomica," &c., Frankfort, 1623.—One cannot avoid asking how it happened that a man of such universal genius, who can only be compared to Aristotle and to Leibnitz, did not attain his goal? Why did his gigantic labours remain almost unfruitful? and why was the subsequent work of Descartes and of Bacon necessary? First, because it is an invariable, logical law, that demolition must precede reconstruction. Catholicism had by this time discharged its functions in the career of universal progress. Luther had appeared. But Campanella, following the example of Marsilio Ficino, strove to use catholicism as an element in the restoration of human knowledge; and it was this error which frustrated his herculean toil. With such tenacity, indeed, did Campanella espouse the cause of the church, that he waged an implacable war with the German reformation. Secondly, as Leroux observes, "Campanella resolved to lay anew the foundations of everything; whereas Bacon (of whom we may say what he said of Plato, that whatever subject he took into consideration, he grasped the whole as from a lofty rock) spent his whole life on a single work, the perfecting of the natural sciences. In certain epochs

the struggles undertaken by the human spirit are like ordinary battles; he is the great general who, presenting a wide front and a wise arrangement, concentrates all his forces on one point, breaks the ranks of the enemy, and crushes him by falling on the wings thus separated. Thus did Bacon, with his immense ardour for progress of every kind, concentrate all his strength on one single point. The natural sciences, whose destiny he presaged, have triumphed; and hence his renown. But Campanella, wishing to embrace all, and to construct all, lost the battle through his eagerness to conquer at every point at once, in battle array, as if the conquest of one point would not have sufficed to decide the rest." But the special and undeniable merit of this man of genius is that of having felt, in the presence of a historical epoch dying and crumbling to atoms, the necessity of unifying the functions of thought and its representations, human activity and its products. To this we must add, the merit of having attempted this unification by initiating a work which was to form the special task of the nineteenth century; and of having, with the keen intuition of genius, recognized two centuries before Lessing and Condorcet, the law of the indefinite progress of the human race, bound together by the ties of our common nature. "The partial steps," says Campanella, "made by individuals and by nations, are but the elements and the efforts which advance the human race, considered as one general association. This association follows the laws which preside over its destiny, and which tend to the development of its faculties in harmonious proportions." And the nineteenth century ought to remember this, for assuredly the consciousness of the future is not to be attained without the consciousness of the past. In that past the modern investigator will find himself arrested by the intellectual monument raised by Campanella, and will find, glistening among the rubbish of a past age, many gems well worthy of being brought to light.

The sepulchral gloom overspreading all Italy, only lighted up to the eye of Campanella, as he watched from his living tomb, by the funeral piles of fresh martyrs, did not in the least degree diminish the hope of the indomitable mind of living to see his speculative system translated into actual fact. Italy, as a nation, was dead, and he concluded that, instead of isolated nations, there would arise a universal monarchy, a cosmopolism which perfectly corresponds to his "Monarchy of Christ." He turned to Spain, and said—"Dare, and thou shalt wield the sceptre of the world." In this view he composed the work "De Monarchiâ Hispanica," Amsterdam, 1640, 24mo. But Spain was deaf to his appeal. One bitter disappointment after another took from him the hope of seeing his desires fulfilled in his lifetime, but nothing could prevent him from dreaming of their realization in the future. So he continued to build up, stone by stone, that city of the future in which the erring human family should hereafter be gathered. His "Utopia" (*Civitas Solis*) is the republic of Plato presided over by Christ. It is a system of socialism, in which religious tolerance is practised, as the only method of reconciling all men, and as almost an indispensable preliminary of the religious unification which is to come. It results in little less than cancelling the human personality by an association of a monastic character; but it unfolds the precious principle "to every man according to his works," a principle divulged by certain contemporary socialists with the air of men who are announcing a new revelation. In his saddest hours, too, Campanella tempered his sorrows with song. He composed Italian poems, warm with the tenderest affections, and ever bright with the hopes which were the source of constant inspiration, as one illusion after another passed away.

At length, in 1626, Campanella was liberated from the prisons of Naples. But the church of Rome could not forget that this man would have robbed her of all the authority she derived from the doctrines of the humiliation of the faithful, of mortification, of the abnegation of every impulse of conscience. Campanella recognized only Christ, radiant with the glory of his transfiguration; Christ promising the reign of God on earth—a reign of justice, truth, and love: so he was accused of heresy. The church did not forget that he had designed a temple that should embrace all religions, so that the catholic faith would only find itself on a level with others. The church looked on tolerance as a mere philosophical hypocrisy—a blind for infidelity—and she accused him of atheism. The unfortunate philosopher, therefore, passed from the subterranean vaults of Naples to the secret dungeons of the inquisition at Rome, where

he lingered for three years longer. Liberated in 1629, he was warned that the implacable Spaniards were resolved to imprison him again in Naples, and various traps were laid for him, which for a time he eluded. But the danger increasing, he resolved to escape; and with the aid of the French ambassador, in 1634 he effected his object, disguised as a Minimo friar. At Marseilles he was warmly welcomed by the illustrious Teireschio, who took him to his residence at Aix. After a few months Campanella took up his abode at Paris in the convent of the Jacobins. Here he was honoured and sought after by all the leading men of the capital. Cardinal Richelieu presented him to Louis XIII., who assigned to him a pension of 1000 francs. He died May 26, 1639, at the age of seventy-one—one of the many martyrs of science whose worth was greater than his fame. His works, besides those mentioned above, are—"Ad doctorem gentium de gentilismo non retinendo, et de prædestinatione et gratia," Paris, 1656, 4to; "De prædestinatione, electione, reprobatione, et auxiliis divinæ gratiæ contra," Paris, 1636, 4to; "De sensu rerum et magiâ," Paris, 1637, 4to; "Apologia pro Galilæo."—[M.]

**CAMPANI, GIOVANNI ANTONIO**, an Italian bishop, born at Carelli in 1427. His birth was so obscure that his real name was unknown; and he might have died without having risen beyond the condition of a shepherd, but for a priest who became struck with the intelligence of the lad, whom he found tending sheep, and, taking him into his service, taught him Latin. Through the aid of the same kind patron he was enabled to complete an education which embraced belles-lettres. While following a course of studies he made the friendship of a man of rank, who recommended him to the pope, and Campani became secretary to Callixtus III. When Pius II. succeeded to the papal chair, he had his predecessor's secretary appointed major domo to his own chief minister, Sassoferrato, and made him bishop of Crotona. It is a striking proof of the opinion entertained of his abilities by a court whose diplomatic skill has never been questioned, that the bishop should have been selected for the delicate task of exciting the German powers to make war against the Turks. His mission failed, and he did not take his failure in a spirit of christian resignation, for he left Ratisbonne uttering maledictions on the German race. It is not improbable that his indignation was not unmingled with generous regrets for what he believed a good cause; for we subsequently find him quarrelling with another pope, Sextus IV., on account of the excesses committed by his troops on the suppression of a revolt in Todi. This learned, acute, and brave bishop, who rose from being a poor nameless keeper of sheep to be the confidant of popes, had not even advantages of face or figure, for he was ugly and deformed. His protest in favour of the people of Todi lost him further favour. He died at Sienna in 1477. His writings, directed to topics of the day, were brisk, vigorous, and effective; but contain no present interest beyond their being illustrative of a remarkable character.—J. F. C.

**CAMPANI, MATTEO and GIUSEPPE**, two brothers, natives of the diocese of Spoleto, flourished about 1678. Matteo is celebrated for several optical inventions, especially object-glasses of enormous focal length. It was by the aid of these that he discovered Jupiter's spots, a discovery which he had to maintain against the claims of Divini. Giuseppe was also a noted inventor and astronomer.

**CAMPANNA, PEDRO**, an artist, born of Spanish parents at Brussels in 1503. He studied in Italy at an early age, and is even alleged to have been a pupil of Raffaele. Charles V. invited him to Spain, where he painted the "Purification" and the "Nativity" for the cathedral of Seville, and a "Descent from the Cross" for the church of St. Lorenzo. He was glad, however, to exchange his success in a foreign city for the sight of his natal place once more, and he died rich and famous at Brussels in 1570.—W. T.

**CAMPANTON or CANPANTON, RABBI ISAAC BEN JACOB**, celebrated as a teacher of the Talmud, and therefore styled the "Gaon of Castile," died in 1463, at the remarkable age of 103 years. He composed an excellent treatise on the method of studying the Talmud, under the title of "Darche Ha-Talmud" (The Ways of the Talmud), which has gone through several editions.—T. T.

**CAMPANUS OF NOVARA**, the first translator of Euclid into Latin. It is not certain when the Campanus lived who did this eminent service to mathematics. There was one of the name

who wrote a calendar in 1200, another who was chaplain to Pope Urban IV., elected 1261, and the honour has been claimed for both. Some have thought that it is due to an even earlier Campanus living some time in the eleventh century. The translation was manifestly made from an Arabic version, and was first printed in 1482.—J. B.

**CAMPANUS, JOHANN**, a German divine of the sixteenth century. He was a follower of Luther till 1530, when he founded a sect of his own called the Campanites. He held a peculiar opinion respecting the Supper, and taught that the Son and Holy Spirit are not two persons distinct from the Father.

**CAMPBELL**, one of the most powerful clans among the Scottish Highlanders, whose chiefs have for upwards of five centuries taken a prominent part in the public affairs of the country. According to tradition their original name was O'Dubbin, and their seat Lochow. One of their chiefs named Diarmid was a famous warrior, and from him the clan were frequently denominated "the sons of Diarmid." In the reign of Malcolm Canmore, a chief named Gillespie married the heiress of Lochow, and assumed the name of Campbell, which was henceforth borne by the whole clan. Sir COLIN, one of his descendants, was so distinguished by his warlike achievements and the additions he made to his estates, that he obtained the surname of MORE or GREAT, and from him the chief of the clan is to this day styled in Gaelic MAC CALLUM MORE, or the son of Colin the Great. His eldest son, Sir NEIL, was one of the first to join Robert Bruce, and adhered with unwavering fidelity to that monarch's cause throughout the whole of his chequered career. He was rewarded with the hand of Lady Mary, Bruce's sister, and with a grant of the forfeited estates of the earl of Athol. Sir COLIN, his son, rendered important service to Edward Bruce in his Irish campaigns, and to David, son of King Robert, in expelling the English from the kingdom. Sir DUNCAN, the great-grandson of Sir Colin, was accounted one of the most wealthy barons in Scotland, and was raised to the peerage by James II. in 1445. He was appointed king's justiciary by James I. with the title of Lord Campbell. His grandson COLIN, first earl of Argyll (1457), acquired by marriage the extensive lordship of Lorn, and after holding successively many important public situations, such as master of the household, ambassador to the courts of England and France, royal justiciary, &c., eventually, for a long period, filled the office of chancellor of Scotland. He received in 1481 an extensive grant of lands in Knapdale, from the forfeited possessions of the Lord of the Isles. His son and successor, ARCHIBALD, second earl, fell in command of the vanguard at the disastrous battle of Flodden. During the seventeenth and eighteenth centuries the Campbells continued to make rapid advances in territory and in power. COLIN, third earl, obtained the important hereditary office of justice-general of Scotland. His son ARCHIBALD was the first person of rank and influence in Scotland who embraced the protestant religion, and was one of the most strenuous supporters of the Reformation. On his deathbed he earnestly entreated his son to maintain the protestant religion as his most precious heritage. ARCHIBALD, fifth earl, was deeply involved in the plots and wars of the troublous times of Queen Mary, and commanded the vanguard of her army at the battle of Langside. He was ultimately appointed lord-high-chancellor, an office which was also held by his successor, COLIN, sixth earl. ARCHIBALD, seventh earl, gained considerable reputation as a military officer, and served with great distinction under Philip of Spain in his wars against the states of Holland. It was probably through his connection with that monarch, that he renounced the hereditary faith of his family, and joined the Romish church. In consequence of this step the government compelled him to make over the greater part of his estates to his son,

CAMPEELL, ARCHIBALD, Lord Lorn, afterwards ninth earl and first marquis of Argyll, the celebrated GILLESPIE GRUMACH, or ARCHIBALD THE GRIM, the leader of the covenanting party during the great civil war. He was born in 1598, and was early introduced into public life. In 1626 he was made a privy councillor, and in 1634 was appointed one of the extraordinary lords of session. When the arbitrary and impolitic measures of Charles I. and Laud had kindled a flame throughout Scotland, which ultimately destroyed the royal authority, Argyll was summoned to London to assist the king with his counsel, and earnestly recommended the entire abolition of those innovations on the worship of the Scottish church, which had roused the

indignation of the people. His advice was not followed, and on his return to Scotland he signed the national covenant, and a few months after attended the famous assembly which met at Glasgow, November, 1638, and declared publicly his approbation of its proceedings. When hostilities at length broke out between Charles and the Scottish nation in 1639, Argyll raised his vassals and espoused the popular cause. In 1640, he marched to the north at the head of five thousand men, and compelled the inhabitants of Badenoch, Athol, and Mar, to submit to the authority of the parliament. Then marching eastward into Angus he demolished Airlie and Forthar, the castles of the earl of Airlie, who had fled on hearing of his approach. Next year when Charles visited Scotland, with the view of gaining over the covenanters, he raised Argyll to the rank of marquis, and made every effort to conciliate his powerful subject. When Charles took up arms against the English parliament, Argyll, who was now the recognized leader of the covenanters, induced the Scottish council to make repeated offers of mediation; but these proposals having been rejected by the king, the Scots at length resolved to send an army to the assistance of the parliament. From this time onward Argyll took a prominent part in the civil war; and when, after the battle of Marston Moor, Montrose took the field in behalf of the king, and collected a considerable body of Highlanders to his standard, the marquis was appointed commander-in-chief of the covenanting army. His talents, however, were not of a warlike kind, and he met with a bloody defeat at Inverlochy, 1st February, 1645—the most signal disaster that ever befell the race of Diarmid. His estates were so completely wasted by the devastating inroads of Montrose and Colkitto, that a sum of money was voted by the parliament for the support of his family, and a collection was ordered to be made throughout all the churches for the relief of his plundered clansmen. Argyll took no direct part in the negotiations between the Scottish army and the parliament respecting the disposal of the king's person; but he opposed the engagement entered into by the duke of Hamilton, and other presbyterian royalists, for the purpose of restoring the royal cause; and after the defeat of the engagers at Preston, Argyll, Warriston, and the other leaders of the covenanting party seized the reins of government. The execution of Charles completely alienated this party, and indeed the whole Scottish nation, from the English republicans; and they immediately proclaimed Prince Charles, the eldest son of the deceased monarch, king of Scotland in his father's stead. At his coronation on the 1st of January, 1651, Argyll placed the crown on the young monarch's head. So great was the influence of the marquis at this juncture, that Charles, though secretly fearing and hating him, promised to confer upon him a dukedom, and made a proposal to marry his daughter, which the wary chief prudently declined. After the defeat of the Scots at Dunbar and Worcester, Argyll, amid almost universal despair, strove to raise the depressed spirits of his fellow-nobles, and mustered his clan with the view of resisting the victorious forces of the Commonwealth, but without effect; and a reluctant submission was at last extorted from him by Major-general Dean, who unexpectedly arrived at Inverary by sea, and surprised the marquis while confined to his castle by sickness. On the death of Cromwell, Argyll was elected by the county of Aberdeen a member of Richard's parliament, and showed great zeal in promoting the interests of the exiled monarch. At the Restoration he repaired to London, for the purpose of congratulating the king; but on his arrival at Whitehall, he was immediately arrested and committed to the Tower. He was shortly after sent down to Scotland and tried on fourteen different charges, extending over all the transactions which had taken place in Scotland since 1638. The trial was conducted by Middleton, the royal commissioner, with a total disregard, not merely of justice, but of common decency. The unanswerable defence of the accused peer compelled the parliament, though filled with his enemies, to exculpate him from all the charges in his indictment except that of compliance with Cromwell's usurpation. Even on this point the evidence was defective, and his acquittal seemed certain; but after the case was closed, a number of private letters which Argyll had written to Monk, were laid before the court by a messenger, whom that treacherous villain had sent down from London with all haste, on learning the scantiness of the proof against his former friend. On evidence thus basely obtained and illegally brought forward, the

old nobleman was found guilty and condemned to be beheaded. This sentence was executed on the 27th of May, 1661. The marquis displayed great calmness and dignity during the closing scene. "I could die like a Roman," he said; "but I choose rather to die like a Christian." The character of Argyll was not free from defects; but he was a true patriot, a staunch presbyterian, and a statesman of great sagacity, experience, and consummate address. His vast influence and ambition made him equally dreaded and hated by the neighbouring chiefs; but he was almost adored by his own clan, and his memory is still held in high veneration by the Scottish presbyterians.

CAMPBELL, ARCHIBALD, ninth earl, was the eldest son of the preceding. He received an excellent education under the eye of his father, and travelled for three years on the continent. On his return he took the opposite side from his father, and, attaching himself to the royal cause, fought for Charles II. at the disastrous battle of Dunbar. Even after the final defeat of the Scottish army at Worcester, he still continued in arms, and in 1654 joined the earl of Glencairn with a strong body of his clan; and, in his zeal for the interests of the king, consented to serve against the English parliament along with the Macdonalds, and other hereditary enemies of his house. After all hope of resistance was extinguished, Lord Lorn submitted to Monk, who treated him with great severity, and even committed him to prison in 1657, where he lay till the Restoration. In return for his services, Charles remitted his father's forfeiture, and bestowed upon him the family estates and the ancient earldom, to the great disappointment of the greedy and unscrupulous Middleton, who expected to be enriched by the spoils of the man whom he had hunted to death. In 1662, the earl was condemned to death by the Scottish parliament, because in a private letter which Middleton intercepted, he had complained of the calumnies of his enemies; but the king at once interposed, and saved his life. For twenty years he continued to give a moderate though steady support to the government, and even to some extent countenanced their persecution of the covenanters—a part of his conduct which he afterwards bitterly bewailed. In 1681 the Scottish parliament, at the instance of the duke of York—afterwards James VII.—enacted the notorious test of passive obedience, which was so absurd and self-contradictory, that even eighty of the episcopal ministers refused to take it, and were in consequence ejected from their livings. Argyll was prepared to resign his office of privy councillor rather than subscribe this test; but, at the request of the duke, he at length complied, subjoining the explanation, that he took it so far as it was consistent with itself and the protestant religion. James had previously been made aware that this explanation was to be given by the earl, and had apparently received it with great satisfaction. He had perceived, however, that he could not rely on the support of Argyll in his flagitious designs against the religion and liberties of the country, and therefore resolved to avail himself of this opportunity to destroy him. The earl was accordingly apprehended and brought to trial for treason and leasing-making, found guilty, and condemned to death on the 18th October, 1681. On the evening of the 20th, however, he made his escape from the castle of Edinburgh, in the disguise of a page holding up the train of his stepdaughter, Lady Sophia Lindsay; and, in spite of a keen pursuit, made his way to London, and thence passed over to Holland. Sentence of attainder was immediately pronounced against him, his estate was confiscated, his arms were reversed and torn, and a large reward was offered for his head.

Argyll remained in Holland, living in obscurity, until 1685, where, in company with other exiles, he planned an invasion of Scotland, simultaneously with the descent of Monmouth on the southern coast of England. They set sail from Amsterdam on the 2nd of May; but on reaching his own country, Argyll found that ample preparations had been made against his attack, and that even his own clan were disheartened, and unable to afford him adequate assistance. The covenanters cherished a deep grudge against Argyll on account of the support which he had formerly given to the persecuting government, and refused to unite with him. His ships were captured by some royal frigates, his military stores fell into the hands of the enemy, provisions failed, and the Highlanders deserted by hundreds. In this extremity, Argyll, in compliance with the urgent advice of his associates, quitted the highlands, and marched towards Glasgow. But his guides mistook their way during the night, and led the troops into a morass. All order and subordination ceased, the diminished and disheartened

band of insurgents broke up and dispersed, and next day their unfortunate leader was taken prisoner by a party of militia while attempting to cross the Cart at Inchinnan, near Paisley. He was immediately conveyed to Edinburgh, every kind of indignity being heaped upon him during his journey. On reaching the castle he was put in irons, and informed that he was not to be brought to a new trial for his rebellion, but to be executed under his former sentence. He bore all this treatment with astonishing patience and equanimity, and though threatened with the torture by the positive orders of James himself, to compel him to reveal the names of his supporters, he resolutely declined to say anything that could compromise his friends. He professed deep penitence for his former unworthy compliance with the sinful measures of the government, and expressed his firm conviction that the good cause would ultimately triumph. His behaviour on the scaffold was remarkably composed, and even cheerful; and his farewell speech breathed the spirit of piety, resignation, and forgiveness. He was beheaded on the 30th of June, 1685, and his head fixed on the tolbooth. After the expulsion of the Stuarts, the iniquitous sentence against Argyll was treated as a nullity by the convention, and his son was at once restored to his estate and honours, and was selected from the whole body of Scottish nobles to offer the crown to William and Mary.

CAMPBELL, JOHN, duke of Argyll and Greenwich, born 10th October, 1678, was the son of Archibald first duke, and grandson of Archibald ninth earl of Argyll. At an early age he gave promise of his future eminence as a statesman and a soldier. In 1694 King William bestowed upon him the command of a regiment, and on the death of his father in 1703, he was made a privy councillor, captain of the Scotch horse guards, and one of the extraordinary lords of session. In 1705 he was appointed high commissioner to the Scottish parliament, and in return for his services in promoting the union between the kingdoms, he was created an English peer by the titles of Baron of Chatham, and Earl of Greenwich, and in 1710 was made a knight of the garter. He served with great distinction in Flanders, under the duke of Marlborough, and was present at the famous battles of Ramilies, Oudenarde, and Malplaquet, and at the sieges of Ostend, Lisle, Ghent, Bruges, and Tournay. He had a considerable share in defeating the French at Malplaquet, where his coat, hat, and peruke were pierced by musket balls. On the change of ministry in 1710, the duke was appointed commander-in-chief in Spain; but having been seized with a violent fever, and disappointed of supplies through the treachery and mismanagement of the government, he returned home. He denounced the conduct of the ministry in his place in the house of lords, and was in consequence deprived of all his employments. On the fatal illness of Queen Anne in 1714, the duke repaired uninvited to the council board, along with the duke of Somerset; and by his presence and prompt measures completely disconcerted the plot of Bolingbroke and his Jacobite accomplices, for the restoration of the Stuarts. On the accession of George I., the important services which the duke had rendered to the protestant succession were not overlooked, and he was made groom of the stole, and commander-in-chief of the forces in Scotland. When Mar induced the Highlanders to take up arms in 1715, Argyll, who was now esteemed, after Marlborough and Stair, the greatest British commander of his day, was despatched to Scotland for the purpose of suppressing the rebellion. The number of regular troops placed under his command was altogether inadequate; but by prompt and vigorous measures, he succeeded in raising a large body of volunteers for the protection of the country south of the Forth. After a long and ruinous delay at Perth, Mar, who was utterly incompetent for the task he had assumed, set out on his march towards the south; but his progress was arrested by Argyll, who led his forces out from Stirling, and gave battle to the Highlanders at Sheriffmuir, near Dunblane, 13th November, 1715. After a brief but sharp struggle, the left wing of both armies was defeated, and both generals in consequence claimed the victory. But all the advantages of the contest remained with Argyll. He returned triumphant to London, and at first stood high in the favour of the king; but in a few months he was deprived of all his offices in consequence, it was generally believed, of the moderation of his counsels, and the humanity he had exhibited in the hour of victory. The government soon became sensible of the blunder they had committed, in affronting a nobleman so powerful and popular, both in the Highlands and Lowlands of Scotland; and in 1719 he was appointed lord-

steward of the household, and created duke of Greenwich. During the ministry of Walpole the government of Scotland was virtually intrusted to the duke and his brother, Lord Hay. His influence as a statesman was great, both in the senate and the cabinet, and was, no doubt, increased by his vast authority as a highland chieftain. He did not hesitate to risk the favour of the court, and to incur the loss of his places, by opposing whatever measures he considered injurious to the country; and his defence of the privileges of the Scottish capital on the occasion of the Porteous mob, gave great offence to Queen Caroline, who acted as regent in the absence of George II. on the continent. He spent the last three years of his busy and useful life in retirement, and died in 1743, in the sixty-fifth year of his age. A monument, executed by Roubillac, has been erected to his memory in Westminster abbey, and Pope has paid a beautiful and well-known tribute both to his public and domestic virtues.—His brother, ARCHIBALD, earl of Hay, who succeeded him in the dukedom, was born in 1682. He at first studied law at Utrecht, but afterwards adopted the military profession, and served for some time under the duke of Marlborough. He was one of the commissioners for treating of the Union, and, after it was completed, was chosen one of the Scotch representative peers in the first parliament of Great Britain. When the rebellion broke out in 1715, he took up arms in defence of the reigning dynasty, and was wounded at the battle of Sheriffmuir. He was appointed keeper of the privy seal in 1725, and the great seal was held by him from 1734 till his death in 1761. He was for many years intrusted with the management of Scottish affairs, and had almost unbounded influence among his countrymen. The duke was as much distinguished for his literary accomplishments as for his political talents and experience, and had collected one of the most valuable libraries in Great Britain.

\* CAMPBELL, GEORGE JOHN DOUGLAS, eighth duke, born in 1823, is distinguished both as a statesman and a man of letters. He succeeded his father in 1847, was appointed lord-privy-seal, January, 1853, and held the office of postmaster-general from November, 1855, till the overthrow of Lord Palmerston's administration in 1858. The duke is hereditary master of the queen's household in Scotland, and hereditary sheriff of Argyleshire. He was elected chancellor of the university of St. Andrews in 1851, and rector of the university of Glasgow in 1854. He is the author of "An Essay on the Ecclesiastical History of Scotland since the Reformation," and of several pamphlets on church questions.—J. T.

Besides the ducal house of Argyll, several branches of the clan Campbell have been elevated to the peerage. The most powerful and noted of these is the Breadalbane branch, which sprang from Sir Colin Campbell, second son of Sir Duncan of Lochawe, who was created by James II. Lord Campbell of Argyll.

CAMPBELL, SIR JOHN, of Glenorchy, the first earl of Breadalbane, acted a conspicuous part in public affairs at the period of the Revolution. In 1690 he was employed by the government to treat with the Jacobite chiefs, and was intrusted with the sum of twelve or fifteen thousand pounds to distribute among them, with the view of attaching them to the interest of King William. When afterwards asked to account for the money, he answered—"The Highlands are quiet, the money is spent, and that is the best way of accounting among friends." Though he had sworn allegiance to William and Mary, he took a leading part in Montgomery's plot for the restoration of James; and the Jacobite chiefs affirmed that he advised them to give in their adherence to the new government for the present, but to hold themselves in readiness to take up arms for James when he should call upon them to do so. On this charge he was for some time committed to prison. The earl was deeply implicated in the massacre of Glencoe; and was the only one of the perpetrators of that atrocious deed who had any personal ends to serve by the extermination of the Macdonalds. He was at once cruel, treacherous, and venal; and is described by Mackay as being "grave as a Spaniard, as cunning as a fox, as wise as a serpent, and as slippery as an eel."—(Macaulay's *History of England*, vol. iv.)—J. T.

CAMPBELL, ALEXANDER, D.D., the founder among the Baptists of the United States of America of a new sect, called after himself Campbellites, died at New Orleans in 1855, aged sixty-three. He edited a monthly journal named the *Millennium*

*Harbinger*, in which he expounded and advocated his peculiar views. The new sect prevails chiefly in the western states, and its chief peculiarities seem to be a renunciation of all creeds, and some original doctrine respecting the millennium. In 1850, according to a very careful estimate made for the Baptist Almanac, the sect numbered nearly 2000 churches, 848 ministers, and over 118,000 communicants.—F. B.

CAMPBELL, SIR ALEXANDER, a distinguished British officer, born in Perthshire in 1759. He was sent to India in 1793 with the 74th regiment, and served there for fourteen years, rising in 1802 to the command of the northern division of the Madras army, and being appointed, when Sir Arthur Wellesley left the East, to succeed him in the command of Seringapatam, Mysore, and all Tippoo's dominions. He next served in the peninsular war, winning special distinction as the leader of the right wing of the British army at the battle of Talavera, where he was severely wounded. He was made a baronet in 1815. In 1820 he was appointed commander-in-chief at Madras, and died at Fort St. George in 1824.—J. B.

CAMPBELL, ARCHIBALD, a Scottish prelate, a descendant of the Argyll family, was consecrated in 1711, and in 1721 elected by the clergy of Aberdeen to be their bishop. Along with Bishop Gadderar, he represented his brethren in Scotland in the negotiations entered into at that period, for the union of the Greek church in Turkey and Russia with the nonjuring episcopalians of England and Scotland. These negotiations were broken off by the death of the czar, Peter. Bishop Campbell died in London, having a considerable time before his death resigned his office at Aberdeen.—J. B.

CAMPBELL, SIR ARCHIBALD, Bart., G.C.B., &c., a meritorious and most distinguished British officer, descended from the Campbells of Glenlyon. The military profession having been almost hereditary in his family, he entered the army in 1787. The following year he embarked for India, where he remained till 1801, and was actively employed in the Mysore, and against Tippoo Sultan. In 1808 he embarked for Portugal, and served with great distinction both under Sir John Moore and Wellington; and was present at nearly all the great battles and sieges in the Peninsula. After the downfall of Napoleon, Sir Archibald was appointed by the prince regent of Portugal to the command of a division of his army, with the rank of major-general. He returned home in 1820, and soon after sailed for India as colonel of the 38th regiment. At this juncture war broke out with the Burmese, and Sir Archibald, on his arrival in India, was appointed to the command of the expedition against Rangoon, the principal seaport of Burmah. He anchored off that place on the 10th of May, 1823, and captured it in twenty minutes after the landing of his troops. The enemy assembled an army of nearly 60,000 men, with 300 pieces of cannon, while the British troops did not exceed 6000. A series of engagements followed, in every one of which the Burmese were defeated with great slaughter, and ultimately compelled to make peace on terms dictated by the British. Sir Archibald was rewarded for his brilliant and important services with the thanks of the governor-general and of the two houses of the British parliament, along with a pension of £1000 per annum. He returned to England in 1829, and in 1831 he was created a baronet, and appointed lieutenant-governor of New Brunswick, an office which he held for ten years. In 1839 he was offered and accepted the appointment of commander-in-chief in Bombay, but was soon after compelled by ill health to resign the office. He died at Edinburgh in 1843.—SIR JOHN CAMPBELL, his son, born in 1807, was also a general in the British army, and fell at the siege of Sebastopol, 18th June, 1855, in the unsuccessful attack on the Redan. His loss was deeply deplored, and his kindness and courtesy, not less than his brilliant courage, endear his memory to all who knew him.—J. T.

CAMPBELL, COLONEL ARTHUR, born in Augusta county, Virginia, in 1742; died in Knox county, Kentucky, in 1815. When only fifteen years old he was captured by the Indians, and carried into the wilderness near the great northern lakes, where he was protected by a chief who adopted him as a son. He staid with them three years, during which time he learned their language, joined in their excursions, and adopted their habits. Then he made his escape; and after travelling several hundred miles through the forests, obliged to make long circuits to avoid the Indian encampments, he reached the outposts of the English army, and thence regained his home. In the war

of the revolution he took the popular side, attained the rank of colonel, and saw considerable service. He also had a seat in the Virginia assembly, and assisted in forming the constitution of that state.—F. B.

CAMPBELL, COLIN, an architect, a native of Scotland, who published between 1715 and 1725 a series of architectural designs named "Vitruvius Britannicus." Two supplementary volumes were published in 1767 and 1771 by Gandon and Woolfe. Mr. Campbell was surveyor of the works at Greenwich hospital, and died about 1734.—J. B.

CAMPBELL, SIR COLIN. See CLYDE.

CAMPBELL, GEORGE, D.D., one of the most distinguished theologians of Scotland, was born at Aberdeen in December, 1719. He received his education at the grammar school in that town, and afterwards attended the literary classes in its university. The profession which he originally chose, or which was chosen for him, was that of the law; and he was regularly articulated to a clerk or writer to the signet in Edinburgh. Before the expiry of his apprenticeship, however, he had formed the resolution of quitting the law for the church, and with that view resumed his attendance on the classes necessary to prepare him for being licensed as a preacher during the continuance of his legal engagements. In the year 1746 he received license at Aberdeen, and two years afterwards was appointed to the charge of Banchory-Ternan, a country parish upon the Dee, about twenty miles above Aberdeen. He remained there eight years, quietly prosecuting his studies and discharging his pastoral labours. It was during that period, and about the year 1750, as we learn from his own prefaces, that two of the works by which he subsequently became most favourably known were begun—his "Philosophy of Rhetoric," and his "Translation of the Gospels." In 1757 he was promoted to one of the city charges in Aberdeen; and in 1759 he was made principal of Marischa college. In 1760 he preached a sermon before the synod of Aberdeen, in which he vigorously grappled with the well-known argument of Hume against miracles. He was requested by the synod to publish the discourse; but he wisely preferred throwing it into the form of a treatise, which afforded greater scope for doing justice to the subject. The manuscript in this form was transmitted to Dr. Blair, for the purpose of being submitted to Mr. Hume; and it appeared before the public in 1763, with the letter written by Hume on its perusal. This was Dr. Campbell's first publication, and it has always been regarded as one of his best. In 1771 Dr. Campbell was appointed to the chair of divinity and church history in Marischa college, and on accepting this appointment he resigned his parochial charge. In 1777 he published a sermon preached before the Society for Propagating Christian Knowledge, on the "Success of the first Publishers of the Gospel, considered as a proof of its Truth." The argument for christianity on this ground has, perhaps, never been within a short compass more clearly and happily put. Several other productions of a smaller kind proceeded at intervals from his pen, which it is unnecessary to specify here. In 1776 he published his "Philosophy of Rhetoric," a work which fully sustained his reputation, and which is characterized by Archbishop Whately, in the introduction to his treatise on rhetoric, as the most important that had been produced on the subject in modern times, for "depth of thought and ingenious original research, as also for practical utility to the student." His largest, and in various respects his greatest work, was his "New Translation of the Gospels," accompanied by preliminary dissertations on the language and more peculiar phrases of the New Testament, and with critical notes on the portion translated. It made its appearance in 1778. In many important respects the work on the gospels is far superior to any production of the period, and is still deserving of careful perusal. Dr. Campbell lost his wife in 1792, and his own death took place in 1796. They died without issue. His lectures on church history, and those also on divinity and the composition of discourses, were published after his death. A uniform edition of Dr. Campbell's works has been published by Tegg & Co., London, in six 8vo. vols.—P. F.

CAMPBELL, GEORGE W., born in Scotland about 1768; graduated at Princeton college in America in 1794. At one period he was judge of the United States district court in Tennessee. From 1803 to 1809 he was a representative in congress from the same state; and during the last two years of this term he held the important post of chairman of the

committee of ways and means. From 1811 to 1814, and again from 1815 to 1818, he was a senator in congress. During the interval between these two periods, he was secretary of the treasury under President Madison. In 1818 he was appointed minister-plenipotentiary to Russia, and remained abroad for two years. The latter part of Mr. Campbell's life was spent in retirement. He died at Nashville, Tennessee, in 1848.—F. B.

CAMPBELL, SIR ILLAY, president of the supreme court of Scotland, born in 1734, was the son of a writer to the signet in Edinburgh. He became a member of the bar in 1757. One of the first circumstances to bring him into notice was his employment in the famous Douglas case, and in time he acquired a very extensive practice. His merits as a counsel were, sagacity, clearness, great ingenuity in argument, and the possession of a widely extended knowledge of law. In 1783 he was appointed solicitor-general, and in the following year lord-advocate, when he was returned to parliament as member for the Glasgow burghs. The disadvantages he laboured under—of a monotonous voice and inexpressive features—were such as to prevent his ever becoming a favourite speaker in a popular assembly. He was not, however, altogether without reputation beyond the walls of the court, for he received the honour of being elected lord rector of the university of Glasgow. On the death of Sir Thomas Miller of Glenlee, Lord-advocate Campbell was appointed president of the court; and, until his resignation in 1808, he discharged the duties of the office with diligence and eminent success. He was liberal and patient, treating every one with respect and courtesy. As judge he took in general a firmer and a wider grasp of any question than his compeers; and he was one of the few lawyers of that day who were thoroughly acquainted with the principles of mercantile law—a circumstance especially fortunate for the rising commercial prosperity of Scotland. The kind encouragement he gave to the younger members of the profession was long gratefully remembered. Cockburn and Bell have borne witness to it; and the late Lord-justice-clerk Hope was wont to refer with admiration to “that great lawyer, Sir Ilay Campbell.” When in 1808 the court of session was so remodelled by the legislature as to be almost a new institution, two courts of more manageable numbers being formed in place of the ancient unwieldy council of fifteen, Campbell resigned the presidency, and left the introduction of the new system to younger men. On retiring he was created a baronet. He still, however, devoted much of his time to the service of the public, as chairman of two commissions which were successively appointed for the improvement of the law of Scotland. He died in 1823, at a very advanced age. The only writings he published were one or two tracts upon law reform, and a collection of the rarer “acts of sederunt.”—J. D. W.

CAMPBELL, JOHN, an eminent historical and political writer of the last century, was born at Edinburgh in the year 1708. His mother, who was an Englishwoman, took him with her to England when he was five years old, and settled at Windsor, from which time he never saw Scotland again. He was intended for the law; but having a strong predilection for a literary career, he did not long continue his legal studies. In 1736 he published the “Military History of Prince Eugene and the Duke of Marlborough.” Several other works issued anonymously from his fertile pen before the year 1742, in which appeared his “Lives of the English Admirals,” the first of his writings to which he prefixed his name. In 1743 he published a curious pamphlet called “Hermippus Revived,” founded upon a foreign publication of the same name. Its ostensible and apparently serious object was to prove the possibility of prolonging human life indefinitely, by the inhalation of the breath of young girls; and great learning and ingenuity are expended on the illustration of this thesis. But the writer afterwards confessed that his real purpose was to rival the celebrated Bayle, by showing that neither the serio-comic style of writing, nor recondite and curious learning, were confined to the French side of the Channel. In 1745 he began to write for the *Biographia Britannica*, and continued his contributions to it for several years. His articles are written in a tone of the utmost impartiality, and err, if at all, on the side of too indiscriminate eulogy. In 1754 the university of Glasgow rewarded his untiring literary industry by conferring on him the degree of LL.D. His last work of importance, published in 1774, was entitled “A Political Survey of Britain, being a series of reflections on the situation, lands, inhabitants, rivers, colonies, and

commerce of this island.” Though his habits were extremely sedentary, his manner of life was so regular and abstemious that his health remained good up to the latest period of his life. In March, 1765, he was appointed his majesty's agent for the province of Georgia. He died in December, 1775, at his house in Queen Square, Ormond Street, London. His style, though correct, is diffuse and unimaginative, to a degree that borders on tediousness. His literary industry brought him large profits, so that Dr. Johnson could say of him—“He is the richest author that ever grazed the common of literature.”—T. A.

CAMPBELL, JOHN, served as master's mate on board the *Centurion*, under Lord Anson, in his famous voyage of discovery. On his return to England he was speedily advanced, and we find him as flag-captain in the *Royal George*, under Sir Edward Hawke, taking a prominent part in the memorable defeat of the marquis de Conflans in 1759. He was honoured to bear to England the news of the victory. In 1782 he was appointed governor of Newfoundland, and in 1787 advanced to the rank of vice-admiral of the red. He died in 1790.—J. B.

CAMPBELL, JOHN, an independent minister at Kingsland, and author of “Travels in South Africa,” was born in Edinburgh in 1766. He took an active part in establishing the British and Foreign Bible Society, and on two different occasions, 1812–15 and 1818–21, visited the stations of the London Missionary Society in South Africa, publishing accounts of both voyages. Mr. Campbell wrote chiefly for the young. He died in 1840.

CAMPBELL, JOHN, Lord-chancellor of England, and at one time Lord-chancellor of Ireland, was the second son of the Rev. Dr. Campbell, minister of the first charge in Cupar-Fife. He was born at Springfield in 1779, and died in 1861. His eldest brother, Sir George Campbell, made a successful career in India; and during his latter years he lived in easy retirement at Edenwood, near his native town, performing independently, and with superior intelligence, the various duties of a Scottish country gentleman.—John thought at first of the Scottish church as a field of useful and honourable exertion; but finding some incongeniality between that profession and his own nature, he repaired to London and enrolled himself in 1800 at Lincoln's inn. Occupying his leisure as reporter for the *Morning Chronicle*, a course which also fed his then not over-copious pecuniary resources, he sedulously pursued his legal studies, and was called to the bar in 1806. There is no doubt that young Campbell had to struggle hard, and needed all the courage and perseverance belonging to him. But his clear head, full knowledge, and well-known resolution ultimately made way, and he rose gradually but surely to a large practice. His early history was one of stern and continuous battle, in which one inch was gained to-day and two on the day following. In that battle, the strongest of course overcame at last. In 1827 Campbell received his silk gown—but for the injustice of Lord Eldon, he would have had it a number of years sooner. Shortly afterwards Campbell entered on political life, and was elected in 1830 member of parliament for Stafford. He bore his part so well in the great struggle of 1830 and 1831 in the matter of the Reform Bill, that Lord Grey selected him for the important office of solicitor-general in 1832: in 1834 he had risen to the office of attorney-general. With a brief interval, during Sir Robert Peel's short tenure of office, he occupied this high office—latterly under Lord Melbourne—until 1841, when he became lord-chancellor of Ireland. Meanwhile, Campbell had changed his constituency from that of Stafford to that of Dudley, and his countrymen subsequently did him the honour to elect him a representative of the city of Edinburgh. Campbell was always listened to with interest in the house of commons. Orator, in the usual sense of the word—in the sense, for instance, in which it is applied to Lord Brougham—he certainly was not, and never aspired to be; but his speaking was clear, and his arguments always consequent and often cogent. He knew distinctly what he meant to say, and he said it plainly and precisely. After a brief tenure of the seals in Ireland he took his seat in the house of peers. On the return of the whigs to power in 1846, he became chancellor of the duchy of Lancaster, and on the retirement of Lord Denman he succeeded him as lord-chief-justice. In June, 1859, he was elevated to the woolsack. Lord Campbell's reputation at the bar was that of a man of full knowledge of his subject, and who, withal, was acute and resolute as a pleader. He had the conduct of many important cases, such as the famous plea of *Norton v. Lord Melbourne*; the case of *John Frost* for high

treason; that of *Lord Cardigan* for murder, before the high court of Peers; and he has collected a few of his addresses into one volume. They are eminently characteristic of his peculiar powers.—As a member of the house of commons, as well as subsequently in his place as a peer, Lord Campbell was a zealous law reformer in the true direction; nor do we know any address containing sounder principles on this subject than the one he pronounced before the bar of Ireland previous to his leaving Dublin. Law reform seems the most difficult of all. Lord Campbell was thwarted too frequently by the formidable obstructions thrown in his way by the profession. As a judge his lordship had the highest repute. His acuteness was never at fault. The charge to the jury in the difficult case of the murderer Palmer, will be long remembered. That charge and the speech of the attorney-general, Sir Alexander Cockburn, are probably as fine pieces of clear reasoning as were ever pronounced in an English court of justice.—He also amused his leisure hours by occupying himself with literary pursuits. We owe to him seven volumes of "Lives of the Chancellors of England," and three volumes of "Lives of the Chief-Justices." All these memoirs are most pleasantly written. They present in an agreeable form, traditional anecdotes, and the usually-received characters of the personages of whom he writes.—His lordship married a daughter of Mr. Scarlett, afterwards Lord Abinger.—J. P. N.

CAMPBELL, JOHN, D.D., a leading nonconformist divine, who was long editor of the *Christian Witness* and *British Standard*, and minister of the Tabernacle in London. His early career somewhat resembled that of Elihu Burritt, both in his original position, and in the indomitable energy and perseverance with which he prosecuted his studies. But Dr. Campbell enjoyed the advantage of attending the university of St. Andrews—the senatus of which showed their estimate of his talents and acquirements by conferring upon him in 1841 the degree of D.D. Dr. Campbell rendered most important services to the cause of religion and social progress; and to his unwearied exertions the virtual abolition of the obnoxious bible monopoly in England is mainly to be attributed. He wrote "Maritime Discovery and Christian Missions;" "The Martyr of Erromanga, or the Philosophy of Missions, illustrated from the labours, life, and character of the late John Williams;" "Jethro," a prize essay on the diffusion of the gospel among our home population; "Theology for Bible Classes;" "Church Fellowship," &c. Dr. Campbell died in March, 1867.—J. T.

CAMPBELL, SIR NEIL, a distinguished British officer, born about 1770. After serving in the West Indies and the Peninsula, he was in 1813 appointed to serve in connection with the Russian army, to which he was attached till its entry into Paris in March, 1814. In April of that year he was sent by the British government to accompany Napoleon from Fontainebleau to Elba, and charged to remain as long as the presence of a British officer should be deemed necessary. He was away from the island for eleven days, when Napoleon left it, 26th February, 1815. Toward the close of that year Sir Neil was appointed to prosecute Mungo Park's discoveries on the Niger. In the summer of 1826 he was sent to Sierra Leone, but fell a victim to the noxious climate in the following year.—J. B.

CAMPBELL, SAMUEL, Colonel, an American officer, was born in Londonderry, New Hampshire, in 1738, and removed with his father in 1745 to Cherry Valley in New York, then a frontier settlement. Though very young, he was in military service in the "old French war," that of 1756; and in the revolutionary contest he commanded a body of militia, and had a share in most of the battles fought on his portion of the frontier. When General Herkimer advanced to relieve Fort-Schuyler, then besieged by the tories and Indians, Campbell was his subordinate, and took part in the terribly destructive battle of Oriskany. He was present also when the Indians and loyalists surprised Cherry Valley, and subjected it to nearly the same fate as Wyoming. His house was then burnt, his lands ravaged, and his wife and all his children, except his eldest son, carried off into captivity. They were finally brought to Montreal, where Mrs. Campbell was exchanged for the wife of Colonel John Butler, and the children also were redeemed. After the peace he was elected to the legislature, where he was a zealous member of the republican party. He died in 1824.—F. B.

CAMPBELL, THOMAS, the youngest son of Alexander and Margaret Campbell, was born in Glasgow on the 27th of July, 1767. His father, a retired Virginia merchant, then in his

sixty-eighth year, fondly predicted, it is said, that the "son of his old age" would grow up to be an honour to his country; and he had the happiness to see his prediction fulfilled. The child evinced a precocity of intellect from his very cradle, and when sent to the grammar school, attracted the special notice of his master, and took the lead in every class. These indications of genius were the delight of his home circle, where his father, careful to foster a literary taste, was still more so to imbue his infant mind with the practical lessons of early piety. When eleven years old—and the fact deserves mention from the influence it had upon his opening mind—the boy was sent to recruit his health in the country; and there the latent germ of poetry first began to assert its vitality. At the age of thirteen he entered the university, and gained several prizes, which lured him on to higher attainments. His curriculum, extending over six college sessions, was distinguished by a long series of literary competitions, in which he carried off the chief prizes in Latin, Greek, Logic, and Moral Philosophy. He excelled in translations from the Greek drama, and was so much commended for his English essays, chiefly poetical, that he was called the young "Pope of Glasgow"—a title which proved to be no great misnomer. During a college recess which he passed in the Isle of Mull, he translated the *Chœphoræ* of Æschylus, and there also—what appears to have given specific direction to his taste—he read the *Pleasures of Memory*, by Rogers. The perusal of that poem quickened all his literary aspirations. It was the magic key that unlocked the fountain of his genius: the sparkling waters gushed forth, and the first idea of "the Pleasures of Hope" took possession of his mind. Once suggested, the theme was soon reduced into shape; and, though often interrupted, it was never laid aside until he had given it to the public in its present form. Returning from the "lonely Hebrides," he supported himself at college by private tuition, living, so to speak, out of his inkstand. Though still a mere youth, he was a keen politician, a ready speaker at the debating club, looked upon with deference by his companions, and quoted in knotty points as a "competent authority." But all the honours he had gained—all the praise lavished upon him by his teachers, had only, as he complained, diverted his attention from other and more profitable studies. Poetry had expelled mathematics; a string of idle fancies had strangled the lessons of worldly prudence. He felt he had no social standing, no means of improving his circumstances, and no prospect of acquiring the independence for which he longed. With these melancholy reflections, he accepted the office of a domestic tutor, and retired with his pupil to the banks of Loch Fyne. The fair face of nature, and the first sight of the hills, soothed and tranquillized his spirit; and, calling in the muse to his aid, he was soon himself again, and deep in poetry. There he wrote "Love and Madness," "Caroline," numerous epistles to friends, and added another and another episode to "the Pleasures of Hope."

In November, 1788, at the age of twenty, he arrived in Edinburgh. His manuscript poem was read and approved by Dr. Anderson, then offered to the booksellers, and finally sold to "Mundell and Son" for sixty pounds in money and books. It was a fortunate speculation. No sooner was it published than the juvenile author was hailed as a new light on Parnassus. At one flight, it was said, he had taken his place with the first poets of the age, and the high estimate of his private friends was soon confirmed by the voice of public admiration. While the tide of popularity was at its height, the youthful poet embarked for Germany, landed at Altona, wrote his "Exile of Erin," and letters to the *Morning Chronicle*, and then proceeding forward to the seat of war, spent several months at Ratisbon. There he was a spectator of several grand military operations, and witnessed a hot conflict between Austrian and French hussars, which suggested "the Battle of Hohenlinden," "the Soldier's Dream," and other spirited lyrics.

In the spring of 1801, after being chased ashore by a French privateer, Campbell arrived in London, and at the table of Mr. Perry made the acquaintance of many literary magnates, who became his attached friends through life. Suddenly called home by the death of his father, he spent the remainder of the year with his widowed mother in Edinburgh, where he published "Lochiel's Warning, and other Poems." The following spring he returned to London in his new capacity of private secretary to Lord Minto, who introduced him to the leading men of the day.

In September, 1803, he married his cousin, Miss Matilda Sinclair, a lady of refined taste and personal beauty; and with "fifty pounds in his writing desk," and the prospective "fruits of literary engagements," he sat down to work with a "happy and contented mind." But with a continual round of visitors, letters, cards, invitations, appeals to the author of "the Pleasures of Hope," which deranged all his plans, he was soon compelled to retreat from Pimlico to a cottage on Sydenham heath. There he found quiet congenial friends, who honoured his talents, and united their efforts to promote his welfare. This was the happiest period of his life. With his busy forenoons in town and studious evenings at home, he made literature a staff on which he could lean with comfort. His familiar letters of that period exhibit the poet and his little household in a very amiable and engaging light.

In 1806 the king was graciously pleased to grant him a literary pension of £200 a year. Three years later appeared his "Gertrude of Wyoming;" "O'Connor's Child;" "Battle of the Baltic," and other poems, which had their full share of popularity. He then wrote a course of lectures on poetry, which he read at the Royal Institution, edited Specimens of British Poets, and lectured in the provinces. But at length, in losing his favourite child, he appeared to have lost all his health and energy; and then acting upon professional advice, he struck his tent, packed up his books, and removed to a house near Hyde Park. There he undertook the editorship of the *New Monthly*, which he conducted for many years, making it the vehicle of numerous articles from his own pen, both in prose and verse. His house was the evening resort of a brilliant literary circle. He was identified with every scheme of public and private benevolence, a friend and promoter of talent in every department, and charitable often to excess. He was the avowed champion of the Poles, of all "patriots" and "refugees;" and never was literary championship more vigorously sustained. He founded the London university, visited the public schools of Germany on its behalf, and reported to his colleagues on the Prussian system of education. He founded the Association of the Friends of Poland, and the Literary Club, and gave lectures for public charities on various occasions.

In November, 1826, he had the "crowning honour" of being chosen lord-rector of his native university, a "sunburst of popular favour," as he expressed it, which was repeated a second and a third time, and acknowledged on his part by singular devotedness to the duties of his high office. His "Letters to the Students of Glasgow," published in his magazine, were much read and commended at the time as models of classical taste and composition. After the publication of his new poem, "Theodoric," he undertook a life of Mrs. Siddons, the queen of tragedy, whom in 1814, in company with John Kemble, he had attended on her visit to Paris. Having completed this task—a dying bequest—he went abroad, where he was publicly feted in Paris as the "Champion of Poland—the Poet of Freedom—the Friend of Mankind;" and with these plaudits ringing in his ears he embarked for Africa, and spent the winter in Algiers. The results of that tour were published in his "Letters from the South." On his return home through Paris he was graciously received and complimented by Louis Philippe upon his lucid report of Algiers and the regency. The next works to which he gave his name were a life of Frederick the Great, a life of Petrarch, and a new edition of Shakspeare, with introductory notes and comments, which furnished him with pleasing occupation, but neither advanced his fame nor improved his income. He was then in delicate health; but a summer tour in the Highlands set him up, and brought under his notice materials for a new poem, which he published with the ominous title of "Glencoe!" Its reception by the public was not very flattering. The bursts of applause which had followed and cheered him through forty years of his poetical life, now fell on his ear with a fainter and fainter echo. He had lived in the society of warm hearts—in times of great excitement—in the sunshine of popularity. But most of his old friends were now departed, and he looked anxiously around for something which neither fame nor friendship itself could bestow. "When I think," he said, "of the existence that shall have commenced when the cold stone is laid over my head, what can literary fame appear to me but as vanity—as nothing!" But he consoled himself with the conviction that he had never written a line to countenance infidelity, nor to lower the standard of christian morals.

The last beautiful edition of his poems, illustrated from drawings by Turner, soon reimbursed him for the heavy outlay, and during his latter years brought him a handsome annuity. This, with his pension and several legacies bequeathed to him by his friends, Telford and others, might have rendered him quite independent of "literary drudgery." But his practical benevolence, acting as a continual drain upon his resources, involved him in difficulties, from which the more wary and calculating are generally exempt. At his farewell breakfast given in London, Rogers, Moore, Milman, and two or three intimate friends, were his guests. The party was cheerful; and during this act of hospitality his wit and humour played gracefully round the table. But it was painfully evident that these momentary flashes were but the fitful lights that often precede the hour of sunset. In a few months he parted with his house at Pimlico, and took the lease of an old family mansion in Boulogne, not far from that in which Le Sage and also the poet Churchill had expired. It was a rash step, the result of a needless panic, and the change was rapid. His health broke down, his pen was laid aside, all literary speculations were abandoned, and with a "forecast" that his time was come, he took to his bed—never again to leave it until removed in his coffin to Westminster abbey. On the 15th of June, 1844, at a quarter past four in the afternoon, he entered, by a calm and painless transition, into a new state of existence.—*Hoc erat luctuosum suis, acerbum patriæ.*—All necessary arrangements being concluded, the poet's remains were embarked at midnight on the 27th June, conveyed to London, and then to the "Jerusalem chamber" in the abbey (where the body of Addison had lain), there to wait the ceremony of interment. On the 3rd of July the funeral procession moved to Poets' Corner. The pall was supported by eight peers of the realm, headed by the duke of Argyll, while the sublime service for the dead, chanted by the choir, and responded to by the deep-toned organ, produced an effect of indescribable solemnity. At the moment the coffin was lowered, and while the Reverend Dean Milman pronounced the words—"Dust to dust, ashes to ashes"—Colonel Sczyrna, heading a deputation of Polish nobles in deep mourning, took from his breast a handful of dust, brought from the tomb of Kosciusko, and with a trembling hand sprinkled it over the poet's coffin. This delicate token of respect and affection to him who had been emphatically "the exiles' friend," drew tears from many eyes, and formed an appropriate close to the solemnities of the day.—A fine classic statue of Campbell, by Marshall—on a pedestal, presented by Mrs. Roylance-Child, now faces that of Addison in Poets' Corner, and occupies one of the best sites in Westminster abbey.—W. B., L.

\* CAMPBELL, WILLIAM HUNTER, a Scotch botanist, was born at Edinburgh about the year 1815. He prosecuted the study of law, but devoted much time to botany, and made many excursions in Scotland. He was one of the originators of the Botanical Society of Edinburgh, and acted as its first secretary. He now occupies an important judicial office in Georgetown, Demerara, the government of which lately appointed him, along with two others, to explore a route by the rivers Waini, Barama, and Cuyuni to the goldfields of Caratal, and thence by Upata to the river Orinoco. The report was presented by him in December, 1857. His collection of plants, which contains numerous Indian species, has been handed over to the herbarium of the university of Edinburgh. He is an LL.D. of King's college and university, Aberdeen.—J. H. B.

CAMPE, JOACHIM HEINRICH, a distinguished German educator and author, was born at Deensen, duchy of Brunswick, in 1746, and studied theology at the universities of Helmstedt and Halle. Attracted and inspired by the educational reform then everywhere in progress, he engaged with no less zeal than ability in the work of education. He accepted a mastership which was offered him in the Dessau philanthropinum, and was soon raised to be one of its directors. His love of independence, however, induced him to establish an academy of his own at Trittow, near Hamburg, which his feeble health obliged him to resign some years after to one of his colleagues. In 1787 he was appointed scholastic councillor at Brunswick, and there superintended a thorough reform of schools and scholastic affairs. At the same time he purchased the so-called "Schulbuchhandlung," which, chiefly by the publication of his own works, he raised to a highly flourishing state, and after his death bequeathed to his son-in-law, Mr. Vieweg. He died in 1818. His works

take a high rank in German literature, and for their exquisite morals, as well as their purity and elegance of style, will always be held in great esteem.—K. E.

**CAMPEGIO** or **CAMPEGGI**, **LORENZO**, Cardinal, was born at Milan in 1474. He first followed the profession of law, but having entered the church, he rose to various positions of honour. Created cardinal in 1517, he was sent to England to induce Henry VIII. to join the confederation against the Turks. He was well received, and was created bishop of Salisbury; but failing to accomplish the object of his errand he returned to Rome. He was, however, sent back in 1527 as papal legate, to try the question concerning the king's divorce. He died at Rome in 1539. His letters have been published under the title "Epistolarum miscellanearum libri decem."—J. B.

**CAMPEN**, **JAMES VAN**, a Danish architect of the seventeenth century. His principal work was the re-erection of the Hôtel de Ville at Amsterdam, which had been destroyed by fire. He also built a palace for Prince Maurice of Nassau.

**CAMPEN** or **KAMPEN**, **JAN VAN DEN**, a learned Dutchman, born in 1490. He taught Hebrew for some time at Louvain, the labours of Reuchlin having directed his attention to that language. In 1521 he set out on a tour through Germany, Poland, and Italy, for the purpose of perfecting himself in the oriental tongues. He died of the plague in 1538. His paraphrastic exposition of the psalms has been translated into many languages.

**CAMPENON**, **VINCENT**, a French poet, born at Guadaloupe in March, 1772. He arrived in France at a time when the great revolution was on the point of breaking out, and seeing with disgust the indignities to which the royal family were exposed, was bold enough to express his feelings in a copy of verses addressed to the queen, Marie Antoinette, which appeared in an anti-revolutionary journal. The consequence was that he was obliged to fly to Switzerland, where he wrote a poem which proved to be so like Delille's *Trois Regnes de la Nature*, that, fearing to be set down as a plagiarist, he published some fragments only. These, however, were considered so beautiful, that on the death of Delille in 1813, the French Academy voted him worthy of succeeding to the place of one with whose genius his own was so perfectly in accord. Campenon purchased the favour of the emperor by an epithalamium on the occasion of his marriage with Maria Louisa, which did not prevent his becoming, on the restoration of the Bourbons, the king's private secretary. Besides poems and essays, he translated Robertson's *History of Scotland*, and contributed an essay on the life and writings of David Hume—prefixed to the *History of England*. He died in 1843.—J. F. C.

**CAMPER**, **PETER**, an anatomist and physician, born at Leyden on the 12th of May, 1722. His father, Florent Camper, was a clergyman, who numbered amongst his friends the celebrated Boerhaave, Gravesande, Musschenbrœck, and Moor; and in their society Camper imbibed his taste for science and the fine arts. He was instructed in drawing by Moor, and in geometry by Labordes. On entering the university of Leyden, he devoted himself to the study of medicine under Gaubius, Van Rooyen, the elder Albinus, and Trioen, under whom he soon rose to distinction. In 1748 he visited London, where he spent a year associating with Mead, Pringle, and Pitcairn, and where his taste for natural history was awakened by the cabinets of Sir Hans Sloane and Collinson, and the collections of Hill and Catesby. He successively filled the chairs of philosophy, anatomy, surgery, and medicine in the universities of Franeker, Amsterdam, and Groningen. His introductory addresses in these several departments were remarkable for their clearness, and the amount of information they evinced. He obtained prizes from many learned and scientific bodies, and was a member of most of the continental and English scientific societies. He was a fellow of the Royal Society of London, and also a foreign associate of the Academy of Sciences at Paris, being the only Dutchman except Boerhaave who had attained that honour. Camper died of pleurisy on the 7th April, 1789, in the sixty-seventh year of his age, leaving behind him the well-earned reputation of a distinguished anatomist and philosopher, and of an honest man. His works, as enumerated in the *Bibliography of Agassiz*, are thirty-seven in number, chiefly detached essays and papers. In his "Anatomical Demonstrations," he treats of the structure and diseases of the human arm, and of the human pelvis. He published also separate dissertations on the following subjects—on the sense

of hearing in fishes; on the physical education of children; on the origin and colour of negroes; on the signs of life and death in newborn children; on infanticide, with a project for establishing a foundling hospital; on the operation of lithotomy at two different times according to Franco's method. To the different learned societies his papers were numerous. Among the noticeable points in his works is the discovery of the presence of air in the bones of birds; his demonstration that the curvature of the urethra is greater in children than in adults; his remarks on the variation of the facial angle in different nations, and his osteological investigations into lost races of animals.—E. L.

\* **CAMPHAUSEN**, **LUDOLF**, a Prussian statesman, born in 1803. Camphausen was already well known as a public man when he took his seat in February, 1848, in the committee of estates at Berlin. On 29th March he became president of the council of ministers; but the restlessness of the democracy on one side and the immobility of the court on another, rendered his attempts at useful legislation abortive. After two years more of political life he returned to his banking-house at Cologne.—His brother, **OTTO**, born in 1812, is also well known in the political world for his moderate liberalism.

**CAMPHUYS**, **JOHANN**, was born at Haarlem in 1634; died in 1695. Camphuys was a common artizan when, at the age of twenty, he entered the service of the Dutch East India Company. Step by step he rose to the office of governor-general. This office, the highest which his countrymen in the east could aspire to, he held from 1684 till 1691, when he resigned. After this he lived near Batavia, his chief delight being in his fine flower garden.

**CAMPHUYSEN**, **DIRK THEODORE RAPHAEL**, a Dutch artist, born at Gorcum in 1586, painted under Diedric Goverts. He was most successful in small pictures of moonlight scenes decked with ruins—Rhine castles, peasant huts, and boats with figures, thinly painted, yet delicately and dexterously. Considerable doubt veils his history. He is reputed to have abandoned the fine arts for theology, at the age of eighteen, when he became a minister of the reformed church. Another account makes him occupy the position of tutor to the sons of Lord Nieuport, and afterwards the office of secretary to that nobleman. It is evident that his career is not very accurate in its drawing. "The pictures of Camphuysen," says Pilkington, "are scarce and dear." His death is said to have occurred in 1626.—W. T.

**CAMPI**, **BALDASSARE** and **MICHELE**, brothers, Italian botanists, lived during the first half of the seventeenth century. They were born at Lucca. They devoted themselves zealously to botanical science, and after studying the works of Dioscorides, and many of the older botanical writers, especially Arabian authors, they undertook excursions to the Alps and Pyrenees in quest of plants. Their conjoint works are treatises on balsam; on the true mithridatium; and on the cinnamon of the ancients. They were printed at Lucca, 1640–1669.—J. H. B.

**CAMPI**, **BERNARDINO**, an Italian painter, born at Cremona in 1522. He studied his art at Mantua, Parma, and Modena, and afterwards returned to Cremona, where he painted his enormous work in the cupola of St. Gismondi, representing an assemblage of the blessed of the Old and New Testament. His execution was wonderfully rapid; his skill in drawing the nude very great; and his composition and expression very powerful. He died about 1590.—W. T.

**CAMPI**, **GIULIO**. This artist was the son of Galeazzo Campi, a respectable painter of Cremona. He studied first under his father, and afterwards in the school of Giulio Romano at Mantua. His advance was great; and with facile execution, architectural knowledge, and considerable creative talent, he went to Rome to study the antique, and the works of Raffaele. For the glories of colour, he went to the pictures of Titian and Pordenone. He attained to no mean rank in his time, and was regarded as the founder of the school of his country. The church of St. Margaret at Cremona is crowded with his paintings. He died in 1572.—W. T.

**CAMPIAN**, **EDMUND**, an English Roman catholic who suffered death in the reign of Elizabeth, was born in London in 1540. Having won distinction at Oxford, he went to Ireland in 1568, and wrote a history of that country. Suspected of popery, he had to flee into England, and thence, in 1571, into the Low Countries, where, at the jesuits' college of Douay, he openly renounced protestantism. Admitted into the order of jesuits, he lived for some time at Bruie, then at Vienna, and then at

Prague, where he taught rhetoric and philosophy in a newly founded jesuit college. In 1580 he was sent into England, and made himself active, though living in retirement, in disseminating the principles of his faith. He published a work named "Rabsaces Romannus," which attracted considerable attention; and, unfortunately for Campian, came under the notice of Secretary Walsingham. His retreat in Berks was discovered, and he was conveyed to the Tower with this inscription on his hat—"Edmund Campian, a most pernicious jesuit." Suspected of being one of a band of plotters against the life of the queen, he was condemned for high treason, and hanged at Tyburn, 1st Dec., 1581. In addition to his "History of Ireland," he left several works, which, with the testimony of contemporaries, have won for him the reputation of an eloquent and subtle writer.—J. B.

CAMPISTRON, JEAN GALBERT DE, born at Toulouse in 1656; died in 1713. He is said to have found it convenient to leave Toulouse in consequence of a duel in which he was engaged. However this be, he is found in Paris in 1683, writing tragedies, instructed and patronized by Racine. His tragedies are mentioned with the doubtful praise, that the situations in his dramas are tragic, and the style is that of high comedy. Racine did something better for Campistron than encourage him to write dramas; he introduced him to the duke de Vendôme to conduct the representation of a drama at his chateau. The duke took a fancy to him, made him his secretary, and obtained for him some foreign orders, among others that of St. Jago of Spain. In 1701 Campistron became member of the French Academy. He was also member of the Jeux Floraux of Toulouse. In 1723 he died of apoplexy. The fit was brought on by a violent squabble with a chairman, who refused to carry him on account of his size and weight, he being "more fat than bard besemed." His "Theatre" has been often reprinted.—J. A., D.

CAMPO-BASSO, NICHOLAS, Count de, a celebrated commander of Italian mercenaries, lived in the latter half of the fifteenth century. He at first supported the interests of the house of Anjou in the kingdom of Naples, but afterwards transferred his services to their opponent, Charles the Bold, duke of Burgundy. By accommodating himself to the opinions, and pandering to the prejudices of that headstrong prince, he acquired great influence over his mind; and, in the end, availed himself of the confidence placed in him by the duke to sell him to his enemies, and ultimately to lead him to his ruin. While the duke was engaged in the siege of Nancy in 1477, on the approach of a superior force under Ferrand, duke of Lorraine, to relieve the place, Campo-Basso deserted to the enemy immediately before the armies joined battle. The Burgundians were in consequence defeated with great slaughter, and the duke himself was slain. The treacherous Italian was supposed to be not free from the guilt of his master's death, as the bodies of a number of his men were observed near the spot where the unfortunate prince was found killed and stripped the day after the battle.—(De Comines' *Chronicle*, book v. chap. 9, and Sir Walter Scott's *Anne of Geierstein*.)—J. T.

CAMPOMANÈS, PEDRO RODRIGUEZ, Count, born in the Asturias in 1723; died in 1802. Campomanès was early known as a profound jurist; and the study of political economy—to which attention had been then called, chiefly through the labours of Turgot—occupied his whole mind. In 1764 Charles III. appointed him fiscal-advocate of the council of Castile, an office similar to that of attorney-general in England. He had already published "Historical Dissertation on the Order of the Knights Templars," and a translation of the *Periplus of Hanno*, with notes, sustaining the authenticity of the work. This led to his being appointed a corresponding member of the French Academy, and on Franklin's nomination, he was made an honorary member of the Philosophical Society of Philadelphia. He was director of the Royal Academy of History at Madrid. The highest praise is given by Robertson, in his *History of America*, to two tracts of Campomanès, published in 1774 and 1775—one on the subject of the promotion of industry in Spain, the other on the education of artisans. Robertson speaks of the information to be derived from them on almost every point connected with the police, taxation, agriculture, manufactures, and trade of the country. The incidents of Campomanès' life are few, or have not been recorded. The wisest and best man of Spain during his time is chiefly known through his books. In 1763 and 1764 he published two memorials on the subject of finding employment for gipsies and vagrants; one on free trade in corn

in 1764; on provisioning Madrid in 1768; on the education of artisans in 1775; and in the next year, an elaborate appendix to this last work, containing a vast body of statistical information. This appendix was in four octavo volumes. In 1764 he published a valuable book on the nature of church property, and the subject of land held in mortmain, which was translated by order of the council of Venice into Italian. Campomanès was a man of considerable learning. In early life he published one or two tracts on philological subjects, and he translated from the Arabic a work on agriculture. His various essays on economic subjects were, for the most part, official reports, and were the basis of important legislation. The great object which was always present to his mind, and which he wished to inculcate, was, that Spain should place her chief reliance on the resources of the Peninsula itself, and seek to become, in a true sense, a portion of the European system. He sought to counteract the policy which referred everything to her transatlantic possessions. Campomanès was looked on with distrust by the ecclesiastical party. He was instrumental in the expulsion of the jesuits from Spain. Through the reign of Charles III. his power was almost unlimited, but did not long survive that monarch. On Bianca's coming into power early in the reign of Charles IV., Campomanès was dismissed, and lived in such retirement as to be almost wholly forgotten.—J. A., D.

CAMPSON. See CANSUH.

CAMUCCINI, VICENZO, one of the most distinguished Roman painters of modern times, was born about 1775. He first earned his living by copying the old masters. His earliest original works were historical paintings of prominent scenes in early Roman history, such as the "Infancy of Romulus and Remus;" "Horatius Cocles;" "The Death of Cæsar;" and "Death of Virginia." He painted in the classic style, so much in favour among modern Italians, and was rewarded with numerous honours. He was inspector-general of the papal museums, and of the mosaic works, keeper of the collections of the Vatican, director of the academy of St. Luke, and of the Neapolitan academy at Rome. A series of lithographs, by Scudellari, from his pictures, was published at Rome in 1829.—J. B.

CAMUS, ARMAND GASTON, at one time advocate to the French clergy, was born in 1740. Camus eagerly welcomed the Revolution, and was deputed to the states-general and the convention. He acquired great influence in the latter assembly, and proposed many of its most characteristic measures. It was he who drew up the "civil constitution of the clergy." He voted for the king's death, and was one of the famous deputations sent to Dumouriez whom that general handed over the lines to Cobourg. He lay in Austrian strongholds nearly three years. Camus retained his office of national archivist under Napoleon. Died in 1804.

CAMUS, CHARLES ETIENNE LOUIS, a mathematician and astronomer, was born at Cressy in 1699; died in 1768. He studied at Paris, and first distinguished himself in 1727, by an essay written for the purpose of obtaining a prize offered by the Académie des Sciences. The essay failed to obtain a prize, but nevertheless possessed such merits that it procured his admission as a member of the Académie. In 1736 he was sent with other astronomers to Norway, to determine the flattening of the earth towards the pole; and he was subsequently deputed on a similar work, the determination of the difference between the length of a degree of the meridian at Paris and at Amiens. The appointments of examiner in the schools of artillery, and professor of geometry, were afterwards conferred upon him. He was, for the last eight years of his life, perpetual secretary to the Academy of Architecture, and for the last three a member of the Royal Society of London. He published several works on mechanics, and accounts of the terrestrial observations above described.

CAMUS, FRANÇOIS JOSEPH DE, an ingenious mechanic, was born in 1762 at Rechôme in Lorraine, of a noble family. He was admitted a member of the Académie des Sciences in 1716. During his early years he constantly employed his leisure moments in mechanical amusements, and a clock which he constructed with his own hands was long preserved as a memorial of his skill. His genius flowed in the same course to the end of his days, manifesting itself in the invention of a self-adjusting floating-bridge, automaton soldiers, a coach of improved construction, a machine for excavating and embanking, a clock to go for a year without winding up, an instrument for observing the stars, an automaton watch, a self-adjusting ladder, a

sieve, and a rowing machine. He also proposed improvements in the tempering of metals, and in the manufacture of guns, capstans, wheelbarrows, carriage shafts, and chariots. Being expelled from the academy in 1723 on the ground of absence, he travelled to Holland, in the hope of deriving profit from his rowing machine; and, proving unsuccessful, he repaired to England, where he ended his days amidst much distress in 1732. His principal work is a "Treatise on Moving Forces for the practice of Arts and Trades, with an explanation of twenty-three new and useful machines," Paris, 1722.—J. D. E.

CAMUS, JEAN PIERRE, a French prelate, born in 1582. He was consecrated bishop of Bellay before he had reached the canonical age. He wrote a number of religious novels, intended to counteract the then prevalent taste for reading romances, and was distinguished for his attacks upon the mendicant friars for their laziness and want of discipline. He seems to have had considerable satirical power. He died at Paris in 1652, having written, it is said, more than two hundred volumes.—J. B.

CAMUSAT, JEAN, printer to the French Academy from its first institution till his death in 1639. He attended the sittings of the academy as usher, and occasionally performed the duties of secretary. Before being provided with accommodation in the Louvre, this learned body often met in the house of their printer. At his death the academy, in opposition to the demand of Richelieu that the printer Cramoisy should be appointed his successor, elected his widow to the post, charging her to imitate "the discretion, the civility, and the diligence of the defunct."

CANAAN, the son of Ham, grandson of Noah, on whom the curse was pronounced of which we read in Genesis, chapter ix. 24, 25. His descendants, inhabiting the land which bore his name, were subdued by the Israelites under Joshua.

CANAL, ANTONIO, called CANALETTO, or, incorrectly, CANALETTI. This celebrated artist first saw light at Venice in 1697, and the son of a scene-painter at the theatre, was born and bred in a realm of canvas and paintpots. For some years he laboured with his father at scenic decoration, and then proceeded to Rome, where he made many studies of the great remains of the holy city and its neighbourhood. But his chief works relate to his native place, of which he painted innumerable views. He is stated to have used the camera-obscura to obtain his accuracy of outline. On the advice of Amiconai, Canaletto came to England and remained about two years. During this period he made a drawing of the inside of King's College chapel, Cambridge—distinguished by his usual perspective accuracy and lightness of colour. He died in 1768. The number of his works is very great. Hardly a gallery but possesses a pair, if not more, of examples of this master. There is no doubt that hundreds of the pictures attributed to him, however, are spurious—the work of some of his many pupils and imitators. The pictures of Francesco Guardi more especially resemble Canaletto's; but the genuine works are marked by a precision of line and detail, and a luminous quality of tone, which his disciples have vainly attempted to attain. Canaletto's paintings are eminently favourites of the collectors; but their merits do not reach very much beyond the higher class of scene painting. There is poetry in the subjects, but there is little in the master. He painted one uniform sunshine. He ignored the marvels and beauties of transient rain-clouds, of impending tempests, of dreamful twilights, and the golden hazes, the glowing steams of the sun's rise and set. He thought less of his art than of its emoluments; so, from an artist he degenerated into a mechanic. He made many pictures and much money; coined his future artistic fame into ready cash. To the fervid restlessness of the mind of genius he preferred the steady stillness of a stone from which many pictures may be printed, but all alike.—W. T.

CANALE, NICOLO, a Venetian admiral of the fifteenth century. Having in 1469 assembled a large fleet at Negropont, he reduced the town of Enos to ashes; for which deed of brutality, strange to say, the pope gave thanks to heaven. Mahomet II., although this town was christian, fitted out a fleet to avenge its wrongs. He chased Canale back to Negropont, and, before his very eyes, took possession of that port. Canale's officers vainly remonstrated with him on his criminal inaction, for which he was soon sent in irons to Venice, and exiled to Porto-Gruero.

CANALETTO.—See CANAL.

CANANI, GIOVANNI BATTISTA, an Italian anatomist, born at Ferrara in 1515. He became physician to Pope Julius III., and on his death, chief physician of the duchy of Ferrara. He

discovered the valves of the veins—a discovery confirmed and more fully described by Vesalius. His only work was named "Musculorum humani corporis picturata dissectio." It bears no date, but was printed, Haller thinks, in 1543, Tiraboschi in 1572. He died in 1579.—J. B.

CANARD, NICOLAS-FRANÇOIS, a French mathematician, born at Moulins about the middle of the eighteenth century; died there in 1833. He devoted himself to the study of the exact sciences, and was appointed professor of mathematics in the central school belonging to the department of Allier. Afterwards he filled a higher chair in the lyceum of Moulins. His leisure hours were given to the writing of works on political and scientific subjects.

CANAYE, PHILIPPE DE LA, Sieur de Fresne, born in 1551. Canaye distinguished himself at the bar of the parliament of Paris. He was ambassador from Henry IV. to England, and in 1594 became president of the chambre de Castres. In 1660 he was appointed to arbitrate between the Catholics and Calvinists; to the former he latterly went over. Died in 1610.

CANCELLIERI, FRANCESCO GIROLAMO, distinguished as a writer on ecclesiastical antiquities, was born at Rome in 1751. While librarian to Cardinal Antonelli, prefect of the Vatican, he acquired an extensive knowledge of early church records, and when Pius VI. added a new sacristy to the basilica of the Vatican, Cancellieri established his fame by publishing four volumes, "De Secretariis Basilicæ Vaticanæ," giving an account of its early history and construction. This work was followed by some others on the origin and import of the ceremonies performed on feast days in St. Peter's and the pope's chapel. He also wrote on the statues and different parts of the ancient city, and edited a newly-discovered fragment of the 91st book of Livy. When the French invaded Rome in 1798, Cancellieri was separated from his patron; but when Pius VII. regained the city, was made director of the printing-press of the propaganda. Having rejoined Antonelli, he accompanied him to Paris in 1804 to attend the coronation of Napoleon. He died in 1826.—J. B.

CANCER Y VELASCO, GERONIMO, a Spanish poet, one of the immediate followers of Calderon, born at Barbastro in Arragon; died in September, 1655. He has left fourteen pieces, chiefly comedies. One of his works, "The Death of Baldorinas," is in the index of the inquisition. Another, founded on the story of the conversion of St. Gines, a Roman actor, will repay perusal. His works were first published at Madrid, 1650, and again in 1761.—F. M. W.

CANCERIN or CANCRINUS, FRANZ LUDWIG VON, a German mineralogist, born in 1738 at Breitenbach, Hesse-Darmstadt; died in 1796. He filled several public situations under the government of his native state, and at Altenkirchen, near Coblenz. In 1783 he was appointed by the Empress Catherine, director of the salt mines of Staraja-Roussa, and councillor of the imperial college. Three years after he retired to Giessen in Hesse-Darmstadt, and till 1793 devoted himself to scientific investigations. He then returned to Russia as councillor of state. He published in German many valuable works on mineralogy and metallurgy. His principal one is a standard work on the subject of mines. It has been translated into several languages.—J. B., G.

CANCERIN, GEORG, Count, son of Franz Ludwig, was born at Hanau in 1773; died in 1845. In 1796 he went to Russia, where he obtained an appointment in the commissariat. He was a great favourite with Alexander, who, in 1823, made him minister of finance. This responsible office he filled with complete success, having introduced order and method into his department, and greatly augmented the revenue of the empire.

CANDACE, the title of the warrior queens of Ethiopia. One of them in B.C. 22 invaded Egypt, then held by the Romans, compelled several Roman garrisons to surrender, but was defeated near Pselcha by Petronius the prefect.—Another CANDACE is referred to in Acts viii. 27.

CANDALLE or CANDALE, HENRI DE NOGARET D'EPERON, Duc de, a French general, born in 1591. Candalle quitted, while still young, a governorship in the south of France, and entered the duke of Tuscany's service. Returning to his native country in 1614 he joined the Calvinists; again became loyal, and obtained a peerage in 1621. After that he served, first under the prince of Orange then in the Venetian army, and once more returned to the loyalty of a French soldier. He died in 1639.

CANDAMO, FRANCISCO BANCES Y, a Spanish poet, born in the province of Asturias in 1662. He was of an ancient

family, and was early sent to court, where he obtained some distinction, and filled several offices in the finance department; but died in disgrace, 8th September, 1704. Most of his works were posthumous; his plays and comic poems being published in 1722, and some lyric poems in 1729. The most noted of his pieces, perhaps, is "The Slave in Golden Fetters," founded on a scene supposed to be taken from the life of Trajan. He introduced the zarzuela, a kind of musical drama, which may be considered the precursor of the modern opera.

CANDIANO I., PIETRO, doge of Venice, was killed in a naval fight in 887.

CANDIANO II., PIETRO, doge of Venice, son of Candiano I., was elected in 932; died in 939.

CANDIANO III., PIETRO, doge of Venice, son of Candiano II.; elected in 942. His rule was saddened by the revolt of his son, who was associated with him in the government. A celebrated event occurred during his magistracy. Marriages amongst the Venetian nobles took place only on one day of the year, and in the same church. On that particular day the pirates of Istria once burst suddenly into the church and carried off the brides. Not one of the ravishers, who were immediately pursued, escaped the vengeance of the lovers. The rescued brides were brought back in triumph to the altar.

CANDIANO IV., PIETRO, doge of Venice. The services of his ancestors procured his election in 959. For a while he ruled well; but after his second marriage, which brought him immense wealth, he became tyrannical, and in an insurrection which his excessive rigour had provoked his palace was burned, and he fell a prey to the flames.

CANDIANO V., VITALE, doge of Venice, and brother of Candiano IV., died in 979, after governing fourteen months.

\* CANDLISH, ROBERT SMITH, D.D., one of the leading divines of the Free Church of Scotland, was born at Glasgow. He was educated at the university of his native city, and licensed as a preacher in connection with the established church of Scotland. After being for some time an assistant in St. Andrew's church, Glasgow, and in the parish of Bonhill in the Vale of Leven, he was in 1834 settled as minister of the parish of Sprouston, whence he removed to the pastorate of St. George's, Edinburgh. He soon threw himself with heart and soul into the agitation for ecclesiastical reform, and became one of the most prominent leaders of the movement which resulted in the Disruption of 1843, and the formation of the Free Church of Scotland. Dr. Candlish has, since the death of Chalmers, been the acknowledged leader of the Free Church, and it is in no small degree owing to his untiring activity that so much has been achieved by it for the cause of religion and education. He is thoroughly at home in the region of ecclesiastical politics, and his power as a debater in church courts is well-nigh unrivalled. As a preacher he is distinguished mainly for this, that with little imagination or pictorial power, he is yet able to enchain the large audiences which his fame everywhere collects, by the clear and earnest exposition of that system of doctrine which he believes to be taught in scripture. He is a firm adherent of the old formulas of Scottish theology, which he is at all times ready to defend with a fire and polemical zeal peculiarly his own. While Dr. Candlish's position as a writer is not equal to his reputation as a preacher or debater, his works hold a respectable place in the theological literature of Scotland. The chief of them are a treatise on "The Atonement;" "Contributions to the Exposition of the Book of Genesis;" "An Examination of Mr. Maurice's Theological Essays;" and "Life in a Risen Saviour."—J. B.

CANDOLLE. See DE CANDOLLE.

CANDORIER, JEAN, the mayor of Rochelle, who in 1372 dislodged the English garrison from the citadel of that town by an ingenious stratagem. When Mancel, the English commander, was his guest, he showed him what purported to be an order from Edward III. to review the troops before the citizens. Seeing the royal seal, and being unable to read the document, Mancel led out his troops. They were at once overpowered by an ambuscade, and compelled to surrender.—J. B.

CANETTA, DON ANDREA HURTADO DE MENDOZA, Marquis de, was in 1537 sent as viceroy to Peru. His strong hand restored tranquillity to that distracted country, and completely ruined the cause of the incas. His next undertaking—an expedition to explore the vast regions of the Amazon—miscarried through mutiny. His enemies at last procured his recall. He died in 1560.

CANEVARI, DEMETRIO, an Italian physician, was born at Genoa in 1559, and died at Rome in 1625. He prosecuted his studies at the latter city, and was distinguished for his knowledge of languages, and his taste for belles-lettres, as well as for medicine. He was physician to Pope Urban VII. He soon realized a large fortune. Among his works are the following—"Commentary on Lignum Sanctum," published at Rome in 1602; "Medical Art;" a general treatise on diseases; and a commentary on reproduction.—J. H. B.

CANGA-ARGUELLES, DON JOSÉ, was born in 1770; died in 1843. Having taken an active part in the Revolution, he was deputed to the cortes of 1812, in which he advocated constitutional principles. Ferdinand in 1814 first exiled and then recalled him. On the restoration of the constitution of 1812 in 1820, he became minister of finance; and on its overthrow in 1823, took refuge in England. After his return he wrote a history of Spain.

CANINA, LUIGI, Chevalier, a celebrated Italian architect and archæologist, born at Casal in 1793. His first considerable publication, "L'Architettura antica descritta e dimostrata coi monumenti," the fruit of long and toilsome researches at Rome, appeared about 1830, and was followed by a valuable topographical plan of the ancient city. Having been appointed to continue the excavations commenced at Tusculum in 1840, he collected the materials for his valuable "Descrizione dell' antico Tuscolo," which, with the description of the ancient city of Veii, where he was also for some time officially engaged in archæological research, won him honours from most of the learned societies of Europe. He also published a work on architecture, particularly the christian style; one on maritime Etruria, and one on "The Buildings of Rome." Canina died in 1856.—(Vaperau, *Dict. des Contemp.*)

CANINO. See BONAPARTE.

CANISIUS or CANNIUS, NICHOLAS, a learned Dutchman, whom Erasmus employed to aid him in his literary labours, chiefly in making translations from the Greek. He died in 1555.

CANISIUS, PETER, an eloquent jesuit, born in 1521; died in 1597: famous for his zeal against the reformers. He was prominent at the council of Trent, was papal nuncio at the court of Austria, and wrote a "Summa Doctrinæ Christianæ," which has been often translated.

CANITZ, FRIEDRICH RUDOLF LUDWIG FREIHERR VON, a German poet, was born at Berlin in 1654, and died in 1699. He held several high posts of trust and honour in the court of Berlin, and in 1698 was ambassador of the elector to the Hague. He wrote satirical and other poems. His "Poetical Recreations" went through fourteen editions.—K. E.

CANIZARES, JOSÉ DE, one of those Spanish dramatists who, immediately succeeding the school of Lope de Vega, led the way for that close imitation of the French style which has almost destroyed the distinctive character of Spanish literature. He was born at Madrid in 1676, and died in 1750. He is said to have written plays at fourteen years of age. Of the dramatic pieces—nearly eighty in number—which he wrote, many have perished, but probably literature has sustained no great loss thereby. The most successful of his works are those descriptive of character and the social life of his day, such as "Domine Lucas" and the "Mountaineer at Court," in which he satirizes the poor decayed nobility of the court of Madrid as it was in his day; and "The Famous Kitchen Wench," founded on the story of Cervantes.—F. W. M.

CANNABICH, JOHANN GÜNTHER FRIEDRICH, a German writer on geography, was born at Sondershausen in 1777, and, having studied for the church, became minister of some villages in its vicinity. He wrote a great number of popular and instructive works on geography and statistics, some of which have gone through seventeen editions.—K. E.

CANNE, JOHN, preacher to the congregation of English Brownists at Amsterdam, whither he fled after the Restoration. He was author of an edition of the bible, with parallel passages, Amsterdam, 1664, and Edinburgh, 1727.

CANNICE, an Irish ecclesiastic who lived in the sixteenth century, and was distinguished for piety and learning. He founded several monasteries, and has left some writings, especially a life of St. Columbkil. He died in 1600.—J. F. W.

CANNING, GEORGE, British statesman and orator. Canning so thoroughly lived in the conduct of public affairs, that the loftiest part of the character of the man is most clearly revealed

in the policy of the statesman, and his highest life culminated in a European policy. He was born in London, April 11, 1770. His family was originally English, but migrated to Ireland upon receiving certain estates from James I. His father lived under the ban of family displeasure, in consequence of his marriage with Miss Costello. He forsook the law, to which he had been educated, for literature; became involved in debt; surrendered the entail of the Irish estate; and died on the first anniversary of his son's birth, a broken-hearted man. Mrs. Canning went upon the stage, but was afterwards remarried, and lived to witness her son's career, receiving from him until her death the tenderest treatment of faithful love. Canning's natural endowments were magnificent; and his gifts were as varied as they were mighty. He felt the warmth of keen passion, and knew also the calmness of disciplined thought. He possessed a fervid imagination, united with remarkable logical acumen. He could master a great principle, and warm both himself and others into enthusiastic devotion thereunto, and yet manage passing affairs with the subtle tact of an accomplished man of the world. He was an orator who, by pomp of gorgeous eloquence, could almost compel men to kneel in admiration at his feet, and at the same time a man of business, who never used two words when one word would denote his purpose. He was a wit whose keen darts flew somewhat too wildly, and yet he had a soul to feel—too acutely for its own peace—every passing passion of the wayward world. He was a scholar, not ignorant of the technicalities of learning, but one to whom scholarship was rather a robe of graceful endowment than a restraint to the free life of genius. With gifts so memorable, Canning was early recognized as a man who would die at the head of whatsoever profession he might choose to adopt. It was as certain, however, that he would have fierce foes, as that he would achieve greatness. The very variety of his powers led him, when they ripened into maturity, to attempt "to hold the balance between conflicting principles," and thus drew upon him somewhat of the hatred of the advocates of both, and occasionally involved him in compromises which failed to embody his own noblest thoughts. As a wit, unable to restrain himself in the overflowing enjoyment of his humour, and yet endowed with quick personal sensitiveness, Canning ran as much danger of being wounded as of wounding, and paid ultimately a bitter penalty of inward suffering for every blow he struck. Unconnected with any of the great ruling families, his genius could not protect him from being treated as a parvenu; and some of his high associates never forgave a speech in which he flung back the charge of being an adventurer, with the proud assertion that he had no claims but those of character, and never subscribed to the creed "which assigns to a certain combination of great families a right to dictate to the sovereign and to influence the people."

Canning was educated at Eton, through his uncle's aid, where he edited a periodical started among the lads, named the *Microcosm*, and gave abundant signs of future power. In a poem called "The Slavery of Greece," he poured forth aspirations towards freedom, which never died within him. In 1787 Canning entered Christ Church college, Oxford. At Oxford he gained distinction, and cemented that firm friendship with the Hon. C. Jenkinson (afterwards the premier, Lord Liverpool), which ultimately secured him the ministry of foreign affairs on the death of Castlereagh. From Oxford he proceeded to Lincoln's inn, and although he at first associated with Fox, Burke, and Grey, to whom his friend Sheridan introduced him, he finally entered parliament under the patronage of Pitt in 1793. In 1796 he became under-secretary of state, and from time to time defended the policy of Pitt. At the close of 1797 he commenced the *Anti-Jacobin*, to which he contributed some famous parodies upon Southey—one of which, "The Friend of Humanity and the Knife-Grinder," has assumed a lasting place in humorous literature; "The Rovers," a burlesque on the sentimental drama, containing some exquisite feeling; and "New Morality," a satire on the French. In 1798 Canning married Miss Jane Scott, one of the daughters of General Scott, thereby advancing both his pecuniary and social position. He went out of office with Pitt in 1801, returning with that minister in 1804, but again leaving the government on Pitt's death in 1806. Upon the resignation of the Grey and Granville administration in 1807, Canning became minister of foreign affairs, but withdrew in consequence of a duel with Castlereagh, who held the war office. Castlereagh charged Canning with obtaining a promise that he

should be removed from office, and concealing the whole affair; the king, however, subsequently explained that Canning's complaint had been that their offices clashed, but that it was still hoped to retain both in the government, and that it was not intended to conceal so long the change in agitation. Upon the death of Percival in 1812, Lord Liverpool became prime minister, and sought the aid of Canning. Canning, to his honour, declined to join the cabinet, in consequence of the refusal of Lord Liverpool to take into consideration the catholic claims, although at this moment of his career, as he afterwards declared, he had a temptation to take office more powerful than he had felt at any other period of his political life. In 1812 he was chosen representative for Liverpool, for which borough he was returned in three successive parliaments; and in 1814 he accepted the ambassadorship at Lisbon, his sympathies being closely drawn to the government by its prosecution of the French war. In 1816 he returned to England, and became president of the board of control, the catholic question being left open; but on the accession of George IV. he resigned office in consequence of his opposition to the proceedings against Queen Caroline. In 1822 Canning was announced as the successor to Lord Hastings in the government of India, and prepared to leave England. As he journeyed to Liverpool, however, to take leave of his constituents, great news reached him. Castlereagh, who had been at the foreign office since 1809, had fallen by his own hand, and the name of Canning was on every tongue as his successor. In spite of the opposition of the king and of some members of the cabinet, through the firmness of his old friend, Lord Liverpool, Canning was offered the foreign office, Sept. 11, 1822, which he accepted, and by this act a change came over the foreign policy of Britain; and by a change in the foreign policy of Britain, the whole course of modern history was necessarily directed into a new channel. The substitution of Canning for Castlereagh as minister was an epoch in modern history. Canning's first great aim was the withdrawal of Britain from the Holy Alliance. The grave attempt was then being made in Europe to establish an authoritative congress of royal families, pledged to assist each other by force of arms, and claiming a right to interfere upon the slightest pretext with the internal conduct of every state. Canning directed his policy against this system of holding congresses for the government of the world. His second great aim was to dissolve this Holy Alliance peacefully. He dreaded a fresh war, for he prophesied that it would be a war of opinion. Were there no Holy Alliance to interfere, and had each nation a time of peace in which it could grow according to its genius, then he trusted Europe would achieve her noblest destiny. His third grand aim was to place Britain in such a position that she could act for and by herself. In consequence of the firmness of the British minister in carrying out this policy, it was not decided at the congress of Verona in 1822, to interfere forcibly in the affairs of Spain; and although France ultimately declared war, through dread of a free constitution so near its borders, Canning, while preserving British neutrality, could fairly boast that he had prevented the war from being carried on under the assumed jurisdiction of a congress, and rendered it possible to manage its issues by ordinary diplomacy. He had, however, clearly made known to Europe that the principle on which Britain deprecated the Spanish war, was its acknowledgment "of the right of any nation to change or modify its internal institutions." While these events were going on—to use his own famous phrase—he sought materials of compensation in another hemisphere, and called the new world into existence to redress the balance of the old, "by recognizing the independence of the Spanish South American colonies, which had revolted from the mother country." Canning read another lesson to Europe on the foreign policy of Britain, when the British consul at Tangiers refused to surrender to Spain some political offenders. He regretted that such conduct should be deemed unfriendly, since Great Britain could contract no obligation to surrender political offenders to Spain or any other power. That Canning in his love of peace was not disposed to forget the honour or the ancient obligations of his country, appears from the fact, that when Portugal was invaded from Spain by deserters from its army—an invasion more than sanctioned by the Spanish government—he at once despatched British troops to its aid, risking a general war rather than compromise national faith. He was active in the abolition of the slave trade, although his general position on the subject of slavery was an instance of the way

in which the attempt to balance conflicting principles is often rather a surrender of the right, than the dispensation of an equal justice. To Canning, however, is due the humane order of council on March 16, 1824, which forbade some of the more glaring cruelties of West Indian slavery. With the cause of catholic emancipation his name is closely identified, and he made great personal sacrifices in its behalf, although his conduct was sometimes more directed by considerations of policy than its recognized leaders could brook. There is no doubt, however, that through Canning's influence the catholic cause was accepted by many in high authority, who would have listened to no other teacher. The famous scene in the house of commons in 1823, must be quoted as characteristic. In his speech at Liverpool in 1820, he had suggested a liberal compromise. This was constantly quoted as an abandonment of the cause, and when he afterwards accepted office under an anticatholic premier, the two things were bitterly combined, although the question had been left an open one. Brougham, during one of his philippics, bitterly taunted him with "monstrous truckling." Canning at once interrupted the speaker with the words—"Sir, I rise to say that that is false." A dead silence followed. Canning being called to order, declared that no consideration should induce him to recall his words; but at last accepted the suggestion that Brougham's expressions were addressed to him in his political capacity. Brougham has since honourably declared that Canning was too disposed to act a "high, manly, and honourable part." It is curious to note that while he delivered Britain from the Holy Alliance abroad, he withstood reform at home; and that he upheld the rights of the catholics, while opposing those of the dissenters. Such inconsistencies may be attributed to peculiarities of mental constitution—to his political education—and especially to his overdriving the idea of balancing antagonistic principles, until it compelled him to pursue a path true in direction to neither. In financial policy he supported the enlightened measures of Huskisson. On February 17, 1827, Lord Liverpool, the premier, was seized with an apoplectic fit, and the public voice named Canning as the foremost man in Britain. The king hesitated, but a deputation of noblemen having threatened the withdrawal of their support from government should Canning become premier, his royal pride was touched, and he bestowed on him the seals of office. His old colleagues refused to assist the new minister, but he succeeded in organizing a powerful cabinet, with which he met parliament, May 1, 1827. But now, to this statesman of genius and sensitiveness, came the time of bitter trial. Sharp arrows, well-pointed for rankling in his proud heart, were flung from the hand of every foe. Those who did not see how a great mind can combine within itself varied elements of policy and power, and be really consistent in allegiance to master principles, although apparently inconsistent in practical applications as to outward detail; those who recognized no growth of policy—even as the demands of new-born hours have their individual characteristics, and require their own special treatment; partisans, those "hard taskmasters," who will not brook the following of any path but one, although there may be many roads to the same end; the sufferers from the statesman's wit, who could not forgive a joke for the sake of its genius; high and noble families, who resented the authority of one who had disturbed their accustomed relationships with the government—all joined their voices to swell the storm of personalities with which the premier was beset. Canning's power had often been manifested in bringing peaceful issues out of noisy antagonisms; but the contest now needed the body as well as the mind of a giant, and there was the seat of Canning's increasing weakness. At the close of the session he went for change of air to the duke of Devonshire's villa at Chiswick, occupying the very room in which Fox died. Some time previous he had attended the funeral of his great antagonist the duke of York, and caught his death-chill beside the open grave. On the evening of August 3, 1827, he was attacked by internal inflammation, and breathed his last on the morning of the 8th. He was buried in Westminster abbey, close to Pitt, and his widow was raised to the peerage. Thus solemn was the end of his premiership, after its few months of stormy controversy. The chill of death fell on him at the grave of his greatest opponent, and the chamber sacred to the memory of Fox witnessed the passing of Canning's life into the inevitable shadow; while friend and foe paused in their hot strife to confess that a great man had departed from the land.—L. L. P.

CANNING, CHARLES JOHN, Earl Canning, the third and youngest, but only surviving son of George Canning, was born at Brompton in the suburbs of London, Dec. 14, 1812. He received his early education at Eton, and subsequently at Christ Church, Oxford, where he graduated B.A. in 1833, as a first class in "literæ humaniores." On a casual vacancy in the representation of Warwick in 1836, he was returned to parliament as a supporter of the opposition, headed at that time by the late Sir Robert Peel; but his stay in the lower house was of limited duration, inasmuch as, in the following year, the decease of his mother (who had been raised to the peerage on her husband's death in 1828) transferred him to the house of lords. On the formation of Sir Robert Peel's administration in 1841, he accepted the post of under-secretary of state for foreign affairs, which he held till March, 1846, when he was promoted to the chief commissionership of woods and forests. This appointment, however, he resigned in the following July, on the retirement of his party from office. On the formation of the Aberdeen ministry in 1852, he undertook the office of postmaster-general, which he held until 1855. Towards the close of 1855 the marquis of Dalhousie resigned the governor-generalship of India, and one of the last acts of Lord Aberdeen's government was to nominate Lord Canning as his successor. He reached the seat of government in February, 1856, and immediately set himself to work in earnest, promoting to the utmost of his ability the many social, political, educational, and military reforms, which had been commenced by his predecessor, and developing the internal resources of India by the extension of roads, railroads, and telegraphic communication between the most important cities and military stations. In May of the following year, after smouldering for several weeks, the terrible Indian mutiny broke out in the neighbourhood of Meerut and Delhi. The suddenness of the outbreak was enough to have paralyzed an ordinary mind; but the danger was met by the government of Lord Canning in a way which reflected the highest credit on himself and his subordinates. Instead of issuing threatening proclamations, which it would have been as impolitic as it was impossible to carry into effect, Lord Canning, with characteristic readiness, intercepted the British troops that happened to be on their way to China, ordered such regiments as could be spared to be sent up from Madras and Bombay, and appointed one of the Company's officers, Sir Patriek Grant, to the chief command. Disregarding the public excitement, and the popular outcry raised against him, he resisted the persuasion of those who would have urged him to adopt a bloodthirsty and vindictive course. He at once placed a curb upon the Indian press; and by the appointment of a Mahomedan to a high position, showed the feeling of the government towards such natives as remained faithful in their allegiance. He refused to allow to Europeans the unrestrained use of firearms, being unwilling to stigmatize the natives as a body. And when the mutiny was already far advanced, he issued his celebrated proclamation with respect to Oude, by which he nominally confiscated to the British crown the entire proprietary rights of the land, intending to apply it to individual instances, with such modifications as he might find to be necessary. This despatch was much criticised at the time, and was severely and publicly censured by Lord Ellenborough, the president of the board of control, who in consequence was obliged to resign his post in the administration of Lord Derby. Lord Canning held to his post throughout the period of the mutiny; and for his services at that crisis he was made an Earl and a G.C.B. He resigned in 1861, and returning home, died on the 17th of June, 1862. In 1835, Lord Canning married the eldest daughter of Lord Stuart de Rothesay.—E. W.

CANO, ALONZO. This eminent Spanish painter was born in 1600 at Grenada, and was the son of Miguel Cano, a distinguished architect. From the wide compass of his genius he has been surnamed the Michel Angelo of Spain, succeeding as he did in the triple profession of architect, sculptor, and painter. He was educated as an architect by his father, but the son soon outstripped the sire. He then studied sculpture, and with marked success. He next proceeded to Seville, and entered the school of painting of Pacheco, but afterwards became a pupil of Juan del Castillo. When little more than twenty years of age, he executed works for the public places of Seville that excited great admiration. At this time also he demonstrated his talent as a sculptor by several noble specimens, more especially his two colossal figures of "San Pedro" and "San Pablo," and also

Engraved by J. P. Rosewhite from a picture by Sir Thomas Broun, given to the possession of the Abbot of St. Peter's.

RANIVA.

his "Madonna and Child" in the church of Nebrissa. On the invitation of Count Olivarez, he now went to Madrid, where he was appointed to be royal architect, to be special painter to the king, and to be preceptor to the Prince Don Balthasar Carlos of Austria. But troubles accompanied him, and dimmed his glories. He found one day his wife murdered, and his house robbed. Suspicion fell on an Italian painter, who, however, had disappeared. But then it came to light that Cano had been jealous of this Italian, and had further formed a *liaison* with another woman. The Italian was acquitted, the husband was condemned. The judges considered he had sufficient motive for the crime—another love and a false wife. He took to flight, reached Valencia, and sought refuge in a Carthusian monastery. He waited some time, thought the thing had blown over, and then imprudently ventured again in Madrid. But justice sleeps with one eye open. He was seized and tortured. He bore his sufferings without a murmur; he confessed nothing; so it was concluded at last, that really he had nothing to confess. The king received him again into favour; but Cano, afraid of being subjected to new trials, sought the protection of the church, and by the king's permission he was nominated residentiary of Grenada. The ecclesiastics grumbled a little at the suspected bloodstain on their lawn, but consoled themselves by considering the art-treasures their new brother would bestow on the church. They were right. Rich gifts in painting and sculpture accrued to the cloth, and Cano spent his last years in acts of extreme devotion and charity. He died in 1676 or 1667, as some assert. His works are very numerous, and are to be met with in most of the churches and convents of Spain. In his later life he made no scruple of exacting the full price of his works. A counsellor is related to have said to him—"You have been twenty-five days carving this figure of St. Antony; you demand one hundred pistoles for it; why, that is at the rate of four pistoles a day. Why, I, a counsellor, do not make half that sum by my talents." "Fool," screamed the incensed artist, "don't talk of your talents. I have been fifty years learning to make this statue in twenty-five days!" and he dashed the saint to the earth into a thousand pieces. For this profane violence the king suspended him from his office, but he was restored on his completion of a magnificent crucifix for the queen. Fuseli rates Cano above all his contemporaries, with the exception of Velasquez. He was very grand in style, powerful in effect, and perfect in drawing. His faults were a certain tendency to the overloaded and redundant.—W. T.

CANO, JUAN SEBASTIAN DEL, the first circumnavigator of the globe, was a native of Biscay. He sailed in the *Conception* under Magellan, when he passed through the straits that bear his name; and when that commander was killed at the Philippines, continued the voyage, touched at the Sunda isles, doubled the Cape of Good Hope, and arrived near Seville in 1522. He was rewarded by Charles V., who presented him with a globe bearing the motto "Primus, me circumdedisti." He died in 1526 while on a voyage in the South Seas.—J. B.

CANO or CANUS, MELCHIOR, a Spanish Dominican, born at Tarazona in 1523. He studied at Salamanca, where in 1546 he became professor of theology. He was a bitter opponent of the jesuits, and through their influence, having been summoned by Paul III. to the council of Trent, he was sent away from Spain to be bishop of the Canaries. Philip II., however, recalled him, and he became provincial of his order in Castile. He died at Toledo in 1560. His principal work is a treatise "De locis theologicis," Padua, 1727.—J. B.

CANONICA, LUIGI, an architect, born at Milan in the eighteenth century. He adorned his native city with many noble buildings, and is especially remembered for the construction of the arena or amphitheatre begun in 1805 by order of Napoleon. He died at Milan in 1844.

CANONICUS, a distinguished sachem or chief of the Narragansett Indians in New England. The district over which he ruled lay on the borders of Rhode Island and Connecticut. He continued a firm friend to the English to the end of his life. In the war between Massachusetts and the Pequods, Canonicus was on the side of the colony. In 1644 he submitted himself and his tribe to the authority and protection of the English king, and was one of the noblest specimens of the New England Indians. He died June 4, 1647, aged, as was believed, eighty-five years.—W. G.

CANOPPI, ANTONIO, an Italian artist, first known as a fresco painter, became afterwards a scene painter in the theatres

at Venice and Mantua. Compelled to leave Italy, because he was suspected by the French government, he sought refuge at Vienna, where he became acquainted with the Russian ambassador, at whose recommendation he settled at Moscow in 1807. He there decorated the halls of many of the nobles, and the senate hall. Just before the great fire which destroyed all his works, he had gone to St. Petersburg, where, till his death in 1832, he was scene-painter in the imperial theatre.—J. B.

CANOVA, ANTONIO, was born at Possagno in the province of Treviso, November 1, 1757, of a respectable family of that place; but, having lost his father when still an infant, he was brought up by his grandfather. At a very early age young Canova was set by his grandfather to the work of a stone-mason, and in this humble sphere his capacity for fine art soon developed itself. He attracted the notice, when only thirteen years old, of the Venetian senator, Giovanni Faliero, who placed him with the sculptor Torretti, at that time living in the neighbourhood of Possagno, and with whom Canova passed two years near his native place, when he removed with his master to Venice; and here surrounded by great works, if not by great masters, he rapidly enlarged his views of art. He was so far advanced that, on the death of Torretti, which happened not long after he settled in Venice, his grandfather felt justified in selling a small piece of land in order to find funds to place the young sculptor with a second master, Torretti's nephew, Ferrari, equally obscure as the uncle, yet both quite capable of instructing the young sculptor in the practical work of his art. Their names, however, have been preserved from oblivion, solely by the fact of their having been concerned in the education of the young Canova, and to this alone they owe their immortality. Among Canova's first works were two baskets of fruit, made for the staircase of his patron, Faliero, who also commissioned him to make his first group of figures, "Orpheus and Eurydice," executed in stone, of which he made afterwards a copy in marble for another patron at Venice, by which he acquired considerable local distinction; an achievement, however, then comparatively easy, for the arts were fallen to so low a state in the former mistress of the Adriatic, that its rank was no higher than that of an ordinary provincial town. His next group was "Dædalus and Icarus," which developed a still greater advance, and carried his reputation beyond the limits of the Venetian waters. In 1780 Canova left Venice for Rome, with a pension granted by the state for three years, and a special recommendation to the Venetian ambassador, Count Zulian, who became subsequently a valuable patron to him. He contracted also a friendship with Gavin Hamilton, then an important critic in Rome, and a valuable acquaintance for Canova. He initiated him into the history and principles of ancient and modern art. About 1783 Canova decided to fix himself definitively at Rome. Pompeo Battoni was then the great Roman celebrity in painting. From this time he commenced that series of great works which have earned him the renown of the most distinguished sculptor of modern times. Among the first was "Theseus and the Minotaur." One of his first important monuments was the mausoleum of Clement XIV. in the church of the Santi Apostoli, with three colossal figures. This was followed by the still more important monument to Clement XIII. in St. Peter's, uncovered in 1795, and particularly celebrated for its two crouching lions. In this year he made the bas-relief to the Venetian admiral, Emo, for the arsenal at Venice, and for which the senate sent him a gold medal with this inscription—"Antonio Canova Veneto artibus elegantioribus mirificè instructo ob monumentum publicum Angelo Emo egregiè insculptum Senatus Munus: A. MDCCXCV." Among the minor works of this period is the well-known "Penitent Magdalene," made shortly before the invasion of Rome by the French. It was about this time also that Canova tried his hand at painting. There is a print by Pietro Vitali, entitled *Venere Transteverina*, which is engraved from a painted Venus by Canova. He painted also his own portrait for the Florence gallery, besides several other pictures. When Rome was occupied by Berthier in February, 1798, and Pius VI., a great patron of the arts, was dethroned and removed, a suspension took place in the labours of Canova at Rome, who also left the eternal city and revisited his native place, Possagno. Rome was no place for artists during its short-lived republic, which was a simple interregnum of anarchy. Many of its most valued art-treasures were alienated at this period. Canova made an extensive tour in Germany during his absence from Rome, and the

Austrian government wished to retain him in Vienna, for the treaty of Campo Formio had made every Venetian an Austrian subject. Upon the re-establishment of the papal government under Pius VII. in 1802, Canova returned to Rome. Among the most remarkable of his works of this period is the colossal group of "Hercules throwing Lycas into the Sea;" the figure being the Farnese Hercules in action, the ancient and modern colossus being of the same dimensions. The small bronze made in Paris of the original sketch is well known. This was followed by the beautiful statue of "Perseus," as a rival of the Apollo Belvedere. Pius VII. had it placed in the vacant niche in the Vatican, which had been occupied by the Apollo before it was carried off to Paris. Canova himself visited Paris in 1802 to model a bust of the first consul, Bonaparte, and from which he afterwards made his colossal statue of the emperor, now at Apsley house.

His next great works were the two boxers, Crengas and Damoxenus, of terrible grandeur and effect, now placed in the Vatican. In 1805 Canova was made a knight of the golden spur, and received the appointment formerly held by Raphael, that of superintendent of antiquities, and at the same time inspector of the fine arts. A few other works of this time must be mentioned; those most remarkable for grace and beauty are—the "Venus," now in the Pitti palace, made to replace the Venus de Medici carried to Paris; three "Dancing Girls," in various collections; the "Three Graces," in this country; "Hebe;" and the Trojan "Paris," now in the Glyptothek at Munich; most of them several times repeated.

In 1810 Canova visited Paris a second time, to make a bust of the Empress Maria Louisa; his brother, the Abbate Canova, accompanied him as his secretary. Napoleon wished to retain the sculptor in Paris, but Canova was not to be turned from his purpose by persuasion. He returned to Rome the same year, and was allowed to re-establish the academy of St. Luke, now located in the Fabbrica Vecchia. Canova was elected president or *principe*. In 1815 Canova acted as the papal commissioner to select, for restitution, the works of art which had been plundered by the French from the government of Rome, and he was forced to make a long sojourn in Paris for that purpose. From Paris he repaired to London, and had an opportunity of examining the Elgin marbles, on which he gave an opinion. On his return to Rome in the beginning of 1816, he was created by the pope, for his services in the restitution of the plundered works, Marchese d'Ischia; his name was written in the golden book of the capitol; and he was granted an annual pension of 3000 scudi—about £630—the whole of which income Canova spent on public uses for the encouragement of the arts in Rome. Towards the close of his career he was engaged in building a temple, or Doric church, at Possagno, his native place, for which he had already painted the altarpiece—"The Descent from the Cross." In his excitement in superintending this structure he neglected his health, and he died at Venice, October 12, 1822. His funeral was performed with great honours in the basilika of St. Mark, and his body was buried at Possagno, in the temple constructed by him there. In the interior is placed the monument to Canova, made by general subscription from a sketch by Canova himself, originally for a monument to Titian. It is similar in plan to the great mausoleum by him, raised to the Austrian Archduchess Christina at Vienna. Canova's works are extremely numerous, and they are well known from the many excellent engravings from them. He was the most able and productive of modern sculptors. His works are generally beautiful—the male as well as the female combining natural truth with classic beauty and proportion. His extraordinary ability and industry are both displayed to advantage in the noble collection of casts after his works, now preserved in the academy at Venice. "Hercules, with the tunic of Dejanira, hurling Lycas from the rock into the sea," is a most imposing group. He has been styled by some the renovator of sculpture among the moderns, and the reviver of the antique; but he has been reproached by others as too effeminate in his style. He excelled most in female figures; and in the power of rendering the effect of flesh he is almost alone. Though his masterpieces are less vigorous and grand than some of the great works of ancient art, such as the Torso of Apollonius, or the so-called Discobolus of Naucydes, he is often more beautiful and more natural, and at the same time free both from affectation, and from the severe rigidity which characterizes the antique. The attitude of the Apollo Belvedere

is fine, but its great beauty is in the head; the body and limbs are inferior to many of the figures of Canova; and it is difficult to imagine anything more graceful or beautiful than some of his female figures. There is a fine portrait of Canova by Sir Thomas Lawrence.—(Missirini, *Vita de Antonio Canova*, 1827, Quatremère de Quincy, *Canova et ses ouvrages*, 1836.)—R. N. W.

CANOVAI, STANISLAUS, born at Florence in 1740; died in 1811. An ecclesiastic, professor, at Cortona, of mathematics; afterwards professor of mathematics at Parma. He published some tracts insisting that Columbus was not entitled to the credit of having discovered America, and claiming the honour for Americus Vespuccius. He also published some elementary treatises on mathematics.—J. A., D.

\* CANROBERT, FRANÇOIS CERTAIN DE, a distinguished French general, born in Brittany in 1809. He entered the army as a private in 1830, but doing good service in Africa and elsewhere, he soon attained the command of a regiment of Zouaves, and the rank of brigadier-general. In 1853 he became a general of division, and in the following year was sent to the Crimea, to command the first division under Marshal St. Arnaud. On the death of that distinguished soldier, Canrobert was raised to the command of the French army, and fought bravely at Inkermann; but in 1855 he resigned in favour of General Pelissier, and took his place at the head of his old division. He was created marshal in 1856.

CANSSUIH, a Circassian, who was in 1632 appointed pacha of Yemen, and sent thither to quell a revolt against the authority of the Porte. The expedition was unsuccessful, and the Turkish power in Yemen came to an end.

CANSTEIN, KARL HILDEBRAND FREIHERR VON, was born of an old noble family at Lindenberg, August 4, 1667, and died at Berlin, August 19, 1719. After having studied law at Frankfurt-on-the-Oder, he became attached to the court of Berlin, and afterwards served as a volunteer in the Netherlands, until by a dangerous and protracted illness, he was obliged to return to Berlin, where he formed an acquaintance with Spener and Francke. He actively joined in their pious and philanthropic endeavours, by founding the celebrated "Bibelanstalt" at Halle, which still bears his name, and by which upwards of five millions of bibles have since been published. He wrote a "Harmonie der vier Evangelien" and a "Life of Spener."—K. E.

CANT, ANDREW, an influential Scotch presbyterian clergyman of the seventeenth century, was incumbent of Pitsligo in 1638, and afterwards one of the ministers of Aberdeen. He took a leading part in the abolition of episcopacy, in the promotion of the national covenant, and in all the other measures of the zealous presbyterians during the great civil war. At the division in the ranks of the presbyterians in 1660, Mr. Cant joined the protesters or extreme party, who wished to exclude from the national service all who had not approved of the solemn league and covenant. But he was at the same time a staunch royalist; and even when the English troops were stationed in Aberdeen, he boldly prayed in their presence for the exiled king, Charles II., that "the Lord might deliver him from the bondage of oppressors." On one occasion, some of his military auditors were so enraged at his denunciations of the policy of Cromwell, that they drew their swords and threatened to slay him. Mr. Menzies, the colleague of Mr. Cant, was so terrified that he hid himself beneath the pulpit; but the indomitable preacher, who in his day had wielded the sword as well as the bible, bared his breast, and expressed his readiness to receive the blows of his assailants, "if any will venture to give them, for the truth." At the Restoration he was of course ejected from his church, and obliged to leave the town. He died in 1664. It is very generally supposed that the word "cant" was derived from the name of this zealous and upright, though somewhat rigid divine, but it was in use before his day.—A clergyman bearing the same name, and supposed to have been the son of Andrew Cant, was one of the ministers of Edinburgh during the reign of Charles II., and was also principal of the university between 1675 and 1685. He must, therefore, have been an episcopalian. An Andrew Cant was consecrated one of the bishops of the episcopal church in 1722, and died in 1728; but he was probably the son of the principal, and grandson of the famous "apostle of the covenant," as the royalists termed the minister of Aberdeen.—J. T.

CANTACUZENE, CONSTANTINE. See BESSARABA.

CANTACUZENE, DEMETRIUS, brother of Scherban II.,

waiwode of Moldavia; he was detested by his subjects, and fled to Poland in 1679. He was restored only to be again deposed—this time by Ibrahim Pacha in 1685.

**CANTACUZENE, JOHN V.**, emperor of the East, and one of the Byzantine historians, was born about 1295. He held high office under Andronicus the elder, and attained the highest importance in the state when his grandson Andronicus came to the throne in 1328. He did eminent service to the empire under this younger prince, and on his death in 1341, was appointed regent during the minority of John Palæologus. Exposed to the intrigues of the empress dowager, the patriarch, and some of the nobles, he in self defence, and at the entreaty of the army, assumed the purple, and was crowned at Hadrianople in 1342. It was not, however, till after a civil war of five years that he entered Constantinople, and was acknowledged as joint emperor with John Palæologus. The union was not lasting, for in 1353 jealousies sprang up, and a new war began, which lasted till 1355, when Cantacuzene abdicated and retired to a monastery. He then took the name of Joasaphus Christodulus, and wrote in four books a "History of the Byzantine empire from 1320 to 1355," which forms one of the series of Byzantine histories. He also wrote an apology for the christian faith against Jews and Mohammedans. It is said that he lived more than a hundred years, but the date of his death is uncertain.—J. B.

**CANTACUZENE, MATTHEW**, son of John V., born in 1325. He continued the civil war after his father's death, and was forced by John Palæologus to renounce his title to the throne.

**CANTACUZENE, SCHERBAN**, who made a doubtful claim of descent from John V., was a native of Wallachia, of which he rose to be waiwode in 1678. He long aspired to the throne of Constantinople, and was imprisoned in 1672. Released by the Turks, and holding office under them, he nevertheless conceived the design of driving them from Europe, and coming to the throne of his ancestors. He plotted with the Emperor Leopold and the Czar of Muscovy, but his scheme had just been discovered when he died in 1685.—J. B.

**CANTACUZENE, STEPHEN III.**, son of Constantine Cantacuzene, succeeded his cousin, Constantine Brancovan, in 1714. (See BESSARABA.) Chosen as a pretext for the deposition of his cousin, the Turks immediately determined to get rid of him also. He was executed at Constantinople in 1716, and with him perished the native line of princes.

**CANTARINI, RABBI ISAAC CHAYIM COHEN**, was of the family of the Chasanim, of which word Cantarini is a translation. This great scholar was a native of Padua, where his father had occupied an honourable position. Isaac Cantarini studied medicine at the university of his native city; and although the religious affairs of the congregation over which he was appointed rabbi claimed his principal attention, he never relinquished entirely the practice of medicine, in which, indeed, he arrived at considerable eminence, according to the testimony of contemporary authorities. Some of his Hebrew writings have a mystic tendency, and are composed in a correspondingly obscure although elaborate style. Of this character is "Eth Kez" (The Time of the End), in which the advent of the Messiah is calculated, although investigations of this kind are discountenanced by the rabbinical law. His "Pakad Yitzchak" (The Awe of Isaac), gives an account of the persecution suffered by the Jews at Padua on August 20, 1684. Wolf attributes to Cantarini the authorship of *Vindex Sanguinis*, an apology, in Latin, of the Jews against the absurd accusation of using christian blood in the making of the unleavened passover-bread.—T. T.

**CANTARINI, SIMONE**, called **SIMONE DA PESARO**, was born in 1612. He attained to unquestionable eminence, both as a painter and an engraver. He studied under Giovanni Giacomo Pandolfi, Claudio Ridolfi, and afterwards under Guido Reni. He endeavoured to establish a school at Bologna, but, failing to obtain pupils, in great disgust he set out for Mantua. The duke proffered the sunshine of his patronage, and ordered a portrait. For some cause, either from a want of honesty, or too much of it in the picture, the duke was by no means satisfied. Cantarini's insolent and irritable temper of mind could not bear up under this disappointment. He died in 1648 at Verona, where he had retreated. Stories were told of his having been poisoned by a jealous rival, but of this nothing certain has been ascertained. Cantarini had great talent, but it was of the imitative character merely. He came very near to Guido, not because he could create like him, but because he could copy him. His etchings are

very spirited and clever, but still reflective of a greater man's spirit and cleverness. His saints' heads have been called prodigies of beauty.—W. T.

**CANTE DEL GABRIELLI D'AGOBIO**, became podestat of Florence in 1301. Allied with Charles of Valois, he had already rendered himself odious by his part in the massacre of the Bianchi. His rule was mercilessly severe; and in the records of his numberless decrees of banishment appear the names of Dante, and of Petraccio, the father of Petrarch.

**CANTEMIR, ANTOCIUS**, a Russian poet, fourth son of Demetrius, born in 1709; died in 1744. Having been carefully educated for the imperial service, Cantemir, while still a youth, was rapidly promoted. In 1730, when Anne of Courland came to the throne, his prudence defended her from the machinations of the aristocracy. He was sent as ambassador to London, and afterwards to France. His last years were devoted to study.

**CANTEMIR, CONSTANTINE**, waiwode of Moldavia in the seventeenth century. He served after his father's death in the Polish army, and having returned to Moldavia, ultimately, in 1684, became waiwode of that province. In the war between Sobieski and the Turks, he, being a christian, remained neutral, except so far as to succour the former in his retreat. By means of his political cunning and ability he deluded the Turks, and died on his throne—the latter a rare thing among waiwodes.

**CANTEMIR, DEMETRIUS**, son of the prince of Moldavia, was born in 1673. He was disappointed in his hope of succeeding to his father's dignity, but in 1710 was made governor of Moldavia and sent to defend it against Peter of Russia. He conceived the design of betraying it to the enemy, and when the Russian arms failed, left the territory and became a follower of the czar, receiving large estates and lucrative appointments under his new master. He died in 1723. Cantemir was a learned man, and has left several works, of which the most important is, "A History of the growth and decay of the Ottoman Empire," of which an English translation appeared in London in 1734. Gibbon says this history is full of blunders, and it is now known to have been taken from an inaccurate abridgement of Saad-eddeen's Turkish history.—J. B.

**CANTER, GUILLAUME**, born at Utrecht in 1542; died in 1575. After the usual courses of study in Holland, he learned Greek at Paris from Jean Dorat, and then travelled in Germany and Italy. He is described as on his return from his travels refusing all public employment, and giving himself entirely to his studies—never visiting a friend or receiving a visit. Lipsias describes him as always with an hourglass or clepsydra before his eyes, and devoting each hour to some separate branch of study. He published eight books of what he styled "Novæ Lectiones," being suggested emendations and explanations of passages of Latin writers. He edited Euripides, Sophocles, and Æschylus. His early death is ascribed to overwork.—Two brothers of his are also mentioned as distinguished scholars—**THEODORE**, who published some classical tracts; and **ANDREW**, whose name is found in lists of learned children.—J. A., D.

**CANTON, JOHN**, born at Stroud in 1718, died in 1772; an eminent cultivator of physics. His researches lay chiefly in the field of electricity. We owe him the pith-ball electrometer, and other instruments. He demonstrated the compressibility of water, and he recognized the important fact that clouds are in opposite electric states.—J. P. N.

**CANTONI, SIMONE**, an Italian architect who died in 1818. He was a native of Maggio, and having studied at Rome, settled at Milan, where, as well as at Como and Bergamo, he erected some noble mansions. He rebuilt the great council hall in the ducal palace of Genoa, destroyed by fire in 1777.

\* **CANTU, CESARE**, an Italian historian, born in the village of Brisio, near Milan, in 1805. His father, Celsio, having died suddenly in 1828, he became the head and only support of a very large family. At the age of eighteen he obtained a professorship of belles-lettres, first at Soadrio, then at Como, and finally at Milan. His first work, a tale entitled "L'Algisa della mole dell' Iddegondo," he published when only twenty-two years of age. This was followed by a continuation of the history of Como, some comments on the history of Lombardy, and a variety of treatises and essays, and some poems, the most remarkable of which is the "Madonna of Imbevero." His ode, "The Exile," the Lombard peasants sung triumphantly as they were driven from their homes after the defeat of the Piedmontese army in 1848. If he had written nothing more than his

sacred hymns, his odes to Romagnosi and Parini, and the historical novel, "Margherita Pusterla," all published before 1845, he would have been entitled to a high place in the history of modern literature. But in the dreary solitude of a prison he was to execute a work which marked him out to his countrymen as the first of their historians. His attachment to liberal ideas, and his undisguised abhorrence of the Austrian yoke, drew on Cantù the animadversion of the governor of Lombardy, who caused him to be arrested, and confined nearly a year in the Santa Margherita, the prison in 1821 of Silvio Pellico. Here he wrote his famous "Universal History," a colossal work that has already gone through seven editions. In the memorable year 1848, Cantù followed the Piedmontese army, led by the unfortunate King Charles Albert, against the oppressors of his country; and, after the fatal issue of that unequal contest, Cantù was obliged to seek shelter under the Sardinian flag, and fixed his residence at Turin, refusing many honours and rewards offered him by the government of that kingdom. Austria, however, dreading the mighty influence of the great historian's name on the fervid imagination of the youth of Piedmont, thought proper after a while to ignore the part Cantù had taken in the preceding political events of Lombardy, where he now resides, honoured and esteemed even by his enemies. Cantù has been decorated by many sovereigns, and his name enrolled in almost all the academies and societies in Europe.—A. C. M.

CANUTE I., surnamed DANA-AST, a Danish prince of the tenth century, son of Gorm the Old, who united into a monarchy the various Danish estates. His mother was the famous Queen Thyra Danebod. This prince, who, although he never reigned, is regarded as the first of the name, perished in an expedition into England.

CANUTE II. or THE GREAT, the Danish king of England in the eleventh century. His father, Sweyn, had obtained almost complete ascendancy in England, and had driven the Saxon king, Ethelred the Unready, to seek refuge in Normandy; but on his death in 1014 the nobles invited Ethelred to return. That weak and unprincipled king found Canute a too formidable opponent. The Danes were laying the country waste, and some of the Saxon nobles were deserting to their side. Ethelred, cowardly and discouraged, retired to London, where he died in 1016. His son, Edmund Ironside, who had already taken up arms in defence of his father's government, was more equal to the occasion; and had it not been for the base treachery of Eðric, one of his nobles, he might have retrieved the fortunes of the Saxon line. As it was he fought bravely; but after several battles, and the almost complete desolation of the country, a compromise was effected and the kingdom divided. Edmund obtained Wessex, while Mercia and the north fell to Canute, who, when Edmund was murdered in 1017, became sole king of England. He confirmed his power by banishing the sons of Edmund and marrying Emma, sister of the duke of Normandy and widow of King Ethelred; while he established his popularity by putting to death some of the Saxon nobles who had been most treacherous to their former prince, and by sending back to Denmark, as soon as he could do so with safety, many of his adventurers. Canute soon came to love his new subjects and have full confidence in them. Having undertaken an expedition to Denmark against the king of Sweden, he was attended by Earl Godwin and a band of Saxon warriors, whose bravery secured his victory, and won his lasting esteem. In another expedition, undertaken in 1028, he conquered Olaus, king of Norway, and added that kingdom to his now vast dominions. In his later years he became distinguished for his piety and devotion, building churches, founding monasteries, and performing a pilgrimage to Rome. The well-known story of his reproof to his flattering courtiers by the sea-shore, gives us a glimpse of something beautiful in the heart of the rough old warrior. He stands distinguished among conquerors as one who sought to preserve the liberty, and in every way advance the prosperity of the people he subdued. His last expedition was against Malcolm of Scotland, who refused to pay homage as a vassal for the county of Cumberland. Canute died in 1036, having reigned for twenty years.—J. B.

CANUTE III., called HARDI-CANUTE, son of Canute the Great, was elected king of Denmark on the accession of his brother Harold to the throne of England, and, at the death of that prince, became master of both kingdoms. This last of the Danish kings of England died in 1042, after a short and uneventful reign.

CANUTE IV. or THE PIOUS, succeeded his brother, Harold the Simple, on the throne of Denmark in 1074. He won the epithet by which he is distinguished for his wars against the idolatrous tribes of the north, and for his submission and liberality to the clergy at the expense of his subjects, who at length, on his proposing an expedition against England, broke into open revolt. He was killed in Funen in 1087.

CANUTE V., son of Magnus, and grandson of Nicholas, one of the three princes, who, on the death of Eric, king of Denmark, in 1147, began a contest for the crown of that kingdom, which lasted ten years; Canute being assassinated in 1157, and his brother Valdemar being obliged to take to flight.

CANUTE VI., king of Denmark, succeeded his father, Valdemar I., in 1182, and reigned till 1203. In this reign the country was remarkable for its prosperity and the great success of its arms.

CANUTE, son of Eric III. of Denmark, was appointed to govern the duchy of Sleswick, then attacked by the prince of the Vandals. Canute defeated the invader, and at the same time so won his esteem, that he was appointed guardian of his children and kingdom. He soon became duke of Mecklenburg, and received the title of King of the Vandals; but a conspiracy was formed against him by his uncle, the Danish king, who was jealous of his success, and he was put to death in 1133.

CANUTE, son of Eric the Holy, king of Sweden, fled into Norway on the death of his father and accession of Charles; led an army into Sweden; displaced the new king; and himself ascended the throne in 1169. He successfully resisted the Danes and Goths, and reigned for twenty-three years with great justice and prosperity.

CANUTI, DOMENICHIINO MARIA. This Bolognese artist was born in 1620. He studied under Guido, and attained more reputation than any other of his pupils. His picture of "The Descent from the Cross," in the church of the Olivetani at Bologna, is accounted very highly, from its extraordinary moonlight effect. This work is always called the "Notte del Canuti." He etched very successfully in the manner of Guido, with more finish, but less genius. He died in 1684.—W. T.

CANZ, ISRAEL GOTTLIEB, a learned German theologian of the eighteenth century, was born on the 26th February, 1690, in Wurtemberg, and studied at Tübingen, where he became professor of eloquence and poetry in 1734, of logic and metaphysics in 1739, and of theology in 1747. He was at first opposed to the philosophy of Wolf and its application to theology; but farther study and reflection changed his views, and induced him to give to the world in 1728, his principal work, entitled "Philosophiæ Leibnitzianæ et Wolfianæ usus in Theologia, per præcipua fidei capita." His "Compendium Theologiæ Purioris," published in 1752, was written in the same spirit, and exhibited the doctrinal system of the Lutheran church as modified and supported by the principles of the Wolfian philosophy. Canz published a good many other writings on theology, morals, and philosophy; but he is now only remembered as having contributed more than any other author to the ascendancy which the Wolfian philosophy obtained for a time over the theological mind of Germany. He died on the 28th of January, 1753.—P. L.

\* CAP, PAUL ANTOINE, a French pharmacologist, was born at Macon on April 2, 1788. He is devoted to the natural sciences, and has given his attention particularly to pharmacy. He is a member of many learned societies, and a chevalier of the legion of honour. Among his works are the following—On the classification of drugs; on the inspection of pharmacists; "Elementary Principles of Pharmacy;" treatises on botany and on pharmacy; and numerous articles in the *Journal de Pharmacie*.—J. H. B.

CAPDUEIL or CAPDUEILII, PONS DE. Of Capdueil little is known, except that he was a nobleman and a troubadour belonging to the diocese of Puy-Sainte-Marie, who died towards the close of twelfth century. Late in life he assumed the cross, and became a preacher of the crusades. He wrote poems in furtherance of the object, calling on sovereigns to suspend their private wars till the holy sepulchre was delivered. He himself died in the east in the third crusade.—J. A. D.

CAPECE, CONRADE, MARINO, and JACOPO, three Neapolitan nobles and brothers, put to death in 1268. Devoted to the house of Suabia and the Ghibelline party, they abetted Manfredi in his attempt on the throne of Naples. After his death, Conrade and Marino were commissioned by the Ghibelline nobles to offer the standard of Suabia to Conradin his nephew, and the

last prince of that house. Conradin agreed to put himself at their head; but the brief prosperity of his cause was utterly extinguished at the battle of Tagliacozzo, after which the Capece, along with many of the Ghibellines, were mercilessly slaughtered by Charles of Anjou.

CAPECE-LATRO, GIUSEPPE, a Neapolitan archbishop, born in 1744; died in 1836. More liberal than most of his order, Capece-Latro wrote against the hierarchical pretensions of the Roman see, as well as against the celibacy of the clergy. At the outbreak of the Revolution he advised the reformation of abuses, but without effect. Imprisoned after the Restoration, the king was soon forced to set him again at liberty. He was minister of the interior under Joseph Bonaparte and Murat.

\* CAPEFIGUE, BAPTISTE HONORE RAYMOND, French historian, born at Marseilles in 1801. Perhaps no writer could be named who has produced so many historical volumes as this prolific author; and although his works are not deficient in grace and vivacity of style, they have failed in creating that high reputation which such untiring labour would seem almost of itself to merit. To enumerate his writings would be to chronicle every portion of French history, from the earliest period down to the reign of Louis Philippe, which alone occupies ten large volumes. Besides general histories, he has written memoirs of modern statesmen and public characters who have figured at different times. As a critic of men and manners he has been guilty of the greatest errors. What is to be thought of a grave historian and politician, who can take for the subject of solemn eulogy that duke of Richelieu, the most notorious profligate of the infamous profligates of the reign of Louis XV., and who has attempted to raise madame de Pompadour from the mire, and place her on a par with Jeanne d'Arc, attributing to this adulteress and courtesan the purest motives of patriotism? As a political writer, Capefigue did himself much injury by the assumption of a misleading *nom de plume*. He who had never been in office, nor had even represented a constituency, published bulky pamphlets under the title—*homme d'état*. The title in this case was unwarrantable, because it offered a voucher for the position of the writer; it was as if one who had never received a diploma should give out a treatise as the work of a physician, or a layman write under the title of a church dignitary.—J. F. C.

CAPEL, ARTHUR, was the son of Sir Henry Capel, sheriff of Essex. In 1640 he was chosen to represent the county of Hertford in the celebrated "long parliament," and was elevated to the peerage in 1641 by the title of Lord Capel of Hadham. When the civil war broke out he espoused the side of the king, and raised and maintained a troop of cavalry at his own expense. On the total ruin of the royal cause Lord Capel submitted to the parliament, and retired to his mansion at Hadham. When the designs of the republican party became manifest, he once more took the field; and along with Goring, Sir Charles Lucas, and other cavaliers, threw himself into Colchester, which was immediately besieged by Fairfax and Ireton. After a protracted and desperate resistance, during which the garrison were reduced to feed on putrid horse flesh, and even on more disgusting substances, they were compelled to surrender. Sir George Lisle and Sir Charles Lucas were immediately shot. Lord Capel was condemned by the commons to be banished; but some of the parliamentary leaders, judging the sentence too lenient, caused him to be committed to the Tower. After the execution of the king he contrived to make his escape, but was apprehended two days after, and brought to trial at Westminster for treason and other high crimes. He pleaded that he was a prisoner of war, and that his life was promised him by Fairfax; but the plea was rejected, and he was executed in Palace-yard on the 9th of March, 1649, displaying on the scaffold the greatest calmness and dignity. Lord Capel was the author of "Daily Observations, or Meditations Divine, Moral, and Political," to which are added "Letters addressed to several persons;" a posthumous publication, afterwards reprinted under the title of "Excellent Contemplations," with an account of his life. While lying in the Tower he wrote several stanzas, which were published in the *Gentleman's Magazine* for 1757.—J. T.

CAPEL, ARTHUR, son of the preceding, was, after the Restoration, created Viscount Malden and Earl of Essex. He filled the office of lord-lieutenant of Ireland from 1672 to 1677, and was subsequently made first commissioner of the treasury. He had been a prominent member of the country or whig party, but consented to take office with the view of effecting a reconcilia-

tion between that party and the throne. The perfidy of Charles, however, and his arbitrary designs against the liberties of the people, speedily produced an irreparable breach between him and the whigs. Essex was implicated in the charges brought against his friends, Lord William Russell and Algernon Sidney, and perished by his own hand in the Tower, 13th July, 1683. "He was," says Lord Macaulay, "a man of solid, though not brilliant parts, and of grave and melancholy character."—J. T.

CAPELL, EDWARD, a laborious commentator on the works of Shakspeare, was born near Bury, Suffolk, in 1713, and died at London in 1781. He held the office of deputy-inspector of the plays, with an annual salary of £200. In 1768 his long projected edition of the plays of Shakspeare appeared in ten volumes, with an elaborate and strangely-written introduction. In these he gave promise of some others which were afterwards published, containing notes, comments, and various readings; and also of a work named "The School of Shakspeare," containing extracts from English books in print during the lifetime of the dramatist, and from which he might have taken his fable and part of his dialogue.—J. B.

CAPELLA, MARTIANUS MINEUS FELIX. The dates of Capella's birth and death have not been ascertained. He lived towards the close of the fifth century of our era. A passage from the eighth book of his poem on the "Nuptials of Philologia and Mercury," seems to prove that he was born, or at least educated, at Carthage. His biographers say that he was at one time proconsul, but the rank seems to have been given him without any evidence. Nothing is known of him but that he left a work, entitled "De Nuptiis Philologiæ et Mercuriæ," which is a kind of encyclopædic romance, partly written in verse and partly in prose, in the manner which was adopted by Boethius, and which Cowley sought to introduce into English literature, in essays written with such felicity that we feel surprised at his not having found many imitators. Capella's subject is the circle of the sciences, according to the views taken of them in his time. The poem consists of nine books. Mercury is weary of single life, and determines to marry. The first object of his choice is the fair Sophia (Wisdom). She has unluckily made a vow of celibacy, and so Sophia cannot be his. Psyche is next thought of, but Psyche's old engagement with Cupid interferes. At Apollo's recommendation the disappointed god looks round him again, and is attracted by a young lady of great learning, and who, it is suggested, may not be unwilling to change her name, and so he addresses Philologia, who accepts him with an absolute shout of delight. There are, however, difficulties: Mercury is the son of Jupiter, Philologia a mere daughter of the Earth, and in heaven marriages of disparagement are not approved of. The difficulties, however, are got over. Such is the subject of the first book. In the second, Philologia ascends to heaven to the circle of Mercury. She arrives at the milky way, and then her marriage is celebrated with great splendour. Seven more books follow. The first of the seven—the third of the work—tells us of Grammatica, the daughter of Mercury. Dialectica, an Egyptian woman with sparkling eyes, is the subject of the fourth book. She has a taste for argument, but gives way to her sister Rhetorica. Rhetorica reveals the secrets of her art, which are reducible to a few elements; but the fervour of her nature is expressed by her printing a burning kiss on the forehead of Philologia. Geometry, in the sixth book, commences a lecture on the science known by her name; but the subject not being adapted for prelections, she hands a copy of Euclid to the god who presides. Then comes Arithmetic speaking on her fingers, and is followed by a splendid phantom, Astronomy, a virgin with dazzling hair, limbs covered with eyes, and wings on her shoulders. She is summoned from a hollow globe by Apollo. In this book is a remarkable passage, which is said to have suggested to Copernicus his system of the universe. Capella says that Venus and Mercury do not revolve round the earth, but round the sun as the common centre of their orbits. The ninth book closes the work. In it Musica explains the theory of her art, and a hymn from her terminates all. The book was probably once popular, as few works are so often found in manuscript. It has been often printed. Grotius, when but fifteen, published an edition of some character. The best edition is Kopp's, Frankfort, 1836. Leibnitz at one time proposed publishing it.—J. A., D.

CAPELLARI, GENNARO, an Italian jesuit, celebrated as a Latinist, was born at Naples in 1655. After a sojourn at Rome,

where he was on terms of friendship with the most eminent men of the capital, he was pursuing quietly his literary avocations in the society of his early friends, when, having incurred the enmity of a prince of the church, he was accused of treason, and without even the show of justice, condemned to death in 1702. His principal works are—"De Laudibus Philosophiæ;" a Latin poem on comets; and a history of the Arcadian union. He wrote also some dramas, sonnets, and canzones.—A. C. M.

**CAPELLEN, GODERD GERARD ALEXANDER PHILLIP**, born in 1778; died in 1848. Capellen, whose career began early, was appointed préfet to East Friesland by Louis, king of Holland. After this he held several high offices. But his best services to his country were rendered when he was first colonial minister, and afterwards governor-general in the East. He greatly increased the revenue of the Dutch colonies.

**CAPELLEN, THEODORE FREDERICK**, Baron van, born in 1762; died in 1824. Capellen spent the first part of his life cruising chiefly in the North Sea, and off the coast of Africa. When the Dutch fleet in 1799 surrendered to the British, Capellen was condemned to death for contumacy. He escaped to England; but subsequently served under the Dutch flag.

**CAPELLI, MARCO ANTONIO**, an Italian scholar, author of a treatise on the Last Supper. He took part with the Venetian republic against the interdict of Paul V., but was afterwards reconciled to the pope. He died in 1625.

**CAPELLO, BIANCA**, second wife of Francis de Medicis, grand duke of Tuscany, was the daughter of a Venetian noble. Having formed an attachment for Bonaventuri, a Florentine merchant, she fled with him to his native city, where her beauty and talents attracted the notice of the grand duke. On the death of his first wife he married her, and granted her an influence which she so abused, that she acquired the name of the "Detestable Bianca." She died in 1587, the day after her husband, and of the same disease, but not without the suspicion of its influence being aggravated by poison.—W. B.

**CAPELLUS or CAPPEL, LOUIS**, an eminent French Hebraist, called by Bishop Hall "Magnum Hebraizantium oraculum in Gallia," was born at Sedan in Champagne about 1579. He seems to have studied at Oxford, going thither in 1610, and residing for a time at Exeter college. On his return he became professor of oriental languages at Saumur, where he died, 16th June, 1658. Capellus is chiefly famous for his controversy with the younger Buxtorf, concerning the antiquity of the vowel points in Hebrew. Buxtorf the elder had written a treatise in defence of the opinion, that the points are coeval with the language, and were always in use among the Jews, and his son defended his position. On the other hand, Capellus held that they were an invention of the modern rabbis, to preserve a language which was fast ceasing to be spoken, and ascribed them to the Masoreth Jews of Tiberias, about 600 years after Christ. He defended his opinion in a treatise entitled "Arcanum punctuationis revelatum." So great was the opposition of the French protestants, who feared that were the theory of Capellus received they would lose many of their arguments against the Vulgate, that it was only in Holland he could find liberty to print his paper. He had the misfortune once more to displease his protestant brethren—tremblers for the authority of the canon—by writing his "Critica Sacra," a collection of various readings and errors which he noted as having crept into the text through the fault of transcribers. He was occupied for thirty-six years in preparing this learned work, of which Grotius writes in the very highest terms. Of his other works we note "De gente Capellorum," in which he gives some account of his own life; "Spicilegium post messem," a collection of criticisms on the New Testament; "Chronologia Sacra," to be found among the prolegomena to Walton's Polyglot; an edition of the "Critica Sacra," containing many of his minor tracts, published at Halle in 1775 and 1778.—J. B.

**CAPERAN, ARNAUD THOMAS**, born in 1754 at Dol, and died in 1826; a learned orientalist, employed at Rome in the college Mariano in teaching Syriac and Persian, afterwards acting as curé of the parish of Tronchet in his native district. His learning was very considerable, but towards the close of his life he became insane. The subject of the Incarnation had occupied his thoughts, and on it he published some tracts. He believed himself to be the Messiah. He published several philological works.—J. A., D.

**CAPET, HUGUES or HUGH**, son of Hugues the Great; crowned king of France in 987; died in the year 996. *Capet* is a sur-

name of unknown origin, bestowed and accepted, that this Hugues might be distinguished among the multitudes of chieftains named Hugh. Whatever its origin, it has passed into the family name of a succession of sovereigns, stretching through a space of years far exceeding the duration of our Plantagenets, and quite as illustrious. "Remember," said Marie Antoinette to her vacillating husband, "remember thou art a Capet." The Capets belonged to Anjou; they were obscure chieftains, first known in the reign of Charles the Bald. Step by step this family advanced. We learn, from its annals, of Robert the Strong, of Eudes, of Hugues the Great—the list culminating in Hugh Capet, sovereign of all France. Capet had the wisdom to recognize the realities of his position. Although nominally sovereign, many counts were at his side, some of whom were richer than he, and as powerful. With consummate sagacity he rallied these men around the throne, as its grand vassals; and then, for the first time, Feudalism, which, of course, had its roots long laid in the constitution of society, became a recognized and orderly part of the government of France. Hugues on his accession found seven great princes in existence, each with a vast territory. He increased the number to twelve, and on these, as on twelve massive pillars, he rested the dome of the monarchy. But he also delivered the monarchy from entanglements, establishing hereditary succession, and bestowing the dangerous office of "master of the palace" on the king's eldest son. This grand institution stood for ages. The number of the great vassals indeed gradually increased—the power of each being thereby weakened; but civilization proceeded under its guardianship until the relentless axe of Louis XI. cut down those supports, and left the monarchy sustained by the strength of the king alone.—J. P. N.

**CAPILUPI, CAMILLO**, author of a work which answers to the strange description of an apology for the massacre of St. Bartholomew's day; born at Mantua, died towards the end of the sixteenth century. His eccentric, although deeply serious account of the horrible work of Charles IX., was, fortunately for the fame of the author, suppressed by the cardinal of Lorraine. Capilupi had some success in Latin poetry.—A. C. M.

**CAPILUPI, LELIO**, an Italian author, elder brother of Camillo, born at Mantua in 1498. Moreri considers Lelio the greater of the two brothers. He wrote a parody of Virgil's *Æneid*, in which he has surpassed Ausone and Proba Falconia. According to De Thou, an eminent authority, but that Capilupi wrote on subjects unknown to the Roman bard, his versification might be mistaken for that of Maro himself. He died in 1560.—A. C. M.

**CAPISTRANO, GIOVANNI DE**, a Franciscan, born at Capistrano in Italy in 1385. He was originally a lawyer; but having taken holy orders, he became a zealous servant of the church, first against the Hussites, and afterwards against the Turks under Mahomet II. He died in 1456, soon after the victory of Belgrade, to the gaining of which he very much contributed. He wrote a work entitled "Speculum Clericorum," in which he defended the full power claimed by the pope and councils.

**CAPISUCCHI, PAOLO**, a Roman prelate, born in 1479; died in 1539. Capisucchi, come of a warlike family, rose rapidly in the church. Being asked by Clement VII. to consider of the question, he gave his opinion against Henry VIII. in the matter of his divorce. He was employed by the popes in many difficult negotiations.

**CAPITO, CAIUS ATEIUS**, an eminent Roman jurist of the time of Augustus, is known chiefly as the founder of a celebrated school of law. His father had been tribune of the people, and had taken an active part in public life in the time of Cæsar. The date of Capito's birth is not known; but Augustus made him consul suffectus, A.D. 5, when he was probably about forty-two, the proper age for appointment to that office. In the year 13 he received the important office of "curator aquarum publicarum," which he held till his death in 22. Capito studied law under Ofilius. Tacitus describes him as skilled in every department of law, human and divine; but he is believed to have been but imperfectly acquainted with any other branch of knowledge. The position he attained proves that he possessed some ability. He certainly possessed ingenuity, which, being backed by a large share of servility, was sufficient to acquire for him the favour of Augustus and Tiberius. It is from anecdotes preserved by Suetonius and Tacitus, that we attain this knowledge of his character. When the widespread conquests and commerce of Rome had rendered the narrow

doctrines of her ancient jurisprudence no longer tenable, the party which still wished to preserve them unaltered found naturally their leader in Capito. This party was in favour with the emperors, who were afraid that changes which did not directly strengthen their power, might indirectly weaken it. Strangely enough, the opposite party found its leader among those who had most strenuously opposed the recent political changes. Labeo, a man of great ability, of courage, and old republican independence; holding the old ideas of freedom; skilled in all the known branches of science; and bringing all his knowledge to bear on his legal studies—was well fitted to lead those who demanded reform of the private law. A contest thus arose. Capito defended by ancient authority the existing laws; being willing, however, to modify them on individual points, where experience had proved them hurtful. Labeo attacked the system, and announced principles of law which, with strong logic, he pursued to their furthest consequences. Hence originated the two schools. That of Capito received the name of Sabiniani, from Masurius Sabinus, one of his followers; and occasionally that of Cassiani, from Cassius Longinus, another follower. The school of Labeo likewise received its name from one of his followers—Proculiani, from Sempronius Proculus. The contest between the schools continued long after the success of the principles of that of Labeo had become inevitable, and long after all traces of the original causes of dispute had vanished. Capito was a voluminous writer, but nothing beyond mere fragments has been preserved. He is quoted in the Pandects some nine times, but each time at second-hand, in quotations from other jurists. He wrote a work called "Conjectanei," in which he had collected various laws of Augustus and Tiberius; and also treatises—"De Publicis Indiciis;" "De Officio Senatorio;" and "De Pontificio Jure."—(*Gell.* xx. 2, and iv. 6, 10, 14.) Macrobius (*Saturn.* lib. iii., cap. 10) mentions a treatise—"De Jure Sacrificorum."—(*Tacitus, Annal.* iii. 70, 75; *Suetonius, De Illust. Gram.* 22; Pomponius, quoted in the *Pandects*, lib. i. lit. ii. fr. 2, § 47; Dirksen, *Beitrage zur Kunde des Römischen Rechts*, cap. i. § 1; Püchta, *Cursus der Institutionen*, v. § 96 to 99; Corn. van Eck, *De Vita, Moribus, et Studiis M. Antistii Labeonis et C. Atteji Capitonis*, in Oelrich's *Thesaurus Novus Dissertationum*, v. i. p. 825; Pothier, *Pandectæ Justinianæ Prefatio*, pars. ii. cap. i. § 25, 26, and cap. ii.; *Smith's Dictionary of Greek and Roman Biography*.)—J. D. W.

**CAPITOLINUS, T. QUINCTIUS BARBATUS**, a Roman patrician, who lived in the fifth century B.C. He was six times elected consul, and gained several brilliant victories over the Volscians and the Æqui. During his second consulship in 468 B.C. he was honoured with a triumph, and probably on that occasion received the surname of Capitolinus. In the dispute between the patricians and the plebeians in 471 B.C., he took the side of the latter, and assisted in passing the Publilian law, which enacted that the tribunes should be nominated in the comitia by the nobles. During his sixth consulship he refused the office of dictator, which was conferred upon his brother L. Quinctius Cincinnatus, and two years after, he served as lieutenant under the dictator Mam. Æmilius Mamertinus.

**CAPITOLINUS, JULIUS**, one of the authors of the "Augustine History," of whom nothing more is known save that he died in the early part of the fourth century of our era. He is said to have been of patrician origin. The "Augustine History" contains the lives of thirty-four emperors, and extends from the years 119 to 284, a period of one hundred and sixty-seven years. The sixth, seventh, and eighth of these lives are attributed on seemingly good authority to Capitolinus.—J. A., D.

**CAPITO or KOEPSTEIN, WOLFGANG FABRICIUS**, a German Hebraist and theologian, born in 1478. He studied theology and the canon law at Basle, where he also became a physician. He filled several ecclesiastical offices, and figured a good deal at diets and conferences, having the reconciliation of the protestant churches much at heart. He died of the plague in 1542.

**CAPMANY Y DE MONTPALAU, ANTONIO DE**, a Spanish writer, born 24th November, 1742. In his youth he was a soldier, and served in the wars against Portugal in 1762. We next hear of him as engaged in a scheme for colonizing the Sierra Morena, on the failure of which he returned to Madrid, where he remained until the entrance of the French in May, 1808. He afterwards became a prominent member of the Cortes of Cadiz, where he died of yellow fever in 1813. His

most important work is the "Teatro Critico de la Elocuentia Espanola." His "History of Barcelona" contains, besides topographical details, some valuable speculations on the influence of French manners in the south of Spain. He also composed an excellent French and Spanish dictionary, and some miscellaneous essays entitled "Questiones Criticas;" but he himself valued above all his others works a pamphlet, entitled "Centinela contra Franceses," or a Sentinel against the French, against whom, stung by the calamities they had inflicted on his country, he cherished the bitterest hatred. The work is dedicated in terms of warm friendship to Lord Holland.—F. M. W.

**CAPO D'ISTRIA or CABODISTRIAS, JOHN**, Count, president of Greece, was born in Corfu about 1780. His father was a physician, and chief of the Seven Islands at the time of the treaty of Tilsit, by which they passed under the protection of France. The son then entered the Russian service, and in 1812 was appointed private secretary to the Emperor Alexander. He soon after went as minister to Switzerland, accompanied Alexander to Paris in 1814, represented him at the Congress of Vienna, and afterwards conducted the department of foreign affairs in conjunction with Count Nesselrode. The Greeks in Turkey, disappointed that the congress of Vienna did not, as they had hoped, interpose in their favour, formed an extensive and carefully organized secret society, called the Hetairists, which embraced the flower of their population, and almost the whole of their clergy. Of this association Capo d'Istria and his master were, in all probability, the founders and leading members. But the insurrections which broke out in Spain and Italy in 1821 alarmed Alexander, and, adhering to the principles of the Holy Alliance, he declined to favour any movement of the kind in Turkey, though well aware that his support would secure success. Capo d'Istria immediately threw up his appointments, and retired to Switzerland, whence he watched the progress of the Greek insurrection. Nicholas succeeded Alexander in 1825, and the virtual independence of Greece was recognized by all the European powers except Turkey in 1827. On the 20th of April in that year Capo d'Istria was elected president for seven years by the national assembly at Troezen, and on the 18th of January following he landed at Napoli di Romania, and assumed the government. But the turbulent elements over which he presided were not easily to be reduced to order, and he did not meet with anything like unanimous support from his countrymen. So little confidence was felt by the European powers in the stability of the Hellenic government, that it was not permitted to take any part in the discussions which continued to be carried on for the settlement of its political position and geographical boundaries. In February, 1830, the plenipotentiaries offered the crown of Greece to Prince Leopold of Saxe Coburg. The letters of Capo d'Istria so strongly impressed this prince with the difficulties with which he would be surrounded, and the doubtful nature of his welcome, that he declined the proposal. Capo d'Istria remained president, but a general insurrection broke out against his authority, and he was assassinated at Napoli by two brothers named Mauromichaeli, on his way to prayers on Sunday morning, October 9, 1831.—A. H. P.

**CAPON, WILLIAM**, an English architect and scene-painter, born at Norwich in 1757. He was employed by Mr. Kemble in the decoration of the new Drury Lane theatre in 1794, and painted many of the scenes for Covent Garden. The works on which his fame rests are his plans of the old palace at Westminster, and ancient substructure of the abbey, which occupied him for more than thirty years. He died in 1827.

**CAPORALI, CESARE**, an Italian poet, born at Venice in 1531, and died at Castiglione, near Perugia, in 1601. He excelled in burlesque satire, which, in his hands, never degenerates into indecency or buffoonery. Secretary of three cardinals in succession, he was appointed governor of Atri in the Abruzzo, but resigned this post, and went to reside with Ascanio, marquis della Cornia, with whom he passed the remainder of his life. His principal poems are—"Viaggio del Parnasso;" "Avvisi di Parnasso;" "Esequie di Mecenate;" "I Giardini di Mecenate;" and "La vita di Mecenate."—A. C. M.

**CAPOZZOLI, DOMENICO, PATRIZIO, and DONATO**. The brothers Capozzoli, celebrated Italian carbonari, were born of an ancient and wealthy family towards the close of the eighteenth century, at Monteforte in the district of the Valle, province of Salerno. From 1821 to 1827 they, together with a priest, De Luca, led an insurrection in Calabria, and were frequently, even

signally victorious over the royal troops. In 1828 the mountaineers of Cilento, headed by the Capozzoli, defeated the royal troops at Palinuro; but not being seconded they were obliged to retire into their mountains. The king despatched against them the notorious and ferocious Del Carretto, chief of the police, supported by a large body of soldiers, who perpetrated atrocious cruelties on their way, and reduced whole villages to ashes. The brothers Capozzoli succeeded in evading the pursuit of the royal forces, but De Luca and many others were captured at Bosco after a vigorous resistance. The brothers Capozzoli, with another of the leaders of the insurrection, named Galotti, after incredible hardships succeeded in escaping in a small boat; and after many days of semistarvation at sea they landed near Leghorn, and fled into the mountains. A Neapolitan police-agent discovered their retreat, and passing himself off as a brother patriot, succeeded in persuading them to return to Cilento. On their arrival they were invited to dinner by a pretended friend, and during the meal the house was surrounded by the royal troops. The brothers defended themselves with extraordinary courage and obstinacy, but were at length overpowered by numbers. They were carried in chains to Salerno, and beheaded on the 17th June, 1829. They died as bravely as they had lived, their last words being a prayer for their unhappy country.—E. A. H.

CAPPE, NEWCOME, a Soeian preacher and writer of some note, was born in Leeds, February 21, 1732-33. Having been educated at Kilworth under Dr. Aikin, at Northampton under Dr. Doddridge, and subsequently at Glasgow university, he became pastor of the dissenting church of St. Saviour-Gate, York, where he was forty years distinguished as an eloquent preacher. He died in 1800. Of Mr. Cappe's works we mention—"A Selection of Psalms for Social Worship;" "Discourses on the Providence and Government of God;" "Critical Remarks on many Important Passages of Scripture," &c.; "Remarks in Vindication of Dr. Priestley," &c.—J. B.

CAPPELLARI. See GREGORY XVI.

CAPPELLE, JAN VANDER, a Dutch artist, born about 1635. He painted marine pieces and river views in the manner of Vanvelde.—W. T.

CAPPELER, MAURICE ANTOINE, a Swiss physician and naturalist, born at Lucerne in 1685; died in 1769. In the early part of his life he practised as physician in the imperial army. On his retirement to his native place, while following his profession, he devoted his attention to scientific subjects, particularly crystallography. In 1730 he was admitted a member of the Royal Society of London. He wrote a number of papers, chiefly scientific; one on crystallography appeared in the *Philosophical Transactions*. A complete work in German on the same subject was left at his death in MS., but has not been published.—J. B., G.

CAPPELLO, BERNARDO, an Italian poet, born of a patrician family at Venice; died in 1565. While a student at Padua, he formed an intimacy with the celebrated Bembo, who gave him lessons in poetry, and, somewhat later, was in the habit of submitting to his critical judgment those historical and poetical works which have made the fame of the cardinal. He became a member of the Venetian senate, and disturbed that assembly by a style of oratory so vehement and caustic, that he incurred sentence of banishment. Protected by Cardinal Alexander Farnese, he passed his later years in the papal states, where he held several lucrative offices. His canzoni are warmly eulogized by Tiraboschi and Crescimbeni.—A. C. M.

CAPPER, JAMES, a British officer and traveller, who attained the rank of colonel in the East India Company's service, and was subsequently appointed comptroller-general, and intrusted with the charge of the fortifications on the coast of Coromandel. On his return from a visit to England in 1778, he traversed the Arabian desert, and passed down the right bank of the Euphrates to Bassora. He embodied the results of his observations during this journey in a quarto volume, with plates and maps, which he published in London in 1782, with the title of "Observations on the Journey from England to India by Egypt, &c." He died in 1825.—J. T.

CAPPERONIER, CLAUDE, born at Montdidier, May, 1671. Son of a tanner, he contrived to teach himself Latin, and by his ardent love of learning attracted the attention of his uncle, a monk of the Benedictine order, who had the lad sent to the college of Montdidier. He received orders in 1698, and, becoming a teacher of Greek, had the good fortune to give lessons to the illustrious Bossuet, the year of the latter's death, 1704. In

1722 he was appointed Greek professor in the college of France, where he assisted in preparing new editions of the classics. Besides his translated works, he entered the field of controversy with Voltaire on the subject of the merits of Sophocles, whose name that irreverent wit had not spared. He died in Paris, 24th July, 1744.—J. F. C.

CAPPERONIER, JEAN, nephew of Claude, was born at Montdidier, March, 1716. As Claude owed his good fortune to his uncle the Benedictine, so he in turn helped his own nephew, Jean, whom he brought to Paris to share his labours. On Claude's death, Jean succeeded to his chair of Greek professor, and in 1759 was made conservator of the royal library. He died 30th May, 1775.—J. F. C.

CAPPONI, a Florentine family holding high office in the republic. GINO was one of its earliest magistrates, and wrote an account of the revolution in 1378, of which he was an eyewitness. His son NERI gained a brilliant victory at Anghieri in 1440. But the most famous of the family was PIETRO, Gino's grandson. Charles VIII. of France having been allowed to pass through Florence on his way to Naples, laid claim on that account to the sovereignty of the city, and caused his secretary to read before the magistrates a document setting forth his pretensions. Pietro Capponi stepped forward and tore the paper, saying—"Before we condescend to such dishonourable conditions, you may order your trumpets to sound, and we shall ring our bells." He then left the room, followed by his brother magistrates. The king was daunted by his boldness, recalled him, and signed a treaty preserving the liberties of the republic. Died in 1496.—J. B.

CAPRA, BALDASSARE, was born at Milan, where he afterwards practised medicine. He applied himself to philosophy and astronomy, and claimed the invention of Galileo's proportional compass. Capra attacked the great astronomer in a work entitled "Considerazione astronomica sopra la nuova stella del 1604."

CAPRANICA, DOMENICO, an Italian cardinal, born in 1400. He became legate to the Marca d'Ancona, and leader of the army which defended that province against Francis Sforza. He afterwards put an end to the quarrel between the church and Alphonso of Naples, and died in 1458, having won the repute of great learning. He founded a college for the maintenance of students, which still bears his name. He wrote "Italica constituenda, ad Alfonsum regem;" "De Actione belli contra Turcos gerendi;" and "De contemptu mundi;"—the last a famous work, of which there are editions in most European languages.

CAPRARA, GIOVANNI BATTISTA, an Italian prelate, born in 1733. While still a young man, Caprara was sent as nuncio to Cologne, Lucerne, and Vienna. It was he who crowned Napoleon king of Italy. He died in Paris, an infirm and blind old man, in 1810.

CARA-KOOSH, a name meaning an *eagle*, borne by Bahaeddeen, whom Saladin made governor of Cairo. He was among the defenders of Acre, was taken prisoner at its fall in 1191, but released the following year, and reinstated in his government in Egypt. He died in 1193.—J. B.

CARA-MUSTAPHA, a Turkish officer under Mohammed IV., born at Merzisor in 1634; died at Belgrade, 26th December, 1683. In 1661, through the friendly influence of Kupruli-Mohammed, the grand vizier, he was appointed grand equerry, and in 1676 he was raised to the rank of grand vizier. In this capacity he became odious for his pride, avarice, and cruelty, and extorted for his own aggrandizement enormous sums from the provinces subject to the Porte. At last his insatiable desire of wealth proved his ruin. At the siege of Vienna in 1683, being anxious to appropriate to himself the vast treasures which he believed were to be found in that capital, he was unwilling to abandon it to the pillage of the Turkish soldiery, and accordingly obstinately refused to give orders for the assault. In the meantime, Sobieski arrived to the succour of the city, and completely routed the Ottoman army. For this crime Cara-Mustapha was arrested by order of the grand signior, and put to death.—G. M.

CARA-YAZIDJI-ABDUL-HALIM, a Turkish soldier of fortune, died in 1602. A rebellion having broken out against the government of Mohammed III., Cara-Yazidji placed himself at the head of the insurgents, defeated the Ottoman army sent against him, and assumed the state of a sovereign with the title of Halim-Chah (Always Victorious). He was, however, defeated in turn, and sought refuge in the mountains of Djamik, where he died.—His brother, DELI-HUSSEIN, succeeded him as head of the

yet unsubdued rebels, but in 1603 he made his submission to the sultan, and received in recompense the government of Bosnia. He was afterwards put to death on a charge of treason.

CARA-YUSEF, the first prince of the Turcoman dynasty of the Black Sheep, born in the second half of the fourteenth century; died in 1420. He commenced his career as the chief of a horde of brigands, who, issuing from their retreat at the foot of the mountains of Armenia, ravaged the plains of Irak, plundered the caravans of Mecca, and rendered themselves formidable to the inhabitants of the banks of the Euphrates. After a variety of fortune, he succeeded in 1410 in rendering himself master of Diarbekir, Kurdistan, Aderbidjan, and a part of Armenia and Georgia.

CARACALLA, whose proper name was MARCUS ANTONINUS BASSIANUS, received the sobriquet, which is now his common historical appellation, from the *caracalla*, a long Gallic tunic, which he brought into fashion at Rome. He was one of the sons of the Emperor Severus by his second wife, Julia Domna; and he seems to have inherited the haughty ambition without the wisdom of his father, and the loose morals which have been ascribed to his mother, without her generous disposition and literary tastes. Impatient and unscrupulous in his desire of power, he made more than one attempt to hasten the issue of the distemper which was carrying Severus to his grave; but when the throne at length became vacant in 211, he was compelled to share it with his brother Geta. Their discords soon destroyed the hope of their reigning amicably in concert; and a proposed partition of territory would have given him the guiltless possession of Europe and Asia, had not the murder of Geta by two of his partisans placed him in the undivided sovereignty under the brand of fratricide. This crime was followed by a pitiless massacre of all whom he feared or suspected; no fewer than 20,000 persons are said to have fallen victims, and among them the accomplished and upright jurist, Papinian. The power thus acquired was not of long continuance; and but for the favours which the tyrant heaped upon the army, probably a shorter period than the five years which elapsed between his brother's assassination and his own, would have terminated the excesses which he carried from Rome into the provinces of the empire. He met his fate on a pilgrimage to the temple of the moon at Carrhæ, being slain by a disappointed officer of his guards, at the instigation of the prefect Opilius Macrinus, who succeeded him in 217.—W. B.

CARACCIOLI, the name of a celebrated Neapolitan family, of which the following are the most distinguished members:—

CARACCIOLI, GIANNI, who in 1416 obtained the office of secretary to Queen Joanna of Naples, and became so great a favourite that he was elevated to the dignity of constable and grand seneschal, with the title of duke of Vicenza. During sixteen years he exercised almost absolute authority; but his arrogance and ambition ultimately lost him the favour of the queen. With her knowledge and consent a conspiracy was formed against him, and he was assassinated in 1432, during the festival given on the occasion of his son's marriage.

CARACCIOLI, GIANNI, prince of Melfi, grand seneschal of the kingdom of Naples, born in 1480; died in 1550. After the conquest of Charles VIII. of France, Caraccioli attached himself to the French; but on their expulsion he espoused the Spanish cause. In 1528 the prince of Orange intrusted to him the defence of Melfi against the army of De Lautrec; but after a desperate resistance the tower was taken, and the garrison, with the exception of the prince and a few of his officers, were put to the sword. Caraccioli was carried into France, and there set at liberty. Francis I. appointed him lieutenant-general, and bestowed upon him a grant of extensive estates. His services in the defence of Luxembourg in 1543 were rewarded with the rank of marshal, and in 1544 he was made governor of Piedmont.

CARACCIOLI, DOMENICO, Marquis, born in 1715; died in 1789. He commenced his diplomatic career as ambassador to Turin, and afterwards discharged the duties of the same office in England and France. In 1781 he was appointed to the government of Sicily, and in 1786 was nominated minister of foreign affairs. Marinontel has pronounced a high eulogium on his character and conduct.

CARACCIOLI, FRANCESCO, a Neapolitan admiral, who was for some time in the British service, and commanded a Neapolitan squadron before Toulon. The cold reception which he met with on his return home alienated him from the Neapolitan court,

which was at that period in a most deplorable state. When the royal family fled to Palermo, and Naples was abandoned to the French in January, 1796, Caraccioli entered the service of the new government, termed the Parthenopæan republic. A few months after, Cardinal Ruffo, at the head of what he called the Christian army, and assisted by Captain Foote of the *Seahorse* and some Neapolitan frigates, besieged Naples. The "patriots" who garrisoned the castles of Uovo and Nuovo capitulated on condition that their persons and property should be protected. But Nelson, who arrived soon after, annulled the treaty; and notwithstanding the strenuous opposition of Ruffo, delivered up the patriots to the vengeance of the court. Caraccioli was immediately tried by a court-martial of Neapolitan officers assembled on board the British flag-ship, found guilty, and condemned to be hanged. This sentence was, by Nelson's orders, carried into execution that same evening, and the body of the aged prince was cast into the sea. This transaction has left an ineffaceable stain on the character of the great admiral.—J. T.

CARACCIOLI, LOUIS ANTOINE, a French litterateur, born in 1721; died in 1803. He is chiefly remembered as the author of the "Interesting Letters of Pope Clement XIV.," which were for a long time a mystery to Europe. He is also the author of a "Life of Clement XIV.," of a "Dictionary Picturesque and Sententious," and of many other works.—J. T.

CARACTACUS, a famous king of the Silurians, the ancient British inhabitants of South Wales, who lived in the first century B.C. Having, with varied success, but with indomitable valour, resisted the Romans for nine years, he was at length defeated, after a desperate struggle, by the prætor Ostorius, and took refuge with Cartismandua, queen of the Brigantes. But she treacherously delivered him up to the Romans, who carried him to Rome in 51. He bore his misfortunes with such patient dignity, and addressed the Emperor Claudius in such noble yet touching language, that he at once obtained a pardon for himself and his friends.—(Tac. *Ann.* xii. 33, 38; *Hist.* iii. 43.)—J. T.

CARADOC, a Welsh historian of the twelfth century. He wrote in Latin a history of the Welsh kings from Cadwalladr to his own time. The original, which was long preserved in Christ college, Cambridge, is now lost, and only a Welsh translation remains. Caradoc wrote some other books.

CARADUC, author of the most ancient Welsh lay known. The time and place of his birth and death have not been discovered; but he must have lived at or after the time of King Arthur, as many of the incidents of the lay relate to his court.

CARAFFA. See PAUL IV., Pope.

CARAFFA, MICHELE, a musician, was born at Naples, November 28, 1785, according to M. Fétis, but other authorities state in 1787. He is the second son of the prince de Colobrano, and, though his musical education was assiduously prosecuted in his youth, he was designed for the military profession. He accordingly became an officer of hussars under Murat, in whose service he was appointed ecuyer du roi. He was engaged in the expedition against Sicily, and was created a chevalier of the order of the Two Sicilies. He served also as an officer in the French campaign in Russia in 1812; on his return from which he was created a chevalier of the legion of honour. His musical studies, at first undertaken as a source of amusement, were carried on for some years at the conservatorio of his native city, where Monte Oliveto was his instructor. He next had lessons from Francesco Ruggi; then from Feneroli; and lastly, when he was settled at Paris, from Cherubini. His first attempt at composition was an opera called "Il Fantasma," which was represented by amateurs. His next was in 1802, when he wrote two cantatas, "Il Natale di Giove," and "Achille e Deidamia," for performance on the birthday of his mother, who was then, by a second marriage, princess di Caramanica. He came before the public as a musician in 1814, when his opera, "Il Vascello d'Occidente," was produced at the Fondo theatre in Naples. This was followed in successive years by "La Gelosia Corretta;" "Gabriele di Vergi;" "Ifigenia in Taurida;" "Adele di Lusignano;" "Berenice," in Siria; and "Elisabetta," in Derbyshire (both in 1818); "Il Sacrificio d'Epito," and "Le due Figari." His next work, "Jeanne d'Arc," was written for and played in Paris in 1821; but had no success. He then spent some time in Rome, where he produced "La Capricciosa ed il Soldato;" and wrote also "Tamerlano," which was not performed; and "Le Solitaire," which was given at the Faydeau theatre in Paris in August, 1822, with great applause, and

has since been represented in Italian with equally good effect. He then brought out "Eufemio di Messina," in Rome, and "Abufar," in Vienna. The "Valet de Chambre" was produced in Paris in 1823, very successfully, and has recently been revived there with the same good fortune. Remaining for a time in Paris, he next gave "L'Auberge supposée," and "La Belle au bois dormant." "Il Sonnambulo" was produced in Milan, and "Paria" in Venice. In 1827 Carafa returned to Paris; there he produced "Sangarido," "La Violetto," in which Leborne wrote some pieces; "Masaniello;" "Jenny;" and "Le Nozze di Lammermoor," for the Italian theatre, in which Sontag personated the heroine. Still resident in Paris, he wrote the ballet of "L'Orgie," and the opera of "La Prison d'Edinbourg," and "La Grande Duchesse." There are two other Italian operas of this composer, "Aristodemo," and "Gl'italici e gl'Indiani;" a mass, a requiem, and a stabat mater written in Paris; an overture to the opera of La Marquise de Brinwilliers; several other orchestral pieces, and many for the pianoforte. Besides his military orders, Carafa has the artistic distinction of being a member of the Institut des Beaux Arts. He holds the important appointment of principal of the conservatoire militaire, by which he has the supervision, if not the superintendence, of all the military music throughout France; and, in this capacity, his opposition to M. Sax's inventions for extending the capabilities of brass instruments, is not without beneficial influence in hindering their universal adoption, and so preventing the pernicious effect, even in regimental bands, and the still worse tendency in the orchestra, of the noisy monotony which cannot fail to result from the employment of these injudicious though ingenious innovations.—G. A. M.

CARAMAN-OGLOU (Son of Caraman), the common designation of the princes of a petty dynasty which ruled over the province of Caramania. The first who bore the name was the son of an Armenian named Nur Isofi, who received from Ala-Eddyn, the first sultan of the Seljukian dynasty, the principality of Selucia, together with his sister in marriage. His grandson, Mahmood Bedr-ed-deen, who died in 1317, first established the sovereignty of the family over Caramania, after the downfall of the Seljukides. Caraman, the grandson of this prince, after maintaining a long and desperate struggle against Amurath I., his father-in-law, and his successor, Bajazet I., was taken prisoner, and put to death by one of the generals of the latter. His descendants, however, continued to exercise authority over their dominions, as vassals of the sultans, until the reign of Mohammed II., when Caramania was finally united to the Turkish empire.—J. T.

CARAMAN, PETER PAUL RIQUET DE BONREPOS, Count de, a French general, born in 1646. He was made ensign in the guards in 1666, and by his courage and conduct, gained the various steps of promotion, till he was made lieutenant-general in 1702. He served in Flanders under Marshal Villeroy and Boufflers, and gained the grand cross of the order of St. Louis by his bravery in covering the retreat of the French army in 1705, when driven by Marlborough from the lines of Gette. Count Caraman distinguished himself in 1706 by his defence of Menin, and was present at the battles of Ramilies, Oudenarde, and Malplaquet. He died in 1730.—J. T.

CARAMAN, VICTOR LOUIS CHARLES DE RIQUET, Duke of, born in 1762. At the Revolution he left France, and entered the Russian service. He returned to his native country during the consulate, but was arrested and kept in confinement till the fall of the empire. Louis XVIII. appointed him minister at Berlin in 1814, and ambassador to Vienna in 1815. He assisted at the congresses of Aix-la-Chapelle, Troppau, Laybach, and Verona, and was raised to the rank of duke in 1828. After the revolution of 1830, he occupied himself almost exclusively with industrial questions. He died in 1839, leaving memoirs, part of which have since been published in the *Journal des Debats*.—His brother, Count MAURICE—born in 1769; died in 1837—was an officer in the army, a member of the legislative body in 1811, and a member of the chamber of deputies from 1824 to 1828.—J. T.

CARAMUEL DE LOBKOVITCH, JUAN, a Cistercian monk who combined great scholarship with a peculiar taste for mechanics, was born at Madrid in 1606. He studied at Salamanca, was successively professor at Alcalá, abbot of Melrose, titular bishop of Missi in the Low Countries, intendant of fortifications in Bohemia, bishop of Konigsgratz, and then of Vigerano in the Milauese, where he died in 1682. He wrote

some works of controversial theology, and a system of divinity in Latin, 7 vols. folio.—J. B.

CARAMURU, or "Man of Fire," the name given by the savage natives of Bahia in South America to DIOGO ALVAREZ, a Portuguese seaman of the sixteenth century. He was shipwrecked on their coast, and was saved by the savages—who murdered all his fellow-voyagers—that he might assist them in procuring spoil from the wreck. Finding a musket, he fired it off in their presence, and so impressed them that they made him their chief, gave him their daughters for wives, and persuaded him to turn his fire against their enemies. Sailing with his favourite wife in a French vessel, he arrived at the court of France, and was highly honoured. Returning to Bahia, he fortified his position, and established himself in his dominions. Father Durand, a native of Brazil, and the earliest poet of that country, has written an epic on the adventures of Caramuru.

CARASCOSA, MICHAEL, Baron de, a military officer, born in Sicily in the latter half of the eighteenth century. He served with the troops of the Parthenopæan republic, and when Naples was retaken by the French in 1806 he received a commission in the forces raised by Joseph Bonaparte. In 1814 he commanded a division which fought with the Austrians against the French. In 1820 Caracosa, then minister of war, was appointed to suppress the military insurrection which broke out in that year; but, unable to cope with the insurgents, he placed himself at their head. His corps being dispersed by the Austrians, he took refuge in Barcelona, and subsequently, being condemned to death for contumacy, he withdrew to England.—G. M.

CARAUSIUS, emperor of Britain in the third century, was a native of Flanders, of low origin, who having done service to the Roman emperors, was appointed by Maximian to the command of a fleet at Boulogne, for clearing the seas of the Frank and Saxon pirates. Having connived at their ravages that he might enrich himself with the spoils of their vessels, he was apprised of the emperor's design to punish him with death. He sailed with his fleet, and took possession of Britain. The emperor finding the naval force of the usurper strengthened by the pirates, who had joined his standard, at length ceded to him the government of the island, which he held for seven years, till in 293 he was murdered by his chief minister.—J. B.

CARAVAGGIO, MICHELANGELO DA, the name by which MICHELANGELO AMERIGI is generally called; he was born at Caravaggio in the Milanese in 1569. He was originally a mason's labourer, but had sufficient ability and determination to establish himself as a portrait painter, first at Milan, and afterwards at Venice, where he painted also historical pictures. He then went to Rome, and unable through poverty to establish himself independently, he entered the service of the celebrated painter the Cavaliere D'Arpino, who employed Caravaggio to paint the accessory parts of his pictures. Eventually, however, he produced a picture of some "Cardplayers" (Il Giuoco di Carte), which, from its unusual force and truth, attracted great notice, and established the independence of the painter. Caravaggio now made rapid progress; he was employed to paint several oil pictures for the Contarelli chapel in the church of San Luigi de' Francesi, but his style was so exceedingly forcible and unusual, that the monks rejected his first picture of "St. Matthew writing the Gospel," as too vulgar for such a place and such a subject. He painted another, but the first found a willing purchaser in the Marchese Vincenzio Giustiniani. Caravaggio's masterpiece in Rome is the "Deposition from the Cross," now in the Vatican gallery; there is a mosaic of it in St. Peter's. He attained a great reputation in Rome, but his fall was as sudden as his rise; he was capricious, idle, and ostentatious, and of an exceedingly irritable and overbearing temper. He painted only a few hours a day, and used to parade about in the afternoon with his sword at his side; and on an occasion when engaged in a game at tennis, he became so violent in the dispute with his companion that he killed him on the spot. He fled to Naples, where he remained a short time; he then went to Malta, where he obtained the protection of the Grand-master Vignacourt, but here too he quarrelled with one of the knights, and was cast into prison; he, however, contrived to make his escape, and we next find him painting at Syracuse, Messina, and Palermo. From Sicily he returned to Naples, and by the intercession of some friends, having procured the pope's pardon, he determined to go back to Rome. He set out in a felucca from Naples; but being mistaken for another person by the Spanish

coastguard, he was arrested and detained for a short time, and when liberated, he discovered that the crew of the felucca had gone off with all his effects. He wandered despondingly along the coast, until he reached Porto Ercole, where he was seized with fever, brought on by vexation and exposure, and he died after a few days' illness in 1609, aged only forty.

Caravaggio introduced a new and forcible style, depending chiefly upon contrasts of light and shade, in which, however, the latter prevailed. His subjects were generally very ordinary, and his imitation exact; or, if his subject is not ordinary, the actors are sure to be so, but everything is rendered with great power. His followers were called "naturalisti," because they were opposed to the ideal principle of selection, copying literally what was set before them. He completely revolutionized the art of his time, and found a host of imitators among the younger painters; even Guido and Domenichino were not exempt from his influence for a period. Guercino was at one time a complete Caravaggiesco. His permanent followers were Spagnoletto, Bartolomeo Manfredi, Carlo Saracino, the French Valentin, and the Flemish Gerard Honthorst, known in Italy as Gherardo della Notte. He and his followers generally painted only half figures.—(Bellori, *Vite de Pittori*, &c., 1672.)—R. N. W.

CARAVAGGIO, PIETRO-PAOLO, born at Milan in 1617; died in 1688. After receiving a careful education, he procured a place in the magistracy of his country; but abandoned this for the profession of arms. He afterwards taught Greek and mathematics; and from 1676 till his death was a sort of inspector of the castles belonging to the duchy of Milan. He wrote a number of works on various subjects, all of considerable merit; but his fame rests principally on his contributions to the art of military engineering.

CARAVAGGIO, POLIDORO DA, the name by which POLIDORO CALDARA is commonly known. He was born at Caravaggio about 1495, and was originally a mason's labourer, in which capacity he was employed in the Vatican in 1512 among the workmen of Raphael. Maturino of Florence, one of Raphael's assistants, having discovered a peculiar ability in the Lombard labourer, undertook to teach him to draw, and Polidoro made such rapid progress that he became very useful to his master, and eventually attracted the notice of Raphael himself. He and Maturino executed many beautiful *chiariscuri* (designs in light and shade) in the Vatican chambers, such as friezes and other decorations in imitation of marble and bronze. Vasari says they copied all the remains of ancient art in Rome. Their compositions were conspicuous for their fine classical style and proportions. Few of these works remain, but some are preserved in the prints of Alberti, Bartoli, and Galestruzzi. The last engraved the "Niobe," painted on a house near the Palazzo Lancellotti at Rome, their masterpiece. The sack of Rome in 1527 by the soldiers of Bourbon, put an end to these and almost all other art-labours for a season. Polidoro went first to Naples, and afterwards to Messina, where he resided many years, and executed many pictures and other good works in the former style of decoration. Vasari mentions a "Christ led to Calvary" as a masterpiece. In 1543 Polidoro, having acquired a considerable fortune by his labours, determined to return to Rome; and having got everything ready, was prepared to set out on his journey the following morning, in company with an old servant who had lived with him many years. This wretch hired some assassins to murder his master, which they did during the night, and he shared the spoil with them. Having strangled and stabbed Polidoro, they placed the body at the door of the house of a lady he was in the habit of visiting. A friend of the painter, however, suspected this servant, and had him put to the rack: the whole infamous affair was confessed by the villain, and he was tortured to death. The gallery of Naples possesses some of the pictures painted by Polidoro at Messina. He etched a few plates in a good style, which are very scarce.—(Vasari, *Vite de Pittori*, &c.)—R. N. W.

CARBAJAL, LUIS DE, a Spanish artist, born in 1534. He was a native of Toledo, and became a pupil of Juan de Villoldo. He was employed by Philip II. in the decoration of the Escorial. Some scenes from the life of the Virgin in the principal cloister, were painted by Carbajal. Several of his works deck the churches of Madrid and Toledo. He died in 1591 at Madrid. Some statements, however, make him living in 1613, and employed on the Pardo.—W. T.

CARBO, a Roman family, of whom we notice:—

CARBO, CAIUS-PAPIRIUS, a celebrated orator, born about 164; died about 119 B.C. Having undertaken the defence of Opimius, who was accused of the murder of Caius Gracchus, he became unpopular with all parties, and being himself accused, and fearing a sentence of condemnation, he terminated his existence by poison.

CARBO, C. PAPIRIUS, son of the preceding, and, like his father, an orator. As a supporter of the aristocracy, he fell into popular disfavour, and was assassinated, B.C. 82.

CARBO, CNEIUS PAPIRIUS, three times consul at Rome, was a leader of the Marian party, and fought against Sulla, B.C. 82. He was afterwards taken prisoner and put to death by Pompey.

CARBON. See FLINS.

CARBONE, LODOVICO, an Italian orator and poet, born of a patrician family at Ferrara about 1436; died at Rome in 1483. He had scarcely attained the age of twenty when he was appointed to fill the chair of eloquence and poetry in the university of his native city. Pius II., whom he addressed in a splendid oration on the occasion of his passing through Ferrara, raised him to the dignity of count palatine. He recited more than two hundred orations, and, as he boasted to the Emperor Frederic III., composed upwards of ten thousand lines of Latin verse. Many of his orations were delivered at Bologna, where he long resided. He left some important historical works which are still in manuscript.—A. C. M.

CARBURIS, JOHN BAPTIST, Count, physician, brother of Marine, born at Cephalonia; died at Padua in 1801. Charles Emmanuel, desirous of reforming his medical schools, gave him a chair of medicine at Turin, which he filled twenty years. He was ultimately professor of physiology at Padua. Carburis was a member of the Royal Society of London.

CARBURIS, MARINE, a celebrated Greek engineer, known also by the name LASCARIS, was born in Cephalonia early in the eighteenth century. The achievement in connection with which he is remembered, was the removal from Cronstadt of the large granite block which supports the equestrian statue of Peter the Great at St. Petersburg. The feat was accomplished in 1769.

CARBURIS, MARK, Count, brother of the preceding, born in 1731; died at Padua in 1808. The government of Venice appointed him to the chair of chemistry at Padua, and sent him to examine the mines of Denmark, Sweden, Hungary, and Germany. One of his discoveries was that pure crystals can be obtained from sulphuric acid.

CARDANO, GIROLAMO, born at Pavia in 1501, a celebrated philosopher, and one of the most learned men of the sixteenth century, remarkable both for his eccentricities and his extraordinary intellectual powers. Ill-treated during his childhood and early youth by his parents, he was left almost entirely to his own exertions in the acquisition of knowledge; whilst the leanings of his father towards magic, astrology, and apparitions of spirits, gave to his mind a superstitious turn. His writings bear the stamp of the contrast between this disposition and the subsequent work of his faculties of observation and reasoning. He studied medicine, first at Pavia, then at Padua, where in 1525 he took his doctor's degree. In 1538 we find him at Milan professor of mathematics and at the same time celebrated as a physician. He became famous throughout Europe, and received the offer of a professorship from Denmark, which, however, he refused. After a journey to Scotland—where he proceeded in compliance with the request of the bishop of St. Andrews, John Hamilton, who was suffering from asthma, and who derived benefit from his cure—and a short stay in London, where he was received with much honour by Edward VI., he returned to his native land, and resumed his occupations as a teacher and a writer. One of the most renowned mathematicians of that time, Luigi Ferrari, was his pupil. He went subsequently to Bologna, where he taught with great success until 1570. He was singularly afflicted throughout life with domestic misfortunes, which contributed in a great measure to the strangeness of his temper, and to his gloomy views of human destiny. In the latter part of his life he went to Rome, where he was received with hospitality, and made a member of the college of physicians. He died there in the year 1575.—(See Morley's *Life of G. Cardano*, London, 1854.) One of the most interesting books of Cardano is his autobiography. In this work the reader may trace out the growth of a powerful nature, developed almost entirely through its own native energies in spite of a false education, struggling with obstacles both external and internal, and conquering, amidst many difficulties and aberrations,

some splendid fragments of science and truth. Laying open with perfect sincerity the antagonisms of his character, he tells us how, with many a call for the highest developments of intellect and many a germ of evil, he grew, on the one side, wild in fancy, and often in folly; and, on the other, strong in thought, not devoid of noble and generous instincts, impressionable, changeable, inconsistent, still capable of great mental achievements, and of an ardent devotion to scientific discovery and the extension of knowledge. (See *Liber de vita propria, Cardani Opera*, vol. i.) He embraced in his works (10 vols. fol. Lugd., 1663) almost every department of philosophy and natural science, mathematics, astronomy, physics, medicine, divination, theology, morals, history of literature, of philosophy, &c. His treatises, "De Subtilitate, et rerum varietate," besides being, on the whole, extremely valuable documents for the history of science in those days, contain some original ideas and observations on the phenomena of heat and cold, on light, colours, &c., experimental attempts in physics, chimics, and mechanics, and descriptions of machines, which, as G. Libri says in his *Histoire des sciences mathématiques en Italie*, have been recently reproduced as modern inventions. (*Libri*, vol. iii., p. 178. See also, as regards the studies and experiments of Cardano in mechanics, his *Opus Novum, Oper.* tom. iv.) Cardano also took the deepest interest in the progress of geometry and algebra, and, together with his great contemporary, Nicolò Tartaglia, gave a fresh impulse to that branch of knowledge, which was in his opinion one of the highest attainments of man's mind. He actually co-operated to the solution of some mathematical problems, which, at that stage of the science, were considered of the greatest difficulty. (Cardano, *Ars magna*, cf. Cossali, *Storia dell' Algebra*.) Thus, at the beginning of the sixteenth century, before Bacon and Galileo had led the way to the discoveries of natural philosophy. Cardano's mind having shaken off the trammels of scholastic authority, and trusting only to its own reason and deep insight, foresaw by intuition, though unable fully to comprehend them, those laws of nature and of the human mind, which the collective work of three centuries has afterwards ascertained and organized into a system of scientific knowledge and useful application.—A. S., O.

CARDER, PETER, an English naval officer, who lived in the latter half of the sixteenth century. He was with Drake when that celebrated commander was despatched to the South Sea for the purpose of harassing the Spanish commerce, and was sent by him to England, September 6, 1586, with tidings of the expedition. Carder passed safely through the Straits of Magellan on his homeward voyage, but having been overtaken by stormy weather to the north of Rio de la Plata, his vessel was shipwrecked, and he and one sailor alone escaped with their lives. They suffered the most frightful hardships from the want of food and water, but at last succeeded in constructing a raft out of the wreck of their ship, and after a perilous voyage of three days, they reached the continent of America. Carder's companion perished, but he fell into the hands of the native tribes, who pitied his misfortunes and supplied his pressing wants. He quitted the friendly savages after a residence among them of some months, and ultimately succeeded in reaching England in 1586.—J. T.

CARDI, LUDOVICO, called CIGOLI, a distinguished artist of the Florentine school, born at the castle of Cigoli in Tuscany in 1559. He was a pupil of Alessandro Allori, and afterwards of Santo di Titi. At Florence he studied earnestly the works of Michel Angelo, Andrea del Sarto, and Pontorno, and received instruction in architecture and perspective in the school of Bernardo Buontalenti. He was received into the academy of Florence, and was rewarded by the patronage of the grand duke, for whom he painted a "Venus and a Satyr," and a "Sacrifice of Isaac," to adorn the Palazzo Pitti. His patron sent him to Rome. He there painted "St. Peter healing the Lame Man at the Gate of the Temple," estimated to be one of the chief art-treasures of the Vatican, although now fatally injured by damp. He painted smaller pictures of saints and magdalens, remarkable for their devotional fervour and for their Dutch-like finish. He died in 1613. A fine work by him is the "Stoning of Stephen," in the convent of Monte Domini at Florence. He executed one or two engravings in a good style.—W. T.

CARDIGAN, JAMES THOMAS BRUDENELL, seventh earl of, was born in 1797, and succeeded to the title in 1836. He entered the army as cornet in the 8th hussars in 1824, and became in 1832 lieutenant-colonel in the 15th hussars, but left this regi-

ment in the following year, when Captain Wathen, whom he had accused of insubordination, was acquitted by a court-martial. In 1836 his lordship was appointed to command the 11th hussars. It would be unprofitable to follow him through his famous "black bottle quarrel" at Canterbury, his duel with Captain Tuckett in 1840, and his subsequent trial and acquittal before the house of peers. In the Crimean war he led the famous charge of the light brigade at Balaklava, 25th October, 1854. We cannot enter into the question as to his share of the blame in connection with that glorious, but disastrous engagement. His whole conduct in the war made him unpopular in England, but it is only fair to mention that when he commanded the 11th hussars, the duke of Wellington complimented him on the general efficiency of his regiment. He was appointed, after the Crimean war, inspector-general of cavalry. He died 28th March, 1868.—J. B.

CARDINI, IGNATIUS, a physician and naturalist, born in Corsica in 1563; died about the close of the century. He practised medicine in his native town, and was distinguished for the universality of his acquirements. Cardini wrote in Latin a remarkable work on the minerals and plants of Corsica, but brought on himself the odium of the priests by some satirical letters against the clergy appended to his book. He was obliged to flee to Lucca, where he died.—J. B., G.

CARDIUS, OLAF, a Swedish clergyman, pastor of Sodermanland, who lived in the eighteenth century. He was the author of a ballad history of Sweden, from Christina to Adolf Frederik, written in the manner of the Folk's songs, and called "Höns gumman's Visa," or the Henwife's Song. This is one of the latest of the many imitations of the old Folk's songs; and, whilst it retains its place in every cottage of Sweden, it is devoid of true poetry, or of that tender sentiment which characterizes the true old national poetry of all lands, and for which the Folk's songs of the north are so remarkable.—M. H.

CARDOSO, GEORGE, a Portuguese priest and author, born at Lisbon; died 3d October, 1669. His chief work is entitled "Agiologio Lusitano, dos Sanctos e varones illustres en virtude do reino de Portugal e sus angustas," or a calendar of the saints and illustrious men of Portugal. The first part of this work appeared in 1652, but the author only lived to complete half the year. At the time of his death he was engaged on a "Parnaso Lusitano."—F. M. W.

CARDOSO, ISAAC, was born in the early part of the seventeenth century at Cerolica de Fruta, in the Portuguese province of Beira, of parents who belonged to the numerous class of the new, *i. e.* compulsory, christians. He chose the science of medicine, fixed himself at Madrid, and soon acquired great fame as a practitioner among the nobles and the clergy. In the midst of his professional successes, however, he found no refuge from the pangs of his conscience, which upbraided him with the duplicity of which he had been guilty from his childhood. At length, unable to sustain his mental agony, he escaped from Spain, and safely arrived at Venice. On the free soil of that republic he re-entered the synagogue to which his ancestors had belonged; he changed his name, and subsequently removed to Verona, where he lived a number of years, apparently at ease, amid the congenial occupations of literature and medical practice. His earlier years produced some poetical effusions; several medical treatises were also published by him previously to his flight from Spain. His claim to posthumous fame, however, rests on his "Philosophia Libera" (on Philosophy and Dogmas), and more especially on his work, "Las Excelencias de los Hebreos" (The Privileges of the Hebrews). He died at Verona, some time after the year 1680.—ABRAHAM, Isaac Cardoso's brother, experienced nearly the same vicissitudes. He, too, broke loose from Spain and catholicism. He emigrated into Africa, where he became physician to the dey of Tripoli, and devoted his leisure to philosophical studies, as is proved by a work of his still extant, entitled "De Scala Jacobi."—(Fürst.)—T. T.

CARDOSO, MICHAEL and RAPIHAEL, two brothers, adherents of the pseudo-Messiah, Shabbatai Zevi, lived in the African state of Tripoli, towards the end of the seventeenth century. They fanaticized a great number of their brethren, and ultimately caused, perhaps unwillingly, many Jews in North Africa to embrace the Islam, in imitation of their pretended Messiah. They expressed their hope of enforcing, by this wholesale defection from Judaism, the advent of the Son of David. Michael Cardoso, whose cabbalistical writings have been preserved, boldly declared himself to be the fellow-Messiah (Messiah ben Ephraim)

to Shabbatai. The descendants from these sectarians have been completely absorbed by the Mahomedan population, from whom it is now impossible to distinguish them.—(*Jost.*)—T. T.

CARDUCCI, BARTOLOMEO. This artist was born at Florence in 1560, and studied under Federigo Zuccherò. He assisted his preceptor in painting the great eupola at Florence, and accompanied him on his visit to the capital of Spain. Conjointly with Peregrino Tibaldi, he painted the celebrated ceiling in the library of the Escorial, his portions being the figures of Aristotle, Euclid, Archimedes, and Cicero. His most distinguished work is his "Descent from the Cross," in the church of St. Philipe al Real at Madrid, which has been classed with the best works of Raffaele. His "Last Supper" and "Circumcision" are also highly accounted. He died in 1610.—VINCENTO, his younger brother, became king's painter to Philip III., and afterwards also to Philip IV. He died in 1638. His works are to be seen in all of the cities of Segovia, Salamanca, Castile, Toledo, and Valladolid. He published an important work on painting in 1633.—W. T.

CAREL DE SAINTE GARDE, JACQUES, born about the beginning of the seventeenth century, and died about 1684. He was a churchman, and had some character as a preacher. He accompanied an embassy to Spain, but does not seem to have had any fixed provision. In the want of better occupation while there, he commenced a poem which he entitled "Childebrand ou les Sarrasins chassés de France," and printed in 1666 the four first cantos. Boileau ridiculed the name of the hero, and the public found the cantos dull reading. The epic of "Childebrand" was therefore never completed.—J. A., D.

CAREW, BAMFYLDE MOORE, famous as a genuine "gipsy-king," was the son of the Rev. Theodore Carew, rector of Bicklegh, Devon, and was born in 1690. Having got into some scrape, he ran away from the grammar school at Tiverton, and falling in with a company of gipsies, was so pleased with their mode of life that he abandoned his home and family and joined their society. He became a great adept in all manner of disguises, and frequently deceived the same persons, even when apprised of the design, several times in one day. He was so much respected by the community that they elected him their king. He continued to live with them many years, but finally returned to Bicklegh, where he died in 1758.—M.

CAREW, SIR EDMUND, Baron Carew of Ottery Mohun, was an eminent military commander in the wars of Henry VII. and Henry VIII. He was one of those who relieved Exeter when besieged by Perkin Warbeck in 1497, and having accompanied the expedition to France, he was killed at the siege of Terouenne in 1513. He was the last of his family who bore the title of Baron Carew.—M.

CAREW, GEORGE, Baron Carew of Clopton, and Earl of Totnes, second son of Dr. George Carew, who held many high preferments in the church in the reign of Queen Elizabeth, was born in 1557, and admitted a gentleman commoner of Broadgate hall, now Pembroke college, Oxford, in 1572. Leaving college he proceeded to Ireland in a military capacity, and quickly made himself conspicuous by his courage and conduct. In 1581 we find him governor of the county of Catherlagh, being at that time only twenty-two years of age. Captain Carew was also constable of Leighlin castle. In 1585 he received the honour of knighthood. In 1587 he was created master of the ordnance in Ireland for life. In 1589, by a special grace, he was made master of arts of Oxford, and, in the following year, he was admitted a member of her majesty's privy council of Ireland. In January, 1592, upon the surrender of his Irish patent, he was created lieutenant of the ordnance in England. By his careful and vigorous administration, he caused the removal of many abuses which had existed in this branch of the public service, and introduced a system which, without any material change, has been found to work well even to our own day. In 1596 he accompanied the expedition under the lord-admiral, Howard, and the earl of Essex to Cadiz, distinguishing himself as commander of the *Mary Rose*. In 1594 he had drawn up a treatise on the condition of Ireland, in which, with great clearness and ability, he pointed out the danger which threatened the kingdom from the ambitious designs of Hugh O'Neil, earl of Tyrone. His predictions were afterwards amply fulfilled. In consequence of his knowledge of Irish affairs, he was appointed in 1599 lord-president of the province of Munster, then in open rebellion. By sowing division in the councils of the Irish chieftains, and by vigorous action in the field, he soon restored

order in the province. He then demanded his recall, but this the arrival of the Spaniards at Kinsale rendered impossible. He was actively engaged in the siege of that place during the winter of 1601-2, under the lord-deputy, and, subsequently, by the display of the most extraordinary energy and valour, he captured the almost inaccessible fortress of Dunboy castle at Beerhaven. In 1604 he was constituted, by act of parliament, one of the commissioners to treat about the union between England and Scotland, and in the same year the king granted him the office of receiver-general of his revenues. Higher honours still awaited him. On the 4th of June in the following year he was advanced to the dignity of a peer of parliament, and in 1606 appointed master of the ordnance. In the year 1611 Lord Carew was again sent on a special mission into Ireland, for the purpose of inquiring into the causes of the inadequacy of the revenue of that kingdom to meet the expenditure, and to make such suggestions as might appear necessary to remedy the evil. On the accession of Charles I., in consideration of his long and meritorious services, he was advanced to the title of Earl of Totnes in the county of Devon. He died at his house in the Savoy in 1629.—(*Lamb MSS.; State Paper Office MSS.; Ordnance MSS.; Holinshed, &c.*)—M.

CAREW, SIR GEORGE, knight, was the second son of Sir Wymond Carew of Antony. After being called to the bar he became secretary to Lord Chancellor Hatton. He was subsequently knighted by Queen Elizabeth, and in 1598 was sent on an embassy to Brunswick, Sweden, Poland, and Dantzic, to obtain the removal of an edict against the merchant adventurers. On the accession of James I. he was employed as one of the commissioners to treat of the union with Scotland, and in 1605, being then the representative in parliament of the borough of St. Germans, he was sent ambassador resident at the court of France, where he remained until 1609. He died in 1612.—M.

CAREW, SIR JOHN, sixth baron of Carew and Mullensford, was an eminent soldier and statesman of the reign of Edward III. In 1350 he was appointed lord-deputy of Ireland, and died in 1363.

CAREW, SIR NICHOLAS, knight, of Beddington, Surrey, appointed master of the horse to King Henry VIII. in 1521. He was created grand esquire of England in 1527, in which year he accompanied the Viscount Lisle on an embassy to Francis I. of France. In 1529 he was sent to Bologna to ratify, in the king's name, the treaty of Cambray. In 1536 he was elected K.G. He was executed in 1539 for corresponding with Cardinal Pole.—(*State Papers.*)—M.

CAREW, SIR PETER, of Ottery Mohun, Devonshire, born in 1514, was the youngest son of Sir William Carew. In his twelfth year he was placed in the grammar school at Exeter, where he was only remarked as a truant and a scapegrace. To get rid of a troublesome charge, his father sent him to France with a gentleman of his acquaintance, who was to educate him for the profession of arms, in consideration of receiving his services as a page. Some time after, one of his relatives discovered the young Carew in the dress, and performing the duties, of a muleteer. Rescued from this degradation, he accompanied his kinsman into Italy, was taken into the service of a French nobleman, and after the battle of Pavia, where his master fell, entered the service of the princess of Orange. In 1532 he returned to England, bearing very flattering letters of commendation from his late mistress. He was immediately appointed one of the king's pages, and not long afterwards a gentleman of the privy chamber. In 1535 he accompanied Henry VIII. to France, and in 1539, with other courtiers and great officers of state, was sent to Calais to conduct Anne of Cleves to England. In 1545 he distinguished himself in the attack upon Treport, being the second man who landed. For his bravery he was honoured with knighthood by the lord-admiral, and was deputed to convey the gratifying intelligence to the king. Although warmly attached to Queen Mary, when the project of her marriage with Philip of Spain was known, he is said to have joined with others in a conspiracy to prevent the landing of the prince, was proclaimed a traitor, and narrowly avoiding apprehension, escaped into France. In 1555 he was traitorously seized at Brussels by Lord Paget, conveyed to England, and committed to the Tower, from which he was not liberated until 1556, when he received pardon. In 1569, when the Irish rebellion broke out, known in history as the "Butlers Wars," Sir Peter, who had just recovered large ancestral estates in Ireland, was appointed to command a division of

the royal forces, and was mainly instrumental in the restoration of peace. He died at Cork in 1575.—(*Life of Sir Peter Carew.*)—M.

CAREW, RICHARD, of Antony, was born in 1551, and was educated at Christ Church, Oxford. He was a friend of Camden and Cotton, and gave much attention to the study of antiquities. When the society of antiquaries was founded in 1572, he was one of the original fellows. In 1602 he published the first edition of his "Survey of Cornwall," in quarto, a second edition of which was published in 1723, and a third in 1789. He was a man of good abilities and studious habits, being self-taught in the Greek, Italian, German, French, and Spanish languages. He died suddenly in 1620.—M.

CAREW, SIR THOMAS, knight, eighth baron of Carew and Mullesford, son of Leonard, Baron Carew, born in 1368. He was a distinguished commander both by sea and land. We find his name in the list of persons summoned to attend a great council of the nation in 1405. He was present at the battle of Agincourt in 1415. In 1417 he commanded the expedition which conveyed the earl of March to France. The next year he was made captain of Harfleur, and was intrusted with the defence of the passage over the river Seine. Died in 1430.—(*Acts of Privy Council, State Papers, &c.*)—M.

CAREW, THOMAS, of Bicklegh, Devon, was the second son of Sir Edmund, Baron Carew of Ottery Mohun, in the same county. He joined the expedition under the earl of Surrey against Scotland in 1513, and was present at the battle of Flodden Field. Before the battle began, a gallant Scottish knight sent a challenge to the English army, offering battle to any gentleman that would fight him for the honour of his country. Carew received permission to accept the challenge, and won the victory. He greatly distinguished himself in the battle, but was ultimately taken prisoner.—M.

CAREW, THOMAS, an English poet of great merit, friend of Ben Jonson and Davenant. His parentage and the date of his birth are somewhat uncertain, but there are strong reasons for believing that he was the second son of Sir Matthew Carew of Littleton in the county of Worcester, and that he was born in 1589. He entered at the Temple, and was afterwards for a short time secretary to Sir Dudley Carleton, from whose service he was dismissed in 1616. He was also a gentleman of the privy chamber, and sewer to King Charles I. He lived a gay and dissipated life, but Clarendon says "he died with the greatest remorse for that license, and with the greatest manifestation of christianity that his best friends could desire." Wood says that his death occurred about 1639. Thomas Carew has often been confounded with Thomas Carey, son of the earl of Monmouth, who lived at the same time, and was also a poet of considerable celebrity. The similarity in the pronunciation of their names, has probably given rise to the mistake, Carew being pronounced Carey. Carew's poems were published in 1640. Several beautiful songs of his yet remain in MS. in the Ashmolean library, and there are, doubtless, other stray pieces in the British museum. Many of his lyrics and sonnets were set to music by the famous composers, Henry and William Lawes, and were sung frequently at the court masques. Hallam says of Carew, that he has more fancy and more tenderness than Waller; high praise, in which, however, Percy, who has also commended our author, would have joined.—M.

\* CAREY, ALICE and PHOEBE, two American sisters, who have published several volumes of poetry and miscellaneous prose, which have attracted considerable notice. They were born in a rural district near Cincinnati, Ohio—the eldest, Alice, in 1822—and have had the advantages only of a common school education. They have lived together in the home which was their birthplace, most of the time in portionless orphanage, with little aid from books or literary friends. A volume of their poems was printed at Philadelphia in 1850; and this was succeeded the next year by one of prose sketches, entitled "Clovernook, or Recollections of our Neighbourhood in the West." A second series of these sketches appeared in 1853, and these have been followed by several other volumes of prose and verse. Without showing any of the higher qualities of art, their books are popular, as they are written in an easy and natural style, and evince a lively fancy, a nice observation of nature, and correct sentiment.—F. B.

CAREY, GEORGE SAVILE, son of Henry Carey, the composer, inherited a considerable portion of his father's taste and spirit,

and much of his misfortunes. He was brought up as a printer, but his passion for the stage led him to the theatres, in which he had little success, yet enough to give him a wandering unsettled disposition. For forty years he employed himself in composing and singing a vast number of popular songs, chiefly of the patriotic kind, in which there was not much genuine poetry, or cultivated music. These he performed from town to town, in what he called "Lectures." He wrote also, from 1766 to 1792, several farces—a list of which may be seen in the *Biographia Dramatica*, and by the performance of which he earned temporary supplies. Besides these dramatic pieces, he wrote "Analeets in Prose and Verse," 1771, 2 vols.; "A Lecture on Mimicry," 1776; "A Rural Ramble," 1777; and "Balnea, or Sketches of the different Watering-places in England," 1799. In the latter part of his life, being in very necessitous circumstances, G. S. Carey laid claim, on the part of his father, to the authorship of the words and music of the national anthem. This was done in the hopes of securing for himself a government pension; but his claim was too ill-founded to receive the slightest support. The anthem in question is a composition of a much earlier date. (See under BULL, JOHN.) This son of Momus died July 14, 1807, aged sixty-four, being born the year his father died, and was buried by subscription among his friends, having never realized any property, or, indeed, having been ever anxious but for the passing hour. One of his daughters was the mother of the celebrated actor, Edmund Kean.—E. F. R.

CAREY, HENRY, Earl of Monmouth, born in 1596, was the eldest son of Robert the first earl of Monmouth. He was educated at the university of Oxford, becoming at the age of fifteen a fellow commoner of Exeter college. Two years afterwards, having taken the degree of B.A., he left Oxford to improve himself by foreign travel. He profited much by his sojourn abroad, and acquired a thorough knowledge of French and Italian, which languages he spoke with remarkable facility. He wrote very few original works; of these, his "History of the Wars of Flanders," and "Politic Discourses," rank highest. It was as a translator that he chiefly excelled.

CAREY, HENRY, a musical composer and poet, once of great popular reputation, is commonly said to have been an illegitimate son of George Savile, marquis of Halifax, who had the honour of presenting the crown to William III. Of his education nothing seems to be known, except that he was not a regularly bred musician. He received lessons when a young man from Linnert, Roseingrave, and Geminiani; but the result of all this did not, as his friend Lampe used to say, enable him to put a bass to his own ballads. Being thus slenderly accomplished in his art, his chief employment was teaching at small boarding-schools and among people of middling rank in private families. He possessed a prolific, ready invention, and very early in life distinguished himself by the composition of songs, of which he was the author of both words and music. One of these, "Of all the girls that are so smart," or "Sally in our alley," was sung by everybody when it came out, and has never ceased to be a favourite since. This, the author relates, was founded on a real incident; and mean as the subject may appear, he states that Addison was pleased with that natural ease and simplicity of sentiment which characterize the ballad, and more than once vouchsafed to commend it. The first we hear of Carey is in the year 1713, when he published a small volume of poems. Here he speaks of his "parents" as still living, which seems to disprove the claim of his relationship to the marquis of Halifax, who died in 1695. Probably his mother then kept a school, as we find in the volume, "A Pastoral Eclogue on the Divine Power of God, spoken by two young ladies, in the habits of shepherdesses, at an entertainment performed at Mrs. Carey's school by several of her scholars." In 1715 he produced two farces, one of which, "The Contrivances," had considerable success. In 1720 he published another collection of poems; and in 1722 a farce called "Hanging and Marriage." In 1729 he brought out by subscription his poems much enlarged, with the addition of one entitled "Nabby Pamby," in ridicule of Ambrose Phillips' lines on the infant daughter of Lord Carteret. When Miss Rafter, afterwards the celebrated Mrs. Clive, first appeared on the stage of Drury Lane as a singer, it was at the benefit of Harry Carey in 1730, who seems to have been her singing master. The manner in which this benefit was announced in the *Daily Post*, December 3, is so singular that we shall transcribe the paragraph. After announcing the play, which was Greenwich Park

and the additional entertainments of singing, particularly a dialogue of Purcell, by Mr. Carey and Miss Rafter, and a cantata of Mr. Carey's by Miss Rafter, there is an apology from Carey for the "tragedy of half an act" not being performed; but a promise is made of indemnification by the entertainments between the acts. The editor of the paper then adds—"But at our friend Harry Carey's benefit to-night the powers of music, poetry, and painting assemble in his behalf, he being an admirer of the three sister-arts. The body of musicians meet in the Haymarket, whence they march in great order, preceded by a magnificent moving organ, in form of a pageant, accompanied by all the kinds of musical instruments ever in use from Tubal Cain to the present day; a great multitude of booksellers, authors, and painters, form themselves into a body at Temple Bar, where they march with great decency to Covent Garden, preceded by a little army of printers' devils, with their proper instruments. Here the two bodies of music and poetry are joined by the brothers of the pencil; when, after taking some refreshment at the Bedford Arms, they march in solemn procession to the theatre, amidst an innumerable crowd of spectators." In 1732 Carey produced the words of two serious operas, "Amelia," and "Teraminta." The first of these was set by Lampe, and the second by J. C. Smith, Handel's friend and ananensis. Two years afterwards his mock tragedy of half an act, called "Chrononhotonthologos," was first performed at the little theatre in the Haymarket—a piece of humour that will always be in season as long as extravagance and bombast shall dare to tread the stage. In 1736, and for several subsequent years, his little English opera, entitled "The Honest Yorkshireman," was almost always in constant run. The year 1737 was rendered memorable at Covent Garden theatre by the success of the burlesque opera of the "Dragon of Wantley," written by Carey and set by Lampe, "after the Italian manner." This excellent piece of humour had run twenty nights when it was stopped, with all other public amusements, by the death of her majesty Queen Caroline, on November 29, but was resumed again on the opening of the theatres in January following, and supported as many representations as the Beggar's Opera had done ten years before. Lampe, in the music of this farcical drama, has capitally burlesqued the style of the Handelian opera. In the following year, "Margery, or the Dragoness," a sequel to the "Dragon of Wantley," written with equal humour, and as well set by Lampe, was produced; but had the fate of all sequels. The "Dragoness" appeared but a few nights, and was never revived. "Nancy, or the Parting Lovers," written and composed by our author, next appeared, and was for a long period an especial favourite with the public. Carey's separate songs and cantatas are innumerable. His burlesque birthday odes turned the odes of Cibber into ridicule as effectually as Pope's Dunciad could do. In the latter part of his life Carey collected his scattered songs, and published them in folio under the title of "The Musical Century," 1737-40. His last publication was a collected edition of his dramatic works, which was printed in 1743 in quarto, with a long list of subscribers. He died Oct. 4, 1743, at his house in Warner Street, Coldbath-Fields. It is generally said that "he put a period to a life, which had been led without reproach, when at the advanced age of eighty, by suicide." But this seems not to have been the fact. In the *Daily Post* of October 5, 1743, we read—"Yesterday morning Mr. H. Carey, well known to the musical world for his droll compositions, got out of bed from his wife in perfect health, and was soon after found dead. He has left six children behind him." On November 17, of the same year, the performance at Drury Lane was for the benefit of "the widow and four small children of the late H. Carey." His age at the period of his decease was probably about fifty-five. It has been observed of Carey that "as a poet, he was the last of that class of which D'Urfey was the first; with this difference, that in all the songs and poems written by him on wine, love, and such kind of subjects, he seems to have manifested an inviolable regard for decency and good manners." This remark is not quite accurate. Dibdin was the last of that order of poets of which D'Urfey was the first.—(*Hawkins; Burney; and original sources.*)—E. F. R.

CAREY, MATTHEW, who became eminent in America as a book-publisher, author, and philanthropist, was born in Dublin, Ireland, January 28, 1760. After receiving a common English education, he was apprenticed, at his own earnest request, to a printer, though his father's circumstances were such that he

might have aimed at some higher occupation. At the age of seventeen, he wrote an essay against duels, and when but little more mature, he published a pamphlet on the wrongs endured by the Irish catholics. This was denounced as treasonable in the Irish parliament, and the writer was obliged to fly for safety to France, where he remained a year, being employed for most of the time by Dr. Franklin, who had a small printing-office at Passy for the convenience of printing his despatches and other papers. Returning to Dublin after the noise excited by his pamphlet had died away, he began in 1783 to publish the *Freeman's Journal*, a newspaper afterwards described by himself "as enthusiastic and violent," and which soon procured him the honour of imprisonment in Newgate by order of parliament, and a prosecution for libel on one of the ministry. Parliament adjourned for a few weeks, and he was then necessarily released; but to avoid trial on the other complaint, it was thought best that he should emigrate to America. Disguised in a female dress to escape the notice of the police, he embarked, and was landed in Philadelphia in November, 1784, with only a few guineas in his pocket. Fortunately, while in France he had become slightly acquainted with Lafayette, who now kindly recommended him to his friends, and lent him, without solicitation, 400 dollars to enable him to set up a newspaper. Accordingly, in January, 1785, he began to publish the *Pennsylvania Herald*, which had great success, because it contained, what was then a new thing in America, a full account, reported by himself, of the debates in the assembly. He afterwards began successively two monthly magazines; one of which, the *American Museum*, was continued for six years. In 1791 Mr. Carey began his career as a bookseller and publisher, in which he was afterwards so eminently successful. The noted William Cobbett was then pouring forth his political diatribes in Philadelphia under the name of Peter Porcupine; and Mr. Carey, nothing loath, entered into a fierce newspaper and pamphlet warfare with him, and showed himself no contemptible adversary of this great master of personal invective. In 1814 he wrote and published the "Olive Branch," a volume intended, "by a candid publication of the faults and errors of both sides, to calm the embittered feelings of the political parties." It struck the right note at the right time, and had extraordinary success. In 1818 it was followed by "Vindiciæ Hibernicæ," pronounced by high authority to be the best vindication of Ireland that was ever written. Mr. Carey then began his vindication of the American system of protecting domestic manufactures, and continued it for many years in a series which finally numbered fifty-nine distinct publications, forming by far the best and most successful plea ever published in America for protective duties, and the encouragement of native industry. Among his later publications were an autobiography contributed to the *New England Magazine*, and the "Philosophy of Common Sense." His business had now long been prosperous, and he had accumulated a large fortune, which was chiefly gratifying as it enabled him to indulge his charitable disposition. As a practical philanthropist, brave, munificent, and discreet, his adopted country is under lasting obligations to him. Few have ever done more good, or in a more disinterested and unostentatious manner. He was an untiring advocate of popular education, and a bold reformer of municipal abuses—labouring effectually to carry out the greatest good of the greatest number. His personal charities he reduced to system, by forming a long list of objects of benevolence, to whom he administered aid once a fortnight. At the age of eighty he met with an accident, being overturned in his carriage; and though the injury seemed slight at first, it hastened his death, which took place September 17, 1840. His funeral was one of the largest ever seen in Philadelphia.—HENRY C. CAREY, son of Matthew Carey, and his successor in the book-selling and publishing business, as well as in the advocacy of the American system of protecting domestic industry, was born in Philadelphia in 1793. From the time of his father's retirement in 1821, he conducted successfully the affairs of one of the largest publishing houses in America till the period of his own withdrawal, with a competent fortune, in 1838. Since that time he has been a diligent and effective writer upon subjects of political economy.—F. B.

CAREY, WILLIAM, D.D., the founder of the baptist mission in India, and a distinguished oriental scholar, was born at Paulerspury, Northamptonshire, 17th August, 1761. Having received a scanty education at a free-school, taught by his father, he was, when only fourteen years of age, apprenticed to

a shoemaker at Hackleton. In 1783 he joined the baptist communion and began preaching, and three years later was chosen pastor of a congregation at Moulton, where, however, he had still to labour at his trade to win a scanty support for his family, for he had by this time married. Nevertheless, he found time to acquire a knowledge of Latin, Greek, and Hebrew, and to prepare for missionary labour in distant lands. He prepared a rude outline map, which he hung upon the wall of his workshop, and on which he was in the habit of making notes concerning the population, religion, and manners of various countries. In 1787 he removed to the pastorate of a congregation in Leicester, where he employed his extended influence to excite an interest in the state of the heathen. The result was that a meeting of his brother ministers, among whom were Robert Hall, Fuller, and Ryland, was held at Kettering, Northamptonshire, October 2, 1792, when they formed themselves into a Baptist Missionary Society. They chose India as the field of labour, and Carey as their first missionary. Early in 1794 he landed in Bengal with his wife and family. He had to encounter early disaster, for all that he had provided for the establishment and support of the mission was lost by the upsetting of a boat on the Hooghly. Thus deprived of the means of subsistence, and desolate in a strange land, Carey and his party proceeded in an open boat, till about forty miles east of Calcutta they found refuge at Dehatta, the residence of Charles Short, Esq. Mr. Carey soon obtained a situation as manager of an indigo factory near Malda. He did not, however, lose sight of his great work, but erected a school near the factory, where he also preached in the language of the country on two days every week, making occasional journeys into neighbouring districts to prepare the way for missionary labour, when he should be joined by assistants from England. When these came, however, the East India Company refused them permission to settle, because they fancied the operations of the mission were in violation of the treaties they had made with the native governments. Mr. Carey, therefore, resolved to avail himself of the protection of the Danish governor, Colonel Bie, and removed in 1799 to Serampore, where, with Messrs. Ward, Marshman, and Fountain, he opened schools, began preaching, and established a printing-press. Early and marked success attended these varied labours. Mr. Carey's fame as an oriental scholar became so great, that in 1801 he was appointed by Marquis Wellesley to the chair of Sanscrit, Bengalhee, and Mahratta, in the new college at Fort-William. In 1805 he began to preach with great success in the Loll bazaar at Calcutta; but in the following year, on the breaking out of the Vellore mutiny, which was foolishly attributed to animosity against the missionaries, orders were issued by the Bengal council that their labours should cease. They still, however, found protection and encouragement in the Danish settlements, and ere long were able to resume operations even in the territory of the company, the true cause of the mutiny having come to light. In 1814 they had twenty stations; and in the following year the new charter act came into operation, which gave a legal sanction to their exertions as schoolmasters and teachers. In 1805 Mr. Carey received the degree of D.D. from a British university, and in 1806 was elected a member of the Asiatic Society. From about this time till his death on June 9, 1834, he continued to prosecute his missionary and philological labours with uninterrupted and increasing success. The extent of Dr. Carey's acquirements as a student of eastern languages, may be gathered from the fact, that he published a Mahratta grammar, 1805; a Sanscrit grammar, 1806; a Mahratta dictionary, 1810; a Pamjabee grammar, 1812; a Felingee grammar, 1814; the "Raymayana," in the original text, three vols. 4to, 1806-1810; a Bengalhee dictionary, 1818; a Bhotanta dictionary, 1826; and, with the assistance of Dr. Marshman, a grammar of the same language. From the Serampore press there issued during his lifetime, editions of the scriptures in the dialects of more than forty tribes, comprising nearly 200,000,000 of human beings. Dr. Carey had also no mean distinction as a man of science, from his researches into the botany of the East.—J. B.

CARGILL, DONALD, one of the foremost of Scotland's noble army of martyrs. He was minister of the Barony parish of Glasgow at the restoration of Charles II. in 1660. His refusing to observe a day of thanksgiving for the Restoration, which no presbyterian could consistently do, exposed him to the fierce opposition of the civil power; he was forbidden to preach, and

sentence of banishment was passed on him as a rebel. In spite of these tyrannical acts, however, he continued to proclaim the gospel whenever an opportunity offered. He took part with Richard Cameron in the Sanquhar Declaration in 1680. After that dauntless witness for truth and liberty fell, Cargill was one of the most distinguished in bearing aloft the banner of the covenant. He had the courage to pronounce in due form sentence of ecclesiastical excommunication on the king and a number of his associates among the nobility. This is known in history as the Torwood Excommunication, from the place in Stirlingshire where it occurred. The act, however much censured, has this to be said in its defence, that it was only too well merited by the character and conduct of those on whom it fell. After many remarkable escapes, Cargill was at length apprehended by his pursuers, was carried to Edinburgh, tried, and condemned to the gallows. He was, accordingly, along with some others, executed at the cross of Edinburgh in 1681. His behaviour at the scaffold, his dying speech and testimony, and some letters addressed to friends, bear ample and touching witness to the lofty piety, the ardent zeal, and the uncompromising fidelity of the venerable martyr.—(See *Scots Worthies*; *Cloud of Witnesses*; *Hind Let Loose*; *Biographia Presbyteriana*; *Wodrow's History*, &c.)—W. S.

CARGILL, JAMES, a Scotch physician and botanist, resided at Aberdeen during the sixteenth century. He studied botany and anatomy at Basle during the time that Caspar Bauhin held the professorship of those sciences, for whom a chair was first created in that city in 1589. Bauhin mentions Dr. Cargill as one who transmitted seeds and specimens to him. Gesner and Lobel also acknowledge his services, and the latter speaks of him as a philosopher, and as well skilled in the sciences of botany and anatomy. He appears to have been alive in 1603, when he sent specimens of fucus (*laminaria*) *digitatus* to Bauhin. He has not left any writings.—J. H. B.

CARIBERT or CHARIBERT, I. and II. See MEROVINGIANS.

CARIBERT or HARIBERT, eldest son of Clothaire I., lived in the sixth century. On the division of the dominions of Clothaire, at the death of that monarch in 561, Caribert had for his share the kingdom of Paris. He afterwards obtained some other towis, among which were Avranches and Marseilles. He died near Bourdeaux about the year 567.

CARIBERT or CHARIBERT, son of Clothaire II., and younger brother of Dagobert, whom he obliged to cede to him the realm of Aquitaine. He died in the year 631.

CARIBERT or CHAROBERT, son of Charles Martel, king of Naples and Hungary, born at Naples about 1292; died in 1342. His succession to the throne of Hungary having been disputed by Wenceslaus, fourth king of Bohemia, Pope Boniface VIII. summoned the rival princes to plead before his tribunal, and by a bull dated 30th May, 1303, decided in favour of Caribert, who, during a long and flourishing reign, greatly extended by conquest and diplomacy the frontiers of the kingdom.

CARIGNANO. The name of a branch of the royal house of Savoy, which ultimately succeeded to the throne of Sardinia. It took its name from Carignano, a small town in the province of Turin. The first prince of Carignano was THOMAS FRANCIS, son of Charles Emmanuel I., duke of Savoy. He was born in 1596, and at the age of sixteen gave signal proofs of courage and ability in the Italian war which his father waged against the Spaniards. In consequence of the hostility of Cardinal Richelieu, he abandoned the French and joined the Spanish interest, and gained considerable advantages over the French and their allies the Dutch. His ambition excited great troubles in Savoy during the minority of his nephew, but ultimately peace was established through the mediation of the pope, Urban VIII., and Carignano obtained the commission of lieutenant-general of the French and Piedmontese army. The great Turenne served under him when Asti and Trino were taken from the Spaniards. The favour of Cardinal Mazarin obtained for the prince the office of high-steward of France, in the room of the prince of Conde, who had been declared guilty of treason. He died at Turin in 1656. His grandson, VICTOR AMADEUS, who died in 1741, was lieutenant-general of the armies of France and Savoy. A grandson of this prince, bearing the same name, was a lieutenant-general in the service of France, and died in 1780, and CHARLES ALBERT, his grandson (see CHARLES ALBERT), ascended the throne of Sardinia, on the failure of the

main branch of the house of Savoy in 1831, in the person of CHARLES FELIX.—J. T.

CARILLO D'ACUNHA, ALFONSO, a Portuguese of the fifteenth century, who became known in Spanish history. In 1446 he became archbishop of Toledo, and rose to be minister of state to Henry IV., king of Castile, against whom he led a band of rebels, who, though defeated, and condemned by the pope, at length succeeded in compelling Henry to sign a treaty, declaring his daughter Jane illegitimate, and the celebrated Isabella, his sister, heiress to the throne. He afterwards deserted the interest of Isabella, and became the champion of the princess against whom he had before intrigued; but he failed, and was compelled to retire into a convent at Alcalá, where he died in 1482.—J. B.

CARINUS, MARCUS AURELIUS, a Roman emperor, associated with his father Carus in the government A.D. 283, and raised to the throne conjointly with his brother Numerianus in the following year, was assassinated by his own officers at the battle of Margum, 285. He was one of the most cruel and profligate of the Roman emperors.

CARISSIMI, GIACOMO, a musician, was born at Padua (some say at Venice) about 1582, and died, most likely at Rome, about 1672. In 1649, according to the statement of Kircher, who was his intimate friend, Carissimi held the office of *maestro di capella* at the church of S. Apollinari in the German college at Rome. Further than this nothing is known of his personal history. There is no valid ground for the assertion that he lived and wrote for some years at Paris, and Baini's valuable account of the pontifical chapel disproves the statement that Carissimi was once a member of that establishment. He lived to the advanced age of ninety, was greatly honoured by his contemporaries, and died in affluence. This composer importantly aided the progress of music by his development of recitative, which was originated in his own time by Caccini; but though Peri, Monteverdi, and Cavaliere, also wrote in this form before Carissimi, his is the merit of having first brought it to maturity. He, too, was the first who wrote cantatas on sacred subjects. This style of composition, an alternation of recitative and rhythmical melody, had already been employed for secular subjects by Barbara Strozze, but the merit of his productions established it in general esteem. He was one of the earliest who wrote for string instruments in ecclesiastical music, showing thus, in all he did, a tendency to break through the trammels of the old Roman school; and though little of his music is now known, his influence upon art is still in operation. The imperial library at Paris contains MSS. of many oratorios by Carissimi, one of which, "Jephtha," is esteemed his masterpiece. There are also a large number of motets, and some comic pieces of considerable humour. A series of twenty-two of his cantatas was published in London at the beginning of the last century; there are some works in MS. by him in the British museum; the most extensive collection of his music, however, is that presented by Dean Aldrich to the Christ Church library at Oxford, who also adapted several pieces of this master, as anthems, to English words. The most accessible specimen of his talent is "Perorate, filiæ Israel," a chorus in his "Jephtha," which Handel appropriated to the words "Hear, Jacob's God," in the oratorio of Samson. Carissimi bequeathed his flowing unlaboured style to his pupils, the most distinguished of whom were Bassani, M. A. Bononcini, Cesti, and A. Scarlatti.—G. A. M.

CARL, JOHANN SAMUEL, German physician and naturalist, born at Ehningen, principality of Hohenlohe, in 1676. He studied at Halle in Saxony under Hoffman and Stahl. He filled several important public situations, and finally was appointed first physician to Christian VI. of Denmark. His works are numerous, and on various medical and scientific subjects. He was the first to notice that fossil bones do not yield a volatile alkali by distillation, as recent bones are found to do. His medical works are remarkable for advanced views on the laws of hygiene, especially on the connection between mind and body.—J. B., G.

CARLE, PIERRE, a French engineer, born in 1666; died in 1730. He quitted France at the revocation of the edict of Nantes, entered the service of William III. of England, and was actively engaged in the war which was ended by the peace of Ryswick. On one occasion William signified his confidence in the abilities of the Frenchman in a manner offensive to his generals. At a council of war, the king terminated a long and acrimonious discussion by saying—"We shall follow the counsel

of the lame fellow," meaning Carle. Carle served also in the war of the succession in Spain. His last years were devoted to agriculture.

\* CARLEN, EMILIE, born SMITH, a Swedish novelist, born in 1807, and widow of a country medical practitioner—Flygere—who died in 1833. In 1841 she married J. G. Carlen, a Swedish lawyer and author, and is now one of the most productive and universally read of all the novelists of her country. Whilst yet at school she wrote novels; but it was owing to the extreme poverty to which she was reduced, after the death of her first husband, that in 1838 she published her first and very popular work, "Valdemar Klein," anonymously. From the publication of this first work to the year 1853, she has produced twenty-four separate works, amongst which may be named—"Professorn och hans skyddslingar," 1846; "Rosen på Tistelön," 1842; "Bruden på Omberg," 1845; "En nat vid Bullarsjön," 1847; "Formyndaren," 1851; "Inom Sex Veckor," 1853; many of which, if not the greater number, have been translated into German, Danish, and English. The son of her first marriage, EDWARD FLYGERE, magister at the university of Upsala, also a promising novelist, was unfortunately cut off by death in 1852, since which time, his mother, who was deeply attached to him, has not written anything.—M. H.

CARLETON, SIR DUDLEY, afterwards LORD DORCHESTER, an English statesman in the reigns of James I. and Charles I., was born in 1573. He sat in James' first parliament. After discharging some less important embassies, he was sent as ambassador to the states-general of Holland, an office which he held from 1616 to 1628. He was the last English minister who sat in the council of state for the United Provinces. In the disputes between the Arminians and Gomarists, he embraced the cause of the latter, who were headed by Prince Maurice. On the death of his patron, the duke of Buckingham, Lord Dorchester was appointed by Charles I., secretary of state, an office which he held till his death in 1631. The letters to and from Sir Dudley Carleton, during the first part of his embassy in Holland, were published by the earl of Hardwick in 1757.—J. B.

CARLETON, GEORGE, an English divine and voluminous writer of the 17th century, was born at Norham in Northumberland, where his father was governor of the castle. He studied at Edmund hall, Oxford, took his master's degree in 1585, and became doctor of divinity in 1613. In 1618 he was consecrated bishop of Llandaff, and in the same year sent by King James I., with four other divines, to attend the synod of Dort, where he so ably defended episcopacy that on his return he was promoted to the see of Chichester, where he died in 1628. In addition to a large number of independent works on various subjects, he took part in preparing the Dutch annotations and the new translation of the bible, undertaken by order of the synod of Dort.—J. B.

CARLETON, GEORGE, Captain, an English officer who was employed in various negotiations by James II., and served in the war of the succession in Spain, under Lord Peterborough. He died about 1740. The interesting work entitled "Memoirs of an English Officer who served in the Dutch War in 1692," &c., by Captain George Carleton, has been sometimes attributed to Defoe, but on grounds that recent research has rendered extremely doubtful.—J. T.

CARLETON, SIR GUY, afterwards LORD DORCHESTER, a British general distinguished in the American war, was born at Strabane in Ireland in 1724. Having done good service in Canada, he was raised in 1772 to be governor of Quebec, and when the American war broke out in 1775, he bravely defended the town, and repulsed the besieging force under Generals Montgomery and Arnold. He then prepared for offensive operations, and in 1776 defeated Arnold's force on Lake Champlain, and took possession of Crownpoint. In the next year the command of the Canadian armament being unaccountably given to General Burgoyne, Carleton resigned his government; but in 1781 he was appointed to succeed Sir Henry Clinton as commander-in-chief in America, where he remained till the close of the war. In 1786 he was reappointed governor of Quebec, Nova Scotia, and New Brunswick, and raised to the peerage. After some years he returned to England, and died 10th Nov., 1808.—J. B.

CARLETON, RICHARD, an English priest and composer of madrigals in the reign of Elizabeth. Nothing seems to be known of his biography. He published "Madrigals to Five Voyces" in 1601, dedicated to Thomas Farmer, Esq., of Norfolk; and contributed one of the compositions to Morley's celebrated

publication, in honour of the "virgin queen," the Triumphs of Oriana. He appears to have graduated Mus. Bac. at Oxford.—(Rimbault's *Bibliotheca Madrigaliana*.)—E. F. R.

CARLETON, WILLIAM, an Irish novelist, well known for his unrivalled delineations of the habits and character of his countrymen, was born at Prillisk in the county of Tyrone. His parents were of the class known as small farmers. He received his education at one of those schools which he afterwards immortalized by the well-known tale entitled the "Abduction of Mat Kavanagh." His father and mother were both persons who, if not well educated, were at least better informed than most of their class, and seem to have been possessed of mental gifts, which, in another station, and with other culture, might have rendered them remarkable. The former was gifted with a memory of such marvellous grasp, that it is said he could repeat the greater part of the bible "by heart." He was also a repository of legendary lore, and could tell tales and sing songs from Christmas to Christmas. His mother was noted for her beautiful voice, and her powers in the wild Ossianic poetry of the *Caoiné*. William was intended for a priest, and accordingly commenced the studies necessary to fit him for entering Maynooth. He has given to the world an interesting and humorous picture of himself at this period of his life in the story of "Denis O'Shaughnessy going to Maynooth," a character which has all the freshness and firmness of touch of a study from nature. At this critical period of his career his father died, and, with a fuller liberty, came a change of purpose. For reasons that can only be surmised, he abandoned all thoughts of the priesthood, and some years afterwards he left the Roman catholic church, and joined the church of England. Of a volatile and imaginative temperament, he was led to take the first independent step in life by the wafting of a feather. Chance threw in his way a copy of Gil Blas, which so worked upon his fancy that he determined to seek his fortune, and, full of the hopeful errantry of youth, left his native vale to battle with the world. His first effort at independence produced a very sombre result. He obtained a situation as tutor at a miserable salary in a farmer's house. Here his chivalry pined over strips of spelling, and languished over "Voster." It rose against them at last. He resigned the ungenial occupation in disgust, and started for Dublin, where he found himself, without any definite plan in his head, and with two-and-ninepence in his pocket. Some years more elapsed, which were devoted to the uncongenial labours of a tutor; but disciplined by hardship and heavy experience, he now patiently submitted to that toil from which the sanguine youth had revolted. In Dublin he was introduced to the Rev. Caesar Otway, at whose suggestion he wrote the "Lough Derg Pilgrim," which appeared in the *Christian Examiner*, and attracted general notice. This sketch was followed by "Father Butler," which evidences the same graphic touch. In 1829 appeared the first series of the "Traits and Stories of the Irish Peasantry," which was followed in 1832 by the second series of the same. These sketches are masterpieces of art, and stories of inimitable fun: they are fresh and forcible because the author wrote what he had seen and felt before thought and feeling had become venal. He has continued his literary career ever since, with varied success. He became a regular contributor to the *Dublin University Magazine*, in which many of his best stories have appeared. In attempting to depict the life of the more wealthy classes he has been less successful, as might naturally be expected. Some of his novels exhibit singular power and skill. A finer or more striking work of fiction than "The Miser" has rarely appeared. This book is further interesting as giving an accurate description of Ribbonism as it existed in Ireland some years ago. In the "Black Prophet," a tale of the famine, he has portrayed the Irish female character with matchless strength and pathos.—W. W.

CARLI, GIOVANNI GIROLAMO, an eminent philosopher and biographer, born near Siena; became professor of eloquence, first at Colle in Tuscany, then at Gubbio in the papal dominions, where he was so much respected and beloved by the inhabitants as to be frequently employed in important public affairs. Returning to Siena he accepted the secretaryship of the academy. He subsequently removed to Mantua, where he was created perpetual secretary of the academy of arts. There he wrote the greater number of his scientific and literary works. Of these many are inedited. Carli published translations of elegies from Tibullus, Propertius, and Albinovanus, and several valuable biographies. He died at Florence in 1505.—A. C. M.

CARLI, GIOVANNI RINALDO, Count de, commonly called CARLI-RUBBI, one of the most prolific writers of the eighteenth century, was born at Capo d'Istria in 1720, and died in 1795. Such was the precocity of his intellect, that before he had completed his twentieth year he was admitted a member of a learned academy for having, by various publications, advanced the sciences of philology, archæology, mathematics, and astronomy. To his skill in these branches of knowledge, he added a considerable mastery over the dramatic art, which he had cultivated almost from his infancy, publishing in his twelfth year a drama to which, in his old age, he often alluded with complacency. In his twenty-fourth year he was elected professor of astronomy and of nautical science by the Venetian senate, who had to thank him for the zeal with which he discharged the duties of the office. He corresponded with the most eminent savants of Italy, took part in all the leading questions, political as well as scientific, of his day, and enjoyed the double honours of philosopher and poet. Upon the death of his wife, who left him a large fortune, he resigned his chair at Venice, retired to Istria with the naturalist Donati, and occupied himself with archæological pursuits; the results of which, particularly his discovery of the amphitheatre of Pola, he gave to the world in dissertations of remarkable elegance. Having transferred a cloth manufactory left by his wife to the neighbourhood of his residence, he undertook the superintendence of the business, and lost his entire fortune. In 1771, to compensate him for this disaster, he was named by the government of Austria president of the council of finance established at Milan. His great work on Italian antiquities appeared in 1788.—A. C. M.

CARLINGFORD, THEOBALD TAAFE, Earl of, was distinguished for the active part which he took with Lord Clanricarde in 1639 in suppressing the disturbances in Ireland, where he undertook to raise 2000 men to support the royal cause, and the lord-lieutenant granted him a commission to levy troops, with which he besieged and took several garrisons. He accompanied Ormonde into Westmeath, and was constituted general of the province of Munster in 1646. After the surrender of Cahir to Lord Inchiquin, Taafe retired with his army from Cashel, and subsequently encountered Inchiquin's forces at Knocknones, where, notwithstanding great personal bravery, the English troops were routed. On Inchiquin's giving his allegiance to the king, he was joined by Taafe, who, though he had reason to complain of a preference shown to Lord Castlehaven, yet continued his arduous efforts in the king's cause. He was soon after made master of the ordnance. Taafe went to Paris in order to raise a loan, and succeeded in obtaining £5000 to buy arms and ammunition. In Cromwell's act of parliament for the settlement of Ireland, Taafe was excepted from pardon for life and estate, but after the Restoration he was reinstated in his property, and in June, 1662, was created Earl of Carlingford, with a grant of £4000 a year. He died in 1677.—J. F. W.

CARLISLE, Earls of. The first person who bore this title was ANDREW DE HARTCLA, warden of the marches, a distinguished soldier in the Scottish wars. The earldom was conferred on him by Edward I., along with immense estates, for his victory over the rebel earl of Lancaster at Boroughbridge; but he was subsequently convicted of treason and executed in 1322. After the lapse of more than three centuries, the earldom of Carlisle was revived, and conferred upon a branch of the great house of Howard, descended from "Belted Will," famous in border tradition and song.—(See *Lay of the Last Minstrel*.)

CARLISLE, FREDERICK, fifth earl of, born in 1748, was distinguished both as a statesman and a poet. He was appointed lord-lieutenant of Ireland in 1780, and for several years took an active part in parliamentary discussions. He mixed largely in the gay world, to the serious detriment of his estate, and was the friend of Selwyn, Fox, and other leaders of fashion.—(See Hayward's *George Selwyn, his Life and Times*.) Lord Carlisle was the author of a number of fugitive pieces of poetry, and of two tragedies, "The Father's Revenge," and "Bellamere." But his poetical reputation has suffered serious injury from the unjust and acrimonious attack of Lord Byron in his English Bards and Scotch Reviewers, for which, however, his lordship subsequently made a beautiful atonement in the third canto of *Childe Harold*. Lord Carlisle died in 1826.

CARLISLE, GEORGE, sixth earl of, born in 1773; died in 1848; was employed in various diplomatic services, and was a member of Canning's government in 1827.—J. T.

**CARLISLE, GEORGE WILLIAM FREDERICK HOWARD**, seventh earl of, was born in London on the 18th April, 1802. Known then as Lord Morpeth, he greatly distinguished himself at Oxford by his fine scholarship. Soon after quitting the university he became an attaché of the embassy of St. Petersburg. He entered parliament in 1826, representing successively the town of Morpeth and the West Riding of Yorkshire. He lost his seat for the latter very important district, which he represented from 1830 to 1841, solely because of his attachment to the now triumphant doctrines of free-trade. Lord Carlisle held important offices under the various whig governments. He was chief secretary for Ireland at the time when the agitation for repeal of the union was at its height, and even then made himself popular by his urbane and conciliatory manners. In the establishment of the Irish poor-law he took an active interest. From 1846 till 1850 he was chief commissioner of woods and forests, and in the latter year succeeded Lord Campbell as chancellor of the duchy of Lancaster—a situation which he held till the return of Lord Derby to power in 1852; having meanwhile, by the death of his father in 1848, become Earl of Carlisle. Freed from the calls of official duty, he in 1853 travelled in the East, and on his return embodied his observations, and the impressions derived from his tour, in a work entitled a "Diary in Turkish and Greek Waters," in which he speaks of the fall of the Ottoman empire as certain and impending. In keeping with these views, he about the same time published a versified paraphrase and commentary on the prophecy of Daniel. After he lost his seat for the West Riding, he visited the United States. Returning to England, he in 1850 gave two lectures in the Mechanics' Institute at Leeds—one on America, and the other on the "Life and Writings of Pope." They attracted much notice at the time, not only on the ground of their acknowledged merits, but from the novelty of one in his lordship's elevated rank volunteering to lecture before an audience of mechanics; though such an act was a very natural result of his enlightened liberality of sentiment and benevolent disposition. His essay on Pope, if not remarkable for the depth or originality of its views, affords at least ample evidence of fine taste and high intellectual culture. As a speaker Lord Carlisle possessed in an eminent degree that power which sincerity and kindness of heart never fail to infuse into the utterances of an accomplished mind. In 1855, and again in 1859, he went to Ireland in the capacity of lord-lieutenant. Throughout his tenure of office he was unwearied in his endeavours to develop the natural resources of the country, and to diffuse education; and no one ever more thoroughly succeeded in securing the love and esteem of the people. Ill health, however, obliged him to abandon office, and returning to England, he died after severe illness at Castle Howard, Yorkshire, on the 5th of December, 1864.—J. D.

**CARLISLE, ANNE**, painted portraits very dexterously, and, according to Walpole, had a repute for her copies of Italian works. She died about 1680. She probably painted in oil, as well as in miniature.—W. T.

**CARLISLE, SIR ANTHONY**, a distinguished surgeon, born near Durham in the year 1768; died in London on the 2nd November, 1840. The early part of his medical education was carried on first at York, and afterwards at Durham, under Mr. Green, the founder of the hospital in that city. He afterwards went to London and entered as a pupil at the Westminster hospital under Mr. Watson, then surgeon there. On the death of Mr. Watson in 1793, Mr. Carlisle was appointed his successor. He was very early elected on the council of the College of Surgeons, and was for many years a member of the examining board, and one of the curators of the Hunterian museum. He also held the appointment of professor of anatomy and surgery, and in 1829 became president of the college. He was surgeon to George IV. when he was prince regent, who conferred knighthood upon him at the first levee he held after he became king. In 1808 he succeeded Mr. Sheldon as professor of anatomy to the Royal Academy, which office he held for sixteen years. Sir Anthony Carlisle was, when a young man, in intimate and frequent communication with John Hunter. His early literary productions were chiefly on subjects connected with the studies to which he was introduced by that great master of comparative anatomy. In 1793 he wrote a paper on a case of an unusual formation in a part of the brain; and in 1794 contributed to the Transactions of the Linnæan Society, "Observations upon the structure and economy of those intestinal worms

called *Tæniæ*." In 1800 he was elected a fellow of the Royal Society, and contributed a paper to the Philosophical Transactions of that year, entitled "An account of a peculiar arrangement in the Arteries distributed on the Muscles of Slow-moving Animals." There are several other contributions of his in the same Transactions. In 1804 he gave the Croonian lecture on muscular motion. To medical literature Sir Anthony Carlisle made many contributions—"On the Nature of Corns and their Cure;" "A new method of applying the Tourniquet;" "On the general and indiscriminate use of Bougies;" "Letter to Sir Gilbert Blane on Blisters, Rubefacients, and Escharotics," giving an account of the employment of an instrument adapted to transmit a defined degree of heat to effect those several purposes. In 1817 he published a large work entitled "Essays on the Disorders of Old Age, and the means of prolonging Human Life;" a second edition was published in 1818. Many contributions by him to other branches of literature still exist, on plants, antiquities, and one of the most worthy of notice on "Galvanic Electricity," in *Nicholson's Journal*, in which he was the first to point out the fact that water might be decomposed by the galvanic battery.—E. L.

**CARLOMAN**: the name of some French princes of early date, of whom we notice—**CARLOMAN I.**, the eldest son of Charles Martel, and brother of Pepin le-Bref, who was for many years sovereign of Austrasia, Suabia, and Thuringia. He died at Vienne in Dauphiné in 755.—**CARLOMAN**, second son of Pepin le-Bref, a younger brother of Charlemagne, born about 751. On the death of his father, he received as his share of the paternal dominions, Austrasia, Burgundy, and part of Aquitaine—the remainder falling to the lot of Charlemagne. He died in 771, after a reign of four years.—**CARLOMAN**, third of that name, the son of Louis II., the Stammerer, was king of Aquitaine and part of Burgundy, and married a daughter of Boson, king of Provence, who was first his ally, and afterwards his enemy. In 882, on the death of his brother, Louis III., whose assistance had enabled him to overcome his numerous adversaries, Carloman became sole king of France; but two years after he died, without issue, of a wound received in hunting the wild boar.—**CARLOMAN**, fourth son of Charles the Bald, lived about the end of the ninth century, and was appointed by his father abbot of St. Medard. In 870 he was accused of a conspiracy against Charles, deprived of his benefices, and put in prison at Senlis. In 871, after devastating, at the head of a band of brigands, Belgium, Lorraine, and Burgundy, he consented to return to his father, who a second time put him in prison at Senlis, and in 875 he was deposed from the office of priest by a synod assembled there, and condemned to be deprived of his eyes. He did not long survive the loss of his sight.—J. T.

**CARLOMAN**, king of Bavaria, was the eldest son of Louis I., king of Germany. At his father's death in 876 he succeeded to the sovereignty of Bavaria, including also Bohemia, Moravia, Carinthia, Austria, Sclavonia, and part of Hungary. He invaded Italy, and having made himself master of several towns, assumed the title of king of that country. He was ultimately defeated by the Moravians, who took up arms against his authority.—J. T.

**CARLONI, GIOVANNI**, a Genoese painter, born in 1590. He was a pupil of Pietro Sorri, and afterwards studied under Domenico Passignani at Florence. Returning to Genoa he obtained celebrity as a painter in fresco. With his brother he completed an important work in the cathedral of the Guastato at Genoa. He was subsequently invited to Milan, and died in executing the ceiling of the church of the Theatins. He was remarkable for his correct drawing and glowing colour. He died in 1630.—W. T.

**CARLONI, GIOVANNI BATTISTA**. This painter, the younger brother of Giovanni Carloni, was born at Genoa in 1594. He studied in the school of Passignani at Florence. With his brother he painted the three naves of the cathedral at Genoa. In the same church he also painted the "Presentation in the Temple," and "Christ disputing with the Pharisees." He died at the advanced age of eighty-six. He was noted for his affluence of invention, the grace of his drawing, and the lucidity of his colour.—His son **ANDREA** was also a painter of some note. He was born in 1639, and died in 1697.

**CARLOS, DON**, of Navarre, born in 1421, was son of John, brother of Alfonso V., king of Arragon, and Blanche, queen of Navarre. On the death of the latter in 1441, a contest ensued between Carlos and his father for the throne of Navarre. Carlos

took refuge with his uncle, King Alfonso, who resided at Naples. On the death of Alfonso without issue in 1458, he became heir to the crown of Arragon, but was compelled to rouse the Spanish population to obtain from his father, John II., the acknowledgment of his right. Died without issue in 1461.—A. H. P.

CARLOS, DON, eldest son of Philip II. of Spain, by Mary of Portugal, his first wife, was born at Valladolid, July 8, 1545. A constant and bitter animosity prevailed between this unfortunate prince and his father. The disposition of Carlos was ambitious and uncontrollably passionate, but he was altogether destitute of capacity for the business of government, a defect at which Philip was greatly disappointed. Carlos, on his side, was deeply incensed at his father's marriage with Isabel, daughter of Henry II. of France, to whom he had himself been betrothed. It is said that Philip suspected an intrigue between them. In the beginning of 1568, the king, informed that Carlos had secretly expressed sympathy with the protestants of the Netherlands, and meditated quitting Spain and placing himself at their head, and had even attempted the life of the duke of Alva, who had accepted that government, repaired at midnight with a guard to his son's chamber, and placed him under arrest. Kept in a rigorous confinement, the unfortunate prince made several attempts upon his own life, which was at last terminated by poison, by order of the king, and on the sentence of the inquisition of Madrid, in July, 1568.—A. H. P.

CARLOS, DON, pretender to the crown of Spain, and next heir to the old French monarchy after the descendants of Charles X., was the second son of Charles IV., king of Spain, and Maria Louisa of Parma, and was born March 29, 1788. He shared the captivity of his family in France in 1807. In March, 1830, his brother, Ferdinand VII., repealed the salic law in favour of his own daughters, Isabella and Louisa. This law had been introduced by the Bourbon kings, and formed no part of the ancient Spanish constitution. Ferdinand died September 29, 1833, and the absolutist party immediately asserted the claim of Carlos. A sanguinary war followed, in which the pretender's cause was brilliantly sustained until his general, Zumalacarrégui, was killed before Bilboa in June, 1835; after which he met with a series of reverses, and in September, 1839, was compelled to retreat into France, where the government placed him under surveillance at Bourges. He abdicated his claims, May 18, 1845, and retired into Italy, with the title of Count de Molina. He married in succession two daughters of John VI., king of Portugal, viz., Maria Francesca, September, 1816, and Maria Theresa, October, 1838. Died at Trieste in 1855.—His eldest son, COUNT DE MONTEMOLIN, born in 1818; married in 1850, Maria Carolina, sister of Queen Christina, and of Ferdinand II., king of the Two Sicilies, but has no issue.—The younger, DON JUAN CARLOS, has two sons.—A. H. P.

CARLOWITZ, ALOISE CHRISTINE, Baronne de, born at Fiume, 15th February, 1797, and although of German origin, considered a French authoress. She has written historical and other romances of merit, yet her reputation rests chiefly on a translation of the Messiah of Klopstock, which, with her translation of Schiller's History of the Thirty Years' War, obtained the high approbation of the French Academy.—J. F. C.

CARLSON, GUSTAV, born in 1647, was a natural son of Charles X., king of Sweden; his mother was Brita Allertz. After the death of his father in 1660, the queen-dowager, Hederig Eleanora, took charge of his education. The estates of Byringe and the convent of Lindholm in Skaane were settled upon him, and from the year 1658 to 1668, he travelled under the care of Count Lindsköld through the greater part of Europe; after which he entered the French army, and served in the war between France, England, and Holland. In 1673 he was elevated to the rank of count and "frilherre" of the before-mentioned estates in Skaane. During the war in Germany under Charles XI., he became prisoner in Brandenburg. On the conclusion of peace he returned to Sweden, but shortly afterwards, offended by his non-recognition by the royal family, left that country for ever, and entered the Dutch service as lieutenant-general, in which capacity he was employed by our William III. in his Irish campaign. After this he lived the remainder of his days in tranquillity in Holland, and died, without descendants, 1708. Carlson was a lover of learning and science, and left behind him a valuable library.—M. H.

CARLYLE, ALEXANDER, D.D., a well-known Scotch divine, was born in 1721, and in 1747 became minister of Inveresk,

near Edinburgh. He was a very zealous moderate, and strenuously supported those ecclesiastical measures with which the name of Principal Robertson is identified. Though he published little or nothing himself, Dr. Carlyle was the intimate friend and counsellor of David Hume, Hugh Blair, Adam Smith, John Home, and other illustrious writers who at that period flourished in Edinburgh. When the tragedy of Douglas was privately rehearsed, Carlyle enacted the part of Old Norval, and afterwards attended its first representation at the theatre. He was rebuked by the ecclesiastical courts, both for this offence and for the publication of some satirical *jeux-d'esprit* reflecting on his brethren for their proceedings in regard to this affair. The personal appearance of Dr. Carlyle was exceedingly imposing, and he obtained the nickname of Jupiter Carlyle, from the resemblance which his noble countenance bore to the Jupiter Tonans in the capitol. The world is indebted to him for the preservation of Collins' beautiful ode on the Superstitions of the Highlands. Dr. Carlyle died August 25, 1805, in the eighty-fourth year of his age. His valuable and deeply interesting memoirs of his own time which he left behind him were not published until 1860.—J. T.

CARLYLE, JOSEPH DACRE, celebrated as an Arabic scholar, was born at Carlisle in 1759. He was a student of Christ's college, Cambridge, where he took his master's degree in 1783. While resident at the university he studied Arabic with the assistance of David Zamio, a native of Bagdad. On the resignation of Dr. Paley, he became chancellor of the diocese of Carlisle, and in 1794 was elected professor of Arabic in Cambridge. Having been in 1799 appointed chaplain to Lord Elgin's embassy to Constantinople, he had an opportunity of visiting the libraries of that city, and of travelling through the countries of Asia Minor, as well as through Italy, Tyrol, and part of Germany. He returned to England in 1801, and was presented to the living of Newcastle-upon-Tyne. He published—"Rerum Ægyptiacarum Annales, ab anno Christi 971 usque ad annum 1453," in Arabic and Latin, 1792; and "Specimens of Arabic Poetry from the earliest time to the extinction of the Khalifs, with some account of the Authors." After the author's death appeared his "Poems, suggested chiefly by scenes in Asia Minor, Syria, and Greece," 1805. Mr. Carlyle was engaged in preparing a correct edition of the Arabic Bible, and a very complete edition of the Greek New Testament, when he died in 1805.—J. B.

\* CARLYLE, THOMAS, was born at his father's farm, near Ecclefechan in Dumfriesshire in 1795; and after some years of training in his own parish, went to the grammar-school of Annan to prepare for a course at the university. He became a student at Edinburgh in 1809, and remained there during seven sessions. Not much is known of his college life: we may infer from the hints we have, that he lived mainly with his own thoughts, and owed comparatively little to the system under which he was reared. Yet he distinguished himself as a pupil of Leslie, in the pursuit of mathematics. For some years after leaving the university, he was engaged as a teacher of this science at a school in Fifeshire, and in 1823 he became tutor to the late Mr. Buller. Carlyle had been originally destined for the Scottish ministry; but during his course of study his views regarding the church had become modified, and his thoughts were already turning towards a literary life. He commenced his career as a writer, by the contribution of articles to Brewster's Edinburgh Cyclopædia on Montesquieu, Montaigne, Nelson, and the two Pitts; articles not republished in his collected works. About this time he translated Legendre, and prefixed to his translation an original essay "On Proportion." The first part of his "Life of Schiller" appeared in the *London Magazine* in 1823; it was completed in the following year, and published in 1825 in a separate form. Among other encouraging signs, a German version of this biography was introduced by a favourable preface from Goethe himself, whose works had already begun to exercise a paramount influence over the mind of the rising author. Carlyle's translation of Wilhelm Meister's Apprenticeship was published in 1824. It was attacked in the *London Magazine* by a celebrated writer, who has made himself, on various occasions, notorious for the injustice of his criticism; but, on the whole, it met with a cordial reception. Even Jeffrey, in his absurd review of the book itself, speaks in high terms of the talent and skill displayed by the translator. The "Wanderyahre," which now composes the third volume of the English edition of Meister, first appeared as the last of four volumes of

German romance, published in 1827. Carlyle married in 1825, and about the same time retired to his country farm of Craigenputtock in Dumfriesshire, where he remained for several years to cultivate, undisturbed, his own line of literature and contemplation. There is an interesting reference to his abode and manner of life in one of his letters to Goethe, with whom he at this period maintained a friendly correspondence:—"Here Rousseau would have been as happy as on his island of Saint Pierre. My town friends, indeed, ascribe my sojourn here to a similar disposition, and forebode me no good result. But I came here solely with the design to simplify my way of life, and to secure the independence through which I could be enabled to remain true to myself. This bit of earth is our own; here we can live, write, and think as best pleases ourselves, even though Zoilus himself were to be crowned the monarch of literature....From some of our heights I can descry, about a day's journey to the west, the hill where Agricola and the Romans left a camp behind them. At the foot of it I was born, and there both father and mother still live to love me....The only piece of any importance that I have written since I came here, is an 'Essay on Burns.'" Besides this (1828), he had contributed to the *Edinburgh Review* his first article on Richter and a survey of German literature (1827). From that date till 1844 he continued to write at intervals for the *Edinburgh, Foreign Quarterly*, and *Frazer*, the series of critical and historical essays which make up his "Miscellanies." Those on Count Cagliostro and the Diamond Necklace form a sort of proem to the "French Revolution." That work itself appeared in 1837, and with it Carlyle's name was for the first time brought before the public. "Sartor Resartus" was originally written in 1830, and after being rejected by several London firms, was printed in successive numbers of *Frazer's Magazine*. Published as a single volume only in 1838, it made its way in this country slowly but steadily, and helped to establish the author's place in the front rank of our thinkers. "Chartism" appeared in 1839. Meanwhile Carlyle, who had transferred his residence to the metropolis, had been distinguishing himself in another sphere. In the summer of 1837 he delivered a course of six lectures on German literature, and a second series of twelve on the history of literature (1838). In 1839 he gave a course on the revolutions of modern Europe; and in 1840 delivered the lectures on "Heroes and Hero-worship," which were afterwards published. Carlyle himself, at the conclusion of his last lecture, expressed his satisfaction with the cordial way in which his call for attention had been answered, but it was his last effort in this direction. He has confined himself since then to the other channels of literature, in which he judged, perhaps rightly, that his force more really lay. His "Past and Present" was published in 1843; "Oliver Cromwell's Letters and Speeches" in 1845. The rapid sale of this latter work bore testimony to the growing fame of its author. A new edition was called for a few weeks after its publication, and a third, with additions, appeared in 1849. The "Latter Day Pamphlets" came out in 1850, and the "Life of John Sterling" in 1851. His "Life of Frederick the Great," 2 vols. 8vo, appeared in 1860.

When Carlyle's essay on German literature first appeared, it marked an era in the history of criticism. The writers who contributed to the early numbers of the *Edinburgh Review*, brought with them a large amount of taste and sound judgment, which they successfully applied to such works as fell within their sphere, and could fairly be tested by their canons. In dealing with a new literature they failed to criticise, because they had never made the necessary effort to comprehend it, and intolerantly proscribed all that did not conform to rules which, applied beyond that sphere, became mere arbitrary formulæ. If such criterions have been dismissed as inadequate—and it is a first principle of our criticism that we must place ourselves as far as possible in the position of our author—it is mainly owing to the influence of the "Miscellanies." The literature of Germany—to which three-fourths of those papers are devoted—first became known in England through Carlyle, because he himself was the first to apprehend its meaning. At the close of one of his essays he gives two pieces of advice, salutary at all times, but more especially needful at the time they were given. The first records his conviction that careful study is necessary to understand well anything that is much worth understanding;—the belief, in his own phrase, that nothing great can be "adequately tasted." Nothing more impresses the student of his

works than his *thoroughness*. He never takes a task in hand without the obvious determination to perform it to the best of his ability; consequently, when he has satisfied himself that he is master of his subject, he will more than satisfy others. His second impresses the duty of trying to throw ourselves into the mind of others before we pronounce judgment on them. This is the grand secret of Carlyle's success as a critic: to it is chiefly owing his pre-eminent skill to interest us in the thoughts, feelings, and fortunes of every one of whom he writes. He has many of the minor requisites of a good critic; he knows how to distinguish the essential from the accidental—what to forget and what to remember—what to say and what not to say—where to begin and when to stop. Not only his biographies of Schiller and Sterling, but the shorter notices scattered among his essays, are intrinsically more complete, and throw more real light on character, than whole volumes of ordinary memoirs. He exhibits in prose the same penetrating imagination which distinguishes a great poet, and, *circum precordia ludens*, brings out in bold relief the main features of the men whom he designs to commemorate. His desire to find good in all greatness—a charitable breadth of sympathy expressed in the saying, that we must judge a man not by the number of his faults, but by the amount of his deflection from the circle, narrow or wide, which bounds his being—enables him to appreciate those most widely differing in creed, sentiment, and lines of activity from each other and himself. We can understand how a native of the Scottish Lowlands, having much of his nature in common with their lyricist, should have written the best of essays on Robert Burns; or how one so remarkable for stern independence and strength of will, should find congenial themes of discourse in Johnson, Luther, Mirabeau, and Francia; but when the same searching criticism is applied to such names as Voltaire, Diderot, and Novalis, with the same generous liberality, we admire a genius as flexible as it is intense. Carlyle sums his view of history, when he calls it "the essence of innumerable biographies." Nothing is more characteristic than his tendency to *individualize* every thing he meets, and his dislike of abstractions, political or moral, which he cannot connect with something concrete, single, and definite. Most biographies are too vague for him; he delights in Boswell. He glides over dissertations and generalizations, to pick out some little bit of fact from the heart of Clarendon or Hume. The essence of history does not lie in laws, senate-houses, and battle-fields, but in the tide of thought and action—the world of existence that in gloom and brightness blossoms and fades apart from these. Other writers have expanded biography into history—Carlyle condenses history into biography. Even in the "French Revolution," where he has pre-eminently to deal with masses, he gives a striking prominence to their leaders. They pass before us as the writer gives them names, and calls them back again as they lived, and moved, and died, amid those stormy scenes. But this is only one of the aspects of the work. The "Revolution" has been compared to an epic poem. Its author recognizes in his theme the longest and fiercest fight the world ever saw—the death-wrestle of outworn feudalism and young democracy. Hence there is a deep back-ground to all these figures, in the rush and surge of contending multitudes. If the book is in prose, it is such prose as was never seen before. It is all a "flame picture," every page seems on fire; we read the whole as if we were listening to successive volleys of artillery. "Cromwell" is avowedly biographical. The events of the period are brought out in Carlyle's book only so far as they are connected with the career and character of his hero; but in its elucidation of that character it is without a rival. There never was a work which more completely reversed a historical verdict. The old notions of hypocrisy, fanaticism, and ambition are refuted out of his own mouth; but it required the illustrative genius of his editor to bring back life and meaning to those half-forgotten letters, and sweep away the clouds that so long obscured the august proportions of the Protector. "Frederick" abounds with evidences of the same revivifying power. The introductory portion, which has to lead us through one of the most tangled mazes of early Prussian history, is rendered interesting mainly by the restoration of a whole gallery of German worthies. In the main body of the book, the men and women connected with the Prussian court are brought out in fuller light and shade:—Frederick himself at Sans Souci, with his cocked hat, walking stick, and wonderful grey eyes; Sophie Charlotte, with her grace, wit, and

music; Wilhelmina and her book; the black artists, Seekendorf and Grumkow; George I. and his Bluebeard chamber; the Old Dessauer; August the Strong; Voltaire; Algerotti. All these, and more are summoned as by a wizard's wand from the land of shadows to march or flutter past the central figure of his volumes. Carlyle as a historian is notably exact. What he himself calls "a transcendent capacity of taking trouble," and a genius for accuracy, preserves him from being carried away from the strict confines of fact. He has a keen eye for nature, and the reliance we come to have on their fidelity adds a new charm to his pictures. His descriptions of places and events, even the most trivial, have a freshness which one hardly finds anywhere else out of Homer. See especially in "Cromwell" the account of the battle and battle-field of Dunbar, where the narrative is sustained throughout with more than Homeric grandeur. His last work brings before us a host of places and scenes—all vividly realized, and enriched by the memories that are made to cluster round them.

Much of the power of this writing is connected with the peculiar fascination of the author's later style. Questionable as a model for others, his own manner suits him, for it is emphatically part of his matter. Its abruptness corresponds with the abruptness of his thought, which proceeds often by a series of electric shocks, as if—to borrow a simile from a criticism on St. Paul—it were breaking its bounds and breaking the sentence. It has a rugged energy which suggests a want of fluency in the writer, and gives the impression of his being compelled to write. He is at all hazards determined to convey his meaning; willing to borrow expressions from all lines of life and all languages, and even to invent new sounds and coin new words, for the expression of a new thought. He cares as little for rounded phrases as for logical arguments, and rather convinces and persuades by calling up a succession of feelings than a train of reasoning. Hence his love of repetitions, and his profuse use of *επεκτεροντα*. The most Protean quality of Carlyle's genius is his *humour*. Now lighting up the crevices of some quaint fancy; now shining over his serious thought like sunshine on the sea, it is as subtle as that of Cervantes, more humane than Swift's, and only less exuberant than Richter's. There is in it, as in all humour, a sense of ever-present contrasts and apparent contradictions, a sort of double sight, of matter for laughter in sorrow and tears in joy. It has besides a gloomy fervour of its own, and an irony which is more Socratic than Sophoclean, for it is as often at the expense of the writer as of others. He seems perpetually checking himself, as if afraid of betraying too much emotion, and throwing in absurd illustrations of serious propositions, partly to show their universal applicability, partly to escape the suspicion of sermonizing. Carlyle's humour is a mode in which he practises his doctrine of golden silence. It is, in one of its aspects, the offspring of intense reserve. Sometimes it takes a lighter form, and appears as side-splitting satire; sometimes it consists in drollery of description; sometimes in oddity of conception; sometimes it is a character sketch; sometimes it is prominent in the account of an event; now it is an antithesis—now a simile; sometimes it lurks in a word, sometimes in a sentence. Its most unfortunate use is where Carlyle forgets his own warning, and makes laughter a test of truth; its noblest accompanies the *purity* which enables him to handle fearlessly themes that in more awkward hands might have easily become disgusting. Unlike others, he can touch pitch and not be defiled. His humour is equal to that of Sterne; his *pathos* is profounder, in proportion as the man himself is more true. Pathos is the other side of humour. It is the same deep sympathy that laughs with those who laugh, and mourns with those who mourn. Its two phases are often simultaneously prominent in our author's works; but his reverence for the past makes him more touched by its sorrows than moved by its folly. With a sense of brotherhood he stretches out a hand of compassion to all that were weary; he feels even for the pedlars climbing the Hohenzollern valley, and pities the solitude of soul on the frozen Schreckhorn of power, whether in a dictator of Paraguay or a Prussian prince. He leads us to the death-chamber of Louis Quinze, of Mirabeau, of Cromwell, of Sterling, his own lost friend; and we feel with him in the presence of a mystery which solemnizes the errors as well as the greatness of men. Ever and anon amid the din of battle and the cares of state, some gentler feeling wells up in his pages like the chime of Sabbath bells. It is Teufelsdröckh left "alone with the night"

—Oliver remembering the old days at St. Ives—or the Electress Louisa bidding adieu to her Elector. "At the moment of her death, it is said, when speech had fled, he felt from her hand, which lay in his, three slight slight pressures—Farewell, thrice mutely spoken in that manner, not easy to forget in this world." There is nothing more pathetic than the whole account of the relations of father and son in the domestic history of the Prussian court, from the first estrangement between them—the young Frederick in his prison at Custrin, the old Frederick gliding about seeking shelter from ghosts, mourning for Absalom—to the reconciliation, the end, and the after-thoughts about the loved one—a scene never to be mentioned without thoughts that lie too deep for tears.

What Carlyle says of Dante's Francesca, that it is "a thing woven as of rainbows on a ground of eternal black," might be applied to his own tenderness. Every reader of his works has felt in them the presence—sometimes the excess—of an element of sternness. He is a good hater. What he loves most is truth; what he hates most is falsehood, and his denunciations of all its forms—as shams, hypoerisies, phantasms—often remind one of the Hebrew prophets, or Dante himself in their condensed ferocity. He is constantly drawing lessons from history to show their necessary overthrow, and in somewhat exaggerated terms proclaiming their essential weakness. A strong sympathy with strength is one of his characteristic qualities. A Titan himself, he is ever ready to shake hands with Titans, Gothic gods, burly Dantons, Mahomet, Knox, Columbus. Hence his connection of truth and strength; his view that virtue, valour, and victory, are inseparable; his assertion that Might is Right; that all power is moral—convictions which express a truth as yet but partially realized, and which in their premature anticipation of it lead this writer to partial verdicts even on questions of history and biography. He is apt to find excuse for all the tyranny of conquest, and withdraw his sympathy even from the greatness of conquered nations. His burden is too prevalently a "Væ victis." We may admit that right is might, and remember that wrong is might also. We can only hope for the ultimate triumph of the better power. There is nothing more difficult to guard against in speculation than schemes of crude optimism; it seems almost irreligious to draw no morals from history. Yet surely we do not honour God by being too eager to justify his ways to men. In the fraction of the universe we see, our notions of justice are but imperfectly borne out; we may try to enlarge them, but we only jump the difficulty by proclaiming loudly that they are borne out. When we make success or failure the test of national or individual merit, we revive in a new form the old error that made sorrow the sign of sin. Power may accompany the right to conquer, but they are not indissoluble, for the right is not derived from the power. Even the power to rule is an insufficient test; it is only the power to rule well that is a warrant of just victory. We may avoid the logical consequences of a partial view by a vague use of words. If power means moral force it is of course moral; but the assertion, explained, is tautological; unexplained, it is misleading. Carlyle's desire to reconcile the moral and intellectual powers, leads him to fill up the side of a character which is wanting from his imagination. He attacks other schemes of historical optimism, and yet frames one for himself which embraces only half the truth. We need only read it between the lines of his chapter on the Reformation to see its limitations. But his view of the past is comparatively a just one; in long periods the laws of the universe do at least dimly appear, and in the main assert their supremacy. It is when he turns to politics with the eye of a historian, and regards present relations as history accomplished instead of history in progress, that he falls into serious errors. While apprehending more, perhaps, than any previous writer the foundations of existing greatness, it is strange how seldom he tries to realize what may properly be called the new ideas of the age. He wars against the anarchy of passion, and yet respects that other anarchy which takes the name of order. Rebellion is generally but an indication of impatience; nations which cannot obey need not hope to command. He ridicules the American abolitionists in the assertion of a principle which is not based on his view of national deserts. Strength of mind and industry, the prime marks of merit, do not appear prominently in the negro race. It is a proof that it had better remain as it is, in slavery. He derides, in the same way, all female emancipation and other movements which rest

their sole authority on a recognition of the rights of weakness. He acknowledges the importance of new powers that have not yet found their place; but he despises new ideas that have not yet become powers. This is the negative aspect of Mr. Carlyle's political philosophy. Its positive side is *Hero-worship*—his notion of Order and Fealty. Feudalism had its chiefs, and flourished, or not, as it followed them well or ill. Democracy, the new idea of this age, must also find its representatives in great men. Political science consists in discovering the will of the people; but this will is not to be found by universal suffrage and ballot-boxes. It is only a sovereign, well chosen and loyally served, who can express it. Theoretically Carlyle's view ignores the conception of collective wisdom and the action of masses, different in kind as well as degree, from that of units. It is partly a result of his excessive individualism. He forgets the practical impossibility of finding wisdom before trial—the misery of mistakes which are irrevocable. What we want is the guidance of our wisest men; but how many of her wisest men has any nation been able to rank among her kings? In despotic governments we have a happy hit for how many unhappy misses? Carlyle assigns everywhere too wide a sphere to compulsion, and forgets that freedom itself is greater than any end. He is not altogether responsible for the use that has been made of his views to support theories of absolutism; but it cannot be concealed that some of these views lie athwart the best tendencies of the time, and have materially obstructed their progress. Even this, the weakest phase of Mr. Carlyle's philosophy, has some advantages. Standing aside from all political parties, he corrects in turn the errors of each, and checks their exaggerations even by his own. He sees deeply into the undercurrent evils of the time. He assails, with equal force and justice, our practice of leaving those evils to adjust themselves, or dealing with them by empty catchwords. He brands the meanness which too often marks our mercantile dealing, the selfishness which results from over-strained competition, and teaches a truth we are apt to ignore; viz., that *wealth is not the one thing needful for national prosperity*. Some of his direct suggestions are practical and excellent; as the advice to let merit rise from the ranks in all spheres—to employ our army and navy in time of peace—to provide a national education for the people—to fix more exactly the province of the executive and legislative bodies—to promote men of eminence who cannot face a popular election—to organize a new chivalry of labour—making industrial regiments of our able-bodied paupers, and enlarging the sphere of partnerships in all trades. Even on the vexed question of the negroes, his proposals to change their servitude into serfdom, and open the door to the purchase of liberty by the slaves themselves, indicate the best path towards securing their ultimate emancipation.

But it is neither as a politician nor a biographer, nor even in the domain of history proper, that Carlyle's greatness preeminently appears. Everything he writes has at bottom a personal reference. It is as an *ethical and religious* teacher that he has the largest claim on our gratitude. When he first came to London, everybody was making inquiries about the political and religious opinions of the rising author; was he a chartist, an absolutist, a calvinist, or an atheist?—inquiries which were then and ever doomed to disappointment. He had come from the Scottish moors and his study of the great German literature, a strange element into their society, not to promulgate a new set of opinions, but to infuse a new spirit into those already existing. He found Benthamism prevailing in philosophy; the Byronic vein in poetry; formalism in religion; society was regulated by fashion and routine; men wore their dogmata like their dress, and really believed only in that on which they could lay their hands. His mission was not to controvert any form of creed, but to show the insufficiency of this mode of belief. He raised the tone of literature by referring to higher standards; he tried to elevate men's minds to the contemplation of something better than themselves, and impress upon them the necessity of professing nothing with their lips which in their hearts they could not believe. He taught that we must make our own convictions, and that the matter of profoundest consequence is the degree of sincerity with which we hold them. Beliefs by hearsay are not merely barren but obstructive; it is only "when half gods go, the gods arrive." Carlyle had to war against credulity, in order to grapple with unbelief. A deep sense of *reverence* lies at the root of all his symbolism. He uses new phrases to express a meaning that old

ones have ceased to convey. After all that has been done to explain it, this world seems to him still a mystery, and we ourselves the miracle of miracles. There is beneath all the soundings of science a deeper deep. Content with what we see and know, we would need no religion. It is the feeling that mere sight and knowledge leave us only more forlorn, that creates the grand want. However Carlyle's own form of faith may differ from others (and we have no right to assume more than he chooses to announce), his appeal to the *sense* on which they all depend, has done service to the cause of religion which it is not easy to estimate. He has done much to shatter all existing schemes of utilitarianism. Our relation to our fellows is not a relation of repulsion merely; we are bound to them by invisible yet adamant chains of duty. Duty is with Carlyle something which cannot be derived. Bare calculation would leave the world a wilderness of mean contentions. It is through the sense of the infinite within and around us, that our moral, as well as our religious nature, first truly unfolds itself. "The hero gives his life, he does not sell it." We must be ready to renounce the pursuit of happiness, and in self-annihilation—merging our interests in our duties—we shall find blessedness. Thus alone are true ethics possible. There may be something of the spirit of the mystic in that portion of "Sartor Resartus" where this view is unfolded, but surely there is much of the essence of christianity. It is a firm grasp of the religious sentiment that qualifies any one to be the exponent of religious epochs in history. By this alone, says Dr. Chalmers, "Thomas Carlyle has done so much to vindicate and bring to light the Augustan age of christianity in England." It is the secret of his sympathy with the Puritans. It is the secret, also, of his appreciation of the higher Teutonic literature. "It is obvious from all his writings," we quote from the same authority, "that they are not the dogmata of Germany which he idolizes, but the lofty intellect, the high-souled independence, and above all, as most akin with the aspirings of his own chivalrous and undaunted nature, the noble-heartedness of Germany." Those are the common characteristics which have bound him so closely to Goethe. The relation between the great poet and his English interpreter is a remarkable one. There are many points of contrast between them. The one, self-centered, solitary in his calm, "totus teres atque rotundus," an Apollo sending forth notes of Memnonian music; the other, a rough giant, struggling, restless, suffering with the sorrows of all humanity; the one all symmetry, the other all strength. It is as if Shakspeare and Luther had been born again as master and disciple. Yet they are one at heart. They have the same deep insight—the same sense of the glory and mystery of the universe—the same great grasp of life—the same reverence for man as man—the same intense convictions and the earnestness they bring. The essential difference between Carlyle and the Germans is that of action and thought. To *know* is not his end, but to *be*. Either to know ourselves or others is in great measure impossible. "Know thy work and do it." A practical philosopher, he habitually depreciates metaphysicians. (Vide his treatment of Leibnitz.) He loves the lyre, but it is the lyre that builds the walls of cities. Truth is with him not so much a majestic vision, as an element to mould the character and rule the will. Carlyle does not rest in it—paint, sing, or prove it; but breathes, moves, fights, and dies for it. He loves the strife; like Luther's, his words are battles. Hence his *gospel of labour*, his sympathy with all its forms. *Laborare est orare*. He, and he alone, is honourable who does his day's task bravely, whether by the axe, or plough, or pen. Knowledge and strength are the rewards of toil. Action converts the ring of necessity that girds us into a ring of duty; it frees us from the unhealthy blight of self-consciousness—from morbid dreams—from childish fretfulness—from despair itself—and makes us men. There is nothing grander in literature than some of these litanies of labour. They have the roll of music that makes armies march; rousing us, as by a trumpet, to put forth new power, and force, and energy. They are among the most beneficent influences of Carlyle's philosophy, for they continue to present it on its most genial side. It has another and less consolatory aspect. The appreciation of what is wise and excellent involves, in a world like ours, an equally present sense of folly and crime; but it is unfortunate when the sense of evil predominates over the sense of good. Carlyle seems to forget his own best teaching when, turning from the past with its religious aisles and solemn memories—the past, softened and harmonized

by time—to the present, with its tumults, discord, and wrong, he addresses it in words of impatient anger. This mood has grown upon him. His accents come to us oftener in the thunder and the whirlwind, more rarely in the still small voice. We have had less in recent years of the sublime hopefulness that illumines "Sartor Resartus,"—that most beautiful of all his works, "written in star fire and immortal tears," so rich in tenderness and grace, full of all sights and sounds and modes of melody. Turning from this to the scorn and mockery of the "Latter Day Pamphlets," we are impressed with a somewhat saddening contrast. It is as if he who had led us so far on the way had himself lapsed backward into the Everlasting No. Loss of temper is not loss of faith; but the gloom which pervades some of Carlyle's later writings goes deeper than loss of temper. The "riddle of the painful earth" weighs too heavily upon him. The pressure of infinity itself threatens to overwhelm his liberty; the old doubts ever and anon recur, and the shadow of a dreary fatalism seems to pass over his mind. But the doubts are never quite victorious. There is a profound sense in the remark of one who loved him—He is never at rest in his fatalism, and while he resists it, it is not fatalism. It is a struggle, "yet a struggle never ended, ever with true unconquerable purpose begun anew." His fiery unrest is a sign of the presence and conflict of the spirit of freedom, and an unwearied will.

We have accorded a greater length to this than is generally due to contemporary notices, from a sense of the paramount influence Carlyle's works are exercising, and are long destined to exercise, on the whole speculation of the age. They have already made a deeper impression on the literature of England than the works of any writer who has lived for a century. They have done much to mould some of the best thinkers in America; and are extending their influence to the continent of Europe. Thomas Carlyle has been, by his advice and guidance, the Greatheart to many a pilgrim. Not a few could speak in the words of the friend whose memory he has so affectionately preserved:—"Towards me it is still more true than towards England, that no man has been and done like you." He is one of those regarding whom we are constrained to acknowledge, after all is said that can be said about their works, the man is mightier than them all.—J. N.

CARMAGNOLA, FRANCESCO, a celebrated Italian general, was born in Piedmont about the year 1390. His original name was Busone, but after his elevation he assumed the designation of Carmagnola, from the place of his nativity. In his youth he was a swineherd, but enlisted as a private soldier in the service of Philip Maria Visconti, duke of Milan. His courage and abilities attracted the notice of that prince, who made him commander-in-chief of his army. His brilliant successes soon showed the wisdom of the choice. Carmagnola inflicted several severe defeats on the enemies of the duke, restored to him the whole of Lombardy, and afterwards added to his dominions Piacenza, Brescia, Bergamo, and other towns, and made him the most powerful prince in Italy. In return for these important services, Philip created him Count of Castelnuovo, gave him in marriage one of his natural daughters, and made him governor of Genoa. These honours, and the great wealth he had accumulated, raised up many enemies to the fortunate soldier, and excited the jealousy of the duke, who was of a dark and suspicious temper. In 1424 he deprived Carmagnola of his military command, and refused to listen to his defence, or even to grant him an audience. Indignant at this treatment, the count immediately quitted the territory of Milan, and ultimately repaired to Venice, and revealed to the senate the intrigues and ambitious designs of Philip, who meanwhile had confiscated the immense possessions of Carmagnola, and had sent an assassin to murder him. War was immediately resolved on against Visconti, and Carmagnola was appointed commander-in-chief of the united army of Venetians and Florentines. In the campaigns of 1426 and 1427 he was eminently successful, and the duke was compelled to purchase peace in 1428, by ceding to the Venetians Brescia, Bergamo, and one half of the province of Cremona. But in 1431, war having again broken out between Venice and Philip, Carmagnola was appointed to his former office, but met with various reverses, which excited the suspicion of the Venetian senate, and he was eventually invited to Venice, for the purpose, it was pretended, of assisting the government with his advice. On his arrival he was received with marked distinction, and conducted to the ducal palace, where he was suddenly

arrested, charged with treason, put to the torture, and then beheaded on the 5th of May, 1432. Considerable diversity of opinion prevails as to the question of Carmagnola's guilt or innocence; but the base treachery of the Venetian senators cannot be too severely condemned.—J. T.

CARMATH or CARMATHI, the founder of the sect of Carmathians among the Mahomedans of the tenth century. He belonged originally to the sect of the Ismaili, but openly avowing and carrying to excess their infamous secret doctrines, he at length separated from their chief, and founded the sect which bears his name, and which existed for some time after his death.—J. B.

CARMEI, MICHEL ANGELO, a distinguished Greek and Hebrew scholar, born at Cittadella, near Vicenza, in 1686; died in 1766. He entered the Franciscan order, and became professor of theology and sacred history. Carmei translated Euripides into Italian verse in a style which Piattoni has pronounced classic. On the subject of this translation the author had to maintain a long controversy with Reiske. He has also left a translation of Aristophanes' Pluto, and a version from the Hebrew of Ecclesiastes and the Canticles. A complete list of his works, which are exceedingly numerous, is given by Tipaldo.—A. C. M.

CARMICHAEL, GERRHOM, a Scottish minister at Monimail, Fifeshire, and afterwards professor of moral philosophy in Glasgow university, was born in 1682, and died in 1738. He wrote some learned notes on Puffendorf's *De Officiis Hominis*. His son FREDERICK—born in 1708; died in 1751—succeeded his father in Monimail, became afterwards one of the ministers of Edinburgh, and left a volume of elegant sermons.—J. B.

CARMICHAEL, JAMES, a practical engineer, well known as the inventor of the fan-blowing machines, was born in Glasgow in 1776. In 1810 he became a partner with his brother Charles, who had commenced business as a millwright in Dundee some years before. The brothers soon became famous as ingenious workmen, and were reputed especially successful in the construction of stationary engines. In 1821 they constructed the first twin steamboat for the ferry across the Tay at Dundee. For this vessel James invented an apparatus commonly described as reversing gear, which entitles him to honourable mention among the improvers of steam navigation. In 1829 Mr. Carmichael succeeded, after numerous experiments, in constructing his fan-blast, and with a liberality of which there are few examples, declined to patent the invention. He died in 1853.—J. S., G.

CARMICHAEL, RICHARD, M.R.I.A., for many years a surgeon of the first eminence in Dublin, was the fourth son of Hugh Carmichael, solicitor in that city, and was born on the 6th of February, 1779. After graduating in the schools of the College of Surgeons in Ireland, he was appointed to the Wexford militia. In 1803 he settled as a practitioner in Dublin, and was in the same year elected surgeon to St. George's hospital and dispensary, where his attention was particularly directed to the nature and treatment of cancerous disease. This was the subject of his first publication, an essay which appeared in 1806, and was reprinted in 1809. In 1810 he published an essay on scrofula, and in the course of that year was nominated one of the surgeons to the Lock hospital. This appointment led to the appearance of the great work in which he put forward his ideas on the use and abuse of mercury—views which have undoubtedly ever since modified the practice of the profession, in the therapeutical employment of that mineral. In 1816 Mr. Carmichael was appointed one of the surgeons of the Richmond, Hardwicke, and Whitworth hospital, which office he resigned in 1836. He continued, however, as consultant surgeon to the institution up to the period of his death, and in that capacity gave from time to time clinical lectures on his favourite subjects—scrofula, cancerous diseases, and syphilis. In 1826 Mr. Carmichael, in conjunction with Dr. Robert Adams and the late Mr. McDowell, founded the "Richmond," now known as the "Carmichael" school of medicine. To this school he gave annually during the last eight years of his life, the sum of £50 to be distributed in premiums to the students, and by his will he left £2000 as a premium fund. He also left £8000, under certain regulations, for the improvement of the school. In 1808 Mr. Carmichael was one of the censors, and a member of the court of examiners of the Royal College of Surgeons in Ireland, and in 1813, 1826, and 1846, he filled the office of president of the college. He was also a member of the Royal Irish Academy, and of the Royal Dublin Society; and in February, 1835, he

received the sparingly bestowed honour of the corresponding membership of the Royal Academy of Medicine in France. A complete list of his writings, thirty-one in number, is given in the ninth volume of the *Dublin Quarterly Journal of Medical Science*. Mr. Carmichael's active and useful career was, on the 8th of June, 1849, brought to a sudden and melancholy close by drowning in a rapid stream, while endeavouring to cross on horseback the Strand, in the neighbourhood of Dublin. The bequests made by his will to the medical institutions of Dublin were worthy of his generous nature.—W. D. M.

CARMICHAEL, WILLIAM, an American diplomatist of the revolutionary epoch, was a native of Maryland, of Scotch extraction. In 1775 he was in England, and went to Paris, on his way home, with despatches from Arthur Lee. Being detained by sickness, he aided Silas Deane in his official correspondence, and went to Berlin to give information to the king of Prussia respecting American commerce. He returned to America in May, 1788, and soon afterwards was made a delegate from Maryland to congress, where he seems to have borne testimony against Deane. In 1779 congress appointed him secretary of legation to Mr. Jay in his mission to Spain. He went to Madrid in this capacity, and when Mr. Jay left in June, 1782, he remained as chargé d'affaires. Congress soon appointed him to this office, and he remained in it at Madrid for several years. Carmichael returned to the United States, and died early in 1795.—F. B.

CARMIGNANI, GIOVANNI ALESSANDRO, was born at Pisa in 1768, and educated at the college of Arezzo, where he obtained the degree of LL.D. He was called to the bar at Florence, and in 1799 appointed to a magistracy at San Minato. Selected by the government of Tuscany for the post of professor of jurisprudence in the university of Pisa, he accepted the appointment, but under protest that he would teach from the chair his views of the inutility, injustice, and inhumanity of capital punishments. The rest of his life was devoted to the task of rescuing human victims from the hand of the executioner, and he was often rewarded by success. In his leisure hours he occupied himself with literature, and his comments on the *Teatro d'Alfieri* are of high merit. He died in his native city in 1847.—A. C. M.

CARMONTELLE: born at Paris in 1717. He merits a place amongst literary celebrities, for being the inventor of that charming entertainment which the French call "Proverbe." It is a drama which, depending altogether on dialogue, without aid of scenery or decoration, may be acted in a drawing-room, or got up by a party enjoying a day in the country. Carmontelle obtained a place in the household of the duke of Orleans, which he lost by the Revolution. He died in 1806.—J. F. C.

CARNE, JOHN, the author of several pleasant volumes of travel, particularly "Letters from the East," and "Letters from Switzerland;" died at Penzance, in his fifty-fifth year, in 1844. Born in affluent circumstances, he cultivated literature merely as a recreation, and probably was as much astonished as delighted at the success of his productions. The latter part of his life was spent at Penzance, where, although accustomed to the pleasures of London literary society, he lived in kindly and contented intercourse with his rustic neighbours.—J. S., G.

\* CARNE, LOUIS MARCEN, Comte de, a French publicist and politician, was born at Quimper in 1804 of an ancient and distinguished family. After passing through the offices of attaché and ambassador's secretary, he became a member of the general council of Finisterre in 1833, and a deputy in 1839. In 1845 he supplanted M. Drouyn-de-Lhuys in the ministry of foreign affairs, and held this office till the revolution in 1848. He is the author of numerous articles in the *Revue des Deux Mondes* and other periodicals, and of sundry political works.—J. D. E.

CARNEADES, a Greek philosopher, famous as the founder of the Third or New Academy, was an African, a native of Cyrene, and was born about 213 B.C. In company with Critolaus and Diogenes, he was sent by the Athenians to Rome in 155 to complain of the injustice of a fine which, under the authority of the Romans, had been imposed upon Athens by the Sicyonians for having laid waste Oropus, a town in Bœotia. Each of the three ambassadors excited the attention of the learned men of Rome by some display of learning or eloquence, and particularly Carneades, who harangued in praise of justice before Galba and Cato the censor, with such subtlety of reasoning and copiousness of diction, that when on the day following he undertook to refute all his

own arguments, Cato, in dread of the effect such displays of tongue-fence might have upon the youth of the capital, in diverting them from the pursuit of arms to that of Grecian learning, abruptly dismissed the three Athenians. Carneades died in 129. The leading doctrine of the New Academy was that neither our senses nor our understanding supply us with sure criteria of truth. It was also distinguished by its opposition to the tenets of the stoics.—J. S., G.

CARNEAU, ETIENNE, born at Chartres in the beginning of the seventeenth century, and died in 1671. He first studied jurisprudence under the care of his father, a distinguished avocat, then devoted himself to polite literature. In 1630 he joined the Celestines, and died in their monastery at Paris. Carneau amused himself by writing verse, and published among other volumes one which has been often reprinted, and which still has some interest, "L'Economie du Petit Monde." The "Petit Monde" was in the language of the alchemists, the microcosmos, or man. He translated into verse some tracts of St. Augustine.

CARNEGIE, SIR ROBERT, a Scottish lawyer and statesman, appointed in 1547 a lord of session. His father, John de Carnegie, had fallen at Flodden. Sir Robert attached himself to the regent, Arran, in whose service he visited England and France. After the assumption of the regency by the queen dowager, Carnegie was clerk to the treasurer of Scotland, and one of the commission for concluding peace with England. At the Reformation he treated with the lords of the congregation in name of the regent, but having gone over to their party he was sent as their ambassador to France and England. He died in 1556, leaving a work on Scots law named "Carnegie's Book."—J. B.

CARNOT, JOSEPH FRANÇOIS CLAUDE, an eminent French criminal lawyer, born at Nolai, department of Côte-d'Or, 22d May, 1752; died in 1835.—W. J. M. R.

\* CARNOT, LAZARE-HIPPOLYTE, son of the illustrious member of convention, born at St. Omer in 1801. The associate of his great father in his exile—in Belgium, Bavaria, Poland, and various parts of Germany, he returned to France in 1823, and devoted himself to the bar. Led away, like many other of the young sanguine and intelligent spirits of Paris in those days, Carnot was deluded by the dreams of St. Simon, and united himself closely to *Enfantin*. Repelled, however, by the excesses of this enthusiast in reference to the question of marriage, Carnot, along with Jean Reynaud, Leroux, and others, unfurled a flag of his own; and propagated more chastened ideas through the columns of the *Globe*. He has never quite escaped from the impressions ruling this early period of his life; but he has gained sufficient wisdom to know that the statesman and the politician must, as such, stand apart at present from all these theories,—that the thing to be asked for is simple liberty to test them through private enterprises and organizations. Carnot was elected deputy in 1839, 1842, and 1846, and took his place prominently among the *Mountain*, or the party of radical opposition. On the occurrence of the revolution of 1848, the portfolio of the ministry of public instruction was confided to him; and it cannot be denied, that, during his brief tenure of office—aided by his friends, Reynaud, Renouvier, &c.—he acted with an intelligence and good faith not unworthy of his descent. He fell chiefly through the imprudence of Renouvier, with whom Socialism was still all in all—being replaced by Vaulabelle. He was subsequently elected to the constituent assembly for the department of the Seine by 200,000 suffrages; but notwithstanding his strongly-pronounced republicanism, he had the manliness to concur in the vote that "the General Cavaignac had deserved well of his country." After the *coup d'état*, three republicans, Cavaignac, Carnot, and Henon, were returned to the legislative assembly. Their seats were vacated on their refusal to take the required oath. Carnot was again returned in 1857 for one of the districts of Paris, but he persisted in his refusal to acknowledge the legitimacy of the power of Louis-Napoleon. He now pursues in Paris important literary labours, being engaged on a History of Germany during the War of Liberation, and the Memoirs of his Father. He has already written and published much—for instance, his curious "Memoires de Bertrand Barrere," in 4 vols., and of "Henri Gregoire, Bishop of Blois." There is also an interesting volume by him—"Quelques reflexions sur la domesticité."—J. P. N.

CARNOT, LAZARE-NICOLAS-MARGUERITE, a mathematician, man of letters, engineer, and military administrator of the highest order, and the most able, honest, and brave of French

republican statesmen, was born at Nolai in the department of Côte-d'Or, and province of Burgundy, on the 13th of May, 1753, and died at Magdeburg on the 23d of August, 1823. His father was a member of a respectable family of middle rank, and the parent of eighteen children. In 1771, the young Carnot having passed the necessary examination with distinction, was admitted to the government school of engineering at Mézières, where for two years he received the instruction of several distinguished professors, and especially of the famous Monge. In 1773 he received his commission as lieutenant, and was sent to Calais to superintend the progress of military and hydraulic works. In the course of the ensuing year, besides distinguishing himself in his profession, he published various lyric poems and scientific essays. The most remarkable of the latter was his "Essai sur les Machines en général," first published in 1783, republished in 1786, and again republished and remodelled under the title of "Essai sur les principes de l'équilibre et du mouvement," in 1803. In that essay we first meet with a distinct term—"force vive latente"—to designate what is now called "potential energy." In 1784 he obtained much celebrity by gaining the prize offered by the Academy of Dijon for the éloge of Marshal Vauban, and was elected a member of that academy. The science and art of fortification were amongst the special subjects of Carnot's study, and he did much to improve them. In 1786 he married Mademoiselle Dupont, a lady of the Pas de Calais. On the breaking out of the Revolution, Carnot strongly avowed republican principles. In 1791 he was elected, along with his brother, deputy to the legislative assembly from the department of the Pas de Calais. In August, 1792, he took an active part in the suspension of the royal power. In 1793 he was one of those who voted for the execution of Louis XVI. In the summer of 1793, having gone, as republican commissioner, to superintend the operations for the defence of Dunkirk, threatened by the army of the duke of York, Carnot in person led the successful assault of the important position of Furnes. On the revolt and flight of Dumourier, Carnot, being present with the army of the north, exerted himself with success to prevent the defection of the soldiers. He soon afterwards again distinguished himself in actual combat, by leading in person, and on foot, one of the attacking columns of the army commanded by Jourdan, which dislodged the Austrians from Wattignies, and forced them to raise the siege of Maubeuge. On the 14th of August, 1793, Carnot was appointed a member of the equally famous and infamous committee of public safety. To Carnot alone was intrusted the whole conduct of affairs of war. To his skill in directing and combining the operations of sometimes as many as fourteen armies at once, and to his judgment in choosing officers to command them, are to be ascribed all the honour which belongs to the central organization of the glorious career of victory that marked the early wars of the French republic. Fully occupied by his own duty of guarding the frontier of France, Carnot had no share in the domestic butchery by which his colleagues earned for the period of their domination, the name of the "reign of terror." By the leaders amongst them he was regarded with fear and hatred, which he repaid with contempt and abhorrence. After the fall of the terrorists, Carnot continued to direct the military affairs of the nation with the same success as before. The original idea of the polytechnic school is by many ascribed to him. In 1795 he was appointed one of the five directors, and was elected a member of the Institute. Soon afterwards he encountered a military genius, before which his own had to give way; for on his attempting to control the movements of Bonaparte in Italy, the young general threatened to resign, unless he were allowed to conduct his campaign according to his own plans, and Carnot yielded. The jealousy of Carnot's colleagues in the directory led to a plot for his assassination in 1797, from which he narrowly escaped; but was proscribed as a conspirator and compelled to fly to Germany. In 1799, when Bonaparte seized the supreme power, Carnot was recalled to France, and appointed minister of war. In 1800, disapproving of the consular government, as being opposed to his republican principles, he resigned his office, and retired to a country seat at Étampes, where he passed about two years in scientific labours and in the education of his family. About this time he rose to the rank of colonel of engineers by seniority alone, never having used his former great authority for his own promotion or profit. He ultimately attained the rank of lieutenant-general.

In 1802 Carnot was appointed a tribune; in that capacity he steadily opposed all measures of the consular government having an aristocratic or monarchical tendency; and finally stood alone in opposing the elevation of Napoleon to the empire. It is to the honour of both those great men that, to the end of his career, Napoleon never ceased to evince the highest esteem and even personal regard towards this inveterate political adversary. On the abolition of the tribunate in 1806 Carnot retired into private life. In 1809 the emperor granted him an annual pension of 10,000 francs, which he lost at the restoration of the Bourbons. Shortly after the former date he was elected to the senate by his native department of the Côte-d'Or, and was most favourably received by the emperor, who offered him his choice of offices and dignities, but in vain. At length, in 1814, when the power of Napoleon was tottering to its fall, Carnot, believing the safety of his country to be involved in the maintenance of the empire against its threatened overthrow by foreign powers, came forward to offer those services which he had refused in the time of Napoleon's highest prosperity. The offer was gladly accepted by the emperor, who appointed Carnot to be governor of Antwerp, the most important fortress in his dominions. The day after Carnot's arrival in Antwerp its bombardment by the allies commenced. Carnot practised with success those principles which he had previously published respecting the defence of fortresses; he held out firmly against force and negotiation for nearly three months, and even after the news of Napoleon's abdication had reached him; and it was not until he was assured of the acceptance of Louis XVIII. by the French nation as its sovereign that he surrendered, on the 18th of April, 1814. Carnot on arriving in Paris was coldly received by the king, to whom he afterwards addressed a memorial on political affairs.

On the return of Napoleon from Elba, he created Carnot a count and peer, and minister of the interior. In that capacity Carnot recommended liberal measures to the emperor, and forbade the practice of opening letters in the post-office. On the final overthrow of Napoleon, it was Carnot whom he charged with the reading of his abdication to the chamber of peers. Carnot then became a member of the provisional government, and published an exposition of his political conduct. He alone, of all Napoleon's ministers, was proscribed by the government of Louis XVIII. Being in danger of arrest, he quitted France by the aid of a passport furnished to him by the Emperor Alexander I. of Russia. That sovereign, having a mind capable of appreciating the great and good qualities of Carnot, offered him the rank of lieutenant-general in his army, which he declined, preferring to settle at Magdeburg, where he passed the remainder of his life in the cultivation of literature and science, and died on the 23rd of August, 1823.

We are informed that Carnot was of tall stature, and a noble carriage; that his features were expressive and regular, his forehead broad and high, his eyes blue, lively, and full of intelligence, his nose slightly aquiline; and that his mouth was expressive of serenity and kindness.

Carnot's poetry is marked by simplicity and tenderness, his political writings by truthfulness and energy. His works on geometry and mechanics, full as they are of genius and originality, would be sufficient of themselves to immortalize his name; but their lustre grows pale before the splendour of his political virtue. In him we see the man who rejected wealth, rank, power, and all that common men prize—who braved the mob, the demagogue, the despot, and all that common men fear—who showed by his every act that patriotism, to common men a pretext or a fable, was to him a reality, and the ruling principle of his life—one of the few men of whom Horace's description is true:—

"Justum et tenacem propositi virum;  
Non civium ardor prava jubentium,  
Non vultus instantis tyranni,  
Mente quatit solidâ."

Besides the life of Carnot by Körte, his memoirs, chiefly compiled from his own documents, have been written by Tissot. His life, by one of his sons, has long been announced as forthcoming; but so far as the author of this article has been able to ascertain, it has not yet been published.—W. J. M. R.

CARNOT, SADY, son of Lazare Carnot, and captain of engineers, discovered one of the laws of the motive power of heat, and published it in 1824, in an essay called "Réflexions sur la Puissance Motrice du Feu."—W. J. M. R.

CARO, ANNIBALE, a celebrated Italian poet, born at Nova, near Ancona, in 1507; died in 1566. At an early age, compelled by the poverty of his parents to do something for his own support, he was taken into the service of a nobleman, first as tutor to his family, and then as his secretary, and so won the favour of his patron as to be appointed to a priory and a rich abbey. In 1543, after the death of this nobleman, Caro found a patron of like munificence in Pierluigi Farnese, who supplied him so liberally with money that he could gratify his taste for archæology by collecting a museum of antiquities. This in course of time became one of the richest in Europe. Caro's fame rests principally on his translation of the *Æneid* into blank verse, a work which has been warmly praised by Maffei, Sismondi, and others. He left a volume of rhymes, a play, "Gli Straccioni," and some translations from the Greek. His "Lettere Famigliari" are admirable both in style and matter.—A. C. M.

CAROLAN, TURLOUGH O', the celebrated Irish bard, was born in the year 1670, at Nobber, or, as some assert, at a neighbouring village in the county of Westmeath, and died at the age of sixty-eight in 1738. Early deprived of his sight by the small-pox, the inhabitant of a country recently desolated by a civil war, and add to these his propensity to dissipation, we must wonder at the proofs he has given of the depth and versatility of his talents. Some idea of the fertility of his invention may be formed from the circumstance, that one harper who attended the Belfast meeting in 1792, and who had never seen Carolan, nor been taught by any person who had an opportunity of imitating him, had acquired upwards of one hundred of his tunes, which he asserted constituted but an inconsiderable portion of them. As an instance of the facility with which he committed tunes to memory, as well as of the astonishing ease with which he could produce new melodies, take the following fact, vouched for by the *Monthly Review*:—"At the house of an Irish nobleman, where Geminiani was present, Carolan challenged that eminent composer to a trial of skill. The musician played over on his violin the fifth concerto of Vivaldi. It was instantly repeated by Carolan on his harp, although he had never heard it before. The surprise of the company was increased when he asserted that he would compose a concerto himself at the moment; and the more so when he actually played that admirable piece known ever since as Carolan's Concerto." Carolan was the first who departed from the purely Irish style in composition; but, although he delighted in the polished compositions of the Italian and German schools, with which style many of his melodies are strongly tinged, yet he felt the full excellence of the ancient music of his own country, and has been heard to say that he would rather have been the author of Molly M'Alpine—a charming original air by O'Connellon—than of any melody he himself had ever composed. Yet, it must be admitted that he has produced some airs of surpassing tenderness and of purely Irish structure. We are not informed as to the exact time or cause of Carolan's commencing his career as an itinerant musician; whether he "n'eut abord d'autre Apollon que le besoin"—whether it was necessity or a love of music which induced him to adopt that mode of profession. However, without further dwelling on this question, we can fancy our bard mounted on a good horse, and attended by a harper in the character of a servant. Wherever he goes, the gates of the mansions of the nobility and gentry are thrown open to him. Like the Demodocus of Homer, he is received with respect, and a distinguished place assigned him at the table; near him is his harper, ready to accompany his voice. Ritson considers him the genuine representative of the ancient bard.

It was during these peregrinations that Carolan composed most of those airs which continue to afford delight, and he seldom failed to pay the tribute of a song for the kindness and respect shown to him; thus, as Goldsmith remarks, "his songs in general (for he wrote both words and music) may be compared to those of Pindar, as they have frequently the same flights of imagination, and are composed (I don't say written, for he could not write), merely to flatter some man of fortune upon some excellence of the same kind." Thus, like Pindar's, one is praised for his hospitality, another for the beauty or the good qualities of his family, and the like. His playful song of

"O'Rourke's noble feast will ne'er be forgot,  
By those who were there, or those who were not,"

is generally known as being translated by the witty Dean Swift,

but it by no means takes the first place amongst our bard's numerous compositions. Our "Irish Orpheus" was inordinately fond of "Irish wine," as Pierre le Grand used to call the whisky; but it is remarked that he seldom used it to excess, and that he only imbibed that spirit from the feeling that it was not ungrateful to the muse. Carolan was not the only bard who drew inspiration from that generous source, for "there have been several planets in the poetical hemisphere that seldom shone but when illuminated by the rays of rosy wine." Though Carolan died universally lamented, he would have died unsung, had not the humble muse of M'Cabe poured a few elegiac strains over his cold remains. He left seven children, six daughters and one son. The latter, who had studied music, went to London, where he taught the Irish harp. He published in 1747 a collection of his father's music. To this work a short preface is prefixed, in which most fulsome praise is lavished on our bard, and a parallel drawn between him and Horace.—(Walker's *Irish Bards*; Bunting's *Third Collection*, &c.)—E. F. R.

CAROLINE (AMELIA ELIZABETH), daughter of Charles William, duke of Brunswick, was born 17th May, 1768, and married in 1795 to George, prince of Wales, afterwards George IV. As the marriage was one of mere convenience on the part of the prince, he from the first treated the unfortunate princess with indifference, which speedily deepened into hatred, and three months after the birth of their daughter, the Princess Charlotte, a separation took place at his instance. Caroline took up her residence at Blackheath, where she dispensed her charities with a liberal, though not always with a prudent hand. Meanwhile unfavourable rumours arose regarding her conduct, and in 1808 the most serious accusations were brought against her by her husband. But a secret commission appointed by the king to inquire into these charges, after a rigid scrutiny, acquitted her of all guilt. At length, goaded beyond endurance by the insults heaped upon her by her husband and his infamous associates, she resolved to seek peace and comfort abroad; and, contrary to the urgent advice of her friends, she quitted England in 1814, with the view of travelling in Italy and Greece. She spent six years on the continent, and on the accession of her husband to the British throne in 1820, the most liberal offers of money were made to induce her to renounce the title of queen, and to remain permanently abroad. These proposals, however, were indignantly spurned by her, and she immediately declared her determination to return home, for the purpose of asserting her rights. On her arrival in England the ministry, at the urgent demand of the king, proceeded to take steps for her degradation and divorce, on the alleged ground that, during her residence on the continent, she had been guilty of adultery with one of her attendants, an Italian named Bergami. The premier, Lord Liverpool, accordingly laid before the house of lords on July 5th, 1820, a bill of pains and penalties against the queen. Her defence was conducted with transcendent ability by her counsel, Messrs. Brougham and Denman, and the speech of the former in particular is one of the finest specimens of forensic eloquence in the English language. Meanwhile the tide of popular feeling ran high in favour of Caroline. The shameful treatment which she had throughout received from her husband, the mode in which the investigation into her conduct had been conducted, and the character of the witnesses adduced against her, roused the indignation of the public to such a pitch, that there can be little doubt a serious insurrection would have broken out, if the obnoxious measure had been carried. But the majority for the second reading having dwindled down to nine, the bill was withdrawn on the 10th of November. Further indignity, however, was yet in store for the hapless princess. In July, 1821, when the coronation of George IV. was about to take place, Caroline demanded that she should be crowned along with her husband, but the privy council decided against her claim. In spite of this decision, she presented herself at the door of Westminster abbey on the day of the coronation (19th July), but was refused admission. This was her last contest with her husband, for on the 2nd of August following she was attacked with inflammation, which in five days terminated her troubled career. (See Lord Brougham's *Speeches*, vol. i.)—J. T.

CAROLINE (WILHELMINA DOROTHEA), daughter of John Frederick, marquis of Brandenburg-Anspach, and wife of George II., king of Great Britain, was born in 1683, and married George, then electoral prince of Hanover, in 1705. On the death of George I. in 1727, her husband succeeded to the throne; and

from this period till her death she and Walpole were the real governors of the country. The king, who rarely took any step against her will, had implicit confidence in her judgment and affection, though he was in continual dread of the imputation of being governed by his wife. But she had the dexterity to persuade him that in adopting the course which she and Walpole had previously settled, he was only following the dictates of his own judgment. Her power, however, was dearly bought; for she often sacrificed her own inclinations and tastes to his wishes, connived at his sinful connection with Lady Suffolk, and even submitted to bear the imputation of his avarice and other vices. She possessed considerable personal attractions, together with a vigorous understanding and indomitable resolution, combined with great tact and address, which, however, not unfrequently degenerated into duplicity. When inoculation for the small-pox was first introduced into England, she had the courage to cause her own daughters to be inoculated by Dr. Mead. Her learning was considerable, and she was fond of patronizing literary and scientific men. It was at her request that Newton drew up an abstract of a treatise on Ancient Chronology, and she pressed Halley to become the tutor of her second son, William, duke of Cumberland. Her favourite study was divinity; she delighted in controversial treatises, and Butler's Analogy was the work most frequently perused by her. Walpole says she had rather weakened her faith than enlightened it by study. She was certainly not orthodox in her creed, but though, as Walpole affirms, she patronized "the less-believing clergy," such as Whiston and Clarke, yet, on the other hand, it is no less certain that Butler, Berkeley, and Secker owed their advancement to her influence. She died 20th November, 1737. A minute and graphic description has been given by Walpole, Hervey, and Chesterfield of the character and habits of Caroline, and of the mingled gaiety and grossness of the court during her reign.—J. T.

CAROLINE MARIA, queen of Naples, daughter of Francis I. and Maria Theresa, was married to Ferdinand the Neapolitan monarch in 1768. The French invasion of Italy compelled her, with the rest of the royal family, to take refuge in Sicily in 1798. She participated in the restoration which followed the fall of Napoleon. Born in 1752; died in 1814.—W. B.

CAROLINE MATHILDA, queen of Denmark, daughter of Frederick Lewis, prince of Wales, and sister of George III. of England, born in 1751, was married to Christian VII. in 1766. Her beauty and amiable disposition encountered in the weak intellect, fickle temper, and dissipated habits of her husband an adverse influence, which speedily consigned her to neglect, cruelty, and insult. A reconciliation was effected through the representations of Count Struensee; but it was followed by reports prejudicial to the honour of the queen, who seems to have been imprudent, though not guilty, in her intercourse with the minister. On his downfall she was arrested, tried on a charge of infidelity, and divorced. Three years afterwards she died a prisoner in the castle of Zell in Hanover, at the age of twenty-four.—W. B.

CAROLOSTADT or CARLSTADT, ANDREW BODENSTEIN, one of the first reformers, was a native of Carolostadt in Franconia. Being professor of divinity, and archdeacon at Wittenberg, he early joined Luther and did good service to the Reformation. But in 1522, while Luther was at Wartburg, Carolostadt became the leader of the iconoclasts at Wittenberg, inciting them to great excesses. Laying claim to a peculiar spiritual enlightenment, he taught that learning was useless, and through his influence many of the students renounced their studies. Luther of course opposed this fanaticism, and the breach between the two was widened by Carolostadt's embracing the sacramentarian doctrines. After retiring for a time to Orlamund and Jena, he was banished from the elector's dominions and wandered through various German towns, encouraging the disturbances then so rife. Recalled in 1525, chiefly through Luther's intercession, he recanted some of his more extreme opinions, and afterwards retired to Switzerland, where he was received by Zwingli, who sympathized with his doctrine of the sacrament. He seems to have spent his later years in something of the calmer zeal that had at first distinguished him. He died at Basle in 1541. Carolostadt was the first of the reformers who ventured to marry.—J. B.

CAROSELLI, ANTONIO: this painter was born at Rome in 1573. He was a pupil of Caravaggio, whose manner he imitated, adding a grace and elegance of his own. He was remarkable for the extreme felicity of his copies of more renowned artists. He died at Rome in 1651.—W. T.

CAROSO, FABRITIO, "da Sermoneta," was the author of a valuable book on dancing, entitled "Il Ballarino," published at Venice in 1581, 4to. This singular volume contains engraved plates of the various dances used in Italy in the sixteenth century, as also the music in tablature for the lute.—E. F. R.

CAROVÉ, FRIEDRICH WILHELM, a German philosophical and controversial writer, was born at Coblenz, June 20, 1789, and studied the law. After having been employed for some years in the French administrative service in Holland, he retired from office in 1815, and devoted himself to the study of philosophy under Hegel at Heidelberg. Here he became one of the originators of the Burschenschaft, and was one of their representatives at the famous Wartburgfest. In 1818 he followed Hegel to Berlin, lectured some time at Breslau, and finally retired to Frankfort-on-the-Maine, in order to devote himself exclusively to literary labours. In 1848-49, he took a prominent part in the proceedings of the Vorparliament, and of the peace congress, and died at Heidelberg in 1852. Several of his works are directed against papacy, and the rest are descriptive of the philosophical and religious state of France.—K. E.

CARPANI, GIUSEPPE, born at Rome on the 2nd of May, 1683; died in 1765. He entered the order of jesuits in 1704, and became professor of rhetoric, philosophy, and theology, in the Roman college. Under his academic name of Tirro Creopolita he published two ascetic works, entitled "De Jesu Infante," which have been translated into many languages. He is also the author of seven tragedies in Latin which have been highly praised, and of some theological essays.—A. C. M.

CARPANI or CARPINI, G. ETANO, a musician of the middle of the eighteenth century. He held the office of maestro di capella in the Jesus Church at Rome, and was also connected with several other jesuitical establishments. He was celebrated as the most profound contrapuntist of his time, and he produced many ecclesiastical compositions of elaborate character. He was the instructor of Jannaconi and Lorenzo Baini, both eminent masters of the same Roman school, and also of Clementi. The roughness of his manner is as much spoken of as the extent of his learning.—G. A. M.

CARPENTER, GEORGE, a British officer, who rose to be Baron Carpenter of Killaghy in Ireland. Entering the army in 1672, he served in Ireland, Flanders, and Spain, distinguishing himself at the unfortunate battle of Almanza, at Almenara, and especially at Britmege, where he bravely defended in person a breach in the wall, and received a wound which nearly proved fatal. In 1714 he entered parliament, but had soon to be sent north to quell the rebellion in Scotland. In 1716 he was made governor of Minorca, and commander-in-chief of the forces in Scotland. He died in 1731-32.—J. B.

CARPENTER, Dr. LANT, a learned unitarian clergyman, was born in 1780, and received his education first at the dissenting academy, Northampton, and afterwards at the university of Glasgow. He became in 1805 the pastor of a unitarian congregation in Exeter, where he remained twelve years. The university of Glasgow conferred on him the degree of LL.D. in 1806. He removed to Bristol in 1817, and performed the duties of the ministerial office there for nineteen years. While travelling for the recovery of his health, he accidentally fell overboard on his passage from Naples to Leghorn, and was drowned, 5th April, 1840. Dr. Carpenter was a voluminous author. His principal work is entitled "A Harmony or Synoptical Arrangement of the Gospels." He also wrote "An Introduction to the Geography of the New Testament;" "Unitarianism, the doctrine of the Gospel;" "Principles of Education, Intellectual, Moral, and Physical;" "Sermons on Practical Subjects;" various other polemical works, and articles on grammar, and on mental and moral philosophy, &c.—J. T.

\* CARPENTER, Mrs. MARGARET, born at Salisbury in 1793. She is the daughter of Alexander R. Geddes, Esq., an associate of the academy. She received her earliest lessons in painting from an artist of her native town. The earl of Radnor was her first patron, and did much to foster her talents as well as her ambition, by throwing open to her his fine gallery of paintings. On his recommendation she sent pictures for three seasons to the exhibition of the Society of Arts, and in 1813 she obtained the gold medal for a child's head, afterwards purchased by the marquis of Stafford. The following year she removed to London, where she married in 1815 Mr. W. U. Carpenter, then a curator, and since keeper of the prints and

drawings of the British museum. For thirty years Mrs. Carpenter has been a constant contributor to the exhibitions of the Royal Academy and British Institution. Firmness of touch and fineness of colour are the remarkable qualities of her art. She contributed to the General Exhibition of 1855 a portrait of an aged woman, which excited attention. The sister of Mrs. Carpenter married in 1822 the late William Collins, R.A.—W. T.

CARPENTER, NATHANIEL, an English divine, born in 1588 at North-Lew in Devonshire, where his father, John Carpenter, the author of some sermons well known in their day, was rector. He was appointed by Archbishop Usher one of his chaplains in Dublin, and was intrusted with the education of a number of sons of Roman catholics, who, as king's wards, were to be brought up in the protestant faith. He seems to have risen to the dignity of dean, and died in Dublin about 1625 or 1638. He published "Philosophia libera, triplici exercitationum decade proposita," 1621—one of the earliest attacks on the Aristotelian philosophy; "Geography," in two books, 1625; and a number of sermons bearing on political subjects.—J. B.

CARPENTER, RICHARD, an English divine and poet of the seventeenth century, was a student of Cambridge, but having gone to study abroad, he became a Roman catholic. Entering the Benedictine order, he came to England to proselytize; but while there he returned to the protestant faith, and became rector of Poling in Sussex. At the time of the civil war he went to Paris, became again a Roman catholic; returned once more to England, and once more left the bosom of mother church, only, however, to return a third time and to die in her communion. He published a number of works, of which only two are worthy of note—a treatise, entitled "Experience, History, and Divinity," 1642; and a comedy, published after the Restoration, named "The Pragmatical Jesuit."—J. B.

\* CARPENTER, WILLIAM BENJAMIN, M.D., one of the most distinguished physiologists and writers on physiology of the present day. He is the son of the late Dr. Lant Carpenter of Bristol. On leaving school he was destined for the career of a civil engineer, and commenced a course of study accordingly. His tastes, however, led him ultimately to choose the medical profession, and he entered at University College about the year 1833, where, as a student, he was distinguished for his accurate knowledge, and for the elegance of his written compositions. He passed his examination at the College of Surgeons, and the Society of Apothecaries, in 1835, and afterwards pursued his studies at Edinburgh, where his capacity for original thought and dealing with the most profound physiological discussions became apparent. One of his earliest papers on the subject of physiology was published in the *Edinburgh Medical and Surgical Journal* (No. 132), entitled "On the Voluntary and Instinctive Actions of Living Beings." In this paper may be discovered the germs of those views he has so fully developed in his various works on physiology. He graduated at Edinburgh in 1839, but not until he had published the three following papers—"On the Unity of Function in Organized Beings;" "On the Differences of the Laws Regulating Vital and Physical Phenomena;" "Dissertation on the Physiological Inferences to be deduced from the Structure of the Nervous System in the invertebrate class of Animals." This paper was published in Edinburgh in 1838, and translated in Muller's *Archiv* for 1840. In these papers he laid the foundation of those principles which he afterwards developed more fully in an independent work, entitled "Principles of General and Comparative Physiology," 1839. This was one of the first works in our language, giving a general view of the science of life, and pointing out the relation of physical laws to vital phenomena. It was a very remarkable production for so young a man, and soon gained for Dr. Carpenter the recognition of physiologists, and the position amongst them which he so well deserved. A second edition appeared in 1841. He now settled at Bristol, with the intention of practising his profession, and was appointed lecturer on medical jurisprudence in the medical school of that city. The practice of his profession was, however, less in accordance with his tastes than the pursuit of those studies by which alone the science of medicine can be advanced. With an almost unrivalled facility of acquiring and communicating knowledge, it is not to be wondered at that he found it more agreeable to write books on science than to submit to the drudgery of medical practice. In 1843 and subsequent years he wrote the "Popular Cyclopaedia of Science," embracing the subjects of mechanics, vegetable physio-

logy and botany, animal physiology and zoology. These works were professedly only compilations; but they contain many of the author's original views, and are written in a very agreeable style. In 1846 Dr. Carpenter published a work on the "Principles of Human Physiology," which reached a fourth edition in 1853. It may be truly said that this is the best work extant on the subject, and has done much to establish the author's reputation as a great physiologist. Whilst the "Human Physiology" was passing through its several editions, the "Principles of Comparative and General Physiology" reached a third edition, thus forming a companion volume. It was, however, thought desirable to separate the general from the comparative physiology, and in 1854 a volume entitled the "Principles of Comparative Physiology" was published. This will be followed by the "Principles of General Physiology," in one volume. These three volumes will form a cyclopaedia of biological science in themselves. This work indicates not only a vast amount of labour in its production, but a large extent of careful reading and research. Such works might well have occupied a lifetime, but Dr. Carpenter, with indefatigable industry, has been a constant contributor to the *Cyclopaedia of Anatomy and Physiology*, where some of the most important articles are from his pen. In addition to the works above mentioned, Dr. Carpenter has published a "Manual of Human Physiology," for the use of students, which has gone through several editions. For many years he edited the *British and Foreign Medico-Chirurgical Review*, and was for some time lecturer on general anatomy and physiology at the London Hospital school of medicine; and an examiner in physiology and comparative anatomy in the university of London. In 1856 he resigned these positions, on being elected registrar to the university of London, which office he now holds. He is also the professor of medical jurisprudence at University College. Dr. Carpenter has since published a work "On the Microscope, its Revelations and its Uses." It displays the same industry, accuracy, and impartiality, as his other writings, and undoubtedly deserves a high position amongst works devoted to an account of the uses and structure of this instrument. Dr. Carpenter has been for some time engaged in preparing a work for publication by the Ray Society, containing the results of his researches on the structure, functions, and general history of the family Foraminifera. In 1849 he gained a prize of one hundred guineas offered for the best essay on alcoholic liquors. His essay was published in 1850, under the title of the "Use and Abuse of Alcoholic Liquors." He advocates the principles of total abstinence, and has acquired great popularity among the friends of this system. Dr. Carpenter occupies the position of resident director at University Hall, an establishment built for the purpose of insuring a comfortable home and personal supervision to young men pursuing their studies at University College, chiefly connected with the Unitarian denomination.—E. L.

CARPENTIER, PIERRE, a member of the Benedictine order of St. Maur, born on the 2nd February, 1697. He distinguished himself for the zeal with which he pursued his painstaking research into old MSS., following the footsteps of Ducange. The latter had in his *Glossarium ad Scriptores mediae et infimae Latinitatis*, gone through the corrupt Latin of the middle ages, but not so perfectly as not to leave room for the mighty erudition of Carpentier to correct errors and supply deficiencies. Ducange's glossary, as enlarged by Carpentier, is a most useful work of reference. He died in Paris, December, 1769.—J. F. C.

CARPI, GIROLAMO DA. this artist was born at Ferrara in 1501. He was a pupil of Benvenuto Garofolo, and was accounted one of the most promising of his scholars. He went to Bologna and practised portrait painting, visiting subsequently Parma and Modena, and other cities of Italy. He was early imbued with a sense of reverence for the works of Correggio, and applied himself to the imitation of the graces of that master. He succeeded in this to the full. Many of his copies were accepted as the genuine original works. But he was not a skilful copyist only; his own unaided efforts brought him extraordinary commendation. His most celebrated works are his "Adoration of the Magi," and his "Madonna and Saints," at Bologna. He died in 1556.—W. T.

CARPI, UGO DA: this painter and engraver was born at Rome about 1486. To him is generally attributed the invention of that method of wood-engraving known as chiaro-oscuro, per-

formed with three blocks of oak wood of different gradations of shadow. This manner of art was afterwards carried to perfection by Baldassarre Peruzzi and by Parmegiano. Carpi's works are chiefly copies of the works of Raffaele, including the Cartoons. He died about 1530.—W. T.

CARPINI, JOHN DE PLANO, a celebrated traveller, was born probably in the kingdom of Naples, early in the thirteenth century, and became a friar of the Franciscan order. One of six monks sent into Chinese Tartary in 1246, to negotiate on the part of Pope Innocent IV. with the reigning descendant of the Mongol conqueror, Jenghis Khan, he wrote an account of the journey and was the first to give Europeans any true idea of the country and customs of the dreaded Tartars. His book, or the substance of it, was inserted by Ramusio in his "Raccolta di Navigazioni e Viaggi," Venice, 1556, and from it copied by Hakluyt into his Navigations and Discoveries.—J. B.

CARPIONI, GIULIO. This painter was born at Venice in 1611, and was a pupil of Alessandro Varotari, called Paduanino. He painted after the manner of Paolo Veronese. His paintings are principally of a small size. The subjects are often of a Bacchanalian character, and are remarkable for spirit of execution and beauty of colour. Considerable resemblance has been found in them to the works of Poussin. He also painted sacred subjects for the Venetian churches. His pictures are rare and highly valued. He died in 1674.—His son CARLO had some success as a portrait painter.—W. T.

CARPOCRATES, or CARPOCRAS, OF ALEXANDRIA, a gnostic, founder of the sect of Carpocratians, lived in the reign of the Emperor Hadrian. Like the other gnostics, he maintained the existence of one Supreme Principle, and the formation of the universe by angels. Others of his tenets were that Jesus was but human, having been born in the ordinary course of nature of Joseph and Mary; and that although endowed, in consequence of what he had seen in a pre-existent state, with wonderful firmness and purity of mind, it was not impossible to equal and even excel him in these respects. The sect of the Carpocratians, according to some historians, was distinguished even from all other gnostic sects by the immoral practices of its members, who, deducing from their system the maxim that there is no distinction between right and wrong not depending merely on human opinion, and taking their lusts for monitors of the will of the Supreme—indulged in the most open and flagrant licentiousness. Other historians have defended the character of the sect, and treated this charge of systematic immorality as a calumny.—J. S., G.

CARPZOV, the name of a German family, various members of which have attained distinction as jurists or as theologians:—

CARPZOV, BENEDICT, an eminent German juriconsult, was born at Wittenberg in May 27, 1595, and died at Leipzig, August 30, 1666. Besides the chair of criminal law in the university of Leipzig, he held several high posts, and wrote a number of important works on jurisprudence. According to the spirit of his age, he was a great defender of the rack and of capital punishment. He is said to have pronounced more than twenty thousand sentences of death, and to have read his bible fifty-two times.—K. E.

CARPZOV, JOHANN GOTTLIB, a German protestant theologian and orientalist, born at Dresden in 1679, became, after many years' service in the church and in various universities, first pastor of the cathedral of Lübeck, where he died in 1767. His works are numerous and display an uncommon acquaintance with biblical literature.—J. S., G.

CARR, JOHN, an English architect, a native of Yorkshire, was born in 1721, and died in 1807. He belonged to the Anglo-Palladian school, and adorned his native county and the districts of England adjoining with many noble buildings. He realized a very large fortune.

CARR, SIR JOHN, a writer of poetry and books of travel, was born in Devonshire in 1772, and died in 1832. His first publication was named "The Fury of Discord, a poem," 1803. Afterwards he wrote "The Stranger in France;" "The Sea-side Hero, a drama;" "A Northern Summer, or Travels Round the Baltic;" and "The Stranger in Ireland"—a work severely satirized by Edward Dubois in a volume entitled My Pocket-book, or Hints for a righte merrie and conceitede tour to be called the Stranger in Ireland. Sir John also published an account of travels in Scotland, in Spain, and in the Balearic Isles, and in 1809 a volume of poems.—J. B.

CARRA, JEAN LOUIS, born in 1743 at Pont de Veyle. While a young man he entered the service of the hospodar of Moldavia, and on his return to France became employed in the king's library; but on the Revolution breaking out, entered into the ranks of the enemies of the court. Becoming a member of the Jacobin club, he was one of the loudest in calling for war against foreign despots; and for the sake of more efficaciously putting forward his ultra-democratic views, founded the *Journal de L'Etat et du Citoyen*. Elected a member of the convention, he took a leading part in denouncing military operations which did not seem vigorous enough, and on account of his presumed military knowledge and ardour, was sent to watch Dumouriez. The commission was fatal to himself; for, whether rightly or wrongly, he was in turn accused of having allowed himself to be captivated by that suspected general, and, at the instance of the terrible Murat, tried and executed, 31st October, 1793.—J. F. C.

CARRA-SAINTE-CYR, JEAN FRANÇOIS, Count de, a French general, born in 1756, began his military career in the American war, and attained the rank of general of brigade in 1794. He contributed greatly to gain the battles of Marengo, Hohenlinden, and Eylau, and in 1805, as commander of the army of occupation in Naples, took 6000 prisoners after the retreat of the Archduke Charles. He was created baron of the empire in 1808, and was appointed governor of Dresden and of the Illyrian provinces. His abandonment of Hamburg in 1813 brought him into disgrace with Napoleon, but in 1814 the emperor again availed himself of St. Cyr's great military talents, and confided to him the defence of Bouchain, Valenciennes, and Condé. After the return of the Bourbons, St. Cyr was nominated by Louis XVIII. count and chevalier of the order of St. Louis, and appointed governor of French Guienne. He retired from active life in 1824, and died in 1834.—J. T.

CARRACCI: the name of three cousins, LODOVICO, AGOSTINO, and ANNIBALE, celebrated painters of Bologna of the close of the sixteenth century, and the founders of the famous school of painting of that city, distinguished for its numerous able disciples:—

CARRACCI, LODOVICO, the eldest, the actual founder of the school, was born at Bologna, April 21, 1555. He was educated in the school of the painter Prospero Fontana, and appeared so inapt in his art, that he acquired the nickname of il Bue (the Ox) among his fellow pupils. What he wanted in quickness, he made up for by his perseverance. After leaving Fontana, he studied with Passignano in Florence, and then successively visited Parma, Mantua, and Venice, to make himself acquainted with the works of the great masters of these celebrated cities of the arts—Correggio, Giulio Romano, and Titian. Having discovered distinct excellencies in these several masters, and exclusively possessed, it occurred to him that by combining their qualities, a really perfect style might be developed. This became the great effort and ambition of his after life, and was the origin of the designation *eclectic*, as given to the school and style of the Carracci, as explained in the sonnet afterwards written by Agostino:—

"Let him who a good painter would be  
Acquire the drawing of Rome,  
Venetian action, and Venetian shadow,  
And the dignified colouring of Lombardy;  
The terrible manner of Michelangelo,  
Titian's truth and nature,  
The sovereign purity of Correggio's style,  
And the true symmetry of a Raphael;  
The decorum and thoroughness of Tibaldi,  
The invention of the learned Primaticcio,  
And a little of Parmegiano's grace.  
But without so much study and toil,  
Let him only apply himself to imitate the works  
Which our Niccolino has left us here."

This sonnet sufficiently explains the principles of the eclectic school, and shows their purely technical tendency.

Lodovico opened his school in 1589, his cousins, Agostino and Annibale, assisting him in his labours. They worked together until the year 1600, when it was carried on by Lodovico alone until his death, December, 13, 1619. Domenichino, Guido, Albani, and Lanfranco, were all pupils of this school, which produced a change in the principles of most other schools in Italy. General excellence of execution became the common aim—drawing, colouring, and chiaro-oscuro; the higher qualities of expression and composition being practically neglected in the eager pursuit after the more palpable and material qualities.

Such is the nature, and such were the consequences of the academic eclecticism of the Carracci. Lodovico was equally distinguished for his oil paintings and his frescos. In the opinion of Sir Joshua Reynolds, no painter knew better how to harmonize the treatment of a picture with its subject than Lodovico Carracci. His style was sombre, and his pictures were generally of grave and dignified subjects; indeed, both somewhat of the ascetic in taste. In the gallery of Bologna are thirteen of his oil pictures. His chief frescos were those in the convent of San Michele in Bosco, but now known only by the prints of Giovanni.—(*Il Claustro di San Michele in Bosco di Bologna*, &c., 1694.) "Susannah and the Two Elders," in the National Gallery, is a very fine example of the works of this painter, and of unusual excellence in colour.—(Belvisi, *Elogio Storico del Pittore Lodovico Carracci*, Bologna, 1825.)

CARRACCI, AGOSTINO, was born at Bologna in the summer of 1559, according to the inscription on his tomb, published by Bellori—"OB. V. ID. MART. MDCL. ÆT. SUE. AN. XLIII." Malvasia fixes his birth two years earlier. His father, Antonio, was a tailor, and Agostino was at first articled to a jeweller, but was afterwards, through the influence of his cousin, Lodovico, placed with Fontana to learn painting. He studied afterwards with Domenico Tibaldi and Cornelius Cort, under whom he took up engraving; and though he never wholly gave up painting, his chief occupation was that of an engraver, and there are many excellent plates by him in most public collections. Agostino also studied at Parma and Venice. Towards the beginning of the seventeenth century, Agostino joined his brother at Rome, who was then engaged painting the Farnese gallery. Agostino assisted Annibale in the paintings of the ceiling. He not only designed the two great compositions of Galatea and Aurora, of which the cartoons are now in the National Gallery, but executed the frescos themselves; and with such success, that it was reported in the art circles of Rome that the engraver had surpassed the painter in the Farnese, for Agostino had until then been chiefly known as an engraver. This rivalry caused some jealousy between the brothers, and a rude jest of Annibale's caused their final separation. Agostino was fond of what is considered great society, a weakness of which Annibale was well aware, and taking advantage of it, he, on one occasion, while Agostino was surrounded by some of his distinguished friends, placed in his hands a caricature of their father and mother busy at their tailoring work. Agostino was so much offended that he left Rome for Parma, where he entered the service of the Duke Ranuccio, but after painting a very few pictures there, he died on the 22nd of March, 1602, in his forty-third year only, and was buried in the cathedral of Parma. The artists of Bologna, however, honoured his memory with the ceremony of a public funeral, which was celebrated with great pomp. A description of the ceremony was published by Vittorio Benacci in 1603, which is reprinted without the cuts in the *Felsina Pittrice* of Malvasia. Agostino's masterpiece is the "Communion of St. Jerome," now in the gallery of Bologna. It is said to be the only picture on which he wrote his name. The treatment of this picture in its main features was borrowed by Domenichino in his celebrated composition of the same subject, which is now in the Vatican, hanging opposite the Transfiguration by Raphael. Among the most celebrated engravings of Agostino, are an unfinished plate of St. Jerome, which was completed by Francesco Brizzio; the Crucifixion by Tintoretto in the scuola of San Rocco at Venice, and by which he won the affections of the old Venetian painter. Also the St. Jerome of Vanni; the Marriage of St. Catherine, after Paul Veronese; and the Adoration of the Kings, by Baldassare Peruzzi, from the drawing in the National Gallery. Agostino was considered the most learned of the Carracci. Malvasia observes that he was always more correct than Annibale, and sometimes more correct than Lodovico.

CARRACCI, ANNIBALE, the younger brother of Agostino, was born at Bologna in 1560. His father designed to bring him up as a tailor, but his cousin Lodovico persuaded him to turn his attention to painting, and became his instructor in the art. In 1580 he went to Parma, and there devoted himself to the study of the works of Correggio. From Parma he went to Venice, and returned to Bologna to take part in the academy proposed by Lodovico, which was established in 1589. The three worked this academy conjointly for about ten years, when Annibale was invited to Rome by the Cardinal Odoardo

Farnese, to decorate the great hall of his palace in the Piazza Farnese. He was well received by the prince, says his biographer, being allowed a monthly salary of ten scudi (about two guineas), and maintenance for himself and two servants. The works were completed in 1604, and Annibale received a present of five hundred scudi, over and above his moderate salary; which, however, his friends considered very unhandsome treatment, after the production of so great a work as the Farnese gallery, which was preferred by Nicolas Poussin to all the paintings in Rome after those of Raphael. It comprises many subjects from ancient mythology. It has been several times engraved, first by Carlo Cesio in 1657, in thirty sheets, with descriptions by Bellori.—(*Galleria nel Palazzo Farnese in Roma*, &c.) The several compositions are of a good dramatic effect, and of a grand style of form, but inferior in colouring, and devoid of expression. Annibale's health seems to have declined after the completion of this work. He painted little more during the remaining five years of his life. The altarpiece in the chapel of San Diego in San Giacomo degli Spagnoli, must have been completed about the same period. The frescos of the chapel were painted chiefly by Albani from Annibale's designs. Annibale received 2000 scudi for the entire work, half of which he gave to Albani for his assistance, though he had endeavoured in vain to persuade his friend to accept a much larger proportion of the amount of the commission, maintaining that the great merit was in executing the frescos, not in the designing them. The transaction showed a generous heart on the part of both painters. Annibale Carracci died at Rome, July 15, 1609, and was buried near Raphael in the Pantheon. Fine works by this painter are common in England; among the best are—the "Three Marys" at Castle Howard; the "Coronation of the Virgin" at Clumber; and "Erminia and the Shepherds," "St. John in the Wilderness," and "Silenus Gathering Grapes," in the National Gallery. He was a good landscape painter, and also engraved a few plates.—(Malvasia, *Felsina Pittrice*; Bellori, *Vite de Pittori Moderni*; Baglione, *Vite de Pittori*, &c.)—R. N. W.

CARRACCI, ANTONIO, surnamed IL GOBBO, a natural son of Agostino, born at Venice in 1583. He was a pupil of Annibale, and accompanied him to Rome. He was an artist of singular promise, and, under the patronage of Cardinal Tonti, executed several frescos, representing scenes from the life of the Virgin and the passion of the Saviour, in the church of St. Bartolomeo nell' Isola. A highly-esteemed work is his frieze in the palace of Monte Cavallo. He attended Annibale in his last moments, and honoured his remains with a superb funeral. He died at Rome in his thirty-fifth year.—W. T.

CARRACCI, FRANCESCO, the brother of Agostino and Annibale, and pupil of Lodovico, born at Bologna in 1595. He was expert as a painter of the nude, and was highly accounted by his preceptor for his correctness and general freedom of execution. But his vanity lured him on to the breakers. He re-enacted the old frog and the bull fable. He set up an academy in opposition to Lodovico, and inscribed over the door—"This is the true school of the Carracci." He thought that the greatness of his name exempted him from the ordinary labours which work men up to success. He stopped, therefore, at mediocrity—the usual goal of impudence and indolence. He died in 1622. He painted "St. Roch and the Angel," in the church of St. Rocco at Bologna; and, aided by Lodovico, "The Death of the Virgin," in the church of St. Maria Maggiore. He engraved a few plates from the designs of his brothers.—W. T.

CARRADORI, GIOVACCHINO, an Italian physician, was born at Prato in 1758, and died in 1818. He was for some time professor of philosophy at Pistoga, but had to resign his chair in consequence of a dispute with the bishop. He afterwards practised medicine in his native town, and wrote upon agriculture and natural science. He was a powerful advocate of vaccination. Among his published works are the following—"Della trasformazione del Nostoc in Tremella verrucosa, in Lichen fascicularis e in Lichen rupestris, 1797;" "On the Reproduction of some of the Lower Plants;" "On Plant Life;" "On the absorbing organs of the roots of Plants;" "On the irritability of Plants;" "On Heat;" "On Animal Electricity;" "On Epizootic Diseases;" "On the fertility of the Earth;" "On the History of Galvanism;" and "On the Contagious Fevers."

CARRANZA, BARTHOLOMEW, a Spanish bishop, born at Miranda in Navarre in 1504. In 1546 he was sent by Charles V. to the council of Trent, where he read a paper, "De neces-

saria residentia Episcoporum et aliorum pastorum"—afterwards published. He attended upon Philip when he went into England to espouse Queen Mary, and was employed by the queen in the endeavour to convert her protestant subjects. He was afterwards created archbishop of Toledo, 1557. Having published a work named "Commentarios sobre el Catechismo Christiano," Antwerp, 1588, he was accused of heresy by the inquisition, and subjected to imprisonment and persecution, which lasted till his death in 1576. In addition to the works referred to, he wrote "A Summary of the Councils," Venice, 1546.—J. B.

CARRARA, a family of Longobard origin, who long held the sovereignty of Padua. JACOPO was elected lord of Padua in 1318. FRANCESCO I., who, in 1355, became sole sovereign, was at the head of the Guelph league against the Visconti of Milan. He joined in 1378 the Genoese in their attack on Venice. Allied against Verona with Gian Galeazzo Visconti, he was betrayed by his ally, who took Padua and Treviso, and arrested Francesco in 1388, keeping him prisoner till his death in 1393. This Francesco was the friend of Petrarch. His son, FRANCESCO II., regained Padua in 1390 with the assistance of Venice, forming an alliance with that government, which he afterwards broke, and in consequence lost his territory, which was never regained by the family. He was put to death in 1406.—J. B.

CARRÉ, FRANCIS, an artist, born in Friesland in 1630. His pictures are not greatly known out of his own country. He painted landscapes and rural festivals. He was appointed chief painter to the stadtholder, William Frederick, prince of Orange. He died at Amsterdam in 1669.—W. T.

CARRÉ, GUILLAUME-LOUIS-JULIEN, a French lawyer, born in 1777; died in 1832. He distinguished himself first at the bar, and afterwards as a teacher of law, having in 1806 been made professor to the faculty of Rennes. Carré exhibited some courage in defending the victims of the reactionary politics of 1815; but he shrank from the task, imposed on him by his eminent position, of urging the necessary reforms in the law. After 1830 he was offered high preferment in Paris, but chose to abide by his chair, in the duties of which, and in correcting his numerous writings, he passed the rest of his life.—R. M., A.

CARRÉ, HENRY: this painter was the eldest son of Francis Carré, and was born at Amsterdam in 1656. He was a scholar of Juriaen Jacobsz and Jacques Jordaens. He served for some years in the army in the regiment of the princess of Orange, and was present at the siege of Groningen. Subsequently, however, he returned to the arts of peace, and was appointed state painter at the court of Friesland. He painted chase and animal subjects after the manner of Snyder. He died in 1721.—W. T.

CARRÉ, LOUIS, a French mathematician, born in 1663. Cast off by his father because he refused to become a priest, he was employed by Malebranche as his amanuensis. Under him he studied mathematics and philosophy, which he soon undertook to teach. In 1687 he was admitted into the Academy, of which he speedily became associate and then pensioner. Thus provided for, he devoted himself to study and investigations connected with mechanics, and died in 1711. In 1700 he published "A method of Measuring Surfaces and Solids, and finding their centres of gravitation, percussion, and oscillation."—J. B.

CARRÉ, MICHAEL, born at Amsterdam in 1666, and the younger brother of Henry Carré. This painter first studied with his brother, and subsequently in the school of Nicholas Berghem. He is stated to have visited England, but to have met with little encouragement. He was afterwards invited to the court of Berlin, and appointed one of the principal painters to the king. He died at Alkmaar in 1728. His best work is a saloon at the Hague—a landscape with figures, from the story of Jacob and Esau. He had a bold and facile manner, and his landscape and cattle pieces are esteemed.—W. T.

\* CARRÉ, NARCISSE-EPAMINONDAS, a French magistrate, now occupying the chair of councillor in the *Cour Imperiale* at Paris; born in 1794. Of course he is chevalier of the Legion of Honour. Carré is not a mere judge, he has devoted himself to the study of civil jurisprudence in its largest sense, and produced a number of excellent and instructive works. Among these ranks foremost his edition of *DOMAT*, in nine volumes. He wrote also the "Code des Femmes," a useful repertory and analysis of the laws especially affecting women. Other treatises from his pen are well known in France.—J. P. N.

CARREL, NICOLAS ARMAND, a celebrated French journalist, was born at Rouen, May 8, 1800, and educated at the military

school at St. Cyr. He obtained a commission in 1821, but in 1823 repaired to Barcelona, and fought in the foreign liberalist legion on the side of the Spanish revolutionists, but in the cause of Napoleon II. For this conduct he was tried for high treason, but acquitted, in 1824. He then acted for six months as secretary to M. Augustin Thierry, author of the *Norman Conquest of England*. During the next three years he published the following works—"Résumé de l'Histoire d'Écosse;" "Résumé de l'Histoire des Grecs Modernes;" and "Histoire de la Contre-revolution en Angleterre." He also at one time kept a bookseller's shop. In August, 1830, he became principal editor of the *National*, in which capacity, after supporting the Orleanist government for some time, he gradually adopted republican sentiments. The freedom of his expressions brought him into repeated collision with the government, as well as with private persons. He fell by the hand of M. Emile de Girardin in a duel, July 22, 1836, and died two days after. Thirty thousand people attended his funeral.—A. H. P.

CARRENNO DE MIRANDA, DON JUAN: this Spanish painter was the descendant of an old family, and was born at Abiles in Asturias in 1614. He entered the school of Pedro de las Cuevas at Madrid, but subsequently studied under Bartolomeo Roman. He was employed in decorating some of the palaces of Philip IV. with fresco painting, and so satisfied that monarch, that he received the appointment of painter to the court about 1651. He painted also for many of the churches of Madrid, Toledo, Alcala de Henares, Segovia, and Pamplona. His colour is described as something between Titian's and Vandyck's—rich, brilliant, and very superior to his drawing. As a painter of expression and feeling, he has been ranked next to Murillo. He died at Madrid in 1685.—W. T.

\* CARRERA, RAFAEL, born in 1814 in Guatemala of poor parents, was in his early days employed as a drummer boy and cattle-driver. An insurrection, consequent on the distress caused by the appearance of cholera, having broken out in 1837, Carrera joined it, and soon became its leader. In 1839 he obtained possession of the town of Guatemala, and in the following year the triumph of the popular party was completed by the defeat of General Morasan. Since then Carrera has almost constantly remained at the head of public affairs, which he has conducted with singular wisdom.—J. B.

CARRICHTER, BARTHOLOMÆUS, a German physician, flourished about the middle of the sixteenth century. He was a believer in astrology, and published several works in which he advocates the virtues of herbs as depending on the influence of the stars. In his "Krauterbuch," published at Strasburg in 1573 and 1575, he mentions the medicinal properties of plants in connection with the signs of the zodiac; in another *Krauterbuch* he describes the plants of Germany in relation to the influences which they receive from the heavenly bodies. He also wrote on German dietetics, and on the harmony, sympathy, and antipathy of plants. The early editions of his works appear under the name of Philomousus.—J. H. B.

CARRIER, JEAN-BAPTISTE, one of the most infamous names in the history of the Revolution. This bloody demagogue was born at Zolai in 1756. Entering the convention in 1792 he helped to set up the revolutionary tribunal, and voted for the death of the king. At Nantes, whither he was sent from Normandy, he perpetrated, in name of the convention, but really without its knowledge, the most shocking atrocities. The detail of his crimes is, at the present day, read almost with incredulity. On the fall of his party he was recalled; and the world was happily rid of a monster who, on a throne, would have been a worse than Nero, when Carrier was brought to the block in December, 1794.

\* CARRIERE, MORITZ, a German philosophical writer, was born at Griedel, grand duchy of Hessian, March 5, 1817, studied philosophy at Giessen, Göttingen, and Berlin, and then travelled for some years in Italy. In 1849 he obtained the chair of philosophy at Giessen, and in 1855 was translated to Munich as professor of the history of art.—K. E.

CARRINGTON, NOEL THOMAS, author of some volumes of poetry, was born at Plymouth in 1777, and died in 1830. He wrote "The Banks of Tamar" in 1830; "Dartmoor, a descriptive poem," in 1826; and "My Native Village, with other Poems," published after his death.

CARRION-NISAS, MARIE HENRI FRANÇOIS ELISABETH, Marquis de, born at Montpellier in March, 1787. The Revolu-

tion found him a cavalry officer, at a time when every young nobleman felt it incumbent on him to be in the king's service. He was arrested in 1793, but was liberated on the fall of Robespierre. Turning to the rising star of Napoleon after the 18th Brumaire, he became a member of the tribunate, and was, through the interest of Cambaceres, with whom he was connected by marriage, raised to the presidency of that assembly; which favour he repaid by supporting the ambitious wish of the first consul to be recognized emperor, and more signally by helping to extinguish what little appearance of constitutional liberty the tribunate still presented. He afterwards returned to the military profession, for which he proved his capacity by saving Junot in Portugal from being made prisoner. After the defeat of the French at Talavera, it was Carrion who was selected to bear the unhappy tidings to the emperor; and he put so good a face upon the matter, that he who entered a poor major with bad news, quitted the imperial presence a baron of the empire. That there was something better in him than command of plausible language, he proved. When disgraced for having failed in an enterprise, he re-entered the army a private soldier, and fought his way up to a coloneley. On the return of the Bourbons he was allowed to resume his old title of marquis, was made secretary-at-war, and having in that capacity done all he could to stop the miraculous progress of Napoleon on his escape from Elba, joined the conqueror as soon as he reached the Tuileries, for which he lost the favour of Louis XVIII. His literary attempts were not successful; for his two tragedies of "Peter the Great" and "Montmorency" failed. He died in 1841.—J. F. C.

CARROLL, CHARLES, the latest surviving signer of the declaration of American independence, was of a Roman catholic family of Irish origin. He was born at Annapolis, Maryland, September 20, 1737. He studied at Paris and at Bourges, and in 1757 went to London, and became a member of the inner temple. In 1764 he returned to his native colony in the midst of the excitement consequent on the stamp act, in which he zealously espoused the cause of the colonies. Elected to congress in 1775, along with the other members, he signed the declaration on August 2nd of the following year. In 1778 he resigned his seat in congress, and returned to his place in the state legislature, where he was actively engaged in settling the difficult questions consequent on the revolution. In 1804 he withdrew to private life at Carrollton, his patrimonial estate, where, as his life advanced, he became an object of universal veneration. His mind was highly cultivated, and his manners were graceful and attractive. He survived by six years all the other signers of the declaration of independence, and in his 96th year died at Baltimore, November 14, 1832.—F. B.

CARROLL, JOHN, D.D., LL.D., brother of the preceding, and first Roman catholic bishop in the United States, was born at Upper Marlborough in Maryland in 1734. He was sent to Europe at the age of thirteen for his education, which he received chiefly at the famous institution at St. Omer. When the order of the jesuits, to which he belonged, was suppressed by the pope, he went to England, and acted as secretary to the dispersed fathers in their efforts to obtain, from the various courts in Europe, a mitigation of their sentence. In 1775 he returned to America, and acted for some time as a parish priest in Maryland. When it was first determined to establish a catholic spiritual hierarchy in the United States in 1786, Mr. Carroll was appointed vicar-general, and took up his residence in Baltimore. Three years afterwards he was made bishop, and went to England in 1790 to be consecrated. He was made an archbishop a few years before his death in 1815.—F. B.

CARRON, GUY-TOUSSAINT-JULIEN, l'Abbé, a celebrated French moralist, was born at Reines in 1760; died in 1821. Carron early manifested an earnest and enlightened spirit of philanthropy. Driven from France in 1792, he went first to Jersey and then to London, where he opened a college and a school—the one for the sons and the other for the daughters of French emigrants; built chapels, established hospitals, and in many ways wrought unweariedly for the benefit of his exiled countrymen. After his return to France he obtained from Louis XVIII. the endowment of l'Institut Royal de Marie Thérèse, in which were educated the children of those who had died in exile. Carron found time to write many books of practical religion, which, with many recommendations, boast none so weighty as the name of the venerable author.—R. M., A.

CARRUCI. See PONTORMO.

CARRUTHERS, WILLIAM A., an American novelist, born in Virginia about 1800, and educated in part at Washington college in that state. He began to publish in New York about 1834. Among his works are—"The Cavaliers of Virginia, a Historical Romance of the Old Dominion;" "The Kentuckian in New York;" and "The Knights of the Horseshoe." Carruthers passed the latter years of his life at Savannah, Georgia, where he practised medicine, and wrote for the southern magazines.—F. B.

CARSON, ALEXANDER ROSS, LL.D., rector of the High school of Edinburgh, born about the year 1778, in the county of Dumfries. At the age of twenty-four he was appointed head-master of the grammar school of Dumfries, and four years afterwards, having already given proof of the acuteness of intellect and energy of character which distinguished him throughout his professional career, he was promoted to a mastership in the High school of Edinburgh, of which he was rector for twenty-five years previous to his retirement in 1845. He published "Exercises on Attic Greek." He died in 1851.—J. S., G.

CARSTAIRS, WILLIAM, an eminent Scotch divine and politician, and one of the most remarkable men of the Revolution era, was born at Cathcart, near Glasgow, in 1649. His father was presbyterian minister of the High church, Glasgow, and was ejected from his church at the Restoration. Young Carstairs was educated first at the university of Edinburgh, and afterwards at Utrecht, under the celebrated professors Leusden, Witsius, and Grævius. In the distracted state of his native country, he resolved to remain in Holland, and was there licensed as a preacher of the gospel. Having been introduced to William of Orange, he so completely gained the confidence of that prince, that nothing of importance was undertaken by him respecting the British court without the advice of Carstairs. He was repeatedly sent on important missions to Scotland and England, and was admitted into the councils of William Lord Russell, Sydney, Argyll, and the other patriots who were in constant correspondence with the prince of Orange. After the discovery of the Rye-house plot in 1684, and the execution of Lord Russell, Carstairs was apprehended and brought before the privy council; but as he steadfastly refused to make any disclosures, he was illegally sent down to Scotland, to be tried and examined by torture before that infamous tribunal, the Scottish privy council. He bore the excruciating suffering inflicted by the thumbscrew for an hour and a half with the utmost fortitude. But on being threatened with a repetition of the question, and having learned that the government had made certain discoveries by torturing Spence, the earl of Argyll's secretary, he gave way, and answered the questions put to him, on condition that his answers should not be used as evidence against any person. He confessed, however, nothing more than the government already knew, and the council had no suspicion that he withheld from them secrets of vast importance, which had been intrusted to him by Pensionary Fagel, the discovery of which, at this time, might not improbably have been fatal to the Revolution. On his release from prison he returned to Holland, and was appointed one of the chaplains of the prince of Orange, and was elected minister of the English protestant congregation at Leyden. He accompanied William to England in 1688; and when the landing of the troops had taken place at Torbay, performed divine service at their head. He was mainly instrumental in procuring the peaceable settlement of the presbyterian church in his native country; and became, indeed, the real prime minister for Scotland. He was appointed his majesty's chaplain for that kingdom; and as he was constantly in attendance upon the king, he had apartments assigned him in the palace when at home, and when abroad with the army was allowed £500 a year for camp equipage. He enjoyed more of William's confidence and esteem than any other Scotchman, or indeed than any other of his councillors, except Bentinck. In consequence of his vast influence, he obtained the significant nickname of Cardinal Carstairs. On one occasion in 1693, when a collision between the Scottish church and the government was imminent, he ventured even to stop the messenger who was about to hasten down to Scotland with instructions, which the king and his ministers had agreed to issue in the absence of their confidential adviser. William, though highly displeased at first, when Carstairs showed him the packet which he had taken from the messenger and confessed what he had done, speedily yielded to the remonstrances of his trusty

friend, and ordered the despatches to be destroyed, and others of a different tenor to be drawn out by Carstairs himself, which happily removed the grounds of dissatisfaction on the part of the Scottish people, and averted the impending danger of an open quarrel between them and the court. After the death of King William, Carstairs was in 1704 appointed principal of Edinburgh college and minister of the Greyfriars', and three years later of the High church. He was a liberal benefactor to all the Scottish universities, and contributed greatly to promote the cause of learning in Scotland. His influence in the Scottish church was as powerful as in the court; and in the space of eleven years he was four times elected moderator of the general assembly. He strenuously opposed the restoration of patronage in 1712; and though his efforts were unavailing in regard to this obnoxious measure, he succeeded in defeating some other schemes of the tory ministry for curtailing the privileges of the Scottish church. He did not long survive the accession of George I., who gratefully acknowledged the services he had rendered to the Hanoverian dynasty. He died in 1715, in the sixty-seventh year of his age. Carstairs was probably the most sagacious statesman Scotland has ever produced. He exhibited the rare combination of profound learning and genuine piety with great shrewdness and knowledge of the world, and what is even more worthy of notice, the firmest adherence to his own principles, along with remarkable benevolence and liberality towards the members of other religious bodies. Amid all the intrigues and treacheries of the Revolution era, the integrity of Carstairs was unquestioned; and his piety, humility, and warm affection for his relatives and friends remained uninjured either by the possession of great power, or by courtly adulation.—(Rev. D. McCormick, *The Carstairs State Papers*, &c.)—J. T.

CARSTENS, ASMUS JACOB, an artist, born in 1754 at St. Gurgun, near Schleswig. He commenced life as an apprentice to a wine merchant; but when not engaged in drawing corks, drew portraits with considerable success. After painting an "Adam and Eve," which was purchased by the crown prince, he entered the academy of Copenhagen as a student, but, quarrelling with his professor, he quitted it in 1783 for Italy. His funds failed him at Milan, however, and with his brother he commenced to journey to Germany on foot. At Lubec he took up his residence for five years, and obtained some success as a portrait painter. He then moved to Berlin in 1788, and remained there two years, giving lessons in art, and making drawings for the booksellers. He was employed on the decoration of the Dorvill palace, and there became known to the minister, who afterwards introduced him to the king, from whom he obtained a pension. In 1792 he was enabled to visit Rome. He studied the works of Michel Angelo and Raffaele, and produced several classical works in imitation of the latter. His last work was an "Edipus Tyrannus," and he died while executing a "Golden Age," May 25, 1758.—W. T.

CARTE, THOMAS, a learned English historian, was born in Warwickshire in 1686. After studying at Oxford and Cambridge he was appointed reader in the Abbey church at Bath; but refusing to sign the oath of allegiance to George I. he had to resign the preferment. Suspected of some share in the rebellion of 1715, and afterwards of being concerned in the treason of which Bishop Atterbury, to whom he was secretary, was accused, he had at length to flee to France, where he remained till about 1730, when, on the intercession of Queen Caroline, he was allowed to return to England. Soon after this he issued "The History of the Life of James, Duke of Ormonde," and applied himself to the preparation of a "General History of England," the proposals for which excited considerable attention, and procured many subscribers. This work is valuable for its research, but is disfigured by an obtrusion of the author's ultra-political opinions. He wrote many minor works.—J. B.

CARTER, ELIZABETH, a learned lady, was born in 1717 at Deal in Kent, where her father, Dr. Nicholas Carter, was perpetual curate. She was educated along with her brothers, under her father's care. She showed at first but little aptitude for learning; but as the result of great perseverance, she acquired a knowledge of Latin, Greek, French, German, Italian, Spanish, Portuguese, Hebrew, and Arabic. When only seventeen she began to write verses for the *Gentleman's Magazine*, which appeared with the signature "Eliza." A collection of these earlier poems was published in 1738 by Mr. Cave, the proprietor of the magazine, to whom Dr. Johnson thus writes—"I have composed a Greek epigram to Eliza, and think she ought to be

celebrated in as many different languages as Lewis le Grand." Her fame was greatly extended by her publication in 1739 of a translation from the Italian of Crousaz's *Examen of Pope's Essay on Man*—a work which Boswell tells us was ascribed to Dr. Johnson. In the same year she published a translation of Algarotti's *Explanation of Newton's Philosophy*, for the use of Ladies. These works brought Miss Carter into correspondence with such men as Butler, Benson, Johnson, Burke, Reynolds, and Archbishop Secker. Her translation of Epictetus appeared in 1758. In 1762 she published another volume of poems. She wrote two papers, Nos. 44 and 100, for Johnson's *Rambler*. The later years of her life were spent in the enjoyment of the society of her literary friends, by whom she was held in great esteem for her varied accomplishments. She died in London, 19th Feb., 1806. In the year after her death there appeared "Memoirs of her Life," &c.—J. B.

CARTER, GEORGE. This painter was more renowned for his eccentricity than his art. He was born of poor parents, was educated at the free school in his native town, Colchester, became a shopman, then a shopkeeper, a bankrupt, then a painter—felicitous stepping-stones to art. He journeyed to Rome, St. Petersburg, Gibraltar, and the East Indies—was despised for his want of ability, and yet somehow seemed to thrive upon contempt, and to coin incompetence. He realized a fortune, retired, and died at Hendon in 1795.

CARTER, NATHANIEL HAZELTINE, an American author, born at Concord, New Hampshire, in 1787; graduated at Dartmouth college in 1811. When the legislature in 1817 altered Dartmouth college into a university, he was appointed professor of languages in the new institution; but lost this place a year or two afterwards, when the supreme court abrogated this act of the legislature as unconstitutional, and reconstituted the college. Then he became editor of a newspaper in New York, which advocated the interests of De Witt Clinton. In 1824 he wrote and delivered a poem called "The Pains of the Imagination." The next year he visited Europe, and on his return published in two octavo volumes, "Letters from Europe, comprising the Journal of a Tour through England, Scotland, France, Italy, and Switzerland in the years 1825-27." This work was received with well-merited favour. Ill health obliged him, after spending the winter of 1828 in Cuba, to sail for Marseilles in France, where he died a few days after his arrival.—F. B.

CARTER, THOMAS, a distinguished composer of vocal music, was born in Ireland about the year 1758 (not 1768 as generally stated), and in the early part of his life held the situation of an organist in that country. Having paid considerable attention to the study of vocal music, he was patronized by the earl of Inchiquin, who appears to have contributed towards defraying the expenses of a journey into Italy, which he undertook for the purpose of completing his musical education. At Naples he was much noticed by Sir William and Lady Hamilton. After this he went to India, where for a short time he conducted the musical department of the theatre in Bengal; but his health suffering from the heat of the climate, he was under the necessity of returning to England. As a composer Carter had considerable merit. He was a large contributor to the theatres, and amongst the pieces for which he composed the music are the following—the *Rival Candidates*, 1775; the *Milesian*, 1777; the *Fair American*, 1785; the *Soldier's Farewell*, 1791; *Just in Time*, 1792; the *Birthday*, 1799. He is popularly known as the composer of the music of the pleasing ballad, "O, Nanny, wilt thou Gang wi' Me," and the celebrated description of a sea fight, "Stand to your Guns, my Hearts of Oak." In the year 1793 he married one of the daughters of the Rev. Mr. Wells of Cookham in Berkshire; and worn down by a complaint in his liver, supposed to have been the consequence of his residence in India, he died on the 8th of November, 1800, leaving a widow and two children.—E. F. R.

CARTERET, SIR GEORGE, distinguished during the civil war for his steadfast loyalty to the house of Stuart, was born in 1599 in Jersey, of which island he rose to be governor in 1626. On the outbreak of the civil war he was appointed by parliament vice-admiral of the fleet, but at the command of the king he declined the office and retired to Jersey, where, and in the neighbouring counties, he was active in the royal cause. On the death of the king he at once proclaimed Charles II., whom he entertained for six months in Jersey. But the government sent a fleet under Blake in 1651, and after an obstinate resistance Carteret had to abandon the island and betake himself to the

king, whom he followed in his wanderings till the Restoration. He was rewarded with the appointment to some high offices of state, and was about to be made a baron, when he died in 1679.—J. B.

CARTERET, JOHN, Lord, afterwards EARL GRANVILLE, a distinguished statesman in the time of the first two Georges, was born 22nd April, 1690. He was early distinguished for his profound and extensive learning. This gave weight to his speeches when he was introduced to the house of peers in 1711. He rose through various grades, and by the successful discharge of various embassies, to be secretary of state in 1721. He was an especial favourite with George I., being, it is said, the only one of his ministers who could converse with him in his native German. In 1724 he became lord-lieutenant of Ireland, an office to which he was reappointed in 1727, after the accession of George II., and in which he won the regard of the people, and the special friendship of Dean Swift and the other literary men of the country. He returned to parliament in 1730, and joined, indeed became the leader of the opposition against Sir Robert Walpole. When the fall of that minister was, after a twelve years' contest, accomplished in 1742, Lord Carteret became secretary of state and chief minister. In great favour with the king, and supporting measures which he had before condemned, he had in turn to confront a formidable opposition, and was at length displaced in 1744 by the duke of Newcastle. Now Earl Granville, he regained, but could only retain for four days, the seals of office in 1746. He still, however, continued in favour with the king. He died in 1763. In the most exciting times of his political career, he found time to discuss questions of scholarship with Bentley, who undertook at Granville's request his edition of Homer. Even Horace Walpole, of whose father he was the bitter opponent, confesses that, of the statesmen of the day, none equalled Lord Carteret in genius.—J. B.

CARTERET, PHILIP, an English voyager of the eighteenth century. In 1766 he was appointed commander of the *Swallow*, to sail under the orders of Captain Wallis in the *Dolphin*, on a voyage of discovery. The ships were parted by foul weather in the Straits of Magellan, and the *Swallow* proceeded alone. Sailing in the Southern Pacific, Carteret discovered and named a large number of little islands; proceeding westward, and touching at Borneo and Celebes, he doubled the Cape of Good Hope, and arrived in England in 1769, winning thus accidentally a place among the circumnavigators of the globe.—J. B.

CARTES. See DES CARTES.

CARTHEUSER, JOHANN FRIEDRICH, a German physician and chemist, born at Hayn in Prussia in 1704; died in 1777 at Frankfort-on-the-Oder. In the university of the latter town he held several professorships. His works were valuable and very numerous; but his chief merit consisted in the salutary reform he effected in materia medica. He subjected the plants used in medicine to the most careful analyses, determining their composition, the nature of the vegetable oils and salts, and was thus enabled to make many improvements in the pharmacopoeia.

CARTIER, JACQUES, a French navigator and explorer, was born at St. Malo, December 31, 1494. The French government, desiring to found a settlement near the banks where many of their vessels were engaged in the fisheries, sent out Cartier in command of an expedition consisting of two vessels in April, 1534. He passed through the Straits of Belleisle—sailed round the Gulf of St. Lawrence—discovered the great river which empties into it—gave a name to the bay of Chaleurs, and returned to France in September of the same year. The next May he was sent again, in command of three vessels, with a more ample outfit, to prosecute his discoveries. He now sailed up the St. Lawrence, discovered the island of Orleans, near Quebec, and in his pinnace and small boats ascended as far as where Montreal now stands—opening friendly relations with the natives by the way. Returning to his ships, he selected a place which he called La Croix, near Quebec, where he landed his company and passed the winter. Next May they all returned to France, carrying with them several of the Indians, all of whom died soon after their arrival. Cartier published an account of this voyage, which contains some useful information and many strange and incredible stories. In 1540 a third expedition was set on foot, under Roberval, who was commissioned as lieutenant-governor of Canada. Cartier was made his pilot, and second in command, and sailed first with five vessels. He passed up the river about four miles above his former position at La Croix, and there landed his company, and built a fort called

Charlesbourg. But again experience of the hardships of a new settlement in the wilderness sickened the people of their undertaking, and in less than two years they all embarked, and turned their faces homeward. At Newfoundland, however, they met Roberval, who was now first coming out, and were ordered by him to return. But Cartier chose to disobey, and sailing away privately in the night reached France. Roberval persevered, and founded a colony. Of Cartier's subsequent history nothing is known.—F. B.

CARTISMANDUA, the queen of the Brigantes in Britain, who perfidiously delivered up Caractacus to the Romans. Having discarded her husband, Venusius, and married Vellocatius, his armour-bearer, her subjects revolted. She asked the assistance of the Romans, who thus obtained possession of the country.

CARTOUCHE, LOUIS DOMINIQUE, a famous brigand, born at Paris about 1693. He commenced his larcenous career with petty depredations, and ultimately became the chief of a numerous band of robbers, over whom his courage, craft, and prodigious strength gained him absolute authority. The Parisian police were at that time exceedingly inefficient, and Cartouche kept the citizens of the capital in constant terror by the number and audacity of his depredations. He was at length captured by the authorities, and after a lengthened trial, which excited extraordinary interest, he was condemned, and executed on the 28th of November, 1721. A well-known French proverb says—"Cartouche began by stealing pins."—J. T.

CARTWRIGHT, EDMUND, the inventor of the power-loom, was born at Marnham, Nottinghamshire, in 1743. He studied at University college, Oxford, was elected a fellow of Magdalene, and held successively the livings of Brampton and Goadby-Marwood. Before he directed his attention to mechanical invention, he occupied himself with literary pursuits, contributing for some time to the *Monthly Review*, and publishing some little poems—"Arminia and Elvira;" "The Prince of Peace;" and "Sonnets to Eminent Men." Cartwright had completed his fortieth year when, in 1784, being on a visit to Matlock, he chanced to meet some gentlemen from Manchester, whose conversation turned on the mechanical appliances for weaving. He became interested in the subject, began to study it, and made so rapid progress that, early in the following year, he was able to set his first power-loom in motion. It was met by great opposition on the part of the workmen, and of many of the manufacturers, who were afraid to offend their labourers, and it did not soon come into general favour. The first mill that was built for working the new looms, and which contained 500 of them, was wilfully burned to the ground. So late as the year 1813 there were no more than 2300 of these power-looms in the United Kingdom. But Cartwright was nothing daunted, and persevered in devising improvements, till he had brought to very great perfection what was at first a rude unwieldy machine, but what has since become a prime necessity of British manufacture. Nor did he confine himself to this, but took ten different patents for inventions of various kinds. One of them was a patent for combing wool, taken out in 1790. His great invention brought him no increase of fortune. In 1807 a petition was sent to government by the principal cotton-spinners, craving for some recognition of his numerous services to the manufacturing interest, and in 1809 a grant of £10,000 was given—a sum which did not nearly compensate him for his outlay. He died October 30, 1823.—J. B.

CARTWRIGHT, JOHN, known as Major Cartwright, was the brother of Edmund, and was born at Marnham in 1740. He entered the navy, and took part in the capture of Cherburg and some other important engagements. When the war with America broke out in 1774, he refused to serve against the colonies, because of his views on the subject of constitutional liberty, which he embodied in a work entitled "Letters on American Independence." In 1775 he received a major's commission in the Nottinghamshire militia, and retained through life the title which that appointment gave him. He was early known as zealous in the cause of parliamentary reform, being, indeed, one of its first advocates. He took part with Dr. Jebb and Granville Sharp in forming, in 1780, the "Society for Constitutional Reformation," and was known to have co-operated with Tooke, Hardy, and Thelwall, who were tried for their zeal in the cause of reform. He died in 1824, and a statue was erected to his memory in Burton crescent, London.—J. B.

CARTWRIGHT, THOMAS, an eminent puritan divine, born

in Hertfordshire about 1535. He studied at St. John's college, Cambridge, of which he was chosen fellow in 1560. Ten years later, having meanwhile been elected to a fellowship in Trinity, he was appointed Lady Margaret's divinity reader. His lectures and sermons attracted very great attention, the more especially that he took occasion to deliver his sentiments on church discipline, which were unfavourable to the established hierarchy. He was cited before the vice-chancellor and heads of the university, but defended his conduct by asserting that he had only taught what seemed to him to flow from the texts he was expounding, and that he had never done so in any spirit of controversy. One of his principal opponents, Dr. Whitgift, having in 1571 become vice-chancellor, Cartwright was at once deprived of his professorship, and very soon after of his fellowship. He then went to the continent, and became acquainted with Beza and many other eminent scholars. During his exile he officiated as minister to English merchants, first at Antwerp, afterwards at Middelburg. Returning to England, he soon came into fresh trouble. "An Admonition to Parliament" concerning the discipline of the church and the measures which had been taken against the puritans, having been presented, its authors, Messrs. Field and Wilcox, were committed to Newgate in 1572. Mr. Cartwright ventured to address the parliament in a "Second Admonition," which involved him in a long controversy with Whitgift, and compelled him once more to leave the country. He was abroad for five years, officiating as minister at some English factories. He was offered by James VI. of Scotland a professorship at St. Andrews, which he declined, choosing rather to return to England, where, however, he was soon apprehended and committed to prison. He was released through the interest of the earl of Leicester, and by that nobleman appointed master of a newly-founded hospital in Warwick. At the request of many protestant divines, he undertook to write against the Rhemish translation of the New Testament; and notwithstanding the prohibition of Archbishop Whitgift, prepared the work—which was published in 1618, many years after his death—entitled "A Confutation of the Rhemish translation, glosses, and annotations on the New Testament." By the command of Aylmer, bishop of London, he was again sent to prison in 1585, was released, and again imprisoned till 1592. He was finally set at liberty through the intercession of Lady Russell and of King James, who had always admired him, and who wrote a letter to the queen on his behalf. His health was sadly impaired by his wanderings and imprisonments, and he died December 27, 1603. Besides the works referred to, Mr. Cartwright published "Commentaria Practica, in totam Historiam Evangelicam, ex quatuor Evangelistis harmonicè concinnatam," 1630; Commentaries on the Proverbs and on Ecclesiastes; "A Directory of Church Government;" and "A Body of Divinity."—J. B.

CARTWRIGHT, WILLIAM, an English poet of some reputation in his day, was born at Northway, near Tewkesbury, September, 1611. He studied at Oxford, and having taken orders, became a preacher of note in the university—one of his sermons finding a place, as a specimen of university preaching, in a volume of Five Sermons in Five several Styles or Ways of Preaching. In 1642 he received an appointment to an office in the church of Salisbury, and was in the same year made one of the Oxford council of war, appointed to provide for the king's troops stationed in the town. In 1643 he was chosen junior proctor in the university, and reader in metaphysics; but he did not long hold these offices, for he died in December of the same year. He had attained very great reputation, and was spoken of in terms of the highest commendation by Ben Jonson and others of his time. His works are now scarcely remembered. His "Comedies, Tragi-Comedies, and other Poems," appeared in 1647, and again in 1651. Wood praises his scholarship, and mentions that he wrote "Poemata Græca et Latina."—J. B.

CARUS, FRIEDRICH AUGUSTUS, a German philosopher, author of several works on the history of psychology, containing some of the most original views on that branch of science which have illustrated its annals in the present century, was born at Bautzen in 1770, and died at Leipzig in 1807. He was for some time pastor of a protestant congregation at Leipzig, and latterly professor of philosophy in the university. His most remarkable publication is a "History of the Psychology of the Hebrews," a subject on which he has lavished all the resources of his great talents and remarkable erudition. He wrote also "Elements of Psychology," and "History of Psychology."

CARUS, KARL GUSTAF, a distinguished German physician and naturalist, was born in 1780, at Leipzig, where his father practised the art of a dyer. His early education was conducted in the gymnasium of his native city, and he studied chemistry in the university, with the view of following his father's business. Having, however, acquired a taste for anatomy he determined on the pursuit of medicine as a profession. He pursued his studies with so much success, that in 1811 he was appointed extraordinary professor to the university, and delivered lectures on comparative anatomy, which had not till that time been taught in the university. Whilst devoting himself to the pursuit of the science which he taught, he practised more especially the obstetrical branch of his profession, and wrote many able papers and two works on the subject. He also cultivated with great success the art of drawing, as the illustrations to many of his works on comparative anatomy show. In 1813 he caught a fever during his professional labours, which rendered him for some time incapable of scientific research. In 1815, on the foundation of the medico-chirurgical academy of Dresden, he was appointed to the chair of clinical midwifery. In 1822 he published his "Manual of Midwifery," and in 1828 his "Handbook of Gynæcology," in two volumes. These works display great practical acquaintance with the science of obstetrics, and the physiology of the human female. In 1829 he was appointed physician to the king of Saxony, a post he held till the death of the king. In 1829 he accompanied the Prince Frederick-Augustus in a journey through Switzerland and Italy. He also subsequently came to England with the king. The works of Carus on the subject of comparative anatomy are very numerous. He is best known in this country for his researches on the typical forms assumed by the vertebrate skeleton, a subject to which he devoted several of the numerous papers that he published in the Transactions of scientific societies, and in philosophical journals. He wrote several systematic works on zoology, comparative anatomy, and physiology, amongst which may be mentioned his "Introduction to Comparative Anatomy," published in 1827. This work was translated into English by Gore, and published in two volumes with an atlas. In 1834 he published an "Elementary Treatise on Comparative Anatomy," which was translated into French, and published in Paris in 1835. In 1840 he completed in three volumes a work entitled "A System of Physiology." His papers are very numerous, and contain much original and valuable observation, especially those devoted to the subject of embryology. Most of his works are illustrated with drawings from his own pencil, and possess considerable artistic merit. The list of his works published in 1850 in the Bibliographia Zoologiæ et Geologiæ of Agassiz and Strickland, contains forty-nine titles. These probably do not exhaust the whole of the contributions of this indefatigable observer and writer to the literature of natural history and the medical profession.—E. L.

CARUS, MARCUS AURELIUS, a Roman emperor, died in 283. He was proconsul of Cilicia, and prætorian prefect of the Emperor Probus, whom he succeeded, but not without the suspicion of having been accessory to his murder. The reign of Carus was short, but brilliant. Of an austere nature, he disregarded the senate, enforced a rigorous simplicity in the camp, and maintained an uncompromising hostility against the enemies of Rome. Having defeated the Sarmatians in Illyricum, he prepared to execute the long-suspended design of the Persian war, and had already carried his victorious arms beyond the Tigris, when death suddenly overtook him. It is believed that his fate was similar to that of his predecessor. Carus was succeeded by his two sons, on whom he had conferred the title of Cæsar. His reception of the Persian ambassadors is well known.—R. M., A.

CARUSO, LUIGI, a musician, was born at Naples, September 25, 1754; the time and place of his death are unknown. He studied his art first under his father, and subsequently under Nicolo Sala. He is said to have been designed for a singer; but failing in this capacity, turned his attention to composition. His first opera, "Il Baronne di Trocchia," was produced at Brescia in 1773. In the summer of 1774, he brought out "Artaserse" in London. He wrote in all sixty operas, the last of which, "L'Avviso ai Maritati," was given at Rome in 1810. Besides these voluminous dramatic works, he composed many pieces for the church, like them in a very light style; he produced also four oratorios and several sacred and secular cantatas.

There is no satisfactory foundation for the statements that he lived for some time in Germany and in Paris, and that he was maestro di capella in Palermo.—His brother EMMANUELE was also a musician.—G. A. M.

CARVALHO DA CASTA, ANTONIO, a Portuguese ecclesiastic, born in 1650; died in 1715. In spite of the discouragements arising from a deformed person and extreme poverty, he resolutely applied himself to study. Mathematics and cosmography were his favourite pursuits, the best part of his life having been spent on his great work "*Corographia Portugueza*."

CARVER, JOHN, first governor of Plymouth in North America. Little is known of his early life. He joined at Leyden the congregation of separatists, who had followed Richard Clifton and John Robinson from Nottinghamshire to Amsterdam in 1608, and to Leyden in the following year. When they determined in 1617 to remove to America, Carver, along with Robert Cushman, was sent to England, to solicit from the king an assurance of religious toleration, and to negotiate with the Virginia company for a grant of land. In the same year he was despatched a second time to London on the same errand, and two or three years after, when the arrangements had been completed, including a partnership with some London merchants who were to furnish an outfit, he went to Southampton "to receive the money, and provide for the voyage." The *Speedwell*, having brought over from Holland a portion of the Leyden congregation, was joined at Southampton by the *Mayflower*, and the two vessels put to sea with about a hundred and twenty passengers. The leaky condition of the *Speedwell* compelled her twice to put back, and the *Mayflower* sailed a third time with a company of a hundred and two persons, of whom Carver was one. After a passage of nine or ten weeks, she arrived on the 11th of November, 1620, in the harbour of Cape Cod, where an instrument was signed on the same day, which has been called by President Adams, "the first example in modern times of a social compact, or system of government, instituted by voluntary agreement." On the same day Carver was chosen governor of the colony. In the following month Plymouth was selected for the site of the plantation, by an exploring party which Carver commanded. His death in the first week of the ensuing April caused great sorrow in the community.—F. B.

CARVER, JONATHAN, was born at Stillwater in Connecticut in 1732, and died 31st January, 1780. He studied medicine, but afterwards entered the army, and served in the English regiments during the American war. On the restoration of peace, he travelled in America, and published an account of his travels during the years 1766, 1767, and 1768. He seems to have been in reduced circumstances during the latter period of his life, and to have accepted a mean situation in a lottery office in London. He published in 1779 a work on the culture of the tobacco plant.—J. H. B.

CARY. See FALKLAND.

CARY, HENRY FRANCIS, the accomplished and well-known translator of Dante, was born at Birmingham in 1772. He early displayed a taste for poetry, publishing in 1787 "*An Irregular Ode to General Elliot*," and in the following year a collection of "*Sonnets and Odes*." Having entered as a commoner of Christ's church, Oxford, he applied himself not only to the study of Latin and Greek, but to acquiring a very extensive acquaintance with the languages of modern Europe. In 1797 he was presented to the vicarage of Bromley Abbot's in Staffordshire, and then devoted himself to his task of furnishing English readers with a version of the work of the great Italian. In 1805 the *Inferno* appeared, accompanied with the original, and in 1814 Cary was able to issue his translation of the whole poem, which he chose to name the "*Vision*"—a title, he says, "more conformable to the genius of our language than that of the '*Divine Comedy*.'" A second edition was called for in 1819, and in issuing it Cary acknowledges his obligation to Coleridge, to whose "prompt and strenuous exertions in recommending the book to public notice," the fame to which this translation has attained is mainly owing. A third edition was called for in 1831, but it was not till February, 1814—in the August of which year he died—that Cary found time to prepare it for the press. From 1826 to 1832 he held the office of assistant-librarian in the British museum; and for some years before his death he enjoyed an annual pension of £200 conferred by government. Of his other works, we may mention verse translations of the *Birds of Aristophanes*, and of the *Odes*

of Pindar; "*Lives of English Poets*," in continuation of Johnson; "*Lives of early French Poets*;" and editions of Pope, Cowper, Milton, Thomson, and Young.—J. B.

CARY, LOTT, a negro clergyman and missionary, one of the founders of the civilized African colony of Liberia, was born a slave in Virginia about 1780. At Richmond, where he joined a congregation of Baptists, he learned to read and write, studied the scriptures and many other books, and preached regularly to the blacks in the town and its neighbourhood. He was employed at a tobacco warehouse, where his services were highly valued, and where, from the presents which he received, and the profits of some little trade on his own account, he saved up money enough to buy his own liberty, and that of two of his children, at the cost of 850 dollars, or about £170. He soon rose to be the owner of a little farm near the city, received a salary of 800 dollars for his services in the warehouse, and became much esteemed as a preacher. But as soon as the American Colonization Society began active operations, he resolved to leave all, and emigrate under their auspices to Africa. He sailed from Richmond in January, 1821, and went first to Sierra Leone, where he worked as a cooper and missionary, till the Colonization Society obtained Cape Mesurado for their settlement. The next year he went thither, and soon proved himself one of the most active and useful members of the little community. In 1826 he was appointed vice-agent of the colony, and two years afterwards, when Mr. Ashman was obliged by sickness to return to America, the whole government devolved on Cary. He administered the affairs of the colony successfully till November, 1828, when he was killed, with seven others, by an accidental explosion in the magazine where they were making cartridges, against a threatened attack upon the settlement by the native tribes.—F. B.

CARY, ROBERT, a learned chronologer, was born at Coekington in Devonshire about 1615. He belonged to an old and famous family. Having studied at Oxford, where he won considerable distinction, and having travelled on the continent for some time, he was, on his return, presented to the rectory of Portlemouth in Devon. In 1662 he was preferred to the archdeaconry of Exeter, but he only held that dignity for two years. Returning to his rectory of Portlemouth, he lived there till his death in 1688. The book in connection with which he is remembered is named "*Palaeologia Chronica*; a chronological account of ancient time, in three parts—didactical, apodeictical, and canonical," London, 1677.—J. B.

CARYL, JOHN, a dramatic writer of the latter part of the seventeenth century. He was secretary to Mary, James II.'s queen, and seems to have followed the fortunes of the exiled king, who rewarded him with knighthood, and the honorary titles of Earl Caryl and Baron Dartford. He, however, returned to England, for we find him in London in the time of Queen Anne, living on terms of intimate friendship with Pope, who addressed to him the *Rape of the Lock*, the subject of which he is said to have suggested. Caryl wrote two plays, "*The English Princess, or the Death of Richard III.*," 1667; "*Sir Salomon, or the Cautious Coxcomb*," 1671. He also published the *Psalms of David*, translated from the Vulgate, 1700. The date of his death is uncertain; he was living in 1717.—J. B.

CARYL, JOSEPH, a nonconformist divine, author of a commentary on *Job*, was born in London in 1602. He took a prominent part in the public questions of the day, was appointed by parliament to attend Charles I. at Holmby house, was one of the commissioners to the Isle of Wight, and in 1650 was sent along with Dr. Owen to officiate as minister, and to attend on Cromwell in the Scottish expedition. After the passing of the act of uniformity, he collected a congregation in the neighbourhood of London bridge, where he continued to officiate till his death in 1673.—J. B.

CASA, GIOVANNI DELLA, a celebrated Italian poet, orator, and philosopher, born of noble parentage at Mugello in Tuscany in 1503; died in 1556. Having prosecuted his elementary studies at Bologna and at Florence, he was sent to Rome, where he completed his acquaintance with the classics and studied theology. In 1538 his reputation for scholastic learning drew on him the attention of Cardinal Alexander Farnese, who obtained for him a secretaryship in the apostolic chamber. The talents he displayed in that office secured him early promotion. He was sent as nuncio to Florence, and soon after intrusted with an important embassy to the court of Venice. On this latter occasion

Della Casa pronounced before the senate two of his most celebrated orations. In 1544 he was raised to the archbishopric of Benevento as the reward of his diplomatic success. Involved in the disgrace of his early patron, Farnese, and obliged to quit Rome, he sought consolation in his studies at a small villa in the province of Treviso. In this retreat he remained till the elevation of his protector to the pontifical throne, under the name of Paul IV., when he was raised to the dignity of secretary of state. His licentious life, or perhaps rather the immoral character of his works alone prevented his being dignified with the purple. Both in prose and verse his style is singularly felicitous. "Della Casa," says Gioberti, "is the first of lyric poets who abandoned the servile imitation of Laura's bard, and sang of love in strains never heard before, combining the wisdom of a philosopher with the graceful melody of a poet." His principal prose works are—"Il Galateo," and a treatise in Latin entitled "De Officiis," of which he left an Italian translation. All his works are considered classic, and his name has been enrolled amongst those of the greatest writers of the sixteenth century.—A. C. M.

CASABIANCA, LOUIS, a French naval officer born in 1755; died in 1798. He entered the service young, and soon acquired such a reputation for bravery, that he was elected a deputy to the national convention, and afterwards became a member of the council of five hundred under the directory. In the French expedition to Egypt he was appointed flag-captain to Admiral Brueys; and in the battle of Aboukir was mortally wounded by a splinter at the time the *Orient* caught fire. His son, a boy of ten years of age, refused to abandon his father when the opportunity was offered of escaping in a small boat, and perished with him in the explosion of the ship.—J. T.

CASAL or CAZAL, EMMANUEL AYRES DE, a Portuguese geographer of the seventeenth century. He took orders, and went while still young to Brazil. His book, "Corografia Brasiliica," has not yet been superseded. Casal spent much labour on it, diligently examining records, and gathering information from the most recent travellers; its accuracy has been recognized by Humboldt.—R. M., A.

CASANOVA, FRANCESCO: this artist, brother of Giacomo, was born in London in 1732. At a very early period of his life he was sent to Venice to study under Francesco Simonini, a painter of battles in the style of Borghese. Casanova imitated his master—himself an imitator. But his imitative skill was leavened by a considerable creative talent of his own. He painted landscapes bloody with battle, and landscapes benign with peace. He painted marine and pastoral subjects. Some years of his life he spent at Dresden; some at Paris, where his reputation spread, and he was received into the Academy. Subsequently he appeared at Vienna, where his works were highly accounted, and he etched royal plates. He died in 1805.—W. T.

CASANOVA, GIACOMO, a notorious adventurer, born at Venice in 1725. The family of Casanova was of Spanish origin, and, from the fourteenth century, addicted to the same irregular habits which were so perfectly developed in the famous Giacomo. Casanova began life as an ecclesiastic, but soon quitted the church to enter on his vagrant career. A recital of his adventures, which he has minutely detailed in his "Memoirs," is here impossible. Their name is legion. Some of the incidents taken by themselves—such as his imprisonment at Venice and subsequent escape—are surpassingly interesting; but the effect of the whole is that of a dreary record of repulsive scoundrelism. His life was a succession of intrigues, impostures, duels, imprisonments, escapes, arrests, amours, brawls, conjurings, and debaucheries. And yet, strange to say, he found favour for a short time almost wherever he came; managed to get himself presented at most of the European courts, and lived familiarly with the noble and learned. He could hoodwink a marquise d'Urfé, talk learnedly with a d'Alembert, or bandy irreverent sarcasms with a Voltaire. The resources of his consummate impudence were boundless, provided only the liberty of moving about from capital to capital were allowed him. Casanova reminds us of Cagliostro, although he deals less in the black art, and has scarcely any of the archquack's solemn pretence of respectability, trusting more in his native impudence and swiftness of heels. The last years of his life were spent—discontentedly, as might be expected—at the castle of a Bohemian count. It is uncertain whether he died in 1799 or 1803. One of his last sayings was—"I have lived a philosopher, but I die a christian."—R. M., A.

CASAS. See LAS CASAS.

CASATI, the name of four musicians much esteemed in their day:—

CASATI, FRANCESCO, was an organist and composer at Milan in 1600, first at the church of St. Maria della Passione, and afterwards at that of St. Marco; his compositions are all ecclesiastical.

CASATI, GASPARO, lived at Venice in 1650; he was distinguished as a vocal composer, and his works, though not all designed for the church, are all of a sacred character; this makes it remarkable, considering the severe style then employed for religious music, that many of his canzonets are written in triple measure, which at that period was regarded as light, if not trivial.

CASATI, GIROLAMO, was maestro di capella at Mantua in the middle of the sixteenth century; he produced many sacred compositions for one or more voices.

CASATI, TEODORO, lived at Milan in the latter half of the seventeenth century; he was organist successively of the churches of S. Fidele and S. Sepolcro, and finally of the cathedral; he held this last office in 1667, when he was one of the umpires who elected the celebrated San Romano to be organist of St. Celso. Maria Anna, queen of Spain, was so pleased with an opera of this composer, that she offered him an appointment at her court, which, however, he did not accept.—G. A. M.

CASAUBON, ISAAC, one of those great scholars of the middle ages who studied classical literature with an affection and self-devotion almost apostolic in its intensity and fervour. He was born at Geneva, February 8, 1559, of a proscribed family from Dauphiné; and when a young man of twenty-four succeeded Portus as professor of Greek in the university of that city. His anxiety to be worthy of his position as a classical scholar, was sufficiently pure and noble to partake of a certain religious character. In 1586 he married Florence, daughter of the eccentric printer and scholar, Henri Estienne (Henry Stephens), and from time to time issued editions and translations of Greek and Latin authors, with notes and commentaries. In 1596 he was appointed professor of Greek and belles-lettres at Montpellier; but in consequence of miserable treatment as to pecuniary matters, he accepted an invitation to Paris given him by Henry IV., who wished to place him in one of the university chairs. Henry, however, on account of the opposition raised because of Casaubon's protestant opinions, ultimately substituted the appointment of royal librarian. The scholarship of Casaubon was varied, and probably no man has published commentaries on a greater number of authors; but his chief delight was in Greek. The Greek language may, indeed, be called *le démon familier* of his life, solacing his worst troubles, and creating his most grateful pleasures.—The scholars of the middle ages may be arranged in several distinct classes. Around Cardinal Bessarion, in the fourteenth century, may be grouped those who dug out from the hard soil of oblivion the remains of antiquity, as a Layard might excavate Nineveh. In the beginning of the sixteenth century, we may group around Erasmus those who loved the ancient spirit more than the letter, and sought to breathe into the present the glory of the past, and rival classical productions upon actually existent grounds. These men were less famous as excavators than as new builders upon old foundations. Around Casaubon, at the end of the sixteenth century, may be grouped scholars who combined both these previous tendencies, and who sought by original critical commentary to give life to the excavated remains. The bible had not yet gained its commanding authority over the critical intellect of Europe, although that time drew near; and Casaubon once or twice turned from classical to scriptural commentary. This tendency occurred, however, after a severe illness, and did not hold its ground when returning health gave strength to his natural tastes. His memory was wonderful, and he could correct author by author with apt quotations; while he possessed that sagacity in the detection of textual corruptions, which in the true scholar is a fine instinct; and he must be numbered amongst those who carried into philology that self-same rigorous method of observation which was brought by Bacon to bear upon the study of nature. Casaubon's devotion to study was an enthusiasm so single-minded as to be lovable. In a rude and troubled time how could learning have lived had it not thus been served with a completeness of self-surrender? The life of Casaubon, in relation to his age, may have been one-sided

but an overstress on commentary alone preserved literature in times when mind was generally undervalued in comparison with the sword. Casaubon published an edition of Aristotle in Greek and Latin, and a similar edition of Polybius—the latter being the more excellent of the two—with commentaries on Diogenes Laertius, Theophrastus, Theocritus, Persius, Suetonius, Pliny the younger, and many others. His commentary on the *Deipnos Sophistæ* of Athenæus is probably the most notable of all. He remained a protestant throughout life, although his modest and kindly spirit, and his anxiety to be fair and just, exposed him to constant proselytizing efforts on the one hand, and to suspicions among his fellow-believers on the other. One of the most honourable facts of his life exposed him to the greatest annoyance. At the conference of Fontainebleau, the protestant champion, Duplessis was convicted of misquoting the Fathers; and Casaubon, who had been nominated one of the judges on the protestant side, not being able to resist the evidence, honourably decided against his own party. One of his friends concluded from this conscientious fairness that he must be a catholic in disguise, and was thus indignantly rebuked—“I conjure you by the immortal God do not soil my life with this stain, that like a masker my countenance belies my heart. Such a one I am not, I never have been, and I never will be.” His conversion to catholicism being found impossible he was accused of atheism. To this charge he pointedly answered—“Had I been an atheist, I should have been at Rome, where I have frequently been invited.” Upon the assassination of Henry IV. he went to England, where he was favourably received by James I., and becoming that monarch’s chief theological adviser, so pursued the even tenor of his way that the puritans were even scandalized at the moderation of his polemics, and the jesuits thought him deserving of every imaginable reproach. At James’ request he prepared an examination of the *Annals of Baronius*, but his ecclesiastical was not equal to his classical learning. Casaubon died July 6, 1614, and was buried in Westminster abbey. Some time previous to his death he had been offered various Oxford degrees, and had replied with mingled modesty and pride, that as long as he lived his name should be his only title.—L. L. P.

CASAUBON, MÉRIC, son of the more famous Isaac Casaubon, was born at Geneva in 1599. He came to England with his father in 1610, and was entered at Christ church, Oxford, where he took his master’s degree in 1621, and in the same year published a defence of his father, named “*Pietas contra maledicos patrii nominis et religionis hostes*,” which brought him into notice, and secured for him the favour of the king, at whose command he published a second defence in 1624. He received various preferments in the church, which he held till about 1644, when the violence of the civil wars deprived him of his livings. He was, however, honoured by a request from Cromwell to write the history of the war, which he declined, as well as the offer of a pension. He also refused a flattering offer from Christiana of Sweden, who wished him to undertake the inspection of her universities. At the Restoration he received his ecclesiastical preferments once more, and enjoyed them till his death in 1671. His works were very numerous. Sir William Temple praises his work on *Enthusiasm*; and his treatise “*Of Credulity and Incredulity in things natural, civil, and divine*,” is remarkable as avowing his belief in “spirits, witches, and supernatural operations.”—J. B.

CASE, JOHN, M.D., a learned physician of the sixteenth century, and the author of an interesting little work, entitled “*The Praise of Musick; wherein, besides the antiquity and dignity, &c., is declared the sober and lawful use of the same in the congregation and church of God*,” printed at Oxford, 12mo, 1586, with a dedicatory epistle to Sir Walter Raleigh. He was born at Woodstock about the year 1550, and died in 1599. A list of his works, which, with the above exception, possess little interest at the present day, may be seen in *Wood’s Athenæ Oxonienses* (ed. Bliss. i. 686).—E. F. R.

CASE, JOHN, M.D., a noted astrologer of Queen Anne’s time. He was a native of Lyme-Regis in Dorsetshire, and succeeded to the magical apparatus of Lilly and Salford. A work entitled “*Compendium Anatomicum, nova arte institutum*,” is with much probability ascribed to Case. It is a defence of De Graaf’s opinion as to the generation of all animals *ab ovo*.—J. B.

CASEARIUS, JOHN, a Dutch botanist, lived during the second half of the seventeenth century. He resided as a mis-

sionary at Cochin, and assisted Rheede in his *Hortus Malabaricus*. He arranged the plan of that great work, and described the plants in the first two volumes. An American genus of plants is called *Casearia* in honour of him.—J. H. B.

CASES. See LAS CASES.

CASES, PIERRE JACQUES, a French painter, born at Paris in 1676. He obtained the grand prize for painting in 1699, and was received into the academy in 1704. He painted a great number of works, but towards the end of his life he stooped to become a mere art-machine for the rapid production of pictures, which were, of course, of small value. He was the instructor of Le Moine. He died in 1754 at Paris.

CASIMIR, the name of five kings of Poland:—

CASIMIR I., surnamed THE RESTORER, and also THE MONK, son of Miecislav II., and of Riksha, niece of the emperor, Otho III., died in 1058. At the death of his father, which occurred in 1034, when Casimir was still a minor, his mother undertook the government with the title of regent; but her administration proving unpopular she fled with the young prince to France. Becoming a member of the Benedictine order of Cluni, he remained in France till recalled by his subjects in 1041. He was a just and liberal monarch, and did much to foster the civilization of the kingdom by his patronage of letters, and by repressing idolatry.

CASIMIR II., called THE JUST, younger son of Boleslav III., born in 1017, succeeded his brother, Miecislav III., in 1177, and reigned till his death in 1194. He defeated the heathen tribes of Prussia, and compelled them to adopt the christian faith, and at home protected the common people from the tyranny of the nobles.

CASIMIR III., styled THE GREAT, born in 1309; died in 1370. He succeeded his father, Wladislas, in 1333, commencing a reign of singular lustre and beneficence with the character, only too well deserved, of a reckless libertine. His first public acts augured little for the prosperity of the kingdom under his rule. Absorbed in pleasure he allowed several provinces to be wrested from the crown, purchased peace with his enemies at the price of dishonour, and connived at the most shameful abuses of the administration and the courts of justice. The memory of these delinquencies, however, he gradually effaced by successful wars with the Tartars, Cossacks, Livonians, and Bohemians, and at length completely obliterated, by the introduction of reforms into every branch of the public service, which only the talents of a great legislator, and the wisdom and beneficence of a great sovereign, could have been effectual in inaugurating. A higher title than that by which he is commonly distinguished in history, was that by which the nobles of the kingdom sought to point the finger of scorn at his administration, calling him “the peasants’ king,” with a contempt which it was his glory to have earned, not by the vulgar acts of display and condescension, but by earnest, although not always successful exertions to relieve the great body of his subjects from the oppression of feudal institutions. He abolished the arbitrary powers of the judges by the introduction of a double code of laws (for the Greater and the Lesser Poland), established a supreme court of appeal at Cracovia, projected and endowed schools and hospitals for the poor, and on the model of the university of Paris founded that of Cracovia (1347). In contrast to all this beneficence, however, was his absurd submission to a Jewish mistress, who had the art to obtain from her countrymen commercial monopolies, which throughout the reign of Casimir continued to weigh heavily on the enterprise of other classes of his subjects. Casimir III. was twice married, to Anne, daughter of Gedemin, grand duke of Lithuania, and to Adelaide of Hesse, but left no children by either of his wives. At his death in 1370, the two kingdoms of Hungary and Poland were united, under the rule of his nephew and successor, Louis of Anjou.

CASIMIR IV., second son of Jagello, grand duke of Lithuania, who married a daughter of King Lewis, and afterwards became king of Poland, under the title of Wladislas III. Casimir succeeded to the crowns of Poland and Lithuania at the death of his brother, Wladislas IV., who fell gloriously at the battle of Varna in 1444. Personally little entitled to distinction, his character being that of an indolent although not incompetent sovereign, Casimir gave his name to a period in the history of Prussia, which was illustrated by the subjection of the Teutonic knights, and by the introduction of deputies from provinces into the diet of the kingdom. He died in 1492.

CASIMIR V., JOHN, son of Sigismund III., king of Poland,

and of Constance of Austria, born in 1609; died in 1672. His brother, Wladislas V., succeeding to the crown on the death of his father in 1633, Casimir undertook in 1638 the hazardous task of assisting, by a naval armament collected at Genoa, the designs of Philip III. of Spain against the commerce of the French on the Mediterranean. His fleet being driven by contrary winds on the coast of Provence, he was taken prisoner, and confined by order of Richelieu at Vincennes. After two years' imprisonment he was allowed to return to Poland. He was at Rome, where he had entered the church, and been promoted to the rank of cardinal, when the news of his election to the sovereignty of Poland, following the tidings of his brother's death, reached him, and necessitated an appeal to the pontiff for a dispensation from his clerical vows. With this, which was readily granted, and with a license to marry his brother's widow, he returned to Poland, and commenced his long wars with the Tartars and Cossacks, the evils of which were shortly to be increased by an incursion of Swedes under the formidable Charles Gustavus. Charles overran the greater part of Poland, and defeated the Polish army in a great battle, near Warsaw. By the treaty of Oliva in 1660, Casimir gave up Livonia to the Swedes, and Smolensk and Kiew to the Russians. In 1667 he abdicated the crown and retired to France, where the abbacy of St. Germain-des-Prés and other benefices were conferred upon him by Louis XIV. His death occurred at Nevers.—J. S., G.

CASLEY, DAVID, an English bibliographer of the first half of the eighteenth century. He was subkeeper of the Cottonian library; published "Report of Committee on the Cottonian Library, &c., with an Appendix," 1732; and compiled a catalogue of the MSS. of the king's library, and of the Harleian MSS. from 2405 to 5709.

CASLON, WILLIAM, a distinguished letter-founder, was born in Shropshire in 1692. His original occupation was that of an engraver of ornaments on gun-barrels, with which he combined the making of tools for bookbinders, and the chasing of silver plate. Mr. Bowyer, the printer, having seen the lettering on the back of a book, which was executed with peculiar neatness, inquired who had furnished the letters. Finding that it was Mr. Caslon, he waited on him, and persuaded him to devote himself to letter-founding, for which he soon showed peculiar aptitude. He was first employed to cut the letters for an edition of the New Testament and Psalter, printed in Arabic by the Society for Promoting Christian Knowledge. After this he began to cut pica, and in 1722 furnished the fount for printing an edition of Selden. Encouraged by Mr. Bowyer he opened a foundry, and soon, by his peculiar excellence in the art, made the importation of types from Holland unnecessary. Indeed, ere long, the productions of his foundry began to be exported to the continent. Mr. Caslon realized a considerable fortune, and died at his country seat at Bethnal-green in 1766.—J. B.

CASMANN, OTTO, a German divine of the sixteenth century, known as one of the earliest of the so-called scriptural philosophers, who formed a system of philosophy founded entirely on the records and doctrine of the bible. He died in 1607. Among other works he wrote a treatise named "Cosmopœia," in which he derives a system of natural philosophy from scripture; and "Modesta Assertio Philosophiæ et Christianæ et Veræ," in which he professes to write the christian institutes of grammar, rhetoric, logic, arithmetic, &c.—J. B.

\* CASS, LEWIS, General, an American statesman of considerable notoriety, was born at Exeter, New Hampshire, about the close of the last century. He was originally intended for the legal profession, but quitted it for the army. His military career, however, gained him no laurels, for his only service in the field appears to have been in the luckless expedition against Canada in 1812, which terminated in the surrender to the British of the American army under General Hall. On the return of peace, General Cass was elected governor of Michigan. In 1831 he received the appointment of secretary of war from General Jackson, and subsequently became United States minister plenipotentiary at the court of France, where he was noted for his cordial approbation of the policy of Louis Philippe. He resigned his office and returned home, in consequence of a difference of opinion with President Harrison respecting his foreign policy. Since that time he has taken a leading part in political affairs; and in 1844 was an unsuccessful candidate for the office of president. Cass is now a senator for the state of Michigan, and a member of President Buchanan's cabinet. He is a violent and factious

partisan of the democratic party, a zealous supporter of slavery and of a high protection tariff; and has always shown himself an unscrupulous advocate of the annexation of Texas, the war with Mexico, and the other aggressive measures of the American government against their neighbours.—J. T.

CASSAGNES, JACQUES, a French writer, born at Nismes in 1633. Early known as a poet, he was admitted at the age of twenty-seven into the French Academy, and rose in court favour, till, when preparing to become a court preacher, he was satirized by Boileau, which so affected his spirits that he became insane. He died in 1679, leaving odes, and some translations.—J. B.

CASSANA, GIOVANNI AGOSTINO, called L'ABATE: this painter, the younger brother of Nicolletto, was born at Genoa in 1658, and was instructed by his father. He painted portraits successfully, but is more celebrated for his quadruped likenesses. His animal and fruit pieces have been very highly considered, and follow the style of Benedetto Castiglione. He died in 1720.—W. T.

CASSANA, GIOVANNI FRANCESCO, a painter, born at Genoa in 1611. He studied under Bernardo Strozzi. He excelled most as a portrait painter, but he executed a St. Girolamo in the dome of the church of the Mirandola with great credit. He died in 1691. He was the progenitor of a group of painters.

CASSANA, NICCOLO, the second son of Giovanni Francesco Cassana, born at Venice in 1659. He was surnamed NICOLLETTO. He studied under his father, and aided him in many of his works. He excelled as a painter of portraits. He visited the court of Tuscany, and earned great fame by his portraits of the grand duke and his wife. The Tuscan aristocracy, of course, followed the suit of the court, and had their illustrious faces limned by the favourite painter. He practised historical painting in the intervals of his more profitable labours. His large picture at Florence of the "Conspiracy of Catiline" is not without merit. He visited England, and had a great success. "Queen Anne's" refined features figured on his canvass, and her majesty bestowed great favour upon him. The British nobility also patronized him. But his career in England was not long. He died in 1713.—W. T.

CASSANDER, king of Macedonia, was born about 354 B.C. His father Antipater had Macedonia allotted to him on the division of the empire after the death of Alexander the Great. When Antipater died, B.C. 318, he appointed Polysperchon, one of the oldest of Alexander's captains, to succeed him. Cassander, enraged at his exclusion, repaired to Asia, and obtained assistance from Antigonus to enforce his claims upon the Macedonian throne. In the end Polysperchon was overthrown, and Olympias, the mother of Alexander, whom he had associated with himself in the government, was blockaded in Pydna by Cassander, and on the capitulation of the town, B.C. 315, was put to death through his agency, in express violation of the terms of surrender. He then, in the hope of strengthening his dominion, married Thessalonice, the half sister of Alexander the Great, and soon after founded the flourishing city of Cassandria in Pallene, and began the restoration of Thebes, which Alexander had destroyed. He formed an alliance with Ptolemy, Lysimachus, and Seleucus against Antigonus. Peace was concluded in 311 B.C., on condition that Cassander should be military governor of the European provinces till the son of Alexander by Roxana should attain his majority. But two years after this, both the young prince and his mother were put to death by his orders. Polysperchon then set up against him Hercules, the son of Alexander by Barsine, the daughter of Darius, but he agreed to put Hercules to death at the instigation of Cassander, and thus the line of Alexander the Great became totally extinct. Cassander now assumed the regal title as he had long enjoyed the power. He became a party to a new combination against Antigonus, who was signally defeated at Ipsus B.C. 301, and died of his wounds. But Cassander did not long survive the removal of his most formidable enemy, having died B.C. 296. He was succeeded by Philip, his eldest son.—J. T.

CASSANDER, GEORGE, a Roman catholic divine, born in Cadsand, near Bruges, in 1515. Distinguished as a scholar, he latterly devoted himself exclusively to theology, and to the endeavour to effect a reconciliation between his own church and protestantism. With this view he wrote, in 1562, his work "De officio viri pii," &c., which involved him in a controversy with Calvin. Afterwards encouraged as a mediator by the German princes, he published his "Consultatio Cassandri," in

which he reviews the Augsburg Confession, and suggests concessions that might be made by Rome. He died in 1566. His works were collected and published at Paris in 1616.—J. B.

CASSARD, JACQUES, a famous French naval officer, born at Nantes in 1672. He commanded a privateer, which inflicted considerable injury upon the English commerce, and performed several daring exploits, which obtained for him a wide celebrity in his native country, but were not productive of any permanent benefit to his own interests. After the peace of Utrecht, when his services were no longer required, he was completely neglected by the French court, and died in great poverty in 1740, having been confined for the last twenty-one years of his life in the fortress of Ham.—J. T.

CASSAS, LOUIS FRANÇOIS, a French painter and architect, born in 1756; died in 1827. He published several illustrated works of travel, particularly "Voyages pittoresques de la Syrie, de la Phénicie, de la Palestine, de la basse Egypte," 1799, remarkable for its plans and views of Palmyra and Baalbek; and "Pictorial Sketches of the principal Sites and Monuments of Greece, Sicily, and Rome."

\* CASSEBEER, JOHANN HEINRICH, a German botanist, celebrated for his work "Ueber die Entwicklung der Laubmoose," published at Frankfort-on-the-Maine in 1823. A genus *Cassebeera* is named after him.—J. H. B.

CASSERIO, JULIUS, a celebrated Italian anatomist, born in 1545, and surnamed PLACENTINUS from Placentia the place of his birth. He was originally a servant in the family of Fabricius de Aquapendente, of Padua, who, having marked his great talents, gave him instructions in anatomy, in which he soon made astonishing progress. Fabricius was proud of his accomplished pupil, and frequently employed him as his substitute in giving public lectures; and when, in 1604, his advanced age compelled him to resign his professorship, the Venetian senate appointed Casserio his successor. The minuteness and accuracy of his dissections enabled him to make many valuable discoveries, especially regarding the organ of hearing, which have immortalized his name. He died in 1616. His great work on anatomy, consisting of ninety-seven folio plates, representing all the parts of the human body, was not published till some years after his death.—J. T.

CASSIANI, GIULIANO, an Italian poet, born at Modena in 1712. Having been elected professor of poetry in the college for the nobility of his native state, he devoted his time entirely to poetical composition. He ranks amongst the first lyric poets of Italy, and every lover of Italian poetry is acquainted with his inimitable sonnet, "Il Ratto di Proserpina." Francis, duke of Modena, appointed him professor of eloquence in the university, intrusting him at the same time with the lucrative office of ducal historiographer. Cassiani's poetical and prose works have been published by his favourite pupil, Marquis Girolamo Luccesini. He died in 1778.—A. C. M.

CASSIEN, JEAN, born about 350; died about 443. The place of his birth is doubtful, some statements making him the native of a Greek city on the Black Sea. The authors of *L'Histoire littéraire de la France* describe him as descended from a distinguished French family. Marseilles is said to have been his birthplace. However this be, at Marseilles he chiefly resided; he wrote all his works there; he founded in that city his famous abbey of St. Victor, and there he died. Pilgrimages were the passion of the period in which he lived, and Cassien, with his friend, Germain, visited, first Bethlehem, and then the Thebaid. On his return he was ordained deacon at Constantinople by St. Chrysostom, and soon afterwards is said to have obtained priest's orders at Marseilles. At Marseilles he founded two monasteries—one of men, the other of females. In the first there were subject to his rule as many as five thousand monks. Cassien's chief works are his "Monastic Institutions," and his "Twenty-four Conferences of the Fathers of the Desert"—they were translated into French by Nicolas Fontaine. Another work of Cassien's is "A Treatise on the Incarnation," written at the request of Pope Celestine against Nestorius.—J. A., D.

CASSINI, the name of a family originally of Italy, but naturalized in France since the time of Louis XIV., all the representatives of which, with one exception, have attained eminence as astronomers. We notice:—

CASSINI, JEAN DOMINIQUE, a celebrated astronomer, was born at Périnaldo in the county of Nice in 1625. His studies, commenced under an able schoolmaster, were continued among

the jesuits at Genoa; and a love of literature then manifested itself, which he retained through life. His attention was called to astronomy by means of the study of astrology, which he prosecuted for a short time with much interest, and he is said to have made, in accordance with its rules, several predictions which the event fulfilled. But he soon discerned the emptiness of its pretensions, and relinquished it for the more reliable investigations of astronomy. His progress in this science was so rapid, that in 1650, at the age of twenty-five years, he was chosen by the senate of Bologna to fill the chair of astronomy in the university of that town, vacant by the death of the famous mathematician, Cavalieri. While occupying this position, he performed what was considered a very difficult achievement, the tracing of a meridian in the church of the Petrone, and was employed by the senate to design and execute some works connected with the embanking of the Po. He also undertook the fortification of Urbino and Perugia, and was besides intrusted with some important negotiations with the Roman and Tuscan governments, relative to the courses of the Po and Chiana. In 1665, while residing at Città della Pieve in Tuscany, he discovered the shadows cast upon the planet Jupiter by his satellites, and made use of the discovery to amend the theory of satellite motion. He also discovered about the same time, by means of the fixed spots on Jupiter, Mars, and Venus, the times of rotation of these planets, which he determined to be respectively, 9 h. 55 m., 24 h. 40 m., and about 24½ hours. In 1684, while residing in France, where he had been naturalized in 1673, he discovered four of the satellites of Saturn, in addition to the one which was previously known through the discovery of Huygens. He investigated the zodiacal light, and gave an exact description of its form and position; and he was the first to announce the inclination of the moon's axis. The laws of its apparent variation, which he announced with considerable precision, constitute one of his finest discoveries. He was one of the principal projectors of the Cayenne expedition, which resulted in the disclosure of the fact, that gravity diminishes from the poles to the equator. In 1668 he published tables of the motions of Jupiter's satellites, a work of immense labour, and performed with great exactness, considering the state of astronomical science at the time. A revised edition appeared in 1693. In 1700 he completed the measurement of an arc of the meridian extending from some distance south of Paris to Roussillon, part of which had been previously measured by Picard and Lahire. He died in 1712.

CASSINI, JACQUES, son of the preceding, was born at Paris in 1677, and admitted a member of the Academy of Sciences in 1694. He travelled successively in Italy, Holland, and England, where he made the acquaintance of Newton, Halley, and Flamsteed, and was admitted a member of the Royal Society of London in 1696. On his return to Paris he prepared a number of scientific papers for the Academy; and in 1717 presented to this society his great work "On the Inclination of the plane of the ring, and orbits of the satellites, of the planet Saturn." But he is best known by his terrestrial measurements. He had assisted his father in 1701 in extending an arc of the meridian to Canigou. In 1718 he carried it on to Dunkirk, and published his work "On the Size and Figure of the Earth," Paris, 1720. He was then intrusted by the Academy with the measurement of an arc of longitude extending across the whole kingdom of France, from Brest to Strasbourg. Cassini also published "Astronomical Tables of the Sun, Moon, Planets, Stars, and Satellites," Paris, 1740, which for a long time ranked among the best. A supplement was added to this work by his son in 1756. Jacques Cassini died at Thury in 1756.

CASSINI DE THURY, CESAR FRANÇOIS, son of the preceding, was born in 1714, and at the age of twenty-two was received into the Academy of Sciences. The great work of his life was a trigonometrical survey of France, the expense of which was borne by government till 1756, after which time it was chiefly sustained by private enterprise. The results were published from time to time in the form of large charts on a scale of a line to 100 toises, and the whole were capable of being united in one large chart 33 feet high and 34 broad. The positions of all the towns are determined in it, with reference to the meridian of Paris, and a perpendicular to it passing through Paris. The publication of this magnificent work effected a complete revolution in geography, and it has served as a model for many subsequent undertakings. Cassini de Thury died of small-pox in 1784, having lived to see his work almost completed.

CASSINI, ALEXANDRE HENRI GABRIEL DE, a descendant of the preceding, was born in 1781, his father being director of the Paris observatory. He had no taste for the pursuits in which his ancestors had distinguished themselves, but devoted himself to botany, and made extensive researches in the department of synantherous plants. His excessive multiplication of genera prevented his nomenclature from being generally followed. He was the author of numerous botanical articles in the *Journal de Physique*, the principal of which he collected and published under the title of "Opusculs Phytologiques;" Paris, 1826. He was also one of the most active editors of the *Magasin Encyclopédique*, and of the *Dictionnaire des Sciences Naturelles*. Having commenced the study of law in 1804, he was in 1810 appointed juge au tribunal de première instance, afterwards became a member of the court of cassation, and in 1830 was admitted to the chamber of peers. He died of cholera in 1832, having been a member of the Academy of Sciences since 1827.—J. D. E.

CASSIODORUS, MAGNUS AURELIUS, a distinguished statesman, historian, and man of letters, who enjoyed the confidence of Theodoric the Great, and was for a long series of years at the head of the government of the Ostrogothic kingdom, was born at Sylacium in Bruttium, about A.D. 468, his father being the representative of an ancient and wealthy Roman family. At the age of seventy he retired to the monastery of Viviers, in Calabria, where he died, almost a centenarian, leaving the following works, a complete edition of which was published by D. Garet at Rouen in 1679:—"Chronicon;" "De artibus ac disciplinis Liberalium Literarum;" "De Institutione Divinarum Literarum;" a few other treatises, and twelve books of his letters (state papers), written in accordance with the instructions of Theodoric and his successors.—J. S., G.

CASSIUS, the name of one of the most illustrious of the Roman gentes, originally patrician, afterwards plebeian. The more distinguished members of this gens follow in chronological order:—

CASSIUS VISCCELLINUS, SPURIUS, thrice consul; first in 502 B.C., when he defeated the Sabines at Cures; again in 493, when he concluded a treaty with the Latins; and lastly in 486, when he made a league with the Hernicans, and carried the first agrarian law, the *lex Cassia*, in spite of the bitter opposition of the patrician order, of which he was a member. The provisions of this law were never carried into execution; for its author was accused of treason by the patricians, and condemned to death immediately on resigning his office in 485 B.C.

CASSIUS LONGINUS, CAIUS, elected consul with P. L. Crassus in 171 B.C., obtained as his province Italy and Cisalpine Gaul. Desiring to engage in the war in Macedonia, he endeavoured to penetrate thither through Illyricum, but, being prohibited after a time by the senate, he desisted and returned to Italy. In 170 B.C. he was accused by ambassadors from various tribes before the senate for his conduct during the war, but escaped with a reproof. When censor in 152 B.C., along with his colleague Valerius Messala, he erected a theatre. It was demolished by the senate at the instance of Scipio Nasica, on the plea of its injuriousness to public morals. The date of his death is uncertain.

CASSIUS LONGINUS RAVILLA, LUCIUS, the son of Q. Cassius Longinus, a Roman of consular rank. In 137 B.C., when tribune of the Plebs, he passed the second *lex tabellaria*, extending the use of the ballot. In 127 B.C. he was elected consul along with Cornelius Cinna, and in 125 B.C. censor along with Cn. Servilius Cæpio. In his judicial capacity he was noted for severity and uprightness.

CASSIUS LONGINUS, LUCIUS, consul along with C. Marius 107 B.C.; died that year fighting against the Tigurini. While prætor in 111 B.C., he went as ambassador to Numidia, and returned bringing with him the celebrated Jugurtha.

CASSIUS LONGINUS, CAIUS, one of the leaders of the conspiracy against Cæsar. Nothing is known of his history until the expedition of Crassus against the Parthians B.C. 53, when he acted as quæstor, and succeeded in rescuing about five hundred horse, the only remnant of the army that escaped destruction. He afterwards defeated the victorious Parthians when they laid siege to Antioch, and compelled them to abandon Syria. During the civil war between Cæsar and Pompey, Cassius attached himself to the aristocratic faction, and commanded the fleet of Pompey in the Hellespont. After the battle of Pharsalia B.C. 48, he fell in with Cæsar, who had only a single vessel with him, and might easily have taken him prisoner; but for reasons which

have never been explained he at once obeyed the summons of the victorious general to surrender, and passed over to his side. History is silent concerning Cassius from this time until the period of the conspiracy against Cæsar. He was the main-spring of the plot, and was evidently actuated by strong personal as well as party dislike to the great dictator, and it was he who succeeded in drawing into the confederacy Brutus, whose sister Junia he had married. After the murder of Cæsar, Cassius was deprived of the command of Syria through the agency of Antony; and, on receiving this intelligence, he immediately collected an army and made himself master of Syria, Phœnicia, and Judea. But he was recalled to Europe by Brutus for the purpose of resisting the triumvirs.—(See BRUTUS.) At the battle of Philippi, which was fought against his advice, the left wing which he commanded was defeated by Antony, and thinking all was lost he committed suicide. He was certainly an able man, and one of the best generals of his age. But he was jealous and morose, and much better fitted for a conspirator than Brutus.—J. T.

CASSIUS LONGINUS, QUINTUS, first cousin of the preceding, went as quæstor of Pompey into Spain in 54 B.C., and became infamous in the province for rapacity and cruelty. By the year 49, when he was tribune of the Plebs, he had deserted the interests of Pompey, and espoused those of Cæsar, whom, on being expelled from Rome as a too zealous partisan, he accompanied into Spain. After the defeat of Afranius and Petreius, the legates of Pompey, Cassius received from Cæsar the governorship of Farther Spain. Escaping the twofold peril of a popular insurrection and a mutiny of the soldiery, he left the province in 47, but his ship sank, and he was lost in the mouth of the Iberus.—J. S., G.

CASSIUS PARMENSIS, TITUS, so called from Parma his birth-place, a poet and one of the murderers of Cæsar, fought against the triumvirs, and after the defeat of Brutus and Cassius joined Pompey with a fleet off Sicily. He afterwards followed the fortunes of Antony. After the battle of Actium he went to Athens, where he was put to death by command of Octavian B.C. 30. Cassius was the author of two tragedies, "Thyestes" and "Brutus," and of some epigrams and other poetical pieces.

CASSIUS LONGINUS, CARUS, a famous jurist, who flourished in the reigns of Claudius and Nero. He traced his descent on the mother's side to the lawyer Servius Sulpicius, and was connected on the other with the family of Cassius the conspirator. We hear of him first on occasion of his being commissioned as governor of Syria, to lead to the banks of the Euphrates, Meherdates, whom the Parthians had chosen as their king, A.D. 49. Peace prevailed during his tenure of office, and left more room for the display of his legal than his military talents. On his return to Rome he was regarded as an authority among her statesmen, and his aid was called for on various emergencies; but his growing reputation, wealth, and independence of character, brought upon him the enmity and persecution of a jealous court. The detection of Piso's conspiracy served to intensify the tyranny to which he at last fell a victim. After the death of Poppæa he was prohibited from attending her funeral—a sign, says Tacitus, of his approaching doom. There stood among his ancestral images a statue of C. Cassius, with the inscription "Dux Partium," graven on its pedestal. This inscription was made the ground of a capital charge, and by a decree of the senate he was exiled, as one of the "suspect" (A.D. 65), to the island of Sardinia. His name does not again appear in history; but we learn that he was in his old age recalled from banishment by Vespasian. He wrote ten books. "De Jure Civili," and his commentaries on Vitellius and Ferox are referred to in the *Digest*. In law he was an adherent of the school of Capito, and transmitted the name of Cassiani to those who followed in the same track.—J. N.

CASSIUS, AVIDIUS, an able general of Marcus Aurelius, was a native of Cyrrhus in Syria. His father, Heliodorus, who was præfect of Egypt, enjoyed great reputation as a rhetorician. In the Parthian war, A.D. 162–165, Avidius served under Verus, and, after defeating the Parthians, took Seleucia and Ctesiphon. He also fought against the Sarmatians on the Danube. He was subsequently appointed governor of Syria, and in 170 suppressed an alarming insurrection of banditti. A few years after, A.D. 175, he took up arms against the emperor Marcus Aurelius, and proclaimed himself imperator in the East. He reigned only a few months, and was assassinated by two of his

own officers before M. Aurelius, who had marched against him, and who acted with great moderation in the affair, arrived in the East. The humane emperor lamented his death, and spared the lives of his family.—J. T.

CASSIUS CHÆREA. See CHÆREA.

CASSIUS DION. See DION.

CASSIUS, ANDREW, a German physician of considerable celebrity, was born at Schleswig. His father, who was physician to the duke of Holstein, was the inventor of a kind of bezoard which he regarded as an infallible remedy against the plague. The younger Cassius was the discoverer of the chemical substance which forms the rose and violet colours on china, called from him the purple of cassius. It is prepared by adding the hydrochlorate of the protoxide of tin to a solution of the hydrochlorate of gold. Cassius wrote a treatise entitled "De triumphu intestinali cum suis effervescentiis," which has been frequently reprinted; and another concerning the nature, production, and effects of gold, and its fitness for works of art, 8vo, Hamburg, 1685.—J. T.

CASSIVELAUNUS or CASSIBELAN, a British prince, who at the time of Julius Cæsar's invasion of England ruled over the country north of the Thames, and was chosen commander-in-chief of the confederated tribes which made common cause against the invaders. He had a high reputation for skill and bravery, and repeatedly baffled the attacks of the Roman legions, but was in the end deserted by his allies, and compelled to submit to the terms dictated by Cæsar.—J. T.

CASTAGNO, ANDREA DEL, sometimes called THE INFAMOUS, was born at Castagno in the Mugello in Tuscany about 1406. His works are not numerous, and little is known of his education; but he is remarkable as being the first Florentine who adopted the new method of painting commonly called *oil painting*, but which is literally varnish painting, and it is very doubtful whether any oil whatever entered into the vehicle used by the Van Eycks and their school. (See VAN EYCK.) It was the mode in which Andrea acquired this secret that procured him his surname of the Infamous after his death. About the year 1460 Domenico Veneziano, who had learnt the new method of Antonello da Messina, was engaged with Andrea del Castagno at Florence, to execute some paintings in the Portinari chapel in Santa Maria Nuova, when the greater sensation caused by the superior brilliance of the pictures of Domenico excited the envy of Andrea, who, according to Vasari, insinuated himself into the confidence of Domenico, acquired his secret from him, and then waylaying him on one occasion as he returned in the evening from his work in the Portinari chapel, struck him on the head with a piece of lead, and returned immediately to the chapel, whence he was called out shortly afterwards to his wounded friend Domenico, who died in the arms of his treacherous companion. This was about the year 1463. The story rests entirely on the recorded confession of Andrea; it was, however, never contradicted. The paintings of the Portinari chapel have perished. Up to this time the works of Andrea were exclusively in fresco and tempera, and the pictures by him preserved in the Florentine academy are in this method. He must have been nearly sixty years of age before he commenced oil painting. During his lifetime Andrea had acquired the name of Andrea degli Impiccati, or of the *Hanged*, instead of his original name del Castagno, from the pictures of the Pazzi and other conspirators concerned in the murder of Giuliano de' Medici, whom he represented in 1478 on the wall of the Podestà of Florence—a fresco which has long since perished. The conspirators were represented hanging with their heads downwards; it was considered Andrea's best work. His drawing was good for the time, but his lines are hard and his figures ugly. There are works by him still remaining at the monasteries of San Giuliano and Degli Angeli at Florence, and at Legnaia; there are also four in the Florentine academy, and a work by him was bought for the nation in the Lombardi collection lately purchased. The date of his death is not known, but it is supposed to have been shortly after 1480.—(Vasari, *Vite dei Pittori*, &c., ed. Le Monnier.)—R. N. W.

CASTALDI, CORNELIUS, an Italian poet and lawyer, was born in 1480, and died in 1536. He studied at Padua, where he founded a college. He was the friend of many of the most eminent scholars of his day. His poetical works were published in 1757, under the title of "Poese Volgari e Latine." His Latin poems have been preferred to those written in his native tongue.

CASTALIO or CHASTEILLON, SEBASTIAN: the place of his birth is uncertain. In his epitaph he is said to be ALLOBROX, which might mean of Savoy or the Dauphiné. He was probably born in the latter country in 1515. He was a man of brilliant learning, but questionable theology. He studied first at Lyons. He afterwards lived at Geneva. Here he incurred the hostility of Calvin by doubting the inspiration of Solomon's Song, refusing subscription to the article in the Genevan Catechism on the Descent into Hell, and to the views of Calvin on election and predestination. In 1553 he was nominated professor of Greek at Basle. In 1551 he published a version of the Old and New Testaments in Latin, with annotations, dedicated to King Edward VI. Beza and the Calvinists charged him with the errors of Pelagius; and others have openly accused him of rationalism. He died at Basle in 1563. He edited Homer, Xenophon, and Herodotus; German Theology, 1557; and Thomas à Kempis, 1563. Scaliger says that he died of actual want. Montaigne in his essays tenderly alludes to this circumstance.

CASTANHEDA, FERNANDO LOPEZ DE, a Portuguese historian, from whose history of the discovery and conquest of India by the Portuguese, Camoens borrowed the greater part of his materials for the *Lusiad*, died in 1559. The history, which is singularly trustworthy, appeared in 1551.

CASTANOS, DON FRANCIS XAVIER DE, Duke de Baylen, the most distinguished Spanish general in the peninsular war, was born about 1756. He was descended from an eminent Biscayan family, and was a pupil of General Count O'Reilly, whom he accompanied to Germany, where he studied military tactics in the school of Frederick the Great. He attained the rank of lieutenant-general in 1798, and when Napoleon seized upon Spain in 1808, Castaños was appointed to the command of a division of the Spanish army on the frontiers of Andalusia, and defeated a French force under Dupont in the important battle of Baylen (July 22, 1807), which had the effect of driving Joseph Bonaparte from Madrid. But in November of the same year he was routed by the French at Tudela. In 1811 he was appointed by the regency commander of the fourth corps of the army, and was present at the battles of Albuera, Salamanca, and Vittoria. After the return of Ferdinand VII. he was nominated captain-general of Catalonia, and in 1815 commanded the Spanish force which invaded France in conjunction with the British army under Wellington. He resigned his office in 1816. Though a member of the moderate party, and a zealous supporter of Ferdinand, he opposed the changes made on the right of succession to the crown in 1833, and retired into private life till 1843, when, on the downfall of Espartero, he accepted the office of tutor to the young Queen Isabella. Castaños died 24th September, 1852, at the age of ninety-six, only ten days after the decease of the duke of Wellington.—J. T.

CASTEL, LOUIS BERTRAND, a French mathematician and physician, belonging to the order of the jesuits, was born at Montpellier in 1688. He came to Paris in 1720, on the invitation of Fontenelle and Tournamine, became a contributor to the *Journal de Trevoux* and the *Mercury*, and published a considerable number of scientific treatises, several of which attracted a great deal of attention. His principal works are a "Treatise on Universal Gravity;" an "Abridged System of Mathematics;" a "Universal System of Mathematics," which gained him admission into the Royal Society of London; his "Clavecin Oculaire," or Ocular Harpsichord, which at one time excited great attention, but is now forgotten; and his "True System of General Physics," in which he highly eulogizes Newton, but opposes his philosophy. Castel died in 1757.—J. T.

CASTEL, RENÉ LOUIS RICHARD, a French poet and naturalist, born at Vire, 6th October, 1758. He sat in the legislative assembly, but his bent was decidedly towards natural history, which at first took a poetic form. His poem, descriptive of plants, published in 1797, was very successful. Inspiring himself with the Georgics, he wrote another poem descriptive of Fontainebleau. Appointed inspector-general of the university by Napoleon, he was dismissed by the Bourbons, when he turned his attention seriously to the study of natural history, taking for the chief subject of observation, fishes, on which he wrote largely. He died in 1832.—J. F. C.

CASTELA, HENRI, a French traveller, a native of Toulouse, who visited Palestine and Egypt about the beginning of the seventeenth century, and published an account of his travels, with the title of "Saint Voyage de Jerusalem et du Mont Sinai,

en l'an du grand jubilé, 1600;" Bordeaux, 1603. He was the author of a "Guide to the Holy Land."—J. T.

CASTELL, EDMUND, an oriental scholar, the industrious compiler of the "Lexicon Heptaglotton," a dictionary of seven languages, was born at Hatley, Cambridgeshire, in 1606. His great work cost him seventeen years' labour and an outlay of £12,000, absorbing his whole fortune, and reducing him to poverty. In 1669 he published his Lexicon, but the sale of the work in no way repaid the labour and expense it had cost him. In 1666 he was made Arabic professor at Cambridge, and two years later a prebendary of Canterbury. He received various other ecclesiastical preferments. Dr. Walton was much indebted to him in the preparation of the Polyglot Bible. His oriental MSS. were bequeathed by him to the university of Cambridge. Died in 1685.—J. B.

CASTELLANE, ESPRIT VICTOR-E.-B., Count de, marshal of France, was born in 1788. He entered the army in 1804 as a private soldier, and rose rapidly in the service, having gained the confidence of Napoleon, both by the courage and skill which he displayed in the Spanish, German, and Russian campaigns, and by the fidelity with which he discharged various missions intrusted to him. He served faithfully the various governments which have successively arisen in France since the downfall of Napoleon, and after the revolution of 1848 he contributed greatly to establish order and tranquillity in the district of Rouen, where he had held an important command. He was nominated a senator in 1852, and received at the same time a marshal's baton from Napoleon III. He died in 1862.—J. T.

CASTELLANUS. See DUCHATEL.

CASTELLES, ADRIAN, an Italian prelate, whose writings are remarkable for their elegant Latinity, lived in the first half of the sixteenth century. In 1503, being then on a mission to Henry VII., he was created bishop of Hereford, and the year following translated to the diocese of Bath and Wells. On his return to Italy, Pope Alexander VI., in many of whose crimes he is said to have participated, raised him to the rank of cardinal. Under the pontificate of Leo X. he was outlawed as a traitor.

CASTELLI, BENEDICT, an Italian mathematician and physician, was born at Brescia in 1577. He was one of the most celebrated pupils of Galileo, whom he assisted in his astronomical observations, and whose hydrostatical theories he defended in a treatise entitled "Risposta alle opposizioni," &c., Florence, 1615. From this date until 1623 he occupied the mathematical chair at Pisa, and then removed to Rome on the invitation of Pope Urban VIII., and was made mathematical professor in the college Della Sapienza. He was the first who applied the new theory of motion to hydraulics, and wrote a treatise on the subject entitled "Della Mesura dell' Acque Correnti," Rome, 1638. But he fell into a mistake in supposing that the velocity of issuing fluids is proportional to the height of the reservoir, instead of the square root of the height. He was often consulted respecting the best means of introducing water into cities, and was successful in draining the stagnant waters of the Arno. He died in 1644.—J. T.

\* CASTELLI, IGNAZ FRIEDRICH, a prolific German dramatist, was born at Vienna, May 6th, 1781. He held several subordinate situations in the administrative service, but since 1840 lives retired from office in an elegant cottage near Lilienfeld, in one of the most picturesque valleys of Austria. He was for a long time one of the chief representatives of literature and belles-lettres in Austria, and has written upwards of one hundred dramatic pieces, all of which are distinguished by great good humour and naïveté. He has also published a great number of poems, chiefly in the Austrian dialect, tales, sketches, and anecdotes. His complete works appeared at Vienna in fifteen volumes (second edition), 1848.—K. E.

CASTELLI, PIETRO, an Italian physician and botanist, was born at Messina, and died in 1657. He studied medicine at Rome. He instituted the botanic garden at Messina, and became the first director of it. He published some works under the cognomen of Aldinus. Among his writings may be noticed—a treatise on hellebore; on the plants in the Farnesian garden at Rome; on the garden of Messina; on opobalsamum; on smilax aspera; catalogue of the plants of Etna; on the aphorisms of Hippocrates; on emetics; besides medical treatises.—J. H. B.

CASTELLI or CASTELLO, BERNARDO, this painter was born at Genoa in 1557. He was a pupil of Andrea Semini, and subsequently followed the manner of Luca Cambiaso. He pos-

sessed considerable talent, but not so much judgment. He was industrious and rapid, but did not, or perhaps could not, bestow much thought upon his work. But his name will live. He was the intimate of Tasso, for whose Jerusalem he made the original designs, engraved by Agostino Carracci. Other poets of note called him friend, and so he gets embalmment in their verses. He painted miniatures also, and is praised by Marino the poet, for his delineations of insect life. His works are possessed by Genoa and Rome. He died in 1629.—W. T.

CASTELLI or CASTELLO, GIOVANNI BATTISTA, called IL BERGAMASCO: this painter was born in Gaudino, in the Valla Seriona in the Bergamese in 1500. He was a pupil of Aurelio Bussi of Crema, whom he accompanied to Genoa. On the departure of his preceptor from the city, Castelli, thrown entirely upon his own resources, attracted the attention of a Genoese nobleman, who sent him to Rome to study the great masters, and perfect himself in all the branches of his art. He did credit to his patron, and returned a proficient in architecture, sculpture, and painting. His first work on his return was the decoration of the palace of his patron. He painted the frescos in the church of St. Marcellino and the monastery of St. Sebastiano. Soon afterwards he was employed, in conjunction with Cambiaso, in the Nunziata di Portoria, where, on the ceiling of the choir, he painted "Christ at the Judgment receiving the Elect," a work dazzling in its golden effects of light. Cambiaso painted the laterals, being "The final dooms of the Blessed and the Cursed." Castelli fairly eclipsed his rival by the strength of his composition, the magnificence of his colour, and the grandeur of his style, approaching the glory of Giulio Romano, and hinting already the coming of the art-god Raffaele. He also painted subjects from the Iliad in the saloon of the Lanzi palace at Goro. He was not sufficiently appreciated, or was not satisfied with his appreciation in Italy; for he afterwards journeyed to Spain, and was appointed painter to the court of Charles V., for whom he adorned the palace of the Pardo with subjects from Ovid. He died at Madrid in 1570.—W. T.

CASTELLI or CASTELLO, VALERIO, the son of Bernardo, was born at Genoa in 1625. He was a pupil in the school of Domenico Fiasella, but his education was chiefly derived from his study of the works of Procaccini at Milan, and Coreggio at Parma. His colour is noted for its vigour and harmony, and his composition for its freedom and life. He earned a reputation for battle pieces and historical pieces, in the style of Tintoretto and Veronese. His fresco paintings came near to Carloni. He decorated the cupola of the church of the Annunciation at Genoa, a very important work. He painted the "Conversion of St. Paul" at the Franciscan's, and the "Descent of the Holy Ghost" at the Augustine's. He died in 1659. Several of his smaller works are in English collections.—W. T.

CASTELLO, GABRIEL LANCELOT, a distinguished Sicilian antiquary, born at Palermo in 1727, author of an elaborate work on the "History and Antiquities of Halesa," a colony of Niconia, which was swallowed up by an earthquake in 828, and of "Siciliæ Populorum et Urbium, Regum quoque et Tyrannorum, veteres nummi Saracenorum epocham antecedentes." Castello died in 1794.—J. T.

CASTELLOZE, DAME DE. This lady was a troubadour who lived in the thirteenth century. She was born at Auvergne, and married a noble who bore the name of Truc de Mairona. Armand de Bréon was admired by the lady of Castelloze, and appears not to have returned her passion with the ardour she expected. She can only be described in the dialect of her own day—"Era una domna mout gaia, mout ensegnada, et mout bella." The attribute of "mout ensegnada" expresses that she possessed all the accomplishments which were fashionable in her day. Three of her chansons remain; they are highly praised by the antiquarians who have succeeded in accustoming their ears to the versification of such pieces, and who are skillful enough to detect more meaning in them than they convey to us.—J. A., D.

CASTELNAU, JACQUES DE CASTELNAU-MAUVISSIERE, Marquis de, marshal of France, grandson of Michel, born in 1620; died in 1658. His first campaign was in Holland, where he fell into an ambuscade, and was carried prisoner to Cambrai, but contrived to make his escape. He was severely wounded at Friburg in 1644; and next year, at the battle of Nordlingen, where the imperial general, Mercy, was slain, Castelnau had two horses killed under him, and received no fewer than six wounds from musket balls. His distinguished bravery pro-

cured him the appointment of major-general from the king. In 1646 he was present at the siege of Mardick, where he was again wounded, and the following year at the siege of Dunkirk. In 1650 he attained the rank of lieutenant-general, and took part in the campaign of Guienne. In 1653 he served under Turenne; and in 1656 commanded the French army in Flanders during the absence of that famous general. After the battle of Dunes in 1658, where he routed the Spanish cavalry, Castelnau was mortally wounded in an attack upon the fort of Leon, and died at Calais, two days after the king had sent him the baton of marshal of France.—J. T.

CASTELNAU, MICHEL DE, Sieur de la Mauvissiere, a celebrated French ambassador and soldier, was born about 1520. He received a good education, and made rapid progress in literature and science. After completing his studies he entered the army, and soon acquired a high reputation for courage and skill in the war between France and Spain. He next entered the navy, and held a command under the grand-prior of France, Francis of Lorraine. His behaviour gained the confidence of the cardinal of Lorraine, who intrusted him with several important missions. The king sent him into Scotland with Mary Stuart, the affianced bride of the dauphin, and afterwards into England for the purpose of conciliating Queen Elizabeth, whom he persuaded not to insist on the restoration of Calais. This successful embassy was followed by various other missions to Germany, the Low Countries, Savoy, and at last to Rome, where Castelnau assisted in procuring the election of Pope Pius IV. On his return to France he re-entered the naval service, in order to serve under his former patron, the grand-prior of France; and it was he who first discovered the Amboise conspiracy. After the death of Francis II. Castelnau accompanied Queen Mary to Scotland, and fought for her cause against her insurgent protestant subjects. He was a judicious and zealous friend of that unfortunate princess, and paid several visits to the English court with the view of effecting a reconciliation between Mary and her rival Elizabeth. The civil war having broken out in France in 1562, Castelnau returned home, and embraced the Roman catholic side, but acted with great moderation. He was present at the battles of Dreux, Jarnac, and Moncontour, and in various ways rendered important services to his party. In 1572 he was intrusted with several missions to England, Germany, and Switzerland; and in 1574 he was sent by Henry III. as his ambassador to the English court, where he continued to reside for two years. When Henry IV. ascended the throne he treated Castelnau, in spite of his former support of the Romish league, with great regard, and intrusted him with various confidential missions. Castelnau died in 1592. His "Memoirs," published in 1731, in three vols. folio, were composed during his residence at the English court. They are of great value to the historian.—J. T.

CASTELNAU, PIERRE, a Cistercian monk of the convent of Fontfroide, near Narbonne, who was invested by Innocent III. with the title of legate, and, along with two other monks of the same convent, sent against the Albigenses, commissioned to exterminate the heretics by fire and sword. Raymond VI. of Toulouse opposed to the fury of the legate a cool determination to protect the lives of his subjects, which so irritated Castelnau that he excommunicated the count. This bold measure a gentleman of the count's retinue resented by following the legate to some distance from Toulouse, and, after a short preliminary dispute, stabbing him with his poniard (1208).—J. S., G.

CASTELVETRO, LUDOVICO, an Italian critic and miscellaneous writer, born of a noble family at Modena in 1505. He studied with distinction at Bologna, Parma, Siena, and Padua, and at the conclusion of his university career was offered a bishopric, which his determination to devote himself exclusively to study prevented him from accepting. His acquaintance with the structure of his native tongue was reputed unequalled, and he was recognized throughout Italy as the supreme authority on all philological questions. This flattering recognition of his scholarly attainments, as appeared in his famous controversy with Annibale Caro about one of his sonnets, had a pernicious effect on his temper, which was originally none of the best. The literary squabble of these two eminent men had unfortunate consequences for Castelvetro, who, it is said, was accused by his opponent of atheism, and obliged to save himself from the fangs of the inquisition by a timely flight. During his exile he wrote his corrections of Varchi's Ercolano, and an admirable version of Aristotle's Poetics. He died at Chiavenna in 1571.—A. C. M.

VOL. I.

CASTI, GIAN BATTISTA, an Italian poet, born at Prato or at Montefiascone, was educated at the seminary of the latter place. In his sixteenth year he obtained a professorship of belles-lettres, and a few years later was appointed to a canonry, which, after the success of his first poetical publication had opened up to him a more congenial line of life, he resigned. He afterwards lived a gay and somewhat profligate life at various courts, residing for a number of years at Vienna, where he was honoured with the laureateship. His principal works are—"Novelle Galanti;" a satire on the court of Catherine II. of Russia; five dramas in the manner of Metastasio; and "Gli Animai Parlanti." He died at Paris in 1803.—A. C. M.

CASTIGLIONE, BALDASSARE, a distinguished Italian statesman and author, born of a noble family in the duchy of Mantua in 1478. He was related by his mother's side to the ducal family of Gonzaga, and was educated under the direction of the two most eminent scholars of the period, Merula and Calecondilo. Having embraced a military career, he served under Ludovico Sforza, then under his relative Gonzaga, and afterwards under the duke of Urbino, by whom he was sent as ambassador to Henry VIII. of England. Returning to Urbino, he was raised to the dignity of count, and on the accession of Leo X. to the papedom, despatched as ambassador to Rome, where his diplomatic talents procured him the favour and confidence of Leo and his successor, Clement. He was frequently employed by the latter pontiff in negotiations with Charles V., at whose court he was for some time resident, and whose favour he so conciliated as to be appointed to a bishopric, and raised to the rank of a Spanish grandee. Having fallen under a suspicion of venality during his residence at Madrid, he did not return to Rome, but occupied himself in voluntary exile with his famous work, "Il Cortigiano." He died at Toledo in 1529, leaving a variety of poetical compositions, and a most interesting collection of letters.—A. C. M.

\* CASTIGLIONE, CARLO OTTAVIANO, Count of, an eminent Italian numismatist and linguist, was born of a patrician family at Milan towards the end of the eighteenth century. In 1819 he published a volume entitled "Monete Cufiche dell' I. R. Museo di Milano," which at once established his fame as an antiquarian. With the assistance of the celebrated Angelo Maio, he also published in 1817 the fragments of Ulphilas, lately discovered by Maio in the Ambrosian library. He has since given to the world various works of biblical criticism.—A. C. M.

CASTIGLIONE, GIOVANNI BENEDETTO, called GRECHETTO, a distinguished Genoese painter, born in 1616. He studied under Battista Paggi, and afterwards in the school of Giovanni Andrea de Ferrari. But probably his best art-education was derived from the instruction and friendship of Vandyck, who was at that time visiting Genoa, and who is reputed to have taken the student by the hand and encouraged him in every way in the practice of his art. He painted almost every branch of subject—history, animal, landscape, portrait. His rural subjects were his most successful, and so probably the most congenial to his own tastes. His groups of animals, cattle caravans, shepherds and flocks, are accounted to be unsurpassed for truth, colour, and correctness of drawing. His manner is marked by a certain proneness to red in his tones. His landscapes were also singularly felicitous. But his higher style of works is noteworthy. His "Nativity," "Magdalene," and "St. Catherine," at Genoa, are very highly esteemed. He visited Rome, Naples, Florence, Parma, and Venice; found liberal patrons, such as Sacredo, the Venetian senator, and the duke of Mantua, and yet contrived to die poor in 1670. The etchings of this artist are also remarkable. He left about seventy plates, distinguished by their vigorous and tasteful execution. Some in their free effects of light approach the power of Rembrandt. Among his principal works are—"The Animals entering the Ark," "Rachel hiding her Father's Gods," "The Angel appearing to Joseph," "The Nativity," "The flight into Egypt," "Diogenes," "Fauns and Satyrs," and two sets of heads.—W. T.

CASTIGLIONE, VALERIO, a learned Italian writer, born at Milan in 1593, entered at an early age the order of the Benedictines, among whom he acquired distinction as an orator. Pope Innocent X. bestowed on him the dignity of prior. He wrote a history of Louis XIII. of France, and one of Charles Emmanuel of Savoy. Of his numerous works, in Latin and in Italian, we may mention his "History of the Revolutions of Piedmont;" "Clio," an Italian poem in blank verse; and his "Elogium de

6 B

gestis heroicis Caroli-Emmannellis de Sabuadia." He died at Milan in 1668.—A. C. M.

CASTIL, BLAZE. See BLAZE.

\* CASTILHO, ANTONIO FELICIANO DE, one of the latest and most distinguished poets of Portugal, born at Lisbon in 1800; one of four brothers, all of whom attained to some eminence. At six years of age he lost the sight of one eye by measles, and hence is often spoken of, by a pleonasm, as the "blind poet." At the age of ten his predilection for sculpture attracted the notice of the Portuguese artist, Machado de Castro, who was anxious that his genius should be cultivated, and retained in the service of his own country. At sixteen years of age, however, the young artist-poet was sent to Coimbra to study law, a profession for which he never evinced any inclination. His first literary essay, "Cartas de Echo a Narcissus" (Letters from Echo to Narcissus), led to a romantic correspondence, at first carried on clandestinely, with a lady, Dona Maria Nabel de Baena, to whom he was at length married, and who died two years afterwards. After this Castilho resided constantly with his brother, Augusto Federigo, a clergyman settled at Aveira. Under King John VI. he held a government post. On the accession of Don Miguel, both the brothers were obliged to flee from Portugal, but returned when Don Pedro came into power, and have since resided at Lisbon. In 1836 he wrote "Noite de Castello" (Night at the Castle), a tale in verse. The plot of this piece is the same as that of Monk Lewis' once celebrated ballad of Alonzo and Imogene, though Castilho states he had never seen the ballad until four years after his own work was written. Another of his works is entitled "Amor y melancolia, o a novissima Heloisa" (Love and Melancholy, or the Newest Heloise). His "Dia de Primavera" (A Day in Spring), reminds the English reader of Thomson. Other works are a historical essay on Camoens, and a treatise on Portuguese versification. His greatest production, however, is his "Quadros historicos de Portugal," a series of descriptions of paintings, intended to illustrate the history of Portugal, published in Lisbon, 1838. This work is the joint production of Antonio and his brother above named. The "Excavações Poeticas" (Poetical Foragings), were published in 1844. Besides these works, Castilho has published some translations from Ovid, a Portuguese version of the "Paroles d'un croyant" of La Mennais, and various smaller tales in the *Jornal da Sociedade*. His poems are distinguished by a rich appreciation of natural beauty, and a nobility both of sentiment and diction, which deserve to be more widely appreciated.—F. M. W.

CASTILLA, FRANCISCO DE, a descendant by an illegitimate branch of Pedro the Cruel, lived in the time of Charles V., and was for some time attached to the court, but withdrew from it, and devoted himself to literature. His "Theorica de las Virtudes" (Saragossa, 1552) is a bibliographical curiosity, being licensed by the inquisition, though dedicated to the emperor. His other works are—"A Treatise on Friendship;" a "Satire on Human Life," an allegory; "Virtue and Happiness;" and the lives of the good kings of Spain, from Alaric the Goth to Charles V. His style is the old Castilian—pithy and ornate, but often encumbered with learning.—F. M. W.

\* CASTILLA, RAMON, president of the republic of Peru, was born there in 1793. At an early age he manifested a fondness for the military profession, and entered the Spanish cavalry. But in 1821, when General St. Martin proclaimed the independence of Peru, Castilla quitted the service of the mother country, and fought with great courage and enthusiasm in the ranks of the patriots. On the successful termination of the war he was appointed a colonel; in 1834 he was elevated to the rank of general of brigade, and in 1845 was elected president of the republic. He discharged the duties of his difficult situation till 1851 with great prudence, and then voluntarily resigned the reins of government. In January, 1855, amidst general enthusiasm on the part of the Peruvians, he again placed himself at the head of affairs.—J. T.

CASTILLEJO, CHRISTOBAL DE, a Spanish poet, born probably in 1494 at Ciudad Rodrigo. From the age of fifteen he was attached to the court of Ferdinand I., the younger brother of Charles V., and afterwards emperor of Germany. A great part of his life was spent at Vienna, and a young German lady named Schomburg, figures largely in his poems as Doña Ana de Xomburg,—the harsh German sounds not being readily admissible in Castilian verse. Disgusted with court intrigues, Castillejo returned to Spain, and died in the convent of Val de

Iglesias, near Toledo, in 1596. If the date of his birth as given above be correct, he must have attained the patriarchal age of one hundred and two. Castillejo was by some early critics placed in the foremost rank of poets, but their judgment has not been sustained by posterity. His most striking characteristic is the vigour with which he maintained the old Spanish style of poetry against the *movalemo* of the "Petrarquistas," Boscan, Garcilaso, and others of his time, who were labouring to introduce the spirit and metre of Italian poetry. His comedies are little known, and several of his works, having been condemned by the inquisition, are lost; but a selection was published in 1573. Some of his love verses and canciones or lyric pieces are exquisitely graceful and tender. Satire was his forte, however—his "Dialogue on Woman," and "Transformations of a Drunkard into a Mosquito," abounding in the highest qualities of satirical writing. His moral works are generally speaking the dullest of all, but the "Loves and Grievs of a penitent soul" may still be read with pleasure. Castillejo's works may be found in the *Collecion* of Fernandez, vols. xii. and xiii.: Madrid, 1792; and a more modern edition in Aribau's *Biblioteca*.—F. M. W.

CASTILLO, BERNARD-DIAZ DEL, a Spanish officer and historian, born 1519. He accompanied Cortes in his expedition against Mexico, and distinguished himself greatly by his courage and conduct. Indignant at finding that Gomara in his Chronicle had made no mention of his name, and had ascribed all the glory of the conquest to Cortes, Castillo resolved to write his own history of the campaign, which was published in Madrid, in 1 vol., folio, under the title of "Historia Verdadera de la Conquista de Nueva España." The author died in Mexico about 1560.—J. T.

CASTILLO, FERNANDO DEL, a Spanish author, of whom little or nothing is known save that he was the compiler of the first "Cancioneros Generales," or collection of popular poems, published at Valencia in 1511.

CASTLEREAGH. See LONDONDERRY.

CASTOLDI. See GASTOLDI.

CASTOR, ANTONIUS, a Greek physician and botanist, lived at Rome at the beginning of the christian era, and died about the year 80. Pliny states that he possessed a botanic garden which contained many interesting plants. He is said to have written a herbal.—J. H. B.

CASTOR OF RHODES, a Greek grammarian, surnamed PHILOROMEUS, lived, it is supposed, about B.C. 150. A portion of his "Art of Rhetoric" is still extant.

CASTREN, MATTHIAS ALEXANDER, remarkable for his devotion to philological research, was born in 1813 in the province of Uleborg in Finland. At the university of Helsingfors he became an enthusiastic student of the language and literature of his native Finland. In 1838 with three companions he set out on a tour as far as the Lake Enaré, with the object of investigating the antiquities and mythology of Lapland. His second expedition, which he undertook at the expense of the literary society of Finland, was a more successful one. He travelled into Russian Carelia, and collected ballads and legends illustrative of the ancient Finnish mythology. In 1841 he published a Swedish translation of the great Finnish poem, Kalevala, which had been discovered by Lönnrot. The translation brought the poem into general notice. It is said that Longfellow's Hiawatha is, to a great extent, modelled on the Kalevala. Castren's next journey was a most arduous one. He went by the Lake Enaré and Kola, the capital of Russian Lapland, as far as the country of the Samoyeds on the banks of the White Sea. In the hut of one of the savages he passed nearly a whole summer, learning the Samoyed language. About the end of his four years' journey he crossed the Tundras, between the White Sea and the Ural. He returned to Helsingfors in 1849 with a ruined constitution. In 1851 he was appointed by the Duke Alexander of Russia professor of the Finnish and old Scandinavian languages at Helsingfors; but he did not long survive his accession to this honourable office. He died May 7, 1852. Besides the translation referred to, and many interesting letters written during his travels, he published a number of philological works of great interest and value to students of the Ugrian family of languages. His lectures on Finnish mythology were published in 1853, and in the same year, at Leipzig, a German version of his travels by Helms.—J. B.

CASTRIOT. See SCANDERBEG.

CASTRO, CHRISTOPHER BACA DE, a Spaniard, sent to Peru

in 1540 by Charles V. to re-establish order in that province. He defeated and brought to the block Almagro (see that name) and his confederates in the murder of Pizarro. He died in 1558.

CASTRO, GUILLEN DE, a Spanish dramatist, was born at Valencia in 1567. It is probable that he was early a distinguished member of the Nocturnos, a society which formed the nucleus of the Royal Academy of Madrid. At one time he was a captain of cavalry, and held an office under Benevente, viceroy of Naples. He also received a pension from the duke of Ossuna. The most notable of his works are the two plays entitled "Noce-dades del Cid" (Youthful Amusements of the Cid); from these pieces Corneille drew the greater part of the materials for his more celebrated drama. In all, there exist twenty-seven or twenty-eight plays of this author, of which we need only name—"Alli van leges donde quieren Reges" (Laws must twist as monarchs list); "Santa Barbara, or the Mountain Miracle and Heaven's Martyr;" "Caballero Bobo;" "Maravillas de Babilonia," founded on the history of Nebuchadnezzar; "El Amor Constante" (Constant Love), of which the scene is laid in Hungary; "New Matches in Valencia;" "Dido and Æneas;" and some others. He was also the author of the ballads of "Count Alareos" and "Count d'Islos." He seems to have been the intimate friend of Lope de Vega, and in 1620 assisted him at the festival of the canonization of St. Isidore. In 1615 he is spoken of by Cervantes in a manner which indicates that he was then an author of some reputation. He died in poverty in 1631. Lord Holland has written a life of Guillen de Castro, subjoined to his Life of Lope de Vega: London, 1817.—F. M. W.

CASTRO, ISAAC OROBIO DE, a Spanish physician, was secretly brought up in the Jewish religion by his neo-Christian parents, whom the dread of the stringent laws in force throughout the Pyrenean peninsula against judaizing, induced to have their son ostensibly baptized as Balthazar, and educated at Salamanca. His eminent abilities gained for him the chair of metaphysics at the university where he had graduated. He afterwards removed to Seville, and began to practise medicine, in which profession he soon became very successful. Here, however, in the midst of his professional successes, he incurred the suspicion of being a secret adherent of judaism, and was incarcerated for three years in the dungeons of the inquisition. After his release he journeyed to Toulouse, where he became for a time teacher of medicine; but finding that here, too, he was under the surveillance of the inquisition, he resigned his chair and betook himself to Amsterdam, where he publicly connected himself with the synagogue, and lived many years in great repute as a skilful physician and an eminent scholar. The three Latin theses of this author which gave rise to the colloquy between him and the learned christian theologian, Peter Limborch, and other theological tracts, attest his zeal for the honour of the Jewish religion. "Israel vengé" is a controversial work, published in French by Henriquez, but professedly translated from the Spanish of Orobio. It is probably Orobio's "Exposition of the fifty-third chapter of Isaiah" in a French dress. Orobio's adventurous life terminated at Amsterdam in 1687.—(*Basnage, Schudt, Wolf, De' Rossi, Carmoly.*)—T. T.

CASTRO, JOHANN VON, a musician, distinguished as a composer and as a performer on the lute, was born at Liege, and died at Juliers. In 1570 he followed his profession in Lyons; and in 1580 he held the appointment of kapellmeister to the prince of Juliers. He published, between 1569 and 1600, many sets of madrigals, chansons, sonnets, odes, and cantiones sacræ for one and many voices. It has been supposed that these works were the production of two composers of the same name, but the supposition is not substantiated.—G. A. M.

CASTRO, JUAN DE, Portuguese viceroy of the Indies in the sixteenth century, belonged to a noble family, originally Gallician, and was educated along with Don Louis, son of King Emmanuel, under the celebrated Pedro Nunez. His first military services were those which he performed against the Moors in Africa, where he won the applause of Charles V., as well as the favour of his own sovereign; and on his return to Lisbon in 1538, he was rewarded with the commandery of St. Paul de Salvaterra. His marriage soon followed, but the revenues of his office were small, and in the course of a year or two he accompanied his maternal uncle, De Noronha, to the East Indies, to take part in the struggles by which the Portuguese were then maintaining and seeking to extend the new empire which they had founded at Goa. His bravery made him a valuable acquisition in the camp, and he

rendered to Stephen Da Gama, in the exploring of the Red Sea, scientific services not less honourable, and then more rare. When he was subsequently appointed, in 1545, to succeed De Souza in the governorship of the Indies, he had a fierce contest to maintain against Mahmoud, king of Cambodia, whose energetic ministers, Khodja Sophar and Roumi-Khan, tasked severely for a time his military talents. Having brought that war to a triumphant issue, he set himself to administer wisely the dominions which he had so valiantly defended and enlarged, being well fitted, by his generous disposition and high integrity, to repair the evils which a series of dissolute and tyrannical rulers had introduced. In 1547 he received the rank of viceroy, but in the following year died in the arms of his friend, St. Francis Xavier, having acquired not only among his own countrymen, but among the natives, an honourable reputation, which long survived him. His "Hydrographical account of the Red Sea" was published in 1833 at Paris, from a copy of the manuscript in the British Museum.—W. B.

CASTRO, PAUL DE, an Italian jurist of the first half of the fifteenth century, famous for his skill in Roman law, which he taught successively at Florence, Bologna, Ferrara, and Padua. Cujas held his works in the highest estimation, saying—"Qui non habet Paulum de Castro, tunicam vendat et emat."

CASTRO, RODRIGUEZ DE, a Spanish Jew, born at Lisbon, studied philosophy and medicine at Salamanca. After having, for a considerable period of his life, outwardly conformed with the observances of the catholic religion, he embarked stealthily for Holland, then the only refuge in Europe for the religiously and politically proscribed, and once on a free soil, made a public profession of Judaism, of which he remained a staunch adherent till his death. From Holland he removed to Hamburg, where he was distinguished as a medical practitioner and writer, during the space of thirty years, from 1596 to 1627, when he died an octogenarian.—BENEDICT, or Baruch Nehemiah de Castro, was a son of Rodriguez. He embraced his father's profession, and ultimately became attached as physician to the court of Christina, Gustav Adolf's eccentric daughter. He died in 1684 at the advanced age of eighty-six.—Rodriguez's younger son, DANIEL, or Andreas de Castro, studied medicine and philosophy, and rose to the rank of first physician to the king of Denmark.—T. T.

CASTRUCCI, PIETRO, a violinist and composer, immortalized by the pencil of Hogarth, who has preserved the lineaments of this vain and irascible, but not contemptible musician, in the Enraged Musician, was a Roman by birth. He was made first violin at the opera-house about 1718, and died in London at the age of eighty.

CASTRUCCIO-CASTRACANI, a celebrated Italian general, born at Lucca in Tuscany in 1284. At an early age he embraced the profession of arms, and served successively in France, England, and Lombardy. A staunch adherent of the Ghibellines, he rendered such signal service to his party, that the people of Lucca elected him chief of their republic. He was the principal adviser of the Emperor Louis of Bavaria, in his Italian campaign against the Guelphs in 1327, and in return for his services he was made Count Palatine, and acknowledged as duke of Lucca, Pistoja, Volterra, and Lunigiana. He put himself at the head of the Ghibelline party in Tuscany, and carried on a war with the Florentines for the space of fifteen years. In the end the Ghibellines triumphed, and in May, 1328, the opposite faction were defeated in a great battle, in which no fewer than 22,000 of them were killed. The supreme authority in Tuscany was now within reach of Castruccio, when he died of ague, after an illness of a few days, caught by his imprudently halting while tired and heated, after the action, to address his victorious soldiers, as they passed from the field of battle. His death gave a fatal blow to the Ghibelline party in Italy. The Italian historians extol highly the enlarged views of Castruccio, his military tactics, the secrecy of his plans, and the rapidity of his movements. Machiavelli wrote a life of this distinguished general, but it is more a romance than a real biography.—J. T.

CAT, C. N. LE. See LE CAT.

CATALANI, ANGELICA, the renowned singer, was born at Senigaglia, near Rome, in 1783, and died at Florence in 1849. Her singularly beautiful voice attracted general attention while she was yet a child, and gained for her the zealous patronage of Cardinal Onorati, who placed her in the convent of S. Lucia, at Gubbio, for her education, when she was twelve years old. While there, her singing was so remarkable that the public, who heard

her in the celebration of high mass, interrupted the divine service by their applause, an indecorum which the cardinal could only suppress by disallowing her to take part in the performance. In her fifteenth year the father of Angelica, who was a merchant, found his affairs so embarrassed in consequence of the political disturbances of the time, that he yielded to her ardent desire to appear upon the stage, and she accordingly sang at Venice at that early age with distinguished success. This was the commencement of one of the most brilliant careers that has ever been accomplished by a public vocalist. She then sang at all the chief theatres of Italy, and about the end of 1801 went to Lisbon to gain new honours. She remained there for five years, and in 1806 married M. Valabreque, who had been an officer in the 8th French hussars, and was then attached to the French embassy. Their union was the result of the romantic coincidents of their having each, on the first occasion of their meeting, secretly resolved to marry none but the other. From the time of their marriage, her husband undertook the entire conduct of her affairs; he contracted her engagements, managed her concerts, received her payments, disbursed her expenses, and, it has been said, squandered much of her earnings at the gaming-table; whatever may be the truth of this last report, it is certain that she lived in undisturbed happiness with him. She went from Lisbon to Madrid with letters to the queen from the court of Portugal; thence to Paris, and next proceeded to London. She made her first appearance here at the King's theatre, 13th December, 1806, in Portogallo's opera of Semiramide, and the sensation she created was wholly unexampled in the history of the lyric stage. She was re-engaged the following season, when her salary of £2000 was increased to £5000, the amount of which was more than doubled by her receipts for singing at concerts during the six months, which were then the extent of the London season. The enormous sum paid to her at the theatre, necessitated such limitation of the salaries of other singers, that no one of any talent, besides herself, was engaged; so great, however, was her attraction, that the establishment was most prosperous, though this was its only resource. M. Valabreque accordingly increased his demands for a subsequent season, an exaction which the management resisted; but he readily obtained his own terms for the following year. Madame Catalani was no less sought at the English theatres than required at the Italian, and she was sometimes engaged to sing *God Save the King*, and *Rule Britannia*, at both Drury Lane and Covent Garden on the same evening. She remained in England, the idol of all classes, until the first restoration of the Bourbons, when she went to Paris by invitation of Louis XVIII., who had heard her in England, and who gave her the direction of the *Théâtre Italien*, with a subvention of 160,000 francs. Upon the return of Napoleon, she quitted France for Germany; but revisited Paris in 1816 to resume her management and to experience a repetition of her London success. Her husband continued the policy of making her the sole attraction of the opera, a policy by which even her prodigious popularity was exhausted, and made critics discuss the decline of her powers. After the season of 1818 she went to Berlin, then appeared in all the principal cities of Germany, and finally at Vienna, where the magistracy had a medal struck in acknowledgment of the benefits to public charities that resulted from her performances. She next visited Russia, where, besides a popular reception totally unprecedented, she experienced such personal courtesies from the nobility, and from the emperor himself, as have been accorded to no other artist. In the summer of 1821 Madame Catalani returned to London, where, contrary to the opinion of the French critics, the writer in the *Musical Quarterly Review*, in noticing her first concert, speaks of her transcendent powers of voice, of execution and of declamation, as undiminished in every respect. She sung at concerts here in each of the two following years, including the famous festivals of 1823 at York and Birmingham; and in 1824 reappeared on the stage at the King's theatre, where she gave her last series of theatrical performances, and in this year took her final leave of England. She continued to give concerts in the chief continental cities until 1827, when she retired with her three children to an estate she had purchased at Florence, in which city she founded a musical academy.

Madame Catalani's munificent liberality to charitable institutions and to members of her own profession, is remembered in every place she visited; besides large donations in money, she gave concerts for the benefit of the poor wherever she found opportunity to do so, the results of which were always as advan-

tageous to the necessitous as honourable to herself. Her private character was as spotless as her public career was brilliant. Her manners were amiable, and the natural simplicity of these had a charm that counterbalanced her manifest educational deficiencies. The fascination of her personal appearance had a considerable share in the unparalleled effect of her singing, and this was a type of all the admirable qualities of her character. Her voice was remarkable for its quality, power, and great compass, extending upwards to G in altissimo. She possessed a most voluble execution—evinced in her singing of the air *Son Regina*, in the last act of Portogallo's *Semiramide*, and of Rode's air with variations for the violin, which she was the first vocalist to attempt. Her impressive declamation was best exhibited in some of Handel's songs, in our two national airs, and in *Non più an drai*, from Mozart's *Figaro*, which was a favourite concert song with her. All these remarkable qualifications were entirely natural to her, for her artistic training was of the shallowest description, and she was almost entirely without technical knowledge. She is variously stated to have been passionately fond of the stage, and to have had great repugnance to it; be this as it may, her dramatic talent, both in tragedy and comedy, appears to have made a wonderful effect during the first years of her performances, however she may have neglected to exercise it on the occasion of her reappearance. Unique as were her powers, she must be regarded rather as a phenomenon in art than as an artist; for, besides that she allowed no parallel talent to share her applause, the operas which, for the most part, she chose to sing were of the flimsiest character, and thus, while she was the meteor of her own time, she has bequeathed a memory, but no influence to ours.—G. A. M.

CATEL, CHARLES SIMON, a musician, was born at Aigle in the Pays de Vaud in June, 1773, and died at Paris, November 29, 1830. He went early to Paris where, through the interest of Sacchini, he was admitted a pupil of the *école royale de chant et de déclamation*, an institution founded in 1783 by Papillon de la Ferté. Here he studied the pianoforte successively under Gobert and Gossec, and composition under the latter; when fourteen years of age, he was appointed accompanist and professor in this school, and three years later he was engaged as accompanist at the opera, and held the office till more important avocations induced him to resign it in 1802. The most important circumstance of his life was his friendship with Sarete, which commenced in 1790, and continued without interruption. This led to his appointment as chief of the *corps de musique* of the national guard, which Sarete established; and in 1795, upon the organization of the *conservatoire*, in which the same politician was principally concerned, to his being included in the list of professors. Catel's first important essay as a composer was a "De Profundis" for the funeral of M. Gouvion, major-general of the national guard, in 1792. He wrote a vast number of marches and other pieces of military music, besides some compositions of far higher pretension, in which a vocal chorus was combined with wind instruments, and which were performed at the public military festivals. His first opera, "*Semiramis*," was given in 1802, with little success. He wrote seven other works of this class, of which "Wallace," produced in 1817, was the most esteemed. He wrote also a ballet, and a portion of an opera with other composers. The production by which the name of Catel is most extensively known, is his "*Treatise on Harmony*," written for the use of the *conservatoire*. The principles expounded in this work were submitted to and approved by a committee of professors, under whose authority it was adopted in the *conservatoire* immediately on its publication in 1802. Catel's system is opposed to that of Rameau, which was in general use in France before this work appeared. Its view of the subject is derived from earlier German theorists; this consists in the classification of harmonic combinations as natural, namely, derived from harmonic vibrations; and artificial, namely, produced by suspension or other forms of preparation; it traces all the natural combinations to one fundamental root, and shows one general principle to prevail for the treatment of each of them. It is held in the highest esteem in France, and is still the class-book of the *conservatoire*. This work rendered its author a special mark of the attacks levelled against the *conservatoire* by the musicians not comprised in the staff of the institution; and his intimacy with Sarete drew upon him further invectives in connection with the same seminary. It was not till 1810 that Catel was added to Cherubini, Gossec,

and Méhul, as professor of composition in the conservatoire, and he relinquished this appointment four years later, when the great political changes in the country removed his friend and patron Sarette from a share in the direction of the institution, after which nothing could induce him to resume it. The honours of membership of the Institute, and chevalier of the legion of honour, which he received in 1815 and 1824, were conferred upon him entirely without his seeking, becoming thus the greater testimonies to his merit. His personal character was so highly and so generally esteemed, that his obsequies were attended, not only by the chief musicians at Paris, but by a multitude of persons of all classes and callings.—G. A. M.

CATELAN, LAURENT, a French pharmacist, lived at the beginning of the seventeenth century. He devoted his attention to the composition of various medicaments—among others, of the famous confection called theriacum, concerning which he wrote a treatise, which was published at Montpellier in 1614 and 1626. He also wrote an essay on the mandrake, which was published in Paris in 1639.—J. H. B.

CATELLAN-AUMONT, JEAN ANTOINE, Marquis de, a French statesman, born in 1759. Throughout the stormy period of the first revolution, the empire, and the revolution of 1830, he showed himself a moderate royalist and friend of the constitution. His reports on various legal and constitutional questions are valuable. He was elevated to the chamber of peers in 1819, and died in 1834.—J. T.

CATESBY, MARK, an English naturalist, was born about the end of 1679 or the beginning of 1680, and died in London on 23d December, 1749. He had an early propensity to the study of nature; and in order to gratify his taste in that respect he repaired to London, and afterwards to distant parts of the globe. The residence of some relations in Virginia induced him to visit that country in 1712. He remained there seven years, making a large natural history collection, with which he returned to Britain in 1719. During his residence abroad he sent seeds and plants, both dried and in a growing state, to Mr. Dale of Braintree in Essex. On his return to Britain he secured the friendship of Sir Hans Sloane, Dr. Sherard, and other naturalists, and they induced him to pay a second visit to America. Accordingly, in 1722 he went to Carolina. He examined the lower parts of the country, making excursions from Charleston, and afterwards sojourned for some time among the Indians near Fort Moore. He then travelled through Georgia and Florida, and having spent nearly three years on the continent, he visited the Bahama Islands, taking up his residence in the Isle of Providence. In 1726 he came back to England, and employed himself in preparing an account of his travels, which was published in parts, from 1730 to 1748, and was illustrated by etchings made by himself. The whole work is comprised in two volumes folio, and is entitled "The Natural History of Carolina, Florida, and the Bahama Islands; containing the figures of birds, beasts, fishes, serpents, insects, and plants; particularly the forest trees, shrubs, and plants, neither hitherto described or very accurately figured by authors; together with their description in French and English." He also added observations on climate and agriculture. The subjects described and figured are—plants, 171; quadrupeds, 9; birds, 111; amphibia, 33; fishes, 46; insects, 31. He was elected a fellow of the Royal Society of London after his second return from America. Besides his large work already referred to, he published "Hortus Britanno-Americanus; or a collection of trees and shrubs of North America, adapted for the soil and climate of England;" and "Hortus Europæo-Americanus; or a collection of 85 common North American trees and shrubs, adapted for the climate of most parts of Europe." He was the author of a paper printed in the forty-fourth volume of the Philosophical Transactions, "On Birds of Passage." His name is recorded by Gronovius in the genus of plants called *Catesbæa*, one of the natural family Rubiaceæ.—J. H. B.

CATHALA-COTURE, ANTOINE DE, born at Montauban in 1632. Having distinguished himself as an advocate at the bar, as well as by his active benevolence, he dignified his retirement by taking for the subject of his studies the antiquities of his native province of Quercy, the result of which he gave in a published history. He also wrote poems. He died in 1724.—J. F. C.

CATHALAN, JACQUES, a celebrated French orator, a member of the order of jesuits, born in 1671; died in 1757. His order signified their admiration of his talents by appointing him to

pronounce the funeral oration over most of the royal personages who died in his time.

CATHARINUS, AMBROSE, an Italian bishop and voluminous author, born at Sienna in 1483. His original name was LANCELOT POLITI. He joined the Dominicans in 1515, and having acquired celebrity by his writings, he was sent to the council of Trent in 1545, where he distinguished himself by his ability and learning. He was made bishop of Minori in 1547, and archbishop of Conza in the kingdom of Naples in 1551. He died in 1553. Catharinus was, undoubtedly, a man of great natural abilities, acuteness, and learning. He was the author of two works against Luther, of the "Mirror of Heretics," and of a vast number of theological and polemical treatises of a similar kind. He was the first who defended the dogma that the sacraments are valid, if properly administered, even though the officiating priest should be an unbeliever.—J. T.

CATHCART, a noble Scottish family, which for several centuries has been distinguished for the high military talents of its members. Barbour, speaking of a singularly daring and successful exploit performed by Edward Bruce in 1308, says, the particulars were recounted to him by SIR ALAN DE CATHCART, who was present—a knight

"Worthy and wight, stalwart and stout,  
Courteous and fayr, and of goode fame."

Lord Hailes observes, in reference to these lines, that it is pleasant to have a family likeness in an ancient picture. ALAN master of Cathcart, fell at Flodden, and his son at Pinkie. CHARLES, eighth Lord Cathcart, a distinguished military officer, was present at the battle of Sheriffmuir, filled several high offices in the court of George II., and ultimately was appointed in 1740 commander-in-chief of all the British forces in America, but died at sea a few months after.—His son, CHARLES, ninth baron, also attained the rank of general, and served as aid-de-camp to the duke of Cumberland at Fontenoy. His son—

CATHCART, WILLIAM SCHAW, tenth baron and first earl of Cathcart, born in 1756, adopted, like his ancestors, the profession of arms. He entered the army in 1777, and served with great distinction throughout the American war. On his return he was elected one of the representatives of the Scottish peerage, and for four years filled the office of chairman of the committees of the house of lords. He served under Sir David Dundas in the unfortunate campaign in Holland in 1795. In 1803 he was appointed commander-in-chief of the forces in Ireland. In 1805 he was nominated ambassador-extraordinary to the court of St. Petersburg, and commanded the British contingent in the allied army. After the disastrous battle of Austerlitz he returned home, and was appointed commander of the forces in Scotland. In 1807 the British government having resolved to send an expedition to the Baltic for the purpose of seizing the Danish fleet, the command was intrusted to Lord Cathcart. He was completely successful, and as a reward for his services was raised to the British peerage, and received the thanks of both houses of parliament. In 1813 he was again sent on an important mission to St. Petersburg, and was present with the allied army during the whole of their campaign in Germany. In 1814 he was advanced to the dignity of an earl, and died June 6, 1843, in the eighty-seventh year of his age. His eldest son, a lieutenant-general in the army, succeeded him as commander of the forces in Scotland, &c.

CATHCART, SIR GEORGE, K.C.B., third son of the first earl of Cathcart, a distinguished British general, was born 12th May, 1794, and fell at Inkermann, November 5th, 1854. He was educated first at Eton, and afterwards at the university of Edinburgh. The military profession having become almost hereditary in his family, Sir George entered the army in 1810, and in 1812 accompanied his father as aid-de-camp, when the earl was sent as plenipotentiary to Russia. At the time of his arrival at St. Petersburg the French were in possession of Moscow, and shortly after, the Emperor Alexander having taken the field in person, Lord Cathcart and his son joined the imperial headquarters, and remained with the grand allied army throughout the whole of the eventful campaigns of 1813-14 in Germany, and 1814 in France. Sir George had thus the opportunity of witnessing the great battles of Lutzen, Bautzen, Dresden, Leipzig, and the other sanguinary conflicts of that momentous period. He published in 1850 a valuable volume of Commentaries upon these campaigns, in which he gives a clear and soldier-like narrative of the operations of the hostile armies, and by the aid of diagrams and charts, enables even the unprofessional reader to

understand the plan of the campaigns and battles, and the strategic errors into which the commanders on both sides fell. In 1814 he accompanied his father to the congress of Vienna. On the return of Napoleon from Elba, Sir George was appointed extra aid-de-camp to the duke of Wellington, and was present at the battles of Quatre Bras and Waterloo. He held the post of aid-de-camp to the duke for twelve years, and subsequently served for about seven years with his regiment in Nova Scotia, Bermuda, and Jamaica. When the outbreak took place in Canada in 1837, Sir George did excellent service in protecting the frontier of Lower Canada from the inroads of American sympathizers, and contributed greatly to restore tranquillity in the disturbed districts. In 1852 he was appointed governor and commander-in-chief at the Cape, and in that capacity brought the Caffre war to a satisfactory conclusion. On his return to England in 1854 he was despatched with all speed to the Crimea, as commander of the fourth division of the British forces before Sebastopol, and after his arrival was appointed adjutant-general of the army. High expectations were formed of the services of an officer, who with long experience and a decided genius for war, still combined all the activity and endurance of youth; and many looked forward to him as the future commander-in-chief of the British army. But these hopes were frustrated by his untimely death in the battle of Inkermann, while cheering on the guards in their desperate struggle against the overwhelming masses of the Russians. Sir George was buried along with Generals Strangways and Goldie, and eleven other officers, on the hill which now bears his name.—J. T.

CATHELINEAU, JACQUES, commander-in-chief of the army of La Vendée, and one of the noblest specimens of a peasant soldier the world has ever seen, was born at Pin in 1759, and followed the trade of a hawk of woollen goods. He was a man of great intelligence and piety, and was held in such high estimation in the district, that he was called the "Saint of Anjou." As soon as Jacques heard of the breaking out of the royalist insurrection in La Vendée in 1793, he resolved on leaving his wife and family, and putting himself at its head. With a small band of trusty followers, he attacked and captured the chateau of Jallais, garrisoned by 150 soldiers, and thus obtained a supply of arms and ammunition. In a few days he was joined by two other peasant leaders, named Stofflet and Forêt. With their combined forces they attacked and carried the town of Chollet, and immediately after dispersed a body of national guards at Vihiers. The whole district was now in a state of great excitement, and several other armies of insurgents took the field, under different officers. A powerful force under General Berenger, who had been sent down by the convention to suppress the insurrection, was defeated by the peasants at Cherville, 11th April, after a desperate struggle. Proceeding in their enterprise, the insurgents, though occasionally worsted by the regular troops, succeeded in expelling the enemy from Brassure, Thouars, and Saumur; and their numbers, having now greatly augmented, they found it necessary, about the middle of June, to appoint a commander-in-chief, and Cathelineau, who had shown himself possessed of military genius of a very high order, was unanimously elected by the other leaders. But the noble peasant commander did not long discharge the arduous duties of his office. On the 29th of June he was mortally wounded in heading a desperate attack upon the town of Nantes, and died in a few hours. Three of his brothers perished in the first Vendean war, along with upwards of thirty of their near relatives. One of his sons lost his life in the attempt which the duchess de Berri made to raise the inhabitants of La Vendée in favour of her son in 1832.—J. T.

CATHELINIÈRE, RIPAULT DE LA, one of the royalist chiefs in the insurrection in La Vendée. He sometimes co-operated with Charette, at other times held an independent command, and showed great courage and energy in carrying on the unequal struggle against the government. He was severely wounded by a musket-shot in February, 1794, shortly after fell into the hands of his enemies, and was tried and executed at Nantes.—J. T.

CATHELINOT, DON ILDEFONSE, a learned Benedictine, who wrote, under the direction of Calmet, a great number of historical, philological, and theological works, and contributed the supplement to Calmet's Dictionary of the Bible; born in 1670; died in 1756.

CATHERINE I., Empress of Russia, was a Livonian peasant girl, born in 1687. The most contradictory accounts have been

given of her parentage, some alleging that she was the natural daughter of a country girl, others that she was the legitimate daughter of John Rebe, the quartermaster of a Swedish regiment at Afsborg. Be this as it may, it is certain that she was, at an early age, left an orphan, in such destitute circumstances that the parish clerk of the village took pity on her and received her into his house. Soon after, Ernest Gluck, protestant minister of Marienburg, took her into his family and employed her in taking care of his children. In 1701 she married a dragoon of the Swedish regiment of Marienburg, who was immediately after sent with a detachment to Riga, and she never saw him more. When Marienburg was captured by the Russians, Catherine was taken prisoner and conveyed to Moscow, where she fell into the hands of General Bauer. She superintended his domestic affairs for some time, and was believed to be his mistress. She next passed into the family of Prince Menchtchikof, and lived with him till 1704, when the Czar Peter saw her and fell in love with her. She inspired him with so strong an affection that, after she had lived with him for several years, he married her privately at Yaverhof, near Warsaw, 29th May, 1711, and the ceremony was publicly performed with great pomp at St. Petersburg on the 20th of February, 1712. The original name of the new empress was Martha, which she changed for Catherine when she embraced the Greek religion. After her marriage she accompanied her husband in his campaign against the Turks in 1711, and when his army was surrounded on the Pruth by a vastly superior force of the enemy, Catherine succeeded in bribing and persuading the grand vizier into a negotiation, by which the Russians were permitted to retire, and peace was restored on terms by no means so disadvantageous as might have been expected. On the death of Peter, 28th January, 1725—the imperial guards having been previously gained over—the senate and nobility were induced by Menchtchikof, who declared that such was the wish of the czar, to proclaim Catherine his successor. She was, however, extremely averse to business, and having neither inclination nor abilities for government, left the entire management of the affairs of the empire in the hands of the man who had been the means of raising her to the throne. She was intemperate in her habits, and careless of her health, so that her reign lasted only about two years. She died 17th May, 1727, in the fortieth year of her age. She bore a numerous family of daughters to the czar, but only three of them survived their father.—J. T.

CATHERINE II., Empress of Russia, whose original name was SOPHIA AUGUSTA FREDERICA, was born in 1729, and was the daughter of Christian Augustus, prince of Anhalt-Zerbst in Upper Saxony, and governor of Stettin. When only fourteen years of age she was selected by the Empress Elizabeth of Russia to be the wife of her nephew, Charles Frederick, duke of Holstein-Gottorp, whom she had designated as her successor. The unhappy union was celebrated at St. Petersburg in 1745; the ill-assorted couple having been previously received into the communion of the Greek church, when the duke took the name of Peter, and his consort that of Catherine Alexiowna. After the celebration of the marriage, they were formally acknowledged by the czarina and the senate as grand duke and duchess of Russia. Disagreements soon took place between them. Peter was disfigured by the small-pox, was vulgar in his manners, intemperate, irresolute, and foolish, although not without some good and even noble qualities; and almost from the outset was an object of contempt to his clever, cunning, and ambitious wife. He spent his time in military exhibitions, in training dogs and arranging puppets, in the pleasures of the table and the company of his mistress, and seldom saw Catherine except in public. She, on the other hand, lived in retirement, cultivating her mind by means of books. She acquired a thorough knowledge of the Russian language, professed great attachment to her new faith, was exceedingly affable in her intercourse with the people, and affected a decided predilection for Russian manners and customs. The life of the Russian court at this period, as depicted in Catherine's autobiography, was peculiarly dismal. "Its formality was oppressive, its espionage was frightful. Universal selfishness, universal suspicion, universal plotting and counter-plotting, were the order of the day, and there was nothing but intrigue and drink to relieve the stately tedium of daily duties." For several years after her marriage the conduct of Catherine was irreproachable, and presented a marked contrast to the gross debauchery of her husband, and of the Russian nobility. But the corrupt atmosphere of the court in time exercised an injurious influence upon her char-

acter; and about 1754 suspicions began to be entertained that an improper intimacy had commenced between the duchess and Count Soltikof, for whose society she indicated a marked preference. The count was replaced by his friend Leon Narichkine, and he in turn gave place to Stanislaus Poniatowski, a young and handsome Polish noble, whom Catherine afterwards made king of Poland. Peter discovered or suspected the intimacy between the duchess and Poniatowski, and on his accession to the throne, 5th January, 1762, he is said to have talked of repudiating his wife. There is reason to believe that she had long cherished the desire to obtain the crown for her son and the regency for herself, and she now resolved at once to anticipate the movements of Peter by a bold stroke for the empire. She had numerous partisans both among the nobles and the people. By her liberality and affability she had completely gained the soldiers who did duty around her residence, and a conspiracy was immediately formed for the deposition of Peter. The regiments in the capital were instigated to revolt, partly by bribes and promises, partly by misrepresentations and falsehoods. The emperor, while living in fancied security, totally unconscious of his danger, was arrested 14th July, 1762, prevailed on by threats and entreaties to sign an act of abdication, conveyed to the castle of Robscha, and six days afterwards strangled by Alexis Orloff, one of Catherine's favourites. Catherine was then solemnly crowned at Moscow. Soon after, the unhappy Prince Iwan, grandnephew of Peter the Great, who had been destined by the empress, Anne Iwanowna, as her successor, and had been kept a close prisoner for eighteen years, was put to death on the plea that a plot had been formed to set him at liberty, and raise him to the throne. All competitors for the crown being now removed, Catherine set herself vigorously to carry out her schemes for the aggrandizement of Russia. She expelled the reigning prince of Courland, and set up Biron, a creature of her own in his place. Partly by bribes and partly by threats she procured the crown of Poland for her favourite, Count Poniatowski. She suppressed a dangerous insurrection in her own dominions, and carried on several successful wars with the Turks, which terminated in her acquirement of the Crimea and other provinces of the Ottoman empire. She was the moving spirit in the partition of Poland, as Russia was ultimately the principal gainer by that infamous transaction. She was preparing to take part in the revolutionary war against France, when she was seized with an apoplectic fit, and died 10th November, 1796, after a reign of thirty-five years. Catherine was undoubtedly an able and vigorous sovereign. She had a considerable taste for letters and for painting, and was passionately fond of music. She showed great favour to Diderot, D'Alembert, Euler, Voltaire, and other literary and scientific men; composed several treatises herself, and established schools in all the provinces of her empire. She also encouraged commerce, founded towns, docks, and arsenals, reformed the courts of justice, and to some extent ameliorated the condition of the serfs. But her grossly licentious life, and the fearful crimes to which her wicked ambition led, have left an indelible stain upon her memory. A very curious autobiography of Catherine was found after her death among her most secret papers. It was carefully suppressed by her family, but a copy was taken in some unknown way, and has been published (1859) with a preface by M. Herzen.—J. T.

**CATHERINE DE BOURBON**, Princess of Navarre and Duchess of Bar, born in 1558. Her brother, Henry IV. of France, constrained her to marry in 1599 Henry of Lorraine, duke of Bar, much against her will, as she was strongly attached to the count de Soissons. Like her brother, Catherine was distinguished for her power of repartee. She continued steadfast in her adherence to protestantism, notwithstanding Henry's abjuration of that faith. She died in 1604. Her life has been written by Mdle. Caumont de la Force.—J. T.

**CATHERINE DE MEDICIS**, consort of Henry II., king of France, born at Florence in 1519, was the daughter of Lorenzo de Medici, duke of Urbino (grandson of Lorenzo the Magnificent), and of Madeleine de Boulogne, a princess of the house of Anvergne. Bereaved of both her parents, her mother dying in giving her birth and her father soon after, she was brought up under the care of her uncle Giulio de Medici, afterwards Clement VII., who, when she had hardly completed her thirteenth year, had her betrothed to Prince Henry, second son of Francis I. Although endowed with extraordinary qualities both of mind and person, and possessed, as the latter part of her career witnesses, of no less talent than fondness for political intrigue,

she contented herself, during the lifetime of her father-in-law, with the modest position at court her noble, not royal birth, and the divided affections of her husband assigned her; and during the reign of Henry she was no less artful to secure real power by appearing to support the influence of the Guises, while she secretly directed the schemes of their enemies the Huguenots. By Henry she had five sons, of whom three successively wore the crown of France, namely, Francis II., Charles IX., and Henry III. Still controlled by the power of the Guises during the reign of the first of these princes, as soon as Charles IX., at the age of eleven, ascended the throne, she asserted her independence with a high hand, assumed the title of regent, and from that time wielded the destinies of France until the close of a reign which corruption and cruelty, culminating in the fearful butchery of St. Bartholomew's day, have consigned to everlasting infamy. After the accession of her youngest son, Henry III., Catherine retained a considerable portion of her former power, and this she exerted as little to the advantage of the kingdom as destructively to the schemes of her rivals; the principal of whom, the Guises, notwithstanding her solemn denial of being concerned in their death, she has not been thought guiltless of removing by assassination. She died at Blois in 1589, leaving the kingdom in a state of anarchy, and the illustrious name she bore indissolubly and, but for her munificent patronage of arts and letters, exclusively associated with the worst crimes and the most calamitous disturbances of the period in which her family held the throne of France.—J. S., G.

**CATHERINE OF ALEXANDRIA**, Saint, martyred during the persecution of Maximin towards the year 307.

**CATHERINE OF ARRAGON**, wife of Henry VIII. She was the youngest daughter of Ferdinand, king of Spain, and of Isabella of Castile, and was born in 1483. In her eighteenth year she became the wife of Prince Arthur, the eldest son of King Henry VII. of England, and in five months after was left a widow. Upon her marriage with Arthur, Catherine's father had settled upon her a large dowry, a considerable portion of which, however, remained unpaid at the time of her husband's demise; and Ferdinand scrupled to pay the remainder, unless the king of England would agree to give the widowed princess in marriage to his other son, Henry, who by the death of Arthur had become heir-apparent to the throne. A threat was even held out that if this were not done the sum already paid must be refunded, and this so worked upon the cupidity of the English monarch, that he entered at once into the proposed arrangement, and procured a special dispensation from the pope sanctioning the union. The young widow, accordingly, became the wife of her brother-in-law, Henry, who, upon his accession to the throne, had his marriage with Catherine publicly ratified, both being crowned by Warham, archbishop of Canterbury. For a period of nearly twenty years they lived together in the greatest harmony and apparent affection; but the want of male issue had ever been to Henry a source of great disquietude, and there is little doubt that his feeling on this point, together with an ardent passion which had suddenly sprung up in his mind for Anne Boleyn, one of Catherine's maids of honour, caused him to seek a dissolution of his marriage. He accordingly applied to the pope for a dispensation of divorce, which was promised, but deferred from time to time on various pretexts. Ultimately Henry took the matter into his own hands, and first of all privately married Anne Boleyn early in 1533, and then appealed for a divorce to an ecclesiastical court convened at London, where the question was publicly tried. The result was that Cranmer, then archbishop of Canterbury, pronounced, not a divorce, but a sentence, declaring the king's marriage with Catherine a nullity, because it had been contracted and consummated against the divine law; and Catherine, under the title of the Dowager Princess of Wales, retired almost broken-hearted to Kimbolton castle in Huntingdonshire, where she died in January, 1536, in the fifty-second year of her age. Whatever opinion may be formed of the motives by which Henry was actuated in seeking a divorce, it must be conceded by every one conversant with the facts of the case, that Catherine was an attached and faithful wife, an affectionate mother, a true christian, and an oppressed and most unfortunate woman.—G. A.

**CATHERINE OF BRAGANZA**, daughter of John IV., king of Portugal, was born in 1638, and in 1661 was married to Charles II., king of Great Britain. The marriage was highly unpopular in the country, though the princess brought with her

a dowry of half a million sterling, with Bombay and the fortress of Tangier in Africa. It was an unfortunate union for Catherine herself, who was most shamefully treated by her callous and libertine husband. Immediately after his marriage he introduced his mistress, Lady Castelnaine, to his bride, and insisted that she should be one of the ladies of the bed-chamber. The queen at first indignantly resented this gross insult; but friendless and alone in a strange country, and deprived, too, of the attendance of her Portuguese servants, subjected to daily insults and mortifications, the whole of the licentious court against her, and even the lord chancellor, Clarendon, according to his own account, striving "to induce her to a full compliance with what the king desired," her resolution at length gave way. From that time forward she seems to have borne her unhappy lot with patience, or at least without open complaint. Charles treated her with indifference or contempt, but he interposed for her protection when she was accused by the infamous Titus Oates, at the bar of the house of commons, of complicity in the Popish plot. Buckingham, at the same time, proposed to the king a plan for carrying off the queen to some plantation in the West Indies; but Charles, profligate though he was, had still some faint remains of conscience, and he told Burnet that, considering his faultiness towards the queen in other things, he thought it would be a horrid thing to abandon her now. The commons voted an address for the removal of the queen, but the lords would not join in this step, and the accusation was allowed to drop. In 1693 Catherine returned to Portugal, and died there in 1705.—J. T.

CATHERINE OF FRANCE, daughter of Charles VI., and wife of Henry V., king of England, was born in 1401, and married in 1420. Henry died in 1422, and in 1426 Catherine espoused Owen Tudor, a Welsh gentleman, to whom she bore three sons, and who was put to death by the duke of Gloucester, afterwards Richard III. After the termination of the wars of the Roses, Henry VII., the grandson of Owen Tudor and Catherine, ascended the English throne. Catherine died in 1438.—J. T.

CATHARINE OF SIENNA, was so called from the Tuscan town where she was born in 1347. At the early age of eight she took the veil, and when she reached her twentieth year, was admitted into the Dominican order. Her austerity, fasting, and rigid adherence to the rule of her order, obtained for her the reputation of extraordinary sanctity, whilst her alleged visions caused the Tuscans to regard her with superstitious veneration. Her influence became so great that she was sent on a political embassy to the pope, Gregory XI., by the Tuscan people, in order to procure their restoration to the pontifical favour, and the removal of the sentence of excommunication under which they lay. Her persuasion contributed to induce the pope to return to Rome in 1376, and thus to terminate what Roman catholics have called the "Babylonish captivity" of their church. St. Catherine died in 1380, and was canonized by Pope Pius II. in 1461. A collected edition of her works was published at Sienna in 1707, 4 vols. 4to.

CATHERINE HOWARD, fifth wife of Henry VIII. of England, and granddaughter of Thomas, second duke of Norfolk. Her father, Lord Edward Howard, was marshal of the horse at the battle of Flodden. On the divorce of King Henry from Anne of Cleves, he married Catherine in August 8, 1540, mainly through the influence of her uncle the duke of Norfolk, and Gardiner, bishop of Winchester, the leaders of the papal party, by whose counsels she was entirely guided. She speedily gained great ascendancy over the king, which she employed to arrest the progress of the Reformation; and on his return to London from York, whither she had accompanied him in 1541, he gave public thanks for his domestic felicity. The very next day, however, conclusive evidence of the queen's immorality was laid before the king by Archbishop Cranmer. She confessed her guilt to a commission appointed by parliament to examine her; though it is doubtful whether her confession extended farther than the admission of licentious conduct before her marriage to the king. She was shortly after attainted of high treason, and, along with the Lady Rochford, her accomplice, was beheaded on Tower-hill on the 12th of February, 1542. Lady Rochford was the sister-in-law of Anne Boleyn, and had been the principal instrument in bringing that unfortunate lady, together with her own husband, to the block. Her death was therefore commonly regarded at the time as a judgment from heaven. Lord William Howard, and several other relatives of Catherine, were found guilty of misprision of treason, and condemned to imprisonment and

forfeiture of their goods; and Dercham and Culpepper, her associates in guilt, were executed.—J. T.

CATHERINE PARR, sixth and last wife of Henry VIII., was the daughter of Sir Thomas Parr of Kendal. She had been twice married before the king selected her for his consort; first, to Edward, eldest son of Thomas, Lord Brough; and, secondly, to John Neville, Lord Latimer. She had no children by either. At the time of her marriage to Henry, 12th July, 1543, she was in her thirty-fourth year, and was esteemed "a very matronly, learned, discreet, and sagacious woman." She was well versed not only in polite literature, but in theology, and was a zealous adherent of the protestant faith. She became, in consequence, exceedingly obnoxious to the papal party, who laid a plot for her destruction, which she narrowly escaped by her adroit submission to the authority of the king, whom she had provoked by arguing with him on religious subjects, and urging him to perfect the work of the Reformation. When Henry set out on his famous expedition to France in 1544, he appointed Catherine regent during his absence. She must have frequently felt, however, that her life hung upon a thread, especially after disease and confinement had aggravated the headstrong disposition and impatient temper of her imperious husband. After the death of Henry, Catherine married, in 1547, Sir Thomas Seymour, lord-admiral of England, and brother to the protector, Somerset—a marriage of affection on her part, but of interest on the part of Seymour, who was a man of inordinate ambition, and very speedily neglected and ill-treated his wife. She died, after giving birth to a daughter, on the 30th of September, 1548. On her death-bed she pathetically complained that "those about her cared but little for her," and that she had received some neglect or mismanagement at the time of her delivery. Catherine was learned, and a lover of learning. She published in 1545 a volume of "Prayers and Meditations, collected out of Holy Woorkes," and containing some psalms and other devotional pieces of her own composition. She wrote also the "Lamentation of a Sinner Bewailing the Ignorance of Her Blind Life," meaning the errors of popery in which she had passed her earlier years. This work was published after her death in 1548, with a preface by Lord Burleigh, Queen Elizabeth's famous minister.—J. T.

CATHARINE PAULOWNA, fourth daughter of Paul I., emperor of Russia, was born at St. Petersburg in 1788. After refusing the hand of Napoleon, she married in 1809 Peter Frederick George, duke of Oldenburg, who died in 1812. The widowed princess accompanied her brother, the Emperor Alexander, who was fondly attached to her, all through the campaigns of 1813 and 1814. In the beginning of 1816 she married the prince royal of Wurtemberg, who, nine months after, succeeded to the throne under the title of William I. This able and accomplished princess died suddenly in 1819.

CATHERINOT, NICOLAS, a French lawyer and philologer, born at the château de Susson, near Bourges, in 1628; died at Bourges in 1688. He was educated in the faculty of law at Bourges, then practised as avocat at Paris for three years, and afterwards returned to Bourges, having obtained there some judicial appointment. His being known beyond his own day arose from the accident of his being an antiquarian as well as a lawyer, and one whose labours were not much valued. The antiquities of Berry early engaged his attention, and he published a number of pamphlets about them—if his mode of circulating his works can be called publication. Booksellers would not be at the expense of printing what nobody would buy: the author, as he could afford it, would print a pamphlet of some ten or twelve pages; would then loiter in bookshops, or at bookstalls, affecting to look over works exposed for sale, and before going away, contrive to leave on counters, or among the pages of the books he had been examining, his brochures. For nearly thirty years he pursued this strange habit, and secured for his name and for his works a sort of fame, which, had they been published in the ordinary way, they could not have obtained. The difficulty of getting a complete set of parts in this way dispersed, was such as to render the search an object of interest to traders in book rarities; and Catherinot's works are still looked for, and bring very high prices. In the Bibliothèque Curieuse of David Clement, one hundred and eighty-two of these pamphlets are mentioned. Catherinot was also a poet. He tells us that he had composed fifty thousand lines without biting his nails, thus violating the established cus-

tom of the irritable race. Eight books of Latin epigrams proved his stupidity and his scholarship. He also published some law tracts, said to be of no value.—J. A., D.

CATILINE, or with his full name, L. SERGIUS CATILINA, occupies a much more prominent position in the annals of the civil conflicts of Rome than the influence he exercised upon them would warrant, had not the extant writings of Cicero and Sallust made his name familiar to us from our schoolboy days. Descended from a noble family; endowed with strength of mind and body; with courage, capacity, and ability equal to the discharge of any office, whether civil or military, in the service of his country, he might have satisfied an honourable ambition and become a benefactor of his fellow-citizens. But with great and shining intellectual qualities he combined a moral depravity which, even in his depraved age, secured him a disgraceful prominence. His brutal and savage disposition was stimulated to madness by the intoxicating revelry in infamous lust and civil blood, with which the partisans of Sulla were allowed to gorge themselves after the triumph of their leader. Catiline was foremost among the bloodhounds of the dictator. He had free scope to follow the inclinations of his savage nature, and to restore his dilapidated fortune with the spoils of his victims. He is accused of having murdered his brother-in-law, his wife, his son, and many others, who suffered at his hands not only a cruel death, but more cruel tortures before death, and disgraceful indignities after. Yet, such was the state of public morals of those times, that, nevertheless, he obtained in due season the office of prætor, B.C. 67, and was sent to govern the province of Africa. This is explicable only from the unsettled state of public affairs at that time. Rome had just passed through a sanguinary civil war, which had so thoroughly shaken the principles of legality, that instead of time-honoured and deep-seated reverence for law and order, and for those who, as the executive of the state were the bearers of its majesty, it was force and violence, fraud and cunning, which upheld the government and animated the opposition. Thus Catiline, through his daring and ability, soon found himself the apparent leader of a band of noble profligates, who had nothing to lose and everything to gain in a political and social revolution. It was a matter of no moment to him that the party in power, whom it was his object to overthrow, were his old confederates, the aristocracy. He longed for another general confusion, Sullan proscriptions, spoliation of the wealthy, and abolition of debts; and he was bold enough to aspire to become a second Sulla himself. It was easy in the then state of society to find confederates among the highest and among the lowest classes. But this was only part of the danger by which the state was menaced. It was no secret to the ruling aristocracy that their real enemy was not Catiline, but a craftier and more dangerous man working behind the scenes, and waiting for an opportune moment to step in and secure for himself all the advantages of their overthrow. This was no other than C. Julius Cæsar. He was too discreet and wary to make common cause with such a desperate character as Catiline. He guarded his words and actions so that no charge of complicity could be brought against him; but, nevertheless, he pulled the strings, and though he may have thought Catiline's success improbable, he knew it was possible, and he lay ready to pounce upon the prey if it should be hunted down by his hounds. The political situation of Rome was very favourable for a bold stroke. Pompey, the champion of the aristocracy, was absent in Asia with all the military strength of the republic. He had brought to a victorious issue the long war with Mithridates. What his intentions were, was a subject of anxious and doubtful speculation for a man like Cæsar. If Pompey returned to Italy with his army, it was in his power to make himself master of the Roman world. No time was, therefore, to be lost if his rivals wished to prevent this. They might hope to obtain possession of the machinery of government, just as Marius and Cinna had done before to oppose Sulla, and as Pompey afterwards did himself to oppose Cæsar. Having constituted themselves the legitimate government, no matter by what means, they might hope to dictate the law to Pompey. To give a colour to this selfish and personal policy, the leaders of this party proclaimed themselves the patrons of the people and the enemies of the aristocracy. They endeavoured to gain adherents by proposing popular measures, such as the agrarian law brought in by Cæsar, by which it was intended to sell all the domain land of the state in the provinces, and to allot land in the valuable domain of Capua to

the hungry populace of Rome. Such was the state of parties when Catiline, soon after his return from Africa in B.C. 66, attempted to seize the consulship by open violence. Cæsar and Crassus are said to have been privy to his conspiracy; but it failed through the impatience of Catiline, who gave the preconcerted signal before his associates were ready. It must create surprise that so outrageous an attempt, which only failed through a mere accident, was not followed by an official investigation, and by the punishment of those implicated in it. But the aristocratical party in possession of the government was without moral strength and without able leaders. United by no principle, its members consulted their own interest alone, which counselled caution rather than vigour and severity. We consequently find Catiline undiscouraged by his first failure, offering himself for the consulship of the year 63 B.C., and straining every nerve to defeat the candidate of the aristocracy, the great political triumvir, M. Tullius Cicero. Foiled in this competition, he determined once more to try his chance at the next consular elections; but at the same time to prepare his party for open resistance and civil war. But Cicero, who, through his spies, was informed of all his doings, met him at every point, and by alarming the people with vague and perhaps exaggerated reports of Catiline's nefarious and bloody schemes, created a general panic, the result of which was that Catiline lost his election a second time. Now there was nothing left to him but open violence. He despatched emissaries into various parts of Italy to organize the insurrection, especially into Etruria, which swarmed with the disbanded veterans of Sulla. He himself resolved to stay at Rome, where, simultaneously with the advance of the insurrectionary forces, an outbreak was prepared, the hideous atrocity of which we could hardly credit, had not the Marian and Sullan massacres preceded. Even after having fixed upon his atrocious plan, Catiline had the impudence and audacity to appear in the senate, and, when charged by Cicero with every detail of his attempt, to protest his innocence and challenge inquiry. But when he saw the alarm and indignation caused by Cicero's discovery, he left Rome in the following night for the army in Etruria, intrusting the execution of the concerted scheme to his associates. With the flight of Catiline the greatest danger was averted, for in an open war even an abler man must have succumbed to the organized forces of the government. But so long as a powerful section of the conspirators was left in Rome the government could not feel safe. It was well known to Cicero who these conspirators were, and what were their plans. The prætor, P. Cornelius Lentulus, and C. Cornelius Cethegus, were at their head, and grave suspicions attached to Cæsar, Crassus, and even to L. Antonius, Cicero's colleague in the consulship. But such was the feebleness of the government, and the inefficiency of the means of public safety, that these men continued to carry on their treasonable plotting under the very eyes of the public authorities. If their leader, Lentulus, had been a man of capacity they must have succeeded; but whilst neglecting to act promptly and energetically, they seemed to delight only in planning and plotting. They were foolish enough to open negotiations with the members of an embassy of the Celtic tribe of the Allobroges, who were then in Rome on a mission of complaint and remonstrance from their countrymen. The conspirators tried to gain over the Allobroges, for objects so distant and uncertain that we are at a loss to discover them. The Allobrogian ambassadors pretended to listen to these overtures, but at the same time reported the transactions to the consul. The conspirators were immediately summoned to appear in the senate, and being convicted by irrefragable evidence, they confessed their guilt. At this stage one would fancy that the troubles of the government ought to have been over. But in Rome the difficulty seemed rather increased than diminished; for the question arose, what was to be done with the prisoners. There was no efficient force, whether military or police, even to keep the prisoners in safe custody. They might at any time be forcibly liberated by their adherents. Nor was there a short and safe procedure by which they could be tried and punished. The popular assembly for the trial of capital offences had fallen into disuse, and would have been too cumbersome and dangerous a machinery, if it could have been resorted to. The senate had no jurisdiction in this matter, but all the risk and all the responsibility. If, therefore, the city was to be saved from anarchy, it was necessary to strain the law. It fell to the lot of Cicero, one of the most timid and vacillating of public men, to propose

this bold and extreme measure. He was well aware of the dangerous responsibility he incurred, but he had firmness enough on this momentous occasion to advocate a vigorous policy. He carried the senate with him, and in spite of the opposition of Cæsar, sentence of death was passed on the prisoners. The sentence was executed without delay. In the dismal prison under the capitol, some of the first nobility of Rome were, in the same night, strangled by the common executioner. The people received the news with shouts of triumph, and welcomed Cicero as their deliverer and as the father of his country.

Thus the conspiracy found an inglorious end in Rome. Meanwhile, Catiline had taken the command of a body of troops in Etruria, which soon swelled to the dimensions of two legions, animated with the courage of despair; but the forces of the government, victorious in all parts of Italy over the irregular levies of the conspirators, gradually surrounded Catiline on all sides. The consul Antonius, who was not unjustly suspected of favouring Catiline's design, but who had been kept in check by his colleague Cicero, commanded the Roman army; but he seemed not inclined to come to the rescue of an old associate whose cause had become desperate. Under the pretext of suffering from gout, he left the command to his legate, Petreius. Catiline, seeing there was no escape, offered battle near Pistoria in Etruria, and fell with his adherents to the number of 3000. in March, 62 B.C. When the body was found, his features even in death were stamped with the ferocity of his character. Such was the sanguinary end of a civil commotion which, indeed, had no lasting influence upon the destinies of Rome, but is highly interesting to the historian, as showing clearly the rotten state of the Roman republic, and its inability to resist the designs of men like Cæsar and Augustus.—T. I.

**CATINAT DE LA FAUCONNERIE, NICOLAS DE**, marshal of France, and one of the ablest generals of Louis XIV., was the son of the president of the parliament of Paris, and was born 1st September, 1637. He studied for the bar, but having lost his first cause unjustly, as he imagined, he quitted the profession in disgust and entered the army. His conspicuous bravery in the presence of the king at the siege of Lisle in 1667, procured him a lieutenancy in the regiment of guards. He distinguished himself at Maastricht, Senef, Cambray, Valenciennes, and other places noted in the wars of Louis XIV., and rose rapidly in the service, till he attained the rank of lieutenant-general in 1688. Two years after this he inflicted a sanguinary defeat upon Victor Amadeus, duke of Savoy, at Staffarde, and again in 1691 at Marsaille, and made himself master of the whole of Savoy and of a part of Piedmont. In 1693 he was created a marshal of France. In 1696 he acted as plenipotentiary of the French king in arranging the terms of peace with the duke of Savoy. He was then appointed commander of the army in Flanders, and, in spite of the efforts of the prince of Orange and the elector of Bavaria, besieged and took the town of Ath in 1697. In 1701 war broke out again in Italy, and Catinat was opposed to the celebrated Prince Eugene, who commanded the imperial forces. The issue of the campaign was disastrous to the French, and Catinat was superseded by Marshal Villeroi. He was shortly after nominated to the command of the army of Alsatia, but a large portion of his forces having been withdrawn by Marshal Villars, Catinat was reduced to a state of inactivity, and in consequence solicited and obtained his discharge. He spent the remainder of his days in retirement at St. Gratien, and died in 1712.—J. T.

**CATLIN, GEORGE**, a native of Wyoming, North America, was born in the beginning of this century, of parents who entered that sylvan valley after the close of the revolutionary war and the Indian massacre. The events of his life are well-marked and of considerable interest; his earliest boyhood spent in Wyoming; ten years in the valley of the Oc-qua-go, where he held alternately the plough, the rifle, and the fishing-rod; five years at the classics; two years under Reeve and Gould in Connecticut, studying Blackstone and Coke; three years practising in the courts of Pennsylvania; five years at the easel in Philadelphia; eight years amongst the Indian tribes of the prairies and Rocky Mountains; and eight years in the civilized capitals and towns of Europe, presented to kings, queens, and princes. His father, practising as a solicitor, educated his son for a higher walk in the same profession. But two passions, growing with his growth and strengthening with his strength, shaped a life now rough-hewn for law, into a unique and unexpected model. The love of adventure, fostered by stories of tomahawks and

bisons; and the love of art, the gift of benignant fortune, made the pursuits of his profession distasteful. Accordingly he sold his library and the appurtenances of his office, converted the proceeds into brushes and paint-pots, and started for Philadelphia. When practising the art of painting there, without teacher or adviser, "a delegation of some ten or twelve noble and dignified-looking Indians," strutting about in silent and stoic dignity, with their brows plumed with the quills of the war eagle, wearing tunic and mantean, shield and helmet, arrived in the city, and fired the sensitive imagination of the aspiring painter. Despite the solicitations of friends, relatives, and wife, he remained immovable in his determination to traverse the "far west!" to place on canvass the figures, customs, and ceremonies of people little known, and thus to snatch from oblivion the memory of tribes whose origin was lost in antiquity, and whose existence was rapidly drawing to a close. During the eight years of his travels, Mr. Catlin visited forty-eight tribes; familiarizing himself with their economic and ceremonial history, by becoming one of themselves, and assiduous in the use of brush and palette. By dint of laudable toil he collected three hundred and ten portraits in oil, all painted in their native dress and in their own wigwams, together with two hundred other paintings in oil, containing views of Indian villages, their sports, their dances, their ballplays, buffalo hunting, horse racing, and religious rites. Few books have greater interest to the reader of history than the "Letters and Notes" of Mr. Catlin. On his return, he exhibited his Indian collection in New York, Boston, and Philadelphia. In 1839 he embarked at New York for Liverpool, with six hundred portraits, two grisly bears, &c., making altogether a freight of eight tons. When Mr. Catlin arrived in London, large audiences crowded to see his unexampled specimens, and to hear his lively descriptions. He received visits and invitations from gentry and nobility, looked down on Hyde Park from the top of Mr. Disraeli's house, danced in the Caledonian ball at Almacks, and was presented to the queen. In 1844 a Mr. Melody landed in Liverpool with fourteen Ioway Indians for exhibition in this country, and prevailed upon Mr. Catlin to deliver lectures on their habits and customs. After a short stay in England, they exhibited in Paris and in Brussels. In 1848 Mr. Catlin returned to London, and betook himself once more to painting. But his wife having died some time previous, the healing wounds of bereavement were torn open by the death of his only boy; whereupon he determined to quit England, and return to his native country. Besides the "Letters and Notes on the Manners and Conditions of the North American Indians," Mr. Catlin published a volume entitled "Catlin's Notes of Eight Years' Travels in Europe," and a pamphlet under the title of "Catlin's Notes for the Emigrant to America."—G. H. P.

**CATO**: the more distinguished persons who bore this name follow in chronological order:—

✓**CATO**, *i. e.*, "the Wise or Sagacious," a surname given to **MARCUS PORCIUS PRISCUS**, sometimes called the Censor and Cato Major, a celebrated Roman soldier, statesman, and orator, who was born at Tusculum in 234 B.C., and passed his earlier years on his father's farm in the Sabine territory. At the usual military age of seventeen he commenced his career as a soldier, in 217 B.C., the year in which Hannibal was laying waste the north of Italy, and throughout the remainder of the second Punic war he signalized himself by his hardness and sobriety no less than by his valour. On the termination of the war he retired to his farm, and is said to have taken for a model the frugality and simple manners of the famous old Roman, Curius Dentatus, who once occupied an adjoining farm. Many of Cato's shrewd and laconic maxims became current among his neighbours, and at length his reputation attracted the attention of Valerius Flaccus, a young nobleman of considerable influence, who persuaded him to remove to Rome and to become a candidate for office. He was elected quæstor in 204 B.C., and served in Africa under Scipio, whose profuse expenditure excited his strong disapprobation, and who was afterwards violently denounced by him before the Roman senate. In 199 B.C. he was made ædile, and in the following year prætor, having Sardinia assigned him as his province. He was elected consul in 195 B.C., along with his friend and patron Valerius, and was appointed governor of Spain, where he conducted military operations with great ability and success, and was rewarded with a triumph on his return to Rome in 194 B.C. Three years later he served under the consul M. Aclius Glabrio in the campaign against Antiochus in Greece, and the

chief glory of the victory gained by the Roman army at Therinopylæ was ascribed to Cato. This action terminated his military career, and from this time he took an active and conspicuous part in civil affairs. In 184 B.C. he was elected censor, with his friend Valerius again as his colleague. The remarkable strictness with which Cato performed the duties of this office, and the unflinching determination with which he attacked the vices and crimes of the nobles and checked their luxurious habits, subjected him to great obloquy and raised him up a host of enemies, who assailed him with incessant prosecutions. But he resolutely persevered in his efforts to stem the tide of luxury and vice, and to restore the ancient simplicity of manners and purity of morals. With all his severity and rusticity, Cato was a friend to literature, and was one of the patrons of the poet Ennius, whom he brought from Sardinia to Italy. He learned the Greek language after he was sixty years of age, and according to Cicero, was a warm admirer of the historians, philosophers, and orators of Greece. He was scarcely less celebrated as an orator than as a statesman and soldier, and left behind him 150 orations which were long held in admiration by his countrymen. With all his excellencies, Cato was a man of strong prejudices, and his character was disfigured by great faults. He was envious as well as ambitious, harsh and severe; a man of iron body and iron soul, Livy terms him; and utterly unscrupulous in amassing wealth by all means which the law did not forbid and punish. He was the chief instigator of the third Punic war, maintaining that Rome could never be safe as long as Carthage was in existence, and adding to every speech he delivered in the senate, no matter what the subject might be, the well-known words, "Carthage must be destroyed." He died in 149 B.C. at the age of eighty-five, leaving behind him, besides his orations, a work on rural affairs, entitled "De Re Rustica," and a historical work entitled "Origines," of which only a few fragments remain.—(Livy, lib. xxxix. cap 40; Plutarch, *Life of Cato*; and a life which passes under the name of Corn. Nepos.)—J. T.

CATO, M. PORCIUS LICINIANUS, the senior of the two sons of Cato the censor, and the second of his name, is famous for his eminence as a practical jurist, and his authorship of works which became authorities in the Roman law. He was reared in the stoical principles of the elder Cato, and the care bestowed on his physical education had the effect of bracing a naturally weak frame to endure the vicissitudes and hardships of warfare. He served under Popilius Lænas in Liguria in 173 B.C.—in a legion which was afterwards disbanded. Cicero (*De Officiis* i. 11), in illustration of the strict forms of military law, mentions that Cato on this occasion thought it necessary to renew his military oath, before engaging with the enemy. He fought again at Pydna (B.C. 168), and was commended for his prowess by the consul Æmilius, whose daughter he subsequently married. From this time till his death, in 152 B.C. he was exclusively engaged in his legal pursuits. He died as prætor designatus some years before his father. Cicero, in the *De Oratore*, alludes to the publication of Cato's "Responsa," and objects to the introduction of the names of persons, which they seemed to authorize. Aulus Gellius speaks of his having written a valuable treatise "De Juris Disciplina." He is quoted by the jurist Paulus, and Festus refers to his commentaries. It is probably from him that the regula Catoniana take its name. This was a rule of Roman law applying the maxim "quod initio non valet, id tractu temporis non potest convalescere," to test the legitimacy of legacies. He decided that those only could be considered valid which were valid from the first. A bequest, for instance, could only be received by one who was in a rank legally entitled to receive it when the bequest was made; he could not claim it on the ground of having afterwards risen to that rank.—J. N.

CATO, MARCIUS PORCIUS, surnamed UTICENSIS (of Utica), from the place of his death, was the great-grandson of Cato the censor, and was born in 95 B.C. From his earliest years he exhibited great firmness and independence, and as he advanced towards manhood, the inflexible decision, harshness, and severity of his character increased. He applied himself to the study of the stoic philosophy under Antipater of Tyre; and taking his great-grandfather as his model, adopted frugal habits and manners, and inured himself to hardships and privations by frequent exposure to cold and fatigue, by abstaining from food, and by making long journeys on foot, bareheaded, and in all weathers. He affected singularity, and stood out conspicuous from the profligate nobles of his day, in his morals no less than in his

manners. He served his first campaign as a volunteer under Gellius Poplicola in the servile war of Spartacus, 72 B.C., and afterwards, about 67 B.C., as legionary tribune in Macedonia under the proprætor Rubrius, where he distinguished himself by his sobriety and temperance, as well as by his courage and activity. In 65 B.C. he was elected quæstor, and corrected various abuses in the administration of the public funds. He supported Cicero against Catiline and his associates in 63 B.C., and made a vigorous speech in support of the motion, that the conspirators should be put to death. On the breaking out of the great civil war, having failed in his efforts to effect a reconciliation between Cæsar and Pompey, he joined the latter, and after the battle of Pharsalia and the death of Pompey, he passed over to Africa. He resigned the command of the army there to Q. Metellus Scipio, the father-in-law of Pompey, who proved incompetent for the task, and was completely defeated at Thapsus, April 6, B.C. 46. Cato then fled to Utica, followed by Cæsar, and finding that the inhabitants were unwilling to stand a siege, he advised his friends to save themselves by flight, but refused to accompany them himself, and resolved to die rather than submit to the conqueror. After partaking of his evening's meal, he tenderly embraced his son and the friends who remained with him, and withdrew into his chamber, where he first read a portion of Plato's Phædo on the Immortality of the Soul, and then stabbed himself below the breast, and died that same night. On receiving intelligence of this event, Cæsar exclaimed—"Cato, I grudge thee thy death, since thou hast grudged me the glory of saving thy life."—(Plutarch, *Life of Cato Minor*; Sallust, *Catil.* cc. 52-54; *Lucan*, i. 128, ii. 380; Addison's *Cato*.)—J. T.

CATO, VALERIUS, a distinguished Roman grammarian and poet, who lived about the close of the republic. He was left an orphan at an early age, and was stripped of his patrimony during the usurpation of Sulla. He afterwards acquired a villa and beautiful domain at Tusculum, but his creditors ultimately seized all his property, and he died at an advanced age in great poverty. Besides various treatises on grammar, he was the author of two poems, "Lydia," and "Diana," of which only the titles have survived. To Cato has also been ascribed a poem entitled "Diræ," edited at Oxford in 1838 by Dr. Giles.—J. T.

CATO, DIONYSIUS, the name given to the author of a Latin work entitled "Disticha de Moribus ad Filium." These distichs are in hexameter verse, and consist of moral precepts for the young. During the middle ages they were extensively used in schools, both on the continent and in England. An English version was published by Caxton in 1483.—J. T.

CATROU, FRANÇOIS, a learned French author, and a member of the Society of Jesus, was born in 1659. He officiated as a preacher for seven years, and then undertook the management of the *Journal de Trévoux*. His principal production, "Histoire Romaine," 2 vols. 4to, has been translated into Italian, Spanish, German, and English. It is a learned and valuable work, but disfigured by a bad style. Catrou died in 1737.—J. T.

CATS, JACQUES, born in 1577 at Brouwershaven; died in 1660 at Zagvliet. First studied at Leyden, and then took the degree of doctor at Orleans. He refused a professorship at Leyden, wishing to devote himself to his own studies. But political duties were forced upon him; in 1627 and 1631 he was ambassador in England; in 1636 and 1651 he was grand pensionary of Holland. Cats' poems are described as characterized by simplicity and naïveté. They shared the fate of most national poetry—for a while popular, then disregarded or forgotten, then recalled to public attention and again admired, because it becomes a sort of patriotism to admire them. In something of this feeling, Bilderdijk and Frith republished Cats' poems in 1800. A monument was erected to him at Gand, which, to use the phrase adopted on such occasions, was inaugurated in 1829.—J. A. D.

\* CATTANEO, CARLO, born at Milan at the commencement of the present century, celebrated as the greatest economist and statistician of contemporary Italy. He took an active part in the Lombard insurrection of 1848, first, by personally heading the attack in Contrada del Monte; then as the leading member of the committee of war, which so admirably directed the memorable five days' struggle in Milan, that for a while emancipated Lombardy. Cattaneo may be said to have then had Milan in his hands; but when the king of Piedmont entered Lombardy and offered to prosecute the war, Cattaneo, although by conviction a republican, at once yielded his power to a provisional government formed of the king's adherents, and withdrew from all interference in public

affairs. When the king, after repeated defeats, signed an armistice, by the terms of which Milan was again delivered up to the Austrians, Cattaneo went to Switzerland, where he published a valuable work on the Lombard insurrection, and the true causes of its overthrow—as a commentary to which he undertook the publication of very important historical documents relating to that period, under the title of “Archivio Storico,” of which three volumes have already appeared. Cattaneo has been created a Swiss citizen, in consideration of his valuable services in relation to various undertakings of public industrial and economical utility, and has been honoured with the appointment of professor of philosophy at the lyceum of Ticino. Among his most important works may be mentioned a translation of Zschockke’s History of Switzerland; “Notizie Naturali e Civili della Lombardia;” and the “Lettere sopra alcune istituzioni agrarie dell’ Alta Italia applicabili a sollievo dell’ Irlanda,” written in reply to some questions addressed by Lord Ebrington to the Austrian government of Lombardy.—E. A. H.

CATTANEO, DANESE, an Italian sculptor and architect, was born at Carrara about 1500. He spent some time at Verona, as a pupil of Sansovino. Among many other works he executed the tomb of the Venetian general, Alexander Contarini, at Padua; the mausoleum of Giano Fregoso at Verona; and the tomb of Andrea Badouero at Venice. Cattaneo left behind him a long poem entitled “L’Amor di Marfisa.”—J. T.

CATTANEO, GIAMMARIA, a learned Italian writer, who died at Rome in 1529, was the author of a celebrated commentary on the Letters and Panegyric of Pliny the Younger: Venice, 1500, and Milan, 1506; of translations of Isocrates and Lucian; and an unfinished poem on the taking of Jerusalem by the crusaders.

CATTENBURGH, ADRIAN VAN, a Dutch divine, born in 1664; died in 1737. He was one of the leaders of the Dutch Remonstrants, and held the Arminian tenets of that sect. He is the author of “Spieilegium theologiæ Christianæ Philippi a Limborch,” 2 vols., folio; a “Life of Hugo Grotius” in Dutch, 2 vols., folio; “Bibliotheca Scriptorum Remonstrantium,” 1 vol., 8vo; “Syntagma Scientiæ Mosaicæ,” 4to, against deists and atheists.—J. T.

\* CATTERMOLE, GEORGE, an English painter in water-colour, born in 1800 at Dickleburgh in Norfolk. His subjects are chiefly prominent scenes in English history, in Scott’s novels, and Shakspeare’s plays. His productions are distinguished by genuine poetic feeling and fineness of colour and tone. He designed the engravings for the History of the Great Civil War in England by his brother, the Rev. R. Cattermole.—J. B.

CATTHO, ANGELO, archbishop of Vienna, was born at Tarentum, and died at Vienne in 1494. He resided for some time at the court of Charles the Bold of Burgundy, and was the friend of Philip de Comines, to whom he gave some assistance in the composition of his celebrated Memoirs. After the defeat of the duke of Burgundy by the Swiss, Cattho repaired to France, where he was cordially welcomed by Louis XI., who made him his almoner, and afterwards created him archbishop of Vienne in 1482. He addicted himself to the study of astrology, and is said to have announced to Louis the death of his enemy, the duke of Burgundy, at the moment it occurred.—J. T.

CATTON, CHARLES, an English artist, born at Norwich, who served his apprenticeship as a coach painter. He afterwards studied in the academy of St. Martin’s Lane. He was the first to introduce any close resemblance to nature, or indeed any sort of art, in the rendering of the animals of heraldic designs. A collection of his drawings of animals was engraved and published. He was chosen one of the original members of the Royal Academy, and became master of the company of paper stainers in 1784. He died in 1798.—His son CHARLES had some fame as a landscape painter. He emigrated to New York in 1800, and died there in 1819.—W. T.

CATULLUS, CAIUS VALERIUS, one of the two poets of the republic whose genius still shines with a lustre unobscured by the brilliancy of the Augustan age. Old politics often pass away in a blaze of light. The sunset of Greek liberty was the meridian of Greek speculation. The last days of free Rome were peculiarly rich in the display of literary eminence, and illuminated by a whole cluster of great names. The earlier poets were rivalled, if not surpassed, in the graces of refinement and fluency by those who, in the succeeding epoch, adorned the imperial court; but they had on their side all the advantage of greater freshness and greater freedom. They were at least

imitators at first hand; their language and imagery were new in Latin speech, while those who followed in their track frequently present only the reflection of a reflection. This freshness is a distinguishing feature of the poems of Catullus. He was a keen student of her literature, and adopted many of his measures, thoughts, and expressions from the lyrists of Greece. Some of his verses are direct translations; others in their metaphors, phrases, and subject matter, vividly recall Greek models. But those phrases and expressions had not become the common stock of poetry, and he applied them with all the vigour of an original mind to the purposes of his own inspiration. He lived before the times of patronage and dictation, with a large share of that daring spirit which belongs more to an ideal than an actual republic. He wrote to please himself, his mistress, and his friends, because he chose and as he chose, and this gives his verses the fascination of freedom which we sometimes miss in Horace, and look for vainly in Virgil. The personal career of the poet was that of most youths of fortune in his age. He was born at Verona about 87 B.C. His father, Valerius, held a good station in society, and was known as the friend and occasional host of Cæsar. Catullus himself must have enjoyed a comfortable independence. Besides the family residence on a promontory of the Lago de Garda, he had a villa near Tibur, celebrated in another of his songs. He came to Rome early in youth—“venustus et dicax et urbanus”—and became a favourite with the wits and ladies of the city. Cicero, C. Nepos, Asinius Pollio, Varus, and Calvus were among his friends; to the first he offers one of his most complimentary addresses; the last is the theme of one of his lighter satires. Having wasted his means by a somewhat reckless pursuit of pleasure, Catullus was pestered by duns, and accompanied the prætor Memmius to Bithynia, with a view of reinstating his fortune. Disappointed in his hopes of the expedition, he has recorded his chagrin in verses which allude to “Memmi clara propago” in terms strangely contrasting with the eulogy of his more philosophic admirer. The “Dedicatio Phælii,” and the exquisite lines in praise of Sirmio, refer to the poet’s return. The death of his brother in the Troad, which called forth some of the most touching expressions of fraternal affection, probably occurred at a later period. The exact term of his own career is unknown; it is only evident from Carmen 52 that he must have seen Vatinius consul in 47 B.C. He appears to have divided the latter years of his life between his northern villa and the capital.

The poems of Catullus which have come down to us are derived from a MS. discovered at Verona early in the fourteenth century. They consist of one hundred and sixteen pieces, a large proportion of which record the shifting moods of the poet’s impulsive nature. The most ardent of lovers, a warm friend, a good hater, he has given expression to all forms of passion, with an equal disregard of restraint. His amatory verses are, in their grace, sweetness, and simplicity, gems of art, but they owe their special charms to an air of genuineness. Rich in the most playful fancies, none of them seem to have been written as mere exercises of the imagination. Catullus found in song the natural vent for strong feeling. Whoever Lesbia or Clodia may have been, some living and breathing beauty must have set the poet’s heart on fire. His epigrams sparkle with wit, sprightly or spiteful as they serve to preserve a jest or perpetuate sincere indignation. Their scurrility must be explained by the taint of coarseness which pervaded the literature of the time. Three of the most virulent are aimed at Cæsar himself. There is a story told, that on reading one of them, he threw it into the fire, and invited the writer to dinner on the same afternoon, which, if true, places in a conspicuous light the magnanimity of the great Julius. Among the finest of those fugitive pieces are “Ad Passerem;” “Miser Catulle, desinas ineptire;” “Furi et Aureli comites Catulli;” “Ad Dianam;” “De Acme et Septimio;” “Ad Pocillatorem;” &c. The three elegies “Ad Hortalum,” “Ad Manlium,” and the “Inferiæ ad Fratris tumulum,” are interesting memorials of the author’s life, and express with delicate pathos the sorrows of his bereavement. Of the poet’s longer performances, the most remarkable are the two odes written for the nuptials of Julia and Manlius, the “Epithalamium Pelei et Thetidis,” and the “Atys.” The first are for passionate depth of conception, beauty of expression, and choice profusion of imagery unrivalled among the love songs of classical antiquity. The exquisite stanza about the young Torquatus has tried and baffled a host of copyists, while the similes of the flower and the vine

in the *carmen* have provoked more imitations than any other in the range of Latin poetry. The hexameters in the Peleus and Thetis have a greater majesty and flow than is to be found in the verses of the Augustan age. The picture of Ariadne's solitude, and the description of "Bacchus and his crew," are in the highest degree dramatic; in richness of colouring they are equal to the best passages of Keats. The "Atys," both in its tone and rhythm, bears traces of a Greek origin. It is unlike any modern production, and can hardly be appreciated in a northern country. It is properly a birth of the East, a wonderful representation of a wonderful worship. Its wild intensity seems to suit the religion of Cybele. The dithyrambs, which now hurry along with the fire of a maddening frenzy, now break into the passion of remorse, and again die away in a wail of despair, are inspired by the very spirit of the Mænad. Catullus is the most versatile of the Latin poets; he touched almost every theme of poetry, and adorned all he touched. Lucretius surpassed him in sublimity; Horace in the melody and refinement of his lyric strains; Ovid was the greater master of elegy; the epigrams of Martial have a keener sting; but Catullus was excellent in all, and only second in any of those lines of effort. He held a high place in the esteem of his contemporaries. Among his successors Ovid speaks of him as the glory of Verona, and feigns to have met his shade among the foremost of the blessed bards. Propertius declares that Lesbia has, through her Roman lover's praise, outstripped the fame of Helen herself; and Martial, in reference to the earlier poets, says, with a mixture of modesty and confidence, "uno sed tibi sim minor Catullo." The epithet *doctus* so frequently applied to him, may refer to his intimate acquaintance with Greek literature; but it is more likely used in the sense of *callidus*, to express the skill and subtlety of his own language. One of our living classics has called Catullus "the most elegant of all poets in all ages." We do not know that he belonged to any philosophical sect, but his writings are those of an Epicurean. Oppressed by a prevailing sense of the shadows that close round the sunshine of life, he seeks and finds refuge in the joys of the hour. His morality was that most prevalent in his age. *Πῦν καὶ φαίγε, θνήσκῃς ὁ βίβας.* "Let us eat and drink for to-morrow we die." The same strain of thought is common in the odes of Horace; it appears in the poetry of all nations from a sort of beauty in the contrast between gaiety and gloom on which it rests. "Death is the end of life; ah, why should life all labour be?" Catullus wrote in thirteen varieties of metre. His text is very corrupt. The best restoration of it is Lachmann's. Dunlop gives a fair selection of imitations of his most famous passages; but the most adequate criticism of him that has yet appeared is Landor's. There have been many versions of his poems; few of them are very successful. It requires a poet to translate a poet—a poet, a lover, and a man of fashion to translate Catullus.—J. N.

CATULUS, the name of an illustrious Roman family belonging to the gens Lutatia, which has produced a considerable number of distinguished generals and statesmen:—

CATULUS, CAIUS LUTATIUS, was consul along with A. Postumius Albinus in 242 B.C. He acquired great distinction in the first Punic war by defeating, near the Ægates, the Carthaginian fleet under Hanno, destroying no fewer than 120 galleys.

CATULUS, QUINTUS LUTATIUS, consul along with Marius in 102 B.C., gained, in conjunction with his colleague, a signal victory over the Cimbri at Vereellæ, in the north of Italy. In the civil war he espoused the cause of Sulla, and was prescribed by Marius, B.C. 87. Finding escape impossible, he put an end to his life by shutting himself up in a room filled with the fumes of burning charcoal. Catulus is warmly commended by Cicero for his wisdom, integrity, and eloquence. He possessed a highly cultivated mind, was well skilled in Greek literature, and was celebrated for the purity and elegance of his style.

CATULUS, QUINTUS LUTATIUS, son of the preceding, born about 120 B.C., was chosen consul along with Æmilius Lepidus in 78, the year in which Sulla died. He opposed the attempt of his colleague to rescind the laws of the dictator, and afterwards, as proconsul, defeated him in two engagements, and compelled him to take refuge in Sardinia, where he perished. Catulus resisted the proposal to intrust Pompey with the command of the forces appointed to exterminate the pirates in the Mediterranean, and was equally hostile to his nomination to the command of the war against Mithridates. He died B.C. 60, leaving behind him the reputation of an honest and courageous man.—J. T.

CAUCHE, FRANÇOIS, a French sailor, born at Rouen, who visited Madagascar in 1638, and along with several companions, spent three years on that island. They afterwards sailed to the Red Sea, where they seem to have followed piratical practices, and captured several vessels belonging to the Arabs and the people of Malabar. Cauche published in 1651 "A true and curious account of the island of Madagascar," &c., the accuracy of which has been impeached, but without just reason, by Flacourt, the governor of the French colony in Madagascar.—J. T.

CAUCHON, PIERRE, bishop of Beauvais during the first half of the fifteenth century. He took an active part in the civil broils which at that period convulsed France, and after the death of Charles VI. became an active partisan of the Burgundian faction. He has been doomed to perpetual infamy by the share which he took in procuring, by the vilest arts, the condemnation of Joan of Arc. Cauchon died suddenly in 1443, twelve years after the perpetration of this crime. He was excommunicated by Calixtus IV., and his character and conduct were held in such abhorrence by the people of his diocese that his remains were dug up and cast upon the highway.—J. T.

CAUCHY, AUGUSTIN LOUIS, one of the most remarkable of the more recent mathematicians of France. Born on 21st August, 1789, his family was happily of a humble though respectable station belonging to the *tiers état*; and so their moderate fortunes escaped being affected by the political hurricanes which afterwards devastated France. Cauchy obtained an excellent classical education, chiefly in consequence of a counsel given his father by the great Lagrange, then *faucile princeps* of all analysts—"Do not permit your son to open a mathematical book, or intermeddle with a solitary figure, until he shall have completed his literary studies." The most wholesome advice was followed; but Cauchy's predilection for abstract science soon manifested itself, and he left the polytechnic school, after a brilliant career, in 1807. He began his original labours in 1811, by some remarkable papers (on *polyhedrons*) of pure geometry; but subsequent efforts connected with abstruse points in the Modern Analysis and the Theory of Numbers, as well as his remarkable essay on the propagation of waves on the surface of a heavy fluid of profound depth (crowned by the Academy in 1816), indicated the rise of a genius whose powers and sympathies were confined to no special branch of scientific inquiry, but could encompass and enrich them all. It were useless to attempt to enumerate all Cauchy's services—much less can we reckon up the innumerable papers and memoirs which, to the end of his life, continued to flow with scarcely conceivable rapidity from his too prolific pen. It may be said in perfect truth that there is scarcely a portion of Analysis which he did not advance; less even by what he did himself than by the impulse which his remarkable ideas communicated to the thoughts and investigations of others. He brought the force of his intellect to clear up several of the obscurest and most arduous problems in physical astronomy; and to him are unquestionably owing those last perfections in the Undulating Theory of Light, which, imperfectly appreciated at the period of their publication, lay hidden amid the mass of his memoirs until the experimental researches of Jamin and other physicists of quite recent years, established by experiment the very facts that Cauchy predicted, and of which, so long before, he had divined the cause. Notwithstanding the indisputable eminence of Cauchy as a thinker, it were indeed vain to conceal that great imperfection attached to him as a writer. His earlier works, the "Course of Analysis," the "Differential Calculus," and the "Application of the Infinitesimal Calculus to the Theory of Curves," are confessedly unexceptionable either as to rigour or method; but even here one painfully discerns the rudiments of an obscurity which rapidly grew upon him—an obscurity frequently and fatally affecting the writings of men eminent in various departments of thought. In rare cases perhaps, through affectation, in others through a certain intellectual imperfection, the writers in question forget that a writer and a thinker are different; that to write means to instruct; that, in order to instruct, the condition of the mind to be instructed must be retained constantly before the writer's mind, and that unnecessary ellipses and startling enigmas, whether in algorithm or development, are not a whit more commendable than "stammering" in ordinary speech. In this respect Cauchy sinned greatly. It never occurred to him to ask whether a new idea could not be adequately and fully expressed in common symbols; with the thought, he generally threw

down before one some new and probably unnecessary symbol—demanding that his reader, before being benefited by his discovery, should acquire his new language! Strangely enough, verbosity often attends this kind of obscurity. How often and sadly he wearied the Academy by his everlasting repetitions concerning his famous "Coefficient of extinction," many men still living may tell! He became latterly, indeed, a very *bore* in the Academy. Not the less, however, are his writings a precious mine, from which many bright and unexpected treasures will assuredly yet be disinterred. Cauchy died in 1857. In private life he was all that could be desired—devoted and pure. In politics he had attached himself to the elder Bourbons, and considerations of self-interest never sullied his loyalty. He was naturally pious, and, through conviction as well as education, a sincere catholic.—J. P. N.

**CAULAINCOURT, ARMAND AUGUSTIN LOUIS DE**, Duke of Vicenza, the celebrated French diplomatist to whom Napoleon, confided many of his most important negotiations, particularly with Russia, was born of noble parentage in the department of the Somme in 1772, and died in 1827. He had some experience in military matters, but none in diplomacy when, on the accession of the Czar Alexander, he was intrusted with an embassy to St. Petersburg. In this and many subsequent diplomatic charges, however, he exhibited so much address, as completely to gain the confidence of Napoleon, who lavished upon him both money and titles. To the intercession of Caulaincourt with Alexander, Napoleon owed not a little of the consideration with which his wishes were treated by the allied sovereigns on the occasion of his first abdication. Caulaincourt, after the fall of the empire, lived in retirement, persecuted by well meaning but probably misinformed partisans of the restored Bourbons, who endeavoured, in spite of his solemn refutation of the charge, to bring home to him the obloquy of having been concerned in the murder of the duc d'Enghien.—His brother, **AUGUSTE-JEAN-GABRIEL**, an able general, served with distinction in the campaigns of the Rhine, in the Peninsula, and in Russia, where he was killed at the battle of Moskowa in 1812.—J. S., G.

**CAULET, ETIENNE FRANÇOIS DE**, bishop of Pamiers, was born in 1610. He was appointed to that office by Vincent de Paul, and vindicated the choice by his zeal in remedying the evils which the civil war had brought upon his diocese. He introduced various salutary reforms, and devoted a great part of his revenues to the relief of the poor, the aged, and the infirm. Along with the bishop of Aleth he espoused the cause of the Port Royal, in the contest between the Jansenists and Jesuits. He also boldly resisted the claims of the crown to dispose of ecclesiastical revenues during the vacancy of a see. He was in consequence deposed, and died about 1680.—**JEAN CAULET**, his nephew, bishop of Grenoble, was the author of various treatises on ecclesiastical subjects.—J. T.

**CAULFIELD.** See **CHARLEMONT.**

**CAULFIELD, JAMES**, an English writer, born in 1764; died in 1826. He became an enthusiastic collector of rare prints and engravings, for the sale of which he opened a shop in 1780. Among his works are—"Lives and Portraits of Remarkable Persons;" "History of the Gunpowder Plot;" "Gallery of British Portraits;" "Cromwelliana;" "Chalcographiana, or the Printseller's Chronicle and Collector's Guide to the Knowledge and Value of Engraved British Portraits," &c.—J. B.

**CAUMARTIN, LOUIS LEFEVRE DE**, a distinguished French statesman, born in 1552, was successively ambassador to Switzerland, councillor of state, and president of the grand council. Louis XIII. had such a high opinion of his talents and judgment, that he placed him at the head of the magistracy of the kingdom; but he died three months afterwards, in 1623.—His great-grandson, **LOUIS URBAIN**, born in 1653, was educated by the celebrated Flechier, and was highly eulogized by Boileau. He held in succession various important public offices. It was at Caumartin's seat of St. Ange that Voltaire, who had addressed to him some complimentary verses, first conceived the plan of his *Henriade*.—J. T.

\* **CAUMONT, ARCISSE DE**, a geologist and antiquary who has contributed more than any other living French author to the propagation of a taste for the study of archæology among his countrymen, born at Bayeux in 1802. He is the founder of the Linnæan Society of Normandy, and of the society for the conservation of works of art, and has written several archæological works of great merit.

**CAURROY, FRANÇOIS EUSTACHE DU**, Sieur de Saint Frémin, a musician, was born at Gerberoy, near Beauvais, in 1549, and died at Paris, August 7, 1609. He was designed by his parents for the order of Malta, of which his brother was a commander. His inclination and his talent for music, however, were so great that the intention was given up, and he was allowed to devote himself to this art. He entered holy orders—at that time quite compatible with the profession of music—became canon of Ste. Chapelle in Paris, and prior of St. Aioul de Provence. About the beginning of 1569 he was appointed superintendent de la musique du roi, an office that was created for him, and which he held successively under Charles IX., Henri III., and Henri IV. The cardinal du Perron was his intimate friend, and not only supplied him with verses for music, but wrote the eulogistic epitaph inscribed on the monument erected to his memory by his successor, Nicholas Formé. He was called by his contemporaries "Le prince des professeurs de musique," a title that rather proves their admiration than his merit, since the same name was given to Palestrina and Orlando di Lasso, both greatly his superiors. He appears to have produced a large number of noels (songs for Christmas, mostly of an elaborate character), one of which is printed in Burney's History. His most reputed work is a "Missa pro defunctis" for five voices, which, until the beginning of the last century, was always performed at the obsequies of the kings of France. His published works are "Preces Ecclesiasticæ," in 1609; "Precum Ecclesiasticarum," in the same year; "Mélanges de Musique," published by his grandnephew, André Pitart, in 1610; and "Fantaisies," in three, four, five, and six parts, likewise in the year after his death. Besides these, there exist several compositions in manuscript; and he is said to have written some theoretical works which are unknown.—G. A. M.

**CAUS, SOLOMON DE**, whose name is associated with the history of the steam-engine, was born in Normandy towards the end of the sixteenth century. From his childhood he showed great taste for mechanics and hydraulics. He first settled in England, where he was employed in the service of the prince of Wales; then in Germany, as engineer to the elector of Bavaria, who gave him the superintendence of his buildings and pleasure-gardens. Having spent the greater part of his life with this prince, he returned to France, where he died about 1630. He has left several works on subjects connected with mechanics, and in one of them he describes an engine for raising water by the pressure of steam. He proposes to introduce one end of a pipe below the surface of the water, and then by admitting steam to press upon the surrounding surface, to force the water up the pipe. It has been erroneously said that his opinions on the subject of steam power being considered those of a madman, Solomon de Caus spent the last years of his life in a lunatic asylum.—J. D. E.

**CAUSSIN, NICOLAS**, a learned French jesuit, born in 1583. Through the influence of Cardinal Richelieu he was appointed confessor to Louis XIII., but he soon lost the favour of his patron, and nine months after his appointment was dismissed from office, and banished from Paris, because, as he alleged, he would not reveal some things he had learned from the king's confession, nor submit to the dictation of his superiors as to the mode in which he should direct the royal conscience. He died in 1651.—J. T.

\* **CAUSSIN DE PERCEVAL, ARMAND PIERRE**, son of J. J. Antoine, a distinguished writer on Oriental philology and history, born at Paris in 1795, passed some time among the Maronite christians of Syria, became dragoman at Aleppo, and, after his return to his native country, was appointed professor of Oriental languages in the college of France, and interpreter of Arabic to the ministry of war. Besides a grammar of Arabic and some translations of Arabic historical documents, he has published "Essais sur l'histoire des Arabes avant l'Islamisme, pendant l'époque de Mahomet, et jusqu'à la reduction de toutes les tribus sous la loi musulmane," 1847.—J. S., G.

**CAUSSIN DE PERCEVAL, J. J. ANTOINE**, an oriental scholar, born at Montdidier in 1759; died in 1835. He was the pupil of Deshautesayes, whom he succeeded as professor of Arabic at the college of France in 1783. In 1787 he was appointed keeper of the manuscripts at the Bibliothèque Royale, and in 1803 he became a member of the Academy of Inscriptions. His works are a translation into French of the Argonautic expedition, by Valerius Flaccus; "A Sequel to the Thousand

and one Tales of the Arabian Nights," translated from the Arabic; and "A History of Sicily under the Mussulmans," also translated from the Arabic, 1802.—B. de B.

**CAUX DE CAPEVAL, — DE,** born at Rouen in 1700. His admiration for Voltaire's not very sublime epic, the *Henriade*, was so enthusiastic as to inspire him with resolution to translate it into the becoming language of Virgil. That his own taste was not unexceptionable, may be considered proved by the singular, if not original poem which he wrote under the title of "Parnassus." The poet imagines Apollo to take that precious monarch, Louis XV., to the top of Parnassus, and to march before his eyes all distinguished persons of all times in every branch of literature and art. Disgusted with the coldness of the public, the poet retired to Manheim, where he died in 1774.—J. F. C.

**CAVAGNA, GIOVANNI PAOLO:** this artist was born at di San Borgo Leandro in the territory of Bergamo in 1560. He visited Venice in the noon of Titian's glory, and is supposed to have received instruction from that master. On his return to Bergamo he entered the school of Moroni, the eminent portrait painter, and for some time he followed his delicate colour and firm free manner. Subsequently, however, he adopted the style of Paolo Veronese, and caught very happily his florescence, dash, and dramatic effect. He painted both in oil and fresco, and acquired repute for the expression of his old men and children. He died in 1627.—W. T.

**CAVAIGNAC, JEAN-BAPTISTE,** a French statesman, born 1762, studied law, and, after holding some subordinate offices, was elected a member of the national convention, in which he voted for the death of Louis XVI. He subsequently served in several diplomatic missions, had a seat in the council of five hundred and in the cabinet of Murat at Naples, was prefect of the Somme during the hundred days, and died in exile at Brussels in 1829.—His brother, **JACQUES-MARIE,** Viscount Cavaignac, born in 1773, rose to the rank of general in the French service. He distinguished himself under Moreau and Murat in Italy, received from Napoleon the grand cross of the legion of honour at Austerlitz, commanded a brigade of cavalry in covering the retreat from Moscow, and fell into the hands of the allies at the capitulation of Dantzig. After his liberation, he obtained his peerage, and other honours.—W. B.

**CAVAIGNAC, LOUIS-EUGENE,** a younger son of Jean-Baptiste, was born in 1802. Having chosen the military profession, he served in the Morea, obtaining his captaincy in 1829; and in the following year, being at Arras with his regiment when the revolution broke out, he promptly declared himself in favour of the republic. In Algeria, to which he was commissioned in 1832, he built up the fabric of his military reputation by ten years of active service, during which his bravery in the field, his resolute endurance of hardships, and his strategic skill, were equally conspicuous; especially at the taking of Tlemcen, where he won from Marshal Clausel the honour of being appointed commander of the captured fortress; and also in his obstinate defence of that post with a small company of volunteers, against repeated assaults of the Arabs, and an exhausting blockade directed by Abd-el-Kader in person. In 1840 he commanded the advanced guard of Marshal Bugeaud's army, and after other important services was appointed governor of Algeria, with the rank of general of division, by the provisional government in 1848. In the same year he declined the portfolio of the war-office, but promptly undertook the defence of the government against the disaffected and insurgent classes of the Parisian populace. A fierce struggle followed, during which the capital was declared in a state of siege, and Cavaignac invested with the powers of dictator; but at length, after four days of hard fighting at the barricades, he succeeded in completely crushing the insurrection. On resigning his dictatorship, he was elected president of the council; and in the close of the year was the rival of Louis Napoleon for the presidency of the republic. At the *coup d'état* of 1851 he was arrested and imprisoned, but speedily released, and permitted to reside in France. In 1852, and again in 1857, his popularity with the Parisians secured his election to the legislative assembly, but refusing to take the oath of adhesion to the new government, he was excluded from his seat by the votes of a majority of his fellow-deputies. He died in 1857.—W. B.

**CAVALCANTI, BARTOLOMMEO,** an Italian writer, born in 1503; author of a treatise called "Rettorica," which has been often reprinted; of "Trattati, ovvero discorsi sopra gli ottimi

reggimenti delle repubbliche antiche e moderne;" and of a translation into Italian of the *Castrametation* of Polybius, 1552. He died at Padua in 1652.—J. T.

**CAVALCANTI, GUIDO,** an Italian philosopher and poet, known as the intimate friend of Dante, and a sufferer with him in the political troubles of the thirteenth century, was born at Florence. It is curious to note, that while the greater poet takes Virgil for his guide in the infernal regions, the lesser minstrel decries the study of the Roman bard as hostile to the spread of the Italian language, and, therefore, a crime against national feeling. Cavalcanti's most famous productions are his canzones to love, written under the inspiration of a passion he entertained for a French girl, whom he names Mandetta. He died of a fever at Sarzana in 1300.—A. C. M.

**CAVALIER, JOHN,** one of the principal leaders of the Camisards or protestants of the district of Cevennes in France, who rose in insurrection on the revocation of the edict of Nantes. He was the son of a peasant, and was born in 1679 at the village of Ribaute. When the persecution of Louis XIV. had driven the protestants of his native district into rebellion in 1702, Cavalier, who was only twenty-three years of age, was one of their first chiefs, and by his great courage, aided by the predictions of a pretended prophetess, he acquired vast influence among the insurgents. Like the Scottish covenanting ministers, the leaders of the Camisards discharged the duties both of preachers and of generals. Cavalier, who possessed military talents of a very high order, worsted the French generals in a succession of sanguinary conflicts, and ultimately compelled the marshal de Villars, who had a great admiration of his abilities, to offer him, in 1704, highly favourable terms. It was agreed that he should be received into the royal service, with the rank of colonel of a regiment of his fellow-protestants, who were to be allowed the free exercise of their own religion. The other chiefs of the Camisards, however, refused to agree to these terms, and persevered in their resistance. But Cavalier, faithful to his engagement, abandoned his native mountains and proceeded to Paris. Finding, however, that he was regarded with jealousy and suspicion by the king and court, he withdrew to Lausanne and afterwards to Holland. He organized a regiment of seven hundred refugees, whom he commanded at the battle of Almanza, where they fought with desperate fury against the French. He ultimately entered the English service, and obtained the rank of a general, with the governorship of Jersey. He discharged the duties of this post with great discretion, as well as bravery and talent. He died at Chelsea in 1740.—J. T.

**CAVALIERE, EMILIO DEL,** a musician of noble family, was born at Rome about 1550, and died in 1601. He cultivated his natural taste for music in the severe schools of his native city, and produced some madrigals that proved his practical knowledge of the contrapuntal style. He quitted Rome at the invitation of Ferdinand de Medicis, to officiate at the court of this prince as inspector of the fine arts. Here he became associated with Bardi, Corsi, Vincenzo Galileo, and Rinuccini, in their purpose of restoring to music the declamatory character it held with the ancient Greeks, as opposed to its very vague expression of sentiment and frequent confusion of sense, by the repetition of words, in the imitative style of canonical contrivance, which at that time universally prevailed. Unlike the two greatly esteemed singers, Giulio Caccini and Jacopo Peri (who were likewise concerned in this important movement, which originated recitative and founded the modern lyrical drama), Cavaliere had a large amount of theoretical knowledge to bring to bear upon the subject, and had, besides this, much of the natural feeling for vocal effect, by which alone their writings are distinguished. In 1590 he produced "Il Satiro," and "La Disperazioni di Filene," two of the earliest attempts in that class of composition which has been modified into the opera of the present day; and, in 1595, "Il Giuoco della Cieca," another piece in the same form, was represented before Cardinals Monte and Mont' Alto. Cavaliere's most important work, and the only one that is printed, is the oratorio of "La Rappresentazioni di Anima e di Corpo," the poem of which was furnished by Laura Guidiccioni, a noble and religious lady of Lucca, and which was performed in the oratory of St. Maria in Valicella in February, 1600. The oratorios of Animuccia, so called on account of their performance in the oratory of the church, had, half a century earlier, excited such general interest, that it was now a piece of ecclesiastical polity to attract the public to the churches by similar entertain-

ments. Though designed for the same purpose, and performed in the same situation, Cavaliere's oratorio was eminently different in character from those of his predecessor; its form was dramatic, and it was represented with scenic decorations, and with action, and even dances accompanied the choruses. Thus, as Aninuccia founded the ecclesiastical oratorio—most nobly exemplified in the Passions-Musik of Bach—so the work under consideration originated the dramatic oratorio; of which Handel's Samson, and like productions, are familiar specimens. In this composition the newly-invented recitative forms a prominent feature; but though we find in this the germ of that grand style of declamation which Handel brought to perfection, its merit admits of no comparison with that of the masterpieces of the last century and a half have produced. "La Rappresentazioni di Anima e di Corpo" has not only accompaniments for instruments independent of the voices—which at that period were most uncommon—but also a figured bass, from which the performer on the harpsichord improvised a counterpoint. In this respect it agrees with an opera by Peri and Caccini, bearing the same date, and containing, as this does, an explanation of the figures. We thus learn that the practice—always ineffectual, and now happily obsolete—of employing this form of musical shorthand, instead of writing the notes to be played, originated at this period, if not with these composers. Cavaliere was also the first to write, and perhaps the inventor of, the embellishments of the turn and the shake, of which Alessandro Guidotti, the editor of the "Rappresentazioni di Anima e di Corpo," gives a careful description in his preface to this work.—G. A. M.

CAVALIERI, BONAVENTURA, a famous mathematician, was born at Milan in 1598. At the age of fifteen he entered the order of the hieronymites, and at first studied theology; but his taste for geometry soon manifested itself, and he removed to the college of his order at Pisa that he might have better opportunities of instruction. Here he was introduced to Galileo, and soon became one of his most distinguished pupils. He devoted special attention to the determination of areas and volumes contained by curved lines and surfaces, and finally invented a mode of procedure known as the "method of indivisibles," which very much shortened the process till then in use, and was preliminary to the differential calculus. On the recommendation of Galileo he was made professor of mathematics in the university of Bologna, which he filled till his death in 1647. He died of gout, from which he had been a great sufferer during his life; in the ardour with which he prosecuted his favourite studies, he found, it is said, more relief from pain than in the nostrums of physicians. His "Geometry of Indivisibles" was published at Bologna in 1635. The subject was eagerly taken up by the best mathematicians of the day, including Pascal, who made considerable use of it. Cavalieri published a defence and exposition of his method in the year of his death, under the title of "Exercitationes Geometricæ Sex," Bologna, 1647.—J. D. E.

CAVALLI, FRANCESCO, a musician, was born at Venice in 1610, where probably he died in April, 1676; at least Monferrato was appointed his successor at the duomo on the 30th of that month. His family name appears to have been Calletto, the reason for the change of which is unknown. He was famous as a singer, still more as an organist, and most of all as a dramatic composer. The first of his operas seems to have been "Le Nozze di Teti e di Peleo," dated 1639; and the last, "Coriolano," dated 1669. It has been stated, and frequently repeated, that in his opera of "Giasone," dated 1649, is the earliest instance of an aria so defined by title, and distinguished by rhythmical regularity from the recitative, in which the entire dialogue of the first lyrical dramas was conducted; but Monteverde anticipated him in this important feature of dramatic music. He held for some time an appointment at the court of the elector of Bavaria. In 1660 he went to Paris by invitation of Cardinal Mazarin, where he produced, on the occasion of the marriage of Louis XIV., his opera of "Xerxe," which had been given in Italy six years earlier. In 1668 he succeeded Rovetta as maestro di capella at the cathedral of St. Mark in his native city. His many operas were greatly esteemed in his own time, and several of them remained upon the stage long after his death. A piece from his opera of "Eismena" is printed in Burney's History.—G. A. M.

CAVALLINI, PIETRO: this eminent old painter was born at Rome in 1279. He is believed to have been a pupil of Giotto; his style undoubtedly follows that master, and with Giotto he

worked in mosaic in the navicella of St. Peters. He practised his art with an enthusiasm that was quite devotional; according to some accounts the number of his works amounted to 1300. His industry was only equalled by his piety; his life was so ascetically exemplary that he was within a few inches of being canonized. In fact, he was as good as a saint, if he were not one, and some of his handiworks performed miracles in the most orthodox and saintly manner. A crucifix wrought by him was gifted with speech, and a figure of the Virgin, of his carving (for he was a sculptor also) performed some very extraordinary feats. His most remarkable work was his fresco of the "Crucifixion" in the lower church of San Francesco at Rome, a wonderful vestige of Giotto-esque art. The relics of this artist are few and fragmentary, and much doubt and discussion cling to every portion of his history and his works. By some he is reputed to have contributed the designs of the house of Edward the Confessor in Westminster abbey, and also the crosses in memory of Queen Eleanor. There are some anachronistic stumbling-blocks in the path of this notion however. He probably died in 1364.—W. T.

CAVALLO, TIBERIUS, a distinguished electrician, born at Naples in 1749; died at London in 1809. He was sent to London to acquire a knowledge of commerce in 1771, but being of a studious turn, was diverted from mercantile to scientific pursuits, and finally relinquished the former altogether. He made some interesting researches in the science of electricity, and invented some useful instruments. In 1779 he was elected a fellow of the Royal Society of London. His principal work is a "Complete Treatise of Electricity," 1777; enlarged and republished in 1795. He wrote also "An Essay on the Theory and Practice of Medical Electricity," 1780; and "Elements of Natural and Experimental Philosophy," 1803.—J. B.

CAVAM-ED-DOWLAH (Elevated in the State), the title of a Turkish prince frequently called Carbonas and Cammoran, but whose real name was Ketboga, who lived in the time of the first crusades. After the death of Malek Shah, he supported Barkyaroc, the eldest son of that prince, against his uncle, Tatash, but was worsted in the conflict, and taken prisoner. Tatash died soon after, however, and Ketboga recovered his liberty. He was subsequently made prince of Mosul, and at the head of an immense force blockaded the army of the crusaders in Antioch, but was signally defeated by them (June 28, 1098), and driven out of Syria. He died in 1101.—J. T.

CAVANILLES, ANTONIO JOSÉ, a celebrated Spanish botanist and ecclesiastic, was born at Valencia on 16th January, 1745, and died at Madrid in May, 1804. His parents were poor. He received his first education among the jesuits of Valencia. He subsequently turned his attention to theology and philosophy. He removed to Murcia, and was appointed by the duke de l'Infantado to superintend the education of his sons. In 1777 he accompanied the family to Paris, where he continued for twelve years. During that period he had an opportunity of studying natural history, and particularly botany, to which subject he afterwards devoted much of his time. His botanical writings extend from 1785 to 1790. His earliest botanical work consisted of dissertations on plants belonging to the class monadelphia. It included figures and descriptions of species and genera of malvaceæ, sterculiaceæ, and geraniaceæ, as well as of passiflora and other plants having their stamens united by the filaments. The work extended to ten fasciculi, and was published partly in Paris and partly in Madrid. The number of plates is 296. Cavanilles also published figures and descriptions of plants which grow naturally in Spain, or are cultivated in gardens in that country. The work extends to six volumes, and contains many interesting plants from Mexico, Peru, and Chili, as well as from New Holland and the Philippine Islands. Among his other works may be noticed—"A Treatise on the Natural History, Geography, and Agriculture of the Kingdom of Valencia," 1795, 2 vols.; "Observations on the article 'Spain,' in the new Encyclopædia;" and contributions to the Madrid Annals of Natural Sciences. Cavanilles was elected a corresponding member of the French Institute; and in 1801 he was appointed director of the royal botanic garden at Madrid. He afterwards published "Elementary Principles of Botany," and a description of the plants used in his public lectures. At the time of his death he was engaged in the preparation of his "Hortus Regius Matritensis," which was to contain descriptions of rare or curious plants in the garden or herbarium at Madrid. The genus Cavanillea was named after him by Thunberg.—J. H. B.

CAVARAZZI, BARTOLOMEO, called CRESCENZI. This painter was born at Viterbo about 1590, was a pupil of Cavaliere Roncalli, called Pomarancio. He was subsequently taken under the patronage of the noble family of the Crescenzi, from whom he derived his sobriquet. He painted many pictures for his patron, and for the churches of Rome. He possessed, according to Lanzi, "a captivating and natural style." He painted a St. Anna in the church of that saint "in his best taste, and with a vigorous pencil," writes Baglione. In the church of St. Orsola there is a remarkable work of Caravazzi's, representing the saint with the famous legend of the eleven thousand virgins. He died at Rome in 1625.—W. T.

CAVE, EDWARD, a printer, born at Newton in Warwickshire in 1691. His father followed at Rugby the trade of a shoemaker, and was supported by his son in the latter part of his life. Edward was educated at Rugby school under the Rev. Mr. Holyock, who was so greatly pleased with his progress as to recommend him as a servitor to some of his wealthy scholars, and to resolve to prepare him for the university. Being unjustly charged with a petty theft, however, Cave lost the favour of his master, and was at length compelled to leave the school, and abandon all hope of a literary education. He then entered the service of a collector of excise, but being harshly treated by his employer's wife, he proceeded to London in search of work, was for a short time in the employment of a timber merchant, and then became apprentice to Mr. Collins, a printer of some note. In this new situation he commended himself so much to his master by his skill and ability, in the course of two years, as to be sent to Norwich to conduct a printing-office, and publish a weekly paper. His master dying before the end of his apprenticeship, he left the house and married. At this time he worked as a journeyman in the printing-office of Mr. Barber, and wrote in *Mist's Journal*. He corrected the *Gradus ad Parnassum*, and was liberally remunerated by the company of stationers. He also wrote "An Account of the Criminals," and published many pamphlets. He had obtained a place in the post-office, which did not occupy all his time, and afterwards became clerk of the franks, a situation in which he acted with great firmness—frequently stopping franks given by members of parliament to their friends. This procedure, however, led to his citation before the house for a breach of privilege. He was accused of opening letters. By pleading his oath of secrecy he was dismissed. Having purchased a small printing-office, he began the *Gentleman's Magazine*, a periodical that has been continued with remarkable success till the present day, and by means of which he amassed a considerable fortune. After his wife's death in 1751, he lost his sleep and appetite, and fell into a bad state of health, from which he never recovered. He died January 10, 1754, after the completion of the *Magazine's* twenty-third year. Cave is described as a man of large stature and great strength. In his latter years he was much afflicted with the gout. His mental faculties were slender, narrow, and slow; but his memory was tenacious, and his disposition calm. His chief claim to notice is his having commenced, by a new species of publication, an important epoch in the literary history of Great Britain. His life has been written by Dr. Johnson, who, in the earlier part of his career in London, was liberally befriended by the printer.—S. D.

CAVE, WILLIAM, a theologian of great learning, was born at Pickwell in Leicestershire on the 30th of December, 1637. In May, 1653, he was admitted into St. John's college, Cambridge, took his B.A. degree in 1656, and his M.A. in 1660. In 1662 he was presented to the vicarage of Islington. After taking the degree of D.D. in 1672, he was presented to the rectory of Allhallows the Great, London, in 1679. In 1684 he became canon of Windsor, and in 1690 vicar of Isleworth in Middlesex, having previously resigned the rectory of Allhallows, and soon after the vicarage of Islington. His death took place in 1713; and his body was interred in Islington church, where a monument has been erected to his memory. For some time he had been chaplain to Charles II. The life of Dr. Cave seems to have been that of a studious man, who took comparatively little interest in public affairs, because he was so much occupied with books, and his own publications. His principal works are—1. "Primitive Christianity, or the religion of the ancient christians in the first ages of the gospel," London, 1672. This has been several times reprinted. 2. "Tabulæ Ecclesiasticæ, tables of the ecclesiastical writers," London, 1674; reprinted at Hamburg in 1676

without his knowledge. 3. "Antiquitates Apostolicæ, or the history of the lives, acts, and martyrdoms of the holy apostles of our Saviour, and the two evangelists, St. Mark and St. Luke. To which is added, an introductory discourse concerning the three great dispensations of the church, patriarchal, mosaical, and evangelical; being a continuation of Antiquitates Christianæ, or the life and death of holy Jesus," written by Jeremy Taylor: London, 1676, folio. 4. "Apostolici, or the history of the lives, acts, deaths, and martyrdoms of those who were contemporaries with, or immediately succeeded the apostles; as also of the most eminent of the primitive fathers for the first three hundred years. To which is added, a chronology of the first three ages of the church," London, 1677, folio. 5. "A Dissertation concerning the government of the ancient church by bishops, metropolitans, and patriarchs; more particularly concerning the ancient power and jurisdiction of the bishops of Rome, and the encroachments of that upon the other sees, especially the see of Constantinople," London, 1683, 8vo. 6. "Ecclesiastici, or the history of the lives, acts, deaths, and writings of the most eminent fathers of the church that flourished in the fourth century," London, 1682, folio. 7. "Chartophylax Ecclesiasticus," London, 1685, 8vo. 8. "Scriptorum Ecclesiasticorum Historia Literaria," i.e., a literary history of ecclesiastical writers, in two parts, folio; the first printed at London, 1688, and the second in 1698. The best known of these works are 1, 3, 4, and 8, especially the last, which is by far the most valuable of all. The rest have been superseded by modern works, which in many instances give better and more correct information on the topics discussed. But the "Historia Literaria" is still indispensable to the scholar, and will perpetuate the name of the author. It was reprinted at Geneva in 1705 and 1720; but the best edition is that which was printed at Oxford by subscription, in two vols., folio, 1740-43. This contains the author's last amendments and additions, with some contributions by others. It was principally superintended during the printing by Dr. Daniel Waterland.—S. D.

CAVEDONE, GIACOMO: this master was born at Sassuolo in the Modenese in 1577, and died in 1660. The inconsiderate severity of his father drives him at a very early age into the world to earn independent bread. He enters the service of a nobleman, a lover of art, and a collector of pictures. The patron exhibits his page's drawings, and introduces him to Annibale Carracci, who encourages the young beginner, and lends him drawings to copy. The student prospers, and soon is received into the school of the master. Formally apprenticed to art, he works assiduously and progresses wonderfully. After some time he proceeds to Venice and carefully examines the works of Titian. He seeks to dive into the secret of their delicious colour. From day to day he subjects them to his piercing perusal, and he comes away victorious. He paints afterwards in a blended manner derived from Carracci and Titian. At Bologna his works were esteemed as equal to the productions of Carracci; and Albano, asked by a stranger if there were any Titians at Bologna, replied—"No, but there are two works by Cavedone in St. Paolo, which are as good." It is even recorded that Rubens, Velasquez, and Michelangelo Colonna supposed Cavedone's "Visitation of the Virgin" in the king of Spain's chapel, to be the work of Annibale Carracci. He painted for the churches of Bologna both in oil and fresco. His manner in the latter mode of art was so felicitous that Guido adopted him as a model. He possessed an extraordinary facility and extreme rapidity of execution; yet never—for he was a true artist—condescended to be negligent, or upheld want of finish, or conceived coarseness to be good effect. He was correct in drawing, and especially careful of his hands and feet—a good sign. He favoured simple attitudes and gentle expression: length of proportions, a compendious method of treating the hair and beard, a graceful and rapid touch, and a rectilinear folding of his draperies, characterize the manner of Cavedone. He rose to the highest eminence in his art; he then tottered, fell, and ended miserably. Troubles gathered thickly round him. His wife was charged with witchcraft, and the foolish, foul accusation preyed upon his mind. His only son, a youth of great promise, fell sick and died. Illness came also upon him; a scaffolding badly constructed, falling, nearly crushed him. His was a nervous anxious temperament, easily disorganized. The canker of disease formed in his mind, and palsied his hand. Imbecility and poverty came next, and then death. He left many important works, which are rightly prized as gems, even in such a diamond mine as

Bologna. Of these the most noted are his "Adoration of the Magi;" his "Holy Family;" "Last Supper;" "Four Doctors of the Church;" and the great work in the church of the Mendicanti di dentro, representing St. Alo and St. Petronio kneeling before the virgin and child, surrounded by angels. Bologna rightly esteems these; yet the old man that painted them begged for bread, and not getting it, died of hunger in the streets of the same Bologna.—W. T.

CAVEIRAC, JEAN NOVI DE, a French ecclesiastic, born in 1713. He is the author of several works against tolerating the protestants, and of apologies for the massacre of St. Bartholomew's day, and the revocation of the edict of Nantes. He wrote a treatise in defence of the jesuits entitled "Appel à la raison des écrits publiés entre les Jesuites de France," and was in consequence condemned to perpetual banishment. But he was permitted to return to France after the disgrace of the duke de Choiseul. Caveirac is the author of two pamphlets against Rousseau. He died in 1782.—J. T.

CAVENDISH, the name of a noble English family, two branches of which have attained dukedoms, and have figured conspicuously in the history of the country. They sprang from SIR JOHN CAVENDISH, chief justice of the court of king's bench in 1366, 1373, and 1377, and chancellor of the university of Cambridge. His younger son is said to be the person who actually slew Wat Tyler, and the judge himself was put to death by a mob of insurgent peasants in the fifth year of Richard II. WILLIAM, the fourth in descent from him, was gentleman-usher to Cardinal Wolsey, and one of the few who adhered to him in his disgrace. He wrote a life of his old master, which was published in a mutilated form in 1641, and was first correctly printed in Wordsworth's Ecclesiastical Biography. After the death of the cardinal, Cavendish was taken into the service of the king, was made treasurer of his chamber, and a privy councillor, and laid the foundation of the vast possessions of the Cavendishes, by obtaining extensive grants of abbey lands at the dissolution of the monasteries. Sir William was the founder of Chatsworth. His third wife, the famous Bess of Hardwick, added largely to the estates and influence of the family. His grandson,

CAVENDISH, WILLIAM, Earl, Marquis, and Duke of Newcastle, was a zealous supporter of the royal cause in the great civil war. He was born in 1592, and at an early age, by his remarkable abilities and attainments, he attracted the notice of James VI., who raised him to the peerage in 1620 as Baron Ogle and Viscount Mansfield. Charles I. advanced him to the higher dignity of earl of Newcastle, and subsequently intrusted to him the care of the prince of Wales. When hostilities broke out between Charles and the parliament, the earl contributed £10,000 to the royal treasury, and raised a troop of horse, consisting of two hundred gentlemen, who served at their own charge. In 1642 the king appointed him general of all the royalist forces in the northern and midland counties. In the course of a few months he drove the enemy nearly out of Yorkshire, and next year he recovered Scarborough, took Rotherham and Sheffield, and after some minor successes, inflicted a severe defeat upon Lord Fairfax at Atherton Moor, near Bradford, June 30, 1643. He then captured in succession the towns of Bradford, Gainsborough, Lincoln, and Beverley, but he was unsuccessful in an attempt to reduce Hull, the only place then held by the parliament north of the Humber. The king rewarded him for these achievements by raising him to the rank of marquis of Newcastle. When the Scotch army marched into England, the marquis kept them for some time at bay in Northumberland and Durham, but was ultimately obliged to retire southward for the purpose of preserving York, which was seriously endangered. After sustaining a siege of three months in that city, he was relieved by the arrival of Prince Rupert at the head of twenty thousand men. The parliamentary army withdrew at his approach to Marston Moor, about eight miles from the city. Not content with raising the siege, the prince insisted on attacking the enemy, in opposition to the earnest advice of the marquis. The royalists were defeated with great slaughter. Newcastle's regiment, composed of his old tenants and domestic retainers, refused to flee, and were slain almost to a man. Their chivalrous leader, weary of a strife always distasteful to him, and disgusted with the treatment he had received from the court, retired to the continent, and continued abroad till the Restoration. His extensive estates were confiscated by the parliament, and he was reduced to extreme poverty. He and his wife were at one time forced even to pawn

their clothes. On the accession of Charles II. the marquis returned to England. He was loaded with honours, and in 1664 was created duke of Newcastle. He died in 1676 in the eighty-fourth year of his age, and was buried in Westminster abbey. During his exile he wrote a treatise on horsemanship, and several comedies, "The Country Captain;" "The Humorous Lover;" "The Triumphant Widow," &c.

CAVENDISH, MARGARET, Duchess of Newcastle, the second wife of the preceding, was born about the end of the reign of James VI., and was the daughter of Sir Charles Lucas of Colchester. She married the duke at Paris in 1645, and remained abroad with him till the Restoration. On her return to England she spent the remainder of her life in writing an immense number of plays, poems, overtures, and philosophical discourses, together with a life of her husband, amounting in all to thirteen folio volumes, ten of which are in print. This most voluminous of female writers died in 1673. "The high-souled" duchess, as she has been termed, was an especial favourite with Charles Lamb.

CAVENDISH, WILLIAM, second son of Sir William, carried on the main line of the family, and was elevated to the peerage as Baron Cavendish in 1605, and created earl of Devonshire in 1618.

CAVENDISH, CHARLES, a younger son of the second earl of Devonshire, born in 1620, acquired great distinction by his valour and skill in the civil wars between Charles I. and the parliament, and attained the rank of lieutenant-general in the royal service. He captured Grantham, and defeated a body of the parliamentary forces at Donnington in 1643; but a few days after was defeated and slain in an encounter with Cromwell near Gainsborough. Cavendish was among the most lamented victims of the civil war. He was so much beloved, that when his body was brought to Newark, it was with great difficulty, and not till after the lapse of some days, that the people would allow it to be interred.—(See *Cromwell's Letters and Speeches*, vol. i. p. 122, and vol. iii. pp. 388, 391.)

CAVENDISH, WILLIAM, fourth earl and first duke of Devonshire, was born in 1640. He was one of the most upright statesmen and distinguished patriots of his time. He spent the early part of his life abroad. On his return to England in 1661, he entered the house of commons as member for Derbyshire, and soon distinguished himself by his vigorous opposition to the corrupt measures of the court. In 1678 he was one of the committee appointed to draw up articles of impeachment against the treasurer, Danby. Next year he was chosen a member of the privy council as remodelled by Temple; but the perfidious conduct of the king and his advisers soon compelled him to withdraw. In 1680 he carried up to the house of lords the articles of impeachment against Chief-justice Scroggs, and took a prominent part in the desperate struggle of the whig party to exclude the duke of York from the succession to the throne. At great personal risk he supported his friend Lord William Russell on his memorable trial. After his condemnation, he offered to change clothes with him in the prison, and remain there while Lord William made his escape. He was one of the principal promoters of the Revolution, and upon the landing of the prince of Orange, was the first nobleman who appeared in arms to welcome him. He held several important offices at the court of William and Mary, and was created duke of Devonshire in 1694. His last public service was to act as a commissioner for concluding the union with Scotland. He died 18th August, 1707, and directed the following inscription to be inscribed on his monument:—

WILHELMUS DUX DEVON,  
BONORUM PRINCIPUM FIDELIS SUBDITUS,  
INIMICUS ET INVISUS TYRANNIS.

J. T.

CAVENDISH, HENRY, one of our most celebrated English physicists; born in 1733; died at the ripe age of 77. Cavendish was second son of the duke of Devonshire; possessed, therefore, of a competent, although moderate fortune. The elders of this noble family earnestly desired that, according to custom, Henry should raise himself by means of a profession, advancement in which would be secured to him by their influence in the state; but to their serious disappointment—a disappointment rising from disapproval to alienation—his tastes lay in the direction of the culture of science, and in the enjoyment of the simplicities of life. His career was a most successful one, and soon gained him a personal consideration more elevated and lasting than title or rank could have bestowed. A controversy has recently been carried to some degree of keenness among scientific men, as to whether the honour of the discovery of the composi-

tion of water—one of the most remarkable in history—be due to Cavendish or James Watt. The fact had to some extent been indicated by Scheele; and perhaps the truth is, that the somewhat vague presentiment, known to both these eminent men, was defined by each. It is most certain that Lavoisier accepted the investigation of Cavendish as original, and confirmed it by experiments on a larger and more adequate scale. First of all, by common consent, Cavendish detected the peculiar properties of hydrogen; and he advanced, through effect of his peculiar precision, to his memorable analysis of nitric acid—succeeding in combining oxygen and nitrogen by the electric spark. It merits to be recorded, that on his announcing this discovery to Berthollet, the eminent Frenchman replied by the same courier that he had detected the composition of ammonia. The facts referred to have now in so far lost their interest through familiarity; but in history they will be ever memorable; they are great landmarks in the progress of discovery. Perhaps, however, the name of Cavendish is now most generally known through his determination of the mean density of the earth. Availing himself of the ease with which the torsion of a thread can measure small forces—a principle brought into play first by Coulomb—he constructed the great apparatus which is now so widely known. His experiments, recalculated by Francis Baily, give us that mean density, 5.448. They have been three times repeated since—once by Baily himself, and twice by Reich—the results being 5.660, 5.440, and 5.577. The mean of the last three is 5.559, and the mean of all the four 5.531, no slight evidence of the accuracy of the original efforts of Cavendish.—As years passed on, the fortunes of this excellent person underwent a very great change—an uncle bequeathing him a fortune of £300,000. Nothing, however, was thereby changed to Cavendish, excepting that his liberality showed itself on a larger scale, and that his benefactions to science increased in proportion. He altered indeed the details of his household, but he preserved intact his primitive simplicity, his methodical habits, and the purity of his pursuits. And he was enabled to collect one of the choicest libraries ever brought together by a single man: he threw this open to all inquirers, issuing with great freedom tickets to some, that enabled them to consult and read in his magnificent hall, while others obtained the power to carry what books they desired to their homes. The liberty thus generously given was of course guarded by strict regulations, to all of which Cavendish with some whimsicality compelled himself to submit. To prevent interference with his privacy, his great library was placed several miles from his house, and it is said, that when he wished a book, he applied to the librarian exactly in the way to which the public were required to conform! Cavendish left at his death an accumulated fortune of £1,300,000, a sure evidence of the constant moderation of his life. Few names in English science remain surrounded with a higher respect.—J. P. N.

CAVENDISH, LORD FREDERICK, the third son of the third duke of Devonshire, was born in 1729. He chose the military profession, and ultimately attained the rank of field-marshal. He represented first the shire, and afterwards the town of Derby in several parliaments, and was distinguished by his chivalrous sense of honour. He died in 1803.—His brother, LORD JOHN CAVENDISH, was one of the most prominent members of the whig party towards the close of the last century. He was one of the lords of the treasury under the marquis of Rockingham in 1765, and, on the resignation of Lord North in 1782, Lord John was made chancellor of the exchequer in Lord Rockingham's second administration. He died in 1796.—J. T.

CAVENDISH, SIR ROBERT SPENCER, a distinguished English naval officer, was born in 1791. He entered the navy at an early age, and served under Nelson in the East Indies, and against the combined French and Spanish fleets, was in the expedition to Egypt in 1807, at the blockade of Toulon in 1808, and of Marseilles in 1813; served in the contest with the United States, and on the coast of South America in 1819. In 1823 he signed the capitulation granted to the dey of Algiers, and was sent to the coast of Greece and into the Archipelago to protect our commerce. Sir Robert was for some time secretary to the duke of Clarence, afterwards William IV. He returned to active service in 1828, and was appointed to the Mediterranean station. He died at Alexandria in 1830. A kind of manual or naval catechism entitled "Ninety-Nine Questions," is said to be from his pen.—J. T.

CAVENDISH or CANDISH, THOMAS, born at Trimby in Suffolk, was the second Englishman who sailed round the globe. He entered the naval service at an early age, and when war broke out between Spain and England, he resolved to repair his dilapidated fortune at the expense of the Spaniards. In 1585, having obtained letters of marque, he undertook an expedition to the coast of Virginia and Florida, and returned to England with considerable booty. This success encouraged him to undertake a second expedition, and next year, July 22nd, he sailed from Plymouth with three small ships. His first descent was made on Sierra Leone and the coast of Guinea, where he collected a rich booty. He then touched at the island of St. Sebastian, sailed along the coast of Patagonia, passed through the Straits of Magellan, 7th Jan., 1587, defeated the Spaniards in numerous encounters, burned and pillaged their villages and towns, and took many rich prizes along the coasts of Chili and Peru. On the 28th of July he fell in, near California, with the *Santa Anna*, an Acapulco ship of seven hundred tons, laden with a cargo of immense value, and in spite of the inequality of his force, captured her, after a conflict which lasted six hours. On the 12th of May, 1588, he doubled the Cape of Good Hope, and having completed the circumnavigation of the globe, he reached England again on the 9th September. His voyage gained him honour as well as immense wealth, as it contributed not a little to the progress of geographical discovery. But his hastily gotten riches were as rapidly dissipated, and he was compelled in 1591 to undertake another voyage, which was entirely unsuccessful. His ships were driven back by contrary winds, and at length shipwrecked on the coast of Brazil. He became dispirited at his reverses, and died of grief in the flower of his age.—J. T.

CAVOIE, LOUIS D'OGER, Marquis de, a distinguished French officer, who was born in 1640, and died in 1716. He was one of the most brilliant attendants in the court of Louis XIV., and was remarkable for his intrepidity. In 1666 he entered as a volunteer in the Dutch fleet, and served with great distinction under De Ruyter in the war with England. His conspicuous bravery gained him the friendship of Turenne, whom he accompanied in all his campaigns. He was much esteemed also by Marshal Luxembourg and Racine, and bore the highest reputation for loyalty and integrity. He was a liberal patron of literature.—J. T.

CAVOLINI, FILIPPO, an Italian naturalist, born at Naples in 1756, published a number of dissertations of considerable value, the principal of which are on zoophytes and marine plants. He died in 1810.

CAVOUR, CAMILLO DI, Count, the younger son of an ancient Savoyard family, was born at Turin, August 10, 1810. Cavour was sent at an early age to the military academy, where he obtained the rank of lieutenant in the corps of engineers, and shortly afterwards was appointed one of the royal pages. He resigned his commission and his position at court, however, in order to gratify his desire to travel, and proceeded to England. The power and influence of the English nation appear to have produced a great impression on his practical and positive intelligence. He attributed the supremacy of England less to the vigour and energy of the national character than to her institutions, and consequently became an earnest admirer and advocate of constitutional monarchy. He also applied himself to the study of political economy, and declared himself a believer in the principles of free trade. With these views, it is not surprising that on his return to Turin, Count Cavour should have taken part in the disturbances that compelled the king of Piedmont to grant the constitution of 1818. He was chosen with Santa Rosa, Brofferio, Durando, and others, to form a deputation to urge upon the king the danger of longer delay in yielding to the demands of his subjects. Shortly after the proclamation of the constitution, Cavour was elected deputy to the chamber by the first electoral college of Turin, but his debut in political life does not appear to have been very successful, and at the next election he failed to obtain a seat. He was, however, re-elected in 1850, and nominated minister of agriculture, commerce, marine, and finance. He resigned in 1852, and again visited France and England. On his return, he was commissioned by the king to form a cabinet, and, with the exception of a very brief period in 1859, he held the position of prime minister till his death. In January, 1855, through Cavour's influence, Sardinia was induced to make

common cause with France and England by aiding in the Crimean war—a step which, when first proposed, met with strong opposition in the Sardinian chambers, but which was certainly the wisest, as to Italy it proved the most advantageous, that could have been taken, involving as it did the recognition of her existence as a nation by the most powerful states in Europe, and her consequent right to be heard in their councils. Accordingly, on the part of Sardinia, Cavour took his place in the conferences which assembled in Paris to settle the terms of peace. He embraced the opportunity of bringing the condition of his country, and of pleading her rights, before the conferences. The jealousy and resentment of Austria were roused, and in March, 1857, the Austrian minister was recalled from Turin, and the Sardinian minister from Vienna. Having ceased to hope for material aid from the British government in the struggle now seen to be inevitable, Cavour naturally turned to France; and, after a series of negotiations and arrangements, he had, in the end of March, 1859, an interview with Louis Napoleon at Paris, when the plan of operations, on the breaking out of hostilities, was finally settled. The warmly-cherished hopes of a free and united Italy “from the Alps to the Adriatic,” inspired by the magniloquent promise of his powerful ally, Cavour now thought in a fair way of being realised. The illusion was soon dispelled.

For a sketch of the leading events connected with the war with Austria, and Garibaldi's subsequent attempt to make Rome the capital of Italy, the reader is referred to the article VICTOR EMMANUEL. Burning with indignation at the abrupt and, to Sardinia, insulting peace which Louis Napoleon had made with his Austrian brother at Villafranca, and finding the counsels which he urged on his sovereign at that crisis rejected, Cavour resigned his office as premier, and retired to his property at Leri. It was soon found, however, that his services could not be wanted in such a state of affairs as then existed, and early in 1860 he was again prime minister. From first to last, in this capacity, he displayed the most dexterous statesmanship, and by his efforts to improve her financial, commercial, and agricultural condition, did incalculable service to his country. Driven by the necessities of his position, and the interests he served, to a continually wavering policy, he, with great diplomatic skill, alternately caressed or persecuted, according to circumstances, the revolutionary element then so powerful in the more oppressed states of Italy. But none can deny that Count Cavour steered the vessel of his government amid conflicting elements and through difficult channels with consummate skill. He was admired in the Piedmontese chamber for facility and clearness in discussion. He had acquired some renown as a journalist, and was the author of several highly esteemed works on political economy. He died on the 6th of June, 1861.—E. A. H.

CAWTHORN, JAMES, a minor poet of the last century, was born at or near Sheffield in 1721. But little is known of his family or of the events of his life. He was educated at the grammar schools of Rotherham and Kirkby-Lonsdale; whether he went to any university is uncertain. In 1743 he was chosen master of Tunbridge school by the Skinners' company of London. In conjunction with his patrons, he founded the library annexed to that seminary. He is said to have been in the general intercourse of life generous and friendly; but in the management of his school singularly harsh and severe. Although a bad rider, it is said that he was much addicted to hunting; and with no ear for music he was enthusiastic on the subject of concerts and operas. He was killed by a fall from his horse in April, 1761, and was buried in Tunbridge church. Cawthorn's poems consist chiefly of moral tales, moral essays, epistles in the style of Ovid, and one or two amatory pieces. He is a close but feeble imitator of Pope. Always straining after sublimity and point, he mistakes bombast for grandeur, and only puns where he means to be witty.—T. A.

CAWTON, THOMAS, a learned English divine, was born in 1605. He was celebrated not only for his classical attainments, but for his knowledge both of the Oriental and of the modern European languages. Cawton gave assistance to Walton in the compilation of his polyglot bible, and to Castell in his polyglot lexicon. He was presented to the living of Wivenhoe in Essex in 1636, and subsequently to the rectory of St. Bartholomew in London. Though Cawton held the religious principles of the puritans, he boldly denounced, in a sermon before the lord mayor and aldermen, the conduct of Cromwell and his associates in the execution of the king, and was in consequence imprisoned. He

ultimately retired to Holland and became minister of the English church in Rotterdam, where he died in 1659.—J. T.

CAWTON, THOMAS, son of the preceding, was born in 1637. He studied first at Utrecht, where he acquired a high reputation for learning, and subsequently at Oxford under Samuel Clarke. He received ordination from the bishop of Oxford in 1661; but his principles would not allow him to submit to the sway of the party then dominant in the established church; and after officiating for some time as chaplain to Sir Anthony Irby, and subsequently to Lady Armin, he became minister of a nonconformist congregation in Westminster, and died in 1677. He was the author of a dissertation on the Hebrew language, of a life of his father, and of a treatise on Divine Providence.—J. T.

CAXTON, WILLIAM, the introducer into England of the art of printing, was born in the Weald of Kent early in the fifteenth century. The exact date of his birth has not been ascertained. Oldys places it in 1412. Some time between his fifteenth and eighteenth year, after receiving an education more than usually liberal for the time, he was apprenticed to Robert Large, an eminent London mercer, who was lord mayor of the city in 1439. Books would probably form part of Mr. Large's merchandise, and it has been conjectured that Caxton's literary tastes were developed while in this employment. He did not, however, fail to give ample attention to business, for we find that his master, who died in 1441, left him as a token of favour a legacy of twenty marks, and he was about the same time admitted a freeman of the company of mercers. In the course of the year following he went to the Low Countries, either to transact business on his own account or as agent for some trading house. We find him in 1464 commissioned, along with one Richard Whitehill, “to continue and confirm a treaty of trade and commerce between Edward IV. and Philip, duke of Burgundy.” The two commissioners are named “ambassadors and special deputies.” Caxton, however, was not wholly occupied with business, but found leisure to study the art of printing, and also to translate into English Raoul Le Fevre's *Recueil des Histoires de Troyes*. He seems to have begun the work in 1468, and for some reason to have discontinued it. When the Lady Margaret of York was married to Charles, duke of Burgundy, Caxton was admitted into her household, and seems to have occupied some high position there. At the request of his mistress, and “having,” as he says, “no great charge or occupation, and wishing to eschew idleness,” he resumed and finished his translation of the *History of Troy*. The date of his first essay in the art of printing is not known, neither how he acquired the knowledge of it. This only is manifest, that he learned it wholly in the Low Countries, for the types which he first employed must have been made without his having seen those in use at Paris, Venice, or Rome. The first product of his press was the original of his favourite *Recueil des Histoires de Troyes*; the second the oration of John Russell on Charles, duke of Burgundy, being created a knight of the garter; and the third his own translation from the French of Raoul Le Fevre, “whyche sayd translacion and werke,” as the title testifies, “was begonne in Brugis in 1468, and ended in the holy cyte of Colen, 19th Sept., 1471.” These three works were certainly printed by Caxton when abroad; but when he returned to England is not distinctly ascertained, farther than that it was before 1477. It is, however, more than probable that he established himself in London in 1474, for the figures of that date are inwrought with his device as a printer. If this be so, his translation from the French of the *Game and Play of the Chesse* (see CESSOLEE, JACQUES DE), printed in that year, is to be set down as the first book printed in England. There is, indeed, a story to which, however, no credit can be given, that in 1468 Edward IV. sent over a M. Turnour, who, with the assistance of Caxton, bribed Frederick Corsellis, a servant in a Dutch printing-office, to bring to England the secret of his art, and that a book at Oxford, with the date 1468, is entitled to the honour which we claim for the *Game and Playe of the Chesse*. Whether this book was printed on the continent or in England, it is at least certain that Caxton was fairly settled in his native country in 1477, and that in that year he printed the *Dietes and Notable Wyse Sayenges of the Phylosophers*, a translation from the French by one of his earliest patrons, the Earl Rivers. Mr. Caxton's first printing-office was at Westminster, and, as appears from a curious old advertisement in his largest type, and preserved at Oxford, it was set up in the almonry of the abbey. It was afterwards removed to King Street. Mr. Caxton not only busied

himself to the very close of his long life in his occupation as a printer—which cannot have been idly prosecuted, seeing that as many as sixty-four books issued from his press in no more than twenty years—but he was constantly employed translating works to be printed, chiefly from the French. His last labour was the translation of the Lives of the Fathers, which we learn from an edition published by Wynkin de Worde in 1495, he finished “at the last day of his life.” In the parish records of St. Margaret's, Westminster, for the year 1491 or 1492, we read—“Item, atte bureyng of William Caxton, for iij torches,” and “Item for the belle at same bureyng.” It may be interesting to quote the titles of a few more of the earlier products of this first English printing-press—The Book named Cordyale, or Memorare Novissima, which treateth of the “Four Last Things,” 1478–80; The Chronicles of England, 1480; Description of Britayne, 1480; The Mirrour of the World, or thymage of the same, 1481; The History of Reynart the Foxe, 1481; The Book of Tullius de Senectute, with Tullius de Amicitia, and the Declamacyon, which labourerth to shew wherein Honour sholde rest, 1481; Godefroy of Bologne, or the Last Siege and Conqueste of Jherusalem, 1481; The Pylgremage of the Sowle, 1483, &c., &c.—(The sources of information with regard to Caxton and the early history of printing are Lewis' *Life of Caxton*, London, 1737; Oldys in *Biog. Brit.*; Warton's *Hist. of Eng. Poet.*; Dibdin's edition of Ames' *Typog. Antiquities*; Chalmers' *Biog. Dict.*; *Penny Cyclopædia*.)—J. B.

CAYET, PIERRE VICTOR PALMA, born at Montrichard in Touraine in 1525; died in 1610. He adopted the reformed doctrines in early life, and was chaplain and preacher to Catherine de Bourbon. The example of Henry IV. was not lost on the puritan preacher, and after a passage of arms in a theological tournament, Cayet was reconciled to what in France was called the church. It was a neck and neck race between Catholics and Calvinists for the body and soul of the wretched man. The Calvinists held a synod and deposed him, in order that the opposite party should not have it to boast that they had converted a man revered among the reformers, but had, by receiving a man degraded and deposed, in some degree shared such indignities as were studiously heaped on him. Degraded and deposed he was by the Calvinists; by the party who had won him, he was given priests' orders at the age of seventy-five. By the party whom he left he was accused of immoralities of a kind from which the period of life to which he had arrived might have protected him, were there any protection from the accusations of people so strongly preoccupied by prejudice as to be almost incapable of reasoning. Cayet was accused, not alone of such crimes as in any state of society may be imputed truly or falsely, but of others which, as resting on no grounds that could be examined, were more easily believed. The memory of Cayet cannot be washed clear of the scandal and the sin of apostasy. He was believed to be a magician, to have entered into a contract with the devil, who was to have his soul finally, on the strange condition of enabling him to have the best of every adversary in theological argumentation. Among other works of Cayet was a translation from the German of one of the legendary histories of Faustus. Cayet's book was entitled “Histoire prodigieuse et lamentable du Docteur Faust, grand magicien.” Another of his books is the “Veritable history of the delivery of the soul of the Emperor Trajan from hell torments, by the intercession of St. Gregory the Great.” Cayet at his death did not quite satisfy the clergy of the church which he joined. He, however, was given the last rites of the church, and buried in the monastery of St. Victor, the abbé expressing some doubts as to the propriety of the concession.—J. A., D.

\* CAYLEY, ARTHUR, a very eminent English mathematician, born at Richmond, 16th August, 1821. Mr. Cayley was destined for the bar, but his scientific tastes prevailed. He has devoted himself chiefly to the culture of the transcendental analysis; and his able memoirs are found in all our scientific collections. One paper, out of the multitude, may be remarked, viz., “On the Theory of Linear Transformation.” Mr. Cayley seems destined to confer yet many services on analytic science.—J. P. N.

CAYLUS, ANNE-CLAUDE-PHILLIPE DE TUBIÈRES DE GRIMOARD DE PESTELS DE LEVI, Count de, a distinguished student of the fine arts, born at Paris in 1692. He became a soldier at an early age, and won considerable distinction. After the peace of Rastadt he left the army and travelled into Italy, for the purpose of studying art, and afterwards visited Constan-

tinople, Ephesus, and Colophon. On his return to Paris he was employed in engraving and illustrating the stones and medals of the king's cabinet, and superintending the publication of works descriptive of the collection. In 1731 he was admitted into the Academy of Painting and Sculpture, and in return for the honour wrote the lives of its more distinguished members. Among numerous works of less moment, Caylus prepared the “Recueil d'Antiquités Egyptiennes, Etrusques, Grecques, Romaines, et Gauloises,” 7 vols. 4to. He died at Paris in 1765.—J. B.

CAYLUS, MARTHE MARGUERITE DE VILETTE DE MURÇAY, Marquise de, well known as the authoress of “Memoirs,” edited by Voltaire in 1770. She was the granddaughter of the celebrated Theodore Agrippa D'Aubigné, and was consequently related to madame de Maintenon, who took her to Paris at an early age, and introduced her into courtly society. Her extraordinary beauty, talents, and accomplishments found her hosts of admirers, who loaded her with adulations, a husband whom she reasonably detested for being always drunk, and the opportunity of amassing those interesting “Souvenirs,” which have added to her fame with posterity the only merit she seemed to lack in the eyes of her contemporaries—that, namely, of an accomplished authoress. She was born in Poitou in 1673, and died in 1729.—J. S., G.

\* CAYX, REMI JEAN BAPTISTE CHARLES, born at Cahors, July, 1795. Having, under the monarchy of Louis Philippe, held high appointments in the university, which, owing to the restrictive system adopted by Napoleon III., no longer exist, M. Cayx is now obliged to be contented with the rectorship of the departmental academy of the Seine. Elected in 1840 a member of the chamber of deputies, he took little part in any discussions which related not to the interest of letters, of which he showed himself the faithful guardian. He is the author of a history of France during the middle ages, and of a history of the Roman empire from the battle of Actium, in 2 vols.—J. F. C.

CAZALES, JACQUES ANTOINE MARIE DE, famous for the eloquence and hardihood with which he enforced the doctrine and supported the cause of constitutional monarchy during the early days of the first Revolution; and for the zealous although not inconsiderate services he rendered to the Bourbon family during their tedious exile, was born at Grenade-sur-Garonne in 1758. At the age of fifteen, when he entered the military service, his education was exceedingly, although for a young gentleman-soldier not singularly defective; but so diligently had he applied himself to study, especially the study of Montesquieu and the English historians, during the period between the date of his enlistment and that of the formation of the first national assembly, that upon being deputed to that body by the noblesse of his native bailliage, he at once assumed a lead in the most important deliberations then pending respecting the rights and privileges of the three orders of the state and those of the sovereign. A royalist by birth and inclination, and the chief defender of royalty, in virtue of the command he exercised by his eloquence over his fellow-deputies; a zealous defender also of the privileges of the order he served—he was, nevertheless, as Mirabeau and others have testified, held in respect by all parties, and no less admired for his virtue than his talents. He was in exile in England when he learned that Louis XVI. was to be brought to judgment. With characteristic devotion he wrote to the unhappy monarch, praying to be allowed to conduct his defence. To Louis XVIII. his political talents, and no less his high character, were often of singular advantage. In 1803 he was allowed to return to France. Till his death in 1805 he lived in the greatest privacy on a small estate near his native village.—J. S., G.

CAZAN-KHAN, the seventh sovereign of the Mogul dynasty in Persia, was placed upon the throne on the deposition and death of Baidu in 1295, through the influence of the emir Norouz. He at the same time embraced the Moslem religion, but was always suspected of adhering in secret to his former faith. He behaved with great ingratitude to his powerful supporter, Norouz, drove him from court, and ultimately put him to death in 1297. He entered into an alliance with Pope Boniface VIII. against the mamelukes, invaded and subdued great part of Syria, and inflicted a signal defeat upon the sultan, Nasser-Mohammed, near Hems, in 1299. But in 1303 he was stripped of all his conquests in Syria, and completely defeated by the sultan at Mardj-safar, near Damascus, with the loss of almost his whole army. Cazan's mortification at this defeat is said to have shortened his life. He died in 1304. His person

was dwarfish and completely deformed; but he was possessed of great courage and ability, and, by his enactment of a new code of laws and his vigorous administration of justice, conferred great benefits upon his people. He was also a munificent patron of literature and art, and was justly reckoned one of the ablest Asiatic princes of his age.—J. T.

CAZOTTE, JACQUES, born at Dijon in 1720. The name of Cazotte is better known in connection with a strange prophecy regarding the Revolution than as an author, notwithstanding the grace and liveliness of his "Diable Amoureux," and other pleasant tales. It is related by La Harpe, one of the persons present, that at a banquet where appeared amongst the guests a number of distinguished individuals, doomed victims of the approaching revolution, Cazotte distinctly prognosticated the manner of the death of each. He told Condorcet that he would commit suicide to escape the guillotine; to Chanfort he announced the death that followed by his own hand; predicted what would be the fate of Bailly; and, in reply to some question touching the attendance of priests at the scaffold, announced that there would be only one confessor spared for the benefit of the king of France. It must be acknowledged that the description of this very miraculous piece of clairvoyance, which up to a late period was held worthy of controversy, is now believed to have been the work of La Harpe, *après coup*. At the time Cazotte was said to have lifted the veil of the future, he had become a religious mystic, animated by the most ardent piety. He was himself one of the victims of the Revolution, being brought to the scaffold, 25th September, 1792.—J. F. C.

CAZWYNY, ZACHARIAS-BEN-MOHAMMED-BEN-MAHMOUD, a famous Arabic naturalist, born at Cazwyn, a town of Persia, about the year 1210; died in 1283. At Bagdad, where he studied law and natural science, he won the favour of the caliph, and was taken into the public service. His great work entitled "Wonders of Created Things, and Singularities of Existing Things," a cosmogony derived from Greek and Arabic sources, which has procured its author the title of the Pliny of the East, but which is still imperfectly known in Europe, no edition of the text having as yet appeared, was written after the capture of Bagdad by the Tartars in 1258.—J. S., G.

CECCHI, GIOVANNI MARIA, a Florentine comic dramatist, born in 1517. His plays, of which only ten are extant, although now little read, are of considerable interest to the historian of letters, inasmuch as they were the first to revive the idea of the classic comedy, and to displace from the stage the absurd troop of Harlequin and Pantaloon. He died in 1587.—A. C. M.

CECCO D'ASCOLI, or FRANCESCO STABILI, an Italian encyclopedist, born at Ascoli in 1257. He taught astrology in the university of Bologna, and published a work on the occult sciences, for which he was first subjected by the church to correctional punishment, and then condemned to death. He was burned alive at Florence in 1327. His death has been sometimes attributed to the enmity of Dino del Garbo, a friend of Dante.—A. C. M.

CECIL, ROBERT, first earl of Salisbury, the son of William Cecil, Lord Burleigh, by his second wife, was born about the year 1550, and educated at St. John's college, Cambridge. He was trained by his father to statecraft as a profession, and was early employed by Queen Elizabeth in many difficult and delicate negotiations. He was deformed in person, but, as an old biographer quaintly says, "upon his little crooked body he carried a head and a head-piece of a vast content." He inherited much of Lord Burleigh's courteous prudence, skilful foresight, and exquisite good sense; and proved himself possessed of that consummate tact which amounts to wisdom, in the discharge of public business. He served on board the English fleet against the Spanish Armada in 1588; and represented the county of Hertford in parliament. The queen sent him as assistant to the earl of Derby, ambassador at the French court; and afterwards (1596) created him second secretary of state under Sir F. Walsingham. Upon the death of Walsingham he succeeded to his office, and served during the remainder of his life as first secretary. In 1597 he became chancellor of the duchy of Lancaster, and lord privy seal; and ultimately succeeding his father as prime minister (1599), conducted the affairs of state with the power of a kindred prudence and patriotism. He upheld Elizabeth's policy in resistance to the Spaniards, and support of the United Provinces, and while subduing an Irish rebellion turned his attention to many practical measures for the

relief of the country. In the course of Cecil's administration we find him wisely alive to Irish grievances, endeavouring to abate the charges of the garrisons, to introduce systematic law, and to develop industrial energies. Upon the accession of James I., with whom he had kept up a private correspondence, Cecil continued to hold the office of prime minister, and appeared "in dearness and privacy" with the king, as though he had been his faithful servant for many years before. Sully called James the wisest fool in christendom, and he certainly had wit enough to perceive the value of a well-trained statesman who understood the management of a kingdom. Cecil advanced his principles of policy though free of practical necessities; and when compelled to act in a way opposed to his own views, he still continued in office as a means of tempering antagonisms, and preventing the complete triumph of an inimical cause. Thus, although he could not overcome James' desire to make peace with Spain, he yet moderated his servility; and while there was scarce a courtier of note who tasted not of Spanish bounty either in gold or jewels, he kept himself free from corruption. Every transition age needs these mediators between abstract laws of right, and the prominent, tangible, vested interests of the hour; and there is no doubt that James' reign would have been more shameful, had Cecil been absent from the council chamber. In especial, his allegiance to protestantism did good service. His devotion to the interests of the United Provinces caused many unsuccessful efforts to be made by the Spaniards and their partisans to effect his ruin. Cecil came to the knowledge of the "surprise plot," according to which James was to be compelled to change his ministry and favour the catholic party; and he was a chief agent in preventing its success. The prosecution of Sir W. Raleigh, however, upon the alleged discovery of Spanish treason, was a deep blot upon his administration. Upon the death of the earl of Dorset, Cecil became lord high treasurer, May 4th, 1608, and carried out some financial reforms. In the words of an old biographer, "he encouraged manufactures, as the home making of alum; salt by the sun; salt upon salt by new fires and inventions; copper and coppers of iron and steel; that the subjects at home might be kept on work, and the small treasure of the nation hindered from going abroad." On the other hand, Cecil sometimes stretched the claims of the royal prerogative in the raising of money. For instance, it is said that he got £200,000 for making two hundred baronets, telling the king—"He should find his English subjects like asses, on whom he might lay any burden, and should need neither bit nor bridle, but their asses' ears." Cecil's intense application to business aggravated certain consumptive tendencies, and rendered him an easy prey to a tertian ague. He died at Marlborough, 24th May, 1612, and was buried at Hatfield in Hertfordshire. He left two children by his wife Elizabeth, daughter of Lord Cobham, viz., a son, William, who succeeded to the title, and a daughter, Frances, married to Lord Clifford, heir to the earldom of Cumberland. In Cecil, James lost a councillor who tried, with consummate skill, to unite the service of his royal master with the prosperity of his country, and who played the double part of a courtier and a patriot. Had he been less a courtier, his country would have suffered through the loss of his influence in the council chamber. In an age when an enlightened patriotism ran in danger oftentimes of being condemned as treason, Cecil, Lord Salisbury, by an exquisite prudential tact managed to maintain himself as the servant and lover both of his king and of his country. He was the author of a treatise against the papists; some parliamentary speeches; a treatise concerning the state and dignity of a secretary of state, with the care and peril thereof, and of some notes on Dr. John Dee's discourse concerning the reformation of the calendar. His correspondence has been published by Lord Hailes.—L. L. P.

CECIL, THOMAS, an English engraver who flourished about 1630. Evelyn highly praises him, accounting him on a level with the greatest artists of his day. His plates show very neat clean execution, and are principally portraits after his own drawings.—W. T.

CECIL, WILLIAM, Lord Burleigh; the foremost statesman of the great Elizabethan era of English history; was born at Bourne in Lincolnshire, Sept. 15, 1520. He was the son of Richard Cecil, master of the robes to Henry VIII. An accident introduced him to the notice of Henry. Happening to meet in the presence-chamber two Irish priests who had accompanied their chieftain

O'Neil, to court, he entered into a Latin controversy with them concerning the supremacy of the pope, and displayed such rare ability that his antagonists lost their temper. Henry hearing of the dispute sought conversation with him, and determined to engage him in his service. Cecil's father, at the king's request, selected an office for his son, and chose the reversion of the *custos brevium* in the common pleas. By a marriage with a daughter of Sir John Cheke, his influence was still further increased, and he was introduced to the earl of Hertford, afterwards duke of Somerset. When Edward VI. ascended the throne Cecil became *custos brevium*; and his first wife having died at an early age, he married a daughter of Sir A. Cook, director of the king's studies. His protestantism as well as prudence rendered him acceptable to Somerset, who, on becoming protector in 1547, appointed him master of requests. He accompanied his patron in the expedition against Scotland, and narrowly escaped losing his life at the battle of Pinky. In 1548 he became secretary of state; but in 1549 he fell with the protector, and was sent with other noblemen to the Tower. Cecil had, however, established his own position as a statesman, and by his skilful mastership of the ways of the world had done much to blunt the edge of animosity. There was no personal rancour to be gratified by his disgrace. He was soon released therefore from imprisonment, and as highly advanced by Northumberland as he had been by Somerset. He again became secretary of state, was knighted, and admitted to the privy council. Following the dictates of a wise patriotism, Cecil disregarded the intrigues of court life, and with thoughtful industry devoted himself to the discharge of the practical duties of government. He discerned at once the weak and the strong points of those around him, and with fine tact could make meaner minds minister to his wise purposes. On the death of Edward VI., he refused to join Northumberland in advancing the cause of Lady Jane Grey; and was well received by Queen Mary. Mary would willingly have taken advantage of his abilities and employed him in his old offices, but he refused to abandon his faith, and remained unconnected with the government. During the reign of Mary, he quietly mingled with men of all parties, and threw the weight of his influence on the side of moderation, especially cultivating the friendship of Cardinal Pole, who also resisted extreme measures. In his place in parliament, as member for Lincolnshire—for which county he had been elected without solicitation—he boldly opposed the bills brought forward for increasing the civil penalties upon protestantism. "I incurred," he writes, "much displeasure by this conduct, but it was better to obey God than man." Meanwhile he pondered over the condition of England, and considered the plans by which the approaching reign might be made more glorious. With Elizabeth he kept up a secret correspondence; and on the very day upon which she ascended the throne, he presented her with a list of what he considered the most pressing necessities of state. He was the first person sworn upon the queen's privy council, and remained during the remainder of his life chief minister of her state. No man ever went through more toil with a calmer spirit. Passing over the claims of rank to find the men best fitted to fill the posts at his disposal, he was ever willing to hazard personal offence in behalf of a public good. Deliberate in thought and character, he measured every opponent with an accuracy beyond the reach of passion. Tolerant and generous in disposition, he appeared more anxious to do justice to his opponents, than even to benefit his friends. Possessed of a perfect command of his temper, secrets of state and of family were alike safe in his keeping. He understood the wisdom of silence, and ruled men at times by what he did not say, as much as by what he did. Cecil's first advice to Queen Elizabeth was to call a parliament, and the first great question on which he entered was the Reformation; and through his influence, the queen was induced to consent to measures far more decidedly protestant than her natural inclinations sanctioned. Yet his mind rose clearly above sectarian animosities, and he was willing to tolerate the catholics so long as they did not interfere with the peace of the state. He remonstrated strenuously against that harsh treatment of the nonconformists which found favour with the queen and some of the prelates. He characterized their proceedings as too much savouring of the Romish inquisition, and indicating a desire "rather to seek for offenders than to reform any." In the conduct of foreign affairs Cecil was emphatically a minister of peace. His policy was to support the protestants

against catholic governments in different European countries, and thus by preventing any combination against England, to give her a vantage-ground in negotiation; while he risked popularity by refraining from taking advantage of opportunities of aggression. It was one of his maxims "that a realm gains more by one year's peace than by ten years' war." Although many of his financial measures were not in harmony with modern science, yet the strict and successful economy of Elizabeth's government was chiefly due to his judicious administration. In 1571 Cecil was created baron of Burleigh, and subsequently became knight of the garter and grand treasurer. After the execution of Mary Queen of Scots, Elizabeth tried to cast the blame on Burleigh, and forbade him her presence; but, this storm passing, he regained his influence, and prepared for the defence of England against the Armada. From time to time plots were laid against him—on one occasion by the favourite earl of Leicester; and the queen's wayward impetuosity sometimes fell rudely on him; but until his death Lord Burleigh held his place in the hearts of queen and people as the foremost statesman of the land. His private life was pure, gentle and generous. Although he maintained a princely magnificence of state and equipage, he cared anxiously for the poor. Lord Burleigh died August 4th, 1598, after having wisely guided the destinies of his country as prime minister for forty years. It was one of his own sayings, that he that is false to God can never be true to man; his countrymen may reverently reverse the sentiment, and say of the great statesman himself, that by his truthfulness to man he made nobly manifest his truthfulness to God.—L. L. P.

CECILIA, SAINT, a Roman virgin, reputed as the patron saint of music, flourished in the second century. She was eminent for piety, and had vowed perpetual virginity, but was espoused by her parents to a heathen nobleman named Valerian, whom however she prevailed on to embrace christianity, and to respect her vow. They both suffered martyrdom, either at the close of the second or the beginning of the third century. The body of Cecilia was discovered about 821 by Pascal I., in the cemetery of a church which bore her name, it is said, from the sixth century. The honour paid to Saint Cecilia as the patroness of music can be traced to no better origin than the devotion or credulity of the early Italian painters and poets, who, on the faith of her "Acts"—now considered an apocryphal production—represented her as the inventress of the organ. About 1683, musicians began to celebrate her birthday, the 22nd November. Dryden's Ode to St. Cecilia is well known.—J. B.

CECINA or CÆCINA, ALIENUS, a Roman statesman and general, was quæstor in Bætica at the time of Nero's death, and joining the party of Galba, was rewarded with the command of a legion in Upper Germany. Prosecuted for peculation, he joined Vitellius, who intrusted him with a large army, with which he gained a victory over the troops of Otho, the successor of Galba, at Bedriacum. He was afterwards consul under Vitellius, but again proved traitor, and yet again, having within ten years joined Vespasian, and headed a conspiracy to dethrone him. He was slain by order of Titus, A.D. 79.—J. S., G.

CECINA or CÆCINA, AULUS, author of a libel against Cæsar, for which he was banished; of a work entitled "Querela," dedicated to Cicero, who recommended him to the favour of several public characters; and of "Etrusca disciplina," a work quoted by Pliny and by Seneca—lived about the year 46 B.C., and enjoyed immense reputation as an orator.

CECINA or CÆCINA, SEVERUS, a distinguished Roman general, who lived in the reigns of Augustus and Tiberius. He was governor of Mæsia in A.D. 6, when the insurrection under the two Batos broke out in the neighbouring provinces of Dalmatia and Pannonia. He marched against the insurgents and defeated them. In the following year he gained a second victory over them. In A.D. 14 he was appointed lieutenant to Germanicus, and sent against Arminius, whom he defeated. He was rewarded with the honours of a triumph.—J. T.

CECROPS or KECROPS, a mythical personage, who is said by Apollodorus to have been the first king of Attica. According to some authorities he was an Egyptian, who immigrated into Attica about 1580 B.C.; but the greater number represent him as indigenous or earthborn. He is said to have instructed the semibarbarous inhabitants in the advantages of social life, of marriage, property, justice, and civil rights. To him is also attributed the erection of the first temples in the country, the institution of the court of Areopagus, and the distribution of

the inhabitants of Attica into twelve local sections. A second Cecrops is mentioned by tradition; but Mr. Grote is of opinion that he is a mere reduplication of the first Cecrops.—J. T.

**CEDERHJELM, JOSIAS**, a Swedish baron, born in 1673. He held a post in the home department, was also royal secretary, and was employed in various diplomatic services under Charles XII during his stay in Poland and Saxony. After the battle of Pultowa he was taken prisoner, but liberated on a written engagement to return in four months; when he hastened to Stockholm to lay before the government the proposal of the Czar, and also to assure the nation of the king's safety. This done, he faithfully returned to his imprisonment, from which he was not released till 1722, on the conclusion of peace. Distinguished by his knowledge, energy, and ability, he was immediately afterwards nominated to the office of secretary of state. He attached himself to the Holstein party, and even when member of the council, which he became in the following year, placed himself at its head. After the death of Czar Peter, he was sent in 1725, contrary to the wishes both of the king and Horn, as ambassador to Russia, and in this capacity laboured, in opposition to the object of his mission, to bring about a reconciliation between the contending parties, and to establish a treaty of alliance between Sweden, Austria, and Russia. He was recalled the following year; and the plans of the Holstein party being defeated, Cederhjelm, to avoid his dismissal, petitioned for leave to retire from office; which being granted, he withdrew to his estate of Lindholm in Upland where, two years afterwards, he died, 3rd September, 1729.—M. H.

**CEDERSTRÖM, OLOF RUDOLF**, a Swedish admiral, born 8th February, 1764. He distinguished himself in the war of 1788–89. In 1790 he conducted an expedition against Roggersvik, stormed its defences, and destroyed the supplies. In 1808 he drove the Russians out of Gothland, and on the conclusion of peace became governor of that island, where he established an armed force among the people. During 1813–14 he acted as vice-admiral; in 1815 he was appointed councillor of state; and in 1819 received the title of Count. In 1821 he became one of the lords of the empire, and in 1824, after having laboured to reorganize the Swedish navy, he was appointed lord high admiral. Owing to the disgraceful trading which went forward in the commissariat department of the navy, the management of which was committed to Cederström, and the continual attacks on government which it gave rise to, he retired from office in 1828. He died 1st June, 1833.—M. H.

**CEDRENIUS, GEORGIUS**, a Greek monk and chronicler of the eleventh century, author of a synopsis of the Greek general histories published before his time—a work of little value to the student either of history or letters. The last edition of Cedrenus is that of Bekker, published at Bonn in 1838.

**CELAKOWSKY, FRANTISEK LADISLAW**, a Bohemian poet and philologist, born near Prague in 1799. Devoting himself to the study of the Slavonic languages, he became editor of a Bohemian newspaper in Prague, and professor of the Bohemian language in the university of that city—offices from which he was dismissed about 1831, for animadverting on the severity of the Russian emperor against the Poles. After being for a time librarian to the Princess Kinsky, he was appointed in 1842 to a chair of Slavonic literature in Breslau, and in 1849 returned to Prague to enter on a professorship of Slavonic philology, which he held till his death in 1852. Celakowsky did much to advance the knowledge of Slavonic literature. He wrote many original works in Bohemian, and made valuable translations from other languages. We notice—a volume of poems; a translation of Herder's *Leaves of Antiquity*; a collection of Slavonic national songs; a translation of a collection of Russian national songs; "The Hundred-leaved Rose;" and a work named "The Philology of the Slavonic Nation in Proverbs."—J. B.

**CELER**, a Roman architect, who, in conjunction with Severus, drew the plans of Nero's immense palace—the famous golden house. They also projected a navigable canal from the lake of Avernus to the mouth of the Tiber. This gigantic scheme was commenced by Nero, but was left unfinished.

**CELESTI, CAVALIERE ANDREA**: this painter, born at Venice in 1637, studied under Matteo Pozzoni, but followed a different manner of art to his preceptor's. He was a fertile, florescent, graceful painter of the Paolo Veronese type—luminous and tender in colour, and frehanded and courageous in drawing. He painted both sacred and profane subjects. His chief histori-

cal works are in the church of the ascension at Venice. Some of his works are much in the manner of Rubens, and marked by an excessive proneness to a tone of purplish carnation. He painted landscapes also, which are scarce and highly prized. Some of these are very beautiful views of Venice and other cities of Italy. He died in 1706.—W. T.

**CELESTINE**: the name of five popes:—

**CELESTINE I.**, a Roman, was elected in 422 on the death of Boniface I. The personal character of this remarkable pope can be but dimly guessed at from the records, voluminous though they are, which attest his earnestness as a theologian, and his unresting activity as chief bishop of the church. The acts of his pontificate we notice under two heads—his resistance to heresy, which was called into action mainly in the east, and his measures to evangelize the heathen, which transport us to the north and west.

Nestorius, the famous author of a heresy which in the east still counts its adherents by millions, succeeded to the patriarchate of Constantinople in 428. He prided himself on his zeal for the purity of the faith; and to prove it commenced a cruel persecution of the Arians, Novatians, &c., at Constantinople. But his sermons against the Apollinarians overshot the mark; and while reprobating those who confounded the two natures, he himself denied by implication the unity of the *person* of Christ. Cyril, the patriarch of Alexandria, detected and combated the error. Nestorius thereupon referred the matter to the pope, to whom Cyril also wrote, sending copies of all the documents which had passed, and stating that he had not yet broken off communion with Nestorius, pending the declaration of the pope's opinion. Celestine, after being furnished with all that each side had to allege, convened a council at Rome, which condemned the doctrine of Nestorius. Upon hearing this, the emperor, Theodosius the Younger, strongly urged by the Nestorian party, convoked the general council of Ephesus, which met in 431. At the second session of the council the papal legates appeared and opened the proceedings by reading a letter from Celestine. The condemnation and deposition of Nestorius were finally resolved on. During the entire proceedings the pope kept up a diligent and vigorous correspondence with the emperor, the council, St. Cyril, and all concerned, and his letters bear the stamp of no common ability. While thus he crushed the new heresy in the east, he was not less watchful against the inroads of an old enemy in the west. He combated semi-pelagianism in Gaul, and pelagianism in Britain, whither he sent St. Germanus in 430 to root it out.

The other great division of his actions embraces his labours for the conversion of the heathen, and must here be very briefly summed up. Early in his pontificate he sent Palladius to convert the Scots; and upon hearing of his death in 432, he selected St. Patrick as his successor, ordained him bishop, and sent him to preach the faith in Ireland. A man, one would say, of some discernment in his choice of instruments! Celestine died in April, 432.

**CELESTINE II.**, a Tuscan, succeeded Innocent II. in 1143, at a time when disastrous news were constantly arriving from the christian kingdom of Jerusalem. He died within five months after his election—"happy only in this one circumstance," says Platina somewhat satirically, "that on account of, as I suppose, the shortness of the time, he was harassed by no seditions during the whole of his pontificate."

**CELESTINE III.** (Cardinal Hyacinth Bobo), of the family of the Orsini, succeeded Clement III. in 1191, being then in his eighty-fifth year. The most memorable act of his pontificate is his interference to procure the release of our Richard Cœur de Lion from imprisonment. Duke Leopold of Austria had seized the king while on his return from Palestine, and for a sum of money transferred him to the custody of the emperor, Henry VI. Moved by the bitter entreaties of Eleanor, Richard's mother, the pope exerted himself to induce the emperor to release his prisoner. But it was not till the payment of a large ransom, of which Leopold received one-third, that Richard obtained his liberty. After the death of Leopold the pope obtained the restitution of his third of the spoil, as the condition of his receiving christian burial. Celestine died in 1197.

**CELESTINE IV.**, a native of Milan, was elected upon the death of Gregory IX. in 1241, in the midst of the struggle between the papacy and the empire, but lived only eighteen days after his elevation.

CELESTINE V. (Peter of Morrone) was elected in 1294, after the papal chair had been vacant for more than two years. He had lived for many years as a hermit on the mountain of Morrone, and was totally unacquainted with the ways of the world. He at once accepted the papal dignity, imagining in his simplicity that it was the direct will of heaven. Charles II., the king of Naples, immediately visited him, and easily contrived to make him see all things in the light that best suited Neapolitan interests. Hence the pope was led to commit many foolish and hasty acts, such as creating new cardinals without consulting the old ones, nominating unfit persons to benefices, &c. Affairs were rapidly getting into confusion; but the aged pope, with a degree of sense and humility seldom displayed by men in power, found out before five months were over that his great office was not suited for him, nor he for it, and he determined upon abdicating. He carried out his purpose against much opposition, and was succeeded by Boniface VIII. in December, 1294. For an account of his death see the article on that pope.—T. A.

CELESTIUS, an Irish ecclesiastic of the fifth century, the pupil of Pelagius, and with him identified in the heresy that bears his name. Celestius was a man of great vigour and ability, and an eloquent writer. He was by many reputed to be the real author of works that bear his master's name. After the death of Pelagius, Celestius and a brother pupil, Julian, continued to propagate their tenets till they were expelled from Gaul. Their opinions spread through Britain and Ireland.—J. F. W.

CELLAMARE, ANTONIO GIOVANNI, Duke of Giovenazzo, Prince of, was descended from a noble Genoese family, and born at Naples in 1657. He was educated in the court of Charles II., and declared for Philip V. on his accession to the throne. In 1702 he accompanied that monarch in his campaigns in Naples against the imperialists, obtained the rank of major-general after the battle of Luzzara, and was taken prisoner at the siege of Gæta. He regained his liberty at the peace of 1712, and, returning to Spain, adopted a diplomatic career. He was sent as ambassador to France in 1715, and having become implicated in a plot against the regent, which was accidentally discovered at the moment of execution, Cellamare was arrested and escorted to the frontiers of France, and dismissed. The Spanish court, as a compensation for this affront, nominated the duke captain-general of Old Castile. He died in 1733.—J. T.

CELLARIUS, CHRISTOPH, a distinguished German scholar and educator, whose real name was KELLER; he was born at Schmalkalden, November 22nd, 1638, and successively became teacher and head master in various renowned gymnasia. In 1693 he was appointed professor of rhetoric and history at Halle, where he died, 4th June, 1707. Besides numerous editions of Latin classics, he has published many learned works, amongst which we mention—"Antibarbarus Latinus," 1677; "Antiquitates Romanæ," 1710; "Notitia Orbis Antiqui," 2 vols.; "Orthographia Latina," new edition, by Harless, 1768.—K. E.

CELLINI, BENVENUTO, the son of Giovanni and Elisabetta Cellini, was born at Florence on the night of November 1, 1500, in the Via Chiara, No. 5079. He was named Benvenuto (Wellcome), because his parents had so long desired a son. The first instruction he received from his father was to play on the flute and to sing, much to Benvenuto's distaste, whose heart was in drawing and modelling. His inclination to be a sculptor was so decided that his father placed him in 1513 with the jeweller Baccio Bandinelli; and two years afterwards he entered the shop of a jeweller named Antonio Marcione. Benvenuto commenced his wanderings when quite a boy, undertaking various jeweller's work in Sienna, Bologna, Pisa, and Rome, before his twentieth year. He had the opportunity in 1518 of visiting this country with Torrigiano; but he declined, owing to the dislike he had to that sculptor for the blow he gave Michelangelo when a boy. Benvenuto went to Rome in 1519, but he does not mention Raphael in his account of this visit, though he was there for two years, and at the time of that painter's death. He returned to Rome in 1524, and from this time dates his successful career as an ornamental jeweller. He was employed by Clement VII. and several of the Roman nobility. Benvenuto was in Rome also during the sack of the city in 1527, by the soldiers of Constable Bourbon; and, according to his autobiography, it was he who shot Bourbon as he was scaling the walls. The consequent disturbances of the time caused Benvenuto to leave Rome and return to Florence. The great school of Raphael was dispersed by the same events. Having passed

some time at Mantua and Florence, always engaged in his art, Benvenuto Cellini was recalled to Rome by the pope in 1529, and was employed, not only in jewellery, but also in making the dies for medals and for the mint. He was appointed papal mace-bearer; and after the death of Clement, Paul III. became his patron. He, however, seldom remained long in one place; being repeatedly in difficulties, owing to his violence and quarrels with his fellow-artists and others, he was compelled to fly from one city to another. In 1534 he assassinated a rival; in 1535 he was engaged alternately at Rome, Naples, Florence, and Venice; and in 1537 he visited Paris, where he was presented to Francis I. Again in Rome in 1538, he was imprisoned in the castle of Sant' Angelo, upon a false accusation of having embezzled some jewels: he escaped from the castle, but fell and broke his right leg. When recovered, he was remanded to the castle, but obtained his freedom before the close of the year, through the intercession of the cardinal d'Este. In 1540 Cellini, through his friend the cardinal d'Este, was received into the service of Francis I., with an allowance of seven hundred scudi a year, independent of payment for all work done. This is the salary which the same king gave to Leonardo da Vinci. Cellini gained the favour of Francis, who gave him letters of naturalization, and a small estate, and employed him on the decorations of Fontainebleau. His position soon created him invidious enemies, who, aided by his own nature, destroyed his peace. He returned with a great reputation to Italy in 1545, and received from Duke Cosmo de' Medici at Florence the commission for the celebrated Perseus, which was cast in 1546, but not completed till 1554; it is now in the Loggia de' Lanzi in the Piazza Granduca at Florence. In this year (1554) Benvenuto Cellini's name was inscribed among the nobility of Florence. In 1558 he made up his mind to turn monk, and received the first tonsure; but wishing to marry in 1560, he abandoned the resolution. In the following year Duke Cosmo gave him a house in the Via del Rosaio. There is no account of his marriage, but it must have been about 1563, as his first legitimate child, a daughter, was born in 1565. His numerous children up to this time were all illegitimate. In 1569 he had a son, legitimate, Andrea Simone. He died at Florence, February 13, 1571, leaving his property to his three legitimate children, his son and two daughters. Benvenuto Cellini's was a life of strange adventure and constant trouble, owing perhaps chiefly to his own violent temper and dissolute habits. He has, indeed, painted himself in his autobiography as a thorough vagabond; he confesses to three homicides, among many other disgraceful adventures, though they may have been then of very ordinary occurrence, and quite consistent with the habits of the sixteenth century. His labours were divided chiefly between Rome, Fontainebleau, and Florence. As an ornamental jeweller, or silversmith, he was the most distinguished artist of his time. He was also a good sculptor. He himself quotes in his "Life," a letter from Michelangelo at Rome, in which the great Florentine compliments him on a bronze bust of Bindo Altoviti, saying, that he had "long known him as the best of jewellers, and that in the bust of Bindo Altoviti he had shown himself equally good as a sculptor." His principal work as a sculptor is the bronze of the Perseus with the head of Medusa, already mentioned, of which there is a cast at the Crystal Palace; but this is a work of no remarkable merit. His ornamental silverwork, on the other hand, is of unrivalled excellence—chased dishes, salt cellars, and such work for the table. His style is *renaissance*, in contradistinction to *cinquecento*, the style chiefly of the architectural sculptors. Cellini's designs generally abound in the *cinquecento* arabesque, but very much mixed and sometimes overloaded with the strap-and-scrolled-shield-work which distinguishes our Elizabethan. Cellini is, in fact, the great exponent of this style; and it is sometimes described as Cellini-work, like the similar term Boule-work, after the French artist of that name.—(*Vita di Benvenuto Cellini scritta da lui medesimo*, &c.: Molini, 1832.)—R. N. W.

CELSIUS, ANDREW, a Swedish astronomer, born at Upsal in 1701. His father, Olaus Celsius, was a celebrated theologian and savant, and his grandfather, Magnus Nicolaus, a famous mathematician and botanist. Andrew Celsius was a professor of astronomy at Upsal. He was associated with Maupertuis, Clairaut, and other French savans, in their voyage to Lapland for the purpose of measuring a degree. He was the first who used a centigrade thermometer. He wrote several scientific treatises, of which we may mention—"Dissertatio de novo

methodo dimetiendi distantiam solis a terra;" "CCCXVI. observationes de lumine boreali;" "De Luna non habitabili;" and "Letters on Comets," in Swedish.—J. T.

CELSIUS, MAGNUS NICOLAUS, a Swedish naturalist and mathematician, was born in 1621, and died in 1679. He was professor of mathematics at Upsal; but his published works are on natural history—such as "De Plantis Upsaliæ," 1647, and "De Natura Piscium in Genere et Piscatoria," 1676.—J. H. B.

CELSIUS, OLAUS or OLAF, a well-known medical botanist and theologian, was the son of Magnus Nicolaus Celsius. He was born in 1670, and died in 1756. He was professor of theology and of the oriental languages at Upsal. By order of Charles XI. he travelled through the principal European states. His most celebrated work is entitled "Hierobotanicon," or an account of the plants mentioned in the Bible. It is a very learned work, and shows that the author was both a good oriental scholar and a botanist. He was one of the founders of natural science in Sweden, and he was the first instructor of Linnæus, who named the genus *Celsia* after him. Besides numerous botanical dissertations, Celsius wrote various theological works, such as—on the original language of the New Testament; on the Suedo-Gothic versions of the Bible; on the warlike laws of the Hebrews; on the sculpture of the Hebrews; on Solomon's navigation; on the pyramids of Egypt; on the Arabic language, &c.—J. H. B.

CELSUS, an Epicurean philosopher of the time of the Antonines, a friend of Lucian, supposed to be the author of the work against christianity entitled *Λόγος ἀληθής*, which the reply of Origen rendered famous.—J. S., G.

CELSUS, in English CELESTINE, and in Irish CELLACH, born in 1079, was consecrated archbishop of Armagh in 1106. He was deeply learned, and is called in the Antiquities of Oxford, "an universal scholar." He was present at the great synod held in 1111, convoked "to regulate the lives and manners of the clergy and laity." He died in 1129, aged fifty years, and was buried at Lismore.—J. F. W.

CELSUS, ALBINOVANUS, a Roman poet who lived about the beginning of the christian era. He was the secretary of Tiberius Claudius Nero, and the friend of Horace, who has addressed to him one of his epistles.—J. T.

CELSUS, AULUS or AURELIUS, CORNELIUS, the most celebrated, and one of the most valuable of the ancient Latin medical writers. His exact date is unknown, but he lived probably at the beginning of the christian era, and at Rome. Little or nothing is known of his personal history, and it is even doubtful whether he was a physician by profession, or whether he was merely a literary man who wrote on various subjects, and on medicine among the rest. At any rate, his work "De Medicina," which is the only one of his writings that remains (with the exception of a few fragments of a treatise on rhetoric), shows that he was quite on a level in scientific and medical knowledge with his contemporaries; and it is the best synopsis we possess of the opinions and practice of the physicians of his day. It is divided into eight books, and treats in a cursory manner of diet, hygiene, pharmacy, anatomy, medicine, surgery, &c. The most valuable portion of the work is his account of various surgical operations which were commonly performed in his day, and which show, that, while the medical theories of his contemporaries were frequently erroneous, and their treatment of internal diseases feeble and unskilful, their surgical practice was much superior, and exhibited considerable boldness and judgment. It ought not to be forgotten that the style of his Latinity is peculiarly elegant, and fully equal to that of his contemporaries in the Augustan age. Celsus does not seem to have been much read during the middle ages; but four editions of his work were published in the fifteenth century, and it has ever since continued to be reprinted from time to time. Part of its present popularity in England is caused by its being one of the usual text-books for medical students. Among the principal editions may be mentioned that by Targa, Patav., 1769, 4to, whose text has been the basis of most subsequent editions. There is a good edition by Milligan, Edinburgh, 1826, 8vo; and a new edition has been prepared by Dr. Daremberg for a publisher at Paris. Celsus has been translated into English, French, Italian, and German; none of the English translations that the writer has had an opportunity of inspecting appear to be very good.—(For further particulars respecting his opinions and practice—see Haller's *Biblioth. Chirurg.*, vol. i.; and *Biblioth. Medic. Pract.*, vol. i.; and the *Histories of Medicine* by Le Clerc, Sprengel, Bostock, and

Hamilton. See also Choulant, *Handbuch der Bücherkunde für die Aeltere Medicin*, Leipzig, 1840, 8vo; Dr. William Smith's *Dict. of Greek and Roman Biography*.)—W. A. G.

CELSUS, CAIUS TITUS CORNELIUS, one of the thirty tyrants of Rome. Proclaimed emperor in Africa, A.D. 265, in the twelfth year of the reign of Gallienus, he was slain on the seventh day after his assumption of the purple.

CELSUS, P. JUVENTIUS, the name of two Roman jurists, father and son, both cited in the Digest. Of the elder little is known. The younger flourished under Nero and Trajan, and wrote "Digestorum libri XXXIX.;" "Epistolæ;" "Commentarii;" and "Institutiones."

CELTES, KONRAD, an eminent German scholar, whose real name was either PICKEL or MEISSEL. He was born at Wipfelde, near Wurzburg, in 1459, and died at Vienna in 1508. His father's intention of making him a vintner was frustrated by his flight to Cologne, where he strenuously applied himself to the study of the ancient languages, and soon distinguished himself as a scholar and poet. He then visited the most renowned universities of Germany, was crowned poet laureate at Nurnberg in 1487, by the emperor, Frederick III., and travelled in Italy in 1488, where he formed acquaintances with the foremost scholars of his age. After his return he spent some years at Cracow, and thence proceeded to Mentz where he originated the celebrated Rhenish Society of Letters. In 1497, he was appointed professor of poetry and rhetoric in the university of Vienna by Maximilian I. Here he founded the Collegium Poetarum in 1502, enriched the imperial library with numerous Greek and Latin works, and first introduced theatrical representations in the court. In one of his frequent travels, he discovered in the convent of Tegernsee that celebrated old map, known as the Tabula Peutingeriana, so called after its first editor. He wrote a number of Latin works, edited the writings of the nun Hroswitha, and chiefly excelled in Latin poetry after the model of Horace and Tibullus.—(See Klupfel, *De vita et Scriptis C. C.*; edition by Ruel and Zell, Freiburg, 1827, 2 vols.)—K. E.

CENCI, BEATRICE DI, a Roman lady of the eleventh century, whose memory has been preserved by her extraordinary beauty and tragical fate. She was the daughter of Count Francesco Cenci, a man notorious for his debauchery and frightful wickedness. He had on various occasions purchased at an enormous price, from the papal government, pardon for murder and other shocking crimes. He had married a second time, and had conceived an implacable hatred towards his children by his first wife, and is even charged with having put two of his sons to death. The remarkable beauty of his daughter Beatrice, excited in the breast of the old villain "feelings at which nature shudders," and the gratification of his incestuous passion was aggravated by every circumstance of cruelty and violence. His unfortunate victim appealed to the pope, Clement VIII., but in vain; and her attempts to escape by flight having been frustrated, she sank into despair. At length her mother-in-law and brother, unable longer to bear the ill-treatment and villanies of the count, conspired with his steward and several other persons to put their oppressor to death, which they accomplished by means of a hired assassin. It is uncertain whether or not Beatrice was privy to this plot. Suspicion, however, fell upon her as well as upon the other members of the Cenci family, and they were all arrested, carried to Rome, and subjected to the most frightful tortures. Beatrice constantly asserted her innocence, but she was condemned to death along with her mother-in-law and two brothers. The most earnest entreaties for her pardon were made to the pope by the noblest families in Rome, but the pontiff was inexorable, and Beatrice was executed on the 11th September, 1599, along with her mother-in-law and elder brother; the younger having been spared on account of his youth. The immense possessions of the family were confiscated by the pope. The details of this terrible tragedy were long kept secret by the papal court, and have only within these few years been brought to light. The story of the Cenci has been made the subject of a powerful drama by Shelley.—J. T.

CÈNE. See LECÈNE.

CENNINI, CENNINO, an Italian painter, born about 1360. He was a pupil of the celebrated Giotto. The only frescos of his which remain are in the church of St. Francis at Volterra. He is best known now, however, by his treatise on painting, the earliest extant, which lay unnoticed in the Vatican until it was discovered in 1821, and published by the chevalier Tambroni.

It is curious and valuable, and shows that painting in oil was known before the time of John Van Eyck, to whom its invention had been previously ascribed.—J. T.

**CENSORINUS**: the name of a plebeian family of the gens Marcia, originally called Rutilus. The following are the more distinguished members of this family:—**CAIUS MARCIUS**, the son of that Caius Marcus Rutilus who, chosen dictator in 356 B.C., was the first plebeian who filled the office. In 310 B.C., the year of his father's death, he was consul, and engaged in war with the Samnites. He was one of the first four plebeians who were elected pontifices, in 300 B.C., under the Lex Ogulnia. He was twice censor, first in 294 B.C., and again in 265 B.C.—**CAIUS MARCIUS**, one of the chiefs of the Marian party, executed after its defeat in 82 B.C. by order of Sulla.

**CENSORINUS**, a Latin chronologer and grammarian, who lived under Alexander Severus and his immediate successors, about the beginning of the third century. His only work which has been preserved is a treatise, "De Die Natali," in which he treats of various matters of chronology, mathematics, and cosmography. There is a fragment, "De Metris," by this author, still extant. He wrote also on accents and on geometry, but both of these works have been lost. The earliest edition of Censorinus is that of Bologna, 1497, and the latest that by Gruber, Nürnberg, 1805.—J. B.

**CENSORINUS, APPIUS CLAUDIUS**, a Roman, after having filled with credit many of the highest offices in the state, was living in retirement near Bologna, when, in spite of his remonstrances, some malcontents of the army proclaimed him emperor in A.D. 270. Seven days after his election he was assassinated.

**CENTENO, DIEGO**, a Spanish officer, born in 1505. He accompanied Pizarro to Peru; after his death joined Gonzalo, his brother; and took a prominent part in the wars and murders of that period. He assassinated his own friend, Almedras, in order to obtain possession of the supreme authority in Charcas. After several alternate successes and reverses, he was completely defeated by Gonzalo in the battle of Huarina, 16th October, 1547. He fled for safety to the royal army, and next year assisted in crushing the partisans of Gonzalo. He was poisoned at a banquet in 1549.—J. T.

**CENTLIVRE, SUSANNAH**, a dramatic writer of considerable reputation. The exact date of her birth is a matter of dispute, and so is the place of her nativity. We are inclined to concur with those who state her to have been born in the year 1680, and in Ireland, whither her father, a Lincolnshire gentleman of the name of Freeman, had to fly upon the restoration of Charles II., in consequence of his religious and political principles. A few years of exile and poverty brought the life of Freeman to a close, and his daughter was soon thrown upon the world almost without friends, resources, or education. It is said a stepmother took the charge of her, but this wants confirmation; indeed that such a person existed is doubtful. Some way or other the girl contrived to gather knowledge both of books and of human nature, as genius always, and genius alone gathers them. Ere long she formed the bold idea of making her way to London and seeking her fortune there. Her finances were so slender that she commenced the journey on foot; but she soon broke down, and, weary and desponding, sat down by the roadside and wept. It so happened that Anthony Hammond, a gentleman of literary note, met the fair and destitute girl; and the result was that, learning her story, he took her under his protection, and lodging her in the neighbourhood of Cambridge, procured her, as Whincop states, the advantages of university tuition in the disguise of male attire. The connection thus formed did not last many months, and Susannah again resumed her route to the metropolis, not without the means of pushing her fortune, which were supplied by Hammond. Here she applied herself diligently to the improvement of her mind, at the same time frequenting the places of public entertainment. Her accomplishments and personal attractions soon won the affection of a nephew of Sir Stephen Fox, to whom, as some allege, she was married. Scarcely a year elapsed before this connection was terminated by his death in his seventeenth year, leaving Susannah once more free. She soon after became the wife of an officer named Carroll, who, in less than two years from his marriage, was killed in a duel. Now, for the first time, Susannah, widowed and in poverty, betook herself to authorship. Her first dramatic production was a tragedy called "The Perjured Husband," which had not sufficient intrinsic merit to insure success, nor had the author a patron who could

promote it. A comedy, her next work, had no better fate; and she was forced to take an engagement as an actress in Bath, still labouring at dramatic literature. Her perseverance was at length rewarded. Of three pieces which she contrived to bring on the stage, one, "The Gamester," met with a decided success, and was followed by others which were played at Drury Lane. Meantime she continued to appear on the boards, and while at Windsor, acted a male part, that of Alexander the Great. In this it is said she captivated the heart of an honest official of her majesty's household, whose administrations, if not the highest, were of the most important—a royal cook—Joseph Centlivre by name. Happy Joseph, who, by his marriage with Susannah in 1706, has transmitted his patronymic to posterity with a richer, though not a more savoury renown than Kitchiner or Soyer. Joseph made her a good husband, and Susannah was as good a wife; and thus, having at last found "snug lying," she gave her undistracted attention to literature. "The Busy Body" was the first offspring of her new life, and a sickly babe it seemed to be, with small chance of living. The first night it was scarcely tolerated by the few yawning auditors in Drury Lane. The second night was somewhat better, and even theatrical censors found something to praise. This brought a full house on the third night, and a decided success, which was sustained by a reasonable "run" of eighteen nights. Next season the piece was performed both at the Haymarket and Drury Lane, and the authoress established in reputation. After one or two other dramas came "The Wonder," a comedy which, for spirit, plot, and brilliant dialogue has few equals, and placed Mrs. Centlivre in almost the highest rank of dramatic writers. We pass over intermediate dramas till 1718, when "A Bold Stroke for a Wife" enhanced the reputation of the writer, and falsified at least one part of the prediction of Wilkes, that "the play would be damned, and the writer damned for writing it." Mrs. Centlivre wrote several other dramas; but her fame rests on the three we have last mentioned, which still retain their places as stockpieces. At length, after a life of happiness and respectability, passed amidst the society of some of the distinguished authors of the day, she died on the 1st December, 1723, in Spring Gardens, London. As a dramatist Mrs. Centlivre still holds a very respectable place. She was undoubtedly a woman of genius, observation, and knowledge of the world, and not without learning. It is true her works are disfigured by much that is condemnable, both in sentiment and expression. Their morality is of the laxest, and the language often of the coarsest. But this fault is not hers alone, but that of her times, for the taint of the Caroline morals had not yet disappeared. Society was not yet healthy enough to expel it from the system. In private life Mrs. Centlivre enjoyed esteem and respect as a woman of a sterling nature, benevolent and amiable.—J. F. W.

**CEO, VIOLANTE DO**, a Portuguese poetess, born in 1601; died in 1693. She became a nun of the order of the Dominicans at the age of eighteen, but previous to this she had written a comedy entitled "Santa Engracia." Her literary labours, though in a changed direction, were continued in the convent till her death. Violante do Ceo has been styled the tenth muse of Portugal, and some of her works show considerable vigour of fancy; but they are defaced by the affectation of far-fetched images and trivial conceits, universally prevalent in her time. Some of her sonnets, both in Spanish and Portuguese, have considerable grace and sweetness. "By her writings after the revolution of 1640," says Bouterwek, "she distinguished herself as a patriot, but not as a judicious poetess." Her miscellaneous works were for the first time collected after her death under the title of "Parnasso Lusitano de divinos y humanos versos." Her "Remas," chiefly Spanish, were printed at Ruan in 1646—one of the few pieces among these that can be read with pleasure, is an ode on the death of Lope de Vega.—F. M. W.

**CEOLFRID** or **CEOLFIRTH**, a Saxon writer, born in Northumberland about 642. He founded the abbey of Wearmouth in 674, and for thirty years presided over that institution. His school attained great celebrity, and the venerable Bede and other illustrious ecclesiastics were among his pupils. Worn out with age and infirmity, he resigned his office in 716, and after addressing the monks in a touching farewell speech, which is recorded by Bede, he set out for Rome, in order that he might end his days in that city. But he was unable to travel farther than the neighbourhood of Langres in France, where he died on the 25th September. He was the author of "A Treatise Concerning

Easter," addressed to the king of the Piets, which forms the 21st chapter of the 5th Book of Bede.—J. T.

GEOWULF, a Saxon king, who reigned over Northumberland in the eighth century. He ended his days in the monastery of Lindisfarne, where he sought refuge from the troubles which distracted his kingdom. He is highly commended by Bede for his piety and justice.—J. T.

CEPHALAS, CONSTANTINUS, a Greek author of the tenth century, whose "Anthologia," edited by Reiske in 1754, was reprinted with a preface by Warton at Oxford in 1766.

CEPHISODOTUS, an Athenian general and orator, much employed in negotiations with Sparta about the year 370 B.C. He was sent against his friend Charidemus, who had traitorously turned his arms against the Athenians and possessed himself of the Chersonese; but failing to subdue the traitor, he concluded a treaty so disadvantageous to the Athenians, that he was deprived of his command and heavily fined. He was living in 355 B.C.

CEPHISODOTUS, a celebrated Greek sculptor, a contemporary of Praxiteles, was alive in 372 B.C. He executed a group of figures in marble for the temple of Jupiter at Megalopolis, a statue of Peace for the Athenians, and a group representing the Nine Muses on Mount Helicon.—Another CEPHISODOTUS, a sculptor, called "the Younger," son of the great Praxiteles, was alive in 300 B.C. Along with his brother Timarchus he executed various works in marble, bronze, and wood, for the Athenians and Thebans, particularly a statue in wood of Lycurgus the orator, and statues of Latona, Diana, and Æsculapius.

CEPIO or CÆPIO, a patrician family of the gens Servilia, several members of which are distinguished in early Roman history. We notice—CN. SERVILIUS, who, succeeding to the command of the army in Spain about the year 140 B.C., induced two friends of Viriathus, the Lusitanian chief, to murder him.—QUINTUS SERVILIUS, who commanded in Spain about the year 110–108 B.C., became consul in 106 B.C.; served afterwards as military commander in Gaul, where he tarnished his reputation by robbing a temple at Thoulouse of the sacred treasure; and by his share, which was considerable, in the terrible defeat the Roman legions suffered in an action with the Cimbri. He lost his command, and was committed to prison. During his consulship the law of C. Gracchus, committing the whole judicial power to the equestrian order, was repealed, and one passed by which the judges were to be chosen jointly from the senate and the knights.—QUINTUS SERVILIUS, who was urban quæstor in 100 B.C., and distinguished himself by his violent opposition, as leader of the equestrian party, to the lex judicaria of M. Livius Drusus; and afterwards more creditably by his valour in the Social War.

CERACCHI, GIUSEPPE, a sculptor, born in Corsica about 1760; was executed in 1802 for attempting, along with four others, the life of Bonaparte. His reputation as a sculptor towards the end of last century was only second to that of Canova.

CERATINUS, JAMES, a learned Dutchman, successively Greek professor at Leipzig, Tournay, and at Louvain, where he died in 1530. Erasmus entertained the highest opinion of his scholarship, and wrote a preface for his edition of the Græco-Latin Lexicon, printed in 1524 by Froben.

CERCEAU, JEAN ANTOINE DU, born at Paris in 1670; died at Veret, near Tours, in 1730. Cerceau at eighteen became a jesuit. He showed some talent for literature, and published some Latin poems of no great merit. His next efforts were more successful. They were dramas, drawn up for educational purposes, and possessed the strange peculiarity of being without female characters. The parable of the Prodigal Son furnishes the subject of one of these plays; in another some scenes of Don Quixote were imitated. A prose work of his, "The Conspiracy of Rienzi," which was published, with some additions, by Brumoy, is greatly praised. His death was occasioned by the accidental discharge of a pistol in the hands of his pupil, the prince of Conti.—J. A. D.

CERDA: the name borne by Ferdinand, eldest son of Alfonso X. of Castile, and his descendants. It originated with this prince, who was so called on account of his having a mole on his shoulders. He was married in 1269 to Blanche, daughter of St. Louis, king of France, and died in 1275.—His two sons, ALFONSO and FERDINAND, notwithstanding the great exertions of their mother Blanche, and their grandmother, wife of Alfonso X., to secure their succession to the crown of Castile, vainly combated the ambition of their paternal uncle, Sanchez, who, on the death of his brother, took possession of the throne. Alfonso,

the eldest of these brothers, finally submitted to his uncle's son and successor, Ferdinand, receiving in exchange for an abnegation of his rights to the throne, the lordship of certain considerable towns.—J. S., G.

CERDIC, the leader of a band of Saxons, who about the beginning of the sixth century landed in Britain, and after a protracted warfare of many years' duration with the native tribes, conquered Hampshire and the Isle of Wight, and founded the kingdom of Wessex or West Sussex. He died about 534 A.D., and was succeeded by his son Cynric.—J. T.

CERDO, a Syrian heresiarch belonging to the school of gnostics known as that of Italy or Asia Minor, came from Syria to Rome in the time of Antoninus Pius about the year 141. The accounts of his doctrine are meagre and inconsistent, perhaps, because it varied with the necessities of his residence in a foreign city; but it seems at least certain that he, at one time, taught the existence of two opposite principles—one good and unknown God, the father of Jesus; and the other, evil and known, the Creator who spoke in the law and appeared to the prophets.

CERÉ, JEAN-NICOLAS, a French botanist, was born in 1737 in the Mauritius, where, after being educated in France, he became director of the royal botanic garden. He cultivated trees and shrubs with singular success, and earned the gratitude of European naturalists, both by the gifts of specimens which he made to various botanical societies, and by his contributions to their journals. He died in 1810.—J. S., G.

CEREZO, MATTEO: this Spanish artist was born at Burgos in Andalusia in 1635. He was a pupil of Don Juan Correño at Madrid. He painted some fine works for the churches of Madrid and Valladolid, and was employed by Philip IV. on some of the decorations for the royal palace. His best work is his "Christ at Emmaus." He died in 1685. Bermudez considers some of his works as equal to those of Titian, and other applauders have dubbed him the Vandyck of Spain.—W. T.

CERINTHUS, a noted heretic of the first century, whose opinions it is not easy to comprehend or characterize. The early fathers are not consistent in their descriptions of his errors. Epiphanius seems to charge him with judaism; Eusebius pictures him as a sensual millenarian, and Irenæus expressly ascribes gnostic views to him. The latter account is entitled to credit, though probably he formed a connecting link between Ebionism and Gnosticism. Theodoret affirms that he was educated at Alexandria, and there was taught philosophy and theology. He maintained the existence of angels or emanations, by some of whom of the lowest grade the world was created; denied the supernatural conception of the Saviour, holding that the Æon called Logos, or Christ, descended on him at his baptism, but left him on the eve of his crucifixion. Cerinthus lived and taught in Asia Minor, and the tradition is, that the apostle John meeting him in a public bath hastily quitted it in terror lest the roof should fall on the malignant errorist. His followers, at least at a later period, denied Christ's resurrection and observed circumcision. There is no distinct proof that the fourth gospel was written in refutation of his tenets, though such a hypothesis has been plausibly maintained.—(Neander's *Church History*; *Eusebius*; *Irenæus*, &c.)—J. E.

CERISANTES, MARK DUNCAN, son of a Scotch physician settled at Saumur, was born there about the year 1600. He became preceptor to the marquis de Fors, son of the marquis de Vigueau, and was present with his pupil at the siege of Arras, where the young marquis was killed in 1640. He was afterwards sent as ambassador to Constantinople by Richelieu, and at a later period figured somewhat notoriously as Swedish envoy at Paris, where his vanity and insolence got him into endless troubles. From Paris he went to Rome, and then to Naples, where, having joined the duke of Guise in supporting an insurrection of the citizens, he was killed in 1648.—J. S., G.

CERQUOZZI, MICHELANGELO, commonly called MICHELANGELO DELLE BATTAGLIE, from his skill in painting battles, was born in Rome, February 2, 1602. He was first the pupil of Giuseppe Cesari, and studied afterwards with a Flemish battle painter, known at Rome as Giacomo Fiammingo; and also with Pietro Paolo Bonsi, known as the Gobbo dei Carracci, an admirable flower painter. Cerquozzi painted battles, *genre*, flowers, all equally well; and from his skill as a *genre* painter, or imitator of Pieter Laer, was known likewise as Michelangelo delle Bambocciate. His colouring is forcible and effective; in this respect he followed the example of the *tenebrosi*, or imitators of

Caravaggio. He made money by his pictures; but was rendered unhappy, and almost insane, by the fear of losing it. He was in the habit of burying it, and hiding it in various parts of the house, until by the advice of his friends he was induced to invest it; and he finally conquered his strange mania, though retaining all his parsimonious habits. He died at Rome in his own house in April, 1660, and was honoured by his fellow-artists with a public funeral. He left a nephew the considerable income of three hundred scudi per annum, entirely acquired by his industry. Cerquozzi's masterpiece is considered "Masaniello in the market-place at Naples," now in the Palazzo Spada at Rome.—(Passeri, *Vite dei Pittori*, &c.: Rome, 1772.)—R. N. W.

CERRINI, GIOVANNI DOMENICO, called IL CAVALIERE PERUGINO, was born at Perugia in 1606. He was a pupil of Guido and Domenichino. His best work is his fresco of St. Paul's vision in the cupola of la Madonna della Vittoria. His style fluctuates a good deal, but he more generally aims at the manner of Guido, who frequently worked on his pictures, and so leavened them with value that they often pass current as the legitimate offspring of the great master. He died in 1681.—W. T.

CERUTTI, JOSEPH ANTOINE JOACHIM, born at Turin in 1738; died in 1792. He was educated at Turin by the jesuits, and became a member of the order. An essay of his on "Republics, Ancient and Modern," was crowned, as is the phrase, at Toulouse, and, before the author was known, was for a while attributed to Rousseau. In the year 1762 Cerutti published his "Apologie de l'institut des Jesuites." The order of jesuits was, in spite of his advocacy, suppressed; but his book, written with considerable talent and in an honest spirit, led to the ex-jesuits receiving protection and support from Stanislaus the Polish king, and his grandson the dauphin. In 1788 Cerutti was among the thousands engaged in preparing all manner of possible and impossible constitutions for France and for the world. He was one of the many men of talent who worked up subjects for Mirabeau. He published a political journal entitled *Feuille Villageoise*, creditable to his talents, and useful in communicating the results of science to classes imperfectly educated. His newspaper led to his being elected to the legislative assembly. He pronounced a funeral oration on Mirabeau, and himself died soon after.—J. A. D.

CERVANTES, MIGUEL DE CERVANTES SAAVEDRA. There can scarcely be mentioned a writer of ancient or modern times who at all approaches the illustrious subject of this memoir in the wide extent of his popularity, and the universal reception which his great work has had in every portion of the civilized world. With the exception of Homer, or rather of the Homeric poems, and in particular of the *Odyssey*, the great works and the great authors of the classical world have been, since the revival of letters, familiar but to the scholar and to the student alone; while in modern times the brightest luminaries that have risen above the horizon move in a much narrower orbit, and shed their light within more limited space. To take the highest instance, that of Shakspeare, though his name is now probably a familiar one in every quarter of the globe, and his works, bound up as they are with the language of the British isles, must, in the course of time, be as widely diffused as is the race whose most glorious product they are, still, at present, no one would venture to assert that any characters of his are pictured to the eye with the same clearness, and are so impressed upon the memories and affections of such myriads of beings, as those immortal photographs of the pen—the knight, the squire, and the steed—which have not only been transferred to every literature, but have given their names as types of things to almost every language in which their adventures have been read. This cannot be said of Dante, of Milton, or of Goethe. The first and greatest of these has no doubt the highest and most intellectual audience in the world. That of the second is, as he himself predicted, "fit," but, alas! still "few;" while Goethe, like Shakspeare, may claim a naturalization in two nations at least. But the only household work which is "as familiar as a household word" throughout the world, is "Don Quixote."

Cervantes was born in the small, but once flourishing city of Alcala de Henares, about twenty miles from Madrid, and was baptized in the parish church of Saint Mary Major's, on the 9th of October, 1547. His family had been a distinguished one for many generations, both in the mother country and in the colonies, but had declined in consequence and wealth long before the birth of the great writer, whose genius was destined to confer

upon it a new glory which can never fade. He was the youngest of four children—a brother who immediately preceded him, and two sisters. Alcala being at the time the seat of a university, it is probable that Cervantes received his education there, although it is asserted that he spent two years at the still more celebrated university of Salamanca, whither his parents, notwithstanding their poverty, contrived to send him. The knowledge of student life at Salamanca, as evinced by him in his "Exemplary Novels," next to "Don Quixote" the most charming of his works, renders this extremely probable, and the street in which he is said to have resided is still pointed out. There is, however, no evidence of his having matriculated at Salamanca, which probably the necessity of embracing some means of living prevented. His boyish years were characterized by that insatiable thirst for knowledge that usually distinguishes the youth of eminent men, and his love of reading was evinced by his collecting even the scattered pieces of torn paper which he found in the streets, so as to draw from them some food for the ever-craving necessities of his growing intellect. An early love for poetry and the drama was stimulated if not created by the rude exhibitions of Lope de Rueda, the founder of the Spanish theatre, whose performances he witnessed both at Segovia and Madrid before his eleventh year. His first appearance as an author is supposed to have been in a little volume which his schoolmaster, Juan Lopez de Hoyos, published in 1569, commemorative of the magnificent funeral ceremonies connected with the interment of Elizabeth de Valois, the first wife of Philip II., which took place on the 24th of October, 1568. To this volume Cervantes contributed six short poems, which are only remarkable for the terms of affection and respect in which they are introduced to the reader by Lopez de Hoyos, as being written by his "dear and well-beloved disciple."

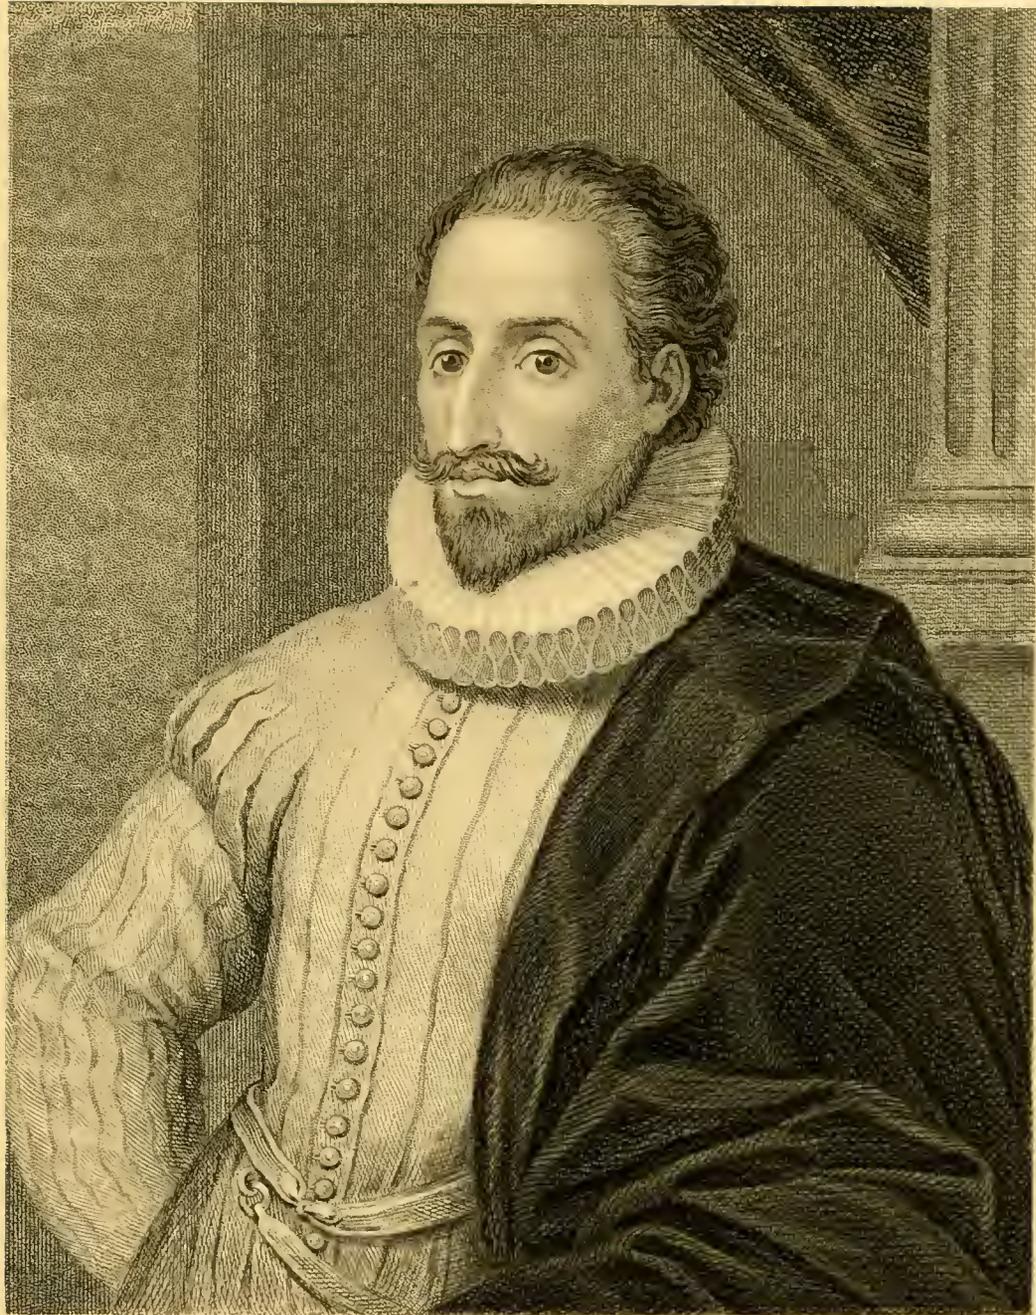

In 1570 we find him acting in the capacity of chamberlain at Rome to the prelate and nuncio, Monsignor Aquaviva, who subsequently became a cardinal. Whatever may have been the cause of his dissatisfaction with this employment, it is certain that Cervantes abandoned it after a short trial. In the following year (1571) we find him volunteering as a private soldier in the holy league against the common foe of Christendom—the Turk; and losing his hand in the memorable sea fight of Lepanto, on the 7th of October of that year. With the rest of the wounded in that famous action he was carried to Messina, in the hospital of which place he continued till April, 1572. On being able to resume active service, he immediately joined the expedition of Mark Antonio Colonna to the Levant, the most memorable result of which otherwise unsuccessful expedition was the story of the captive in "Don Quixote," which the poor maimed soldier founded upon it. In the next year he was again under the command of the hero of Lepanto, Don John of Austria, at Tunis, and in the subsequent three or four years saw much of Sicily and Italy, particularly of Naples, where he resided more than a year. On his being discharged in 1575, he determined to return to Spain, to endeavour to obtain some recognition of his long services in three campaigns, and some reward for his many wounds. He accordingly procured letters of recommendation from the duke of Sesa and Don John, and with his brother Rodrigo, also a private soldier, embarked at Naples for Spain, from which he had been so long absent. On the 26th September his ship, *El Sol*, was captured by pirates, and he and all on board were carried prisoners to Algiers. He was sold as a slave, and continued for five years in this condition, going through adventures and trials more romantic and dangerous than any he had previously experienced. At length, however, his day of liberation arrived, and, by the sacrifices of his poor widowed mother, the exertions of his brother, who had been previously ransomed, and the charitable efforts of a poor friar, whose name, Fray Juan Gil, he has gratefully recorded in his "Trato de Argel," the trifling sum required for his liberty was made up, and Cervantes was once again a free man. Being without any resources, it is not very surprising, notwithstanding all his previous sufferings, that on his return to Spain he should once more resume the military life, and rejoin his brother, who was serving under the duke of Alva in the newly-acquired kingdom of Portugal, and subsequently at the Azores. The residence of Cervantes at Lisbon is memorable for some interesting circumstances connected with his private life, as well as for the opportunities it afforded him of studying the pastoral romances of Portugal, with which, and with the country itself,

he has expressed himself in several places as being much pleased. His first published book, the "Galatea," is professedly an imitation of the Portuguese romances of this class that preceded it. It is said that the "Galatea" was written to win the affections of a Spanish lady with whom he was in love; and having succeeded in this object before the completion of the work, his interest in it ceased, and it thus remains unfinished. Be this as it may, he married Doña Catalina de Palacios de Salazar, who is supposed to be the heroine of the story, on the 14th December, 1584, with whom he lived in happiness, if not in wealth, for more than thirty years, and who surviving him, desired at her own death to be buried at his side.

After his marriage he appears to have settled at Madrid, and commenced writing for the stage as the readiest mode of contributing to the support of a family. The Spanish drama was then almost in its infancy, and had not developed into the marvellous completion it was destined to attain at the hands of Lope de Vega, Calderon, and their great contemporaries. Cervantes, however, did more than any one who preceded him, and attained a success which even towards the end of his life he regarded with complacency and pride. Of the twenty or thirty plays which he tells us that he produced at this period, he has himself recorded but the names of nine, and of these only two have been discovered. These were the "Numancia" and "Trato de Argel," which were first published with an edition of the "Journey to Parnassus" in 1784. The "Trato de Argel," or Life in Algiers, though defective in many respects, contains some striking episodes, in which Cervantes' own adventures during his captivity in Africa are described with spirit and fidelity. The "Numancia," which has earned for him the epithet of the Spanish Æschylus, has been pronounced by August Schlegel not only as one of the most memorable efforts of the early Spanish theatre, but one of the most striking exhibitions of modern poetry—a dictum which less enthusiastic critics have disputed. These dramas are not to be confounded with the eight *comedias* and *entremeses*, or farces, which he produced and printed at a much later period of his life; and which are so much below what might have been expected from Cervantes in the maturity of his intellect, that some Spanish critics, in order to uphold the intellectual character of their idol, have put forward the untenable theory that they were written as a caricature of the successful dramas of Lope de Vega, which were then carrying everything before them. They were first published in 1615, the year of Cervantes' death, and have been republished in 1749, in two volumes, quarto.

However those early dramas, of which "Numantia" and "Life in Algiers" are the only specimens that have reached us, may, in the decline of his life, have satisfied the perhaps overpartial remembrance of their author, it is certain that they did not add considerably to his material prosperity. The golden days of the Spanish theatre had not yet arrived, nor had Cervantes at any period of his life that happy facility of adapting himself to the tastes of his immediate audience, that could bring him in those substantial results that followed the exercise of Lope de Vega's splendid and genial power of improvisation. Whether the fault was the public's or his own, it is certain that the dramatic muse whom he courted at this time with so much assiduity, like the gentle muse of Goldsmith at another time and in another place, "found him poor, and left him so." Finding his efforts to support himself, his wife, daughter, and an unmarried sister who was dependent on him were unavailing, he determined to leave Madrid, and seek his fortunes elsewhere. In 1588 he went to Seville, and there acted in several humble employments; among others as a collector of debts, not only on behalf of the government, but even for private individuals. In this capacity his duties led him to various parts of Andalusia and Granada, and thus gave him an opportunity of visiting the most beautiful portions of his native country, and of making those observations on life and manners that afterwards enriched his later works. "During his residence at Seville," says Mr. Ticknor, "which, with some interruptions, extended from 1588 to 1598, or perhaps somewhat longer, Cervantes made an ineffectual application to the king for an appointment in America, setting forth by exact documents—which now constitute the most valuable materials for his biography—a general account of his adventures, services, and sufferings while a soldier in the Levant, and of the miseries of his life while he was a slave in Algiers. This was in 1590. But no other than a formal answer seems ever to have

been returned to the application, and the whole affair only leaves us to infer the severity of that distress which should induce him to seek relief in exile, to a colony of which he has elsewhere spoken as the great resort for rogues." Little as there is known of Cervantes during his ten years' residence at Seville, we know still less of his proceedings during the few subsequent years between 1598 and 1603, when we again hear of him at Valladolid. It is probable that he still continued to discharge the duties of debt-collector and clerk for any who would avail themselves of his services. There is a tradition, probably referring to this pursuit, which, as it has some connection with the great work that has immortalized his name, may be mentioned. It is said that being employed by the grand prior of the order of St. John in La Mancha to collect rents due to his monastery, he proceeded to the village of Argamasilla for that purpose. Whether the defaulters disbelieved his agency, or that there was some informality on his part, we know not; but his claims were rejected, and he himself thrown into prison. It was in this prison, it is said, that he commenced writing the first part of "Don Quixote," making the village in which he had been so badly treated the scene of the knight's insanity and misfortunes. We have his own authority, indeed, for the fact that "Don Quixote" was begun in a prison; but he was an inmate of so many, of which we have unquestionable evidence, that it is unnecessary to adduce this, perhaps imaginary one of Argamasilla as the one alluded to. Notwithstanding all his privations he found opportunities of completing the first part of "Don Quixote," which was licensed in 1604 at Valladolid, and printed in 1605 at Madrid. The success which attended its publication, though giving but a very faint idea of its future celebrity, was however satisfactory. A new edition was called for at Madrid before the end of the year. Two more were published elsewhere—"circumstances which, after so many discouragements in other attempts to procure a subsistence," says Mr. Ticknor, "naturally turned his thoughts more towards letters than they had been at any previous period of his life." In 1606 the court having returned from Valladolid to Madrid, Cervantes followed. In 1609 he joined the fraternity of the holy sacrament, a religious society of which Lope de Vega, Quevedo, and other eminent writers, were members. In 1613 he published his "Novelas Exemplares," or Moral Tales, next to "Don Quixote" the most delightful of his works. In 1614 appeared his "Journey to Parnassus," a satirical poem, written in *terza rima*, the most interesting portion of which treats in a light and cheerful spirit of his own earlier writings. The "Comedies," already referred to, appear to have been his next work. Stimulated by an audacious continuation of "Don Quixote" which a writer, who assumed the name of Avellanada, but whose real name has not transpired, brought out as the second part of "Don Quixote" in 1614, Cervantes hurried on the completion of his great work, which he published in October, 1615. In the dedication of this part to the count de Lemos, he speaks of his failing health, and intimates that he did not expect to survive many months. His spirits, however, and his industry never forsook him. He worked vigorously at his "Persiles and Sigismunda," the last of his works, which, though not entitled to be considered what he himself thought it would prove, "either the best or worst book of amusement in the language," is remarkable for the fertility of imagination it displays, and for that innate love of the wild and marvellous which he has so amusingly depicted in his immortal satire. In the spring of 1616 he made an excursion to Esquivias, with which place his wife was connected, and where she had a little estate. On his return he wrote the remarkable preface to his unpublished romance, in which he states that his pulse had warned him that he would not live beyond the next Sunday; concluding it in this cheerful but solemn manner—"And so farewell to jesting, farewell my merry humours, farewell my gay friends, for I feel that I am dying, and have no desire but soon to see you happy in the other life." His preparations for death were made with the calmness and solemnity which might have been expected from his philosophical mind and strong religious belief. On the 2nd of April he entered the order of Franciscan friars, whose habit, in accordance with the custom of many of his great contemporaries, he had assumed some years before. On the 18th of the same month he received the last rites of the church, and in four days after, on Saturday, the 23rd of April, 1616, in the full possession of his faculties, and in perfect peace, this great writer surrendered his spirit into the hands of his Creator.

This memorable day in the history of Spain (April 23, 1616) is also a memorable one in the history of England, the death of Shakspeare being recorded with the same date. Shakspeare, however, dying on the 23rd of April, 1616, survived Cervantes twelve days, England not having adopted the Gregorian calendar till 1754.

The eloquent French writer, M. Viardot, in his *Notice sur la vie et les ouvrages Cervantes*, thus epitomizes the varied events of Cervantes' career, who he eloquently says was "an illustrious man before he became an illustrious writer, one who was the doer of great deeds before he produced an immortal book:"—"Behold the sum of all that history records of this illustrious man, one of those who purchases by the misfortunes of an entire life the tardy honours of posthumous glory! Born of a family honourable but impoverished; receiving at first a liberal education, then thrown by misery prematurely into the struggle of life; a page, a valet-de-chambre, at last a soldier; mutilated by the loss of his hand at the battle of Lepanto; distinguished at the taking of Tunis; captured by a barbarous corsair; a slave for five years in the bagnios of Algiers; ransomed by public charity after ineffectual efforts of audacity and enterprise; again a soldier in Portugal and the Azores; attached to a lady as well-born and as poor as himself; led at one moment by love to the pursuit of letters, and then torn away again from them in another by distress; rewarded for his services and his talents by the magnificent appointment of an insignificant collectorship; accused of defalcation in his accounts; thrown into prison by the underlings of the king; released after the proof of his innocence; then again imprisoned by mutinous peasants; becomes poet and commercial agent; doing a little business to earn his bread by making sales on commission, and supplying the theatre with dramatic pieces; discovering at fifty years of age his true vocation; finding a careless public that condescended to laugh indeed, but neither to appreciate nor to comprehend him; jealous rivals who ridiculed and defamed him; envious friends who were deceitful to him; pursued by want even to his old age; forgotten for the most part, neglected by all, and dying at last in solitude and in distress—such was, during his life, Miguel de Cervantes Saavedra. It was only after about two centuries that the world began to inquire about his cradle and his tomb—that a marble bust of him was placed in front of the house in which he lived—that a statue was erected to his honour in the public square of Madrid, and the obscure name that it bore, being effaced from the corner of the little street in which he died, inscribed thereon the great name that fills the world."

The editions of "Don Quixote" in Spanish are almost innumerable; the best being the magnificent edition printed by the Spanish Academy, Madrid, 1780, 4 tom. folio; that of Pellicer, Madrid, 1797-98, 5 tom. 8vo; and the edition of Clemencin, Madrid, 1833-39, 6 tom. 4to. There are several translations in English of "Don Quixote," of which perhaps that by Motteux is the most spirited. The best edition of this translation is the Edinburgh one, 1822, in 5 vols. 8vo. This contains a Life of Cervantes by the late Mr. Lockhart; and in the notes are given those translations of Spanish ballads which have done so much in England towards keeping alive a taste for Spanish poetry. The "Novelas Exemplares," or Moral Tales, have also been translated into English—a very good edition of them has been given by Mr. Bohn in one of his libraries.—D. F. M'C.

CERVOLE or CERVOLLE, ARNAULD DE, a famous captain of free lancers, commonly called the Archpriest, was born in Perigord about the beginning of the fourteenth century. He was wounded and taken prisoner at the battle of Poitiers in 1356, along with King John. On his return to France, he collected a large body of men-at-arms, and marched into Provence, where they took many strong towns and castles, and wasted and plundered the country as far as Avignon. Pope Innocent VI., who resided there at this time, was fain to enter into a treaty with the Archpriest, whom he entertained with great distinction, gave him absolution from all his sins, and on his departure presented him with forty thousand crowns to distribute among his companions. In 1359 Cervole entered into the service of the dauphin, then regent of France; but next year, after the treaty of Brequigny, he reassembled his band, which now acquired the name of "the white company," from the white crosses on their shoulders, and ravaged the country around Langres, Lyons, and Nevers. The count de Nevers was compelled to enter into a treaty with him in 1361, which was ratified by the king. The Arch-

priest was faithful to his engagements, and commanded the vanguard of the royal army in the conflict with a strong force of brigands near Brignay, in which the former were defeated with great slaughter, and Cervole and many other knights taken prisoners. He subsequently entered the service of Philip the Hardy, duke of Burgundy, and commanded a corps of Burgundians at the battle of Cocherel. In 1365 we find the Archpriest at the head of a numerous body of brigands, whom he purposed to lead on a crusade against the Turks; but the merciless ravages they inflicted on the countries through which they marched, roused the inhabitants against them, and they were chased from province to province, till the remnant was driven back to France, where the Archpriest was soon after killed by one of his own servants.—(*Froissart*, chap. 176 and 215.)—J. T.

CESAR or CÆSAR. The more distinguished persons of this name follow in chronological order:—

CESAR, SEXTUS JULIUS, prætor B.C. 208, the first of this name of whom mention is made in history.

CESAR, LUCIUS JULIUS, consul B.C. 90, in which year he carried a law conferring the citizenship upon the Latins and the Socii, who had remained faithful to Rome in the civil wars of the period. He was put to death by Marius in 87.

CESAR, CAIUS, surnamed STRABO VOPISCUS, brother of Lucius Julius, was curule ædile in 90 B.C., and was slain along with his brother by Marius in 87. He was an orator and dramatist, and renowned in both characters, particularly the former. The names of two of his tragedies are preserved—"Adrastus" and "Tecmessa."

CESAR, LUCIUS JULIUS, son of the consul of the same name, and uncle by his sister Julia of Antony the triumvir, was consul B.C. 64. He belonged originally to the aristocratical party, but appears to have deserted it before the year 52 B.C., when he was one of C. J. Cæsar's legates in Gaul. On the death of the dictator he sided with the senate, in opposition to his nephew Antony, and was consequently proscribed by the latter in 43. A son of this person, bearing the same name, joined Pompey on the breaking out of the civil war, and was sent by him to Cæsar with proposals of peace. After serving in Africa, and in Utica, where he was proquæstor to Cato B.C. 46, he submitted to the dictator, and was shortly afterwards put to death.

CESAR, CAIUS JULIUS, the father of the dictator, was prætor, in what year is uncertain, and died suddenly at Pisæ in 84 B.C., when his son was at the age of sixteen.

CESAR, CAIUS JULIUS, the dictator. See CÆSAR.

CESAR, CAIUS and LUCIUS, sons of M. Vipsanius Agrippa and Julia, and grandsons of Augustus, by whom they were adopted; died, the one in Lycia, A.D. 4, of a wound which he received in Armenia; and the other, A.D. 2, at Massilia, on his way to Spain.

CESARI, ANTONIO, an eminent Italian grammarian, born at Verona in 1760, entered the order of the oratory in 1798, and studied theology under Bertolini. With a view to reviving a taste for the early purity of his native tongue, he published, after an assiduous study of their style, the works of the Trecentisti, beginning with Passavanti's *Specchio di Penitenza*, the style of which he particularly admired as a model of simplicity and elegance. He was for many years occupied in annotating the *Divina Commedia*. His "Selva," a collection of poetical pieces composed about the time his native city was taken by the French, abounds in vituperation of the invaders. After the proclamation of peace, he undertook to revise the famous dictionary of La Crusca. He died in 1828.—A. C. M.

CESARI, CAVALIERE GIUSEPPE, called D'ARPINO, and sometimes GIUSEPPINO. This artist was born at Rome in 1560. His father, a painter of very humble pretensions, was a native of Arpino, in the kingdom of Naples. With great desire for fame, but as yet very ill supplied for attaining it, the young Cesari journeyed to Rome seeking employment. A group of artists were hard at work at the Vatican under Gregory XIII. Some one was very much wanted to grind colours and set palettes, and to these humble offices Cesari was only too happy to apply himself. While thus occupied he attempts painting, and is reported to the pope, who protects him, and places him in the school of Niccolò Pomerancio. His success is wonderful, and Pope Clement VIII. follows Gregory in conferring patronage and honour upon the artist. He is made knight of the order of Christ and director of St. John Lateran. In 1600 he accompanied Cardinal Aldobrandini in his mission to France on the

marriage of Henry IV. with Mary de Medici. With success came arrogance. He rushed headlong into quarrels, blinded by an impetuous vanity and an utter want of appreciation of any talent but his own. Cesari died at Rome in 1640. His works at Rome are numerous—too numerous in fact. He painted both in oil and fresco, but his fresco works are the more esteemed. His best productions are his cupola of St. Prassede, representing the "Ascension;" the madonna on the ceiling of St. Giovanni Grisognono; the gallery of the Casa Orsini; and the birth of Romulus, and the battle of Romans and Sabines, in the Campidoglio. His fame was very great, but it must be confessed that his style is vicious. His talents were not balanced by taste and judgment. He abused his gift of facility to abandon nature more and more. His freedom lapsed into looseness and want of care. However, his battle pieces are vigorous, and the treatment of his horses very admirable. He was a great artist, though he did little good to art, for he rather hurried on the reign of depravity and falsehood that afterwards ensued. He was much assisted by his brother, Bernardino Cesari, who followed an identical manner, and painted a large work in the church of St. John of Lateran.—W. T.

CESARIO or CÆSARIO, son of C. Julius Cæsar and Cleopatra, originally called Ptolemæus, was born 47 B.C., and executed by order of Augustus in 30 B.C. In 42 the triumvirs gave him the title of king of Egypt, and in 34 he received from Antony that of king of kings.

CESAROTTI, MELCHIORE, an Italian miscellaneous writer, born of a patrician family at Padua in 1730. When very young, he himself relates, he was sent to pass a school vacation with his uncle, a Franciscan friar, who, having no great love of children in general, and being particularly annoyed with the importunities of this nephew of his, shut him up in the library of the convent. This confinement, intolerable at first, soon became a delight—a taste for reading being formed in his mind, which found ample gratification in the literary stores of his prison. From this time forward his eminence in literature was rendered certain by an ardent love of study, and by the encouragement of learned patrons. His philosophical works, which were his earliest, were the models on which were composed those of Gioberti and Rosnini. His immense acquirements as a linguist he turned to account in translations of Æschylus and Voltaire, and particularly the poems of Ossian. His success in the translation of this last work was in some degree owing to the assistance of Charles Sackville. It appeared in 1772, and was received with rapture throughout Italy—the author being appointed to a chair of languages at Palma, and to the secretaryship of the academy of science and belles-lettres. His other translations, and his philological treatises, are still standard works. On the downfall of the Venetian republic in 1798, Cesarotti earned an immense popularity by some essays of a patriotic character. He was allowed a handsome pension, and decorated with the insignia of the order of the iron crown. All his works are remarkable for elegance and even harmony of style.—A. C. M.

\*CESATI, VINCENZO, Baron, an Italian botanist of the present century, has made himself known by the following works—"A Treatise on the study of Physiological Botany," Milan, 1836; "Remarks on the Geographical Distribution of the Plants of Lombardy," Milan, 1844; and "A Description of Rare or New Italian Plants."—J. H. B.

CESI, BARTOLOMEO: this artist was born at Bologna in 1556. He was a pupil of Giovanni Francesco Bezzi, called Nosadella, but subsequently he studied the works of Pellegrino Tibaldi. He was the friend of the Carracci, though he often painted in competition with them. They respected the artist while they loved the man; for he was both talented and good. From him Tiarini acquired the art of fresco-painting; and on his works Guido founded his chaste poetic manner. Many of his pictures might fairly be ascribed to Guido's early style—beauty and simplicity are so similarly felt and created by the two painters. It is said that Guido in his youth was in the habit of sitting for hours in rapt contemplation and wonder before the works of Cesi. He was a scrupulous follower of nature, though he sought her in her happier moments. He studied simplicity in his forms and folds, subdued attitude and hues; and was rather refined than vigorous. Malvasia's opinion was that Cesi's manner at once satisfies, pleases, and enamours the beholder, being as exquisite and sweet as any style of the

best Tuscan masters in fresco. His principal works are at Bologna. He died in 1629.—W. T.

CESI, FEDERICO, Prince of, called also CÆSIUS, an Italian naturalist, was born at Rome in 1585, and died in 1636. His zeal for natural science was early displayed. At the age of eighteen he founded a society called the Academy of Lincei, expressing the care or lynx-eyed attention with which the members examined objects. The prince formed in his palace a botanic garden, cabinet of natural history, and a library, all of which were open to the members of the academy. While he was a sort of Mæcenas of his day, he also worked at natural science. The spores of fungi, the microscope, and the telescope attracted his attention. He wrote numerous treatises and aided in the publication of valuable works, more particularly that of Hernandez on the plants, animals, and minerals of Mexico.—J. T.

CESPEDES, PABLO, called in Rome CEDASPE. This painter and ecclesiastic was born at Cordova in Spain about 1535. He was educated in the clerical seminary; and, noted for his learning and merit, was raised to the rank of a dignity of the church. He is one of the most distinguished of his country's painters. He travelled twice to Rome to perfect himself in art, and to contemplate the works of Michel Angelo and other great masters. At Rome he contributed several works to the public edifices—among others the "Annunciation" and the "Nativity," in the chapel of the Trinita di Monti. He became the intimate friend of Federigo Zuccheri, who, applied to by the bishop of Cordova to decorate the cathedral of that city, answered that, while Spain possessed Cespedes, she need not send to Italy for painters. His works are chiefly at Cordova, and are remarkable for their extraordinary beauty of colour, which has been compared to Corregio's. His "Last Supper" is his most esteemed work. He died at Cordova in 1608, and was buried in the cathedral. He was as esteemed for his modesty as for his genius.—W. T.

CESSELES, JACQUES DE, a monk of Picardy, whose "Game of Chess Moralized," a work in Latin, which long enjoyed an extraordinary popularity in almost all the countries of Europe, and an English translation of which, printed by Caxton in 1474, in folio, was the first typographical production bearing a date that is known to have been executed by the first of English printers, lived at Reims in the thirteenth century.—J. S., G.

CESTI, PADRE MARCO ANTONIO, a musician, was born at Arezzo, according to various authorities, in 1720 or 1724. He died at Rome, some say in 1675, others in 1681. He was a pupil of Carissimi, and followed his master's example in the composition of cantatas with eminent success. In 1646 he was appointed maestro di capella at Florence. Three years later he produced his first opera, "Oronthea," at Venice, which was a favourite work throughout Italy for nearly forty years. The advance of this class of composition owes much to the labours of Cesti and his fellow-pupil Cavalli, particularly in the development of the aria as distinguished from recitative, by its rhythmical periods; for, although Monteverde anticipated them both in the employment of this form, their talent gave a grace to it which it had not in the hands of the earlier writer. "La Dori," produced at Venice in 1663, is described as the best of Cesti's dramatic works; and "Il Pomo d'Oro," written for the Emperor Leopold I., and represented with singular magnificence, appears to have excited in its time a remarkable sensation. Cesti went to Rome in 1658, and two years later was appointed tenor singer in the pope's chapel, in which capacity Bainsi speaks of him. After this he became maestro di capella to the emperor, and held this office in 1667, when he wrote, in company with Ziani, the opera of "La Schiava Fortunata" at Vienna. His motets, and other compositions for the church, are less numerous, but not less esteemed than his secular works. A valuable collection of his music is preserved in the library of Christ church, Oxford; and Hawkins and Burney each print a specimen of his vocal writings, which are interesting illustrations of the state of dramatic composition in his time.—G. A. M.

CETINA, GUETIERRE DE, one of that band of poets who, says Velasquez, introduced true poetry into Spain, was born at Seville in the early part of the sixteenth century. Many authorities, and among them the Biographie Universelle, confounding him with another person, have stated that he was an ecclesiastic; but it is beyond doubt that he early embraced the career of arms, and fought bravely in Italy. Afterwards he went to Mexico, but returned to die in his native city about 1560. The greater part of his works have been lost, though they existed in manu-

script in 1776. His Anacreontic poems—the first of their kind—have been highly admired; and several of his comedies in the old manner are remarkable, as marking the transition to a new school of poetry.—F. M. W.

CETRAS or GERAS, a mechanician of Chalcedon, celebrated for the improvements he effected in the construction of the ancient machine of war, the battering-ram, used for the purpose of effecting breaches in walls.

CEVALLOS, PEDRO, a Spanish statesman, was born in 1764. After being employed as secretary to the embassy at Lisbon, he was appointed minister of foreign affairs, and discharged the duties of that office with great prudence and moderation. When Napoleon made known his designs upon Spain, Cevallos espoused the patriotic side, and took a prominent part in rousing the country against the aggressions of the French. After the return of Ferdinand he filled several high offices, and at one time possessed great influence with the king. He retired into private life in 1820, and died in 1840.—J. T.

CHABANNES: the name of an ancient family of Limousin in France. ROBERT DE CHABANNES, Lord of Chartres, was killed at the battle of Agincourt in 1415. His second son—

CHABANNES, JACQUES DE, Grandmaster of France, Lord of La Palice and of Curton, &c., was born about 1400. He was one of those French captains, who by their bravery rendered signal service to their native country during the disastrous broils of the fifteenth century. He died in 1454.

CHABANNES, ANTOINE DE, youngest son of Robert, lord of Chartres, grandmaster of France, Count of Dammartin, was born about 1411. Like his brother he signalized himself at the siege of Orleans in 1428, and assisted Joan of Arc in her campaigns against the English. He afterwards tarnished his reputation by becoming captain of a body of brigands called "the flayers," who wasted the country with fire and sword. Chabannes died in 1488, governor of the Isle of France and of Paris, leaving behind him a high reputation for bravery and military skill. It was this Chabannes who enjoyed for a long period, and abused at the court of Charles VII. that monstrous power, and that immunity from the consequences of mal-administration, which the king conceded to his favourite ministers.

CHABANNES, JACQUES DE, Lord of La Palice, Marshal of France, was born in the latter half of the fifteenth century. He was distinguished both for his valour and his fidelity to the service of his sovereign. He was governor of Rubos, when that place was attacked by the Spaniards under the celebrated Gonsalvo; and having been severely wounded and taken prisoner in a sortie, was threatened with an ignominious death, unless he gave orders to his lieutenant to surrender the citadel. He was brought to the foot of the wall for this purpose; but instead of yielding to the threats of his captors, he exhorted the garrison to hold out to the last extremity. According to Arnaud, Chabannes was in consequence put to death; but this is a mistake. Gonsalvo, who could well appreciate such an instance of courage and fidelity, spared his life, and had him cured of his wounds. After his liberation Chabannes took a prominent part in the Italian wars of Charles VIII., Louis XII., and Francis I., and contributed greatly to the victory of Ravenna in 1512, and of Marignano in 1515, which decided the fate of the whole duchy of Milan. He was taken prisoner by an Italian officer at the fatal battle of Pavia in 1525, which was fought against his earnest advice, and was brutally killed by a Spaniard.

CHABANNES, JEAN DE, Lord of Vendenesse, brother of La Palice, was one of the most famous captains of his age, and, on account of his remarkable bravery, was surnamed "the Young Lion." At the battle of Agnadel he took prisoner the celebrated Venetian general, Alviano, and presented him to Louis XII. on the field of battle. He played a conspicuous part in the battle of Marignano. He was mortally wounded in the retreat of Rebec in 1524.

CHABANNES, JEAN BAPTIST MARIE FREDERIC, Marquis de, was born in 1770; died in 1835. He quitted France on the breaking out of the Revolution, and joined the army of Condé. After this force was disbanded he retired to England, where he busied himself with projects for purifying charcoal, and lighting the city of London. On the repeal of the law against emigrants he returned to Paris, and devoted himself to the construction, on an improved principle, of carriages, which received the name of velocifers. On the restoration of the Bourbons, he returned to public life, and was elevated to the chamber of peers.—J. T.

VOL. I.

CHABANON, MICHEL-PAUL-GUI DE, poet and musician, born at St. Domingo in 1730. He is best known through his own memoirs, which possess the interest that must ever attach to an account of personal experience, written with the warmth of one who sees the world through the medium of excited, even if erroneous feelings. In early life he was religious, even to fanaticism; and having devoted so many years to religion, and then so many to love, he gave up eight years to music, and three to literature, with a success which insured him admission into the Academy of inscriptions and the Academy of letters. His poetry is devoid of originality, and his dramatic efforts have not retained possession of the stage. His life is more interesting than his works. He died in June, 1792.—J. F. C.

CHABERT, JOSEPH BERNARD, Marquis de, an eminent French admiral, astronomer, and geographer, born at Toulon in 1724; died at Paris in 1805. He made several voyages to America, with a view to rectifying the charts of Acadie and Newfoundland, and was long occupied with projects for obtaining correct charts of the Mediterranean. He served with the French fleet in the American war, and was for some time during the revolutionary period an exile in England, where he was honourably entertained by Dr. Maskelyne. On his return to France, Napoleon gave him a pension. He was a member of most of the learned societies of Europe.—J. S., G.

CHABOT, FRANÇOIS, one of the most cruel and corrupt of the French revolutionists, was born in 1759. He was originally a capuchin monk, but the perusal of the works of certain infidel philosophers converted him to atheism. In 1791 he was elected a member of the assembly, and at once took his seat among the extreme democrats. He was the instigator of not a few, and a strenuous promoter of all of the atrocious measures, adopted by the assembly during the frenzy of that terrible period. It was Chabot who was the author of the well-known blasphemous statement that "citizen Jesus Christ was the first sans-culotte of the world." He affected great severity of manners, and attended the convention in clothes made of the coarsest materials, his neck and breast bare, and his person filthy and squalid in the extreme. This ferocious monster was as notorious for his corruption as for his cruelty. In the end he became implicated in a conspiracy along with two profligate German barons named Frey, whose sister he married. His intrigues were detected, and finding death inevitable, he attempted to destroy himself by swallowing corrosive sublimate. His life, however, was prolonged in extreme torture for three days, and he was guillotined on the 5th of April, 1794.—J. T.

CHABOT, PHILIPPE, Count of Charni and Busançois, known by the name of the Admiral de Brion. He was born about the end of the fifteenth century, and was educated along with Francis I., and several distinguished young nobles. In 1524 he threw himself into Marseilles, then besieged by the imperialists, whom he compelled to raise the siege. In 1535 he was intrusted with the management of the war against Savoy, and in a short time gained possession of nearly the whole of Piedmont; but he is said, through the influence of the cardinal of Lorraine, to have neglected to follow up his success. On his return to France he was mixed up with the intrigues of the court, and through the enmity of the constable De Montmorency, was arrested, brought to trial on the 3rd February, 1540, found guilty of various malversations, and condemned to pay a heavy fine, to banishment, and the confiscation of his goods. Francis, however, was induced to pardon Chabot, through the entreaties of the duchess d'Étampes, and to reinstate him in all his employments. In a short time after, the constable was in turn disgraced, and Chabot and the cardinal de Bourbon were appointed to succeed him in his offices. Chabot was the author of the project to colonize Canada. He died in 1543.—J. T.

CHABOT DE L'ALLIER, GEORGES ANTOINE, a distinguished French lawyer, born in 1758. He was admitted a councillor of the parliament of Paris in 1783. He was president of the tribunate when the peace of Amiens was concluded, and energetically supported the elevation of Napoleon to the imperial throne. Chabot was nominated inspector-general of schools of law in 1806, member of the legislative body in 1807, and councillor of the court of appeal in 1809. On the downfall of Napoleon, he was confirmed in all his offices by Louis XVIII. He died in 1819, leaving some legal dissertations.—J. T.

CHABREY or CHABRÉE, DOMINIQUE, called also CHABREUS, a physician and botanist, was born at Geneva towards

6 F

the end of the sixteenth century, and died about 1670. He practised his profession at Yverdun. He published descriptions and drawings of plants, particularly native species and those used in the arts, domestic economy, and medicine. He also superintended, but very inefficiently, the publication of Bauhin's *Historia Plantarum*.—J. H. B.

**CHABRIAS**: a renowned Athenian general. In 388 B.C. he defeated Gorgopas at the head of a powerful Spartan force in the island of Ægina. In 379 he was sent with an army of 5000 men to the assistance of Thebes against Agesilaus, whom he forced to retire on one occasion, by drawing up his troops with their right knees on the ground, their shields resting on their left, and their spears protruded. The Athenians erected a statue to Chabrias in commemoration of this success, representing him in the attitude which he had caused his soldiers to assume. In September, 376 B.C., in a sharply-contested action near Naxos, he completely defeated the Lacedæmonian fleet under Pollio, disabling or capturing forty-nine triremes, and regained for Athens the mastery of the sea. The Athenian admiral then sailed victorious round the Ægean, and, according to Demosthenes, made prizes of other twenty triremes; took three thousand prisoners, with one hundred and ten talents in money; and added seventeen new cities to the Athenian confederacy. After many other brilliant exploits, he at length perished in the social war, 358 B.C., in an attack upon Chios, which had thrown off the Athenian yoke.—J. T.

**CHABROL DE CROUZOL, ANDRÉ JEAN**, Count, a distinguished French statesman, was born in 1771. He was prefect of the Rhone when Napoleon landed from Elba, and dexterously contrived to evade the duty imposed upon him by that responsible situation of resisting the advance of the emperor upon Lyons. On the restoration of the Bourbons, violent tumults broke out at Lyons against the Bonapartists, and many innocent persons were assassinated, or murdered, under the forms of law. Chabrol incurred deserved odium for not resisting the proceedings of the fanatical royalist mob, and was recalled in 1817. Soon after his return to Paris, however, he was employed by the ministry, and after filling various subordinate situations, was created a peer in 1824, and minister of marine. His economical and energetic administration of this department gave general satisfaction. In 1829 the urgent entreaties of Charles X. induced him reluctantly to accept the portfolio of finance under Prince Polignac. During his short term of office he effected considerable savings in the public expenditure. After the revolution of 1830, Count Chabrol devoted himself mainly to agricultural, scientific, and literary pursuits. He died in 1836.—J. T.

**CHABROL DE VOLVIC, GILBERT JOSEPH GASPARD**, Count de, brother of the preceding, was born in 1773. He was a member of the scientific expedition sent to explore the antiquities of Egypt; took part in the preparation of the great work on Egypt, compiled by the members of the expedition; and published a volume of his own "On the Manners and Customs of the Modern Egyptians." His services and abilities attracted the attention of Napoleon, who appointed him prefect of an Italian department, and afterwards of the department of the Seine. He subsequently gained the entire confidence of Louis XVIII., and for many years devoted himself with untiring assiduity to the duties of his situation. He reformed and enlarged the public hospitals, constructed slaughter-houses, sewers, canals, bridges, fountains, walks, and the Bourse, together with a great number of churches. The fine arts also were the objects of his constant solicitude, nor was he less anxious to promote public education. He erected the royal colleges of St. Louis, Stanislaus, and Rollin, contributed towards the restoration of the Sorbonne, and instituted great numbers of primary schools, leaving, when he quitted office, twenty-six thousand children, instead of seventeen hundred, under instruction in his department. After the restoration of 1830, Chabrol retired into private life, and died in 1843.—J. T.

**CHACON or CIACONIUS, PEDRO**, a learned Spaniard, born at Toledo in 1525; died at Rome in 1581. His erudition was the admiration of such learned contemporaries as Baronius, De Thou, and Casaubon. He was canon of Seville.

**CHADERTON, LAURENCE**, first master of Emmanuel college, Cambridge, was born in Lancashire in 1546. He was educated a Roman catholic, and intended by his father for the profession of law. Devoting himself to theology, and becoming a student at Cambridge, he was disinherited by his father. He gradually rose in his profession, till, in 1584, Sir Walter Mildmay, the

refounder of Emmanuel college, chose him for its first master. He was one of the divines employed under James I. in the translation of the scriptures. He is the author of some sermons, and of a treatise on justification. He died in 1640.—J. B.

\* **CHADWICK, EDWIN**, was born on the 24th January, 1801, in the vicinity of Manchester. He was intended for the bar, but the natural bent of his mind was towards social and statistical questions, and he attracted considerable attention by an article on life assurance in the *Westminster Review* in 1828, and by two papers—one on "Preventive Police," the other on "The Administration of Medical Charities in France"—which appeared in the *London Review* in 1829. In 1832, when preparing to practise at the common law bar, he was, on the recommendation of Mr. Senior, appointed an assistant-commissioner upon the inquiry into the working of the poor laws in England and Wales. The masterly report which he prepared obtained for him at once a seat in the commission of inquiry. He was next employed, along with Dr. Southwood Smith and Mr. Tooke, in an inquiry into factory labour. When the poor law board was constituted in 1834, Mr. Chadwick was appointed secretary to the board, and for thirteen years discharged the duties of that laborious and responsible office with untiring assiduity and vigour. During that period he also assisted in carrying out various important measures for promoting public health, and drew up the report of the constabulary commission, and the report "On the General Sanitary Condition of the Labouring Classes in Great Britain." In 1847 Mr. Chadwick was appointed to the metropolitan sanitary commission, and in the following year he was nominated a member of the general board of health. It is undeniable that this board contributed greatly to the improvement of the public health, but its vigorous sanitary measures excited the hostility of several powerful individuals and interests, and when the government proposed in 1854 to renew the public health act, they were taken by surprise, and unexpectedly defeated by a small majority. The administration of the act was in consequence intrusted to a member of the house of commons, and Mr. Chadwick, who had previously received the honour of companion of the bath, retired upon a pension.—J. T.

**CHEREA, C. CASSIUS**, the originator of the conspiracy by which the Emperor Caligula was slain, A.D. 41, was tribune of the prætorian guards. On the accession of Claudius he was put to death.

**CHEREMON**, a celebrated tragic poet, flourished at Athens, 380 B.C. Three epigrams in the Greek anthology are ascribed to Chæremôn.

**CHEREMON OF ALEXANDRIA**, a stoic philosopher, chief librarian of the Alexandrian library, came to Rome, and was appointed one of the preceptors of Nero. Besides treatises on hieroglyphics and comets he wrote a history of Egypt.

**CHEREPHON**, the well-known disciple of Socrates, was banished by the thirty tyrants, returned to Athens 403 B.C., and died some time before the condemnation of his master in 399.

**CHAGIS, R' JACOB BEN SAMUEL BEN JACOB**, descended from a Spanish family, settled at Fez. He passed some time of his life at Leghorn, then officiated as rabbi at Jerusalem, and ended his days at Constantinople in 1688. His fourteen works, enumerated by his son, Moses Chagis, in a preface to one of Jacob Chagis' compositions, are valuable introductions to the study of the Mishna and Talmud.—**MOSES CHAGIS**, son of Jacob, was a native of Jerusalem, and came to Europe for the purpose of collecting funds for the support of the Eastern synagogues. He resided for a time at Altona near Hamburg; in 1738 he returned to Sidon, thence to Zephath, where he died at an advanced age. His literary activity was great; he wrote on the Talmud; a commentary on Daniel; several books on ethics; also a topography of Jerusalem and the adjacent country. The doctrines of Sabbatai Zebi, propagated in Europe by Nehemiah Chayun, were zealously controverted by Chagis in the "Iggereth Hakkenaoth" (the Epistle of Zeal); "Shofetim Baarez" (the Judges in the Land); and "Sheber Poshim" (the Shattering of the Wicked); in which the system and the history of Sabbatai's school are unsparingly exposed.—T. T.

**CHAHYN-GHÉRAI**, the last khan of the Crimea, who reigned from about 1777 to 1780. He was installed on the throne through the intervention of the emperor of Russia, who afterwards, availing himself of an insurrection in the khan's dominions, sent an army into the Crimea. To resist this aggression, the Tartars and Turks entered into an alliance, but their

army was defeated, and the Russians became the virtual masters of the country. In 1779 a treaty was entered into between the Empress Catherine and the Porte, through the intervention of the French court, by which the former became bound to evacuate the Crimea. But new disturbances soon arose among the Tartars, and the unhappy khan, worn out with domestic troubles and foreign intrigues, in 1783 renounced his rights in favour of Russia, and received in return a pension of eight hundred thousand roubles. Having afterwards sought an asylum in Constantinople, he was put to death by order of the sultan.—J. T.

CHAIK, CHARLES, an eminent protestant divine, born at Geneva in 1701, became pastor of a congregation at the Hague in 1728; and till the close of his long and laborious life enjoyed the reputation of an eloquent preacher, an erudite writer on theology, and a zealous promoter of institutions for charitable purposes. Besides a translation of the bible, with a commentary, in six volumes, he published various tracts on theological subjects, and an edition of Hainault's Chronological History. He died in 1785.—J. S., G.

CHALAFATA, R' JOSE BEN C., one of the Tanaim or teachers of the tradition among the Jews in Palestine, lived in the early part of the second century at Sepphoris. His moral sayings, amounting to upwards of three hundred, are preserved in the Talmud, and bear evidence of the depth of his feeling and of the correctness of his judgment. Notwithstanding his high authority as a teacher of the people, he practised the humble craft of a tanner. He composed for his own use an epitome of the traditional laws under the Greek title of "Nomicon." None of his contemporaries showed an equal zeal for the collection of chronological data bearing on the history of the Jews. He left behind him a chronicle extending from the creation of the world to the war of Bar Cochba, entitled "Seder Olam" (Order of the World). He endeavoured to fix the chronology of the biblical events, and to fill up historical gaps with traditional notices. From the epoch of Alexander downward, the chronicle of R' Jose furnishes independent and trustworthy, though but meagre data.—(*Grätz*, vol. iv., p. 218.) This "Seder Olam," of which mention is made in the Talmud, exists in two recensions, viz., "Seder Olam Rabba" and "Seder Olam Zuta" (the Great Chronicle and the Small Chronicle), the latter of which certainly speaks of facts by much posterior to the time of Jose Ben Chalafata.—T. T.

CHALCIDIUS, a platonic philosopher, who lived probably either in the fourth or the sixth century of our era. His translation into Latin of the Timæus of Plato, with its voluminous commentary, was edited by Meursius, Leyden, 1617; and by Fabricius, Hamburg, 1718. The religious tenets of this philosopher have been the subject of much controversy among the learned; some maintaining and others denying that he was a christian.

CHALCOONDYLAS, LAONICOS or NICOLAOS, born at Athens towards the close of the fourteenth century; died about 1464. He was of a princely family. In the year 1430, or about that period, he went to Constantinople to solicit from the sultan a participation in the government of Attica, which was at the time in the hands of his family or their near connections. The visit to the sultan was an unfortunate one, for it not only failed in its object, but during Chalcoondylas' absence a different faction got the upper hand in Athens, expelled the governing party, and gave the management of the city to two Florentines. Chalcoondylas, becoming an object of suspicion to the sultan, was arrested, made his escape (with the loss, however, of considerable property), and fled to the Peloponnesus. He was there taken, delivered to the sultan—his money was of more moment to the sultan than his life—and the only measures taken against him were to declare thirty thousand pieces of gold, which had fallen into Amurath's hands, confiscated. Chalcoondylas' future course is no further traced than that we know he was occupied in long, and probably fruitless efforts, to beg back his money. His "History of the Turks" is, in some respects, one of the most valuable of the works of Byzantine history. It is divided into ten books. The first is introductory. If we are to regard it as the commencement of the work, the whole narration may be described as extending from 1298 to 1462. However, the year 1389 may more properly be described as the date from which the actual history commences. His account of the taking of Constantinople is very spirited, and has supplied many details to Gibbon and Von Hammer.—J. A., D.

CHALIER, MARIE JOSEPH, a French revolutionist, born in 1747 in Piedmont. He was originally destined for the church, but ultimately settled at Lyons as a merchant. In 1789 he abandoned his mercantile pursuits, and threw himself with headlong fury into the vortex of the Revolution. He became a zealous partisan of the party of the Mountain, and applauded their most sanguinary edicts. He resolved to carry out their policy at Lyons, and proposed, February 6, 1793, to a club which he had established there, that they should put to death nine hundred of their fellow-citizens, and cast their bodies into the Rhone. But the mayor of the city having fortunately received notice of this diabolical plot, called out the national guard for the protection of the inhabitants. At length a conflict took place between them and the Jacobins on the 29th of May, in which the latter were worsted. Chalier and his accomplices were seized, tried, and condemned to death, and this ferocious monster was guillotined on the 16th of July.—J. T.

CHALKHILL, JOHN. See WALTON, ISAAC.

CHALMERS, ALEXANDER, an industrious man of letters and eminent biographer, was born at Aberdeen, March 29, 1759. Having received a classical and medical education, he left his native city in 1777, intending to proceed as surgeon to the West Indies; but when at Portsmouth and about to sail, he changed his mind and proceeded to London, where he soon found employment in connection with the periodical press. He contributed to many of the leading journals, and was for a time editor of the *Morning Herald*. It was as an editor of standard works, however, that he was to be permanently connected with the metropolitan press. We cannot afford space to enumerate all the works which were published under his editorial care. In 1803 he edited the *British Essayists*, in forty-five volumes, beginning with the *Tatler* and ending with the *Observer*. The historical and biographical prefaces of this work are executed with singular carefulness and discrimination. In the same year he prepared an edition of Shakspeare; and in 1805 prefixed lives of Burns and Dr. Beattie to editions of their respective works. In 1806 he edited the works of Fielding, Johnson, and Warton, and assisted Bowles with his edition of Pope. From this date to 1812 we find him editing Gibbon's History, Bolingbroke's works, the works of the English poets—with Johnson's Lives, and supplemental lives from his own pen—Hurd's edition of Addison, Pope's works, and Cruden's Concordance. He also wrote a history of the public buildings of Oxford, and in 1822 edited the ninth edition of Boswell's Life of Johnson. But the work on which Mr. Chalmers' fame must rest is his "General Biographical Dictionary; containing a historical and critical account of the most eminent men in every nation." The first volume appeared in May, 1812, and the thirty-second and last was published in March, 1817. By this work, which might well seem to represent a lifetime of patient and conscientious toil, all subsequent publications of the same kind and literature in general have deeply profited. Mr. Chalmers was for the long period of fifty years well known and highly respected as an industrious, talented, and upright man, among the chief literary men and booksellers of the metropolis. He died, December 10, 1834. We are indebted for these facts to a biography in the *Gentleman's Magazine*, to the pages of which Mr. Chalmers was long a valued contributor.—J. B.

CHALMERS, GEORGE, a Scottish antiquary and general writer, was born in 1742 at Fochabers in Morayshire. He was educated at King's college, Aberdeen, and after studying law at Edinburgh, he emigrated to North America, where he followed the legal profession until the breaking out of the revolutionary war. He then returned to England, and was appointed clerk to the board of trade—an office which he continued to hold for the remainder of his life. He had previously written "Political Annals of the United Colonies from their Settlement till 1763," and "An Estimate of the Comparative Strength of Great Britain," which works, together with the losses he had sustained in consequence of his loyal sentiments, recommended him to the patronage of the government. He now devoted himself zealously to literary and antiquarian pursuits. He wrote the lives of De Foe, Thomas Ruddiman, Sir John Davis, Allan Ramsay, Sir James Stewart, Gregory, King, and Charles Smith; together with a number of pamphlets and fugitive pieces, and a life of Thomas Paine, which he published under the name of Oldys. He also edited the works of Allan Ramsay, Sir James Stewart of Coltness, and Sir David Lindsay of the Mount. His principal work,

however, entitled "Caledonia," a historical and topographical account of North Britain from the invasion of the Romans down to the present time, in 3 vols. 4to, was left unfinished at the time of the author's death. It displays prodigious research, and is full of valuable information, but is disfigured by an awkward clumsy style. His last published work was "The Life of Mary Queen of Scots," in 2 vols. 4to, a violent and prejudiced defence of that unfortunate princess. Mr. Chalmers died on the 31st May, 1825.—J. T.

CHALMERS, THOMAS, born at Anstruther, Fife, March 17, 1780; died at Edinburgh, May 31, 1847. His boyhood was not remarkable; but when a young student at St. Andrew's under Dr. James Brown, his intellect awoke, and geometry was the fairy world on which the eyes of his understanding opened. Soon after, the perusal of Jonathan Edwards on the Freedom of the Will introduced him to "a sort of mental elysium, in which he spent nearly a twelvemonth; the one idea which ministered to his soul all its rapture being the magnificence of the Godhead, and the universal subordination of all things to the one great purpose, for which he evolved and was supporting creation." And in much the same way did other truths from time to time effect their advent, gaining all the homage of his intense and enthusiastic nature. Thus for some years he was absorbed in chemistry, which the discoveries of Black, Lavoisier, and Davy conspired to render the most romantic of the sciences; and, by and by, as the disciple of the Wealth of Nations, he was entranced in economical reveries, and bent all the strength of his mind to questions of taxation, trade, and labour. In the meanwhile he had become a minister. On the 31st July, 1799, from the presbytery of St. Andrew's, he obtained license to preach the gospel; from July, 1801, till September, 1802, he was the assistant minister at Cavers in Roxburghshire; and in November of the latter year he was appointed to the charge of Kilmany in Fife. But whilst the ministry was his profession, science was his pursuit. Not but that he loved his people, and occasionally perambulated their abodes, "his affections flying before him;" and in frank and homely exhortations he sought to soften their manners and improve their morals, but with very inconspicuous success. His own heart was divided, and it was the lesser half which conscience was able to rescue for his parish and his pastorate. The Saturday afternoon was devoted to some hasty preparation for the pulpit, and the rest of the week he was wandering among the glorious hills, alone or in the society of his neighbour and brother-naturalist, Fleming of Flisk, chipping the rocks, and exploring the quarries; or he might be seen trudging along to St. Andrew's, to enlighten its heges on the wonders of oxygen, or to improvise mathematical poems to a class of applauding students; whilst the gospel, which it was his commission to proclaim, lay upon the shelf an unsolved enigma, or looked out upon him from the pages of the Testament, an "open secret" to which he had never yet adverted.

The death of a beloved sister, followed by a lingering illness of his own, forced his mind into earnest contact with the truths of revelation. The first result was a new view of the lofty requirements of christianity. As delineated in the apostolical writings, and as exhibited in the person of its Divine Founder, it possessed a symmetry and grandeur of which he had never formed the least conception; and for many months it was his daily effort, both in intercourse with others and in the on-goings of the inner man, to realize the beauty of its holiness. Very noble were his efforts, and probably no one except himself would have pronounced them entirely unsuccessful. Still, the very process which, in the eyes of on-lookers, was elevating his character, tended to quicken his own moral sensibilities so much more rapidly, that the usual paradox was repeated, and growing excellence was hidden from his own eyes by a deepening sense of his own deficiencies. In this mood of mind, he was prepared to hail a statement of the divine plan for saving sinners, and nobilitating anew their natures, which he first met in the Practical View of Mr. Wilberforce. A right relation to God as the starting-point and not the goal, a gratuitous forgiveness, and a present salvation, were the truths which he then for the first time apprehended; and as they rose upon his soul in all their self-commending majesty, he felt "the true light now shineth," and he wept and exulted in the immortal day-spring.

From this time forward (and he had reached his thirtieth year) it may be said that all the powers of his extraordinary intellect were devoted to develope and apply the great discovery;

and it was not long till Kilmany and the district adjacent confessed the power of his fervid ministry. The change in his preaching was followed by a perceptible change in many of his people. In a valedictory address he declares—"I am not sensible that all the vehemence with which I urged the virtues and the proprieties of social life, had the weight of a feather on the moral habits of my parishioners. And it was not till I got impressed by the utter alienation of the heart in all its desires and affections from God; it was not till reconciliation to him became the distinct and the prominent object of my ministerial exertions; it was not till the free offer of forgiveness through the blood of Christ was urged upon their acceptance, and the Holy Spirit, given through the channel of Christ's mediatorship to all who ask him, was set before them as the unceasing object of their dependence and their prayers . . . that I ever heard of any of those subordinate reformatations which I aforesaid made the earnest and the zealous, but I am afraid, at the same time, the ultimate object of my earlier ministrations."

Of such preaching and its results the fame soon spread, and in July, 1815, he was transferred to the Tron church in Glasgow, which, in 1819, he exchanged for the new church and parish of St. John's in the same city. In this latter sphere his leonine energies were chiefly given to work out his fondly-cherished ideal of a city parish, in virtue of which it should be approximated as nearly as possible to a rural district, with provision for maintaining a friendly christian intercourse with all its families, and for educating and morally elevating all its inhabitants; and with the fellow-workers whom his own fervour enlisted, his success was remarkable. But it was his efforts in the pulpit which chiefly contributed to render memorable and unique the eight years of his Glasgow ministry. All his powers were in their prime. One by one the great truths of revelation had come into his soul; and, as with its illimitable grandeur and infinite adaptation, each divine announcement filled that soul like a possession, it was the effort of the sermon to gain for it the vivid perception and intelligent assent of a promiscuous auditory; but even whilst labouring by the simplest illustrations to make it plain, the elevation of his spirit still kept it sublime. With something of each hearer in his own composition; with a store of good sense, and a proverbial homeliness which conciliated the practical, and with an imagination which carried helplessly captive the more sentimental; with a pathos which melted every tender heart, and a fearless majesty which made every manly nature thrill with contagious heroism—he brought to his theme an intellectual ascendancy and a fervour of spirit entirely his own, and the listener who at first walked on the same level, at last could only keep him company by catching the skirt of his mantle or mounting his chariot of fire. Into each discourse he threw his soul entire—the geometrician's breadth of axiom and carefulness of deduction, the psychologist's insight into the arcana of human consciousness, the philanthropist's desirousness for his hearers' welfare, the christian's high-toned virtue and devotion. Like a pebble cast into the quiet crater, he often commenced with some plain and simple aphorism; and as it began to gather towards itself the materials which a copious science furnished, the overhanging cloud expanded and displayed the chromatic glories which a gorgeous imagination cast upon it; and as then the ground began to tremble and the firmament to mutter with mysterious emotion, the volcano burst—like flaming seraphim words of rapture went up, like red lava the overwhelming demonstration came down, and with thunder in his ears and an earthquake in his frame the hearer carried away a new sensation at the least, and along with it, peradventure, the elements of a change in his moral constitution.

Like all noble natures, Dr. Chalmers was distinguished by a profound and all-pervading sincerity. He could not be perfunctory. When he commenced his career, the evangelical ministry was wont to confine itself to a few traditional topics and time-honoured commonplaces. The consequence was that most of its preaching missed the mark. It edified believers, but it was little calculated to increase their number. With his eyes open to the immediate exigency, Dr. Chalmers could only grapple with existing evils. For example, amongst the more intelligent citizens he found not a few whose religious faith was disturbed by scientific doubts; but instead of denouncing as black arts astronomy and geology, or flinging anathemas in the face of facts, he stepped forward with philosophy in the one hand and the bible in the other, and by such feats of sanctified eloquence

as the "Astronomical Discourses," he vindicated for the christian revelation its place of high and magnificent enthronement. Then again, he knew right well that in a commercial capital the gospel's great opponent was not any scientific doubt or intellectual difficulty, so much as actual earthly-mindedness; and leaving it to others to adjust theological niceties, he dealt open war with the love of pelf, the pride of purse, the tricks of trade, the gambling, the swindling, and the hardness of feeling which are apt to beset men hastening to be rich; and to such frank and faithful exhortations as abound in the "Commercial Discourses" may be ascribed not a little of the public spirit and princely munificence which, amidst many mortifying exceptions, still make "Glasgow flourish."

Such sermons, however, and such toils were self-consuming. Accordingly, when the chair of moral philosophy in his own *alma mater*, St. Andrews, was offered to him in 1823 he accepted it as an asylum opportune and welcome. His fame secured a crowded classroom, and from his high-souled religious grandeur, as much as from his ethical expositions, a multitude of ardent disciples carried away the impulses which are not yet exhausted, and the lessons for which the world is the better still. Here, too, he was enabled to revise and mature those opinions on social science, of which the ripe results were afterwards (1832) given to the world in his volume "On Political Economy." According to the testimony of Mr. John Stuart Mill and other competent judges, this work, characterized by free and independent thought, has thrown much new light on the perplexed but urgent questions of which it treats; and the great principle by which it is pervaded, viz., the need of moral worth in order to a nation's material well-being, is every day forcing itself on our legislators and statesmen more and more. It may be questioned, however, whether the originality and value of his speculations on social and economical topics have been sufficiently recognized in his own country. Doubtless, it was chiefly to these that he was indebted for a high distinction conferred on him in 1834, when he was elected a corresponding member of the Institute of France.

In 1828 he was translated to the professorship of divinity in the university of Edinburgh. This appointment not only gave him opportunity to expatiate on those broad and comprehensive features of the christian faith for which his own soul had an intense affinity; but it enabled him to inculcate with eager minuteness those views of parochial administration with which as a christian patriot he believed that the well-being of his country was identified. Nor was he content with academic demonstrations. Convinced that the thousand parish churches, supplemented by some hundreds of seceding chapels, did not provide for the population a sufficiency of instruction and superintendence, he committed himself to a herculean undertaking; and, through the prestige of his name and the powerful appeals with which he passed from town to town and from village to village during the campaigns of successive summers, contributions were obtained for the erection of nearly two hundred places of worship. But before this movement was completed a contest had arisen between the civil and ecclesiastical tribunals of the country, which, on the 18th of May, 1843, ended in the disruption of the church of Scotland. At the head of the maintainers of spiritual independence was Dr. Chalmers; and he was borne by acclamation into the moderatorship or presidency of the first Free Church Assembly. He had now passed the grand climacteric, and with so many of his favourite projects for ever frustrated, and with his new churches left behind him, it would have been no wonder if his spirit had soured or his heart had broken; but though disappointed, he was not dismayed. Cheered by the self-sacrifice of four hundred and seventy ministerial brethren, and by the munificence which evolved like magic over all the land in a still larger number of new churches, he set to work and organized that mutual sustentation fund which invites the stronger congregations to support the weak, and which seeks to give a palpable expression to presbyterian parity. Called to the principalship of the Free Church college, and surrounded by the love and reverence of his brethren, he passed his few remaining years in thankfulness and hope, and abounding in labours to the last. That last came abruptly; his sun went down when no one thought that it was setting, and the pang which the sudden tidings sent through the nation's heart proclaimed that, like Knox, and Burns, and Scott, all Scotland was proud of Thomas Chalmers.

Before his death he had edited his own works in a collective

series, extending to twenty-five foolscap volumes. Of these, to thoughtful readers, the most abidingly valuable are likely to be his work on the Christian Evidences, and his Bridgewater Treatise. Since his death nine additional octavos have appeared, five of them being observations on passages of scripture, unspeakably interesting and valuable as the free and off-hand expression of a piety so genuine and of an intelligence so superior. Known to his contemporaries chiefly as a pulpit orator, or as the champion of some great principle in church courts, Dr. Chalmers will go down to posterity as the most inventive and influential of christian philanthropists. Familiar as they have now become, his schemes of beneficence were once so novel that few did not deem them visionary. Territorial missions and volunteer agencies for raising the helpless and reforming the vicious, were so little dreamed of in the days of our fathers, that we who see them carried out in reformatories and ragged schools and city missions, can hardly conceive how transcendental and impracticable they once appeared. But happily their first propounder was no mere poet; as soon as the plan was clear before him, he was impatient to put forth his hand and commence the great experiment. And he was happy in finding or creating coadjutors. Like all men of overmastering energy—like all men of clear conception and valiant purpose—like Nelson and Napoleon, and others born to be commanders—over and above the assurance achieved by success, there was a spell in his audacity, a fascination in his sanguine chivalry. Many were drawn after him, carried irresistibly along by his fervid spirit and his force of character; and though at first some felt that it needed faith to follow, like the great genius of modern warfare, experience showed that, for moral as well as military conquests, there may be the truest wisdom in dazzling projects and rapid movements and unprecedented daring. At the same time it must be remembered that it was owing to the width of his field, the extent of his future, and the greatness of his faith, that the most venturesome of philanthropists has proved the most victorious. The width of his field—for, whilst operating on St. John's he had an eye to Scotland; in seeking an optimism for his own church or country, he had an eye to Christendom. The extent of his future—for it is only by overtopping his coevals that a man can be the vaticination of some age to come, and Chalmers was the giant who struggled evermore to speed his generation onward, and bring it abreast of that wiser kinder epoch of which he himself was the precocious denizen. The greatness of his faith—for it was his belief that whatsoever things are scriptural are politic. Whatsoever is in the bible, he believed shall yet be in the world. And he believed that nothing is too great to hope for which Divine goodness has promised, and that nothing is impossible which God has asked his church to perform.—(See *Memoirs of Dr. Chalmers*, an ample and delightful biography by his son-in-law, Dr. Hanna; *North British Review*, vol. vii.)—J. H.

CHALON, JOHN JAMES, R.A., was born of Swiss parents in this country about the year 1785; he was the elder brother of Alfred Edward Chalon, the royal academician. John Chalon painted figures, animals, landscapes, and marine pieces, but is best known as a *genre* painter. His pictures are painted with great skill and much humour; his taste is shown in some "Sketches of Parisian Manners," which he published in 1820. Of his landscapes the "Castle of Chillon" is spoken of as a noble work. Chalon was a member of the Sketching Society from its commencement, and he displayed remarkable skill in some of the sketches he produced at the evening meetings of that society. He was elected an associate of the Royal Academy in 1827, together with Sir Charles Eastlake, but he did not attain to the full honours of membership until 1840. He died on the 14th of November, 1854.—R. N. W.

CHALONER: the name of a family distinguished in politics and literature in the sixteenth and seventeenth centuries. SIR THOMAS, the elder, was born in London about 1515. After distinguishing himself at Cambridge, he was received at the court of Henry VIII., and sent on an embassy to Charles V., whom he followed in the fatal expedition against Algiers. On his return to England he was appointed first clerk of the council. During the reigns of Edward and Mary, his fortunes were somewhat variable, but when Elizabeth came to the throne he rose into high favour, and was the first ambassador appointed by the queen. His was sent to Ferdinand I., and was eminently successful in his mission. He was next despatched to the court of Spain in 1561, where he remained till 1564. During his

residence in Spain he wrote his great work, "Of the Right Ordering of the English Republic." He died in 1565, leaving a number of minor tracts and some poetical pieces, afterwards published under the patronage of his constant friend Lord Burleigh. That statesman took a warm interest in the education of his son, SIR THOMAS, the younger, who was born in 1559, and who, after studying at Oxford, travelled for some years, remaining longest in Italy, and there acquiring a taste for natural philosophy for which he became distinguished. About 1600 he discovered alum mines not far from Gisborough in Yorkshire, the first wrought in England. Toward the close of Elizabeth's reign Sir Thomas went to Scotland, where he gained the favour of King James, whom he accompanied in his journey to England, and by whom he was appointed tutor to Prince Henry in 1603. He died in 1615. He wrote a work entitled "The Virtue of Nitre, wherein is declared the sundry cures by the same effected," London, 1584. He had three sons, all of some note.—EDWARD, born in 1590; died of the plague at Oxford in 1625; wrote a treatise on the authority, universality, and visibility of the church. —THOMAS and JAMES were both members of the long parliament, and were among the king's judges. The latter was also literary in his habits, and was the author of a history of the Isle of Man.—J. B.

\* CHALYBÆUS, HEINRICH MORITZ, a German philosophical writer, was born at Pfaffroda in Saxony in 1797, and studied at Leipzig. In 1839 he was appointed professor of philosophy at Kiel, but was dismissed from his chair in 1852. He has written—"Historische Entwicklung der speculativen Philosophie von Kant bis Hegel," 4th edition, 1848; "System der speculativen Ethik," 1850, 2 vols.; "Philosophie und Christenthum," 1853, &c.—K. E.

CHAMBER or CHAMBRE, JOHN, a learned English physician of the sixteenth century, one of the founders of the college of physicians, took his degree of M.A. at Oxford about 1502; afterwards studied medicine at Padua, and on his return to England became physician to Henry VIII. Henry's charter for the foundation of the college of physicians, dated 1518, was obtained through the intercession of Cardinal Wolsey, at the request of Chamber and other four physicians, two of whom, like himself, were attached to the court. Chamber afterwards obtained preferment in the church, being ordained in 1510 canon of Windsor, and in 1524 archdeacon of Bedford. He was also prebend of Salisbury; in 1525 was elected warden of Merton college, and at the same time became dean of the royal college and chapel adjoining to Westminster hall, dedicated to the Virgin Mary and St. Stephen. This chapel he endowed with a considerable gift of lands, and enlarged by the addition of a cloister which cost 11,000 marks. He died in 1549.—J. S., G.

CHAMBERLAYNE, EDWARD, born in Gloucestershire in 1616; died at Chelsea in 1703. He wrote a number of works, historical, political, and polemical, which, that they might be preserved for posterity, he caused to be covered with wax, and buried in his grave. He published "Angliæ Notitia, or the Present State of England, with divers reflections upon the ancient state thereof," 1668. This book passed through twenty editions in the author's lifetime.—His son JOHN continued the "Angliæ Notitia." He was distinguished for his extensive acquaintance with modern European languages, from which he made numerous valuable translations. He published the Lord's Prayer in a hundred languages. Died in 1723.—J. B.

CHAMBERS, DAVID, a Scottish judge, and author of several historical and legal works, was born in Ross-shire in 1530. He received his education at the college of Aberdeen, and afterwards at Bologna, where he studied under Marianus Sozenus in 1556. On his return to his native country he entered into clerical orders, and was presented to the parish of Suddie, and made chancellor of the diocese of Ross. He continued, however, at the same time the prosecution of his legal studies, and in 1564 was elevated to the bench by Queen Mary, under the titular designation of Lord Ormond. He was about the same time intrusted, along with other high legal functionaries, with the duty of compiling the volume of the acts of parliament known by the title of "the Black Acts." Notwithstanding both of his clerical and legal character, he was implicated in Bothwell's conspiracy against the life of Darnley; and after the perpetration of that atrocious deed, he was publicly denounced as an accomplice in the king's murder. On the flight of Bothwell and the capture of the queen, Chambers quitted the kingdom, and took refuge in

Spain. He subsequently took up his residence in France, where he published in 1572 a work entitled "Histoire Abrégée de tous les roys de France, Angleterre, et Ecosse," mainly founded on the fabulous narrative of Boeoe. In 1579 he published a panegyric upon the laws, religion, and valour of his native country, under the title of "La Recherche des singularités les plus remarquables concernant l'estait d'Ecosse," and a vindication of the right of succession of females, entitled "Discours de la legitime succession des femmes aux possessions des leurs parens et du gouvernement des princesses aux empires et royanmes," dedicated to Queen Mary. This learned but unprincipled writer ultimately returned to Scotland, and, strange to say, was restored to the bench by King James in 1586, and continued to discharge his judicial functions till his death in 1592.—J. T.

CHAMBERS, DAVID, a Roman catholic writer who flourished in Scotland in the seventeenth century. He is the author of a work dedicated to Charles I., and entitled "Davidis Camerarii, Scoti, de Scotorum Fortitudine, Doctrina, et Pietate, Libri Quatuor:" 4to, Paris, 1631.—J. T.

CHAMBERS, EPHRAIM, author of the "Cyclopædia of Science" which bears his name, was born towards the close of the seventeenth century at Kendal, Westmoreland, where his father was a farmer. After receiving an ordinary education, he was sent to London, and apprenticed to Mr. Senex, a globe-maker, in whose employment he acquired that taste for science which resulted in the preparation of the work on which his fame rests. Indeed it is said that the first articles for the dictionary were written behind the counter. Finding, however, that more leisure was needed for prosecuting his design, he left the establishment of the globe-maker, took chambers in Gray's inn, and devoted himself entirely to the preparation of his dictionary, the first edition of which appeared in 1728. It immediately won reputation for its author, who was in 1729 elected a fellow of the Royal Society. A second edition of the Cyclopædia was called for in 1738, and such was its popularity that it reached a fifth in 1746. Ere this, however, the author was dead. He had gone to the south of France to recruit his health, but with little success; and returning to England, he died in 1740. The Cyclopædia continued its popularity. A sixth edition appeared with supplemental articles by Mr. Scott and Dr. Hill, and the work was made the basis of the Cyclopædia published under the care of Dr. Abraham Rees, the issue of which was begun in 1778, and completed in 1785. Mr. Chambers contributed to the *Literary Magazine*; was associated with Mr. John Martyn in publishing English abridgments of the papers on natural science, read before the Royal Academy at Paris; and translated from the French the Jesuits' Perspective.—J. B.

CHAMBERS, GEORGE: this artist was born at Whitby, Yorkshire, about the close of the last century. He was the son of a poor seaman, and at the age of ten years commenced to follow his father's profession as a cabin-boy on board a small trading sloop. For two years the little fellow served in this humble capacity, and was then apprenticed to the master of a brig trading in the Mediterranean and Baltic. He was not in a very auspicious arena for the developing of his art-resources; the rough seamen he was cast among were not great applauders or appreciators of pictorial art, and were at first disposed, doubtless, to snub and deride so land-lubber an accomplishment as sketching. But neither tar, nor ropes, nor rough work, nor the jeers of the fore-castle, could manacle the childish hand born with a facility for design; or could keep back the childish mind already breaking out eagerly into the first steps of art. And soon the fore-castle applauds the sketching sailor-boy, and his fame spreads "aft," and the captain's cabin at last gets wind of the business. The boy is encouraged to quit the sea for land, there to ply his pencil for his living—his indentures are cancelled, and he works his way home again in another ship. The boy returns to Whitby, but finds the entrance to his adopted profession no easy matter to one so poor and unaided as himself. He has no learning; he knows nothing of colours; he has had no single lesson, no one word of instruction; he has nothing but his own good cause, his stout heart, his active mind, and his facile fingers. But poverty clogs his ambition. His first connection with his profession is rather distant from art. Still it is dabbling with colour, and that is something. He apprentices himself to an old woman who kept a painter's shop. He paints houses; it is not certain that he does not plumb and glaze and carpenter also. But he finds time and money to

commence legitimate work at higher branches of art. He takes lessons of a drawing-master at Whitby, Bird by name, and paints, and sells for anything he can get, small pictures of shipping subjects. For three years he went on in this way; his love of art growing and swelling within him all the while. He never despaired, but he longed for a wider field of chances; he burned to come to London. But the money? There was but one way. The sailor was called in to aid the artist. He worked his way before the mast in a brig trading between Whitby and London. And now fortune took him by the hand. He obtained an introduction to Mr. Thomas Horner, and was employed for seven years to assist in painting the Panorama of London at the Colosseum, Regent's Park. Then he is appointed scene painter at the Pavilion theatre. Admiral Lord Mark Kerr notices him, and introduces him to King William the Fourth. That urbane monarch does not know which to applaud the most—the painter or the seaman. Chambers now stood fair to establish, on secure foundations, both fame and fortune. Unhappily his strength gave way. His health, never good, had been keenly tried by the vicissitudes of his career. Mind and body suffered. He gradually sunk, and died in 1840. His best works are his naval battles. Three of these decorate the hall of Greenwich hospital; all are very spirited. Collectors set a high price upon pictures of this nature by Chambers.—W. T.

**CHAMBERS, SIR ROBERT**, chief justice of the supreme court of judicature in Bengal, born at Newcastle-on-Tyne in 1737; died at Paris in 1803. Educated at Oxford, he was chosen in 1754 an exhibitor of Lincoln college; shortly afterwards became a fellow of University college; in 1762 was elected by the university Vinerian professor of the laws of England, and in 1766, on the nomination of the Earl of Lichfield, obtained the appointment of principal of New Inn Hall. In 1774 he went to Bengal as second judge in the superior court; in 1778 received the honour of knighthood; and in 1791 was advanced to the dignity of chief justice. In 1799 the state of his health obliged him to return to England, which he quitted in 1802 to winter in France, where his honourable and useful career was terminated by a paralytic seizure in 1803. He left a large collection of Oriental MSS.—J. S., G.

**CHAMBERS, SIR WILLIAM**, a distinguished architect, born at Stockholm in 1726. He was of Scotch descent, and when only two years old, was brought to England. He made a voyage to China in the service of the Swedish East India Company, but did not long continue in commercial life, for, at the age of eighteen, he seems to have become an architect and draughtsman in London. He was soon appointed to teach the prince of Wales, afterwards George III., the elements of architecture. This laid the foundation of his fame and fortune, for after the accession of that prince, he was employed to lay out the gardens at Kew. Before receiving that appointment, he had published in 1759, "Designs for Chinese Buildings," and a "Treatise on Civil Architecture;" and after entering on his duties, he issued in 1765, "Plans, Elevations, Sections, and Perspective Views of the Gardens and Buildings at Kew." Both in his writings and his designs he showed a peculiar predilection for the Chinese mode, both of architecture and gardening. In 1771 he was made a knight of the Swedish order of the polar star, and in the following year published "A Dissertation on Oriental Gardening," which attracted much attention, and called forth a clever satire, attributed to Mason the poet. Of the many buildings with the execution of which he was intrusted, the most important were Somerset Place (never completed); the seat of the marquis of Abercorn, near Edinburgh; and Milton Abbey, Dorsetshire. He died in 1796.—J. B.

**CHAMBERS, WILLIAM FREDERICK**, a distinguished physician, born in India in the year 1786. He was the eldest son of William Chambers, Esq., a gentleman in the civil service of the East India Company, and a distinguished oriental scholar. He received his early education at the grammar school at Bath, and was afterwards transferred to Westminster, and from thence to Trinity college, Cambridge. He then entered at the Windmill Street school of medicine, London, at the head of which was Mr. Wilson, and studied there for some time. Having taken the degree of M.A. at Cambridge, he went to Edinburgh, and spent a year there in diligent attendance upon the various lectures of that school. On his return to London he placed himself under the tuition of Dr. Bateman and Dr. Laird, at the Bishop's Court dispensary, Lincoln's inn. He afterwards enrolled himself

as a pupil at St. George's hospital, and studied at the Eye infirmary, under Dr. Farre, and Messrs. Travers and Lawrence. While at St. George's he became a licentiate of Cambridge, and commenced practice at Dover Street. In 1816, when Dr. Chambers was just thirty years of age, he was appointed full physician to St. George's hospital. About the same time he graduated at Cambridge. In 1819 he was appointed, on the resignation of Dr. Dick, to the office of examining physician to the East India Company. In 1820 he married his first cousin, Miss Frazer, by whom he had two sons and two daughters. In 1822 he was appointed one of the censors of the College of Physicians. He had also been elected honorary physician to the Lock hospital, an office he held for some years, and resigned in 1827. In 1836 he was gazetted physician in ordinary to the queen. Upon the illness of the king in the following May, he was appointed physician in ordinary to his majesty, William IV., who created him K.C.H., but allowed him to decline the honour of ordinary knighthood, which had until that time been considered a necessary accompaniment of the commandership of the Guelphic order. On the accession of Queen Victoria, he was gazetted one of the physicians in ordinary, and in 1839 he was appointed physician in ordinary to the duchess of Kent. In 1835 he resigned the office of physician to the Hon. East India Company, and about 1837 he ceased to lecture. In 1839 he resigned the post of physician to St. George's hospital, with which he had been so long and so honourably connected. From the year 1836 Dr. Chambers' annual professional income ranged for many years between seven and nine thousand pounds, and it kept up to its full point even in the year of his temporary retirement through illness in 1848. In the year 1850 he was obliged to retire from the active duties of his profession, from the existence of that disease of the brain which was destined to terminate his earthly career, and of which he died on Monday, the 15th of December, 1855. Dr. Chambers was by no means a voluminous author. Lectures on medical subjects, published in the *Lancet* and *Medical Gazette*, formed the bulk of his literary labours. Nevertheless he was a great writer. From the time he began practice, he regularly made clear and concise memoranda in Latin respecting every case which came before him, and kept a copy of every prescription given to his patients. The books he used for this purpose were quarto volumes of about four hundred pages each. At the time of his retirement there existed sixty-seven of these valuable volumes, besides numerous thinner quartos, in the shape of indices. This labour frequently occupied him until the night was far spent, when he would seek a short rest, to begin work again between eight and nine o'clock in the morning. To these extensive notes he would add sketches of his patients and their maladies, and it was with the most painstaking assiduity that each case was investigated and recorded—not for public reputation and display, but from a conscientious desire to satisfy his own mind that all was done that was possible in each particular case, numerous as they were. We see in this thorough performance of duty the great secret of Dr. Chambers' unrivalled success as a London physician, which could neither have arisen nor been maintained by merely fortuitous circumstances.—E. L.

\* **CHAMBERS, WILLIAM and ROBERT**, two Scottish authors and publishers, who have contributed greatly to the diffusion of literature among the common people. They are natives of Peebles, and the former was born in 1800, the latter in 1802. Having at an early age been thrown upon their own resources, they removed to Edinburgh, and opened two small bookshops in Leith Walk. William also taught himself the art of printing, and being unable to pay for assistance, continued to work for some years as his own compositor and pressman, often toiling half the night at his handpress. The brothers early displayed a taste for Scottish literature, and in 1824 appeared Robert's first work, entitled "The Traditions of Edinburgh"—a popular and exceedingly interesting handbook of the antiquities, and local traditions, of the ancient capital of Scotland. This was followed in 1826 by a curious and most agreeable volume entitled "Popular Rhymes of Scotland," and in the following year by "The Picture of Scotland," in 2 vols. The "History of the Scottish Rebellions of 1638, 1715, and 1745," and "A Life of James I.," followed, in successive volumes of Constable's Miscellany; and three volumes of "Scottish Songs and Ballads, with Annotations." Robert also edited a Biographical Dictionary of Eminent Scotchmen, in 4 vols. Meanwhile William was engaged in the preparation of an elaborate work, entitled "The Book of

Scotland," which appeared in 1830, and furnishes a clear and succinct account of the chief institutions of that country, as well as of its more prominent and peculiar laws and usages. In 1832 the celebrated *Edinburgh Journal* was established by the brothers, and was from the outset received with a degree of favour which far outstripped the most sanguine expectations. The circulation of this far-famed cheap periodical at one period reached ninety thousand copies; and though many formidable competitors have since started up, it still retains its rank, and is widely circulated, not only in Great Britain, but in the Colonies and the United States. In 1834 the Messrs. Chambers issued a series of popular, scientific, and historical treatises, entitled "Information for the People," of which the sale of each number has averaged thirty thousand copies. "The Cyclopædia of English Literature," in 3 vols.; the People's Editions of Standard English Works; "The Educational Course," designed as a complete set of text-books for public or private tuition; "The Miscellany of Useful and Entertaining Tracts;" "The Popular Library;" "The Juvenile Library;" and "The Papers for the People," followed in succession, and attained a wide circulation. All these works have been printed at their own establishment, which sends forth on an average ten millions of sheets annually. The Messrs. Chambers make no pretensions to having been the founders of that stupendous system of cheap literature with which their names are indelibly associated; but they may justly lay claim to the high honour of having given it a wholesome and beneficial direction, and of having contributed largely towards the substitution of entertaining and useful works for the coarse and degrading publications which were once extensively read by the working classes of this country. In addition to the works already mentioned, Mr. Robert Chambers is the author of a treatise on "Ancient Sea Margins," a "Life of Robert Burns," and "The Domestic Annals of Scotland," 2 vols., 8vo. "The Gazetteer of Scotland," 2 vols., 8vo, is a joint production of the two brothers; but the chief share of the work devolved on William, who has also published "Observations on America," the result of a tour through that country. Since his return from America, he has purchased an estate in the neighbourhood of Peebles, and has presented to his native town, at the cost of many thousand pounds, a reading and newsroom, and well-furnished library.

CHAMBRAY, GEORGES DE, Marquis de, known as the historian of Napoleon's disastrous Russian expedition, born at Paris in 1783; died in 1850. In the Russian campaign he was captain in the imperial artillery, was left sick at Wilna, and became a prisoner. After 1815 he returned to Paris and entered the garde royale, but on account of his health was permitted to retire in 1829, with the title of major-general. In 1833 appeared the first edition of his "Histoire de l'Expedition de Russie;" a second and fuller edition was issued in 1835. He also published some tracts on military subjects.—J. B.

CHAMBRAY, ROLAND FREART DE, born at Mans in the early part of the seventeenth century; died in 1676. Chambray having been employed by the government to make selections of works of art in Italy, met Poussin, for whom he formed the most profound attachment and admiration, and whom he was the means of bringing to France. Chambray was also an author, and published a number of works on architecture and painting.—J. F. C.

CHAMBRE (in Scotch, CHAMBERS or CHAMBER), NICOLE or NICOLAS, a member of a Scotch family which established itself in France in the beginning of the fifteenth century. Nicole, who was captain of the Scotch guards of Charles VII., became one of the first favourites of that king, through whose liberality he acquired great riches. In 1448 he purchased the seigneurie de la Guerche, one of the residences of his royal master.

CHAMBURE, AUGUSTE LEPELLETIER DE, a famous French soldier, born in 1789. Various anecdotes are told by French writers of his reckless courage. At the siege of Dantzic in 1813, the company which he commanded was named "the Infernal," and Chambure himself received from the besiegers the designation of "the Devil," on account of his daring. One of his exploits in 1813 has been made the subject of a celebrated picture by Horace Vernet. Chambure died of cholera at Paris in 1832.—J. T.

CHAMFORT, SEBASTIENN-ROCH-NICOLAS, born in Auvergne in 1741. After receiving a good education, he became clerk to a lawyer. It was in 1764 that his first work appeared, "La Jeune Indienne." He had previously contributed essays to

the *Revue Encyclopedique*. There was something in his first romance which, besides the graces of composition, chimed in with the feelings of the day; and it was certain to evoke the plaudits of numerous readers, those especially to whom the gross excesses of a corrupt civilization seemed to invest with seriousness the paradoxical opinions of Jean-Jacques Rousseau in favour of savage life. In 1766 Chamfort produced his "Mustapha and Zeangir," a dramatic piece which greatly increased his popularity. The court proffered him royal patronage, which he at first rather declined. He was fond of the society of intellectual women, and preferred the conversation of old Madame Helvetius, enjoyed in the little village of Autueil, to the pleasures found in the saloons of the capital. Having accepted an offer from the Princess Elizabeth, the unfortunate sister of an unfortunate king, to become her reader, for her amusement he wrote his commentaries on La Fontaine, and other writers of fables—a form of composition to which he appeared much attached. Although he disliked the Revolution, yet it was his singular fortune to originate that famous title to a pamphlet of which the credit has devolved on the Abbé Sièyes—"What is the Tiers Etat? Nothing. What ought it to be? All." The reforms contemplated by Chamfort were far, indeed, from the excesses which he characterized by one of his own comprehensive sayings—"Be my brother, or I kill thee." Having been appointed conservator of the national library by the minister Rolland, Chamfort was, on the fall of that statesman, arrested on suspicion, but soon liberated. So keenly did he suffer during his short imprisonment, that to escape a second incarceration, he attempted suicide by inflicting several wounds on himself with a razor. He lived on for a month, and would probably have recovered had he not been unskillfully treated. His influence on others was so great, that Mirabeau called his head an electrifying one. The man who could inspire natures so opposite as those of Sièyes and Mirabeau, must have been of no ordinary stamp. He died on the 13th April, 1794.—J. F. C.

CHAMIER, DANIEL, a learned French protestant divine, born about 1570, and killed by a cannon ball at the siege of Montauban (where he was professor) in 1621. Chamier distinguished himself by his opposition to the anti-protestant intrigues of the court, and is said to have had a chief share in framing the edict of Nantes. His vast erudition was shown in his *Catholica Panstratia*, a work written against Bellarmine, and published at Geneva under the care of Turretin in 1626. Chamier was remarkably corpulent, and his love of good cheer once brought upon him the anger of the synod of Privas.—R. M., A.

\* CHAMIER, FREDERICK, a novelist of some note, born in 1796. He served for many years in the British navy. His best tales are "Ben Brace" and "The Arethusa." He was an eye-witness of the French revolution of 1848, and has published a review of it. His tales of the sea are modelled on those of Marryatt.

CHAMILLARD, MICHEL DE, a French statesman, born in 1651. He was appointed by Louis XIV. controller-general of the finances in 1699, and minister of war in 1701. Chamillard was not a politician, or a soldier, or a financier, and he allowed himself to be guided in the discharge of his onerous duties by his subordinates. He sacrificed the interests of France in order to preserve the favour of the king, and allowed himself to become the mere tool of the court. Under his administration the finances fell into extreme disorder; the ablest generals were displaced, and their places filled by incapables, and the country was brought to the brink of ruin by a succession of mortifying defeats and disasters. The general dissatisfaction of the people at length compelled Chamillard to resign office in 1708-9. He died in 1721, leaving behind him the reputation of a very bad minister, but an honourable man in private life.—J. T.

CHAMILLY, NOEL BOUTON, Count de, a French marshal, born of a good family at Chamilly in Burgundy in 1636. He entered the army at an early age, and soon acquired distinction by his remarkable courage. In 1664 he accompanied Marshal Schömberg into Portugal, and took a conspicuous part in the battle of Villa Viciosa. He served subsequently with distinction in Candy, Italy, and Holland, and in 1675 covered himself with honour by his gallant defence of Grave, which he held out for ninety-three days against the prince of Orange, who lost in the siege 16,000 men. Chamilly was created a lieutenant-general in 1678, and received a marshal's baton in 1703. He died in 1715. It was to this nobleman that Marianna Alcaforada (see that name) addressed her celebrated *Lettres Portugaises*.—J. T.

**CHAMISSO, ADELBERT VON**, a German naturalist and poet of French extraction, was born at the castle of Boncourt, near Sainte-Menehould, on 27th January, 1781, and died at Berlin on 21st August, 1838. He was of a noble family, that was obliged to emigrate to Berlin at the commencement of the first French revolution. There young Chamisso became one of the queen's pages, and in 1798 he entered the Prussian army, in which he served until after the peace of Tilsit. He was a self-taught botanist in the first instance. He commenced the study of plants at Copet, situated near the lake of Geneva, where madame de Staël had a beautiful residence. Her son, the Baron Auguste von Staël Holstein, was much attached to Chamisso, who was his first instructor in botany, and the earliest companion of his botanical excursions, which, having exhausted the immediate vicinity, were extended to St. Gothard and the country round Mont Blanc. Here he laid the foundation of his excellent herbarium. In 1812 he went to Berlin, where he attended lectures on natural science, and became acquainted with Schlechtendal, who accompanied him in his rambles. Chamisso organized a party of working botanists, of whom he was the foremost. His dress during their trip consisted of an antique garb, once the state dress of a South Sea chief, much worn, mended and stained, and a black cap of cloth or velvet. About this time he frequently visited the estate of Count Von Itzenplitz, near the Oder; and here he composed his well-known romance, "Peter Schlemihl, or the Man without a Shadow." He did not neglect his botanical studies, and published, with the assistance of the count's gardener, "Annotations on Kunth's Flora of Berlin." He devoted much attention to potamogetous and other aquatic plants. In 1818 he engaged to accompany, as naturalist, the expedition fitted out by Count Romanzoff, and he embarked at Copenhagen on board the ship *Rurick*. He was engaged in the voyage for three years, and made large collections of plants. He visited Teneriffe, Brazil, Chili, Kamtschatka, the islands which divide America and Asia, California, Sandwich islands, Unalashka, Guajan, Manilla, and the Cape of Good Hope. Returning to Prussia, his adopted country, he presented his zoological and mineralogical collections to the university museum at Berlin, and commenced arranging his plants according to their places of growth, and their natural families. He was aided in the description of his plants by Schlechtendal, Nees von Esenbeck, Kaulfuss, Trinius, and others. In 1819 the university of Berlin conferred on him the honorary title of doctor of philosophy, and he was appointed professor in the Berlin botanical institution, including the botanic garden. He now prepared a familiar grammar of botany, also thirty herbaria for schools, with descriptive letterpress. He became one of the editors of the botanical journal called *Linnæa*. He presented a specimen of everything which he had collected to the royal herbarium at Berlin. Exposure to weather brought on a bad cough in 1833, from which he never entirely recovered, and which finally caused his death. A plant among the amarantaceæ, described by his friend Kunth, bears his name. He will be long remembered as an enterprising traveller and a zealous botanist. He was a member of the Berlin Academy of Sciences. Among his published works are the following—"Account of Kotzebue's expedition;" "One of the Animals described by Linnæus;" "On the Useful and Deleterious Plants of the North of Germany;" "On the Hawaiian Language;" besides poetical works, and the romance already noticed.—J. H. B.

**CHAMOUSSET, CLAUDE HUBERT PIARRON DE**, a French gentleman, distinguished for his remarkable philanthropy and benevolence, was born in 1717, and was the son of a judge in the parliament of Paris. He devoted his time and fortune to the alleviation of the sufferings of the poor, transformed his house into an hospital for the diseased indigent, and by his wise and zealous efforts succeeded in effecting a great reform in the hospitals of Paris. He was appointed surveyor-general of the military hospitals of France, and took extraordinary pains in promoting their efficiency. Among many other useful schemes he suggested the establishment of a penny post in Paris, the bringing of good water into the city, the institution of fire insurance companies, and of societies among the workmen for their mutual support in sickness, and the adoption of a measure for the suppression of begging. He died in 1773. His complete works were published in 1783, in two vols., 8vo.—J. T.

**CHAMPAGNE**, the Dukes of, will be found under their respective names.

**CHAMPAGNE, PHILIP DE**: this painter was born at Brussels in 1602, and studied under Bouillon, Michel Bourdeaux, and Fouquier. At the age of nineteen he set out for Italy. Taking Paris in his way, he proceeded no further on his journey, but took up his abode in the college of Laon, and commenced an acquaintance with a fellow-lodger, Niccolò Poussin. Du Chesne, painter to Mary de Medicis, engaged the two artists to assist him in decorating the Luxembourg. Poussin executed some portions of the ceiling; Champagne painted the pictures for the queen's apartments. The queen was so much pleased that Du Chesne grew jealous, and Champagne, who preferred a quiet life among his paints and brushes to success amidst brawls and jealousy, made his escape from Paris and returned to his native Brussels. He came back again to Paris on the death of Du Chesne, was made director of the queen's painting, had a pension of 1200 livres settled on him, with rooms in the palace. In this clover Champagne was eminently happy, for there was only one thing he liked better than work, and that was the money that work brought him. He lacked neither. He painted for the chapter house of Notre Dame, for the Carmelite convent, for the king's apartments at Vincennes. He was made director of the Royal Academy of Paintings. He was a calm, industrious, painstaking man, and he went constantly to nature, and was noted for his fidelity to her. But he was cold in his correctness, he could not appreciate fire and movement, he possessed no intensity. He loved art, but he could not feel thoroughly the subjects which elevate and give life to art. Expression was a sealed book to him, passion an unknown language. He was an honest plodding man, and had a good eye for correct drawing and correct colour, and so no wonder his portraits are highly esteemed. One of Colbert has been ranked with Vandyck. He painted also faithful portraits of Richelieu, and Louis XIII. praying to the Virgin. He died at Paris in 1674.—W. T.

**CHAMPAGNY, JOHN BAPTIST NOMPÈRE DE**, Duc de Cadore, a French minister, was born in 1756. He served with distinction in early life in the navy; was appointed deputy to the states-general by the noblesse of Forez; and on the establishment of the consulate, became a zealous partisan of Bonaparte. He was sent in 1801 as ambassador to Vienna; in 1804 was appointed minister of the interior in the room of Chaptal; in 1807 succeeded Talleyrand as minister for foreign affairs, and the following year was created Duc de Cadore. He accompanied Napoleon throughout the campaign of 1809, and assisted in framing the treaty of Vienna, and in bringing about the marriage of the emperor to the Archduchess Maria Louisa. In spite of his services and his subserviency the duke lost the favour of Napoleon, and was deprived of his office in 1811. During the critical campaigns of 1814 and 1815, Champagny seems to have followed a trimming course, and on the restoration of the Bourbons he retired into private life. He died in 1834.—J. T.

**CHAMPEAUX** (in Latin, *CAMPELLENSIS*), **GUILLAUME DE**, a scholastic philosopher and divine, was born near Melun, and died in 1121. Ordained archdeacon of Paris, he lectured on logic for some time with great success in the school of the Notre Dame cathedral; but latterly retired to a suburb of the city near the chapel of St. Victor, where he founded in 1113 the abbey of that name. In the same year he became bishop of Châlons-sur-Marne. The name of Champeaux is known in connection with that of Abelard, who was first his disciple and then his adversary. He took the side of Realism, and is supposed to have been the first public professor of scholastic divinity.—R. M., A.

**CHAMPEIN, STANISLAS**, a musician, was born of Greek parents at Marseilles in 1753; he died at Paris, September 19, 1830. His precocious talent for music was confided to the instruction of two incompetent masters, which accounts in some degree for the want of technical acquirement shown in his writings. In 1766 he was appointed music master at the college of Pignon in Provence, for which establishment, extremely young as he was, he composed a mass, and several other pieces of church music. He went in 1770 to Paris, where, after a short residence, he had some of his sacred compositions performed before Louis XV. He commenced his career as a dramatic composer, in which he made his reputation, with the comic opera of "Le Soldat Français." This was followed by nearly fifty other works of the same class, the most esteemed of which, and the only one that has been performed out of France, is "La Mélomanie," in one act, produced in 1781. The extreme lightness of his style gained instant popularity for his music, but

made it as quickly to be forgotten. He wrote "Le nouveau Don Quichotte" in 1789, for the theatre de Monsieur; as the patent of this establishment was for the production of Italian compositions, the opera was pretended to be a translation, and the name "Zuccharelli" was fabricated for its author, by which even the Italians were deceived. In 1793 Champein obtained a small appointment in a government office, and from this time, though he wrote several works for the stage, nothing of his composition was produced in public. The political disturbances in France, at the period when he ceased to bring out his operas, upset the old institutions, and thus prevented Champein from receiving in his latter days any payment for the performance of his works. A pension was granted him by Napoleon, which he lost on the Restoration; and he suffered great privation until the commission of authors settled upon him an annuity of 1200 francs, and obtained for him a further grant from the civil list. This was but a short time before the close of his long life.—G. A. M.

CHAMPIER, SYMPHORIEN, called also CAMPEGIUS, a French physician, born in 1472, and died in 1533. His early studies were prosecuted at Paris, and he subsequently studied medicine at Montpellier. He settled as a medical practitioner at Lyons. He entered the army as a medical man, and accompanied Louis XII. to Italy. He was rewarded for his services on the battle-field by being knighted. His success appeared to have elated him much, and he became anxious to claim a descent from some family of renown. He was severely lampooned by Scaliger for his vanity and conceit, and more particularly for his ignoble attempt to separate from his wife, whose family he found out to be unworthy of his high pretensions. His self-love was much exalted by subsequent honours conferred on him by the medical men at Padua. On his return to Lyons he became a councillor, and seems to have purposed the founding of a school of medicine in that city. He wrote numerous works on history and on medicine; among others, a "Hortus Gallicus, or an account of the native medicinal plants of France;" and "Campus Elysus Galliae."—J. H. B.

CHAMPION, JOHN G., a zealous botanist, was born at Edinburgh in May, 1815, and died at Scutari, 30th November, 1854. He gained his commission in the army at Sandhurst in 1831, and was appointed to the 95th regiment, with which he served uninterruptedly in various climes until his death, when he had attained the rank of major. He was engaged in the Crimean war, and behaved most gallantly at Alma and Inkermann. He had a great taste for natural history, and in his youth was fond of entomology. He continued to collect and examine objects of nature wherever he was located. Botany became a favourite pursuit. When at Ceylon, he was stimulated in this department of science by Gardner, the superintendent of the botanic garden. For three years he was stationed at Hong Kong, and he investigated thoroughly the entomology and botany of the island. A beautiful longicorn beetle discovered by him at Hong Kong has been called *erythrus championi*. He collected nearly five hundred species of plants at Hong Kong, exclusive of grasses and ferns. The whole collection is now in the herbarium at Kew. Some interesting plants, such as *rhodoleia championi* and *rhododendron championæ*, have been introduced by him to this country.—J. H. B.

CHAMPIONNET, JEAN ETIENNE, a distinguished French general, was born in 1762. His services in suppressing the rising of the Girondists, and in the campaigns on the Rhine and in Flanders, especially at the battle of Fleurus, procured him rapid advancement. In 1798 he was appointed by the directory to the command of the army sent to occupy Rome. With a force of only 13,000 men he had to contend against an army of 60,000 Neapolitans, and was obliged to evacuate the city on the approach of General Mack, leaving a garrison, however, in the castle of St. Angelo. But, in a short space of time, the Neapolitan army underwent a succession of humiliating defeats. Mack was compelled to surrender, Rome was reoccupied by Championnet, Capua and Gaeta taken, and at length Naples itself was captured by him, 23rd January, 1799. He immediately took measures to pacify the mob, who were fiercely hostile, and to organize the Parthenopean republic, but he felt so much disgusted by the misconduct of the directory, that he refused to enforce their orders, and was in consequence arrested and put in prison at Grenoble. He regained his liberty on the revolution of the 30th Prairial, and the new members of the directory appointed him to the command of the army of the Alps, in the room of

Joubert, immediately after the disastrous battle of Novi. He found the troops without ammunition, provisions, or money, pent up in a most difficult position, and greatly outnumbered by the enemy. The revolution of the 18th Brumaire speedily followed, and Championnet, whose principles were republican, disapproved of the *coup d'etat* of Bonaparte, and demanded and obtained his recall. He died in 1800.—J. T.

CHAMPLAIN, SAMUEL DE, the founder of Quebec and governor of Canada, was born at Brouage in France, and died at Quebec in December, 1635. In the wars of the League he served under Henry IV., who granted him a pension. Having contracted, in the course of a voyage which he made to the West Indies, a taste for maritime adventure, he was induced by the governor of Dieppe to take the lead in an expedition which anchored in the St. Lawrence, May 24, 1603. In 1604, under De Mants, he explored the Bay of Fundy, formed a little settlement at St. Croix, went as far south as Cape Cod, and returned to France in 1607. Having once more obtained an outfit from some merchants at St. Malo and Dieppe, he again went to the St. Lawrence in 1608, and established a settlement at Quebec, a spot which he had selected in the former voyage as most suitable for the purpose. The fur trade soon caused a little town to spring up there, but it was not fortified till 1624. The next summer he joined an expedition of the Huron Indians against their enemies, the Iroquois, and passing up the river Richelieu, discovered and explored the great lake which bears his name. A series of explorations followed in several successive summers, extending far up the Ottawa, and to the western shore of Lake Huron. On these were founded the French claim to all those possessions in North America which were called New France. Having a robust frame and a pliable disposition, Champlain lived much among the Indians, made them his sole attendants in his voyages, and sometimes rowed his own boat alone up rivers where no white man had preceded him. He went to France in 1620, and brought out his family and a commission as governor of the new settlement. Eight years afterwards, an English expedition under Kirk passed up the river, and having first captured the French vessels which had been sent out with supplies, compelled Quebec, from the want of provisions, to surrender. Still undismayed, Champlain went to France in an English ship, and mainly through his exertions Canada and Acadie passed again to the French, by the treaty of St. Germain. He returned to Quebec in 1633, with the necessary supplies for placing the settlement, which had been temporarily abandoned, on a permanent footing. A college was founded at Quebec in 1635, with special reference to the instruction of Indian children; but Champlain did not live to witness its good effects. He was an able pioneer and governor, and deserves to be remembered as the father of New France. An account of his voyages was published by him in quarto in 1632, having appended to it a catechism in the Indian language, and a treatise on navigation.—F. B.

CHAMPOLLION, JEAN FRANÇOIS, an eminent orientalist, born at Figeac on the 26th of December, 1790; died at Paris on the 4th of March, 1832. Like many distinguished men devoted exclusively to study, the life of M. Champollion is merely the history of his intellectual progress. He commenced the study of the classic languages while very young; and so intense was his application, that he contracted a permanent defect of his left eye in consequence of his prolonged readings by candlelight. In addition to his philological training, his taste for antiquities was awakened by the example of his brother, who possessed an extensive collection of medals, and whose assistance was always at hand. Besides these advantages, he had the valuable endowment of a taste for drawing, which enabled him to write or copy oriental characters with facility and elegance. From the classics he passed to the study of the Semitic languages and biblical literature; and the young philologist gave proof of his zeal, if not of his proficiency, by writing a memoir, in which he endeavoured to prove that the giants mentioned in scripture were merely the powers of nature personified. It is but justice to state that in his maturer years he had the good sense to characterize this performance as the folly of his youth. From the Semitic languages the transition to Egyptian antiquities and Coptic literature was easy; and he now entered on the career which was to conduct him to eminence. When entering on this very difficult investigation, his point of departure was the assumption that the Coptic language, as preserved in the version of the

scriptures and in fragments of other eminent writings, was the representative of the ancient Egyptian tongue, and of the idiom in which the hieroglyphic inscriptions are written. In accordance with this view, he endeavoured to restore the topography of the land of the Pharaohs by making a collection of all the names of Egyptian towns and localities to be found in old writings, whether Hebrew, Greek, or Arabic, and endeavouring to restore them to their original Coptic forms. This investigation led to the writing of a memoir, which, whatever may be its merits, we cannot but admire as the production of a boy of sixteen. While employed in this manner, Champollion resided at Grenoble, where his pursuits fortunately brought him under the notice of the mathematician Fourier, at that time prefect of the department, and who had been a member of the scientific commission which accompanied Bonaparte to Egypt. M. Fourier, naturally interested in everything that related to Egypt, assisted the young archæologist by his influence, and induced him to remove to Paris, where he would meet with encouragement, and find greater facilities in following out his pursuits.

While residing in Paris, M. Champollion obtained a copy of the inscription on the famous Rosetta stone, which is now preserved in the British museum. As this well-known stone bears an inscription in hieroglyphic characters, accompanied by a Greek translation, it obviously afforded the key by which the mystery of Egyptian writing might be deciphered. We need not mention here the discoveries of Dr. Young respecting the Rosetta inscription, nor the way in which they have been treated by French writers, but will be content to follow the progress of M. Champollion. To prepare himself for the task, he composed a grammar and dictionary of the Coptic language. Guided by this preliminary study, and by comparing the Rosetta inscription with the writing on a papyrus, he succeeded in detecting twenty-five letters of the alphabet in what is called the Demotic character. In 1809 he was appointed to a professorship at Grenoble, and in this retirement he was enabled to publish his geographical description of Egypt. It was not, however, until 1822 that his most important memoir was read before the institute, in which he succeeded in giving the interpretation of the hieroglyphic names of Ptolemy, Berenice, Cleopatra, &c. This memoir produced a great excitement among the learned in Paris; and it is to the credit of Louis XVIII., that he lost no time in bestowing due honour on its author. In this respect the conduct of the French government to Champollion exhibits an honourable contrast to the neglect which Dr. Young experienced from that of England. From this time every facility and national aid was afforded to Champollion in the prosecution of his researches, and his life was one of incessant activity. He examined the rich Egyptian collections of Turin and Rome, and was the means of securing for his country the valuable collections made in Egypt by Mr. Salt, the English consul. He was afterwards sent to Egypt at the public expense, and furnished with an efficient staff of assistants. Unhappily, he did not long survive his return to France, and died while occupied with his great works the "Egyptian Grammar" and "Dictionary of Hieroglyphics."—[J. S.]

CHAMPOLLION-FIGEAC, JEAN JACQUES, elder brother of the preceding, was born at Figeac in the department of Lot in 1778. He was successively keeper of the MSS. in the royal library at Paris, keeper of the library of the palace of Fontainebleau, and librarian to the Emperor Napoleon III. Of his numerous works we notice—"Lettre à M. Fourier sur l'inscription grecque du temple de Denderah en Egypte," 1806; "Antiquités de Grenoble," 1807; "Nouvelles recherches sur les patois, ou idiomes vulgaires de la France," 1809; "Annales de Lagides, ou Chronologie des rois grecs d'Egypte, successeurs d'Alexandre le Grand," 1819 (this work received the prize of the Académie des Inscriptions); and "Les Tournois du Roi René," 1827-28. He also published some charters and ancient documents illustrative of the history of France in the middle ages, a treatise on archæology, and another on chronology.—J. B.

CHANCELOR, RICHARD, a celebrated English voyager, who was appointed to the command of one of the vessels in the expedition under Sir Hugh Willoughby, sent out in 1553 by a company formed by Sebastian Cabot to find a north-east passage "to Cathay and India." The ships were separated by a violent tempest off the Loföden isles, Sir Hugh was driven to the coast of Lapland, and in September put in at the mouth of the river Arzina, where he spent the winter. In

the following year he and all his crew were found by some Russian fishermen frozen to death. Chancellor was more fortunate, and succeeded in reaching Archangel, where he was well received by the inhabitants. He thence proceeded to Moscow, where he was cordially welcomed by the czar, Ivan IV., and entered into arrangements with him which laid the foundation of the commercial intercourse between England and Russia. On his return home in 1554, Chancellor formed the Muscovy Company, and next year returned to Archangel with three ships, accompanied by two agents of the new association, who concluded a most satisfactory treaty of commerce with the czar. But on his homeward voyage in 1556 Chancellor was shipwrecked in Pitsligo bay, off the coast of Aberdeenshire, and perished, along with the greater part of his crew. Only one of his vessels, which carried the Russian ambassador, reached England.—J. T.

CHANDLER, MARY, an English poetess; born at Malmesbury in 1687; died in 1745. Her parents being in humble circumstances, she was brought up to the business of a milliner, which she continued longer than was necessary but for the sake of her poor relations. Mary schooled her intellect and taste by reading the best authors, and published, besides a volume of shorter pieces, a poem on Bath, which attracted considerable notice. She was honoured by a visit from Pope, and enjoyed the valuable friendship of Mrs. Rowe.—R. M., A.

CHANDLER, RICHARD, D.D., a celebrated antiquary and traveller, was born in 1738, and educated at Oxford. In 1763 he edited, by the appointment of the university, the *Marmora Oxoniensia*, for which he wrote an elegant Latin preface. His fame, however, is founded on his connection with a society called the *Dilletanti*, composed of gentlemen who had travelled in Italy, and who were associated for the purpose of preserving and spreading a taste for the antiquities in which they had been interested while abroad. By this society Chandler was sent in 1764, along with Revett the architect and Pars the painter, to explore certain parts of the East, and to make research among the monuments of classical antiquity. The party visited Troas, Tenedos, Scio, Smyrna, Athens, Marathon, Salamis, Megara, Argos, Corinth, Delphi, and many adjacent places of interest, and returned to England near the close of 1766. In 1769 there appeared their joint work "*Ionian Antiquities*." In the same year Dr. Chandler was appointed to the livings of East Worlham, and West Tisted, Hants, whence he removed to the rectory of Tylehurst, Berkshire, where he died in 1810. As the result of his travels Dr. Chandler published several itineraries and antiquarian dissertations. He also prepared, but did not live to publish, a life of Waynflete, bishop of Winchester, lord high chancellor of England under Henry VI., and founder of Magdalen college. It was published in 1811.—J. B.

CHANDLER, SAMUEL, D.D., born in 1693 at Hungerford in Berkshire, where his father, the Rev. Henry Chandler, was minister to a congregation of protestant dissenters, received the chief part of his education at Gloucester, having for fellow students Secker, afterwards archbishop of Canterbury, and Butler, author of the *Analogy*. Having laid a solid foundation for the stores of classical, biblical, and oriental learning, which he put forth in after-life in numerous valuable writings, Dr. Chandler settled as minister of a presbyterian congregation at Peckham, near London. While in this post he took part in the celebrated debate at Salter's hall in 1719, on subscription to articles of faith, and his name appears in the majority, along with those of Lardner, Lowman, Hunt, &c. Losing considerable property in the fatal South Sea scheme of 1720, he engaged for some years in the trade of a bookseller. In 1726 he became assistant minister and afterwards pastor of the presbyterian congregation in the Old Jewry, where he officiated for the space of forty years. Dr. Chandler distinguished himself by several works calculated to establish, illustrate, and enforce the divinity of christianity, particularly as assailed by the unbelievers of his day. Of these the principal are his "*Vindication of the Christian Religion, in two parts*," &c.; "*Reflections on the Conduct of Modern Deists in their late Writings against Christianity*;" "*A Vindication of the Antiquity and Authority of Daniel's Prophecies*;" "*The History of Persecution, in four parts*," &c.; "*A Vindication of the History of the Old Testament, in answer to the misrepresentations and calumnies of Thomas Morgan, M.D.*;" "*The Witnesses of the Resurrection of Jesus Christ re-examined, and their Testimony proved entirely Consistent*;" and "*A Critical History of the Life of*

David." Dr. Chandler was a man of extensive learning and eminent abilities, and both his talents and general character were such as to procure for him a powerful influence in the dissenting body of which he was a member.—J. R. B.

CHANDOS, SIR JOHN, a famous English knight, who contributed greatly to the success of Edward III. and the Black Prince in their wars with France. He commanded a division at the battle of Poitiers, where King John was taken prisoner, and was mainly instrumental in gaining the victory. He was appointed regent of all the possessions which the king of England had in France, and constable of Guienne. His courage and skill mainly decided the battle of Auray in 1364, which gave the duchy of Brittany to the house of Montfort. Sir John was as generous as he was brave; and when his great antagonist, Bertrand de Guesclin, was taken prisoner at the battle of Navarette in 1367, Sir John solicited and obtained his liberty, and himself became security for his ransom. This valiant knight was at length mortally wounded in a skirmish at the bridge of Lussac near Poitiers. "God have mercy on his soul," says Froissart, who dwells upon his exploits with great delight, "for never since a hundred years did there exist among the English one more courteous nor fuller of every virtue and good quality than him."—J. T.

\* CHANGARNIER, NICOLAS-ANNE-THEODULE, a celebrated French general, who took a leading part in public affairs between the overthrow of Louis Philippe and the *coup d'etat* of Louis Napoleon. He was born in 1793, educated at the military school of St. Cyr, and entered the army in 1815 as sous-lieutenant. He took part in the invasion of Spain in 1823, and distinguished himself in the affair of Jorda and of Caldes. After the revolution of 1830 he was sent on the African expedition with the rank of captain. The courage and coolness he displayed in an expedition which Marshal Clausel undertook against Achmet-Bey extricated the French troops from a position of great peril, and gained for Changarnier the rank of lieutenant-colonel. He was actively engaged in all the subsequent expeditions against the Kabyles and Abd-el-Kader, and in 1843 was promoted to the rank of general of division. M. Changarnier visited Paris in 1848, but in May of that year was sent to replace General Cavaignac in the government of Algeria. Five months after, he returned to France, and was chosen by the electors of the Seine to represent them in the national assembly. When the insurrection broke out in Paris in June, 1848, Changarnier was appointed commander of the national guard, and retained that office after the election of Louis Napoleon as president of the republic. He was subsequently invested also with the command of the troops stationed in the capital. He resolutely opposed the ambitious projects of Louis Napoleon, and exhibited unwavering fidelity to the national assembly. He was in consequence arrested and imprisoned, along with the other leading statesmen and generals, on the night of the *coup d'etat*, 2d December, 1851, and since the establishment of the empire has lived in exile at Brussels.—J. T.

CHANGE. See DUCHANGE.

CHANGEUX, PIERRE JACQUES, born at Orleans, January, 1740. Attention was first called to his name by an article in the famous *Encyclopedie* under the title "Realité," which he made the vehicle for propounding a doctrine which, at the present day, characterizes a rather small, but yet important sect. Reality, according to Changeux, never belongs to extremes, but is always found in what the doctrinaires call *le juste milieu*. Whatever be the truth of this maxim, it would have been well for the author had he confined it to speculative philosophy. He attempted to bring within its scope all branches of human knowledge, and in trying to fit facts of science to an ethical theory, failed in many important particulars. He was a profound thinker, a good metaphysician, and skilled in the natural sciences. He died in October, 1800.—J. F. C.

CHANNING, EDWARD TYRREL, LL.D., brother of William Ellery Channing, professor of rhetoric and oratory in Harvard college from 1819 to 1851, was born in Newport, December 12, 1790. He was educated at Harvard, in the class which graduated in 1808, and then studied law and was admitted to practice in Boston. But his tastes were literary, and he became associated with a club of gentlemen who founded the *North American Review*, to the early pages of which he was a frequent contributor, and of which, in 1818, he was the editor. The next year he was appointed to a professorship in the college. The

graduates of his day were more deeply indebted to him than to any other person for the guidance of their tastes, and the formation of their opinions. He did not publish much; some contributions to the reviews, and a life of his grandfather, William Ellery, being all that appeared in his lifetime; but after his death a volume which he had himself prepared, of selections from his lectures, was printed at Cambridge. He retired from office in 1851, and died February 7, 1856, aged sixty-five.—F. B.

CHANNING, WILLIAM ELLERY, D.D., an eloquent American preacher, essayist, and philanthropist, was born at Newport, Rhode Island, April 7, 1780. His father was an able lawyer in that place, who had held high offices in the state; his mother was a daughter of William Ellery, one of the signers of the declaration of independence. From early childhood Mr. Channing was remarkable for sensibility of temperament, sweetness of disposition, purity of manners, and a peculiar earnestness of faith and feeling, so that his associates used to call him "the little minister." Small and slightly built, delicate in health, with a very expressive face and a melodious voice, he quickly won the confidence and esteem of all around him, and bright hopes were entertained of the part which he was to play in life. And, in these respects, the child was the father of the man; his whole career was but the uniform and consistent development of these traits of mind, character, and person. "Washington Allston the artist, his life-long friend, described him as a brave and ingenuous child, who, though his junior, inspired him with a sentiment of respect." After completing his preparatory studies under the charge of one of his uncles, he entered Harvard college when only fifteen years old, and graduated in 1798 with the highest honours of his class. In order to support himself while studying theology, he became a private tutor in a wealthy family in Virginia, and there soon learned to detest the institution against which he laboured so long and so earnestly in his subsequent life. "This alone," he wrote home, "would prevent me from ever settling in Virginia. Language cannot express my detestation of it. Master and slave! Nature never made such a distinction, or established such a relation." His earnestness in study, which he was wont to continue late into the night, and some injudicious attempts to harden himself by an ascetic regimen, injured his health, so that when he returned to Newport in 1800, it was as a thin and pale invalid. Still he pursued his studies for the ministry at home and in Cambridge, Mass., and in June, 1803, he was ordained a pastor of the church in Federal Street, Boston. In this situation he continued for the rest of his life, though ill health often prevented him from discharging all its duties; and, after the lapse of twenty years, he was obliged to ask the aid of a colleague, upon whom by degrees a large portion of the work was devolved. Towards the close of his life, aware that he was performing but little clerical labour, he repeatedly asked leave to give up his position and salary altogether; but his people were so much attached to him that they would not think of a total separation. His preaching made a strong impression even on those, who, two years after his settlement, had the privilege of hearing for the first time the silver tones and fervid eloquence of the younger Buckminster. Never before or since has the standard of pulpit eloquence been so high in Boston as it was during the early ministry of these two young men, the elder of whom was hardly twenty-five years old. Channing was always a spiritualist, and in the latter part of his life he inclined perhaps to mysticism. But in expression he was always simple and clear, his depth of feeling and earnestness of purpose always finding forcible and perspicuous utterance. His tenets were those of unitarianism, most of his earliest published discourses being a defence of the doctrines usually known under that name, or rather an exposure of what he regarded as the gloomy views of calvinistic theology. But he grew more and more impatient of any bondage of sects or creeds, and wished to work out a faith for himself, and to be known only as a liberal christian, claiming and conceding the largest liberty of thought. He wished to carry out the precepts of christianity into action and life, and with advancing years he became more and more interested in the movements for opposing slavery and instituting social reforms.

Dr. Channing became generally known as a brilliant essayist by the publication, in 1826-29, of his articles on Milton, Bonaparte, and Fenelon. They are characteristic productions, not pretending to breadth or completeness of portraiture, but regarding the subject exclusively from a moral and christian point of

view, glowing with a fine enthusiasm, and fervidly eloquent alike in eulogy or denunciation. In common with nearly all the eminent men of New England at that time, Dr. Channing was a federalist in his politics, and had thus learned to look with utter distrust and aversion on revolutionary France, and the military usurper whom he regarded as the bloody offspring of a great national crime. He took a warm interest in all measures tending to meliorate the condition and elevate the character of the human race; and his published addresses on temperance, self-culture, and the elevation of the labouring classes, attained a wide circulation and great influence both in England and America. In 1823 he visited Europe, and remained a year abroad, and in 1830 sickness obliged him to spend the winter in the West Indies. What he saw while in the island of Santa Cruz of the practical effects of slavery, revived and strengthened the aversion to it which he had felt during his early residence in Virginia; and he resolved upon an attempt to rouse his countrymen from their apathy upon the subject—for apathy it was. Since the agitation of the Missouri question in congress in 1820 the topic had slept, politicians and even philanthropists fearing to touch it, seeing the difficulties with which it was surrounded, and shrinking from the fearful consequences which the discussion of it might involve. While in the West Indies he began the work on slavery, which was not published till four years afterwards. The length of the interval shows how anxious he was to consider the matter in all its relations, and not to begin a controversy, the bitterness of which he foresaw, till he could promise himself that it would lead to some useful result. The work appeared in 1835, and “from that time he seemed to consider himself bound to the cause of abolition.” There followed in rapid succession a letter to J. G. Birney on the Abolitionists; one to Henry Clay on the Annexation of Texas; “Remarks on the Slavery Question;” “The Duty of the Free States, or Remarks suggested by the Case of the Creole;” and the last work of his life, “An Address delivered at Lenox on Emancipation in the British West Indies.” The natural result followed, that the more he wrote upon the subject, the more his interest in it deepened, and the more inclined to favour radical measures for its extirpation. Yet he never identified himself either in action or opinion with the extreme and violent abolitionists. His good taste and the gentleness of his disposition shrank from fanatical counsels and desperate measures. He wrote upon it almost as if engaged in an abstract discussion, loving to recur to first principles and dwell upon them, and taking little notice of particular facts or special remedies. Yet the unaffected earnestness of his manner, the loftiness of his rebukes of timidity, ignorance, or apathy on such a subject, and the eloquence of his denunciations of a great social wrong, did much to help the cause; they found many listeners, and made many converts. The abolition movement gradually absorbed all his powers, and up to the day of his death it was the interest nearest his heart. The summer of 1842 he passed in a beautiful mountainous district in the western part of Massachusetts. He intended to return home through the passes of the Green Mountains; but he was attacked at Bennington by a fever, which continued more than three weeks, and finally terminated his life, October 2, 1842. His memoirs, with copious extracts from his correspondence, have been published in three volumes by his nephew, W. H. Channing; and his collected works have also appeared in a handsome edition in six volumes.—F. B.

CHANTREY, SIR FRANCIS, was born at Norton in Derbyshire on the 7th of April, 1782. His father had a small farm there, and Chantrey's first impressions of the great world were acquired in his occasional visits to Sheffield with his mother on market-days, when she went into town to dispose of the produce of the farm. It was on these visits that the young sculptor's attention was first drawn to carvings and similar objects exposed in the shop windows, which produced in him the ardent desire of imitating such works; and he was eventually placed with a carver of Sheffield, to whom he was bound for three years, though his father had wished to make an attorney of him. Chantrey was, however, soon dissatisfied with carving, which he found too mechanical a process, and he turned his attention to modelling in clay. He left Sheffield, first for Dublin; he then tried Edinburgh, and finally settled in London, where he was fortunate in obtaining the patronage of Nollekens, whose attention was attracted to a bust by the young sculptor of J. R. Smith. It is related that Nollekens, during the disposition of the works for exhibition,

singled out this early work of Chantrey's, saying—“It is a splendid work; let the man be known; remove one of my busts, and put this in its place.” Nollekens recommended Chantrey on all occasions when a bust was required, and his own works soon established his reputation with the public. He was elected a member of the Royal Academy in 1818, after being only two years on the list of associates. And during a visit to Italy in 1819, he was elected a member also by the academies of Rome and Florence, and he was knighted by the queen in 1837. He died of disease of the heart, November 25, 1841, leaving many works unfinished in the hands of his friends and assistants, Allan Cunningham and Henry Weekes, to be by them completed. Chantrey was buried in a vault constructed by himself in the church of his native place, Norton in Derbyshire; and he bequeathed £200 a year to the clergyman of the place, to be paid so long as his tomb shall last, as a charitable fund to provide for the instruction of ten poor boys, and to furnish a pension of £10 a year to five poor men and five poor women, parishioners of Norton, to be selected by the clergyman; the residue to be reserved by the clergyman for his own use.

Sir Francis Chantrey earned the distinction of being the best bustmaker of his time; he was also a good monumental sculptor, but met with only very partial success in the few practical works he attempted, notwithstanding he had the aid of Stothard in their composition. Two of his finest pieces—Lady Louisa Russell at Woburn abbey, and the sleeping children in Lichfield cathedral, are from designs by Stothard. One of his very best statues is the bronze of William Pitt in Hanover Square. He was essentially a portrait sculptor only, or maker of what the Greeks called iconic figures; he is entitled to the same rank, therefore, in sculpture that is given to successful portrait painters in painting. His equestrian statues are not successful, the horses are particularly inanimate; as, for instance, in the monument to George IV. in Trafalgar Square. His last work of this class, that to the duke of Wellington before the London Royal Exchange, was executed almost entirely by Mr. Weekes.

Chantrey's will has secured him a very important position in the future history of the art of his country. His great success enabled him to accumulate a large fortune, and as he had no children he bequeathed it to the nation, to be laid out, according to directions provided, in the encouragement of British art. He left the reversion of his property, at the death or remarriage of his widow, at the disposal of the Royal Academy of Arts, to be laid out in the purchase of the finest examples of painting and sculpture executed within the shores of Great Britain; all purchases to be *bonâ fide* purchases of finished works. The amount to be thus expended towards the formation of a national collection of British fine art in painting and sculpture, is supposed to be about £2500 per annum, from which are to be paid annuities of £300 to the president of the Royal Academy, and £50 to the secretary; payable on the 1st of January of every year. Chantrey trusted to the nation to find a repository for these purchases, as he has expressly prohibited any of his fund from being used for such purpose. The fund is not to accumulate for more than five years. Chantrey left to his friend and principal assistant, Allan Cunningham, £2000, and in a codicil a life annuity of £100, with reversion to his widow; he left also £1000 to his assistant, Henry Weekes, provided, in both cases, that they continued in their offices as assistants until the completion of his unfinished works, or such as it might be necessary to finish. Allan Cunningham did not survive Chantrey an entire year. There are two monographs on Chantrey—Recollections of his Life, Practice, and Opinions, by George Jones, R.A., 8vo, London, 1849; and Memorials of Sir Francis Chantrey, R.A., Sculptor, in Hallamshire and elsewhere, by John Holland, 8vo, London, 1851.—R. N. W.

CHAPELAIN, ANDRÉ, is supposed to have lived at the court of Philippe Augustus somewhere between 1180 and 1223. He wrote a work—“De Arte Amatoria et Reprobatione Ameris,” which, coming from an ecclesiastic, throws curious light upon the sentiments of the time.—J. F. C.

CHAPELAIN, JEAN, a French poet, born at Paris in December, 1595. His connection with the foundation of the French Academy, of which he was one of the principal originators, would alone insure his name a place in the memory of men of letters. While yet a child, he learned the Spanish and Italian languages by himself, and his enraptured mother foreseeing fame and fortune for her gifted son, would not let his father make him a

notary. While a tutor in the family of the grand provost of France, he attracted the attention of the cardinal de Richelieu, who named him a member of the academy, and gave him a pension. He subsequently found another patron in the duc de Longueville, who allowed him a pension while writing a poem, "La Pucelle." The money did not happily inspire the bard, who took over twenty years to produce a dead failure; but the patron, instead of showing vexation, doubled the annuity. Chapelain was said to have grown avaricious with age, but the charge is not supported by sufficient testimony. As he often displayed liberality, he may have indulged in some peculiarities which gave a handle to the envious. Died in 1674.—J. F. C.

CHAPELLE, CLAUDE EMMANUEL LULLIER, born at La Chapelle, near St. Denis, in 1626. His intimacy with Moliere gave rise to a rumour that he aided the most famous of French comic writers in the composition of his immortal productions, which so offended the latter that he laid a trap for Chapelle by asking him to write a scene for a play in which he was engaged. Armed with this proof of inferiority, he stopped the pretended partner's tongue by threatening to show what he had written. The fact was, that Chapelle possessed ready wit and singular humour in conversation, which chilled when he took the pen in hand. It is greatly to the credit of the poet that he could exhibit, in a servile age, a personal independence which amounted to intrepidity. While travelling with the duc de Brissac, whose service he had entered, his eye lighted on a passage in a classic author to the effect that service of the great and slavery were synonymous terms, on which he threw up his employment. As he was much addicted to the bottle, his friend, the celebrated Boileau, kindly undertook to remonstrate with him; but the conversation ended in the censor being left dead drunk by his captivating companion. He was one of a wild party who, at Moliere's, in a fit of intoxication proposed to bid adieu to a wicked world by jumping into the Seine, a mad act which was prevented by the dramatist, who was a teetotaler. Moliere, with great presence of mind, proposed that so heroic a deed should have the day for witness, and the day witnessed no worse than aching heads. In conjunction with Bachaumont, Chapelle wrote the famous "Voyage en Provence." He died in September, 1686.—J. F. C.

CHAPMAN, GEORGE, a dramatist of the Elizabethan period, but better known as the translator of Homer, was born, probably in Kent, in the year 1557. He resided two years at Trinity college, Oxford, but did not take a degree, because, Anthony Wood thinks, though he excelled in Latin and Greek, he had no turn for logic or philosophy. He afterwards settled in London, and lived, it is said, in familiar intercourse with Shakspeare, Spenser, Ben Jonson, Daniel, Marlow, and other poets. He was intimate also with Inigo Jones the celebrated architect, and dedicated to him one of his plays. He found a powerful patron in the Secretary Walsingham. Wood describes him as "a person of most reverend aspect, religious and temperate, and highly esteemed by the clergy and academicians."—(*Athenæ, Oxon.*, i. 592.) He died at an advanced age in 1634, and was buried in the churchyard of St. Giles'-in-the-Fields. Chapman's claim to literary distinction mainly rests on his translation of Homer. His version, which is in long rhyming lines of fourteen syllables, like the metre of Drayton's *Poly-olbion*, comprises, not only the *Iliad* and *Odyssey*, but the Homeric hymns and the *Batrachomyomachia*. Until of late years Pope's translation had completely driven it out of the field; but a new edition was printed some years ago and attracted much attention. Chapman renders his original rather more faithfully than Pope; but his long unwieldy lines can never vie with the spirit and *verve* of the more modern version. Our author wrote eighteen plays, partly tragedies and partly comedies, which are now forgotten. One of his tragedies, "Bussy d'Amboise," seems to have been a good acting play, for it was popular on the stage; but Dryden speaks of it as intrinsically the most despicable stuff. "A famous modern poet," says Dryden in the dedication to his *Spanish Friar*, "used to sacrifice every year a Statius to Virgil's manes; and I have indignation enough to burn a D'Amboise annually to the memory of Jonson." Warton, strangely enough, is in doubt whether this passage be meant to convey praise or censure!—(*Hist. Eng. Poetry*, vol. iii.) One of his comedies, "Eastward, Ho!" is said to have been the joint work of himself, Jonson, and Marston, and is remarkable as having furnished Hogarth with the idea worked out in the *Idle Apprentice*.—T. A.

CHAPMAN, JOHN, an English divine, born 1704, died 1784. He became domestic chaplain to Archbishop Potter, and archdeacon of Sudbury. His first book was against Collins the infidel, and in his "Eusebius" he answered the objections of Morgan and Tindal. He wrote also several short pieces on classical matters, in one of which he maintained that Cicero published two editions of his *Academics*. As executor to Potter, he presented himself to the precentorship of Lincoln; but by a decision of the house of lords was deprived of the office.—R. M., A.

\* CHAPMAN, MARIA WESTON, an American lady, one of the earliest and most zealous abolitionists in the United States, was born in 1806 at Weymouth, near Boston, Massachusetts, and was educated first at Weymouth public schools, and afterwards in England. She became in 1829 the associate of Ebenezer Bailey, Esq., of Boston, in his undertaking of the collegiate education of young ladies. In 1830 she married Henry Grafton Chapman, Esq., of Boston, and both became ardent supporters of the anti-slavery cause. It is perhaps not easy now to understand all that was involved in this early adherence to the cause of antislavery in America. Every inducement of a social and worldly nature tended in the strongest manner to dissuade one in Mrs. Chapman's position from giving it the least support. But in her case there was neither doubt nor hesitation. She saw the justice, righteousness, and necessity of the movement, and cheerfully undertook to bear her share of the opprobrium heaped upon its promoters. Mrs. Chapman was one of the women of Boston and vicinity who, in 1835, formed the "Female Antislavery Society." In 1836 an attempt was made by the abolitionists to reach the judiciary and law of the state of Massachusetts. The decision of the supreme court, in the "Med" case, placed the Massachusetts judiciary on the old level of the English "Somerset" case; while the "Latimer" law, forbidding the prisons and jails of the state to be used for the detention of fugitive slaves, and all state-officers from taking part in their arrest, raised the state-legislation to nearly as high a point as it can be brought, while remaining in a common union with slaveholders. Another undertaking in 1837 was the reform of the church by influences from without—a movement which secured the co-operation of all the abolitionists, and has ever since been successfully continued. In all these movements, Mrs. Chapman was a leading spirit both in the design and the execution. It was on the petition of herself and others of Weymouth, sustained by 30,000 other women of Massachusetts, for the abolition of slavery in the district of Columbia (in which Washington, the seat of the national government, is situated), that the hon. John Quincy Adams encountered on the floor of congress the southern threat of assassination, and, "persisting in reading the petition, was compelled to take his seat amid uproar and confusion." During all these years it was Mrs. Chapman's effort to connect the antislavery cause in America with the earlier opponents of slavery in both hemispheres; and Clarkson, John Quincy Adams, and others, gave her their cordial co-operation. She was at one time co-editor of the *National Antislavery Standard*, which she had largely assisted in establishing in 1840, as the organ of the American Antislavery Society; and she published historical statements of the several undertakings above-mentioned in four little works, entitled "Right and Wrong in Boston and Massachusetts." The series of annual volumes, entitled "The Liberty Bell," composed of original contributions from the ablest and most distinguished friends of freedom both in the Old world and the New, is owing mainly to her labours. In 1841, Mr. Chapman being ordered to a milder climate in search of health, his wife accompanied him to Hayti. Taking letters from the Antislavery Society, they travelled both in the French and the Spanish parts, and gathered such information as enabled them on their return to put in motion, through the Massachusetts Antislavery Society, the first popular effort by petition for the recognition of Haytian independence. In 1848, after the death of her husband, Mrs. Chapman took her family to France, and resided on the continent until 1855, continuing unweariedly her exertions in the cause of antislavery.

CHAPONE, HESTER, a literary lady, known as the authoress of "Letters on the Improvement of the Mind," and as the friend and correspondent of some of the most eminent of her day, was born in 1727. She was the daughter of Thomas Mulso, Esq., of Twywell, Northamptonshire. She early displayed her literary tastes, and it is said at the age of nine composed a romance entitled "The Loves of Amoret and Melissa." Through her

friend Richardson, she was introduced to Mr. Chapone, a barrister at the Temple, to whom, after a long acquaintance, she was married in 1760, but who only survived ten months. Her early widowhood was somewhat cheered by the friendship of Mrs. Montague, Lord Lyttleton, and Miss Carter. Mrs. Chapone contributed one of the earliest numbers of Johnson's *Rambler*; wrote a story named "Fidelia," which appeared in the *Adventurer*; an ode to peace; and an ode addressed to Miss Carter on the publication of her translation of Epictetus. Her first avowed work was the "Letters," written at first for the benefit of a favourite niece, but published in 1773 at the request of Mrs. Montague. This was soon followed by a volume of miscellanies. She died in 1801. Her works, with a sketch of her life, were published in two volumes in 1807.—J. B.

CHAPPE, CLAUDE, a French mechanic, nephew of the famous astronomer the Abbé Chappe d'Auteroche, was born at Brulow in Normandy in 1763. He is distinguished as the inventor of the telegraph or semaphore, a machine for carrying signals between distant places similar to that invented by Dr. Hook in England, and modified by Amontons in France. He died in 1805.—J. B.

CHAPPE D'AUTEROCHE, JEAN, a French astronomer, born of a distinguished family in 1722. While studying at the college of Louis le Grand, his progress in mathematics and astronomy attracted the notice of the principal, father De la Tour, who introduced him to Cassini—an introduction that proved the beginning of his good fortune. In 1760, he departed for Tobolsk, to observe the transit of Venus, predicted by Halley to happen in the following year. He accomplished the object of his journey amid incredible hardships, and published an account of it in two volumes in 1768. In 1769 another transit of Venus took him to California, where he died in August of the same year, after having been successful in making his observations. They were published by C. F. Cassini in 1772 under the title of *Voyage de Californie*.—R. M., A.

CHAPPELL, WILLIAM, an English divine, was born in 1512. Appointed soon after 1533 provost of Trinity college, Dublin, he was preferred in 1538 to the bishoprick of Cork, Cloyne, and Ross. But he soon got into trouble. Charged with puritanism at Cambridge, he was now accused of popery in Ireland. He was impeached in the house of peers—the charges being perjury and malice towards the Irish. He left Ireland at the breaking out of the rebellion, and died at Derby, after suffering many misfortunes, in 1649. He wrote a work entitled "Methodus Concionandi," and also an account of his own life in Latin. Some have supposed him to be the author of *The Whole Duty of Man*.—R. M., A.

\* CHAPPELL, WILLIAM, F.S.A., a musical antiquary, was born in London, November 20, 1809. His father founded the extensive music warehouse which bears his name. Engaged in this establishment, Mr. Chappell's national pride was continually offended by his hearing the existence of English music denied; and the more so as the fashion of the day for Scotch songs, arising from the successful performance of popular singers, induced the manufacture of numberless pieces pretending to be Scotch, and the false attribution to Scottish origin of many excellent melodies native to the south side of the border. Accordingly, he applied himself with such zeal as can only belong to a labour of love—to the investigation of whether or not England possessed any national music; and in the prosecution of this inquiry he collected the materials for his first publication. This was "A Collection of National English Airs," which appeared in parts in 1838, 1839, and 1840. It contains an immense number of songs and dance tunes, procured from antiquarian sources and from tradition, with a historical account of each; and the remarkable beauty of these fully demonstrates, not only that England possesses music of its own at least equal in merit to any other national music in the world, but that the want of disposition for music with which this country is familiarly characterized, is an entirely false aspersion. On the completion of this work, Mr. Chappell was elected a fellow of the Society of Antiquaries. In seeking materials for the "Collection of National English Airs," he came across so many interesting specimens of early poetry and light literature—illustrating manners and customs—equally valuable to historians, antiquaries, and bibliographers, that he thought it desirable to take measures for their republication. Accordingly, after the example of the Camden Society, he founded, in conjunction with Dr. Rimbault, and with

the assistance of Mr. Halliwell and others, the Percy Society, for printing these works by the subscription of its members. The society commenced its operations in 1840, continued its existence for eleven years, and produced ninety-five books. It was at first designed to include in the proceedings of the Percy Society, the republication of the musical compositions of the Elizabethan masters which had become obsolete, which would as powerfully prove the scholarly musicianship that formerly flourished in England, as did Mr. Chappell's collection the prevalence with our forefathers of a popular taste for music. Finding it inconvenient, however, to combine these two objects in one institution, the founder again, in conjunction with Dr. Rimbault and with the Gresham professor, Mr. E. Taylor, established the Musical Antiquarian Society, in order to carry out his favourite idea of vindicating the English musical character. This society was formed in November, 1840, lasted six years, and issued eighteen works, which throw most valuable light on the history of the art. Of this, as of the Percy Society, Mr. Chappell and Dr. Rimbault officiated as treasurer and secretary. In 1843 Mr. Chappell became a partner in the music firm of Cramer & Co. His labours in the cause of English national music ceased not with the issue of his first publication. On the contrary, this work served the editor as a nucleus, round which to gather fresh proofs of the indigenous musical character of his country—fresh examples of the beautiful melodies that at once expressed and inspired the feelings of former generations of Englishmen. The original book having been for some time out of print, Mr. Chappell commenced in 1845 the publication of "Popular Music of the Olden Time," in parts, the last of which has been issued in 1859. This work is greatly more extensive than the former, and much more systematic in its arrangement; it forms, in fact, an illustrated history of music in England from the time of Alfred to that of George III.; and the beauty of its examples and the force of the facts proving their once general popularity, must have the effect of obliterating the stigma prejudice has stamped upon the character of the country, and demonstrating that England is a musical nation. The thanks of every one of his countrymen who is interested in art, will repay the editor's elaborate and indefatigable researches.—G. A. M.

CHAPPELOW, LEONARD, a celebrated Orientalist, was born in 1683, and died in 1768. He studied at Cambridge, and in 1720 succeeded Simon Ockley in the Arabic chair. He held, besides, the livings of Great and Little Horstead. In 1727 he published Spencer's work, *De Legibus Hebraeorum Ritualibus*, with additions and corrections; in 1730 "Elementa Linguae Arabicæ;" and soon after a Commentary on Job. In 1765 appeared Bull's Two Sermons on the State of the Soul after Death, with a preface by Chappelow. His last publication was entitled "Six Assemblies," &c. It is part of a large work written in Arabic by Hariri of Basra.—R. M., A.

CHAPTAL, JEAN ANTOINE, Count de Chanteloup, an eminent French chemist, of the Lavoisier period, was born in 1756; died in 1832. Throughout his long career he was passionately fond of chemistry, and devoted himself more particularly to the application of that science to the industrial arts. He obtained his diploma as M.D. at Montpellier in 1777, and then repaired to Paris, where his progress was rapid, and attended with remarkable success. On his return to Montpellier in 1781, the states of Languedoc founded for him a chair of chemistry in the school of medicine. Having succeeded to the fortune of a rich uncle, he instituted several establishments for the manufacture of chemical products. He improved the processes for the production of mineral acids, alum, soda, white-lead, sugar of lead, &c.; discovered a new method for dyeing turkey red, and was also successful in naturalizing the barilla of Alicante in the south of France. For these useful labours he was rewarded with letters of nobility, and the cordon of the order of St. Michael. He adopted all the ideas of the Revolution, but he highly disapproved of their excess. He was appointed director of the saltpetre works at Grenelle, and was soon afterwards intrusted with the reorganization of the school of medicine at Paris, in which he was professor of chemistry. The 18th Brumaire opened to his talents a more brilliant career. He was named by the first consul, councillor of state, and on the retirement of Lucien, received the portfolio of the interior. Under his administration chambers of commerce were founded, special encouragements granted to the industrial arts and manufactures, the culture of beet-root and woad extended, and schools for

trades established. The Conservatoire des arts et metiers is indebted to him for several useful collections. He resigned office in 1804, and in the same year he entered the *senat-conservateur*, of which he was appointed treasurer. In 1813-14 he was commissioner extraordinary at Lyons. On the return of Napoleon from Elba, he accepted the direction of commerce and manufactures; and for his devotion to this cause his name was erased by Louis XVIII. from the list of peers. In 1816 he was elected member of the Institute, to which he communicated several important memoirs. Chaptal has left a number of works, all marked by elegance of style, rigorous method, and great perspicuity; and which, though now old, may still, especially his "*Chimie appliquée aux Arts*," be consulted with advantage. His declining years were visited by cruel reverses; and of the immense fortune amassed by his great labours, and during his long and useful career, only a wreck eventually remained.—F. P.

CHARDIN, SIR JOHN, an eminent eastern traveller, born at Paris in 1643, was the son of a jeweller, and was brought up to the same profession. To gratify his taste for travel, and "to endeavour the advancement of his fortunes and estate," he left France for the East in 1664, and before his return in 1670, visited Persia and the East Indies. In 1671 he again went to Persia, where he remained till 1677. In the course of his two journeys, he gained a perfect acquaintance with the language, and attained much familiarity with the manners and customs of Persia. In 1681 he settled in London, and was appointed jeweller to the court and the nobility; was knighted by Charles II., and elected a fellow of the Royal Society. The first part of his "*Travels*" was published in 1686, and the second in 1711. The work has been translated into various languages: an edition in 10 vols. 8vo, with notes by Langlés, was published at Paris in 1811. Chardin resided during the last years of his life at Turnham Green, and was buried at Chiswick in 1713.—J. S., G.

CHARES, a statuary of the seventh century. He was a native of Lindus in Rhodes, and a disciple of Lysippus. His fame rests on his colossus of the sun at Rhodes, which was wont to be reckoned one of the seven wonders of the world. The popular account of this wonder, dating from the time of Blaise de Vigenère, is now exploded. The statue was thrown down by an earthquake, *n.c.* 224.—R. M., A.

CHARES, an Athenian general, was born about 400 *b.c.* He was sent in 367 to the assistance of the Phliasiens, who were hard pressed by the Argives, Arcadians, and the Theban garrison of Sicyon, and gained some successes over these aggressors. In 361 he was nominated successor to Leosthenes, who had met with a defeat from the ships of Alexander, and landing at Coreyra assisted the oligarchical faction in that place to overthrow their democratical opponents. In 358 he was sent to Thrace at the head of a considerable mercenary force, and compelled Charidemus and Chersobleptes to execute the convention of Athenodorus, by which the whole of the Chersonese was surrendered to Athens. In the following year Chares was appointed to take charge of the social war, along with Timotheus and Iphicrates, whom he accused before the people because they refused to risk an engagement, on the ground of a storm that was then raging. During the Olynthian war Chares was sent to the assistance of the Olynthians, and obtained some advantages over the mercenaries of Philip. He was one of the commanders of the Athenian army at the disastrous battle of Chæronea, and exculpated himself from blame by throwing the responsibility of that engagement on one of his colleagues, Lysicles, who was condemned to death. We last hear of him as holding Mitylene for the Persians, with a garrison of two thousand men; but, unable to hold out against the Macedonians, he agreed to evacuate the city, in 333 *b.c.* Chares acquired immense sums by plunder, which he spent in bribing the orators and gratifying his licentious tastes.—J. T.

CHARETTE DE LA CONTRIE, FRANÇOIS ATHANASE, one of the principal heroes of the Vendean war, was born in 1763. He was descended from an old and respectable family, and his father was a captain in an infantry regiment. He entered the navy in 1779, was engaged in the American war, and attained the rank of lieutenant, but retired from the service when the Revolution broke out. He was living on his estate in Brittany when the outbreak of the royalists took place in March, 1793. Yielding to the urgent requests and even threats of the peasants of Machecoul, he reluctantly consented to be their leader. The army which he led was called that of Bas-Poitou, to distin-

guish it from the Vendean force under Cathelineau, which was called the army of Haut-Poitou. On the 29th the two armies united in the unsuccessful attack upon Nantes, in which Cathelineau was mortally wounded. While acting in concert, though defeated in an attack upon Luçon, they gained three signal victories over the republicans on the 19th, 21st, and 22nd of September. But Charette, who, with all his patriotism, had much personal ambition, quarrelled with the other generals, quitted the grand army, and carried on operations by himself. When General Hoche was sent with a numerous army to terminate the contest in the western provinces, he offered Charette liberty to quit the country with all the persons whom he chose to name, but the offer was rejected. On the 23rd of March, 1795, Charette was attacked by an overwhelming force, severely wounded, and taken prisoner. He was carried to Nantes, where, on the 29th, he was tried by a military commission, condemned, and immediately executed. The death of this able soldier terminated the war in La Vendee.—J. T.

CHARIDEMUS, a Greek general, born at Oreus in Eubœa, about 400 *b.c.* He was a commander of a band of mercenaries, and was in the habit of hiring himself to the best bidder. He entered into the service of Athens under Iphicrates, and was employed against Amphipolis in 367, but not long after entered into the pay of Cotys, king of Thrace, a decided enemy of Athens. Having been captured by the Athenian fleet, he was again prevailed on to serve Athens, and assisted Timotheus in his attack upon Amphipolis. He subsequently passed over into Asia, and hired himself to the satrap Artabazus, who had revolted against Artaxerxes III. Then returning to Europe, he took service with Cotys (whose sister he married) against his former employers the Athenians. On the murder of Cotys in 358, Charidemus became the main support of his son Chersobleptes, in his struggle with Athens for the possession of the Chersonesus. (See CEPHISODOTUS, CHABRIAS, and CHARES.) In the end he was compelled to surrender the long-coveted territory to the Athenians, retaining however Kardia for himself. In 349 Charidemus is once more found in the service of Athens, and was appointed commander of the troops sent to the assistance of the Olynthians; but next year he was superseded by Chares. From this period he disappears from history.—J. T.

CHARIDEMUS, an Athenian orator, was born about 390 *b.c.* In 358 he was sent ambassador along with Antiphon to Philip of Macedon, ostensibly for the purpose of confirming the treaty between that monarch and the Athenians; but in reality to treat secretly with him for the restitution of Amphipolis. He was a second time ambassador at the Macedonian court, when Philip was murdered in 336 *b.c.* Charidemus was one of the orators whose surrender was demanded by Alexander, 335 *b.c.*, after the destruction of Thebes. He fled to Asia, and took refuge with Darius, by whose orders he was put to death, 333 *b.c.*, shortly before the battle of Issus.—J. T.

CHARILAUS, king of Sparta, son of Polydectes, lived about 800 *b.c.* His father died early, leaving a pregnant widow, who made to her husband's brother, the celebrated Lycurgus, a proposal that he should marry her, and become king. Lycurgus, however, indignantly rejected the offer; and, on the birth of his nephew, Charilaus, held up the child publicly in the agora as the future king of Sparta, and immediately relinquished the authority which he had provisionally exercised. Charilaus undertook an expedition against the Tegeans, but was defeated and taken prisoner by an ambuscade of the women. They set him at liberty without ransom, telling him to remember never again to make war upon the Tegeans.—J. T.

CHARISI, R' JEHUDAH BEN SOLOMON ALCHARISI, surnamed by some writers ALCHOFNI, a distinguished Hebrew poet and ingenious translator into Hebrew, was born about the year 1175 in a part of Spain subject to the Moors. He took for his model the famous Makamat by Mohamed ben Ali Al-Hariri of Basra, in which the Arab poet introduces two personages, Hareth ben Hemmam and Abu Seid, for the narration of their adventures in rhymed prose, interspersed with metrical pieces. This singularly charming production, Charisi imitated in Hebrew, under the title of "*Mechaberath, or Maclbereth, Ithiel*," of which, unfortunately, instead of the fifty chapters of the original Arabic only twenty-seven have been preserved in Hebrew. The applause with which the version of Hariri's poem was received by the Hebrew-reading public in Spain and southern France, encouraged Charisi to attempt an original production of the same species of

fiction, which, under the title of "Thachkemoni" (see 2 Sam. xliii. 8) ranks foremost in the secular poetry of the Jews. As a translator, Charisi was especially active on behalf of the Jews in the Provence, to whom the writings of the Spanish Jews of that period were unintelligible in their Arabic originals. Thus, we meet with a translation by Charisi of Maimonides' Commentary on the Mishna, order "Serain;" of Maimonides' great work, the Moreh; of the Musre Haphilosophim (Moral Apothegms of the Philosophers); and the Iggereth Aristo (Aristotle's Letter); and even of several medical dissertations of Greek origin. Charisi's travels extended over many lands; to say nothing of the peninsular cities which he visited, he speaks familiarly of Marseilles, Alexandria, Cairo, Jerusalem, Damascus, Bagdad, &c. He returned in 1218, and probably died sometime before 1235.—(Zunz in Benjamin of Tudela, ii. p. 258; Dukes, *Ehrensäulen*; Carmoly, *Revue Orientale*, vol. iii.; Jost, *Geschichte*, &c.)—T. T.

CHARKE, CHARLOTTE, youngest daughter of Colley Cibber, the famous actor and poet laureate. Charlotte received a very masculine education, and married, while still young, a violinist of the name of Richard Charke. The profligacy of his life, however, soon caused a separation. Charlotte then betook herself to the stage; but quarrelling with Fleetwood the manager, she ultimately joined a strolling company, and died in a state of the utmost misery in 1760. In 1755 she published a narrative of her own life.—R. M., A.

CHARLEMAGNE, eldest son and successor of Pepin le Bref, first Carolingian king of the Franks, born in 742. But little is known of his history until he ascended the throne at the age of twenty-six. At the age of eleven, in the year 753, he met Pope Stephen II. at the Lombard frontier of France, and conducted him to join his father Pepin at Pontyon. Next summer, with his father and younger brother, he received from the pope the royal consecration, and the title "patrician of Rome." We hear of him as engaged in the Aquitanian war which fills the close of Pepin's reign; and these are the only notices we possess respecting his youth. At the death of Pepin in 768, the empire was shared between Charlemagne and his brother Carloman. They extinguished together the last sparks of agitation in Aquitaine; and Bertrade the queen-mother, after reconciling a rising difference between the brothers, departed for Pavia to negotiate a union between Charles and the daughter of the king of Lombardy. Notwithstanding the violent repugnance of the pope to a match which would unite the pious royalty of the Franks to the nation of the Lombards, "perfidious, horrible, fetid, and the authors of leprosy," Charles repudiated his first wife to marry Desiderata. The marriage, however, was of no long continuance, the sensitive and delicate constitution of the Lombard princess not realizing the Frank's ideal. The divorce of Desiderata left room for the Suabian Hildegarde, a strong-voiced princess, and was closely followed by the death of Carloman, whose wife and children fled to Lombardy, leaving Charlemagne sole monarch of the Franks.

Before entering on this great reign, it is important to trace lightly the origin and nature of the "renaissance," of which it forms the culminating point. The barbarian invasions have of late assumed their real place in the perspective of history. The image of the Roman empire was rather shattered by them than effaced; like a reflection on water, it was ready to return when the ripple subsided. The barbarians felt awed, and as it were, trode softly. They were like beggars hutting in a palace—the place had harboured greater men than they. The church of the Romans had met, and even welcomed Clovis on the frontier. Signs and wonders lighted him to victory, and the ordeal of battle had vindicated the religion of the christians. But the history of the Franco-Gallic church is one of failure and corruption, and we must look to the Anglo-Saxon missionaries of Rome, seconded by the papacy and the mayors of the Austrasian palace, if we wish to identify the causes which, in the eighth century, infused an altered spirit into religion and politics. Three potent influences—the popes at Rome, the Pepins in Austrasia, and the Anglo-Saxon missionaries in the Teutonic forests—presided at the first of the three great "renaissances." The reign of Charles Martel exhibits the revolution in its clearest form. He is the man of the new religion, gathered by Boniface in "the huts where poor men lie." He plunders and degrades the Franco-Gallic church, but he sustains the pope against the Lombards, and he saves the world at Tours. Pepin le Bref continues the same policy. The almost Hebraic unction con-

ferred on him by Boniface marks the rise of the royalty of the future; the Lombard wars of 754–55, and the territorial donation to the pope, settle the spiritual power on a firm basis; and a clause in a Saxon treaty of 753, binding the Saxons to allow the preaching of the gospel among them, indicates the missionary and crusading character of the new dynasty. A moral idea and purpose was penetrating and organizing the chaotic and incoherent nationalities of western barbarism; and the centre of this revolution was Rome, the only spot in the empire which had risen to a new life without the renovating touch of a barbarian conquest. No longer based, as in the days of the republic, on the exclusive domination of Italy—for the feeble or generous provincialism of the empire had long made the Eternal City the seat, instead of the possessor of imperial power—Rome directed the world in virtue of its past glories, and still more, of its precious possession of the bones of St. Peter. The characteristic of the Roman empire had been conquest made creative. Charlemagne was about to earn a revival of the title by a revival of the work. The atmospheric pressure of barbarism which destroyed the old empire showed some signs of recommencement. Between the Rhine and the Carpathians extended a vast surface of half-settled barbarous nations, entering like a wedge between the two civilizations of East and West. Since the era of the Roman empire little progress had been made in diminishing this standing menace to regular government. Varus had never really been avenged; Thuringia and Alemannia had, indeed, long been more or less subject to the Franks, and Frankish influence was felt in Bavaria and even Saxony; but between Metz and Constantinople was ranged a double cordon of uncivilized races—the first, Teutonic, consisting of the Frisons, Saxons, and Bavarians; the second formed by the Slavonic Wiltzes in the north, the Slavonians of Carinthia on the Adriatic, and between them the Mongol Avars, camped on the Hungarian plains. The great and permanent result of the reign of Charlemagne was to be the creation of Germany in this wilderness of barbarism.

Ten active years, the last of Pepin's life, had definitively carried the Frankish authority to the foot of the Pyrenees, but had allowed a pressure on the north-eastern frontier, which early attracted the attention of Charlemagne. Amid the shadows and solitude of their gigantic forests, the Saxons spurned the religion, the royalty, and the civilization of the Franks. Sullenly constant to the ideas of their fathers, the three tribes acknowledged no common king, retained the indefinite boundaries of the old Teutonic gau, and knew nothing of the division into tithings and hundreds, common to the Franks and the Saxons of England. War commenced characteristically by the burning of a church at Deventer in 772. The spring assembly of the Franks was held at Worms—the first of those thirty champs de Mai which gathered up the Frankish levies to the field of action, and then launched them on the Saxon marches. The attack was directed against the Hermen-Saul, a mysterious idol in the form of a column set on the summit of the castled rock of Ehresburg, the scene of the destruction of Varns and his legions, and possibly raised in commemoration of his victor. After destroying this image, Charlemagne penetrated to the Weser, and returned with twelve hostages to the patrimonial residence of the Pepins, at Héristal, near Liege.

The two next years were occupied by a war with Desiderius, king of the Lombards, who resented the divorce of his daughter, supported the sons of Carloman against their uncle, and had despoiled the pope of certain cities of the exarchate, in revenge for his refusal to adopt the same cause. Late in the autumn of 773 the Frankish forces gathered at Geneva, and, pressing through the snows of the Great St. Bernard and the Mount Cenis, besieged Desiderius in his capital of Pavia. The city opposing an obstinate resistance, Charlemagne, says Eginhard, "went to Rome to pray there," and renewed the alliance of the popes and the Carolingians at the tomb of St. Peter. He returned to Pavia in time to receive the submission of its famished defenders. The Lombard duchies, with the exception of Benevento, made their submission. No hostile territory now intervened between Aix-la-Chapelle and Rome, but the native dukes and counts were left undisturbed in their authority, and, with the exception of a Frankish garrison in Pavia, there was little external change to tell that the king of the Franks was now the king of the Lombards. This settlement of Lombardy was of short duration. One year later, Roger, the duke of Friuli, revolted. Charles pounced upon him from the Alps with the

swoop of an eagle. The Lombard counts were dispossessed all over north Italy, and Franks put in their place. The duchy of Benevento remained independent till 786, when Aregise, its duke, fled to Salerno before the arms of Charlemagne, and was reduced to pay an annual tribute. On the death of Aregise in 788, his successor, Grimold, found himself in presence of a formidable Greek invasion, headed by Adalgise, the son of the last Lombard king of Italy. The Greeks were routed with severe loss, and from that time forward, Italy, the tribe of Levi among modern nations, renounced all hopes of independent national sovereignty, and remained faithful to the pope and the emperor, both alike its glory and its ruin.

The earlier years of the reign of Charlemagne are remarkable for rapid change in the scene and direction of his campaigns. Breaching the firm enceinte of barbarism which hemmed him in, now in this direction, now in that, each isolated conquest worked like a charged mine among the yet unthreatened portions of the fabric. From Aquitaine he turns on Saxony, from Saxony on the Lombards, thence to Saxony again, and then he pours through the two great rifts of the Pyrenees, at their eastern and western extremity, a stream of Franks, of Bavarians, Lombards, Gascons, and Provençals, converging on Saragossa to receive from the local governor his proffered submission. Disappointed of this, the Franks laid siege to Saragossa, received the submission of the country between the Pyrenees and the Ebro, and withdrew in triumph by the gorge of Roncevaux. Charlemagne had already gained the crest of the pass, when a host of Gascons, emerging from the dense forests which covered the mountain slopes, threw themselves on the rear-guard, rent it from the main body, and hurling it in confusion into the valley of Pampeluna, destroyed it to a man. Among the names of those who fell, Eginhard has preserved for us that of "Roland, prefect of the march of Bretagne." The winded horn and the terrible sword of the deserted hero are claimed by poetry; but the silence of the mountain valley, so suddenly broken and so rapidly restored, stands out as a poetic feature, even in the dry pages of the secretary of Charlemagne.

The Lombard and Spanish campaigns interrupt, parenthetically, the one long Saxon war which lasted nearly through the reign. Spring after spring, the Frankish armies flooded the Saxon marches, leaving each autumn as they retired a fort and garrison in the fastnesses of the country. Sometimes the Frankish foragers returning to their fort at nightfall, would be joined by pretended comrades, who avenged at midnight the plunder of the day. At other times a spirit of submission would seize the nation, and the camp of Charlemagne, fixed at the sources of the Lippe, would be crowded by myriads of Saxons, recognizing, perhaps, in the brookside the seats of their early pagan worship, and pressing to be baptized in token of subjection, or to secure the tunics of fair white linen they received after the ceremony. In 778 the nation broke out again, and from Deutz to Coblenz, the Austrasian dwellers on the left bank of the Rhine saw the blaze of villages, farms, and churches, advancing fast and far along the right. A Frankish force crossed the Rhine, defeated the Saxons at the ford of the Adern, and pushing across the Weser and Ocker to the Elbe, discovered in the darkness of the East, the Wends, the northern link in that great chain of Slavonic nations, which stretched from the Baltic to the Gulf of Venice. The episcopal organization which Saxony now received appears to have kept it in order for four years; but in 782, the heavy defeat of the Franks at Sonethal, though cruelly revenged by the decapitation of 4500 Saxons in one day, inaugurated a struggle more severely contested than any previous. Charles sought and found the Saxons on the Teutberg, near Dethmold; they offered a sullen resistance; the carnage was terrific; and he retired, baffled, to Paderborn. Reinforced from France, he again attacked them; this time the defeat was total; the merciless army of Charlemagne burst over Saxony from the Rhine to the Elbe; the roads echoed with the tramping of captive men and cattle, setting steadily to the West; the king established his family at Ehresberg for the winter, scattered his army in flying columns, and directed in person a systematic slaughter of the Saxons in their homes. This tremendous and penetrating warfare met with complete success. Witikind, the great Saxon leader, accepted the offers of Charlemagne, and was baptized at the royal villa of Attignisur-Aisne. The happy news was sent in triumph to Offa, the Anglo-Saxon; and the pope crowned with masses the missionary

proless of the sword. Baptism had now in fact assumed a new meaning; it was not merely the outward sign of christianity; it was the shibboleth of civilization. The baptism of Witikind was more significant than his execution could have been, for it implied not merely his defeat, but his adoption of the ideas of his victor. The capitulary of 785 seconded the example of the Saxon leader. It punished with death the refusal to be baptized, the burning of the dead, and the non-observance of Lent; an inquisitorial enactment of civilized customs which betrays the terrors of a christian régime of conquest in those early days.

These dark and relentless years possibly point to the influence of the beautiful Fastrada, whom Charlemagne had married after the death of Hildegard in 783, and whose cruelty now raised more than one conspiracy against her husband's life. The first was Thuringian. There was no difficulty in its detection. One of its leaders boldly avowed in the presence of Charlemagne—"If my advice had been followed, you would never have repassed the Rhine alive." The merciful sovereign imposed on them some edifying pilgrimages to the tombs of saints, but had them murdered on their way home. Seven years later, a natural son, named Pepin, conspired against his life at Ratisbon. The nocturnal conference of the conspirators in the church of St. Peter was overheard by a humble deacon concealed beneath an altar, who, penetrating half clad through the seven doors and seven passages which led to the king's chamber, was received with stifled merriment by the queen's waiting-women, but succeeded in communicating his news to Charlemagne, who laid his iron hand on the conspirators, and sent Pepin to the monastery of St. Gall, "considered," says the monk of St. Gall with humour, "the poorest and most outlandish spot in the vast empire."

The submission of the Lombards, completed by the homage of the duke of Benevento in 786, laid open the duchy of Bavaria to Frankish attacks on the south, as well as on the west and north. The fortunes of Lombardy and its overhanging Alpine plateau were then, as now, indissolubly connected. Three armies converged upon Bavaria. The people disavowed the intrigues of their duke with the Avars; he was degraded at the assembly of Ingelheim, and the hereditary duchy gave place to Charlemagne's favourite government of counts and margraves.

The first or Teutonic enceinte of barbarous nations was now levelled, but only to disclose a second barrier. The spear of Charlemagne had pierced the outer plate of the barbaric shield, but rang vainly on the inner. In 789 he aided the Obotrites of Mecklenburg against the Weletabians, receiving hostages for the latter; and the submission of Bavaria laid bare the singular nation of the Avars. Here opened a prospect worthy indeed of Charlemagne. To fix and settle the wild and tumultuous oscillations of those intrepid cavaliers who bathed their horses, says Gibbon, alternately in the Euxine and the Adriatic, was to dry up the well-head of barbarism from the Alps to the mouths of the Danube. The Saxons, the Frisons, the Thuringians, the Franks, and the Aquitanians, moved in two great masses down the two banks of the Danube, and penetrated to the Raab, while the Italians, under their king, Pepin, pierced the outermost circle of the mysterious ninefold ring, situated between the Danube and the Theiss, within which the brigand nation brooded like an eagle over the accumulated treasures of two centuries of plunder. The army returned on foot from this achievement, for its horses were lost in the marshes of Hungary.

The irritability of exhaustion followed this tremendous effort. Like the sailors of Columbus, or the Israelites in the desert, the world wearied of Charlemagne,—

"There is no joy but calm,

Why should we only toil, the roof and crown of things?"

Pepin conspired against his father's life; the count Theodorie gathering reinforcements in Saxony for the Hungarian war, was massacred with all his forces; the revolt of Benevento stripped Aquitaine of defenders; Duke William of Toulouse was defeated in attempting to protect that province; even spirits from the other world fought against Charlemagne, for the ears of corn were empty, and a council declared that demons had blighted them because the tithes were not duly paid. These dark clouds passed away with the death of Fastrada in 794. Charlemagne was not content with replacing the bishops and counts in Saxony; the missionaries had worked well as pioneers, but they were unequal to government. He drew off a vast number of

Saxons into Germany and France, and divided the confiscated lands among great feudatory vassals. These deportations were thrice repeated in 796, in 798, and in 804; but this terrible combination of Eastern and Western, Assyrian and feudal methods of empire, extinguished even Saxon resistance, and created a civilized nation, which, in the next century, gave emperors to Germany, and kings to France. Everywhere the barbarian world gave signs of exhaustion; the creation in 798 of the "march of Spain," advanced the Frankish frontier to the Ebro. Herrick, the duke of Friuli, penetrated the nine circles of the ring, and Pepin, king of Italy, rased it the year after. The gold of the Avars brightened the two capitals of the West; but its late owners, deprived of their palladium, the ring, petitioned to be allowed to settle west of the Danube, and the Bohemians succeeding to their plains and marshes, were reduced in one campaign by the eldest son of Charlemagne.

In the midst of these triumphs the state of Rome caused anxiety. Leo III., the successor of Adrian, was surrounded by enemies. The nephews of the late pope attacked him on his way to the church of San Lorenzo in Lucina, and attempted to deprive him by mutilation of speech and sight. Leo fled to Charlemagne at Paderborn, who restored him to the papal throne, and followed him to Rome. On the 24th of November, 800, Charlemagne was received on the steps of St. Peter's by the pope, the bishops, and the clergy. An inquiry, held a few days after, into certain charges preferred against the pope by the two nephews, resulted in the acquittal of the pope and the exile of his accusers. Leo, in the pulpit of St. Peter's, with the holy gospels in his hand, made a solemn affirmation of his innocence. But the great event was reserved for Christmas day. The Frankish and the papal courts met for high mass in the great Basilica. The pope in person chanted the service; Charlemagne knelt in devotion. A crown was placed upon his bent head by Leo, and the Romans thrice shouted—"To the most pious Charles, Augustus, crowned of God, mighty and pacific emperor, life and victory!" The pope completed the ceremony by adoring the new emperor in the manner prescribed by ancient imperial custom.

The Roman empire was restored. Again came the age of those mighty imperial artificers, under whose hands the map of civilized Europe had grown—pushing with the earlier Cæsars to the banks of the Rhine, or spreading with Trajan to the foot of the Carpathians. Again the landmarks of civilization were plucked up, and the tide of barbarism flung backwards ten degrees; but though the work was the old work, the spirit was new. In the "Holy Roman Empire" of the ninth century appears a new figure; this counted two leaders—a spiritual and a temporal—the emperor and the pope. "Duo soli," says Dante—

"Che l'una e l'altra strada,  
Faci'n vedere, e del mondo, e di Dio."—*Purg. Cant. XVI.*

The polytheism of ancient Rome had suited well with conquest, but more by its tolerance after victory than by any eagerness it inspired for war. The christianity of the Frankish period was warlike and propagandist throughout. "Alas," said Charlemagne, when disappointed by the retreat of a band of Norman brigands, "why have I not deserved to see how this christian arm of mine would have played about those apes!" This spirit of conquest—half theological, half military—is the distinctive characteristic of the reign of Charlemagne. Nor were these the only respects in which the empire was changed. Its silent and flexible mechanism was replaced by a noisy publicity, necessary in so Homeric an age. The terrible tongue of Charlemagne was everywhere—applauding, sneering, scolding. Two assemblies in spring and autumn gathered the important men of the empire together, and interested them in its welfare and progress. The emperor was among them, his shrill voice audible as he greeted his great nobles, chatted with rare visitors, comforted the old, joked with the young, and had a word for everybody. They gathered in the palace court, the stout Teutonic figures, who sustained the western world upon their lances—marquises and margraves from the march of Spain; the few dukes whom the jealous Charlemagne still suffered to exist; Herrik of Friuli, glittering with the spoils of the Avar Ring, with the warriors round him who had carried each of them nine wends together transfixed upon their spear-points; here and there one of the strange Carolingian bishops, so open to temptation, so inconsolable in their remorse, so naïvely ignorant of this world, and so intimate with the evil spirits of the other; or an old noble

from the sequestered valleys of Austrasia, who scorned with Charlemagne the short, many-coloured mantle of the Gauls, and stood there in his long blue tunic, with a knotted applestock in his right hand, a living relic of the past. Whatever their office or their origin, there were few to whom the gigantic presence of the emperor was not familiar; the round head, white and war-worn, the full bright eyes, the big nose, the great cheerful face and sturdy figure, were known in every county of the empire. They had seen him hunting on the Tyrolese Alps in his suit of sheepskin, bathing with a hundred paladins in the warm springs of Aix-la-Chapelle, or mounted on his war-horse, his daughters cavalcading behind him; "a man of iron, an iron helmet on his head, and gauntlets of iron on his hands, his iron chest and shoulders shielded by an iron cuirass, in his left hand a lance of iron lifted in the air, and grasping with the right hand his invincible 'Joyeuse.'" Or, perhaps, they had watched him at matins in his lighted chapel; his long white mantle reaching to his feet, following in an undertone the chanting of his unequalled choir, or uplifting that terrible high voice to rebuke a failure in the service. Such failures seldom occurred. A military precision reigned in the chapel of Charlemagne. No mark was needed or allowed to identify the lesson for the day. A movement of the imperial hand started the reader, and an inarticulate guttural ejaculation brought him to a close, frequently (*sic visum superis*) in the middle of a sentence. The liturgy used was that of Rome—the Gregorian chant had supplanted the Ambrosian. A story was told about the organ. Late one evening as he sat in his palace, Charlemagne heard melodious sounds of devotion from an adjacent chamber, where some Greek envoys were celebrating vespers with an organ. The emperor listened in rapture, and the imperial carpenters starved and thirsted until they produced an imitation. His grief could be as intense as his pleasure. He mourned for his friend, Pope Adrian, with passionate fits of weeping. The same intensity showed itself in his pursuit of knowledge. "Alcuin," says the biographer of Charlemagne, "appeased a little his thirst for learning, but could not satisfy it." When urged to punish Paulus Diaconus the historian, for conspiring to murder him, he replied—"How can I cut off one who writes so elegantly?" He spoke Latin, and understood Greek. But religious writings, especially those of St. Augustine, were his favourite study. "I would rather," he said to Archbishop Riculf, an obstinate admirer of Virgil, "I would rather possess the spirit of the four evangelists than that of all the twelve books of the Eneid." Alcuin was his master in grammar. He laboured long and successfully at rhetoric, logic, and astronomy; but the art of writing presented difficulties which he never fully overcame. Under the pillows of his camp-bed tablets and copyslips were always hidden, and the great emperor might be seen, in the intervals of his triumphs, humbly schooling his warworn fingers in the formation of the letters of the alphabet.

But his own studies were the least part of his services to knowledge. Around him were the foremost scholars of the age, gathered from all countries—Alcuin the Anglo-Saxon, Paul the Lombard deacon, the Goth Theodulf, the Scot Clement, the Tuscan Peter of Pisa; and the schools which produced later the great names of Anselm and Abelard were framed on the model of the palace school at Aix-la-Chapelle—the creation of Alcuin, who may take place, as the reviver of letters, with Boniface, the reformer of christianity, and Charlemagne, the restorer of the empire.

If we turn to the internal organization of the imperial government, we shall find ample reason why Charlemagne should seek to rest upon religion and education the vast system which, in reality, his indomitable resolution alone kept in play. His instruments of government were the legacy of ignorant and anarchical times. His counts and margraves were identical with those of Clovis, hardy Teutons, incapable as ever of comprehending office distinct from property, but checked by the institution of "missi dominici," imperial inspectors of administration, and by the precaution, which Charlemagne always observed, of never placing more than one county in the same hands. The slow paralysis of feudalism had long been stiffening the action of the empire. One hundred years before, the great mayor of the Neustrian palace, Ebroin, had torn in pieces with his own hands, the decree that bound him to select the counts from the counties they were to govern; but Charlemagne seems seldom to have been able to appoint his counts from the palace. The old judicial institutions of the Franks were giving way; the rakim-

bourgs or freemen no longer flocked as assessors to the court of the count, who made their absence an opening for extortion; and Charlemagne substituted the Scabini, seven assessors named by the count himself. But the principle and practice of territorial jurisdiction by the great lords within their fiefs, appears clearly admitted in this reign, and the final policy of Charlemagne in Saxony indicates in the plainest manner that the proprietor was looked upon as the surest instrument in maintaining submission. This irresistible feeling placed beyond a doubt the ultimate triumph of the feudal organization; and Charlemagne stands in a double relation to the social system that supplied the place of his commanding intellect in the following century. On the one hand, by the impulse which he gave to the practice of commendation, he expressed his sense that the surest guarantee of society was then the government by and through great lords; and, on the other, he instinctively delayed the day when the great human organization of the western world—its brain at Rome, its heart at Aix-la-Chapelle—should degenerate into the low feudal type of the diffusion of nervous centres. By the precautions to which reference has already been made, by requiring an oath of fidelity from every free subject, by the promotion of foreigners, and by the recognition of low-born merit, but still more by his systematic elevation and purification of the church, he strove to win an hour or two of empire for the achievement of that great effort towards the settlement of the barbarous nations, which, we can conceive, he foresaw the utter impotence of feudalism to effect. The capitularies of Charlemagne, which an ignorant age or a grateful priesthood attributed to the direct inspiration of God, enact the payment of tithes, exempt the clergy from the jurisdiction of the civil courts, institute ordination examinations, and, towards the close of the reign, raise the episcopal courts high above the secular, authorize them to judge all manner of causes, and declare the bishops' sentence without appeal. As the world grew more worldly, the church grew more distinctively clerical. The bishops were forbidden to serve in the wars; the semi-monastic order of canons was instituted, and largely extended; the monasteries were reformed by St. Benedict d'Aniane. But the episcopate, under the successors of Charlemagne, degenerated into a hereditary caste of proprietors; its ideas were smothered in gold; and the church was not finally to shake the dust of the world from its feet, until Hildebrand, during the height of feudalism, enforced the celibacy of the clergy.

Never was empire founded on such heterogeneous bases. Like the architecture of the age, it pieced and patched the native barbarism of the Teuton with marble relics gathered from the rivers of Rome. The traditional instinct of imperial subordination had been effaced by the Teutonic immigrations, and its place was imperfectly supplied by an incessant and ubiquitous vigilance. The government of Charlemagne was "full of eyes, before and behind." The palace itself was pierced with peeping holes. Nothing was too minute for Carolingian legislation. The mighty emperor, who denounced adoptionism, maintained the Filioque, or thundered against the adoration of images, stooped to prohibit drunkenness, and to forbid nuns writing love-letters. It was not well that the office of pope and emperor should be thus united. The dissolution of the Carolingian power left the world free to carry out, in the hands of Hildebrand, that severance of the spiritual and temporal authority which was necessary to the age. But we recognize in this activity, not the meddling interference of a pedant, but the honest enthusiasm of a man who felt deeply, and reflected seriously, the fresh and varied interest of a world awakening to thought.

The story of the last fourteen years of Charlemagne's reign remains still to be told. For five of them he rested at Aix-la-Chapelle. The patriarch of Jerusalem sent the great crusading emperor the keys of the Holy Sepulchre; two embassies from Haroun al Raschid laboriously found their way to the west; the emir of Fez sent envoys; the pope of Rome and the converted chagan of the Avars met at the great northern capital, and across the now settled and christianized districts which separated the two empires, Charlemagne offered his hand to the Empress Irene. An assembly at Thionville in 806, ratified the testament of the emperor, which arranged that on his death the empire should be divided between his three sons, Charles, Louis, and Pepin. Pepin was to receive Italy, Bavaria, and all Alemannia south of the Danube, and east of the Upper Rhine; the kingdom of Louis to extend eastward to the Rhone and Mont Cenis;

Charles to inherit the remainder. The pope's subscription of this testament was requested and secured, and it is remarkable that the arrangement of the kingdoms places Rome at the centre of the three, as the transalpine possessions of Pepin were reached by the valley of the Adige; while an entrance into Italy was secured to Charles by the Val' d'Aosta, to Louis by the Mont Cenis. The empire, which now extended from the Elbe to the Ebro, from Capua to the mouths of the Rhine, no longer dreaded the great waves of invasion which set across the eastern plains, and seemed ready to drown the kingdoms of the west. For eighty years, until the incursions of the Magyars, that danger was appeased; but forts rising at the mouths of rivers, fleets gathering within the harbour bar, lighthouses and watchtowers scattered along the headlands, betrayed the new danger that menaced the empire—the Northman and Saracen invasions by sea. Godfrey, king of Denmark, might avert the stream of Frankish invasion by the barrier of the Danewirk, drawn from sea to sea; but Charlemagne, in visiting a port of France, was subject to the vexation of seeing Norman pirates plundering in the harbour, and we read on an occasion of this kind, that the great emperor rose hurriedly from the table, and turning to the window which faced the east, the scene of his victories, stood gazing into the distance, his face streaming with tears. He lost his son Charles in 811; a gloom fell upon the palace; a bitter tone of sarcasm appears in the capitularies; and the burning of the great bridge of Mayence, the narrow portal through which christianity had entered Germany, was held to portend the death of its great constructor, who survived it but a few months. They buried him in his own cathedral. "There," says Palgrave, "they reverently deposited the embalmed corpse, surrounded by ghastly magnificence, sitting erect on his curule chair, clad in his silken robes, ponderous with broidery, pearls, and orfray, the imperial diadem on his head, his closed eyelids covered, his face swathed in the dead-clothes, girt with his baldric, the ivory horn slung in his scarf, his good sword, 'Joyeuse,' by his side, the gospel-book open on his lap, musk and amber and sweet spices poured around, his golden shield and golden sceptre pendant before him."—W. L. N.

CHARLEMONT, JAMES, first earl of, grandson of William second Viscount Charlemont, was born in Dublin in 1728. He received his early education at home, being too delicate for a public school, and in his eighteenth year he set out on a course of continental travel, from which he returned, at the end of eight years, with a mind richly stored both from observation and study. He was created a doctor of laws, and appointed governor of Armagh, and a privy councillor. At this time the government was in conflict with the Irish house of commons upon the celebrated question of the right to dispose of the surplus revenues of that kingdom. The house of commons carried their resolution, but the government, notwithstanding, applied the money according to their own discretion. Such a state of things was highly embarrassing, and Lord Charlemont's influence was resorted to in order, to effect a reconciliation between the parties—an object which he accomplished successfully. A spirit, however, was awakened by the contest that never subsided till it had manifested itself in the most remarkable events of the Irish history of that period. A steady supporter of the rights of his country and the privileges of his order, Lord Charlemont felt the injustice of depriving the Irish peers of their functions as an appellate court of law, and instituted a fictitious suit for the purpose of trying the question. Illness, however, prevented his prosecuting the matter to an issue. On the accession of George III. the peeresses of Ireland were at first denied the right to appear at the coronation according to their rank. Lord Charlemont took up the matter, and after experiencing much unworthy and vexatious opposition, succeeded in establishing their right. In the struggle which took place between the Irish house of commons and the crown, Lord Charlemont was an active sympathizer with the former, and one of five lords who protested against the proceedings of Lord Townshend. When the American and French fleets infested the Irish channel and seized on trading vessels, the English government, unable to afford sufficient protection, permitted Belfast to raise a volunteer corps. The example was followed by most of the northern towns, and that of Armagh was committed to Lord Charlemont. This was the origin of that celebrated body, the Irish volunteers, with which the name of Lord Charlemont is historically connected. On the 10th of November, 1783, a national convention of delegates from all the volunteer corps in Ireland met in Dublin,

and elected Lord Charlemont their president—a post which he accepted chiefly with the hope of being able, by his moderation and prudence, to control the acts of so powerful and dangerous a body. In this he was to a great extent successful, and his moderation, sagacity, temper, and firmness enabled him not only to do good service to the state, but to strengthen the hands of the real patriots in their efforts to obtain reform. During the progress of the great political events of this period, Lord Charlemont exercised a more efficient and beneficial influence than any other man. The head of a great party, to a certain extent in antagonism with the British government, he yet commanded the esteem and respect of the latter. With a high spirit of the purest patriotism, he held back from all the honours and advantages which were offered to him, and his whole conduct exhibits no taint of ambition—no spirit of self-aggrandizement. In 1786 Lord Charlemont was elected president of the Royal Irish Academy—an office he most worthily filled, having contributed several papers to the Transactions. After he had attained his sixty-second year, the health of Lord Charlemont became infirm; but he did not relax his vigilance or activity in taking his part in all the leading political events of his time; and shortly before his death he was faithfully at his post resisting the great measure of the legislative union of Great Britain and Ireland. But the excitement and agitation of the struggle was too much for him. His constitution was entirely shattered, and he died on the 4th of August, 1799, in his seventy-first year. If the talents and genius of Charlemont were inferior to those of Grattan and Flood, and others of his contemporaries, the rare and eminent combination of high and useful qualities, the purity of his heart, his integrity and patriotism, all assign him a place amongst the highest of his day. Accomplished, high-minded, and eminently moral; endowed with the most refined intellectual tastes, the noblest aspirations, the most endearing social affections, he was a politician without the tincture of corruption, and a patriot without the alloy of a selfish motive. He was created an earl in 1763.—J. F. W.

**CHARLEMONT, SIR TOBIAS CAULFIELD**, first lord, born in 1565, was descended from an ancient family of Oxfordshire, and at an early period of life served under the celebrated Martin Frobisher, with whom he went to the Azores in the expedition to these islands, where he conducted himself in a manner to elicit high approbation. He was present in a naval campaign under Howard of Effingham against a Spanish fleet destined for Ireland, on which occasion he won new honour and fame. Subsequently he entered the land service, being engaged under Essex and other commanders, serving in France and Belgium, and signalizing himself at the siege of Dreux, where he was severely wounded. In 1598 he went to Ireland in command of a troop of horse, and rose rapidly into honour and public trust during the wars against the earl of Tyrone. In 1602 Lord Mountjoy gave him the command of Charlemont fort, then lately built to command the Blackwater, as a key to Tyrone's county, where his services obtained him large grants of the estates of the rebel earl; in 1615 he was appointed one of the council for Munster; and in 1620 was created Lord Caulfield, baron of Charlemont. He died in 1627.—J. F. W.

**CHARLEMONT, WILLIAM**, second viscount, grandnephew of the preceding, took a distinguished part in the wars which preceded the revolution of 1688, and was visited with attainder and sequestration by the parliament of James II., but was reinstated by William III. He served with distinction under the earl of Peterborough in Spain, especially at the siege of Barcelona and the attack upon Monjuich, when he received the thanks of the king of Spain. He rose to the rank of major-general, and was made governor of the counties of Tyrone and Armagh.—J. F. W.

**CHARLES**. The emperors, kings, and princes of this name we notice under the names of their respective countries:—  
1. England; 2. Germany; 3. France; 4. Navarre; 5. Spain; 6. Sweden; 7. Naples; 8. Savoy and Sardinia:—

I.—CHARLES OF ENGLAND.

**CHARLES I.**, King of Great Britain, the second son of James Sixth of Scotland and First of England, and of Anne of Denmark his wife, was born at the palace of Dunfermline, 19th November, 1600. His Scotch title was Duke of Albany; but after his father's accession to the throne of England, Charles was created Duke of York. The death of his elder brother, Henry, in 1612 opened to him the succession to the throne, and in 1616 he was formally created Prince of Wales. He was a very weakly child; but as he advanced towards manhood his

strength gradually increased, and at twenty he was distinguished for his skill in manly exercises. He received an excellent education, and was of a gentle and serious disposition; but his close intimacy with his father's infamous favourite, the frivolous Buckingham—"Steenie," as James called him—exercised an injurious influence upon his character, and sowed the seeds of those political errors which lost him both his kingdom and his life. In 1618 James entered into negotiations with the Spanish court for the marriage of Charles to the sister of the reigning king of Spain. But though the prince undertook an incognito journey to Madrid in 1623 for the purpose of expediting the match, it was ultimately broken off, mainly through the artifices of Buckingham, whose violence and dissolute conduct had rendered him as obnoxious to the Spaniards as to his own countrymen. In 1625 Charles espoused Henrietta Maria, daughter of Henry IV. of France, a most unfortunate union for himself and his family. On the 17th of March of that same year he succeeded his father in the throne. His accession was hailed with great favour by the nation; but as he inherited his father's principles of government, and his arrogant favourite still continued to sway the councils of the young king, his popularity was shortlived. The nation had now become conscious both of its rights and its strength, and the spirit of freedom kept pace with the growing wealth and intelligence of the people. An inevitable collision soon took place between the nation and their new sovereign. His first parliament met in June, 1625; but as the commons showed their determination to obtain the redress of grievances rather than to vote liberal supplies for carrying on the war with Spain, the king dissolved them on the 12th of August. A second parliament, which was convoked in the spring of 1626, adopted the same policy as its predecessor, impeached the obnoxious Buckingham, and was preparing a remonstrance against the levying of tonnage and poundage—an odious and oppressive tax—without the consent of the legislature, when Charles, alarmed and indignant at its proceedings, dissolved parliament on the 15th of June. He then had recourse to forced loans and other arbitrary methods of raising money, and imprisoned nearly eighty gentlemen who refused to comply with his illegal demands. The ill success of a war with France, which was brought about by the violence and profligacy of Buckingham, compelled Charles to summon a third parliament in 1628. The commons voted five subsidies, or £280,000, to the king, but refused to pass this vote into law until Charles gave his solemn assent to the "petition of right"—the second great charter of the liberties of England, as it has been termed—by which he bound himself to abstain from forced loans and other illegal taxes, and from arbitrary imprisonments and billeting soldiers on the people. As soon as the parliament was prorogued, however, the king violated his promise, and resumed those arbitrary assertions of his prerogative which had been expressly provided against in the "petition of right." When the legislature again met, therefore, the contest with the king was renewed; and Charles, finding that the commons were determined to vindicate their rights, dissolved the parliament on the 10th of March, and committed Sir John Elliot and several others of its leading members to prison.

Charles now resolved to call no more parliaments, and entered upon a course which would soon have entirely destroyed the liberties of his subjects. Taxes were raised by his own arbitrary authority; ship-money was, for the first time, levied from the inland counties; the puritans were imprisoned, fined, and cruelly mutilated; and an attempt was systematically made to reduce parliament in future to a nullity. At length the king and his adviser, Laud, attempted to force a liturgy upon Scotland, and this foolish project produced an open rebellion among the inhabitants of his ancient kingdom, and ultimately led to the total overthrow of his long-cherished schemes. The Scots entered into a general combination against this religious innovation, framed the famous document called the "national covenant," which was eagerly signed by all classes of the community, and at length took up arms in defence of their religious liberties. Charles marched northward in the spring of 1639, at the head of a powerful army, for the purpose of enforcing submission to his decrees; but on reaching the borders of Scotland he wavered in his resolution, and in the end concluded a treaty with the insurgents, and withdrew his forces. But this peace was not of long duration. The Scots proceeded to carry out their own religious views, and abolished episcopacy. Charles attempted to reassemble an army, with the view of coercing them; but finding it

impossible to support his forces by his former illegal expedients, he was compelled to convoke a parliament in the spring of 1640.

The new house of commons was remarkably moderate in its views and procedure. Even Clarendon acknowledges that it "was exceedingly disposed to please the king and to do him service." But the members, though willing to give a large supply, showed that they were not disposed to overlook the grievances under which the country was suffering, and the king in consequence dissolved the parliament in an angry speech, and threw several of the members into prison. By means of forced loans, and other similar expedients, he was enabled to equip and set in motion an army of upwards of twenty thousand men for the suppression of the Scottish insurrection. But his soldiers had no heart for the enterprise. The Scots crossed the borders, defeated a detachment of the English army who opposed their passage of the Tyne, and occupied the northern counties of England. Charles, in this extremity, was compelled to make a truce with the Scots, and to summon a parliament. The houses met in November, 1640, and proceeded at once with vigour and resolution to the work of redressing the grievances of the country. They passed a bill of attainder against Strafford, and brought him to the block, imprisoned Laud, and in various ways punished the other instruments of royal tyranny. They abolished the star-chamber, the high commission court, and the council of York; and wrung from the king an assent to a law providing that the existing parliament should not be prorogued or dissolved without its own consent. In the autumn of 1641 the houses were adjourned, and Charles visited Scotland, where he made large concessions for the purpose of gratifying the people, and used every artifice to gain over the leaders of the covenanting party. On his return from Scotland, the English parliament met after a recess of six weeks. The Irish rebellion had meanwhile broken out, and the puritans believing that it had been secretly encouraged by the court, and distrusting the king's sincerity, framed an address to him, called the "grand remonstrance," enumerating all the illegal and oppressive acts of his reign, and entreating him to employ only persons in whom the parliament could confide. But a reaction had now taken place both in the country and in the legislature. Many of the moderate reformers, who had cordially supported the previous measures of the parliament, were of opinion that sufficient concessions had now been made by the king, and rallied round the throne. The grand remonstrance was carried, after a fierce and protracted debate, by a majority of only eleven, and if Charles had only been true to himself and to his friends, there cannot be a doubt that he would soon have triumphed over the opposition of his enemies. But after a brief show of moderation, he suddenly, on the 3rd of January, 1642, sent down the attorney-general to impeach Lord Kimbolton, and five members of the house of commons, of high treason, at the bar of the house of lords, and next day went in person to the house with an armed force to seize these members at their post. They, however, had received intelligence of his design, and withdrew before his arrival, so that this perfidious and unconstitutional step, which was the direct cause of the civil war, completely failed, and indeed brought ruin on its author. The commons felt that they could no longer trust the king, that their own personal safety, as well as the security of the national rights, required that he should be deprived of the power to do them injury, and demanded that the militia should, for an appointed time, be intrusted to officers whom they should nominate. "No, not for an hour," was the indignant reply of the king. Both parties had now proceeded to such extremities, that nothing remained but an appeal to arms, and the royal standard was at length raised at Nottingham on the 25th of August, 1642.

Our limits will not permit us to enter into the details of this disastrous contest. The war was carried on for some time in a languid and desultory manner, and after two campaigns the issue was still doubtful. But the genius of Cromwell, and the intervention of the Scots, who sent an army of twenty thousand men under General Leslie to the assistance of the parliament, turned the scale in their favour, and the decisive battle of Naseby, on the 14th of June, 1644, completely ruined the royal cause. Charles ultimately fled for refuge to the Scottish army at Newark on the 5th of May, 1645; and after several months had been spent in negotiations and discussions, as he steadily refused to accede to the terms offered by the presbyterian party, he was, at his own request, delivered up to the English parliament. His

removal to Holmby house, and seizure there by Cornet Joyce at the instigation of Cromwell, the march of the army to London, the submission of the parliament, the overthrow of the presbyterians, and the complete ascendancy of the republican party speedily followed. The first demands made by the army were exceedingly moderate; but when these were rejected by the king, who expected to hold the balance between the two parties, fierce invectives were launched against him by the army agitators; and Charles, becoming alarmed for his personal safety, fled to the Isle of Wight, where he was detained as a prisoner in Carisbrooke castle by Colonel Hammond the governor. Negotiations were again entered into with the king, but the terms offered were opposed by the Scottish commissioners, with whom he entered into a secret treaty; and encouraged by their support, he refused to accede to the demands of the parliament. This brought matters to a crisis. The extreme republicans now first broached their daring proposal to bring the king to trial, and to put him to death by a judicial sentence. The Scottish parliament, on the other hand, levied an army which marched into England for the purpose of restoring the king by force of arms. But the levies were raw and undisciplined, and the duke of Hamilton, their general, was utterly unfit for the management of such an enterprise, and they were totally defeated by Cromwell at Preston on the 17th of August, 1648. Several desultory risings of the royalists in various parts of England were at the same time crushed, and the army returning victorious to London, expelled the leaders of the presbyterian party from the house of commons, put a stop to all negotiations with the king, seized his person, and prepared to bring him to a public trial. A high court of justice was constituted for this purpose, consisting of the chief officers of the army and the other leaders of the republican party, and presided over by John Bradshaw, a lawyer. This unprecedented trial began on the 20th of January, 1649. Charles, who conducted himself throughout these proceedings with great dignity and firmness, was three times brought before the court, but persisted in declining its jurisdiction. He was brutally insulted by some of the soldiers and rabble, but bore their treatment with exemplary meekness and patience. On the 27th sentence of death was passed upon him, and on the 30th his head was severed from his body, on a scaffold erected in front of Whitehall palace. He died in the forty-ninth year of his age, and the twenty-fourth of his reign, leaving six children, of whom the two eldest, Charles and James, successively ascended the British throne. Charles possessed many of the qualities which adorn private life, and if his lot had been cast in more propitious circumstances, he might have been a respectable and useful, if not a popular sovereign. But it was his misfortune to live at a period when the ancient forms of the constitution required to be accommodated to the growing intelligence and spirit of the people; and he perished in the vain attempt to resist the onward progress of freedom. The celebrated work entitled "Eikon Basilikè," which was published immediately after his death, and purported to be from his pen, was long regarded as authentic, but is now generally believed to have been written by Dr. Gauden, afterwards bishop of Worcester.—J. T.

CHARLES II., King of Great Britain, second son of Charles I., and of his queen, Henrietta, was born 29th May, 1630. His elder brother, Charles James, died on the day of his birth, 18th March, 1629. On the breaking out of the civil war, Charles, though a mere youth, took up arms in his father's cause. After the fatal battle of Naseby he retired to Scilly, and ultimately took refuge in Paris. The Scots, who had for some time felt aggrieved by the proceedings of the English parliament and army, deeply resented the execution of Charles I., and a few days after, on the 3rd of February, 1649, proclaimed Prince Charles king of Scotland in his stead. They still adhered, however, to their presbyterian principles, and they carefully stipulated that Charles should acknowledge the "solemn league and covenant," and confirm the presbyterian government and worship. He landed in Scotland on the 23rd of June, 1650, and on the 15th of July was again proclaimed at Edinburgh. The unpalatable terms exacted from him, and the austerity of manners prescribed by the covenanters, led him ever after to regard them and their religion with the deepest aversion. A few weeks after the arrival of the prince, Cromwell invaded Scotland at the head of a powerful army. The cautious policy of David Leslie for a time completely foiled the attempts of Cromwell to force the Scottish lines, and reduced the English forces to the utmost

extremity; but the folly of the committee of estates and kirk led to the battle of Dunbar on the 3rd of September 1650, in which the Scots were completely defeated, and the whole country south of the Forth, together with the capital, fell into the hands of the victors. The coronation of Charles, however, took place at Seone on the 1st of January, 1651. In the course of the following summer, Cromwell turned the position of the Scottish army at Stirling, and Charles adopted the desperate expedient of marching into England, in the hope that his friends in that country would flock to his standard. In this expectation, however, he was completely disappointed. The Scottish forces were overtaken at Worcester by Cromwell, at the head of an army nearly three times their number, and, after a fierce and protracted engagement, were totally routed on the 3rd of September. Charles himself with great difficulty made his escape. Clothed in the garb of a peasant, he found refuge sometimes in a barn, at other times in wretched hovels. On one occasion he concealed himself for twenty-four hours among the branches and leaves of a large oak. After a variety of romantic adventures and hairbreadth escapes, he at last found refuge in France, forty-five days after his defeat at Worcester. He continued to reside on the continent, principally in France and Flanders, often in great distress, until 1660. The resignation of Richard Cromwell, the cabals of the officers, the dissolution of the rump parliament, and the apprehensions of a military despotism, led the great mass of the people of England to turn their eyes towards the heir of their ancient race of monarchs. The new parliament declared in his favour. General Monk had previously entered into secret negotiations for his restoration to the throne, and at length, on the 25th of May, 1660, Charles landed at Dover; four days later he made his entry into London amid the most extravagant demonstrations of joy, and took up his residence in the palace of his ancestors.

It soon appeared that adversity had taught Charles neither self-denial nor industry, and that he had returned from exile indolent, selfish, unfeeling, faithless, ungrateful, and insensible to reproach or shame. The reforms which the long parliament had introduced were at once swept away, and the old abuses restored. A number of the regicides and leading republicans were put to death with the most revolting cruelties, episcopacy was re-established, and the puritan clergy expelled from office and treated with shocking insolence and cruelty. The old cavaliers, who had lost their all in the royal service, were suffered to pine in want and obscurity, while the revenues of the court were profusely squandered on harlots and buffoons. Scotland, which had freely spent its blood and treasure in the support of his claims, was treated with great injustice and severity. The presbyterian form of worship, which Charles had solemnly sworn to maintain, was abolished, and "black prelacy," which the Scots abhorred, was set up in its room. The supporters of the covenant were fined, imprisoned, tortured, and put to death; the entire proceedings of the various parliaments which had been held since 1633, were at once annulled, and all the barriers which had been raised to protect the civil and religious liberties of the nation, were at one swoop annihilated. The injury which the profligate conduct of Charles and his associates inflicted upon the cause of religion and morality, was perhaps even more fatal than his arbitrary measures, to the well-being of the community; and there can be no doubt that his shameless debaucheries contributed in no small degree to produce that deeprooted and general corruption of morals and manners which throughout his reign disgraced the nation.

Our space will not permit us to do more than glance at the leading events which occurred during the quarter of a century Charles occupied the throne. In 1663 the government engaged in hostilities with Holland, which were so grossly mismanaged that the Dutch fleet burned the ships which lay at Chatham; and this war terminated in a humiliating peace. At this disastrous period too the plague broke out in London, and in six months swept away six hundred thousand human beings. The great fire followed, which laid a large portion of the metropolis in ruins. In 1668 the sagacious counsels and skilful management of Sir William Temple brought about a treaty between England, Holland, and Sweden, commonly called the Triple Alliance, for the purpose of thwarting the ambitious schemes of Louis XIV.; but this wise and popular policy was speedily abandoned. The lavish expenditure of Charles on his licentious pleasures kept him always in poverty, in spite of his liberal civil list and the large sums which he contrived to divert from the public funds to his own private

use. The once loyal and subservient parliament began to exhibit unequivocal signs of reluctance to allow the public money to be squandered on debasing indulgences and frivolous amusements; and so great was the anxiety of Charles to escape this irksome dependence on the commons for the supply of his necessities, that he stooped to become the hired lacquey of the French king, and bartered his own reputation, the independence of his crown, the honour and interests of his kingdom, and the safety of Europe, for the purpose of satisfying the rapacity of his worthless courtiers and the profusion of his female favourites. In 1670 he entered into a secret treaty with France, by which he bound himself in return for the promise of a large subsidy, to make a public profession of the Roman catholic faith, and to assist Louis in making war upon Holland, and in his designs upon the Spanish monarchy. War was accordingly declared against the United Provinces, and the funds for carrying it on were obtained by gross fraud and a violation of faith with the public creditors. But the policy was as unsuccessful as it was unprincipled and unpopular, and Charles was compelled to dismiss the infamous cabal ministry from office, and to make peace with Holland in 1674. His domestic policy was equally detested by the people. He claimed and exercised the power of suspending by his own authority the penal laws against Roman catholics and protestant nonconformists, and, by his marked popish leanings, excited great alarm for the safety of the established church and of the protestant religion. Throughout the excesses and judicial murders caused by the alleged discovery of the pretended popish plot, Charles, though convinced of its falsehood, readily went with the current. But he strenuously resisted the attempt to exclude the duke of York from the succession to the throne on the ground of his profession of the Romish faith, and three times dissolved the parliament, rather than sanction the exclusion bill passed by the commons. In the end, a tory reaction set in throughout the country, and rose to such a height that the whigs were speedily at the mercy of the court. A series of attacks on the constitution of the country followed. It was resolved that no more parliaments should be called. The charters of the great towns, in which the strength of the whigs lay, were confiscated; the persecution against the nonconformists was renewed; Russell and Sydney were brought to the scaffold by the most glaring perversion of law and justice; the Scottish covenanters were goaded into rebellion by the oppressive and merciless misgovernment of Middleton, Lauderdale, and the duke of York, and put to death with the most shocking tortures. In the midst of these despotic and cruel proceedings, Charles was suddenly seized with a fit of apoplexy on the 2nd of February, 1685, and expired on the 6th, in the fifty-fifth year of his age and the twenty-fifth of his reign. A few hours before his death he made a profession of the Romish faith, which he had long held in secret, and received absolution from a popish priest. Charles possessed excellent abilities, and was good-tempered, witty, affable, and polite; but he was an unfaithful husband, a cold-hearted and treacherous friend, a profligate man, and a bad sovereign.—J. T.

CHARLES-EDWARD LOUIS PHILIP CASIMIR STUART, called THE PRETENDER, was the grandson of James II., the exiled king of Great Britain, and son of the titular chevalier St. George, by his wife, the Princess Clementina Sobieski, granddaughter of the celebrated King John Sobieski of Poland. Charles-Edward was born on the 31st of December, 1720. He was skilled in many exercises, but his intellectual training was shamefully neglected, and he was allowed to grow up in almost entire ignorance of the constitution of the country which he aspired to govern; while his instructors took care to instil into him those antiquated notions of hereditary divine right, and passive obedience, which had proved so disastrous to his family. Various projects for the restoration of the Stuart dynasty had been entertained by the French government, and afterwards laid aside. At length, in the spring of 1745, Charles-Edward determined to undertake an expedition to Scotland on his own resources, with such pecuniary assistance as he was able to obtain from private individuals. Charles landed on the 25th of July at Moidart, Inverness-shire, with a train of only seven persons, afterwards called "the seven men of Moidart." The general rendezvous of his adherents was appointed to be at Glenfinnan, a desolate sequestered vale about fifteen miles from Fort-William, and there, on the 19th of August, the Jacobite standard was unfurled by the old marquis of Tullibardine.

The Macdonalds, Camerons, M'Phersons, M'Gregors, and other Jacobite clans flocked to the camp in considerable numbers, and Charles in a short time found himself at the head of several thousand men, ill-armed many of them, and slenderly provided with warlike equipments, but all of them brave, active, hardy, and skilled in the use of their own weapons. The almost incredible stupidity of Sir John Cope in marching to Inverness where there was no enemy at all to encounter (see COPE), having left the low country open to the Highlanders without obstruction, Charles promptly took advantage of this blunder, and at once began his march to the south. On the 17th of September he was in possession of Edinburgh, and next day took up his quarters in Holyrood palace. Cope meanwhile had transported his troops by sea from Aberdeen to Dunbar, and was on his march towards the city. On receiving intelligence of his movements, the Highlanders marched out to meet him on the 20th of September, and found his forces encamped near the village of Prestonpans, a few miles to the east of Edinburgh. Next day a battle took place, which terminated in the complete destruction of the royal army. This victory made Charles master of the whole of Scotland, with the exception of the castles of Edinburgh and Stirling, and a few insignificant Highland forts. He was eager to march immediately into England, but his proposal was overruled by his council, and he spent several weeks in the palace of his ancestors, discharging the functions of royalty, issuing proclamations, exacting forced loans and contributions, holding levees, giving balls, and exerting himself to the utmost to render his entertainments attractive, and to secure the public favour. His prepossessing personal appearance, well-formed and regular features, dignified mien, and easy graceful manners, contributed not a little to increase the popularity of his cause. On the 31st of October, the prince quitted Edinburgh and began his romantic march towards London, at the head of between five and six thousand men. He entered England by the western border on the 8th of November, and took the town of Carlisle, after a feeble resistance. He then resumed his march through the northern counties without meeting any opposition, but obtaining little countenance from the people. On the 4th of December the insurgents reached Derby, only 127 miles from London; but their condition had become exceedingly perilous, opposed as they were by three armies, each more numerous than their own, with no prospect of succours from France, and no symptoms of any rising in their favour among the people of England. The chiefs were unanimously convinced of the necessity of a retreat, and in spite of the obstinate resistance of Charles, they commenced their retrograde movement on the 6th of December. They crossed the Scottish border on the 20th, and marching through the south-western counties, they entered Glasgow on Christmas day. After levying heavy contributions on that staunch whig and presbyterian city, the Highlanders proceeded to Stirling, and spent several weeks in an unwise and fruitless attempt to reduce the castle. On the 17th of January, 1746, they outmanœuvred and defeated, on Falkirk moor, the royal army under the incompetent and brutal General Hawley, and captured his cannon, military stores, and baggage. But this was the last of their triumphs. The approach of the duke of Cumberland at the head of a greatly superior force, compelled them to abandon the siege of Stirling castle on the 1st of February, and to retreat towards their Highland fastnesses. They spent two months at Inverness, suffering great privations from the scarcity both of money and provisions. At length, on the 16th of April, they gave battle on Drummossie moor, near Culloden, to the duke of Cumberland, under every disadvantage as regards inferiority in the numbers, equipments, arrangement, and condition of their forces, and even the locality of the fight; and after a brief but fierce struggle, were defeated with great slaughter. The conquerors behaved with shocking cruelty to the prisoners and the wounded, as well as to the defenceless inhabitants of the surrounding country, leaving neither house, cottage, man, nor beast, within the compass of fifty miles.

The interesting and romantic adventures of Charles after the battle of Culloden, form one of the strangest chapters in history. For upwards of four months he wandered from place to place in constant peril of his life, subjected to almost incredible hardships and privations. Sometimes he found refuge alone in caves and huts, sometimes he lay in forests or on mountain tops, with one or two attendants; frequently he was compelled to pass the night in the open air exposed to every vicissitude of

the weather, suffering from hunger and thirst, often barefooted, and with clothes worn to tatters. In the course of his wanderings, he had occasion to trust his life to the fidelity of a great number of individuals, many of whom were in the humblest walks of life; and yet not one of them could be induced to betray him, even by the offer of a reward of £30,000. At length a privateer of St. Maloes, hired by his adherents, arrived in Loch Nannuagh, and Charles embarked on board that vessel for France, accompanied by Lochiel and a few other friends, and on the 29th of September, 1746, landed in Brittany.

It would have been well for the reputation of Charles if he had perished at Culloden. The faults of his character gathered strength with his advancing years; and sad to relate, humiliating habits of intoxication, and family discords, arising out of an unhappy union with Louisa of Stolberg, a German princess, darkened the close of his unhappy career. After his compulsory removal from France in 1748, on the conclusion of peace with England, he went first to Venice and then to Flanders. He continued for years to be the object of the hopes of the Jacobites and the centre of their intrigues, and in 1750 ventured to pay a visit to London, for the purpose of promoting a scheme which was soon found to be impracticable. In 1766 he laid aside the title of prince of Wales, and assumed that of count D'Albany. He died at Rome, 31st January, 1788, in his sixty-eighth year, and was interred in the cathedral church of Frescati.—His brother HENRY, a cardinal, and titular duke of York, the last male heir of the line of Stuart, survived till 1807. He was a prince of a mild and amiable character, and during the latter years of his life was supported by an annuity of £4000, assigned him by the British government.—J. T.

#### II.—CHARLESSES OF GERMANY.

CHARLES I. See CHARLEMAGNE.

CHARLES II. See CHARLES I. of France.

CHARLES III., surnamed LE GROS, son of Louis le Germanique, was born in 832, and at his father's death inherited the German portion of his dominions with the imperial title; his brothers, Louis and Carloman, being crowned kings of France. After the death of these princes in 881, he was called to the throne of France during the minority of Charles the Simple. His reign was short and inglorious, being seriously disturbed by the incursions of the Normans, whom he was obliged to propitiate by large concessions. He was deposed in 887, and in the course of the following year died poor and neglected.—W. B.

CHARLES IV., son of John of Luxembourg, king of Bohemia, was elected emperor at the death of Louis of Bavaria in 1347, but had difficulty in establishing himself on the imperial throne. His subserviency to the pope displeased the electors, and an attempt was made to substitute Edward III. of England, whose wars with France, however, did not permit him to take advantage of the movement in his favour. Charles at length succeeded in securing the imperial dignity, and was subsequently consecrated king of the Romans by the pope. He fixed his residence at Prague, and spent his principal care on his patrimonial kingdom of Bohemia, to which Brandenburg and Silesia were annexed in his reign. His most important act was the issuing of the "golden bull," in 1355, which defined the respective rights of the electors and the emperor, and is still looked to as a basis of the Germanic constitution. He died in 1378, leaving the imperial dignity and the crown of Bohemia to his son Wenceslas, who enjoyed the former only two years.—W. B.

CHARLES V., emperor of Germany and king of Spain, was born at Ghent, 24th February, 1500. He was the son of Philip the Handsome, archduke of Austria, and Joanna, second daughter of Ferdinand and Isabella of Castile and Arragon, and the grandson of the Emperor Maximilian, and of Mary, the only child of Charles the Bold, duke of Burgundy. His early years were spent in the Low Countries, under the care of two princesses of great abilities, Margaret of Austria, his aunt, and Margaret of York, sister of Edward IV. of England. William de Croy, lord of Chievres, was appointed governor of the young prince, and Adrian of Utrecht, his preceptor; and both seem to have discharged the duties of their respective offices with great fidelity. Charles early showed a passion for the chase and martial exercises, rather than for books and learning; but he was carefully instructed in the history of his kingdom and in the art of government, and thus acquired the habits of gravity, thoughtfulness, and reserve, for which he was distinguished through life. At the age of six Charles lost his father, and his Flemish dominions were intrusted

to the charge of his grandfather, Maximilian, who acted as regent. The succession to the Spanish throne was opened to Charles by the death of Ferdinand in 1516; but, as Joanna was still alive, although in a state of mental imbecility, it was not without great difficulty that, on his visit to the Spanish dominions in 1517, the Cortes were prevailed upon to acknowledge him as joint-king. The death of Maximilian having left the imperial throne vacant, Charles, after a keen contest with Francis I. of France, was elected emperor at Frankfort, 28th June, 1519. The preference given to Charles on this occasion excited in the mind of Francis feelings of jealousy and rivalry, which subsisted during the remainder of their lives, and involved them in almost perpetual hostilities. Both were eager to gain the assistance of Henry VIII. of England in their impending struggle, and courted him and his minister Wolsey with the greatest assiduity. Charles paid a sudden visit to England, on 26th May, 1520, and by his attention to Henry, and by a liberal pension and lavish promises to his powerful minister, succeeded in detaching them from the French alliance. He then proceeded to Aix-la-Chapelle, where he was crowned emperor with extraordinary solemnity and pomp.

The first act of his administration was to convoke a special diet of the empire, to be held at Worms, 6th January, 1521, for the purpose of checking the progress of those religious opinions which, under the influence of Luther, were rapidly diffusing themselves over Germany. The great reformer himself was summoned to appear before the diet, and a letter of safe conduct was at the same time sent him, which Charles afterwards regretted that he did not violate. Luther was permitted to depart in safety; but, a few days after he had left Worms, an edict was published in the emperor's name, condemning his doctrines and placing him under the ban of the empire. Other questions soon arose, however, to divert the attention of Charles from these religious disputes. As a rupture with Francis seemed imminent, he entered into a secret alliance with Leo X., for the purpose of expelling the French out of the Milanese. But while the emperor and the pope were preparing to carry out this project, hostilities commenced in Navarre, which Charles unjustly withheld from the children of John d'Albret in violation of the treaty of Noyon. An army, levied in name of Henry d'Albret, but with the connivance of Francis, overran Navarre, but in a short space of time was completely defeated, and their general and principal officers were taken prisoners. About the same time, a petty prince named Robert de la Marek, relying on the support of Francis, declared war against the emperor, ravaged the open country of Luxembourg, and laid siege to Vireton. Charles retaliated by sending an army under the count of Nassau, who entered France, took Mouson, and laid siege to Mezieres, but was foiled by the strenuous resistance made by the famous Chevalier Bayard, and compelled to retreat with loss and disgrace. Meanwhile a congress was held at Calais, 5th August, 1521, under the mediation of Henry VIII., in order to reconcile the differences between Francis and the emperor. But Wolsey, to whom the sole management of the negotiation was committed, was exclusively devoted to the interests of Charles, and took no pains to conceal his partiality. In the end, the congress proved utterly abortive, and after negotiations were broken off, Wolsey joined the emperor at Bruges, and concluded with him a treaty in the name of his master, in which it was agreed that they should invade France—Henry on the side of Picardy, Charles on the frontier of Spain—each at the head of an army of forty thousand men; and that the latter should espouse the Princess Mary, the only child of the English king. Meanwhile the Milanese had become the theatre of war through the intrigues of the pope, and the haughtiness and rashness of the marshal de Lautrec, and his brother, who commanded the French troops in that province. Left without adequate supplies either of men or money, Lautrec was unable to resist the united imperial and papal forces, who compelled him to retreat to the Venetian territories, seized Milan, and stripped the French of nearly the whole of their conquests in Lombardy. In spite of the death of Leo X., 2nd December, 1522, the succeeding campaign was equally disastrous to the French, who were completely defeated at Bicocca, owing to the turbulence of their Swiss allies; and the whole of the fortified places in the Milanese, except the citadel of Cremona, surrendered to the imperialists.

At this juncture an insurrection broke out in his Spanish dominions, which for some time diverted the attention of Charles from his schemes of foreign conquest. The citizens of Segovia,

Toledo, Burgos, Valladolid, and other cities of Castile, took up arms for the purpose of obtaining redress of their political grievances, and of vindicating their rights and privileges, which had been grossly violated by the ministers of Charles, and headed by Don John de Padilla, son of the commendado of Castile, a young nobleman of great talent and courage, they inflicted several defeats on the royal troops, formed an association called "The Holy Junta," and for a time obtained the complete control of the kingdom. In the end the insurrection was suppressed, not without considerable bloodshed. Padilla was taken prisoner and executed; the privileges of the free cities of Castile were gradually abolished, and the Cortes, once one of the most considerable orders in the state, were deprived of their right to examine and redress public grievances, and had their powers limited to granting such supplies as the king chose to demand.

Charles had now succeeded in detaching from Francis all his ancient allies, and in uniting them in a confederacy against him. To add to the perplexities of the French monarch at this moment, a domestic conspiracy was discovered which threatened the ruin of his kingdom; and the constable Bourbon, his most powerful subject, provoked beyond endurance by the injuries he had received, went over to the enemy (see *BOURBON, CHARLES DE*). The French army in the Milanese, owing to the incapacity of its commander, Bonnivet, was foiled by the imperial general, the veteran Colonna. But an English force which entered Picardy under the duke of Suffolk was compelled to retreat; and an army of Flemings and Spaniards, which invaded Burgundy and Guienne, was repulsed with great disgrace in 1523. In the following year the French army was driven out of Italy, and completely defeated on the banks of the Sesia, where the famous Chevalier Bayard was mortally wounded; and an army of eighteen thousand imperialists, under the marquis of Pescara, invaded France and laid siege to Marseilles, but were compelled to retreat with considerable loss. Francis, elated with this success, and eager to recover the possessions of which he had been stripped in the former campaigns, imprudently marched into the Milanese at the head of a numerous army, drove the enemy out of Milan, and laid siege to the town of Pavia. Here, in opposition to the advice of all his most experienced officers, he risked a battle on the 3rd of February, 1525, and was defeated and taken prisoner with the loss of ten thousand men. (See *FRANCIS I.*) Charles did not use his victory with the moderation which he at first professed. He immediately began to revolve vast and ambitious designs altogether inconsistent with the balance of power and the liberties and peace of Europe, and which excited great alarm in the minds of his allies, and ultimately induced both Henry VIII. and the pope to make common cause with the French king. In the end Charles profited little by his ungenerous treatment of his captive rival. Francis recovered his liberty by a convention agreed upon between him and Charles at Madrid, in January, 1526, but on his return to France he peremptorily refused to fulfil the rigorous terms which had been exacted from him in his prison. The pope, Clement VII., not only absolved the French king from the oath which he had taken to observe the treaty of Madrid, but united in a "holy league," as it was termed, with Henry, Francis, the Venetians, and the duke of Milan against the emperor, to compel him to set at liberty the French king's sons who had been left in his hands as hostages, and to abandon his designs upon the Milanese. The confederates, however, were tardy in their movements and unsuccessful in their projects. Clement was compelled to withdraw from the confederacy; but in spite of this abandonment of his allies, Rome was soon after stormed by the constable Bourbon, who fell in the assault, the inhabitants were cruelly abused and pillaged, and Clement himself was taken prisoner and shamefully treated by the imperialists. Charles hypocritically professed to lament the captivity of the pontiff, and appointed prayers and processions throughout all Spain for the recovery of his liberty. War continued to be waged in the Milanese between the imperialists and the French with varied success. In the end both parties were exhausted by the protracted struggle, and became desirous that it should terminate; and at length peace was concluded at Cambray on the 5th of August, 1529, on terms which, though they modified considerably the treaty of Madrid, left all the advantages of the contest with Charles, and inflicted a serious injury both on the reputation and the interests of his rival. The emperor then proceeded to Italy, where he affected great moderation in his dealings, gave Francis Sforza a full pardon of all past offences,

and granted him the investiture of the duchy of Milan, with the hand of his niece, the daughter of the king of Denmark, and by force of arms compelled the Florentines to submit to the restoration of the Medici. After the publication of the treaty of peace, 1st January, 1530, he was solemnly crowned by the pope at Bologna, king of Lombardy and emperor of the Romans.

Charles now turned his attention to the state of Germany, where the reformed doctrines had gained much ground; nearly one half of the German body indeed had thrown off the papal yoke, and the emperor, who was a zealous supporter of the Romish faith, saw that prompt and vigorous measures alone could prevent the entire revolt of Germany from the papal see. A diet of the empire was therefore held at Spire, March 15, 1529, at which a decree was carried by a majority against the reformed doctrines. The elector of Saxony, the marquis of Brandenburg, and other princes, along with the deputies of fourteen free cities, entered their protest against this decree, and thenceforward were distinguished by the name of "Protestants"—an appellation which has since been given to all who have abandoned the Romish faith. Charles made various attempts to gain over both the protestant divines and princes, but without success. He resolved, therefore, to adopt vigorous measures for the suppression of the reformed doctrines, and induced the diet of Augsburg to issue a decree condemning the peculiar tenets held by the protestants, and forbidding any person to protect or tolerate those who taught them. Alarmed at this step, which convinced them that the emperor was resolved on their destruction, the protestant princes assembled at Smalkalde, and concluded a league of mutual defence against all aggressors, and soon after sent ambassadors to the kings of France and England, to entreat their assistance. The determined front presented by the protestant confederacy, together with the precarious state of his relations with Francis, Henry, and the Sultan, convinced Charles that he had acted with imprudent haste in provoking the enmity of a body so united and vigorous. He therefore made overtures to the elector of Saxony and his associates, that, after some difficulties and delays, terminated in the pacification of Nuremberg, by which it was agreed that no person should be molested on account of his religion. The protestants, grateful for this concession, raised a powerful body of troops to assist in repelling an invasion of the Sultan Soliman, who had entered Hungary with three hundred thousand men, and Charles took the field in person in 1532 at the head of a numerous and well-disciplined army, which compelled the invaders to retreat to Constantinople. Shortly after, the emperor undertook an expedition to Africa, vanquished Barbarossa, king of Algiers, re-established Muley Hassem on the throne of Tunis, and set at liberty twenty thousand christian slaves. On his return to Europe Charles found himself involved once more in hostilities with Francis, who had seized the dominions of the duke of Savoy, the emperor's ally, and again laid claim to the duchy of Milan, which had become vacant by the death of Sforza in 1535. Charles, after launching against his rival a manifesto filled with bitter invectives, invaded Provence at the head of a formidable army and laid siege to Marseilles; but was completely baffled by the prudent tactics of the marechal de Montmorency, and was ultimately compelled to retreat with the loss of one half of his troops by disease or famine. Next year (1537) Francis in his turn invaded the Low Countries and took several towns, but hostilities in that quarter were speedily terminated by a truce for ten months, though the war continued to rage for some time longer in Piedmont, till a truce for ten years was ultimately concluded at Nice, June 18, 1538.

It soon became evident that hostilities had continued so long as nearly to exhaust the emperor's resources. His troops broke out into open mutiny, on account of the vast arrears of pay which were due to them, and the greater part of them had to be disbanded. His Spanish subjects too complained loudly of the load of taxes with which they were oppressed, and the Cortes at length refused to vote the supplies which Charles demanded. After employing in vain arguments and entreaties to induce them to comply with his wishes, he indignantly dismissed them, and from that time called neither nobles nor prelates to these assemblies, but only the deputies of the eighteen cities, who were entirely subservient to the crown. The inhabitants of the Netherlands also complained of the exactions made upon them for the purpose of carrying on the ambitious schemes of the emperor; and in 1539 the citizens of Ghent, enraged at the violation of

their ancient privileges, and the arrogance with which they were treated by the emperor and his deputy, took up arms against their sovereign, invited the assistance of the other towns of Flanders, and even went the length of making overtures to the French king. The insurrection assumed so alarming an aspect that Charles, who was then in Spain, and eager to repair in person to the spot, asked from Francis permission to pass through France on his way to Flanders, assuring him at the same time, that he would soon settle the affair of the Milanese to his entire satisfaction. Francis gave implicit credit to this assurance, and at once granted the request of his rival, and received him with the greatest honours. The unfortunate citizens of Ghent, left entirely without support, were compelled to surrender at discretion. Notwithstanding their claims on the forbearance of their sovereign, they were treated with the greatest severity, their privileges and immunities were declared to be forfeited, their revenues confiscated, and twenty-six of their leaders were executed, and a greater number banished (1540.) But Charles having thus gained his end, first eluded the demands of Francis, and then peremptorily refused to fulfil the promises he had made respecting the Milanese—a breach of faith which has left a deep stain upon his character.

In 1541 Charles undertook an expedition against Algiers, though warned by his old admiral, Andrea Doria, of the dangerous nature of the enterprise. The voyage proved tedious and hazardous, but he succeeded in landing his army near Algiers without opposition, and began the siege of the city. A dreadful storm, however, destroyed the greater part of his ships with their crews, his troops were cut off by disease and the incessant attacks of the Arabs, and at last he was compelled to abandon his artillery and baggage, and re-embark with the remnant of his forces; and after having been tossed about for weeks by contrary winds, with great difficulty he reached his own dominions. In the following year, war again broke out between the emperor and the French king, in consequence of the barbarous murder of two ambassadors of Francis by the marquis del Guasto, governor of Milan. The first campaign was attended with alternate success and reverses on both sides. In the second, the imperialists were defeated with great slaughter by the duke d'Enghien, at Cevalsolles in Piedmont. On the other hand, Charles invaded Champagne, and took several towns, and Henry VIII., his ally, entered Picardy in 1544; but nothing of much importance was effected, and as both parties needed peace, a treaty was soon after concluded between Charles and Francis at Crespi (1545.)

The conclusion of peace with France left Charles at liberty to put into execution the scheme which he had formed for the overthrow of the protestant party in Germany. He employed various artifices, however, to deceive the reformers, and to lull them into a state of security, until his plans were ripe for execution; when he at once threw off the mask, and prepared to maintain by force of arms the claims of the papal see. The protestants, on becoming aware of their danger, sought assistance from the Venetians, the Swiss, and the kings of England and France, but without success. Though left single-handed, however, to fight the battle of religious liberty, and deprived of the assistance of Maurice of Saxony, and others of their own number who had been gained over by the artifices of Charles, they succeeded in assembling in a few weeks a numerous and well-appointed army, and took the field in 1546 under Frederick, elector of Saxony, and the landgrave of Hesse. But the slow and dilatory movements of the elector showed his unfitness for the position which he occupied. His own dominions, which, when he took the field, he committed to the protection of Maurice, were treacherously seized by that prince, who, though a protestant, and the son-in-law of the landgrave of Hesse, sided with the emperor, in the hope of being rewarded for his support at the expense of the confederates. The death of Francis at this juncture freed the emperor from all apprehensions of a diversion on the side of France. The league fell to pieces, and the Saxons were completely defeated at Muhlberg; the elector himself was taken prisoner, treated with great harshness, and deprived of his electorate, which was bestowed upon his perfidious kinsman Maurice. Charles sullied his success, both by his duplicity and his ungenerous treatment of the elector and also of the landgrave of Hesse, whom he treacherously detained a prisoner when he had repaired to the imperial camp in reliance on the emperor's safe conduct. This perfidious act excited general

indignation throughout Germany. The ambition, arrogance, and rapacity now displayed by the emperor amid the intoxications of his success, alarmed not only the protestants, but even the pope himself; a scheme called the Interim, which Charles published with the view of conciliating the rival parties, roused the violent hostility of both; and Maurice of Saxony, who bitterly resented the harsh and perfidious treatment of his father-in-law, the landgrave of Hesse, and the disregard of his own reiterated applications to Charles for his release, entered into a secret alliance with the other protestant princes of Germany, for their mutual protection against the arbitrary designs of the emperor. Maurice acted with consummate skill, and successfully employed various artifices to deceive Charles as to his real intentions, and to gain time for maturing his schemes. So dexterously did he conceal his operations from his wary and suspicious superior, that his machinations remained entirely unsuspected, until his plans were ripe for execution. At length, in 1552, he suddenly threw off the mask, took the field at the head of a powerful army, for the purpose of securing the protestant religion, maintaining the constitution and laws of the empire, and delivering his father-in-law from his long and unjust imprisonment. So rapid were his movements, that he had nearly surprised Charles himself, who was living in security at Innsbruck; and it was only by a rapid flight over the Alps by roads almost impassable, amid the darkness of a stormy night, that the bewildered and mortified emperor escaped being taken prisoner. At this juncture too, Henry II., the new king of France, resumed hostilities against his father's unscrupulous enemy. In these circumstances, Charles was compelled to relinquish all the advantages he had wrested from the protestant confederacy, and to sign the treaty of Passau, August 1552, by which the free exercise of their religion was secured to all the adherents of the reformed faith.

The war with France still continued, but the issue proved disastrous to the imperialists, who lost several towns, and Charles himself totally failed in his attempt upon Metz, which he besieged with an army of one hundred thousand men. "Fortune," he said, "resembled other females, and strove to confer her favours on young men, while she turned her back on those who were advanced in years." In 1554 he bestowed on his son Philip the crowns of Naples and Sicily, on his marriage with Mary, queen of England. In the following year, Joanna of Spain died, after having been insane for nearly fifty years; and Charles, disgusted with the reverses of fortune which had clouded his latter days, and oppressed by sickness, resolved to carry into effect a resolution which he had formed many years before, to resign his dominions to his brother and his son. Having assembled the states of the Low Countries at Brussels, 25th October, 1555, he surrendered to his son Philip the sovereignty of the Netherlands. "From the seventeenth year of his age," he said, "he had devoted all his thoughts and attention to public objects, reserving no portion of his time for the indulgence of his ease, and very little for the enjoyment of private pleasure. He had visited Germany nine times, Spain six times, France four, Italy seven, Flanders ten times, England twice, Africa as often, and had made eleven voyages by sea. He had never shunned labour nor repined under fatigue; but now, when his health was broken, and his vigour exhausted by the rage of an incurable distemper, his growing infirmities admonished him to retire from the helm. He was not so fond of reigning as to wish to retain the sceptre with an impotent hand." Then turning to his son, he gave him some prudent advice respecting his duties to his subjects; and exhausted with fatigue and emotion, he concluded this impressive and touching scene. A few weeks after he resigned in the same solemn manner, in the presence of an assembly of Spanish grandees and German princes, the crowns of Spain and of the Indies. He retained the imperial dignity a few months longer, in the vain hope that he might at last induce the electors to bestow it upon his son; but finding all his efforts ineffectual, he resigned the government of the empire to his brother Frederick. In August 1556 he embarked for Spain, which he had selected as his place of final retreat. He landed at Laredo in Biscay on the 28th September, and lost no time in proceeding towards the place which he had chosen for his residence—the Hieronymite monastery of Yuste, situated in a sequestered valley near Placencia in Estremadura. As the apartments which he had ordered to be prepared for him were not ready, he took up his abode for some months at Jarandilla, a village two

leagues east of Yuste. At length, on the 8th of February, 1557, accompanied by a small body of retainers, he took possession of the simple residence in which he was destined to pass the brief remainder of his days. There he amused himself principally with mechanical pursuits, and especially with the adjustment of clocks and watches, in which he was assisted by a clever mechanic named Torriana. He continued however to take a lively interest in public affairs, and regularly sent advice to his son respecting the measures which he considered requisite for the welfare of his kingdom. Towards the close of his eventful career, incessant attacks of gout, aggravated by the intemperate indulgence of his appetite, which had been one of his besetting sins through life, shattered his constitution, and enfeebled his mind as well as his body. He became the prey of a gloomy superstition, and sought to expiate his sins by the practice of ascetic austerities, and the application of the lash with such severity, that the scourges which he used were found after his decease stained with blood. At length he caused his own funeral obsequies to be celebrated in the chapel of the convent, and himself took part in the mournful ceremony. The exact date of this event cannot now be ascertained, but very soon after, some say on the same day, he was seized with a fever, which his enfeebled frame could not resist. He expired on the 21st of September, 1558, in the fifty-ninth year of his age. Charles V. was undoubtedly the greatest monarch of the sixteenth century, and occupied the most prominent place in its annals. He was both a consummate politician and a brave soldier. He was alike bold and sagacious—cautious in the extreme in forming his plans, and prompt as well as indomitably firm and persevering in carrying them into execution. He possessed great skill in reading characters, and in selecting counsellors and generals whose abilities were admirably adapted for the duty intrusted to them. In spite of his phlegmatic temperament and reserved disposition, he was good-humoured, easy, and affable in his manners, and was always a favourite of the multitude. But his ambition was insatiable, and his policy fraudulent and insidious. He was cold, selfish, and suspicious, and he was not unfrequently as ignoble in his rivalries and aims as he was unscrupulous in the means which he adopted to obtain success. Though he laboured zealously to uphold the Romish faith, he showed no fanaticism while he wielded the sceptre; but on his retirement into the cloister he exhibited, as Mr. Stirling remarks, all the passions, prejudices, and superstitions of a friar. He dwelt with complacency on his persecution of the protestants, and frequently expressed his deep regret that he had kept his plighted word to Luther. As a codicil to his will, he enjoined upon his son to pursue every heretic in his dominions with the utmost severity, and without favour or mercy to any one. By his queen Isabella, daughter of Emmanuel of Portugal, a princess of great beauty and accomplishments, Charles had one son, who succeeded him, and two daughters. He left also a number of natural children, of whom the most celebrated was DON JOHN OF AUSTRIA.—J. T.

CHARLES VI., born in 1685, was second son of Leopold I., and was destined by his father to the crown of Spain. On the death of Charles II. in that country, his testamentary heir, the duke of Anjou, assumed the sovereignty under the title of Philip V., and Charles, aided by England, Holland, and Portugal, was engaged in a protracted and fluctuating struggle with that prince, when the death of his brother Joseph I. called him to the imperial throne, to which he added the crown of Hungary in the following year. The peace of Utrecht in 1713 secured to his rival in Spain the government of that country, and left Charles to employ his famous general, Prince Eugene, for the defence of Venice against the Turks. Subsequent wars, consequent on the disputed succession in Poland, involved the loss of considerable territories and at the peace of Belgrade in 1739; he was compelled to cede Wallachia and Servia to Turkey. He died of a surfeit in 1740.—W. B.

CHARLES VII., born in 1697, was the eldest son of Maximilian-Emmanuel, elector of Bavaria. In early life he served against the Turks, and at the death of his father in 1726 he succeeded him in the electorate; but his passion for the chase, his licentious habits, and the extravagance in which he indulged, were incompatible with a wise and honourable administration. Although he had joined the European powers in the pragmatic sanction, by which Charles VI. hoped to secure the rights of his daughter, Maria Theresa, the elector at the death of that monarch laid claim to the imperial crown, on the plea of his descent

from a daughter of Ferdinand I.; and by the aid which France and Prussia afforded him, he succeeded in solemnizing his coronation at Frankfort in 1762, having previously occupied Bohemia, and been invested with the crown of that kingdom. But he had a resolute and spirited rival in Maria Theresa. The enthusiasm which she awakened among the Hungarians enabled her to devastate Bavaria; thence she carried her success into the Bohemian territories. By the cession of Silesia to Frederick II., she detached Prussia from the hostile alliance; Sardinia declared in her favour; and George II. of England, taking the field in person, defeated the French at Dettingen in 1743. The war, however, was still in progress and the issue uncertain, when Charles died in 1745, being succeeded in the electorate by his son, Maximilian Joseph, who dropped the claim to the imperial crown.—W. B.

CHARLES-LOUIS, Archduke of Austria, third son of the Emperor Leopold II., was born in 1771. His brother, Francis II., succeeded to the imperial throne in 1792. In the same year the French declared war against Austria and Prussia; and the archduke holding a command under Prince Cobourg, took a prominent part in the campaigns of the two following years on the Belgian frontier, distinguishing himself specially in the brilliant charge of cavalry, which he led at Landrecis. After the treaty between France and Prussia had thrown the burden of the war in that quarter on Austria, he was invested with the command on the Rhine, and in 1796 gave proof of great military talents against Moreau and Jourdan. Compelled at first to retreat, he succeeded in separating the forces of the two French generals, defeated Jourdan at Teiningen, Amberg, and Wurms, and improved his success so vigorously, that Moreau, who had penetrated into Bavaria, was constrained to fall back, fighting his way with difficulty through the Black Forest to a position of security beyond the Rhine, and even the *tete du pont* at Strasburg fell into the hands of the archduke. His next campaign was against Bonaparte in Italy, where he did all that vigour and skill could effect with a few dispirited troops to retard the progress of that wonderful captain, particularly at Tarves and Glogau; nor was he without the hope of drawing together, in the rear of the French, such a force as would have made their advanced position extremely perilous, when his operations were interrupted by the temporary peace, negotiated at Leoben, and ratified at Campo Formio towards the close of 1797. Hostilities being recommenced in 1799, Charles defeated Jourdan in Suabia and Massena at Zurich; then moving down the Rhine to support the duke of York, he captured Philipsburg and Mannheim; but in the following year he was compelled by the state of his health to give up his command and return home, where he made some unsuccessful efforts to reform the military administration of the empire. In 1805 he was again at the head of an army in Italy, and defeated Massena at Caldiero; but four years later, notwithstanding the victory which he gained against Napoleon at Aspern, he was driven back into Moravia, and compelled to conclude an armistice, which issued in the treaty of Vienna. The remainder of his life was spent in comparative retirement, and he died in 1847, having published a work on military strategy, and a history of the campaign of 1799.—W. B.

### III.—CHARLES OF FRANCE.

CHARLES MARTEL, or the HAMMER, a renowned warrior and monarch in the early annals of France, was the illegitimate son of Pepin d'Heristal, duke of Austrasia, and mayor of the palace under the last Merovingian kings. He was born in 689, and after Pepin's death, was raised to the dignity of duke by the Austrasians in 715. The Neustrians, and their allies the Frisians, invaded his duchy, but were signally defeated by him in a succession of fierce encounters. Chilperic II., who succeeded to the throne after the murder of Dagobert III., finding Charles too strong for him, entered into an alliance with Eudes, duke of Aquitaine, but the associates were entirely defeated near Soissons. Eudes, disheartened by this disaster, delivered up Chilperic into the hands of Charles, who, however, treated him with the greatest respect, though he allowed him no real power, but exercised supreme authority in his name. Chilperic died in 720, but Charles continued to possess the chief authority of the state, as mayor of the palace to his successor Thierry IV. Charles was soon after attacked by the Suevians, Frisians, Alemanni, and the adherents of Eudes, whom he successively defeated, and compelled to do homage to the Frankish crown. He had scarcely

freed himself from these enemies, when he was called upon to contend with the Saracens, who had overrun Spain, and now threatened to subdue the whole of Europe. Charles encountered and defeated them in a great battle between Tours and Poitiers, in 732, in which three hundred and seventy-five thousand of the invaders, together with their commander Abderrahman, are said to have perished; but the number is doubtless greatly exaggerated. "This victory," says Mr. Hallam, "may justly be reckoned among those few battles of which a contrary event would have essentially varied the drama of the world in all its subsequent scenes." Charles subsequently defeated the Frisians, annexed their country to his own dominions, and compelled them to profess christianity. At length the fame of Martel became so great, that Pope Gregory III. chose him as his protector, sent him the keys of the tomb of St. Peter, and offered him the dignity of Roman consul. Charles, however, was not a favourite with the clergy, as he compelled them to contribute towards the expenses of the war against the Saracens. He died in 741; and his dominions were divided among his three sons, Carloman, Pepin, and Griffin.—J. T.

CHARLES I., LE CHAUVÉ (the Bald), son of Louis le Debonnaire and his second wife, Judith, was born at Frankfort-on-the-Maine in 823. By his first marriage, Louis had three sons, Lothaire, Pepin, and Louis, among whom, previous to the birth of Charles, he had partitioned his dominions, associating Lothaire to the empire, and assigning to Pepin and Louis respectively the kingdoms of Aquitaine and Bavaria. As a provision for his youngest son, Louis formed a new kingdom, which was called the kingdom of Germany. This comprising portions of the territories assigned to the three elder brothers of Charles, he incurred their united enmity, and was ultimately shut up in a monastery in the diocese of Treves in 833. In 839, however, by a new partition of the empire, and somewhat later, by the death of Pepin, he came into possession of territories which more than equalled in extent the gift of his father. On the death of his father in 840, Charles disputed with his brother Lothaire the succession to the imperial crown; and allying himself with his other brother, Louis of Bavaria, brought about, by the victory of Fontenay, the final partition of the empire of Charlemagne. Charles obtained as his portion that part of France which lies to the west of the Meuse, Saone, and Rhone, and that part of Spain which lies between the Pyrenees and the Ebro. In 858, disgusted with the imbecility of his government, and distracted by the ravages of the Northmen, the subjects of Charles offered the crown to his brother Louis le Germanique. This bold measure had the effect of driving Charles from the kingdom; but at the end of a year, having effected a reconciliation with his brother, he was allowed to return. In 869 the dominions of Lothaire, the younger, nephew of Charles, were divided between his two uncles, the king of France and Louis le Germanique. Louis II., brother of this Lothaire, died without issue in 875. Charles, on the invitation of the pope, immediately went to Rome, and was invested with the imperial crown. Louis, his brother, exasperated by the success of this movement, invaded France in 876; but on the return of Charles from Italy, hastily retreated. The following year one of the sons of Louis II. succeeded in driving Charles out of Italy. He was in retreat for France when he died suddenly at Brios, in the neighbourhood of Mount Cenis in the Alps, in 877.—J. S., G.

CHARLES II. See CHARLES III. of Germany.

CHARLES III., LE SIMPLE, son of Louis le Begue and Adelaide, his queen, born in 879; was called to the throne in 893, by a party of nobles discontented with the government of Eudes, count of Paris, who had succeeded Charles le Gros. The party of the malcontents, with a king only fourteen years of age for their chief, were unable to cope with Eudes; but on the death of that prince in 898, they procured the general assent of the nation to the election of Charles. One event of his reign, the cession of Normandy to the Northmen under Rollon or Rollo, renders it memorable, in spite of its uniform character for civil discord, the result of the monarch's incapacity. He was ultimately deposed by his subjects, who called to the throne a brother of the late King Eudes. This prince, treacherously surprised in his camp by Charles, fell with a great part of his troops; but the remainder, under his son Hugues, made head against Charles, who was again driven from the kingdom. Raoul, duke of Bourgogne, succeeded to the vacant throne. Charles, seeking the assistance of a friend in Heribert, count of

Vermandois, found a jailor who kept him in confinement the remainder of his life. He died in 929.—J. S., G.

CHARLES IV., LE BEL, third son of Philip IV., le Bel, born in 1294, succeeded his brother Phillip V., le Long, in 1322. His reign was short and unmarked by great events. He dealt severely with unjust judges and public defaulters of all kinds, extending his cognizance of defalcations backwards to the late reign, one of the financiers of which he even put to the torture. His sister Isabella was married to Edward II. of England. On the breaking out of hostilities between the brothers-in-law, Isabella undertook to compromise the quarrel, and coming to Paris, succeeded in conciliating the French king, from whom she obtained supplies of men and money, with which to assault the power of her husband and the favourite by whom it was wielded, Le Depenser. The intrigues of Charles at the papal court respecting the imperial crown were fruitless, although enforced by an invasion of Germany by a horde of pagan barbarians, whom his gold had lured to an attack on the empire. He died in 1328 without male issue. In him the direct succession of the line of Capet ceased, the crown passing into the collateral branch of the Valois.—J. S., G.

CHARLES V., LE SAGE, son of the unfortunate King John, who was taken prisoner by the English at the battle of Poitiers in 1316, was born in 1337, and died in 1380. During the captivity of his father, with the title first of lieutenant, and then of regent of the kingdom, but with an authority which the rising spirit of liberty in the states-general circumscribed within limits little flattering to his ambition, he conducted public affairs with considerable address and resolution, gaining often by the arts of diplomacy what it would have been madness to attempt by force, and averting the revolutionary schemes of his enemies by infusing discord into their councils. When assailed by the formidable provost of the merchants of Paris, Etienne Marcel, he detached, by secret means, from the party headed by the provost, Charles le Mauvais, king of Navarre, and with the aid of the mercenaries in the pay of that prince, maintained his position against popular outbreaks and the more dangerous movements of the states-general. After the murder of Marcel by some of his fellow-citizens, Charles gained possession of the capital, Paris, and with a firm hand set himself to redress the disorders of the kingdom. "The free companies" and "the Jacquerie" (see GUILLAUME CAILLET,) were successively put down, and an invasion of the English, notwithstanding the anarchy of the time, met with a stout resistance on the part of the regent. By the treaty of Bretigny, King John being restored to his dominions, the power of the regent determined. In 1364, however, John died, and Charles resumed the government of the country with the undisputed title of king. In 1369 he declared war against Edward the Black Prince, and his father Edward III., both of whom, the one by disease and the other by age, were then incapacitated from taking the field in person. The task of answering the challenge of the French king was therefore committed to John of Gaunt, who marched with thirty thousand men from Calais to Bourdeaux without encountering an enemy. A truce for a year was concluded and renewed, and during its continuance occurred the deaths of the Black Prince and Edward III., 1376-77. Immediately after the news of the death of the king of England reached France, Charles prepared for a descent on the English coast, which was effected by a combined French and Castilian fleet, at the same time that the king's brother ravaged Guienne. In 1380 the English reinstated the duke of Bretagne, the enemy of Charles, in his dominions, and again traversed a great part of France unopposed. In the midst of such humiliations Charles expired in the forty-third year of his age. That he deserved the appellation of le Sage for his patronage of letters if not for his learning, is not disputed; but that he was cruel and perfidious is also placed beyond question, by many of the facts of his reign. He founded the *bibliothèque royale* at Paris, and the no less celebrated institution of the bastille.—J. S., G.

CHARLES VI., called LE BIEN-AIME, and also L'INSENSE, son of the preceding, was born at Paris in 1368, and died in 1422. At the age of twelve he was called to the throne on the death of his father; his four uncles, the dukes of Anjou, Berry, Bourgogne, and Bourbon recognizing the authority of their nephew, and trusting to his youth for license to enrich themselves at his expense. Anjou confiscated for his own use the treasures left by the late king. To replenish the royal exchequer, a heavy tax was laid upon the nation. This, however, the people, already

sufficiently irritated against their rulers, would not pay; "the Jacquerie" reappeared everywhere under other names, and, as Froissart declares, it seemed as if the time were come for gentleness to perish utterly under the assaults of infuriated mobs. In these circumstances Bourgogne engaged his nephew to lead an army into Flanders, which had risen in insurrection against Count Louis, Bourgogne's father-in-law. The result was fatal to the spirit of insurrection in that country, the battle of Rosebecque (1382) and several successful sieges having been followed by a wholesale slaughter of the Flemish peasants; and was no less fatal to the insurgent subjects of Charles, who, on his return to Paris flushed with victory, were treated with merciless severity. In 1385 Charles married Isabella, daughter of Stephen duke of Bavaria, Ingolstadt. Shortly afterwards he proposed to make a descent on England; but this proposal miscarried through the avarice of his uncle, Berry, and before long the English were in possession of several of his fortresses. Charles having in 1388, by a bold exercise of his authority, rid himself of the tutelage of his uncles, recalled the most hateful of their enemies, the ministers of his father. Of these Clisson was particularly obnoxious to the duke of Bretagne, and this minister being assassinated in Paris, his murderer found protection at the court of the duke. This led to an invasion of Bretagne by the royal forces, which was rendered memorable by an incident that deprived the monarch of his reason. As he was traversing, almost unattended, a lonely spot in the forest of Maine, he was accosted by a person of sinister visage who so terrified him with assurances that treason tracked his footsteps, that, on issuing into the open country, he was discovered to be in a state of insanity. The malady never left him except for short periods, which recurred with less and less frequency; and for the rest of his life this unhappy king was thus what he had been in its earlier years, a mere tool in the hands of his perfidious relatives. Than the thirty years of French history which succeeded the first outbreak of the king's insanity, it would be impossible to find in the annals of any country a period more replete with disaster and disgrace. The detail of the bloody feuds which arose out of the division of the kingdom into two great factions, that of Burgundy and that of the Armagnacs, must, however, be sought elsewhere—the chronicles of the period, particularly Monstrelet's, give it with characteristic and appalling minuteness. In 1396 the infant daughter of Charles was affianced to Richard II. of England, but the deposition of Richard two or three years afterwards nullified the match. About this period the duke of Orleans, who was more than suspected of an improper intimacy with the queen, maintained his baneful ascendancy at court in spite of the utmost efforts of his rival the duke of Burgundy, and, on the death of the latter, he obtained the complete mastery of the kingdom; but in 1407, having unwarily ventured into the presence of the son of his late rival, he was treacherously murdered. Again the chiefs of the opposing factions resumed their deadly strife, and it seemed as if there were nothing so desirable for their unhappy country as political extinction, under the grinding yoke of a foreign tyrant. The battle of Agincourt, where Henry V. of England made good his demands for a daughter of France, dowered with all the provinces ceded to England by the treaty of Bretigny, and with the arrears of the ransom of King John, eventually gave to France for its salvation a foreign master. Although unaccountably induced to retire from France after this decisive victory, Henry was far from renouncing the claims he had put forth, and far even from renouncing his expectations of obtaining the crown of France. While the Armagnacs and the Burgundians butchered each other with remorseless eagerness, Henry kept together by pay and promises not a few partisans who steadily counselled the opposing factions to call in the king of England for the settlement of their quarrels, and who, after the massacre of the Armagnacs and the subsequent murder of the duke of Burgundy at Montereau, had doubtless some share in hastening the alliance of the party of the murdered duke with Henry, who had just completed the reduction of Normandy. The treaty of Troyes, which was concluded in 1420, placed the administration of France in the hands of the English monarch, and provided for his succession to the throne to the exclusion of the dauphin, who had retired to Poitiers. Henry survived the ratification of this treaty and his consequent marriage with the princess Catherine only two years, which were mainly occupied in prosecuting the war against the dauphin, afterwards Charles VII. He died in

August, 1492, and in October of the same year died Charles VI., after a disastrous reign of forty-two years.—J. S., G.

CHARLES VII., *LE VICTORIEUX*, fifth son of the preceding, and of Isabella of Bavaria, born at Paris in 1403; died in 1461. He became dauphin in 1416, on the death of John, fourth son of Charles VI. Two years afterwards, the party of the duke of Burgundy having surprised Paris, and by the most sanguinary means exterminated the party of the Armagnacs, with whom Charles was allied in the factious movements of the time, he fled to Poitiers in Languedoc, and there having convened a parliament, assumed the title of regent of the kingdom. This was a bold and hazardous proceeding; and the hatred it evoked on the part of his mother and the Burgundian party, now in favour with the queen, he had the temerity to inflame, by shielding the murderers of Jean-sans-peur, duke of Burgundy. The consequence of this atrocious deed was to throw the party of the murdered duke into the hands of Henry V. of England, who now found no difficulty in securing, by diplomacy, all that he had failed to extort by the victory of Agincourt. After the conclusion of the treaty of Troyes (see CHARLES VI.), Charles, disowned by his parents, and derided as a bastard by the partisans of England, led a vagrant life in the southern provinces of the kingdom, which, with Henry V. at Paris, were far from offering security as well as subsistence; but on the death of Henry in 1422, an event which was followed at an interval of a few months by that of Charles VI., the partisans of native royalty took a bolder attitude, and in the autumn of that year Charles was proclaimed king at Bourges. At the same time Henry VI., the infant son of Henry V., was crowned with all solemnity at Paris by his uncle the duke of Bedford, to whom the late king had confided the tutelage of his son and the regency of France. By the year 1428, the English having prosecuted the war with all but uniform success, hardly one fourth part of the realm owned the authority of Charles. In that year, Orleans, the most important of the towns on which he reckoned for assistance, was besieged by an English force, under leaders of high renown. The place was defended by Dunois, a bastard of the family of Orleans, by Xaintrailles, La Hire, and other famous captains, who, receiving little aid from Charles, disputed the attacks of the English with less and less success. The fall of Orleans must have been fatal to the hopes of Charles and his adherents; but at this juncture appeared the famous Joan of Arc (see JOAN), and at once, and as it proved conclusively, turned the scale of victory in their favour. From this time onwards, in his struggle with the English, and especially after the treaty of Arras had secured him the assistance of Burgundy, Charles, although in general cautious of exposing his own person to the risks of war, pursued by his generals an almost uninterrupted career of victory. In the same year in which Joan raised the siege of Orleans, he was again solemnly crowned at Reims, principally in obedience to the demands of the Maid of Orleans, who for a brief period ruled the court no less than the camp. In 1436 the English surrendered Paris, in 1450 quitted Normandy, and in 1456 Guienne; thus relinquishing within a brief period the whole of their possessions in France, except Calais and the surrounding territory. To this glorious period, besides the assertion of the national independence, are to be referred two great events of the reign of Charles—the issuing of the Pragmatic Sanction, and the organization of a standing army, but on neither of these points have we space to dwell. The victorious monarch had need of his well-appointed regiments when the wars of the “Praguerie,” and the repeated defections of the dauphin his son, afterwards Louis XI. (see that name), threatened to subvert his throne, and for a period endangered his person. The latter years of his life, although not free from the stains of debauchery, and of a too facile forgiveness of the crimes perpetrated by the rapacious and sanguinary ministers who from time to time gained the ascendant in his councils, were little chargeable with the indolence and effeminacy of his youth and early manhood—a remarkable metamorphosis of character, which is properly ascribed, perhaps, to the influence of his wife, Mary of Anjou, but is more frequently, although erroneously, attributed to the eloquence and the graces of his mistress, Agnes Sorel; having occurred to him about the time when his affairs began to assume a hopeful aspect after the first triumph of the Maid of Orleans. His treatment of Joan, however, even in the absence of all other subjects of reproach—and, unfortunately, the long career of Charles furnishes not a few—would always

seriously impair his title to the veneration, although he cannot be denied the gratitude of his countrymen. Charles, who was at last afflicted with a kind of monomania, that manifested itself in a dread of being poisoned by his family, died of exhaustion, after seven days' abstinence from food—J. S., G.

CHARLES VIII., king of France, succeeded his father Louis XI. in 1483, being then only thirteen years of age. During the minority the guardianship of the king's person was vested in his eldest sister Anne of Beaujeu. The power which she enjoyed excited the jealousy of the duke of Orleans, the next heir to the throne, who made some unsuccessful attempts to subvert the royal authority. He and his allies were finally defeated in 1488. The king was soon in new trouble, on account of his marriage with Anne of Bretagne, the betrothed of Maximilian the Austrian emperor, to make way for which he broke an engagement with the daughter of Maximilian. Henry VII. of England and Ferdinand of Spain supported the aggrieved emperor, and entered with him into a confederacy against France; but by the payment of money and cession of some provinces to the confederates, a settlement was effected in the treaty of Senlis in 1493. Thus freed from danger at home Charles set about asserting his claim to the throne of Naples, which he founded on the rights of the house of Anjou, purchased by his father Louis XI. Advancing with an army and passing through Florence and Rome, he took possession of Naples in 1495, the king retiring on his approach. He then began to conceive ambitious designs of eastern conquest, at the very time that a league was forming to intercept his return to France. Leaving a garrison in Naples he began his homeward march with a force of about nine thousand men, and was met at Fornovo, near the foot of the Apennines, by the army of the hostile confederacy, numbering forty thousand. He bravely met and vanquished this vast force, winning, however, by his victory little more than a safe retreat. Naples was soon recovered and the king restored by Gonsalvo, a Spanish general. The subsequent projects of Charles for its reconquest were never carried out. He had only three sons, none of whom survived him, so that on his death in 1498 the duke of Orleans, Louis XII., succeeded to the throne.—J. B.

CHARLES IX., king of France, succeeded his brother, Francis II. in 1560, being then in his eleventh year. The government was conducted during his minority by his mother, Catherine de Medici, assisted by Anthony, king of Navarre, who joined himself to the Huguenot party, to which Catherine also for a time showed signs of favour. In 1561 an edict being issued to prevent the preaching of the reformed religion, the Huguenots took up arms and demanded a conference, which led to no important result, except that it gave the king of Navarre a pretext for deserting to the catholic side. Through the influence of Catherine, who was jealous of this union of Navarre with the Guises, a pacific edict was issued, which procured a temporary peace. This was soon broken by a quarrel at Vassy in Champagne, which ended in a war, led on the protestant side by Prince Condé and the admiral Coligni; and on the other by the constable Montmorenci, the duke of Guise, and the marshal St. André, who were named the Triumvirate. In 1563 a peace followed the siege of Orleans and the death of the duke of Guise. As early as the following year, however, the protestants had reason to be dissatisfied with some of the edicts issued, and in 1567 Condé and Coligni attempted to seize the person of the king, and gave rise to the second religious war, in which Catherine exerted all her influence against the Huguenots. A short peace followed the battle of St. Denis, in which Montmorenci fell, but was soon broken when the king issued an edict ordering all the protestant ministers to leave the kingdom. The battle of Jarnac followed in 1569, when the protestants were defeated, and their leader, prince Condé, killed. The head of the party was now Henri of Bourbon, prince of Béarn, but the command remained with Coligni, to whose resolution and courage, as well as to the king's jealousy of his brother, the duke of Anjou, now leader of the catholic party, is to be attributed the peace of 1570, and the favourable provisions which it secured for the exercise of the protestant worship. It is not certain, indeed, that the granting of this favourable peace was not part of the deep plot for the destruction of the Huguenots, which resulted in the massacre of St. Bartholomew, two years later. This at least is sure, whether or not the king was a party to the plot, the peace was made by the conspirators the foundation of their schemes. Coligni was invited to court. Suspicious of the designs of Catherine, he

refused the invitation, but in the end of 1571, after receiving repeated assurances of goodwill, he at length repaired to Blois, where Charles was holding his court. Any suspicion he might still have had was soon removed by the apparent kindness of the king, which he crowned on the 18th of August, 1572, by the marriage of his sister to Henry of Navarre. On Friday the 22nd an attempt was made to shoot Coligni, as he was passing a house occupied by a dependent of the duke of Guise. The king professed to be deeply grieved by this cruel attempt, and visited the wounded man; but the conspirators were plotting deeply, and whatever were the king's motives for his previous conduct, it is sure that his consent was obtained for the dreadful massacre which was begun on the morning of the 24th. He professed to have discovered a conspiracy against his life, and that he ordered the slaughter of the Huguenots in self-defence; but was ever afterwards distracted with the thought of the cruelty to which he had given his sanction, and died in great distress in 1574.—J. B.

CHARLES X., King of France, was the youngest son of the dauphin, grandson of Louis XV., and brother of Louis XVI. He was born at Versailles in October, 1757, and received at his birth the name of Charles-Philippe, and the title of Count of Artois. His early years were spent in frivolity and dissipation. On the breaking out of the Revolution, he resolutely opposed all concession to the popular demands, and quitted France in July, 1789, after the destruction of the bastille. He peremptorily refused to return when invited to do so in 1791, and the legislative assembly in consequence stopped his allowance and confiscated his property. When war was declared against France, Charles took the command of a body of emigrants, and joined the Austrian and Prussian armies in the unsuccessful campaign of 1792. In the following year, after the execution of his brother, Louis XVI., he undertook a journey to Russia, in the hope of obtaining assistance from the Empress Catherine. He next made a descent on the coast of Brittany, after the breaking out of the Vendean war, but speedily re-embarked, and returned to England without accomplishing anything of importance. He resided some years in the palace of Holyrood at Edinburgh; but in 1809 he joined his brother, Louis XVIII., at Hartwell, and in 1814 he went to Germany to watch the progress of events. On the abdication of Napoleon, the count of Artois entered Paris on the 12th of April, and the senate conferred on him the provisional government of the kingdom. On the arrival of the king, his brother, Charles was appointed colonel-general of all the national guards of the kingdom. The return of Napoleon, of course, compelled the count to leave France along with the rest of the royal family; but he returned after the battle of Waterloo. As the leader of the ultra-royalist and priestly party, the count exercised great influence on the government of his brother, and indeed from the date of M. Villele's ministry in 1821, Charles may be regarded as the real king of France. He succeeded to the throne on the death of Louis XVIII., 16th September, 1824. He was fond of popularity, and for a short time his conduct seemed to make a favourable impression upon the French nation; but the priests and jesuits, by whom he was really though unconsciously governed, soon induced him to adopt measures that interfered with the rights and privileges, both sacred and secular, of the people, and excited the strong disapprobation of all sagacious and moderate men. Among the most hateful of these measures may be mentioned the law which was proposed in 1827 for restricting the liberty of the press. Opposition to the government continued to gather force; and in November the chamber of deputies was dissolved by the king. The new elections were decidedly unfavourable to the ministry; and in 1827, M. de Villele and his colleagues were compelled to resign, and were succeeded by Viscount Martignac, counts de Ferronays, Portales, and others. Several good measures were brought forward by the new ministry. M. Martignac, however, did not possess the confidence of the king, and was only endured by him as a necessary evil, to be got rid of at the first favourable opportunity. Accordingly the ministry, having been defeated by a coalition of parties on a bill for reforming the municipal councils, were soon after dismissed by the king (August, 1829), and a government composed of extreme royalists, with Prince Polignac at their head, was established in their room. The appointment of such men was regarded as an insolent defiance to the nation, and a conspiracy against its liberties. It was vehemently denounced by the press, and excited such indignation throughout the whole country, that associations

were formed for the purpose of resisting the payment of taxes. The new ministry were defeated on the address in the chamber of deputies by a majority of forty; but the king, in reply to the address, which told him plainly that his ministers did not possess the confidence of the representatives of the people, declared that his resolution was immovable. The next day (March 19) the chamber was prorogued to the 1st of September, and a dissolution was resolved on in May. A crusade was undertaken against the press, and the managers of several of the liberal journals were convicted and severely punished. The new elections went strongly in favour of the opposition. The whole policy of the government was violently reprobated, and every act of theirs was regarded with suspicion or dislike. Even the tidings of the conquest of Algiers, which arrived at this juncture, in no degree lessened their unpopularity. Charles and his advisers, however, were determined not to give way, and at length it was determined on the 7th of July to suspend the constitution. Accordingly, on the 25th, the king issued several ordinances, countersigned by his ministers, abolishing the liberty of the press; dissolving the newly-elected chamber of deputies; which had not yet met, and establishing a new electoral system; reducing the number of deputies from four hundred and thirty to two hundred and fifty-eight; altering the electoral franchise; and placing the elections under the direct influence of the prefects. On the publication of these fatal ordinances, the chief journalists of Paris signed an energetic protest, written by M. Thiers, and continued to publish as before. This was followed by a protest from a number of deputies declaring the ordinances illegal. The people rose in arms, erected barricades in all the principal quarters of Paris, and prepared to overturn the government by force. With a folly and want of foresight almost incredible, Charles and his ministers had taken no precautions whatever against a popular outbreak. The troops in the city were comparatively few in number, and no arrangement had been made to furnish them either with provisions or ammunition. A fierce and sanguinary contest ensued, which lasted for three days, and terminated in the complete triumph of the insurgents and the establishment of a provisional government. Marmont, to whom the command of the garrison of the capital had been intrusted, was compelled to evacuate the city. When the disastrous result was communicated to Charles, who remained at St. Cloud, he was at length induced to revoke the obnoxious ordinances and to dismiss his ministers. But this concession came too late. The popular leaders assembled at the Hotel de Ville, issued a proclamation that Charles X. had ceased to reign. Deserted on all sides, the unhappy monarch finding further resistance hopeless, abdicated the crown on the 9th of August in favour of his grandson, the duke of Bourdeaux; and set out for Cherbourg. The chambers, however, refused to recognize the claims of the young prince, and elected the duke of Orleans, who had previously (July 30) been nominated lieutenant-general of the kingdom by the provisional government. (See LOUIS-PHILIPPE.) From Cherbourg the dethroned monarch sailed for England, and ultimately took up his residence in Holyrood House. He afterwards spent some time in Prague in Bohemia. In the autumn of 1836 he removed to Goritz in Styria, and died there of cholera on the 6th of October. Charles married in 1773 Maria Theresa of Savoy, sister to the wife of his brother, Louis XVIII. His eldest son, the duc d'Angouleme, who died at Goritz in 1843, was childless. His second son, the duc de Berry, who was assassinated in February, 1820, left one daughter and a posthumous son, the duke de Bourdeaux, or Count Chambord, as he is now called.—J. T.

CHARLES THE BOLD, Duke of Burgundy, and Count of Charolais, was the son of Philip the Good, and of Isabella of Portugal, and was born in 1433. The mild and free government of Burgundy, in the time of Phillip, had raised the duchy to a degree of prosperity unparalleled at any former period. During the greater part of his reign, Charles was at enmity with his feudal superior, Louis XI. of France. In the lifetime of his father he put himself at the head of a confederacy of the principal French nobility, who had been oppressed by Louis, and marched with a powerful army towards Paris in 1465. A battle took place at Montlhery, where, after an obstinate struggle, Charles remained master of the field. In 1467 he succeeded to the dukedom of Burgundy on the death of his father, from whom he inherited immense treasures, which he squandered in the prosecution of his ambitious and often fantastic schemes. In 1468 he entered into

a league against his suzerain with Francis, duke of Bretagne, and Edward IV. of England. With the view of detaching him from this confederacy, Louis, who despised the intellect of Charles, and had an overweening confidence in his own powers of persuasion, determined to risk a personal conference with his rival, and paid him a memorable visit at Peronne, a fortified town of Picardy, belonging to the duke. Unluckily for this crafty schemer, the inhabitants of Liege, among whom he had secretly fomented disturbances, broke out into open rebellion against Charles at this critical moment, and massacred many of his adherents. The duke, transported with rage at this treachery, commanded the gates of the castle in which Louis had taken up his residence to be shut and strictly guarded, and vowed the severest vengeance on the perfidious instigator of the revolt and massacre. It was only by the distribution of large sums of money among the counsellors of the duke, and by making great promises and concessions, that Louis regained his liberty, on condition that he should be present at the assault of Liege, and witness the savage punishment which, for the second time, Charles inflicted upon that turbulent city. As might have been expected, the peace concluded at Peronne was not of long duration. No promises or treaties could bind Louis, and as Charles was rash and impetuous, and not much more scrupulous than his rival, grounds of quarrel were never wanting. The French king employed all his art to overreach the duke, and lost no opportunity of fomenting disturbances among his Flemish subjects, and embroiling him with his neighbours; while Charles, on the other hand, organized several successive confederacies against the French king, which that cunning and politic prince contrived, by one means or other, to dissolve. Charles was for a time, however, successful in almost all his projects. He suppressed and punished with great severity the insurrections of Ghent, Liege, and other Flemish cities; invaded France, captured several important cities, and wasted the country with fire and sword, with the landgraviate of Alsace and the duchy of Lorraine. He was compelled, however, to raise the siege of Nuz, the possession of which would have made him nearly master of the whole course of the Rhine, and he was deeply mortified by the failure of his attempt to obtain the dignity of king, when apparently on the eve of being successful. His violence and rashness soon after involved him in a war with the Swiss, by whom he was ignominiously routed in 1476, at Granson in the Pays de Vaud, with the loss of his military chest and baggage, and of his plate and jewels. This mortifying defeat threw him into a severe sickness, but after his recovery he resumed his insane project of conquering Switzerland, and having collected a numerous army, attacked the combined Swiss and German forces at Morat, near Friburg. After an obstinate struggle he was again defeated, with the loss of eighteen thousand men. This second disaster was followed by the defection of most of his allies, with the loss of the city of Nancy, and the greater part of Lorraine, which was now recovered by the dispossessed duke. Charles was completely overwhelmed with this defeat, and for a time was sunk in silent and sullen despair; but at length he roused himself from his inactivity, and, in opposition to the earnest advice of his best officers, laid siege to Nancy. The duke of Lorraine advanced to the relief of the city at the head of a powerful force, while the besieging army was small and dispirited. Charles, however, desperately set his life upon the cast, and giving battle, was defeated and killed. There is every reason to believe that the unfortunate prince was murdered in the tumult by certain emissaries of Count Campobasso, who basely deserted his standard at the commencement of the action, but left behind him twelve or fifteen of his followers, for the purpose of assassinating the master whom he had betrayed. Charles was possessed of several good qualities; he was intrepid beyond most men, generous, liberal, and easy of access to his servants and subjects; but his ambition, together with his pride and arrogance, and violent and headstrong disposition, involved him in perpetual quarrels, and ultimately led to his ruin. After the death of the duke, Burgundy was seized by Louis, who alleged it was a male-fief which reverted to the crown, as Charles left no son. His Flemish possessions were united to Austria by the marriage of his daughter Anne with the Emperor Maximilian.—(*Cominès; Froissart.* For a masterly character of Charles see *Quentin Durward* and *Anne of Geierstein*, by Sir Walter Scott.)—J. T.

CHARLES OF LORRAINE. See LORRAINE.

CHARLES DE BLOIS, or DE CHATILLON, Duke of Bretagne,

son of Marguerite, sister of Phillip of Valois, married in 1337 Jeanne de Penthièvre, daughter of Gui de Bretagne. The conditions of the marriage were, that Charles should assume the name and the arms of his bride's family, and that he should succeed to the duchy on the death of Duke John III. When this event happened in 1341, a formidable rival in the person of Jean de Montfort, brother of the late duke, arose to dispute the title of Charles to the duchy; and between these two princes a bloody war was waged in which England and France took part, and which was only terminated by the death of Charles de Blois who was killed at the battle of Auray in 1364. The struggle of Charles and his rival for the possession of Bretagne was rendered memorable by the heroic conduct of the countess de Montfort, and by the exploits of such famous warriors as Duguesclin, Beaumanoir, and Sir John Chandos.—J. S., G.

CHARLES I., called LE BON, Count of Flanders, son of Canute IV., called le Saint, succeeded Baldwin of Flanders in 1119. The throne of Jerusalem, vacant in 1124 by the imprisonment of Baldwin II. by the Turks, and the crown of Germany on the death of the Emperor Henry V., were offered to Charles; but his Flemish subjects, by whom he was revered for his talents and his virtues, prevailed on him to decline both of these dignities. He was assassinated in one of the churches of Bruges in 1127.—J. S., G.

CHARLES, called OF ARTOIS, Count of Eu, son of Phillip of Artois count of Eu, and of Marie de Berry, afterwards married to John duke of Bourbon, was born in 1393, and died in 1472. Allied during the reign of Charles VI. with the Orleans faction, he took part in the battle of Agincourt, was made prisoner, carried to London, and confined in the Tower twenty-three years. On his return to France he was taken into confidence by Charles VII., and bore arms in most of the campaigns undertaken by that monarch. Louis XI. also distinguished him by honourable appointments, both civil and military.—J. S., G.

CHARLES OF VALOIS, Count of Maine and Anjou, third son of Phillip the Hardy, king of France, was born in 1270. His title and estates he derived from his marriage with Marguerite, daughter of Charles II. of Anjou, king of Naples. Pope Martin IV. had conferred on him the title of king of Arragon, but this his father-in-law obliged him to renounce. He took a prominent part in the wars which the pope and the house of Anjou waged with the republics in Italy, and in those which his nephew, Phillip le Bel, commenced against Edward II. of England in Flanders and Guienne. He died in 1325, leaving by the first of his three wives a son, who, under the title of Phillip VI., succeeded to the throne of France, and commenced the dynasty of the Valois.—J. S., G.

CHARLES I. and II., Counts of Maine and Anjou. See CHARLES OF NAPLES.

CHARLES III., Count of Maine, third son of Louis II. of Anjou, king of Naples, born in 1414; died in 1473. He was a marked favourite of Charles VII., who, along with various grants of land, gave him the government of Languedoc. Under Louis XI. he held high military command; but his conduct at the battle of Montlehery, which was dastardly in the extreme, lost him the favour of the king. He died in 1472.—J. S., G.

CHARLES D'ANJOU or CHARLES IV., Count of Maine and Anjou and King of Sicily, born in 1436; died in 1481. Inheriting from his uncle René le Bon, who died in 1480, besides the realm of Sicily, the counties of Anjou and Provence, he had the misfortune to fall under the power of Louis XI., who deprived him of the former county, and by artfully repulsing in his behalf the attempts of the grandson of René to establish himself in Provence, gained over the chief minister of Charles, and then the prince himself, to the execution of a deed by which, on the death of Charles, Anjou was to be permanently united to the realm of France.—J. S., G.

#### IV.—CHARLESSES OF NAVARRE.

CHARLES I. See CHARLES IV. OF FRANCE.

CHARLES II., surnamed the BAD, King of Navarre and Count of Evreux, was born in 1332. He was the great-grandson of Philip the Hardy, king of France, and grandson by the mother's side of Louis the Boisterous. He succeeded to the throne of Navarre in his seventeenth year, and in 1353 married Joanna, elder daughter of King John of France. He was remarkable for the graces of his person, and for his courage, eloquence, liberality, and address; but he was no less detested for his crimes. In 1353 he caused Charles de la Carda, con-

stable of France, to be murdered in his bed, out of revenge, because he had been disappointed in his attempt to obtain the duchy of Angoulême, which the king had bestowed upon La Cerda. He soon after began to intrigue against his sovereign, set up a claim to the throne of France in right of his mother, and even ventured to draw the dauphin into a confederacy against his father. But the king having obtained full information respecting these machinations, suddenly arrested Charles and his adherents while seated at dinner with the dauphin in the castle of Rouen, sent him a prisoner to Chateau Gaillard, and put several of his most obnoxious associates to death. After the disastrous battle of Poitiers in 1356, at which King John was taken prisoner, the king of Navarre made his escape, and soon after proceeded to Paris, where his eloquence and winning address had rendered him, in spite of his crimes, a great favourite with the citizens. He continued his intrigues against the royal authority, and having attracted to his standard numbers of Norman and English adventurers, known by the name of Companions, he declared war against France, took several towns and fortresses, and reduced the dauphin almost to the last extremity; but at length peace was concluded between them in 1360. The remainder of the reign of this able but unprincipled sovereign was spent in continual plots and broils. In 1361 he entered into an alliance with Pedro the Cruel, and assisted him in his campaigns against the king of Arragon. He conducted the Black Prince, who came to the assistance of Pedro with a body of English troops, through his own territories, as far as Pampeluna, but was accidentally taken prisoner by a French knight before the battle, in which the prince defeated the French army that had espoused the cause of the king of Arragon. He soon regained his liberty, however, and peace was subsequently concluded between him and Charles, his brother-in-law, the new king of France, which lasted for four years. But hostilities again broke out on the discovery of a conspiracy on the part of the king of Navarre, to poison the French king. The poison was actually administered, and Charles never recovered from its effects, though its immediate operation was partially suspended by the skill of a physician, sent by the Emperor Charles IV. Unable to resist the French arms, the king of Navarre entered into a treaty with the English and engaged to deliver Cherbourg into their hands as the price of their aid. On this condition a powerful army was sent to his assistance, and soon turned the tide in his favour. This wicked sovereign died in 1387. His death was worthy of his life. He was wrapped in clothes that had been dipped in spirits of wine and sulphur, to reanimate the chill in his limbs caused by his debaucheries, and to cure his leprosy. By some accident they caught fire, and burnt the flesh off his bones.—(*Froissart*).—J. T.

**CHARLES III.**, King of Navarre, called **THE NOBLE**, on account of his good qualities, was born in 1361. He married in 1375 Leonora, daughter of Henry II. of Castile, surnamed the Magnificent. Charles ascended the throne of Navarre in 1390. In 1404 he entered into a treaty with Charles VI. of France, by which he renounced his pretensions to the provinces of Champagne, de Brie and d'Evreux, receiving in exchange the duchy of Nemours. Charles died in 1425.—J. T.

**CHARLES IV.**, son of John II., king of Navarre and Arragon, and of Blanche, daughter of Charles III. the Noble, born in 1421, became titular king of Navarre on the death of his mother in 1441; but after some fruitless attempts to overcome the opposition of his father, which was vigorously supported by Joan of Castile, John's second wife, he abandoned his claims to the crown, and accepted the title of Count of Barcelona. This accomplished and unfortunate prince was poisoned in 1461.—J. S., G.

#### V.—CHARLESSES OF SPAIN.

**CHARLES I.** See **CHARLES V. OF GERMANY**.

**CHARLES II.**, son of Philip IV., was a child of four years at his accession to the throne in 1665, and the country, already wasted by his father's follies, had to undergo the evils of a long minority. The queen-mother held the regency; and her subserviency to her favourites was checked only in part by the influence of Don John of Austria. This able and popular commander obtained the ascendancy, when Charles, at the age of fifteen, assumed the reins of government; but the young king was speedily left by the death of his minister to responsibilities, for which he was incapacitated by bodily weakness and mental imbecility. It was in this reign that Portugal secured

her independence; but the most serious dangers arose out of the ambitious attempts of Louis XIV. to annex the Low Countries to his dominions, and to obtain for a Bourbon prince the heirship of the childless Spanish monarch, in opposition to the claims of the Emperor Leopold and the electoral Prince Joseph Ferdinand. The alliance of England, Holland, and Germany checked the progress of the French arms in the Netherlands; and at the peace of Nimeguen in 1678, the marriage of Charles to a niece of Louis was expected to be the bond of a permanent accord. Her death, however, in the following year, brought on new conflicts, which were embittered by the marriage of the king to an Austrian princess, and continued till the peace of Ryswick in 1697. Charles died in 1700, having been induced by the plots of Philip and the influence of the pope to execute a will in favour of Philip of Anjou, who succeeded him.—W. B.

**CHARLES III.**, a younger son of Philip V., born in 1716, acquired distinction at an early age by his military services in Italy, and was invested by his father with the sovereignty of the Two Sicilies, in which he was confirmed by the treaty of Vienna in 1730. Succeeding to the throne of Spain at the death of his brother, Ferdinand VI., he found the kingdom strengthened in its internal organization and resources by the wise and beneficent administration of his predecessor, and his own disposition led him to cultivate similar means of national prosperity. But the confederacy of the Bourbon princes in the middle of the century involved him in a war with the British, who captured Manilla, and some of the other Spanish colonial possessions. After the peace of Fontainebleau, Charles again devoted himself to the social and administrative improvement of his kingdom, and made an attempt to repress the Algerine pirates, which proved unsuccessful. In the struggle of the British colonies in America for their independence, he joined France in aiding them with a naval force; and at the close of the war, the provinces of Florida, with the island of Minorca, were ceded to Spain. His death occurred in 1788.—W. B.

**CHARLES IV.**, King of Spain, son and successor of Charles III., was born at Naples in 1748, and died at Rome in 1819. He married his cousin, Maria Louisa Theresa of Parma, in 1765, and was crowned king of Spain at Madrid in 1789. His reign was anything rather than glorious. Of a violent temper, and destitute of almost every kingly quality, it was impossible that he should distinguish himself in the task of guiding the national councils during the stormy times which succeeded the French revolution. His father had tried to rouse the Spaniards out of their natural indolence; but immediately after the accession of Charles IV., the ancient spirit of inaction and routine took possession of the nation. In 1792 he superseded his able minister Florida Blanca by Aranda, whom he soon after exiled for favouring the French revolutionists. Charles, who had hitherto been at peace with the Revolution, took vigorous measures to save the life of Louis XVI., and, failing in his efforts, entered into war with France. In 1795 a peace was negotiated at Basle by Godoy, the queen's favourite, who had been appointed prime minister, and was now created Prince of Peace, high admiral, and generalissimo. An alliance, offensive and defensive with France, which followed the treaty of Basle, drew Spain into war with Portugal and England; the consequences of which were the ruin of her commerce and the annihilation of her fleet at the battle of Trafalgar. Charles was now tired of France, but the hostile proclamation made by Godoy in 1806, only brought him more under the power of Napoleon, who forced him in the following year to sign a secret treaty, that had for its object the partition of Portugal between the queen of Etruria and the Prince of Peace. The French troops, which had professedly been sent to enforce the stipulations of this treaty, were however ordered to Madrid, upon which Godoy withdrew with the court to Andalusia. Charles prepared to flee to America, but was arrested by the populace, and on the 9th of March, 1808, abdicated the throne in favour of his son Ferdinand. The ruin of the dynasty was at hand. Napoleon, having now gained over Godoy, who had long been the mortal enemy of Ferdinand, enticed the royal family to Bayonne, and there succeeded, with the aid of the Prince of Peace and of the queen, in depriving the house of Bourbon of the Spanish crown. He assigned to Charles a pension of seven millions of francs, and the château of Compeigne for a residence. The unfortunate monarch afterwards lived for sometime at Marseilles. In 1811 he departed with his little court for Rome, where he died.—R. M., A.

## VI.—CHARLESSES OF SWEDEN.

CHARLES I., or following the purely mythological nomenclature of John Magnus, CHARLES VII. (SVERKERSON), the first who bore the title of king of Sweden and Gothland, was assassinated after a short reign in 1168.—J. S., G.

CHARLES VIII. (CANUTSON), elected king of Sweden in 1448; the union of the crowns of Denmark, Norway, and Sweden being dissolved in that year, by the death of Christopher, duke of Bavaria, who had reigned over the three countries. A war ensuing between Charles and Christiern, king of Denmark, the former was deprived of his crown in 1458. Recalled after an exile of six years, Charles was worsted in an encounter with his powerful subject the archbishop of Upsal, and again obliged to quit his dominions. Again recalled by his subjects in 1467, he survived this second restoration only three years, dying in May, 1470.—J. S., G.

CHARLES IX., fourth son of the famous Gustavus Vasa, born in 1550; came to the throne in 1604. He was involved in various wars with Denmark, Poland, and Russia, in which, being indifferently seconded by the diet of the kingdom, he was, although a brave soldier and an acute politician, generally worsted. He died in 1611, and was succeeded by his son, the renowned Gustavus Adolphus.—J. S., G.

CHARLES GUSTAVUS X., son of John Casimir, count palatine of the Rhine, and of Catharine, daughter of Charles IX., king of Sweden, was born at Upsal in 1622, and died in 1660. Acceding to the throne of Sweden on the abdication of his cousin Christina in 1654, he undertook, with an impoverished exchequer, an expedition against Poland, the greater part of which he overran, but without attaining any other object than that of humiliating Casimir the king, on whom he revenged a slight affront by obliging him to take shelter in Silesia. His expedition against Denmark was no less fruitless; the partition of the country, at which he aimed, being reprobated by several of the great potentates of Europe, Cromwell among the number. While engaged in a second attempt against the independence of Denmark, he was seized with a fever, which proved fatal. Charles Gustavus X. is to be ranked among those Hotspurs of princes who have loved war, if not merely, yet to an astonishing degree devoutly, for its own sake.—J. S., G.

CHARLES XI., son and successor of the preceding, born in 1655. On the death of his father he was proclaimed king, under the regency of his mother and a council, by whom peace was successively established with Poland, Denmark, and Russia. In 1672, the year of his accession to power, Charles, acting under the control of France, invaded the electorate of Brandenburg, and thus involved himself in a war with Denmark and Holland, the result of which, notwithstanding the success of his campaign in the electorate, was disastrous to Sweden, the province of Pomerania having been lost to the crown. This province, however, was restored to Charles by a treaty concluded in 1679 between Denmark, Sweden, and Brandenburg. In 1682 Charles, by an unconstitutional exercise of authority, reduced the number of the Swedish senators, and from that period till the end of his reign, sternly and sometimes savagely affected the character, while circumstances gave him the power, of an absolute monarch. Fortunately he was disposed to exercise his tyrannical authority for the protection of the inferior classes of his subjects against the rapacity of the nobles, and in general for the well-being of his kingdom, the internal polity of which under his severe, but just and equitable rule, was not a little ameliorated. The payment of the debts of the nation, the restoration to the crown of lands unjustly rent from it by the rapacious nobles, and constant accessions of territory—the result of successful wars with neighbouring powers—were events which gave a lustre to the reign of Charles, that disguised, if they could not conceal, many of its harder features. Among the arbitrary edicts of his administration which he enforced with characteristic severity, was one forbidding the exercise in his dominions of any religion but the Lutheran. He died in 1697.—J. S., G.

CHARLES XII. This renowned sovereign, son of Charles XI., and of Ulriké Elenoré, a Danish princess of excellent character and understanding, was born at Stockholm on the 27th of June, 1682. He lost his mother in his eleventh year, and his father in 1697, when he was only fifteen. The regency was invested in his grandmother, and Charles left all care of government with her. His great propensity at that period was for active physical exercises, and especially for bear-hunting. At

the same time he was well grounded in mathematics, and in the German language, then the court language at Stockholm, as well as in Latin and French. At a martial review, the very year that he came to the throne, he hinted to the councillor of state, Piper, that he desired to command the troops himself, and the supreme power was transferred to the young prince, who was crowned, 24th December of the same year. The depreciatory accounts which the ambassadors of the northern nations had sent to their court regarding Charles' abilities, encouraged them to the attempt on his provinces on the other side of the Baltic. Peter I., afterwards called the Great, of Russia, Augustus II. of Saxony and Poland, and Frederick IV. of Denmark, made a league to seize and divide these provinces amongst them. The Swedish ministers were consulting on the best means of avoiding a war by negotiations and concessions, when the young king, suddenly broke forth with the declaration that he would concede nothing, but undertake the three monarchs, one after another, and so teach them the ancient terrors of the Swedish name. The Danes commenced the first attack on the territory of the duke of Holstein-Gottorp, who had married Charles' elder sister, and to whom Charles was greatly attached. On the 17th June, 1700, he crossed the sea with thirty line-of-battle ships and a great number of lesser ones, supported by a squadron of Dutch and English vessels which he had called to his aid, and on August 4th, landed near Copenhagen. As the water was shallow, Charles was the first to leap into it, in the face of the Danish batteries. His brave officers fell on either hand, but he showed no sign of fear, and made good his landing. The Danes were compelled to make a hasty peace at Thavendahl, resuming the league with Russia and Poland, and restoring the territory of the duke of Holstein-Gottorp. Augustus II., elector of Saxony and king of Poland, had marched down upon Livonia, whilst Charles was engaged at Copenhagen. Charles sent thither twenty thousand men under General Dahlberg, who defended Riga against the Polish king, and Charles himself hastened with only eight thousand men to encounter the czar, who was besieging Narwa, and threatening the coast of Finland with eighty thousand. But Charles, encouraged by the news that the king of Poland had retreated from before Riga, attacked the Russian fort on the 30th of November, in the midst of a furious snow storm, and put the huge Russian army to flight, with the slaughter of eighteen thousand men, and the capture of thirty thousand prisoners. Peter, however, instead of being cast down, coolly observed to his officers, that he was well aware that the Swedes must beat them a good many times before teaching them how to conquer in turn. Charles then crossed the Düna, attacked the camp of the Saxons, and won a complete victory over them. It was now in his power to conclude a peace, which should have made him the umpire of the north; but at this crisis he began to display that fatal want of political wisdom, which, instead of a great monarch, made him for a time a wild and terrible meteor of war. Instead of making such a peace, or watching and confronting the far more dangerous and ambitious Peter, he determined to drive Augustus from the throne of Poland, and set another king upon it. For seven years he prosecuted this object, refusing to listen to any terms of accommodation from Augustus, till he had dethroned him in Poland, set up in his place, as king, Stanislaus Leszinsky, the waiwode of Posen, and following Augustus into Saxony, compelled him to an ignominious peace. But during these seven years, which brought no real advantage to Sweden, the politic czar, Peter, had been assiduously at work, conquering the Swedish provinces on the Baltic. He had defeated a Swedish army on the Peipus lake, had conquered Dorpat and Narwa, and laid siege to Reval. In 1703 he took Noteburg on the lake Ladoga, and fortified it so strongly that he now named it Schlüsselburg, or the Key of the Land, and the following year he took Nienschanz, on the Neva; and having obtained what he had long aimed at, a portion of the Baltic, he began to build his new capital of St. Petersburg on the very land reft from Sweden. All this time, instead of attacking and driving away the czar, Charles was pursuing Augustus, and did not cease till he had completed his utter subjection, and compelled the delivery of Patkull, whom he tortured and put to death. At length, having glutted his unworthy vengeance on the Polish king, he turned his attention to the czar, but instead of concentrating all his power in driving Peter out of the Baltic provinces, and destroying his newly-founded town, he determined to attack the distant Moseow, which could only be reached by a

terrible march through a hostile country. Wherever he came the Russians fled at his approach, and Peter himself, who was in Grodno, retreated to Petersburg. Had Charles marched thither, the campaign would have been ended; but instead, he pursued his way to Smolensk; Mazeppa, the Cossack hetman of the Ukraine, who was disaffected to the czar, offering to join him with thirty thousand men and provisions, and thus facilitate his conquest of Moscow. It was in vain that Count Piper and his most experienced officers dissuaded him from this rash enterprise; and with amazement and exultation Peter saw him, about midsummer, marching away towards the Ukraine.

It was the 23rd of October, winter and a fearful country were before them; but no persuasions could induce the military madman to give up the hopeless march he purposed. The unexampled winter of 1708-9 set in, and his troops fell by hundreds, frozen on the way. On reaching Baturin, Mazeppa's capital, in November, where they expected to pass the winter, they found it a heap of ashes. Prince Menzikow had been before them, burnt down the city, laid waste the country, and hung the effigy of Mazeppa on a gallows. Even Mazeppa now joined with his own officers to persuade Charles to a retreat, but he would not listen to it, and went on through the winter, losing men, artillery, and ammunition. Reaching Pultowa, the Russians kept him out of the city, with a garrison of eight thousand, and Peter marched down upon him with sixty-five thousand fresh troops. Charles, in a skirmish, was shot through the ankle, and whilst thus disabled, Peter attacked him, and completely routed his army. This celebrated battle, which was fought on the 27th of June, 1709, saw the hitherto unconquered king of Sweden flying in a litter for the frontiers of Turkey; not only his army, but his generals, his military chest, containing six millions of Saxon dollars, and his able and faithful minister, Piper, in the hands of the Russians. After a painful flight of three weeks, he crossed the Bug into Turkey, and was received at Bender with much honour, though attended by merely a thousand followers. His enemies now overran his territories, and hoped to seize and divide Sweden amongst themselves. Augustus of Saxony abandoned the treaty of Altranstadt, and prepared to recover the throne of Poland. Peter overran Livonia, and the king of Denmark landed in Schonen to make himself master of Sweden. But the Swedes, under General Stenbock, drove the Danes from Schonen, and passed over to defend Finland against the Russians, who, however, poured in such shoals into that province, that they were irresistible. The news of those invasions roused Charles to endeavour to induce the Poles to join him in a war against the Russian czar, whom he represented as designing next to attack Turkey. He was so far successful, that the Turks declared war against Russia, and at Falezin on the Pruth, a great battle was fought on the 30th of June, 1711, in which the Russians were routed with great slaughter, and Peter himself and his czarina, Catherine, taken prisoners. Peter was so completely disheartened that he shut himself up in his tent, saying—"Now I am far worse off than my brother Charles at Pultowa!" But the wit of his wife rescued him from his dilemma. Charles was furious, and made vehement representations to the Porte of the dangers to be apprehended from Peter, but in vain; the Russian agents were already making their representations in Constantinople, and Charles received instant orders to quit Turkey. He refused unless he received six hundred thousand dollars; they were sent, but he demanded five hundred thousand more. At this the sultan ordered him to be driven out with force. The madman and three hundred followers fortified his little camp at Varnitza, near Bender, and set at defiance the whole Turkish army. His defences were attacked and driven in, the thatched hut in which he lived set on fire, and in making a furious sally on his enemies, the desperate Swede fell, on which a crowd of Turks rushed upon him and overpowered him. He was then conducted to Demotika, where he continued to importune the sultan to make alliance with him against Russia; and to prevent his being sent away, he pretended to be ill, lay in bed for two months, and kept his chamber for ten, amusing himself with reading and writing; but at length convinced that the grand Turk was immovable, he suddenly announced his intention to depart, and was accompanied on his way by a splendid retinue of Turks. Suddenly, however, leaving them, he rode away day and night for a fortnight, having left all his own attendants behind, except Colonel Düring, and in that time travelling nearly thirteen hundred miles

without once going to bed, he reached Stralsund at midnight on the 22nd of November, 1714, to the great wonder and joy of the people. His boots had to be cut from his legs, they were so swollen, but he had not much time for rest. Nothing could be worse than the situation of his affairs; he had destroyed a noble army, ruined the exchequer of his country, and found, in addition to his old trio of enemies, the kings of England and Prussia joined with them in the league against him—Prussia in possession of Swedish Pomerania, the dukedom of Bremen and Verden sold by the Danes to Hanover. He was himself immediately besieged in Stralsund by an overwhelming army of allied Russians, Danes, Saxons, and Prussians, and though he did wonders of bravery, he was compelled to evacuate the city on the 23rd of December, 1715, and crossed in haste to Lund, in order to take measures for the defence of his own coasts. That winter he spent with Görtz in striving to restore the national finances. In the beginning of February he marched into the mountains of Norway to avenge himself on Denmark, to which it belonged, but with indifferent success. He spent again the winter in Lund, planning with Görtz a treaty with Russia. There was a talk of a combined Russian and Swedish army landing on the coast of Scotland to drive George I. thence; but no sooner did his affairs appear to be taking an auspicious turn, than he once more invaded Norway with twenty-seven thousand men. One division, under General Armfeld, commenced its march in August, 1718, but was overtaken in the mountains by winter, and perished almost to a man. Whole regiments seized by the frost stilted as they stood in the ranks erect; whole squadrons lay overwhelmed in the snows, and others slipping from the ice-covered rocks, perished in the abysses below. Long after these mountains were thronged with bears and wolves, which had been drawn there by the scent of the remains of Armfeld's host, and were reckoned the best hunting grounds in Norway. Scarcely five hundred of this unfortunate ten thousand reached Sweden again. Charles reconducted his division by the southern route to Friedrichshall, where on Sunday evening, December 11, 1718, about nine o'clock, he walked out with two French officers, the chief engineer, Megret, and the lieutenant-general, Siquier, to note the progress of the siege. The officers left him resting his arms on the breastwork of a battery, watching the firing from the city. Soon after, Megret returned with some of the officers, when Siquier met them and informed them that the king was dead. On reaching the place they found him leaning with his back against the wall, his hand on his sword, his head and gloves bloody. He was shot through the head, as was at first supposed, by a ball from the city. But it was discovered that the ball was a pistol-ball, and it was then recollected that not even a musket-ball could have reached him at that distance. There was no doubt that he had fallen by the hand of an assassin, and the suspicion fell on Megret. As there was a violent opposition party in Sweden, it was believed that the nobles of that party had bribed these two Frenchmen to commit the murder.

The passion of Charles for war amounted to little short of insanity. For the rest he had many virtues. He despised luxury and effeminacy. He was most simple and temperate in his diet, he avoided pleasures and amusements, eat coarse bread, banished wine from his table, and dressed in a coarse blue coat with brass buttons, leather breeches, huge jack-boots, and buff-leather gloves, reaching nearly to his elbows. He lay on the bare ground in his camp, like his soldiers, wrapt in his mantle. In the most desperate circumstances his spirit never gave way, and in the brief times of peace he was busily engaged in promoting the commerce and the maritime affairs of the country, and in enjoying the company of men of genius and learning, whom he allowed incomes to enable them to travel. The life of Charles has been written by his chaplain, Norberg, and by Voltaire; his military achievements by Adlereld.—W. H.

CHARLES XIII., King of Sweden and Norway, second son of Adolphus Frederick and Louisa Ulrica, sister of Frederick the Great, born in 1748; died in 1818. He was carefully trained to the naval service, having been appointed at his birth to the dignity of high admiral. In the revolutionary troubles of 1772, he powerfully supported his brother Gustavus III., who, to show his gratitude, named him governor of Stockholm, and duke of Sudermania. Gustavus having been assassinated in 1792, his son, a minor, acceded to the throne, under the tutelage of his uncle Charles, to whom the late king, by testament, had assigned the regency. Having, during the reign of his brother,

acquired considerable distinction as a commander in the wars with Russia, he readily established the credit of the new government, and succeeded in intimidating Denmark and other hostile states into treaties of peace. When his nephew Gustavus IV. attained his majority in 1796, Charles at once resigned his post of regent, and retired into private life. In 1809, on the abdication of Gustavus, he was called to the vacant throne, and the estates of the kingdom formally proscribing Gustavus and his descendants in the excess of their zeal for the interests of the new monarch. Two years afterwards, the death of the prince of Holstein, who had been named heir-apparent, was followed by a burst of popular feeling in favour of Bernadotte, which constrained Charles, not unwillingly, to recognize the famous marshal as his heir and successor. This done, he ceased to take an active part in the business of government, confiding it with a confidence which was repaid by affection, to the more energetic hands of his adopted son.—J. S., G.

CHARLES XIV. See BERNADOTTE.

VII.—CHARLESSES OF NAPLES.

CHARLES D'ANJOU, King of Naples and Sicily, was born sometime between 1220 and 1226, and died in 1285. He was the youngest son of Louis VIII., and was made duke of Anjou and Provence. He took part in the eastern crusade of his brother, St. Louis, and on his return exercised, as the right hand of the regent, great authority in France. His ambition subsequently began to look towards Italy, and the death of the Emperor Conrad IV. gave him hopes of success in that quarter. Pope Urban, jealous of the house of Suabia, which had reigned in Naples more than half a century, offered the crown of the Two Sicilies to Charles on condition that he would conquer them from Manfred, their present usurper, and hold them as a fief of the holy see. Upon this a crusade was proclaimed against Manfred, as an enemy of christendom. Charles d'Anjou at the head of the finest chivalry in Europe, encountered him on the banks of the Calora; Manfred, who had an inferior force, seeing that the battle went against him, plunged into the midst of the enemy and fell. But Conradin, grandson of Frederick II., and the heir to the throne, was still living. When he was sixteen years old the eyes of the people no less than the hopes of the Ghibellines, who now felt the unmitigable severity of the French rule, were turned towards him. Conradin, who inherited the spirit of his father, at the head of the chivalry of Germany penetrated into Lombardy. The Ghibellines sent him reinforcements as he went onwards; but the battle of Tagliacozzo, in consequence of a cruel stratagem of Charles, proved fatal at once to the hopes of Italy and the house of Suabia. Conradin was taken and butchered after a mock trial. The cold-blooded cruelty and habitual perfidy of the new rulers led to the terrible tragedy known in history as the Sicilian Vespers, in which about eight thousand Frenchmen were massacred when the bells were ringing to evening service. After this the crown of Sicily was given to Don Pedro of Arragon, whose admiral, Roger di Loria, burned Charles' fleet before his eyes. Charles, whose rage was unbounded at the loss of Sicily, was making preparations for the recovery of that island, when he fell sick at Foggia.—R. M., A.

CHARLES II., surnamed THE LAME, King of Naples, son of the preceding, was born in 1248, and died in 1309. He was made prisoner of war by the Arragonese in a naval action, and recovered his liberty only on this condition, among others, that the pope should be allowed to crown James of Arragon king of Sicily. He himself was crowned at Rieti, in 1289, king of Naples, Apulia, and Jerusalem. The crown of Hungary came to him on the death of his wife's brother Ladislaus, king of that country, but he gave it to his son Charles Martel. Charles II. greatly contributed to the embellishment of Naples, to the prosperity of the university, and the increase of monasteries. He was succeeded by ROBERT, his third son.—R. M., A.

CHARLES III., DURAZZO, called THE LITTLE, King of Naples and Hungary, was born in 1345. Son of the count of Gravina, he was adopted by Joan I., queen of Naples, who afterwards disavowed him in favour of Louis, duke of Anjou. Upon this, Charles Durazzo, stirred up by Urban VI. and the king of Hungary, the sworn foe of Joan, raised an army, with which he entered Naples, and took possession of the kingdom. Joan, because she refused to renew her act of adoption, was, by order of Charles, shut up in the castle of Muro, where she was smothered to death among mattresses. The reign of Charles in Naples was neither long nor happy. He was in a short time

excommunicated by the pope, who also placed his kingdom under an interdict. In 1385, at the invitation of the nobles who were tired of the regency of Elizabeth, he accepted the crown of Hungary. But in the end of the following year he was, at the instigation of Elizabeth and in her own presence, assassinated at Buda.—R. M., A.

CHARLES IV., King of Naples, Sicily, and Spain. See CHARLES V., emperor.

CHARLES V., King of Naples, Sicily, and Spain. See CHARLES II. of Spain.

VIII.—CHARLESSES OF SAVOY AND SARDINIA.

CHARLES I., THE WARRIOR, Duke of Savoy, born at Carignano in 1458; died at Pignerol in 1489. He was brought up at the court of Louis XI. of France. On the death of that monarch he went to Turin, and assumed the government of his duchy. It was at the court of this accomplished prince that the celebrated Bayard first donned his armour.—J. S., G.

CHARLES II., or CHARLES JOHN AMADEUS, Duke of Savoy, son and successor of the preceding, born in 1489; died in 1497.

CHARLES III., THE GOOD, Duke of Savoy, born in 1486; died in 1553. His reign extended over forty-nine years. Menaced on one side by the emperor Charles V., and on another by Francis I., he yielded now to the threats of one, and now to the cajoleries of the other, but still managed to retain possession of his estates. He repressed with considerable severity an insurrection of the Genevese.—J. S., G.

CHARLES EMMANUEL I., THE GREAT, Duke of Savoy, born in 1562; died in 1630. He succeeded his father, Phillibert Emmanuel, in 1580. Ambitious and meddling to an extraordinary degree, he attempted, on the death of Henry III., to seize the crown of France; successively laid claim to the kingdom of Cyprus, the province of Macedonia, and the duchy of Mantua; attacked in a treacherous manner the Genevese; carried on a war with Genoa; and on the death of the Emperor Matthias, he became a candidate for the imperial crown. He was ultimately despoiled of most of his estates by Louis XIII.—J. S., G.

CHARLES EMMANUEL II., Duke of Savoy, son of Victor Amadeus I., born in 1634, succeeded his brother Francis in 1638, and died in 1675. He was a munificent patron of the arts, and by an enlightened system of policy foreign and domestic, improved the commerce of his estates.—J. S., G.

CHARLES EMMANUEL III., King of Sardinia, was born in 1701, and died in 1773. He came to the throne on the voluntary abdication of his father, Victor Amadeus I. Charles, who was a warrior prince, joined France and Spain in the war against Austria, and, after the victory of Guastalla, succeeded in adding Novara and other valuable territories of the Milanese to his dominions. In 1742 having changed his political connections, he fought by the side of Hungary against his former allies. Charles was a mild and prudent ruler, and the return of peace afforded him opportunities, which he eagerly embraced, of fostering the prosperity of his country. A new code of laws known as the *corpus carolinum*, was published under his direction in 1770. The pope gave him the right of conferring ecclesiastical dignities, and of subjecting the clergy to taxation.—R. M., A.

CHARLES FELIX, GIUSEPPE MARIO, King of Sardinia, was born in 1765. He was the fourth son of Victor Amadeus III., and took the title of Duke of Genoa. When the revolutionary disasters of the end of last century overtook his family, he followed it into Sicily, and became in 1799 viceroy of that island. He married in 1807 Maria Christina of Naples, sister of the queen of Louis Philippe, and obtained the crown of Sardinia on the abdication of his brother, Victor Emmanuel, in 1821. He died without issue in 1831.—R. M., A.

CHARLES ALBERT, King of Piedmont and Sardinia, born prince of Savoy Carignano, a younger branch of the ducal family of Savoy, on the 2nd October, 1798. The dukedom of Savoy having been overthrown by the French revolution, Piedmont became a French department, and Charles Albert was educated in France. On the fall of Napoleon I. the prince returned to Piedmont. In 1817 he married the Austrian arch-duchess, Maria Teresa, daughter of the grand duke of Tuscany. By this princess he had two sons; the eldest, Victor Emmanuel, succeeded him on the throne of Piedmont. On the partition of Italy by the treaties of 1815, Geneva, Piedmont, and Sardinia fell to the share of the house of Savoy. Against this partition of Italy among foreign rulers, however, the spirit of Italian nationality rebelled, and the association of the carbonari spread over the whole

peninsula, and penetrated all ranks of society. It was arranged that Naples should commence the revolution, and that Piedmont should follow up the movement; both states were then to unite to expel the common enemy, Austria. The Piedmontese carbonari affiliated the prince of Carignano, and accepted him as leader of the constitutional movement. The Neapolitan revolution was promptly victorious, the Piedmontese was equally successful, and the Spanish constitution was proclaimed in all the important cities of the two kingdoms. In 1821 the king of Piedmont abdicated in favour of his brother Charles Felix, and nominated the prince of Carignano regent, until the arrival of the new king. The prince publicly swore fidelity to the constitution. Terrified, however, by the proclamation with which the new king heralded his arrival at Turin, he fled secretly at midnight to Novara, thence, after a conference with the general of Felix's forces, to Milan; nor was it until after three years' time, and at the price of bearing arms in Spain against the very constitution he had conspired to establish and sworn to maintain in Piedmont, that Charles Felix permitted him to return to his country.

On the death of Charles Felix in 1831, Charles Albert ascended the throne. The secret association of "Young Italy" was founded by Mazzini, already an exile, at Marseilles in this year. Its aim being the overthrow of all the existing Italian governments, for the creation of the unity of Italy by means of a war of the whole people, it was even more dreaded by the princes of Italy than carbonarism; and the edicts of Charles Albert condemned to the galleys all guilty of perusing or possessing the journal of the association. In 1833 an accident revealed to the government a trace of the vast conspiracy; indiscriminate arrests commenced, and fresh discoveries were the result. From this time forward, says Brofferio in his History of Piedmont, "the external policy of the Subalpine government may be briefly summed up by the words 'Rome and Vienna,' the internal may be expressed by 'the jesuits and the police.'" On the other hand, the king encouraged industry and the arts, promoted railways, and erected many useful public works, from which reforms the court party rapturously prophesied the pacific redemption of Italy, though the marriage of the duke of Genoa with an Austrian princess in 1842 was significant of opposite tendencies. In 1843 the centre of Italy was the scene of constant and threatening agitations among the people. In 1844 occurred the attempt of the Bandiera in Sicily. In 1847 the Sicilian revolution broke out, not alone in the name of reform and constitution, but of "Italy and Nationality," cries which were instantly echoed in every corner of Italy. Rome, Tuscany, and even Naples arose, and obliged their sovereigns to grant them representative governments and a national guard. Not until all the other princes of Italy had yielded, and when longer resistance was impossible, did Charles Albert concede to the threats of his subjects the constitution he had denied to their entreaties. A few days after, the news arrived of the insurrection of Milan and expulsion of the Austrians (1848). The excitement of the Piedmontese people could no longer be restrained; they loudly demanded to be led against the Austrians, and threatened to overthrow the government in case of a refusal. The king was compelled to yield; but before crossing the frontier, he addressed despatches to the governments of Europe, and especially to England, protesting that the step was taken under compulsion and in order to save his crown, as the republic would inevitably be proclaimed were he to delay. The Austrians—disorganized by their defeat at Milan, acted merely on the defensive, and fled, rather than retreated, into the fortresses of Verona, Mantua, Peschiera, and Legnago. Hampered by treaties with the other European governments, however, Charles Albert was unable to prosecute the war with vigour. He disbanded all the volunteers, withdrew those already in action from the passes of the Alps, leaving them and the port of Trieste open to the enemy, and sat down with the whole of his army before the fortresses. At the end of four months the Austrian general, Radetsky, having resumed the offensive, the king was defeated in two engagements, and obliged to make a precipitate retreat on Milan. The Milanese, on the approach of the Austrians, appealed to Mazzini to organize the defence of the city. He nominated a committee of defence who displayed extraordinary energy, and had already commenced vigorous preparations for resistance, when the Piedmontese army appeared before the walls. The king entered Milan, presented himself to the people, declared

that his army would protect them, and swore that he and his sons would die in their defence. He had, however, secretly signed an armistice with Radetsky, the terms of which included the surrender of Milan, and he had no sooner thus quieted the people, than he fled privately from the city and withdrew his army into Piedmont, leaving Milan exposed to the merciless Austrians. On the expiration of the armistice, the renewed threats of his subjects, and it is thought also his own remorse, compelled the king to continue the war. The Piedmontese, 100,000 strong, under General Chrzanowsky, and the Austrians, 110,000 strong, under Radetsky, again confronted each other at Novara. The king exposed his own life so rashly during the engagement as to create the impression that, tortured by remorse, he wished to die; and the rout of the Piedmontese was so rapid and complete, though only a small portion of the army was engaged, that it was universally attributed to treachery in high quarters. The general-in-chief, General Ramorino—the same man who had betrayed Mazzini in Savoy—and even the king's eldest son, were accused by popular rumour, and it was found necessary to appease the public indignation by the execution of Ramorino for treason. The king again demanded an armistice, but the terms offered by Radetsky were so humiliating, that Charles Albert preferred to abdicate rather than submit. He immediately retired to Portugal to a small villa on the banks of the Douro, where he expired, a prey to grief and remorse, on the 28th July, 1849.—E. A. H.

CHARLES, JACQUES ALEXANDRE CESAR, a famous French natural philosopher, born at Beaugency in 1746; died at Paris in 1823. Attracted to the study of electrical science by the discoveries of Franklin, he gave prelections on that branch of natural philosophy to crowded Parisian audiences, from the fashionable as well as the scientific portion of which, his ingenious and flashy experiments never failed to elicit rapturous applause. The fame which he acquired in this way was little, however, compared with that which attended his experiments in the science of aërostation. Substituting hydrogen gas for the heated air used by the brothers Montgolfier in their experiments, he prepared a balloon of immense compass, and in company with Robert made an ascent from the garden of the Tuilleries, the triumphant success of which had some results advantageous both to the fortunes and the fame of the aëronaut, for he was assigned by Louis XVI. apartments in the Louvre, and shortly afterwards admitted into the academy. In his apartments in the Louvre, the amiable and retiring philosopher was surprised by the unwelcome visitors who crowded from the faubourgs to the Tuilleries on the memorable 10th of August, 1792. It was an experiment, on the success of which the life of the philosopher depended, when he raised his voice to remind the furious mob of their delight at the success of his aerial voyage two years before. Charles' lectures, and many of his scientific papers, have merited the eulogies of Franklin and Biot. He was latterly occupied with the sciences of optics and acoustics, which he enriched with the results of numerous ingenious experiments.—J. S., G.

CHARLETON or CHARLTON, WALTER, a learned physician, born at Shepton-Mallet in Somersetshire in 1619. He was educated at Oxford, where he had for tutor Dr. Wilkins, afterwards bishop of Chester. Charleton was an ardent student of philosophy and medicine. He received his doctor's degree in 1642, and was soon after appointed one of the physicians in ordinary to the king, who at that time (the beginning of the civil wars) kept his court at Oxford. He removed to London, however, before the royal cause was completely ruined, and there, having been admitted of the College of Physicians, met with considerable success as a practitioner. He also became physician in ordinary to Charles II., and was one of the first members of the Royal Society. Charleton engaged in a controversy with Inigo Jones about the origin of Stonehenge; lectured on anatomy in the college theatre in 1683, and was chosen president of the College of Physicians in 1689. He is famous also for his defence of Harvey's claim to the discovery of the circulation of the blood. His last years were spent, in consequence of his straitened circumstances, in the island of Jersey. The following are some of his numerous writings—"De Lithiasi Diatriba," Leyden, 1650; "Natural History of Nutrition, Life," &c., London, 1658; "Exercitationes Physico-Anatomicæ de (Economia Animali)," 1659; "Natural History of the Passions," 1674; "Epicurus, his Morals," 1655. The last work has been translated into several languages.—R. M. A.

CHARLEVOIX, PIERRE FRANÇOIS XAVIER DE, a French

jesuit, the historian of New France, as the French possessions in North America were called, was born at St. Quentin, October 29th, 1682, and died at La Flèche, February 1st, 1761. Early in life he was a teacher of philosophy and the languages in a jesuit seminary. Being detailed for service on the missions in Canada, he embarked at Rochelle in July, 1720, and soon after his arrival in America undertook a long journey of exploration. He made large collections for the history of Canada, and an account of the native tribes, embracing his own observations; and in 1744 his work appeared, in 3 vols. quarto, entitled a "History of New France." It was translated and published in London in 1769. Though containing much extraneous matter, and showing considerable credulity and not much elegance of style, it is still the chief authority for the history of French America.—F. B.

CHARLOTTE (CAROLINE AUGUSTA), Princess of Saxe-Coburg, the only child of George IV. of England by his queen Caroline, was born 7th January, 1796. As heir to the English throne she was looked upon with deep interest by the nation, to whom her warm affection, great benevolence, and more than usual intelligence had endeared her. Stories are told, however, which show that she combined with these qualities a very irritable and imperious temper. It was long thought that the prince of Orange was her accepted lover, but in 1816 she was married to Prince Leopold, king of the Belgians. Besides the usual dowry and outfit, an annuity of £50,000 was settled on the royal couple during their joint lives. The hopes of the nation arising from this auspicious union were soon blighted by the death of the princess in childbed, November 6, 1817. The sad event caused deep lamentation throughout the country.—J. B.

CHARLOTTE DE SAVOIE, Queen of France, was born in 1445. A daughter of Louis, duke of Savoy, she was betrothed in 1450 to the dauphin, afterwards Louis XI., against the wishes of his father, Charles VII. It was chiefly the influence of the duke of Burgundy, in whose territories the dauphin for many years found an asylum, that brought about this alliance. The marriage, which proved an unhappy one, was consummated at Namur in 1457. The dauphin, after succeeding to the throne, broke with his former protectors, the houses of Savoy and Burgundy. His queen shared the consequences of his displeasure against her father's court. He kept her shut up with a small train of attendants, now in one castle and now in another. She founded a convent of the order of St. Francis at Paris in 1472, and died three months after the king in 1483.—R. M. A.

CHARMIDES, an Athenian philosopher, son of Glaucon, cousin to Critias, and uncle by the mother's side to Plato, who, in the dialogue which bears his name, introduces him as a youth of surpassing beauty. In 404 B.C. he was one of the ten magistrates appointed by Lysander when he took Athens, and was slain fighting against Thrasybulus at the Piræus.—J. S., G.

CHARNACÉ, HERCULE-GIRARD, Baron de, a French soldier and diplomatist, was born towards the end of the sixteenth century. He was connected by marriage with the family of Richelieu. The cardinal appointed him ambassador to Sweden, where he concluded the treaty of Berwalde with Gustavus Adolphus in 1631. He was employed in other embassies, and fell in the trenches at the siege of Breda in 1637.—R. M. A.

CHARNOCK, JOHN, a writer of some note, was born in 1756. After studying at Winchester and Oxford, he retired to his father's house, and applied himself to the study of naval and military tactics. He entered the naval service as a volunteer, and attained considerable distinction. Retiring into private life, he sought to support himself by literary labour. Neglected by his friends, and though heir to a considerable fortune, he fell into debt and died in the prison of King's Bench, 16th May, 1807. His principal publications were—"Biographia Navalis," 6 vols., 1794, a very valuable work; "A Letter on Finance and on National Defence;" "A History of Marine Architecture;" and a "Life of Lord Nelson."—J. B.

CHARNOCK, STEPHEN, a learned nonconformist divine, was born in London in 1628. He was for a time senior proctor at Oxford, whence he went to Dublin, where he was admired as an eloquent preacher. After the Restoration he refused to conform, removed to London, and became minister of a dissenting church. He died in 1680. The greater part of his writings appeared after his death. They are—"Several Discourses of the Existence and Attributes of God," 1682; "Works," 1684; and "Two Discourses of Man's Enmity to God, and of the Salvation of Sinners," 1699.

CHARON OF LAMPUSACUS (on the Hellespont), a Greek historian who lived before Herodotus, flourishing about 464 B.C. He wrote a history of his native town; of Persia; and of Crete; but only fragments have reached us.—J. B.

CHARONDAS, a lawgiver of Catania, who flourished before the time of Anaxilaus, tyrant of Rhegium, B.C. 494-476. This tyrant abolished the laws of Charondas. They were long in use in Catania and other cities of Chalcidian origin in Italy and Sicily. Charondas is said to have been a disciple of Pythagoras. A tradition declares him to have fallen by his own hand in obedience to a law he had himself enacted against the wearing of arms in the popular assemblies—this law being inadvertently violated by him on the occasion of his being hastily summoned to quell a tumult which had arisen in an assembly of the people.

CHARPENTIER, FRANÇOIS, born at Paris in 1620. His talents were of so high an order that the great minister, Colbert, engaged his pen to forward some of his own comprehensive projects for the public good. It was Charpentier who, by desire of Colbert, drew up a paper in favour of the plan of an East India company, which, after promising beginnings, was destined to yield to British ascendancy in that part of the globe. It was he also whom the minister placed at the head of the Académie des inscriptions et belles-lettres, which he had lately founded. A writer on the fine arts, he took the side of the moderns against the ancients, but the prejudices of the day were too strong for argument. He died in April, 1702.—J. F. C.

CHARPENTIER, FRANÇOIS-PHILIPPE, a French mechanic, born of poor parents at Blois in 1734. The discovery of a process by which he took coloured copies of the great masters, was the first of a long series of useful and ingenious inventions which his country owed to the genius of Charpentier. He refused many tempting offers of place and pension, and died in poverty in 1817.—R. M., A.

CHARPENTIER, JACQUES, a French physician and philosopher, born in 1524; died in 1574. For sixteen years he taught philosophy with prodigious success in the college de Bourgogne. He then studied medicine, and became dean of the faculty of Paris in 1568. Charpentier was devoted to scholasticism, and defended it, though too bitterly, against the famous Peter Ramus. He is even suspected of having been accessory to the murder of his opponent.—R. M., A.

CHARRIERES, MME. ST. HYACINTHE DE, born at the Hague in 1740. This lady, although of Dutch family, has left writings which French critics pronounce to be, for style and sentiment, worthy of an eminent place in their literature. At an early age she married a Swiss gentleman, who lived as tutor in her father's family, and whom she accompanied to his native land. They lived for some time in the neighbourhood of Neuchâtel, and afterwards at Lausanne. Her letters, descriptive of Swiss scenes and manners, are singularly graphic. Besides her published correspondence, she has left "Trois Femmes," a novel. She died, December, 1805.—J. F. C.

CHARRON or LE CHARRON, PIERRE, the son of a bookseller, who had twenty-five children, was born at Paris in 1541. He was sent to study law, first at Orleans, and then at Bourges, where he obtained the degree of doctor. Having returned to Paris, he practised as an advocate in the court of parliament for five or six years; but, meeting with little success, he embraced the ecclesiastical state, and speedily obtained great reputation as a preacher. Arnaud de Pontac, bishop of Bazas, promoted him to be a canon in his diocese. The queen named him her preacher in ordinary, and the king, though a protestant, heard him with pleasure. After an absence of seventeen years, he returned to Paris in 1585, to accomplish a vow which he had made to enter the monastery of Chartreux. He was refused admission on account of his years, the austerities of the order requiring all the vigour of youth to sustain them. Having experienced a similar refusal from other religious orders, he considered his vow to be no longer binding, and resumed his preaching, first at Agen, and then at Bourdeaux. In this latter place he contracted a friendship with the celebrated Montaigne—a friendship which gave to his thoughts and character a new complexion. Montaigne, having no children, permitted Charron to bear the arms of his family, and he seems also to have inoculated him with the light and sceptical humour by which he was himself distinguished. Charron testified the sincerity of his friendship by bequeathing all he had to the brother-in-law of Montaigne. The first work of Charron was published anony-

mously at Cahors in 1594, at Brussels in 1595, under the name of Benoit Vaillant, and also at Bourdeaux, under the name of the author. It was entitled "Les Trois Verités," and was intended to prove:—1st, That there is a God whom we ought to worship; 2nd, That of all religions the christian is the only true one; 3rd, That of all christian communions the Roman catholic is the only safe one. This treatise attracted at once the condemnation of Duplessis Mornay, and the favour of Ebrard of Saint Sulpice, bishop of Cahors, who appointed the author vicar-general of his diocese, and canon theological of his church. In 1600 Charron published at Bourdeaux, "Discours Chretiens," a work as irreproachably orthodox as the preceding. But the work by which he is now best known, "De La Sagesse," did not appear till the following year, at the same place. When he was in Paris in 1603, superintending a second edition of this work, Charron died suddenly in the street of an attack of apoplexy. The issuing of this work was opposed by the rector of the university of Paris, by the Sorbonne, and by the parliament. At length it appeared with many changes and mutilations in 1604. A third edition, from the MS. of the author, was published at Paris in 1607; the subsequent editions have been too numerous to be specified. His collected works were published in quarto at Paris, in 1635, with a life of the author by Michel de la Roche-maillet. There have been two translations into English of the treatise "De La Sagesse;" the latest by George Stanhope, D.D.

In his treatise, "De La Sagesse," Charron manifests much of the sceptical humour of his friend Montaigne. He almost equals him in the eloquence with which he delineates the miseries of human life (Liv. i. c. 6). His comparison of the state and faculties of man with those of the inferior animals is full of severe satire (Liv. i. c. 8). And notwithstanding his arguments in favour of religion, and especially of the christian religion, as professed by Roman catholics, he speaks of the various forms of worship among men as introduced and upheld not by reason and conviction, but by custom and policy. According to him true religion is an affair of the heart, and not the ceremonial or superstitious worship of God. External forms are not altogether to be neglected; but they should be in accordance with reason, and should be observed merely as the means of awakening and cherishing that true worship which is internal. In a similar spirit he dwells with complacency upon the differences in the opinions, customs, laws, and morals of men. He represents all knowledge as coming from the senses, and all our faculties as the results of organization and temperament (Liv. i. c. 12). And as to the immortality of the soul he speaks of it, as "a thing the most generally, religiously, and usefully believed, and the most feebly proved or established by reason" (Liv. i. c. 15). Notwithstanding these dangerous statements, the treatise, "On Wisdom," contains views which show the author to have been in many respects before the age in which he lived. In the first book he notices what is peculiar to our several senses; enumerates the different faculties of understanding, memory, and imagination; and hints at classifying human knowledge with reference to them, as was subsequently done by Bacon. He defines passion (Liv. i. c. 20) as a violent movement of the soul in its sensitive part, prompting it to seek what is apprehended as good, and to shun what is apprehended as evil. He analyses the different forms which passion assumes, as love and hatred, hope and fear, &c., and urges the great importance of knowing ourselves psychologically. In the second book he lays down the general rules of practical wisdom; and these rules, although savouring somewhat of selfishness and scepticism, contain much sound sense and knowledge of the world. The third book treats of the four cardinal virtues, and the rules to be observed in the practice of them by the different ranks and conditions of men. His style is lively; his remarks striking, and his spirit daring. If not always original, he seldom fails to embellish what he has borrowed; and although inferior to Montaigne in the vigour and richness of his thoughts, he often reminds us of his sarcasm and naïveté. The treatise "On Wisdom," notwithstanding the censures to which it was exposed, had astonishing success; and there can be little doubt that it had a beneficial effect in liberalizing the public mind, and preparing the way for more free and independent thinking than was then common. The errors which it contained were not unmingled with great and important truths, which attracted attention, and produced fruit; and the scepticism which pervades it seems in some degree to have been assumed, as it is not consistently maintained. Like many others, by his love of saying some-

thing startling, he seems sometimes to have been seduced into saying more than he really meant or thought. Dr. Stanhope, his translator, says, "he was a good man, and a good christian;" and Buhle, the historian of philosophy, did not think he was liable to the charges of infidelity which were levelled against him. Sir William Hamilton (*Lectures*, vol. i., p. 89) calls him "the pious Charron."—W. F.

CHARTIER, ALAIN, born at Bayeux between 1380 and 1390. The dates of his birth and death are uncertain. Du Chesne and Pasquier state his death to have occurred in 1458; by others it is referred to 1449. He was early distinguished at the university of Paris, and his whole afterlife was a succession of triumphs. He was successively secretary to Kings Charles VI. and VII.; and there is some reason to think he had been in the same office to King Charles V. The traditions of his family make him archdeacon and prebendary of the cathedral of Notre Dame, and send him as ambassador to Scotland. He had the reputation of being one of the cleverest and also one of the ugliest men of his day. Margaret of Scotland, wife of the dauphin, who afterwards became Louis XI., saw him asleep and kissed him. "How kiss so ugly a man?" asked the lord in attendance, for the favour was a public compliment. "I do not kiss the man," said she, "but the lips from which have proceeded so many brilliant sentences."

Alain wrote earnestly on subjects of church discipline, and vindicated the marriage of the clergy as the only cure for some of the abuses. He was best known as a poet. His poems were eminently national and patriotic. At a time when almost all France was in the possession of the English he published the "Quadrilogue Invectif," a discussion in which France, the noblesse, the people, and the clergy are the interlocutors; and also, soon after the battle of Agincourt, the "Livre des Quatier Dames," in which each of four ladies laments her lover lost by death or captivity on that fatal day. Another of his publications was the "Bréviaire des Nobles." Of this book it is said that the pages and young gentlemen at court were obliged to get passages by heart, and to read it as regularly and as religiously as priests their breviary and devotional offices. Among other works written by Chartier, or attributed to him, there is one which professes to instruct us on the nature of the fire of hell, another is on the wings of the cherubim.

Alain Chartier contributed his part to the moral and political regeneration of his country. His songs aided in the creation or the diffusion of a sound public opinion. They echo or predict the great facts of the period. A strong reason with us that his death occurred in 1449 is, that the English abandoned their conquests in Normandy in 1450, and there is no song of exultation from Chartier on the event.—J. A., D.

CHARTIER, GUILLAUME, born at Bayeux about 1400; died at Paris in 1472; brother of Alain and Jean Chartier. Guillaume Chartier was councillor to the parliament of Paris, and afterwards bishop of Paris in 1447. In 1455 he was appointed one of the commissioners to examine the process against Joan of Arc, with the view of repairing the injustice to her memory. The bishop of Paris was for awhile a favourite of Louis XI.; but taking part with the leaguers, he so provoked the king, that his death occurring seven years after in no way softened his displeasure. An epitaph which recorded the virtues of the bishop the king ordered to be removed.—J. A., D.

CHARTIER, JEAN, born at Bayeux; brother of Alain and Guillaume Chartier. The date of his birth is not recorded. He died about 1462. A Benedictine, Jean Chartier was chantre of the abbaye of St. Denis. From the time of Suger one of the monks of St. Denis was appointed to draw up the annals of the kingdom, and Jean Chartier filled this office for the reign of Charles VII. On the accession of Louis XI. another annalist or chronicler was appointed. Godefrin has published what he calls "L'Histoire de Charles VII., par Jean Chartier," but with such alterations and corrections as essentially to vary the character of the book.—J. A., D.

CHARTIER, RENÉ, a French physician, born in 1572; died in 1654. Chartier was a versatile scholar, and prior to his receiving his doctor's degree in 1608 had taught rhetoric and mathematics. He was afterwards attached to the French court, and in 1617 succeeded Etienne de la Font in the chair of surgery in the royal college. In 1624 he went to Spain, afterwards into Italy, and eventually followed Henrietta Maria into England. He wrote several medical works.—R. M., A.

CHARTRES, RENAUD DE, cardinal-archbishop of Reims and chancellor of France, was born about 1380. Chartres rose rapidly in the church, having obtained the archbishopric of Reims at thirty-four. He joined the cause of the dauphin, afterwards Charles VII., and reached also the highest office in the state. He was chancellor of France when Joan of Arc presented herself before Charles at Chinon. Elated with his honours and jealous of a rival, he frowned on the pretensions of the maid of Orleans. When she fell into her enemies' hands, he proved himself worthy to have such a suffragan as the brutal bishop of Beauvais. Chartres, however, managed to retain the king's favour. He died in 1444.—R. M., A.

CHASDAI or CHISDAI, BEN ISAAC, BEN EZRA, BEN SPROT, lived at the court of Abderrahman III., surnamed Naser Ledin Allah, 912-961, the greatest of the Omayyad khalifs of Cordova. Chasdai, who appears in Arab writings under the name of Iza ben Ishac, and of Hasdai ben Bashrout Israili, stood high in the favour of his sovereign, under whose sway the Moors of Spain reached nearly the zenith of their greatness in arms, arts, and commerce. "In the houses of the wuzier, Iza ben Ishac, and of Chalaf ben Abas el Zahrawi," says Conde, the historian of the Arabs in Spain, "both of them famous for their learning in all the sciences, and especially for their erudite works on medicine, conferences were held by men conversant with the physical sciences and astronomy, the science of numbers, and other studies. Both of them were physicians to the king; and they were so charitable that their houses remained open by day and night for the relief of the numerous afflicted that came to consult them."—(Conde, *Hist. de la Domin. de los Arabes en Esp.*, part ii. chap. 81.) At the court of Abderrahman, the splendour of which attracted visitors from many remote countries, Chasdai had valuable opportunities for inquiring into the condition of his brethren in various parts of the world. Through some envoys from Chorassan, and others from Hungary, he was informed of the existence of the Jewish kingdom of the Khazars on the shores of the Caspian Sea. He resolved on placing himself in communication with the king of Khazaristan, in which, after several fruitless attempts, he succeeded. Joseph, the king of the Khazars, replied to Chasdai's inquiries, confirming the statement referred to in his letters respecting the Judaism of the chakans (rulers), and adding that, at the same time, the professors of other religions enjoyed equal privileges in the land of the Khazars. Both these documents—viz., the letter from Chasdai ben Sprot to the king, and that from the king to Chasdai—were known in Spain in the twelfth century, as they are mentioned by Abraham ben David Hallevi, whose *Sepher Hakkebala* was written in 1161.—(Zunz on the *geographical writers of the Jews*, in Asher's Benjamin of Tudela, page 245.) They were printed by Isaac Akrisch at Constantinople in the sixteenth century, and by Buxtorf in the preface to his edition of *Cusari*, a philosophical work by the great Judah Hallevi. For a long time the genuineness of the correspondence between Chasdai and King Joseph—indeed the very existence of such a kingdom as that of the Khazars—was more than doubted by writers in good repute. Basnage, Wolf, Baratier, Buxtorf, are unanimous in rejecting the whole correspondence as a forgery; Jost, while acknowledging the authenticity of Chasdai's letter, is unwilling to admit the reply of King Joseph. The suspicions of these historians were nevertheless ill-founded. The genuineness of both letters is no longer impugned, since the principal objection—viz., the apocryphal character of a Khazarite kingdom—has been completely removed by the production of indisputable affirmative evidence from oriental and contemporary writers, all attesting that the kingdom of the Khazars played an important part in the history of Asia from the fourth to the eleventh century, and also that the chakan, Bulan, was converted to Judaism about the middle of the eighth century. By Jewish writers this conversion is ascribed to a Babylonian rabbi named Isaac Singari.—(*Ibn Haukal*; Massoudi, *Karamsin*; *Frühn*; Jost, *Geschichte*, vol. vi.; Carmoly, *Revue Orientale III.*; Zedner, *Auswahl*, p. 27; D'Herbelot, s. v. *Khazar*.)—T. T.

CHASE, PHILANDER, D.D., bishop of the protestant episcopal church in Ohio, and afterwards in Illinois, for some years senior bishop in America, was born in Cornish, New Hampshire, in 1775, and graduated at Dartmouth college in 1795. In 1805 he was invited to commence preaching in the city of New Orleans where he organized a church, became its rector, established a school, and made missionary excursions in the

vicinity. In 1811 he became rector of Christ church in Hartford, Connecticut; and in 1818 he was elected bishop of the newly-erected diocese of Ohio. He succeeded, not without the display of uncommon energy, in raising funds to found a college in connection with his diocese. It was established in the town of Gambier, and called Kenyon college. But no sooner was it in operation than difficulties arose between the professors and himself as bishop and *ex officio* president; and the final decision of the convention in 1831 being in favour of the former, he at once gave up all connection with the college; resigned his episcopate, and removed to Michigan where he began to labour again as a missionary. In 1835 he was elected bishop of Illinois, where the church was still younger and feebler than in Ohio. In this diocese he founded Jubilee college at Robin's Nest, Illinois. The remainder of his life was devoted to the interests of this new establishment, and the labours of his episcopate. Besides some pamphlets written to recommend his various projects, he published, in two volumes octavo, some very lively and faithful "Reminiscences" of his own labours and life. He died at Peoria, Illinois, in 1852.—F. B.

CHASE, SAMUEL, a judge of the supreme court of the United States, was in the practice of the law at Annapolis, Maryland, when the revolution began. He became a delegate to the provincial congress at Philadelphia in 1774, serving in that body for several years. In 1783 he was sent to England, as the Maryland agent to reclaim a large amount which had been intrusted to the bank of England. He removed to Baltimore in 1786; became a member of the state convention to consider the national constitution, 1790; and was appointed, the year after, chief-justice of the general court of Maryland. In 1796 he became associate-justice on the supreme bench of the United States, which office he held till his death in 1811. The memorable event of his history was in 1804, when, at the instigation of John Randolph, he was impeached for his conduct on the trial of Fries and Callender—a measure of mere party hostility. It resulted in acquittal by his judges and the senate, and that on almost every count triumphantly.—F. B.

CHASLES, LOUIS, born at Chartres in 1754. Originally a priest, he, like not a few of his order, adopted the principles of the Revolution in their most exaggerated form. He attached himself to Marat, and voted for the death of the king. Having been appointed by the convention commissioner to the army of the North, he took part in several engagements, and was wounded at Hondschoote. On his return to Paris he tried to continue Marat's journal, *L'Ami du Peuple*, with little success. He appealed in vain to the jacobin club, and was at last imprisoned, but again let loose by the directory. Ultimately his wife obtained a small situation, and he was admitted into the Hotel des invalides, where he died in 1826.—J. F. C.

\* CHASLES, MICHEL, one of the most eminent and original of modern French geometers, born at Epernon on 15th November, 1793. Very few writers of any age have so largely united erudition and the finest spirit of criticism. The essay which first distinguished Chasles was the "Aperçu sur l'origine et le développement des methodes en Geometrie," published in the memoirs of the Academy of Brussels. It glances over the whole range of geometrical methods, ancient as well as recent, detects their philosophical character, discriminates and defines their range. The modern reform in geometry begun by Carnot, and carried so much farther by Poncelet, has been almost completed by Chasles in a later work—the famous "Traité de Geometrie Superieure." In one respect it is a revolt against Des Cartes—asserting the sufficiency of purely geometrical ideas in dealing with geometrical problems. These new views did not for a considerable time make way in this country; but latterly they have taken firm hold of what may be termed the Dublin or Trinity college school. The merits of this geometer have long been recognized in France. Chasles has been appointed one of the presidents of the Academy of Sciences.—J. P. N.

\* CHASLES, VICTOR EUPHEMION PHILARETE, son of Louis, born in October, 1799, at Mainvilliers, near Chartres. Banned apprentice to a bookseller, a man who to the neglect of his business entered into political conspiracies against the Bourbons, young Chasles shared the opinions and feelings of his master, and early got into difficulties. He was arrested, but on account of his youth allowed to depart for England, where he completed his apprenticeship. After he had passed seven years amongst the English, studying their manners and literature

while following his ordinary avocations, he went to Germany, where he passed some years in the like pursuits. At length the *Journal des Debats* opened its columns to him; his letters upon English and German literature secured him a regular connection with this important journal. From the *Debats* to the *Revue des deux Mondes*, the transition was natural and easy, as nearly all the writers for the one were essayists in the other. His connection with the metropolitan press speedily led to his being appointed professor of foreign literature in the college of France, where his lectures upon living English and German writers gained him great popularity. Besides his professorship he holds the situation of keeper of the Mazarin library.—J. F. C.

**CHASSAIGNON, JEAN MARIE**, a French writer of eccentric mind and manners, the absurdest personage and the most savage moralist of his age, was born at Lyons in 1736, and died in 1795. On the outbreak of the Revolution he had the heroic courage to write in defence of priests, and against the vices of the people, and, a more dangerous undertaking still, offered to defend the king. Among the titles of his dissertations we notice, "Cataractes de l'Imagination;" "Deluge de la Scribomanie;" "Vomissement Litteraire;" and "Hemorrhagie Encyclopedique."—J. F. C.

**CHASSANÉE**. See **CHASSENEUX**.

**CHASSÉ, DAVID HENRY**, a Dutch general, born in 1765; died in 1849. He sided with the patriots in the Revolution, fled, returned with Pichegru, and again entered his country's service. He commanded the Dutch troops in the Peninsular war. After 1814 he again returned to Holland, and distinguished himself at Waterloo. He earned a European reputation by his long and gallant defence of the citadel of Antwerp, where he was besieged by the Belgians in 1830, and by the French in 1832. In the latter year he was made prisoner by the French, but was set at liberty the year after.—R. M., A.

**CHASSELOUP-LAUBAT, FRANÇOIS**, Marquis, a French general of engineers, born in 1754; died in 1833. He served with great honour in the Italian, Prussian, and Russian campaigns; was made general of a division in 1799, and grand officer of the legion of honour in 1811. At the Restoration, Louis XVIII. raised him to the dignity of a peer of France.—R. M., A.

**CHASSENEUX, BARTHELEMY DE**, Seigneur de Prelay, a French lawyer, born in 1480. After a sojourn in Italy, he began practising as an advocate in Burgundy, became in 1531 a counsellor of the parliament of Paris, and the next year rose to be president of that of Provence. He suspended the execution of a decree of the latter against the Vaudois of Cabrieres and Merindol. It took effect, however, with the utmost cruelty after his death in 1541.—R. M., A.

**CHASTEL or CHATEL, JEAN**, famous for his attempt on the life of Henry IV., was the son of a Parisian draper, born in 1575. The king, just returned from Picardy, was surrounded by his nobles, when Chastel, then only nineteen years of age, having slipped unnoticed into the chamber, dealt him a blow with a dagger. He luckily received but a slight wound. The ruffian, who was a tool of the jesuits, pretended that he was driven by the wickedness of his past life to do some great action. He was condemned to a fearful death.—R. M., A.

**CHASTEL**. See **DUCHATEL**.

**CHASTELAIN, GEORGES**, was born in the comté d'Alost in Flanders in 1403; died at St. Valenciennes in 1475. He claimed to be descended by his father from the noble house of Gavre and Mannes. At seven years of age some favourite opportunity offered of giving him the education fitted for a soldier. In after life he was known by the title of "L'Adventueux." While yet a boy, he visited France and England, and was favourably received at the court of Charles VII. Philippe le Bon, duke of Normandy, his own sovereign, was especially his patron. In 1443, Chastelain left the military service altogether for that of the duke. He was first his pannetier, or pantler; next he was styled his orateur, or littérateur; and finally bore the title of official chronicler of the house of Burgundy. A satire which he wrote in 1455 gave offence to the royal family of France, and his personal safety seems for a while to have been endangered. In 1467 Philip the Good was succeeded by his son, Charles the Rash, who continued Chastelain as chronicler. Chastelain now resided at Valenciennes, where he continued till the time of his death. A manuscript in the imperial library at Paris has a vignette of Chastelain presenting his book to the duke. Georges Chastelain was buried at Valenciennes, in the collegiate church of Salle-le-Compte, to which he is recorded as a great benefactor,

and, in particular, as the founder in that church of what would seem to have been an annual service in connection with his patron saint—La solennité de St.-Georges à l'honneur des tous chevaliers. The student of history will find it worth while to consult Chastelain. Impartial he is not. On the contrary, he writes with strong party feelings; but his sketches of individuals are always such as impress us with the feeling that we are looking at a portrait, and that the features are given from frequent and careful observation.—J. A., D.

**CHASTELARD, PIERRE DE BOSCOSEL DE**, would probably be forgotten as a poet, were it not for his insane passion for Mary Queen of Scots, that purchased for him at once an untimely death and literary immortality. Either fate was somewhat beyond his merits. In our days he would have finished his life in a lunatic asylum, and his fame would have terminated in an obituary entry. He was born in Dauphiné in 1540. Having the blood of Bayard in his veins, he was, as he said himself in his last moments, "sans peur," and to this he joined the qualities of a gentleman of his day and nation, much liveliness, a little poetry, and less religion. The poet Ronsard was his master and his model, and when Mary returned to Scotland after the death of Francis II., Ronsard addressed some complimentary verses to her, which he sent to her by Chastelard. The favourable reception accorded to him for the sake of his master and his mission, and in honour of his profession, by one whose attractions were irresistible, turned the brain of the conceited poet. He not only loved madly, but in his madness fancied his love was returned. The account of this untoward affair is differently stated by the French and English writers. The former insist that the queen encouraged the poet, that she replied to his amatory verses, inflamed his passion, excited his imagination, and threw him into a fever of delirium. The latter for the most part acquit Mary of impropriety. Be this as it may, the poet was discovered on the 12th February, 1562-3, concealed with a sword and dagger under her bed, by her ladies, before she entered her chamber. On being informed the next day of this outrage, the queen, says Miss Strickland, ordered the mad bard to quit her court. M. Dargeau asserts, that Mary not only pardoned, but encouraged him in his folly. At all events, she went next day to Burntisland, whither Chastelard followed her, and again gained entrance into her chamber. The queen's screams brought Moray to her rescue, whom she passionately ordered "to put his dagger in the villain." Moray calmed the queen, and reserved the poet for a legal trial, and he was condemned to be beheaded. To all entreaties for his pardon she was inexorable, and the sentence was put in execution. Mad to the last, the poor gentleman ascended the scaffold reading, not his breviary, but "The Hymn of Death" of his master Ronsard. On the whole, we think posterity will acquit Mary of giving any encouragement to poor Chastelard, though we cannot concur in the suggestion of Miss Strickland, that the story of Margaret of Scotland kissing Alain Chartier (see that name) was confounded with a similar liberty, said to have been accorded by Mary to Chastelard. It is quite impossible that such a confusion should take place between living persons and those dead more than a century.—J. F. W.

**CHASTELER, JEAN-GABRIEL-JOSEPH-ALBERT**, Marquis du, a famous general in the Austrian service, born at Mons in 1763. In 1789 his conduct at the assault of Belgrade, in the Turkish war, won for him the cross of Maria Theresa. From that time till the peace of 1802 he distinguished himself in numerous sieges and battles. In 1805 he was again in the field under Archduke Charles, and defeated Marmont at Gratz. Three years after he threw himself into the Tyrol, raised the brave mountaineers, and was almost master of the province, when he was totally routed by Lefevre. Chasteler was general of artillery in the campaigns of 1813-14, fought against Murat in 1815, and in the same year was appointed to the difficult post of governor of Venice, where he died in 1825.—R. M., A.

**CHASTELET**. See **DUCHATELET**.

**CHASTELET, PAUL HAY DU**, a French publicist, born in 1593; died in 1636. He was at first advocate-general to the parliament of Rennes, but subsequently became a hireling of the court. He was employed in a paper war against the house of Savoy. One of the judges of the marshal de Marillac, he published a libel against him during the trial. Richelieu had to commit him for this offence, but he was too useful a tool to be long imprisoned.—R. M., A.

CHASTELLUX, FRANÇOIS JEAN, Chevalier, and afterwards Marquis de, born at Paris in 1734; died there in 1788. He entered the army at the age of fifteen; at twenty-one became colonel of the regiment of Guyenne, and served from 1756 to 1761 in Germany. In 1780 he served in America with distinction. He wrote occasional verses with ease and grace, and was a poet in the sense of the word which is not meant to express more than a becoming accomplishment. Chastellux, however, was born and educated for better things; and he published in 1772 an essay which attracted great admiration—"De la félicité publique, ou considerations sur le sort des hommes dans les differens époques de l'histoire." The object of the work was to show that the happiness of mankind increases in direct proportion to their increased knowledge. Malesherbes gave the book high praise in saying that it was worthy of Chastellux's grandfather (D'Agessseau). Voltaire said it was superior to Montesquieu's *Esprit des Loix*. This work led to the author's becoming a member of the academy. In 1780 he published his "Travels in North America." His connection with the academy led to an eloge on Helvetius. He wrote some articles for the supplement to the *Encyclopedie*. He married in the year 1787 an Irish lady. The marriage was not happy. Some details connected with it are given in the edition, published in 1822, of his "Félicité publique."—J. A., D.

CHATEAUBRIAND, FRANÇOIS AUGUSTE, Viscount de, a French statesman and miscellaneous writer, was born at St. Malo in 1768. The youngest of ten children, his father intended him for the navy; but he showed an invincible repugnance for that as well as the military branch of the service. His early years were passed in solitude and ardent study, from which the attractions of the capital could not divert him. The attack on the Bastille, and the subsequent humiliation to which the royal family became exposed, roused the studious recluse into activity. As occurred throughout his subsequent career, his sensitive nature seems to have been operated upon in contrary ways; for while a sentiment of honour and family traditions bound him to the cause of royalty, he could not exclude certain sympathies with the republican movement. In 1791 he set out for America, inspired with the grandiose idea of discovering the north-west passage. Stopping at Baltimore, the monarchical young viscount paid his respects to General Washington, who, with a mild wave of his hand, cut short a florid strain of compliment, and then sensibly advised him to desist from his project of discovering the north-west passage. How far he might have proceeded, had not an English journal with startling intelligence fallen in his way, it would be needless to inquire. It was in a remote settlement of the backwoods that he read of the flight of the royal family to Varennes, and their arrest. The voice of honour, he tells us, whispered him to return; and he did return, with his genius awakened by the contemplation of nature, as seen in the wild magnificence of American savannahs, lakes, and forests. His family received him with joy; and, probably with a view to keep the wanderer out of adventures, provided him with a wife, whom he accepted with indifference, and never afterwards either loved or hated. Resolved upon joining the *émigrés* at Coblenz, he turned the assignats which made up his wife's fortune into money, and out of their depreciated value realized 12,000 francs, of which he lost 10,500 at a gaming table. Having joined in the futile attack on Thionville, he was left for dead in a ditch; was taken up by a few flying soldiers and thrown into an ammunition waggon, until arriving at Namur, they assigned him to the tender charities of the good women of the place, from whom he parted strengthened and refreshed to seek an asylum in Brussels. He proceeded after some time to Jersey to join the royalists, but stopped at Guernsey in a raging fever, was saved from death by the kind attentions of an English family, and finally made his way to London. During the reign of terror Chateaubriand was living in London, suffering such extreme poverty, that he declares himself to have passed three days without food; yet were his spirits sustained by a light-hearted cousin, who fought privations with his guitar and song. A clergyman employed him to assist in a work he was preparing for the press; and the clergyman's daughter showed herself not insensible to attentions, which went so far as to require explanation, when Chateaubriand rather tardily avowed his marriage. Losing his secretaryship, he taught French and translated books until 1797, when he appeared as an author, with his "Essay on Revolutions," which met with no success. A letter written by his mother on

her death-bed, and sent through a sister whom he dearly loved, who herself died before the letter reached her brother, wrought by its pious sentiments, to which the attendant circumstances gave greater force, a revolution on his mind, the effect of which became manifest in his "Genie du Christianisme." The effect produced by this work was prodigious. Its merits have not, indeed, stood the test of time, but it came into the world with the great advantage of meeting a present want. Men were feeling a certain tenderness towards the past, when Chateaubriand hit exactly the sentiment of the moment with those poetical and fanciful views and descriptions which, while they exalt the imagination and cheer the soul, disturb not by challenges to controversy, with hard reasonings, or dogmatic assertions. In 1800 he ventured to return to France; and his fame becoming further spread by "Atala" and "René," the first consul sent for him and appointed him in 1803 secretary to the legation at Rome, and then minister to Switzerland. Upon the execution of the duc d'Enghien, Chateaubriand to his honour resigned. The publication of his "Martyrs," a sort of prose epic, in which christianity and paganism contend to the disadvantage of the latter, confirmed his reputation, despite the objections of critics, who found that a work half-romance and half-poem violated propriety in more ways than one. In 1806 he paid that pilgrimage to Jerusalem which produced his least objectionable work, abounding as it does in vivid and graphic description, and animated with sincere sentiments of veneration for the subjects suggested by the scenery of the Holy Land. It was this work which softened the resentment of Napoleon, who—having deprived Chateaubriand of his periodical, the *Mercur*—intimated to the academy his wish that they should elect him to the seat vacant by the death of Marie Joseph Chenier; but Chenier was a jacobite, and as Chateaubriand would be obliged to pronounce an eulogium on his predecessor, he declined the proffered honour. When Bonaparte was sent to Elba, Chateaubriand, in order to confirm the new-born zeal of the country towards the Bourbons, published his "Bonaparte and the Bourbons." Louis XVIII. pronounced it worth an army, and appointed the author ambassador to Sweden; but as he was setting out, Napoleon landed at Cannes, and the ambassador followed the king to Ghent. After Waterloo, Chateaubriand refused to take office under Fouché. Henceforward he is to be viewed rather as the statesman than the author, and with no advantage to his fame. Whatever opinion may now be pronounced on his writings, it is certain that they produced great influence on his generation. Inflated and fantastic rather than eloquent and imaginative, and conceived with a view to effect, there nevertheless shone through his works a fine chivalrous nature and a noble invention, which tended to redeem the factitious tastes which prevailed, and with which they were in harmony. When, however, the florid author attempted to act a showy statesman's part, in order to attract attention to his own appearance, it would be well if we had no worse to say than that he failed. While professing love for constitutional principles, and even avowing his belief in the future advent of the republic, he inconsistently sided with that ultra-monarchical party, whose intrigues thwarted the enlightened aims of Louis XVIII. Having successively represented France at Berlin and London, Chateaubriand was sent to the congress of Verona, where he advocated that abominable invasion of Spain in 1822, which, as minister for foreign affairs, he odiously carried into effect. Unceremoniously turned out by the president of the council, Villele, at the instance of the king, who disliked him, he became a newspaper writer, and avenged himself in the columns of the *Journal des Debats* upon the cabinet. His antagonist having at length fallen, the new minister, Martignac, sent Chateaubriand as ambassador to Rome; but on the nomination of Polignac to be prime minister, he threw up his post. He arrived in Paris in time for the revolution of July, received an ovation from the people, proceeded, however, to the chamber of peers, where he proposed the recognition of the duc de Bourdeaux with a regency, and failing in his motion, refused to take the oath of allegiance to Louis Philippe, and resigned his seat. The rest of his life was spent in the preparation of memoirs for publication after his death; while his literary labours were relieved by the society of the once beautiful madame de Recamier, at whose mansion, the Abbaye aux Bois, he passed several hours every day without taking much part in conversation, and seldom satisfied unless at the hearing of his own praise, for he was inordinately vain. At length his feebleness increased so far that

he had to be borne from his carriage to the salon; yet, as long as strength sufficiently remained, he continued his daily visit to her whose goodness and amiability never wearied towards her illustrious friend. He lived long enough to see the advent of the republic he predicted, and long enough to see it diverge into a wrong and fatal course; for he died 10th July, 1848. Besides the works we have referred to, he published a pamphlet on elective monarchy in 1831: *Natchez*; "Historical Studies, or Fall of the Roman Empire;" essay on English Literature; a prose translation of *Paradise Lost*; "The Congress of Verona;" "Life of the Abbé de Rancé," &c. &c.—J. F. C.

CHATEAUBRIANT, FRANÇOISE DE FOIX, Comtesse de, mistress of Francis I., was born about 1495, and died in 1537. Françoise, who was cousin to Gaston de Foix, nephew of Louis XII., appeared at the court in the time of Anne of Brittany, and accepted the hand of the count of Chateaubriant. Her great beauty and accomplishments made her a favourite with Francis I., but she afterwards found a successful rival in Mlle. de Heily.

CHATEAUBRUN, JEAN BAPTISTE VIVIEN DE, was born at Angoulême in 1686; died in 1775. In 1714 his tragedy of "Mahomet II." appeared, and was favourably received. In 1754, forty years after, was acted his "Troyennes," a drama, which, as far as it can be called inspired at all, was inspired by the genius of Euripides. The cause of this long silence was, that Chateaubrun was maitre d'hotel ordinaire of the duc d'Orleans, and sous-precepteur of his son; and he thought it inconsistent with the implied duties of his station to appear as a dramatic author. Chateaubrun, although no great dramatist, did as well as Racine for Mademoiselles Clairon and Jussieu, who appeared as Cassandra and Andromache in his tragedy. "Philoctetes" and "Astyanax" were Chateaubrun's next ventures. He had composed two other tragedies—"Ajax" and "Antigone"—and left them, without any apprehension of the manuscripts being stolen, in an open drawer. He searched for them in vain, and at last asked his servant about them. "Have you seen," said the master, "two very large paper books?" "Yes," replied the servant; "they had been lying there a long time, and I took them 'pour envelopper ces côtelletes de veau, que vous aimez tant.'" The poet survived what his biographers call the "disgrace" more than twenty years. He became a member of the academy in 1753. In a discourse delivered at the academy, Buffon gave him the highest praise for integrity and the entire absence of selfishness in all his dealings. He died poor, but his will exhibited unusual confidence, which was not misplaced, in the generosity of his pupil, the duc d'Orleans. He left annuities to two nieces, and also provided in the same way for two domestic servants, requesting the duc—to whom, however, he gave no funds for the purpose—to pay them. They were paid.—J. A., D.

CHATEAUROUX, MARIE-ANNE, Duchesse de, one of the mistresses of Louis XV., died in 1744. She married in 1734 the marquis de la Tournelle, and was left a widow at twenty-three. She then became, what three of her sisters had been before her, mistress of Louis, by whom she was created duchess of Chateauroux, with a pension of eighty thousand livres. It was she who induced the king to take the field in 1744, thinking to compound for her guilt by contributing to her country's glory. Two volumes of her letters were published in 1806.—R. M., A.

CHATEL. See CHASTEL.

CHATEL, FRANÇOIS DU: this painter, renowned as the favourite pupil of David Teniers, was born at Brussels in 1625. He followed the manner of his preceptor, and did him infinite credit. He also dealt in guardrooms and village festivals, hobnobbing peasants and inebriated burghers, but he occasionally handled higher subjects with success. He painted groups of family portraits, conversation pieces, and assemblies of persons of rank. His design was correct, his colouring pure, and his execution very delicate, neat, and spirited. His best production is a large painting nearly twenty feet long at Ghent, representing Philip IV. of Spain receiving the oath of fidelity from the states of Brabant and Flanders in 1666. It is stated that the number of figures in this work amounts to one thousand, but the disposition is so excellent, that the effect is singularly unconfused. His pictures are frequently ascribed to Teniers, and also to Gonzales Coques. He died in 1679.—W. T.

CHATELAIN. See CHASTELAIN.

CHATELAIN, JOHN BAPTIST: this artist was born in England of French parents in 1710. He designed and engraved with extraordinary cleverness. Unfortunately he was so disso-

lute and depraved as to render this cleverness almost altogether nugatory. He engraved after his own drawings or after Poussin. He died in London in 1744.—W. T.

CHATELET. See DUCHATELET.

CHATHAM, WILLIAM PITT, Earl of, younger son of Robert Pitt of Boconnock in Cornwall, was born November 15th, 1708. His grandfather had been governor of Madras, and his mother was sister to the earl of Grandison. William Pitt was educated at Eton and Oxford; and upon quitting the university travelled in France and Italy, for the purpose of alleviating the gout—a disease which seized him in his youth, and haunted him through life with frequent and cruel agonies. Returning to England, he selected the army as his profession, and obtained a cornetcy in the Blues. In 1735 he entered parliament as member for Old Sarum, and in consequence of his opposition to Sir Robert Walpole, then at the head of the government, was deprived of his commission. He received, however, the appointment of groom of the bedchamber to Frederick, prince of Wales, and continued to assail the ministry with unyielding vigour. The commanding genius of Pitt soon gained for him high parliamentary authority. He was the orator of orators, at a time when the agitated passions of the country, having no sufficient vent in the press, concentrated themselves upon individual men; and when the house of commons was, in consequence, a more frequent theatre for those gladiatorial combats in which eloquence is mastery. Pitt was not only a consummate actor, both by natural endowment and careful culture—perfect in tone, glance, and movement—but was also sufficiently subject to the inspiration of the hour to give freshness and glowing warmth to his artistic skill. Walpole says, that though no man knew so well how to say what he pleased, no man ever knew so little what he was going to say. He thus possessed a twofold power, blending the mechanical skill of the cultured artist, with the passion of the speaker whose heart vibrates with the emotion of the moment. He is described as greatest among British orators in causing men to *fear* his power, and the epithet "terrific" is applied to those declamations he poured forth in which passion and sarcasm contended for the mastery. In his speeches, arguments lived and moved as if warm with life. As they marched on to their purposed end, he flung about lively anecdotes and sarcasms, jests and denunciations, disarming or frightening opponents on every side. He thus conquered by anticipation all that his worst foe could say; and never cared to have the last word. He gained his victory before his antagonist rose to speak. It is said of Michel Angelo, that by his skill he could give dignity to a hump on the back of a dwarf; and Pitt possessed, as an orator, a kindred power of giving a certain majesty to the commonest glance, circumstance, or word. With such wonderful endowments, in an age of corruption when parliamentary votes were regularly bought and sold by the minister of the day, Pitt was able to command any price he might choose to name. He refused, however, either to soil his hands with a bribe, or even to take advantage of customary official perquisites. He loved his country, and sought power for no selfish end. He loved England, Macaulay writes with truth, "as an Athenian loved the city of the violet crown; as a Roman loved the city of the seven hills;" and his policy sought to deliver his native land from the disgrace into which she had been dragged by incapable intriguers. Among the first of great modern statesmen he appealed for support not simply to ruling aristocratic families, but to the people at large; and in their pride and love, his countrymen delighted to call him "the Great Commoner." Most significant in relation to this point, was the answer of George II. when Pitt pleaded for mercy on behalf of Admiral Byng:—"The house of commons, Sire, seems inclined to mercy," pleaded Pitt. "Sir," replied the king, "you have taught me to look for the sense of my people in other places than the house of commons;" and when Pitt resigned office in 1761, in language seldom heard in those days, he declared himself "accountable to the people, who had called him to power." A list of the great statesman's faults and failings could readily be drawn up. The skill of the actor degenerated at times into an affectation which darkened his best virtues; towards his colleagues he often behaved more like an eastern satrap than a British minister; distracted by the pain of constitutional gout, his conduct is occasionally scarcely referable to any distinct principle whatever; but when the list of his imperfections is completed, William Pitt, earl of Chatham, still

remains "the Great Commoner" who, when his country was in despair, out of weakness brought forth strength; who appealed to the people, when such appeals were rare indeed; who used power not for personal aggrandizement, but for national glory; whose hands were clean in an age of foul corruption; a statesman who could persuade as an orator, and an orator who could command and govern as a statesman. On the retirement of Walpole, Pitt became vice-treasurer of Ireland, and, subsequently, paymaster of the forces during the ministry of the duke of Newcastle. The perquisites of the latter office were great, and no dishonour attached to their reception, but he would accept only the legal salary. The conduct of Pitt in the house was not distinguished by any submission to the inferior men placed above his head. Although holding a suboffice he ridiculed the government leader of the commons, or rather, with more cutting sarcasm, assisted that gentleman in bringing ridicule upon himself: on one occasion he boldly referred to the premier, and asked whether the house of commons sat only to register the edicts of one too powerful subject, and finally refused a seat in the cabinet when Newcastle almost fell at his feet entreating him to accept it, on condition of supporting the king in his wish to carry on the French war by a system of subsidies to Russia and the German states. Grave events, however, thickened day by day. The country was defenceless, and German mercenaries were imported—the Seven Years' war commenced in Europe—Minorca was lost. It was an evident necessity that political intriguers should make place for men of power and patriotism; and on December 4th, 1756, Pitt became secretary of state, in the administration of the duke of Devonshire. A fresh vigour was immediately infused into every branch of national life. A national militia was substituted for German mercenaries; the Highland clans were made friends instead of foes, by being converted into regiments of the line for foreign service; and the new minister who had opposed a "system of subsidies," proved no niggard in giving aid when he found in the field a great man, like Frederic of Prussia. George II. dismissed, however, both Pitt and Temple in April, 1757, declaring, that he did not consider himself a king in their hands; but the affairs of the nation became more and more disastrous, and Pitt was recalled, 27th June, 1757. "I am sure," said Pitt, in his proud consciousness of administrative power, "that I can save my country, and that nobody else can." The four following years during which Pitt held office, were the noblest of his life. He redeemed the government in some measure from the domination of corrupt factions, and his spirit breathed itself within his officers, animating them to deeds of daring which rang through Europe. Every man knew that there was more chance of being pardoned for an overbold enterprise than for a weak retreat. "Pitt," says a contemporary, "expressed himself with great vehemence against Earl Loudoun, who reported that he found the French too strong to justify an attack on Louisburg." The energy of the statesman pervaded the British forces both by land and sea. Wolfe climbed the heights of Quebec, and Canada was won. Hawke gained the famous victory at Belleisle, replying, in the spirit of the minister he served, to the master who reported the danger of the navigation—"You have done your duty in making this representation; now obey my orders, and lay me alongside the French admiral." It is one of the most significant signs of Pitt's genius that he thus created his captains. Hawke and Amherst, for instance, displayed abilities in the service of Pitt which never could have been called forth by the duke of Newcastle. Soon after the accession of George III., the "family compact" was concluded between France and Spain, and Pitt advocated against the latter country an immediate declaration of war; but, overruled in the cabinet, he resigned office in 1761, proudly declaring that he "held himself accountable to the people who had called him to power." Upon his retirement, his wife was created Baroness Chatham, with a pension. The Spanish war broke out within a few weeks, and Pitt showed his magnanimity by taking no party advantage of the fact that his rejected advice had become a necessary state policy. Burke remarks, that the behaviour of Pitt when the new parliament met, in which he made his own justification without impeaching the conduct of any of his colleagues, or taking one measure that might seem to arise from disgust or opposition, "set a seal upon his character." "A time of war," said the orator, "is no season for personal altercation. In the face of the common enemy, England should be united as one man." His future career was frequently and terribly over-

shadowed, through the agonies of his constitutional diseases—agonies so stern as to affect the healthful working of his mighty mind. During the proceedings taken against Wilkes, Pitt denounced that surrender by the house of its privilege of protection from arrest, which was voted for the purpose of enabling the government to arrest the democratic leader for libels in the *North Britain*. The importance attached by him to the liberty of the press, strikingly appears in all his private correspondence. When the stamp act threatened the American war, he used all his strength to secure its repeal. On the 14th January, 1766, he delivered one of his mightiest speeches in opposition to that act. "I rejoice," exclaimed Pitt, "that America has resisted. Three millions of people so dead to all the feelings of liberty as voluntarily to submit to be slaves, would have been fit instruments to make slaves of the rest." When noticing the legal technicalities of the question, he finely remarked that he did not come "with the statute-book doubled down in dogs' ears to defend the cause of liberty;" and drawing the distinction between legislation and taxation, and taxation as essential to freedom, altogether denied the right of the commons of Great Britain to give in grant even to the king the property of the commons of America. During the five years which had elapsed since Pitt's resignation (1761-66), he had three times been offered office; and in 1766 he returned to the government as Earl of Chatham. His bodily infirmities increased upon him to such an extent, that his greatness is hardly recognizable in the feebleness of that administration. He was one of the first, however, to discern the importance of Indian affairs, and the necessity of ameliorating the condition of Ireland. In the early part of 1767, he was so afflicted as to be incapable of transacting business. During his retirement his colleagues adopted measures entirely opposed to his principles, and on October 12th, 1768, he finally resigned. From time to time, when his strength permitted, he was carried to the house of lords, and continued to recommend the abandonment of coercive measures towards America. Even after the declaration of Independence, he endeavoured to induce the government to agree to some terms of reconciliation. Upon the conclusion of the treaty between France and America, the final separation of the colonies from the mother country, became certain; and then Pitt's pride in the glory of the British empire flamed forth in indignation against its dismemberment. Of all men, his personal happiness and honour were bound up inextricably with the greatness of his nation; and the loss of America was like an affliction brought down upon the very flesh and blood of the "old man eloquent." Few will agree with his policy, but all will feel as one of the most touching scenes in history, that last appearance of the earl of Chatham in the house of lords (April 8th, 1778), when he entered supported by his son, and his enthusiastic energy struggled with his feebleness as he opposed the withdrawal of the British troops from America, until he fell in a convulsive fit, and was carried forth a dying man. Upon May 11th, 1778, at Hayes in Kent, the earl of Chatham died. He was buried in Westminster abbey; the chief mourner being his second son, William Pitt, whose name, with his father's, will live for ever in the pages of British history.—L. L. P.

CHATTERTON, THOMAS, was born at Bristol on the 20th November, 1752. There was nothing remarkable about the family, except that a taint of madness ran in the blood. The father had been for years subchanter at the cathedral, and master of the free school in Pyle Street. A few months previous to the birth of Chatterton he died, leaving a widow and daughter. In the straitened circumstances of this humble family the higher advantages of education were not to be thought of, and the little boy was therefore sent to the free school. From the subsequent versatility of his mind we naturally look for early indications of precocity. But he was remarkably stupid. The master gave him up in despair, and pronounced him utterly incapable of instruction. The mother undertook the task which had worn out the patience and baffled the skill of the stranger. Weeks and months passed; all the experiments which affection could suggest had been tried, yet, in the seventh year of his age, Chatterton showed no signs of intelligence. The saddest thought that can flash across a parent's mind, now struck her to the ground—she had given birth to an idiot! Lying about the house was an old musical manuscript in French, over which the deceased subchanter had spent many a noisy hour. Tossed about for seven years, in the recurring confusion of housewife

industry, that fragment of paper had been preserved unharmed. It was destined to start the mind of Chatterton on its swift and terrible career. By chance the boy took it up, fixed his eyes upon the large capitals illumined with gorgeous colours, and grew solemn with emotion. Not by the persuasive caresses of a mother, not by the indestructible hornbooks of Pyle Street free school, but by the gentle force of colour, was the soul of Chatterton aroused from its chrysolitic sleep. Once liberated from the blind dominion of instinct, his mind passed by a sudden transition into the highest type of genius. "At eight years of age he was so eager for books that he read from the moment he waked, which was early, until he went to bed, if they would let him." About this time the thought that he was destined to be great seized him like a passion. This ambition was no ephemeral fancy, flitting in moments of conceit across the mind, but a stern reality, enthroning itself imperially in the centre of his being. Wandering alone on the banks of the Avon, sitting beside the sepulchre of Canynge, in full view of the chiselled towers and lofty steeple of St. Mary, Redcliff, or gazing upon the frolic and mirth of boyish pastime, the consciousness of future fame haunted him like a spirit. This is the key to his strange behaviour—the melancholy which clouded his gayest moments, the unaccountable fits of crying which alarmed his friends, the dreary solitude in which he loved to indulge, and the veil of mystery behind which he performed his greatest achievements. On the 3rd of August, 1760, close upon his eighth year, he was admitted to the blue-coat school, endowed by a Bristol gentleman of the name of Colston. The prospect of entering Colston's school threw him into great enthusiasm—"Here," he said, "I shall get all the learning I want." But the routine of reading, writing, and arithmetic soon damped his ardour. From the first dawn of intelligence his mind exhibited astonishing vigour and rapidity. As if conscious that life was short, he flew through his career with lightning speed. In his eleventh year he had the thoughts and experiences of a man. He had already read seventy volumes; neat copy-books and ingenious sums were objects of no attraction. The proffered advantages of school were spurned away as chaff; he wanted solid nutritive knowledge. This he found in the study of history and divinity. Three circulating libraries were soon laid under contribution, and barely sufficed to meet the demands of the blue-coat boy. What books fell into his hands in the course of this reading is not known. It is interesting to learn that among them was Speght's Chaucer, the glossary of which he transcribed for his own use. Once a week, on Saturday afternoons, the blue-coat boys were at liberty to visit their friends. Chatterton spent these half-holidays invariably in the little cottage on Redcliff hill, with his mother and sister. They were very fond of him, and believed thoroughly in his future fame; upon them the tendrils of his affection fastened and grew. In the storms of life, the hold upon them was never lost. In school he was known as a proud, perhaps overbearing boy. Social familiarity was impossible. The nearest approach he could make to it, was to mount the church-steps, and "repeat poetry to those whom he preferred among his schoolfellows." Nevertheless he had a kind heart. The sight of a beggar on the old bridge drew tears to his eyes. At home he was all love. One of the greatest pleasures he anticipated from his approaching greatness, was that of being able to present his mother and sister with rich gowns and pretty bonnets. Much as he loved them, however, they shared little of his society. In a lumber-room, fitted up for his own use, he would remain under lock and key all day. If they remonstrated, his short answer was—"I have a work on hand." What was he doing with so much secrecy in this little chamber Saturday after Saturday? "In this room he had always by him a great piece of ochre in a brown pan, pounce bags of charcoal dust, and a bottle of blacklead powder." When he came down to tea, his face and hands were begrimed with yellow and black. It must have been on one of these Saturday visits, sometime before the summer of 1764, that Chatterton made the famous discovery of what he called the manuscripts of Rowley. It thus happened:—One day his eye was caught by some thread papers which his mother and sister used. The writing upon them appeared old, and the characters uncommon. After submitting his mother to a cross-examination, he was led to a full discovery of all the parchments which remained. To the last day of his life he continued to set a high value upon them. Even on that solemn morning when the time and manner of his death had in all probability been determined, and there remained no inducement

to perpetuate a deception, he expressed in significant language his appreciation of their worth. The tendency of modern criticism is to disparage these papers as containing nothing of a literary character. The truth is, we are in complete ignorance of their contents. That Chatterton should have been allured to palm some of his best poems upon an old monk of the fourteenth century is not to be wondered at; that he should have so completely succeeded remains to this day a marvel. These very manuscripts no doubt suggested the idea. Their history is shortly this:—In a room over the north porch of Redcliff church, some half a dozen chests, supposed to contain legal documents, were forced open in 1727 under the superintendence of an attorney. The deeds referring to the church were removed, and all the other parchments were left there scattered about as being of no value. In 1748, Chatterton's father being nearly related to the sexton, was permitted to take away from time to time "baskets full" of these documents for covering bibles and copy-books. Mrs. Chatterton also found them useful for "making dolls, thread papers, and the like." It was the bulk which survived these depredations that afterwards obtained such celebrity as the manuscripts of Rowley. From the De Burgham pedigree, it is evident that Chatterton, while yet in the blue-coat school, had not only conceived the plan of his literary imposture, but had actually entered upon its execution. Attached to the genealogical tree was a poem, "The Romaunte of the Cnyghte," actually written by an illustrious ancestor of the pewterer! It is chiefly noticeable as being the first in point of time of those antique poems on which the fame of Chatterton mainly rests. But it was not until he had left school and entered upon his apprenticeship as lawyer's clerk, that the Bristol people became aware of his existence. His first adventures in literature had produced no great sensation. "The last Epiphany or Christ's coming to Judgment;" "Sly Dick;" "The Churchwarden and the Apparition;" and "Apostate Will," were smart pieces for a boy not yet in his teens. But they had not moved the world—not even Bristol. One morning in 1768, however, when the municipal excitement of opening a new bridge was at its height, the inhabitants of Bristol were startled with a remarkable paragraph in *Felix Farley's Journal*. It contained a graphic account of the opening several centuries before of the old bridge; under the signature of "Dunkelmus," who had extracted it from ancient documents in his possession! Inquiries were instituted, and the authorship was traced to Chatterton. At first he gave evasive answers, then prevaricated, afterwards retracted, and finally made the statement to which he adhered all his life. The success of the adventure flattered his vanity, and concealed from his view the degradation of his conduct. His moral nature, originally weak, had never been cultivated, and his intellect asserting a supremacy over his whole being, urged him forward against terrible odds. Nothing but some strong internal convulsion could now restore him to manly honesty and peace. It was the crisis of his life. If our estimate of Chatterton is correct, it was at this juncture, that he deliberately resolved upon that career of unscrupulous imposture, which has exposed him to the just censure of aftertimes. Horace Walpole was at this time collecting materials for his *Anecdotes of Painting in England*, Chatterton inclosed him "The Ryse of Peyncteyne in Englande, wrotten by T. Rowlie, 1469, for Master Canynge!" Barret the surgeon was engaged in writing a history of Bristol. Chatterton from time to time supplied him with invaluable facts! On the 21st December, 1768, he informed Mr. Robert Dodsley, a London publisher, that he had in his possession "poems and interlude, and perhaps the oldest dramatic pieces extant, wrote by one Rowley, a priest of Bristol, who lived in the reigns of Henry IV. and Edward IV." This sixteenth year was the busiest of his life. "The Bristowe Tragedy;" tragical interlude called "Ella;" a fine pastoral entitled "Elinore and Inga," were all completed before the close of 1768. In the meantime his professional studies were sadly neglected. Mr. Lambert was a rough-handed gentleman, and sometimes administered correction to the young apprentice in the form of a "blow or two." Then he made Chatterton sleep with the footboy, and take his meals with the servants, which was not pleasant. The scraps of poetry found about the floor were characteristically called "stuff," and hurled at Chatterton's head. On the whole, his "life was miserable." There was found in the office that will, written in contemplation of suicide, which one cannot read without a

shudder. Mrs. Lambert was afraid to continue under the same roof as this desperate young man, and thus Chatterton was liberated from the obligations of his apprenticeship. On the 24th April, 1770, a week after leaving Lambert's, he started for London, with high hopes of earning a livelihood and literary fame. The rapidity with which he accomplished so much during his residence in London is astonishing. In May and June he had articles in the *Town and Country Magazine*, the *London Museum*, the *Freeholder's Magazine*, the *Political Register*, the *Court and City Magazine*, and *Gospel Magazine*. One week he is about an oratorio; the second finds him busy with a burletta, which was afterwards acted at Marylebone gardens; and the third opens with another dramatic effort—"The Woman of Spirit." Little songs, for which Mr. Hamilton paid him at the rate of eightpence a piece, took well at the gardens, and became popular with street boys. Such were the rare endowments of Chatterton that, in these various occupations, his talent never failed him. We must not, however, apply the rigid laws of criticism to these hurried contributions to literature. He was writing for bread, and not for fame. The antique poems exhibit a fine imagination and true poetic feeling. His talent lay in depicting the stronger emotions, and giving form and life to abstract ideas. In his political essays and letters we do not find evidences of such rare powers. They are written in smart serial style, without much thought. Chatterton arrived in London with some five pounds in his pocket. Three months had not passed away before he was reduced to a state of penury. At last he was driven to buy his bread stale, that it might last the longer. One whole week he took nothing but a loaf. His pride repelled the benevolent advances of his friends. Mr. Cross, a chemist, living in the same street, and very intimate with Chatterton, was afraid to ask him to supper. Mrs. Angell, the landlady, out of sheer pity, returned him sixpence from the rent, but this he indignantly refused, and added, pointing to his forehead—"I have that here which will get me more." Under so severe a pressure the powers of nature gave way. Neighbours noticed a certain wildness about his looks. He was observed to talk to himself, to pause suddenly in conversation, and then to start off volubly on some irrelevant subject. On the 22nd of August, 1770, he came home in a great passion with the baker's wife, who had refused to let him have another loaf till he had paid her three and sixpence, which he owed her previously. This drove him to the last desperate act. Under the pretence of having an experiment on hand, he purchased a quantity of poison from Mr. Cross. The next morning Chatterton was not astir at the usual hour. When the door of his bedroom was burst open, he was found "lying on the bed with his legs hanging over, quite dead. Some of the bits of arsenic were between his teeth." Of the Rowleian manuscripts Chatterton only produced four originals. That which he exhibited first, the longest of the four, has been lost. It contained "The Challenge to Lydgate;" "The song to Ella;" and "Lydgate's Answer;" amounting in all to sixty-six verses. The remaining three, which may now be seen in the British museum, were—"The Accounte of William Canynge's Feast;" "Epitaph on Robert Canynge;" and thirty-six verses of the "Storie of William Canynge." These are written in continuous lines, extending like prose across the breadth of the parchment. The square pieces of vellum were, no doubt, "antiquated" by himself, and the writing exhibits a skilful imitation of mediæval orthography.—G. H. P.

CHAUCER, GEOFFREY, the most distinguished of the early poets of England, was born in the first half of the fourteenth century, but in what year cannot be stated with positive certainty. Tradition assigns the date of his nativity as 1328, while Leland gives a later period, and a deposition made by Chaucer seems to confirm this view. Sir Harris Nicolas, who has investigated the matter with his usual care and ability, is disposed to think that upon the whole the earlier date is the nearest to probability. The birthplace, parentage, and education of Chaucer are involved in like obscurity, and it would be a bootless task to pursue all the speculations on these subjects. The probabilities are in favour of his having been born in London; whether he was the son of a knight, a merchant, or a vintner, it is in vain to inquire: there is, however, reason to believe that his family, though not of rank, were wealthy and respectable, and it is certain that he received the education befitting a gentleman of those times. Where that education was received is equally problematical; Cambridge and Oxford each claim the honour, but

neither can adduce any proof to support its pretension. It is not improbable that he may have studied in each, and Leland asserts that he completed his education at Paris. But be this as it may, Chaucer acquired a large amount of information and learning, which the evidence of his contemporaries and his own compositions abundantly attest. Indeed there is no branch of the knowledge of his times in which he appears to be deficient, and he was equally proficient in scientific subjects as in the learning of the schoolmen, in divinity, law, and philosophy. The first reliable notice of Chaucer occurs in 1359, when it appears that he served under Edward III. in the expedition against France, and was taken prisoner. In that country he remained some years, probably till the conclusion of the peace of Chartres in 1360. Shortly after he married Philippa, a maid of honour in the royal household, and daughter of Sir Payne Roet, a gentleman of Hainault, who came to England in the retinue of Queen Philippa; another daughter, Katherine, attached herself to Blanche, the first consort of John of Gaunt, by which circumstance Chaucer was subsequently brought into intimate acquaintance with that noble. It is remarkable that Chaucer's wife afterwards entered into the service of John's second wife, while Katherine subsequently became his third wife, and secured to Chaucer and his wife the favour and protection of the duke. Chaucer's accomplishments and brilliant parts soon recommended him to the patronage of Edward III. In 1367 he was made one of the valets of the king's chamber, and received a grant for life of twenty marks a year. In 1372 he was sent with two Genoese citizens on a commission to determine an English port where a Genoese commercial establishment might be formed, and appears to have left England in the end of that year upon this mission. During his absence he visited Florence and Genoa, returning to his native land in November, 1373. It was during this visit to Italy that Chaucer is said to have met Petrarch at Padua. That such is the fact there is strong presumption, which more than counterbalances the mere assertions of those who maintain the contrary. Petrarch was certainly at Arqua when Chaucer was at Florence, and it is scarcely credible that the latter would have omitted the opportunity thus afforded of forming the acquaintance of one who was then the most distinguished literary man living. Wharton asserts that they met at the marriage of Violante, daughter of the duke of Milan, with the duke of Clarence, and that Boccaccio and Froissart were of the party. The clerk of Oxenford, in the prologue to the tale of Griselda, states that he learned it from "a worthy clerk" at Padua, "Franceis Petrark, the laureat poete," and we know that at this period Petrarch had translated the tale from the Decameron, and had even previously shown it. In 1374 Chaucer was granted "a pitcher of wine daily," and in the same year was appointed comptroller of the customs in the port of London, under the obligation of writing the rolls with his own hand. If the poet ever performed this duty, no roll in his handwriting is now extant. Grants, pensions, and other emoluments followed, and in the two following years he was employed in two secret missions to Flanders, the object of which was, if we credit Froissart, to negotiate a marriage between Richard, prince of Wales, and Mary, daughter of the king of France. Richard II. continued to Chaucer the favour which Edward had accorded him, and employed him on several embassies, in one of which, to Lombardy, he was accompanied by his friend the poet Gower. In February, 1385, Chaucer was permitted to appoint a permanent deputy, and being thus released from a personal discharge of the duties of comptroller, he turned his attention to politics, and sat in parliament in 1386 as representative for Kent. His known attachment to the duke of Lancaster was, there is little reason to doubt, the cause of his being deprived shortly afterwards of his office in the customs. The older biographers of Chaucer, relying on the adventures in "The Testament of Love" as an autobiographic statement by the poet, assert that he was dismissed for defalcations; was engaged in an affray in which several lives were lost; that he fled to Hainault to avoid arrest, and then to Zealand, whence, after remaining three years, he was forced through poverty to return to England; that he was committed to the Tower, and obtained his liberty on condition of impeaching his former confederates. Happily for the fame of the poet, Sir H. Nicolas supplies an authentic and complete refutation of the whole narrative; and we now know, that when Chaucer was said to have been a fugitive and exile, he was at large in London enjoying his pension; and at the very moment when he is

supposed to have been a prisoner in the Tower, he was sitting in parliament as a knight of the shire for one of the largest counties in England. In 1387 Chaucer lost his wife, and with her the pension settled upon her by Queen Philippa. Upon the accession of the Lancaster party in 1389 he was appointed clerk of the king's works—an important office which he was allowed to perform by deputy: this post he held till 1391. From that period we have nothing authentic in relation to the poet till 1394, when he obtained a grant from the king of £20 a year; but we learn that his circumstances were far from easy, and he was protected from arrest for debt by a royal letter. That Chaucer should have been in pecuniary difficulties is somewhat surprising, seeing that he had, with occasional interruptions, what must be considered, at the lowest, a competency. It is said he lived extravagantly, a supposition that some passages in his writings seem to favour. Be this as it may, the prosperity which had been interrupted by these circumstances happily returned to brighten the close of his career. Another grant of wine was made to him, and Henry IV. on his accession conferred on the poet an additional pension of £26. 13s. 4d. a year. Chaucer was now over seventy years old, residing, not at Dorrington castle in Berkshire, as is generally asserted, but in London in a house taken by him nearly upon the site of Henry VII.'s chapel at Westminster. His end was approaching, and he spent his last hours in tranquillity and resignation, having composed a poem entitled "Gode Counsaile of Chaucer," made by him "upon his dethe bed, leying in his gret anguyse." Chaucer died on the 25th October, 1400, about the age of seventy-two, and was buried in Westminster abbey, where a monument erected to him in 1556 may still be seen, though the inscriptions are nearly effaced. In his younger days Chaucer must have been handsome; he is described in his thirtieth year as being "of a fair and beautiful complexion, his lips full and red, his size of a just medium, and his port and air graceful and majestic." Later in life he became corpulent, and lost much of his grace of person, though his features retained their fairness. In addition to the portraiture he has given of himself in "The Canterbury Tales," we have several portraits, especially that of Ocelave, which conveys "the perfect image of a character not less remarkable for its rare combination of power and sympathy, than for the variety of accomplishments by which it was graced."

We have next to speak of Chaucer as a poet. As such he stands pre-eminently before us as "the father of English poetry," as one who laid the foundations "that still support the fabric of our poetical literature, and will outlast the vicissitudes of taste and language." Amongst his own contemporaries this his position was accorded to him; successive ages continued it to him; and the present affirms it. The praises of Lydgate, and Gower, and Ocelave, and Ascham, and Spenser, have received the imprimatur of Wharton and Drayton, Coleridge and Hallam, Byron and Tennyson, and every critic of taste and erudition. He was in England what his great contemporary or rather predecessor, Dante, was in Italy, each the maker of a language, which, as long as it shall last, will uphold the fame of its author. An elegant modern writer thus speaks of him—"Poet, soldier, and diplomatist, and master of the philosophy, science, and divinity of his time, the versatility of his genius is not more remarkable than the practical judgment he displayed in its employment. With a complete command of the springs of universal interest, the tragical and the humorous, the solemn and the gay, the sublime and the grotesque, he applied his knowledge of life and nature, his consummate art, the copious resources of an imagination that seemed incapable of exhaustion, and a power of expression as extensive as the empire of his genius, to the creation of works which, while they reflect in vivid colours the features of his own time, possess also an enduring value for all time to come." Mr. H. Reed, in his able lectures on English literature, portrays Chaucer with happy eloquence. "No poet ever held such large and free communion with the world and his fellowmen. He stood in the presence of kings and nobles, and became versed in the lore of chivalry—its principles and passions; he went forth from the pomp of a court to do a soldier's service, and, in the season of peace, to muse in the fields, to look with loving eyes upon the flowers, to sympathize with the simple hearts of children and of peasants, to honour womanhood alike in humble or in high estate, and to commune with the faithful and the zealous of the priesthood. What most distinguishes the genius of Chaucer is the comprehensiveness

and variety of his powers. You look at him in his gay mood, and it is so genial that *that* seems to be his very nature, an overflowing comic power, touched with thoughtfulness and tenderness—"humour" in its finest estate. And then you turn to another phase of his genius, and with something of wonder and more of delight, you find it shining with a light as true and natural and beautiful into the deeper places of the human soul—its woes, its anguish, and its strength of suffering and of heroism. In this, the harmonious union of true tragic and comic powers, Chaucer and Shakspeare stand alone in our literature; it places these two above all the other great poets of our language, for such combination is the highest endowment of poetic genius."

It remains now to notice briefly the various works of Chaucer. It is impossible to ascertain their chronological order. "The Court of Love" was probably one of his earliest productions, and "Troilus and Creseide" may also be assigned to his youth. "The Assemblée of Foules" was written before the marriage of Blanche of Lancaster, probably about 1358; and "The Booke of the Duchesse" after her death. "The Legende of Good Women" must have been written before 1382, and "The House of Fame" somewhere about the same time. We are not able to assign a date to the "Romaunt of the Rose." It is a translation from the French poem commenced by William of Lorris, and concluded by John of Meun. In the hands of Chaucer it is infinitely improved and beautified. His other poems are "The Cokkow and the Nightingale;" "The Flower and the Leaf"—the latter an exquisite composition; and "The Testament of Love." But the great work upon which the fame of Chaucer rests imperishably is "The Canterbury Tales." These were the occupation of the last ten years of his life. Wharton, following tradition, says that they were composed partly at Woodstock, and partly at Dorrington in Berkshire, but there is good reason to doubt that he occupied the latter place. The poem is unfinished, but for what it achieved, as well as what it proposed to accomplish, is worthy of high admiration. The design, suggested probably by the Decameron of Boccaccio, is extremely happy. A company of pilgrims to the shrine of St. Thomas à Becket at Canterbury, set out from the Tabard inn at London, and, at the instance of the host, each tells a tale to beguile the way. The prologue presents us with the truest and liveliest picture of the state of society in England in the fourteenth century—we see the freedom and ease of intercourse between the personages, though ranging through every grade of life. Each character is drawn with the hand of a master, and stands out a living reality—a type of a class. The various tales exhibit the wondrous power of Chaucer, as various and flexible as it is deeply skilled in the heart of humanity and the soul of nature—the inward and the outward of mind and of matter. "After four hundred years have closed over the mirthful features which formed the living originals of the poet's descriptions, his pages impress the fancy with the momentary credence that they are still alive." All the powers of his learning, his experience, and his genius have here free scope, and place Chaucer next to Shakspeare as one, who, dealing not only with what is changing and evanescent in the times and in the character of man, but comprehending also what is enduring and essential to humanity, has written for all times, and will be read while the English language shall last.—J. F. W.

CHAUDET, ANTOINE-DENIS, a French sculptor, born at Paris in 1763; died in 1810. After returning from Rome he executed for the Pantheon a group representing the emulation of glory. Not being of the vicious style then in vogue, it was at first neglected. Chaudet's next work was his fine statue of "Edipus." "Paul and Virginia," "Surprise," "Belisarius," &c., followed, and raised him to the first rank among modern sculptors. His articles in the dictionary of the fine arts are said to be also admirable.—His wife, JEANNE-ELISABETH, who was also his pupil, gained a considerable reputation by her exquisite paintings of familiar subjects.—R. M., A.

CHAUDON, LOUIS MAYEUL, born in Provence in 1737; a benedictine of the congregation of Chuny, who, like so many of that learned order, devoted himself to historical research. His "Nouveau Dictionnaire historique," first published in 1766, went through several editions. This was followed by his "Dictionnaire Antiphilosophique," directed against the Philosophical Dictionary of Voltaire. As the witty sceptic too often sacrificed dry fact to the desire of saying smart things, and rather loved

to exaggerate the ridiculous side of circumstances than to enter into careful investigation, the painstaking benedictine frequently succeeded in exposing his errors and his bad faith, and restoring the truth of history. His works are valued on account of the impartiality of his judgments on historical personages. The severity of his studies affected his sight, which some time before his death left him entirely. After the suppression of monasteries at the Revolution he retired to Mezin, where his portrait may be seen in the town-hall, a testimony of the regard of his fellow-citizens. He died in 1817.—J. F. C.

CHAULIAC or CHAULIEU, GUI DE, a celebrated writer on surgery, who lived in the latter half of the fourteenth century. He studied at Paris and Bologna; practised some years at Lyons, then went to Avignon, where he became physician to Popes Clement VI., Innocent VI., and Urban V. There he wrote his famous "Inventorium sive collectorium partis chirurgicæ medicinalis," a work which greatly contributed to the scientific study of surgery. It was used as a class-book for several centuries. Chauliac has left us a description of the plague, which, sweeping from the east, ravaged a great part of Europe in 1343. He was himself attacked by it, but recovered.—R. M., A.

CHAULIEU, GUILLAUME AMFRIE DE, born at Fontenoy in 1639; died in 1720. He was sent early to Paris, where he was educated for the church. He was patronized by the grand prior of Vendôme, and given large benefices. The parties of the Abbé de Chaulien were among the pleasantest in Paris, and he himself, as men who give pleasant parties will often be regarded, was regarded as one of the wittiest men of his time. He suffered from gout, but amused himself during the fits in writing poems, which his friends praised, but which were too negligently written to have much chance of being remembered beyond the days which they enlivened. In this way he lived on till he attained the age of eighty-one. In the year before his death, he suffered from the two calamities of blindness and of love. He addressed with more than the fervour of youth the witty lady known under the names of Mademoiselle Launai and Madame de Staël. He was prevented from being named as a member of the academy by a successful cabal. He disregarded a slight, which, when others having similar claims suffered, excited them almost to madness.—J. A., D.

CHAUMEIX, ABRAHAM JOSEPH DE, born at Chateau, near Orleans, in 1730; died at Moscow in 1790. He was the son of a distinguished military engineer. His first work was, considering what France then was, a daring adventure. It was no less than an attack on the Encyclopedists—on their principles and on their book. Voltaire assailed him in stinging satire. Chaumeix could have weathered the storm, had his enemies confined themselves to fair warfare; but this was not the way in which controversy was then carried on. Chaumeix was described as a man of the lowest grade in society; he had, it was said, married his cook. A hundred idle stories of this kind were circulated. He was driven from Paris by these calumnies. He found a home in Russia. There he earned his support by assisting in the education of the sons of some of the families of the nobility. Chaumeix was a benevolent man; and from the time of his settling in Russia endeavoured, not altogether unsuccessfully, to ameliorate the condition of the serfs.—J. A., D.

CHAUMETON, FRANÇOIS PIERRE, a French medical man, was born at Chouzé on the Loire in Touraine on 20th September, 1775, and died on 10th August, 1819. After officiating as military surgeon for many years in hospitals and in the field, he retired from the service and took up his residence in Paris, where he published various literary and scientific works. Along with Chamberet and Poiret he published a Medical Flora, illustrated by coloured drawings. He wrote an essay on medical entomology, and contributed articles to scientific periodicals.—J. H. B.

CHAUMETTE, PIERRE-GASPARD, a French revolutionist, born in 1763; died in 1794. He was one of the most violent and brutal demagogues of the time. He heaped insults on the king when confined in the Temple, and, along with Hebert, concocted the foul accusation brought against Marie Antoinette on her trial. Chaumette was the originator of the Fêtes de la Raison, and planned the procession of the goddess of Reason. He fell a sacrifice to the jealousy of Robespierre in 1794, and left to posterity an execrable name.—R. M., A.

CHAUNCEY, CHARLES, D.D., an eminent nonconformist divine, born in Hertfordshire in 1592. After quitting the university of Cambridge, where he held a Greek professorship, he

was presented to a living in Hertfordshire; but his puritanical principles soon brought him into difficulties. He was condemned by the court of high commission, and obliged to recant some charges he had made in a sermon. He afterwards went to New England, where he was for twelve years minister of the little town of Scituate. He was pressed to return to England during the Commonwealth; but the presidentship of Harvard college having meanwhile been offered to him, he accepted it, and died in the new world in 1672. It was this Chauncey that wrote the *επίτομις* prefixed to Leigh's *Critica Sacra*.—R. M., A.

CHAUNCEY, CHARLES, D.D., the twelfth minister of the mother (first) church of Boston, New England, of which place he was a native. He was a graduate, at an age unusually early, of Harvard college in 1721, and six years after became the colleague of the Rev. S. Foxcroft, his complete ministry extending to sixty years; in the last nine of which he had himself the aid of a younger pastor—the Rev. John Clarke. This long career was signalized by his opposition to Whitfield, who once and again in his day visited the Massachusetts churches, and by his zeal against episcopacy; his "Complete View" of which appeared in 1771. Dr. Chauncey's belief was of the strongest Arminian type; but the distinctive feature of his theology arose from his coming forth as the earliest champion perhaps within his denomination of the "restoration" theory, so called, in relation to a future life. His great defensive work, "The Mystery hid from Ages, or the Salvation of all men," published in 1784, was replied to by the younger Edwards. His "Benevolence of the Deity considered," and "Five Dissertations on the Fall of Man," both issued in 1785, bear on the same topic. Beside the works now specified, Dr. Chauncey's fugitive productions, inclusive of more than thirty occasional discourses, amounted to little less than half an hundred. He died at the age of eighty-two in 1787.—F. B.

CHAUNCEY, SIR HENRY, author of the "Historical Antiquities of Hertfordshire," was born in 1632. He was educated at Cambridge, from whence he removed to the middle temple. He was called to the bar in 1656, made a member of the middle temple in 1675, knighted by Charles II. in 1681, and lastly made a Welsh judge in the year of the Revolution. His book was not published till 1700.—R. M., A.

CHAUNCEY, MAURICE, a monk of the Charter-house, London, died in 1581. He was imprisoned by Henry VIII. for refusing to own his supremacy. After the dissolution of the monastery, he and a few of his brethren led an unsettled life, now in England and then abroad as the times permitted. He wrote an account of some of the catholic martyrs—now a rare book. It contains Sir Thomas More's epitaph by himself.

CHAUSSARD, PIERRE JEAN BAPTISTE, born in Paris in 1766. His first work, which appeared in 1789, was on the subject of criminal law, in which he put himself forward as a reformer. As the Revolution advanced, he entered so warmly into its spirit, that he was deemed worthy of being despatched to Belgium as a commissioner for propagating the new spirit in that country. His zeal so far outstripped his discretion, that he excited the people of Antwerp to sedition by throwing their bishop into prison. In 1803, he was appointed professor of belles-lettres at the college of Rouen, from whence he was removed to Nismes, in the capacity of professor of Latin poetry. He wrote "L'Esprit de Mirabeau;" a translation of Arrien's Expeditions of Alexander; besides some poetical pieces and treatises not altogether free from objection, as he occasionally indulged in a tone of levity on sacred subjects unbecoming the position he held, and of which he was deprived by the Bourbons, although the reasons that prompted them to this were political. He died in 1823.—J. F. C.

CHAUVEAU, FRANÇOIS, an engraver and painter, born in Paris about 1621. He studied under Laurent de la Hire, and painted cabinet pictures in the style of his master. His success as a painter was not great. He had a quick and lively fancy, and soon discovered that the etching needle was a more convenient instrument wherewith to develop his fertile imaginings than the more slowly-moving brush. Painters, sculptors, booksellers, carvers, goldsmiths, jewellers, embroiderers, and even joiners and smiths, alike came to him for aid. He engraved with his own hands upwards of four thousand plates, and about fourteen hundred were engraved by others from his designs. He occasionally resumed the painting brush, and many of his pictures were purchased by Le Brun. The great number of works

on which he was engaged brought such a multitude of authors so frequently to his house, that their meetings ultimately resulted in the establishment of the French Academy. He was admitted into the Royal Academy of Painting and Sculpture in 1663. He died in Paris in 1676. He worked very hard, but work was easy to him, for mind and hand were both fertile and facile.—W. T.

**CHAUVEAU-LAGARDE, CLAUDE-FRANÇOIS**, a French advocate, born in 1756; died in 1841. His timidity kept him strictly to his profession. He defended General Miranda, Brissot, and Charlotte Corday. But his most illustrious client was Marie-Antoinette. After her condemnation, he was cited before the revolutionary committee to reveal the secrets she had confided to him. The advocate replied he had none of her secrets, and touchingly laid before them a lock of hair as the only recompense he had received from the noble victim.—R. M., A.

**CHAUVELIN, FRANÇOIS-BERNARD**, Marquis de, a French politician, born in 1766. In spite of his royalist connections, he was sent to London as the representative of France, to secure the English neutrality. Returning to his country, he was next sent to Florence, but Lord Hervey peremptorily demanded his dismissal. Napoleon named him councillor of state, and afterwards governor of Catalonia. He enjoyed the confidence of Louis XVIII. after the restoration, and died of cholera in 1832.

**CHAUVIN, ETIENNE**, a protestant divine, born at Nismes in 1640; died in 1725. On the revocation of the edict of Nantes he fled to Rotterdam, where in 1688 he occupied Bayle's chair during his illness. He became professor of philosophy at Berlin in 1695. Chauvin was a follower of Des Cartes. His chief work is entitled "Lexicon Nationale, sive thesaurus philosophicus, ordine alphabetico digestus:" Rotterdam, 1692.—R. M., A.

**CHAVES, EMMANUEL DE SILVEYRA PINTO DE FONSECA**, Marquis de, a Portuguese officer of noble birth, who served with distinction in the peninsular war from 1809 to 1814, holding a command in the contingent furnished by his country against the French. Ten years later, when the revolutionists threatened the sovereignty of John VI., De Silveyra, then count d'Amarante, organized a military force against them, but after some successes he was compelled to retire into Spain. In the subsequent restoration of the royalist cause his services were rewarded with the marquisate, which he enjoyed only for a few years, his death taking place in 1830.—W. B.

**CHAYUG, R'JUDA BEN DAVID FASI** (in Arabic, Yahia Abu Zechariah), of Fez in Africa, flourished in the beginning of the eleventh century (1020-1040), as physician and grammarian. In the latter quality he received from Ibn Ezra the title of "Rosh Hammedakdekin" (Prince of Grammarians). He studied medicine at the school of Kairwan, and wrote a commentary on Ebn-Sina (Avicenna), now lost. His grammatical works on the Hebrew language were originally written in Arabic, and subsequently translated into Hebrew by Moses ben Gekatilia Haohen, and by Abraham Ibn Ezra, under the respective titles of "Sepher Othioth Hannuach" (on the Quiescent Letters); "Sepher Hakkephel" (on the Geminate Verbs); "Sepher Han-nikud" (on the Vowels and Accents). These three treatises have been published by Leopold Dukes, with valuable notes. The Bodleian library possesses also a "Sepher Harikma" (on the Syntax) by Chayug, translated from Arabic into Hebrew by Gekatilia; his lexicon of the sacred tongue is mentioned by Jona ben Gannach among the older, and by Salomo Parchon among the more modern writers on Hebrew lexicography. Chayug, says the learned Dukes, was the first who investigated the properties of the quiescent letters and their permutations. He established the triliteral character of all Hebrew roots, previously unnoticed, and thus removed much confusion from the grammar and exegesis of the scriptural text.—T. T.

**CHAYUN, R'NEHEMIAH CHYA**, came from Zephath in the beginning of the eighteenth century, professedly to collect for the eastern synagogues among the Jews in Europe. His real object, however, was the propagation of Sabbatai Zebi's Messianic doctrines. Chayun seems to have had many of the resources of an adroit adventurer. A follower of Zebi at Smyrna having raised a report of the resurrection of their Messiah, Chayun at once availed himself of the excitement thereby produced among the Jews in Eastern Europe, on whose credulity he largely imposed. He elected for his apostle one Löbli of Prossnitz, skilled in jugglery of all kinds, and the two representatives of the Messiah sold talismans, wrought wonderful cures, and pro-

mised the immediate opening of the millennium. To gain the countenance of the ruling power, Chayun made some show of an endeavour to argue the Jews into an adoption of the dogma of the trinity, on the basis of the cabalistical books then in high authority among them. It is said that in an audience which he obtained from the emperor of Germany, Chayun boldly promised the conversion of all the Jews in the empire. The works which he published in defence of his doctrines did not fail to excite the antagonism of the leading men in the Jewish communities in the west of Europe. The rabbis at Amsterdam, London, and several German cities laid a *cherem* (ban of excommunication) on the author and his books, in which they were joined even by heads of eastern congregations, so that the signatures of one hundred and thirty rabbis appeared on the document. The deception, however, was not as easily put down as brought to light. Multitudes joined these fanatics, and the mysticism under whose garb they disguised their profound immorality has left deep roots in the Jewish population of some parts of Poland and Russia. Chayun himself led for many years the life of an adventurer, and died blind and destitute at Amsterdam, universally detested for his principles, but as generally admired for his extensive learning. The numerous works published by Chayun in the midst of his wanderings refer to the Kabbala, and are most of them controversial. From the account given by R. David Nuñez Torres, in the *Bibliothèque Raisonnée*, of the spirit of Chayun's writings, Wolf infers that his metaphysical system was Spinozism.—(*Bibl. Heb.* part iv. page 928.)—T. T.

**CHECKLEY, REV. JOHN**, was one of the earliest episcopal ministers in New England. He was born in Boston, of English parents, in 1680, but was early sent to England for his education, where he studied at the university of Oxford. After his return to Boston he published, in 1715, a tract against the calvinistic views of the puritans, and in 1723, "A modest view of the Government settled by Christ and his Apostles in the Church." For the publication of a "Discourse concerning Episcopacy," &c., he was prosecuted, and fined fifty pounds by the supreme court of Massachusetts. In 1727, having conceived the idea of becoming a clergyman, he went to England for episcopal ordination, which he obtained only after twelve years' solicitation. He returned to America in 1739, and was settled as rector of St. John's church in Providence, Rhode Island. He was regarded as a man of wit and of some classical acquirements, but of great eccentricities of character, and extremely fond of controversy. He died in 1753.—F. B.

\* **CHEEVER, GEORGE BARRELL**, an eminent American clergyman and man of letters, was born on the 17th of April, 1807, at Hallowell, Maine; graduated at Bowdoin college in that state in 1825; and studied theology at the Andover seminary in Massachusetts. He was first settled at Salem, Mass., in 1832. His early contributions to the *Biblical Repository*, *North American Review*, and other periodicals, were remarkably popular. In 1828-30 he published three compilations of American prose and verse, selected with excellent taste, and illustrated with biographical and critical notices. Being an earnest advocate of the cause of temperance, he wrote a striking allegory or dream, called "Deacon Giles's Distillery," in which the spirits are represented as demons, and the whole scene as an inferno, one of the facts mentioned being, that the owner had a little counting-room in one corner of the distillery, where he sold bibles, and that he went to church on the sabbath, where he heard unitarian or universalist doctrines preached. The publication of it brought upon the author a suit for libel; all the circumstances described pointing out with sufficient distinctness the real owner of the distillery, though his name was not Giles. Mr. Cheever was convicted and suffered a month's imprisonment, beside receiving a severe beating in the street from the foreman of the distillery. In 1836 he visited Europe for a year, and in 1839 removed to the city of New York, where he is the pastor of a large and flourishing congregation. His numerous publications, his excellence as a pulpit orator, and his vehement and unsparing manner as a controversialist have kept him almost constantly before the public. His doctrine is that of orthodox congregationalism; and he has had frequent discussions with Romanists, episcopalians, unitarians, and presbyterians, all of whom he has attacked with considerable asperity. But he has made himself respected by his literary talents, and by the evident sincerity and earnestness with which he inculcates what he considers to be the truth. Of late years he has been especially conspicuous as an uncompromising opponent of slavery.

Among his works, all of which cannot be specified here, are—"The Hill Difficulty and other Allegories;" "The Windings of the River of the Water of Life;" "Lectures on Bunyan and the Pilgrim's Progress;" and "Wanderings of a Pilgrim in the Shadow of Mount Blanc and the Jungfrau Alp."—F. B.

CHEFEZ, R'MOSES BEN GERSON (in Italian, Gentile), died at Venice in 1711, at the age of forty-eight years, and not, as Rossi erroneously states, one hundred and three years old.—(See a notice by S. D. Luzzatto in the *Orient*, 1847, Lit. B., p. 280.) He was an eminent scholar, as well read in the philosophical writings of christians as in the Talmud and the Kabbala of the Jews. His philosophical commentary on the Pentateuch, entitled by him in Hebrew, "Melecheth Machshebeth" (Work of Thought), and styled in Latin, "Opus ad inventum," gives ample evidence of his great learning. His views on the souls of animals gave offence to the orthodox rabbins of his age, who felt inclined, it is said, to interdict the work in consequence. Under the title of "Cha-nukath Ha-bayith" (the Inauguration of the House), he described with great care and erudition the second temple at Jerusalem.—T. T.

CHEFFONTAINES (in Latin, A CAPITE FONTIUM), CHRISTOPHE, a French cordelier, born in 1532; died in 1595. After teaching theology at Rome, he was chosen general of his order in 1571. When the term of his rule expired, he was made archbishop of Cæsarea by Gregory XIII. Cheffontaines was charged with heresy, but had his orthodoxy satisfactorily established by the Holy See.—R. M., A.

CHEKE, SIR JOHN, a celebrated English scholar of the sixteenth century, was born of a good family in 1514 at Cambridge, where he was early admitted a member of St. John's college. Devoting himself to the classical languages, he soon became a distinguished student, particularly for his knowledge of Greek, which was at that time almost entirely neglected in the English universities. Thomas Smith, a member of Queen's college, was one of the few students at Cambridge who shared in Cheke's tastes and pursuits, and a close intimacy and friendship sprang up between them, which continued through life. Having been brought under the notice of Henry VIII. by Dr. Butts, the king's physician, Cheke was nominated king's scholar along with Smith, and a handsome stipend was assigned to him to enable him, not only to prosecute his studies at home, but also to visit foreign universities and courts. His services as a fellow and tutor of St. John's were of the greatest importance in the revival of learning and scriptural theology in the university. "He directed," says his biographer Strype, "to a better method of study, and to more substantial and useful learning, so that he was said by one that knew him well, to have laid the very foundation of learning in that college." Strype here refers to Roger Ascham, who was a pupil of Cheke's, along with many other men who were afterwards highly distinguished in church and state—such as Bill, Lever, Pilkington, Hutchinson, and William Cecil. In or about 1540 a professorship of Greek having been founded in Cambridge by Henry VIII., Cheke was appointed to the chair, though only in his twenty-seventh year. His appointment gave a great stimulus to Greek studies in the university, and having embraced the views of Greek pronunciation which were first broached at Cambridge by his friend Sir Thomas Smith, he did his utmost to recommend and introduce the new and improved method. This innovation, however, gave offence to many who were jealous or envious of the influence of the young scholar, and involved him in an unpleasant controversy with Bishop Gardiner, then chancellor of the university, who was so illiberal as to issue an order for the discontinuation of the new style of pronunciation. In 1544 Cheke was appointed joint-tutor, along with Sir Anthony Cooke, of Prince Edward—afterwards Edward VI.—and his instructions powerfully contributed to form the character, and determine the faith of the future monarch. His services were liberally rewarded by Edward on his accession to the crown. He received the honour of knighthood, along with a gift of lands sufficient to enable him to maintain this new rank, and was advanced, in succession, to several offices of high honour and trust in the court and in the public service. On the death of Edward his fortunes declined. Having espoused the cause of the unfortunate Lady Jane Grey, and acted for a short time as her secretary of state, he was committed to the Tower by Queen Mary, and though pardoned and released in the following year (1554), he found it desirable to consult his safety from persecution on the score of religion, by

obtaining leave to withdraw to the continent. He went first to Basle, then to Padua, where he gave lectures to some of his countrymen on Demosthenes; and next to Strasburg, where he was compelled, by the confiscation of his whole property at home, to support himself by giving lessons in the Greek language. Hearing, in the beginning of 1556, that his wife had come from England to Brussels, he set off to join her there. But his enemies were on the watch for him, and he was arrested on the road between Brussels and Antwerp, hurried on board an English ship, and carried prisoner under hatches to London. The offence laid to his charge was, that he had exceeded the time allowed him in his leave of absence from the kingdom, and that he had openly associated himself with the worship of the heretical exiles at Strasburg. Dr. Feckenham, the popish dean of St. Paul's, was sent to reason with him in the Tower on the doctrines of the church, and he was brought into the presence of Cardinal Pole, who counselled him to return to the unity of the faith. The alternative was a fearful one—recant or burn—and Cheke's courage and constancy were not equal to such an emergency. He consented to be submissive to the queen's pleasure; he only begged that he might be spared the humiliation of a public recantation. But even this poor satisfaction was sternly refused him, and he was compelled to make an open retraction before the whole court. The pangs of his remorse and shame were extreme, and he died of a broken heart in Wood Street, London, September 13, 1557. To Sir John Cheke belongs the honour of having been one of the foremost revivers of classical knowledge in England, and especially one of the first to infuse that love of Greek learning which has ever since continued to adorn the English universities. His principal works are—"De Pronunciatione Græcæ potissimum linguæ Disputationes." "De Superstitione"—addressed to Henry VIII., and prefixed to a translation of Plutarch's treatise on the same subject; "De Obitu doctissimi et sanctissimi Theologi Domini Martini Bucerii, Epistolæ Duæ:" London, 1551; "The Hurt of Sedition, how grievous it is to a Commonwealth," 1549.—P. L.

CHELMSFORD. See THIESIGER.

CHELSUM, JAMES, D.D., a learned divine of the church of England, author of "Remarks on Gibbon's Roman History," 1772, a work which excited some attention, was born in 1740, and died rector of Droxford in Hampshire in 1801.—J. S., G.

CHEMNITZ, MARTIN, a distinguished Lutheran theologian of the sixteenth century, was born on the 9th of November 1522, at Treuenbitzen in the Middle Mark of Brandenburg, where his father, though sprung from an ancient noble family, carried on the trade of a clothmaker. After studying for some time at Frankfort-on-the-Oder under the eye of his relative, Professor George Sabinus, he repaired in 1545 to Wittenberg, where he became a favourite student of Melancthon, by whose advice he directed his special attention to mathematics and astrology. When the university of Wittenberg was scattered and almost annihilated by the Smalkaldic war in 1547, he withdrew to Königsberg where Sabinus had preceded him, and was appointed rector of the cathedral school. Here he continued till 1553, occupying himself chiefly with the systematic study of theology in all its branches, and amassing an immense store of learning, of which he gave the first public example in a controversy which he maintained during those years with Andreas Osiander, one of the Königsberg theologians, on the subject of the Lutheran doctrine of justification, on which Osiander had proposed several very material and indeed dangerous modifications. His opponent, however, prevailed in the strife, and Chemnitz was obliged to leave Königsberg. Returning to Wittenberg, he was cordially welcomed by Melancthon, and began, by his advice, to deliver lectures in the university on Melancthon's *Loci Communes*. But an invitation to settle in Brunswick having been offered him in 1554, he accepted it, and in that city he spent the remainder of his life; first as coadjutor in the pastorate, then as pastor, and, finally, as superintendent. He died, 8th April, 1586. Chemnitz was one of the most learned theologians of the Lutheran church. He took a prominent part along with Andrea against the Crypto-Calvinists, and in the drawing up of the Formula Concordiæ; and he highly distinguished himself by his polemical treatises against the jesuits and the decrees of the council of Trent. His principal writings were as follows—"Loci Theologici, quibus et Loci Communes Phil. Melancthonis perspicue explicantur:" Frankfort, 1591; "Theologiæ Jesuitarum præcipua capita:" Leipzig,

1562; "Examen Concilii Tridentini," 1565; "De duabus naturis in Christo:" Jenæ, 1570. It was acknowledged by the Romish divines that since Luther's death, no protestant theologian had brought such formidable weapons to bear against their system, or had inflicted such heavy blows upon it as Chemnitz.—P. L.

**CHENEDOLLÉ, CHARLES JULIEN PIVOULT DE**, was born at Vire in 1769. On the breaking out of the Revolution, he took part with the royalists, joining the army of the prince of Condé, and suffering great hardships. In 1807 appeared his poem, the "Genius of Man," in which he treats with eloquence and feeling the ordinary yet never common-place subject of wonder and mystery—that mixed nature which, sinking at one time to bestial debasement, rises at another to angelic power. While holding the inspectorship of the university of Val de Vire, his unfortunate sovereign Charles X. passed by, a discrowned king, on the road to exile, when Chenedollé, unmindful of place, turned out his whole family to pay homage to his old master. The act did him no harm with the new governor. Two years afterwards he resigned office, to cultivate in retirement his love of poetry and of nature. His poems descriptive of pastoral scenes reveal the fine spirit of the man, who in his youth took Klopstock to his heart, and in his old age revised the translated works of Shakespeare. He died in 1833.—J. F. C.

**CHENEVIX, RICHARD**, an Irish chemist of French extraction, died in 1830. Chenevix is known in literature by his "Mantuan Rivals" and tragedy of Henry VII.; but it is on his chemical writings that his reputation chiefly rests. His earliest work was entitled "Remarks on Chemical Nomenclature according to the System of the French Neologists," 1802. His "Observations on Mineralogical Systems" appeared first in a French translation in the *Annales de Chimie*. It may be added that an "Essay on Natural Character" was published after his death.—R. M., A.

**CHENIER, ANDRÉ MARIE DE**, a poet, was born at Constantinople on 29th October, 1762. His father, who exercised the functions of consul, married a Greek lady. André imbibed, with the knowledge of Greek taught him by his mother, a passionate love for the poets of ancient Greece, whose style he successfully imitated. Brought to France when two years old, he was, when arrived at the proper years, sent to the college of Carcassonne. His parents, who ambitiously desired for him a diplomatic career, had him attached to the embassy at London; but yielding to his overruling love of letters, he devoted his attention to the study of Milton and Shakspeare. Soon after the outbreak of the French revolution he returned to France, sharing the hopes felt by so many at the outset of that great national movement. Acquainted with Condorcet, Sieyès, and other men of the same high stamp, he was introduced into the distinguished club which met at the palais royal; and in the character of secretary wrote a manifesto, expressing at once love of liberty and hatred of violence. King Stanislaus sent the writer a medal in testimony of his admiration, but revolutionists of the temper of Camille Desmoulins repudiated such moderate sentiments. As the jacobite party increased in strength, André's opposition to their principles grew more decided and his courage became more conspicuous. On the occasion of the banquet given by the municipality of Paris to the forty-five soldiers who had mutinied, the poet's indignation found vent in a vehement satire, in which he boldly attacked the formidable Collot d'Herbois, the author of the affair, by name. With still more courage he offered himself to Malesherbes, the counsel for the unfortunate Louis XVI., and his services being accepted, wrote several of the papers for the defence, and was the author of the king's letter to the assembly, claiming right of appeal from its sentence to the judgment of the people. At last he became so obnoxious to the terrorists that, yielding to the advice of his friends, he retired to Versailles; but hearing of the arrest of his friend, madame de Pastoret, he flew to her assistance, and committed the further imprudence of getting into an altercation with the officer charged with her arrest. Taken off as a suspected person, his antecedents soon became known, and he was summarily examined and condemned by the revolutionary tribunal. While in prison he composed that exquisite production, "La Jeune Captive," inspired by the youth and beauty of his companion in misfortune, mademoiselle de Coigny. Fully conscious of his own powers, and thinking that his scattered papers were little likely to be collected, he, on leaving prison for the place of execution, struck his hand against his forehead, saying—"There was something here." He was guillotined with forty-four others,

25th July, 1794. Twenty-six years afterwards the poems of André Chenier appeared for the first time in a collected shape, and were received with a burst of admiration; and there can be no doubt that his influence on modern French poetry was very decided. "The most melodious verses of Lamartine," observes the fine critic, M. de Villemain, "have perhaps derived inspiration from Chenier's poetry, and have not eclipsed it." Nor did Victor Hugo and the rising romantique school, whose canons of criticism were directly opposed to those of M. de Villemain and his classic followers, show less delight. Under that pure attic form which they thought superannuated, they recognized the true beat of a fervid heart.—J. F. C.

**CHENIER, MARIE JOSEPH DE**, brother of the foregoing, born at Constantinople in 1764; died in 1811. He produced on the 4th of February, 1789, his tragedy of Charles IX., remarkable as an exposure of the crimes of a king of France, while the old regime was yet standing in apparent strength, and remarkable also as having furnished Talma with the part which began his splendid career. The shock which the execution of his brother André gave his mind, was felt so profoundly that he wrote nothing more till the year 1804, when he produced the "Advent of Cyrus," meant to please Napoleon by flattering allusions to the new emperor. The old jacobin, while missing the aim of his production, stirred up the anger of former associates, who saw in him a renegade; and with the too frequent recklessness of party, they did not hesitate to circulate accusations of his having been privy to his brother's death, for which there does not appear to have been a shadow of proof. Besides his tragedies, which, although they had much success when first produced, are now little remembered, he wrote lyrical pieces, one of which, the "Champ du Depart," almost rivalled the Marseillaise, during the late revolutionary days of February, 1848, as much as it did when the republican youth rushed to the frontier at the cry of "La Patrie est en danger." Successively a member of the convention, of the council of Five Hundred, and of the tribunate, Marie Chenier honourably distinguished himself by his wise zeal in the cause of public education, which he is acknowledged to have much advanced.—J. F. C.

**CHEOPS or CHEMBES and CHEPHREN**, ancient kings of Egypt. According to Herodotus, Cheops was a wicked and impious prince. He closed the temples, and robbed his people of their labour. The first and largest pyramid is thought to have been built by him. Chephren, his brother and successor, was not less cruel. It was he who built the second great pyramid. The Egyptians so inveterately hated these two brothers, that they publicly reported that the pyramid had been erected by a shepherd called Philiton.—R. M., A.

**CHERON, ELIZABETH SOPHIA**: this artist was born in Paris in 1648. She was the daughter and pupil of Henry Cheron, a painter in enamel. She distinguished herself by her portraits, which were not merely correct likenesses, but had the additional artistic merit of being good pictures—remarkable for their beauty of colour, graceful design, and dexterity of execution. She painted also historical subjects with marked success; and on the proposal of Le Brun she was received with marked respect and distinction by the Academy of Paris in 1676. She died in 1711. She plied the graver felicitously, and left many plates from original and other designs.—W. T.

**CHERON, LOUIS**: this painter, the brother of Elizabeth Sophia Cheron, was born in Paris in 1660. When young, and furnished with means through the liberal love of his sister, he went to prosecute his studies in Italy. He particularly studied the works of Raffaele and Romano; and on his return to Paris he painted two pictures for the church of Notre Dame—one being "Herodias with the head of John the Baptist," and the other "Agabus before St. Paul." He was a coldly correct painter, and worked as though he knew design, but did not love it, and neither knew nor loved colour. The religious troubles of France compelled him to seek refuge in England, where he obtained considerable patronage, particularly from the duke of Montague, for whom he painted "The Council of the Gods," "The Judgment of Paris," and other works. He etched several plates in a spirited and agreeable manner. He died in 1713, or in 1723 as others say, who credit him with the ornamental designs to the edition of Milton's *Paradise Lost*, published in 1720.—W. T.

**CHERRY, ANDREW**, an Irish actor and dramatic author, was born in Limerick on the 11th January, 1762, and was the eldest son of John Cherry, an eminent printer and bookseller of that city.

Andrew received a good education, being intended for the church; but he was ultimately bound to Mr. James Potts, a printer in Dublin. Potts appears to have been very kind to young Cherry; and being partial to theatres, he generally took the lad with him there, finding that he had a strong turn in that direction. The printing-office was soon deserted by young Cherry for the stage, and at fourteen years of age he made his first appearance at a temporary theatre fitted up in James' Street. A manager of a strolling company induced Cherry and some other play-struck lads to join him, and with him Cherry continued for ten months, going through the provincial towns all the time, laboriously studying most of the principal characters in tragedy and comedy—half-starved, ill-lodged, and without a shilling in his pocket. At length he was reduced to the verge of starvation, and after four days' fasting the truant returned to his friends and his trade, to which he attended steadily for three years. Then the old passion came strong upon him, to which was added the passion of love; and so he enlisted under the management of Richard William Knipe as his master, and that of his daughter as his wife. Belfast was for a time the scene of his labour, where he acquired considerable reputation, and in 1797 he got an engagement in the Theatre Royal, Dublin, where his success was such as soon to place him at the top of his profession as a comic actor. Cherry accepted an engagement to play in the provinces in England, and returned to Dublin, where he wrote and produced two operatic pieces which were received with general approval. Leaving Ireland once more he went to Manchester, and thence to Bath, where his performance was pronounced to be "as finished a picture of the scenic art as had ever been performed on their boards." In 1802 he made his first appearance at Drury Lane, where he at once established a high character and position. In February, 1804, Cherry came out as a dramatic author by the production of "The Soldier's Daughter." This comedy had a run of thirty-five nights to crowded houses during the first season, and has kept the stage ever since. Though somewhat mawkish in sentiment and full of claptraps, it is nevertheless an effective piece, and affords opportunities for good acting. Its great popularity was in no small degree due to the acting of Mrs. Jordan as *Widow Cheerly*, a part afterwards sustained by Miss O'Neile at Covent Garden. In 1805 Cherry brought out "All for Fame," "The Village," and a musical interlude entitled "Spanish Dollars." The following year he produced "The Travellers," a grand operatic drama, the music of which was composed by Corri. He wrote a few other pieces, and continued to play in Drury Lane till it was burned; after which he took the management of a company that travelled through Wales, and of which Edmund Kean was the leading actor. He died at Monmouth on the 7th February, 1812, in his fiftieth year.—J. F. W.

CHERSIPHON, the Cretan architect who designed the famous temple of Diana at Ephesus, and who, with his son Metagenes, determined the proportions of the Ionic order, flourished about 560 B.C. His writings were still extant in the time of Vitruvius.—J. S., G.

CHERUBINI, MARIA LUIGI CARLO ZENOBIO SALVATOR, a musician, was born at Florence, 14th September, 1760, and died at Paris, 3rd February, 1842. His father, Bartolo, taught him music when he was but six years old; three years later he began to study composition under Bartolo Felici and his son Alessandro, and upon their death, Bizzari, and subsequently Castrucci, were appointed his masters. The best evidence of his extremely early susceptibility of instruction, and of the successful result of the teaching he received, is the fact, that in 1773 he composed a mass, which is said to have possessed far more than boyish pretensions. This was followed by some other sacred works, and some light pieces for the theatre, of such merit as to draw upon the young artist the attention of the grand duke of Tuscany, who gave him a pension to enable him to pursue his studies under the famous Sarti. From 1778 till 1782, first at Bologna, and then at Milan, Cherubini received the lessons of this theorist, by which he was trained in the contrapuntal formulæ of the severe Roman school—a discipline to which is to be attributed the earnest character and classic tendency of his writings. Sarti's instruction, however, was of a nature to develop his pupil's imagination, as much as to exercise his reason, and thus, so far as teaching might influence his genius, he owed to this master the best elements of his style. During his pupilage, he was often intrusted to write pieces for

the minor characters in the operas of his master, which were produced without mention of his own name; and these were not of greater assistance to Sarti in saving his trouble, than of valuable service to Cherubini in exercising his invention while still under a teacher's direction. In 1780 Cherubini produced his first opera, "Quinto Fabio," which the censure of the time pronounced to be of a character too elaborate for its purpose—a criticism common to all works of art that aim above the applause of the million, and one which was a surety for the genuine artistic integrity of the career of which this opera was the commencement. Several other works of the same class were brought out by our composer in quick succession at different Italian cities, with such fortune, that in 1785 he was engaged as music director at the king's theatre in London. Here he wrote "La Finta Principessa" and "Giulio Sabino," and many additional pieces for the operas of other composers. In 1787 he made a sojourn at Paris, where he published some inconsiderable compositions, and then proceeded to Turin, where, early in the following year, he produced "Ifigenia in Aulide," the best accredited of his early operas. He returned to Paris in 1788, which place was from thenceforward his permanent abode.

Cherubini's artistic life assumed a new character from the period of his adopting France as a country, from which time, by writing for its establishments and to its language, and becoming an active member of its musical institutions, he influenced in a marked degree the progress of his art in that nation. "Démophon," his first French opera, was produced at the académie, 5th December, 1788; it had little success, partly because his style was new to the public, and above immediate appreciation; partly because Vogel, who had recently died, had left an unfinished opera on the same subject, of which the overture had obtained popularity; but *Démophon* stamped the character of its author, and gained him a high position in Parisian esteem. In 1789 Cherubini was engaged to direct an Italian opera at the Théâtre de la Foire Germain, for which, as previously in London, he composed many pieces to be introduced in the different works that were brought out; these are noticed for the far greater lightness of their style than that in which he generally wrote; a proof of his capability to adapt his thoughts to the situation for which he conceived them. He made a most important success with "Lodoiska" in 1791, notwithstanding the rivalry of the opera of Kreutzer of the same name; this was the first of his works that has made a lasting impression. On the establishment of the conservatoire in 1795, Cherubini was appointed inspector, and also professor of composition, and in this capacity he has done more than perhaps any one in the establishment of a school of music peculiar to France. To pass over several compositions which are now less known, particular mention must be made of "Médée," produced in 1797 at the Théâtre Feydeau. This opera underwent some subsequent alterations by the composer; it is now not unfrequently performed at Frankfort and Berlin, and the soundest judges declare it to be a masterpiece. "L'Hôtellerie Portugaise," the name of which is made familiar in England by its favourite overture, was first performed in 1798. The work upon which, above all others, the fame of Cherubini rests, "Les Deux Journées," was first performed at the Théâtre Feydeau, 16th January, 1800. Though forgotten in France, this most beautiful opera is still, like several others of its author, a standard work at the principal German theatres, where, under the name of "Der Wasserträger," it ranks high in popular esteem and critical approval. In England little is known of it beside the overture; but this, by the power of its ideas, their admirable development, the peculiarity of its form, and the vigour and brilliancy of its orchestration, gives Cherubini a foremost rank among musicians, in the estimation of all who set the highest value on the greatest order of artistic productions. "Anacréon, ou l'Amour fugitif," an opera in two acts, the overture of which is here better known, and, far from justly, more admired than any other composition of Cherubini, was produced at the Théâtre de l'Opéra, 4th October, 1803. The success of his music in Germany, even then exceeding what it met with in Paris, led to his invitation to visit Vienna, where he went in July, 1805. There he reproduced at the imperial theatre his opera of "Lodoiska," with some additions, and he composed for the same establishment the eminently beautiful opera of "Faniska," which was brought out at the commencement of the ensuing year. Cherubini returned to Paris in the spring, but produced no work of importance there for some

considerable time. He was never in favour with Napoleon, for which some account by the emperor's liking for light Italian music, others, by his personal disinclination for Cherubini. He wrote, it is true, some odes and other occasional pieces for public festivals during the Bonaparte administration; but he appears to have had all the difficulties of the want of court countenance to prevent his theatrical prosperity. He spent much of the latter part of 1808 on a visit at Chimay, where he commenced his admired mass in F for three voices, which he completed at Paris the following year. This recurrence to ecclesiastical composition gave a new direction to his genius; and the many grand works of the same class—of which that just mentioned is to be dated as the first—that he produced during the latter half of his career, redound as much to his glory, and prove as decidedly his individuality, as anything he wrote. Some circumstances of special good fortune led to his being commissioned to compose a one-act Italian opera, "Pimmalone," to be performed before the emperor at the theatre in the Tuileries in November, 1809; and still in court favour, he wrote an ode for the imperial marriage in the following May. The opera of "Les Abencérages" was produced in 1813, but its first success was greatly qualified by the public grief for the calamities of Moscow. Cherubini was engaged by our Philharmonic Society in 1815, the third year of its existence, to write an overture, a symphony, and a vocal quartet for their concerts, and he came to London in the February of that year, to complete the commission, and to direct the performance of the works. His celebrity at this time as a composer in the classical style, was second to that of no contemporary, save only Beethoven; and the active energy of the young society whose inaugural concert had been opened with his overture to *Anacréon*, directed this application, as a measure for advancing the art for the furtherance of which they were associated. The result proved, however, that their estimate was erroneous of Cherubini's genius, the power of which was quite unfitted for concert composition; neither the overture nor the symphony was ever played after the first performance.

The Bourbon restoration made a complete change in the circumstances of our composer, if not in the consideration in which the world held him; he was appointed in 1816 *surintendant de la musique du roi* and master of the royal chapel; he was created *chevalier* of the legion of honour, and invested with the order of St. Michael; and these beams of royal grace were reflected by the public establishments, the *Institut des beaux Arts* admitting him as a member, and the conservatoire, on its reorganization, appointing him chief professor of composition. From this time until the choir was dismembered in consequence of the revolution of 1830, Cherubini was indefatigable in his labours for the service of the chapel; he produced, in the year of his appointment his masterly requiem in C minor, and this was followed by a constant succession of masses and lesser pieces of ecclesiastical music. Of these may be specialized the mass in G, composed in 1819 for the coronation of Louis XVIII., and that in A, comprising an unusual number of pieces for the coronation of Charles X., which was completed in April, 1825. He was installed director of the conservatoire in 1822, and held this most important office till his death. The celebrated party led by Baillot, played in 1829 Cherubini's violin quartet in E flat, which was written fifteen years previously; the impression made by this induced the composer to adapt as a quartet the symphony produced in London, transposing the work from the key of D to C, and substituting a new adagio for a movement of the original. These quartets were published with a third, and dedicated to the eminent violinist to whose playing is due the good effect they made; their merit entitles them to no distinction, and it is scarcely to be supposed that his several subsequent works of the same class which have not been printed, can possess any greater interest, since these prove the author's entire want of feeling for the style, and aptitude for the form of instrumental chamber music. In 1831 Cherubini wrote a portion, in company with several others, of the opera of "La Marquise de Brinvilliers," and in 1833 produced "Ali Baba" at the académie, portions of which had been long composed, but which had been extended from three into four acts, and finally completed, immediately before its performance. The success of this work, remarkable for its merit, and still more so from the great age of its author, was but indifferent in Paris; the opera, however, excited the warmest admiration in Germany, where it was received with applause, and criticized with enthusiasm. The

last composition of magnitude that Cherubini produced was his requiem for male voices, which he wrote in 1836, because a recent ecclesiastical regulation forbidding the employment of females in church choirs, had prevented the performance of his requiem in C minor at the funeral of Boieldieu, in the preceding year. This extraordinary effort of a man of seventy-six years proves the unabated activity of his mind, if not the unexhausted freshness of his invention; it was first performed at the obsequies of the composer. The last six years of Cherubini's life were constantly occupied in composition, and in the discharge of his duties at the conservatoire. A month before his death, Louis Philippe conferred on him the grand cross of the legion of honour, this being the only occasion on which that special distinction has been received by a musician; and the most rare testimony to the eminence of the master may be regarded as a symbol of the reverence of the whole artistic world.

Cherubini produced twenty-four complete operas, besides participating in the composition of four more with other authors, writing many additional pieces for introduction in standard works, and commencing several operas which he abandoned. He wrote eighteen masses besides his two requiems, and an enormous number of minor pieces for the church. He composed many odes and cantatas for the frequent public occasions of the first quarter of a century of his residence in Paris, and chamber music of almost every class, to a scarcely conceivable extent. His countless solfeggios and other exercises for the use of the conservatoire, are held in great estimation. In addition to these works of instruction, he was prominently concerned in writing the treatise on singing adopted by the same institution, and his course of counterpoint and fugue is one of the most perspicuous books upon the subject that exists. Of this last, however, it must be admitted, that admirable as are its rules, and lucid as is their explanation, there is not one of them which is not violated in some or other of the illustrative examples—a fact to induce the supposition that the principles may have been taken down from his oral teaching, and the examples supplied by one of his pupils who had a better memory for the rules than capacity for their application, and this at a period when the infirmity of advancing age disinclined the master for his strict revision of the work. Cherubini's position is unique in the history of his art; actively before the world as a composer for threescore years and ten, his career spans over more vicissitudes in the progress of music than that of any other man. Beginning to write in the same year with Cimarosa, and even earlier than Mozart, and being the contemporary of Verdi and of Wagner, he witnessed almost the origin of the two modern classic schools of France and Germany, their rise to perfection, and, if not their decline, the arrival of a time when criticism would usurp the place of creation, and when, to propound new rules for art, claims higher consideration than to act according to its ever unalterable principles. His artistic life was indeed a rainbow based upon the two extremes of modern music, which shed light and glory on the great art cycle over which it arched. Notwithstanding the great merit of some of his overtures, this appears to have been the result of momentary inspiration rather than of mastery in that style of writing; for he was manifestly deficient in the principles of construction, and instrumental music was therefore a department in which he was unqualified for success. Though evincing a rare power of dramatic effect, even the best of his operas are blemished by a disregard of the exigencies of the scene, which are often sacrificed to the technical development of the musical idea. His excellence consists in his unswerving earnestness of purpose, in the individuality of his manner, in the vigour of his ideas, in the fluency of his melody, and in the purity of his harmony. His personal manners appear to have been harsh and repulsive to strangers, but to have grown so cordial with familiarity, as to have bound to him in inseparable friendship all who approached near enough to him to experience his amiable qualities. Foremost in the list of his friends was M. Halévy, who witnessed his dying moments. A singular proof of the orderly precision of mind which eminently characterizes his scores, is an accurate chronological catalogue in his own writing of everything he composed from 1773 to 1839, by which interesting document the chief facts of the present notice have been verified. In conclusion, his powerfully beneficial influence upon music in France is proved by his having produced as pupils the following—the most eminent musicians of that country of the present century—Boieldieu, Auber, Carafa, Halévy, and Berton.—G. A. M.

CHESELDEN, WILLIAM, a distinguished surgeon and anatomist, born in Leicestershire in 1688. At the age of fifteen he commenced his medical studies in London, and at the early age of twenty-two he began himself to give lectures on anatomy, of which a syllabus was printed in 1711. Till then such lectures were very uncommon in England, having only been introduced by M. Bussiere, a French refugee, a surgeon of great eminence in the reign of Queen Anne. He was elected into the Royal Society in 1712, and contributed many papers to the Philosophical Transactions. One of the most remarkable of them is an account of the sensations of a youth of fourteen, blind from his infancy, on recovering his sight by the formation of an artificial pupil. This paper has been much quoted by metaphysical writers, and the operation, now common, was then perfectly new, and added greatly to Cheselden's reputation. In 1713 he published a work on anatomy which passed through several editions, and was long the text-book of that science in the medical schools. He became surgeon to St. Thomas, and afterwards to St. George's and the Westminster hospitals. As an operator and skilful surgeon he was unrivalled, and has perhaps never been surpassed in dexterity and coolness; he is said also to have been as tender as he was skilful. He was almost the first surgeon to operate successfully in lithotomy. We are told that out of forty-two patients who came under his hands for this operation he lost but one—the present average being at least six in that number. In 1723 he published a work on the subject, and in 1733, his great work on the bones, which he dedicated to Queen Caroline, appeared. It was a series of plates of natural size with short descriptions, and was then unequalled in execution and accuracy. Cheselden was an intimate friend of Pope, and seems to have had a turn for rhyming himself; and he was more gratified by a compliment on a well-turned extempore stanza than by being called the first operator in Europe. In 1737, after a brilliant professional career, he retired from practice at the age of forty-nine—it is said partly in disgust at the jealousies and asperities to which his success had exposed him. In his leisure he undertook the duties of honorary surgeon to Chelsea hospital, which he retained for the rest of his life. His last contribution to science was a series of plates, with original remarks, appended to Gataker's translation of Le Dran's Surgery. In 1743 Cheselden was elected sheriff of London and Middlesex with Horatio Townsend, Esq. He, however, did not serve. In 1751 he suffered an attack of apoplexy, from which he recovered, but a return of the complaint caused his sudden death at Bath on the 10th of April, 1752, in his sixty-fourth year. Cheselden's reputation as a surgeon was solid, and will be lasting. In his character there was much to admire, though we cannot but regret that he should have prided himself on talents for literature and classics which he did not possess, instead of endeavouring to consolidate his reputation on the true basis of his professional knowledge and great skill.—E. L.

CHESENE, ANDRÉ DU. See DU CHESNE.

\* CHESNEY, FRANCIS RAWDON, was born in Ballyrea in the north of Ireland, on the 16th of March, 1789. Being destined from an early age for the army he was educated at Woolwich, whence he entered the Royal Military Academy in January, 1804. In November following he passed his examination for the royal artillery, and obtained a first lieutenancy on the 28th October, 1805. His regiment was sent to Guernsey in March, 1808, to protect the Channel Island harbours, where he remained some time on the staff as aid-de-camp to Sir A. Gladstones, occupying himself in studying military tactics. Having obtained his captaincy in 1815, he was withdrawn from active service till 1821, when he was sent to Gibraltar, whence he returned in 1825, after the death of his wife. He now formed the project of exploring the Niger, but the expedition was abandoned, and Chesney then occupied his active mind in visiting the great battle-fields of Europe. He next went to Turkey, with the recommendation of Sir Sydney Smith, and was employed by the Porte in fortifying the passes of the Balkan; but his operations were interrupted by the treaty of Adrianople. He now travelled through Greece, Asia Minor, and Egypt, the result of which was the publication of the first report on the steam navigation to India by way of the Red Sea. A subsequent tour of inspection was undertaken through Palestine and Arabia Petrea; and embarking on the Euphrates at Anah on a raft navigated by three Arabs, and accompanied by a Turk as an interpreter, and a young boy, he descended as far as the Indian ocean. The

narrative of this exploration is one of the most interesting on record. Chesney returned to England in 1832, and in 1834, the house of commons having granted £20,000 for the further prosecution of experiments in relation to the two routes, an expedition was fitted out, the command of which was given to Chesney with the rank of lieutenant-colonel, who sailed from Liverpool on the 10th of February, 1835. After unexampled difficulties which occupied nine months, in transporting two iron steam vessels across the desert, they were launched on the Euphrates, and the expedition commenced to descend the river on the 16th of March, 1836. One of these vessels, the *Tigris*, with all her instruments, journals, and surveys, was wrecked in a hurricane, when Chesney, who was on board, with difficulty escaped, his two lieutenants and most of the crew being drowned. With undaunted courage Chesney persevered, determining to take on himself the risk of continuing the enterprise; and accordingly he proceeded with the other vessel and reached the Indian ocean in safety on the 19th of June. After making extensive surveys, he ascended the Tigris as far as Bagdad. Another ascent of the river was subsequently made and valuable surveys completed, and Chesney returned to England just after the death of William IV. In 1846 Chesney was made lieutenant-colonel, and in 1850 he published "The Expedition for the Surveys of the rivers Tigris and Euphrates," in two vols. He obtained his colonelcy the following year. He has since published observations on firearms and their probable effects in war, and a narrative of the Russo-Turkish campaigns of 1828-29.—J. F. W.

CHESTERFIELD, PHILIP DORMER STANHOPE, Earl of, was born in London, September 22, 1694. He is famous in literary history as the author of those confidential letters to his son, which, while reducing gentlemanly behaviour to a systematic art, attempt the elaboration of a science of life so shrewd as to render its devotee the master of fools and knaves, even in matters of worldly interest and repute; so adapted to varying circumstances as to lessen the chances of a "checkmate" in any schemes of personal pleasure or ambition; so fascinating in its grace as to render ladies, courtiers, and princes unconscious servants of its will. Lord Chesterfield stands the representative of that class of "men of the world," who may more justly be said to exalt etiquette into a moral system with its own special characteristics, than to bring down morality to etiquette, and who, while sanctioning indulgences from which purer teachers justly shrink, at the same time uplift matters of behaviour into certain principles of conduct, without which sanctity itself cannot make manifest the perfection of its inward charms. In the absence of any corresponding English terms, Chesterfield must be described as *l'homme comme il faut*, who practised the art *de savoir vivre*. He studied at Cambridge, not without distinction. He could read Greek with ease; and pursued mathematics under the eminent blind professor, Saunderson, attending also classes in civil law and philosophy. The desire to excel others was very strongly implanted in his nature, and he felt great sympathy with the saying of Julius Cæsar, that he would rather be the first in a village than the second in Rome. This resolute wish to outstrip others was so powerful within him, that he applied it, according to his own confession, to vices as well as virtues. He referred the vices of his youth not to any natural inclination, but to a resolution not to be second to any "man of pleasure." "I always naturally hated hard drinking," he wrote in one of his confidential letters, "and yet I have often drunk with disgust, only because I then considered drinking as a necessity for a fine gentleman." With even-handed justice, however, he applied the same principle to his studies as well as to his enjoyments, and became sufficiently accomplished to enjoy the friendship of Pope, Bolingbroke, and Montesquieu. His confession about his pleasures must, therefore, be in fairness united to his other and nobler declaration—"I used to think myself in company as much above me, when I was with Mr. Addison and Mr. Pope, as if I had been with all the princes in Europe." On leaving the university, Chesterfield travelled in Holland, Italy, and France. He had learnt French from his nurse, and not only was a perfect French scholar, but so enthusiastic an admirer of the graceful side of the French character, that he revered a cultivated Frenchman as the type of a perfect man. He often said that the "perfection of human nature" was manifested in a Frenchman who united the manners and good breeding of his country, with a fund of virtue, learning, and good sense. He cultivated his character according to this favourite standard, more success-

fully than Englishmen generally are able to do, and frequently received in Paris the compliment—"Monsieur, vous êtes tout comme nous." Lord Chesterfield returned to England upon the accession of George I., and entered the house of commons, where his very characteristic fear of being ridiculed kept him from taking any frequent part in the debates, although his talents soon made a favourable impression. Upon the death of his father in 1726, he took his place in the house of lords, which afforded a more favourable theatre for displaying the polished subtilty of his cultured style both of thought and speech. In 1728 he was appointed ambassador to Holland, and for his conduct on this mission, received from George II., who had come to the throne in 1727, the order of the garter, and an appointment in the royal household. He was recalled from the Hague in 1732, but shortly returned to fill the same office as before. Subsequently he became viceroy of Ireland; and in 1748 was advanced to the dignity of secretary of state and member of the cabinet. Although the fall of Walpole in 1742, whom Chesterfield had steadily opposed for ten years, apparently left for him an open path to a position of the highest authority, yet he never secured any very considerable political power. He injured his prospects of advancement early in his career, by a mistake of a character, not uncommon among adepts in that peculiar knowledge of the world upon which he prided himself, and overreached himself by basing his calculations too exclusively upon the weakness of human nature. In order to secure the favour of George II. before his accession to the throne, Chesterfield paid court to him through his mistress; and this was neither forgotten nor forgiven by George's wife, Caroline of Anspach, when queen of England. In addition to the adverse influence thus brought to bear upon his career, Chesterfield's shrewd insight into the failings of men was not united with an equal amount of practical managing skill. He was rather the critical observer, who can detect mistakes made by players at chess, when looking on unbiassed by the eager anxiety of the game, than himself the master of the board. In 1744, when in his fiftieth year, Chesterfield's health began to fail, and his political ambition not having been sufficiently gratified to encourage him in running any risks, or putting himself to much anxiety on its behalf, he retired from public life. The great interest of his life was now concentrated upon the education of his son. Philip Stanhope, an illegitimate child, his mother being madame de Bouchet, a French lady whom Lord Chesterfield had met in Holland, deeply absorbed both his affection and his ambition. He would train up the child systematically and firmly, and create a model statesman, who should be the most educated, the most polished, and the most powerful courtier in Europe. Chesterfield accordingly commenced a confidential correspondence with the young lad in his earliest years, and continued it until his manhood. Dr. Johnson's often-quoted criticism upon these letters, that they teach "the morals of a courtesan and the manners of a dancing-master," fails in justice. Chesterfield urges upon his son that his first duty is towards God; his second to obtain knowledge; and his third to be well-bred; and very evidently does not intend to spare any weakness, or to corrupt any principle, but has a certain ideal of character into the likeness of which he is striving to fashion his child's mind and conduct. He believed himself a severe rather than an over-indulgent monitor. "Be persuaded," he writes, "that I shall love you extremely while you deserve it, but not one moment longer." With respect to mental culture, the discipline directed is firm and wise, and embraces a range of subjects not usual among the young men of the day. *Approfondissez*, he urges again and again, go to the bottom of things; anything half done and half known, is, in my mind, neither known nor done at all. The precepts enjoined concerning good manners, often coincide with the sweet graces of a true christian gentleness. The well-bred man is described as one who remembers that honest errors are to be pitied and not ridiculed; who can converse with his inferiors without insolence, and be at perfect ease with kings; who is indulgent towards other people's innocent though ridiculous vanities; who is careful never to make another fear a mortifying inferiority in knowledge, rank, and fortune, and is never indifferent about pleasing. While, however, there are principles inculcated which would carry a man to the height of christian virtue—as when it is declared that he would much rather die than do a base or criminal action—other principles are also urged which would lead to voluptuousness and hypocrisy. The morality of Cato is

forgotten in that of Alcibiades; and the didactic dignity of a Nestor advising a Telemachus is mingled with the libertinism of a refined count de Grammont. Lord Chesterfield felt no passion to reform the world, he would simply master it and enjoy it; hence he directs his son to take kings and kingdoms as he finds them, and never to deprive himself of anything he wanted to do or see, by refusing to comply with an established custom; and lays down the principle that, while every one should think as he pleases, "or rather as he can," no one should communicate ideas which might trouble the peace of society. "Leave people tranquilly to enjoy," he writes, "their errors of taste as of religion." The son, upon whose education Chesterfield lavished such anxious care, proved a man of sense and learning, rather deficient than otherwise in the graces upon which such stress had been laid, and became envoy at the court of Madrid, but died before his father, when in his twenty-sixth year. Dr. Johnson dedicated to Chesterfield the plan of his dictionary, declaring himself overpowered by the enchantment of his address; but conceiving that he was unduly neglected, indignantly rejected the praise Chesterfield lavished on it upon its publication, and took his revenge by substituting the word *patron* for *garret* in his famous couplet—

"Yet think what ills the scholar's life assail,  
Toil, envy, want, the patron, and the jail."

Dr. Johnson's testimony to the learning and grace of Chesterfield is, however, striking—"His manner was exquisitely elegant, and he had more knowledge than I expected." During his latter days Chesterfield was afflicted with deafness, and lived entirely apart from the world, solacing himself with literature and gardening. He cultivated fine melons and peaches, and awaited death without desiring or fearing its approach. Lord Chesterfield died March 24, 1773. The best edition of his works is in 3 vols., 4to, London, 1777.—L. L. P.

CHETHAM, HUMPHREY, founder of the college and library at Manchester which bears his name, was born in 1580, and died in 1653. He was the third son of Henry Chetham of Cramprall, a Lancashire proprietor. Of his personal history little is known, except that, having engaged in trade, he realized a large fortune, and that he was high sheriff of the county of Lancaster in 1635. He died unmarried, and made provision in his will for the erection of the college and library with which his name is still associated. The design of the former was to maintain and educate forty poor boys. Since 1780, however, this number has been doubled. Chetham gave £1000 to found the library, and left to it besides what remained of his estate after endowing the school and providing for other charities and bequests. It is one of the few really free libraries in the kingdom, and contains, besides its thousands of valuable books, a great number of rare manuscripts.—R. M., A.

CHETWOOD, KNIGHTLY, D.D., a learned divine of the church of England, born in 1652; died in 1720. He contributed a "Life of Lyeurgus" to the translation of Plutarch's Lives published in 1683. The "Life of Virgil," and the preface to the Pastorals prefixed to Dryden's Virgil, were from the pen of this ingenious writer. He rose to be dean of Gloucester.

CHETWOOD, WILLIAM RUFUS, author of a "General History of the Stage," 1749; died in 1766. He followed for some time the calling of a bookseller in Covent Garden, and in later life was prompter at Drury Lane theatre.—J. S., G.

CHETWYND, JOHN, a learned and eloquent English writer, born in 1623; died in 1692. He was vicar of Temple in Bristol, and prebendary of the cathedral. His now scarce and curious work, "Anthologia Historica," was published in 1674, and reprinted in 1691, with the title of "Collections, Historical, Political, Theological," &c.—J. S., G.

CHEVALIER, ANTOINE-RODOLPHE, a French philologist, born in 1507; died in 1572. Chevalier acceded to the reformed faith, and became professor of Hebrew at Geneva. He afterwards went to Caen, where, on account of persecution, he passed into England. It is said that he taught Queen Elizabeth French. He was also appointed to teach Hebrew at Cambridge, where he remained till his return to Caen.—R. M., A.

CHEVALIER, ETIENNE, treasurer of France, was born about 1410, and died in 1474. He began his career in the service of the Constable Artus de Richemont; but soon passed into that of the king, Charles VII., who made him treasurer of France in 1452. He was attached to the embassy sent to England in 1445 to negotiate a peace; was appointed one of her executors

by Agnes Sorrel in 1450, and, as a last mark of his favour, was similarly honoured by his royal master. Chevalier continued to enjoy his places and pensions under Louis XI.—R. M., A.

CHEVALIER, MICHEL, a celebrated French political economist, born at Limoges in 1806. Having passed through the polytechnic school, and studied for two years in the *École des mines*, he was appointed engineer to the department of the north, in which capacity the revolution of 1830 found him. With the revolution sprung up the socialist sect of the Saint Simonians, of which M. Chevalier became an ardent member. The *Globe* newspaper having been started as the organ of the sect, it devolved on M. Chevalier, as chief editor, to vindicate doctrines which the government of July considered to be subversive of social order. The model establishment at Menilmontant was broken up by the police. M. Thiers, as lenient towards the members as he was hostile to their system, offered employment to those dreamy spirits not unworthy of their talents and ambition. The editor of the *Globe* was sent to the United States to study the American system of railways. His letters from that country, written in 1832, enriched the columns of the *Journal des Debats*. So well did he fulfil the objects of his mission, that he was authorized to go to England in 1836, to make a report on the causes of the commercial crisis of that year. After this he laboured, chiefly through the *Debats*, to prove to the French people the necessity of railway undertakings, with respect to which the country was miserably behindhand; and was rewarded for his pains by a seat in the council of state, and by a chair of political economy in the college of France. In this capacity the professor boldly advocated free-trade. Having been elected deputy for L'Aveyron, his constituents punished the free trader by turning him out at the general election for 1846. Worse still, the republic of 1848 abolished his professorship. The empire not only restored him to his chair, but raised him to the rank of senator. He died in 1863.—J. F. C.

CHEVALLIER, FRANÇOIS FULGIS, a French botanist, died in 1840. He published a flora of the environs of Paris, and devoted attention specially to cryptogamic plants. He wrote a history of the natural order graphideæ, in which he gives valuable anatomical and physiological details, as well as a classification of the genera. A large work containing illustrations of European fungi was left incomplete at his death.—J. H. B.

CHEVERUS, JEAN-LOUIS-ANNE-MADELEINE LEFEBVRE, DE, a French cardinal, who being driven from his country by the troubles of the Revolution, settled at Boston in America, and there during many years by indefatigable labours as a priest and a philanthropist, secured the highest esteem not only of his co-religionists, but of the general community—was born at Mayenne in 1768. Obligated by ill-health to return to France in 1823, he was received with rapture by his countrymen, and was appointed by the king bishop of Montauban, and shortly afterwards archbishop of Bordeaux. He died in 1836.—J. S., G.

CHEVREAU, URBAIN, born at Loudon in 1613; died in 1701. Of his earlier life little is known, except that he was fond of travelling, and found the means of living abroad. In 1652 we find him at Stockholm secretary to Queen Christina. We find him afterwards at Heidelberg conseller of the Elector-palatine Charles-Louis. He is mentioned as the instrument used in the conversion of the Princess-palatine Charlotte Elizabeth, when this step was adopted as a convenient arrangement, previous to her marriage with the duc d'Orleans. After the elector's death he returned to Paris, and was appointed, first, preceptor, and afterwards private secretary of the duc du Maine. He subsequently retired to Loudon, where the rest of his life was past in study and in the cultivation of flowers. He published several dramatic works and romances. A work of his, giving an account of the great rebellions which have changed the face of society, was at one time popular. It has been printed sometimes with the title of "Tableaux de la Fortune," sometimes as "Effets de la Fortune." Another of his works, "Histoire du Monde," has been very often reprinted. He is accused of having, in the earlier part of his work, made too much use of rabbinical legends.—J. A., D.

CHEVRIER, FRANÇOIS ANTOINE, born at Nancy about 1720; died at Rotterdam in 1752. Chevrier's life was irregular and unfortunate. His talents were considerable, his education good, and he entered life with high prospects. He was for a short time in the army, which, however, he left from some impulse of literary ambition. "He thought," says Gustave

Desnoireterres, "that he could better use a pen than a sword; but in his hand the pen became a dagger." He published a history of the illustrious John of Lorraine, and was banished or had to fly the country. It is said that he was sentenced to the galleys for calumny. This is unlikely, for we find him soon after the publication at Paris, engaged in scribbling obscene and libellous pamphlets. He has to quit France, hides for awhile somewhere in Germany, and is next found at the Hague. Here he continues his libels; but not feeling himself safe from the French government, to whom he is afraid of being delivered up, he gets to Rotterdam, and here dies so suddenly that poison is suspected. His works, all of them produced to provide for the wants of the passing day, are very numerous. "The Colporteur" is still looked at occasionally.—J. A., D.

CHEYNE, GEORGE, a distinguished physician, was born in Scotland in the year 1670. He was intended by his parents for the church, but after attending the lectures of Dr. Archibald Pitcairn he determined to study medicine. He took his degree of M.D. in Edinburgh and came to London about the year 1700, and soon after published his "Theory of Fevers," in which he attempts to explain the doctrine of secretion on mechanical principles. His next work, on "Fluxions," was published in 1705, and procured his admission into the Royal Society. This work was rather severely criticised by Drs. Oliphant and De Moivre. In after life he acknowledged the justice of their remarks, which gave him great offence at the time. A work entitled "Philosophical Principles of Natural Religion" was dedicated to the earl of Roxburgh, for whose use it seems to have been written. Cheyne's natural and hereditary disposition to corpulency, increased by full living in London, soon undermined his health, and he gives a very graphic description of his symptoms in a work entitled "The English Malady," published in 1734. His size became prodigious, so that at one time he weighed thirty-two stones. He says—"My breath became so short that upon stepping into my chariot quickly and with some effort, I was ready to faint away for want of breath, and my face turned black." His own sufferings seem to have led him to determine on a rigid diet as the only means of cure, and after trying various forms of food, he confined himself to "seeds, bread, mealy roots, and milk." This treatment answered so well in his own case that he recommended it strongly to his patients, and enforced it on all those who would listen to him. Having been of a very social and jovial disposition, often indulging too freely in the pleasures of the table, this change in his habits was the more remarkable, and lost him the acquaintance of many who had before taken delight in his company. He thus mentions the fact in the account of his own case. "On this occasion all my bouncing, protesting, undertaking companions forsook me, and dropt off like autumnal leaves; they could not bear, it seems, to see their companion in such misery and distress, but retired to cheer themselves with a cheerupping cup, leaving me to pass the melancholy moments with my own apprehensions and remorse. Even those who had shared the best part of my profusions, who had been assisted in their necessities by my false generosity, and in their disorders relieved by my care, did now entirely relinquish and abandon me, so that I was forced to retire into the country quite alone, being reduced to the state of Cardinal Wolsey when he said 'that if he had served his Maker as faithfully and warmly as he had his prince, he would not have forsaken him in that extremity;' and so will every one find when union and friendship are not founded on solid virtue or in conformity to the divine order, but in sensual pleasures, and mere jollity." He goes on to say how at this time he began to look to religion for comfort and consolation, and "at last came to this firm and settled resolution, to neglect nothing to secure my eternal peace, more than if I had been certified I should die within the day; nor to mind anything that my secular avocations and duties demanded of me less than if I had been insured to live fifty years more. This, though with infinite weakness and imperfection, has been my settled intention in the main since." On his recovery to health he gradually returned to a more generous diet, though after repeated attacks of illness he again resumed his milk and farinaceous regimen, which he continued until his death in 1742, which took place at Bath. Dr. Cheyne's published works are six in number, all bearing the impress of earnestness and a desire for truth. They are very interesting as the opinions and practice of an intelligent physician of that period, combined with the thoughts and aspirations

of a religious and earnest man. The titles of the works are as follows—"An Essay of Health and Long Life;" "An Essay of the true nature and due method of meeting the Gout: together with an account of the nature and quality of Bath Waters, the manner of using them, and the diseases in which they are proper;" "A New Theory of acute and slow-continued Fevers;" "Philosophical Principles of Religion, Natural and Revealed;" and "Fluxioni Methodus Inducta."—E. L.

CHEYNE, JAMES, an eminent mathematician and philosopher, born in Aberdeenshire in the early part of the sixteenth century; died in 1602. With John Henderson, under whom he studied divinity at Aberdeen, he went over to France to escape the troubles of the Reformation period, and became professor of philosophy at the college of St. Barbe in Paris. He afterwards resided in the same capacity at Douay. His works are principally on scholastic subjects; commentaries on Aristotle, &c.

CHEYNE, JOHN, a physician of great eminence, a descendant of Dr. George Cheyne, and belonging to a family connected with the medical profession for many generations. His father practised at Leith, where his son John was born on 3rd Feb., 1777. His mother was an ambitious woman of honourable principles, constantly stimulating her children to exertion, and intently occupied with their advancement in life. She was the daughter of Mr. William Edmonston, a fellow of the College of Surgeons, Edinburgh. After passing four years at the grammar school at Leith, young Cheyne was sent to the high school of Edinburgh, under the care of the rector, Dr. Adam, into whose class the boy was immediately introduced. Being totally unprepared for such a position, he was rendered very unhappy at not being able to keep up with his companions, and he often feigned sickness, in order to be kept from school. He was afterwards placed under the care of a clergyman of the episcopal church of Scotland, who proved to be a bad tutor and an idle dissipated man; so that the time spent with him was productive of no good to young Cheyne. In his twelfth year he began to attend his father's poor patients, and thus gained a certain knowledge of disease, which was useful to him afterwards. In his sixteenth year he attended lectures in the university of Edinburgh; and with a very imperfect knowledge of his profession, by the aid of a system technically called "grinding," he was enabled to take his medical degree in June, 1795. On the day after his graduation, having previously procured a surgeon's diploma, he left Edinburgh for Woolwich, where he joined a regiment of royal artillery, to which he had been appointed assistant-surgeon. From 1795 to 1799 he spent his time, as was the custom in the army, in reading novels, shooting, playing billiards, and such follies, gaining nothing but a certain ease of bearing and manner. At last he seems to have awakened to a sense of the folly of such a life, and to feel his own deficiencies in professional knowledge. He accordingly left his regiment, and returned to Scotland, resolved to become once more a medical student. He now commenced study in earnest, for the first time, and happily formed a friendship with Mr. Bell, who encouraged him in every good work and effort to attain knowledge. His attention was chiefly directed to the diseases of children, and acute diseases and epidemics. These he worked at laboriously in every way, and in 1801, at the age of twenty-four, wrote his first essay on "Cynanche Trachealis, or Croup." In the same year, he published a treatise on the "Bowel complaints of Children." These volumes have the advantage of being illustrated with beautifully-executed coloured plates, by Sir Charles Bell. In 1808 he published his third essay on the diseases of children, being "Hydrocephalus Acutus." In 1809 he determined on trying to establish himself in practice at Dublin; and in the year 1811 he became physician to the Meath hospital, and shortly after was appointed lecturer on the practice of physic to the Irish College of Surgeons. In 1812 he published a volume on "Apoplexy and Lethargy," and at this time he appears to have had an increasing and respectable practice. In 1815 he was appointed by the lord-lieutenant one of the physicians to the house of industry. The labour consequent on this office, however, was so great, that he was obliged after a little time to resign the lectureship at the College of Surgeons, as well as his charge of the Meath hospital. In 1816 his private practice yielded an annual income of about £1800, and he then removed into a house in Merion Square, Dublin, where he lived until he left that city in 1831. The course of Dr. Cheyne's prosperity was at last arrested by failing health. In the end of 1825 he

became affected with a sort of nervous fever; he became depressed, feeble, and languid. He was obliged to relax as much as possible in his duties—sleeping out of town, and getting his friends to assist him in his work. By this means he was able to go on until 1831, when finding himself utterly unable to persevere in his medical practice, he resolved on relinquishing it altogether; which he did, much to the regret of his friends and patients in Dublin, and accompanied by the good wishes and kind feeling of all his medical brethren. Dr. Cheyne's chosen retreat was an estate he had purchased in the neighbourhood of Newport-Pagnell, Buckinghamshire, and here he established himself in the private and charitable exercise of his professional skill amongst the poor, which, however, in time extended to his being consulted by some of the more wealthy families in the neighbourhood. He undertook at this time to write some articles for the *Cyclopedia of Practical Medicine*, in compliance with the request of Dr. Tweedie, one of the editors. He thus began again to use his pen, which, however, was soon prevented by the formation of a cataract in his right eye, which from the year 1833 deprived him of the use of that organ. The general breaking up of the system went on gradually, evincing first one symptom and then another, until January, 1836, when after being confined to bed for six weeks he peacefully died. Dr. Cheyne was an extensive writer on medical subjects. He constantly contributed papers to the *Edinburgh Medical and Surgical Journal*, and to the Dublin hospital reports, as well as separate essays on interesting branches of medical science which appeared in the form of separate volumes. He was an earnestly religious man, and in his autobiography, which is preserved, there are many references to this all-absorbing subject from his own pen. His will containing directions for his burial, is singular and impressive. The features of his character were great penetration and decision, courtesy combined with rigidly honourable feelings; and under the appearance of indifference to the sufferings which he daily witnessed, an intense and almost overwhelming sympathy with the sorrows and pains of others. He was a warm admirer of art; and in his domestic relations most amiable, gentle, and wise. His wife was the daughter of the Rev. Dr. Macartney, vicar of Antrim in Ireland.—E. L.

CHEYNELL, FRANCIS, a nonconformist divine, born at Oxford in 1608, became a member of the university in 1623, was elected probationer-fellow of Merton college in 1629, sided with the parliament in the civil war, and was made one of the assembly of divines in 1643, and visitor of Oxford in 1647. He is chiefly memorable for his scurrilous treatment of Chillingworth, whose work, *The Religion of Protestants &c.*, he criticised in the "Rise, Growth, and Danger of Socinianism." Not content with profaning the obsequies of that illustrious divine (see CHILLINGWORTH), he printed in 1644, an attack upon his memory, entitled "Chillingworthi Novissima, or the Sickness, Heresy, Death, and Burial of William Chillingworth." He died at Preston in Sussex in 1665.—J. S., G.

CHIABRERA, GABRIELLE, an Italian poet, called the Pindar of Italy, born at Savona in 1552; died in 1638. He was of an impetuous and irascible disposition, and once in Rome, and again in his native place, fought a duel, each time killing his opponent. He chiefly excelled in lyric measures; his canzones and sonnets are remarkably spirited, but his longer poems are deficient in animation.—A. C. M.

CHIARI, PIETRO: the date of his birth is not recorded, but was about the beginning of the eighteenth century; he died in 1788. He bore the title of the poet of the duke of Modena, but resided at Venice. He wrote for the stage, and within ten or twelve years his prolific muse gave birth to more than sixty comedies, all of which, it would appear, were represented. There were also four tragedies, which, if they struggled to the birth, soon ceased to breathe. Chiari wrote prefaces to some of his plays, to prove that, if not as successful as those of Goldoni and Pozzi, it was owing to the bad taste of the public. At times he took a different tone, and asserted that if heads were reckoned, he had as many admirers as either of the poets above, whom perverse critics still insisted on preferring. Chiari wrote some amusing novels, and he published one or two letters on moral philosophy.—J. A., D.

CHIARINI, LODOVICO: born in Tuscany in 1789; died at Warsaw in 1832. The Abbé Chiarini was educated at Pisa, was first made known by the publication of some poems, and was invited to a professorship of eastern languages and antiquities

at Warsaw. In his professorship he chiefly applied himself to Hebrew learning, and proposed translating the Talmud into French. The announcement of this project created such alarm, both amongst Jews and christians, that Chiarini felt himself compelled to abandon it. A controversy was maintained on the subject of the proposed translation, by Beugnot's writing against it in the *Revue Encyclopedique*, and by Chiarini in detached pamphlets. His "Théorie du Judaïsme," Paris, 2 vols., 8vo, is a work of great interest.—J. A., D.

CHICHELE, HENRY, archbishop of Canterbury, was born about 1362 at Higham-Ferrers. He commenced his literary education at Winchester school, and studied civil and canon law at New college, Oxford. After passing through various preferments, and being employed on various embassies to France and to the pope, Henry IV. presented him to the bishopric of St. David's in 1408. Next year he represented England in the council of Pisa, where the pretensions of Popes Gregory and Benedict were discussed, and themselves both deposed. In 1414 he succeeded to the see of Canterbury. He has been accused of urging on Henry V. to that war with France of which the field of Agincourt was a brilliant memorial. Chichele resisted with no little courage the claim of the pope to dispose of ecclesiastical preferments in England, and he also had no little vexation from the growth of Lollardism, and no little trouble in attempting to suppress it. In his advanced years he commenced and finished the erection of All Souls college at Oxford, and richly endowed it under the name of "Collegium omnium animarum fidelium defunct. de Oxon." The society was to pray for the king and the archbishop during their lives and after their death; for those who had fallen in the war with France; and for the souls of all who had died in faith. He also, by his high influence with all parties in the state, secured various benefits to both the universities. In 1442, and when he was fourscore, "heavy-laden, aged, infirm, and weak beyond measure," as he describes himself, he applied for the necessary papal permission to resign his office, but died ere the result of his application could be known, and was interred in the cathedral of Canterbury. Many instances of his generosity are on record, for he freely expended his wealth in various public and benevolent enterprises. His liberality and enlightenment were beyond the age in which he lived. Education, such as he conceived it ought to be, always found in him a generous and hearty supporter.—J. E.

CHICHESTER, SIR ARTHUR, first Baron Belfast, a distinguished soldier and politician, was born in Devonshire towards the end of the sixteenth century. He is said to have been a boy of very precocious talent, and of a lively and daring temper. This latter quality led him to indulge in a frolic similar to those played off by Prince Hal, and made it necessary for him to leave the country and avoid the vengeance of Queen Elizabeth, who did not view the plundering of one of her bailiffs, even in sport, as a joke. Taking refuge in France, his personal bravery and military talents recommended him to the notice of Henry IV., by whom he was knighted. The reputation of the soldier won from Elizabeth pardon for the practical joker. He transferred himself to the queen's services, was sent to Ireland, rapidly promoted, and during the war with Tyrone was one of the most active, trusted, and successful leaders. Honours and position quickly followed. In 1603 he was appointed governor of Carrickfergus, and the following year commander of all the forces, and governor of the surrounding districts; and, finally, he was made lord-deputy of Ireland. He originated and carried out the plantation of Ulster; and was, in recompense for his great services, created Baron Chichester of Belfast. Having filled the office of lord-deputy till 1615, he was, at his own request, permitted to retire, but was appointed lord-high-treasurer. Chichester also filled some diplomatic functions. He went as ambassador to the Palatinate in 1622. He was afterwards commissioned to treat for a peace with the emperor; and being shut up in Manheim, then besieged by Tilly, he sent to say that it was contrary to the law of nations to besiege an ambassador. Tilly not having noticed this remonstrance, Chichester again addressed him—"If my master had sent me with as many hundred men as he hath sent me on fruitless messages, your general should have known that I had been a soldier as well as ambassador." He died in London in the year 1624.—J. F. W.

CHICHESTER, ARTHUR, first Earl of Donegal, was born in June, 1606, and early entered upon the military life, in which

he became subsequently so distinguished. In 1627 he had the command of a troop of horse, and had risen to the rank of colonel before the breaking out of the rebellion, in which he distinguished himself by his fidelity to the royal cause and his bravery and activity. In reward of his long services, and on the representation of Ormonde, he was, in 1645, created Earl of Donegal. After the restoration he was appointed governor of Carrickfergus, a post which proved to be one of peril and difficulty. He died in Belfast in 1674.—J. F. W.

CHICOYNEAU, FRANÇOIS, a French physician, born in 1672; died in 1752. He was famous as a practitioner, and was sent in 1720 by the regent to Marseilles to plan measures for arresting the plague, then raging in that city. Chirac, who was his father-in-law, introduced him at court; and after his death, Chicoyneau was appointed first physician to the king and councillor of state. He published, amongst other things, a "Treatise on the Causes and Cure of the Plague."—His son, FRANÇOIS, who was born in 1699, and died in 1740, succeeded him in his honourable and lucrative position.—R. M., A.

CHIFFLET, JEAN JACQUES, a physician of Franche-comté, author of various historical and archæological works, born in 1588; died in 1660. Philip IV. of Spain, made him his physician, and commissioned him to write a history of the order of the golden fleece. Several brothers and descendants of this learned writer, also attained distinction in literature.—J. S., G.

CHIGI, FABIO. See ALEXANDER VII., Pope.

\* CHILD, LYDIA MARIA, born FRANCIS, one of the most pleasing, graceful, and pure of American writers, was born in Medford, Massachusetts, in February, 1802. In early life love of letters and a refined taste in writing were developed in her, and her earliest publications were received with favour. Among these were "Hobomok: an Indian story;" and "The Rebels: a Story of the Revolution." At the age of twenty-five she was married to David Lee Child, Esq., editor of the *Massachusetts Journal*. In 1832 she published a small volume, entitled "An Appeal in behalf of that class of Americans called Africans." This work was one of the first on the question of slavery which attracted a general attention in America. Its historical character was of much value—its arguments most weighty—its appeals to the conscience, honour, and humane feeling of the nation most touching. It was an important work, and deservedly placed the authoress among the most prominent of the friends of the oppressed. Subsequently for several years Mrs. Child was one of the editors of the *National Antislavery Standard*, the organ of the American Antislavery Society. Her "Letters from New York," in 2 vols., were first published in that journal. Parents and children are deeply indebted to her for her "Mother's Book;" "Flowers for Children," in 4 vols.; "Girl's Own Book;" "Fact and Fiction;" "The Oasis, a collection of Antislavery Stories;" as well as for the *Juvenile Miscellany*, a small monthly periodical, which she conducted with the happiest success for many years. Her largest work, the result of a life's study and most conscientious inquiry and thought, is the "Progress of Religious Ideas," in 3 vols., published in 1855.—F. B.

CHILD, SIR JOSIAH, an eminent London merchant and writer on political economy, was the second son of Richard Child, merchant, and was born in 1630. He was one of the directors, and for some time chairman, of the East India Company. He is believed to be the author of a tract published anonymously in defence of the trade to the East Indies, and entitled "A Treatise wherein it is demonstrated that the East India Trade is the most national of all Trades," 4to, London 1681. His principal publication, however, is entitled "Brief Observations concerning Trade, and the Interest of Money," by J. C., 4to, London 1688, which has passed through several editions, and was reprinted in Glasgow in 1751, under the title of "A New Discourse of Trade." In spite of a fundamental mistake concerning the interest of money, the work embodies many sound and valuable sentiments happily expressed, and shows that the author was in advance of his day. One of the chapters contains an account of a plan for the relief of the poor, which has attracted a good deal of attention. Sir Josiah was created a baronet in 1678, and died in 1699. He was very wealthy, and his children intermarried with some of the highest nobility.—J. T.

CHILD, WILLIAM, Mus. Doc., according to Anthony Wood, was a native of Bristol, and educated under Elway Bevin, organist of the cathedral of that city. In 1631, being then of

Christ Church, Oxford, he took his degree of bachelor, and in 1636 was appointed one of the organists of St. George's chapel, Windsor, in the room of Dr. John Mundy; and soon after was promoted to an organist's place in the royal chapel, Whitehall. After the restoration he held the office of chanter of the king's chapel, and became one of the chamber musicians to Charles II. In 1663 he was advanced to the degree of doctor in music by the university of Oxford. He died in 1696, having attained the age of ninety years, and was succeeded as organist of the king's chapel by Francis Piggot. Dr. Child's principal productions are his services and full anthems, printed in Dr. Boyce and Dr. Arnold's collections. His service in D is one of the finest specimens of writing in the fugato style of the seventeenth century; and what is still higher praise, the melody throughout is clear and pleasing even to modern ears. His verse service in E flat possesses much elegance, and in a style which must have appeared quite new when first produced. That in E minor is rich in modulation, and shows the hand of a master. "His style," Dr. Burney says, "was so remarkably easy and natural, compared with that to which choirmen had been accustomed, that it was frequently treated by them with derision. Indeed, his modulation at present is so nearly modern, as not to produce that solemn and seemingly new effect on our ears, which we now experience from the productions of the sixteenth century." The memory of Dr. Child is celebrated for a remarkable act of his generosity, and of the meanness of his superiors. His salary at Windsor was much in arrear, and he in vain applied to the dean and chapter to discharge the debt. After many fruitless appeals he told them, that if they would pay what was due to him, he would new pave the choir of St. George's chapel. They complied with his terms; and Sir John Hawkins observes, neither they nor the knights companions of the most noble order of the garter interposed to prevent his incurring such an expense. He was buried in the chapel which he had thus repaired, and the following lines are inscribed on his gravestone:—

"Go, happy soul, and in the seats above  
Sing endless hymns of thy great Maker's love.  
How fit in heavenly songs to bear thy part,  
Before well practised in the sacred art.  
Whilst hearing us, sometimes the choir divine  
Will sure descend, and in our concert join;  
So much the music then to us has given,  
Has made our earth to represent their heaven."

His liberality was not confined to the church; for, at his death, he bequeathed twenty pounds towards the building of the town-hall at Windsor, and fifty pounds to the corporation, to be disposed of in charity at their discretion.—E. F. R.

CHILDEBERT I., one of the four sons of Clovis I., the founder of the Frankish empire, obtained at his father's death the central portion of the divided territories, with Paris for his capital. In conjunction with his brothers, Clodomir and Clotaire, who reigned at Orleans and Soissons respectively, he conquered Burgundy, and, on the death of the former, received a share of his dominions. His kingdom was subsequently enlarged by the defeat of Amalaric the Visigoth, and by the demise of his relative the king of Austrasia without heirs; but, at his own death in 558, the empire of Clovis was reunited.—W. B.

CHILDEBERT II., son of Sigibert of Austrasia, and grandson of Clotaire I., was a child when his father was assassinated, A.D. 575, by the partisans of Fredegonda.—(See CHILPERIC I.) Having narrowly escaped the same fate through the fidelity of Gundobald, duke of Campania, he was established in his royal patrimony by the Austrasian nobles, with the aid of his uncle, Guntram, king of Burgundy, whose dominions he subsequently inherited. He died at the age of twenty-six in 596.—W. B.

CHILDEBERT III., second son of Theodoric III., king of Neustria, succeeded his brother, Clovis III., in the nominal sovereignty of the more extended dominions which Pepin of Heristal had brought under one sceptre. This enterprising and able mayor of the palace was the real monarch, but Childebert bore the royal title till his death in 711.—W. B.

CHILDERIC I., was the son of that Merowig or Merovæus, from whom the Merovingian dynasty took its name. He succeeded his father in the sovereignty of the Salian Franks in 456, but was speedily driven into exile on account of his licentious excesses. Having subsequently recovered his throne and influence, he engaged in a struggle with the Visigoths, and began the series of victories which his celebrated son, Clovis I., completed.—W. B.

CHILDERIC II., son of Clovis II., saw the Frankish sceptre pass, at the death of his father in 656, into the hand of his elder brother, Clotaire III. But the Austrasians, desiring a king of their own, selected Childeric, and on the death of Clotaire in 670, the crown of Neustria also was conveyed to him. Three years later he was assassinated in a revolt of his turbulent nobles.—W. B.

CHILDERIC III., the last of the degenerate Merovingian princes, was placed on the throne by Carloman and Pepin, the sons of Charles Martel. The whole power was in their hands, and when Pepin at length resolved to assume the title as well as the authority of king in 750, the helpless Childeric was consigned to a monastery.—W. B.

CHILDREN, JOHN GEORGE, an eminent scientific writer, born at Ferox Hall, Tonbridge, in 1777; died in 1852. After distinguishing himself as a student of mineralogy, chemistry, and galvanism, and becoming acquainted with Davy, Woolaston, and other eminent scientific writers, he was elected in 1807 a fellow of the Royal Society. In 1808, and again in 1815, he contributed to the Philosophical Transactions a paper on his favourite subject of galvanism. He discovered a method of extracting silver from its ore without amalgamation. In 1826 he was elected secretary of the Royal Society, and resigning the appointment in the following year, on account of ill health, was again elected in 1830.—J. S., G.

CHILLINGWORTH, WILLIAM, was born at Oxford in October, 1602. He was admitted a scholar of Trinity college in 1618, and after taking his degrees, was chosen a fellow in 1628. He had already distinguished himself by mathematical as well as theological study, and had also indulged in versification. At this period the great theme which enlisted the talents and learning of all young men was the popish controversy, sharpened by the king's marriage with the daughter of Henry IV. of France. Several popish polemics lived near Oxford, and often won over students to their side. The jesuit Fisher easily entangled Chillingworth on the question of the necessity of a "living rule of faith," and at length prevailed upon him to renounce the communion of the church of England, and settle at the college of Douay. But Laud, who had been his godfather, and was now bishop of London, entered into a correspondence with him, and as easily induced him to return to Oxford, of which university Laud was also chancellor. He came back in 1631, and set himself to a calm and prolonged re-examination of the whole subject, and in 1635 published, as the result of his studies, "The Religion of Protestants, a safe way to Salvation." This is the work on which his fame chiefly, if not wholly rests. It was a reply virtually to a book called Charity Mistakes, by Mathias Wilson, a jesuit, who had been previously answered by Dr. Potter. The treatise of Chillingworth is a masterpiece, somewhat hard and dry, but made up of arguments compacted with all the rigour and cogency of a mathematical demonstration in proof that the scriptures, and not ecclesiastical tradition, are the sole and infallible rule of faith. It made an immediate and deep impression, for the author's talent and tergiversation were well-known in all literary and theological circles. Two editions of it were published in less than five months, and it has been often reprinted, the edition of 1742 being reckoned the standard one.

The fame of Chillingworth attracted the notice of men in power, and Sir Thomas Coventry, keeper of the great seal, offered him preferment, which he refused, however, because he had scruples about subscription. But Sheldon and Laud dealt with him, and brought him to the convenient belief that subscription to the Thirty-nine Articles was a matter of peace and union, not of belief and assent. With all his dialectic skill, his convictions do not seem to have been very stable, and he was easily wrought upon by the reasonings of others. His doubts being removed by this friendly intervention, he was promoted in 1638 to the chancellorship of Salisbury, with the prebend of Brixworth annexed—and subscribed the articles with the usual formula—*ex animo*. In 1646 he represented the chapter in convocation, but seems to have made no figure either as preacher or polemic during his incumbency.

Chillingworth being a zealous royalist according to Clarendon's own heart, was present with the king's army at the siege of Gloucester, and advised and superintended the construction of certain warlike engines, but having accompanied the royal troops under Lord Hopton to Arundel castle, he was taken prisoner when

the castle surrendered to the parliamentary forces commanded by Sir William Waller. Being in bad health, and unable to be removed to London, he was conveyed to the bishop's palace in Chichester, where he shortly after died in January, 1644, and was buried at his own request in the cathedral. His last days were disturbed by the dogmatic assaults of Dr. Cheynell, who charging him with socinianism refused to bury him, but met the mourners at the grave, and with solemn buffoonery buried Chillingworth's book, "as a cursed treatise which might rot with its author and see corruption."—(See CHEYNELL.)—Chillingworth was one of those men whose subtilty of mind occasionally overreaches themselves—who are so fond of debate, and so ready to split a hair, that they destroy their own powers of belief, and amidst arguments and counter-arguments, doubts and difficulties, and all the other weapons of a sleepless casuistry, gradually, and as if unconsciously, train themselves to scepticism. Tillotson vindicates him from the charge of socinianism, and Locke says that the reading of him "will teach both perspicuity and the right way of reasoning, better than any book that I know." Chillingworth was rather small in stature, "but of great soul," says Wood, and he was rarely provoked into passion, though so often engaged in intellectual skirmishes.—J. E.

CHILMEAD, EDMUND, a deeply-read mathematician, and well skilled both in the theory and practice of music. He was born at Stow in the Wold in Gloucestershire, and became one of the clerks of Magdalen college, Oxford. About the year 1632 he was nominated one of the chaplains of Christ church; but being ejected by the parliament visitors in 1648, he came to London, and took lodgings in the old printing-office of Thomas Este in Aldersgate Street. In a large room of this house he held a weekly music meeting, from the profits of which his chief subsistence was derived. Chilmead was an excellent Greek scholar, and was employed to draw up a catalogue of the Greek MSS. in the Bodleian library. Wood mentions a treatise of his "De Sonis," which does not appear to have been printed. His tract, "De Musica Antiqua Græca," printed at the end of the Oxford edition of Aratus in 1672, contains a designation of the ancient genera, agreeable to the sentiments of Boethius, with a general enumeration of the modes; after which follows three odes of Dionysius, with the Greek musical characters adapted to the notes of Guido's scale. This learned man died in 1654, in the forty-third year of his age, and was interred in the church of St. Botolph Without, Aldersgate.—E. F. R.

CHILON, a Lacedæmonian, one of the seven sages of Greece, flourished about the year 590 B.C. The institution of the ephorality is erroneously ascribed to Chilon. He died of joy, it is said, when his son gained a prize at the Olympic games.

CHILPERIC I., one of the four sons of Clotaire I., attempted, at his father's death, to get possession of the undivided sovereignty, but was compelled to content himself with the kingdom of Soissons or Neustria in 562. Having divorced his first wife, and caused his second to be strangled, he raised to their place his former mistress, the infamous Fredegonda; and her influence, in conjunction with his own licentious ambition, plunged him into a series of wars and crimes, which terminated with his assassination in 583, when engaged in an attempt to dispossess his brother Guntrum of Burgundy.—W. B.

CHILPERIC II., a reputed son of Childeric II., was placed upon the throne of Neustria at the death of Dagobert III. He was a man of considerable energy, and attempted to enlarge his territories by the conquest of Austrasia. But he had to cope with a formidable opponent in the celebrated Charles Martel; and, notwithstanding the aid of Eudes of Aquitaine, he was compelled in 719, to accept terms, which, while they gave him the nominal sovereignty of the Frankish empire, placed the whole power in the hands of Martel.—W. B.

CHIPMAN, NATHANIEL, LL.D., an eminent jurist and senator of Vermont in New England, was born at Salisbury, Connecticut, in 1752, entered Yale college in 1773, quitted it to join the American army as a lieutenant in 1777, and received his degree as A.B. while absent in the field. He spent the winter at Valley Forge, was present at the battle of Monmouth, and then resigned his commission, and began the study of law. He commenced practice in Rutland county, Vermont, and soon became a leader of the bar, being employed in every important case. At several different periods he was chief-justice of Vermont, and from 1798 till 1804, a senator of the United States. In 1796 he was appointed to revise the laws of

the state, and nearly all the revised statutes of the following year were written by him. In 1816 he was appointed professor of law in Middlebury college. He published a volume of reports and legal dissertations, and a work on the "Principles of Government." He died in 1843.—F. B.

CHIRAC, PIERRE, first physician to Louis XV., born at Conques in Aveyron in 1650; died in 1732. He practised for some time at Montpellier, in 1706 went to Italy with the duke of Orleans, the following year accompanied the duke to Spain, and in 1715 was appointed his first physician. He was a member of the Academy of Sciences, and in 1728 received letters of nobility from Louis XV., who made him his first physician in 1731. He left some medical treatises which, although written in an uncouth style, hold an important place in the history of his profession.—J. S., G.

\* CHISHOLM, MRS. CAROLINE, famous for her benevolent exertions on behalf of the emigrant population of Sydney and elsewhere, was born about the year 1810, in the parish of Wooton, Northamptonshire. She married in her twentieth year Captain Alexander Chisholm, with whom shortly after their marriage she proceeded to Madras. There she established a school for the female children and orphans of the British soldiery, which, so long as she remained in India, proved remarkably successful. Her husband being obliged by ill health in 1838 to seek a change of climate, went to Sydney in Australia, and there Mrs. Chisholm was to endear herself to thousands of emigrants, by lending them small sums of money, by receiving into an asylum the destitute girls among them, and by exerting herself to procure situations for all who applied to her. In 1846 Captain Chisholm and his wife revisited England, taking up their residence at Islington. While in England, where she remained till 1854, the date of her return to Australia, Mrs. Chisholm established a "Family Colonization Society" for collecting passage money in weekly instalments, and in various cities explained in public her views on the subject of emigration. Before she left England a considerable sum of money was presented to her by a numerous body of subscribers.—J. S., G.

CHISHULL, EDMUND, a learned divine, and writer on classical antiquities, born at Eyworth in Bedfordshire; died rector of South Church in Essex in 1733. He was educated at Corpus Christi college, and having obtained a traveller's exhibition, and been appointed chaplain to the English factory at Smyrna, he sailed from England in 1698, and continued in Syria till 1702. On his return to England, among other preferments he obtained that of chaplain in ordinary to the queen. The greater number of his dissertations were incorporated in the edition of his "Antiq. Asiaticæ," published in 1724.—J. S., G.

CHITTENDEN, THOMAS, first governor of the state of Vermont in New England, was born at Guilford, Connecticut, in 1730. Having received only a common school education, he was bred a farmer, and being a shrewd, active, and able man, soon rose, in Yankee fashion, to be a colonel in the militia, and a justice of the peace. In 1774, to provide more effectually for the wants of a growing family, he removed to the "New Hampshire Grants," as they were then called—a territory, the jurisdiction of which had long been fiercely disputed between New Hampshire and New York, but which was afterwards, mainly through Chittenden's agency, erected into the independent state of Vermont (1777). Fearful of giving offence to the two outside claimants, however, congress virtually refused to admit Vermont into the union. Chittenden, as governor, therefore opened a correspondence with the English authorities, holding out hopes that Vermont would follow the example of Canada in adhering to British rule. The letters were intercepted, as he probably intended they should be; and congress in dismay then attempted to compromise, but had no power to compel New Hampshire and New York to withdraw their claims. The controversy was protracted till the end of the war; and the people of Vermont being then numerous and stout enough to defend themselves by arms, their independence was virtually acknowledged, and in 1791 the state was finally admitted into the union. Such was the simplicity of manners, that Chittenden, though governor for many years, still continued his original occupations as farmer and inn-keeper. He was a benevolent and religious man, of irreproachable character, and great popularity. In October, 1796, he took a solemn and affecting leave of his associates in the government, and died August 24th in the following year.—His son, MARTIN CHITTENDEN, a graduate of

Dartmouth college in 1789, was a representative in congress from 1803 to 1813, and governor of the state for the two following years. He died in 1840, aged seventy-five.—F. B.

CHIYA, R'CHIIYA BEN ABBA BEN SILLA, of Kafri in Babylonia, a contemporary of R'Jehudah the prince, in the second century, by whom the Mishna, or traditional code of the Jews, was arranged in its present order. After having long been an active teacher of the law in Babylonia, where Huna was at the time exilarch (prince of the captivity), Chiya set out for the Holy Land, where the fame of his learning had prepared for him a friendly reception, especially from R'Jehudah. To R'Chiya, in conjunction with R'Hoshaiah (who belongs, however, to the generation after Chiya), is attributed a collection of traditional legal decisions, apart from R'Jehudah's Mishna, and known under the title of "Thosephtha," in three hundred and eighty-three chapters.—(Printed in Ugolini's Thesaurus, in Alfasi's Talmudical Commentaries, and elsewhere.) Two other compilations made by the same rabbi are no longer extant. An excellent biography of R'Chiya, the product of much research, has been published by Raphael Kirchheim, in the *Orient*, 1848.—T. T.

CHIYA or CHAYA, R'ABRAHAM HA-SEPHARDI, by birth a Spaniard, but who, according to Fürst, at some time resided at Marseilles, was a disciple of R'Moses Ha-Darshan, and teacher of the celebrated Aben Ezra. According to Rossi he still lived in the year 1136, although some annalists fix on the year 1105 as that of his death. Among his astronomical works special mention is due to the Sepher "Zurath Haarez," &c. (on the form of the earth, the spheres, and the orbits of the stars), composed at the request of his teacher; a Latin translation, with notes by Sebast. Münster, was published at Basle in 1546. He has also written on the Jewish calendar.—T. T.

CHLADNI, ERNST-FLORENS-FRIEDRICH, a German philosopher, born in 1756; died in 1827. He was professor of jurisprudence at Leipzig, but resigned his chair in order to apply himself to natural philosophy. Chladni made some ingenious discoveries, the result of numerous experiments, on the nature and properties of sound. He has detailed them in a methodical manner in his "Treatise on Acoustics."—R. M., A.

CHODOWIECKI, DANIEL NICHOLAS, an engraver and designer, born at Dantzig in 1726. His father was a drug merchant, with an amateur talent for miniature painting. He brought up his son to work at drug selling, and to play at miniature painting. His son reversed the paternal precepts, he played at being a merchant, and worked hard as a painter, and luckily as it turned out. The father died prematurely, leaving no money, and a widow and child to live as they could out of a merchant's business which only brought in losses. The young Chodowiecki could not yet feel his art-feet. If he could have earned his own support, he had in addition to render aid to his mother. So he worked still at his art by encroaching on the time allotted him for sleep, and served the remainder of the day in the shop of a grocer. A halo of insolvency hung about him; the grocer failed, and the young man was sent to an uncle at Berlin, to serve out his term of apprenticeship. He still kept up the struggle of art against commerce. He painted snuff-box lids, selling them for what he could get, and sending his earnings to his mother. Gradually the light dissolved the bushel over it; his uncle unharassed him, took the mercantile curb out of his mouth, had him taught enamelling, and bade him Godspeed as an artist. He dived into the sea of art, and soon brought up the pearl success. The Academy of Painting at Berlin took notice of him, and employed him to design and engrave the figures for their almanack. He was soon almost swamped with orders. He produced a series of twelve plates of the "Passion of Christ," which brought him great fame. He published a print called "Les Adieux de Calais," which created quite a sensation. He executed the designs and plates for Lavater's Physiognomy, Klopstock's Messiah, and editions of Don Quixote, Shakspeare, Voltaire, La Bruyere, La Fontaine, Gessner, Lessing, and others. He died at Berlin in 1801, director of the academy of arts of that city.—W. T.

\* CHODZKO, ALEXANDER BOREYKO, a Polish orientalist, born at Krzywicz on the 11th July, 1804; author of "Specimens of the popular Poetry of Persia," London, 1842; "Le Théâtre en Perse," Paris, 1845; "Le Guilan," &c.; "Excursions aux pyles Caspiennes," 1851; "Le Khorazan et son héros populaire," 1852; "Le Deçati," 1852; "Grammaire Persane," 1852; and other oriental works.—F. M. W.

\* CHODZKO, JAMES LEONARD BOREYKO, a Polish historian, born 6th November, 1800, at Oborek; a member of an ancient and noble Lithuanian family which has produced several distinguished men. He studied history at the university of Wilna under the celebrated Lelewel, and afterwards, as secretary to Prince Michel Oginski, travelled over Europe from 1819 to 1826, when he settled in Paris. In the revolution of 1830 he acted as aide-de-camp to La Fayette, but soon returned to literary pursuits, and was successively employed in the libraries of the Sorbonne, St. Genevieve, and the ministry of public instruction. His works are numerous, including "Histoire des légions Polonaises en Italie," Paris 1829; "Les Polonais en Italie," Paris, 1829; "Esquisse chronologique de l'histoire de la littérature polonaise," Paris, 1829; "Tableau de la Pologne Ancienne et Moderne"; "Coup d'œil, etc., sur la guerre actuelle entre la Russie et la Pologne," 1831; "Histoire politique de la Lithuanie," 1831; "Tableaux des révolutions de la Pologne," in conjunction with M. de Marcey; "Notices sur Kosciuszko;" "Fontainebleau," 1837; and a memoir of Lelewel, 1834; "La Pologne, historique, littéraire, monumentale, &c.," 1834-47; "Histoire de Turquie," 1855; and "Histoire de Pologne," 1855. M. Chodzko has also contributed to the *Globe*, *Constitutionnel*, and *Courrier-Français*.—F. M. W.

CHÆRILUS (Χοῦριλος) OF ATHENS, born about 584 years before the christian era; died about 464. He was the author, it is said, of a hundred and fifty dramatic pieces, and to have repeatedly borne away the prize for which Æschylus and Sophocles are described as competitors. Some changes in the arrangement of the chorus, and the introduction of a metre before unused, are referred to him. A line which differs from the ordinary hexameter, by the fact of wanting the final syllable, is by some grammarians called the Chærilian.—J. A., D.

CHÆRILUS (Χοῦριλος) OF SAMOS, born at Samos about 470 B.C. This Chærilus was a slave; author of an epic poem on the war of the Greeks against Darius and Xerxes. The work was entitled "The Persian." Some lines of it are preserved by Aristotle.—J. A., D.

CHÆRILUS (Χοῦριλος) OF JASUS: this Chærilus is mentioned as having lived about 340 B.C. He owes his immortality to Horace, by whom he is described as a sort of poet in ordinary to Alexander the Great. Alexander paid him liberally for his praises, but seems not to have estimated the poet himself highly. "I should," said he, "rather be the Thersites of Homer than the Achilles of Chærilus." The scholiast to whom we owe this story tells another less credible. He says that Alexander agreed to give him a piece of gold for every good verse—a blow for every bad one. He got seven pieces of gold, and so many blows that he did not survive—so many were the blows he earned, and so scrupulously were they paid.—J. A., D.

CHOISEUL, a French family, various branches of which are known in history by the names of representatives who attained distinction as commanders or as statesmen. The following are the more notable members of this family:—

CHOISEUL, CESAR, Duc de, Lord of Plessis-Praslin, known as marshal du Plessis, was born in Paris in 1598, and died in 1675. Particularly distinguished as a soldier, he was also a skilful diplomatist; and while he had the privilege of instructing Louis XIV. in the art of war, he had more than once the honour of assisting Richelieu in his game of diplomacy. It was he who conducted the negotiations between Louis XIV. and Charles II., which resulted in the treaty of alliance against Holland.

CHOISEUL, ETIENNE FRANÇOIS, Duc de, was born 28th June, 1719: entering in early life into the military service under the name of the comte de Stainville, he rapidly rose to the highest rank. In 1753 he commenced his political career as ambassador of France at Rome, and astonished the tranquil court of Benedict XIV. with the splendour of his luxury. He proved himself one of those gay and brilliant men whose influence is almost irresistible through their power of gracefully adapting themselves to the various influences around them, awakening no direct antagonisms, and appearing to favour every party, but in effect guiding all to purposes of their own. He acquired considerable authority at the papal court, and procured a promise of a cardinal's hat for the Abbé Bernis, then minister of foreign affairs in France, and to whose office Choiseul himself soon succeeded. From Rome Choiseul passed to Vienna, and the luxury of the embassy under his charge better suited an Austrian than an ecclesiastical capital. In 1758 he replaced

Cardinal Bernis as minister of foreign affairs, and being created duke and peer, rose to the highest point of favour with Louis XV., and subsequently received the ministries of war and marine. Many circumstances advanced the interest and reputation of Choiseul at the court of Louis XV. He was a favourite with the king's mistress, madame de Pompadour, and to be a favourite of the mistress was to be master of the monarch. He played with one of the king's chief prejudices, viz. his dislike to the dauphin (the father of Louis XVI.), and sacrificed to the living sovereign all chance of success with his probable successor. His personal character, moreover, fitted him admirably for the court of the king he served. Few men ever lived in a sphere more perfectly adapted to their peculiar gifts. Under Louis XIV. Choiseul would have appeared frivolous. The genius of the age would have been beyond his power to grasp and direct. Under Louis XVI., the influence of the throne being greatly lessened, and the stormy dissensions of the Revolution wakening their discords, his peculiar courtly powers of fascination would have had no free scope. The troubled dawn of revolution is no time for developing the skill of the polished gentleman. Choiseul was precisely fitted for the age of Louis XV., an age when the royal prestige was weakened but not destroyed, and ready to make popular concessions if so be the matter could be managed in a gentlemanly way; and when the people, not grown conscious of the terrible use to which their powers could be subservient, were willing to honour and to accept in good part monarchical measures gracefully commended to them. Choiseul, adapting himself naturally to these circumstances, managed to unite the powers both of a courtier and a tribune, and played this double part without injuring the elegant freedom of his character. Fortune also had been prodigal to Choiseul of gifts which nature had refused. Nobly born, he inherited no patrimony wherewith to forward his undisguised ambition; but a marriage with the sister of the duchesse de Gontaut made him rich. A certain capacity for business was united to his lighter accomplishments, so that he could direct the concerns of the state without making them troublesome—an enviable gift in the minister of a monarch who loved his ease, and yet wished to feel himself a king. From this sketch it will appear how precisely the age and the character of Louis XV. furnished the circumstances under which a duc de Choiseul could become the most successful of men. While minister of foreign affairs, Choiseul concluded the famous Family Compact in 1761 between France, Spain, Parma, and Naples, to cement a perpetual union among the members of the house of Bourbon. When really first minister of the crown, although without the title, he consented to the expulsion from France of the jesuits in 1764, and effected this measure in spite of the opposition of the dauphin. Whenever the liberal party became troublesome, this act was constantly appealed to on Choiseul's behalf, and did him good service in securing his popularity when it was threatened by more obnoxious proceedings. Named minister of war and marine at a disastrous epoch, when France had been forced to abandon her German conquests and cede many colonies to the British, he employed himself in preparing for the more successful resumption of the war. He reorganized the army, established new schools for the different services, and introduced a wiser economy. In less than four years he managed to create a considerable fleet. The death of madame de Pompadour in 1764 deprived Choiseul of a powerful friend. Madame du Barry became the reigning favourite, and, being met by Choiseul with disdain, at once became the eager ally of his foes. The enmity between the minister and the favourite increased day by day, and it could not be long doubtful on which side a Louis XV. would declare himself. The duc de Richelieu directed the policy of madame du Barry, and Maupeou, the Abbé Terray, and the duc d'Aiguillon combined themselves together to grasp the power of the chief whose fall was near—a triumvirate now to engage in a contest against the parliament of the kingdom with the rashest party upon which a feeble government ever relied. The king at first hesitated, but at last yielded to the pleadings of madame du Barry, and on the 24th of December, 1770, signed the lettre de cachet exiling Choiseul to Chanteloup. Some hours after receiving the letter, Choiseul left the court more powerful in France than the king himself. So surrounded was the fallen minister with testimonies of national homage, so visited and courted by the noblest of the land, that Chanteloup seemed to render Versailles a desert. The honour paid to Choiseul was in truth a testimony of the degradation into which the royal authority had fallen,

and a warning that men began to foresee those days in which ambition would have more hope in opposing than in serving the monarchy of France. The three years of this disgrace proved the happiest of Choiseul's life. Recalled from exile upon the accession of Louis XVI., he received from that prince an honourable welcome, but never regained political power. The gaiety of his disposition led him to treat the loss of power as of little import, but shrewd sarcasms on public affairs constantly betrayed the spirit of a dismissed minister. Choiseul died in May, 1785, leaving princely legacies to those by whom he had been faithfully served.—L. L. P.

CHOISEUL, CLAUDE-ANTOINE-GABRIEL, Duc de, born in 1760, succeeded to the family honours in 1785; his relative, the celebrated minister of Louis XV., by whom he was beloved almost as a son, dying childless in that year. His share in the king's unfortunate attempt at flight in 1791, and the attachment which he manifested to Louis XVI. when a prisoner in the temple, rendered his own attempt to escape from the scene of revolution peculiarly difficult. It succeeded, however, and almost till the epoch of the restoration, M. de Choiseul was numbered amongst the most unfortunate, as he was certainly one of the most able and patriotic of the emigrés. On the return of the Bourbons, he took his seat in the chamber of peers, where he played a conspicuous and honourable part till his death in 1838.

CHOISEUL-GOUFFIER, MARIE-GABRIEL-FLORENT, Comte de, born in 1752; died in 1817. This accomplished nobleman was the author of a "Voyage Pittoresque en Grèce," which was received with equal admiration by scholars and the unlearned public, and which secured its author's admission into the Academy of Inscriptions. At the Revolution he was ambassador at Constantinople, and being proscribed as a traitor to the republic, fled into Russia, where he won the favour of Paul I., and was created a privy councillor. On the return of the Bourbons, he was made a minister of state, and a peer of France.—J. S., G.

CHOISY, FRANÇOIS TIMOLEON, Abbé de, born at Paris 1644. Descended from two great chancellors, one of whom, the chancellor L'Hospital, was amongst the greatest men of his own or any other country, Choisy, nevertheless, betrayed in his early years a levity and vicious effeminacy which, had he not subsequently reformed, would have rendered his name a blot on the family escutcheon. Up to eighteen years of age he wore female costume, to which he had taken such a perverse fancy that when induced to set it aside for more becoming habiliments, he could not overcome the custom, and resumed them once more. Stung by reproofs in the capital, he withdrew to a chateau in the neighbourhood of Bourges, under the name of the countess de Barres. He travelled through Italy, attending all the gambling tables, and returned having lost all his money, but still dressed as a woman. Having caught a fever on his return home, his mind became sensible of the odious follies of his past life, and he resolved, if spared, to make amends for his transgressions. Yielding his mind to severe studies, he proved that under contemptible appearances there had lain a spark of the ancestral spirit. He wrote dialogues on the soul, on God, on Providence, and on religion. Not satisfied with intellectual speculation, he thirsted for action, and hearing that the king, Louis XIV., was sending an ambassador to Siam, he asked leave to accompany the mission, (March 1685) with the view of converting the pagan monarch to christianity. It was on the voyage out that he was ordained, and said his first mass on shipboard. He failed in his attempt to convert the king of Siam, and on his return in 1686, instead of being received with favour was treated with coldness. His knowledge of the language, however, rendered him necessary to the court. The rest of his life he passed in penitence, but yet retained so much of the courtier as to introduce into his life of Solomon many pointed compliments to the king. Amongst his other works is a translation of the immortal Imitation of Jesus Christ. He died 1724.—J. F. C.

\* CHOISY, JACQUES DENYS, a Genevese botanist of the present century, has contributed several valuable works on botany; among others a monograph of the hypericaceæ, and memoirs on the selaginaceæ and hydroleaceæ. He has also written a monograph of convolvulaceæ, and he revised that order in Decandolle's Prodromus.—J. H. B.

CHOPIN, FREDERIC FRANÇOIS, a pianist and composer for his instrument, was born at Zelazowawola, near Warsaw, in 1810, and died at Paris, 17th October, 1849. He studied his art at the conservatory of Warsaw, where his instructors were

Zywli for the pianoforte, and Elsner for composition. He made in early life several excursions into Germany, where he heard the chief pianists of the time, from whose example, more than from the precepts of his master, he formed his style. The political troubles of 1831 obliged him to quit Poland, and from this period dates his career as an artist. He appeared first at Vienna, with marked success as a player; made an equally good impression at Munich, and reached Paris at the close of the year— which city became his permanent residence. His compositions were at this time of a bravura character, written to display his own execution in public performance; among others, a fantasia with orchestra on "La ci darem," was especially popular. Of a delicate constitution, which eminently affected the character of his mind, he was attacked in 1837 by a pulmonary and asthmatic disease from which he never recovered, that indisposed, if not incapacitated him for appearance in public, and thus concentrated his thoughts upon composition, while it tinged them with a peculiar, not to say a morbid expression, which gives marked individuality to everything he wrote. His intimacy of many years with Madame Dudevant (Georges Sand) cannot have been without influence upon his intellectual powers, and thus, however indirectly, must have affected his music. Add to this the ardent love of his country and of everything associated with it, common to his exiled compatriots, and we have all the external causes that may be supposed for the æsthetical peculiarities of his writing. Circumstances similar to those which compelled him to quit his native land, induced him, for the first time, to leave France during the excitement of 1848. He then visited London, and at the close of the fashionable season made a tour in Scotland. The piercing climate of the north greatly irritated his sufferings from his disease, and he returned to the metropolis late in the autumn. He had played very much in private society during the year, and in November was persuaded to rise from his sick-bed to perform at a ball given for the Polish refugees at Guildhall—this being his only appearance in a public concert-room. He went back to Paris at the end of the year, where he lingered for many months in the protracted hopelessness of his ruthless malady. Chopin wrote two concertos, two sonatas, several concert pieces, eighteen nocturnes, a large number of impromptus, scherzos, ballads, polonaises, waltzes, and studies, and eleven books of mazurkas—all for the pianoforte. The best idea of his playing is to be gathered from his music: it was characterized by the most highly refined delicacy of expression, and rendered very peculiar by his free use of the tempo rubato, which no one ever employed so much, and few with such natural grace and effect. For his remarkable speciality as a composer, he owed little to the technical training of his Polish preceptor; with no command of the principles of construction, he made his lengthened pieces incoherent, and even his lightest productions give occasion to question the soundness of his grammatical knowledge. The singular beauty, and the constant individuality of his ideas, however; his exquisite feeling for harmonic combination and progression, which led to his habitual employment of resources most rarely used by others; his unreserved application of exceptional forms of passing notes, and his perfect and peculiar gracefulness of phraseology—give a charm to his music which is irresistibly fascinating. His mazurkas are unique in the range of musical composition, and they are as full of character, national colouring, sentiment, humour, and technical peculiarity, as they are insusceptible of imitation.—G. A. M.

CHOPPIN or CHOPIN, RENÉ, a famous French lawyer, born in 1537; died in 1606. He practised with great success in the parliament of Paris; but latterly confined himself to his study, where he was consulted as a legal oracle. He was ennobled by Henry III. for his treatise "De Domino Francie;" his best work, however, is the "Commentaires sur la coutume d'Anjou." Choppin's attachment to the league drew on him Hofman's satire, entitled Anti-Choppinus. He seems ultimately to have given in his adherence to Henry IV.—R. M., A.

CHOQUE, PIERRE: lived towards the end of the fifteenth and beginning of the sixteenth century; he was a herald, and in the mysterious nomenclature of that science is designated as Bretagne. He was premier herald and king at arms to Anne of Bretagne. There are in the imperial library at Paris several manuscripts of his, recounting the ceremonies of royal marriages and funerals at which he assisted. A poem translated from the Latin of Brice into French verse by Choque, also exists in the imperial library. Brice, we are told, was Germain Brice

d'Auxerre, canon of the cathedral of Paris, and almoner of Louis XII., and who died in 1538.—J. A., D.

CHORICIUS: born at Gaza. The precise time of his birth and death are unknown, but he is said to have flourished about 520, in the reign of Justinian. He was educated by Procopius, not the historian, but a rhetorician, who bore the same name. Twenty-one discourses of Choricus exist in manuscript. Of these Fabricius published two; Villoison a third; Iriarte and Mai also published some fragments. Monsieur Boissonade had some more fragments transcribed from a Madrid manuscript, and published at Paris in 1846, the whole collectively, under the title of "Choricii Gazæi Orationes, Declamationes, et Fragmenta. Insunt ineditæ orationes duæ."—J. A., D.

CHORIN, R'AAARON BEN KALMAN, for fifty-five years rabbi at Arad in Hungary, one of the most zealous and learned promoters of reform among the Jews in modern times. He published numerous works in defence and furtherance of his cause. The most interesting to Hebrew scholars in general are—"Zir neeman" (the Faithful Messenger), on the fundamental articles of faith; "Emek Ha-shaveh" (the Valley of the Plain, or Shave), on the harmonizing of religious duties with the exigencies of active life; "Dabar be-itto" (a Word in Season), on reforms in synagogue-worship; and his autobiography, "Yeled Zekunim," an eloquent appeal on behalf of progress. This enlightened rabbi died at Arad on August 24, 1844.—T. T.

CHORON, ALEXANDRE ÉTIENNE, a musician, was born at Caen, October 21, 1772, and died at Paris, June 29, 1834. His father was a director of farms under government, an office of considerable emolument, and was so entirely adverse to Choron's adoption of music as a profession, that he threw every possible obstacle in the way of his studying this art; which obstacles, however, the son's strong natural inclination overcame. Choron was placed for general education in the college of Juilly, which he quitted at the age of fifteen with great distinction. Here he developed a remarkable faculty for languages, and so powerful a memory, that till his latest years he had the constant habit of reciting long passages from the Greek and Latin classics. His mastery of Hebrew was such, that when he first went to Paris, he frequently officiated as a deputy teacher at the Ponts et Chaussées; and, in pursuit of his musical studies, he acquired a knowledge of Italian and German to enable him to read the didactic works in those languages. The calculations of musical ratios in the writings of Rameau and d'Alembert directed Choron's attention to mathematical science, and he applied himself to this with the ardour and with the success that distinguish all his studious efforts. He became a pupil of Monge, by whom he was appointed in 1795 teacher of descriptive geometry in the normal school, and afterwards, on the opening of the polytechnic school, chef de brigade in that institution. To conclude this account of his pursuits unconnected with music, it must be stated that he published an ingenious tract on the improvement of instruction in reading and writing, which was not without beneficial influence on the elementary schools of France; and he wrote in 1812, as correspondent of the *Classe des Beaux Arts*, a tract upon the works of Scopa, which is a reputed masterpiece of criticism. Choron was nearly twenty years of age when he began the serious study of music, which was even then undertaken without the aid of a teacher to explain the theoretical works he read, or to correct the exercises he set himself. It was not till 1797 that he obtained his first master, Bonesi; after this, by the advice of Grétry with whom he had become intimate, he took lessons in counterpoint of Abbé Roye, and these two were his only instructors. In 1804 he published "Principes d'Accompagnement des Écoles d'Italie," a work written in conjunction with Focchi, a singing master resident in Paris, but of which Choron contributed the greater portion. With a view to the interests of his art, he embarked his property in the music publishing firm of Le Duc and Co., and devoted great energy to the search after and production of works of a classical character that had not been printed in France, and that, as a commercial undertaking, probably might never have been printed there. At this establishment in 1808 he published the *Principes de Composition des Écoles d'Italie*, an extensive work comprised in three volumes, which included the large collection of specimens of the Italian contrapuntist, that had been printed at Naples by the venerable Sala, but of which the plates had been destroyed at the time when the French invested the city. It included, also, much matter selected from other sources, and a large amount

furnished by himself, and, in fact, somewhat belied its name, being rather an eclectic comprehension of all schools than a representation of the one indicated in its title. He contemplated the translation of Gerber's Musical Biography; but he took M. Fayolle into co-operation with him, to whom, in the end, he confided the entire work, with the exception of some original articles, and a long introductory essay. This book appeared in 1810 and 1811. In 1812 Choron was commissioned to form a plan for the reorganization of cathedral choirs, the success of which led to his appointment as director of the music for religious fêtes and ceremonies. A want of prompt facility, which was a natural consequence of the late commencement of his artistic studies, occasioned him considerable embarrassment in the discharge of this office; by unceasing assiduity, however, he made up for this impediment, and effected a most important reformation in the department intrusted to him. Many circumstances, and perhaps some prejudice, had made him always opposed to the conservatoire; but when this institution, which had been founded by the republic, was dissolved upon the restoration, Choron was intrusted to draw up a system for an establishment to replace it, and the école de chant et de déclamation, which has since been developed into the present conservatoire, was formed under his superintendence. In 1816 he was appointed director of the opera, which office he held for little more than a year. His scheme for bringing forward the talent of untried artists, by allowing such to write one-act operas for the theatre, was deemed a greater boon for these composers than for the public, and his management was generally unpopular. He next conceived a design of an extensive institution for instruction in choral singing, and, after great difficulty, obtained a grant from government for its support. For the purposes of this establishment, he published in 1818 his "Méthode Concertante de Musique à quatre parties," a work admirably appropriate to its object, and the new school, under the name of the Conservatoire de musique classique et religieuse, was opened under Choron's exclusive direction. He now performed an extraordinary art-pilgrimage through the southern provinces to obtain disciples for his seminary, seeking fine voices among all classes of the people, but especially among the peasantry, whose robust constitution is generally favourable to the development of the vocal organs. Besides the efficacy of his system, his personal manner in its administration, and the untiring energy with which he discharged this, produced the most admirable results. Many as were the occupations of his ever active mind, this institution became his chief object of attention, and when, after the revolution of 1830, in the rearrangement of affairs, the grant for its support was so greatly diminished, as virtually to put an end to its operations, Choron's vexations preyed upon him to the extent of undermining his health, and eventually bringing him to the grave. As a composer, he was so successful in "La Sentinelle," one of a set of romances published in 1806, that this has become a popular national song throughout France. All his subsequent publications, however, were for the uses of the church, or practicable exercises in extension of his "Méthode Concertante," and they are highly accredited for the profundity of their style and the purity of their counterpoint. As a theorist, his translation of the works of Albrechtsberger, with copious comments; his translation of the treatise of F. Azopardi; and his many original, critical, and elementary writings, entitle him to be classed above any of his countrymen; at least, if he produced little that was new upon the subject of his art, he exhibited a most profound and comprehensive knowledge of its principles as set forth by previous writers, and an excellent skill in expounding them.—G. A. M.

CHOSROES. See ARSACES.

CHOSROES I. and II. See KHOSRU.

CHOUJAA-ED-DOULAH or SUJAH DOWLAH, surnamed DJELALED-DYN-HAYDER, Nabob of Oude, and Vizier of the monarchy of Hindostan, was born at Delhi in 1729. He was a greedy, cowardly, and cruel tyrant, and his memory has been preserved mainly by his connection with Lord Clive and Warren Hastings. He succeeded his father in 1754, and one of his first acts was the assassination of the governor of Allahabad who had shown a desire to get rid of his yoke. The English were regarded by him with intense hatred, as rapacious usurpers; and he speedily drew down their displeasure by affording shelter to Meer Cossin, who fled to Oude for refuge after the massacre of his English prisoners, which, as Macaulay remarks, "surpassed in atrocity that of the Black Hole." The Company determined

to punish him for this hostile proceeding, but he anticipated them by a declaration of war in 1763, and penetrated to the environs of Patna, which the English were obliged to evacuate. Next year, however (October 22), Major, afterwards Sir Hector Munro, with a force of seven thousand sepoy and English, attacked at Buxhar the army of the nabob, consisting of forty thousand men, and defeated them, with the loss of two thousand men and one hundred and thirty-three pieces of artillery. A second defeat was inflicted upon him and his Mahratta allies at Calpi, by General Carnac, on the 3d of May, 1765, and Sujah-Dowlah, finding farther resistance hopeless, surrendered to the victors on the 19th of May. Lord Clive, by whom the terms of peace were ratified, allowed the nabob to retain possession of his dominions (with the exception of Allahabad and Corah, which were assigned to the Mogul), on condition that he should pay fifty lacs of rupees, as the expenses of the war, and give no further shelter to Meer Cossin, or the German soldier, Sumroo. In 1773 the nabob cast a covetous eye upon the Rohilla country, and entered into an agreement with Warren Hastings, by which he stipulated to pay forty lacs of rupees, on condition that the English troops should assist "in the conquest and extermination of the Rohillas." In fulfilment of this most infamous compact, a British force, under Colonel Champion, invaded the Rohilla territories in 1774, in conjunction with Sujah-Dowlah. A bloody battle took place on the 23d of April. The dastardly nabob speedily took to flight, and left the British to fight single-handed; but after an obstinate struggle the Rohillas were defeated, and their gallant chief, Hafiz Rhamet, was slain. The nabob inflicted the most shocking cruelties on the conquered nation. Men, women, and children were given up to the sword, and the country was reduced to a desert. This transaction has left a deep stain on the character of Hastings and of the British government. Sujah-Dowlah died in 1775.—(See Mill's *History of British India*, vol. iii., and Macaulay's *Essay on Warren Hastings*.)—J. T.

CHRESTIEN, FLORENT, born at Orleans in 1541; died at Vendôme in 1596. He was tutor of Henri of Navarre, afterwards Henri IV. of France. There are several works of Florent Chrestien in verse and prose; tragedies, original and translated; Greek epigrams; a translation of the Quatrains of Pibrac into Greek and Latin; satires against Ronsard; and he assisted in satire Menippée, though his parts are not now known. He translated Hero and Leander from the Greek of Musæus, and also Oppian's book on hunting. His knowledge of Greek was very accurate for the period. He followed the example of the king in becoming a member of the church of France. The fancy of taking Latin names was frequent in Chrestien's day, and he called himself Quintus Septimius Christianus—Quintus as the youngest of five brothers, and Septimius as being a seventh month's child.—J. A., D.

CHRESTIEN or CHRESTIEN DE TROYES, a French poet. Neither the date of his birth or death is known with certainty; he appears not to have died till within the last four or five years of the twelfth century. We find him described as "orateur et chroniqueur" of Madame Jeanne, comtesse of Flanders. He wrote several romances in verse, most of which exist in manuscript in the bibliothèque imperiale. A good many of the stories of the Round Table are told by Chrestien, and as far as we can judge by the extracts given in the *Histoire Littéraire de la France* are amusingly told. The incidents are those familiar to all readers of romances—"fierce wars and faithful lovers—forests and enchantments drear." Some of his romances were translated into prose, and in this form probably gave higher pleasure to a larger number of persons, than had heard the verses of the original said or sung. Perceval le Gallois—a prose version of Chrestien's rhyming legend—printed in folio in 1530, was a volume at one time greatly treasured.—J. A., D.

CHRISTIAN, EDWARD, chief justice of the isle of Ely, and Downing professor of the laws of England in the university of Cambridge, died in 1823. He is the author of an edition of Blackstone, and of several legal dissertations of great merit.

CHRISTIANA, duchess-regent of Savoy, daughter of Henry IV. of France, and Maria de Medicis, was born in 1606, and married in 1619 Victor Amadeus, duke of Savoy. Before his death in 1627, the duke appointed Christiana regent, and guardian of her children. Her regency was one continued scene of troubles and disturbances excited mainly by the cupidity of the French court, who sought to take advantage of her unpro-

ted position, and to seize the principal fortresses of the duchy. Her two brothers-in-law, the Cardinal Maurice, and Prince Thomas, disturbed the peace of the country by their intrigues and plots, invaded Piedmont, and the latter captured Turin and several other important places, while a Spanish army at the same time assailed the duchy. Peace was concluded, however, in 1642 between her and her brothers-in-law. The majority of Charles Emmanuel was proclaimed in 1648, but his mother retained her power until her death in 1663. As a ruler her conduct exhibited ability and firmness, but her private character was not unblemished.—J. T.

CHRISTIANUS, a warlike prelate of the twelfth century, archbishop of Mayence, took an active part in the Italian wars of the Emperor Frederick Barbarossa. He died in 1183.

CHRISTIE, JAMES, a noted antiquarian, followed in London his father's profession of auctioneer. He wrote "An Essay on the ancient Greek game supposed to have been invented by Palamedes" &c., 1802; "A Disquisition upon Etruscan vases," 1806; and "An Essay on the earliest species of Idolatry, the worship of the elements," 1815. He died in 1831.—J. S., G.

CHRISTIE, THOMAS, a Scottish writer, was born at Montrose in 1761. He went to London for the purpose of studying medicine, but soon abandoned that profession, and addicting himself to literary pursuits, commenced a publication called the *Analytical Review*. He visited France in 1789, when he was cordially welcomed by the leaders of the revolutionary party, and wrote a reply to Burke's denunciation of the Jacobins. He died at Surinam in 1796, leaving "Miscellanies, Philosophical, Medical, and Moral," published in 1789.—J. T.

CHRISTIERN I. (CHRISTIAN), the founder of the house of Oldenburg, which still reigns in Denmark, was born in 1425 or 1426. He was the second son of Theodoric, count of Oldenburg, and was elected king of Denmark on the death of Christopher III. of Bavaria, the last of the Waldemars, in 1448. Christiern expected that the treaty of Colmar, which was negotiated under the direction of the celebrated Queen Margaret, and guaranteed the union of the three northern crowns, would take effect in his case. But in the same year in which he was intrusted with the supreme power in Denmark, Carl Knutson (Charles Canuteson) became king of Sweden, and soon after seized on the crown of Norway. Carl was forced, however, in 1450, to resign the latter, which then fell to Christiern; and his arbitrary rule in Sweden at length, in 1458, brought about the union of the three crowns in the person of the same king. Two years after, the duchies of Schleswig and Holstein came also into Christiern's possession. In 1464 an insurrection placed Carl a second time on the throne of Sweden. Christiern made two determined, but fruitless efforts, to recover the crown, in the latter of which he was himself wounded at the sanguinary battle of Brunkebjerg. He founded the university of Copenhagen. Christiern died in 1481. When his daughter Margaret became the queen of James III. of Scotland, Christiern, whose exchequer was unequal to the payment of her dower, pledged the islands of Orkney and Shetland, which have never been redeemed.—R. M., A.

CHRISTIERN II., grandson of Christiern I., king of Denmark, Norway, and Sweden, was born in 1480. He was chosen successor to the throne during the life of his father, John, and from the year 1501 had a considerable share in the government, particularly in Norway, where he suppressed two insurrections with more vigour than humanity. On his accession in 1513 he signed a capitulation favourable to the power of the aristocracy; but this did not hinder him from straining all his energies to render his own sway in the last degree absolute. To strengthen his tyrannical pretensions he allied himself in 1515 with the most powerful dynasty in Europe, by marrying Isabella, sister of Charles V. Soon after this he began to prepare for a war against Sweden, where the younger Sture, who had been named administrator of that country, refused to recognize the treaty of Colmar. His first expedition failed; but in 1520 the battle of Borgesund, in which Sture fell, was won by his general Otto Krumpen, and, notwithstanding the heroic defence of Stockholm by Sture's widow, decided the fate of Sweden. Christiern was crowned king in the same year, and proclaimed an amnesty, which he almost immediately profaned by barbarously murdering about ninety of the Swedish nobles, besides a great number of the people. At last Gustavus Vasa, who had borne the Swedish banner during Christiern's first expedition, and whose father was

one of the murdered nobles, appeared at the head of the famous Dalecarlians. The Danes were soon driven out of the country. Gustavus, the liberator of Sweden, was elected king on the 7th June, 1523, and on that day the treaty of Colmar, which had lasted a hundred and twenty-six years, became a dead letter. Meanwhile Christiern had lost also the crown of Denmark; the nobles having taken advantage of his reverses to revenge the violation of the articles which he had signed on becoming king. For nine years after this he led an adventurous life, chiefly in the Low Countries. He conversed with Erasmus and corresponded with the German reformers, whose doctrines he approved when no opposite interest was present to his mind. In 1531 he at last succeeded, with the aid of Charles V., in conducting an expedition into Norway. The diet of that country proclaimed him king; but soon after he fell into the power of Frederic I., his successor on the Danish throne, who threw him into prison, where he died after a long confinement in 1559.—R. M., A.

CHRISTIERN III., King of Denmark and Norway, and son of Frederic I., was born in 1502, and died in 1559. He ascended the throne in 1536. Like Gustavus Vasa, with whom he was in close alliance, he signalized his reign by a vigorous support of the Reformation. One of the first measures of his rule deprived the clergy of all share in the civil power. At a diet held at Copenhagen in October, 1536, and composed of four hundred nobles, together with a few deputies of the people, Lutheranism was declared the religion of the state. The secularization of the church property immediately followed; although Christiern, listening to the remonstrance of Luther, reserved a considerable part of it for the support of the new establishment. Bugenhagen was brought from Wittemberg to assist in organizing the Danish protestant church. Its constitution, drawn up by the clergy and approved by Luther, was sanctioned at the diet of Odensee in 1539. The university of Copenhagen was likewise placed upon a better footing, and the general reform included a new order of schools for the liberal education of youth. In the midst of these peaceful improvements Christiern was threatened with war. The pretensions of the two sons-in-law of Christiern II. to the Danish throne being again raised, were supported by Charles V. Christiern III. upon this entered into an alliance with France; but the peace of Spire, at which Charles V. abandoned the cause of his brother-in-law, was concluded in 1544, and put an end to the danger. Christiern joined the league of Schmalkalden; but when the war of that name broke out, his treaty with the emperor prevented him from actively engaging in it. Commerce flourished during his reign. His wise policy first effectively neutralized the dangerous preponderance of the Hanseatic towns. Christiern, like many powerful rulers, was an encourager of letters. He was succeeded by his son Nidare.—R. M., A.

CHRISTIERN IV., King of Denmark and Norway, son of Frederic II., was born in 1577, and died in 1648. Being only twelve years of age when his father died, the regency, which should, according to custom, have fallen to Sophia of Mecklenburg, was seized by the aristocracy. He began to reign in 1596. The claims of Russia and Sweden to Norwegian Lapland brought him into collision with these two powers. Christiern, who possessed one of the best fleets of that time, conducted in person a naval expedition against the former in 1599, and twelve years afterwards gained several important victories in a war with Charles IX. It was in this war that the Norwegian peasants of the valley of Guldbrand destroyed a company of Scottish soldiers, one thousand strong, commanded by Colonel Sinclair. Peace was concluded between Sweden and Denmark on the accession of Gustavus Adolphus. The twelve years following 1613 were the most peaceful and illustrious of Christiern's reign. His whole attention was given to the internal condition of his country, and to the extension of her commerce. He improved the legislature, reorganized the university, founded schools of various kinds, made provision for the education of a number of poor scholars, established libraries, and built towns. He was the first monarch that sent expeditions to explore the north-west passage. One of the results of these expeditions was the annexation of Greenland to the crown of Denmark. Christiern also laid the foundation of the Danish power in the East. These peaceful labours were interrupted by the outbreak of the Thirty Years' War. Christiern was appointed captain-general of the league formed by the protestant powers for the defence of the elector-palatine, whose territories were invaded by the emperor. His military career, however, proved unsuccessful. At the head of twenty-seven thousand men of

various nations he had advanced as far as Brunswick, when, on the 27th August, 1626, he was completely overthrown by Tilly at the battle of Lutter-sur-Barenberg. He immediately received a reinforcement of six thousand English and Scotch; but Wallenstein having meanwhile effected a junction with Tilly, he was forced to retire into Fionia, whilst his victorious enemies ravaged Holstein and Jutland. Wallenstein who now, it is said, aspired to the crown of Denmark, occupied Rostock and Wismar, and laid siege to Stralsund. But Christiern, aided by a Swedish army, at length drew him out of the North, and reconquered Jutland, Schleswig, and Holstein. A peace was concluded at Lubeck in 1629. Christiern is said to have entertained the project of conquering Sweden. But the Swedes were beforehand with him in the work of invasion; they suddenly entered Denmark in 1641, and, in spite of the energetic defence of Christiern, forced him to sign humiliating conditions of peace.—R. M., A.

**CHRISTIERN V.**, King of Denmark and Norway, son of Frederick III., was born in 1646, and died in 1699. He succeeded his father in 1670, and was the first hereditary king of Denmark, the crown having been elective till the year 1660. Christiern visited England in 1662, and soon after married the Princess Charlotte-Amelia of Hesse. In 1675, joining the league formed by the German princes, the emperor, and the Dutch, he declared war against Sweden. At first he carried it on with great vigour and success. Jemtland and Scania were conquered, and, at the battle of Uddevalle, General Loevenhjelm with three thousand men routed a Swedish army eleven thousand strong. But victory then went over to the other side; and, notwithstanding the complete success of the combined fleets of Denmark and Holland at sea, Christiern found himself in 1679 obliged, by the defection of his allies, to conclude an unsatisfactory treaty of peace at Ninegen with Sweden and France. His attempt on the independence of Hamburg brought him little honour. That he was a weak ruler is sufficiently proved by the fate of his able minister Griffenfeldt, who was condemned to death in 1676 for crimes that were never proved, the king possessing so little power, that the utmost he could do was to commute the sentence into imprisonment for life.—R. M., A.

**CHRISTIERN VI.**, King of Denmark and Norway, son of Frederick IV., was born in 1699, and died in 1746. He ascended the throne on the death of his father in 1730. His reign was peaceful throughout, and politically considered, is utterly devoid of interest. Nothing but the usual squabbles with the house of Holstein-Gottorp, an insignificant quarrel with Sweden, and an alliance defensive with France, need be noticed. The king and queen, who could not speak the language of their people, surrounded themselves, to the great discontent of the country, with a crowd of needy pietistic Germans. Christiern, however, took a deep interest in the welfare of his subjects, and kept a kindly eye on whatever concerned the advancement of science, of education, and of good morals.—R. M., A.

**CHRISTIERN VII.**, King of Denmark and Norway, son of Frederick V., was born in 1749, and died in 1808. Shortly after ascending the throne in 1766 he married Caroline Matilda, sister of George III. of England. Accompanied by Struensee his physician, he travelled into Germany, Holland, France, and England, where he received the degree of LL.D. from Cambridge. In 1770 Struensee became his prime minister, and governed with almost regal authority for sixteen months. Struensee amongst some other excellent reforms procured the liberty of the press; but the nobles, jealous of his power, conspired his fall. He was condemned to death by a commission, and executed on 28th April, 1772. The fate of Caroline Matilda was involved in that of the favourite. Being accused of an illicit connection with Struensee, she was divorced from her husband, and removed by the English government to Zell in Hanover, where she died in 1775. Soon after this the king fell a victim to insanity. Frederick his eldest son was declared major in 1784, and from that year conducted the government as prince regent, though he did not take the name, till his father's death. The reign of Christiern VII. was the most illustrious in regard to literature, science, and art, that Denmark had yet seen. It is sufficient to mention the names of Baggesen, Ehlerschlæger, Thorwaldsen, and the two brothers Ørsted.—R. M., A.

**CHRISTIERN VIII.**, King of Denmark, son of the hereditary prince Frederick, was born in 1786. He married in 1806 the princess Charlotte Frederica of Mecklenburg. The king, Frederick VI., knowing the designs of Sweden with regard to

Norway, sent Prince Christiern as his representative to the latter country. He was proclaimed king by the loyal Norwegians, but an army of forty thousand men, and threatening notes from the great powers, caused him to abdicate the throne on 26th October, 1814. Before parting with the crown he extorted a promise from Sweden that the independence of the Norwegian constitution should be sacredly maintained. Christiern ascended the Danish throne on the death of Frederick in the end of 1839. He was a most accomplished prince; his accession caused universal joy, but death put an end to his too short reign amidst the troubles of 1848.—R. M., A.

**CHRISTINE**, Queen of Sweden: This extraordinary woman, the daughter of the great Gustavus Adolphus by his queen Eleonore, princess of Brandenburg, was born December 18, 1626. At the time of her father's departure for the Thirty Years' War she was only four years old; consequently though it has been said that Gustavus educated her rather as a boy than a girl, he could have had little or nothing to do with her education. At his death on the field of Lützen, November 16, 1632, she was only six years of age. She was immediately crowned queen of Sweden, and the Swedish parliament appointed the five principal ministers of state as her guardians. At the head of these was the celebrated Chancellor Oxenstjerna, who had been the able and zealous supporter of Gustavus in the great enterprise for the enfranchisement of protestantism, and who continued to prosecute the same design through the famous generals, Duke Bernhard of Weimar, Torstenson, Horn, Banner, and Wrangel, till the object was achieved at the peace of Westphalia.

Christine was educated with great care by Oxenstjerna, who became to her like a father. He gave her the most learned teachers in languages (ancient and modern), history, geography, philosophy, and politics. She displayed on her part an extraordinary force of imagination and of memory, and to these advantages added an unappeasable thirst of knowledge. Her guardians were amazed at the rapid progress she made in her education; but they were as quickly struck with the eccentricity of her character. She had the high courage and the desire of distinction of her father, to whom she bore a strong resemblance. She showed a decided taste for manly, rather than for feminine pursuits and accomplishments. She had a great passion for horseback and fox-hunting, in which no danger could disturb her. She was fond of wearing men's apparel, of associating with men, despised female ornaments, and showed great repugnance to the etiquette of royalty. At the same time, though an Amazon in her spirit and habits, she was under the middle size, and had one shoulder rather higher than the other, which she concealed as much as possible by the aid of dress and the carriage of her person. At sixteen the states proposed to dismiss her guardians and give her independent possession of the government; but she at this time displayed more wisdom than the parliament, excusing herself as too young, and the guardianship was continued two years longer, namely till 1644. Having once undertaken the supreme power, she entered on the business of the state with a zeal and an ability which astonished her ministers. She gave the highest promise of becoming a great sovereign by the tact and firmness of her judgment. She put an end to the war with Denmark begun that year, and at the treaty of Brömsebro in 1645, she obtained some new provinces. She then, contrary to the wishes of Oxenstjerna, hastened the conclusion of peace in Germany, disregarding the chancellor's suggestion that a continuance of the war must procure still greater advantages to Sweden. She turned her attention to the mercantile affairs of the country, and introduced various measures to the advantage of commerce. But her chief delight was in the prosecution of literature and science, and she reformed and promoted the literary and learned institutions of the country. She was, herself, perhaps the most accomplished woman of the age, understanding six languages, of which she wrote and spoke French and Italian like her native tongue; conversed with correctness in German, and read her favourites, Thucydides and Polybius, in the original. She maintained an autograph correspondence with the most learned men of foreign nations, and invited them to visit Sweden, or to send her information of the works they were engaged in. Gassendi sent her his mathematical works. Descartes, Grotius, Salmasius, Bochart, Vossius, Meibom, and other learned men sought her court, and were received with the most flattering distinction. Descartes ended his days at Stockholm; and Salmasius, under her patronage, entered the

lists against the republicanism of Milton. He does not, however, seem to have realized her expectations, for she dubbed him "omnium fatuorum doctissimum." She studied chemistry, astronomy, and even alchemy and astrology, with the most celebrated professors. She purchased, with a royal recklessness of expense, books, pictures, coins, antiquities, autographs, &c., and indulged herself in such liberality to artists and professors of various kinds, and in feasts and entertainments at which they figured, to such a degree, that her ministers and parliament complained of the pressure of her expenditure on the finances of the country, already exhausted by the wars of her father. At the same time her people regarded her with admiration, as capable of taking the lead in the affairs of the north, and the ministers advised her to marry. But, like Elizabeth of England, she could not reconcile the idea of a partner on her throne with her love of independent power, and she rejected the proposal. The states, however, continued to press her on this head, till it became intolerable to her; and the complaints of the people of the waste of the public money on foreign artists and learned favourites, led her to contemplate the abdication of her throne in favour of her cousin, Karl Gustav of Pfalz-Zweibrücken, the son of her father's sister, who had sought her hand, and was highly distinguished for the nobility of his nature, his extensive knowledge, and ability. Though her counsellors, and especially Oxenstjerna, earnestly, and at this time successfully, dissuaded her from this startling project, she prevailed on the states in 1649 to name him her successor, asserting that the kingdom required a king rather than a queen, who could not only rule in the cabinet, but lead his armies in the field. Having settled the succession, she allowed herself to be crowned with great state in 1650, and for some time resumed the reins of government with every appearance of earnestness, and prospect of surmounting the temporary difficulties of the realm. But this did not last long. She showed a growing disposition to neglect the counsels of her quiet ministry, and to listen to those of ambitious favourites, as Tott, De la Gardie, Pimontelli, &c. She relapsed into her extravagance; unworthy favourites were promoted over the heads of men of real standing and ability; the treasury was empty; the court filled with petty feuds and bitternesses. At length, not only the favourites, but herself was in jeopardy from the conspiracy of Messenius. There arose in the three lower estates, especially the clerical, a violent opposition to the nobility in which Christine was imprudent enough to mix herself; and whilst she seemed to incite the opposition, she at the same time raised many unworthy persons to the rank of nobility, and heaped estates and privileges on that class.

The discontent of the people grew from day to day. To add to her motives for abdicating the throne, Christine had resolved to abandon protestantism, the religion for which her father had spent his treasure and his life. In 1654 she again announced her intention to resign the crown, and, notwithstanding the earnest entreaties of all persons and parties, amongst whom one of the most zealous to dissuade was her cousin Karl, who would have preferred marrying her, she this time, on the 16th of June, in an assembly of the states at Upsala, renounced the crown in favour of her cousin. She reserved to herself an annual income of 200,000 dollars, and the right of royal jurisdiction over her own little court. Having addressed the states in a speech which was listened to with tears, she laid down the insignia of her authority—Karl was crowned the same day as Karl X.—and five days afterwards she travelled in man's attire through Denmark to Hamburg. Italy was the country which she had marked out as her home, and where she promised herself—freed from the cares of a throne, and surrounded by art and artists, and in the free enjoyment of her new religion—a felicitous life. In Brussels, where she remained nearly a year, she made a private confession of the catholic faith in the presence of Duke Albrecht and some distinguished Spaniards. At Inspruck she made a more formal and public avowal of it, to the great disgust of the brave Swedes who had fought under her father to check the horrors of catholic oppression. From Inspruck to Rome her journey was a perfect ovation. She rode in Amazon costume on horseback, and all the cities through which she passed were crowded with people shouting in exultation over so great a proselyte, and were all astir with illuminations, feasts, plays, and triumphal arches. At Rome her reception was rapturous; she did homage to the pope, Alexander VII., and received the honour of his name, in addition to hers, being thence styled Christine Alexandra. In 1656

she went to France, where she lived principally at Fontainebleau, Compiègne, and Paris. Her finances were so low that she was obliged to pawn her jewels in Rome before setting out. The Parisian ladies, who were at first terrified at the fame of her talents, were soon very free in criticism on her high shoulder, her small figure, and the tasteless negligence of her dress, as well as her miserable retinue. The men were wonderfully fascinated by her knowledge and the freedom of her opinions. On her return towards Italy she visited the celebrated Ninon de l'Enclos at her country seat. The following autumn she again returned to France, where her arrival excited little attention; but within a fortnight she excited a universal horror by pronouncing sentence of death on her master of the horse, the Marquis Monaldeschi, who had been her confidant, but had betrayed her secrets, and having him put to death in the presence of Father Lebel, the walls and floor being stained with his blood. She received an intimation from the French court to quit the country, and it was two months before she dared to show herself in the streets of Paris: yet she remained in France till the spring of 1658, when she returned to Rome. From the poverty of the Swedish treasury, her annuity now remained unpaid, and the pope was obliged to allow her a pension of twelve hundred scudi. In 1660, Karl Gustav, her successor on the throne of Sweden, died, and Christine hastened to Stockholm to claim the throne again: but her religion was of itself a sufficient bar to her wishes, had not her recent history been sufficiently admonitory to the Swedish people. They obliged her to sign a more binding deed of abdication, and she felt herself compelled to retire from Stockholm. In 1666 she returned to Sweden once more, but being informed that she could not be permitted the public practice of her religion, she returned to Hamburg. There she lived about a year, offering herself to the Poles as their sovereign, but receiving little attention. In 1668 she finally returned to Rome, where she continued to live yet twenty years, and died in 1689, sixty-three years old, and was buried in St. Peter's, the pope himself writing her epitaph. During her later years she founded an academy in Rome, and increased her collections of paintings, coins, and autographs. Her library was purchased by the pope, Alexander VIII.; part of her paintings and the antiques by Odescalchi, the nephew of Innocent XI.; the other part of the paintings by the duke of Orleans. The value of these collections may be seen in Haverkamp's Nummophylacium Reg. Christianæ, in the Museum Odescalcum, and in Schröder's Berichte über die Gemählde und Statuen der Königen Christine.

Christine, with all her talents and learning, was what is now-a-days called a "strong-minded woman." She wanted solid judgment to become a great woman; and the opinion of Fryxell, the Swedish historian, that she was to a certain degree insane, appears to be correct. The same taint was sufficiently obvious in the poetical Erik, in Charles XII., and others of the royal line of Sweden. Some of her writings remain in Arckenholz's memoirs of her, but doubts have been cast on the authenticity of some of the letters bearing her name.—W. II.

CHRISTINE DE PISAN, a French poetess of Italian descent. She was born at Venice about 1363; died about 1431. Her father was astrologer to Charles V. of France. His daughter, then five years old, accompanied him when he fixed his residence at Paris in that capacity. At the age of fifteen she married a French gentleman, Etienne du Castel, who was notary and secretary to the king. The king died, and his death was followed soon by that of his astrologer and his notary. Christine found herself alone in the world at the age of five-and-twenty, with three children, and with little other evidence of property but what was furnished by her being defendant in several lawsuits instituted by persons having claims on her husband. In these circumstances she found some means of support in authorship—of course through the patronage of the great, then the only public for such wares as she dealt in. The marriage of Richard II. was the subject of a poem of Christine's, and on that occasion the earl of Salisbury adopted a son of hers, and brought with him into England a collection of her poetry, which led in the next reign to an invitation from Henry IV. that she should reside in England. She refused this, and also a similar invitation from Milan. She preferred remaining in France, where she wrote "Le livre des faits et bonnes meurs du sage roy Charles," and was patronized and liberally rewarded by several princes of the royal family. She was aided by the duke of Burgundy in marry-

ing her grandchildren. Christine has left a very large number of works both in verse and prose; most of them still remain in manuscript. A poem of hers on the subject of Joan of Arc has been published first by Jubinal and afterwards by Quicherat, in the Procès de la Pucelle. Of her prose works, that which seems of most interest is her "Acts and Manners of Charles V. of France," which has been published in Lebeuf's Dissertations sur l'histoire de Paris, and in the Collections of Petitot and Michaud.

—Her son JEAN DU CASTEL, had some reputation as a poet.—A grandson of hers, another JEAN DU CASTEL, held the official position of chronicler in the reign of Louis XI.—J. A., D.

\* CHRISTISON, ROBERT, M.D., an eminent Scotch physician, was born in 1798. He graduated at the university of Edinburgh in 1819. From an early period of his professional career, he devoted himself particularly to chemical pursuits, more especially those connected with the materia medica and forensic medicine. He was elected to the chair of medical jurisprudence in his alma mater, but subsequently was transferred to the professorship of materia medica, with which was conjoined that of clinical medicine; and among the many eminent men who have contributed to the reputation of the Edinburgh school of medicine, none occupies a more conspicuous position than Dr. Christison. He has been a prolific author. Perhaps the most celebrated of all his works is that on "Poisons," which has been characterized by an able writer as "the most philosophical and perfect which has yet appeared on the subject." Dr. Christison is also author of a "Dispensatory," or commentary on the pharmacopœias, in which vast industry and learning are displayed. In all criminal trials in which questions connected with poisons are investigated, Dr. Christison's authority is invoked. In addition to the above-named volumes, Dr. Christison wrote a treatise on "Granular Degeneration of the Kidneys," and his contributions to periodic medical literature have been very numerous. As a consulting physician he now stands at the head of the profession in Scotland—an honourable position, which has been honourably achieved by severe labour and the exercise of great natural talents.—J. C.

CHRISTOPHE, HENRI, King of Hayti, was of African blood though born in Grenada, and spent the first years of his life in slavery. He received his freedom as a reward of faithful service; and, having acquired some means and a good name by his industry, he was managing one of the principal hotels at Cape François for its widowed proprietrix, when the revolutionary spirit of France spread to St. Domingo, and brought on the fierce struggle between the coloured population and their masters, which, notwithstanding the temporary occupation of the island by the British, issued in the declaration of its independence, in 1801. Christophe was one of the leaders in the wild partisan warfare by which the blacks accomplished this result; his ability and energy having attracted the attention of Toussaint l'Ouverture, who employed him in important enterprises, and ultimately conferred upon him the military command of the north. But the expedition sent out by Napoleon in 1802 revived the contest, and turned the tide of victory. Leclerc, the French general, adding to the force of arms the influence of wily negotiations, undermined the fidelity of some of the insurgent chiefs, and seizing Toussaint by stratagem, sent him to imprisonment in France. Christophe, however, was soon in the field again under Dessalines, the successor of Toussaint. The war was renewed with increased ferocity; and when the French were compelled to evacuate the island in 1803, Dessalines obtained the chief power, with the title of governor-general, which he exchanged ere long for that of emperor of Hayti. On his assassination, Christophe, who had been again made military commander in the north, became a candidate for the throne; but he had a struggle to maintain against other claimants, and it was not till 1810 that the civil war ended in an arrangement which gave Christophe the undisputed possession of a part of the island, with the title of king of Hayti. His reign, which extended to ten years, was that of a capricious and cruel despot; disaffection appeared, and increased till it took the form of a revolt so serious, that the king, abandoning the hope of its suppression, put an end to his life in 1820.—W. B.

\* CHRISTOPHE, JEAN BAPTISTE, a French Roman catholic priest, born in 1809, published in 1852 a "History of the Papacy during the fourteenth century," in 3 vols, 8vo.

CHRISTOPHER, SAINT, a Christian martyr who is supposed to have lived in the third century of our era. He was a native

either of Syria or Palestine, and is believed to have suffered martyrdom by decapitation in the reign of the Emperor Decius.

CHRISTOPHER, Duke of Wurtemberg, a noted personage in the history of the Reformation in Germany, was born in 1515. His father, Ulric, being expelled from his dominions by the confederated Suabian cities, Christopher was carried to Vienna in 1519–20, and, while there, narrowly escaped being made prisoner by the Turks during their siege of the capital. Charles V., who bore him no good will, and dreaded not a little the influence of his talents and energy, in 1532 attempted to confine him in a Spanish monastery; but, on his way to the appointed hermitage, Christopher escaped from his escort and fled to Bavaria, where he enlisted in favour of his father and himself the active support of his uncle, the reigning duke, who, again, was the means of inducing Philip, the landgrave of Hesse, to join the confederation. The battle of Laufen, in which the landgrave was victorious over the Austrians, restored Ulric to his dominions, which were thenceforward under the safe protection of the protestant league of Schmalkalden. Two years after the death of Ulric, who was succeeded by his son, the Lutheran religion was completely established in the duchy. Christopher honourably consecrated the entire property of the church in Wurtemberg to educational purposes, and the support of the ministers of the new religion. It was converted into a fund called the "Wurtemberg church property," the revenue from which supported in vigorous operation the cloister schools of the duchy, the great theological establishment at Tübingen, and other educational and ecclesiastical institutions. Christopher died in 1568.—J. S., G.

CHRISTOPHER I., King of Denmark, died in 1259. He was the third son of Waldemar the Victorious, and succeeded to the throne by election in 1252, on the death of his brother, King Abel, and to the exclusion of his sons. The counts of Holstein on this laid claim to Schleswig, and an arrangement, which was made in 1253, and which recognized Christopher as the guardian of his nephews, and Schleswig as a fief of the crown, proved afterwards a source of embarrassment in the contest between the church and the monarch. Christopher died suddenly in 1259, it is said of poison administered by a canon named Arnfast. He was succeeded by his son, Eric VII.—J. T.

CHRISTOPHER II., King of Denmark, son of Eric VII., born in 1276, succeeded his brother Eric VIII. in 1319. He was involved in continual disputes with the church, the nobility, and even with his own brother, John. At length the nobles raised the standard of revolt, and, having been joined in 1325, by Geert, count of Holstein, they compelled Christopher to abandon his kingdom and take refuge in Rostock, where he lived in great misery for some years, while the throne of Denmark was occupied by Waldemar, duke of Schleswig. He recovered his kingdom in 1330, but in the following year new misfortunes overtook him. He was defeated by Waldemar; Jutland was seized by Geert, and Christopher himself, while he was living in security at the town of Skanderbon, was treacherously made prisoner by two of his nobles. He died soon after, 15th July, 1333.—J. T.

CHRISTOPHER III., of Bavaria, King of Denmark, Norway, and Sweden, was a descendant in the female line of Waldemar the Great. He was elected king of Denmark in 1440, on the deposition of his uncle Eric, of Sweden in 1441, and of Norway in 1442. In 1441 an army of 25,000 Jutland peasants, goaded into insurrection by the oppression of the nobles, defeated the royal troops, and took prisoners twelve nobles, and put them to death. Christopher attacked the victorious insurgents with a powerful force, and defeated them with the loss of 2000 of their number. On the restoration of peace he adopted measures to protect the people from the arbitrary exaction of tithes; exerted himself to abridge the commercial monopoly possessed by the Hanseatic towns; and extended similar privileges to the Dutch, the English, and the Scotch; transferred the seat of royalty from Roskilde to Copenhagen, and made that city the capital of Denmark, and the rival of the Hanseatic towns. He promulgated a municipal code, and devoted himself to the welfare of his kingdom. He died in 1448.—J. T.

CHRISTOPHERSON, JOHN, a learned English prelate of the sixteenth century, educated at Cambridge, was one of the first fellows of Trinity college, succeeded to the mastership, and in 1554 was made dean of Norwich. On the accession of Mary he was made bishop of Chichester. He died in 1558. He was an industrious, but not very successful translator. His Latin

translations of Philo-Judæus and of the ecclesiastical histories of Eusebius, Socrates, Sozomen, Evagrius, and Theodoret are inelegant and not unfrequently inaccurate.—J. S., G.

**CHRISTOPHERSON, MICHEL**, an English Roman catholic theologian, who lived in the seventeenth century, and is chiefly known by his "Treatise of Antichrist, in three parts," in defence of Bellarmine against Dr. Downham.

**CHRISTOPHORUS, ANGELUS**, the author of a work published in 1619 in Greek, with a Latin translation, on the present state of the Greek church, containing many curious details respecting its discipline and ceremonies. A new translation of this work, with notes, was published at Frankfort in 1653 by George Phelavius.—J. T.

**CHRISTOPOULOS, ATHANASIAS**, born at Castoria in Macedonia in 1772; died in 1847. He was the son of a Greek priest, who was settled at Bucharest in Wallachia. Athanasias was sent to Italy for his education, and at Padua studied law and jurisprudence. His attention, however, was chiefly given to classical learning. On his return to Bucharest he was employed as tutor to the children of the prince of Wallachia. He published in 1805 a drama which was acted with some success at Bucharest. About the same time he printed a Romaine grammar, in which he endeavoured to show that the modern language is composed exclusively of the Doric and Oolic dialects. He soon after went to reside in Constantinople, where he published some poems, chiefly bacchanalian and amatory, in modern Greek. The changes of government materially affected Athanasias. During the power of the Prince Mourousi and that of Caradja, Athanasias was employed in several departments of the state. When they had successively passed away, he occupied himself in a work which he called "Parallela," being a comparison of the advantages and disadvantages of different forms of government. He published, together with his collected poems, an essay on the sceptical philosophy of the ancients. Of this there are two editions, one in 1833, the other in 1841, the last of which differs considerably from the former. He translated the first book of the Iliad, and the first two books of Herodotus. He also published a tract, in which he maintained that the pronunciation of the modern Greeks was the true one, and identical with that of the ancient Greeks. His works have been collected, and published at Athens in 1853, under the title "Ἑλληνικὰ ἀρχαῖα λόγια." They are in many points of view of considerable interest.—J. A., D.

**CHRISTY, WILLIAM**, an enthusiastic English botanist and entomologist, died about the year 1840, at an early age. His zeal and success in the pursuit of science were only equalled by his readiness to impart to others a portion of the stores which he had collected. He formed a large herbarium of British and foreign plants, which he gave to the Botanical Society of Edinburgh. He made extensive tours in Britain, and visited Norway and Madeira.—J. H. B.

**CHRISTYN, JEAN BAPTISTE**, a writer on antiquities and jurisprudence, was born at Brussels in 1622. After passing through various subordinate offices, he was sent by the king of Spain as ambassador to the congress of Nimègue in 1678, and in 1681 as first commissioner to the conferences held at Courtray. He was rewarded for his services by being created a baron, and appointed chancellor of Brabant. He died in 1690, leaving a large number of works on jurisprudence and Belgian antiquities. His brother, **LIBERT FRANÇOIS**—born in 1639; died in 1717—edited two works, entitled "De Legibus abrogatis et inusitatis in regno Franciæ," par P. Bugnyon, and "Opera Omnia Juridica" of John and Frederick Van der Sande. His nephew, **JEAN BAPTISTE**, who was born in 1635, and died in 1707, was the author of a great number of treatises on legal subjects.—J. T.

**CHRYSIPPUS**, a famous Stoic philosopher, was the son of Apollonius of Tarsus, and was born at Soli, a town of Cilicia, about B.C. 280. Having spent his patrimony, some say in the public service, he devoted himself to the study of philosophy, and, taking up his residence at Athens, became a disciple of the celebrated Cleanthes, successor of Zeno. He soon became one of the foremost defenders of the philosophy of the Porch, and his disquisitions on the tenets of the Stoics acquired such celebrity as to give rise to the proverbial remark that, "if Chrysippus had not existed, the Porch could not have been." Cicero terms him the main pillar of the Porch, and speaks of his extraordinary acuteness and subtlety, though he admits that he was jejune in

his writings; and Diogenes Laertius affirmed that, if the gods themselves were to hold disputations, they would adopt the manner of Chrysippus. The satirist Persius notices his skill in the arts of sophistry, and his frequent use of the figure *sorites*, which on this account he calls the "heap of Chrysippus." All agree that Chrysippus exhibited great readiness and courage in disputation, combined with equal arrogance and self-confidence. "Give me doctrines," he was in the habit of saying to his preceptor, "and I will find arguments to support them." When a certain person asked him what instructor he would recommend him to choose for his son, he replied, "Me; for if I thought any philosopher excelled me, I would myself become his pupil." On the other hand it is related that, when he was told that some person spoke ill of him, he said, "It is no matter; I will live so that he shall not be credited." Not contented with defending the tenets of his own school, he attacked those of the Academic and Epicurean sects with a vehemence which created him many enemies. Plutarch charges him with numerous inconsistencies and contradictions, as well as with obscurity and excessive subtlety. It is undeniable that his disquisitions abounded more in nice distinctions and curious subtleties than in solid arguments; and his friends of the Stoic school complained that he frequently adopted unusual and illogical modes of reasoning, and that he had collected many arguments in favour of the sceptical hypothesis which he could not answer himself, and had thus furnished his chief antagonist, Carneades, with weapons which he wielded with great effect against himself. Chrysippus has also been accused of impiety and of teaching doctrines subversive of religion, but his tenets do not seem to be fairly open to any other charge on this head than those which may be brought against the Stoical system itself. Chrysippus was indefatigably industrious, and he is said to have seldom written less than five hundred lines a day, and to have left behind him about seven hundred treatises; but of these nothing remain except a few extracts, which are preserved in the writings of Cicero, Plutarch, Seneca, and Aulus Gellius. He died B.C. 207.—J. T.

**CHRYSIPPUS**, of Cnidos, a Greek physician, sometimes confounded with the preceding, lived in the fourth century B.C. His works, which are not now extant, are quoted by Galen. He was son of Erineus, and pupil of Endoxus of Cnidos.

**CHRYSOCOCCES, GEORGIUS**, a Greek physician of the fourteenth century, author of various works on astronomy, which still remain in MS., appears to be the same person who was associated with Gaza in his labours in the Vatican library.

**CHRYSOLORAS, MANUEL**, a learned Byzantine, famous as one of the restorers of classical learning in Italy, was born at Constantinople about the year 1355. He was sent to Italy in 1387 by the Emperor Manuel Palæologus to solicit the assistance of the Venetians and the pope against the Turks. About the year 1396 he settled in Italy as a teacher of Greek, and had for a pupil the famous Leonardo Bruni. He afterwards taught the same language at Florence, Milan, Pavia, and Rome, where he gained such favour at the papal court as to be sent as nuncio to the Emperor Sigismund. He was one of the representatives of the Greek church at the council of Constance, but died shortly after its convocation, April, 1415. Poggio Bracciolini, and Filelfo were also pupils of Chrysoloras. He wrote a Greek grammar entitled "Erotemata," which was one of the first published in Italy. Of this work there were numerous editions between the years 1480 and 1550, 4to and 8vo. Several of his Latin epistles are still extant.

**CHRYSOSTOM, JOHN**, was born at Antioch, of a noble family, in the year 347. His father Secundus dying when he was young, his education devolved on his mother Arethusa, who sowed the seeds of faith in his young mind with pious care, and had the happiness of witnessing their silent growth, amid favourable influences, in the soil of a susceptible heart. Having been designed for the bar, he was sent to learn rhetoric under Libanius, who soon conceived a very high opinion of his eloquence and abilities. But after having commenced a successful practice, he abandoned the forensic profession, in consequence of the influence exerted upon him by the aged bishop Meletius, by whom, after three years' instruction, he was subsequently baptized and ordained teacher. After his mother's death he spent six years in monastic seclusion among the mountains, under the abbot Diodorus, afterwards bishop of Tarsus. Several other young men, whose inclinations led them to the same kind of life, were his companions in such seclusion; one of whom was Theodore,

afterwards bishop of Mopsuestia. Remote from the haunts of men, Chrysostom passed these years in solitary perusal of the Bible, and in rigorous austerities which exhausted his strength so much that he was obliged to return to Antioch and begin another mode of life. Soon after his return he was ordained deacon by Meletius in 381. In 386 he was ordained presbyter by Flavian, bishop of Antioch, from which time his reputation became increasingly great. His sermons were powerful, exciting, and edifying, pervaded by great earnestness and zeal, so that his hearers felt christianity to be a vital system that purifies the principles as well as reforms the conduct. Men learned to fear, while they admired, the bold champion of the gospel, who did not hesitate to attack prevailing corruptions, in whatever rank of society they appeared, with intrepid front. It was here that he preached his famous "Discourses of the Statues"—after an uproar of the city, in which the statues of the Emperor Theodosius, and of the empress, and the two princes Arcadius and Honorius, were insulted and thrown down. But he was not destined to spend the energies of his life in his native city. He was transferred to a more splendid and influential place, though one which was unhappily full of dangers and disquietude. By the influence of Eutropius, who chanced to be one of his hearers on a certain occasion, he was called to the bishopric of Constantinople, on the death of Nectarius in 397. A stratagem was employed to induce him to repair to the imperial city, where all the preparations had been made for his elevation to the patriarchate. The eloquent and successful preacher was not easily drawn away from his native Antioch. It required all the authority of the Emperor Arcadius to induce him to accept the offered see. Perhaps it would have been better had the conscientious man been allowed to follow his own wishes. An imperial mandate to Theophilus, bishop of Alexandria, to consecrate Chrysostom bishop of Constantinople, could not be resisted, and the dedication took place accordingly in February, 398; though Theophilus, too, was secretly opposed to the measure. As soon as he began his labours in this new sphere, it was felt by all classes that an unsparing reformer had come amongst them. In 400 he was engaged in endeavouring to settle disputes among the churches of Asia, at Ephesus, whither he went at the request of the clergy of that city. He deposed thirteen bishops of Lydia and Phrygia, and settled various disorders which had arisen in that church. But his measures created bitter enemies and a formidable party was organized against him, consisting of nobles and ecclesiastics, with whom the Empress Eudoxia herself was leagued. Had it not been for this ambitious and covetous woman, the pious bishop would have suffered less at the hands of his persecutors. But she too thought herself aimed at by the uncompromising advocate of truth, and winced under his reproofs. Theophilus of Alexandria, Chrysostom's old adversary, who had fostered all the machinations of his enemies, came to Constantinople in the year 403. A synod was assembled at a villa near Chalcedon, known by the name of the Oak, where various charges were preferred against Chrysostom, most of them false and unfounded. When the deputies of the Oak synod presented themselves before the illustrious accused for the purpose of citing him to their tribunal, forty bishops from various countries were with him—friends who knew his value to the church of Christ. Justly did they pronounce the court an incompetent one; but he whom they so much respected declared his readiness to appear before the assembly, provided four bishops, who were his determined enemies, should be excluded from the number of judges. This condition was refused; and therefore Chrysostom did not appear, though thrice summoned. Sentence of deposition was then passed upon him. The Emperor Arcadius himself had sent a message to the synod, urging it to that course; nor need we wonder at such a proceeding on his part, since his weak mind was in entire subjection to his queen. Among the charges mentioned was that of high treason, which they left to the emperor to deal with. At first Chrysostom was unwilling to leave his office unless by force; but seeing that the people were greatly excited, and seemed disposed to detain him in opposition to the imperial authority, he surrendered in three days to those who were empowered to carry him into exile, and was conducted by them to a small town in Bithynia. In a few days, however, Chrysostom was solicited to come back—the empress having despatched a letter to that effect. His reappearance in Constantinople

diffused general joy; and although unwilling to resume his office till a regularly-constituted synod had fully and formally reinstated him, he was persuaded by his flock to enter upon his duties at once. In the meantime, he still demanded the calling together of such a synod; till, in the short space of two months, his affairs assumed a different aspect. Having preached against the indecent festivities which were held near his church at the dedication of a silver statue erected to the empress, she was provoked, and tried again to effect his ruin. It is said that her rage knew no bounds, when Chrysostom began a discourse with the words, "Once more Herodias maddens—once more she dances, and once more demands the head of John." If he used this language, it was certainly rash and imprudent. Again, therefore, the synod of Theophilus proceeded against him, alleging that he had not been reinstated in his see by an ecclesiastical court like that which had deposed him, but by the secular power only; and according to a canon of the council of Antioch in 341, he was incapable of administering the episcopal functions. Thus the venerable man was again deposed and sent into exile. In 404 he set out under a guard of soldiers for Nicæa, where he did not stay long, but prosecuted his journey to Cucusus—a desolate city on the borders of Armenia, Isauria, and Cilicia, which was the appointed place of banishment. It is remarkable that the very day he left Constantinople, the great church was set on fire and burned, together with the palace adjoining. In the remote place of his banishment the devoted bishop suffered much, both from the severity of the climate and the threatened invasions of robbers. But his spirit was unchanged. He had the same zeal for the highest welfare of his fellow-men. His friends in Constantinople, persecuted as they were for his sake, were not forgotten. He corresponded with and advised them in religious matters. In the christian widow Olympia he continued to take a lively interest. Priests and monks were despatched to preach the gospel to the Goths and Persians, and to superintend the churches of Armenia, as well as of other regions. Towards the end of the year 405, an invasion of the Isaurians forced him to fly to Arabissus, whence, by order of the emperor, he was conveyed to Pityus, a little town in Pontus, near the eastern border of the Euxine sea, on the very verge of the Roman empire, and in a most inhospitable region. The journey, however, proved too long and fatiguing for the aged saint worn out with labours and sufferings. The fatigues of travelling on foot, the heat, and the rough treatment he received from the guard of soldiers, brought on a fever, of which he died in a few hours at Comanum in Pontus, September 14, 407. His last words were those of Job with which he was so familiar, "Praise be to God for all things," (*δόξα τῷ Θεῷ πάντων ἕνεκα.*) In 438 the body of the saint was brought back to Constantinople, and deposited with great pomp in the temple of the holy apostles. The Greek church celebrates his festival on the 13th November; the Latin on the 27th January.

Chrysostom was the most eloquent though not the most learned of the fathers. As a preacher he excelled all his contemporaries; nor had he, perhaps, any equal in the use of that impassioned eloquence which befits the pulpit, till the time of Jeremy Taylor. He was accustomed to address crowded audiences; and with such applause were his homilies received, that the church of St. Sophia became a sort of theatre to which multitudes of pleasure-loving men and women resorted as to a place of amusement. His language is pure, his style highly figurative, his diction copious and diffuse, but often overwrought and strained. As a commentator, he belongs to the school of historico-grammatical interpreters. He was more of the practical, ethical divine than the logical theologian, conserving rather than advancing theology. The character of Chrysostom presents a fine combination of qualities rarely seen together in so great strength. He was sincere, open-hearted, generous, beneficent pure-minded, simple in his manner of life, hospitable, and without guile. He maintained no outward pomp like other court bishops, but spent the greater part of his income in charitable and benevolent acts. The epithet "Chrysostom" (Golden-mouthed) was given him on account of his eloquence, but not till after his death. It is an honourable and just tribute to his oratory. In person he is described as short in stature, with a large bald head, deeply-wrinkled forehead, hollow cheeks, and sunken eyes. The works of Chrysostom consist of commentaries, homilies, liturgies, treatises, and epistles. The most valuable are the homilies on

the New Testament, and on the Psalms; most of which have been published and translated in the Oxford Library of the Fathers. His treatise "On the Priesthood" was translated by Bunce, London, 1759, 8vo, and subsequently by Marsh. The best and most complete edition of all the works is that of Montfauçon, in 13 volumes folio, Paris, 1718-1738; reprinted at Paris, 1834-1839, in 13 volumes imp. 8vo, under the editorship of Sinner. Earlier editions were those of Sir H. Savile, 8 volumes folio, Eton, 1610-1613; and of Fronto Ducæus, completed by Morell, Paris, 1609-36, 12 vols., folio. His life has been written by Palladius, Socrates, Sozomen, Theodoret, Erasmus, Dn Pin, Tillemont, Montfauçon, Cramer, Cave, Oudin, Schroeckh, Neander, Böhringer, and others. The best biography is that of Neander, third edition, 1858, translated by Stapleton from an earlier edition, London, 1838, 8vo, vol. i. (all published). Perthes's biography is much briefer and more popular, but has no independent value.—S. D.

CHRYSOSTOM, DION. See DION.

\* CHRZANOWSKI, ADALBERT, a Polish general, born in 1788, descended from an ancient family celebrated in the annals of Poland. He entered the Russian army in 1809, and served with distinction throughout the war with France. After the downfall of Napoleon he returned home and obtained a commission as lieutenant in the new Polish army which was organized under the command of the Grand Duke Constantine. He served under Diebitsch in 1828 in the campaign against the Turks, and was rewarded for his distinguished services by being appointed a lieutenant-colonel by the Emperor Nicholas after the peace of Adrianople. On the breaking out of the Polish insurrection in 1830, Chrzanowski joined the patriots, and was appointed chief of the staff to the commander-in-chief Skrzynecki. Though he seems from the first to have formed an exaggerated opinion of the excellence of the Russian troops, he fought with great bravery in his country's cause, gained a signal victory at Minsk, and made a masterly retreat from Zamosc. Towards the close of the insurrection he was nominated governor of Warsaw, and made a desperate though unsuccessful resistance to the Russian assault. On the capture of the city he retired to France. In 1849 he was appointed commander of the Piedmontese army under the king, in the war with Austria, but was defeated at Novara; and on the termination of the campaign returned to Paris, where he has ever since resided.—J. T.

CHUBB, THOMAS, a noted deistical writer, was born at East Harnham, near Salisbury, Sept. 29, 1679. His early education was scanty, and at the age of fifteen he was apprenticed to a glover in Salisbury. Some time afterwards he became a tallow-chandler in the same city. His leisure time was employed in reading, and acquiring a knowledge of mathematics and some of the sciences. At that period theological controversy ran high, especially about the trinity, and Clarke and Waterland were in the field. After Whiston's Arian work had appeared in 1710, the restless mind of Chubb plunged into the debate, and he published in 1715 the "Supremacy of the Father Vindicated." The book made some noise, as coming from an illiterate tradesman; Pope spoke of it with respect, and its success intoxicated the author. Tract followed tract from his teeming and ill-ordered brain in vast variety. Sir Joseph Jekyll patronized him, and received him for a period into his house. His last years were spent in connection with his business in Salisbury, though authorship engrossed no little of his time; and he died suddenly on the 8th of February, 1746-47, in the sixty-eighth year of his age. In 1730 Chubb published a quarto volume of his collected tracts, and in 1738 he published "True Gospel of Jesus asserted." He left behind him two volumes of posthumous works, which were published in 1748, and from them his last opinions may be gathered—that he had no true faith in revelation—that he did not believe in a future judgment, if even in a future state, and that he held that prayer is not a necessary duty. Among his publications may be mentioned a "Discourse on Reason;" "On Moral and Positive Duties;" "On Future Judgment and Eternal Punishment;" "Inquiry about the Inspiration of the New Testament;" and "Doctrine of Vicarious Suffering and Intercession Refuted." Chubb thought himself qualified to write on any topics in morals or religion, and his style is not without vigour, though he was rash and careless in the extreme. Vanity led him astray, and the idea of being a champion dazzled him. He aimed at too many things in his morbid impatience of mind, became arrogant on points

which he was not fitted to discuss, dealt in low quibbles about obscure passages in the English version of the scriptures, sneered where he could not argue, and at length sank into a species of universal scepticism. As Bishop Law says, "Notwithstanding the caveat he has entered against such a charge, he must unavoidably be set down in the seat of the scorner."—(Leland's *View of Deistical Writers.*)

CHUDLEIGH, LADY MARY, wife of Sir George Chudleigh, Bart., and daughter of Richard Lee, Esq., Devonshire, born in 1656; died in 1710. A number of poetical pieces from her pen, which had been separately published, appeared in 1703, 8vo, and a third edition in 1722. The year of her death, she dedicated to the Princess Sophia of Hanover a collection of essays in prose and verse. Specimens of her correspondence are preserved in various collections.—J. S., G.

CHUMNUS, NICEPHORUS, a Byzantine of high birth, who lived about the close of the thirteenth and the beginning of the fourteenth century, and held several important offices in the court of the emperor, Andronicus Palæologus the elder. He was on the most intimate terms with his imperial master, and in 1295 his daughter Irene married the emperor's son, John. During the civil war which followed Chumnus remained faithful to his master; but he was at length defeated and compelled to retire into a cloister, where he assumed the name of Nathaniel. He died in 1330, leaving a great number of treatises on philosophy, religion, rhetoric, and on civil and ecclesiastical law, and a valuable collection of letters.—J. T.

CHURCH, BENJAMIN, a New England captain distinguished in the Indian wars, was born in Duxbury, Massachusetts, in 1639, and was the first settler of Little Compton in Rhode Island. Philip, sachem of the Wampanoags, a savage of much energy and ability, stirred up a general Indian war against the white settlements in New England, which caused great bloodshed and devastation. Church was commissioned as a captain in this war, and did excellent service till its close, fighting the Indians in their own fashion. Church kept a journal of his adventures, which is a good history of the war, and was published by his son in 1716, and reprinted in 1772. In 1689-1704 he commanded four different expeditions against the French and Indians on the Kennebec and Penobscot rivers, and in Nova Scotia; in all of them showing bravery and good conduct, and having good success. Hutchison calls him a "fortunate officer," and Hubbard describes him as "both prudent and brave." He died on the 17th of January, 1718, in consequence of a fall from his horse, in the seventy-eighth year of his age.—F. B.

CHURCH, Sir RICHARD, an English officer who served in the Greek war of independence, was born in 1780. He embraced the military profession at an early period, and served for many years in the British army, and afterwards in the Neapolitan force. He commanded for some time a Greek corps kept on English pay in the Ionian islands. In 1827 he went by invitation to the assistance of the Greek patriots, whom he found rent into hostile factions, waging furious contests with one another, rather than against the common foe. By his influence, combined with that of Lord Cochrane and Captain Hamilton of the *Cambrian*, a temporary reconciliation was effected between the rival parties, and Church was appointed general of the land forces, while Lord Cochrane was made admiral of the fleet. A vigorous effort was made by these eminent officers to retrieve the decaying fortunes of the Greeks, and a considerable force having been collected, General Church was persuaded to risk a battle for the relief of the citadel of Athens, which was closely blockaded by the Turks. His movements, however, were paralyzed by the insubordination of his troops and their officers, and the result was a disastrous defeat, in which the Greeks lost 1500 men, and the citadel soon after was forced to capitulate. General Church then took up a strong position on the isthmus of Corinth, and after the battle of Navarino he led a force of five thousand men into Acarnania, and recovered all the country south of Arta from the Turks. In 1829 he made himself master of the gulf of Prevesa, and occupied all the places along the gulf of Ambracia, with the exception of Prevesa. But he was treated with base ingratitude by the President Capo d'Istrias, who was devoted to the interests of Russia, and compelled to resign his command. The publication, in 1830, of his pamphlet entitled "Observations on an eligible line of frontier for Greece as an Independent State," was seized as a pretext by the president to order General Church to quit the

Greek territory. On the assassination of Capo d'Istrias, Sir Richard put himself at the head of a body of troops, and along with the portion of the national assembly seated at Megara, prepared to resist by force the government of the president's brother. But the intervention of the French put an end to the civil war. On the elevation of Otho to the throne of Greece, General Church was created a councillor of state.—J. T.

CHURCH, THOMAS, a learned English divine, author of several controversial works, born in 1707; died in 1756. "A vindication of the miraculous powers which subsisted in the first three centuries of the Christian church, in answer to Dr. Middleton's Free Inquiry," 1750; and an analysis of Bolingbroke's philosophical works, 1755; are his principal works.

CHURCHILL. See MARLBOROUGH.

CHURCHILL, CHARLES, a celebrated satirical poet, was the son of the Rev. Charles Churchill, rector of Rainham in Essex, and curate and lecturer of St. John's, Westminster, where the poet was born in February, 1731. He was educated at Westminster school, and entered of Trinity college, Cambridge, which he quitted abruptly, for what reason is unknown, and returning to London, made a clandestine marriage in the Fleet. Mr. Southey, however, is of opinion that Churchill's marriage took place previous to his entering the university, and that he never resided there. He lived for about a year with his wife under his father's roof, and then went for some time to study theology at Sunderland, and having taken orders, officiated first at Cadbury in Somersetshire, and subsequently as curate in his father's living at Rainham. On the death of his father in 1758, he was elected by the parishioners to succeed him in the curacy and lectureship of St. John's. He is said to have carefully discharged the duties of his office at this time, and as the cares of a family were now pressing on him, he endeavoured to eke out his narrow income, by engaging in private tuition. He fell into debt, however, his home became a scene of continual discord, which led to a separation between him and his wife in 1761, and his embarrassments grew so serious, that he was only saved from a jail by the interposition of Dr. Lloyd, one of the masters in Westminster school, who persuaded the poet's creditors to accept of a composition, which he assisted him to pay. It must be stated, to Churchill's credit, that he subsequently discharged all his obligations in full, as soon as his means enabled him to do so. About this period he entered on a literary career. The first of his poems, for which he could find a publisher, was the "Rosciad," a satire upon actors, which appeared at first without his name in 1761, and was received with great favour. This was followed shortly afterwards by his "Apology to the Critical Reviewers," in which he retaliated with great vigour and keenness upon the assailants of his first work. His next publication was a poem called "Night," in which he endeavoured to palliate the convivial excesses in which he now indulged. The best and most successful of his works is a political satire entitled "The Prophecy of Famine." It is directed against the Scottish nation, to gratify the notorious John Wilkes, whose personal political associate he had now become, and is distinguished by its "laughable extravagance." Churchill's other publications, "The Ghost," which was aimed at Dr. Johnson; "The Duellist;" "Gotham Independence," "The Times;" &c., betray unequivocal marks of haste and carelessness, and were avowedly written with the view rather of profiting by the celebrity he had acquired than of increasing his permanent reputation. Meanwhile Churchill had launched into a career of dissipation and extravagance, which drew forth the merited censure of his clerical superiors, and the final complaint of his parishioners. He resigned in consequence his lectureship, plunged deeper and deeper into excesses, and set at defiance both moral principle and public opinion. He became an intimate friend of John Wilkes, equally notorious for his factious and spurious patriotism and his private debauchery, assisted him in the *North Britain*, and narrowly escaped imprisonment when Wilkes was apprehended under the famous "general warrant." When he threw off the clerical profession, he had explicitly declared that he threw off with it his belief in christianity. His conduct showed that he had become equally hostile to its morality, for about this time he separated from his wife, and seduced the daughter of a tradesman in Westminster. At the end of a fortnight, the guilty couple seem to have been struck with compunction, and the unhappy woman, at their joint entreaty, was received by her father. But her home was rendered intolerable by the continual

reproaches of her sister, and she was driven to throw herself again upon Churchill's protection. His friendship with Wilkes led to a quarrel with Hogarth, who caricatured the satirist in the form of a bear dressed in canonicals, with torn bands and ruffles at his paws, and holding a pot of porter. Churchill revenged himself in a satirical epistle to Hogarth, which, though characterized by great bitterness and ferocity, yet contains a glowing panegyric on the painter's works. Churchill's career came to a sad and premature close. In October, 1764, he paid a visit to his friend Wilkes at Boulogne, where he caught fever, and died on the 4th of November, in his thirty-third year. He was buried at Dover, and some of his loose associates placed over his grave a stone, on which was engraved a line from one of his own poems, as much at variance with truth as with good taste—

"Life to the last enjoyed, here Churchill lies."

Churchill undoubtedly possessed vigorous original talents, but his writings are characterized rather by great facility of versification, and the boldness and bitterness of personal invective, than by poetical feeling or imagination. Dr. Johnson, who disliked him both as a man and as a writer, spoke contemptuously of Churchill's poetry, and predicted that it would sink into oblivion. "No English poet," says Southey, "has ever enjoyed so excessive and so short-lived a popularity, and indeed, no one seems more thoroughly to have understood his own powers; there is no indication in any of his pieces that he could have done anything better than the thing he did." "Churchill," says Mr. D'Israeli, "was a spendthrift of fame, and enjoyed all his revenue while he lived. Posterity owes him little and pays him nothing." On the other hand, Cowper had a higher opinion of Churchill than of any other contemporary writer; and Campbell says he may be ranked as a satirist immediately after Pope and Dryden, with perhaps a greater share of humour than either.—J. T.

CHURCHILL, SIR WINSTON, father of the celebrated duke of Marlborough, born in 1620; died in 1688. During the civil war he adhered to the royalist party, and at the restoration was raised to the dignity of knighthood. In 1664, soon after its foundation, he was elected to the Royal Society, and in the following year was appointed to a government office in Ireland. On his return to England he obtained a post at court, which, with a brief interval, he retained till the close of the reign of James II. He published "Divi Britannici, being a Remark upon the lives of all the kings of this Isle from the year of the world 2855, unto the reign of grace 1660."—J. S., G.

CHURCHYARD, THOMAS, an English poet, born in Shrewsbury about the year 1520; died in 1604. He was of a respectable family according to Wood, and was patronized first by the earl of Surrey, and afterwards by the earl of Leicester. At various times he exercised the profession of arms, serving on the continent, in Ireland, and Scotland, but not with advantage to his fortunes, which were bad at home and worse abroad. His productions are numerous; the most esteemed is his "Legende of Jane Shore."—J. S., G.

CHURRUCA Y ELORZA, COSME DAMIAN DE, a distinguished Spanish naval officer, was born 27th September, 1761. He was originally intended for the church, but exchanged the clerical for the naval profession, and studied for it at Cadiz and Ferrol. His first service was in the American war, in which he distinguished himself by his bravery and his humanity. He then obtained an appointment in the expedition sent out by the Spanish government to survey the Straits of Magellan, and some time after his return published an interesting diary of the exploration of Tierra del Fuego. In 1791 he was appointed to the command of an expedition sent to survey the coast of the Gulf of Mexico, and constructed thirty-four charts of the coasts of Cuba, Hayti, &c., which are regarded as models of hydrography. Churruca was highly esteemed by Napoleon, and was appointed to the command of the *San Juan* in the combined French and Spanish fleet in 1805, and was killed at the battle of Trafalgar on the 21st of October of that year. The greatest respect was shown to his memory both by friends and foes.—J. T.

CHURTON, RALPH, an English divine, born at Bickley in Cheshire, in 1754; died in 1831. He was educated at Oxford, and early obtained preferment in the church, partly through his own merit, and partly through the favour of Dr. Townson. Many of the most estimable churchmen of his time were his intimate friends. He published several sermons, letters, &c.

**CHYR-SCHAH** or **SHEER-KHAN** (**HACASALIAN**), the surname of a celebrated prince named Feryd, of Affghan origin, who was born about the beginning of the sixteenth century. He entered the service of the prince of Behar, and distinguished himself by his valour. After the death of his master he seized upon his dominions, to the exclusion of the rightful heir. He afterwards took possession of Bengal, defeated the Sultan Humaion, drove him from his throne, made himself master of Hindostan, and extended the limits of his empire from the Ganges to the Indus. He was a sagacious and vigorous sovereign; his death, which took place in 1545, was regarded as a public calamity, and was succeeded by a period of great disorder.—J. T.

**CHYTRÆUS**, **DAVID**, an eminent German theologian of the sixteenth century, was born 26th February, 1530, near Halle in Schwabia. His father was a disciple of John Breuz, the reformer of Wurtemberg, and died in 1559 as pastor of Menzingen, near Heidelberg. At the early age of nine years Chytræus was sent to Tübingen, where he enjoyed the instructions of Camerarius and Schnepf, and he was still a boy when he took his bachelor's and master's degrees. He then repaired to Wittenberg to study under Melancthon, who received him with paternal affection, after making trial of his attainments, exclaiming—"Tu merito es magister, et tu mihi filii loco eris." During the suspension of that university in the troubled years of 1546 and 1547, Chytræus pursued his studies at Heidelberg and Tübingen; but in 1548 he returned again to Wittenberg, where he delivered lectures with applause on rhetoric, astronomy, and Melancthon's *Loci Communes*. In 1551 he was appointed professor of theology in Rostock, and there he continued to labour till his death in 1600. In many respects his character and career bear a striking resemblance to those of Martin Chemnitz his contemporary. Brought up like him in the school of Melancthon, and inspired with the same veneration and affection for their illustrious master, Chytræus was often associated with Chemnitz in the same ecclesiastical transactions, and devoted his talents and life to the same great interests—the defence of divine truth, the consolidation of the Reformation, and the promotion of sound learning. They drew up in conjunction the statutes of the new university of Helmstadt, and they were both coadjutors of Andrea in introducing into the Lutheran church the *Formula Concordiæ*. But in learning and ability Chytræus was inferior to Chemnitz, and neither his writings nor his practical activity were of the same public importance. The characteristic spirit of the Melancthonian school found in him a worthy representative, and still survives in the following selections from his works—"Historia Angustanæ Confessionis," 1578. "Oratio de studio theologiæ inchoando," 1608; "Oratio de studio Theologiæ exercitiis veræ pietatis et virtutis, potius quam contentationibus et rixis disputationum colendo," Viteb. 1581.—His brother **NATHAN**, born in 1543; died in 1598. He was a man of some repute as a Latin poet.—P. L.

**CIACONIUS**. See **CHACON**.

**CIAMBERLANO**, **LUCA**, an artist, born at Urbino about the year 1580. He first pursued the study of the law, and took a doctor's degree; but ultimately abandoned the subtleties of jurisprudence for the mysteries of engraving. He acquired considerable fame, more especially by his etchings after the Italian masters. A hundred and fourteen plates are attributed to him. His hand was neat and dexterous. Ciamberlano died at Rome in 1641.—W. T.

**CIAMPELLI**, **AGOSTINO**, a Florentine painter, was born in 1578, and educated under Santo di Titi. He did not reach the eminence of his master, but was an able artist, grand in conception, correct in drawing, and brilliant rather than truthful in colour. A "Visitation," with its two laterals in the church of St. Stephen of Pescia, is among his choicest works. He died in 1640.—W. T.

**CIAMPI**, **SEBASTIANO**, born at Pistoia in 1769, and died in the neighbourhood of Florence in 1847. Ciampi took priest's orders in 1793; afterwards studied civil and canon law at Pisa, where he found employment in teaching jurisprudence. He afterwards held a law professorship at Warsaw. He returned to Italy in 1822, and occupied himself with literature. His publications were very numerous between the years 1800 and 1843. Some of them are important to students of the earlier Italian literature.—J. A., D.

**CIAMPINI**, **GIOVANNI GIUSTINO**, born at Rome in 1633, and died in 1698; a learned archæologist, whose first studies

were in jurisprudence, but who afterwards devoted himself to literature. He was member of several literary societies, and himself originated several of the class of academies of which Italy is so fond. His works were collected in three volumes, folio, by Gianini, in 1717.—J. A., D.

**CIAMPOLI**, **GIOVANNI BATTISTA**, born at Florence in 1589; died in 1683. Ciampoli is said to have attended the lectures of Galileo at Padua. From this place he passed to Bologna, where Cardinal Maffeo Barberini gave him some valuable appointments and benefices. From Bologna he went to Rome, where he obtained farther preferments. Maffeo became pope, and had not Ciampoli been born under some unlucky star, which afflicted him with an unconquerable passion for rhyme, and what is less easily to be accounted for, with an irremovable conviction that his poems were better than Tasso's, Petrarch's, or Virgil's, he might have prospered. All this the pope might have endured and smiled at, but the pope was himself a poet, and there was something on the part of Ciampoli like a claim of superiority for his own verses over those of his holiness. This could not be allowed, and the too ambitious poet was sent to a distance from court. His exile was effected by giving him the office of governor or resident magistrate of a country district of little importance. The poet died in his government—in what his biographers call his disgrace. He left his manuscripts to Ladislaus IV., king of Poland, who at no time discontinued his attentions to him. His poems were collected, and published at Rome in 1648.—J. A., D.

**CIASSI**, **GIOVANNI MARIA**, an Italian physician and botanist, was born at Treviso in 1654, and died about 1679. He published in 1677 a work entitled, "Meditations on the Nature of Plants," in which he enters into the phenomena of vegetation in a physiological, as well as in a physico-mathematical point of view.—J. H. B.

**CIBBER** or **CIBERT**, **CAIUS GABRIEL**, was the son of a cabinetmaker to the king of Denmark, and was born at Flensburg in the duchy of Holstein. Exhibiting a promising talent for sculpture, he was sent at the king's expense to Rome. He came to England during the Protectorate, and not long before the Restoration. His early history is not well known. His son, Colley, has recorded many particulars of his contemporaries, but few regarding his father. His most celebrated works are his figures of "Melancholy" and "Raving Madness," which formerly adorned the principal gate of old Bethlehem hospital, and have since been removed to the museum of South Kensington. Allan Cunningham says of these, "that they stand first in conception, and only second in execution, among all the productions of the island. Those who see them for the first time are fixed to the spot with terror and awe." Raving Madness is a naked muscular figure, heavily manacled, writhing in convulsions of passionate agony. It is said to have been modelled from Oliver Cromwell's porter, then an inmate of the hospital. The other figure is feebler in character, and represents rather idiocy than madness. Pope's lines on "the brazen brainless brothers" are well known. The bassi-relievi on two sides of the monument of London, the "tall bully that lifts its head and lies," are by the hand of Cibber. So was the fountain in Soho Square, and one of the vases at Hampton Court, said by Walpole "to be done in competition with a foreigner, who executed the other; but nobody has told us which is Cibber's." He carved some of the statues of kings, and that of Sir Thomas Gresham, in the Royal Exchange. The first duke of Devonshire employed him much at Chatsworth, where he executed two sphinxes on large bases, a fountain of Neptune, several door-cases of alabaster, and many ornaments in the chapel, including statues of Faith and Hope, one on each side of the altar. In 1688 he took up arms under the duke in favour of the prince of Orange. He was appointed carver to the king's closet, and died about 1700. He built the Danish church in London, and was buried there himself, as had been his second wife, to whom he erected a monument.—W. T.

**CIBBER**, **COLLEY**, son of the preceding, a celebrated dramatic author, poet-laureate to George II., was born in London, 1671; his mother, from whom he took his name, being the descendant of a good family in Rutlandshire. He was sent in 1682 to the free school at Grantham in Lincolnshire. In 1687 he was an applicant for a scholarship at Winchester school, the founder of which, William of Wykeham, according to Cibber, was among the ancestry of his mother. This application being rejected, probably because the genealogy on which it rested

was considered doubtful, Cibber thought of entering the university; but this purpose also miscarried, the revolution of 1688 having found occupation for him among the forces raised by the earl of Devonshire at Nottingham. His term of military service over, Cibber no longer dreamt of a university career, but determined to indulge his early passion for the stage. His first appearances as an actor were only respectable, but a decided success attended his first performance of the chaplain in the tragedy of the Orphan; and successively as Lord Touchwood in Congreve's Double Dealer, and as Fondlewife in the Old Bachelor, he was received with uncommon favour. The successful actor now attempted the character of dramatist, his first production being "Love's Last Shift, or the Fool in Fashion" (1695)—a comedy which met with great success, the hero, Sir Novelty Fashion, being personated by the author with such abundant foppery as to give him a monopoly of the character, and of the character of fop in general for the rest of his life. "Woman's Wit," a comedy, and "Xerxes," a tragedy, followed; the one in 1697, and the other in 1699, but neither of these pieces was successful. In 1704, the "Careless Husband," on which Cibber's reputation as a dramatist mainly rests, was acted with the greatest success; and in 1717, taking a hint from the *Tartuffe* of Molière, he produced his comedy of the "Nonjuror," the dedication of which to the king was rewarded immediately with a present of two hundred pounds, and eventually with the dignity of poet-laureate (1730). For nineteen years from 1711, he was one of the lessees and principal manager of Drury Lane, where his impersonations of fops and feeble old men were stock attractions of the most profitable description. Occasionally, after his retirement from the stage, the offer of fifty guineas for one night's performance induced him to reappear in one of his favourite characters; and on such an occasion the popularity of the actor-dramatist appeared unbounded. He was found dead in his bed on the 12th December, 1757. An edition of his plays appeared in 1721, 2 vols. 4to, and an 8vo edition, in 5 vols., in 1777. A list of thirty dramatic pieces, in the production of which Cibber was more or less concerned, is given in the *Biog. Dramat.* His Apology for his life, published in 1740, and since frequently reprinted, is probably the performance by which Cibber is now best known. Johnson allowed it to be very well done—"Very well done, to be sure, Sir;" and Swift sat up all night to read it. Both in this work and in the "Remonstrance" which he addressed to Pope, who made the sprightly and ingenious, but not poetical laureate, the second hero of the *Dunciad*, Cibber exhibited a sturdiness of character and a force of intellect, for which the usual vanity and the occasional absurdity of his conduct had little prepared his contemporaries to give him credit.—J. S., G.

CIBBER, MRS. SUSANNAH MARIA, a celebrated singer, the sister of Thomas Augustine Arne, was born in 1714, and prepared for the stage by the instruction of her brother. She made her first appearance at the theatre in Lincoln's Inn fields in 1732, in Lampe's opera of *Amelia*. The success of his pupil in the part of *Amelia* induced Arne to prepare another for her. He accordingly composed new music for Addison's opera of *Rosamond*. It was performed in 1733, confirming the reputation of Miss Arne, and laying the foundation of that of her brother who now became known for the first time as a composer. Soon after her success in the part of *Rosamond*, Miss Arne became the second wife of the celebrated, or rather notorious, Theophilus Cibber, to whom she was married in 1734. Cibber's own and his wife's emoluments, though very considerable, were insufficient to supply his extravagant expenses; and soon after their marriage the derangement of his affairs rendered it necessary for him to retire to France. During his absence a liaison took place between Mrs. Cibber and a young gentleman of fortune at which, after his return, he is said not only to have connived, but even to have been accessory to their correspondence. He was afterwards induced, however, to bring an action against the gentleman, laying his damages at £5000; but the amount which he recovered (£10), shows the sense which was entertained of his own conduct. This worthless and unhappy man was drowned in a shipwreck in 1758. The vessel in which he had embarked for Ireland, was driven by stormy weather to the western coast of Scotland where it was lost, and most of the crew and passengers perished. Mrs. Cibber remained on the Drury-lane stage till her death, January 30, 1766. When the intelligence of this event was communicated to Garrick, he gave

her character in the following words—"Tragedy is dead with her; and yet she was the greatest female player belonging to my house; I could easily parry the artless thrusts, and despise the coarse language of some of my other heroines: but whatever was Cibber's object, a new part or a new dress, she was always sure to carry her point by the force of her invective and the steadiness of her perseverance." Her person is described by her biographers as having been perfectly elegant. Even when she had lost the bloom of youth, although she wanted that fullness of person which is frequently so effectual in concealing the hand of time, it was impossible to contemplate her figure and face without thinking her handsome. Her voice was naturally plaintive and musical. Davies says, "In grief and tenderness her eyes looked as if they swam in tears—in rage and despair they seemed to dart flashes of fire. In spite of the unimportance of her figure, she maintained a dignity in her action, and a grace in her step. She was a perfect judge of music; and though she was not mistress of a voice requisite to a capital singer, yet her fine taste was sure to gain her the applause and approbation of the best judges." Handel was very partial to her, and some of his finest contralto songs were written for her voice.—E. F. R.

CIBBER, THEOPHILUS, son of Colley Cibber, was born in 1703. After spending four years at Winchester school, he appeared on the stage of Drury Lane in 1720; and notwithstanding some defects of person and manner, became a popular actor. He married an actress of the name of Johnson, and after her death formed a second union with Miss Arne. (See the preceding memoir.) In 1738 he retired to France to escape his duns; on his return separated from his wife; for twenty years lived the life of a prodigal, except when he was in prison; and in 1758, having sailed from Parkgate to fulfil a theatrical engagement in Dublin, perished by shipwreck. He altered a few pieces for the stage, and was the author of one comedy. The "Lives of the Poets," 5 vols. 12mo, was published with his name, but his claim to the authorship of the work has been disputed in favour of a Scotchman, named Shields, who had been amanuensis to Johnson.—J. S., G.

CIBO. See INNOCENT VIII.

CIBOT, PIERRE MARTIAL, a French jesuit missionary at Peking, where he became professor of mathematics to the Chinese court; born in 1727; died at Peking in 1780. He formed the project of illustrating the text of the sacred books by Chinese historical documents, but accomplished only a small part of the work, his annotations being confined to the book of Esther. The work contains some curious allusions to subjects of sacred history, extracted from ancient documents, to which Cibot had access at the court of the emperor.—J. S., G.

\* CIBRARIO, LUIGI, was born at Turin in 1802. The intimate friend of king Charles Albert, he was intrusted by him with many diplomatic missions in the years 1832-33. He was royal commissary to the Venetian republic in the memorable year 1848. After the battle of Novara, Cibrario followed his royal patron into exile, and in vain endeavoured to bring him back to Turin. Nominally a member of the Sardinian ministry, he enjoys the full confidence of Count Cavour, and devotes all his leisure hours to the revision of his numerous historical and statistical works. Amongst these we may distinguish his "History of the Monarchy of Savoy," and his "Economy of the Middle Ages." As a novelist, no less than as a historian, Cibrario is much esteemed.—A. C. M.

CICALA, SCIPIO DE, a famous adventurer, of Italian birth, who rose to be capitan-pasha under the immediate successors of Soliman the Magnificent. He was taken prisoner by the Turks along with his father, a Genoese viscount, at the sea-fight of Djerbi in 1560, and being carried to Constantinople, was employed as a page in the imperial seraglio. He was soon transferred to the more congenial service of the field; and so conspicuous were his talents and bravery, that, on the accession of Amurath III., he was appointed aga of the janizaries. He distinguished himself greatly in the war which shortly afterwards broke out between the Porte and Persia, and on the conclusion of peace was named capitan-pasha. This dignity, after the Hungarian campaign of Mohammed III., which he chiefly directed, and which his personal valour at the battle of Keresztes turned signally to the advantage of the Turks, he exchanged for the title of grand vizir. He was dismissed from the vizirat, however, before the lapse of a month, and resumed his former

rank of capitan-pasha. In the next Persian war, after conducting successfully one campaign, he was signally defeated by Shah-Abbas the Great, and died of chagrin in 1605.—J. S., G.

**CICCARELLI, ALFONSO**, an Italian physician, was born at Bevagna, and died in 1580. In 1564 he published at Padua a work "On Truffles." He made himself notorious for literary forgeries, and fabricated genealogies and family histories. He was arrested by Gregory XIII. for these falsifications, and was executed, after having his hand cut off.—J. H. B.

**CICERO, MARCUS TULLIUS**, the greatest of the Roman orators, was born on the 3rd January, 106 B.C., at Arpinum, where the family, who were of equestrian rank, had been long settled, and where the grandfather of the orator, who was living at the birth of his grandson, was a man of considerable influence. Cicero records an observation of this busy and energetic ancestor, which might have been pronounced by the orator himself in the wider arena which he eventually occupied—that the men of his day were like Syrian slaves; "the more Greek they knew, the greater knaves they were." And we know on the same authority that when the old man had one of the municipal disputes in which he delighted referred to the consul at Rome, he received from the first magistrate of the republic a reply somewhat to the effect, that it was a pity a man of old Cicero's energy should have preferred to be the first man of a village, rather than a considerable personage at Rome. Marcus Tullius Cicero, the father of the orator, though prevented by infirm health from occupying that distinguished position in public life which his talents and literary culture would otherwise have secured for him, was not unknown to several of the leading statesmen of Rome; and when, with a view to the proper education of his two sons, Marcus and Quintus, he removed to the capital, his society was courted by such men as the orators M. Antonius and L. Crassus, and the jurists Q. Scævola and C. Aculeo. The sons of this Aculeo, whose sister Helvia was the mother of the orator, and their cousins, the young Ciceros, pursued their studies together under masters carefully selected for them by Crassus, whose accomplishments as an orator, and experience as a statesman, peculiarly fitted him for the task of directing their education. With but one exception, Cicero's masters at Rome were Greeks. One of them, Archias of Antioch, though of great celebrity in his day as a poet, would now be forgotten but for his connection with the orator, who more than discharged the obligations he was under to his master, by defending in one of the most splendid of his orations the poet's right to be a citizen of Rome. The character and pursuits of this master, no less than his instructions, were influential in forming the character and developing the tastes of Cicero. While under the care of Archias, the pupil imitated the master in the abundance and in the indifferent quality of his verses. When a mere boy he had composed a poem in tetrameters, called "Pontius Glaucus," which was extant in Plutarch's time. He produced before his twenty-fifth year one entitled "Marius," and another "Limon;" and translated into Latin verse the *Phænomena* of Aratus. These efforts of the young poetaster, although hardly rising to mediocrity, served to exhibit the diversity, and no doubt contributed to the improvement of his taste. In his sixteenth year Cicero, having exchanged his boy's dress for the manly gown, was placed under the tutelage of his father's friend, Scævola the augur; and upon his death was committed to the care of the pontifex of the same name, by whom he was initiated into an acquaintance with the constitution of the republic, and the principles of jurisprudence, which, together with the lessons of practical wisdom that he received from the same admirable instructor, gave a distinct direction to his talents and ambition from which they never swerved.

In 89 B.C. Cicero, who was then of age to bear arms, fulfilled the duty imposed upon every citizen of the republic of serving at least one campaign, by following Pompeius Strabo, father of the great Pompey, to the Marsic war. On its termination in the following year he returned to Rome, and resumed his forensic and philosophical studies under the most famous of the numerous Greek teachers who then resided in Rome. For upwards of six years from the date of his short term of soldiering, although haunted by no common ambition of "burning in the forum," he kept himself sedulously aloof from public life—the arena of which, indeed, offered little temptation to a youth of his disposition and talents, at a period when the furious rivalry of Marius and Sulla had annihilated order and government, and committed

the lives and fortunes of the community into the hands of a brutal soldiery. During this period—one of the most calamitous in the history of Rome—Cicero attended first the lectures of Phædrus the Epicurean; then those of Philo, the chief of the new academy, whom the invasion of Greece by Mithridates had driven from Athens to Rome. These were his masters in philosophy; to the first he was chiefly indebted for a spirit of enthusiasm in the pursuit of philosophical subjects; to the second he owed many of the opinions which he put forth in his philosophical works. Diodotus, the Stoic, who lived and died in his house, was his master in logic; and in rhetoric he enjoyed the advantage of being instructed by one of the most famous masters of the art, Apollonius Molo of Rhodes, who, like Philo, had been driven from Greece by the Mithridatic invasion. About this period, simply, it would appear, for the sake of practice in composition, he drew up the treatise "De Inventione Rhetorica," translated the *Economics* of Xenophon, and added a poem or two to the catalogue of his early failures. With an industry and perseverance which were prophetic of his future eminence, he daily exercised himself in declamation—haranguing his friends and companions sometimes in Latin and sometimes in Greek, upon the subjects and according to the rules prescribed by his various masters. When Sulla became master of Rome, and with the establishment of his power a decent although ghastly tranquillity began to reign in the capital, it was thought time that the youth upon whom had been lavished so many advantages of culture, and whose assiduity, no less than his abilities, had answered all the expectations of friends and patrons, should at last enter upon the exercise of his profession; and accordingly Cicero, then in his twenty-fifth year, came forward as a pleader in 81 B.C. The earliest of his extant speeches, although not the first he delivered, is that in favour of P. Quinctius. The first time he appeared in the forum—his former pleadings being in civil suits—was in defence of Sex. Roscius of Ameria, who, at the instance of Chrysogonus, a freedman of Sulla, was accused of parricide. The defence of Roscius, which was undertaken not without danger from the partisans of Sulla, was successful; Cicero, in the course of his pleading, boldly execrating the malice and cruelty of Chrysogonus, and indirectly reprehending the tyranny and injustice of the dictator. So decided was the impression that the fervour and eloquence of his address made upon his auditory, that as he himself says, the public voice at once placed him among the first orators of Rome. If there was any danger to be apprehended from Sulla, when his proceedings during the struggle with Marius were thus publicly called in question, Cicero, either ignorant of it or encouraged to contemn it by the success of his defence of Roscius, within the two following years once more bearded the dictator in the forum: for having undertaken the defence of a woman of Arretium, against whose title to appear in court the preliminary objection was urged that she belonged to a town which in the recent troubles had been deprived of the rights of citizenship, Cicero declaimed with all his power of invective against the measure of deprivation, pronouncing it unconstitutional, and therefore null and void. In this defence he was again fortunate enough to carry his judges with him, and nothing could be more auspicious for his professional career than the character of defender of the oppressed, in which this and the Roscian success established him with the populace. But after two years of assiduous professional labour the state of his health, which had never been robust, began to create serious alarm among his friends, and by the advice of his physicians, which was seconded by his own desire to improve his style of oratory under Greek masters, he departed for Athens. There he found his old schoolfellow, Atticus, who had quitted Rome in 85 B.C., and had during a long residence in the capital of Greece acquired those elegant tastes in all matters of art and literature, which with Cicero, who after this visit to Athens was bound to him by the strongest ties of personal affection, and with many other illustrious contemporaries, were the subject of unbounded panegyric. In the company of this accomplished and amiable person Cicero spent six months at Athens, extending his acquaintance with philosophy in the school of Antiochus of Ascalon, occasionally listening to the lectures of Zeno, the Epicurean, and assiduously studying rhetoric under Demetrius Syrus. When he left Athens it was to pursue, in an extensive tour through Asia Minor, the same objects which had engaged his attention in the city. He cultivated everywhere the society of men of letters, and besought their advice; if they were rhetoricians, obtained from them examples of their art;

and if philosophers, treasured up their dogmas. Before returning to Rome he passed over to Rhodes, 78 B.C., where he became acquainted with Posidonius, and renewed his intercourse with Molo, whose critical strictures upon the young orator's style were of great advantage to him in overcoming a certain tendency to prolixity and redundancy. After an absence of two years Cicero again appeared in the Roman forum; the improvement that travel had wrought upon his person was universally remarked; but, whether he was a more accomplished orator, or indeed an orator at all, after a long residence in the enervating clime of Athens, was for a time a subject of question among those of his fellow-citizens who thought it patriotism to hate Greek, and the votaries of Greek art. If, however, there was any appearance of indolence or effeminacy about the young orator to justify the taunts of Greekling and scholar with which he was assailed, it was no more than an appearance, and before long the ascendancy which he obtained by his splendid powers of declamation over the great orators of the law courts and the forum, Hortensius and Cotta, silenced all cavil, and permanently assigned him the first place in the first rank of Roman orators.

On the completion of his thirtieth year, the age at which he could legally become a candidate for political dignity, Cicero lost no time in offering himself for the office of quaestor, and although comparatively a *novus homo*, was elected by the votes of all the tribes. In the distribution of provinces by lot it was decided that he should serve in Sicily under Sex. Peducæus, prætor of Lilybæum. The duties of his office, although comparatively simple in ordinary times, were during his tenure of it peculiarly difficult; and the credit for tact, energy, and integrity which he obtained among the Sicilians by supplying the granaries of the capital, then almost in a state of famine, with extraordinary contributions of corn, without wantonly harassing the provincials, he hoped, but with more vanity than prescience, to find echoed and exaggerated in the applause of the Roman tribes. The mortification which, on his landing at Puteoli, he experienced on being abruptly accosted by a distinguished citizen of Rome, who inquired where he had been for some time past, he has himself described in one of his speeches; and the humour of the passage strikes us the more forcibly that some other humiliations which befel the orator in the later part of his career, were recorded by him in terms that, for pungent bitterness of complaint, might have become the lips of Timon himself. The lesson he drew from the neglect which he experienced on his return to Rome was, that in order to stand well with the Romans, it was necessary to keep himself constantly before them; for while their eyes were bright and piercing, their ears were dull. The four years following his return from Sicily in 74 B.C., hardly present any trace of him either in a professional or political capacity. During that period we know, on his own authority, that he conducted a multitude of causes, and that his professional reputation was daily on the increase; but, with the exception perhaps of the oration "Pro. M. Tullio," some fragments of which have been recently discovered, none of his speeches have been so much as indicated by name. Although a comparative blank in the life of Cicero, these years were memorable in the history of Rome. Lucullus was in the East victoriously fighting against Mithridates; Crassus in Italy making head against the daring and heroic Spartacus, and Pompey at home manœuvring—now that he was alienated from Crassus—for the suppression of all authority but his own. In the year 70 B.C. Cicero was a successful candidate for the ædileship; he was elected by a majority in each of the Roman tribes, and obtained a greater number of votes than any of his competitors. Shortly before the election one of the few causes in which he was concerned as prosecutor came on for a hearing—the famous impeachment of Verres, who, while prætor of Syracuse, had roused the indignation of the Sicilians by acts of the most flagrant misgovernment and oppression. Cicero, although strongly averse to appearing in the forum in any other character than that of defender, undertook the impeachment, probably out of gratitude to the accusers, who, during his own term of office in Sicily, had, as we have seen, heaped upon him an amount of adulation which satisfied the demands of his egregious vanity. The accused was not easily brought into court; the Metelli and other powerful families interested in his behalf exerted themselves to wrest the cause out of the hands of Cicero; and when, after a two months' visit to Sicily for the purpose of summoning witnesses and collecting evidence, the undaunted orator returned to Rome amply provided with materials for an impeachment, he was met by a

variety of legal manœuvres on the part of Verres' agent, Hortensius the consul elect, which, if successful, would have delayed the trial till the commencement of the following year, have brought Verres before a jury of friends, and have sent the Sicilians home to await the arrival of a new tyrant and peculator. All this opposition, however, was unavailing against the energy and circumspection of Cicero, who opened the case in a brief address on the 5th August, and proceeded at once to the examination of witnesses, and the production of the necessary papers. This was sufficient to elicit the feeling of the court. Hortensius gave up the contest as hopeless, and Verres forthwith departed into exile. If this extraordinary trial had run the lengthened course it was expected to take, Cicero was prepared to substantiate his charges in a series of pleadings, and these he afterwards published, perhaps to show his contempt of the supporters of Verres, or perhaps merely to give the Roman world some evidence of his talents for the business of impeachment. However this may be, the trial of Verres has furnished the world with such specimens of oratory as for minute and scrupulous treatment of evidence, and for splendour of declamation, are unmatched among the productions of their author.

In 69 B.C. Cicero entered upon the duties of his new office, the most important of which was to superintend the celebration of the public festivals. The ædiles were accustomed to lavish immense sums on these celebrations. In this Cicero, with his scanty fortune, could not imitate his predecessors. His old friends the Sicilians, however, came to his aid with seasonable supplies, and the great shows of the capital, under the management of Cicero, passed off not unsuccessfully. Two years afterwards he was triumphantly elected to the office of prætor, 67 B.C. In the duties of this magistracy the tastes of the orator were better suited, and his peculiar talents better employed, than in those of the ædileship. He presided in the highest civil court, and besides acted as commissioner in trials for extortion. At the same time that he discharged these official obligations, he was energetically prosecuting the ever-increasing business of his profession. To the period of his prætorship belong his celebrated defence of Cluentius, and his still more famous address in favour of the Manilian law. The same period was marked by the conviction of Licinius Mæcer in opposition to the prodigious influence of his kinsman, Crassus. By the address in favour of the Manilian law, which was spoken from the rostrum, and commanded the more attention that it was his first political address to the people, Cicero doubtless had private as well as patriotic purposes to serve. The tenor of his life up to this point had been smooth enough, and the ascent to power singularly easy; but the great prize of the consulship was yet to be won; and without the hearty support of one or other of the great parties into which the republic was divided, he could not hope to win it. Pompey was at this time the idol of the masses; to conciliate their idol, as was doubtless one chief purpose of the address, was therefore to court the populace. The party of the optimates, from whose courtesy Cicero would gladly have besought the prize he had in view instead of servilely courting it from the people, were the natural enemies of any man not of their own class who ventured to aspire to the consular seat. The favour of Pompey and of the populace was therefore all in all to the ambitious orator, and the Manilian address was not without its effect, nor intended to be without its effect, in gaining him the favour of both. C. Antonius and the profligate Catiline were the competitors whom Cicero most dreaded; backed as they were by a coalition of the partisans of the politic Cæsar and those of the wealthy Crassus, they were really formidable opponents; but the event belied all expectation, Cicero being chosen by all the centuries, while Antonius, his colleague, obtained only a small majority over Catiline. The eventful year of his consulate—with its tumults, administrative reforms, judicial enactments, and state prosecutions—as belonging rather to the province of the historian than to that of the biographer, we pass over with the remark, that while the new consul in his addresses to the people neglected none of the arts of popularity, he showed unmistakably on various important occasions, that his sympathies lay with the corrupt and selfish oligarchy who had frowned on his access to power, and would have frustrated, if they could, all his efforts to maintain order and dispense justice. This truckling conduct of the consul, if it were at all remarked by the democratic faction, however, was speedily forgotten amid the hurry of preparation for civil strife which began with the

discovery of Catiline's conspiracy. The details of that infamous plot—the history of its origin, its actors, and their utter discomfiture, will be found elsewhere.—(See CATILINE.) If ever the enthusiasm of a community, after a deliverance from proscription and bloodshed, concentrated upon one man, it was when the Romans, after the dispersion of Catiline and his crew, hailed the great orator, whose work it was, as father of his country, and in his name voted thanksgivings to the gods. But the height of popularity to which the sublime achievement carried him was as perilous as it was dazzling, and before long events transpired which rendered his fall inevitable. With the occasion which gave it birth the admiration of the nobles for the saviour of their country passed away, and again it was the vanity and arrogance of the consul which fretted them out of patience with his authority. The leaders of the democratic faction on the other hand were not slow to perceive, that the consul had more than once lent the influence of his station and his talents to the cause of oligarchical oppression; nor had they failed to note some occasions on which the patriotic prosecutor of Verres had come forward to defend the conduct of public officers who had no less shamelessly than the Sicilian prætor practised every form of extortion and cruelty. No sooner had he laid down the emblems of the consular office, than the animosity of the nobles and the disaffection of the populace combined to work his immediate disgrace. His conduct in the Catilinarian conspiracy left him open to the charge of having violated the laws of his country; for, contrary to the statute which provided that no citizen could be put to death without the authority of the people, Cicero, acting merely on the authority of the senate, had given orders for the summary execution of the conspirators. It was in vain the orator contended that Lentulus, Cethegus, and their associates, had by their guilt forfeited entirely the privileges of Roman citizens. To this his enemies easily replied, that the comitia alone were competent to pronounce upon the question of guilt, as they alone could legally determine the question of punishment. On the last day of the year, when he ascended the rostrum to give an account of his official proceedings, so much had the popularity of the great orator declined, that one of the tribunes was allowed to interrupt him with the insulting exclamation, that a man who had put Roman citizens to death without granting them a hearing, was himself unworthy of being heard. The populace indeed, after hearing him solemnly asseverate that he had saved the city and the republic, escorted him home; but by this passing homage to his talents and his character nothing in the aspect of the fallen consul's position was materially changed. Returning to the senate as a private member, he was soon involved in a series of angry disputes, the result of which was only to augment the number and aggravate the hatred of his enemies. The destruction of Catiline and his army in the beginning of 62 B.C., and the return of Pompey from his Asiatic campaign in the autumn of the same year, for a while diverted public attention from these factious recriminations; but they were renewed with tenfold bitterness on the occasion of Cicero's taking part against P. Clodius Pulcher, who was accused before the senate of having violated in the house of Cæsar the rites of the Bona Dea, and began to be the sole subject of talk, and the fertile source of dissension among the citizens. Clodius from this time forward was the mortal enemy of Cicero. After being adopted into a plebeian family, this unscrupulous patrician was elected to the tribuneship in 59 B.C. His purpose in seeking, and the purpose of Pompey, Cæsar, and their partisans in procuring him that office, was undoubtedly the ruin, or at least the humiliation of the ex-consul under forms of law. To the machinations of such an enemy, and to the even more dangerous designs of his supporters, Cicero could oppose neither the vigilance of devoted friends, nor the stern endurance of conscientious integrity. When Pompey, on whom he still reckoned for support against his personal enemies, and through whom he still hoped to control his political adversaries, made common cause with Crassus and Cæsar against the aristocratic leaders, his disgrace was sealed. Clodius could now prosecute his schemes of vengeance with entire impunity. His first act after entering upon office was to get a bill passed interdicting from fire and water any one who had put a Roman citizen to death untried. The purpose of the measure could not be mistaken, and Cicero at once took guilt to himself. He endeavoured to move the senate in his favour, and not altogether in vain; nor was the garb of an accused person, in which he appeared in the forum,

without its effect upon the better portion of the citizens. But the new consuls, Piso and Gabinius, sternly repressed all demonstrations of sympathy, and Pompey, pretending fear of a civil commotion, at length declared against the orator. Cicero now, giving way to despair, resolved to depart from Rome. He quitted the city, April, 58 B.C., and, taking Brundisium in his way, went over to Greece. Plancius, quæstor of Macedonia, entertained him honourably at Thessalonica, where he remained till November. His next residence was at Dyrrachium, where, as at Thessalonica, he was chiefly occupied in corresponding with his wife Terentia, and his friend Atticus. The letters he addressed to them give us a picture of physical and mental prostration under grief, such as it would be difficult to parallel. At Rome, as might have been expected, a reaction, to which the extravagant vengeance of his enemy Clodius no less than the enthusiastic exertions of his friends contributed force and fervour, soon occurred in favour of the expatriated orator. In spite of the formal decree of banishment with which Clodius had pursued his victim, various attempts were made by parties in the senate to procure the recall of the exile. In 57 B.C. political changes, and the accession of Pompey to the ranks of its promoters, determined the success of the movement. On the 4th August the comitia centuriata, by an overwhelming majority, voted the bill of restoration. The same day Cicero, anticipating this event, quitted Dyrrachium and passed over to Brundisium. Along the Appian way, which was his route to the city, the towns sent forth their magistrates to offer him congratulations; and on his arrival at the gates of Rome he was met by a crowd of the citizens, who escorted him in triumph to the capitol, there to render thanks to Jupiter Maximus. In the circumstances of the republic at the time of Cicero's return, his name and the recollections which attached to it would have served him well with the senate and with many of the citizens in an attempt to regain his political supremacy; but, in a contest with Pompey, Crassus, and Cæsar, whose authority was now firmly established, neither the reputation of the great orator nor the splendid memories of his consulship would have supported him for an hour, and a collision with the triumvirs was therefore what he most anxiously and timorously avoided. Cæsar had magnanimously attempted to break the fall of the consul of 63 B.C. by urging him, but in vain, to become one of his legates, and since then had treated him with a frigid civility. No reliance could be placed upon Pompey, and Crassus was decidedly hostile. Thus really at feud with the triumvirs, but caressed by them when he humbly did their bidding, Cicero passed the next five years of his life, either at Rome or one of his country seats. During this period he composed his "De Republica" and his "De Legibus." In 52 B.C., during the third consulship of Pompey, with whom Cicero was then on terms of personal intimacy, a law was enacted with a view to the repression of bribery and corruption, which ordained that no consul or prætor should be appointed to the government of a province until five years had elapsed from the date of his quitting office, and that in the meantime governors should be selected by lot from the class of persons of consular or prætorian rank who had never held any foreign command. Under this law Cicero was appointed to the province of Cilicia, to which were annexed Pisidia, Pamphylia, some districts to the north of Mount Taurus, and the island of Cyprus. The unlucky orator regarded this appointment, although an honourable and lucrative one, only in the light of a second banishment from Rome, and went to his province in the temper of a man on whom fortune had done her worst. His apprehensions on the score of an invasion of Cilicia by the Parthians were not destined to be realized; his administration turned out as popular as he had promised Atticus it should be pure—which, indeed, it was to a degree that astonished and delighted the Greeks; the success of his campaign against the robber tribes of the Syrian frontier was such as to inspire him with hopes of a triumph—but nothing could alleviate the horrors of absence from the capital, and the very day on which his term of office expired Cicero was on his way to Italy. He arrived in the neighbourhood of Rome, 4th January, 49 B.C. It was a critical or rather a fatal moment for the liberties of the republic, and for all who had been conspicuous in their defence. The senate had just commanded the dismissal of Cæsar's army. M. Antony, and one of his colleagues in the tribuneship who had opposed the decree, had escaped to the camp of the future dictator, and the immediate

advance of his legions upon the capital was a matter of doubt only to those who knew little of his character and less of his resources. With the consuls and the leading men of the aristocracy, Cicero quitted the neighbourhood of Rome on the 17th January. It was the intention of the fugitives to guard what they could of the southern parts of the peninsula, and each had the defence of a particular district intrusted to his care. Cicero was to provide for the security of Formiæ and the district around Capua, but this task he soon relinquished in disgust. A prey to fears, none of which were for his country, and to distractions which began and ended in schemes of personal aggrandizement, he inclined now to the side of Pompey, and now to that of Cæsar, corresponded alternately with the partisans of each and with the enemies of both, and lost in idle recriminations, now against Cæsar and now against Pompey, the opportunity and the credit of serving either. At an interview which he had with Cæsar after the departure of his rival from Brundisium, Cicero promised to observe a strict neutrality during the progress of the war, but not long after, he determined to follow the fortunes of Pompey, and accordingly passed over to Greece, June 49 B.C. After the battle of Pharsalia, which occurred in August of the following year, Cicero, who was not present at the engagement, refusing to accept the command of a fleet and of a strong body of troops offered him by Cato, determined at once to throw himself upon the mercy of the conqueror. He landed at Brundisium about the end of November, and there he remained ten months, awaiting the return of Cæsar from his campaigns in Egypt and Africa. During this period he was a prey to the most abject terror, except when compunction for his desertion of his friends got the better of his fears. He narrowly escaped being put to death by the soldiers of M. Antonius; and a traitor himself, he experienced the treachery of his nearest and dearest friends, his brother and his nephew having at this calamitous period repaid the favours of their illustrious relative, by combining to cast upon him the foulest calumnies and the most opprobrious aspersions. Cæsar returned to Italy in September. He had previously addressed a friendly letter to the orator, and now gave him his hand not only in token of forgiveness, but of respect and affection. The next four years of Cicero's life constitute that period of it in which he was least conspicuous in the political world, and in which he did most to exalt his reputation as a writer. To this period, indeed, belong almost all his philosophical and rhetorical works. The production of these was his resource against misanthropy and idleness, when all other activity was forbidden him by the stern censor who now ruled the destinies of Rome; and it was the resource against sorrow to which he naturally, although unsuccessfully reverted, when assailed, as he now was, by domestic discord and bereavement. After separating from his wife Terentia, and contracting a marriage with one of his wards, a young and beautiful lady named Publila, whom he divorced in the course of a year, he lost his only daughter Tullia, and in this loss experienced the utmost bitterness of domestic misfortune. As the fatal Ides of March approached, Cicero's intimacy with Cæsar seemed daily on the increase; subserviency on the part of the orator, and kindness approaching affection on the part of the dictator, seemed to unite them in the strongest bonds of friendship. But, as soon as the scene of assassination in the senate-house had transpired, Cicero was among the first to declare his satisfaction at having seen the tyrant perish. This identified him with the conspirators, and united his fate with theirs. Obligated to retreat from the city by the growing indignation of the populace, he went first to Rhegium, then crossing to Sicily, arrived at Syracuse on the 1st of August. Leaving this place on the following day, he was driven by cross winds to Leucopetra, where he was assured by some people lately from Rome that he might with safety return to the capital, as the chances of a popular commotion were now over. At Velia, where he touched on his way home, he had his last interview with Brutus. He arrived in the capital on the 31st of August, 43 B.C. Two days afterwards he delivered in the senate-house the first of his celebrated Philippics—a series of violent and intemperate harangues, in which, as its oracle, he expended all the rage of a doomed, but still proud and powerful oligarchy. The purpose of these harangues was to rouse the senate and the people against Antony and his friends; it failed, and hastened the doom of the orator, who had shown no mercy and could expect none. Proscription of their respective enemies followed the coalition of Octavianus and Lepidus with

Antony, and among the most odious of Antony's enemies was Cicero. He was at his Tusculan villa with his brother and nephew when he learned the news of the proscription. A rapid flight to Astura on the coast, an unsuccessful attempt to escape by sea, followed next day by another equally unsuccessful, and Cicero was in the hands of the triumvirs' myrmidons. He had reached his villa at Formiæ; in the middle of the night his slaves informed him of the approach of the soldiers; he made an attempt to escape in a litter, but was overtaken in a wood and instantly dispatched. His head and hands, according to Plutarch, were carried to Rome, and by order of Antony affixed to the rostrum in the forum.

The best edition of the complete works of Cicero is that of Orellius. His Life by Conyers Middleton is disfigured by indiscriminate eulogy. Hardly any English translations, except Melmoth's Letters of Cicero, deserve attention. For an admirable account of the works of Cicero, see Smith's *Dict. of Greek and Roman Biog.*—J. S., G.

CICERO, MARCUS TULLIUS, the only son of the great orator and of Terentia, born in 65 B.C. He accompanied his father into Cilicia in 51 B.C.; in the following year passed into Greece, and served with the army of Pompey; after the battle of Pharsalia entered upon a course of study, or rather a career of dissipation, at Athens; was one of the military tribunes under Brutus in his Macedonian campaign; and in the year 30 B.C. was drawn from his retreat in Rome by Octavian, to become consul along with the future emperor. He afterwards held political office in Asia Minor, or, according to some historians, in Syria. So little effect had the *De Officiis* of the great orator and moralist upon the person for whose use it was written, that, according to Pliny, Cicero the younger was reckoned at Rome a greater drunkard than Antony, who was one of the greatest drunkards of the city.—J. S., G.

CICERO, QUINTUS TULLIUS, brother of the orator, born about 102 B.C., was educated along with his brother. He was successively ædile and prætor, and in 61–58 governed Asia as prætor. On his return to Rome he endeavoured to procure the recall of his brother from banishment; in 55 went as Cæsar's legate into Gaul, and there distinguished himself as an able and gallant soldier; in 49 joined the army of Pompey, and was proscribed by the triumvirs and put to death in 43.—J. S., G.

\* CICOĞNA, EMMANUELE ANTONIO, an eminent Italian author, was born at Venice in 1789. His Venetian inscriptions "*Inserzioni di Venezia*," brought him under the special notice of the Austrian government; under its auspices they are still continued. His treatise on orthography has gone through several editions. Cicogna holds the important office of imperial procurator at the supreme court of Venice.—A. C. M.

CICOĞNARA, LEOPOLDO, Count of, born at Ferrara in 1767; died at Venice in 1834. He first studied law; then for a while gave himself to mathematics and to physical sciences; afterwards became an earnest student of the fine arts. With the object of pursuing these studies, he resided for a considerable time in Rome, and visited Sicily. On his return to Ferrara he was at once occupied in the high duties natural to his rank. We find him member of the legislative council—plenipotentiary of the Cisalpine republic at Turin. He is councillor of state; president of the Academy of fine arts at Venice; and the first Napoleon gives him the order of the iron crown. After the fall of Napoleon the emperor of Austria continued him as president of the Academy of Venice. In his position of president Cicognara was of infinite use to the academy. The creation of new professorships; the real education of pupils by the best instructors; and, what is of less moment, the temptation to students to come to the academy by the offer of pecuniary rewards, are all attributed to him. Of his works, those relating to the antiquities of Venice attracted most attention.—J. A., D.

CID CAMPEADOR, RUY or RODRIGO DIAZ DE BIVAR, the favourite hero of the Spaniards, in whose history and literature he fills much the same place that King Arthur occupies in our own. Of the literature relating to the history of the *Cid*, it would be out of place to treat in a biographical memoir. So much is the mythical element mixed up with simple history in the accounts which have come down to us, that some critics have altogether denied his existence. There is no reason for carrying scepticism to such a length; but in endeavouring to disentangle the true from the doubtful, we are often driven back on the remark of the canon in *Don Quixote*, that "there is no reason

to doubt that there was such a man as the Cid, but very great reason to doubt whether he did what is attributed to him." Nor need we wonder at the obscurity which overhangs the life of a hero, contemporary with our William the Conqueror, especially since the earliest MS. of the Poema del Cid bears date either 1207 or 1307. The other chief sources of information as to the history of the Cid are the famous Chronicle, of which the earliest known edition is dated Burgos, 1593, but which was in all probability written within one hundred and fifty years after the Cid's death. This work corresponds (with some curious variations) with the Cronica General of Alfonso the Wise. There are also nearly two hundred ballads on the exploits of the Cid, some of which, judging from internal evidence, may be dated at a period not much later than the lifetime of the hero. From these, and from various old Spanish lives of more or less authority, modern historians extract the following as the principal facts of the Cid's life:—The year of his birth is variously stated, but was probably about A.D. 1040. His father was Don Diego Lainez, a descendant of one of the ancient judges of Castille, and his birthplace was Burgos. The romance of his early years, according to the chronicles, was worthy of his later exploits. Having avenged an insult offered to his father, by Count Lozano de Gomez, in the blood of the offender, the daughter of the slain count, of whom Rodrigo had been it seems enamoured before, besought the king, Fernando I., to give her in marriage to the victor; "for certain I am," thus runs the chronicle, "that his possessions will be greater than those of any man in your dominions." Rodrigo—whether impelled by ancient love, or now for the first time smitten by the charms of the damsel—consented to obey the king, but resolved first to prove himself worthy of his bride by unheard-of exploits against the Moors and the emperor of Germany. In these wars it was that he earned the title of Cid, five Moorish kings submitting at one time to him as their lord or *seid*. There is a bombastic account how he won the city of Calahorra for his lord by overcoming in single combat the champion of the king of Arragon, who preferred a claim to it. But the portion of the Cid's life which belongs to authentic history, may be said to commence with the death of Ferdinand, who, unwisely resolving to bequeath sovereign power to each of his children, left the kingdom of Castile to his son, Sancho II., Leon to Alfonso VI., and Galicia to Garcia; while his daughter Urraca received the city of Zamora, and her sister Elvira that of Toro. Sancho, the most able and powerful of the three, aided by the sword of Rodrigo, soon drove both his brothers from their possessions; but in attempting to seize upon Zamora, the heritage of his sister, he was assassinated, and Rodrigo now owned as lord-paramount his brother Alfonso. But, as the story goes on to relate, so solemnly did Rodrigo challenge his sovereign to swear that he was guiltless of his brother's death, that the king was visibly agitated, and never afterwards regarded the Cid with favour. On some pretext—which the ambition of the courtiers could readily furnish—the Cid was banished from the kingdom. He betook himself first to Barcelona, and then to Saragossa, allying himself with the Moorish king, Almuqtaman. There is no doubt that, at this time, Rodrigo was the chieftain of a powerful band of warriors, whose alliance was eagerly sought by any prince who might have a cause, good or bad, to maintain by arms. On the death of Almuqtaman, Rodrigo became anxious to return to Castile, and his aid was welcome to King Alfonso, who, just then, was engaged in war with Jussef, the emperor of Morocco. But a second time the malice of courtiers, or the smouldering jealousy of the king, led to his being forced to fly the kingdom—his wife and children being seized, and only liberated after some time. Again his aid was sought in the hour of need, and again was he driven away by the jealousy of King Alfonso. The fugitive found an asylum in the kingdom of Valencia, where he fortified the castle of Pinnacatel, and renewed his alliance with the king of Saragossa. His first care, when he found himself again powerful, was to be avenged on his old foe, the count of Naxera; but, having become rich with the booty of a successful expedition, he turned his attention to the city of Valencia, then in a state of great distress under the rule of the Arabs. The Moorish king, Hiaya, had been assassinated in a domestic revolution; and Rodrigo, seeing that the time was favourable, laid siege to the place, and, after an obstinate resistance, became master of it. According to the Arab chronicles, the victory was stained by the most sanguinary ferocity; but the Spanish story extols the clemency and

moderation of the Cid on this occasion. Probably the administration of Rodrigo was marked by a military sternness which might well account for the indignation of the vanquished. But we can gather, that, for the five years from this conquest, till his death (1084–1089) he ruled beneficently and justly—in striking contrast with the habits of his predecessors. He repelled the attempts of the Moorish king to recover his territory, and strengthened himself by various additions to the dominions he had won. Over the history of his later years, there is the same veil of fiction which hides his earlier days. We gather, however, that when he became powerful, he renewed his alliance with King Alfonso, and sent for his wife, Doña Ximena, and his daughters, Doña Elvira and Doña Sol. It would seem that this first-named lady, celebrated as his faithful companion through his later years, was not his first love, of whom we have already made mention, but a second wife, the daughter or niece of the King Alfonso. The chronicle and the old ballads relate with great pathos the matrimonial adventures of the two daughters of the Cid—how they were sought in marriage by the two counts of Carrion, who brutally ill-treated and forsook them—and how the offenders were summoned before the Cortes, made to disgorge the dowry they had thus disgracefully obtained, and deservedly punished. More historically interesting is the fact, that the two daughters of the Cid, Christina, married to the Infanta Ramiro of Navarre, and Maria, married to Ramon Berenguer III., count of Barcelona, are reckoned among the ancestors of the present royal families both of Spain and Germany. Mention is also made of a son, who died young. The death of the Cid took place in 1099, and, soon after this event, the Moors, freed from the terror of his name, recovered possession of the territory of Valencia. The remains of the Cid were interred in the convent of San Pedro de Cardeña at Burgos. They were afterwards removed in 1272 by Alfonso the Wise, and again in 1447, in 1541, and 1736, to various places. They were again disturbed by the French in 1809, but in 1826 they were restored to their original shrine at San Pedro de Cardeña. It is impossible to enumerate the various dramatic works founded on the life of the Cid. For the English reader, the best authorities are Southey's Chronicle of the Cid, and a small work entitled *The Cid*, by George Denis. The chronicle may be read in the original, edited with more than German learning and zeal, by Professor Huber of Berlin (Marburg, 1844). This edition is dedicated to the then reigning emperor of Austria, himself a descendant of the Cid. The Poema del Cid is also carefully edited by Ochoa, Paris, 1842; and of the ballads, the best specimens may be found in Duran's *Romancero General*.—F. M. W.

CIECO, FRANCESCO, one of the first great organists on record. Phillip Villani, who flourished about the year 1343, and who lived till 1408, among the lives of illustrious Florentines, chiefly of his own times, says—"Many are the Florentines who have rendered themselves memorable by the art of music; but all those of former times have been far surpassed by Francesco Ciego, who still lives, and who during childhood was deprived of sight by the small-pox. He was the son of Jacopo, a Florentine painter of great probity and simplicity of manners; and, being arrived at adolescence, and beginning to be sensible of the misery of blindness, in order to diminish the horror of perpetual night he began in a childish manner to sing; but advancing towards maturity, and becoming more and more captivated with music, he began seriously to study it as an art—first by learning to sing, and afterwards by applying himself to the practice of instruments, particularly the organ, which he soon played, without ever having seen the keys, in so masterly and sweet a manner as astonished the hearer. Indeed his superiority was soon acknowledged so unanimously, that by the common consent of all the musicians of his time, he was publicly honoured at Venice with the laurel crown for his performance on the organ before the king of Cyprus and the duke of Venice, in the manner of a poet-laureate." Ciego died at Florence in 1390, and was buried in the church of St. Lawrence with great state.—E. F. R.

CIENFUEGOS, NICASIO ALVAREZ DE, a Spanish poet and political writer, born at Madrid, A.D. 1764. He studied at Salamanca, and afterwards lived a retired life at Madrid for some time. His poetical works consist of two plays, entitled "Zoroeda" and the "Condesa de Castilla," several odes to peace, to spring, to Nice, and some others published after his death. Cienfuegos after a while entered public life, and was employed in the office of the chief secretary of state, and as editor of the *Government*

*Gazette*. In this post he remained until the invasion of the French in May, 1808. An article appeared in the *Gazette* unfavourable to the invader, and Cienfuegos was sent for by Murat, bitterly reproached for his resistance to the conqueror of the day, and sent a prisoner to France. He died in July, 1809, at Ortez, soon after his arrival. So vehement was his anti-Bonapartist feeling, that he suppressed an ode in which he had praised the emperor for having respected the tomb of Virgil. The poet, it would seem, felt that no homage to departed greatness could atone for the destruction of his country's liberty and prosperity.—F. M. W.

CIFRA, ANTONIO, a musician, was born in the Roman States in 1575, and died at Loretto before 1638. He was a pupil of Palestrina and of Bernardo Nanino. His first engagement was at the German college in Rome. In 1610 he was appointed maestro di capella at Loretto; he left this place to fulfil the same office at the church of S. Giovanni di Lateran in 1620; he entered the service of the Archduke Charles, with whom he went to Vienna in 1622; and he returned to Loretto in 1629, to be reinstated in his former appointment, and there remained till his death. He wrote a very great number of masses, motets, and works in every other form of church music, including a series of antiphones for every day in the year; these are reputed as admirable specimens of the severe Roman school. After the death of Cifra, A. Poggioli published two hundred of his compositions under the title of *Ten Concerti Ecclesiastici*; this collection is dated 1638.—G. A. M.

CIGNA, GIOVANNI FRANCESCO, an Italian anatomist, author of several dissertations on electricity, was born at Mondovì in 1734, and died in 1790. He was professor of anatomy in the university of Turin, and was one of the founders of the Academy of Sciences of that city.—J. S., G.

CIGNANI, COUNT CARLO: this painter was born at Bologna in 1628. He was the descendant of an honourable family, and his first efforts in the way of art were in attempting copies of the pictures in his father's gallery. He was then placed in the school of Battista Cairo; subsequently he studied under and became a disciple of Francesco Albano. Of a modest and anxious disposition, and always depreciating his own worth, he nevertheless possessed much original talent, could think for himself when he dared, and even eventually founded a style of his own. It had Carracciesque elements certainly, but it was original nevertheless. He revelled in grand flowing drawing, in elevated and noble heads, in broad and gorgeous folds and draperies, and in a harmony of colours, rich yet strong, mellow but intense. He was very careful of general effect, and his details were most painstakingly wrought out. After visiting Rome, and working for some of the churches there, he returned to Bologna; and in the employ of Cardinal Farnese he painted his "Entry of Pope Paul III. into Bologna," and his Francis passing into that city, for the grand saloon of the palace of the cardinal. He was the founder of the Clementine academy at Bologna, and by the diploma of Pope Clement XI., he was placed at its head. He was soon after appointed to decorate the cupola in the church of La Madonna del Fuoco at Forlì. On this prodigious work he was occupied for above twenty years; and so great was the respect and love of his academy for him, that they moved bodily to and held their *seances* at Forlì, to be near their founder, and receive the full benefit of his superintendence and counsel. Cardinal San Cesareo, passing through Forlì, desired to possess a work of Cignani's, and purchased an "Adam and Eve" which the painter had by him, and wrought at leisurely for his own delectation. The cardinal bought the work for five hundred pistoles, saying, that he gave that sum for the canvass; for the painting, he could only give his thanks, it being beyond pecuniary price. This picture, a work of extraordinary beauty, was some few years back in England, and for sale. It is now in the possession of the king of Holland. Cignani lost much time in cross-examining his own success. His facility was strangely fettered by his want of confidence. Yet he has left many and important works, and his name is a star of some magnitude in art's heavenly host. At Bologna he painted the "Nativity" in the church of S. Giorgio; in S. Lucia the "Virgin and Child," with saints; in S. Michele four sacred subjects, oval shaped, supported by angels of exquisite beauty. Next the Palazzo Zambecari he painted a "Samson," very grandiose and noble; and in the collection of the duke of Devonshire there is a duplicate work of "Joseph's Temptation"—the original being in

the palazzo Arnaldi at Florence—a very fine composition, with beauty in its drawing, and vigour in its colour. For a monastery of Piacenza he painted the "Conception of the Virgin." "Robed in white," says Lanzi, "Mary is seen bruising the serpent's head—while in gorgeous purple, her son stands with an air of dignity and grace, his foot placed upon that of his mother." His "Birth of the Virgin," at Urbino, was treated in so poetic a spirit as to incur censure. He died in 1719.—W. T.

CIGNANI, FELICE: this painter, the son and scholar of Carlo, was born at Bologna in 1660, and died in 1724. He was one of the few disciples who adhered to the finished and unremunerative method of their master.—W. T.

CIGNANI, PAOLO, the nephew and scholar of Carlo, also a good painter, born in 1709; died in 1764.—W. T.

CIGNAROLI, GIOVANNI BETTINO: this accomplished painter was born at Verona in 1706. He studied under Santo Prunati at Venice; subsequently he became a pupil of Antonio Balestra. He attained to considerable eminence, and has been ranked among the first painters of the modern Venetian school. He painted with a serene and graceful manner, dignified in his attitudes, and sober in his general composition. He had an ugly proneness to green shadows in his flesh, with a certain coppery tone in places; and he studied effect, rather than nature, in his disposition of light. The Emperor Joseph II. was wont to declare that he had seen two great sights in Verona—one the amphitheatre, the other Cignaroli, the most accomplished painter in Europe. He was a studious man, fond of philosophical reading, relishing the Roman classics, and himself playing prettily with Tuscan verse. He produced also treatises on the fine arts, of great repute in their day. His finest work is his "Flight into Egypt," at the church of S. Antonio Abate at Parma. He died in 1770.—W. T.

CIGOLI. See CARDI.

CIMABUE, GIOVANNI: this illustrious artist was born in the city of Florence, in the year 1240. At an early age he was sent to Santa Maria Novella, to study letters under a relation who was master in grammar to the novices of that convent. The young Cimabue did not prosper in his studies; he neglected his books all but the margins, which he adorned with multitudinous devices; and when certain Greek painters came to decorate the chapel of the Gondi, situate next to the principal chapel of the Santa Maria, he took every opportunity, legitimate or not, of frequenting their society. Eventually he was taken into their employment. He aided in the decoration of the convent walls, and soon gave ample and astounding evidence of his genius. Fame dawned upon him. He painted a picture for the altar of Santa Cecilia, and of the Virgin in Santa Croce in Florence. He produced a picture of "St. Francis" in panel, on a gold ground, and then a large picture for the abbey of the Santa Trinità. He was gradually emancipating art. He still clove to gold grounds; still something of the mosaic manner clung to his work. But the sharp angles began to disappear, and the hard lines to melt. He painted a colossal crucifix on wood for the church of Santa Croce so successfully, as to obtain a commission to paint a picture of "San Francesco" for the church of that saint at Pisa. For the same church he also produced a large picture of the Virgin with the Infant in her arms, surrounded by angels. He acquired a wide repute by these labours, and received an invitation to decorate the church of St. Francis at Assisi. He here so far surpassed the Greek painters working with him, that he proceeded alone to paint the upper church in fresco. This was a work of amazing labour, which he was obliged to leave incomplete, being recalled to Florence by private affairs. Many years after, Giotto's pencil put the finishing stroke to the work of Cimabue. Returned to his native city, he next painted in the cloister of Santo Spirito. At the same time he sent some of his works executed in Florence to Empoli, where they were preserved for some centuries with great veneration. He next painted the picture of the "Virgin" for the church of Santa Maria Novella. This work created an extraordinary popular enthusiasm. It was carried in procession, amidst trumpeting and acclamations of all sorts, from the house of the painter to the church. It is reported that the studio of the artist was visited, while this work was on the easel, by King Charles the Elder, of Anjou, who was passing through Florence. Cimabue had now reached a high name and great wealth. He had been appointed, in conjunction with Arnolfo Lapi, to superintend the building of the church of Santa Maria del Fiore in

Florence. His repute had reached its zenith—he was crowned with all earthly honours. He died in the year 1300, “having achieved,” says Vasari, “little less than the resurrection of painting from the dead.” He left many pupils, the most celebrated being Giotto, whose greatness and whose art-tastes, bringing him nearer the views of more modern critics, have possibly done something towards diminishing the glory of Cimabue. An Italian critic, writing a few years after the painter’s death, remarks of him, “He knew more of the noble art than any other man. He was so arrogant and proud, withal, that if any discovered a fault in his work, or if he perceived one himself (as will often happen to the artist who fails, from the defects in the materials that he uses, or from insufficiency of the instrument with which he works), he would instantly destroy that work, however costly it might be.” The portrait of Cimabue is in the chapter of Santa Maria Novella, painted by Simon of Siena. Few of the remains of Cimabue give any fair criterion of his genius. Decay is rendering his great influence upon art little more than traditional. That his repute was very great in his time; that, dating from him, all that is beautiful and noble in art fairly commences; that his immediate successors paid him the greatest homage—all these testify to the eminence of the painter. Cimabue painted in fresco and distemper, oil not being in his time employed as a medium.—W. T.

CIMAROSA, DOMENICO, a musician, was born at Aversa in the kingdom of Naples, December 17, 1749, and died at Venice, January 11, 1801. His father was a mason, who, obtaining employment in the erecting of the royal palace at Naples, removed to that city during the infancy of Domenico. There he set up his abode in a miserable dwelling in the neighbourhood of his occupation, which was contiguous to the church of S. Severo; and his wife was engaged as laundress to the fathers of the convent connected with this establishment. Domenico was sent to a free school belonging to the convent, where he showed uncommon aptitude for such limited instruction as the place afforded; but the death of his father, by a fall from the building on which he was at work, before the completion of the boy’s seventh year, led to an important change in his prospects. Padre Polcano, the organist of the convent—partly from compassion for the extreme indigence of the widow, partly from interest in the ability of the son—took Domenico under his particular care, for the purpose of advancing his education. In his hours of leisure this worthy man found his chief pleasure in music; and it was in listening to his playing on the harpischord in his cell, that the remarkable genius of the young Cimarosa received its first impetus. Perceiving the indications of unusual musical talent in his little client, the monk began to teach him his favourite art, for which he was repaid by his satisfaction at the boy’s rapid progress. The statement appears to be incorrect that Aprilì was at any time Cimarosa’s master; the reverend convent organist taught him entirely until the year 1761, and then made successful interest for his admission into the conservatorio of S. Maria di Loreto. Here he successively studied under Manna (afterwards organist at the cathedral at Naples), Antonio Sacchini, and finally Feneroli, from whom he learnt composition according to the principles of Durante. He derived also great advantage from the counsels of the famous Nicolo Piccini, whose attention was drawn to him by the manifestation of his talent, and who regarded him with the kindest feeling of friendship. This master was the first who comprehended a long continuous dramatic action in an unbroken piece of music, constituting the extensive finale of an opera; and from his personal advice no less than from his example, Cimarosa acquired the art of construction in this form of composition which, more than anything else, gives dignity and importance to theatrical music.

Cimarosa began his public career with an opera called “Le Stravaganze del Conte,” which was produced at the Teatro dei Fiorentini in Naples in 1772, with success, which was due entirely to the merit of the music, since it had the disadvantage of an extremely weak libretto. Happier in the choice of his next poem, the young composer more than confirmed the good impression of his first essay, when in the following year he brought out another opera, from the reception of which his reputation rose so high, that he was now engaged to write as rapidly as his wonderfully fertile invention could produce; and a long succession of his operas obtained paramount popularity in all the theatres of Italy. “Il Fanatico per gli antichi Romani,” produced at Naples, 1777,

is said to have been the earliest dramatic work in which Piccini’s principles of construction were transferred from the finale to duets and trios, and in which the whole of the action was thus embodied in music, instead of the music being, as in the earlier lyrical dramas, a series of episodic arias and other pieces that, at most, illustrated the scenic situation, without aiding in the progress of the drama. Cimarosa was invited to all the chief cities to write for their theatres; his singular fecundity made him ever ready with new ideas, the spontaneous freshness of which is intrinsic evidence of his natural facility of production, and of this his rapidity, and the great number of his works, afford equally striking proof. One of his most brilliant successes was “Il Convito di Pietra,” produced at Venice in 1781; after the first performance of which, the audience formed a procession to escort the composer to his home, with many hundred flambeaux—the subject being the same as that of Don Giovanni, and the frequent comparison that has been made between the genius of Cimarosa and Mozart, point particular attention to this remarkable triumph. “Il Sacrificio d’Abramo” (an aria from which still holds its place in the programmes of classical concerts in London), seems to have been produced at Naples about 1786. On the return of Pasiello to Naples in 1785, from an engagement of nine years at the court of Petersburg, the Empress Catherine II. wished his equally distinguished townsman Cimarosa to replace him, and made him liberal offers accordingly to visit the Russian capital; it was not, however, till 1789 that he made up his mind to accept these proposals. In this year he started by sea on his way to his new engagement, but was obliged by a tempest to put in at Leghorn. This accident brought him under the notice of the duke of Tuscany, who invited him to his palace, where he paid him the highest honours, singing several of his compositions at a concert, he appointed him to direct; and dismissed him with costly presents to himself and his wife. Proceeding to Austria, the traveller was inconvenienced by the confiscation of his baggage at the custom-house; his reputation, however, drew friends around him in this dilemma, and procured him the restitution of his property. He then went to Vienna, and was received with marked distinction at the court, and the emperor personally made gifts of valuable jewellery to his wife and himself. He arrived at Petersburg in the December of this year, and was at once installed as director of the imperial opera, and chamber musician to the empress. During his residence in Russia, he wrote four operas, a cantata, and an immense number of detached compositions; and he was there loaded with such honours as only Muscovite munificence confers on an artist, the chief of which was that the Emperor Paul I. officiated as godfather to one of his children. The poor mason’s son was now elevated, through the exercise of his genius, to the greatest eminence a commoner can enjoy; his merit acknowledged throughout Europe, and himself signalized by the kindest courtesies of the greatest potentate. The breaking out of the war with Russia, in the course of the third year of his stay, brought, however, this period of his career to a summary close. Though the opera was dismembered, Cimarosa received proposals to remain in a private appointment at the court; the excitement of a life before the public had, however, become necessary to him, added to which his health was impaired by the severity of the climate, which contrasted too strongly with the genial temperature of his native land; and he therefore quitted Russia in 1792. He now went to fill the post of director of the court opera at Vienna, where he produced the work which had a success, not only greater than any other of Cimarosa’s, but scarcely paralleled in the annals of the lyric stage—the work, moreover, which has held its place permanently in public favour through all the variations of taste till the present day. This was “Il Matrimonio Segreto,” which, on the first night of its performance, so enraptured the audience that the emperor, who was one of them, commanded the repetition of the entire opera on the same evening. In 1793, upon the accession of the Emperor Francis, Salieri was reinstated in the office he had left, when Cimarosa was appointed to it, who, however, resigned it under most honourable circumstances, receiving a costly present from the emperor, and leaving the memory of his remarkable success. Returning to Naples, Cimarosa there reproduced, with some additions, “Il Matrimonio Segreto,” which was there performed for a greater number of successive nights than any other opera has been in an Italian city, where the nightly-repeated visits of the

same audiences to the theatre, make a more frequent change in the entertainment, than in our large metropolis, eminently desirable, if not imperatively necessary. He brought out "Gli Orazii e Curiazii" at Venice in 1794, an opera interesting to us on account of its long popularity in this country, and on account of our famous Brahain having been the original representative of its principal character. In the political troubles that disturbed Naples towards the close of the last century, Cimarosa so far compromised himself with the revolutionary party, that upon the re-establishment of royal authority he was thrown into prison, and there remained for more than a year under sentence of death, which is said to have been remitted in consideration of his artistic distinction. It may be remarked, that his Neapolitan biographers make no mention of Cimarosa's indiscreet interference in politics; but speak of his twelve months' absence from public life as a retirement for the benefit of his health. Upon his release in 1800, he went to Venice, where he completed one opera, which was successfully produced, and was engaged upon another, *Artemisia*, which death prevented him from finishing. The belief was prevalent that he died from poison, secretly administered to him by order of the Neapolitan government, which, though deeming it impolitic to bring a man of such universal popularity to public execution for his state offence, would not suffer one who had made open profession of republicanism to pass unpunished. So greatly was the government scandalized by the currency of this report, that it became necessary to issue officially a certificate of Piccioli, the physician to the court and to the pope, stating that he died from an internal tumour, which, however, obtained very little credence. In the September following his death, a magnificent funeral solemnity for the repose of his soul was celebrated at the church of S. Carlo dei Cattinari in Rome, at the instigation of Cardinal Ercole Consalvi, where the entire music was the composition of Cimarosa, for the performance of which, all the artists of the city, and many from distant states, gave their gratuitous services, as an act of homage to his memory. In 1816, the same cardinal had a monument to the composer, the work of Canova, erected in the rotunda of the church of S. Maria ad Martyres. Cimarosa was twice married; his second wife bore him two sons.

Cimarosa wrote, within eight-and-twenty years, nearly ninety operas, many masses, and other works for the church, several sacred cantatas, and an incalculable number of detached pieces, to particularize which would far exceed the present limits. He lived at a most important epoch in the history of dramatic music, when the opera had assumed its present ascendancy in all the theatres of his country, and when these sent forth their creative and executive artists into all the capitals of Europe, to raise temples to the national muse of Italy, and disseminate a feeling for her worship; but the opera had yet to acquire that grandeur, as a work of art, which it derives, not from its presentation of an individual passion, but from its embodiment of a comprehensive action, in which conflicting emotions and wide diversity of character are involved; and Cimarosa was one of the first to develop this great essential of the lyrical drama, and thus to raise his branch of the art to the elevation at which it now flourishes. It has been, more than it is, a custom to compare Cimarosa with Mozart; and the parallel holds in respect to their spontaneous fluency of thought and to their felicitous application of the resources of their art to the illustration of the business of the scene: but these resources were widely different at the disposal of the two masters; and though their works may have some affinity in design, they are constituted of very dissimilar elements. A more truthful resemblance is to be traced between the genius of Cimarosa and of his contemporary countrymen, Paisiello and Guglielmi, the former of whom certainly ranks with him in excellence, but is distinguished from him by the tender sentiment that stamps his music; whereas that of Cimarosa is marked rather by humour, force of character, and dramatic colouring. Though the majority of his operas have comic subjects, and his best successes were with works of this class, he was far from wanting in ability for the treatment of graver themes, as is proved by the merit of his many tragic works; and, to sum up in one phrase his relationship to other labourers in the same field, his writings form the link between the ancient and modern schools of Italian music—between the styles of Piccini and Rossini.—G. A. M.

**CIMBER, L. TULLIUS**, one of the murderers of Cæsar, 44 B.C. He was near the person of the dictator on the fatal day, under pretence of presenting a petition in favour of his exiled brother.

After the murder he went to Bithynia, the province which had been assigned him by Cæsar, and raised a fleet, with which he co-operated with Cassius and Brutus.—J. S., G.

**CIMON**, one of the most famous Athenian statesmen and generals, was the son of Miltiades, victor at Marathon, and Hegesipyle, daughter of Olorus, king of Thrace, and was born 510 B.C. Cimon brought himself into notice on the invasion of Greece by Xerxes; but his first memorable exploit was the capture of the important town of Eion on the Strymon 476 B.C. Boges, the Persian governor, after defending himself to the last extremity, finding his provisions exhausted, threw his gold and silver into the river, and consumed his wives and children and himself on the same pile. Cimon then seems to have set himself to complete the overthrow of the Persian dominion in Europe, by expelling their remaining garrisons from the coasts and islands of Greece. He seized the island of Seyros, expelled its piratical inhabitants, and peopled it with Athenian settlers. But his most brilliant success was at the Eurymedon in Pamphylia, 466 B.C., where he destroyed a large Persian fleet, then disembarked his men, defeated the army which was drawn up on shore to protect the ships, and finally entrapped and destroyed a squadron of Phœnician ships which was on its way to reinforce the Persians. He took an immense booty and many prisoners, dislodged the enemy from the entire coast of Thrace, and thrust them back to the regions eastward of Phaselis. As the leader of the oligarchy, Cimon was now for some years the most powerful citizen in Athens; but the democratic party, headed by Pericles, gradually gained ground upon their rivals, and at length taking advantage of the insulting manner in which the Spartans dismissed a body of Athenian troops under Cimon, who had been sent to their aid in suppressing an insurrection of the Helots, the partisans of Pericles succeeded in procuring by ostracism a sentence of banishment against Cimon for ten years, 461 B.C. After the unsuccessful battle of Tanagra, however, 467 B.C., in which he was not allowed to take part though he entreated permission to fight in the ranks, he was recalled by a decree proposed by Pericles himself, apparently under the impulse of generous sympathy and patriotic feeling. In 450 a peace was concluded between Athens and Sparta, mainly through the influence of Cimon, and next year the war with Persia was renewed at his instance. He set sail for Cyprus with a fleet of two hundred triremes, and laid siege to Citium. Here he died either from illness or from the effects of a wound. Cimon was noted for his open-hearted manner, convivial habits, and generous disposition. He spent the large fortune he had acquired by his successful expeditions, with unsparing liberality, in decorating and providing for the defence of his native city, and in entertaining the poorer citizens. His great policy was to maintain the unity of the Grecian states, and to carry on incessant war against the Persian monarchy.—J. T.

**CIMON OF CLEONÆ**, a Greek painter of doubtful date, who is reckoned the first painter who adopted foreshortening. He flourished probably before 460 B.C.—J. S., G.

**CINADON**, the leader of a conspiracy against the Spartan oligarchy, who was put to death in 397 B.C.

**CINCINNATO, ROMOLO**: this painter was born at Florence about the year 1525. He was a pupil of Francesco Salviati; and in 1567, on the invitation of Philip II., he proceeded to Spain, and was employed in the decoration of the Escorial. He painted part of the great cloister in fresco, and in the church of St. Lorenzo two subjects representing St. Jerome reading and preaching to his followers, and also two frescoes of St. Lorenzo. He painted "The Circumcision" in the church of the Jesuits at Cuença, and some mythological subjects in the palace of the duke del Infantado at Guadalaxara. He died in 1600.—His two sons, **DIEGO** and **FRANCESCO**, both achieved fair reputations as portrait painters. They studied under their father. Diego was sent to Rome by Philip IV. to paint for that monarch a portrait of Pope Urban VIII., who highly applauded the painter, knighted him, and decorated him with a gold chain and medal. Diego died in 1626; Francesco in 1635.—W. T.

**CINCINNATUS, LUCIUS QUINTIUS**, a famous Roman consul, and a model of integrity and simplicity of manners, was born about 519 B.C. In 460 B.C. he was chosen consul in the room of P. Valerius; and when the messengers went to announce his election they found him cultivating his farm with his own hands. Soon after, in 458 B.C., he was called again to leave his rural employment and assume the office of dictator, in consequence of

the perilous position in which the Roman consul and army had been placed by the Æqui. He rescued the army, inflicted a signal defeat upon the enemy, and then returned to his farm, after holding the dictatorship for only sixteen days. He was a second time appointed dictator at the age of 80 (B.C. 439), for the purpose of suppressing the alleged seditious machinations of Sp. Maelius. A story is told of Cincinnatus having been reduced to poverty by paying a fine imposed upon his son Cæsa; but it is rejected by Niebuhr as a mere fabrication.—(*Tit. Liv.*, lib. iii. & iv.; *Nieb. Rome*, vol. ii. p. 286.)—J. T.

CINCIUS ALIMENTUS. See ALIMENTUS.

CINEAS, a famous Thessalian orator, the friend and minister of Pyrrhus, king of Epirus. He was the most eloquent man of his day, and Pyrrhus was wont to say that "the words of Cineas had won him more towns than all his own armies." He was no less celebrated for the vivacity of his conversation, and many of his *bon mots* and repartees have been preserved by the classical writers. He was a strenuous advocate of peace with the Romans, and was sent to Rome with proposals for a treaty after the battle of Heraclea, 280 B.C. Two years later Cineas was sent a second time to negotiate a peace, but without effect. He appears to have died soon after.—J. T.

CINELLI, CALVOLLI GIOVANNI, born at Florence in 1625, and died at Loreto in 1706. He practised medicine, and after seeking to establish himself in more than one locality, returned to Florence. Through Magliabecchi he obtained access to the library of the grand duke, and employed himself in cataloguing pamphlets and rare books. He printed sixteen parts of his catalogue under the title of "Biblioteca Volante." It was continued to twenty parts by Scanzani, who republished the whole in four volumes, quarto, Venice, 1734.—J. A., D.

CINESIAS, a dithyrambic poet of Athens, who owes his celebrity to the ridicule with which he was treated by Aristophanes and other comic poets.—J. S., G.

CINGETORIX, a chief of the Gauls in the district of Trevisi (Treves), who revolted to the Romans and fought against his own father-in-law, Indutiomarus, the leader of the patriotic party. On the death of that chief and the defeat of his tribe, Cingetorix was appointed his successor by Cæsar.—J. T.

CINNA, CAIUS HELVIUS: the date of his birth is unknown. His death occurred on the day of Julius Cæsar's funeral, 44 B.C. He was mistaken by the mob for Cornelius Cinna, one of the conspirators who had slain Cæsar, and was murdered by them. Cinna was a poet—the friend of Catullus. His name is also mentioned by Virgil. Of Cinna's verses some eight or nine lines remain, being found in accidental quotations. Two lines, not ungraceful, are preserved by Servius:—

Te matutinus flentem conspexit Eous,  
Et flentem paulo vidit post Hesperus idem.

These lines are from an epic poem entitled *Smyrna*, the name of which we learn from Catullus, but what the subject of the poem was, remains unknown.—J. A., D.

CINNA, LUCIUS CORNELIUS, a Roman patrician, an associate of Marius, and the leader of the popular party during the absence of Sulla in the east. In 86 B.C. he was elected consul along with Cn. Octavius, and in violation of his oath to Sulla he attempted to overpower the senate, and to procure the recall of Marius and his party from banishment. In the contest which ensued he was defeated by his colleague and driven from the city. His office thus became vacant, and the senate appointed another consul in his room. He soon returned, however, along with Marius, and laid siege to Rome. The senate were forced to capitulate; but while the votes of the people were being taken for the repeal of the sentence against Marius, he broke into the city, massacred the friends of Sulla, and allowed his partisans to commit the most frightful excesses.—(See MARIUS.) For the next three years Cinna was consul; but Sulla, having brought the Mithridatic war to a close, resolved (84 B.C.) to return to Italy in order to inflict condign punishment on his enemies. Cinna prepared to resist him by force of arms, but was slain by his own troops in a mutiny caused by the orders he had given, that they should cross over from Italy to Greece, where he intended to encounter Sulla.—J. T.

CINNAMUS, JOANNES, one of the most distinguished of the Byzantine historians, lived under the Emperor Manuel Comnenus, in the second half of the twelfth century, and wrote the history of Manuel, and of his father, Calo-Joannes, in six

books. The work was edited by Du Cange, Paris, 1670, folio; and by Meineke, Bonn, 1836.—J. S., G.

CINQ-MARS, HENRI COIFFIER DE RUZÉ, Marquis de, was born in 1620. At the age of eighteen he was presented at court by Richelieu, and soon grew into favour with the king, Louis XIII. Already master of the horse, he chafed at the restraint under which Richelieu kept him, and eagerly longed for political power. His ambition soon compassed his ruin. He framed a conspiracy to overthrow the cardinal, of which the king and Gaston, duke of Orleans, his brother, were members. But Louis was weak and fickle, Eustace perfidious, and Richelieu not the man to be put down by a youth just turned of twenty. Cinq-Mars was delivered up to Richelieu, and beheaded at Lyons, along with his friend De Thou, a young counsellor, on the 12th of September, 1642.—R. M., A.

CINTRA, GONZALOS DE, a Portuguese navigator who lived in the first half of the fifteenth century. He distinguished himself at Ceuta in the great African expedition of John I., and acquired great celebrity by taking part in various exploring voyages along the coast of Africa. A gulf in that coast bears his name. His ship was attacked by the blacks at the isle of Arguin, and Cintra and many of his men were killed in 1445.—J. T.

CIOFANO, ERCOLE, a noted Italian scholar, author of a life of Ovid, and of a commentary on the *Metamorphoses*, which has been highly prized by subsequent editors, was born at Salmo in the beginning of the sixteenth century.—J. S., G.

CIONE, ANDREA DI. See ORCAGNA.

CIPRIANI, GIOVANNI BATTISTA: this celebrated artist was born in Florence about the year 1727. He was descended from a family of Pistoja. He is stated to have formed his style by studying the works of Antonio Domenico Gabbiani, a Florentine painter, then lately dead. His first pictures of any note were two altarpieces for the abbey of St. Michael at Pelago—one of "St. Thesaurus," the other of "St. Gregory VII." These are the more valuable from the fact of the limited number of Cipriani's paintings. In 1750 he was in Rome, where he studied for some two or three years. Thence he proceeded to England in company with Sir William Chambers and Mr. Wilton. When the duke of Richmond opened a gallery for studying the antique at his house in Whitehall, he appointed Cipriani professor of drawing, and Wilton superintendent of the modelling and statuary. This scheme was but short-lived; still it was one of the foundation stones of that more permanent edifice, the Royal Academy. Cipriani was one of the twenty-two artists who signed the petition to George III. for the institution of the academy, and was employed to make the design for the diploma given to the academicians and associates on their election. For his labours, the academy awarded him a silver cup "as an acknowledgment for the assistance the academy received from his great abilities in his profession." It is difficult to define how much of the fame of Cipriani may rest upon the charming interpretations given of him by Bartolozzi; but it would seem that the flow and grace of the painter were eminently adapted to the spirit and dexterous delicacy of the engraver. Each appears to have aided and supported, and given value to the work of the other. Cipriani was greatly patronized in his day. He was employed on the restoration of the Rubens ceilings at Whitehall chapel; also on the paintings of Verrio at Windsor. He painted the compartments of a ceiling in the antique style at Buckingham House. He decorated with poetical subjects a room in the house of Sir William Young at Standlinch in Wiltshire. Some of his pictures were in the collection of Mr. Coke at Holkham, and four are in the ceiling of the library of the Royal Academy. But his fame will probably rest ultimately almost altogether upon his drawings, as engraved by Bartolozzi. Fuseli in one of his lectures renders high homage to Cipriani, both as a painter and a man, when he says—"The fertility of his invention, the graces of his composition, and the seductive elegance of his forms, were only surpassed by the probity of his character, the simplicity of his manners, and the benevolence of his heart." He died on the 14th December, 1785, and was interred in the cemetery at Chelsea. He left two sons, one of whom, PHILIP, held the office of clerk in the treasury, and died in 1821.—W. T.

CIRCIGNANI, ANTONIO, was the son of Niccolò, and was born in 1560, at Pomarance. He was the pupil and assistant of his father, and after his death, decorated by himself a chapel at the Traspontina, another at the Consolazione, and painted also

for private collections. He spent the greater part of his life at Città di Castello, and painted there some of his best pictures. Among these the most admired was "the Conception" at the Conventuali. He returned to Rome in the pontificate of Urban VIII., and was employed in several of the churches. He died in 1620.—W. T.

**CIRCIGNANI, NICCOLÒ**, called **DALLE POMARANCE** or **IL POMARANCIO**. This painter was born at Pomarance in Tuscany in 1516. He studied painting at Rome. His master is supposed to have been Titi. He was employed in the pontificate of Gregory XIII. in the great saloon of the Belvedere. He grew old in Rome, says Lanzi, and left there numerous specimens of the labours of his pencil, which he employed with freedom and at a good price. He showed himself superior to the painters of his day in some of his works, as in the cupola of S. Prudenziانا. He died about 1591.—W. T.

**CIRILLO, DOMENICO**, in Latin **CYRILLUS**, a Neapolitan medical man, was born at Grugno in 1734, and died at Naples in 1799. In early youth he was elected to the chair of botany on the death of Professor Pedillo. He travelled extensively, visiting Germany, France, and Britain. He was elected a fellow of the Royal Society of London, and received distinguished marks of attention in Paris from Buffon, D'Alembert, and Diderot. He became afterwards professor of medicine at Naples, but still continued to prosecute botany, and to publish works on that science. Towards the end of the eighteenth century he became involved in political matters, and was elected by the people their representative under the republic, and afterwards a member, and president of the legislative assembly. He was afterwards put in prison, and condemned to death by Ferdinand, in spite of the remonstrances of Admiral Lord Nelson. He appears to have been a man of great intelligence, and to have possessed good powers of observation. His botanical writings include an "Introduction to the Study of Botany;" "Elementary Botanical Plates;" "An account of the Plants of Naples;" and a treatise "On the Papyrus." He also wrote "On the Insects of Naples;" "On the Manna of Calabria;" "On the Rudiments of Nosology," and "On the Tarantula."—J. H. B.

**CISNER, NICHOLAS**, a learned Lutheran, pupil of Bucer and Melancthon, filled various chairs in the university of Heidelberg. He was born at Mosbach in the palatinate in 1529, and died in 1583. His works, which are numerous and learned, consist of dissertations on subjects of law, history, politics, and philology.

**CISNEROS, FRANCISCO XIMENEZ DE**. See **XIMENEZ**.

**CITTADINI, PIER FRANCESCO**, called **IL MILANESE**. This painter was born at Milan about 1616, and was educated in the school of Guido. He seems to have been a creditable pupil, and his "Stoning of St. Stephen," "Christ in the Garden," "the Flagellation," and "Ecce Homo" in the church of St. Stefano, and "S. Agata," in the church of that saint, were highly applauded. Yet he suddenly dropt from these high flights into a much humbler walk of art, and devoted himself to careful renderings of fruits, flowers, dead game, and still life. Many of his productions of this kind are in the collections of Bologna. He died in 1681.—W. T.

**CIVERCHIO, VINCENZO**: this painter was born at Crema in the state of Venice. He flourished from 1500 to 1535, and had a threefold reputation as a painter, an engraver, and an architect. He was chiefly famed for his portraits. He resided at Milan, and educated several pupils for that school of painting. Vasari praises his frescos very highly. In the great church of Crema was a picture by him of the Annunciation, but his most famous work representing "Justice and Temperance" was seized upon by the French in their capture of Crema, and presented to Francis I. He died about 1540.—W. T.

\* **CIVIALE, JEAN**, a French surgeon, born in 1792 at Thiezac (Cantal), the discoverer of a method of dispensing with the dangerous operation of lithotomy, which he has described in a work published at Paris in 1826—"De la Lithotritie ou broiement de la pierre dans la vessie."—J. S., G.

**CIVILIS, CLAUDIUS**, or **JULIUS**, the leader of the Batavi, a Celtic tribe, who revolted from Rome A.D. 69-70, was of the race of the Batavian kings. His brother, Julius Paulus, was put to death A.D. 67 or 68, and he himself was sent in chains to Nero at Rome. He afterwards became prefect of a cohort, but in this position made himself obnoxious to the army of Vitellius, and with difficulty escaped with his life. The misconduct of the Roman officers in Gaul and Germany made it an

easy task for Civilis to rouse his countrymen against their masters; and accordingly, under pretence of supporting the cause of Vespasian, he assembled an army, and gave battle to the generals of Vitellius, who were completely defeated. Civilis, however, continued in open revolt after the death of Vitellius. He was defeated in A.D. 70. by Petilius Cerealis. What became of him afterwards is not certainly known.—J. S., G.

**CIVININI, GIOVANNI DOMENICO**, an Italian botanist, lived during the first half of the eighteenth century. He published at Florence a work on the history and nature of coffee.—J. H. B.

**CIVITALI, MATTEO**, a distinguished Italian sculptor and architect, who achieved all his success after he was thirty, having till that age followed the trade of a barber, apparently without the least consciousness of his genius for art. Specimens of his art are to be seen in his native city Lucca and at Genoa, which for beauty of composition may be compared with the works of the foremost sculptors of the fifteenth century. He was born in 1435, and died in 1501.—J. S., G.

**CIVOLI**. See **CARDI**.

**CLAGETT, WILLIAM**, an English theologian, was born at St. Edmundsbury in 1646; died in 1688. He was successively rector of Farnham, and chaplain to James II. His principal works are—"Difference of the case between the separation of Protestants from the Church of Rome and the separation of Dissenters from the Church of England," London, 1683; "The State of the Church of Rome when the Reformation began, as it appears by the advices given to Popes Paul III. and Julius III. by creatures of their own."—J. T.

**CLAGETT, NICHOLAS**, brother of the preceding, born in 1654, was for forty-six years preacher at St. Edmundsbury. He died in 1726, leaving "A Persuasive to an ingenuous Trial of Opinions in Religion," 4to, London, 1685; "Truth Defended," &c., 8vo, London, 1710.—J. T.

**CLAIRAUT, ALEXIS CLAUDE**, born in Paris in 1713; died in 1765. In our more modern times there are three great and classical epochs as to mathematical science. The first was filled by the achievements, the fame, and the power of Newton, Leibnitz, and the Bernoullies. Following them we have the great triumvirate Euler, D'Alembert, and Clairaut; to which succeeded the reign of Lagrange and Laplace. Genius did not indeed terminate on the death of Laplace, but the reign of ancient methods certainly terminated then. We have had since Abel and Jacobi; Gauss, and our own Hamilton—the last, the sole survivor, and perhaps the real inaugurator of the coming and not feebly indicated era. During that early triumvirate, in which, as regards taste in composition and its accompanying quickness of perception, Clairaut occupies no inferior rank, the grand problem was the problem of perturbations. And Montucla is correct in saying that Clairaut was the first who had the courage to attack with requisite boldness, and in a mode sufficiently general, the purely dogmatical problem—*Three bodies, the Sun, the Earth, and the Moon, being cast into space, at given distances, and with given velocities and matter, and attracting each other according to the Newtonian law; it is required to determine the curve, which one of them—say the Moon—must describe around the Earth?* Clairaut wrote on every question of astronomical physics that had been cast up at that time. He wrote better than any contemporary on the "Figure of the Earth." It is still most pleasant to read his volume on "Curves of Double Curvature," and his elementary book on Geometry is in many respects a model. Clairaut was no insignificant form in the midst of the "great world" of Paris. He lived in times that precluded the great Revolution—when "territorial constitutions" had come to be at discount.—J. P. N.

**CLAIRON, CLAIRE-JOSEPH-HIPPOLYTE LEGRIS DE LATUDE**, a famous French actress, was born in French Flanders in 1723, and died in Paris in 1803. She was for a long period the chief ornament of the Theatre français. Her name occurs frequently in the literary memoirs of the great dramatic authors of her day. Voltaire, who was delighted with her impersonations of several of his own heroines, has immortalized her in some well-known verses. Her "Memoirs" appeared in 1799.

\* **CLAIRVILLE, LOUIS FRANCIS NICOLAIE**, a dramatic writer, born at Lyons in January, 1811. Originally, like his father and mother, an actor, Clairville at length tried his hand at writing vaudevilles, and the result was perfect success in that light and agreeable kind of dramatic literature. During the revolutionary fever of 1818 he produced a piece which required

some courage at the time. Taking for his subject M. Proudhon's paradoxical maxim that "property is robbery," Clairville brought out his "Propriété c'est le vol"—a piece in which he ridiculed and satirized the various extravagant notions of the socialists with an extravagance no less absurd, but redeemed by being amusing. All Paris went, including the members of the provincial government; some of whom were caricatured before their eyes, and all laughed and applauded. Clairville's fertility in this kind of writing appears inexhaustible.—J. F. C.

CLAJUS, JOHANN, the Elder, a German poet and scholar, was born at Herzberg about 1530, and died in 1592 at Pendeleben near Sondershausen. He wrote several volumes of poetry; his principal work, however, is his German grammar (*Grammatica linguæ Germanicæ*, 11th ed., Nurnberg and Prague, 1720). Life by J. E. Goldhagen, Nordhausen, 1751.—K. E.

CLAJUS, JOHANN, the Younger, was born at Meissen in 1616, and died at Kitzingen in Franconia in 1656. He was a poet-laureate, and one of the founders of the Pegnitzorden. He wrote tragedies—"Herodes" and "Der leidende Christus"—poems, and other works.—K. E.

CLAMENGES, MATTHIEU NICOLAS DE (in Latin CLEMANGIUS), a French theologian, was born about 1360. He was educated in the college of Navarre at Paris under Professors Nogent, Machet, and Gerson, and seems to have imbibed their reforming opinions. He was early distinguished for his learning and eloquence, and in 1393 was elected rector of the Academy of Paris. In the following year he presented to the king, in the name of the Sorbonne, a treatise pointing out various methods by which the king might terminate the schism then existing in the church; but in 1408 a bill of excommunication was issued against Clamanges by Benedict XIII., and he was forced to retire to the abbey of Vallombrosa in Tuscany. He ultimately returned to France, held several important offices, and spent the close of his life in the college of Navarre, where he died about 1440. Clamanges was a man of great ability, learning, and piety, and denounced with unsparing fidelity the vices of wicked princes, and of the pope, the clergy, and the monks. He has left a great many works, including treatises on "Antichrist," "The Corrupt State of the Church," "The Parable of the Prodigal Son," "The Benefit of Adversity," &c.—J. T.

CLANCY, MICHAEL, M.D., an Irish author, whose life from infancy was one of adventure, was born in the end of the seventeenth century. At eight years old he was sent to a college in Paris, whence he stole out to see the duke of Ormond, and being ashamed or afraid to return he made his way to Dublin. Ignorant of the abode of his relations, he was saved from starvation by a stranger who placed him in a free school. He was finally discovered by his relatives, who sent him to Trinity college. He next sought his fortune in France, but was wrecked off the coast of Spain, and ultimately worked his way to Bordeaux, and subsequently obtained the degree of doctor of medicine at Rheims. Finally he returned to Ireland, and had good practice till he lost his sight. He now took to authorship, wrote several plays, one of which, "The Sharpers," is favourably spoken of by Swift, and all held their ground for some time on the stage. His poverty forced him to the singular expedient of playing for his own benefit in the character of the blind prophet "Tiresias," in Dryden and Lee's tragedy of *Œdipus*. He obtained a pension from the king of £40 a-year, and died about the year 1760.—J. F. W.

CLANRICARDE, a branch of the noble family of De Burgho which has given many illustrious names to Irish history:—

ULICK, the first earl, was distinguished in the sixteenth century for his vast territories and power, and the many important towns which he founded, including Roscommon, Galway, Loughrea, and Leitrim. He surrendered all his possessions to Henry VIII. in 1543, and obtained a regrant of them with the earldom of Clanricarde. He died in 1544, and was succeeded by his son—

RICHARD, second earl, commonly known as Sassanagh. He was a firm adherent to the English rule, and in 1548 captured the famous Cormac Roe O'Conor. Lodge states that he was lord-lieutenant of Ireland, and that he gained a victory over the Scots at Moyne in 1553. The latter years of this earl were disturbed by the dissensions of his sons. He died in 1582.

RICHARD, fourth earl, took a distinguished part with Lord Mountjoy in the battle of Kinsale, fought in 1601 between the English forces and those of O'Neil and O'Donnell, displaying

extraordinary valour and personal prowess, for which he was knighted on the field. King James I. appointed him governor of Connaught, keeper of his house at Athlone, and one of the privy council. In 1615 he refused the presidency of Munster, but accepted the command of the county and city of Galway. In 1624 he was created an English peer as Baron Somerhill and Viscount Tunbridge, and Charles I. conferred upon him the titles of Baron Inany, Viscount Galway, and Earl of St. Albans. He sat by proxy in the house of lords in England, died in 1635, and was succeeded by his son—

ULICK, fifth earl, who was born in 1604. His great power and personal influence enabled him to render important service to his sovereign in the Irish rebellion in 1641. He strengthened the fort of Galway, of which he was governor, and when that town at length became infected with the spirit of disaffection and besieged the fort, he subdued the assailants by that moral energy of character for which he was remarkable. Though many overtures were made to him by the leaders of the rebellion, he remained unshaken in his loyalty, and was included in the king's commission, with Ormonde and others, to meet the recusants and transmit their complaints, and went so far as to procure a treaty for a cessation of hostilities for a year. Clanricarde, in conjunction with Ormonde, opposed the progress of Ireton and Coote towards Athlone, and on the return of Ormonde to England he was appointed his deputy with full power. In this arduous duty he had to encounter great difficulties. The success of the republicans did not prevent this loyal noble adhering with desperate fidelity to the cause of his master, till at length, in compliance with the king's instructions, he yielded when resistance could no longer be availing. His high character procured him the respect even of his enemies, and he was allowed to transport himself and three thousand Irish into the service of any foreign prince not at war with England. His Irish estate was confiscated, and he retired to Somerhill in Kent, where he died in 1657.

JOHN, ninth earl, commanded a regiment of foot in the service of James II., and was taken prisoner at the battle of Aughrim. He was outlawed and attainted, and died in 1722. On the accession of Queen Anne the attainder was reversed, and the estates restored to his children.—J. F. W.

CLAP, THOMAS, president of Yale college in New England, born at Scituate, Massachusetts, in 1703, and graduated at Harvard college. After officiating as a minister for thirteen years at Windham, Connecticut, he was appointed in 1739 president of Yale college. He entered on the duties of the office with a high reputation for general scholarship, especially for a knowledge of astronomy and pure mathematics. His career of usefulness in the college was latterly much marred by a controversy with Jonathan Edwards, arising out of the disputes to which Whitfield's visit gave rise among the theologians of New England. He resigned his office in 1766, a year before his death.—F. B.

CLAPAREDE, COUNT, a distinguished general and peer of France, born in 1774; died in 1841. He served in nearly all the campaigns of Napoleon, and earned in various battles the reputation of a brave and able soldier.—J. T.

CLAPPERTON, HUGH, a distinguished African traveller, was the son of a respectable surgeon, and was born at Annan in Scotland in 1788. Having acquired some knowledge of practical mathematics, including navigation and trigonometry, he was apprenticed at the age of thirteen in a merchant-ship which sailed between Liverpool and North America. After making several voyages he was impressed for the navy, and sent on board the *Clorinde* man-of-war as a common seaman. Partly through the influence of a relative, partly by his own intelligence and activity, he was soon promoted to the rank of a midshipman. In 1813 he was drafted on board the *Asia*, the flag-ship of Vice-Admiral Sir Alexander Cochrane, for the purpose of acting as drill-sergeant, and training the crew in the use of the cutlass, in which, along with some others, he had been instructed by the celebrated guardsman Angelo. In the following year he was sent to the Canadian lakes, where he was promoted to the rank of lieutenant, and appointed to the command of the *Confiance* schooner. The flotilla on the lakes having been disbanded in 1817, Clapperton returned home, and was placed on half-pay. After spending some time at Lochinaben, Clapperton removed to Edinburgh in 1820, and became acquainted with Dr. Oudney, a young Englishman, who first directed his attention to the subject

of African discovery. After the return of Captain Lyon from his unsuccessful attempt to penetrate Northern Africa, the government resolved to send out a second expedition to explore that country; and with this view Dr. Oudney was directed by Lord Bathurst to proceed as consul to Bornou in Central Africa; and Captain Clapperton and Colonel Denham were appointed to accompany him. They set out from Tripoli early in 1822, and advanced in a line nearly south to Mourzook which they reached on the 8th of April. Finding it impossible to proceed farther at this time, Denham returned to Tripoli, while Clapperton and Oudney made an excursion westward into the country of the Tuaricks, and penetrated as far as Ghraat, E. long. 11. Denham rejoined them in October; and on the 29th of November they set out for the kingdom of Bornou. On the 17th of February, they reached Kouka, the capital, which they made their headquarters for some months, undertaking occasional excursions to the south and west. On the 14th of December, Clapperton and Oudney quitted Kouka, for the purpose of exploring the course of the Niger. They reached Murrur in safety, but there Oudney breathed his last; and Clapperton, prosecuting his journey alone and in deep distress, succeeded in penetrating as far as Saccatoo, N. lat. 13, and E. long. 6½, where he was obliged to turn back. On his return to Kouka, 8th July, he was rejoined by Denham, who had meanwhile been exploring the shores of the great lake Tchad, and scarcely recognized his emaciated friend. After a harassing journey across the desert, the enterprising travellers reached Tripoli, January 26, 1825, and thence proceeded to England, where they arrived on the 1st of June. The results of this expedition were published in a work entitled "Narrative of Travels and Discoveries in Northern and Central Africa in the years 1821-24." Immediately after his return, Clapperton, who had been raised to the rank of commander, was engaged to undertake another expedition in company with Captain Pearce, R.N., Mr. Dickson, and Dr. Morrison, and attended by a youth, named Richard Lander, and two or three other servants. This time Clapperton resolved to penetrate into Africa from the Guinea coast. He left England on the 25th of August, 1825, and landed in the Bight of Benin on the 28th of November. The party commenced their journey into the interior on the 7th of December; but Pearce and Morrison soon sunk under the maladies of the country. The survivors, who met with great kindness from the natives, reached Katunga, the capital of Yariba, on the 15th of January, 1826, and soon after crossed the Niger at Broussa, the scene of Mungo Park's lamented death. They then proceeded to the great commercial town of Kano, which Clapperton had previously visited. Then turning westward, he went on to Saccatoo, the extreme point of his former expedition. It was his wish to obtain permission from Bello, the sultan of Saccatoo, to proceed to Timbuctoo and Bornou. But Bello was at this time carrying on a war with the sheik of Bornou, to whom Clapperton carried considerable presents from the king of England, and detained him for several months at Saccatoo. The vigorous constitution of the English traveller gave way under the effects of the climate, and privation, and vexation. He was attacked with dysentery, 13th March, and on the 13th of April, 1827, expired in the arms of his faithful attendant Lander. Captain Clapperton was admirably fitted, both bodily and mentally, for arduous and hazardous enterprises. He was tall, robust, and manly in his frame, and united indomitable courage and resolution to great gentleness and simplicity; though he failed in the main object of his expedition, he contributed greatly to our knowledge of Northern Africa.—(*Journal of a Second Expedition into the Interior of Africa, &c.*, by the late Commander Clapperton; *Records of Captain Clapperton's Last Expedition to Africa*, by Richard Lander.)—J. T.

CLARAC, CHARLES OTHON FREDERIC JEAN BAPTISTE, Comte de, antiquarian and artist, born at Paris in June, 1777. Having quitted France on the breaking out of the Revolution, he took up his abode in Russia, devoting himself to study, and becoming a proficient in several languages. He accepted in 1808 the place of tutor in the family of Murat, king of Naples, and while thus employed had an opportunity of examining Pompeii, of which he published an account. In 1814 he went to Brazil attached to the embassy, and on his return was appointed keeper of that splendid collection of antiquities which enriches the museum of the Louvre. Having had his mind opened to the surprising excellence of ancient art, he resolved upon attempting a history of the subject. His work, derived from a study of the

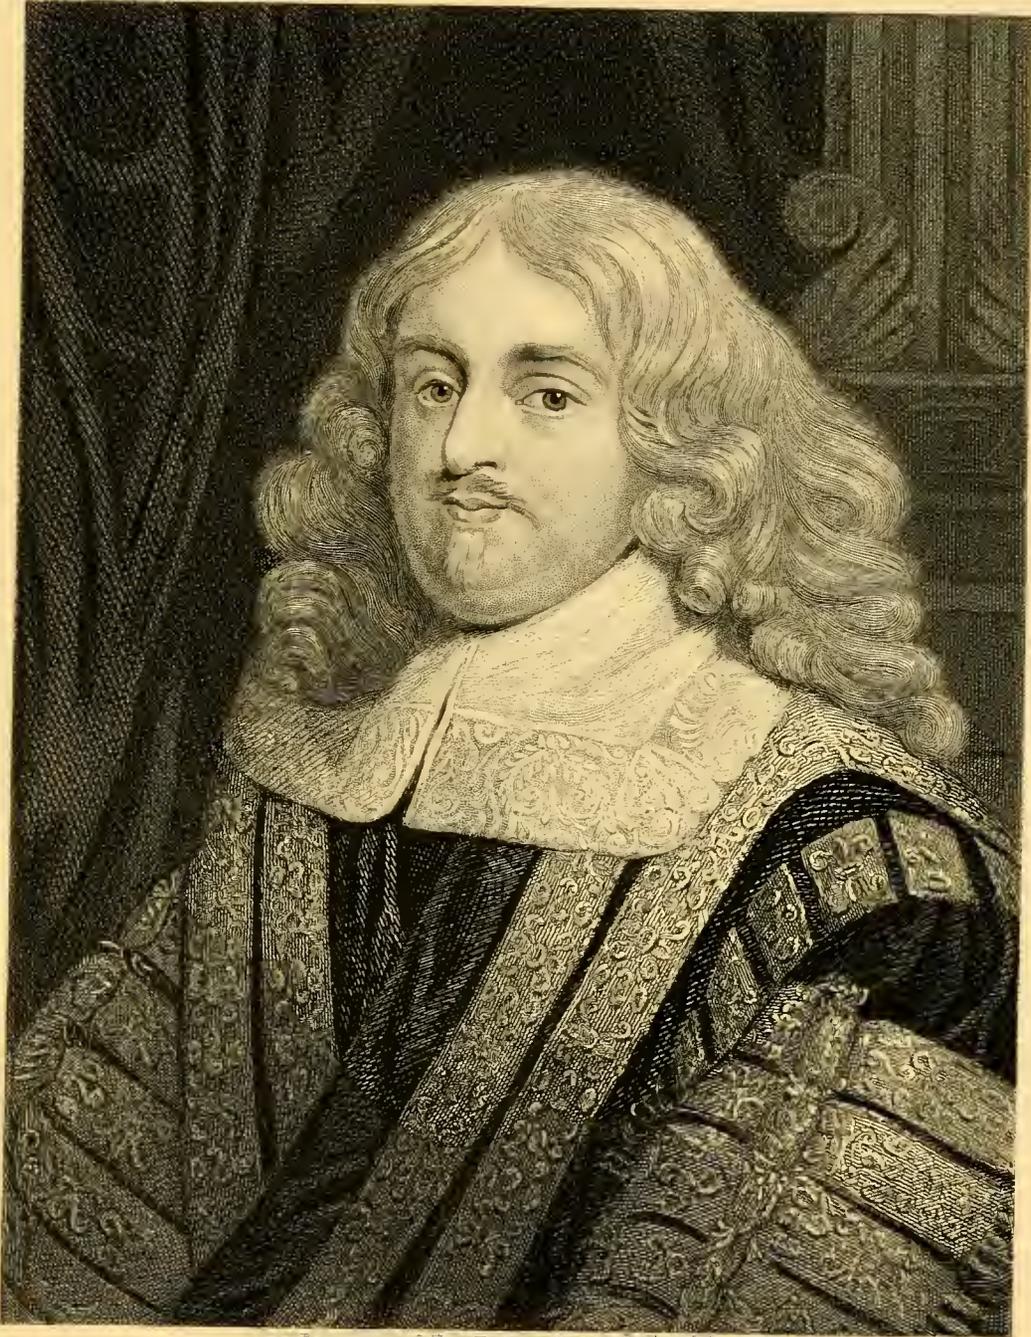

objects under his own care as well as from examinations of collections in other countries, is not considered to have exhausted so fertile a subject. He died in 1847.—J. F. C.

CLARE, JOHN FITZGIBBON, first earl of, was born in 1749; and being destined by his father, an eminent barrister, to follow the same profession, he received a good education, and entered Trinity college, Dublin, where he was the contemporary and rival for academic honours of Grattan. When called to the bar, his energy, industry, and talent at once insured his success, and in 1777 he was elected to represent the university of Dublin, giving his support to the government. In 1784 Fitzgibbon was appointed attorney-general for Ireland, an office due as well to his high professional position as to his parliamentary services. His position was an arduous one, as it arrayed against him the popular opposition of the demagogues of the day; and he exhibited undoubtedly much wisdom, courage, and firmness in the discharge of his duties. In 1789 Fitzgibbon was promoted to the office of lord chancellor, and raised to the peerage by the title of Baron Fitzgibbon. Few men had to contend with greater political difficulties than the chancellor. Ireland was in a state of secret disorganization, that shortly was to eventuate in open rebellion; and no doubt the vigour and wisdom of his measures did much to keep the daring spirits of the day in check. In 1795 he was created Earl of Clare, and in 1799 his signal merits were rewarded by a peerage of the United Kingdom as Lord Fitzgibbon. Lord Clare was one of the most prominent and able advocates for the legislative union, which measure he did not long survive, dying in 1802. His intellect was rapid, clear, and full of power, but its power seems to have consisted more in sagacity and common sense than in depth or extraordinary comprehensiveness. Still, for mere intellect, he may be placed at the head of the eminent Irishmen amongst whom he was an actor. With profound, but rough and masculine strength of feeling, he was endowed with an amount of moral firmness and superiority to popular influences rarely found amongst public men. Few men have been more exposed to censure and calumny than Lord Clare; but we believe that, on the whole, those who carefully weigh his conduct will acquit him of the charges which his enemies were ever ready to bring against him. It is true his zeal may have been sometimes carried beyond the bounds of lenity, but it must be remembered that the crisis demanded strong action, and great allowance may be made in minor matters for one who, nearly alone in that trying time, stood firm and unappalled at the post of duty.—J. F. W.

CLARE, JOHN, the peasant poet of Northamptonshire, was born at Helpstone on the 13th of July, 1793. His parents were very poor, and John was at an early age obliged to assist his father in the labours of the field. He was never sent to school; but when ten years of age he learned to read from an old dame who held her school in the church belfry, his earnings for five days in the week enabling him to attend school on the sixth. At a later period he was taught to write by a kind exciseman at Helpstone, named John Turnbull. At the age of thirteen Thomson's Seasons fell into his hands, and inspired the composition of his first verses, "The Morning Walk." In 1818 Clare, who was still engaged in the toilsome labours of the field, published his first volume of poems on "Rural Life." The volume was cordially reviewed in the *Quarterly* and other journals, and obtained for the author the liberal patronage of Lords Fitzwilliam, Spenser, and Exeter. In 1821 Clare published "The Village Minstrel;" in 1827 "The Shepherd's Calendar;" and in 1835 "The Rural Muse." A pure vein of genuine poetry and feeling runs through the whole of his verses; and his descriptions of nature are true and loving, and are clothed in picturesque and nervous language. Clare unfortunately embarked in some unsuccessful speculations, in which he lost his little all. He sunk in consequence into a deep melancholy, and was for many years a patient in the Northampton lunatic asylum. He died on the 19th of May, 1864.—J. T.

CLARE or CLARA, Sr., founder of an order of nuns called after her name, was born at Assisi in Italy in 1193, and died in 1253. At the age of eighteen she fled from her parents, who were persons of rank, and placed herself under the care of St. Francis, who established her in a nunnery, which the fame of its superior soon crowded with ardent devotees. She was canonized two years after her death by Pope Alexander IV.

WILHELMUS VI

WILHELMUS VI

CLARENDON, GEORGE WILLIAM VILLIERS, fourth earl of, a distinguished diplomatist and statesman, was born in London on the 12th January, 1800. He was descended from Sir Edward Villiers, an elder brother of the famous duke of Buckingham; the Villierses, earls of Jersey, are an elder branch of the family to which the late earl of Clarendon belonged. The first Villiers, earl of Clarendon, was a younger son of a Villiers, earl of Jersey, and married a descendant of the celebrated Hyde, Lord Clarendon; he was successively joint postmaster-general, chancellor of the duchy of Lancaster, and ambassador at the court of Berlin. He was created earl of Clarendon in 1776, and his third son was the father of the subject of this memoir. Lord Clarendon was educated at Cambridge, and, entering early the service of his country, was attached to the embassy at St. Petersburg during the years 1820-23. From 1823 to 1833 he was first commissioner of excise, two of his uncles being or having been favourite companions of George IV. From 1827 to 1829, Mr. Villiers was resident in Dublin, the capital which he was afterwards to visit as viceroy. His ostensible occupation was the arrangement of the union between the two excise boards; but if credence is to be given to a passage in the late Lord Cloncurry's memoirs—he played an important though an unseen part in the local negotiations which preceded the emancipation of the Roman Catholics. To natural talents, conciliatory manners, and good family connections, Mr. Villiers added a singular aptitude for business; and after the formation of the first reform ministry, and the establishment of the monarchy of July, he was sent to negotiate a commercial treaty with France. In September, 1833, he was appointed envoy extraordinary and minister plenipotentiary at Madrid, an important and conspicuous post in the then state of the Iberian peninsula, and which he held until October, 1839. Succeeding, on the death of his uncle in 1838, to the earldom, he returned soon afterwards to England and delivered in his place in the house of lords a speech on Spanish affairs, which produced a considerable effect. In October, 1840, he was admitted into the Melbourne cabinet as lord privy seal, being also, on the death of Lord Holland, chancellor of the duchy of Lancaster *pro tem.*, and held both offices up to the accession of Sir Robert Peel as premier, in the autumn of 1841. On the formation of Lord John Russell's first ministry in 1846, Lord Clarendon was appointed president of the board of trade, from which he was elevated, on the death of Lord Bessborough the following year, to the lord-lieutenancy of Ireland. There he remained during a most critical period of Irish history, until the formation of Lord Derby's first ministry. On the accession of Lord Aberdeen's coalition ministry to power, Lord Clarendon became secretary for foreign affairs, after a brief occupancy of that department by Lord John Russell. The negotiations which issued in the Russian war were, of course, conducted by Lord Clarendon, and on its termination, he, along with Lord Cowley, represented Great Britain at the conferences held in the French metropolis, which led to the treaty of Paris. At the time of his death, 27th of June, 1870, he held the office of foreign secretary in Mr. Gladstone's ministry, in which capacity he displayed great firmness and zeal in his correspondence with the Greek government relating to the recent savage treatment of our countrymen by Greek brigands. In 1839 Lord Clarendon married Catharine, daughter of the first earl of Verulam, by whom he left a family.—F. E.

CLARÌ, GIAN CARLO MARIA, a musician, was born at Pisa in 1669; the time and place of his death are unknown. He studied his art under Giovanni Paolo Colonna, at Bologna, and held the office of maestro di capella in the cathedral of Pistoja. He gained considerable renown by the production in 1695 of an opera at Bologna entitled "Il Savio Delirante," which, however, like almost all his ecclesiastical music, was never printed. His vocal duets and trios, with a figured bass, obtained very extensive circulation in MS. before they were published in 1720. Their appearance in print was preceded by that of a similar collection by Stefani, who, not improbably, had modelled his compositions upon those of Clari; some of these are still occasionally heard in public performance, and the purity of their counterpoint, and the ingenuity of their fugal imitation, justify the very high esteem in which, as a composer in the severe style, their author is held. With his usual freedom of appropriation, Handel has employed several subjects from this work of Clari, in his oratorio of Theodora. An edition of the duets and trios, with a developed accompaniment for the piano-

forte by Mirecki, a Polish musician, was published at Paris in 1823. A profound contrapuntal composition of Clari is printed by Padre Paolucci in his theoretical treatise.—G. A. M.

CLARICI, PAOLO BARTOLOMEO, an Italian botanist, was born at Ancona in 1664, and died at Padua on 22nd December, 1724. He resided at Padua, and devoted his time and attention to the cultivation of plants. Subsequently he entered the church, and became bishop of Padua. He wrote a work on the "Cultivation of Plants in Gardens," which was published by a nephew of the bishop at Venice in 1726.—J. H. B.

CLARIDGE, RICHARD, an eminent Quaker writer, born in Warwickshire in 1649; died in 1723.

CLARIUS or CLARIO, ISIDORE, an Italian prelate, born at Chiari in Brescia in 1495, was promoted to the see of Foligno in 1547. His reform of the Vulgate, with annotations upon the difficult passages, was the great work of his life. He was equally distinguished as an orator and as a critic, and played a conspicuous part at the Council of Trent. He died in 1555.

CLARK, ABRAHAM, a member of congress from New Jersey, and one of the signers of the American declaration of independence, was born at Elizabethtown, New Jersey, 15th February, 1726. At the outbreak of the Revolution, he espoused the popular cause, became a member of the committee of safety, and was elected to congress, just in time to vote for the Declaration. Mr. Clark was a member of congress from 1776 to 1782, and again in 1787-88. He was elected to the convention which framed the federal constitution, but ill health prevented him from taking his seat. After the new government was put in operation, he was again sent to congress, and remained there from 1791 till his death in 1794.—F. B.

CLARKE, ADAM, LL.D., F.A.S., &c., Wesleyan minister, remarkable for his attainments in oriental and general literature, was born of highly respectable parents at Moybeg in the county of Londonderry, Ireland, in the year 1760 or 1762, the precise date being uncertain. His childhood gave no promise of his future literary eminence, as he acquired the rudiments of the English and Latin languages with great difficulty. Intended by his parents for the ministry of the church of England, his connection with the Wesleyan Society in 1778 led to his appointment by Mr. Wesley to the laborious duties of the Methodist itinerancy, which he commenced in 1782 in what was then called the Bradford (Wiltshire) circuit. From that period until his death, he laboured as a regular minister in the most important towns of England, and was at various times engaged in extensive journeys in Ireland, the Channel Islands, Scotland, and the Shetland Islands, in furtherance of the religious missions of the Wesleyan church. As an intelligent, interesting, and most powerful preacher, he was remarkably popular during the whole of his ministerial career, and was on three occasions, namely in 1806, in 1814, and in 1822, elected by his brethren president of the conference. As an instance of "the pursuit of knowledge under difficulties," the record of the early studies of Dr. Clarke, by his latest biographer, is most valuable, and furnishes matter of encouragement to all students similarly circumstanced. By diligent application, and by a scrupulous regard to the value of time, without neglecting the duties of his ministry, he acquired a respectable acquaintance, not only with the Latin and Greek, but also with the Hebrew, Chaldee, Syriac, Persian, Ethiopic, Coptic, and Arabic languages. These acquirements rendered him so serviceable to the committee of the British and Foreign Bible Society, that he was in 1808 continued by the Wesleyan conference in the London circuit, to meet the wishes of that valuable society, who at that time had special need of his literary assistance. He was about the same time elected librarian of the Surrey Institution, but after ten months resigned this position, as incompatible with his other more important engagements. Soon after this, he was engaged by the commissioners of the public records in the editing of Rymer's *Fœdera and Supplement*, but was compelled by his failing health in 1819 to relinquish this employment. To the *Eclectic Review* he was a regular contributor, from its establishment in 1804. His literary labours were not permitted to interfere with his duties to the church to which he belonged, and the various institutions of Wesleyan Methodism received from him no ordinary degree of attention and support. In the cause of the missions to the heathen he was specially zealous, and was for many years an active member of the committee. But he is best known to the world by his "Commentary on the Holy Scrip-

tures," six volumes, 4to, commenced in 1798 and finished in 1805. The publication was deferred until 1809, and from that time was continued in parts until the whole was completed. This work is remarkable for its originality and honesty, as well as for its learning, which at the period of its publication placed it in this respect far in advance of most English commentaries. Some of his opinions—for instance, his attributing the temptation of Eve to the baboon, and not to the serpent, and his notion that Judas was finally saved—drew forth much animadversion, which was yet more justly administered when, in the notes upon Romans, he made use of the writings of the semi-Socinian, Dr. Taylor of Norwich. His opinions on the eternal Sonship were also contrary to those of his own and of most orthodox churches, and were severely criticised by the Rev. Henry Moore and the Rev. R. Watson. The "Commentary," which the more advanced scholarship of the present generation has rendered comparatively useless to the biblical student and critic, must, however, be judged by the standard of its own age, and not of ours. It was in its time an extraordinary work, and gave an impulse to biblical studies of which we now reap the benefit. "It is on the whole one of the noblest works of the class in the entire domain of sacred literature." "The 'Commentary' is not equal through all its parts. The pentateuch and gospels are done well, and so are the apostolical epistles. On the historical books, also, he is generally satisfactory; but on the prophetic portions of the word of God he commonly fails."—(*Life of Dr. Clarke*, by J. W. Etheridge, M.A., LL.D.) The other works of Dr. Clarke are "A Bibliographical Dictionary and Miscellany," 8 vols. 12mo—1802, 1806; "A Concise Account of the Succession of Sacred Literature," 1 vol. 12mo, 1807 (completed by his son, J. B. B. Clarke, in 1831); "Memoirs of the Wesley Family," 8vo, 1823; with sundry sermons and treatises, which after his death were published in a collection of his miscellaneous works, 13 vols. 12mo. He also edited Harmer's Observations, Butterworth's Concordance, Sturm's Reflections, and Fleury's Manners of the Ancient Israelites. Dr. Clarke died rather suddenly of an attack of Asiatic cholera, in London, August 27, 1832.—W. B. B.

CLARKE, DR. ALURED, an English divine famous for his charities, born in 1696; died in 1740. He studied at Cambridge, became one of the chaplains in ordinary to George I. and George II., and in 1740 dean of Exeter. He published some occasional sermons, and an "Essay towards the Character of Queen Caroline," 1738. The whole surplus of his income he expended in works of charity. He was the principal founder of the sick hospital at Winchester.—J. S., G.

CLARKE, SIR CHARLES MANSFIELD, Bart., a successful and learned physician, born in 1782; died on the 7th September, 1857, at Brighton. He was the son of Mr. John Clarke, of Chancery Lane, a surgeon, and received his classical education at St. Paul's school. His medical education was carried on at St. George's hospital, and by attendance on lectures at the Windmill Street school of anatomy and medicine. His elder brother, Dr. John Clarke, was a successful practitioner, especially in the department to which both the brothers ultimately devoted themselves—that of midwifery and the diseases of women and children. In association with his brother Dr. Charles Clarke lectured on these subjects from the year 1804 to 1821. For many years he held the appointment of surgeon to Queen Charlotte's Lying-in Hospital. In 1825 he was elected a fellow of the Royal Society; and in 1830 he became physician to Queen Adelaide on the accession of William IV. to the throne. On September 30, 1831, he was created a baronet; and in 1836 was elected by the fellows of the College of Physicians into their body. His practice was large and lucrative; and his records of cases which came under his own notice, and his contributions to medical societies, prove him to have been a careful investigator of the diseases on which he wrote. His most important work was "On the Diseases of Females."—E. L.

CLARKE, EDWARD DANIEL, LL.D., the well-known traveller, second son of the Rev. Edward Clarke, rector of Buxted in Sussex, was born at Willingdon in that county in 1769. He was educated at Tunbridge school, and Jesus college, Cambridge, which he entered in 1786. From his residence at the university, which he extended to three years, he derived little advantage, having no taste either for classics or the mathematical sciences. He spent his time chiefly in desultory reading; chemistry, mineralogy, and the belles-lettres being his favourite pursuits. In

1790 he became tutor to a nephew of the duke of Dorset, and in company with his pupil made a tour through part of Great Britain and Ireland. In 1792 he accompanied Lord Berwick on a tour through Italy and Germany and in 1797, travelled through Scotland and the Western isles in company with a son of Lord Uxbridge. The following year he was elected fellow of his college. In the spring of 1799, having been appointed tutor to Mr. Cripps, a young gentleman of fortune, he set out in company with his pupil on a tour which was intended to last only six months, but which was protracted through three years and a half. In the course of that time he visited Denmark, Norway, Sweden, Lapland, Finland, Russia, Tartary, Circassia, Asia Minor, Syria, Palestine, part of Egypt, and Greece; and, taking Constantinople on his way home, returned through Germany and France to England. This extensive journey furnished Clarke with materials for six volumes of remarkable interest; they were written with manifest care and candour, and evinced on the part of the author uncommon learning and research, as well as no ordinary powers of observation. Clarke and his fellow-traveller, on their return to England, presented to the university of Cambridge a fragment of a colossal statue of the Eleusinian Ceres, and other valuable antiquities. The university in return conferred on Clarke the degree of LL.D. and on Cripps that of M.A. The Alexandrian sarcophagus—generally but not correctly called that of Alexander the Great, a dissertation on which is among the miscellaneous works of Clarke, he had the honour of rescuing from the hands of the French, and the gratification of seeing safely deposited in the British museum. In 1807 Clarke commenced at Cambridge a series of lectures on his favourite subject, mineralogy; the following year a chair of mineralogy was established in the university and Clarke appointed professor. Shortly after his return from the East, having taken orders, he had been appointed to two livings, one a college benefice, and the other belonging to his father-in-law, Sir William Rush. Clarke was not undistinguished as a man of science; he improved the construction and application of the blowpipe; discovered cadmium in some Derbyshire minerals, and wrote well if not extensively upon mineralogical and chemical subjects. He died in 1822, no less esteemed for his amiable disposition than for the rare activity of his mind, and the variety of his accomplishments.—J. S., G.

CLARKE, GEORGE ROGERS, an American general in the revolutionary war, and a leader of the pioneer settlers of Kentucky, was born in Albemarle county, Virginia, in 1753. In 1775 he first entered what is now the state of Kentucky, and the following year, a convention of the settlers at Harrodstown chose him a delegate to the assembly of Virginia, to obtain military aid against the British, or, if refused, to intimate distinctly that their Indian allies would set up an independent state, and protect themselves. Clark obtained some powder and munitions of war, and a legislative act erecting Kentucky into a distinct county of Virginia, to be represented as such in the general assembly of the state. On his return, he took up his residence in the county, and became the chief counsellor and military leader of its inhabitants, who, under his command, fought long and bravely against the British. He retained military possession of the country till the close of the revolutionary war, and was thus the means of securing it to the United States by the treaty of peace of 1783. The latter portion of his life was unhappy; oppressed by pecuniary difficulties, he became a victim of intemperance. He died in Kentucky, in 1818.—F. B.

CLARKE, HENRI-JACQUES GUILLAUME, Count d'Hunembourg and Duke de Feltre, marshal of France, was born 17th October, 1765. He entered the army in 1782, and rose by successive steps to the rank of lieutenant-colonel in 1792. He was made provisionary general of brigade in 1793, but was suspended in that same year. Two years later he was taken under the protection of Carnot, and was appointed by him to an office in the bureau of the ministry of war, the duties of which he discharged with great energy and success. In 1796 Clarke was despatched by the directory on a secret mission to Vienna, and soon after was sent to Italy to watch the movements of Bonaparte, whose success was exciting uneasiness in the minds of the government. He was so fascinated, however, by that extraordinary personage, that he completely forgot the object of his mission, attached himself to Bonaparte, and assisted him in concluding the treaty of Campo Formio. He was in consequence recalled by the directory, and deprived both of his rank as general and his office as chief of the topographic bureau. After

the revolution of the 18th brumaire, he was intrusted with several important missions by the first consul, and in 1804, was made councillor of state and private secretary to Napoleon for the war department. He accompanied the emperor in the campaign of 1805, and distinguished himself both at Ulm and Jena. In 1807 he succeeded Berthier as minister of war, and held that office until 1814. As a reward for his important services in that department, he was created Count d'Hunebourg in 1807, and Duke de Feltre in 1809. On the downfall of Napoleon, he gave in his adherence to the Bourbons, and held for some time the portfolio of war, and was created a marshal of France. He died in 1818.—J. T.

CLARK, SIR JAMES, Bart., physician-in-ordinary to the queen, was born at Cullen in Banffshire in December, 1788. He received his early education in the grammar school at Fordyce, and afterwards entered King's college, Aberdeen, where he took his M.A. degree. He next studied medicine in Edinburgh, and took the diploma of the college of surgeons of that city, and of London. In 1809 he entered the navy, where he remained until 1815 when he returned to Edinburgh, and in 1817 graduated in that university. Dr. Clark travelled extensively on the continent, visiting all the districts containing the reputed mineral waters, and investigating the effect of climate on health and disease in different places frequented by invalids. He settled in Rome, and for eight years practised regularly there. Becoming acquainted with Prince Leopold of Saxe-Coburg, he was appointed by him to be his physician in 1824. Two years later he returned to England, and having settled in London, was appointed physician to St. George's parochial infirmary. In 1829 appeared his work entitled, "On the Sanative Influence of Climate," which passed through several editions, and has become an authority on the subject. In 1832 he was elected a fellow of the Royal Society, and on the death of Dr. Maton in 1835, became physician to the duchess of Kent and the Princess Victoria. On her majesty's accession to the throne he received the appointment of physician-in-ordinary to the queen. In 1835 he published a "Treatise on Pulmonary Consumption and Scrofulous Disease," which by its clear exposition and able reasoning, has done much to clear away the false notions which formerly obtained respecting the nature and treatment of these diseases. On the establishment of the university of London, Dr. Clark was chosen on the senate. Whilst living abroad he had greatly interested himself in the state of medical education in foreign universities and schools, and had observed their superiority in several points, more especially that of clinical instruction. His views on the subject were set forth in a pamphlet on "Clinical Instruction." This defect in our institutions has been remedied by the senate of the London university, so far as regards its medical graduates. Sir James Clark was created a baronet in 1838. He was a member of the principal foreign, scientific, and medical societies, and was several times chosen on the council of the Royal Society. In addition to his other claims to distinction, he took a warm interest in sanitary reform, and exerted all his influence in favour of measures likely to promote the improvement of public health. In medical politics he took a lively interest, and his appointment by the government as a member of the medical council of the United Kingdom, may be regarded as a public recognition of the services he rendered his profession. He died on the 29th of June, 1870.—E. L.

CLARKE, JAMES STANIER, brother of Edward Daniel, a chaplain in the royal navy, attended Nelson at the battle of Trafalgar, and subsequently became domestic chaplain and librarian at Carlton House. He published a "Life of Lord Nelson," 1809, 2 vols., 4to; and the "Life of King James II., from his own Memoirs and the Stewart MSS. at Carlton House," 1816, 2 vols., 4to, &c. He died in 1834.—J. S., G.

CLARKE, JEREMIAH, a celebrated musician, was educated in the royal chapel under Dr. Blow, who entertained so great a friendship for him as to resign in his favour the places of almoner and master of the children of St. Paul's cathedral. He received these appointments in 1693, and shortly afterwards added to them that of organist of the same foundation. In July, 1700, he was appointed a gentleman-extraordinary of the chapel-royal, and at the expiration of about four years was also made organist. The compositions of Clarke are not numerous, as an untimely and melancholy end was put to his existence before his genius had had time to expand. Early in life he was so unfortunate as to conceive a violent and hopeless passion for a very beautiful

lady, of a rank far superior to his own, and his sufferings under these circumstances became at length so intolerable that he resolved to terminate them by suicide. Being at the house of a friend in the country, he found himself so miserable that he suddenly determined to return to London. His friend observing in his behaviour great marks of dejection, furnished him with a horse and a servant to attend him. In his way to town a fit of melancholy and despair having seized him, he alighted, and giving his horse to the servant, went into a field, in the corner of which was a pond surrounded by trees. This pointed out to his choice two ways of getting rid of life; but not being more inclined to the one than the other, he left it to the determination of chance. He took out of his pocket a piece of money, and tossing it in the air determined to abide by its decision. The money fell on its edge in the clay, and thus seemed to prohibit both these means of destruction. His mind, however, was too much disordered to receive comfort from, or take advantage of this delay. He therefore mounted his horse and rode to London, determined to find some other means of ridding himself of life, and in July, 1707, not many weeks after his return, he shot himself in his own house in St. Paul's churchyard. The works of Clarke published in his lifetime, are lessons for the harpsichord, and many songs to be found in the collections of his day, particularly in Durfey's Pills To Purge Melancholy. He also wrote for Durfey's comedy, The Fond Husband, that pleasing ballad introduced in the Beggars' Opera, and sung to the words, "'Tis woman that seduces all mankind," and he contributed to the Harmonia Sacra. But his compositions for the church are those on which his fame chiefly rests. They abound in melody which time has not antiquated, and are rich in harmony and deeply pathetic. Dr. Burney sums up Clarke's merits in the following discriminating sentence—"Tenderness is so much his characteristic that he may well be called the musical Otway of his time."—E. F. R.

CLARKE, REV. JOHN, one of the founders of the colony of Rhode island in America, was born, as is supposed, in Bedfordshire, England, in 1609. In 1649 he was chosen an assistant or councillor, and also treasurer of the colony; and two years afterwards was sent to England with Roger Williams, first to procure the annulling of a commission or proprietary grant, which had been given to Mr. Coddington of all the islands in Narragansett bay; and secondly, to obtain from the council of state a charter for the colony. After an absence of nearly twelve years he returned to Rhode island in 1664; resumed the care of his church, and was elected to numerous civil stations in the colony. In his last will and testament he left a large farm at Newport in trust, for the support of learning and religion. No name in early New England history shines with a more unsullied brightness. He died without children, April 20, 1676, in the sixty-seventh year of his age.—F. B.

CLARKE, JOHN, Mus. Doc., afterwards known as Clarke Whitfield, was born at Gloucester in 1770. He commenced his musical education at Oxford in 1783, under Philip Hayes, and in 1789 was appointed organist of Ludlow in Shropshire. In 1793 he took his degree of musical bachelor at Oxford, and two years afterwards that of doctor in the university of Dublin. In the same year he was elected organist of the cathedral of Armagh. Dr. Clarke returned to England in 1798, and accepted the post of organist of Trinity and St. John's colleges, Cambridge, which appointments he held for more than twenty years. In 1814, he took the surname of Whitfield, by sign manual, on the death of his maternal uncle, Henry Fotherby Whitfield, Esq. of Rickmansworth Park, Herts. In 1820 he was elected organist of Hereford cathedral, and in the following year professor of music in the university of Cambridge. Dr. Clarke's numerous compositions consist of songs, glees, cathedral music, and an oratorio entitled "The Crucifixion." The latter was performed in the cathedral of Hereford, at the triennial music meeting in 1822. He also edited fifteen volumes of Handel's oratorios, with a compressed accompaniment for the pianoforte; two volumes entitled The Beauties of Purcell, &c. Dr. Clarke was an excellent musician, without displaying much original genius. He died at Hereford in 1836.—E. F. R.

CLARK, JOHN, a Scotch physician, was born at Roxburgh in 1744. He entered the service of the East India Company in the capacity of a surgeon; and, as the result of the experience acquired in several voyages, he published in 1773, in one vol. 8vo, "Observations on the Diseases in long Voyages to hot

countries, and particularly to the East Indies." He subsequently settled at Newcastle and was employed to reform the gross abuses which had crept into the management of the public hospital, and to erect a dispensary for the poor. He subsequently published in 1780 "Observations on Fevers, especially those of the continued type," one vol. 8vo; and "A Collection of Memoirs on the Means of Preventing the Progress of Contagious Fevers," 12mo, 1802. Dr. Clark died at Bath in 1805.—J. T.

\* CLARKE, MRS. MARY COWDEN, the authoress of the invaluable "Complete Concordance to Shakspeare," a work to which the author "devoted the untiring labour of sixteen years—twelve in the preparation of the MS., and four more in guiding it through the press." She is the daughter of Mr. Vincent Novello, and was born in June in 1809. In 1828 she married Mr. Charles Cowden Clarke, the friend of Lamb, Hazlitt, and Leigh Hunt, and the teacher as well as friend of Keats. Notwithstanding all that has been done for the elucidation of the text of Shakspeare by other modern authors, the literary world acknowledges a heavy debt of gratitude to the author of the "Concordance." Mrs. Clarke's "Girlhood of Shakspeare's Heroines;" "Shakspeare Proverbs;" "Kit Bam's Adventures;" "Iron Cousin, or Mutual Influence;" "World-noted Women, or Types of Particular Womanly Attributes of all Lands and Ages, Illustrated," which, published in New York, 1858, are also well-known and admirable works.—J. S., G.

CLARKE, SAMUEL, an estimable English divine, was born in 1599 at Woolston in Warwickshire, where his father had been a long time minister. He was educated at Cambridge; became assistant to the incumbent of Thornton in Cheshire; removed to Shotwick, and, after five years' residence there, was presented to the rectory of Alcester. He refused the *et cetera* oath, and drew up a petition on the subject, which he presented to the king at York. Having officiated nine years at Alcester, he went to London on some business connected with his petition to the king, and was there chosen preacher of the parish of St. Bennet Fink, where he remained till the Restoration. About the year 1662 he was ejected for nonconformity, having, although warmly attached to the constitution and the doctrines of the church, long entertained conscientious scruples respecting certain of its ceremonies and points of discipline. Till his death, which occurred in 1682, he continued to attend as a hearer the service he had formerly conducted, not daring, as he said, to gather a private church out of a true church, which the church of England in his judgment was. His principal works are—"A Mirror or Looking-glass for Saints and Sinners," &c.; "The Marrow of Ecclesiastical History," &c.; "A General Martyrology, and an English Martyrology;" "The Lives of Sundry Eminent Persons in this latter Age;" and "The Marrow of Divinity," &c.—His son SAMUEL published "Annotations on the Bible," which Dr. Owen and Mr. Baxter commended as able and judicious, and which have been of great although unacknowledged service to many modern commentators.—The great-grandson of the martyrologist, also called SAMUEL, pastor of a congregation of dissenters at St. Albans, published a work entitled "Scripture Promises," which has been frequently reprinted.—J. S., G.

CLARKE, SAMUEL, born at Brackley in Northamptonshire, in 1623, was "right famous," according to Wood, "for Oriental learning." After studying at Oxford, he became master of a boarding-school at Islington. While there he assisted Walton in his Polyglott Bible. In 1658 the university elected him archtypographus and superior beadle of the civil law. His death occurred in 1669. He published "Variæ Lectiones et Observationes in Chaldaicam Paraphrasin," "Scientia Metrica et Rhythmica," &c. Some other works of his, printed and in MS., are noticed by Wood.—J. S., G.

CLARKE, SAMUEL, D.D., distinguished as a theologian and philosopher, the son of Edward Clarke, alderman of Norwich, was born there in 1675. He received the early part of his education in the free school of that city, and entered Caius college, Cambridge, in 1691. In order to his degree in arts, he performed a public exercise on a question taken from the philosophy of Newton. Having obtained orders, he became in 1698 chaplain to Dr. Moore, bishop of Norwich, who presented him to the rectory of Drayton. In 1704 he was appointed to preach at the Boyle lecture, and chose for his subject, "A Demonstration of the Being and Attributes of God." He preached at the same lecture next year on "The Evidences of Natural and Revealed Religion." These were first printed in two separate volumes in

1705 and 1706. They have since been printed in one volume, and have gone through several editions. To the later editions are generally appended some Letters from Butler, then attending a dissenting academy in Gloucestershire, and afterwards bishop of Durham, expressing some hesitation and difficulty as to the conclusiveness of the "demonstration." Clarke saw the ingenuousness and ability of his correspondent, and replied so as to satisfy him; for Butler, in the Analogy which he afterwards wrote, accepts the "demonstration" as valid. Clarke did not further interfere in the discussions to which the "demonstration" gave rise. Law, who was afterwards bishop of Carlisle, animadverted upon it in his Notes to King's Essay on the Origin of Evil. He was replied to by Mr. John Clarke. He answered this, and received a second reply; and a controversy of some length followed, in which Mr. John Jackson and Mr. Joseph Clarke took part. In 1706 Dr. Clarke published a "Letter to Mr. Dodwell," in answer to his arguments against the immortality of the soul; and during the same year he translated Newton's Optics into Latin. Sir Isaac was so pleased with this translation, that he made Dr. Clarke a present of £500. During this same year, Bishop Moore procured for him the rectory of St. Bennet's, London; and having recommended him to the favour of Queen Anne, she appointed him one of her chaplains-ordinary, and presented him to the rectory of St. James', Westminster, in 1709. At this time he took the degree of D.D. with much applause. In 1712 he published "The Scripture Doctrine of the Trinity," a work which gave rise to much controversy. It was brought under the notice of the two houses of convocation, to whom Dr. Clarke made an explanation. In 1715 and 1716, a correspondence on the principles of natural philosophy and religion took place between him and the celebrated Leibnitz. This was published in 1717, along with "Remarks upon a Philosophical Enquiry concerning Human Liberty, by Anthony Collins." In 1718 he printed "Select Psalms and Hymns," in which some alterations were made in the forms of doxology, which occasioned considerable discussion. On the death of Sir Isaac Newton in 1727, he was offered, but declined, the place of master of the mint, worth £1200 or £1500 a-year—a proof of his attachment to the church and the cause of religion. In 1729 he published the first twelve books of Homer's Iliad, with an entirely new Latin version. And it was while occupied with the remaining books that he was interrupted by an illness, which terminated in death on the 17th May of that year. During the same year were printed by his brother, Dr. John Clarke, dean of Sarum, his "Exposition of the Church Catechism," and "Sermons," in ten volumes. His sermons are full of plain and clear explanations of scripture, and of vigorous inculcation of sound morality. On the doctrine of the trinity he was charged with Arianism, a charge countenanced by the fact, that Mr. Whiston heard him say that he never read the Athanasian creed in his parish, at or near Norwich, but once; and that was by mistake, at a time when it was not appointed by the rubric. As a philosopher, Dr. Clarke cannot be said to have founded a school, neither can he be said to have been a follower of any school. But he was the strenuous advocate of every cause that could advance the dignity and the virtue of man. He defended human liberty against Collins, and the spirituality and immortality of the soul against Dodwell. He opposed the selfish philosophers, by showing the eternal and immutable obligation of morality; and he combated the atheism of Hobbes, and the pantheism of Spinoza, by his "Demonstration of the Being and Attributes of God." His fame now rests on these two books, especially the last, and it will be proper to give a glance, however slight, at the tenor of its argument. The "demonstration" proceeds *à priori*, and consists of the three following propositions:—I. As something now exists, something must always have existed; otherwise something must have sprung out of nothing. II. That which has always existed must be either one independent and unchangeable being, or an infinite series of changeable and dependent beings. But an infinite series of changeable and dependent beings is absurd, as it has no cause of its existence from without nor from within; and, therefore, that which has always existed must be one independent and unchangeable being. III. This independent and unchangeable being must be self-existent, that is, must exist by necessity of nature. For even when we try to think that nothing has existed always, the idea of something which exists necessarily forces itself upon us, and we cannot dismiss it. But may not that which has existed

always be the external universe? To this Dr. Clarke replies—  
 1. Negatively: that the universe is a contingent existence; that is, we can conceive it to have existed differently, or not to have existed at all. 2. Positively: that there are some things which we cannot think of as not existing. Such are time and space. But time and space are qualities, and qualities imply the existence of a substance to which they belong. And as time and space are infinite, the substance to which they belong must be infinite also; and this infinite substance is God. The germ of this argument is to be found in the scholium of Sir Isaac Newton—"Deus non est duratio vel spatium, sed durat et adest." Time and space are constituted by the existence of God. Similar reasoning had been employed by Cudworth. The validity of it was disputed by Leibnitz, who maintained that time is merely the order of things successive, and space is the order of things co-existing. The reasoning is accepted by Butler, Price, and Stewart, while it is rejected by Brown, Brougham, and Chalmers.—W. F.

CLARKE, STEPHEN, was a teacher of music, and organist of the episcopal chapel in the Cowgate, Edinburgh. He assisted Burns and Johnson in the production of the "Scottish Musical Museum," by harmonizing a number of the airs. He survived Burns little more than twelve months, having died at Edinburgh on the 6th of August, 1797. He was the composer of many airs of considerable merit, and after his death his son and successor, WILLIAM CLARKE, appears to have rendered Johnson the like service in harmonizing the airs for the concluding volume of the *Musæm*. The latter died about the year 1820.—E. F. R.

CLARKE, WILLIAM, a learned English divine and antiquary, rector of Buxted in Sussex, was born in Shropshire in 1696, and died in 1771. His principal work, in which he was assisted by Bowyer, is entitled "The Connexion of the Roman, Saxon, and English Coins," &c. It is highly praised by Pinkerton, and M'Culloch refers to it as containing a very good account of the ancient trade of the Black Sea. His son EDWARD, also rector of Buxted, born in 1730, published on his return from Madrid, where he had been chaplain to the embassy (1760-62), "Letters concerning the Spanish Nation," &c.—J. S., G.

CLARK, WILLIAM, an American explorer, was born in Virginia, August 1, 1770, and went with his father to Kentucky in 1784. In 1803 the government of the United States organized an expedition to explore the vast region acquired by their recent purchase of Louisiana; and President Jefferson offered Clark the rank of captain of engineers, and the joint command of the party with Captain Meriwether Lewis. The company left St. Louis in March, 1804; ascended the Missouri to its source; crossed the Rocky Mountains; struck one of the upper branches of the Oregon or Columbia, and descended that river to the Pacific ocean. They returned in the autumn of 1806; having performed the most extensive and important exploration ever undertaken by the American government. Clark kept the journal which was published in 1814, in two volumes octavo. In 1813, though he had twice refused the appointment, he was made governor of the territory and superintendent of Indian affairs, which two offices he held till Missouri was admitted into the union as an independent state in 1820. He died in 1838.—F. B.

CLARKSON, DAVID, an eminent nonconformist divine, born at Bradford in Yorkshire in 1622; died in 1686. He studied at Clarehall, Cambridge, and became fellow of his college. Tillotson, who was his pupil, succeeded him in his fellowship in 1651. He was ejected for nonconformity from the living of Mortlake in Surrey in 1662. In 1683, having for a year officiated as colleague to Dr. Owen, he succeeded that eminent divine. Of Clarkson's published discourses, the most remarkable are—"Primitive Episcopacy," 1680; "No Evidence of Diocesan Episcopacy in Primitive Times," 1681, in answer to Stillingfleet; and "Discourse of Liturgies," 1689.—J. S., G.

CLARKSON, THOMAS, born at Wisbeach in Cambridgeshire, in 1760, one of the earliest and most devoted advocates of the abolition of the slave trade. He was first educated by his father, who was a clergyman and master of the free grammar school in his native town. He afterwards went to St. Paul's school, London, and completed his studies at St. John's college, Cambridge. In 1784 he gained the prize for a Latin dissertation, and the following year entered with scholastic ardour as a competitor for a similar honour. The subject announced for the thesis by the Rev. Dr. Peckard, vice-chancellor of the university, was "Anne liceat invito in servitatem dare?" (Is it lawful to make slaves of others against their will?) In the course

of his researches and investigations for his essay, his literary ambition gave place to righteous indignation at the enormities connected with slavery and the slave-trade, which furnished him with such cogent arguments in answer to the proposition, that he won the prize; and his mind was so thoroughly roused to the importance of the subject, that he translated his essay into English, and resolved to devote himself to the redress of African wrongs. He gave up his design of entering the church, for which he had taken deacon's orders, and may be said to have chosen antislavery for his profession, as the advocacy of that cause became the chief work of his life. The publication of his essay led to his introduction to Mr. Granville Sharpe, the first public assertor of the rights of negroes in England; and to Mr. William Dillwyn, Mr. Richard Phillips, and other members of the Society of Friends in London, who gladly associated with him in his abolition efforts. From the time of William Penn, who in 1688 denounced the slave-trade, this sect had protested against slavery; and at their yearly meeting in 1760, in addition to the "severe censures" passed in former years on "the cruel and unjust practice of importing negroes," they resolved to disown as members of their society "all who participated in any way in that guilty traffic." In 1787 the first "committee for effecting the abolition of the slave-trade" was instituted by Mr. Clarkson and his friends. They deemed it wise to limit their efforts to the suppression of the slave-trade at first, the extinction of slavery appearing at that time an unattainable object. Universally diffused as information on this subject afterwards became, and now stands recorded in history, it had at that period no existence in literature, and no place in the public mind. Mr. Clarkson visited the principal ports in the kingdom, and, with the utmost industry and perseverance, collected evidence from the custom-houses, on board slave-ships, and from documents concerning West India property. Obtaining an introduction to Mr. Wilberforce, who, as member for Yorkshire and the intimate friend of Mr. Pitt, as well as from his high personal character, held an influential position, Mr. Clarkson induced him to bring the question before parliament, where a party in its favour was gradually formed. Meantime the committee held meetings, and published the results of their researches. In 1788 several petitions were presented to the house of commons in favour of the abolition of the slave-trade, and the question was brought forward, but postponed for further inquiry. In 1789 Mr. Wilberforce introduced the subject, the materials being furnished him by Mr. Clarkson; but the measure was again put off; and year after year a succession of divisions and defeats took place, until, after a struggle of more than twenty years, the "bill for the abolition of the slave-trade" passed the house of commons in March, 1807. Mr. Clarkson's efforts, as prompter and assistant to Wilberforce and his party, never relaxed during this period, and with characteristic ardour he visited Paris, after the breaking out of the Revolution of 1789, to supply Mirabeau with matter for his speeches in the national convention against the slave-trade. He was an active member of the "African institution," which was established in 1807 to promote civilization in Africa, and took part in the contest which terminated, in 1833, with the passage of the act for the "abolition of British colonial slavery." In 1838 the corporation of London granted Mr. Clarkson the freedom of the city, as an acknowledgment of his services as the originator of the great antislavery struggle, and placed his bust in the Guildhall. In his declining years he lost his sight from cataract, but underwent an operation that restored it. He attended the antislavery convention at Exeter Hall in 1840. His last public act was to present a petition to the house of lords against slave-grown sugar. In addition to numerous pamphlets on the subject, he published "A History of the Abolition of the Slave-Trade," 2 vols., London, 1808; "A Portraiture of Quakerism," 3 vols., London, 1806; and other works. His style is diffuse, and he is less remarkable as a writer than as the patriarch of the antislavery cause. He possessed a happy, contented disposition, and passed the last years of his life in his domestic circle at his patrimonial seat, Playford-hall, Suffolk, where he died in 1846, aged eighty-six years.—R. M., S.

CLAUBERG, JOHANN, one of the clearest and most methodical expositors of the Cartesian philosophy, was born at Solingen in Westphalia in 1622; taught philosophy and theology at Herborn, and afterwards at Duisburg, and died in 1665. There is an edition of his works with the date 1699.

CLAUDE, Bishop of Turin. See CLAUDIUS.

CLAUDE, JEAN, an eminent divine of the Protestant church of France, was born in 1619 at La Sauve-Sauvetat, near Agen. His father, Francis Claude, who was also a protestant minister, gave him his first education, and afterwards sent him to the college of Montauban, where he was ordained in 1645. His first charge was at the Hague, his next at St. Afric, from which he was removed, after a pastorate of eight years, to the important position of Nismes, where he gave assistance in training candidates for the protestant ministry. Having incurred the resentment of the court by opposing, in the synod of Languedoc, a project for the reunion of the Roman catholics and protestants, he was prohibited by a decree of council to execute any longer the functions of the ministry in that province. He then became pastor at Montauban, and was again, after an interval of four years, forbidden to preach there also. In 1666 he accepted an invitation from the congregation of Charenton, and continued to labour there with great acceptance and with eminent public usefulness to the cause of his oppressed church, till the revocation of the edict of Nantes on the 22nd October, 1685. At ten o'clock in the morning of that day Claude had an order sent to him to quit France in twenty-four hours. On his arrival in Holland he was humanely received by the prince of Orange, who allowed him a liberal pension. But he survived his expatriation little more than a year. He preached his last sermon at the Hague on Christmas-day, 1686, and died on the 13th of January following. He was a distinguished preacher, but still more distinguished as a polemical writer. He entered the lists against the most eminent controversialists of Rome—against Bossuet, Arnauld, Nouet, and Nicole—and proved himself an antagonist worthy of their steel. His chief writings are—"Défense de la Réformation contre le Livre intitulé, Préjugés Legitimes contre les Calvinistes," 1673, 1680; "Les Plaintes des Protestants cruellement opprimés dans le Royaume de France," 1686; "Sermons sur div. Textes de l'Écriture Sainte," Gen., 1724; "Traité de la Composition d'un Sermon," 1688, first published in his "Œuvres Posthumes," and translated into English in 1778, by Robert Robinson of Cambridge. A new edition was brought out in 1796 by Rev. Charles Simeon. Claude left two sons, ISAAC and JEAN JACQUES, both of whom followed in the footsteps of their father. The former was born in 1653, and died in 1695; the latter was born in 1684, and died in London, where he was pastor of a French congregation, in 1712.—P. L.

CLAUDIUS, CLAUDIUS, born about the year 365 of the Christian era, at Alexandria in Egypt. His mother tongue was Greek, and he only began to write Latin verse when he was past thirty. Claudian was patronized by Flavius Stilico, who held high place at the court of Honorius. In one of his poems he mentions having married an heiress at Alexandria. The poems of Claudian have for us but little interest; they are chiefly panegyrics—a class of poetry almost necessarily dull—and satires, which, to say the truth, are in Claudian's hands almost as dull as panegyrics. The praises of Stilico, of which he is never weary, have the merit of expressing real feeling. On Stilico's death he seems to have retired into private life. The "Rape of Proserpine" gives us more pleasure than any other of his longer poems. The power of commentators to find in a poem whatever they seek for, is illustrated by the notes on this poem, in which some have discovered the Eleusinian mysteries, and others the philosopher's stone. Claudian's "Old Man of Verona," is in our estimation worth all else that he has written, and it has been translated by Cowley with singular felicity.—J. A., D.

CLAUDIUS or CLAUDE, CLEMENS, Bishop of Turin, a Spaniard by birth, and the disciple of Felix, bishop of Urgel; died in 839. In the commentaries of this learned prelate, we meet with perhaps the earliest protest which was raised by an ecclesiastic of his rank against the errors of doctrine and discipline that had crept into the church of Rome.

CLAUDIUS I., Roman emperor. His full name was TIBERIUS CLAUDIUS DRUSUS NERO GERMANICUS. He was the younger son of Drusus, the brother of Tiberius, and of Antonia, the niece of Augustus, and was born at Lyons B.C. 10. In his youth he was exceedingly weak and sickly, and often laboured under cruel maladies. He was shamefully neglected by his relatives. His mother said he was an abortion, and the rough draught of a man, and Augustus used to call him *misellus*, little wretch. He was left to the company of slaves and freedmen, and was allowed no share in public affairs. He appears, however, to have devoted a great part of his time to study, and

became a proficient in the Greek and Latin languages. He was elevated to the consulship by the Emperor Caligula his nephew, A.D. 37, but on the expiry of his term of office, he withdrew again into private life. On the death of Caligula, the mutinous pretorians who were overrunning the palace, discovered Claudius concealed behind some tapestry, and trembling for fear. They dragged him from his place of refuge, and carried him on their shoulders to the camp, where he was proclaimed emperor in spite of the opposition of the senate. He was then fifty years of age, and for some time governed with justice and moderation, endeavoured in various ways to make compensation for the oppressive deeds of his predecessors, and executed the famous Claudian aqueduct and other works of great utility, for the embellishment of the city and the comfort of the citizens. But he afterwards fell completely under the control of his wife and freedmen, who induced him to give his consent to many cruel and tyrannical acts which he never would have committed of his own accord. His third wife, the notorious Messalina, brought great scandal upon his government and family by her shameless licentiousness. After her execution, the emperor married in A.D. 50 his niece Agrippina. Claudius died in the sixty-fourth year of his age, and the fourteenth of his reign. He visited Britain in A.D. 43, and in his reign it first became a Roman province.—J. T.

CLAUDIUS II. (MARCUS AURELIUS, surnamed GOTHICUS), one of the best of the Roman emperors, born in Illyricum, A.D. 214. His origin was obscure, but he acquired distinction by his military services under Decius and Valerian. On the death of Gallienus in 268, Claudius was raised to the imperial throne by the army, and their choice was immediately ratified by the senate. Soon after his accession he defeated, at Milan, Aureolus, who had revolted against Gallienus. He then marched against the Alemanni, who had invaded Italy, and routed them on the banks of the lake of Garda (Benacus). He entered Rome in triumph, and set himself vigorously to reform the abuses of the government. Next year he gained a great victory over an immense host of Goths or Scythians, who had invaded the province of Mæsia, and took a vast number of prisoners, whom he compelled to labour on the public works. This victory gained him the surname of Gothicus. He died in the following year, A.D. 270, at Sirmium in Pannonia, after a short but brilliant reign of two years, and was succeeded by Aurelian.—J. T.

CLAUDIUS, APPIUS PULCHER, held the office of prætor in 57 B.C., and next year was proprætor in Sardinia. In 54 he was consul along with L. Domitius Ahenobarbus, and in 53 he was appointed proconsul of Cilicia, and governed that province with great tyranny and rapacity. Two years later he was superseded by Cicero, whose appointment he regarded with great displeasure. On his return to Rome he was impeached by Dolabella, but was acquitted through the influence of Pompey. He was appointed censor in 50, along with L. Piso, and expelled a number of senators belonging to Cæsar's party—among others, the historian Sallust. On the breaking out of the civil war, he embraced the cause of Pompey, and was in consequence compelled to flee from Rome. He died in Greece before the battle of Pharsalia. He wrote a work on augural science, which he dedicated to Cicero.—J. T.

CLAUDIUS, MATTHIAS, a German popular writer of eminence, was born at Rheinfeld in Holstein, 15th August, 1743, and after having studied at Jena, settled at Wandsbeck, near Hamburg. In 1778 he was appointed reviser to the Altona bank, with permission to reside at Wandsbeck. Under the assumed name of *Asmus* he published from 1770 till 1775 the "Wandsbecker Bote," a quaint miscellany of poetry, essays, reviews, &c., written in a powerful and highly popular style. All the productions of his pen evince a mind as serene as it was pious, and a generous sympathy with the interests of the people. Many of his poems are sung to this day, for instance his beautiful "Rheinweinielied." After a happy old age he died at Hamburg, 21st January, 1815. His collected writings appeared under the title "Asmus Omnia sua secum portans," in 8 vols., new ed. 1844. His life has been written by W. Herbst, Gotha, 1857.—K. E.

CLAUDIUS, PUBLIUS APPIUS PULCHER, the first of the famous Claudian family who bore the name of Pulcher, lived about 250 B.C. Like the rest of his family, he was noted for his pride and haughtiness, and his resistance to the demands of the plebeians, as well as for his deficiency in military skill and valour. He was elected consul in 249 B.C.; and, in defiance of the auguries, attacked the Carthaginian fleet in the harbour of

Engraved by W. Holt, from the original in the Mus. Royale Paris

CLAUDE.

Drepana, and was defeated by Adherbal with the loss of almost all his forces. Having been recalled and commanded to nominate a dictator, he named M. Claudius Glycias or Glicia, the son of a freedman, but the appointment was set aside. He was accused of treason, and severely punished. The exact date of his death is unknown. To the people he was an object of great dislike.—J. T.

**CLAUDIUS.** See **APPIUS CLAUDIUS.**

**CLAUSEL, BERTRAND,** Count and Marshal of France, was born 12th December, 1772. He was the nephew of Jean Baptiste Clausel, one of the regicides. Having entered the army in 1791, he served in several campaigns, and was also employed in various missions. He was made general of brigade in 1799, and sent to St. Domingo. He returned to France in 1802, with the rank of general of division. In 1805 he was employed in the armies of the north, and of Holland, and subsequently in Naples, Germany, and Spain. He was present at the famous battle of Salamanca and assumed the command after Marmont was wounded. He was present also at the disastrous conflict of Vittoria. After the first abdication of Napoleon, Clausel was appointed inspector-general of infantry, and obtained the grand cross of the legion of honour from Louis XVIII.; but this did not prevent him from deserting the cause of the Bourbons as soon as Bonaparte landed from Elba. On the final overthrow of Napoleon, Clausel fled to America to escape the sentence of death pronounced upon him, 11th September, 1816. On the proclamation of the amnesty of 1820 he returned to France, and was elected a deputy. In 1830 Louis Philippe made him commander of the African army, and created him a marshal in 1831. The disastrous result of the expedition to Constantina in 1836 was attributed to Clausel. He died in 1842.—J. T.

\* **CLAUSEN, HENRY NICHOLAS,** a celebrated Danish theologian and statesman, born in 1793; became professor of theology at the university of Copenhagen in 1821; some years afterwards became known as an intrepid champion of constitutional rights; in 1840 was elected a deputy to the legislative assembly; played a conspicuous part in the reforms of 1848, and till 1852 was a member of the Danish ministry. His works are numerous.

**CLAUSSEN, PEDER,** the celebrated translator of Snorre Sturleson, was born at Egersund, on the southwest coast of Norway, in the year 1545. He became, in 1566, parish priest of Undal, as his father had been before him. His translation of Sturleson did not appear till after his decease which happened in 1614. It was brought out in 1633 under the care of the learned Ole Warm, and at the expense of Joachim Moltken. An inferior edition, altered for the worse, was brought out by the printer Godiche in 1757. Claussen's translation of Sturleson's great work is not a mere literal translation, but a free and somewhat abridged rendering, in a very bold and original style. It furnished for a long period the favourite reading of the Norwegian peasantry. Claussen was also the author of a "Description of Norway," published likewise after his death, in 1632, at the cost of the same Joachim Moltken.—M. H.

**CLAVELL, JOHN,** a highwayman of the time of Charles I., nephew of Sir N. Clavell, published in 1628 a poem entitled "The Recantation of an Ill-led Life, or Discovery of the Highway Law." &c.—J. S., G.

**CLAVERÉT, JEAN,** born at Orleans in 1590; died in 1666. He first studied law, and commenced to practise as an advocate. He fancied himself a poet, and formed an acquaintance with Corneille, who advised him to stick to his trade of advocate. He was offended, and commenced a pamphlet war against Corneille. This was not enough; he had interest sufficient to get a comedy acted, which bore the same title as one of Corneille's. The court were for Claverét, the public for Corneille. He regarded this as success, and tried another comedy, which, however, the actors refused to bring out. It was the day when the unities were the rule of the French theatre, and Claverét, who was not daring enough to violate them, escaped from the difficulty with a dexterity all his own. A drama of his, "The Rape of Proserpine," was so arranged as to have the scene now in heaven, now on earth in Sicily, and now in hell. The unity of place was not violated, for the poet imagined a perpendicular line from heaven to hell passing through Sicily.—J. A., D.

**CLAVIER, ETIENNE,** born at Lyons in 1762; bred to the law, he combined with his legal pursuits the study of ancient languages and literature, more especially the Greek, and even

seems to have imbibed the heroic spirit of the days of old. It was while he sat as judge of the criminal court of the department of the Seine that he set an example of independence not very common under the empire. When General Moreau was on his trial before him, the law officers, pressing for a capital conviction on grounds which the court deemed insufficient, thought to overcome scruples by an intimation that the emperor, if gratified by a conviction, would pardon the accused; on which the judge exclaimed—"Who would pardon us?" In 1809 he was elected member of the class of ancient history and literature at the Institute. In 1811 the criminal court over which he presided was suppressed. His chief literary labours consist of translations from the Greek. He wrote, besides, essays on the oracles of the ancients, and "A History of the early times of Greece." He died in 1817.—J. F. C.

**CLAVIÈRE, ETIENNE,** a French statesman of the revolutionary period, was born at Geneva in 1735. He was one of the leaders of the party of the Girondists; in 1792 he was appointed minister of finance. The following year, along with all the most eminent members of his party, he was condemned to death. He killed himself in prison.—J. S., G.

**CLAVIGERO, FRANCISCO SAVIERO,** a Spanish jesuit, born in Mexico in 1720, and author of a curious work on the customs, history, and language of his native country since the Spanish conquest. In the latter part of his life he came to Europe, and resided at Cesena in the papal states, where his great work was published in 1780, under the title of "Storia Antica del Messico," &c.—F. M. W.

**CLAVIJO, RUY GONZALES DE,** a Spaniard, who lived about the commencement of the fifteenth century, and was sent on an embassy to Tamerlane by Henry III., king of Castile, of which an account, supposed to be from his pen, was published at Seville in 1582.—J. T.

**CLAVIJO Y FAJARDA, JOSÉ,** a Spanish author, editor of a journal at Madrid, and the translator of Buffon, born in 1730; died in 1806. He fought a duel with Beaumarchais, who came to Madrid to avenge a slight which Clavijo had put upon one of his sisters. More than one dramatist has made use of the incident.—F. M. W.

**CLAVIUS, CHRISTOPHER,** an eminent German mathematician, called "the Euclid of the sixteenth century," was born at Bamberg in 1537, and died at Rome in 1612. He was employed by Pope Gregory XIII. in the business of reforming the calendar.

\* **CLAY, CASSIUS MARCELLUS,** the seventh son of General Green Clay, born in Madison county, Kentucky, in 1810, has been mainly and very honourably distinguished for his bold and resolute efforts to free his native state from the curse of slavery, and to induce the great body of slaveholders to adopt measures looking to ultimate emancipation. With a view to qualifying himself for an active public and political career, he studied law. The owner of extensive lands and proprietor of many slaves, he commenced his efforts for the freedom of Kentucky by giving his slaves their freedom. His life has since been frequently in danger from the propagandists of slavery. The writings of C. M. Clay, with a memoir by Horace Greeley, Esq., were published in New York in 1848.—F. B.

**CLAY, HENRY,** an eminent American senator and statesman, was the son of a baptist clergyman, and was born in Hanover county, Virginia, in 1777. His father died when he was only four years old, leaving his mother very poor, so that his only education was obtained in a log school-house, and in 1791 he was placed as an apprentice in a store in Richmond. But his stepfather procured for him a place as copying clerk in the office of the chancery court, where his character and talents attracted the notice of the venerable Chancellor Wythe, who gave him the use of his library, superintended his reading, and turned his ambition to the study of law. His preparation was completed in the office of the attorney-general, Brooke, and being admitted to the bar, he removed to Lexington, Kentucky, when hardly twenty-one years old, and began the practice of his profession. His success was signal and immediate; with a competent amount of legal learning, he became one of the most successful advocates that ever addressed a jury. With a winning manner, a silver-toned voice, great fluency of speech, and quickness of thought, and an instinctive appreciation of the characters and prejudices of those whom he addressed, he never failed of enlisting their sympathies, and seldom of winning their assent.

Of course the Delilah of politics soon enticed him away from the more sober charms of the matron who presides over the tribunals of law. The greater part of Mr. Clay's life was spent in the public service, and so important were the official posts which he held, and so numerous and grave the public questions in the settlement of which he had a prominent share, that a full biography of him would be almost a history of his country for half a century. Only a brief summary of his career can be given here. While the old division of parties existed between federalists and republicans, Mr. Clay was heartily associated with the latter; when this distinction passed away, and a new one was instituted about 1829 between whigs and democrats, he became the leader of the former. In 1806 he became a senator of the United States for a single year, to fill the unexpired term of Mr. Adair. The two succeeding years he spent in the legislature of Kentucky. Then he returned to the federal senate for another year, to supply the vacancy caused by a resignation. In 1811 he was elected to the lower house of congress, and was chosen to be speaker, remaining in that post till 1814, when he was sent abroad as one of the commissioners to negotiate the treaty of peace with England at Ghent. During these years embarrassing questions were open between Great Britain and the United States, which gradually ripened into hostilities, and Mr. Clay was most prominent and active among those younger and more impetuous members of his party, who rather pushed than followed President Madison into a declaration of war. Indeed he was the leader of congress upon this subject, and upon the measures requisite for the prosecution of the war. On his return from Ghent he was again sent to congress, and became speaker of the house, in which post he remained with few intermissions till 1825. The chief subjects which he took a prominent part in discussing at this period were, the acknowledgment of the independence of the Spanish American republics, and the protection of American industry by a protective tariff. Mr. Clay also had a prominent share in the vehement discussions about slavery which were excited in 1820 by the question respecting the admission of Missouri into the Union; and he was, if not the author, the earnest advocate of the famous "compromise" on that subject, which established the line of 36° 30' as the northern limit of slaveholding territory. In 1825 he was a candidate for the presidency against Mr. J. Q. Adams, General Jackson, and Mr. W. H. Crawford; and, no choice being effected in the electoral college, when the matter came up in the house of representatives, Mr. Clay and his friends voted for Mr. Adams, and thereby decided the election in his favour. During the whole of the Adams administration, from 1825 to 1829, Mr. Clay was secretary of state, and performed the important duties of that office with consummate ability. In 1831 he returned to the United States senate, where he was the leader of the opposition to the administration of General Jackson, and strove ineffectually for the renewal of the charter of the United States bank. Through his influence, also, the "compromise bill," as it was called, was passed through congress, which put an end to the nullification controversy, by a partial abandonment of the protective system. In 1832 he was again the candidate of his party for the presidency, though with little chance of success, owing to the overwhelming popularity of General Jackson, who was re-elected. He retained his seat in the senate till March, 1842, when he resigned, and retired into private life. Two years afterwards he was again a candidate for the presidency, in one of the most exciting political contests that ever took place in the United States, but was defeated by a very small numerical majority, obtained mainly through the influence of the administration, then in the hands of his political opponents, and the obstinacy of the so-called "liberty party." The immediate consequence of his defeat was the annexation of Texas, a measure to which he had avowed strenuous opposition. This was virtually the termination of his public career, though in 1849 he consented to resume his seat in the senate, in view of the perilous contest which was then impending between the slaveholding and non-slaveholding portions of the country, on the California and territorial questions. He was the author of the famous "compromise of 1850," as it was termed, by which, after a long and vehement struggle, this dispute was adjusted. It was the third occasion in his career in which, by giving the whole weight of his abilities and influence to an intermediate course between two extremes, he put an end to a vehement contest, which menaced the peace of the country and the duration of the Union. On the matter of slavery he

always favoured moderate counsels, and a pacificatory policy. Though born in one slaveholding state and a resident in another, he made his *debut* in political life as an emancipationist, by advocating publicly in 1798 the gradual abolition of slavery. He was always an earnest and efficient friend of the Colonization Society, which has built up a free and flourishing colony of civilized blacks on the African coast, and in the debate of 1850 he avowed in the most decided terms his uncompromising opposition to the extension of slaveholding territory. The excitement and exhaustion of this last great controversy gave the final blow to his already enfeebled constitution. He died at Washington, June 29, 1852, aged seventy-five. The strife of parties was hushed for a moment at his decease, and all united in rendering him the praise which was his due, as an able and patriotic statesman whose public life was without a stain. Mr. Clay's wife was Lucretia Hart, of Kentucky, whom he married in 1799. By her he had a numerous family, consisting of six daughters and five sons. The daughters all died before him, but the sons survived him except one, who was killed in the Mexican war, and three of them are now holding highly respectable positions in the country.—F. B.

CLAYTON, DR. JOHN, an American botanist, was born at Fulham, England, about 1686, emigrated to America in 1705, and died in Gloucester county, Virginia, in 1773, aged eighty-seven. He resided near the city of Williamsburg, and was clerk or prothonotary of Gloucester county for over half a century. He was a private country gentleman of moderate fortune, greatly respected by all who knew him. Several of his papers are published in the Philosophical Transactions; but the work by which he is chiefly known is his "Flora Virginica," which was published at Leyden, by Gronovius, in 1739-43, and again in 1762.—F. B.

CLAYTON, JOHN MIDDLETON, an American statesman, born in Sussex county, Delaware, in 1796, was chosen senator in congress in 1829, and held office till December, 1836, when he resigned. He was immediately appointed chief-justice of his native state, and continued on the bench for nearly three years. In 1845 he was again sent to the United States senate, and remained there till March, 1849, when he became secretary of state under President Taylor. In this capacity he negotiated what is usually called the "Clayton-Bulwer Treaty," adjusting the respective claims of England and the United States in Central America. Mr. Clayton resigned office on General Taylor's death in July, 1850, and immediately re-entered the senate, where he remained till his own decease, 9th November, 1856. He was a zealous member of the whig party, an able debater, and a statesman of high character for talent and uprightness.—F. B.

CLAYTON, ROBERT, D.D., a distinguished prelate, and member of the Royal and Antiquarian societies of London, was born in Dublin in 1695, and died in 1758. He was appointed to the bishopric of Killala in 1729, translated to Cork in 1735, and to Clogher in 1745. He is said to have owed his advancement to Dr. Clarke, who recommended him to the patronage of Queen Caroline. Dr. Clayton was the author of "An Introduction to the History of the Jews;" "Chronology of the Hebrew Bible Vindicated;" "A Dissertation on the Prophecies;" and "A Vindication and Defence of the Histories of the Old and New Testament, in answer to Lord Bolingbroke." The bishop's well-known leaning to Arianism did not hinder his preference; but, in consequence of a motion which he made in the house of lords, that the Athanasian and Nicene creeds should be expunged from the liturgy, their lordships commanded him to be prosecuted for heresy. But he died on the day fixed for the commencement of his trial.—J. T.

CLAYTON, THOMAS, was a member of the royal band of music in the reign of William and Mary. Although a man of very inferior talents in his profession, he was induced in the early part of his life to travel into Italy for the purpose of improvement. On his return to England he so far imposed on the good sense of the public, as to obtain the reputation of an eminent musician. Several persons of distinction were persuaded into a belief, that by means of Mr. Clayton's assistance, rusticity would be no longer the characteristic of English music, and that if due encouragement were given to him, our music would in a very short time emulate that of Italy. Accordingly, in 1705, he produced the opera of "Arsinoe, Queen of Cyprus," in which, as Dr. Burney correctly observes, "not only the common rules of composition were violated in every song, but also the prosody and accents of our language." Yet such was the charm

of novelty, and so effectually had Clayton persuaded the public that he was a great man, that this worthless production was performed twenty-four times the first season, and eleven times the second. Addison unfortunately partook so much of the general delusion as to commit the composition of the music of his opera of Rosamond to this worthless pretender. It was performed for the first time on the 4th of March, 1707; but notwithstanding the favourable prepossessions of the public, and the poetical merit of the piece, it was received with the utmost coldness, and struggled with difficulty through three representations. It was then laid aside, and never again performed in the lifetime of the author, though it was revived thirty years afterwards with new music by Dr. Arne. Rosamond owed its failure in a great measure to Clayton's wretched music, which the audience were now able to compare with better things. Addison's mortification at this ill success appears to have been the cause of the constant hostility he ever afterwards exhibited to the Italian opera. After the failure of Rosamond, Clayton disappeared from the musical world, and the date of his death is unrecorded.—E. F. R.

CLEANDER, was originally a Phrygian slave; afterwards the profligate favourite and minister of the Emperor Commodus. In a popular tumult occasioned by a scarcity of corn, he was torn to pieces by the mob.—J. T.

CLEANTHES: the second in order of the philosophers of the Porch. Born at Assos in the Troad about 300 B.C. he came to Athens in his manhood, and listened for fifteen years to the instructions of Zeno. When he began his studies he had in his possession only four drachmæ. He was not gifted with the faculty of quick apprehension, and his steady industry at first only served to excite the laughter of his fellows. But neither toil, poverty, nor ridicule could damp his zeal, or check his dauntless pursuit of knowledge. In the expressive words of Laertius "he took to philosophy bravely." Unable to purchase paper to make notes on Zeno's lectures, he scrawled them on bits of potsherd and ox-bones. The spectacle of a man in his station and circumstances devoting his entire time to speculative studies attracted the attention of the Areopagus, and in the exercise of an old right they called on him to give an account of his mode of life. It came out that he earned subsistence by drawing water for a gardener during the night, and was thus enabled to surrender his days to the search after wisdom. Struck with admiration for his industry, the judges offered him ten minæ, but the proffered gift was refused in the true spirit of a stoic. When the witty disciples of the porch applied to Cleanthes the nickname of the Ass, he said mildly, "That implied that his back was strong enough to bear whatever Zeno put upon it"—a remark confirmed by the result of after years when he taught in his master's chair, and the same indefatigable perseverance had won for him the more flattering title of the second Hercules. He was distinguished at all times by the composure with which he bore attack. On one occasion when he was satirized on the stage by Sositeus he looked so calm and dignified that the satirist was hissed off the stage by the spectators. He succeeded Zeno in 263 B.C., and continued to teach his doctrines with his faculties unimpaired to the age of eighty years. Cleanthes has no place among the great intellects of Greece, but he had acquired in a pre-eminent degree that grasp of the guiding principles of life which crowns an earnest and self-denying career. His writings manifest that loftiness which springs from purity of thought. He struck out no new path of speculation, but his sympathy with the difficulties of the mass of mankind, his own struggle and triumph, together with a vein of genuine religious feeling, fitted him to be one of the leaders of the stoic philosophy on its most important—its practical side. He is the author of a hymn to Jove, which has been justly characterized as the most devotional fragment of antiquity. It is to this hymn that St. Paul refers in his address at Athens—"As certain of your own poets have said, *εὐ σου γὰρ γένος ἐσμέν.*" It is pervaded by the sense of a personal God having relation to the individual spirit of man. Another fragment of Cleanthes finely expresses the stoic view of fate—"Lead me, Zeus, and thou Destiny; whithersoever I am by you appointed, I will follow not reluctant; but even though I am unwilling, through badness, I shall follow none the less." Several of his detached sayings remain to indicate his observance and inculcation of plain living and philosophic contentment, as, when asked what is the best way to be rich, he answered, "To be poor in desires." The stoic

satirist of Rome refers to him as presenting the best pattern of a life according to the ascetic rules of his school.

"Cultor enim juvenum purgatos miseri aures  
Fruge Cleanthea."

Of the future he taught that all souls are immortal, but that the intensity of existence after death would vary according to the strength or weakness of the soul in life—a view capable of translation into the language of christian faith. His own decease was another instance of the resignation produced by his philosophy. Having fasted for two days by order of the physician to cure himself of an ulcer, Cleanthes said when asked to take food, he had gone so far on the road, he was unwilling to turn back again, and of his free will finished the journey.—J. N.

CLEARCHUS, a Spartan general who was employed on several important expeditions during the latter part of the Peloponnesian war. He latterly served under Cyrus at the head of some Greek mercenaries.

CLEARCHUS, tyrant of Heracleia, born 411 B.C.; was assassinated in 353.

\* CLEAVELAND, PARKER, LL.D., an American mineralogist and man of science, was born in Rowley, Massachusetts, 15th July, 1780; graduated at Harvard college in 1799; and six years afterwards was appointed professor of chemistry, mineralogy, and natural philosophy in Bowdoin college, Maine—a position which he has occupied honourably and efficiently for over half a century. In 1816, he published in one large volume "The Elements of Mineralogy and Geology," founded on the systems of Brongniart and Haüy. It was favourably received, and passed to a second edition, much enlarged, in two volumes, octavo, in 1822. He has been a pioneer in the cultivation of this science in America, and is highly respected for his labours in it, and for his success as a teacher.—F. B.

CLEEF, JOHN VAN: this painter was born in 1646 at Venloo in Guelderland. He studied under Primo Gentile at Brussels, and afterwards in the school of Gaspar de Crayer. Without reaching his beauty of colour he fairly surpassed Crayer in design. He had great facility, and a strong, free hand. His compositions are rich and graceful, and his thorough knowledge of architecture makes itself apparent in many of his works. He was renowned for the painting of his boys. His most celebrated work is in the chapel of the convent of the black nuns at Ghent, representing the sisters relieving the sick of the plague. He died at Ghent in 1716.—W. T.

CLEEF or CLEEVE, JOSEPH or JOAS VAN: this painter, called also Sotto Cleef, was born at Antwerp about 1500. He was highly considered as a colourist, and in this respect his works have been often accounted equal to the best Italian masters, though it does not seem that he ever visited Italy. He painted portraits, and heads of misers, bankers, and Jews weighing and counting money, in the manner of Quentin Matsys, though with more power and finer colour. His altarpieces at Antwerp gained him great esteem. His countryman, Sir Antonio More, brought him to England, and introduced him to King Philip, who took so little notice of his pictures, that the vain and irritable Dutchman quite lost his reason, and, according to Walpole, died in confinement. In Antwerp cathedral is his picture of "St. Cosinus and St. Damien." His portraits of himself and his wife, and his picture of "Mars and Venus," were purchased by Charles I. James II. possessed his paintings of the "Nativity" and the "Judgment of Paris," and Sir Peter Lely and the duke of Buckingham each had specimens of his art. His death occurred in 1536.—W. T.

\* CLEGHORN, HUGH, a Scotch botanist, conservator of forests in the Madras presidency of India. He took the degree of M.D. in the university of Edinburgh, and was one of the early members of the Botanical Society. Proceeding to India as a medical man, in the service of the East India company, he rendered himself conspicuous by his botanical knowledge. He became professor of botany in the Madras medical college, and aided the Agri-horticultural Society in the improvement of their garden. He has printed an Index to Wight's Icones, and has published several papers in botanical periodicals on the "Plants of India." He also contributed to the exhibition of Indian products at Madras, and has sent home many valuable specimens to the museum at the Edinburgh botanic garden.—J. H. B.

CLELAND, JOHN, son of Colonel Cleland, the WILL HONEYCOMB of the Spectator, died in 1789, in his eightieth

year. He was for a time consul at Smyrna, went afterwards to Bombay, quarrelled with some of the residents, and returned to England about 1749. Having fallen into pecuniary embarrassments, he prostituted his talents to the composition of an infamous work, the sale of which produced no less than £10,000. The rebuke he received from the privy council, and the pension of £190 with which it was accompanied, prevented the repetition of a literary scandal which should have sent the author to the pillory. His subsequent publications were political, dramatic, and philological.—J. S., G.

CLELAND, WILLIAM, lieutenant-colonel of the Scottish Cameronian regiment, and author of a volume of poetry, was born about the year 1661. He was a zealous covenanter, and when little more than sixteen years of age, held a command as captain in the army of the insurgent covenanters at Drumclog and Bothwell-bridge. He is supposed to have escaped to the continent on the suppression of this insurrection, and there is reason to believe that he studied civil law at Utrecht in 1684. In the following year he was in hiding among the wilds of Ayrshire and Clydesdale. He again left the country, but returned at the Revolution, and was appointed lieutenant-colonel of the famous Cameronian or earl of Angus's regiment, and commanded them when they were attacked at Dunkeld by a vastly superior force of Highlanders, under General Cannon, 21st of August, 1689. After an obstinate struggle, in which Cleland displayed the most indomitable courage, the insurgents were compelled to retreat, leaving three hundred men killed and wounded behind them. But the gallant young leader of the Cameronians was unfortunately killed in the action. "He was a youth of distinguished courage and abilities," says Macaulay; "his manners were polished, and his literary and scientific attainments respectable. He was a linguist, a mathematician, and a poet." Among other poems, he is the author of a bitter Hudibrastic satire upon the Highlanders. (See Cleland's *Poems*, Edin., 1697; and Macaulay's *History*, vol. iii., chap. 13.) Sir Walter Scott has stated, in his *Border Minstrelsy*, that Colonel Cleland was the grandfather of the notorious John Cleland above noticed. But this is an entire mistake, and has been satisfactorily disproved by a comparison of dates.—J. T.

CLEMENCET, DOM CHARLES, a French historical writer of the Benedictine order, was born in 1703, and died in 1778. He was employed for some time, along with Durand, upon the continuation of the "Decretals of the Popes," and other historical works. He was of a most laborious disposition, and continued his researches till the moment of his death. His most important works are, "The Art of Verifying Dates," begun by Danton, but which Clemencet revised and completed; a "General History of Port Royal," 10 vols., and "The Literary History of France," vols. x. and xi.—J. T.

CLEMENCIN, DIEGO, a Spanish statesman and man of letters, born in Murcia on 27th September, 1765. At ten years of age he was entered at the college of S. Fulgencio in that city, and so distinguished himself, both by character and acquirements, that at the conclusion of his course he was appointed assistant-professor of philosophy and theology. In 1788 he went to Madrid to superintend the education of the sons of the duchess of Benavente. In 1800 he was admitted a member of the Academy of History, and distinguished himself by a memoir on the reign of Isabel the Catholic; he also rendered important services to the academy of the Spanish language, and the national academy. Like nearly all the literary men of his day, Clemencin took a prominent part in the stormy politics of the time. As editor of the *Gazette* of Madrid, he very narrowly escaped with his life from the vengeance of Murat, after the sanguinary conflict at Madrid on the 3rd of May, 1808. Still, however, he continued to defend through the press the interests of Ferdinand VII., and in 1810 he went to Cadiz, where the royalist party maintained their head-quarters, to resume his duty of editing the *Gazette*. In 1813 he was elected a deputy to the Cortes for his native province of Murcia, and in the same year was chosen one of the royal secretaries. The events of 1814 necessitated his retirement into private life; but in 1820 he was again elected to the cortes, and twice filled the post of secretary, and once that of president. For a few months in 1822 he was secretary of state for the colonies, and for a short time for home affairs also. Again, in 1823, the political vicissitudes of the day obliged him to retire to his country-seat, where his time was divided between literary and rural pursuits. In 1827, on his return to Madrid,

he was employed by the government in various duties, which he discharged greatly to the advantage of the country—such as the framing of new laws relating to game, and the redistribution of districts for judicial purposes. A more questionable employment was the compilation of an index of prohibited books. In 1833 he was appointed principal royal librarian, and in 1834 was raised to the dignity of a peer of the realm by the queen-regent. Clemencin's reputation, however, must be considered as literary rather than political. His earliest essay was a translation of the *Agricola* of Tacitus and other classical works. His "Commentary on Don Quixote" may be said to have thrown an entirely new light, even for his own countrymen, on the immortal work of Cervantes; the notes consist not only of philological explanations, but of acute criticisms of the manners and spirit of the time. Only a part of the work was edited by himself, the last three volumes being published by his sons after his death, which took place on the 30th of July, 1834, from an attack of cholera. Among his manuscripts is a memoir on the life of the *Cid*, the publication of which could not fail to be interesting.—F. M. W.

\* CLEMENS, FRIEDRICH, the assumed name of a modern German poet of considerable genius, but of rather eccentric character. He was born of very poor parents, named Gerke, at Osnabrück in Westphalia, on the 22d January, 1801; and the circumstance of having had for godfather the Rev. Clemens von Morsey, induced him to take the "nom de plume" of Friedrich Clemens, under which he is at present known. His career was a very curious one. He began writing verses when about ten years old, and this having attracted the attention of some notabilities of his native town, he was nominated to the post of assistant letter-carrier at the age of fourteen. He next became a student of theology; then an itinerant schoolmaster; after that a footman in the service of a merchant at Hamburg, and finally a lawyer's clerk. As such he married "on fifteen pounds a-year" a little milliner's assistant; set up shop as milliner and tobacconist; failed in both occupations; enlisted with an English recruiting officer for the 60th regiment, then in Canada; and set sail, in company with his wife, for the latter country, in March, 1821. But the life of a soldier proving as unacceptable as any of his former occupations, he again took to verse-making; and procuring by means of it the necessary funds, he bought his discharge from the 60th, and returned to Hamburg in 1823. "Rhymeforging" now became his regular business, to which he added that of a printer of his works, he having himself constructed, "out of an old tobacco press," a printing machine, and obtained the loan of an old set of types. He in this way issued "Erste und heitere Proben meiner Dichtung" (Specimens, light and serious, of my Poetry), a volume which was reprinted afterwards in the regular, and it must be said the better way, so far as the getting-up of the book was concerned. His next publications were "Klänge der Herzens an die Gottheit" (Aspirations of the Heart to God), Hamburg: Hoffman and Campe, 1832; "Die Excentrischen" (The Eccentric People), *ibid.* 1834; and "Manifest der Vernunft" (The Manifesto of Reason) 1836. The last named work made a great sensation in Germany, and was interdicted by the Diet; which, of course, immediately trebled its circulation and the author's renown. After this he published two novels, "Das entschleierte Bild zu Sais" (The unveiled Picture at Sais); and "By Nacht und Nebel" (Through Night and Fog); as also a comedy, "Der Auswanderer am Ohio" (The emigrant on the Ohio.) His friends about this time procured him the office of inspector to the Hamburg-Altona telegraph company, which situation secured him against further want, but likewise prevented him following his literary labours. He produced another work, entitled, "Allbuch" (All-Book,) an attempt to preach the "Religion of Love," but this met with little success, being condemned by the philosophical schools as well as by the orthodox believers, and, besides, suffering from a want of clear logical argumentation. The works of Friedrich Clemens have recently been republished in a new and complete edition.—F. M.

CLEMENS, TITUS FLAVIUS, cousin of Domitian, and his colleague in the consulship A.D. 95. His father was Flavius Sabinus, elder brother of the Emperor Vespasianus. During his consulship he was put to death by Domitian. According to Dion Cassius he was executed on a charge of atheism; for which, he says, many others who had embraced the Jewish opinions were also put to death. It has been inferred from this that he

was a christian. His wife was banished because she had embraced the same religion. Under the church of St. Clement at Rome, on the Cælian hill, was found, in 1725, an inscription in honour of Flavius Clemens, martyr. Sometimes he has been confounded with Clemens Romanus. Notices of him may be found in Eusebius and Jerome.—S. D.

CLEMENS NON PAPA or CLEMENT, JACOB, a musician, was born in Flanders, but the exact time and place are unknown; he died in 1565. He was designated by his contemporaries with the affix "Non Papa" to his name, to distinguish him from Pope Clement VII., who lived at the same time. Clemens spent some years in Italy, where his fame as a composer became very general; he was afterwards engaged to direct the chapel, then in very high repute, of the Emperor Charles V. A mass, printed in 1558, and some pieces in three different collections of motets and secular songs for four voices, were the only works of this master published during his life; but in 1568 and 1569 were printed his "Cantionum Sacrarum" and "Chansons Françaises," and in 1580 his "Requiem." Burney praises the purity of his counterpoint, and Hawkins prints a canon of his composition as a specimen of this, and of the state of music in his time.—G. A. M.

CLEMENT, a distinguished Irish scholar and ecclesiastic, who lived towards the end of the eighth century. He accompanied his friend Albin to the court of Charlemagne at Paris; the manner in which they attracted the notice of the monarch is already stated.—(See ALBIN.) Charlemagne retained Clement in Paris, and all the young men of the city of every rank were put under his tuition. It is right to remark that Tiraboschi, in his History of Italian literature, doubts the truth of the story of these monks' introduction to the emperor; but both Muratori and Denina give credence to it, and there is no reason to doubt the facts of the narrative. Clement wrote a life of his royal patron, and several other works which were held in high reputation.—J. F. W.

CLEMENT, AUGUSTIN JEAN CHARLES, bishop of Versailles, was born at St. Creteil, near Paris, on the 8th September, 1717. After studying jurisprudence he became a clergyman, received priest's orders in 1744, and was admitted into the chapter in the principal church at Auxerre. He was a zealous jansenist, combating the jesuits with great boldness. To promote the jansenist interest, he visited the Netherlands in 1752 and 1762, and took several journeys to Italy and Spain. In 1797 he was appointed constitutional bishop of Versailles. In that year he took a leading part in the first national council at Paris. After Pius VII. entered into negotiation with the Emperor Napoleon respecting a concordat, he resigned his dignity, and died on the 3d March, 1804.—(See *Memoires secrets sur la vie de M. Clement*, by Saillant, Paris, 1812, 8vo.)—S. D.

CLEMENT, FRANÇOIS, a benedictine monk of St. Maur, born at Beze in Burgundy in 1714. He embraced the monastic life in the benedictine abbey of Vendome, where he studied with intense application. Having been ordered by his superiors to Paris, he turned his attention chiefly to history. In 1770 he published, in connection with Brial, the twelfth volume of the "Recueil des histoires des Gaules et de la France," begun in 1738. The thirteenth volume appeared in 1786. He is also the author of "Catalogus MSS. codicum collegii Claromontani," 1764, 8vo; and "L'art de verifier les dates des faits historiques," which, in the third edition, Paris, 1783, three volumes folio, may be called a new work, though founded upon that which was originally published by Dantine, Durand, and Clemencet in 1750, and of which he had superintended the second edition in one volume folio, Paris, 1770. It is said that he spent thirty years on this work. His studies were interrupted by the Revolution, during which he sought shelter in one convent after another, and lastly in the house of his nephew. He had made considerable progress in the composition of another book to be entitled "L'art de verifier les dates avant Jes. Christ.," but died suddenly of apoplexy before its completion, on the 29th March, 1793.—S. D.

CLEMENT, JACQUES, murderer of Henry III., king of France, was born in the village of Sorbonne. He became a dominican monk, and afterwards priest. His disposition was gloomy and enthusiastic. Sights from heaven appeared to him; voices from heaven addressed him. God commissioned him, so he alleged, to sacrifice his life for the faith, and deliver the church from an apostate king. He set out for Paris on the 31st July, 1589, to the camp of the king at St. Cloud, with a knife in his sleeve. La Guesle, procurator-general of the king, whom

he had informed of his having important things to disclose to Henry, conducted him into the royal presence, in the house of one Jerome of Gondi. When the monk presented to the king an epistle, the latter read it as he sat, inclined his ear to the kneeling man to receive the important intelligence which could not be given in the hearing of another, and received a mortal wound in the abdomen from Clement. The king tore the knife from his body, and with it stabbed the murderer twice in the face. La Guesle and the royal servants soon despatched Clement, who never spoke. He is supposed to have been twenty-four or twenty-five years old at the date of his death.—(See *Thuani Hist.* ed. Francof., lib. 94-96.)—S. D.

CLEMENT, JEAN MARIE BERNARD, a French critic of considerable celebrity, born at Dijon in 1742; died in 1812.

\* CLEMENT, KNUT JUNGBOHN, a Danish writer of reputation, was born in the island of Amram on the 4th December, 1803. In 1825, he was sent to Altona, whence in due time he entered the university of Kiel, devoting himself to theology and languages. Here he remained two years, and after a short residence at the university of Heidelberg, took his degree of doctor in philosophy. The reputation of Clement soon attracted the notice of the Danish government, who furnished him with the means of travelling through the British islands, France, Belgium, and Germany. On his return he was attached to the university at Kiel, where he delivered a very popular course of public lectures. The pen of Clement has not been an idle one. Besides several volumes on his travels, he has written on politics, history, languages, and polite literature. He is justly esteemed as a writer of original genius and sprightliness, and enjoys the reputation of being an excellent linguist.—J. F. W.

CLEMENT, NICOLAS, a French historical writer, and one of the librarians of the royal library, was born in 1651, and died in 1716. He prepared a work entitled "Memoirs and Secret Negotiations of France concerning the Peace of Munich," &c., which was published at Amsterdam in 1716. He formed an immense collection of prints (18,000 in number), which he bequeathed to the Bibliothèque Royale.—J. T.

CLEMENT, PIERRE, born in 1707; died in 1767; was the author of a number of plays, both tragic and comic, written in French. He was originally a protestant clergyman in Geneva, but having removed to Paris, and devoted himself to theatrical compositions, was required by the consistory of Geneva, in 1740, to renounce his clerical title.

CLEMENT, TITUS FLAVIUS, one of the most distinguished teachers belonging to the catechetical school of Alexandria. He was descended from a heathen family which resided either at Athens or Alexandria; probably the former. Little is known of the events of his life. Gifted with an inquiring mind, he studied the writings of poets and philosophers in search of truth, but remained unsatisfied. In mature years he discovered in christianity what he had long been seeking, and embraced it cordially as the highest philosophy. What the stores of classical antiquity had failed to supply, he found in the scriptures as interpreted by Pantæus, head of the Alexandrian school. After assisting his preceptor in the management of the school, he became his successor, and laboured there with success about 190-202, till the tenth year of Severus, when persecution obliged him to leave the place. He filled the office of catechist and presbyter with distinguished ability. It is impossible to trace his movements after leaving Alexandria. Probably he repaired first to his disciple Alexander, then bishop of Cappadocia. He was in Palestine and Syria under Caracalla, as is inferred from a letter of Alexander, then bishop of Jerusalem, recommending him to the church at Antioch as a virtuous and godly minister. Some suppose that he returned to Alexandria before 211, and succeeded his preceptor at that time as master of the school; but for this the evidence is slight. His death took place between 211 and 218. The principal works of Clemens Alexandrinus are, *Λόγος προερεπτιζός πρὸς Ἕλληνας*, or Cohortatio ad Græcos, Hortatory discourse to the Greeks; *Παιδαγωγός*, Pædagogus, Pædagogus; *Σερωματεῖς*, Miscellanies. These three are properly parts of one work, in which are traced the successive steps of conversion, discipline, and free insight. The best edition of Clement's works is that of Potter, in 2 vols., folio, Oxford, 1715. The materials for his biography are in Eusebius, Jerome, and Photius.—(See Le Nourry in Sprenger's Thesaurus Patrum, tom. iii., p. 718; Von Cölln's article in Ersch and Gruber's Encyclopædia, vol. xviii.; Neander's *Church History*; Bishop Kaye's *Account of the writings and*

*opinions of Clement of Alexandria*, 8vo, 1835; and Smith's *Dictionary of Biography and Mythology*.)—S. D.

CLEMENT I. or CLEMENS ROMANUS, an ecclesiastical writer belonging to the early church. Very few particulars of his life are known. Many think that he was the same Clement whom the apostle Paul alludes to in the epistle to the Philippians, iv. 3. But though Origen, Eusebius, Epiphanius, Jerome, and others in ancient times, as well as various critics in modern times have asserted the identity, it is more probable that they were different persons. If his first epistle to the Corinthians be authentic, Clement occupied an eminent place in the church at Rome. He seems to have been a bishop there. So at least tradition asserts. The order of succession in the first bishops at Rome is uncertain. The oldest tradition is that found in Irenæus, which arranges them thus—Peter, Linus, Cletus, Clement. The oldest Latin tradition, which is found in Jerome, represents the order thus—Peter, Clement, Linus, Cletus, with which agrees Tertullian's statement that he was ordained by Peter. It has been conjectured that he died the death of a martyr; but Irenæus, Eusebius, and Jerome never once allude to such an event. The year 102 has been assigned as the date of his decease. There is extant a first epistle (so called) to the Corinthians, written, or purporting to be written, by Clement. To its authenticity we think there can be no well-founded objection; though many critics have denied or doubted it—very recently those belonging to the Tübingen school. Presuming, as we do, that the letter was Clement's own production, it probably belongs to the reign of Domitian. Others place it about A.D. 68, which is too early, as Schliemann has shown. It appears to have been occasioned by a strife in the Corinthian church—the same in all probability which existed there in the time of Paul; and its general tenor is to effect a reconciliation between the parties. Another epistle is ascribed to the same writer, the (so called) second epistle to the Corinthians, of which only fragments exist. The production, however, is supposititious, and must have been written at the close of the second century. These two letters are preserved in the Alexandrian MS., whence they were first transcribed and published by Patrick Young, Oxford, 1633, 4to, and afterwards much more correctly by H. Wotton, Cambridge, in 1718. The apocryphal literature included under the name "Clementines," professedly proceeded from Clement of Rome; but this is justly denied by all critics of the present day. Neither the Homilies called the Clementines, nor the Recognitions derived from them; nor the Epitome, the offspring of a later orthodoxy; nor the Apostolic Constitutions and Canons which were written much later than Clement's day—though recording many genuine apostolic traditions—belong to his pen. In like manner the two Syriac epistles to the virgins, first printed by Wetstein at the end of his edition of the Greek Testament, must be dissociated from Clement's authorship, notwithstanding the opinion of Wetstein, Möhler, Zingerle, and others. The remains of Clemens Romanus are included in editions of the apostolic fathers, as in those of Cotelerius (ed. Clericus), 2 vols., folio, Amsterdam, 1724; Jacobson, 2 vols., 8vo, Oxford, 1840; Hefele, at Tübingen, 1 vol., 8vo, 1847. They have been translated into English by Archbishop Wake and Chevallier.—(See Hilgenfeld's *Erforschungen über die Schriften apost. Väter*, 1853, 8vo; and Uhlhorn, in Herzog's *Encyclopædia of Protestant Theology*, article "Clement."—S. D.

CLEMENT II., Pope, a German, bishop of Bamberg, succeeded Gregory VI. in 1046. He immediately crowned Henry III. emperor of Germany. He died in the following year.—T. A.

CLEMENT III., a Roman, one of the cardinals created by Alexander III., was elected pope in 1187. In this year Jerusalem was taken by Saladin, and the christian kingdom of Palestine subverted. Clement endeavoured, and not unsuccessfully, to arrange the quarrels which divided the sovereigns of Europe, and to unite them into a confederacy for the purpose of undertaking a new crusade. He reconciled Henry II. of England and Philip Augustus, and they, together with Frederic Barbarossa, assumed the cross. Clement died in 1191.—T. A.

CLEMENT IV. (GUIDO, bishop of Sabina), was elected on the death of Urban IV. in 1265. He had formerly been a lawyer, and had two daughters living at the time of his elevation. Clement carried on Urban's design of getting Naples and Sicily for Charles of Anjou, whom he vigorously assisted, first against Manfred, then against Conradin, until the whole of Sicily fell into his hands. Crusades were promoted by this pope, in

Spain against the Moors, and in Hungary against the Tartars. He had already mixed in English affairs, having been sent by Urban IV. on a mission of conciliation between Henry III. and his barons, and of coercion as regarded the bishops who sided against the king; and now, as pope, he continued his efforts; exhorted the king of France, St. Louis, to act also as a peacemaker, and sent Cardinal Ottoboni to England as his legate, with highly beneficial results. Clement was a good preacher, and led an ascetic life. He died in 1286.—T. A.

CLEMENT V. (BERTRAND DE GOTH, archbishop of Bourdeaux), was elected in 1305 by the cardinals assembled at Perugia, after the sittings of the conclave had been protracted for eleven months since the death of Benedict XI. He would not hearken to the entreaty of the cardinals that he would come to Italy; but after fixing his court first in Poitou, and then in Guienne, he established it permanently at Avignon in 1309. In two nominations he created none but French cardinals. He granted to Philip le Bel a tithe of the revenues of the French church for five years, to aid him in his unjust war upon Flanders, and in many other ways sacrificed the interests of the church to conciliate this haughty sovereign. Clement died at Roquemaure on the Rhone in 1314.—T. A.

CLEMENT VI. (PETER ROGER, archbishop of Rouen), one of the Avignon popes, succeeded Benedict XII. in 1342. The rupture which his predecessor had unwisely kept open between the Emperor Louis of Bavaria and the holy see, came to a crisis under Clement, who in 1345 fulminated against Louis a bull of excommunication, in which he exhausted the vocabulary of malediction. The candidate favoured by the pope, the Margrave Charles of Moravia, was chosen emperor by the majority of the German electors in 1346. In 1348 Clement purchased the territory and city of Avignon from Joanna, queen of Naples and countess of Provence, for the sum of eighty thousand florins. In 1350 he authorized the celebration of the second jubilee at Rome. He died in Avignon in 1352.—T. A.

CLEMENT VII. (GIULIO), was an illegitimate son of Julian de Medici, who was assassinated in the conspiracy of the Passo at Florence in 1478. He joined the Johannites, and became prior of Capua. Leo X., his cousin, after being elevated to the papacy, made him legitimate, and created him archbishop of Florence, and soon after cardinal in 1513. Henceforth he was Leo's privy councillor. After Hadrian VI.'s death, Giulio was chosen pope in 1523, and took the title of Clement VII. After the battle of Pavia, where the French army was destroyed, Clement was obliged to lean to the side of Charles V., though he had secretly inclined to that of Francis I. He encouraged a league with France and England against the claims of Charles, when the independence of Italy was in peril. When Francis I. purchased his liberty from the emperor, Clement VII. absolved him from the oath he had taken as a prisoner, and did all that he could to organize a confederacy against Charles' exorbitant power. But the agitations of Germany were unfavourable to the pope's success; his allies did not keep their word with him; the enemy pressed on; the papal forces were overthrown at the first assault; the imperial army entered Rome on the 6th of May, 1527; and the city was sacked and pillaged with savage ferocity. The pope himself was besieged in the castle of St. Angelo, and four hundred thousand ducats demanded as the condition of his release. He escaped from prison in the dress of a merchant and fled to Orvieto. Humbled as he was, the kings of England and France could not induce him to enter into their league against Charles. The misfortunes of the French arms in Italy in 1528-29, strengthened his aversion to come to terms with France; and in view of all circumstances he resolved to make a formal peace with the emperor at Barcelona, on the 29th of June, 1529. Towards the close of this same year Clement had an interview with the emperor of Bologna, in which the latter promised to invest Florence, and compel it again to submit to the Medici family. The progress of the Reformation gave Clement considerable uneasiness, and he used various means to regain the influence which Rome had lost by that movement, but generally without effect. He protracted the decision of Henry VIII.'s suit of divorce from his wife, Catherine of Arragon, till the haughty English king was wearied of delay, and procured a sentence of divorce at home. On this the pope, urged by the cardinals of the emperor's party, issued an anathema against Henry, and thus sealed the annihilation of his authority in England. In addition to the troubles which the

events in England caused the pope, Francis I. menaced Italy with a fresh invasion, affirming that he had the pope's oral approbation of the project. The emperor pressed on the reluctant Clement the necessity of convoking a council; domestic troubles embittered his mind, his two nephews falling out about the sovereignty of Florence. He died September 25, 1534. Though his judgment was good, he wanted decision and firmness of character. His covetousness, dissimulation, and faithlessness created distrust of his policy and contempt of his character.

A conclave of cardinals who had suffered from the severity of Urban VI., set up as his rival Cardinal Robert of Geneva, under the name of Clement VII., in 1378. He took up his residence at Avignon, and was looked upon as one of the regular French popes. He died in 1394.—S. D.

CLEMENT VIII. (CARDINAL IPPOLITO ALDOBRANDINO), was elected pope in 1592. Falling between the long period of European warfare, which was terminated by the peace of Chateau Cambresis in 1559, and that which opened in 1618 at the commencement of the Thirty Years' war, the pontificate of Clement presents the holy see in the light of an important arbitrating and reconciling power in the affairs of the south and centre of Europe. In 1598 the papal forces took possession of the territory and city of Ferrara, dispossessing the house of Este. In 1599 occurred at Rome the frightful tragedy of Beatrice Cenci, which has been dramatized by Shelley. Under this pope commenced the long controversy on the doctrines of grace and free will, originated by the writings of the jesuit, Molina. The dominicans opposed Molina, and the matter was referred in 1604 to Clement, who, though leaning to the side of the dominicans, did not live long enough to pronounce a decision. This able pope died in March, 1605.—T. A.

CLEMENT IX. (CARDINAL GIULIO ROSPIGLIOSI), succeeded Alexander VII. in June, 1667. He was a wise and moderate pontiff. He continued the proceedings commenced by his predecessor against the four French bishops who had refused to give an unqualified adhesion to the decision of the holy see upon the famous five propositions of Jansenius. The news of the loss of Candia, taken by the Turks from the Venetians in 1669, is said to have hastened the pope's death, which occurred in December of that year. He was succeeded by

CLEMENT X. (CARDINAL EMILIO ALTIERI), then in his eightieth year. His pontificate is remarkably barren of interest. He died in 1676.—T. A.

CLEMENT XI. (CARDINAL GIAN FRANCESCO ALBANI) was elected in 1700. He was then in the vigour of life, and wore the tiara for twenty years, during a most eventful period of European history. The war of the Spanish succession broke out in 1702, and the pope espoused the cause of the French aspirant, Philip V., a younger son of Louis XIV. In eastern Europe, Clement, true to the traditions of the papacy, brought about a successful combination against the Turks. The result was the great victory of Peterwaradin, gained by Prince Eugene in 1716, which was followed up by other successes, and led for the time to the complete humiliation of the Turkish power. Clement assisted with money the pretender, the son of James II., in his abortive attempt in 1715. In 1713 he issued the famous bull *Unigenitus*, condemning certain Jansenistic propositions extracted from the writings of P ere Quesnel. The personal character of Clement was almost without a blemish. He died in 1720.—T. A.

CLEMENT XII. (CARDINAL LORENZO CORSINI) succeeded Benedict XIII. in 1730. This pontiff was a dilettante in the fine arts, and a lover of show and magnificence; his personal bearing was gentle and noble. He died in 1740, at the age of eighty-eight.—T. A.

CLEMENT XIII. (CARDINAL CARLO REZZONICO), a noble Venetian, was elected on the demise of Benedict XIV. in 1758. He was one of the most excellent of men; in Padua he had passed by no other name than "the Saint." The eleven years of his pontificate were one long struggle against the growing influence of the infidel philosophy of France. The great question of the day was that of the suppression of the jesuits. Clement did not cease to defend by word and act the persecuted society. Nor did he scruple to become in his turn the assailant; he condemned the monstrous production of Helvetius, entitled *De l'Esprit*, and also censured the *Encyclop die* of D'Alembert and Diderot, "as pernicious alike to religion and morality." Clement died in 1769.—T. A.

CLEMENT XIV. (CARDINAL LORENZO GANJANELLI) was elected in 1769 on the death of the foregoing pope. By slow and cautious steps he proceeded to that consummation which he well knew was expected from him—the abolition of the Society of Jesus. On the 23rd July, 1773, having nearly a year before shut up the jesuit seminary at Rome, he signed the bull beginning *Dominus ac Redemptor noster*, by which the order was *ipso facto* abolished in every part of the catholic world. Clement XIV. died in September, 1774.—T. A.

CLEMENTI, MUZIO, the eminent pianist and composer for his instrument, was born at Rome in 1752, and died in London 10th March, 1832. His father, a worker in gold and silver, was chiefly occupied in making ornamental vessels for churches. He was a great lover of music, and was delighted, therefore, when he observed the manifestation of a natural talent for this art in his son; and he was sedulous to procure him the best opportunity for developing his ability. Antonio Baroni, m astro di capella at one of the ecclesiastical establishments in Rome, was a relation of the family; and to his instruction young Clementi was confided when but six years old. The year following, he began to study harmony under a master of some repute named Cordicelli. In 1761 he gained a prize at a public competition by his efficiency for the requirements of an organist, playing fluently from the figured basses of Corelli, and transposing music at sight. He was now placed under Santerelli to learn singing, and he acquired some repute for his voice and his manner. In his twelfth year he became a pupil for composition of the famous Carpini, who was as noted in his own circle for his roughness of manner, as distinguished throughout Europe for the depth of his contrapuntal knowledge. Unknown to his rigid master, Clementi wrote a mass for four voices, and found an occasion to have it publicly executed; Carpini attended the performance, and, though he rebuked his scholar for not having shown him the work, he could not withhold his commendation of its merit.

Peter Beckford, a brother of the eccentric author of *Vathek*, and a participator with him of their father's riches, spent the winter of 1765-66 in Rome, and there made acquaintance with the already remarkable powers of young Clementi. Charmed with these, he took the boy under his special care to England, engaging to make provision for him until he should be of an age to enter upon the world. At this gentleman's seat in Dorsetshire, besides ardently pursuing his musical studies, Clementi cultivated a knowledge of the classics, in the languages of which he became as great a proficient, as his subsequent residence in different countries made him in those of modern Europe. He remained in this retirement until 1770, prior to which he wrote several of the compositions which, when afterwards published, drew upon him the attentive admiration of the best musicians of the time; among others were the six sonatas, op. 2, which are accredited as the origin of this form of writing for the pianoforte; they were printed in 1773, and their merit was at once acknowledged. On leaving Mr. Beckford, Clementi came to London, where he obtained the appointment, now obsolete, of accompanist on the harpsichord at the opera. In 1780 he went to Paris, where the eulogies lavished on his very remarkable playing might well have intoxicated a less genuine artist, whose love of applause had been greater than his ambition to deserve it. Thence he proceeded, in the next year, to Vienna, making a short stay at Strasburg and at Munich. In the Austrian capital he played, nightly, together with Mozart, before the emperor, referring to which occasions a letter of Mozart to his father speaks of Clementi's executive excellence, but denies in him the power of expression, for which he is most particularly reputed. One cannot pass unnoticed this direct opposition of the opinion of the man most qualified to form one, to the verdict of the whole world; but it must be borne in mind, that Mozart's was a private letter, not a public declaration, and that in writing to his father, his object would rather be to quiet any apprehensions in the worthy Leopold, of immediate danger to himself from his new and powerful rival, than to give a faithful criticism of the talents of Clementi, which should be openly discussed in after ages.

Clementi returned to London in 1782, and here remained, except during a short visit to Paris in 1784, for twenty years. So great was his esteem as a teacher, that at the terms of a guinea per lesson, then more exorbitant than in the present day, he was continually compelled to refuse pupils by the want of time to attend to them. Great as was this golden temptation, he never suffered it to allure him from his truthful devotion to

his art, nor to make him disregard his high calling as an artist. By assiduous practice he was always striving to perfect his skill as a pianist; and, in the course of this period, he produced many of his ablest works, and wrote his introduction to the art of playing the pianoforte, the valuable influence of which has been proved in the many admirable players that have been formed upon its principles. The bankruptcy of the firm of Longman & Broderip in 1800, occasioned a severe loss to Clementi, to repair which, by the advice of his commercial friends, he took the principal share in their establishment, and became a music-publisher and pianoforte manufacturer. From this time, except in the case of professional pupils, he entirely gave up teaching, determining to apply himself to the consideration of improvements in the construction of his instrument, in which he was so peculiarly successful as to raise up the high character of his house, which his partner, Mr. Collard, maintains at the present time. In 1802 Clementi commenced a professional tour, upon which he was longer absent from England than at any time after his first arrival in this country. With his pupil, John Field, he visited Paris and Vienna, and then went to St. Petersburg. Returning to Germany, he appeared, with the success which everywhere attended him, at the chief capitals, and went a third time to Vienna. There, through the misrepresentation of ill-judging friends, Beethoven and he were led each to expect such courteous advances from the other, that both were offended at not receiving them; the two, therefore, were never introduced, and though they not unfrequently dined at the same table in a public room, they neither forgave the slight each one thought he suffered, nor ever spoke to one another. At Berlin, Clementi married the daughter of a poor cantor of St. Nicholas' church, and went with her to his native country, which he had not seen for seven-and-thirty years. Mature as was his age, he was passionately attached to his young wife, whose beauty was remarkable; and he felt severely her death, which occurred within a year of their marriage, in childbirth. He returned to Berlin to place the infant under the care of his wife's relations. There he met with Berger, whom he accepted as a pupil; and, to dissipate his grief in changeful excitement, travelled with him in 1805 again to St. Petersburg, resting at every principal town through which they passed. After this he once more visited Vienna, and was called from thence to Italy by the death of his brother, which necessitated his presence to conclude the arrangements of the family affairs. The troubled state of Europe at this time made it impossible for Clementi to leave his native land before 1810, when he finally returned to England. In 1811 he contracted a second marriage, which produced him several children. He now almost entirely seceded from public life, but ceased not his artistic labours. The formation of the Philharmonic Society in 1813, created the opportunity, which had not before existed in England, for producing orchestral compositions; Clementi was an original member of the society, and he wrote several symphonies—one as late as the year 1824—which were played at the Philharmonic concerts. His great work, "Gradus ad Parnassum," was the occupation of some years; it was published about the year 1818, and soon became a class-book for the pianist, and a study for the composer in every music-school in Europe. He received a cruel shock in his extreme old age, from the accidental death, by fire-arms, of his eldest son. On the 17th December, 1827, the musicians of London, with J. B. Cramer and Moscheles at their head, gave a dinner at the Albion tavern, in honour of Muzio Clementi, the father of the pianoforte. On this interesting occasion, the wonderful octogenarian was persuaded to play, when every one of the large assembly was as delighted as astonished at the freshness of his powers evinced, not only in the marvellous finish of his mechanism, but in the spontaneous beauty of his improvisation.

Clementi's playing has left a more lasting impression than that of almost any other executant, since the merits of his style have been handed down, through his many distinguished pupils, to the present generation. Of these pupils, the first in consideration are J. B. Cramer and John Field, both of London; and only less eminent than these were Reuner of St. Petersburg; Klengel of Dresden; and Berger of Berlin, the master of Mendelssohn. As a composer, Clementi may be said to have done for the pianoforte what Haydn did for the orchestra, by appropriating to it, in the sonata, the grand principles of musical construction which the founder of modern instrumental music developed in the symphony. He was a master of all the

resources of counterpoint, with a complete grasp of the powers of modern harmony; and, besides the depth of character resulting from this knowledge, his music is distinguished by energy, fire, and intense passion; tenderness and melodious grace, however, the qualities one would most expect in the writings for his instrument, of an artist whose playing was especially signalized by these points of style, are rarely to be found in his compositions. He wrote no less than a hundred and six sonatas for the pianoforte—some of them with accompaniment for other instruments—besides many works of less extensive form, and his orchestral symphonies. The grandest example of his genius, and the one in which all his best characteristics are combined, is the sonata called "Didone Abbandonata." His extempore playing was such as could only have resulted from the union of his perfections as a composer and as an executant—rich in the fanciful and elaborate development of ideas, it proved at once the mind quick in invention, and the finger ready to give utterance to the thought. Upon the whole, few musicians have exerted greater present, and more lasting influence than Muzio Clementi.—G. A. M.

CLEMENTI, PROSPERO, born about the commencement of the sixteenth century at Reggio; died in 1584. He was one of the finest sculptors of his day. Algarotti calls him the Correggio of his art.

CLEMENTONE. See BOCCIARDO.

CLENARD or CLEYNAERTS, NICHOLAS, a famous Brabantian grammarian, whose Greek grammar, edited by Vossius and others, was long in use. Died in 1542.

CLENNELL, LUKE: this painter, the son of a farmer at Ulgham, near Morpeth, Northumberland, was born on the 30th March, 1781. At a very early age he exhibited a decided tendency to art. His schoolboy's slate was covered with caricatures, which flowed over and submerged his arithmetic. He was taken from school—the pedagogue entertaining rather mean notions of his abilities—and apprenticed to his uncle, a tanner. But the tanyard, no more than the farmyard, could quench his persistent love of art. He was caught caricaturing his uncle's customers. It was thought vain to struggle longer with the predilections of one so incorrigible—so incurable. He was apprenticed to Bewick the wood engraver, and soon became known as one of Bewick's most assiduous and promising pupils. Having served out his indentures, he removed to London in 1804, and married the daughter of Charles Warren the engraver. The fame he had already acquired supplied him with as much work as he could execute. Among many other things he engraved the illustrations to Falconer's *Shipwreck* and Rogers' *Poems*, after drawings by Stothard. The artist-like character of his work became generally recognized, and Clennell was gradually induced to abandon the graver for the brush. He entered as a candidate for the prize offered by the British Institution for the best picture of the "Final Charge of the Guards at Waterloo." Almost to his own surprise he succeeded and received the guerdon, one hundred and fifty guineas. In 1814 he was commissioned to paint a picture in commemoration of the entertainment given by the city of London to the allied sovereigns. It is believed that the anxieties this entailed upon him, the difficulties he experienced in procuring the requisite portraits, and his own doubts and fears about satisfying those he painted, fairly undermined his reason. He worked away manfully, however—had completed a first sketch of his subject, and was full of arrangements for carrying it further, when, with an awful suddenness, his brain gave way, and for ever. He died in a lunatic asylum on the 9th April, 1840. He had considerable genius, great facility of composition, and very dexterous execution. His best work is perhaps his "Day after the Fair," being excellent in colour and rustic character. His "Market Boats at Brighton" received great admiration. His power as a landscape painter is amply exhibited in his work on the "Border Antiquities."—W. T.

CLEOMBROTUS, son of Anaxandrides, king of Sparta. After the death of his brother Leonidas in the famous battle of Thermopylæ, 480 B.C., Cleombrotus was made regent for Plistarchus, the infant son of that prince, and put himself at the head of the forces which, at the time of the battle of Salamis, occupied and fortified the isthmus of Corinth. He died the same year, and was succeeded in the regency by his son Pausanias.—J. T.

CLEOMBROTUS I., twenty-third of the family of the

Agides, king of Sparta, son of Pausanias, succeeded his brother Agesipolis I., and reigned from 380 to 371 B.C. He commanded the Spartan troops several times against the Thebans, and fell at the battle of Leuctra, 371 B.C. He was succeeded by his son Agesipolis.—J. T.

CLEOMEDES, a Greek astronomer who lived somewhere about the year 300 A.D.; Letronne insists that he lived after Ptolemy. The work by which he is known is entitled "Circular Theory (*μετρώγων*) of the Bodies Aloft." It is written with great clearness, and contains many advanced conjectures. He says, for instance, that the first stars are as large as the sun, probably larger; and that they appear small because of their vast distances. He refers the tides to some action of the moon, and distinctly enunciates the fact that this luminary rotates on its axis in the same period that it revolves around the earth. He infers that we, therefore, can never see but one and the same hemisphere of that body. He gives, also, a good explanation of eclipses. Except to the historian of astronomy, the works of Cleomedes have necessarily lost all interest. The best edition of them is that by Bake, Leyden, 1820.—J. P. N.

CLEOMENES: three kings of Sparta of the family of the Agides. CLEOMENES I., son of Anaxandrides, reigned B.C. 520–491. In 510 he went with an army to the assistance of the Athenians against the Pisistratidæ, expelled Hippias, and afterwards aided Isagoras and the aristocratical party against Clisthenes. He had a colleague named Demaratus, whom, by bribing the priestess of Delphi, he succeeded in deposing. Cleomenes rendered himself infamous by his slaughter of the Argives, five thousand of whom he immolated by fire in a wood sacred to Argus. He was seized with madness in 490 and killed himself.—CLEOMENES II., son of Cleombrotus, reigned in 370–309.—CLEOMENES III., son of Leonidas II., reigned in 236–222. He was one of the most remarkable of the Agid sovereigns; simple in his private tastes, but energetic and imposing in his public conduct. His marriage with Agitatis, the widow of Agis IV., although entered into with reluctance by both parties, proved a fortunate event for the young prince, who found in his wife an energy of purpose and activity of mind which were of the greatest service to him in his schemes of political reform. His first object on acceding to the throne was to revive the ancient military renown of Sparta; and this he accomplished in his wars with the Achæans, whom he repeatedly defeated. He then prepared to restore the ancient constitution of Sparta, put the ephors to death, commanded a redistribution of property, and greatly augmented the number of the citizens. In these projects of reform he was interrupted by his old enemies the Achæans, who, having called in the aid of Antigonus Dason, king of Macedonia, carried on a war of three years' duration, which terminated in the battle of Sellasia, and the total defeat of the Spartans. Cleomenes fled into Egypt and placed himself under the protection of Ptolemy Evergetes, on whose death he was imprisoned by the new king Philopator. He eventually escaped from prison and attempted to raise an insurrection, but found no followers, and in despair put an end to his own life 220 B.C.—J. S., G.

CLEOMENES, an Athenian sculptor, whose name is inscribed on the base of the celebrated statue of the Venus de Medici, was the son of Apollodorus of Athens, and flourished between 363 and 146 B.C.

CLEON, a celebrated Athenian demagogue, the son of Cleænetus, was originally a tanner. His first appearance in public life was in opposition to Pericles, whom he denounced with great violence. After the death of this great statesman in 429 B.C., Cleon became one of the most popular leaders of the democracy; and during the Peloponnesian war, was the acknowledged head of the party opposed to peace. In 427, on the capture of Mitylene, he vehemently advocated in the assembly that the whole male population of military age should be put to death, and the women and children sold as slaves. In 424 the Athenians, appointed him to take charge of certain reinforcements which they sent to reduce the island of Sphacteria, then held by the Spartans. Elated by his success in this expedition, he strenuously advocated a war policy, and induced the Athenians to undertake the recovery of Amphipolis. He was appointed to lead the expedition, it is supposed, against his will, for he had neither talents nor experience for a military command. He met with some success at the outset, but was ultimately defeated by Brasidas, the famous Spartan general, under the walls of Amphipolis, and fell in the engagement, 422

B.C. The portrait of Cleon has been drawn in most unfavourable colours, both by Thucydides and Aristophanes. But Mr. Grote has shown that much weight cannot be attached to the satire of the poet, and that the usual impartiality of the historian has been warped by the personal injury inflicted on him by Cleon.—J. T.

CLEOPATRA, the celebrated Egyptian queen, was born 69 B.C. She was the eldest daughter of Ptolemy Auletes, and from her early years was celebrated for her beauty and fascinating manners. She was seventeen at the time of her father's death, and, in accordance with his will, she ascended the throne along with Ptolemy, her younger brother. A dispute, however, soon arose between them, and Cleopatra was expelled the kingdom, and forced to take refuge in Syria. Having collected an army there, she was preparing to march into Egypt when Cæsar arrived at Alexandria in pursuit of Pompey, 47 B.C., and espousing her cause, reinstated her on the throne. The defeat and death of Ptolemy soon followed, but another brother of the same name, and still quite a child, was associated with her in the kingdom. She bore a son to Cæsar, called Cæsarion, who was afterwards put to death by Augustus; and after the departure of the great dictator from Egypt, Cleopatra followed him to Rome, and had apartments assigned her in his palace. After the assassination of Cæsar, 44 B.C. she returned to Egypt, and rendered active assistance to the triumvirate in the overthrow of Brutus and Cassius. She now obtained sole possession of the throne by poisoning her brother Ptolemy. In 41 B.C. she met Antony in Cilicia, after the battle of Philippi; and by her combined beauty and talents, obtained such a complete ascendancy over the susceptible and voluptuous Roman, that he remained ever after her devoted lover and slave. He accompanied her to Egypt, but after the death of his wife Fulvia, he quitted Cleopatra and returned to Italy, for the purpose of marrying the sister of Octavian. In the course of his expedition against Parthia, however, he landed in Syria, and finding himself so near the fascinating queen, the profligate triumvir sent for her, and publicly acknowledged her as his wife, conferring upon her the most extravagant titles and honours. In the war which followed between Augustus and Antony, Cleopatra was present at the battle of Actium, 31 B.C. Her precipitate retreat with her fleet contributed to the loss of this decisive conflict. She fled to Alexandria, where she was joined by Antony. On the approach of Augustus, perceiving that the affairs of Antony were desperate, with characteristic selfishness she attempted to gain the favour of the conqueror, by offering to sacrifice Antony. She fled to an unfinished mausoleum, in which she had collected her treasures, and caused a report of her death to be given out. Antony resolving not to survive her, threw himself upon his sword and died. Finding that all her efforts to conciliate her cold-blooded conqueror had failed, and that he had determined to carry her captive to Rome to grace his triumph, she put an end to her life, 30 B.C., either by the poison of an asp, or by a poisoned comb—most probably by the former. She died in the thirty-ninth year of her age, and with her ended the dynasty of the Ptolemies, who had occupied the throne of Egypt for three hundred years. Cleopatra was undoubtedly a woman of extraordinary beauty, talents, and accomplishments, and refined taste, but degraded by her voluptuousness.

CLEOPATRA, daughter of Antony and of the preceding, was born in 40 B.C. After the death of her parents she was carried to Rome, along with her twin brother, Alexander, and was received under the protection of Octavia, the wife of Antony. She married Juba, king of Mauretania, and by him had two children.

CLEOPHON, a celebrated Athenian demagogue of obscure origin, alleged by Aristophanes to have been a native of Thrace. He possessed great influence in Athens, and towards the latter end of the Peloponnesian war, successfully opposed the proposal to make peace with Sparta. During the siege of Athens by Lysander, 404 B.C., he was brought to trial, condemned, and put to death by the aristocratical party, on the accusation of having evaded his military duty. Cleophon was assinated both by Aristophanes, and by Plato the comic poet.—J. T.

CLEOSTRATUS, an astronomer of Tenedos, supposed to have flourished in the fifth century B.C. The division of the zodiac into signs is attributed to him.

CLERC. See LECLERC.

\* CLERC, LOUIS, a French botanist, who published in 1835

"A Classical and Elementary Manual of Vegetable Anatomy and Physiology, containing an account of all the parts of plants, and their functions." It is illustrated by eight lithographic plates, containing one hundred and sixty figures, and is preceded by a small Flora of France.—J. H. B.

CLERISSEAU, CHARLES LOUIS, an architect and painter in water colours, born in Paris, who came over to England with Robert Adams the architect. He made the drawings for the "Ruins of Spalatro," &c., published in 1764. On the bankruptcy of Adams he returned to France, where he published "Antiquités de France;" "Monumens de Nimes," and other works. In 1783 he was appointed architect to the empress of Russia. He is noted for his very excellent water-colour drawings, which are highly prized. He died in Paris in 1820, in his ninety-ninth year.—W. T.

CLERKE, GEORGE, an English navigator who was born in 1741. He was educated at the marine academy of Portsmouth, and at an early age went to sea, where he distinguished himself by his intrepidity and zeal. In June, 1764, he entered as midshipman on board the *Dolphin*, and made his first voyage round the world under the command of Commodore Byron. He undertook a second voyage in 1768 with Captain Cook in the *Endeavour* as assistant-boatswain's mate. In 1771 he was promoted to the rank of lieutenant, and during the remainder of his life was associated on the most intimate terms with his illustrious commander. He accompanied him a second time in the *Resolution* in 1772; and again in 1776, as commander of the *Discovery*, he joined Cook in his last voyage. On the death of that intrepid navigator, 14th February, 1779, Captain Clerke assumed the command of the expedition, and displayed great prudence and energy in the critical circumstances in which he was placed. After quitting Owhyhee he made some exploratory researches among the other Sandwich islands; and in spite of the feeble state of his health, he resolutely persisted in carrying out the object of the expedition by visiting Kamtschatka and Behring's Straits. On the 28th of March he reached the bay of St. Peter and St. Paul, and after spending some time in repairing and victualling his ships, he proceeded to follow out the attempt to discover the north-east passage; but finding it impossible to penetrate through the ice, either on the coast of America or that of Asia, Captain Clerke was compelled to return to the southward, and on the 22nd of August, 1779, he died of consumption at the age of thirty-eight. Although the voyage was thus unfortunate as regards the two commanders, it made a great addition to our knowledge of the earth's surface. One of the islands near the entrance of the North Sea, discovered by Captain Cook in 1778, was named by him Clerke's island after his colleague.—J. T.

CLERK, JOHN, an English Roman catholic divine, who was at one time chaplain to Cardinal Wolsey. He was deputed by Henry VIII. to present to Leo X. the treatise of the king against Luther, which obtained for Henry the title of Defender of the Faith. On his return in 1523 he was nominated bishop of Bath and Wells. He was subsequently employed by Henry in negotiating with the duke of Cleves regarding the divorce of his sister Anne. The bishop died in 1540.—J. T.

CLERK, JOHN, of Eldin, N.B., author of a famous essay "On Naval Tactics, Systematical and Historical, with Explanatory Plates." In this work is embodied and explained the celebrated naval manœuvre, technically called "breaking the line," which was employed for the first time by Lord Rodney in 1782, and led to his decisive victory over the French under De Grasse in the West Indies, and was adopted with invariable success by Lord Howe, Nelson, and others during the war with France. Mr. Clerk's friends claim for him the invention of this manœuvre. They affirm that he first broached his notions on this subject in 1779, and that, in the following year, he mentioned his plan to Mr. Richard Atkinson, the particular friend of Admiral Rodney, by whom it was communicated to that distinguished officer. On the other hand, this view has been zealously controverted by General Sir Howard Douglas, who affirms that Mr. Clerk's essay could not have been communicated to Lord Rodney before his engagement with the French fleet. It is curious that the author of this ingenious essay had never made a single voyage. Mr. Clerk was a zealous antiquarian. He died in 1812.—(See *Scott's Life* by Lockhart, vol. i.; *Edinburgh Review*, vol. vi. p. 301.)—J. T.

CLERK, JOHN, Lord Eldin, a distinguished Scottish lawyer,

son of the preceding, was born in 1757. He was educated at first with the view to a career in India; but afterwards turning his attention to the law, he was called to the bar at Edinburgh in 1785. His success there was striking; but being a liberal in politics, he was excluded from holding any of the great offices, except for a short time that of solicitor-general for Scotland, under the coalition administration of 1805, Henry Erskine being lord-advocate. After Erskine had retired from practice, and Blair, Hope, Boyle, and one or two others, had been raised to the bench, Clerk remained undisputed leader of the bar; the next after him being Cranston, who used generally to be retained on the other side; and until about 1820, when his faculties began to fail, he was in the receipt of one of the largest professional incomes ever earned in a Scotch court. In personal appearance, as well as in manner of pleading, he was remarkable. His large head; broad, massy, projecting brow; eyes full and clear, overhung by rough shaggy eyebrows; a mouth with lines marking decision; and a lurking sense of humour—spoke to great intellectual vigour. His frame was robust and full of nerve, and a slight lameness in one limb scarcely disfigured him. When pleading, so long as he was unexcited he was slow, distinct, sensible, but nothing more. Once roused, and no man was more easily roused, the words flowed in a torrent of invective; sarcasm and ridicule were heaped on his opponent, and even launched at the bench if he were crossed. His powers of reasoning at the same time were strong, his knowledge of law vast, and he never applied either better than when hurried away by this enthusiasm. But he was very unequal. Few great counsel, it is said, ever made so many poor appearances. From his hastiness and love of opposition, it may easily be believed that he delighted in paradox, and the more he was thwarted, the more strongly would he insist that he was right. When he spoke, crowds gathered to hear him, and it was rare that some piece of brilliant sarcasm or strong humour did not reward them. His hearers relished it none the less that he delivered it in his native Scotch, which with him, however, was tainted with nothing vulgar. His fame extended beyond the courts of law. Although a man so fond of opposition could hardly have been expected to have adopted the politics of those in power, the liberality of his principles had a deeper foundation, and formed part of him. His courage in maintaining them was everywhere respected. He was known as the man who, after Henry Erskine, was the boldest in the popular cause. The threats and allurements of the Dundases and the other tory lawyers who then monopolized power and patronage, had no influence over him, and his example had doubtless effect on others in lower ranks. The parliament house then was one of the few places having an air of publicity, where opinion was freely expressed. When Clerk first entered on life the opposition press had hardly a respectable writer, the terrors of the law of libel hung over it, and public meetings were unknown. Certainly some of the merit of producing that change which he lived to see, must be attributed to the bold, able, and outspoken lawyer. Among his merits, also, it must not be forgotten that he steadily supported law reform. In private life Clerk was almost a different man from what he was in public. Cultivating literature of all kinds, he was passionately devoted to the fine arts. He had great knowledge of painting, was himself a clever drawer and etcher, and also modelled occasionally. A great part of his income was devoted to the formation of a fine private gallery of pictures and of other objects of art, the benefits of which he was far from confining to himself. In times when everyone was social in Edinburgh, he was a favourite with its best society. In his earlier days he would remember when every citizen in Edinburgh, from the judges downwards, spent some portion of his evening in some club or place of public entertainment. In his later days this spirit had not died, though its form had somewhat altered. The age of exclusiveness had not begun. "People visit each other in Edinburgh," said the author of Peter's Letters writing about 1816, "with all the appearance of cordial familiarity, who, if they lived in London, would imagine their difference of rank to form an impassable barrier." This freedom extended to all circles. The literary men, among whom were conspicuous Scott and Jeffrey, and the host of rival contributors to the *Edinburgh Review* and to *Blackwood's Magazine*, with Dugald Stewart and other professors in the university, did not find themselves too enlightened for their fellows; and, while they raised the whole tone of society, in turn profited themselves by an ever fresh knowledge of human nature and

geniality of mind. It was in society such as this, that Clerk shone with never-failing humour and endless store of anecdote. If occasionally he discoursed complacently on his own talents and virtues, it was thought nothing of; for eccentricity had not then become the reproach it is now counted in less cultivated society. Nor did his inattention to dress make him anything the less welcome. The real kindness and liberality of the man's whole nature might well have made much graver faults to be overlooked. At home among the curiosities, he seems to have been not the least himself. Stories are told of how visitors used to find him in his study, surrounded by a litter of books, engravings, and statuettes, with possibly half a dozen cats or dogs lying about, and in all likelihood one of the former animals, of which he was specially fond, perched on his shoulder. The days for these things are past, and half the eccentricity of Clerk would now prevent a man from being what he was in his day—a leader in public opinion, in the courts, and in society, and an authority in literature and art. John Clerk was not made a judge till 1823, when he was very old, and all his faculties were dim. His memory, in particular, had failed. Accordingly, his reputation as a judge is very limited, and his decisions of little value. He resigned his judgeship in 1828, and died in 1832.—J. D. W.

CLERMONT, LOUIS DE BOURBON, Count de, a prince of the royal family of France, was born in 1709. He was at first intended for the clerical profession, and actually received several abbacies; but in 1733 he obtained a dispensation from the pope, Clement XII., authorizing him to bear arms. He served in several campaigns in Germany and the Low Countries. In 1754 he was elected a member of the French Academy—a step which provoked a number of smart epigrams both on the academy and on the new member. In 1758 he was appointed to the command of the French army in Hanover, and was attacked by Prince Ferdinand of Brunswick, driven across the Rhine with great loss, and ultimately defeated at Crefeldt, leaving seven thousand men on the field. He died in 1771.—J. T.

CLERY or O'CLERY, MICHAEL, the chief compiler of the Irish Annals, called "of the Four Masters," was born in the parish of Kilbarron, near Ballyshannon, Donegal, Ireland, about the year 1575. He was a lay brother of the Franciscan order, and while in the world had borne the name of Teige of the Mountain; but on his admission to the order of St. Francis he assumed that of Michael. Soon after joining his order at Louvain, he was sent to Ireland by the guardian of the Irish convent there, Hugh Ward (who was then himself employed in writing the lives of Irish saints), to collect Irish manuscripts and other helps towards this undertaking. O'Clery, who was eminently qualified for the task, pursued his inquiry for fifteen years, during which period he visited the best Irish scholars and antiquaries then living, and transcribed from ancient manuscripts many lives of Irish saints, several genealogies, martyrologies, and other monuments, all which he transmitted to Hugh Ward in 1635, who, however, did not live to avail himself of them; but they proved of great use to the Rev. John Colgan, jubilate lecturer of theology at Louvain, who took up the same subject after the death of Ward. During O'Clery's stay in Ireland, he compiled the following works—in one volume, "A Catalogue of the Kings of Ireland, and the Irish Calendar of Saints' Days;" "The Book of Conquests;" and "The Annals of Ireland," called "The Annals of the Four Masters." None of these works, of which copies are preserved in the library of the Irish academy, have yet been published, except the "Annals of the Four Masters," of which a complete translation has lately been published by Dr. J. O'Donovan, Dublin. Besides these works, Michael O'Clery also wrote and published at Louvain a glossary of difficult and obsolete Irish words, which Lloyd embodied in his Irish dictionary. This work is now very scarce. Colgan, who published his *Acta Sanctorum* in the year 1645, states that Michael had died a few months previously.—J. O'D.

CLEVELY, JOHN: this painter was born in London about 1743. He was brought up in the dockyard at Deptford, but afterwards he entered the navy; and, as a lieutenant in that service, accompanied Lord Mulgrave in his voyage of discovery to the north pole. He subsequently went with Sir Joseph Banks to Iceland. He painted both in oil and water colours—more generally in the latter. His marine pieces brought him renown, and many of his drawings were engraved. He died in London in 1786.—W. T.

CLEVES, ANNE OF. See HENRY VIII.

CLEVES, MARIE DE, Duchess of Orleans, Milan, and Valois, born in 1426, was the daughter of Adolphus IV., duke of Cleves. In 1440 she was married to the duke of Orleans, who was nearly three times her age, and had been twice a widower. Marie of Cleves was a woman of a noble and beautiful appearance, and was possessed of considerable abilities and of high literary culture. She wrote a number of romances, ballads, and other poems, many of which have been preserved. She contributed greatly to the promotion of learning in France, by supporting many students at the universities of Pavia and Orleans, and by giving assistance to the university of Caen.—R. B.

CLEYN or KLEYN, FRANZ: this artist was born at Rosstock, and for some time worked in the service of Christian IV., king of Denmark. Then moved by a strong desire for improvement, he travelled to Italy, and for four years studied zealously at Rome. Afterwards, at Venice, he became known to Sir Henry Wotton and Sir Robert Anstruther, and on their advice journeyed to England, where he was placed in the king's new manufactory of tapestry at Mortlake, and required to furnish historical and grotesque designs for the works. He decorated many mansions of the nobility. A room and ceiling by him at Holland House were lauded as equal to Parmegiano. He was original in design, and elaborate in workmanship. He died in 1658.—W. T.

CLICQUOT, FRANÇOIS HENRI, a French organ-builder of considerable eminence, born at Paris in 1728. He built—sometimes in conjunction with Pierre Dallery—the organs of Notre Dame, St. Nicholas-des-Champs, St. Gervais, the chapel-royal at Versailles, St. Sulpice, and many others. He died at Paris in 1791.—E. F. R.

CLIEVELAND, CLEAVELAND, or CLEVELAND, JOHN, a popular cavalier poet of the reign of Charles I., born at Loughborough, Leicestershire, in 1613, was educated at Christ's college and St. John's college, Cambridge, of which he became a fellow in 1634. Of his poems the best known was a satire entitled "Petition to the Lord-Protector for the Scots Rebel." The author, after his ejection from his fellowship, led an unsettled life during the civil war, and was for some time a prisoner at Yarmouth. Fuller praises his Latinity, his excellent oratory, and the "lofty fancy" displayed in his poems. He belonged to the metaphysical class of poets, and outdid the most conceited of them in conceits. His death occurred in 1659.—J. S., G.

CLIFFORD, the name of a famous noble family, "the stout Lords Clifford" as they were called, whose adventures occupy a conspicuous place in English history. They were descended from the dukes of Normandy, and took their English appellation from their castle in the county of Hereford—

CLIFFORD, ROGER DE, was the first of the family who gained a footing in the north, by inheriting the lands and castle of Brougham, near Penrith, in Cumberland. He was slain in the Welsh wars. His eldest daughter was the "Fair Rosamond" of romantic celebrity.—ROBERT, the son and successor of Roger, was said to have been the greatest man of all the family, being of a most martial and heroic spirit. He was one of the guardians of Edward II. when a minor, and was subsequently made by him lord high admiral. He acquired great celebrity in the Scottish wars, and was rewarded for his valour by grants out of the possessions of the Maxwells and Douglasses. But he went upon his neighbour's land once too often, and was slain at the battle of Bannockburn, 24th June, 1314.

CLIFFORD, ROGER, fifth lord, is said to have been "one of the wisest and gallantest" of the race. He took a prominent part in the French and Scottish wars of Edward III. He was the longest possessor of the family estates of any before or after him till the "Shepherd Lord," and it was his fortune to be the first Lord Clifford of Westmoreland who lived to be a grandfather.—His son THOMAS, was one of Richard II.'s dissolute favourites, and on being banished from the court by authority of parliament, he joined the crusade and was slain, leaving an infant son who married the only daughter of the famous Hotspur, and stood deservedly high in the favour of Henry V. He fell in the flower of his age at the siege of Meux in France.

CLIFFORD, THOMAS, the sixth lord, gained renown at the battle of Poitiers, and did "brave service in the wars in France, at the assault and taking of the strong town of Pointhoise, when and where he and his men were all clothed in white by reason of the snow, and in that manner surprised the town. He also valiantly defended the same town against the assaults then and there

given by the French king, Charles VII." He took a prominent part on the Lancastrian side in the wars of the Roses, and fell at the battle of St. Albans, 22nd May, 1455. This Lord Clifford is the subject of some powerful lines in the second part of Shakespeare's Henry VI.—His son, the "Younger Clifford," is stigmatized by the great dramatist and the old chroniclers, as notorious for his cruelty, even in that merciless age. Leland says, "that for slaughter of men at Wakefield, he was called the 'Boucher.'" The duke of York, the competitor for the crown, fell in that bloody engagement, and his son, the youthful earl of Rutland, was killed in the pursuit by "blackfaced Clifford," as Shakespeare terms him. The perpetrator of this barbarous deed was himself slain soon after, at the age of twenty-six, the day before the battle of Towton; and, according to the traditional account of the family, his body was thrown into a pit with a promiscuous heap of the slain. His estates were forfeited, and bestowed upon the "crook-backed" duke of Gloster, afterwards Richard III.

CLIFFORD, HENRY, Lord, the elder son and successor of this redoubted Lancastrian partisan, was the best of his heroic race. At the time of his father's death, he was a child of seven years of age, and was forced to seek a refuge among the simple dalesmen of Cumberland, where he lived as a shepherd for the space of twenty-four years. During his pastoral life he is said to have acquired great astronomical knowledge, watching upon the mountains, like the Chaldeans of old, the stars by night; and in the archives of the Cliffords have been found manuscripts of this period, supposed to belong to the "Shepherd Lord," which make it more than probable that astrology and alchemy were also among the pursuits to which he was addicted. On the death of Richard III. in the battle of Bosworth, "the good Lord Clifford," as he was affectionately termed, was restored to his ancestral honours and estates—an event commemorated in Wordsworth's beautiful song, *At the Feast of Brougham Castle*, one of the finest specimens of lyric poetry in our language. At the age of sixty, the "Shepherd Lord" went at the head of his retainers to the battle of Flodden Field, "and there showed," says Whitaker, "that the military genius of the family had neither been chilled in him by age, nor extinguished by habits of peace." He died in 1528, ten years after the battle of Flodden.—His son, who was created Earl of Cumberland, sorely disturbed the old age of his venerable father by his follies and vices. But he is said to have been reclaimed in good time, and there is great reason to hope that his father lived to see the effects of his reformation. The earl was the youthful comrade of Henry VIII., and had the address or good fortune to retain the favour of that monarch till the end of his life.

CLIFFORD, HENRY, second Earl of Cumberland, "had a good library," says his granddaughter Lady Anne, "and was studious of all manner of learning, and much given to alchemy." His first wife was the Lady Elinor Brandon, niece to Henry VIII., and daughter of Mary, the widow of Louis XII.; "a woman," says Hartley Coleridge, "to be held in everlasting honour, for she dared, in the sixteenth century, to unite herself to the man of her choice." The most memorable event in the history of the earl was his recovery from a violent sickness which, for a time, suspended all appearances of animation, so that the physicians thought him dead. His body was stripped, laid out upon a table, and covered with a hearsecloth, when some of his attendants perceived symptoms of returning animation, and by the use of warm applications, internal and external, gradually restored him to life.—His son and successor—

CLIFFORD, GEORGE, third Earl of Cumberland, was distinguished by his romantic daring, and his unextinguishable passion for nautical adventure. He made eleven expeditions, fitted out at his own expense, chiefly against the Spaniards and Dutch, to the West Indies, Spanish America, and Sierra Leone. The voyages of this chivalrous but eccentric sea wanderer, are full of extraordinary adventures and perils. In 1588 he commanded one of the vessels in the fleet which destroyed the Spanish armada, and highly distinguished himself by his bravery and skill in the various conflicts with the invaders, especially in the action fought off Calais. In the following year he dismantled Fayal in the Azores, and captured twenty-eight vessels of various sizes, valued at more than £20,000.—(See the narrative of Edward Wright in Hakluyt's Collection.) The earl stood high in the good graces of Queen Elizabeth, who seems to have both admired and flattered his foibles. She invested him with the garter, and appointed him her peculiar champion at all tournaments. He lavished immense

sums on public spectacles, on horse racing—which had just then become fashionable—and in magnificent banquets; and taking this expenditure into account, as well as his great losses at sea, it is no wonder that having "set out with a larger estate than any of his ancestors, in little more than twenty years he made it one of the least." This extraordinary man who saw, and did, and suffered so much, died 30th October, 1605, in the forty-seventh year of his age. His daughter and heiress—

CLIFFORD, LADY ANNE, was the last of this great race, and was one of the most remarkable women whom this country has produced. She was born in 1589, and was married at a very early age to Richard, third earl of Dorset, a man of talent and spirit, but a licentious spendthrift. He died in 1624. Lady Anne speaks gently of his memory, though his licentiousness and extravagance must have caused her much misery. After six years of widowhood, she was wedded in 1630 to Philip Herbert, earl of Pembroke and Montgomery, and nephew of Sir Philip Sidney. This new connection was a source of much misery to the countess. She admits that the marble pillars of Wilton, the ancient seat of the Herberts, were as Knowle (the seat of the Dorset family) had been to her, "oftentimes but the gay harbours of anguish." The earl of Pembroke died in 1650, immediately after the downfall of the monarchy. He had rendered himself peculiarly obnoxious to the royalists, and their contemptuous hatred broke out in keen and bitter satires after his death. One of these, entitled his "Last Will and Testament," &c., has been attributed to Samuel Butler. The death of Francis, fourth earl of Cumberland, uncle of Lady Anne, and of his son, without male issue, terminated the contest which, during thirty-eight years, had been carried on for the Clifford estates, between the male and female branches of the house; and the death of her husband left Lady Anne free and uncontrolled mistress of the inheritance of her ancestors. During the remainder of her life, she was chiefly occupied in repairing the damages of war, of law, of neglect, and of waste. She did great works, and took good care to commemorate them, and had a very commensurate consciousness of her many good and great qualities. She restored six of her ancestral castles, and several churches which had been ruined by the great civil war. She erected a monument to her tutor, "the well-linguaged" Daniel the poet. She was a woman of a high spirit and a determined will, as is abundantly shown by the famous letter which she is said to have written to the secretary of Charles II., who had attempted to interfere with her borough of Appleby. "She patronized," says Dr. Whitaker, "the poets of her youth, and the distressed loyalists of her mature age. Her home was a school for the young and a retreat for the aged, an asylum for the persecuted, a college for the learned, and a pattern for all." She died at Brougham castle in 1675, at the age of eighty-seven, and with her the noble race whose high characteristics seem to have been united in herself became extinct. She left behind her a curious autobiography, containing many interesting details respecting her own life and the history of her family.—(See Whitaker's *History of Craven*; Hartley Coleridge's *Northern Worthies*; *Edinburgh Journal*, vol. xii.; "The Cliffords," by the writer of this sketch.)—J. T.

CLIFFORD, ARTHUR, an English lawyer and writer. He edited the official correspondence of Sir Ralph Sadler, 1809; *The Texall Poetry*, with notes, 1813; and was the author of an ode entitled "Carmen Seculare," 1814, on the centenary of the accession of the Hanoverian dynasty. He died in 1830.

CLIFFORD, JAMES, was the author of a choice little volume entitled "Divine Services and Anthems, usually sung in the cathedrals and collegiate choirs in the church of England," printed in 1663 and 1664—a work frequently referred to by Anthony à Wood, and valuable as giving us the words of the anthems (with the names of the composers) in use from the Reformation to the death of Charles I. Wood says, "He was born in the parish of St. Mary Magdalen in the north suburb of Oxon; educated in Magdalen college school as chorister of the said college, but took no degree in this university. After the restoration of King Charles II. he became petty canon of St. Paul's cathedral in London, reader in a church, near Carter Lane, which is near the said cathedral, and afterwards chaplain to the honourable society of Serjeant's Inn in Fleet Street, London." He died at the close of the year 1699, and was buried in the church of St. Andrew Undershaft.—E. F. R.

CLIFFORD, THOMAS, first Lord Clifford of Chudleigh, was born in 1630, and was the eldest son of Hugh Clifford of Ug-

brook, the head of a junior branch of the great house of Clifford. After completing his education at Oxford, he travelled on the continent, and there went over to the Roman catholic faith. He was elected a member of the parliament which restored Charles II., and soon showed himself one of the most ardent defenders of the royal prerogative, and strove by every means in his power to augment the authority and revenue of the crown. He joined the fleet as a volunteer during the war with Holland in 1665 and 1666, and fought with signal bravery in several engagements. On his return, he was sworn of the privy council, and appointed first comptroller, and then treasurer of the household. He soon became one of the most confidential advisers of the king, and was a member of the notorious "cabal" ministry. He was the most respectable of the number, although he recommended the fraudulent and infamous measure of shutting up the exchequer and robbing the banks, which led to the downfall of the cabal. In 1672 he was elevated to the peerage by the title of Lord Clifford of Chudleigh, and made lord-treasurer. But, in the following year, Charles was compelled to give his consent to the celebrated test act, and Clifford, refusing to conform to it, was obliged to resign his office. Overwhelmed with chagrin, he retired to the country, where he died soon after, September, 1673. Evelyn says he was "a valiant, uncorrupt gentleman; ambitious, not covetous; generous, passionate, and a most sincere constant friend."—J. T.

CLIFT, WILLIAM, a distinguished naturalist, born at Burcombe, near Bodmin, on the 14th February, 1775. He was the youngest of seven children. His father, Robert Clift, died a few years after the birth of his son, leaving his widow and family in narrow circumstances. William was put to school at Bodmin, and soon distinguished himself for the readiness with which he acquired knowledge. His great natural talent for drawing brought him under the notice of Colonel Gilbert of the Priory, whose lady was an intimate friend of Miss Home, who afterwards became the wife of the great John Hunter. Thus Mrs. Gilbert heard of the loss which Mr. Hunter suffered in the departure of his assistant and draughtsman, William Bell, for Ceylon in 1790; and she accordingly suggested to Mrs. Hunter that possibly her young protégé might in some measure supply his place. The proposal was accepted; and William Clift was sent to London, and duly apprenticed to John Hunter for six years in the year 1792. The inestimable advantage of this position of amanuensis, artist, and clerk to such a man, was cut short by the death of John Hunter in 1793. Hunter died in difficulty and debt: the sole provision for his family was his museum. Dr. Baillie, one of the executors, gave Mr. Clift free admission to his anatomical lectures; and the other, Mr. Home (afterwards Sir Everard) occasionally employed him to assist in his operations on private patients, or in the dissection of rare animals. Hunter's premises consisted of the residence in Leicester Square, a house in Castle Street, and the museum which he had built in the intermediate space. The house in the square was let to lodgers; the house in the rear was occupied by Mr. Clift and the old housekeeper of the family; and thus accommodated, Mr. Clift undertook the custody of the museum until government should determine to accept or decline the terms on which it was offered by the testamentary directions of Hunter. After seven years' resistance the government at last purchased the Hunterian collection for £15,000; and it was then transferred to the corporation of surgeons in a better state of arrangement and preservation than when it received in 1793 its last addition from the hands of its immortal founder. The corporation having been reincorporated by charter in 1800 under the title of the Royal College of Surgeons, one of its first acts was to appoint Mr. Clift conservator of the museum, under the superintendence of a board of curators chosen from the council. From this time forwards the time and talents of Mr. Clift were exclusively devoted to this service in various ways, and great were his devotion and zeal in this prime object of his life. His own immediate contributions to science are few. Two only appear in the Transactions of the Royal Society; the first is entitled "Experiments to ascertain the Influence of the Spinal Marrow on the Action of the Heart in Fishes," in the year 1815; and the other is a "Description of some Fossil Bones found in the Caverns at Preston," published in 1823. Both papers are peculiarly clear, simple, and worthy of attention. Soon after their publication Mr. Clift was elected a fellow of the Royal Society, and served in the council in the years 1833 and 1834.

He communicated some papers to the Geological Society, "On the Megatherium," and "On Fossil Remains from the Irawaddi." Mr. Clift, however, worked assiduously for others in determining fossils and in figuring them. His labours are gratefully acknowledged by Baron Cuvier and by Dr. Mantell. From the duties of his office Mr. Clift was allowed to retire, with a full salary of £400 a year, a few years before his death, which took place on the 20th June, 1849.—E. L.

CLINIUS, father of Alcibiades, fought at the battle of Artemisium in 480 B.C., and fell at Coronea in 447.

CLINIUS, a Pythagorean philosopher, a contemporary and friend of Plato, lived at Tarentum. Some fragments of his writings are preserved in Stobæus.

CLINTON, DEWITT, governor of New York, was born at Little Britain, Orange county, in that state, March 2, 1769. He was the son of General James Clinton. In 1798 he was elected a senator in the New York legislature, and in 1802 was appointed by the governor of New York, a senator of the United States. In 1803 he was appointed to the post of mayor of the city of New York—an appointment which he continued to receive by annual bestowment till 1815, with the exception of the years 1807 and 1810. During this period he laid the foundations of several of the most important public institutions of the city, among which were the Orphan Asylum, the Academy of Arts, and the Historical Society. At his suggestion in 1817 the New York legislature authorized the construction of the Erie Canal, to connect the Hudson river with lake Erie. He was president of the board of canal commissioners in 1823 and 1824; and in 1826 witnessed the completion of the Erie canal, and participated in his official capacity in the splendid ceremonies with which the waters of the great lakes were, on that occasion, made to mingle with those of the Atlantic. The length of the Erie canal is three hundred and sixty-three miles, and its cost was near six millions of dollars. It is the noblest monument to the enterprise and sagacity of Clinton, and its beneficial results to the state of New York and to the whole country have more than realized his highest expectations. He died in 1828.—W. G.

CLINTON, GEORGE, governor of New York, and vice-president of the United States, was born in Ulster county, New York, in 1739. He was elected to the continental congress in April, 1775, and voted for the declaration of independence. In February, 1777, he was appointed brigadier-general in the regular army; and a few months afterwards was chosen governor of New York—a post which he continued to hold, by successive re-elections, for eighteen years. He commanded the forts on the Hudson when they were stormed and taken by Sir Henry Clinton—a temporary reverse from which he soon recovered. Clinton was in opposition under the administrations of Washington and the elder Adams, having no voice in the federal councils; but he was chosen vice-president under Jefferson in 1804; and again, though with high claims to the presidency, under Madison in 1808. He held this office till his death at Washington in 1812.—F. B.

CLINTON, SIR HENRY, an English general, who commenced his military career in the Seven Years' war, in 1750, and in 1778 was appointed to succeed Lord Howe as commander-in-chief of the British forces in America. Obligated to evacuate Philadelphia, he made a skilful retreat to New York. He captured Charleston in 1779, but failed in an attempt to drive the French from Rhode Island. It was Sir Henry who entered into a negotiation with the American general, Arnold, to betray the important post of Westpoint, which led to the apprehension and execution of the unfortunate Major Andre. General Clinton was recalled in 1782, and two years after published an account of his American campaigns under the title of "Reflections on the history of the American war." He was appointed governor of Gibraltar, and died there in 1795.—J. T.

CLINTON, HENRY FYNES, a most accomplished classical scholar and author, was born in 1781, and was the eldest son of the Rev. Dr. C. Fynes Clinton, prebendary of Westminster and incumbent of St. Margaret's, Westminster. He was educated first at Westminster school, and then at Christchurch, Oxford. His accurate and extensive scholarship was worthy of his remarkable industry. Having inherited an ample fortune from a distant relative, he represented the borough of Aldborough in parliament from 1806 to 1826, when he was succeeded by his brother. His reputation, however, rests not on his political career, but on his literary productions, and mainly on his "Fasti Hellenici" and "Fasti Romani"—works which have deservedly

attained a European fame. The former, which is now divided into three volumes, contains the civil and literary chronology of Greece from the earliest period down to the death of Augustus, interspersed with dissertations on the early inhabitants of Greece, scripture chronology, the writings of Homer, the population of ancient Greece, &c. The "Fasti Romani" comprises the civil and literary chronology of Rome and Constantinople, from the death of Augustus to the death of Justin II., with an appendix containing the chronology to the death of Heraclius. A useful epitome of both works was published by the author in 1851 and 1853. On the death of Mr. Planta in 1827, Mr. Clinton was an unsuccessful candidate for the office of principal librarian of the British museum. He died in 1852.—J. T.

CLINTON, JAMES, an American brigadier-general in the war of the Revolution, born in 1736. In 1777, congress having made him brigadier-general in the continental army, he commanded in the highlands on the Hudson river, where he was surprised by Sir Henry Clinton, who made a dashing expedition up the river in the hope of rescuing Burgoyne. In August, 1779, he commanded a brigade under General Sullivan, in the expedition up the Susquehanna into the country of the Iroquois Indians, which avenged the massacres at Wyoming and Cherry Valley. Clinton afterwards commanded at Albany, and also served at the siege of Yorktown. He died in 1812.—F. B.

CLISSON, OLIVIER DE, constable of France, born in Brittany about 1332; died at Josselin in 1407. When about the age of twelve, Clisson, having lost his father, who was decapitated by Philip of Valois, was sent to England by his mother, and there he appears to have remained till about 1364. In that year he took part in the battle of Auray, losing an eye in the engagement, and shortly afterwards signalized his prowess by expelling the celebrated Sir John Chandos from the castle of Gavre, which had been given to the Englishman by De Montfort, duke of Brittany. In 1370, after being received with marked favour at the court of Charles V., he became the associate in arms of the famous Duguesclin, whose valour and probity were at that period the chief security of the state against the machinations of the *grandes compagnies*. On his return to Brittany, Clisson was received at the court of the duke with many marks of favour; but shortly afterwards was consigned to prison, and only recovered his liberty after payment of a considerable ransom. Named constable by Charles V. on his death-bed, Clisson commanded the French army at the battle of Rosebecq, where the Flemings lost 20,000 men. In 1393 he narrowly escaped assassination, a band of brigands having been set upon him in the night by one Pierre de Craon, who had long been the mortal enemy of the constable. He was undoubtedly one of the greatest soldiers, and next to Duguesclin, perhaps one of the noblest characters of his age; but he was not above the weakness of a great desire for wealth, and of that infirmity his enemies made the most. With Charles VI. Clisson was as great a favourite as he had been with Charles V.; but the civil broils consequent upon the insanity of the former afforded the enemies of the constable the opportunity of annoying, and eventually of disgracing him. He was accused of malpractices in his public trusts, discharged from all his offices, and condemned to a fine of 100,000 marks of silver. With the remainder of his fortune, which at his death was found to amount to an enormous sum, he retired to his castle of Josselin.—J. S., G.

CLISTHENES, tyrant of Sicyon, between 600 B.C. and 560.—J. T.

CLISTHENES, an eminent citizen of Athens, son of Megacles, and grandson of the preceding, was the head of the Alcmaeonid clan on the expulsion of the Pisistratidæ, and author of an important change in the Athenian constitution, by which the four ancient tribes were abolished, and ten new ones established in their stead in 510 B.C.—J. T.

CLITOMACHUS, a Greek philosopher who, 129 B.C., succeeded Carneades as head of the new academy, and wrote upwards of four hundred books in support of its tenets, was a Carthaginian by birth. He was known among his Carthaginian countrymen by his original name of Hasdrubal.—J. S., G.

CLITUS, a Macedonian general, surnamed THE BLACK, was born about 380 B.C., and died in 328. His sister Hellenice was the nurse of Alexander the Great. He followed his sovereign throughout his campaigns in Asia, and saved his life at the battle of the Granicus in 334. A quarrel arose between them, at a banquet given on the occasion of Clitus' appoint-

ment to the office of satrap of Bactria, when both were heated with wine; and Alexander, provoked at the insolent language employed by Clitus in depreciating his exploits as compared with those of Philip his father, snatched a weapon from one of the guards, and pierced his friend to the heart.—J. T.

CLIVE, CATHERINE, an Irish actress, born in 1721; died in 1785. Her maiden name was Raftor. In 1732 she married a lawyer named George Clive, but the marriage proved unhappy, and she was obliged to separate from him. She excelled in comedy, and was unequalled in the sprightliness of her humour. She was also a good musician, and had an excellent voice. Dr. Johnson had a very high opinion of Mrs. Clive's comic powers, and delighted to converse with her. He thought her the best actress he ever saw. "What Clive did best," he said, "she did better than Garrick, but could not do half so many things well; she was a better romp than any I ever saw in nature." Mrs. Clive retired from the stage in 1768, and died in 1785. Her private character was most exemplary.—J. T.

CLIVE, ROBERT, Lord, the founder of the British empire in India, was born 29th September, 1725, at Styche, in the parish of Moreton-Say, near Market Drayton, Shropshire. Before the age of three years, he was sent to an uncle, Mr. Bayley, in whose family he resided for some time, and proved himself the very king of mischievous boys. Combative, courageous, daring to the last degree, he was impatient of control, and a terror to all quiet-minded people. "I am satisfied," writes his uncle, "that his fighting, to which he is out of measure addicted, gives his temper a fierceness and imperiousness, that he flies out upon every trifling occasion; for this reason I do what I can to suppress the hero, that I may help forward the more valuable qualities of meekness, benevolence, and patience." In young Clive, however, it proved impossible to suppress the hero. He was seen seated on a stone spout near the top of the lofty steeple of Market Drayton church, careless of the danger; and once when a little dam broke, which his companions had made across some water, for the mischievous purpose of making it overflow an obnoxious shop, Clive threw his body into the breach and remained there until it was repaired. It is said also that he used to levy black mail upon tradespeople in return for not leading against their windows and their comfort his little band of mischievous comrades. After spending a few years at the Merchant Taylor's school, London, and at a private school in Hertfordshire, Clive was appointed a writer in the East India Company's service, and left England in 1743, reaching Madras in 1744, with the reputation of a lad by no means addicted to learning, and likely to break his neck in attempting the first hazardous feat that struck his fancy. An unusually lengthened voyage caused Clive to miss the gentleman to whom he had been recommended at Madras, and threw him into debt at his first landing, while a certain proud shyness prevented him from forming many acquaintances. His wild and wayward disposition, intensified by the melancholy fostered in isolation, from time to time broke out so strongly as to endanger his connection with the company's service. In a fit of despondency, indeed, he made an attempt upon his own life. A comrade coming into his room was requested to take up a pistol and fire it out of the window, which he did. "Well," exclaimed Clive, "I am reserved for something! that pistol I have twice snapped at my own head." Fortunately the governor of Madras gave him admission to his library, and Clive's energies spent themselves in repairing the random carelessness of his schoolboy days. At this time the rulers of the French presidencies in India leagued themselves with native powers, and organized a general policy, for the purpose of effecting the ruin of English influence; and it appeared far more probable that an Eastern empire would be achieved by France rather than by Britain. Madras was taken by La Bourdonnais in 1746, and Clive became a prisoner of war under parole. The conditions of parole having been broken through the influence of Dupleix, who aimed at the absolute humiliation of the company, Clive effected his escape to Fort St. David. A remarkable illustration of his spirit of dauntless daring now occurred. He was challenged by an officer to whom he had refused to pay a gambling debt, on the ground that there had been unfair play. Clive fired and missed his antagonist, who came up close to him and desired him to ask his life. Clive complied. The officer then threatened to shoot him unless he retracted his assertions concerning unfair play. "Fire," cried Clive with an oath; "I said you cheated; I say so still; and I

will never pay you!" The astonished officer threw away his pistol, declaring Clive to be mad.

In 1747 Clive obtained an ensign's commission in the army, but passed from military to civil duties according to the exigencies of the time. In 1748, the powerful viceroy of the Deccan, Nizam al Mulk, died, and rival claimants disputing the sovereignty of the Carnatic, severally sought the assistance of the French. The candidate supported by Dupleix, with French forces, triumphed, and there appeared no obstacle capable of preventing the establishment of French supremacy in the Carnatic. The rival prince had been slain, and his son, Mahommed Ali, acknowledged by the English as nabob, was shut up in Trichinopoly, and his surrender became day by day more inevitable. The crisis called forth the genius of Clive, whose skill was ever the most consummate when the danger was the most terrible. He urgently declared that, upon the fall of Mahommed Ali, an Indian empire would be won by France, and proposed to attempt to raise the siege of Trichinopoly by attacking Arcot the capital of the Carnatic. His plan was adopted, and he started with two hundred Europeans and three hundred sepoy, commanded by eight officers, four of whom were from the mercantile service, and six of whom had never been in action. The garrison of Arcot fled, and the little band of warriors marched into the city, through one hundred thousand spectators. Clive immediately prepared for a siege, and fortified his position. Ten thousand men appeared before Arcot, including one hundred and fifty French auxiliaries; while Clive's force had been reduced to one hundred and twenty Europeans and two hundred sepoy. For fifty days the young soldier held his ground, until the besieging army, baffled and dismayed, abandoned the town. What is said of true poets may be said of Clive as a soldier—he was born a general, and not made one. The historian remarks, that notwithstanding he had at this time neither read books nor conversed with men capable of giving him much instruction in the military art, all the resources which he employed in the defence of Arcot were such as are dictated by the best masters in the science of war. After the successful defence of Arcot, victory followed victory, and finally Trichinopoly was relieved; Chunda-Sahib, the French ally in the Carnatic, was put to death, and large bodies of French auxiliaries were compelled to surrender. Before the victories of Clive the natives did not believe that the English as soldiers were equal to the French. But a little time before, Dupleix had been chief arbiter of the destinies of Indian princes, and had been declared governor of India from Kistna to Cape Comorin; while the English settlers had been looked upon as tradespeople, far more capable of driving a hard bargain than of fighting a daring battle. By the genius of Clive the whole prospect of affairs was changed. The chances of French supremacy in the East were overthrown; and measures were taken and victories won, by the might of which a few traders, with fifteen thousand miles of sea between them and their native land, became consuls and proconsuls in authority and wealth, greater than any imperial Rome herself had sent forth. Clive's health being in a precarious state, he returned to England in February, 1753, immediately after his marriage with Miss Maskelyne, sister of the astronomer royal of that name. The daringly mischievous schoolboy was welcomed home as the hero; and his father, somewhat astonished at the result, exclaimed—"The booby has sense after all!" The court of directors voted him a sword set with diamonds; but with great delicacy he objected to receive this gift unless a similar distinction was conferred upon Colonel Lawrence, his old commander, and one of the first to recognize his abilities. In England Clive mingled in parliamentary strife. Receiving the support of Mr. Fox, secretary at war, he was elected for the rotten borough of St. Michael, but unseated on petition. Meanwhile the anticipation of another French war rendered the court of directors very anxious for Clive's presence in India; and he again set sail in 1755, as a lieutenant-colonel in the British army, with the appointment of governor of Fort St. David, and a provisional commission to succeed to the government of Madras. Clive landed at Bombay, 27th November, 1775, and, after destroying the piratical stronghold of Gherich, proceeded to Fort St. David. On the very day upon which Clive assumed the government of Fort St. David, June 20th, 1756, Suraj-a-Dowlah, nabob of Bengal, marched into Calcutta, where the English submitted without daring to offer any resistance. The fearful tragedy of the Black Hole followed, and Clive prepared for victory and revenge. The expedition sailed from Madras, October

16th, and Calcutta was soon recovered and Hooghly stormed. Suraj-a-Dowlah offered terms, and, much against Clive's wish, the company entered into negotiations with him.

Clive now appears upon the stage of Indian history, not simply as a daring soldier, but as a subtle diplomatist, able to match cunning against cunning, and to conquer Asiatic intriguers by the free use of their own weapons. Clive's more than Indian cunning, as a negotiator among native princes, appears in strange contrast with his almost defiant straightforwardness when dealing with his own countrymen. He seems to have made up his mind that it was necessary to meet Hindoos as though himself a Hindoo; and whatever condemnation may be passed upon the crooked ways which the adoption of this policy forced his feet to tread, it yet remains a sign of the inherent nobleness of his nature that, among English gentlemen, he still remained an English gentleman—frank, open, and sincere. Suraj-a-Dowlah proved unfaithful to any terms of peace, and was obviously intriguing against the English on every possible occasion. Clive therefore determined to establish the English power in Bengal by the expulsion of the French, and the overthrow of the nabob. In the first instance, the French settlement of Chandernagore was attacked and taken after a siege of fourteen days. A conspiracy was then formed within the very camp of Suraj-a-Dowlah to place a Mahometan soldier of fortune, Meer Jaffier Khan, upon his throne. Omichund, a wealthy Hindoo banker, acted as chief agent in the deception of Suraj-a-Dowlah, and was himself deceived by Clive, through the instrumentality of a duplicate deed. By the one document an immense reward was secured to Omichund, but in the other his name was altogether omitted. Admiral Watson felt some scruples about the honesty of the matter, and his signature was in consequence forged. Clive, however, before the house of commons, stated that, to the best of his remembrance, Admiral Watson gave the gentleman who carried the fictitious treaty to him leave to sign his name upon it, and defended his conduct generally by the assertion that he thought art and policy warrantable in defeating the purposes of a villain; forgetful that whatever temporary advantages may be gained by meeting knavery with a kindred duplicity, the strength of a British empire in the East must ultimately depend upon the fact that among the faithless it is faithful. Clive at last threw off all disguise, and the nabob at once marched to Plassey with his whole force. On one side of the river was Suraj-a-Dowlah with sixty-eight thousand men; on the other was Clive with three thousand two hundred men, only six hundred and fifty of which were European infantry. For the first and last time in his life Clive held a council of war, at which he voted with the majority that it was not prudent to make an attack. He then retired to a grove of mango trees, and after remaining an hour in silent thought returned to the camp with the word "Forward" on his lips, and gave orders for the advance of the army on the following morning. Upon the 23rd of June, 1757, the battle of Plassey was fought, and the British empire in India was firmly founded. Meer Jaffier was established as nabob of Bengal, and he bestowed upon Clive enormous wealth. When afterwards taunted with his gains, Clive drew a picture of the treasures cast at his feet, and declared himself astonished at his own moderation. Clive's next great task was to check the power of the Dutch, whom his newly-elected nabob secretly favoured; and this he effectually accomplished, forcing upon them a treaty that they should build no fortifications, and raise no troops beyond those required for police. During these proceedings Colonel Forde wrote a note, stating that if he had the order in council he could attack the Dutch with a fair prospect of success. Clive, who was playing at cards, replied in pencil—"Dear Forde, fight them immediately, I will send you the order of council to-morrow." In 1760 Clive again sailed for England, leaving behind him virtually an empire where he found a commercial settlement. He was given an Irish peerage, and engaged deeply in electioneering affairs to aid his friends in the government. His residence in England was greatly embittered by a contest with the court of directors of the East India Company. An attempt was made to deprive him of a land-rent granted by Meer Jaffier, and he was subjected to many paltry annoyances. The state of affairs in India, however, again becoming critical, he was besought to return, and reached Calcutta, May 3, 1765, with the dignity of governor, and commander-in-chief of the British possessions in Bengal. The reform of the civil service was the great and worthy task of Clive's third and last residence in

India. He declared that actions had been committed under the sanction of the company's servants which made the name of the English stink in the nostrils of a Gentoo or a Mussulman; that the company's servants had interfered with the revenues of the nabob; turned out and put in the officers of the government at pleasure, and made every one pay for their preferment. In order to effect a reform, Clive stopped private commercial speculation on the part of the company's servants, and when there was a "strike" among the gentlemen, very unceremoniously filled up their places with substitutes from Madras. He wished to make the company's service a sufficient dignity and profit in itself and for itself, hence awarded the proceeds of the salt monopoly to make up for the loss arising from the surrender of private trade. He enforced the direction that all presents above a certain value should be handed over to the company. Two hundred officers threatened to resign on the same day upon occasion of a financial reform, but Clive gave commissions to civilians, threw himself upon the faithfulness of his sepoy, and thus triumphed by firm boldness over what might have been a fatal mutiny. While these measures were going on, Clive procured from the Mogul sovereign a warrant for the administration and the collection of the revenues of Bengal, Bohar, and Orissa, and thus connected the authority of the company with that native potentate who was, even in his weakness, considered by the natives the legitimate source of all rank. Clive perceived that the company must either abandon all, or take all into their own hands and rule as a military power, and directed his policy towards the establishment of an imperial sway. Clive's health again compelled him to leave India—it proved for ever. He landed at Portsmouth, 14th July, 1767, but found no peace in his native land. Those whom his civil reforms had deprived of opportunities for amassing wealth were numerous, and their enmity was unrelenting. His fellow-countrymen were taught to cast on him the burden of every Indian abuse by those who knew they would have been wealthier men had Clive been less just. Colonel Burgoyne obtained a select committee of the house to inquire into Indian matters, and Clive was cross-examined with bitter and eager enmity. He defended himself with frank and impetuous, although dignified and collected eloquence; and, when the house of commons had resolved that acquisitions made by the arms of the state belong to the state, and that Clive had received large sums from Meer Jaffer, it yet stopped short of voting the great general a paltry criminal, and unanimously agreed to the motion—That Robert Lord Clive did, at the same time, render great and meritorious services to his country. Clive's shattered health could endure no more. He had sought in opium a solace for his physical sufferings, until his mind was overcome by the weakness of the flesh, and he died by his own hand on the 22nd of November, 1774, at the age of forty-eight.—L. L. P.

**CLODIUS**: a family settled at Neustadt, which produced several members distinguished in letters.—**JOHANN**, born 15th August, 1645, was an eminent theologian and philosopher, and died at the ripe age of seventy-eight, leaving a considerable number of dissertations.—His son, **JOHANN CHRISTIAN**, after studying medicine and languages at Jena, settled in Leipzig, where he became eminent as a linguist, especially in oriental tongues, and filled the chair of Arabic in the university. He died in 1745, having written a large number of treatises, principally philological.—**M. CHRISTIAN**, another son of Johann, was a man of letters, but more noted as the father of the poet, Christian August.—J. F. W.

**CLODIUS, CHRISTIAN AUGUST**, a German writer, was born at Annaberg in 1738, and died at Leipzig, 30th November, 1784, where he had honourably filled the chair of rhetoric and poetry. He wrote—"Medon," a drama; "Versuche aus der Literatur und Moral;" "Neue Vermischte Schriften," 1780, 4 vols.; and *Odenm*, a monthly magazine, 1784.—K. E.

**CLODIUS, CHRISTIAN AUGUST HEINRICH**, son of the former, born at Altenburg, 21st September, 1772, was professor of practical philosophy at Leipzig, where he died 30th March, 1836. He wrote poems; "Eros and Psycho," an allegorical poem; "Entwurf einer systematischen Poetik;" "Von Gott in der Natur, in der Menschengeschichte und im Bewusstsein," 4 vols., and edited Klopstock's Remains.—K. E.

**CLODIUS, PUBLIUS**, youngest son of Appius Clodius, member of the illustrious Claudian family, lived in the first half of the century B.C., and was notorious, even in that profligate age, for the open profligacy of his manners, and his avarice and

ambition. In 78 B.C. he served in Asia under his brother-in-law Lucullus; but, taking offence at his not receiving the promotion he expected, he excited a mutiny among the troops. He then joined his other brother-in-law, Q. Marcius Rex, proconsul in Cilicia, and was intrusted with the command of some ships; but he was defeated and taken prisoner by pirates, who, however, set him at liberty through fear of Pompey. He afterwards served in Syria and Transalpine Gaul, where he extorted money by the most nefarious means. On his return to Rome he mixed himself up with the intrigues and contentions of the factions who were then struggling for supremacy, and plunged into the most scandalous excesses. He was accused of incestuous intercourse with his own sisters; and in 62 B.C. profaned the mysteries of the Bona Dea, by entering, in the disguise of a female, the house in which they were celebrated, in order to meet Pompeia, the wife of Caesar, with whom he had an intrigue. He was detected and brought to trial for this gross outrage, but escaped punishment by bribing his judges. He contracted bitter enmity to Cicero, who gave evidence against him on his trial, and in order to accomplish his revenge upon the great orator, renounced his patrician rank, and was adopted into a plebeian family, that he might obtain the office of tribune of the people. He was elected tribune in 58 B.C.; and, with the assistance of Caesar, Pompey, and Crassus, succeeded in driving Cicero into exile, though he was unable to prevent his recall in the following year. A fierce quarrel in consequence broke out between Clodius and Milo, the new tribune of the people, an active friend of Cicero, which led to frequent fights in the streets of Rome between their adherents. At length the rivals met accidentally on the Appian Way, 20th of Jan., 52 B.C. An affray ensued between their followers, and Clodius was killed. The mob, with whom he was a great favourite, broke out at his burial into a violent tumult, which was not without difficulty suppressed by Pompey.—(See **MIL**.)—J. T.

**CLOELIA**, a Roman heroine, who lived about 508 B.C. According to Livy, she was one of the hostages given to Porsenna, but made her escape from the Etruscan camp by swimming across the Tiber. The Romans sent her back, but Porsenna was so struck with her extraordinary daring, that he not only set her at liberty, but also released a number of the other hostages. The Romans erected an equestrian statue of the heroine in the Sacred Way, in commemoration of her exploit.—J. T.

**CLONCERRY, VALENTINE LAWLESS**, Baron, an Irish politician who occupied a prominent position in his day, was born in Dublin on the 19th of August, 1773. His father was a wealthy Roman catholic who two years after the birth of Valentine, was made a peer. Valentine's school-days were spent at Portarlington, where he had both good education and good company. Thence he passed to King's college, Chester, being domesticated with the bishop of the diocese, and finally entered Trinity college, Dublin, where he took a prominent part in the famous Historical Society. In 1792 he went to Switzerland, where he remained for two years. On his return he joined the society of "United Irishmen," but though elected one of the executive committee, he attended only one meeting. While keeping his terms at the middle temple, young Lawless was a constant visitor at the house of John M'Namara, where he became acquainted with many eminent men, including Horne Tooke, Reeves, Sir Francis Burdett, and Pitt. On his return to Ireland he was deeply impressed with the impolicy of the proposed legislative union, and accordingly published his "Thoughts on the Projected Union with Great Britain and Ireland," a pamphlet which increased the jealousy with which he began to be regarded by the government of the day. Again in London, Lawless joined a club called the United Irish, which he assures us had no connection with the United Irishmen, and was not political, but merely social and benevolent. Nevertheless it became the object of suspicion, and one of its acts being a subscription for one Finnerty, the editor of the *Press* newspaper—which Lawless had himself supported, and which was burned by the hangman for a seditious libel—the government imagined the members were in treasonable communication with the French directory. In addition to this, Lawless assisted a priest of the name of Quigley, who was shortly afterwards hanged for treason, and a letter of this man's to Lawless having been found, the government caused Lawless and three others to be arrested. After an imprisonment of six weeks he was discharged, with the observation that he had been imprudent rather than criminal. On the 14th of April, 1799,

Lawless was again arrested upon suspicion of treasonable practices, and committed to the Tower on the 8th of May following, where he remained till the expiration of the suspension of the Habeas Corpus act in March, 1801. His imprisonment resulted in heavy pecuniary losses, including a sum of near £70,000 which his father, on his death in 1799, left away from him lest it should be confiscated. A lady, too, to whom he was affianced died, as he tells us, from anxiety for his fate. Upon obtaining his liberation Lawless, now Lord Cloncurry, commenced proceedings for false imprisonment against the duke of Portland and Mr. Pitt, less, he says, to obtain compensation than to clear his character. These actions, however, were stopped by the bill of indemnity obtained by ministers, and Lord Cloncurry had to content himself with the sentiments pretty freely expressed of the injustice with which he had been treated. He now returned to Ireland; but the frail state of his health from long confinement made it necessary to seek a better climate. Accordingly in 1802 he went to the continent. After his return to Ireland in the end of 1805, though subjected to some annoyances, Lord Cloncurry devoted himself entirely to the duties of his station as a country gentleman, and took an active and useful part as a justice of peace. Upon the accession of George IV. Lord Cloncurry took a very memorable part on the occasion of a meeting convened to address the king, and with the aid of Mr. O'Connell defeated the object of the meeting. Nevertheless, when the king came to Ireland, Lord Cloncurry attended upon his majesty, dined at the royal table, and even invited the sovereign to his seat at Lyons. Meantime he occupied himself energetically in the endeavour to obtain Catholic emancipation, and conducted much to its final concession. It is worthy of remark, too, that in 1827 he projected a ship canal from Dublin to Galway, chiefly with the aim of establishing a transatlantic communication between that port and America, and the arguments used by him are mainly those which thirty years afterwards succeeded in establishing that communication and justifying his sagacity. Though a staunch advocate for the repeal of the legislative union between Great Britain and Ireland, Lord Cloncurry did not approve of O'Connell's mode of carrying this object, and he accordingly refused to preside at a public meeting for the purpose. This led to a public and vituperative denunciation of the lord by the demagogue, and a personal estrangement for several years. In all the political questions which agitated the public mind in Ireland for many years Lord Cloncurry was a participator, and we find him in correspondence with many of the great minds of the day. He closed an active life in his eightieth year, dying at his residence, Maretimo, near Dublin, on the 28th October, 1853.—J. F. W.

**CLOOTS, JEAN BAPTISTE DU VAL DE GRACE**, better known as **ANACHARSIS CLOOTS**, one of the most violent fanatics who figured in the French revolution, was a wealthy Prussian baron, and was born in 1755. He came to Paris in 1766 for the purpose of completing his education, and there imbibed both the republican and materialistic opinions which were prevalent among the French philosophers at that period. He renounced his rank and title, and adopted the classical prenomens of Anacharsis in lieu of his christian names, which he rejected as having a superstitious origin. On completing his education, he travelled over a great part of Europe, including England, Germany, Italy, and Spain, promulgating everywhere his utopian speculations regarding the reformation of the human race. In 1780 he published a work entitled "La certitude des preuves de Mahométisme," which was intended to prove the falsehood of all systems of religion. In 1789 he took up his residence in Paris. When the Revolution broke out, Cloots appeared at the bar of the national assembly, 19th June, 1790, in the assumed character of "the orator of the human race," followed by a number of foreigners, each wearing his distinctive national garb, and demanded in their name the right of admission to the grand federation fête. He became president of one of the jacobin clubs, was elected a deputy to the national convention in 1792, and voted for the death of Louis XVI. He advocated the establishment of a universal republic, of which he professed to be the ambassador, proclaimed himself the personal enemy of Jesus Christ, affirmed that reason would unite all men in a single representative church, that religion was the only obstacle to this utopia, and that the time had arrived for eradicating it. He expended a considerable fortune in his attempts to propagate these opinions, and in supporting the republic against its foreign enemies. He published "La République Universelle," and several

other works. Cloots at length excited the jealousy of Robespierre, and was sent to the scaffold, along with Hébert, Chaumette, and others, in 1794.—R. B.

**CLOQUET, HIPPOLYTE**, a French physician, born in Paris in 1787; died on the 3rd of March, 1849. He took his degree of doctor of medicine in 1815, and filled for some time the positions of prosecutor and professor of anatomy in the schools of Paris. "A Complete Treatise on Descriptive Anatomy," 2 vols., 8vo, Paris, 1816, is his great work, on which his reputation as an anatomist rests.—E. L.

\* **CLOQUET, JULES GERMAIN**, brother of the preceding, was born in Paris on the 18th December, 1790. He is a French physician of great eminence, and has distinguished himself by his contributions to science, in the shape of papers read before the Academy of Sciences, and other learned bodies. As an anatomist, a surgeon, and an author, M. Cloquet has acquired a lasting reputation. His works are many in number, and contain much valuable information and many original views. He is the inventor of many surgical appliances and modes of operation, and excels in the art of making anatomical preparations and models in wax. In 1831 M. Cloquet was appointed professor of clinical surgery to the faculty of Paris.—E. L.

**CLOSTERMAN, JOHANN**: this artist was born at Osnaburg in 1656. In 1679, with his countryman Tiburen, he went to Paris, and was employed by De Troyes. In 1681 he came to England and painted draperies for Riley. He obtained the notice of the duke of Somerset, and painted portraits of the duke's children. He also painted portraits of the duke and duchess of Marlborough and all their children; in reference to which work, and the difficulties that arose in its progress between the artist and the duchess, the duke declared—"It has given me more trouble to reconcile my wife and you than to fight a battle." Closterman died in 1710.—W. T.

**CLOTAIRE I.**, youngest son of Clovis and Clotilde, born about 500, on the death of his father in 511 shared with his three brothers the throne of France. He kept court at Soissons. By the death of his brothers and the murder or degradation of their children, he reigned as sole king from 558 till his death in 561.—R. B.

**CLOTAIRE II.**, an illegitimate son of Childeric, whom he succeeded on the throne of Neustria 584, while still an infant. During his minority he was under the guardianship of the ambitious Fredegonda, his mother, and was protected by Gontran of Burgundy. He died in 628, aged forty-five.—R. B.

**CLOTAIRE III.**, grandson of Dagobert, born about 652, reigned over Neustria and Burgundy from 655 till his death in 670. He was at first ruled by his mother, Bathilda, who, by her marriage, had been raised to royal rank from the condition of a Saxon slave; and latterly by the mayors of the palace.

**CLOTAIRE IV.**, of unknown origin, placed on the throne of Austrasia by Charles Martel. He reigned in 717-720.

**CLOTILDA** or **CLOTILDIS**, daughter of Chilperic of Burgundy, was married to Clovis I. in 493. She professed the christian faith, and her zealous efforts for the conversion of her husband were ultimately successful; but, tradition says, not without the aid of a miraculous interposition in his favour at the battle of Zulpich, against the Alemanni. On the death of Clovis, and the division of his kingdom amongst her four sons, she retired to a life of devotion in the cloisters of St. Martin. The fame of her sanctity, and the miracles which are said to have attended her prayers, procured for her the honour of canonization; although the influence which she exerted on the quarrels of her kinsmen was not always of a peaceful character.—W. B.

**CLOUET, ALBERT**, a Flemish engraver, was born at Antwerp in 1624. He studied in Italy under Bloemaert, and his plates are executed much in the neat finished manner of his master. He engraved some of the pictures in the Palazzo Pitti at Florence; several portraits for the work "Effigies Cardinal. nunc Viven-tium," published at Rome; also, portraits of painters for Belloni's *Vite de Pittori*; and subjects after Baldinucci, Da Cortona, and Borghignone. He died in 1687.—W. T.

**CLOUET** or **CLOWET, PETER**: this Flemish engraver was born at Antwerp in 1624. At an early age he went to Italy, and at Rome studied under Pierre and Bloemaert. He afterwards returned to Antwerp and engraved several portraits after Van Dyck and pictures after Rubens. His plates are finished in a firm, free, masterly manner. His Rubens plates are highly prized. Among these are the "Descent from the Cross,"

"Death of St. Anthony," and "St. Michael defeating the Evil Spirit." He died in 1668.—W. T.

CLOUGH, BENJAMIN, Wesleyan minister and Oriental scholar, born at Bradford in 1791. He was one of the party of missionaries which accompanied Dr. Coke to Asia in 1813, and was stationed in the island of Ceylon from 1814 to 1838. He greatly distinguished himself as a laborious missionary, and as a Singhalese and Pali scholar, and was one of the first translators of the scriptures into these languages. He published a Singhalese dictionary, in 2 vols. 8vo, a work of great value, and died on the 13th of April, 1853.—W. B. B.

CLOVIO, GIULIO GIORGIO: this eminent artist, called the MINIATURIST, and MACEDO or MACEDONE, from his family being of Macedonian origin, was born at Grisone in Croatia in 1498. At the age of eighteen, desirous of improvement, he went to Italy and attached himself to Cardinal Marino Grimani, in whose service he had opportunities of obtaining the counsel of Giulio Romano. This painter, struck with the minute delicacy of some of Clovio's work, recommended him to abandon large works and devote himself to miniature painting entirely, giving him instruction in the use of colours prepared with gum and in tempera. Clovio's success was remarkable. "There never has been, and for many ages there probably never will be, a more admirable and more extraordinary miniaturist," writes Vasari. He died in 1578.—W. T.

CLOVIS I., son of Childeric I., succeeded to the chieftaincy of the Salian Franks, at the age of fifteen, in 481. His first military expedition was against Syagrius, who ruled at Soissons the little remnant of the Roman possessions in Gaul. A single battle in 486 decided the issue of the conflict, and extended the Frankish boundary to the Loire. This conquest of the Alemanni and his conversion to christianity in 496, rapidly followed by his victories over the Armoricans, the Burgundians, and the Visigoths, procured for him in 508 the titles of Roman patrician and consul from the Emperor Anastasius. His progress in the south being at the same time checked by Theodoric the Ostrogoth, he turned his ambitious designs against the independent Frankish princes, Sigebert of Cologne, and Ragnacaire of Cambrai, whose territories fell successively under his sway. He died in 511, after a reign of thirty years, having laid the foundation of the extended empire which, after various vicissitudes, has issued in the modern kingdom of France.—W. B.

CLOVIS II., son of Dagobert, and grandson of Clotaire III., inherited in 638 the united kingdoms of Neustria and Burgundy, the Austrasian sceptre falling to his brother, Sigebert III. Clovis was then only six years of age, and the government, till his majority, was conducted by his mother, Nanthilde. In 656 Grimoald, the Austrasian mayor, having placed his own son instead of the rightful heir upon the throne of Sigebert III., Clovis procured his assassination, and assumed the nominal sovereignty of the whole Frankish empire, but died in the course of the same year.—W. B.

CLOVIS III., son of Theodoric III., held the powerless sceptre of the degenerate Merovingian line from 691 to 695, scarcely visible under the shadow of the famous mayor of the palace, Pepin of Herstal.—W. B.

CLOWES, REV. JOHN, M.A., rector during the long period of sixty-two years of the church of St. John's, Manchester. He was born in Manchester in 1743. Shortly after he had been established in his living, he became acquainted with the theological works of Swedenborg. "The delight," he says in his autobiography, "produced in his mind by the first perusal of the work entitled Vera Christiana Religio, no language could fully express." Before long he was busily engaged in the work of translation; thirty volumes of the works of Swedenborg came from his pen in rapid succession; besides which he published a variety of original works and numerous sermons. He was amongst the first who introduced Sunday schools into Manchester, and was appointed the first secretary to the Sunday School Union in that town. He was never idle when he could promote the cause of popular education, or in any way ameliorate the condition of his fellow-men. No man was ever more profoundly revered, or more affectionately beloved than he was by his flock. At the end of the fiftieth year of his ministry, his congregation erected a fine piece of statuary in the church to commemorate the jubilee. The work was executed by the celebrated Flaxman; it represents the venerable pastor exhorting and teaching three generations. A noble monument, the work

of Westmacot, was erected to his memory shortly after his death, which took place in 1831.—J. H. S.

CLOWES, WILLIAM, an eminent English surgeon of the sixteenth century, who wrote upon the lues venerea, and upon gunshot and other wounds, was surgeon to St. Bartholomew's, and afterwards to Christ's hospital, London. In 1586 he went, by order of the queen, to the Low Countries as surgeon to the army, serving under the earl of Leicester.—J. S., G.

CLOWES, WILLIAM, a printer, who from small beginnings rapidly rose to be perhaps the most eminent man in his profession in London, was born in 1779, and died in 1817. From his immense and well-organized establishment the *Penny Magazine* and *Penny Cyclopædia* issued with admirable regularity for fourteen years. Mr. Clowes was a native of Chichester, where his father, who had been educated at Oxford, was master of a large school.—J. S., G.

CLUBBE, JOHN, author of "The History and Antiquities of the ancient Villa of Wheatfield, in the County of Suffolk," 1758, was rector of that place and vicar of Debenham. He was born in 1703, and died in 1773. His son, WILLIAM, author of some spirited translations from Horace, died in 1814.—J. S., G.

CLUENTIUS, HABITUS A., a Roman citizen, born at Larinum, who accused his stepfather, Oppianicus, of having attempted to poison him; and who eight years afterwards was himself accused by the son of Oppianicus of three attempts at murder by poison. He was defended by Cicero in an oration still extant.—J. S., G.

CLUSIUS or ECLUSE, CHARLES D', a celebrated Dutch botanist, was born at Arras on February 18, 1526, and died at Leyden in April, 1609. He studied medicine at Montpellier, where he took the degree of doctor of medicine. He travelled over various parts of Europe, and settled at Antwerp, where he began to publish his botanical works. He was for some time director of the botanical garden at Vienna, a situation which he was compelled by a court cabal to leave in 1587. In 1593 he became professor of botany at Leyden, and he helped to render the garden of that city famous. His experiment on the palm, called *Chamærops humilis*, tended to confirm Linnæus' views, by showing that pollen required to be applied to the pistil, in order that seed might be perfected.—J. H. B.

CLUTTERBUCK, HENRY, a well-known physician who practised in London, was born at Marazion in Cornwall, 28th January, 1767. His father was a solicitor there, and he was educated at the grammar-school of that town. He received his medical education in London, chiefly within the walls of St. Thomas' and Guy's hospitals. In 1790 he was admitted a member of the College of Surgeons. He passed the sessions of 1802-3 at the university of Edinburgh, and in 1804 he graduated at Glasgow as doctor of medicine. On his return to London in the same year he became a licentiate of the College of Physicians. From the year 1808 to 1826 he gave lectures on various subjects—the theory and practice of medicine, materia medica, and chemistry—with great success. Dr. Clutterbuck held the appointment of physician to the Aldersgate Street general dispensary for a period of five years, resigning his office owing to some dispute in 1833. Dr. Clutterbuck's principal published works are as follows—"An Account of a new and successful method of Healing those Affections which arise from the Poison of Lead," 1794; "Remarks on some of the Opinions of the late Mr. John Hunter respecting the Venereal Disease," 1799. In the year 1795 he instituted the *Medical and Chirurgical Review*, which he continued to edit, without assistance, until the year 1809. The nature and cause of fever was a subject which especially engaged Dr. Clutterbuck's attention. In 1807 appeared the first edition of his "Inquiry into the Seat and Nature of Fever." A second edition appeared in 1825. In 1819 he published "Observations on the Prevention and Treatment of the Epidemic Fever at present prevailing in the Metropolis." In 1837 he wrote "An Essay on Pyrexia, or Symptomatic Fever." For four years Dr. Clutterbuck presided over the Medical Society of London, and he contributed two papers to the Transactions of this society. For many years Dr. Clutterbuck occupied a very prominent position as a physician in the city of London. He was offered the fellowship of the College of Physicians, but declined this, at that time, somewhat equivocal honour. He died at his residence, Bridge Street, Blackfriars, on the 24th of April, 1857, aged eighty-nine years.—E. L.

CLUTTERBUCK, ROBERT, a laborious antiquary and topo-

grapher, author of a "History of Hertfordshire," was born at Watford in that county in 1772, and died in 1831.

CLUVIER, PHILIPP, a celebrated German geographer, was born at Dantzic in 1580, and died at Leyden in 1623. By his disobedience to the will of his father, who had intended him for the study of law, he was reduced to poverty and obliged to enlist in the Austrian army, but was afterwards enabled to follow his literary pursuits at Leyden. Among his works we mention: "De tribus Rheni alveis," 1611; "Germania Antiqua," 1616; "Introductio in Universam Geographiam, tam Veterem quam Novam," 1624; "Italia Antiqua," 1625, &c.—K. E.

CLUYT, ONTGER, in Latin ANGERIUS CLUTIUS, a Dutch botanist of the seventeenth century. He visited the principal countries of southern Europe. As assistant to Belleval, he resided some time at Montpellier. Subsequently he visited Spain and Africa. In the latter country he was seized as a slave, but finally made his escape, and returned to Amsterdam about 1630. He wrote a treatise on the nutmeg tree, as well as works on insects; on the transport of trees, seeds, and fruits; and on "Lapis Nephriticus."—J. H. B.

CLUYT, THEODORE ONTGER, a Dutch botanist of the sixteenth century. He practised pharmacy at Leyden, and took charge of the botanic garden, which was founded in 1577. He devoted his attention to botany and entomology. The botanic garden under his auspices became famous, and contained a large collection of valuable plants. He wrote a work on the natural history of bees.—J. H. B.

CLYDE, COLIN CAMPBELL, Baron, was born in Glasgow on 16th October, 1792. Both his parents were Scotch, so that Caledonia can claim the undivided honour of the hero of Lucknow, to whom Great Britain is mainly indebted for the salvation of her Indian empire. His parents, both of Highland descent, though highly respectable, were far from affluent; and it was to his mother's connections, who was a lady of good family, that the young hero was indebted for his first entrance into life. He received the rudiments of his education at the high school of Glasgow; and by the influence of his uncle, Colonel Campbell, obtained an ensigncy in the 9th regiment of foot on the 26th May, 1808, being then not yet sixteen years of age. Hardly had he donned his uniform, when he was called into that active service in which nearly his whole subsequent life has been spent. He embarked with his regiment in July of that year under Sir Arthur Wellesley, and first heard the whistling of the bullets at the battle of Vimiera, which effected the liberation of Portugal in the autumn of the same year. Subsequently his regiment advanced into Spain under Sir John Moore; and he shared in the calamitous retreat through Galicia by which it was followed, and the memorable battle of Corunna, which threw a ray of glory over the last efforts of one of the bravest armies that ever left the shores of Britain.

After the return of that army to England, and the fitting out of a fresh one under Wellington to continue the Peninsular contest, he was despatched with his regiment to Cadiz, and bore a part in the battle of Barossa and glorious defence of Tariffa in 1811. Soon after, as his military capacity had become known, he was attached in a separate station to the army of Ballasteros, and by his counsels and intrepidity contributed to the prolonged mountain warfare which that gallant chief maintained with the greatly superior armies of France in the mountains of Ronda. He was present also in the less fortunate expedition in 1812 for the relief of Taragona. In the beginning of 1813 he was called to a more glorious campaign under the direction of Wellington; was present with him in the battle of Vittoria on 21st July in that year; and led one of the storming parties at the memorable assault of San Sebastian in the October following, on which occasion he received two severe wounds. His gallantry on this occasion is mentioned in just terms of eulogy by Sir William Napier in his History of the Peninsular War. He recovered in time, however, to take part in the passage of the Bidassoa, when he was again severely wounded by a musket shot, which passed through his right thigh, and disabled him from farther active service in the Peninsular war.

Still Campbell was only a captain, which rank, as well as that of lieutenant, he had received as a reward for his services without purchase; and immediately after the peace of 1814 he was despatched with the 60th rifles, in which he held his commission, to America, and bore a part with it in the victory of Bladensburg in 1814, during the advance on Washington, and in the

gallant though unsuccessful assault of the lines in front of New Orleans in the same year. The conclusion of the general peace in 1815 deprived him for a considerable period of active employment; but he turned this period of comparative repose to good account in making himself thoroughly acquainted with the theoretical as well as practical part of his profession. He was already noted as a thorough disciplinarian, when in 1823 he was intrusted with the command, as brigadier-major, of the troops employed in quelling the insurrection of the negroes in Demerara. But he was ere long called to higher and more important duties. In 1825 he obtained his majority by purchase; and in 1832 he was made by the same means lieutenant-colonel of the 98th regiment. With it he went to China during the war of that year with the Celestial Empire, and was greatly distinguished by his conduct in command of that regiment, both in the attack on Chusan, and the subsequent brilliant operations in the assault of Chin-kiang-fou, and before Nankin in that year. His services in this campaign were so brilliant, that he was rewarded for them by being appointed full colonel without purchase by the Horse Guards.

The Chinese war being concluded at the same time that the Afghanistan contest was closed by the second capture of Cabool and the subsequent retreat from that province, Colonel Campbell was not again engaged in active service till 1848, when, from his abilities in command being well known, he received from Lord Gough the local rank of brigadier, and as such distinguished himself in the untoward affair of Ramnuggur, and afterwards in the hard-fought and, in some respects, calamitous battle of Chillian-walliah, in which last action he was again wounded. His conduct during that perilous passage at arms was so conspicuous, that Lord Gough, in his despatch giving the account of the battle, said—"Brigadier Campbell, with the steady coolness and military precision for which he is so conspicuous, carried everything before him." The governor-general, in his official despatch concerning the battle, added his testimony to the same effect. He was not less distinguished in the subsequent battle of Goojerat, which finally closed the Sikh wars. For his conduct on these occasions Colonel Campbell was made a K.C.B., and was specially named in the thanks of parliament and of the East India Company.

Colonel, now Sir Colin Campbell, still remained in India after the termination of the Sikh wars; and hostilities having again broken out in Scinde, where Sir Charles Napier was in command, he was early selected by that able and discriminating general for high and important separate duties. During the year following he was constantly employed in the conduct of important operations against the hill tribes, who dwelt in the mountains lying to the eastward of the great plain watered by the Indus. In the course of these he distinguished himself in the combat which ended in the forcing of the Kohat Pass under the immediate command of his gallant general; and he was engaged in an almost constant warfare with the Momunds, who mustered eight thousand horse and foot, but were finally defeated at Puni-Pas, and compelled to sue for peace. The final seal was put upon these successes by a decisive victory over the Colwankbail and Ranozan tribes, whose chief stronghold he stormed with three thousand men at Pranghur, and routed with great slaughter at the decisive battle of Isakota, where the enemy mustered eight thousand sabres and bayonets.

Though having had the command in operations of this magnitude in the East, Sir Colin's rank in the army which enabled him to hold these appointments was local only, and when he returned to England in 1853 he was still a colonel in the queen's army. His character as an admirable officer, however, was too well known to permit his remaining in that comparatively humble rank when serious work required to be done; and accordingly, when the Crimean war broke out in 1854, he was promoted to the rank of brigadier-general, and as such intrusted with the command of the Highland brigade, forming the left wing of the division commanded by his royal highness the duke of Cambridge. In consenting to act in this comparatively subordinate situation in the British army, Sir Colin gave proof of the disinterested and patriotic spirit by which he was animated; for nearly all the officers in the army above him were his juniors both in years and military standing, and not a few of them had been in the cradle when he fought his first battle under Sir Arthur Wellesley at Vimiera in 1808.

Though placed under the command of the duke of Cambridge, however, Sir Colin was not long of giving proof of his military

talent. When the attack by the duke of Cambridge's division, composed of the guards and Highlanders at the Alma, was ordered on the Russian entrenchments on the extreme right of their position, the fusilier guards, as is well known, were received by so tremendous a fire that they were obliged to recoil after sustaining a very heavy loss. Seeing this, and feeling that he could not renew the attack without re-forming his men, the duke suggested to Sir Colin to halt his men in order that the attack of the two brigades might be simultaneous. But Sir Colin, who was in the very front of his men among the tirailleurs warmly engaged with those of the enemy, still moved on. He saw his advantage, which in a few minutes would be lost, and which, from his position, could not be known to his royal highness. The Russian guns were levelled a shade too high; their balls were going through the feather bonnets, for the most part above the heads of the men. He pressed on, therefore, without an instant's delay, himself leading on his favourite charger, which was shot dead during the rush. Before the Russians had time to lower their guns, the Highlanders, after delivering a volley, rushed in and carried the right flank of the works with very little loss. "Campbell," says Bezancourt, the official French annalist, "carried the right flank of our works at a run, and the battle was gained." Nearly at the same time the fusilier guards re-formed, and, supported by the grenadier guards, renewed the attack, and entered the entrenchments by the front. The duke of Cambridge, much to his honour, has more than once publicly admitted these facts at meetings in London.

During the terrible winter which ensued, when the troops of all arms were exposed to such unheard-of hardships, Sir Colin was stationed with his brigade on the heights of Kamora, covering the vital point of Balaklava, the sole channel of communication for the army by which all its supplies were obtained. No such evidence could be given of the estimation in which he himself and the brave troops he commanded were held in the army; for it was known that the principal efforts of the enemy would be directed against this point. He gave decisive proof how worthy his followers were to hold the post of honour, when, on the 25th October, at the head of the "thin red line" formed by the 93d Highlanders, not even formed in square, he repulsed the formidable attack of the Russian horse on the post of Balaklava. During the severe winter which followed he was indefatigable in his endeavour to mitigate the sufferings and provide for the comforts of his men; and with such success were his efforts attended, that the Highland brigade was by universal consent the best-conditioned and efficient part of the army. As such it was brought up to the front before the first assault on the Redan, on 18th June, 1855, and held in reserve to rush forward at the decisive moment, if the attack had been found to be practicable. On the final assault on 8th September, when the Malakoff was carried, he marched with his brigade from Kamara to the front, a distance of nine miles, before daylight, and was in the front trenches under a heavy fire with them the whole day, waiting the signal for advancing from the commander-in-chief. When Wyndham was driven out of the Redan, Sir Colin received orders to renew the assault, which, by his advice, was postponed till day-break on the following morning. During the night he arranged his plan of attack, which was to have been made by a general rush of the whole brigade, formed in close column on the open in front of the trenches during the dark, the light company of the 72nd, which happened to be in front, leading. Before midnight, however, the work was found abandoned, and Sir Colin was baulked of a triumph which would doubtless have been won and made the world ring from side to side.

Upon the appointment of General Codrington to succeed General Simpson as commander-in-chief, Sir Colin resigned his command and returned to England, deeming himself ill-used by the appointment of an officer so much his junior over his head. At the earnest request, however, it is said, of the highest personage in the realm, he agreed to resume active service, and return to the Crimea. The most important duty in the campaign which was preparing, was to have been intrusted to the Scottish hero; for he was to have had the command of a corps of fifteen thousand British and twenty-five thousand Turks, who were to have been landed at Theodosia, and ascending the stream which flows into the sea at that place, to have taken the formidable Russian entrenchments on Mackenzie Heights in rear. The conclusion of the war, however, which the French, exhausted in finance, had become unable to carry on, prevented the execu-

tion of this design, and Sir Colin returned to England, where he was made a G.C.B., and received with the highest distinction by his sovereign. There he received also a gratifying mark of general esteem by the presentation of a sword subscribed for by six thousand of his fellow-citizens in his native city of Glasgow.

When the Indian revolt broke out, and every post from the East brought the intelligence of fresh and seemingly overwhelming disasters in Hindostan, all eyes were turned to Sir Colin as the only man capable of staying the disasters which were accumulating round a "sinking throne and a falling empire." Yielding to the universal voice, Lord Palmerston, then prime minister, sent for him on July 11th, and asked him whether he would undertake the command, and if so, when he could set out. "Within twenty-four hours," replied the Scottish chief, then sixty-four years of age. He was as good as his word. On the following evening he set out, accompanied by his staff, for India, with no more baggage than a trooper could carry with him on his saddle; and on the 13th August following reached Calcutta, after an uncommonly quick passage. The labours which then awaited him were such as would have overwhelmed any one of inferior resolution, and less accustomed to make every difficulty yield to an energetic will. Disarmed, and with its forces disbanded or scattered by the imprudent reductions of a pacific administration, the supreme government at Calcutta was utterly unprepared for a contest. The arsenal there was empty; that at Delhi was in the hands of the enemy; arms, powder, guns, balls, all required to be manufactured, and, as fast as they could be got ready, sent off in the utmost haste for the service of the troops, now reduced to the last extremity, despite all the heroism of Havelock and his men in the north-western provinces.

The whole autumn of the year was employed by Sir Colin in the most herculean efforts to repair the deficiencies in military stores, to provide the means of transporting them, with the slender reinforcements which arrived from China, to the theatre of war in the neighbourhood of Cawnpore. At length something like an army having been formed, and the 93rd Highlanders, 1019 strong, having arrived from China, Sir Colin set out from Calcutta on the 26th of October; and after narrowly escaping having been made prisoner by a body of rebels on the road between Allahabad and Cawnpore, he reached the latter town on the 2nd of November. He was there fortunately joined by a body of admirable troops, under General Hope Grant, who had come down from Delhi after the storming of that city. By this accession of forces, Sir Colin's little army was raised to six thousand men and thirty-six guns, and with this small force he forthwith set out to effect the deliverance of Havelock, now at the last extremity in Lucknow, and besieged by sixty thousand of the best troops of Oude.

The task before him was arduous, and to all appearance hopeless, for not only was the force in his front tenfold stronger than his own, but his communications were threatened by the Gwalior contingent, fourteen thousand strong, composed of the best troops in India, disciplined by European officers, which lay at Calpee, only forty-five miles, threatening Cawnpore; the bridge of which, over the Ganges, commanded the only communication with Calcutta, and the base of operations in the south. Yet necessity commanded an immediate effort for the relief of Lucknow, for Havelock could only hold a few days longer the buildings he had so nobly defended, and it was well known, that if forced to surrender, he himself, his brave followers, and the women and children in the residency, twelve hundred in number, would all be massacred. Determined to rescue them or perish in the attempt, he marched with all the disposable troops he could command, only five thousand five hundred in number, on the 8th November, taking the route to Lucknow, which was fifty-two miles distant, leaving Wyndham with twelve hundred to make head against the Gwalior contingent, and hold the important bridge and fort of Cawnpore during his absence.

The operations which followed were conducted with the most consummate ability, and have justly raised Sir Colin to the very highest rank in military glory. Swiftly, yet cautiously advancing, he reached the neighbourhood of Lucknow on the 12th of November, and immediately began his advance to deliver the beleaguered garrison. Directing his march by a semicircular sweep round the city, he avoided the long barricaded street leading direct to the residency, in forcing his way through which, Havelock had lost nine hundred men; but he had still a des-

perate shock to encounter before his object was gained. Every building was garrisoned and loopholed, every palace constructed into a fortress which obstructed their advance. By successive and persevering efforts, however, they were all overcome—the Martinière carried after a sharp conflict, the bridge of the canal forced, and with infinite difficulty heavy guns dragged up to batter the Secunderbagh, garrisoned by two thousand of the best sepoy troops. On to the assault rushed the 93rd and the 2nd Punjaub infantry at a run, striving who should first penetrate in; and they effected an entrance at the same time, and awfully avenged the massacre of Cawnpore, by putting the whole defenders to the sword.

Still the Shah Nussief's mosque stood in the way, strongly garrisoned by sepoys, and till it was carried access to the residency was impossible. Peel's guns were brought up to breach the walls, but the fire of musketry from them was so severe, that the gunners were all struck down and the guns silenced. Sir Colin then ordered up the 93rd, and assembling them around him, told them that the guns were silenced, but the mosque *must be carried* that night, and they must do it with their bayonets, and he would put himself at their head. He did so accordingly. Sir Colin himself and all his staff leading on the assault were wounded or had their horses shot under them; Major Alison, his military secretary, lost his arm in the advance; Captain Alison, his aid-de-camp, was struck down; Colonel Adrian Hope, the bravest of the brave, Sir D. Baird, and Captain Foster, both aid-de-camps to Sir Colin, had their horses shot under them. Success seemed hopeless; for no fissure could be discovered in the massy walls, from which incessantly streamed a terrific fire of musketry. The 93rd was fast falling, and orders were already given to retreat, when Colonel Adrian Hope, with a party of the 93rd, found a small opening, which, being enlarged, they got in, and the fort was carried. This success was decisive—access was obtained next day to the residency. Havelock, his brave garrison, and the whole women and children were brought off in safety; and Sir Colin having achieved this deliverance, set out with the utmost expedition to succour Wyndham, who was hard pressed in his rear.

It was high time he should do so; for that general, overpowered by an overwhelming superiority of forces, had been driven back into Cawnpore. The town was taken, the fort hard pressed, and already the enemy's balls were beginning to fall on the bridge, the sole line of communication of the troops. In a few hours more the bridge would have been taken, the army cut off from its base, itself destroyed, and India lost, for there was no reserve at Calcutta to effect a second deliverance of Lucknow. But Sir Colin soon restored matters; his gray hairs were worth a thousand men. The enemy was soon repelled from the heights they had won which commanded the bridge, and the long file of wounded men, women, and children having been got in safety across, and despatched to Allahabad, the chief sallied forth at the head of six thousand men, and by an extraordinary display of skill and tactics, succeeded in completely defeating an army double the size of his own, flushed with victory, and taking all their guns. This was the crisis of the war—the tide had turned—the Scottish hero had, with an energy and skill equal to the greatest efforts of Napoleon, with an army of seven thousand defeated seventy thousand, brought off the long train of helpless beings without the loss of one, under their very eyes, and delivered India from the greatest peril in which it had been placed since the victories of Clive, a century before, had laid the foundation of the British empire in the East.

The subsequent career of Sir Colin happily proved but one unbroken succession of triumphs. Casting an eagle glance over every part of India, he despatched its forces in every direction, so as to crush all the efforts of the rebels. Before the hot weather had recommenced, he himself had regained the important post of Futtyghur, which restored the direct communication with Delhi and the Punjaub. No sooner had the next cool season commenced, than he advanced, with ten thousand men and eighty guns, a second time against Lucknow, and having by a most skilful movement succeeded in enfilading the whole of the enemy's works with his guns in their rear, he carried the begum's palace by storm, and made himself master of the whole city, with ninety-six guns, immense military stores, and resources of all kinds. This was immediately followed by an advance into Rohileund, and the capture of Bareilly, the next greatest stronghold in possession of the insurgents, after several

hard fought and brilliant actions. The return of the hot season having again necessarily suspended military operations, the interval of rest was turned to such good account by the veteran commander-in-chief, that when he took the field again in November, 1858, he succeeded in capturing the whole strongholds of Oude yet in the hands of the insurgents, and driving the remains of their scattered bands to perish in the wilds of the Nepal mountains. Subsequent accounts contained the gratifying intelligence that Oude, the centre of the insurrection, was entirely pacified; two hundred and seventy-three forts in course of being demolished, and four hundred thousand stand of arms delivered up. For these astonishing successes, Sir Colin, with the entire approbation of the nation, was raised by her majesty to the peerage by the title of Lord Clyde. But history must, in justice to his transcendent merits, give him a still higher title, and pronounce him the greatest general whom Scotland has produced since the time of Robert Bruce, and one of the greatest benefactors to England who has ever appeared; for he preserved and strengthened in its hour of utmost need the British empire in the East. Kindly and affectionate in his dispositions, courteous and high-bred in his manners, independent and manly in his character; he united with these brilliant martial qualities, those most fitted to command respect and win regard in private life. Overflowing with courage, and ever in the front of battle, he was avaricious only of the blood of his soldiers; and by his mingled caution and dash, achieved his glorious successes with an incredibly small effusion of human blood. This great commander died at Chatham, in the house of his friend General Eyre, on the 14th August, 1863.—A. A.

CLYMER, GEORGE, chairman of the committee which prevented the tea sent out by the English ministry from being sold in Philadelphia, and a signer of the American declaration of independence, born of a good family in Philadelphia in 1739; died in 1813.—F. B.

COBAD or CABADES, nineteenth king of Persia of the dynasty of the Sassanides, succeeded his brother, Palasch, in 486. A revolt of the people not long after placed his brother, Jamasp, upon the throne, but, by the assistance of the khan of Tartary, Cobad succeeded in subduing the usurper. He afterwards waged war with the Emperor Anastasius, who compelled him to pay a large ransom. He died in 531.—J. S., G.

COBB, SAMUEL, an English poet of some note, master of Christ's hospital, published "A Collection of Poems on several occasions," 1707; some translations; the Miller's Tale from Chaucer, and a Pindaric ode "the Female Reign," which was printed in Dodsley's Collection. He died in 1713.—J. S., G.

COBBETT, WILLIAM, an English political writer, possessed of peculiar and independent personal characteristics, and of extraordinary influence, was the son of a farmer at Farulham, Surrey, where he was born in 1762. His education being uncared for at home, he took it in hand for himself, and obtained such a mastery of the English language, that few better examples of its severe and vigorous power can be obtained than those afforded by the writings of William Cobbett. Wearied of farm work, he became copying clerk to an attorney in London, but soon deserted this monotonous avocation for the stirring adventures of the army. He proceeded in a regiment of foot, as a common soldier, to Nova Scotia, and in 1791 returned to England a sergeant-major, married, and obtained his discharge. In 1792 he went to France, intending to pass the winter in Paris; but hearing of the dethronement of the king and the massacre of the guards, he changed his route and embarked for Philadelphia, where he landed in October, 1792, and soon obtained abundant employment as a teacher of English to the numerous emigrants who had left France and St. Domingo to avoid the dangers of the Revolution. Cobbett was a thorough Englishman in heart and soul; and although he himself did not shrink from attacking the faults of his country, yet, when upon American soil, he upheld the English constitution as the type of perfection, and would not tolerate one upbraiding word against the government, even when men like Dr. Priestley were driven into exile. For eight years—1792 to 1800—Cobbett remained in America, and took an eager part in the discussion of the question whether an alliance should be sought with France or England. In numerous pamphlets, very personal and sarcastic but sufficiently masterly, which commanded an enormous circulation, Cobbett attacked the French or anti-federal party. The anti-federalists compared him to a porcupine; he accepted the name and

published an autobiography entitled "Life and Adventures of Peter Porcupine." Sometime afterwards when Lord Castlereagh spoke of his writings as twopenny trash, he very characteristically accepted that name also, as the title of his publications. In 1796 he opened a shop at Philadelphia for the sale of his own works. His friends feared for his safety, since the feeling on behalf of France was very strong. "I saw," says Cobbett, "that I must at once set all danger at defiance, or live in everlasting subjection to the prejudices and caprices of the democratical mob. I resolved on the former . . . I put up in my windows, which were very large, all the portraits that I had in my possession of kings, queens, princes, and nobles. I had all the English ministry, several of the bishops and judges, the most famous admirals, and, in short, every picture that I thought likely to excite rage in the enemies of Great Britain. Early on the Monday I took down my shutters. Such a sight had not been seen in Philadelphia for twenty years." In spite of his sympathies, however, the English government found him too independent to become their tool. He heard himself called by the English consul "a wild fellow," and remarked, "When the king bestows upon me £500 a year perhaps I may become a tame fellow and hear my master, my friends, and my parents belied and execrated, without saying a single word in their defence." Cobbett ultimately was involved in several prosecutions for libel, and returned to England in 1800. He was introduced to Pitt, and opened a bookseller's shop in Pall Mall; but disputing the policy of the peace of Amiens, he quarrelled with the government; broke off from many proffered friendships; and in 1802 commenced the *Political Register*, which grew into a weekly essay on politics. His opinions became more and more democratic, but they were always sincere and his own, and he was influenced in their formation neither by threats nor bribes. Cobbett's political writings amount to one hundred octavo volumes. For nearly forty years he gave his thoughts to the public upon political and social questions, at least once a week. Of a vehement and open disposition, he expressed every passion and every wish, every personal prejudice and every patriotic prayer. Bold and sometimes coarse, he was also fearless and free. His hatred and his affections were equally intense. His maxim—professed to be borrowed from Swift—was "If a flea bite me, I will kill it if I can." The greater the odds against him, the higher his courage rose. Inconsistent, he always owned his change, and gave his reason, following the rule laid down by Chatham, "It is the duty and ought to be the honour of every man to own his mistake, whenever he discovers it, and to warn others against those frauds which have been too successfully practised upon himself." He eagerly espoused the cause of reform; but, at the same time, wrote to the journeymen and labourers of England to respect the constitutional history of their country; for, said he, "there is no principle, no precedent, no regulations (except as to mere matter of detail) favourable to freedom, which is not to be found in the laws of England, or the example of our ancestors." In fact, many of the opinions for uttering which Cobbett was called "fool," "incendiary," "vulgar," "libeller," would to-day be regarded alike by whig and tory as plain common sense. With clear insight into the course of history in a free country, in 1816 Cobbett wrote to "the Labourers" of England, that "a reformed parliament would soon do away all religious distinctions and disabilities. In their eyes a catholic and a protestant would both appear in the same light." Upon practical questions, Cobbett's clear-headed advice was of infinite service to the agricultural population, among whom his chief influence was exerted. He pointed out that thrashing machines were no causes of misery to the poor; and endeavoured to persuade the working people not to enter upon a crusade for their destruction. To this day, Cobbett's "Cottage Economy" and "Advice to Young Men" constitute standard books in the cottages of the southern counties, and many a Sussex and Surrey countryman finds that his "Grammar" gives him the most intelligible account of his native tongue. Cobbett was repeatedly tried for libel, and on one occasion was sentenced to a fine of £1000 and imprisonment for two years, on account of some strictures he made on a case of flogging in the army. In 1817 he revisited America, but returned in 1819, bringing with him the bones of Paine. He was returned to parliament for the borough of Oldham in 1832, but having been previously accustomed to retire to rest at nine, and rise at four in the morning, his health could not accommodate

itself to the change of habit; and after a brief illness he died June 18th, 1835. His personalities were forgotten in his power, his inconsistencies in his honesty, his vehement impulses in his common sense, and his thousand battles were remembered only for his fearless daring; while the chief organ of his opponents bestowed upon the peasant politician whose voice had echoed through the mine and the coal-pit, and who, to use the expression of Coleridge, had lifted the latch of every cottage door and thundered with no runaway knock at the palace gate, the not unfitting title of—the Last of the Saxons. Cobbett's political works consist of—"Porcupine's Works," 12 vols. 8vo, Philadelphia, 1794 to 1800; and "The Weekly Political Register," 88 vols. 8vo, London, 1802 to 1835. An abridgment of the 100 volumes has been published by his sons in 6 vols., 8vo, London, 1835. In addition to his political works, Cobbett wrote French and English grammars, "Cottage Economy," "Advice to Young Men," "Legacy to Parsons," &c. &c.—L. L. P.

COBDEN, RICHARD, in his day the chief apostle of free trade, was born at the farmhouse of Dunford, near Midhurst, Sussex, on the 3rd of June, 1804. He was thus, by seven years, the senior of his friend and fellow-worker, Mr. Bright. The family of Mr. Cobden had long been resident in the locality where he first saw the light. His grandfather is still remembered at Midhurst, in the immediate vicinity of his birthplace, as "Maltster Cobden;" and such designations as "Cobden's Lane" still survive there, memorials of Mr. Cobden's progenitors rather than of himself. His father was a substantial yeoman, but some degree of obscurity rests over his earlier years and career. Certain it is that, unlike Mr. Bright, Mr. Cobden was the architect of his own worldly fortunes. It is understood that at an early age he was placed in a London warehouse, from which he emerged as traveller for a Manchester firm extensively engaged in the cotton trade. In 1830 we find him a master calico-printer, in partnership with Messrs. Sherreff and Foster, at Sabden, in a romantic district of hill-country, near Blackburn, in Lancashire, where every valley has its stream of pure water, that indispensable element in the finer departments of calico-printing. Subsequently, with an elder brother, he engaged in the same business at Chorley in Lancashire; the name of the new firm being Richard Cobden & Brothers. Mr. Cobden retired from commerce after the great free trade triumph of 1846.

Up to 1835 Mr. Cobden was little known in Lancashire or Manchester, where he had a counting-house, save as a calico-printer of good taste and business ability, beginning to produce articles of a superior quality, which competed with the best London products, and which grew to be celebrated as the "Cobden-prints." From this period onwards, his local and general activity expanded in scope, until it reached its acme in the repeal of the corn laws. Mr. Archibald Prentice, formerly editor of the *Manchester Times*, has described in his *Annals of the League*, the surprise and delight with which he perused in 1835 some singularly lucid and logical letters addressed to him anonymously on political and politico-economical topics, intended for publication in his journal. Soon afterwards he received a copy of a pamphlet, published in 1835, "England, Ireland, and America, by a Manchester manufacturer;" and in the inscription on the fly-leaf, "From the author," he recognized the hand-writing of the anonymous correspondent, of whom he had predicted that he would one day be a man of note. It was the first literary work of Richard Cobden. All Mr. Cobden's political, economic, and social philosophy, is to be found in this his earliest publication. Mr. Urquhart was beginning his denunciations of Russia; Mr. Cobden maintained that the absorption of Turkey by Russia would be the best possible solution of the Eastern question. Peace, nonintervention, retrenchment, and free trade, were the watchwords of the "Manchester manufacturer." The germ of the Anticorn-law League lurked in his suggestion, that as we had a Linnæan Society, so we ought to have a "Smithian," to diffuse a knowledge of the principles of the Wealth of Nations, and that prizes might advantageously be offered for the best essays on the corn question, and lecturers be usefully sent into the rural districts to enlighten the protectionist ignorance of the agriculturists. Mr. Cobden's views of foreign policy, whether sound or not, were not those of a mere student of books and newspapers. In 1835 he made the continental tour already referred to in the memoir of Mr. Bright, and again in 1837, he traversed some of the chief countries of Europe; on both occasions partly with a view to

business. In the interval, he had published in 1836 another pamphlet, "Russia," in which the views of his former one, still more boldly enforced, were defended from some of the numerous attacks which "England, Ireland, and America" had provoked. It may be added that Mr. Cobden took a prominent part in several local movements. He helped to found the Manchester Athenæum, and to procure a charter of incorporation for the borough of Manchester. He had been already a member of the Manchester chamber of commerce, and one of the members of the first Manchester town council was "Mr. Alderman Cobden." His first attempt to add parliamentary to his other honours was unsuccessful. Stockport, which accepted him as one of its representatives in 1841, rejected him in 1837.

Much had elapsed in the interval to give Mr. Cobden claims to the suffrages of a manufacturing constituency. Soon after his second return from the continent in 1838, the Manchester Anticorn-law Association was formed. This was in the autumn; on the 13th of December a meeting of the Manchester Chamber of Commerce was convoked to deliberate on the propriety of sending a free-trade petition to parliament, and Mr. Cobden was the member who spoke most ably in favour of the step. He was one of the delegates sent the following year to London from the north, to co-operate with the free-trade members of the house of commons; and it was at a delegate meeting in Palace Yard that, recalling the memory of the Hanseatic league, he proposed to give to the Anticorn-law Association the designation which has become so famous. The League took its name from this suggestion of Mr. Cobden. Early in the following year, 1840, the Free-trade hall was erected at Manchester, on ground belonging to Mr. Cobden, and curiously enough, the site had been the scene of the famous Peterloo massacre in 1819. At the crowded and enthusiastic inauguration of the temporary pavilion, afterwards the Free-trade hall, in January 13, 1840, the lion of the occasion, the late Daniel O'Connell, was immediately followed, as a speaker, by Mr. Cobden. The year 1840 was, owing to various causes, one of the busiest in the career of the league, and, before its close, Mr. Cobden's indefatigable activity and skillful oratory, vigorous and persuasive without vehemence or declamation, had secured him the leadership of the movement. At the general election of 1841 he was returned for Stockport, and made his first speech in the house of commons in the course of the debate on the address; the date was the 25th of August. Mr. Cobden's success in the house of commons was rapid, if not immediate. Though never a commanding parliamentary orator of the highest class, he enjoyed from first to last the "ear of the house." In 1846 the long and arduous struggle was successful, and Sir Robert Peel proclaimed that the person to whom the honour of the triumph was mainly due was Richard Cobden. At home a national subscription, which resulted in the collection of £70,000, was raised as a substantial recognition of the labour devoted by Mr. Cobden to the cause of corn-law repeal, at the sacrifice of his own commercial interests. The hero of free-trade now gave himself what was intended to be a holiday; he made another and an extensive continental tour. Numerous ovations, however, from the admirers of free-trade abroad, accompanied his progress, and made it appear the mission of an active propagandist. It was during this continental tour that he received one of the highest honours bestowed on him during his life. He had been requested to allow himself to be nominated a candidate for the representation of Manchester, but he declined; chiefly, perhaps, out of consideration for the claims of Mr. Bright. At the general election of 1847, his old constituents of Stockport re-elected him without opposition. Almost at the same time the greatest constituency in England, that of the West Riding of Yorkshire, semi-spontaneously elected him one of their representatives. Mr. Cobden bade farewell to Stockport, and accepted the trust reposed in him by the electors of the West Riding. Returning to England towards the close of 1847, Mr. Cobden at once declared war against the military and naval expenditure of the country. Early in the following year, the great revolutionary year of 1848, he became vice-chairman of an association of which Joseph Hume was chairman, for parliamentary reform and its corollaries. In 1851 he figured at the opening of the Exhibition of Industry as one of the royal commissioners. In 1854, on the breaking out of the war with Russia, Mr. Cobden joined Mr. Bright in his unpopular crusade against the war, and subsequently against Lord Palmerston's Chinese policy. One gleam

of success at last irradiated his long and seemingly fruitless advocacy of peace-principles. It was when, on the 3rd of March, 1857, the house of commons affirmed a resolution brought forward by Mr. Cobden and Mr. Gibson, condemnatory of Sir John Bowring's proceedings at Canton, and therefore of the last China war. But the victory lost him a seat in parliament. In 1857 Mr. Cobden stood for Salford and Huddersfield, but was defeated at both, and in 1859 set out to visit America. At the dissolution of parliament by the Derby ministry in 1859, Mr. Cobden, who was still in America, was elected M.P. for Rochdale. On his return he was offered a seat in the cabinet and the presidency of the Board of Trade by Lord Palmerston; but his uncompromising opposition to the noble lord's foreign policy compelled him to decline the offer. In 1860, however, he was destined to accomplish another great triumph of free-trade principles, having been eminently successful in negotiating a treaty of commerce with France, the mutual benefits of which are every year being realized more fully, and which holds out the best pledge of peace between the two countries.

The value of such services to the nation has been well expressed by Mr. Gladstone, chancellor of the exchequer, who, when moving the alterations in the tariff for the year 1860, to give effect to the provisions of the treaty, said—"With regard to Mr. Cobden, speaking as I do at a time when every angry passion has passed away, I cannot help expressing our obligations to him for the labours he has at no small personal sacrifice bestowed upon a measure, which he, not the least among the apostles of free trade, believes to be one of the most memorable triumphs free trade has ever achieved. Rare is the privilege of any man, who, having fourteen years ago rendered to his country one signal and splendid service, now again, within the same brief span of life, decorated neither by rank nor title, bearing no mark to distinguish him from the people whom he loves, has been permitted to perform another great and memorable service to his sovereign and to his country." Mr. Cobden possessed conversational powers of the highest kind. Unselfish in his private capacity, as his public career was of stainless purity, posterity will regard him as one of the noblest specimens of the statesman and patriot.

Mr. Cobden died in London of bronchitis, April 2nd, 1865. For his successful negotiation of the French treaty, although far from being a rich man, he refused any official acknowledgment; and in the same spirit, his widow declined to accept a pension of 1500*l.* per annum, which the government offered her. Mr. Cobden has left a family of five daughters; his only son, a very promising young man, having died several years before him.—F. E.

COCCEIUS, NERVA. See NERVA.

COCCEIUS or COCK, JOHN, an eminent biblical scholar, whose opinions respecting the rules of scriptural interpretation gave rise to much controversy in the Netherlands during the latter part of the seventeenth century, was born at Bremen in 1603, and died professor of theology at Leyden in 1669. His complete works were published at Amsterdam in 1673-1675.

COCCEJI, HEINRICH FREIHERR VON, an eminent German juriconsult, was born at Bremen, 24th March, 1644, studied at Leyden and in England, and was successively professor of jurisprudence in the universities of Heidelberg, Utrecht, and Frankfurt-on-the-Oder. In 1712 he was sent on an extraordinary mission to the Hague by King Frederick I., and after his return appointed privy councillor. He died at Berlin, 18th August, 1719. His principal works are—"Juris publici prudentia;" "Anatomia Juris Gentium;" "Exercitationes Curiosæ."—K. E.

COCCEJI, SAMUEL FREIHERR VON, the youngest son of the above, was born at Heidelberg in 1679, and like his father devoted himself to the study of law. By degrees he attained to the highest office in the Prussian service, and in 1746 was even made high chancellor of the kingdom. He was the great reformer of the administration of justice in Prussia. Overwhelming as the duties of his offices must have been, he yet found leisure for literary labours. We mention his "Codex Fridericianus, 1747-50; his "Corpus Juris Fridericianum," 1749-52; his "Jus Civile Controversum" (new edition by Emminghaus); and his introduction to a new edition of his father's Grotius Illustratus—all of them works which are still held in the highest esteem. He died at Berlin 22nd October, 1755.—K. E.

COCCHI, ANTONIO, an Italian physician of high repute for learning and professional skill, who visited this country on an invitation from the earl of Huntingdon, made the acquaintance

of Newton, Mead, and Clarke, and was elected a member of the Royal Society. He resided latterly at Florence, where he was professor of anatomy, and court antiquary. He was born in 1695, and died in 1758.—J. S., G.

**COCCIA, CARLO**, a musician, was born at Naples, April, 1789; the date of his death is uncertain. His father, Nicolo Coccia, was a distinguished violinist; he desired his son to prosecute the study of architecture, but the boy's fondness for music, and his fine soprano voice, induced the relinquishment of the paternal plan, and young Carlo adopted his favourite art as a profession. He sang, as a boy, in some of the Neapolitan churches; and, before the age of thirteen, produced some compositions of considerable extent. He then entered the conservatorio, where he became the pupil of Fenaroli and of Paesiello, the latter of whom took especial interest in him, which he proved, not only by the careful development of his talent, but by obtaining for him opportunities to exercise it. On the recommendation of this famous musician, Coccia was engaged as teacher in the families of the chief nobility, and was appointed accompanist at the court concerts of Joseph Bonaparte, then king of Naples. It was through Paesiello's influence, also, that he produced his first dramatic work, an opera buffa, given at Rome in 1808; the non-success of which, far from discouraging his friend, induced him to exert himself the more to procure Coccia a second trial. At Florence he was more fortunate, and the success he there obtained was the opening of a career of rapid and extensive popularity. For some time he wrote one, two, or three operas every year, and these he composed with remarkable facility—an example of which was the entire completion of "Donna Caritea" in the interval of six days. In 1820 he went to Lisbon, where, during the next three years, he produced several works. He came to London as music director of the King's theatre in the autumn of 1823. Here he was appointed one of the professors of composition in the royal academy of music, at the opening of the institution. In London he was held in great esteem as a teacher of singing, and he obtained great credit for the discharge of his theatrical duties. He had now means of becoming acquainted with the severer style of music, which Italy had not afforded; and this was not without effect upon the character of his writings. He printed in London many detached vocal pieces, but produced no new opera until 1827, when "Maria Stuarda" was brought out with success. At the close of this season Coccia returned to Naples, and remained from that time in Italy, save during a visit to London of a few months in 1833. He continued to write operas for the several Italian capitals, but with more care, and consequently less rapidity than before. In 1836 he was instituted inspector of singing in the philharmonic academy of Turin.—G. A. M.

**COCHIN, CHARLES NICHOLAS**, called the Elder, a French painter and engraver, born at Paris in 1670. He abandoned painting at the age of nineteen, and devoted himself exclusively to engraving. He engraved many plates after Watteau and Lancret, and scripture subjects after Raffaele, Le Moine, Bertin, Coypel, and others. His drawing was neat, and his execution spirited. He died in 1754.—**CHARLES NICHOLAS**, was his son, and is called the Younger. He was born in Paris in 1715. He produced several literary works relating to the fine arts. He executed upwards of fifteen hundred plates, remarkable for the grace of their design and the neatness of their execution. Among some of the portraits he completed are the heads of Charles Sackville, earl of Dorset, David Garrick, the Prince De Turenne, Restout the painter, Bouchardon the sculptor, &c. He died at Paris in 1790.—W. T.

**COCHLAÆUS, JOHN**, a divine of the Romish church, was a vehement opponent of Luther, Bucer, and Melancthon; born in 1479, near Nürnberg; died at Breslau in 1552. Among his works is one, the title of which betrays the pompous and blustering character of the author—"The Broom of Johannes Cochlaeus for sweeping down the Cobwebs of Morrison." It is a reply to Dr. R. Morrison's refutation of the tract published by Cochlaeus against the marriage of Henry VIII.—J. S., G.

**COCHRANE**: a noble Scottish family of great antiquity, which derived its surname from the barony of Cochrane, in the county of Renfrew. About the close of the sixteenth century the family terminated in an heiress, who married a younger son of Blair of Blair.—Her second son, **SIR WILLIAM COCHRANE** of Cowden, was elevated to the peerage in 1647 as Baron Cochrane of Dun-

donald, and in 1669 was advanced to the dignity of Earl of Dundonald.—(See **DUNDONALD**.)

**COCHRANE, SIR JOHN**, of Ochiltree, second son of this nobleman, was a distinguished patriot and presbyterian, and was the bosom friend of Algernon Sidney, Lord William Russell, and other eminent English liberals. He was in consequence deeply implicated in their plans for the exclusion of the duke of York from the throne. On the discovery of their designs, Sir John Cochrane, along with Sir Patrick Hume and other Scottish patriots, fled to Holland, where they remained until the death of Charles II. in 1685, and the consequent accession to the throne of the duke of York. Sir John then took part in the descent of the earl of Argyle upon Scotland, and by his wrongheadedness and jealousy of the earl contributed not a little to the ruin of that ill-fated expedition. On the final dispersion of the insurgents, Sir John was betrayed by his uncle's wife, tried, and condemned to death. His daughter Grizel, a young lady of eighteen, disguised in male attire, near the borders robbed the postman of the mail bags containing the warrant for her father's execution, and thus afforded time for her grandfather, the old earl of Dundonald, to open a negotiation with Father Petre, the king's confessor, and by a bribe of £5000 to procure his son's pardon.—J. T.

**COCHRANE, SIR ALEXANDER FORRESTER INGLIS, G.C.B.**, a distinguished British admiral, son of Thomas, eighth earl of Dundonald, was born in 1758. He entered the naval service at an early age; and after passing through the intermediate steps with distinction, obtained the rank of post-captain in 1782. At the commencement of the war with France he was appointed to the command of the *Hind*, and then of the *Thetis*, and displayed such activity and courage, that in 1793 he captured eight French privateers. In 1796, aided by the *Hussar* frigate, he attacked five French ships in Chesapeake bay, and captured one of the largest of them, the rest having made their escape after they had struck. In 1799 he was appointed to the *Ajax* of 80 guns, and having joined the fleet in the Mediterranean under Lord Keith, appointed to convoy Sir Ralph Abercromby's expedition to Egypt, he was appointed to superintend the landing of the British troops—a service which he performed with admirable skill and success. In 1804 he was elected member of parliament for the Dunfermline burghs, but lost his seat at the general election in 1806. On the resumption of hostilities with France, after the brief peace of Amiens, Captain Cochrane was appointed to the command of the *Northumberland* 74; and in the following year he was made rear-admiral, and pursued to the West Indies and back a French squadron which had contrived to escape from the blockaded port of Rochefort. He then joined Lord Nelson in his famous pursuit of the combined fleets of France and Spain. In 1806, along with Sir John Duckworth, he pursued and overtook a French fleet sent to relieve the town of St. Domingo; and after a severe action, captured the whole except two frigates and a corvette. For this important service Admiral Cochrane received the thanks of both houses of parliament, together with the freedom of the city of London, and a sword of the value of a hundred guineas, and was created a knight of the bath. He subsequently assisted in the reduction of the West Indian islands belonging to Denmark, and of Martinique and Guadaloupe, and in 1810 was appointed governor of this latter island and its dependencies. When war broke out with the United States in 1813, Sir Alexander was appointed to the command of the fleet on the North American station, and effectually blockaded the enemy's ports. In 1819 he was raised to the rank of admiral of the blue; and from 1821 to 1824 held the office of commander-in-chief at Plymouth. Admiral Cochrane died suddenly at Paris on the 26th of January, 1832.—J. T.

**COCHRANE, JOHN DUNDAS**, a British naval officer, surnamed "the pedestrian traveller," was the nephew of Admiral Sir Alexander Cochrane, and was born in 1780. At the age of ten he went to sea, and served with distinction against the French in America and in the East Indies. Resolved to make the tour of the globe on foot, he quitted London in 1820, and in the space of three years and two months traversed France, Germany, Finland, Russia Proper, and Siberia, sailed down the Lena as far as Yakoutik, thence travelled in a sledge drawn by dogs to Nijnei-Kolymek, traversed the country of the Tchouktchis as far as Oschotsk, and visited Kamtschatka, where he married a young lady of the country. He suffered dreadful hardships during this journey, and at one period travelled four hundred miles without meeting a living creature. His restless disposition did not allow

him to remain long at home; and in 1823 he embarked for South America, contemplating a journey on foot through the whole of that country. He died at Valencia, in the state of Columbia, on the 12th of August, 1825. His "Narrative of a Pedestrian Journey through Russia and Siberian Tartary, Frontier of China, to the Frozen Sea and Kamtschatka," published in 1824, contains many very curious and interesting details.—J. T.

\* COCHRANE, SIR THOMAS-JOHN, rear-admiral, son of Sir Alexander, was born in 1789. He distinguished himself in the American war under the command of his father; was for some years governor of Newfoundland; in 1837 was elected member for Ipswich; in 1844 was appointed commander-in-chief on the East Indian station, and undertook a successful expedition against the pirates on the Indian Archipelago; and in 1846 seized the capital of the sultan of Borneo. Sir Thomas was raised to the rank of rear-admiral in 1850.—J. T.

\* COCHRANE, ALEXANDER DUNDAS ROSS WISHART BAILLIE, son of Sir Thomas-John, was born in 1813. He has been successively member of parliament for Bridport, Lanarkshire, and Honiton. He is the author of two novels called "Lucille Belmont" and "Ernest Vane;" and a political work entitled "Young Italy," in which he espouses the cause of the governments of the peninsula in opposition to the liberal party.

COCHRAN, WILLIAM: this painter was born in 1738 at Strathern in Clydesdale. He was placed in the school of design at Glasgow, founded by the two famous painters, Robert and Andrew Foulis; and after studying there for some years, proceeded to Italy in 1761, and for five years received instruction from Gavin Hamilton. He then returned to Glasgow and worked hard for the support of his aged mother and himself. He painted portraits in oil and miniature, which obtained repute for their accuracy of likeness, and general correctness of drawing and colour. Some of his early works of more ambitious character are to be found in Glasgow, viz., "Dædalus and Icarus," and "Diana and Endymion." These were painted during his sojourn at Rome. From a remarkable feeling of diffidence or humility he would never send his works for exhibition at any of the public galleries, or, indeed, affix his name to them. He died at Glasgow in 1785, and was interred in the cathedral there. The inscription on his monument sums up his merits thus—"The works of his pencil and this marble bear record of an eminent artist and a virtuous man."—W. T.

COCKBURN, CATHERINE, the authoress of a number of plays and political and moral treatises which attained considerable celebrity in their day, was born in London in 1679. She was the daughter of a Scotch gentleman named Trotter, who held a naval command in the reign of Charles II.; and in 1708 she married a Scotch theologian of the name of Cockburn. She published three tragedies named "Agnes de Castro;" "Fatal Friendship;" "Gustavus Erikson, king of Sweden;" and a comedy entitled "Love at a Loss." She also wrote a "Discourse concerning a Guide in Controversy;" "A Letter to Dr. Holdsworth concerning the Resurrection of the same body;" "A defence of Locke's Essay on the Human Understanding;" and a "Vindication of Locke's Christian principles," in reply to Dr. Holdsworth; "Remarks upon Rutherford's Essay on the nature and obligations of Virtue," &c.—J. T.

COCKBURN, HENRY, a distinguished Scotch lawyer and judge, was born in 1779, and was the son of Archibald Cockburn, one of the barons of the exchequer in Scotland. He was educated at the high school of Edinburgh, which then numbered amongst its pupils, Brougham, Scott, Jeffrey, and Horner. His education was completed at the university of Edinburgh, and in the far-famed Speculative Society, in which his school-fellows mentioned above, along with Lord Henry Petty (now marquis of Lansdowne), James Moncrieff, and Charles and Robert Grant, took an active part in the discussions. Cockburn was called to the bar in 1800, and although he was nephew to Lord Melville the great dispenser of the court patronage in Scotland, and all his family connections were staunch Tories, the young advocate adopted at the outset the liberal opinions to which he adhered through life. Notwithstanding that he was frowned on by the men in power, Cockburn made steady progress in his profession; he became peculiarly distinguished for eloquence and skill in his addresses to juries, and though the Scotch bar was then crowded with formidable competitors, he ultimately won his way into the foremost rank as a popular pleader. As a lawyer, he was inferior to several of his contemporaries, but as

an orator, he stood at the very head of his profession. His powers of conversation also were of a high and rare order. He was gifted both with a lively fancy and with a quaint and pungent wit. His language was pure Scotch, such as was spoken by the higher classes in Scotland towards the close of last century, and he has justly been pronounced the model of a high-bred Scottish gentleman of the last distinctive school which his country produced. He was known to and heartily liked by all classes all over Scotland. Associated as he was in the most intimate personal friendship with the leading Edinburgh Whigs, he took an active part in promoting the reform of our legal and political institutions; and when the liberal party obtained office in 1830, Cockburn became solicitor-general, while his friend Francis Jeffrey was appointed lord-advocate. In 1834 he was promoted to the bench as one of the lords of session, and three years later received the additional appointment of a lord-commissioner of justiciary. As a judge he was painstaking, acute, judicious, and cautious, and his clear enunciation of legal principles, the soundness of his judgment, and his skill in the detection of sophistry gained him a high reputation in the criminal court; but on questions of feudal law his opinion did not carry much weight. He was universally esteemed and beloved as a relative, a friend, and a citizen. He died after a very brief illness on 26th April, 1854, while he was on circuit at Ayr. Lord Cockburn was an early contributor to the *Edinburgh Review*; but his first separate work was his "Life of Lord Jeffrey," in 2 vols. 8vo, published in 1852, a work remarkable for its genial, humorous, and picturesque writing. Since his death there has been published a volume entitled "Memorials of his time," containing an account of the distinguished men and important events that have marked the progress of Scotland, and especially of Edinburgh, during his day. It is a most delightful book, filled with inimitable sketches of character and manners.—J. T.

COCKBURN, JOHN, of Ormiston, a celebrated Scottish agriculturist, was born in the latter part of the seventeenth century, and was the son of Lord-justice-clerk Cockburn and Susan, the daughter of John, fourth earl of Haddington. John Cockburn was a member of the last Scottish parliament, and was the first representative of East Lothian in the parliament of Great Britain. At one period he also held the office of lord of the admiralty. It was not, however, the public, but the private career of the "father of Scottish husbandry" which has perpetuated his memory. He granted long leases to his tenants, introduced on his estate the culture of turnips, rape, and clover, brought down skilful agriculturists from England, and sent up thither the sons of his tenants to study the modes of cultivation practised in the south. He induced an eminent Irish manufacturer to set up a linen manufactory at Ormiston, and a bleachfield—the second establishment of the kind in Scotland—and brought over from Holland some workmen to give instruction in the art of bleaching. Potatoes were raised on his estate so early as 1734, and are said to have been introduced by the workmen of the Irish linen manufacturer. The Ormiston Agricultural Society, which was instituted by Mr. Cockburn, and comprised nearly all the ablest men in Scotland at that period, was of great service in promoting improvements in the rural economy of the kingdom. This patriotic and public-spirited gentleman died in 1758.—J. T.

COCKBURN, MRS., the authoress of the modern version of the celebrated Scotch song "The Flowers of the Forest," and various other poetical pieces of great merit, was the daughter of Rutherford of Fairmile in Selkirkshire. She married in 1731 Patrick Cockburn, advocate, younger brother of Cockburn of Ormiston, the father of Scottish agriculture, and died in Edinburgh in 1794 at an advanced age. She was distinguished for her wit and conversational powers, as well as for her poetical abilities. Sir Walter Scott, who knew her well, says—"She maintained the rank in the society of Edinburgh which Frenchwomen of talent usually do in that of Paris; and her little parlour used to assemble a very distinguished and accomplished circle, among whom David Hume, John Home, Lord Monboddo, and many other men of name were frequently to be found. Her evening parties were very frequent, and included society distinguished both for rank and talents."—J. T.

COCKBURN, PATRICK, a Scottish divine and Oriental scholar, was a native of Langton in Berwickshire. He studied at Paris, and held for a considerable time the professorship of Oriental languages in the university of that city. He ultimately

returned to Scotland, embraced the reformed faith, and became first protestant minister of Haddington, and then professor of Oriental languages in the university of St. Andrews, where he died in 1559.—J. T.

COCKER, EDWARD, once a very familiar or rather household name in England. He was born about 1631; professionally an engraver, and a teacher of writing and arithmetic. He died about the year 1675. Taking advantage of his skill as an engraver, he is said to have been the first who published engraved *copy-lines*, or exercises in penmanship. Odd, indeed, was their subject matter, viz., descriptions of hell-fire and portraits of fiends! We have surely got a little way on in practical pedagogy since the days of Cocker? But his celebrated work was the one on arithmetic—the first truly commercial and practical treatise. It was not published by Cocker himself, but by one John Hawkins, who, on finding its great success, afterwards forged others bearing the name of Cocker.—Persons, we suppose, are still living who remember Cocker lying on the desks of their schoolmasters, alongside of Dillworth and others as venerable. But the day of these incomparable worthies has passed, and their place been usurped by Gray and Melrose, and a host of very microscopic modern men. *Sic transit gloria!*—J. P. N.

COCKERELL, CHARLES ROBERT, R.A., architect, was born in 1788. After receiving the usual professional training, he spent several years in a careful study of the famous architectural remains in Asia Minor, Athens, Rome, Sicily, &c., and in 1811–12 assisted in excavating the ruins of the temple of Jupiter Ægina and of Apollo at Phygaleia. In 1829 he was elected associate of the Royal Academy; R.A. in 1836; and in 1840 he was appointed professor of architecture in the room of Mr. Wilkins. His lectures contain much valuable information respecting the history and theory of architecture, and sustain his well-earned reputation for ability and learning. He was one of the eight foreign associates of the Academy, of the Institute of France, a member of the academies of St. Luke, Rome, of Munich, &c., and a D.C.L. of Oxford. He had a decided predilection for the classic style of architecture, though he latterly executed several designs in Gothic. The principal structures erected by him are the New Library at Cambridge, the University galleries at Oxford, the Philosophical Institution at Bristol, the College at Lampeter, the Sun Fire Office in London, Westminster Fire Office in the Strand, and the various alterations in the Bank of England. He died September 17, 1863.

COCKERILL, WILLIAM, the celebrated ironfounder in the Netherlands, was a native of Lancashire, and first gained his living by making "roving billies," or flying shuttles. His mechanical genius, however, was of a very superior order, and he could with his own hands make models of any machine of modern invention for spinning. When the Empress Catherine of Russia wished to procure a few artisans from England to promote the progress of art in her own dominions, William Cockerill was recommended to her notice, and was accordingly invited to St. Petersburg, where he met with every encouragement from the empress. But her death, only two years after, blasted his prospects. Her insane successor, Paul, put Cockerill in prison, because he was unable to complete a model in a certain fixed time. He contrived to make his escape, however, and went to Sweden, where he was for some time employed by the government in the construction of the locks of a public canal. Having heard of the want of proper machinery in manufactures at Liege and Verviers, he proceeded to Holland, and commenced in 1807 an establishment in the Pays de Liege for the fabrication of machinery and steam-engines. In 1816 he established at Seraing on the Meuse the greatest iron foundry on the continent, or perhaps in the world. Not less than four thousand persons are employed in this establishment, in which the king of Holland was at one time a partner, having invested in it the sum of one hundred thousand pounds. William Cockerill retired from business a millionaire, and died at Brussels at an advanced age.—His son JOHN, born in 1799; died in 1840, who succeeded him in the management of the great national concern at Seraing, was a very remarkable man. His manufacturing and financial talents were of the very highest order, and entitle him to a conspicuous place in the annals of modern industry.—J. T.

COELES, HORATIUS, a Roman warrior, celebrated for his heroic conduct in defending the city against the army of Porsenna, an Etrurian king who invaded Rome with the view of establishing the Tarquini on the throne. With the assistance

of two others he is said to have kept the whole invading army at bay, while the bridge over the Tiber, which was the only means of communication with the city, was being demolished by the Romans; and, on this being accomplished, it is related that he plunged into the river with all his armour, and swam safely across to his friends. The story of Coeles is narrated by Livy; but little dependence can be placed on its truth.—W. M.

CODAGORA, VIVIANO: this painter flourished about 1650. He studied in the Roman academy, and was distinguished for his views of ancient Rome, and perspective composition. Lanzi designates Codagora the Vitruvius of his class of painters. Many of his best pictures are at Naples. He is often confounded with Ottavio Viviani of Brescia.—W. T.

CODDINGTON, WILLIAM, a principal founder, and the first governor of the settlement at Rhode Island in America, was a native of Lincolnshire, England. He arrived at Salem, 12th June, 1630, in the *Arabella*. The settlement at Rhode Island was begun 7th March, 1638, when Coddington, with eighteen others, affixed their names to a social compact, which recognized the laws of Christ as the laws of their new society. He was at the same time chosen judge of the colony, and for nearly a year was its only magistrate, when three others were associated with him with the title of elders. In 1640 the style of the first magistrate was changed to governor, and the others were called assistants. He continued to be governor till 1645, when the patent was received which united Rhode Island with Providence Plantations, in one jurisdiction. In January, 1649, he sailed for England. At the end of a year or a little more he returned, bearing a commission from the council of state constituting him governor for life of Rhode Island, apart from the other settlements of the colony. This was in effect a revocation of the patent, and being not acceptable to the people, was imperfectly carried into effect. It was annulled by the council in 1652, through the representations of Dr. John Clarke and Roger Williams, who were sent to England for that purpose. From this period Mr. Coddington withdrew from public affairs, but later in life he was an assistant, and in 1674–75, he was again chosen governor. He died in 1678.—F. B.

CODINUS, GEORGIUS: the date of Codinus' birth is not known; he died about 1534. Two works of his are preserved of considerable interest to the students of Byzantine history, viz., "De Officialibus palatii Constantinopolitani," and "Origines Constantinopolitanæ." The authorship of the latter work is not free from doubt.—J. A., D.

CODRINGTON, CHRISTOPHER, was born at Barbadoes in 1668, and died there in 1710. After completing his studies at Oxford, he entered the military service, and took part in the campaigns in Flanders under King William III. He was rewarded for his distinguished services by being nominated governor of the Leeward islands after the peace of Ryswick. He bequeathed a portion of his immense fortune to the Society for the Propagation of the Gospel, on condition that it should establish in Barbadoes a college for teaching medicine, surgery, and theology. He also left a legacy of ten thousand pounds, and his library, to the college of All Souls, Oxford. Governor Codrington was the author of several poems in the *Musæ Anglicanæ*.—J. T.

CODRINGTON, SIR EDWARD, G.C.B., a distinguished British admiral, was born in 1770. He entered the navy in 1783, and acted as lieutenant of the *Queen Charlotte*, Lord Howe's flagship, in the famous conflict with the French on the 1st of June, 1794. He rose steadily in the service; commanded the *Orion* at the battle of Trafalgar in 1805; accompanied the expedition to Walcheren in 1808–9; served on the coast of Spain in 1810–11; in North America in 1814, and took part in the attack on New Orleans. He was promoted to the rank of vice-admiral in 1821. In 1826 he was appointed commander-in-chief of the Mediterranean squadron, and took the leading part in the battle of Navarino on the 20th of October, 1827, in which the Turkish fleet was destroyed by the combined squadrons of Great Britain, Russia, and France. The British government, however, regarded this victory as an "untoward event," and Sir Edward was recalled in April, 1828. He afterwards commanded a squadron of observation in the channel in 1831, attained the full rank of admiral in 1837, and from 1839 to 1842 was commander-in-chief at Portsmouth. In 1832 he was elected member of parliament for Devonport, and was re-elected both in 1835 and 1837. He was a consistent supporter of liberal measures. Sir Edward died in 1851, aged eighty-one.—J. T.

**CODRINGTON, ROBERT**, an English writer, born of an old family in Gloucestershire in 1602. He was educated at Oxford, and died of the plague in 1665. He wrote "The Life and Death of Robert, Earl of Essex;" "The Life of Æsop;" and translated Du Moulin, on the Knowledge of God, Justin, Quintus Curtius, the prophecies of the German prophets, &c.—R. M., A.

\* **CODRINGTON, SIR WILLIAM JOHN**, K.C.B., eldest surviving son of Sir Edward, was born in 1800. He entered the army in 1821, and rose through the intervening grades until he became lieutenant-colonel of the Coldstream Guards in 1836, and obtained the rank of major-general in 1854, without, however, having been engaged in any actual war service. At the commencement of the Russian war he accompanied, as a spectator, the British army sent out to Turkey, immediately before the sailing of the Crimean expedition, and was appointed by Lord Raglan to the command of the first brigade of the light division, vacant by the promotion of General Airey to the office of quarter-master general to the army. He led his brigade with great gallantry at the battle of the Alma, and was the first to give notice of the approach of the Russians at Inkermann. Lord Raglan noticed his conspicuous bravery during the battle, and appointed him to command the light division when Sir George Brown was obliged to leave for Malta, in consequence of a wound received at Inkermann. Sir William led the unsuccessful attack on the Redan, at the capture of Sebastopol, 8th September, 1855; and after the resignation of General Simpson, was appointed commander-in-chief of the British army in the Crimea. On his return home at the close of the war, he was elected M.P. for Greenwich.—J. T.

**CODRUS**, the seventeenth and last king of Athens, was the son of Melanthus, and reigned from 1123 to 1095 B.C.

**COECK OR KOECK**. See **KOECK**.

**COELLO, CLAUDIO**, an eminent Spanish painter, born at Madrid early in the seventeenth century. In 1680 he was appointed cabinet painter to Philip IV., and employed in the Escorial.—W. T.

**COELN, WILHELM VON**, or **WILLIAM OF COLOGNE**, an eminent old German painter of the latter part of the fourteenth century, called also **MEISTER WILHELM**. He is supposed to have been born at Herle, a village near Cologne. As early as 1370 he was certainly settled in Cologne with his wife, Jutta; and a passage in the annals of the dominicans of Frankfort testifies to his extraordinary repute. Many paintings in distemper of the old Cologne school are credited to Coeln, but the evidence of their authenticity is often only conjectural. Other works are attributed to him, equally with his pupil, Meister Stephan, of whom, unfortunately, no reliable records are preserved. Of these pictures is the so-called Dom-bild, or cathedral picture, formerly the altarpiece of the chapel of the Rath-haus of Cologne, but now in the cathedral. The best accounts of both masters are to be found in Dr. Kugler's history of painting, part ii., and in Michiel's *Etudes sur l'Allemagne*. The disputed pictures are remarkable for simple beauty of colour, elaborate execution, Gothic manner of design, and extraordinary resemblance to the school of Van Eyck, without its accuracy of drawing.—W. T.

**COËN, CHANANEL CHAYIM**, of Reggio, died at Florence in 1834, a learned Hebraist whose activity was especially directed towards the religious education of the Italian Jews. He wrote a vocabulary in Hebrew and Italian; a treatise on the language of the Mishna; an account of the heathen deities mentioned in the Hebrew scriptures; a collection of Hebrew synonyms; moral dissertations for the use of young people; and valuable compendia on the poetic art of the Hebrews.—T. T.

**COEN, JAON PIETERZON**, a Dutch East India governor, was born at Hoorn in 1587. He received a commercial education at Rome, went to India in 1607, and returned in 1611. In the following year he was sent out with two ships under his command, and acquitted himself so well, that in 1613 he received the entire management of the Indian trade, with the title of director-general—an office that was created expressly in his favour. He was chosen president of Bantam, and in 1619 founded the town of Batavia, which he declared the capital of the Dutch East India settlement. In 1629 the emperor of Java, jealous of the rising power of the Dutch, made an unsuccessful attack on the capital, soon after which event Coen died.

**COËTLOGON, JEAN BAPTISTE FELICITÉ**, Count de, a poet, born at Versailles in August, 1773. His mother, having accom-

panied her royal highness the countess d'Artois in her exile, took her son with her, and so imbued his mind with the principles of loyalty that his poetry, when he began to write, derived its inspiration from the same source. His odes are all devoted to the royal family. He has written a poem on Bayard, the knight *sans peur et sans reproche*, and even aspired to the high theme of David, and with success enough to justify the council of public instruction bestowing their approbation upon the court bard. He was appointed governor of the royal chateau of Rambouillet. He died in September, 1827.—J. F. C.

**COEUR, JACQUES**, a celebrated French merchant, who was born about the end of the fourteenth century, and took a distinguished part in the political history of Charles VII. At an early age he made choice of a mercantile career, and by his remarkable ingenuity, prudence, and perseverance, soon acquired an immense fortune. He was appointed master of the mint to Charles VII., and was a special favourite of that monarch, whom he assisted with large sums of money to carry on the war for the expulsion of the English. A plot was formed against him in 1450 by Antoine de Chabannes and others, at whose suggestion he was arrested on the charge of having poisoned Agnes Sorel, the king's mistress, and was cast into prison, where he was long confined, tortured, and shamefully treated. Charles, with base ingratitude, left his faithful servant in the hands of his enemies, and even connived at their violation of all law and justice in their treatment of him. In 1453 Jacques Coeur was pronounced guilty, and condemned to pay a fine of four millions of crowns, to have the rest of his property confiscated to the king, and to be imprisoned till the fine was paid, and then to be banished the kingdom. The writers of that age are unanimously of opinion that his riches were his only crime, and "the vultures of the court" shared among them the plunder of their victim. After his liberation in 1455, by the dexterity and daring of one of his agents, Jacques was conveyed to Rome, where he was cordially welcomed by Pope Nicholas V. In the following year he was appointed captain-general of the church against the infidels, and was sent with a fleet to the assistance of the Greek isles, then menaced by the Turks. He was seized with an illness at Chios, and died there in 1456.—J. T.

**COFFEY, CHARLES**, an Irish dramatic author, born at the end of the seventeenth century. He wrote nine dramatic pieces which were all successful—one, "The Devil to Pay," decidedly so, as it has kept the stage ever since, and was the foundation of a successful modern ballet, *Diable a Quatre*. He died on the 13th May, 1745.—J. F. W.

**COFFIN, CHARLES**, born at Buzancy in 1676. Having risen to the distinction of rector of the university of France he signalized his position by a decree establishing gratuitous instruction in the colleges. After three years' occupation of this high post, he resumed his former station of principal of the college of Beauvais. He wrote Latin verses with ease and grace, in which language Coffin composed some hymns for the service of the church. While in one of his Horatian moods he wrote a Latin ode in praise of champagne wine, which so pleased some classic growers of the grape, that they agreed to send the poet a hamper every year. He died in 1749.—J. F. C.

**COFFIN, SIR ISAAC**, Bart., a brave English naval officer, was born in 1760. He entered the naval service in 1773, obtained a lieutenantancy in 1778, and was made a commander in 1781. He shared in a good deal of active service on the Halifax station on the coast of America, and on board the *Barfleur*, under Sir Samuel Hood. Disgusted at some shabby treatment which he had received from the admiralty, Captain Coffin in 1788 transferred his services to the Flemish patriots, but he soon returned to England, and in 1790 obtained the command of the *Alligator*, of twenty-eight guns. On the breaking out of the war with France, Captain Coffin was appointed to the *Melampus* frigate. He was for some time resident commissioner of Corsica, then the superintendent of the naval establishment at Lisbon, and in 1798 he was intrusted with the charge of the arsenal at Port Mahon in Minorca. In 1804 he was promoted to the rank of rear-admiral, was soon after created a baronet, and became a full admiral in 1814. Sir Isaac was for a number of years member of parliament for the borough of Hechester, and was a great favourite in the house, on account of his *bonhomme*, and the facetious remarks with which he enlivened the debates. He died in 1841.—J. T.

**COFFINHAL, JEAN BAPTISTE**, one of the most sanguinary

of the French revolutionists, was born in 1754. He was originally a student of medicine, but abandoned that pursuit for the study of the law. On the breaking out of the Revolution he threw himself headlong into the current, and by his energy, violence, and great physical power, contributed greatly to direct the popular movements. He was executed 29th July, 1794.—J. T.

\* **COGALNICEANO, MICHEL**, one of the few representatives of the Rouman people in the world of letters, was born in 1806, and, adopting the profession of a teacher, obtained the professorship of natural history at Jassy. He left Wallachia in 1834, and travelled through Germany and part of France, in search of materials for his "History of Moldavia and Wallachia," published at Berlin in 1837, in French. Respecting the Tsiganis, or Bohemian slave population, their language and history, he has published some interesting memoirs. He was the founder of the *Etoile du Danube*, and when, on the establishment of the censorship, it ceased to appear at Jassy, he re-established it at Brussels, where it is still published in French. He also contributed to various other journals, and published a valuable collection of ancient chronicles, rescued from the recesses of monasteries. In 1857 M. Cogalniceano was elected deputy to the divan *ad hoc*, for Moldavia. He performed another signal service to his country by establishing a cloth factory at Niamgo, the sole one which Moldavia possesses.—F. M. W.

**COGAN, THOMAS**, an English physician and philosophical writer, was born in Northamptonshire in 1736. He was first the pastor of a presbyterian congregation at Amsterdam. He then studied medicine at Leyden, and returning to London in conjunction with Dr. Harris, founded the Royal Humane Society. He subsequently returned to Holland, where he remained until the breaking out of the French revolution compelled him to withdraw to England, where he died in 1818. He was a voluminous writer on scientific and philosophical subjects.—J. T.

**COGGESHALLE, RALPH**, an English historian and cistercian monk, was born in the middle of the twelfth century, and died about 1228. He wrote a "Chronicle of the Holy Land," which, together with his "Chronicon Anglicanum," and "Libellus de Motibus Anglicanis sub Johanne Rege," were published by the fathers Martenne and Durand in the 5th volume of the *Amplissima Collectio veterum Script., &c.*—R. M., A.

**COGSWELL, WILLIAM, D.D.**, an American clergyman and man of letters, born in Atkinson, New Hampshire, in 1787; graduated at Dartmouth college in 1811, and died in Gilmanton, New Hampshire, in 1850. After leaving college, he taught an academy for two years, then studied theology, and was settled over the south parish in Dedham, Massachusetts, for fourteen years. In June, 1829, he resigned his pastoral charge, and was appointed general agent of the American Education Society; and three years afterwards he was elected secretary and director of this society. He resigned his office in the education society in 1841, and became professor of history in Dartmouth college, and shortly afterwards president and professor of theology in the theological seminary at Gilmanton, New Hampshire. He left a considerable number of works on practical religion.—F. B.

**COHAUSEN, JOHANN HEINRICH**, a physician was born at Heidelberg in 1665, and died at Munster in 1750. Cohausen wrote two satirical pieces against the use of tobacco, the first of which was entitled "Dissertatio satyrica physico-medico-moralis de pica nasi, sive Tabaci sternutatorii moderno abusu et noxa." His "Hermippus Redivivus," which was translated into English, promulgates a new mode of prolonging life.—R. M., A.

**COHEN, ANNE JEAN PHILIPPE LOUIS**, born at Amersfoort in the Low Countries, October, 1781; became first librarian of the Bibliotheque Sainte Geneviève at Paris in 1824. His writings embrace romance, poetry, politics, and travels, and are of average merit. Foreign authors, and particularly English, are indebted to his pen for translations of their works into the French language. Besides translations from German and Swedish, he has rendered into French the novels of Maturin, Lady Morgan, Miss Porter, Bulwer, &c. He died in 1848.—J. F. C.

**COHEN, R'JEHUDA B. SOLOMON**, lived at Toledo in the thirteenth century. His work "Medrash Choehmah" (Investigation of Wisdom), still unedited, proves him to have been eminent as a philosopher and a mathematician, as a biblical scholar and a linguist. When quite a young man he corresponded with Frederick II., the illustrious emperor of Germany, on scientific subjects. He visited Tuscany and the Romagna, and there translated his work from the original Arabic into Hebrew, for

the benefit of the studious among his co-religionists in Italy. (Rossi, *Diz. Stor.*)—T. T.

**COHEN, JACOB SHALOM**, was born at Meseritz, 23d December, 1771, and died at Hamburg in 1846, after a life spent in incessant literary activity. He wrote both in German and Hebrew; but his fame rests especially on the beauty of his Hebrew compositions. He combined an astonishing versatility with indefatigable industry. For the benefit of youth he wrote "Mishle Agur" (Fables in Verse); a catechism of the Jewish religion, "Chinuch Amunah;" a practical Hebrew grammar, "Thorath Lashon Ibrith;" he translated the whole of the Hebrew scriptures; composed Hebrew poems, and furnished the translation of them into German—"Matae Kedem al admath Zafon" (Eastern Plants on a Northern Soil); projected a history of the people of Israel from the Maccabees to the present time, in Hebrew, on the plan of Jost's German work (only the first volume, to the destruction of Jerusalem, is published); composed psalms on the life of David—"Mizmorim;" and attempted dramatic literature—"Amal va Thirzah, Naboth." His epic poem "Nir David" (The light of David), takes rank among the best productions of the neo-hebraic school. He was among the first to promote, through the medium of serials, the diffusion of general knowledge among those classes of his coreligionists whose reading had heretofore been too limited—"Achere Hameseef" (The Gleaner); "Bikure Ha-ittim" (The First Fruit of the Times). His memory is deservedly revered by all lovers of Hebrew literature.—T. T.

**COHEN, R' JOSEPH BEN JOSUA BEN MEIR**, a faithful historian and great physician, was born at Avignon in 1497, where his father had settled after the expulsion of the Jews from Spain. His family originally resided at Cuença, and some time at Hueto in Spain. When Joseph was five years old his father removed to Genoa, but in 1516 the family were again compelled to change their abode. They went to Novi. Here Joseph was married; but from 1538 to 1550 he again resided at Genoa, where he practised medicine, until, on the 2d of April of the last-named year, a decree of banishment against all the Jews of Genoa (dictated, he states, by the jealousy of the Genoese traders), involved him in new troubles. He carried his profession with him to Volteggio, and hence to Costeileto in Montferrat, where he seems to have ended his days about 1575, in long-sought peace. He has become famous in Hebrew literature by two historical works—"Dibre Ha-yamim le-Malche Zarfat u-Malche beth Otman Ha-tugar" (Annals of the Kings of France and of the House of Othman the Turk); and "Emek Ha-baca" (Valley of Baca or Weeping), a narrative of the sufferings of the Jews in the author's times.—T. T.

**COHEN-ATTHAR, ABOULMENY BEN ABOU NASR ISRAYLYN HAROUN**, an eminent Egyptian physician and writer on natural philosophy, born at Cairo about 1100. He was one of the best mathematicians of the Egyptian school; his reasoning is, however, totally at variance with mechanical ideas on any view of the problem to find the force which will support a body on an inclined plane. His principal work is entitled "Materia Medica," a rich mine of natural history, containing every Egyptian plant, and every insect and mineral, truthfully delineated after nature, with descriptive text in Arabic. The only copy which ever reached Europe is to be seen at the Bibliothèque Impériale de Paris, section des manuscrits arabes. Died in 1170.—CH. T.

**COHORN, MENNO**, Baron de, called the Dutch Vauban, was born of a family of Swedish extraction, at Leuwarden in Friesland in 1641. Inheriting from his father a decided taste for military studies, he joined the Dutch army at the age of sixteen. During the earlier part of his career as a soldier, he had little opportunity of engaging in actual service, and he appears to have devoted himself with ardour to the study of military engineering. When the war broke out in 1672 he took part in the defence of Maestricht; and the talent which he displayed there, together with his services in the battles of Senef, Cassel, St. Denis, and Fleurus, procured for him the rank of colonel. His ability as an engineer soon attracted the notice of government; and when peace was concluded, he was employed in repairing and completing the fortifications of the principal towns. In this he was actively engaged till the resumption of hostilities. In 1683 made his services necessary in the field. In all the subsequent campaigns he took a prominent part. At the siege of Namur in 1692, he found himself opposed by his great rival Vauban; and the professional skill of the two greatest engineers

of the age was exhausted in the attack and defence of the town. In the war of the Spanish succession, Cöhorn, now a lieutenant-general, resumed his duties with unabated vigour, and rendered material assistance to the cause of the allies by his success in directing the operations against Venloo, Buremonde, and Liege, and, in the following year, by the part which he took in the capture of Bonn. In the spring of 1704 he was seized with apoplexy, which ended in his death at the Hague on the 17th of March. Cöhorn was the author of various works on the science of military engineering, the most important of which is his "New Method of Fortification," published at Leuwarden in 1685, and afterwards frequently translated.—W. M.

COIGNET, GILES, called GILES OF ANTWERP. This painter was born at Antwerp in 1530, and studied under Antonio Palermo, then residing in that city. He visited Rome and Naples—painting many historical works in fresco and oil. He was admitted into the academy of Antwerp in 1561. The troubles of the time, under the prince of Parma, compelled Coignet to quit his native country, and take refuge in Holland, where he remained many years. He was successful rather in effect than in drawing—in finish, rather than accuracy. Some of his moonlight and candlelight subjects are very admirable. He finally settled at Hamburg, where he died in 1600.—W. T.

COIMBRA, DON PEDRO, Duke de, surnamed ALFARROBEIRA, son of John I., king of Portugal, and Philippa, daughter of John of Gaunt, duke of Lancaster, was born at Lisbon in 1392. After receiving a careful education at the court of his father, he was intrusted with the command of the Portuguese fleet in the first attack upon Ceuta; and subsequently held various commands of importance in the war in Africa. He spent several years in travelling over Europe and part of Asia; and on his return to Portugal devoted himself to scientific studies, till he was called upon in 1439 to assume the regency of the kingdom during the minority of his nephew, Alphonso V. He retained the office of regent with advantage to the state till 1446; but in that year, in consequence of the intrigues of the duke of Braganza, he was deposed by a summary decree of the cortes. Instigated by the duke of Braganza, the young king declared Coimbra a rebel, and marched against him at the head of an army. Don Pedro was at length forced to give battle, which he did on the 20th of May, 1449. He was himself among the first that fell. The common Portuguese account of his travels and adventures is fictitious.—W. M.

COITIER, VOLCHER, an eminent Dutch anatomist, born at Groningen in 1534. He prosecuted his professional studies at some of the most celebrated universities of France and Italy, and was a pupil of Fallopius, Eustachius, and Aranzi. In 1569 he was appointed physician to the town of Nürnberg, but resigned that office to become a physician in the French army. The researches of Coitier greatly promoted the progress of anatomical science, and especially in regard to the formation and growth of the bones in the fœtus, and the muscles of the nose.—J. T.

COITIER or COICTIER, JACQUES, physician to Louis XI. of France, was born in the first half of the fifteenth century. He exercised the most tyrannical influence over Louis, and extorted from his royal patient immense sums of money and donations of lands. He died about 1505.—J. T.

COKAYNE, SIR ASTON, an English poet, born at Elvaston in Derbyshire in 1608, and died in 1684. He was educated at Trinity college, Cambridge, and in 1632 travelled in France and Italy. Cokayne was happy in numbering among his friends such men as Donne, Massinger, Drayton, Randolph, Habington, Suckling, Sir William Dugdale, &c.; but he suffered severely during the civil war on account of his attachment to the cause of the king. His poems and plays, which are not of great merit, were printed and reprinted in 1658, and are now sought after chiefly as curiosities.—R. M., A.

COKE, SIR EDWARD, successively chief-justice of the common pleas and of the king's bench, has been considered for upwards of two centuries the highest authority on the municipal law of England. Notwithstanding the rapid obliteration of almost every trace of feudal precedents from our present system of jurisprudence, the "Institutes" and the "Reports" are to this day greatly venerated by the profession for their learning and accuracy. To form a right estimate of this eminent jurist, we shall view him as a member of the bar, the bench, and the senate. Edward Coke was born in the reign of Edward VI. on the 1st of February, 1551-52; and died under Charles I. on

the 3d of September, 1634. He was the only son of Robert Coke of Mileham in the county of Norfolk—a gentleman whose pedigree was traced by Camden to the reign of King John. When Edward was ten years old, his father, who was a benchet of Lincoln's inn, died in London, and was buried in the church of St. Andrew's, Holborn. After spending some years in the free grammar school at Norwich, he was admitted a pensioner of Trinity college, Cambridge, in September, 1567. Unlike Bacon, the great rival of his later years, who came to the same college a short time after him, and even then conceived the rude outline of a great creation, Coke neither indulged in philosophical speculation, nor emulated the varied accomplishments of a scholar. It was when he was admitted in 1572 to the congenial cloisters of the inner temple, that he felt morally and intellectually at home. In his law studies he was indefatigable. He went to bed at nine, and got up at three—in the winter lighting his own fire. Until the courts met at eight he read Braeton, Littleton, and the year-books. From eight till twelve he sat on the back benches in Westminster taking notes of the cases argued. After a short repast in the inner temple hall, he attended "readings" in the afternoon, and then resumed his private studies till five, or supper-time. After this he took part in the "moots" (always without notes), and before retiring for the night made up his common-place book. In consequence of his superior attainments, the usual period of study was abridged in his favour, and the benchers of the inner temple, as a mark of their high opinion of his legal knowledge, called him on the 30th of April, 1578. He was equally successful as a teacher. Two years after his call, the society of the inner temple appointed him reader to Lyon's inn. "His learned lectures so spread forth his fame that crowds of clients sued to him for counsel." The early popularity of Thomas Erskine, two hundred years from this date, is the only parallel to the rapid rise of Coke. But nothing can be more striking than the difference between these two eminent men on their first appearance as advocates. In Captain Baillie's case, Erskine delivered a bold impassioned harangue, and with his—"I will drag *him* to light"—struck the bar with terror, and brought confusion on the bench. In Lord Cromwell's action of *scan. mag.* against the Rev. Mr. Denny, the ease had gone fairly against the defendant, for whom Coke was retained as counsel. When all was thought lost, Coke, with an acuteness prophetic of his future distinction, ferretted out a misrecital in the declaration of the statute, moved in arrest of judgment, and obtained it. Shortly after this, he took a prominent part in one of the most celebrated cases ever argued in a British court, and succeeded in establishing the important rule in the law of real property, well known as the rule in Shelley's case. His great merits were now recognized by the public. In 1586 he was chosen recorder of Norwich. Five years after, Sergeant Fleetwood, who had been some time recorder of London, was pensioned off at £100 a year, to make room for Edward Coke. The same year, 1592, saw him solicitor-general, reader of the inner temple, and speaker of the house of commons. His lectures at the inner temple were very popular. He had delivered five out of seven on the statute of uses, when he was driven away by the plague from a class which numbered one hundred members of the society. Of these, nine benchers and forty members paid him the honour of escorting him on his way to Suffolk as far as Romford.

Coke owed every step in his promotion to his own talent. His practice was enormous: there was scarcely a single motion or argument before the court of king's bench in which he was not engaged. But he had no influence at court. When Sir Thomas Egerton was elevated to the seals, the earl of Essex stirred heaven and earth to oppose the promotion of Coke, and to secure the office of attorney-general to his favourite, Bacon. But Burleigh, with his practical sagacity, gave preference to the ablest lawyer, and, in the year 1594, Coke became attorney-general. The rivalry which the contest excited between these eminent men, gradually passed into animosity, that exhibited itself in the alternate reverses of their fortunes in undignified acts, until it finally subsided into implacable hate. The freeholders of Norfolk, proud of their countryman, returned him as their representative in 1593, as Coke himself states, without any solicitation or canvassing on his part.

In the annals of the English bar, the scurrility and vituperation of Coke—with one exception—have no parallel. But for his great intellect, and those virtues which grow like parasites

on the trunks of vice, our condemnation of Coke would be unqualified. In fierceness of demeanour he was more odious than Elizabeth's captains—in scholastic conceits more despicable than James's churchmen—in avarice more prurient than the ancient monks, and in bigotry not a whit less violent. His disposition was selfish, arrogant, and harsh. Lost in the acquisition of legal knowledge, and determined thereby to secure his own aggrandizement, he never was the centre of a genial friendship. As advocate he delighted in hectoring trembling criminals, and treating with rudeness his professional brethren. The lowest barrister in the Old Bailey, would this day blush to act the part of Coke in that altercation with Bacon in the court of exchequer. The violence of his manner contrasts painfully with the sustained dignity of the accomplished Raleigh, who—then on his trial for life—was thus addressed by Mr. Attorney—"Thou art a monster. Thou hast an English face and a Spanish heart. . . . All that he did was by thy instigation, thou viper: for I *thou* thee, thou traitor." In his pleadings, he sometimes indulged in quaint antithetical expressions, much to the delight of King James. To one of the jesuits he once said—"You do not watch and pray, but you watch to prey." "True repentance," he said on another occasion, "is indeed never too late, but late repentance is seldom found true." When James, jealous of his purchases, told him he had as much land as a subject ought to possess, Coke, who was then in treaty for the purchase of Castle Acre priory, returned this answer with much pleasantry—"Then, please your majesty, I will only add one *acre* more."

Nothing can be more painful than the tale of his domestic history. His first marriage took place on the 13th of August, 1582. He was then thirty-two, and rapidly rising at the bar. The lady was the daughter of J. Paston, Esq., of Huntingfield hall, Suffolk, who brought him a fortune of £30,000. She died in 1598, after leading a life, as we must charitably suppose, of comparative happiness. This "most beloved and most excellent wife" had not been in her grave many months, when the astute attorney commenced his treaty for a union with the Lady Elizabeth Hatton, granddaughter of Burleigh, now a young, beautiful, and wealthy widow. The formalities of wooing were dispensed with, and the requisitions of the canonical law were also overlooked; so that Archbishop Whitgift summoned the rector, Coke, Burleigh, and all, into the spiritual court, and only remitted the penalty, on the plea of Coke's ignorance of the law. They soon found grounds for domestic dissension. There was an utter discrepancy of taste and manners, as well as of age. Coke spent his days toiling in court and chambers, while his lady was performing in court masques, and complimented by Ben Jonson's verses. In 1617 it was reported that "the Lord Coke and his lady had great wars at the council table."

Though conjugal love may sometimes fail, there must be some unnaturalness of character, where parental affection is obliterated. The conduct of Coke towards his daughter, then a child of fourteen, though not without parallel in the low morality of that age, exhibits a venality, seldom if ever known at the present time. Now in his sixty-sixth year, and through his sturdy independence as a judge thrust out of royal favour, instead of retiring into private life, with the consciousness of his judicial integrity, he determined to sacrifice his child to secure his restoration to honour and office. His plan was to marry Frances to Sir John Villiers, Buckingham's brother. Lady Hatton (who had always refused to be called Lady Cook, as she spelt it) opposed the match. The child "voluntarily and deliberately protested that, of all men living, she could not have him." The mother, a high-handed woman, ran away with the daughter, and concealed her in a house of Lord Argyle's, near Hampton Court. Coke started off with his sons in pursuit, and, after breaking through several doors, dragged away the recusant daughter. A short time after he informs Buckingham that his daughter is quite in love with Villiers; which love on her part, however, exhibits itself in irrepressible sniffings and tears. Then follow negotiations about a settlement, shuffling on the part of the parent, hymeneal rejoicings, reception of the company by bride and bridegroom at their *couchée*, the elevation of Villiers to the peerage under the title of Viscount Parbeck, his desertion and flight to the continent, Lady Parbeck's frailty, and sentence to stand in a white sheet in the Savoy church, and her escape. The only redeeming passage in this affair is, that when the poor girl flew to Stoke for protection, she was kindly received in her degradation by her age-stricken father.

Leaving these domestic scenes, we shall now resume the history of Coke's public career. Having been fourteen years at the head of the bar, on the 30th of June, 1606, three years after receiving the honour of knighthood, he was made chief-justice of the common pleas. It is only as judge that we can contemplate the character of Coke with unmixed admiration. On the bench his conduct was independent and brave; in one or two instances worthy of Gascoigne and Fortescue. Though holding office *durante bene placito*, he ventured to excite the "great rage" of James, by telling his majesty, that he was not learned in the laws of England, and that it was by the law his majesty was protected in safety and peace. He opposed the high commissioner, resisted the claim of the king to sit and try causes, and pronounced an emphatic denial of the power of the crown to alter the law by "proclamations." Thus, by maintaining the prerogatives of the judicial office, and refusing to sanction the despotic pretensions of the king, he lost his lucrative office, and was removed in 1613 to the chief-justiceship of the king's bench. This mark of royal displeasure somewhat damped his courage. A short time after he gave a qualified support to "benevolences." In Peacham's case, after considerable grumbling against taking anticipatory opinions of the judges apart and in writing, this initial resistance ended in giving to Bacon his separate answers in his own hand. Complaints were made against him as chief-justice of the king's bench, for maintaining the jurisdiction of his court against the injunctions of the court of chancery. In one case, Chancellor Ellesmere granted an injunction against suing out execution on a judgment obtained in the king's bench by a gross fraud. Lord Coke declared this to be against the common law, and contrary to act of parliament; but, after taking infinite pains to prove his statement, he submitted to the king's decision, adding, "that he and his brethren had since entertained his majesty's commandment to the contrary, as an order of the court, with a promise to observe it." But in the *commendams*, Coke nobly sustained his character as a fearless judge. The question in this action (*Colt v. Bishop of Lichfield*) was, whether the king had a right to grant ecclesiastical benefices to be held along with a bishopric. The learned counsel, in the course of his address, indulged in some reflections upon the clergy, which the bishop of Winchester, in his report of the trial to the king, represented as an attack on one of the sacred prerogatives of the crown. After consulting Bacon, his attorney-general, a royal prohibition was issued, suspending the trial, until the king should intimate his pleasure to the judges. The royal mandate was disregarded, and the cause was heard and determined in due course. The judges were summoned to Whitehall to answer for their conduct. On being asked, whether they ought not, in a matter of supposed prerogative, to suspend trial until the king had consulted them, all of them, except Coke, answered—"Yes! yes! yes!" But Coke said calmly—"When the case happens, I shall do that which will be fit for a judge to do." In 1616, having made himself still more obnoxious to the court by his late conduct, he was summoned before the council, and being made to kneel, the earl of Suffolk pronounced the sentence of his suspension from the office of chief-justice. A few months later, the *supersedeas* received the royal signature, and Lord Coke was no longer chief-justice.

Stunned by this blow, Coke soon rallied and laid down that unfortunate plan for his restoration to which we have alluded. Bacon at first opposed his intrigues; but finding that the king approved of the proposed match, he opportunely changed his line of conduct, stopped the prosecution in the star-chamber, and declared himself a warm friend to the alliance of the Lady Frances with Sir S. Villiers. The ex-chief-justice did not derive from this alliance the advantages he had hoped for. The influence of Bacon was too strong, and the spleen of James too bitter, to leave any chance of reconciliation. Coke could make no nearer approach to royal confidence than a seat at the council table and star-chamber. This was the most inglorious period in his life. After four years of fruitless expectation he determined to join the ranks of the popular party. In 1620, after an interval of six years, parliament was again summoned, and Coke being now eligible, was returned for the borough of Liskeard in Cornwall. Here, properly speaking, his political career begins. Though twenty years before this date he had been elected speaker of the lower house, he distinguished himself more as attorney-general than as a statesman. His high arrogance, humiliated by rebuffs of the court, gradually changed into a stern determination to

oppose the king and overthrow his favourites. Though the triumphant struggle for liberty upon which he now entered was conducted from motives of high political virtue, it cannot be questioned that coincident circumstances gave to that struggle peculiar charms. Hitherto Sir Edward Coke had professed high-church principles; now he put himself at the head of the puritans. In the first session he carried an amendment "that supply and grievances should be referred to a committee of the whole house." He succeeded in overthrowing monopolies. He inveighed against the attempt of the king to force the adjournment of the house, opposed the negotiations for the proposed match of the prince with the infanta of Spain, vindicated the privileges of parliament, and drew up a "protestation" against the attempted infraction of its liberties and rights. But a revenge, sweeter than the humiliation of a king, was waiting him in the downfall of a subject. A committee was appointed to inquire into the abuses of the courts of justice, and it was soon noised abroad that the lord-chancellor had been guilty of grave delinquencies. Coke, out of decency, declined to be chairman, but superintended all the proceedings. After refusing to refer the case to a royal commission, the house voted the impeachment, and Sir Edward Coke was appointed to conduct it. But the chancellor having made a full confession, and put himself upon "the gracious mercy" of his peers, deprived Coke of that gratification. After this event Bacon never again appeared in public life, but devoted himself to the pleasures of literature and philosophy, while Coke remained a champion in the arena of politics until he carried the famous "petition of rights." The leaders of the opposition had now become so obnoxious to the king that Coke, together with Selden and Prynne, were sent to the Tower. Against Coke several frivolous charges were preferred—that he had concealed some depositions taken against the earl of Somerset—that he had made arrogant speeches when chief-justice, and had compared himself to the prophet Samuel, &c. But his conduct in parliament was the true ground of his imprisonment. By the intercession of Prince Charles, after eight months' imprisonment, he was set at liberty, under an order to retire to his country house, and not to appear at court without express license from the king. In that age expulsion from the court was no trifling matter. It was political death added to the highest public disgrace. But in this instance the victim lost but little of his popularity, and the king was in constant fear lest he should be returned to parliament. To get him out of the way he was appointed on the commission in 1623 to inquire into the Irish church establishment. His exclusion from the second parliament of Charles in 1625, when returned for Norfolk, was substantially managed by the artifice of appointing him sheriff of Buckinghamshire. In 1628, when the impending war with France left the king no alternative but to summon parliament, the attempt to exclude Coke was not renewed. Such were the apprehensions of the people regarding the impending struggle between absolutism and liberty, and such the high value set upon the sternness and integrity of Coke, that he was returned for two counties, Suffolk and Buckinghamshire. Taking his seat for the latter, he proved himself in this parliament the champion of freedom and able expounder of the constitutional rights of Englishmen. Following the footsteps of his father, Charles had already alarmed the country by successive despotic acts, which, though not altogether new, had never before presented such a bold front. He raised money by forced loans and benevolences; he violated the liberty of the subject by imprisoning suspected offenders without specifying the offence in the warrant; he commanded different sea-ports to furnish ships for his service at their own expense; and grossly tampered with the administrators of justice. The commons having initiated the business of the session with solemn fasting and taking the sacrament, addressed themselves in earnest to these grievances, and embodied them in the famous "petition of rights," which Sir Edward Coke was appointed to draw up. His vast legal knowledge, great popularity in the house, and undaunted spirit, qualified him pre-eminently to take the lead on that occasion. Had our ancestors flinched in that hour of trial, we might have been born to the heritage of bondsmen—the slaves of kings, and the drudges of their flatterers. But bravely and well did the commons of England resist the wavering lords, and defy the insolence and pride of the royalists, until they finally wrung from the king his reluctant assent to an enactment which is veritably a second magna charta.

Having conducted this struggle to so happy an issue, and won for himself a high place among distinguished patriots, Sir Edward Coke never again appeared in public life, but devoted his few remaining years to the peaceful occupations of an author. On the 3d of May, 1632, riding one morning to Stoke, his horse fell upon him. The internal injury sustained by this accident was the cause of his death, which happened two years after, on the 3rd of September, 1634, in the eighty-third year of his age. Perhaps Sir Edward Coke is better known as an author than as a statesman or a judge. His great works are—the "Reports" and the "Institutes;" the former, of more interest to the professional lawyer than to the general student of history; the latter, of much value to both. The "Reports"—thirteen in number—are histories of several cases, containing the arguments on both sides, the questions decided, with the reasons given by court for its judgment. The "Institutes" appeared in four volumes. The first is a comment of great length upon a little treatise on tenures, compiled by Judge Littleton in the reign of Edward IV., and is quoted and referred to by modern lawyers under the brief designation of "Coke Littleton." On all questions relating to the common law, this volume contains materials of the highest authority, collected from the ancient reports and year-books. The second "Institute" contains an exposition of magna charta and other statutes; the third of the criminal law; and the fourth of the jurisdiction of the various courts. On account of subsequent changes in the law, the two "Institutes" last-mentioned, have lost much of their original value and interest. In addition to these works, upon which the fame of Coke as an author chiefly rests, he also wrote a treatise on "Bail and Mainprize;" "The Complete Copyholder;" a book of "Entries, or Legal Precedents;" and a book entitled "A Reading on Fines and Recoveries."—G. H. P.

COKE, THOMAS, LL.D., a divine of the church of England, and afterwards the coadjutor of the Rev. John Wesley in his multifarious labours, was born at Brecon in South Wales, 9th September, 1747. His family was influential and wealthy; and being intended for the church, he was educated at the university of Oxford, where he narrowly escaped the contamination of infidelity. In 1772 he served his fellow-townsmen in the office of mayor, and soon after having received orders, he was appointed to the curacy of South Petherton, where his zeal provoked some degree of opposition, and caused him to be dismissed from his post in 1776. Soon after this he became formally acquainted with Mr. Wesley, was by him cordially received, and from time to time appointed by him to visit the Wesleyan societies in Ireland and elsewhere. In 1784 he was deputed by Mr. Wesley to visit the Wesleyan societies in America, and arrange for their future government. On his second voyage to America he was driven by stress of weather to Antigua, one of the West Indian islands, December 25th, 1786, a circumstance which led to the establishment of the Wesleyan mission to the negroes in these colonies. He was specially identified with the mission work of Wesleyan methodism in America, the West Indies, and Western Africa, and his whole life was devoted to journeys beyond the Atlantic, or to exertions at home for raising the pecuniary means necessary for their support. He had long set his heart upon a mission to India, and succeeded at length in inducing the Wesleyan conference to countenance the undertaking; he himself advancing a large sum of money towards defraying its expenses. He set sail in December with six missionaries, but died suddenly at sea, 3rd May, 1814, aged 66. Dr. Coke published—"A Commentary on the Bible," 6 vols, 4to, a very useful compilation; "A History of the West Indies," 3 vols. 8vo; and sundry other treatises and sermons of minor importance. His name will be ever had in reverence by the Wesleyan churches as the founder of their missions, for which, "he stooped to the very drudgery of charity, and gratuitously pleaded the cause of a perishing world from door to door."—(*Minute of Conference*, 1815.)—W. B. B.

COKE, WILLIAM, Earl of Leicester, born in 1752, was the eldest son of Wenman Roberts, Esq., who assumed the surname and arms of Coke on inheriting the estates of his maternal uncle, Thomas Coke, earl of Leicester. Mr. Coke succeeded to his father's estates in 1796, and from that period down to 1832 he represented, almost uninterruptedly, the county of Norfolk in parliament. He was throughout his career a consistent and zealous member of the whig party, and cordially supported all their leading measures. It is as an agriculturist, however,

rather than a politician, that Mr. Coke's memory deserves to be perpetuated. By granting leases to his tenantry, and otherwise giving them the most liberal encouragement, as well as by costly experiments made at his own expense, he enriched himself and his tenantry, and turned his estate into a model agricultural domain. He introduced what is called the Norfolk system of the rotation of crops, the culture of turnips and maize, the crossing of the breeds of cattle and sheep, and other marked improvements; turned bare and barren land into a fine fertile soil, and raised forests where there was scarcely a blade of grass. He increased the population of the village of Holkham from one hundred and sixty-two to nine hundred, and the rental of his estates tenfold. He stated in his will that he had lately expended £500,000 in the improvement of his estate. He long enjoyed the reputation of being "the first commoner in England," but in 1837 he was raised to the house of peers by the title of Earl of Leicester. He died, June 30, 1842, at the age of ninety. A monument was erected to his memory at the cost of £4000, contributed by men of all political opinions.—J. T.

COLALTO, ANTONIO, born at Vicenza in 1717. His claims to authorship rest upon his having written for the French stage a piece called "Les Trois Jumeaux Venetiens," for the sake of playing the three brothers himself, which, according to the concurrent testimony of the time, he did with astonishing effect. The play was taken from the Venetian Twins of Goldoni, but Colalto wished to add a third character, so that he might exhibit wit, stupidity, and irascibility, contrasted in three different persons. Goldoni was himself so pleased that he declared the merits of Colalto's performance to be such as to entitle him to the rank of an original author. Before his appearance in France in 1759 he had acquired fame in Venice. With a fine voice and figure, he could nevertheless stoop to the mummeries of pantaloons, and under so apparently unfavourable a disguise, express every change of feeling with a grotesque air of truth that gave him perfect mastery over the tears as well as smiles of his audience. He died in Paris in 1778.—J. F. C.

COLARD, MANSION, a printer of Bruges, who lived in the fifteenth century. He was protected by Louis de Bruges, seigneur de Gruthuyse, the great patron of letters of the time. Colard was himself a classical scholar, and besides the number of Latin works he printed in the original, published translations of his own into the French language.—J. F. C.

COLARDEAU, CHARLES PIERRE, born at Janville in Beauce in 1732; died in 1776. He was educated by a maternal uncle, Monsieur Regnard, curé of St. Salomon, at Pithiviers. His uncle's object was to have him a lawyer, and with this view he was placed in the office of an attorney or notary. The passion of poetry, however, seized on him, and his law papers were neglected. He dramatized a story from Telemaque, and the piece, after some delay, was acted with success. His next effort was a tragedy, "Calista," which seems to have failed. The literature of England now engaged his mind, and a very successful imitation of Pope's Epistle of Eloisa to Abelard, was followed by a translation of Young's Night Thoughts. Colardeau became a member of the French Academy in 1776.—J. A., D.

COLBERT, AUGUSTE MARIE FRANÇOIS, Comte, was born at Paris in 1777, and entered the army a volunteer in the national guard of Tarbes in 1792. He rose rapidly in his profession, becoming an aid-de-camp to Grouchy in 1796. In the following year Napoleon raised him to the rank of captain, and he quitted Grouchy for Murat. He distinguished himself in Egypt, and then in Italy, under Dessaix, so as to receive in 1800 the cross of the legion of honour. His courageous bearing at Ulm and Austerlitz obtained for him a brigadier-generalship. Napoleon intrusted him with the conveyance to the Emperor Alexander of his final terms of peace after the battle of Austerlitz. In the eighth bulletin of the grand army, his conduct at the battle of Jena is made the subject of special praise. Towards the close of 1808 he went to Spain, having received a cavalry command under the duke of Istria. He was killed at Cacabellos in 1809, while conducting a reconnaissance.—R. B.

COLBERT, JEAN BAPTISTE, born in 1619; died in 1683; one of the most illustrious statesmen of France; inferior in intellect to neither Sully, nor Richelieu, nor Mazarin; superior to them all in integrity. Colbert was discovered by Mazarin, who, a short time before his death, presented him to Louis XIV., with these words—"Sire I owe everything to your Majesty; but

I believe that, in so far, I pay my debt by giving you Colbert." Louis accepted the gift; it would have been well for himself, for France, and for Europe, had he known thoroughly to appreciate it! The finances of his kingdom having fallen into utter confusion under the worthless Frequet, Colbert was happily installed as controller-general, and he finally became finance minister, or rather prime minister of the king. It were wearisome to narrate the measures, through means of which his sagacity and convictions of justice enabled him to draw France back from the verge of the gulf of bankruptcy; and every one of these sound provisions would have borne fruits, but for the restless and reckless ambition of Louis, fostered by the able but unprincipled Louvois. War was expensive then as it is now. The ordinary revenue would not bear the burden of the enterprises of 1672, and Louvois insisted on loans for the king. Colbert, foreseeing the result, energetically opposed having recurrence to an expedient whose issues he knew so well. He was overruled in the council, chiefly by Louvois and the president Lamoignon. "You triumph," said he to Lamoignon; "but have you done this as an honest man? Do you fancy I did not know as well as you that money can be had by borrowing? But do you know as well as I do, the character of the person with whom we have to do—his passion for show, for great enterprises, and all sorts of expenditure? Now the career is open to borrowing, and therefore to expenditure and taxation illimitable! Answer for what you have done to the nation and to posterity!" The history of this great but unfortunate reign is known to the world. Colbert could not restrain the magnificent king, whose extravagance in everything recognized no bounds. His honest minister remonstrated when he could—ever in vain. "The fourth class of expenses," says he in one of his reports, "the expenses of the court, ought to be subjected to all possible retrenchment and economy, in accordance with the following maxim, let even five *sous* be saved in reference to unnecessary demands, in order that we may have millions to expend in support of your Majesty's glory! I declare, for my own part, that a feast costing three thousand *livres* gives me inexpressible pain, while, when the question is concerning millions of gold for Poland, I would sell all my goods; I would pledge my wife and children; I would trudge barefoot through life, in order to contribute towards it what was necessary." Colbert struggled in vain. Louvois and Louis prevailed; and, having first been insulted, the intrepid minister was disgraced. He died soon afterwards at the age of sixty-four.—Colbert's name seldom appears to advantage in our modern histories of political economy. He is presented usually as the systematic originator of the now unfashionable protective system; and every one has heard the famous reply of some merchants to him—"Laissez aller." This, however, cannot be received by any philosophic thinker without much reservation. In so far as regarded the *exterior*, or other nations, his policy was protective; within France itself he delivered industry from every bond and burden that he could remove. As to protection in a national point of view, there is a difficulty grave enough to puzzle even a brain like Colbert's. Not a doubt can exist that the largest amount of material wealth must issue from the installation of the principle of the division of labour carried to its very extreme; but whether a policy having regard to that principle alone, will best conduce to the development of the intellectual and moral activity and well-being of a nation (which after all is its true wealth), is wholly a different question. Or to descend to a lesser problem, it is quite conceivable that a nation having great natural capabilities, originating in its climate and soil, may be unable to start on the special industries suited to it, through its incapacity to contend, at the outset, with other nations already *exercised* in these special industries. Both considerations occupied and influenced Colbert; and whether theoretically correct or not, the merit cannot be denied to him of having evolved the productive energies of France to an extent never hoped for before, and created a force that has borne her since through the disasters of successive and deplorable revolutions. His country is entitled to venerate him as the founder of those industries which are still its pride. He evolved the silk trade of Lyons; he established the manufacture of lace; he destroyed in everything the monopoly of Venice; and, as already hinted, he benefitted every mode of labour by the equity and order of his fiscal laws. Nor was his capacious mind absorbed by the requisition of mere material industry. The present Imperial Observatory, the *Jardin des Plantes*, the Academy of

P. MICHAUD PINXT.

JEAN BAPTISTE COLBERT.

Painting, the Academy of Architecture—all these were institutions of Colbert's. He also left no less an enduring impression in other essentials to the stability and power of France. Previous to his government France had no marine. Colbert taught her how to compete even with England; he created engineers, ministers, captains, and—most indispensable perhaps of all—sailors. The arsenals of Brest, Toulon, and Rochefort, were planned by him, and constructed at his command. Cherbourg—a barren shore of Normandy—grew into a safe harbour. The possessions of France abroad were conciliated and extended; her commerce with India flourished apace; and her flag came to be known in new seas. Quite as much as Richelieu or Mazarin, Colbert was a founder of the French nationality; and his name will last as long as that of his master—the king who first formulized, *L'Etat, c'est moi.*—J. P. N.

COLBURN, WARREN, an American writer upon mathematical subjects, and the theory of education, graduated at Harvard college in 1820, and died at Lowell, Massachusetts, September 15, 1833, aged forty. Not long after leaving college he published "First Lessons in Arithmetic" on the inductive system, or after the method of Pestalozzi—a little book, containing hardly a sentence of disquisition, which has revolutionized the whole theory and practice of elementary mathematical instruction in the United States. Its great success induced the author to carry out the plan by publishing a larger work on arithmetic; one on algebra; and he was meditating one on geometry when he was interrupted by disease and death.—F. B.

COLBURN, ZERAH, whose performances as an "arithmetical prodigy," excited much interest in the United States and Europe over forty years ago, was born of poor parents at Cabot in the state of Vermont, September 1, 1804, and died in 1840.—F. B.

COLBY, THOMAS, Major-general, an able and accomplished officer of engineers, and superintendent of the ordnance survey, was born in 1784. In 1801, when he was only seventeen years of age, he obtained a commission as second lieutenant of engineers. In the following year he was appointed one of the assistants in the ordnance survey, at the special request of Captain Mudge, the superintendent, who had noticed his diligence and zeal in his studies. Though he lost his left hand, and suffered other severe injuries in 1803 by the bursting of a pistol, Lieutenant Colby soon became conspicuous for his unwearied assiduity in the discharge of his duties, surveying during summer at various important points, and passing the winter months in town preparing the results for publication. In 1813 the survey was extended to Scotland, and Captain Colby spent the next three years in superintending operations at the principal stations in North Britain. On the death of Captain Mudge in 1820, Captain Colby was appointed his successor, and was also elected a fellow of the Royal Society. In 1824 he undertook the survey of Ireland, and in the course of his operations invented a "compensation bar," which has been found of great service in making exact measurements. In 1838 he resumed the survey of Scotland, which had been most improperly suspended, and from this date up to 1846 he continued to superintend the work with his characteristic activity and skill. He resigned his office, in accordance with the rules of the service, on attaining the rank of major-general, and died in 1852.—(*Knight's English Cyclop.*)—J. T.

COLCHESTER, VISCOUNT. See ABBOT.

COLDEN, CADWALLADER, an eminent American historian, botanist, and physicist, son of the Rev. Alexander Colden of Dunse in Scotland, where he was born, February 17, 1688; died in 1775. After completing the course of study at the university of Edinburgh, he applied himself to medicine and mathematics for three years, and then emigrated to America in 1708, and practised physic with great success in Philadelphia till 1715. Then he visited London, where he became acquainted with Halley the astronomer, and read a paper on animal secretions before the Royal Society, by whom it was very favourably received. He returned to America; and in 1718 established his residence in New York, where he left his profession and engaged in the public service, filling in succession many important offices, particularly that of lieutenant-governor of the colony under Burnet. He was the author of "A History of the Five Indian Nations," published in 1727; reprinted at London in 1747, and in a third edition in 1755; he also published "The Cause of Gravitation," which was reprinted, with additions, in 1751, and was then entitled "The Principles of Action in Mat-

ter." Among his correspondents were the principal learned and scientific men of his day, such as Linnæus, Gronovius, the earl of Macclesfield, Dr. Franklin, and Peter Collinson. Though he abandoned practice early in life, he never lost his interest in the science of medicine, his publications upon which were numerous and valuable. His essay "On the Virtues of the Great Water Dock" led to a correspondence with Linnæus, who printed in the Acta Upsala, an account of several hundred American plants furnished by Colden. He communicated to Dr. Franklin the first hint of the art of stereotyping, which was only carried into practice in Germany long after his death.—F. B.

\* COLDING, ANDREAS, a civil engineer, born in the neighbourhood of Copenhagen, 13th of July, 1813. Like many of our greatest English civil engineers, he rose from the working class, and after having passed splendid examinations, was appointed by government in 1845, inspector of high roads, and, two years later, of water-works. In 1850 he was sent by his government to England and Scotland, for the purpose of studying our systems of gas, water, and city drainage. In 1856 he was elected member of the Scientific Society, and in 1858 was appointed engineer of his native city. He has had the direction of the new gas and water works of Copenhagen, as also of those of Göteborg and other cities, and the great tunnel between Copenhagen and Christian's harbour has been made according to his plans. He is a man of profound scientific knowledge, and has paid considerable attention to the subject of heat as produced by friction. Some of his works are published independently; others find their place in the publications of the Scientific Society.—(*Nordisk Conv. Lex.*)—M. H.

COLE, SIR G. LOWRY, one of the heroes of the peninsular war, was born in 1772, and died in 1842. For his conduct throughout the campaigns of 1812-14 he received the thanks of both houses of parliament, and was made governor of the Cape of Good Hope.—J. S., G.

\* COLE, HENRY, C.B., one of the originators of the plan for establishing an exhibition of national industry in London, which eventually issued in the Great Exhibition of 1851. Much of the success of that experiment was due to the ability and unwearied assiduity of Mr. Cole. At the close of the Exhibition he was rewarded with the honour of companion of the bath, and the donation of a handsome sum of money. He was soon afterwards appointed to an important office in the department of practical art under the board of trade. He was the English commissioner in the Paris Exhibition in 1855. Mr. Cole is the author of some pleasant guide-books for tourists, published under the name of "Felix Summerly," and of a popular work for the young on "Light, Shade, and Colour."—J. T.

COLE, WILLIAM, an English antiquarian writer, was born in 1714, and died in 1782. He was educated first at Eton, and then at Cambridge, where he took his degree. He was the college friend of Walpole, Mason, and Gray, and he and Walpole visited France together in 1765. He became rector of Hornsey in 1749. Browne Willis the antiquary gave him the rectory of Bletchley in Buckinghamshire in 1753, and he was afterwards presented to the vicarage of Burnham, near Eton. He devoted himself with great ardour to the study of the antiquities of Buckinghamshire. His life was passed in studious drudgery, and though he wrote little in his own name, he contributed an immense number of notes to the works of other writers. He bequeathed his immense manuscript collections, extending to fifty folio volumes, to the British Museum, with an order that they should not be opened for twenty years. They contain much that is valuable, with much that is gossiping, trifling, and scandalous. His great object was to compose an "Athenæ Cantabrigienses," as a companion to the work of Anthony Wood.—(See D'Israeli's *Calamities of Authors*, pp. 90-93.)—J. T.

COLE, WILLIAM, an English botanist and divine, was born in 1626 at Adderbury in the county of Oxford, and died in 1662. He acted as secretary to Dr. Duppa, bishop of Winchester. He wrote on "The Art of Simpling, being an Introduction to the Knowledge and Gathering of Plants." The work was published in London in 1657. He also wrote a work entitled "Adam in Eden, or Nature's Paradise; the History of Plants, Fruits, Herbs, and Flowers."—J. H. B.

COLEBROOKE, HENRY THOMAS, F.R.S., a great oriental scholar, was the third son of Sir George Colebrooke, Bart., and was born in 1765. At an early age he displayed an extraordinary aptitude both for mathematical and classical studies, and

acquired an intimate knowledge also of the French and German languages. In 1782 he was appointed to a writership in India. After passing through various subordinate situations, he was appointed chief-justice of the court of Sudder Dewanna and Nizamut Adawluts, and became a member of the supreme council at Bengal. After he had spent eleven years in India, he began the study of the Sanscrit language, in which he became eminently proficient. He published a critical grammar and dictionary of that tongue, and enriched the Asiatic Transactions, published at Calcutta, with memoirs on "The Religious Ceremonies of the Hebrews," on "The Sanscrit Language and Literature," "The Vedas," &c. He also published the great Digest of Hindoo Law, which had been compiled under the direction of Sir William Jones; two treatises on "The Hindoo Law of Inheritance," translated from the Sanscrit; "Algebra of the Hindoos, &c. Mr. Colebrooke died in London in 1837.—J. T.

COLEMAN, CHARLES, Mus. Doc., a musician belonging to the private band of Charles I. He was an excellent composer, and contributed many pieces of music to "The Musicall Banquet," 1651; "Musicall Ayres and Dialogues," 1652; "Musick's Recreation on the Lyra-Violl," 1656; "Select Ayres," 1659, &c. He also assisted in composing the "Instrumental Musick," for Davenant's Siege of Rhodes, performed at Rutland house in 1656; and contributed many of the explanations of musical terms in Phillips' "New World of Words," 1658. At the restoration of Charles II. the company of musicians was established upon the charter granted by Charles I. to Nicholas Lanier. Coleman who had received the degree of doctor of music in 1651, was admitted a member of this company; and in the minute-book (preserved in Harl. MS., No. 1911) we read, under the date, 1664, July 19, "Thomas Purcell chosen an assistant in the room of Dr. Charles Coleman deceased." He left a son of the same name, who was one of the musicians-in-ordinary to the king in 1694.—(See Chamberlayne's *Anglicæ Notitiæ* for that year.)—E. F. R.

COLEMAN, EDWARD, a musician (the husband of Mrs. Coleman, who acted in the Siege of Rhodes), brother to the preceding. He and his wife are frequently spoken of in the Diary of the old gossip Pepys. He was appointed a gentleman of the royal chapel at the restoration; and the ancient cheque-book of that establishment records his death to have taken place at Greenwich, August 29, 1669.—E. F. R.

\* COLERIDGE, REV. DERWENT, only surviving son of S. T. Coleridge, was born at Keswick in 1800, and received his early education with his brother at Ambleside. He then entered St. John's college, Cambridge, and along with Macaulay, Praed, Moultrie, and others, became a contributor to *Knight's Quarterly Magazine*. He took orders in 1826, but has since been mainly occupied in the business of tuition. He is now principal of St. Mark's college, Chelsea—a well-known training establishment for teachers. He is also a prebendary of St. Paul's. Mr. Coleridge is the author of a work on the "Scriptural Character of the English Church," and since the death of his sister the duty of collecting and editing his father's unpublished works has devolved upon him.—(See COLERIDGE, SARA.)—J. T.

COLERIDGE, HARTLEY, eldest son of S. T. Coleridge, was born at Clevedon, near Bristol, in 1796. He was educated at Ambleside, in the school of the Rev. John Dawes, and in 1815 entered Merton college, Oxford. From the earliest years he was distinguished for the brilliancy of his imagination. Wordsworth, in an exquisite poem addressed "To H. C., six years old," speaks of him as one "whose fancies from afar are brought." At school his story-telling powers were quite marvellous, and at college his extraordinary conversational talents caused his society to be much courted, and his frequent invitations to wine parties exposed him to temptations which he was ill fitted both by constitution and training to resist. He passed his examination for a degree in 1818, and gained a fellowship at Oriel with great distinction; but "at the close of his probationary year," says his biographer, "he was judged to have forfeited his fellowship, on the ground mainly of intemperance; and, as too often happens, the ruin of his fortunes served but to increase the weakness that caused their overthrow." The forebodings of Wordsworth—

"I think of thee with many fears  
For what may be thy lot in future years,"

were unhappily fulfilled in the subsequent career of his gifted

young friend. After leaving Oxford, Hartley spent two years in the metropolis, occasionally contributing to the *London Magazine*. He then removed to Ambleside and reluctantly tried for four or five years the experiment of receiving pupils, which utterly failed. From 1820 to 1831 he contributed a number of admirable articles to *Blackwood's Magazine*. In 1832-33 he resided in London with Mr. Bingley, a young publisher, for whom he wrote his delightful biographies of the "Worthies of Yorkshire and Lancashire." The remainder of his wayward career he spent in the lake district, occasionally contributing a prose sketch, full of deep thought, or a short poem to one of the periodicals of the day. He died in a cottage on the banks of Rydal water, on the 6th of January, 1849, and was buried in Grasmere churchyard. His illustrious friend, Wordsworth, lies by his side. In 1851 appeared his "Poetical Remains," and collected essays and marginalia, in 2 vols. 12mo, with a touching memoir by his brother, one of the most beautiful pieces of biography of the present day.—J. T.

COLERIDGE, HENRY NELSON, son of Colonel Coleridge and nephew of the poet, was born at the beginning of this century. He was educated at Eton and subsequently at King's college, Cambridge, where he acquired a high reputation for talent and scholarship. Along with his cousin and other promising youths he was a contributor to *Knight's Magazine*, under the signature of Joseph Haller. In 1825 he made a voyage to Barbadoes in company with his uncle, Bishop Coleridge, for the recovery of his health; and upon his return he published a lively and amusing narrative of his experiences under the title of "Six Months in the West Indies." Mr. Coleridge was called to the bar in 1826, and shortly after married his cousin, the accomplished daughter of the poet. His progress in his professional career was gradual but steady, and he ultimately attained a good practice in the court of chancery. He did not, however, neglect his literary pursuits; and in 1830 published an "Introduction to the Study of the Greek Classics." After the death of his uncle, to whom he was appointed literary executor, he devoted himself assiduously to the task of collecting and publishing such of his works as were best fitted to exhibit his great abilities as a theologian, philosopher, and critic; and his "Table Talk," his "Literary Remains," "Confessions of an Inquiring Spirit," and a republication of "The Friend" successively issued from the press under his care. This labour of love, however, which was performed with great judgment and unwearied industry, combined with the duties of his profession, seems to have proved too much for Mr. Coleridge's strength. The malady from which he had suffered in 1825 returned upon him; and after a lingering sickness of many months, which he bore with most exemplary patience and cheerfulness, he died on the 10th of January, 1843.—(Knight's *English Cyclop.*)—J. T.

\* COLERIDGE, SIR JOHN TAYLOR, one of the judges of the court of queen's bench, cousin of the preceding, and nephew of the poet, was born in 1790. He was educated at Corpus Christi college, Oxford, where he was first class in classics in 1812, and became the intimate friend of Dr. Arnold, and of Keble, the author of the "Christian Year." He was called to the bar in 1819, and was raised to the bench by Sir Robert Peel in 1835. Mr. Justice Coleridge was for a short time editor of the *Quarterly Review*, and has contributed frequently to its pages. In 1826 he published an edition of Blackstone's Commentaries, with notes.—J. T.

COLERIDGE, SAMUEL TAYLOR, was born at Ottery St. Mary in Devonshire, on the 21st October, 1772. His father was the Rev. John Coleridge, vicar of that parish; a man of considerable learning, of singularly amiable qualities, and remarkable for certain eccentricities of mind and manner, which reappeared in no faint degree in his illustrious son. Samuel Taylor was the youngest of a numerous family, and is said to have displayed even in his childhood many of those qualities which characterized his after life. Averse to the ordinary amusements of children, he loved to dream away the hours in solitary haunts. Having become an orphan at the age of nine, he was, on account of the narrow circumstances of his family, placed on the foundation of Christ's hospital. Leigh Hunt and Charles Lamb were among his contemporaries at that noble establishment, with the latter of whom he formed an intimate friendship which continued tender and true till the day of his death. Coleridge outstripped all his competitors in learning. He made extraordinary advances in classical knowledge, in proof of which it may be mentioned that before completing his fifteenth year he translated the Greek

hymns of Synesius into English anacreontic verse; his choice of these hymns having been prompted most probably by his predilection for metaphysics, in the subtleties of which, as well as of theological controversy, he had already, according to his own statement, bewildered himself. Lamb, in one of his most delightful essays, recalling these early years, denominates Coleridge the "young *Mirandula*," and the "inspired charity boy," and says that "even then he waxed not pale at such philosophic draughts as the mysteries of *Jamblicus* and *Plotinus*." But a more genial influence was destined to give a new direction to his precocious energies before leaving school. The sonnets of *William Lisle Bowles* had just appeared, and, having fallen into Coleridge's hands, made so delightful an impression on his poetic sensibility, that he "transcribed forty copies of them with his own pen, by way of presents to his youthful friends." This impression, singular as it may seem, continued for several years to influence the development of his powers, and to these sonnets must undoubtedly be attributed the awakening of the poet, whose "*Ancient Mariner*" still holds the world enraptured with the melody of his marvellous tale.

In the year 1791 Coleridge was, by privilege of his station at school, transferred to *Jesus college*, Cambridge. His reputation at *Christ's hospital* betokened for him an unusually brilliant career at college; but unfortunately, even before he quitted *Christ's*, he was noted for those habits of desultory study, resulting, it is to be feared, from native instability of purpose, which clung to him through life, and blighted so much of the promise of his enthusiastic youth. He won, however, some distinction in the classics at Cambridge, having obtained the prize for a Greek ode in *Sapphic metre*, and having also distinguished himself in a contest for the *Craven scholarship*, in which *Butler*, afterwards bishop of *Lichfield*, was the successful candidate. In after life he often regretted that he had not applied himself more diligently to mathematics. It was at Cambridge, probably, that he became acquainted with the philosophical system of *Hartley*. That distinguished man had also been educated at *Jesus' college*. His name would naturally, therefore, be still popular there in Coleridge's time. There, at all events, it was that Coleridge, in the rashness of his speculative humour and the exuberance of his enthusiasm for philosophic warfare, embraced the tenets of unitarianism. This, of course, utterly destroyed his chance of academical distinction. He left the university suddenly, and without cause assigned, during the second year of his residence; and, after coming up to London, and wandering about a few days in the metropolis, in a fit of chagrin—the consequence, it is said, of unrequited love—recklessly enlisted in a dragoon regiment. He was in a short time discovered by his friends, and immediately rescued from this degradation. There is another more romantic way of telling the story.

*Robert Southey*, with whom Coleridge had become acquainted in 1792, was now residing in Bristol, and thither accordingly Coleridge now betook himself. They had both hailed with enthusiasm the "ideas of liberty" promulgated by the French revolution; they were both devout unitarians, both had left the university without taking their degrees, and both were devoted heart and soul to literary pursuits, and particularly to poetry. There was another young man there, a poet, and also an enthusiast for liberty. This was *Robert Lovell*, a member of the *Society of Friends*, but possessed of a greater number of accomplishments than is usually approved of by the estimable class of persons to which he belonged. These three friends formed a harmless but extravagant project of trying the experiment of human perfectibility on the banks of the *Susquehanna*, "where," to use Coleridge's own words, "our little society, in its second generation, was to have combined the innocence of the patriarchal age with the knowledge and genuine refinements of European culture, and where I dreamed that in the sober evening of my life I should behold the cottages of independence in the undivided dale of industry,—

'And oft, soothed sadly by some dirgeful wind,  
Muse on the sore ills I had left behind.'

This vision of pantisocracy, as it was affectedly called, was soon dissipated by the marriage of *Southey* and *Coleridge* to two sisters, the *Misses Fricker* of Bristol, to whom *Lord Byron* made so unhandsome an allusion in his *English Bards and Scotch Reviewers*. *Lovell*, who had already married another sister, died soon after this; *Southey* went to Lisbon with his uncle; and

*Coleridge* hired a cottage in *Clevedon*, a village on the *Severn*, and applied himself to the preparation of a volume of poetry, for which he had been paid in advance by *Mr. Joseph Cottle*, bookseller, Bristol. Indeed, the scheme of "establishing a genuine system of property" on the banks of the *Susquehanna* was so absolutely visionary, that, if the authors of the project had clubbed their resources, they could not have paid a steerage passage to the *New World*, far less have freighted a vessel and taken out all sorts of implements, as they innocently talked. It is said that at that time *Coleridge* knew nothing about the *Susquehanna*, not even through what part of America it held its course. The fine poetical name, if we may believe *Mr. Cottle*, who was a most indulgent friend, formed great part of the fascination with which the scheme was regarded. *Coleridge* had not yet parted company from his youthful enthusiasms. His friends hoped, however, that the cares of domestic life would steady his energies, and dissipate the day-dreams in which they were weakened as well as wasted. But that fatal irresolution which had so early revealed itself, grew upon him as he advanced in years. And this was not the worst—he had fairly acquired the habit of taking *laudanum*. This insidious practice was carried by him to such a pitch, that he drank for a considerable time at least as much as a pint a day. It destroyed his naturally robust constitution, uninged the structure of his mind, and blighted for ever his prospect of happiness in this world. If we remember aright, he once seriously proposed placing himself in a mad-house, where he should be under control and medical treatment at the same time. In such circumstances it was impossible that he should contemplate the literary profession, upon which he was now wholly dependent, with other than dubious and apprehensive feelings. Accordingly, in a letter to *Mr. Cottle*, written about this time, he gave expression to those fears with which the thought of the future inspired him:—"It is my duty and business to thank God for all his dispensations, and to believe them the best possible; but, indeed, I think I should have been more thankful had he made me a journeyman shoemaker instead of an 'author by trade.' So I am forced to write for bread! Write the flights of poetic inspiration, when every moment I am hearing a groan from my wife; groans, and complaints, and sickness. The present hour I am in a quickset hedge of embarrassment, and whichever way I turn a thorn runs into me. The future is clouds and thick darkness! Poverty, perhaps, and the thin faces of them that want bread looking up to me. Nor is this all. My happiest moments for composition are broken in upon by the reflection that I must make haste."

The village of *Clevedon* did not long please him. He removed to Bristol. Bristol soon became as irksome as *Clevedon*, and he again sought the country; this time taking up his residence at *Nether Stowey*, a pleasant village at the foot of the *Quantock hills* in *Somersetshire*, where he was in the immediate neighbourhood of his friend and benefactor *Mr. Poole*, and of *Mr. Wordsworth*, who was then living with his sister at *All-Foxden*. We ought to have stated that he had already, in 1795, published his "*Conciones ad Populum, or, Addresses to the People*;" and in 1796 planned and set on foot a weekly paper called the *Watchman*, which did not, however, survive the tenth number. The period of his residence at *Nether Stowey*, was perhaps, in spite of many difficulties and apprehensions, the happiest of his life. "His poetical faculty, which had budded in his sixteenth year, was ripened under the genial impulses of nature, friendship, and domestic affection." He enjoyed the intimate society of *William Wordsworth*, with whom he had almost daily conversation on poetical and other matters. Out of these conversations grew the famous "*Lyrical Ballads*," which appeared in 1798, and attracted so great a share of the attention of the literary world. It was here also that he wrote his tragedy of "*Remorse*," and the first part of "*Christabel*." *Coleridge* still professed the unitarian faith, and for some time preached every Sunday at *Taunton*. Indeed, he had in 1798 accepted an offer to become preacher to a unitarian congregation in *Shrewsbury*, and had actually preached his first sermon, when his friends *Josiah* and *Thomas Wedgwood*, of *Etruria* in *Staffordshire*, granted him an annuity of £150. Upon this he set out for Germany, accompanied by *Wordsworth*. Of these travels, an account is given in the *Biographia Literaria*. They visited the celebrated author of the *Messiah*, whom *Coleridge* was in the habit of facetiously calling *Klubstick*. It should perhaps be mentioned, that the generosity of the *Wedgewoods* had some years previously enabled

Coleridge to proceed to the university of Göttingen, where he completed his education according to his own scheme. Shortly after his return in 1800, in which year was published the translation of "Wallenstein," he and his family settled for some years with Southey, at Keswick. Wordsworth had also by this time come to the north, and was then living in the vale of Grasmere. Coleridge now finally abandoned his unitarian tenets. In the first volume of his "Biographia Literaria," referring to an early period of his life, he says—"I was at that time, and long after, though a trinitarian (*i.e.*, ad normam Platonis) in philosophy, yet a zealous unitarian in religion; more accurately, I was a *psilanthropist*, one of those who believe our Lord to have been the real son of Joseph, and who lay the main stress on the resurrection rather than the crucifixion." His groping after religious truth had been long and difficult. Even before he had arrived at the stage where he fully embraced "the truth as it is in Jesus," he tells us that "his head was with Spinoza and Leibnitz, while his heart was with Paul and John."

His habit of opium-eating having now begun to tell with terrible effect on his health, Coleridge made a voyage to Malta in the year 1804, in search of convalescence. His friend Dr. Stoddart was then king's advocate in that island. He introduced him to Sir Alexander Ball, one of Nelson's old captains, and then governor of Malta. Sir Alexander was so much pleased with the eloquent philosopher, that he appointed him secretary to the government, at a salary of £800 a-year. But a farther acquaintance discovered that there was little congeniality of mind between the governor and his secretary. The consequence was that the latter came home within the year. The fact that Coleridge afterwards devoted a number or two of his "Friend" to a highly-wrought eulogium on Sir Alexander Ball, a man whom nobody else regarded as remarkable for anything, points to one of the enigmatical features of his character. From his return from Malta till the year 1816, he lived a very unsettled, miserable life, now with his family, now with one friend, again with another. In 1809-10 he issued from Penrith in Cumberland, twenty-seven numbers of the "Friend" which were afterwards republished with additions in three volumes. This periodical proving a failure, he went to London, where he lived for some time with Mr. Basil Montagu. He contributed to newspapers—the *Morning Post* and the *Courier*; and delivered lectures at public institutes. This was the most wretched period of his life: that in which the punishment of his habitual sin of opium-eating—for such it was in a very high degree—overtook him, and violently struck him to the ground. It were almost to be wished that the glimpses which we have of his condition during these years of his London life, and of the shifts to which he was put, had been altogether withheld. The depths to which this "rapt one of the godlike forehead" had fallen, cannot be better described than in his own words:—"Conceive a poor, miserable wretch, who for many years has been attempting to beat off pain by a constant recurrence to the vice that produces it. Conceive a spirit in hell, employed in tracing out for others the road to that heaven from which his crimes exclude him. In short, conceive whatever is most wretched, helpless, and hopeless, and you will form as tolerable a notion of my state as it is possible for a good man to have. I used to think the text in St. James, that "he who offends in one point, offends in all," very harsh; but now I feel the awful, the tremendous truth of it. In the one crime of *opium*, what crime have I not made myself guilty of. Ingratitude to my Maker and benefactors, injustice and unnatural cruelty to my poor children, self-contempt for my repeated promise, breach of it, nay, actual falsehood." Silence were best here.

In the year 1816 he placed himself under the care of his friend Mr. Gillman, surgeon, Highgate, in whose family he remained till his death on the 25th of July, 1834. Here he was in the habit of holding weekly *conversazioni*, when he indulged to their full bent those powers of conversation which were the wonder of all who heard him. The influence which in this manner he exercised on ardent young men from the universities and others is quite incalculable. To this period, too, belong some of the most valuable of his works—the two "Lay Sermons;" "Aids to Reflection, in the formation of a manly character, on the several grounds of Prudence, Morality, and Religion, illustrated by passages from our elder divines, especially from Archbishop Leighton;" the "Biographia Literaria;" and the "Constitution of Church and State, according to the

idea of each." His gradual and, we believe, at last, complete emancipation from his almost life-long bondage brought back somewhat of the happiness and peace which he had known in his earlier years; and long before the final scene closed, his naturally intense religious nature found all its longings fully satisfied in that peace which passeth all understanding. A few days before his death he wrote a letter to his godchild, Adam Steinmetz K—, near the conclusion of which occur these words—"I thus, on the very brink of the grave, solemnly bear witness to you that the Almighty Redeemer, most gracious in his promises to them that truly seek him, is faithful to perform what he has promised, and has preserved under all my pains and infirmities the inward peace that passeth all understanding, with the supporting assurance of a reconciled God, who will not withdraw his Spirit from me in the conflict, and in his own time will deliver me from the evil one."

Wordsworth has described his friend as "a noticeable man, with large grey eyes."

It is not our purpose, neither does it consist with our limits, to present an account of the philosophical system of Coleridge. The fact is, that he did not build up a compact logical system. His works are all fragmentary. "The whole labours of Coleridge," it has been said, "present the appearance of an unfinished city—the outline of the streets exhibits only how splendid they might have been: the basement of a pillar shows how gorgeous might have been the capital." His opinions embrace a wide range of subjects—mental, moral, political, literary, and theological; and they are sometimes found jumbled together in a manner that might well bewilder the ordinary reader. The uncouth terminology of his metaphysical writings forms another hinderance to his extensive popularity. He followed the modern Germans in their abstruse doctrines of the "absolute" and the "practical reason," and was the first to introduce the transcendental philosophy into England. He insisted perpetually on what he termed the important distinctions between the "reason" and "understanding"—between "genius" and "talent." From talent without genius—that is, from the exclusive exercise of the understanding, he expects only a swarm of clever, well-informed men—an anarchy of minds—a despotism of maxims. And thence despotism of finance in government and legislation—of vanity and sciolism in the intercourse of life—of presumption, temerity, and hardness of heart in political action. He has a horror of "idealess facts," misnamed proofs from history, and of the substitution of the grounds of experience for principles and the insight derived from them. He waged continual war with the utilitarians, and boldly contended that they had substituted the guess-work of general consequences for moral and political philosophy. The philosophy of Locke and Paley he represented as almost the exact opposite of that which he himself taught in all his writings. "The pith of my system," he says, "is to make the senses out of the mind, not the mind out of the senses, as Locke did." He elsewhere gives a more extended description of his philosophy, or rather of the end at which it aimed. "My system, if I may venture to give it so fine a name, is the only attempt I know ever made to reduce all knowledge into harmony. It opposes no other system, but shows what was true in each; and how that which was true in this particular, in each of them became error, *because* it was only half the truth. I have endeavoured to unite the insulated fragments of truth, and therewith to frame a perfect mirror. I show to each system that I fully understand and rightfully appreciate what that system means; but then I lift up that system to a higher point of view, from which I enable it to see its former position; where it was, indeed, but under another light, and with different relations. So that the fragment of truth is not only acknowledged but explained. . . . I wish, in short, to connect, by a moral *cupola*, natural history with political history; or, in other words, to make history scientific, and science historical—to take from history its accidentality, and from science its fatalism." It is needless to say that this system was not worked out. But in all his writings there are fixed principles which, however imperfectly stated, will, as the reader grows familiar with them, and with their extensive bearings, gradually fashion themselves into recognizable shape.

The mind of Coleridge turned ever more fondly towards theology as his years increased. It is impossible to state here the services which he has rendered to this highest of all studies; or to do more than merely notice his invaluable tractate on the

"Constitution of Church and State, according to the idea of each." We believe that a future age will reckon his theological labours considerably more valuable than the present has yet done. It will, perhaps, be then acknowledged that the "Aids to Reflection," was one of the most remarkable books of its time. Meanwhile this influence has been already very great both in England and America; we might say greater than that of any other single mind which has appeared in theology for many years. And whether for good or for evil, that influence is still steadily gathering force. Coleridge takes high rank also as a critic in poetry and the fine arts. It is very much to be regretted that traces of the irregularity of his efforts are painfully evident in this department of his intellectual activity: for his subtlety, his acumen, his intense literary and artistic instincts, but above all, his hearty sympathy with every kind of excellence, fitted him beyond any man of his time for the difficult office of critic. As it is, we have still but little criticism, worthy of the name, that has not come from his versatile pen. But we believe that the reputation of Coleridge the poet, will outlive that of Coleridge the philosopher and theologian; and this even though it should have to be granted that a considerable part of his poetical writings is of comparatively little value. For whatever of really excellent there is, will be found to be pre-eminently so, and excellent too in such an original sense, that its immortality is as certain as that of anything which has been produced in this age. His earliest poems, it is true, gave but slight indication of what was behind. Their juvenility is strongly marked upon them. They are in a considerable degree turgid and laboured, and betray greater evidences of imitation than originality. This fact has been objected against Coleridge by his detractors, as, though he wanted originality as a poet, because his first efforts are chiefly the result of excited poetic sensibility, acting in conjunction with reminiscence. But nothing, in truth, can be more purely original than the great bulk of his poetry—a fact which is evident enough from the peculiar influence it had on some of the greatest of his contemporaries; such, for instance, as Byron and Scott, and which it continues to exercise on the poetry of the present day. It cannot be denied, however, that in his poetical, as in his prose writings, there is more of promise than performance; that much is left incomplete—glorious fragments, it may be, but still fragments, and wanting that last perfection, which can only be attained when the powerful will acts sweetly under the burden of high imagination. We refer not now particularly to his unfinished pieces—such as "Christabel"—but rather to the fact that, instead of combining his conceptions in one great continuous effort, he has broken them up into small pictures, which, though each may be exquisitely beautiful in itself, give us the notion of imperfection, if not indeed of radical weakness itself: for the strength of the eagle, as has been said, is not measured by the height to which he can soar, but by the time that he continues on the wing. The most prominent characteristic of Coleridge's poetry is its "exquisite and original melody of versification, whose very sound chains the ear and soul!" In this respect he excels all poets. But his poetry cannot properly be called the poetry of high imagination. Its power lies rather in the region of the senses; but the senses breathed upon and spiritualized by imagination. Even the emotions which he describes, belong not to the strong direct passions of our common nature; his love is a kind of romantic and spiritual movement of wonder, blended with an ineffable suffusion of the powers of sense. There is more of aerial romance than of genuine tenderness even in the peerless love of his Genevieve; although, to be sure, the heart is sometimes startled with a tone of true passion, as in the "Keepsake," where he speaks of—

"Her voice, that even in her mirthful mood,  
Has made me wish to steal away and weep."

But in the description of that preternatural fear, that ominous dread of some undefined evil, which properly belongs to superstition, Coleridge is unapproached and unapproachable. It is in the perfect mastery of these feelings—feelings which, in a certain measure, are common to the race—that the indescribable charm of his "Ancient Mariner," the most perfect of all his productions, consists. The loveliness and the terror glide before us in alternate vision, the mind being all the while entranced with the depth and wondrous fascination of its unequalled melody. "Christabel" belongs to the same class—poems to be felt rather than criticised. Coleridge has also produced several highly

elaborate odes; but his want of lyric rapture and fervid human passion necessitated his failure in this most difficult species of poetic composition. But success in ode writing is one of the rarest things in literature. Even Wordsworth's famous Intimations of Immortality, notwithstanding its high reputation and undoubtedly fine poetry, shows but poorly in the light of artistic excellence. Except in a few passages, it is stiff and lumbering, and unworthy of comparison with the splendid productions of this kind which have come down to us from the ancient world. In his "Poems of Later Life," Coleridge touches a different chord from any which he had sounded in his previous poems. There is greater condensation and intensity both of thought and expression—more reflection and less imagination; while in all there is to be detected a certain indefinable pathos, that dimly shadows forth the ineffable sorrow of a mind that has proved untrue to its own surpassing powers. The little poem entitled "Youth and Age," is a thing by itself, and fittingly stands at the portal of that period of his life, during which a serene but genuine sadness carried him gently forward, till the final darkness covered him from our sight for evermore.—R. M., A.

COLERIDGE, SARA, the only daughter of Samuel T. Coleridge, was born at Keswick in 1803, and was brought up and educated by her uncle, Robert Southey, whose influence had a most powerful effect in the formation of her intellectual character. In 1822 she executed an excellent translation of an Account of the Cipones from the Latin of Martin Dobrizhoffer. She married her cousin Henry Nelson Coleridge in 1829; and with the exception of a Latin lesson-book for her children, entitled "Pretty Lessons for Good Children," she produced no literary work until after the death of her father in 1834, when she assiduously aided her husband in the pious duty of editing and annotating the poet's unpublished works. After the death of Henry Coleridge the whole of this arduous work devolved upon his widow; and the mode in which she has executed this labour of love, and especially the elaborate and closely-reasoned dissertations on some of the most important questions in theology, morals, and philosophy with which she has enriched several of the volumes, are fitted to give a very high idea both of her learning and her ability. She died on 3rd May, 1852.—J. T.

COLES, ELISHA, an English lexicographer, of considerable fame in his own day, was born in Northamptonshire about 1640. He was educated at Oxford; taught for some time the Latin and English languages in London, and ultimately removed to Ireland, where he died about 1700.—J. T.

COLET, DR. JOHN, a learned English divine, and the founder of St. Paul's school, London, was the eldest son of Sir Henry Colet, twice lord-mayor, and was born in 1466. After completing his education at Magdalene college, Oxford, he travelled in France and Italy, and there became acquainted with Erasmus, Budæus, and other distinguished scholars, and acquired a knowledge of the Greek language, which was then little known in England. He returned home in 1497, and next year took up his residence in Oxford, where he read lectures on St. Paul's epistles. Colet was possessed of a large estate, without any near relations, and devoted his property to the establishment of St. Paul's school in London, of which he made the company of mercers trustees. He appointed the learned Mr. Lilly first master in 1512. Dr. Colet died in 1519, in his fifty-third year, and was buried in St. Paul's choir. Among other dignities, he enjoyed those of canon and dean of St. Paul's cathedral, and chaplain and preacher in ordinary to Henry VIII. He was the author of "Rudimenta Grammatices;" "Absolutissimus de octo orationis partium constructione libellus;" "Daily Devotions;" "Epistolæ ad Erasimum," &c.—J. T.

COLGAN or MACCOLGAN, JOHN, born in the parish of Donagh, in the barony of Inishowen, Donegal, Ireland, in the end of the sixteenth century, was a Franciscan friar in the Irish convent of St. Anthony of Padua at Louvain, in which he was professor of divinity. After the death of Ward in 1635, Colgan was appointed to complete the lives of the Irish saints, which the latter had left unfinished. He executed this task in two large volumes, which are illustrated by useful and most elaborate notes, especially in what relates to the ancient topography of Ireland. The last of these volumes in order was the first printed, and is entitled "Acta Sanctorum Hiberniæ," &c., Lovanii, 1645, folio. The other volume is entitled "Triadis Thaumaturgæ Acta," Lovanii, 1647, folio. Colgan died in Louvain in 1658.—J. O'D.

**COLIGNI, GASPARD**, a celebrated French admiral, and leader of the protestants, was the son of the Marshal Coligni and of Louise Montmorency, sister to the famous duke and constable of that name. He was born on 16th February, 1517. He accompanied Francis I. throughout the Italian campaign of 1543, and was conspicuous for his coolness in the field. In the following year he and his brother Francis served in Italy under the duke d'Enghien, and distinguished themselves at the battle of Cérisolles. Gaspard Coligni next assisted the dauphin in repelling the invasion of Champagne by Charles V. and Henry VIII. After the death of Francis he was made colonel-general of infantry, and afterwards, in 1552, admiral of France, by Henry II. The courage and skill which he displayed at the battle of Renti in 1554, and in the defence of St. Quentin in 1557, added greatly to his reputation and influence. After the death of Henry II. the admiral joined the party of the Huguenots, and, next to the prince of Condé, became their principal leader. In the civil war which ensued, he fought at the battles of Dreux, St. Denis, Jarnac, and Moncontour; and by his indomitable energy and activity contributed greatly to repair the losses which the Huguenots met with in the field. After the conclusion of peace in 1570, the admiral was invited to court, and flattered and caressed by Charles IX., for the purpose of lulling the veteran and his friends into a fatal security. On the 22nd of August, 1572, as Coligni was returning from the Louvre to his lodgings, he was severely wounded by a musket-shot fired out of a window, at the instigation of the duchess of Nemours, widow of Francis, duke of Guise. The king pretended to be highly indignant at the dastardly attack, but on the evening of the same day the massacre of the protestants, which had long been meditated, was finally arranged. It commenced at midnight, August 24th. As soon as the signal was given, a party, headed by the duke of Guise attacked the admiral's house, forced open the doors, and rushing into the room where the admiral was sitting, murdered the defenceless veteran in cold blood. His body was then thrown out of the window at the command of the duke of Guise himself; and after being subjected to the vilest indignities by the populace, was at last chained by the feet to the common gallows, and the head was cut off and carried to the queen-mother, Catherine de Medici, the prime instigator of the infamous transaction. The body of the admiral was afterwards secretly buried in the vaults of the chateau of Chantilly, and finally transferred to Maupertuis, where a monument was erected to his memory.—J. T.

**COLLARD-ROYER.** See **ROYER-COLLARD.**

**COLLÉ, CHARLES**, the most renowned fabricator of chansons in his day in France, as well as the author of several very successful dramatic pieces, was born at Paris in 1709. At a very early age he displayed a passion for poetry and the theatre. Apprenticed to a lawyer, he spent his time reading La Fontaine and Molière, or associating with Péron, Galert, the younger Crebillon, and others, who were at once convivial and literary. This association led to the establishment of the celebrated "Caveau," so called from the place of meeting, and which may justly be denominated the academy of song. Thence issued the sprightliest and best lyrics of the day, and Collé was the most distinguished of the contributors. From 1729 to 1739, these joyous "noctes" were continued, till at length wealth and rank found an entrance which should be conceded to genius alone, and the Caveau, like other pleasant societies, fell to pieces. We next find Collé filling nominally the post of secretary to the duke of Orleans, but in reality writing comedies for his patron. In this occupation he continued twenty years, producing some admirable pieces, though it must be admitted they were occasionally open to censure for their freedom of language and morals. Collé tried his hand, too, at sentimental comedy, and with remarkable success; and one of these pieces, the "Partie de Chasse," still keeps its place on the French boards. It is, however, as a chansonnier that Collé is principally famous. He may be considered as one of the best representatives—Beranger always excepted, who, indeed, followed in his steps—of the French chanson; sprightly yet sentimental, piquant and graceful, warm—often too much so—but rarely vulgar or actually gross. He died on 2nd November, 1783.—J. F. W.

**COLLE, RAFFAELLINO DEL**, born at Colle, near Citta San Sepolcro, probably at the beginning of the sixteenth century. This painter is generally regarded as the pupil and assistant of Raphael in the Farnesina and the Vatican. He painted cartoons

after the designs of Bronzino for the tapestry of Cosmo I. He kept a school at San Sepolcro whence proceeded Gherardi, Vecchi, and other artists, some of whom may have surpassed him in genius, but none in grace, or finish, or conscientiousness. The date of his death is not known.—W. T.

**COLLENUCCIO, PANDOLFO**, born at Pesaro—the date of his birth is not recorded—died in 1504. He was employed in several embassies and public negotiations by the city of Venice, and exercised the office of "podesta," or governor in several Venetian cities. Pandolfo became an object of suspicion to Sforza, who accused him of a secret correspondence with Cæsar Borgia, and had him thrown into prison, where he was strangled. His principal works are a "History of Naples," and some essays on Pliny's Natural History. He translated into Italian Plautus' Amphitryon.—J. A., D.

**COLLES, ABRAHAM, M.D.**, a surgeon of great eminence in Dublin, was born in 1773 at Millmont, near Kilkenny. In 1799 he was elected resident surgeon to Steevens' hospital; in 1804 was appointed lecturer on anatomy and surgery to the royal college of surgeons in Ireland, and in 1826 became professor of surgery to the same institution. His health having in 1835 begun to give way, he was compelled, in the following year, to resign his professorship in the college of surgeons, on which occasion the college assembled, and presented him with a superb piece of plate and a complimentary address. The college also ornamented their board-room with his full length portrait by Cregan, and their museum with a marble bust by Kirk. The honour of a baronetcy was offered to Mr. Colles, but was declined. He expired in 1843 in the seventy-first year of his age. Among his principal writings are a volume on "Surgical Anatomy;" essays on the injury which has since been designated Colles' fracture of the radius; on ligature of the subclavian artery, published in the *Edinburgh Medical and Surgical Journal*; several papers in the Dublin hospital reports, of which valuable series he was one of the originators; his great work on "The Use of Mercury;" lastly, some posthumous papers have recently appeared in the *Dublin Quarterly Journal of Medical Science*, having been prepared for publication by his son Dr. William Colles.—W. D. M.

**COLLETET, GUILLAUME**, born at Paris in 1598; died in 1659. While yet at school he showed some talents for versification, and he was unlucky enough to have his rhymes praised by Malherbe. He studied law, and in due time became an advocate, but soon gave up the practice of his profession, assigning an impediment of speech as the cause. It is probable that the real motive which influenced him was his passion for literature. He was among the first members of the French Academy, and a discourse read by him in 1636, on the "Oratory of the Ancients," attracted great attention. Colletet was one of five authors pensioned by Richelieu. (See **CORNEILLE, PIERRE DE.**) He was the great prize poet of his day—the very ideal of a laureate. He became rich, and possessed country seats as well as his town house. But he married successively three servant-maids, and on his last marriage, his home was invaded and occupied by his wife's tribe, and became a low cabaret. Colletet was literally eaten out of house and home, by the strange associates to whom his marriage introduced him. He at last died, and was buried by subscription. Colletet wrote a history of French poetry. It contains the lives of one hundred and thirty poets. No member of the academy is among them. Much of Colletet's poetry is very pleasing.—J. A., D.

**COLLETT, JONAS**, a Norwegian minister of state, was born on his father's estate, Rönnebeksholm, in Zealand, in 1772. He was educated at the university of Copenhagen, and devoted himself to the study of the law. In 1814 he was elected a member of the preparatory chamber, and when the national assembly had declared the independence of Norway, he was appointed privy councillor, and head of a department. He acted as minister of home affairs from that year till 1822, and on the resignation of count von Wedel-Jarlsberg, he became minister of finance, trade, and customs. In 1829, he was elected to the presidency of the privy council. In 1836 he retired from public life, desiring to spend the remainder of his days in rural and literary pursuits. Collett had the honour of leaving the financial affairs of his country in so flourishing a condition that the succeeding storting (parliament) abolished all direct impost and reduced many duties, appropriating at the same time large sums to the completion of fortifications, the augmentation of the

fleet, and the diminution of the national debt. Collett died in 1851, highly esteemed by his countrymen.—M. H.

COLLETTA, PIETRO, born at Naples in 1775; died at Florence in 1833. Colletta first served in the army, then showed considerable talents as an engineer. In 1812 we find him "directeur des ponts et chaussées;" in 1813 "directeur en chef du génie militaire;" in 1814 "conseiller d'état;" in 1815 engaged against the Austrians on the banks of the Panaro, and signing the capitulation of Casalanza. After the fall of Bonaparte, we find him still employed, though distrusted, by the government; in 1820 he is sent to Sicily, and from 26th February to 23rd March, 1821, he is minister of war. He is next mentioned as imprisoned by Canosa, and exiled to Brun. We find him then at Florence, and occupied with a history of Naples from 1734 to 1825. The book was not published till after his death. It passed through several editions. A French translation appeared in 1835.—J. A., D.

COLLIER, ARTHUR, a remarkable writer and metaphysician, was born at Langford Magna, near Salisbury, in 1680. His ancestors for several generations were rectors of the parish, the advowson being in the possession of the family. In 1697 he entered Pembroke college, Oxford, but subsequently joined Balliol. In 1704 he was inducted into the rectory of Langford Magna, on the presentation of his mother. In 1707 he married a niece of Sir Stephen Fox, and he died in 1732. Such is the brief record of one who lived and died in comparative obscurity. But Collier was a powerful and original thinker. He had no intercourse with the literary world, never quotes Locke, but was conversant with Des Cartes and Malebranche, his chief friend and counsellor being Norris of Bemerton, a place in the neighbourhood. In fact, he thought out for himself a system of idealism, ignorant of the similar attempt of Bishop Berkeley. In 1713 he published his "Clavis Universalis, or a new inquiry after truth, being a demonstration of the nonexistence or impossibility of an external world." The nature of the theory is so well known that it need not be analyzed. There are many points of resemblance between the Clavis and Berkeley's Hylas and Philonous. There is one marked difference, however, that while Berkeley seeks to strengthen his argument by an appeal to natural or universal belief, Collier somewhat contemptuously rejects such support. Collier lays great stress on the position, that his doctrine would put an end to the dogma of transubstantiation; for, under his hypothesis, the distinction between substance and accidents could have no place. Collier's book remained unknown; and indeed it wants the attractive style and varied illustrative power of Bishop Berkeley's work. Neither Oxford nor Cambridge had a copy of it, but Dr. Reid found one in the library of the university of Glasgow, and his reference to the author turned to him the attention of Dugald Stewart and Dr. Parr. Dr. Parr republished the "Clavis," along with other metaphysical tracts—reissued, London, 1837. Collier also published "The Specimen of true Philosophy" in 1730, and "The Logology," published in 1732, his theology being a species of Arianism.—(Hamilton's *Discussions*, p. 186; *Memoirs of the Life and Writings of the Rev. Arthur Collier, &c.*, by Robert Benson, M.A., London, 1837; *Dictionnaire des Sciences Philosophiques*, art. "Collier.")—J. E.

COLLIER, JEREMY, a learned English divine, was born at Stow-qui, Cambridgeshire, in 1650, and died in 1726. He was educated at Caius college, Cambridge, and took orders in 1677. His first living was the rectory of Ampton in Suffolk, and in 1685 he was made lecturer of Gray's inn, and he also held the office of preacher of the Rolls. His eminent abilities and extensive and profound learning, would, in all probability, have raised him to high ecclesiastical dignity; but he was an extreme high churchman, and, at the Revolution, joined the ranks of the nonjurors, refused to take the oaths to government, and was in consequence obliged to resign all his preferments. He was imprisoned in 1688 for writing in defence of the dethroned monarch, and again in 1692 on a charge of treason, but he was released on both occasions without trial. He continued, however, to harass the government by virulent pamphlets, and carried his factious violence to such a height that he exulted over the loss of the British at the battle of Landen, and the destruction of their property by shipwreck on the Spanish coast. In 1696 he had the boldness to grant absolution on the scaffold to Friend and Parkyns, who were executed for high treason, in plotting the murder of King William. This audacious act excited strong and general dis-

approbation. The matter was brought before the court of king's bench, and a bill was found against Collier by a jury. As he was determined not to recognize the authority of the government so far as to give bail, he absconded. He was in consequence outlawed, and remained under the outlawry until his death. The government, however, with a praiseworthy moderation, made no attempt to molest their indomitable and honest, though violent and bigoted assailant, and from that time forward he employed his leisure principally in the composition of literary works. In 1698 he published his celebrated treatise entitled "A Short View of the Profaneness and Immorality of the English Stage"—a book which produced a powerful and most salutary effect upon English light literature, and involved its dauntless author in a lengthened and most triumphant controversy with Congreve, Vanbrugh, and other theatrical writers of the day. "There is hardly any book of that time," says Lord Macaulay "from which it would be possible to select specimens of writing so excellent and so various." The other publications of Collier are a translation of Moreri's Historical and Geographical Dictionary, in 4 vols., folio; "An Ecclesiastical History of Great Britain," in 2 vols., folio; essays upon several moral subjects, in 3 vols., 8vo; a translation of Antoninus' Meditations, and a volume of practical discourses.—J. T.

\* COLLIER, JOHN PAYNE, an English litterateur and critic, the son of a bookseller and journalist, was born in London in 1789. At the age of twenty he entered as a student of the inner temple, and became also a parliamentary reporter on the staff of the *Morning Chronicle*. He was afterwards appointed editor of the *Evening Chronicle*, and became a contributor to several reviews and magazines. He was one of the earliest critics of the present age who drew the attention of the public to the merits of the old English dramatists, and has contributed largely to the elucidation both of the plays and the life of Shakspeare. Collier's principal works are—"The Poetical Decameron," 2 vols. 1820; "The Poet's Pilgrimage," 1822; "Dodsley's Old Plays," 1825-27; "History of Dramatic Poetry," 3 vols. 1831; "New Facts regarding the Life of Shakspeare," 1835; "New Particulars," 1836, and "Further Particulars," 1835; "Memoirs of the Principal Actors in the Plays of Shakspeare," 1846; "A Book of Roxburgh Ballads," 1847; "Extracts from the Registers of the Stationers' Company of Books entered for publication, 1557-70," 1848, &c. Mr. Collier is a vice-president of the Society of Antiquaries, and enjoys a pension on the civil list of £100 per annum as a recognition of the services he has rendered to literature.—J. T.

COLLIN, HEINRICH JOSEPH VON, a German tragic poet, was born at Vienna, 26th December, 1772, where he held a conspicuous place in the administrative service, and died 28th July, 1811. His tragedies, "Regulus," "Coriolan," &c., are distinguished by manliness of thought. He also wrote lyric poems, 1812. Collected writings, Vienna, 1812-14, 6 vols.—K. E.

COLLIN, JONAS, a distinguished statesman and author, also knight of Dannebrog, was born on the 6th January, 1776, in Copenhagen. Having completed his education he entered the service of government in 1798, in the finance department, to which he always, and with ever-increasing advantage to the state, remained attached. In the year 1809 he became member and president of the Royal Society for the improvement of rural economy, and was especially useful in promoting agriculture. He was also zealous for the public improvement in various directions—for the construction of a fleet at Elsinore; for ameliorating the condition of the county clergy, &c. In fact, his labours for his country extended to every branch of moral and social reform. In 1821 he was appointed one of the directors of the theatre royal, and in this office first became acquainted with the afterwards well-known and greatly admired Hans Christian Andersen (see that name), to whom he proved himself one of the most kind and fatherly of men. He was the author of various works, among which may be mentioned a great variety of articles in periodical publications, on statistical, geographical, agricultural, politico-economical, and philological subjects.—M. H.

COLLIN, MATTHEUS VON, brother of Heinrich, was born at Vienna, 3rd March, 1779. In 1808 he was appointed professor of æsthetics at Craow; in 1813 professor of philosophy at Vienna; and in 1815 governor of the duke of Reichstadt. He wrote tragedies—"Marius," "Der Tod Friedrich's den Streitbaren," &c., operas, and poems; and since 1813 has been editor of the Vienna *Literaturzeitung*.—K. E.

**COLLIN HARLEVILLE, JEAN FRANÇOIS**, a dramatic writer, born at Maintenon in 1755. Intended originally for the legal profession, his inclination for the drama proved too strong for the dry study of law. The "Vieux Celibataire," played in 1792, is esteemed the most successful of his thirteen comedies. He died in 1806.—J. F. C.

**COLLINGS, JOHN**, a learned nonconformist divine, was born in 1623, and educated at Emmanuel college, Cambridge. He was forty years minister of Norwich—a portion of that time he held the living of St. Stephens, from which he was ejected in 1662. He was one of the commissioners at the Savoy conference, and was highly esteemed for his learning and piety. He was the author of many works on controversial and practical theology, the best of which is his "Weaver's Pocket-Book, or Weaving Spiritualized," 8vo, 1675. A considerable portion of Poole's Annotations on the Bible was written by Collings. He died in 1690.—J. T.

**COLLINGWOOD, CUTHBERT**, first Lord Collingwood, a famous British admiral, was born at Newcastle-upon-Tyne on the 26th of September, 1750, of an ancient family, but of slender patrimony. He went to sea when only eleven years of age, under the protection of his uncle, Captain afterwards Admiral Brathwaite; was made a lieutenant by Admiral Graves in 1774; five years later was appointed commander of the *Badger*, and shortly afterwards post-captain of the *Hinchinbroke*. In 1780 he was sent under Nelson, his early and intimate friend, to the Spanish main; and when Nelson received promotion, succeeded him in the command, as he did repeatedly on other similar occasions. He served again with Nelson in the West Indies in 1783-86. In 1793 he was appointed captain of the *Prince*, the flagship of Rear-Admiral Bowyer. He was present in the *Barfleur* at the great naval battle of 1st June, 1794, under Howe; and in the *Excellent* in the battle off Cape St. Vincent on the 14th of February, 1797, under Jervis. On both occasions he distinguished himself so much by his judgment and bravery, that his efforts were the theme of universal admiration throughout the fleet. He was raised to the rank of vice-admiral in 1799, and was actively employed in the Mediterranean until the peace of Amiens. On the recommencement of hostilities with France in 1803, Collingwood was recalled to active service, and never again was permitted to return to his happy home. He was made vice-admiral of the blue in 1804; was commissioned to watch the French fleet off Brest, and spent nearly two years in performing that task with unwearied vigilance. In 1805 he was appointed to the command of a squadron, with orders to pursue the combined fleets of France and Spain, which had sailed from Toulon, and fell in with them as they were returning to Cadiz, but, having only three vessels with him, was not strong enough to give them battle. They were at last compelled to quit Cadiz, however, and the battle of Trafalgar followed, in which Collingwood led one of the two lines of the British fleet, and his vessel, the *Royal Sovereign*, was the first engaged. "See," said Nelson, as this swift-sailing ship penetrated the centre of the enemy's line, "see how that noble fellow Collingwood carries his ship into action." The glorious result of the battle was in no small degree owing to the consummate skill and valour of Collingwood, and on the death of Nelson he assumed the supreme command of the fleet. He was rewarded for his services by the thanks of both houses of parliament, together with a peerage, and a pension of two thousand pounds a year. In spite of his declining health, Collingwood continued at his post as commander of the Mediterranean fleet, and rendered many important, political as well as professional, services to Great Britain and her allies. For nearly three years he hardly ever set foot on shore. He repeatedly requested to be relieved of his command, but was compelled to remain, by the ungenerous refusal of the government to relieve him, and their urgent representations that his services could not be dispensed with by his country. Completely worn out, he died at his post, on board the *Ville de Paris*, off Port Mahon, on the 7th of March, 1810.

The selections from the public and private correspondence of Lord Collingwood, published in 2 vols. 8vo, in 1828, exhibit a most beautiful picture of his private character and domestic life, as well as of his public career. His letters, especially those addressed to his wife, are among the best specimens of letter-writing to be found in the English language.—J. T.

**COLLINS, ANTHONY**, a noted controversialist and sceptic, was born at Horton, near Hounslow, Middlesex, June, 1676.

After preparatory study at Eton he entered King's college, Cambridge, his tutor being Francis Hare, afterwards bishop of Chichester, and on leaving the university he became a student at the Temple. But he soon relinquished legal pursuits, and, possessing an estate of considerable value, he married the daughter of Sir Francis Child, lord-mayor of London. He seems at this period to have been on terms of intimacy with Locke, who bequeathed to him some property, and seems to have held him in high esteem. In 1707 Collins published an "Essay concerning the use of reason in propositions the evidence of which rests upon testimony." In this treatise, amidst much sound thinking, there are hints and observations, especially on Gastrell's book on the Trinity, the covert design of which became more and more apparent in subsequent years. During this year, also, he threw himself into the controversy between Clarke and Dodwell, about the immateriality and immortality of the soul, issued no less than five tracts in support of the theory of Dodwell, and denied that the human soul is in itself naturally an undying principle. Dean Swift, in the twelfth chapter of *Martinus Scriblerus*, has covered Collins' arguments with inimitable ridicule. In 1709 he published "Priestcraft in Perfection, or a detection of the fraud of inserting and continuing that clause—'The church hath power to decree rites and ceremonies, and authority in controversies of faith'—in the twentieth article." Collins maintained that the clause was spurious, as it did not form a portion of the articles established by parliament in the 13th of Elizabeth, or ratified by the convocations of 1562 and 1571. The result was a sharp controversy, with shoals of pamphlets. In 1710 he published a "Vindication of the Divine Attributes," in reply to a sermon by Dr. King, the archbishop of Dublin, On divine predestination and foreknowledge. In 1713 he gave out to the world his notorious "Discourse on Free-thinking." The book is ingenious, but dishonest. It takes for granted that those who support revealed religion must be enemies of free inquiry, and the clergy, as being professionally on the side of scripture, are perpetually assailed with invective and ridicule. Nay, it is maintained that scripture has been falsified through pious fraud, and he lays special stress on a story connected with the Emperor Anastasius. He fetches several objections from the various readings which belong to the New Testament, and which, through the publication of Mill's edition, were then attracting some attention. Dr. Bentley, under the signature of "Phileleutherus Lipsiensis," entered the field, and disposed of this literary objection in a masterly style, pointing out the author's blunders, misrepresentations, and artifices, and showing, among other things, by some striking comparisons, that the text of no ancient author is so satisfactory a state as that of the New Testament. Wharton, Hare, and Hoadley also replied to Collins. After this controversy Collins visited Holland, and on his return was made a justice of the peace and deputy-lieutenant in the county of Essex, where he resided. But his busy brain was ever at work, and in 1715 he published "A Philosophical Inquiry concerning Human Liberty," which was reprinted in 1717. Dr. Clarke replied to it, dwelling more upon what he reckoned the moral consequences of the necessitarian theory so held and argued, than upon its metaphysical nature and grounds. Unfatigued by constant application, and undaunted by so many assaults, he published in 1724 "Grounds and Reasons of the Christian Religion," in two parts. This book created an immediate and deep sensation, and in two years drew forth no less than thirty-five replies. In defence, Collins published in 1727 "The Scheme of Literal Prophecy Considered," and in it he attacks the antiquity and canonical authority of the book of Daniel. Collins was a man of shrewd mind, throwing off his immature thoughts too rapidly, and seeming to have pleasure in the mere sensation which his books created. He had no conscience in making quotations, but would freely alter, transpose, or gloss, so as to serve his purpose. A second trip to Holland was occasioned by some alarm as to his personal safety, some of his antagonists having, in the spirit of the age, hinted at a civil penalty. His character is said to have been marked by generosity and equity, and he ably discharged his functions as a magistrate. After some months of declining health, he died in London in 1729, saying with his latest breath that he "endeavoured, to the best of his abilities, to serve God, his king, and his country."—J. E.

**COLLINS, ARTHUR**, an eminent antiquary, author of a "Peerage of England," 1708—which has gone through many

editions—and of various other useful works, was born in 1682, and died in 1760. Sir Egerton Brydges published an edition of the "Peerage" in 1812. Besides editing with remarkable care and judgment various collections of family papers, Collins compiled a "Baronetage of England" in 1720 and 1741, and "The English Baronage" in 1727.—J. S., G.

\* COLLINS, CHARLES ALLSTON, son of William Collins, born in 1828, and remarkable as one of the original band of young painters who, assuming the affected title of pre-Raffaellite Brethren, have done much to revolutionize, and let it be added, to benefit English art. His most important work is his "Convent Thoughts," first exhibited at the academy in 1850, and subsequently at the Manchester Art Treasures exhibition in 1857. Since this Mr. Collins has exhibited no picture of mark, devoting himself rather to literary than art pursuits.—W. T.

COLLINS, JOHN, an eminent mathematician, a native of Wood-Eaton, near Oxford, was born in 1624, and died in 1683. His father, a nonconformist minister, sent him to Oxford to learn the trade of a bookseller; but, during the civil war, he went to sea and saw some service on board a man-of-war in the Mediterranean. On his return to England he adopted the profession of an accountant, the laborious duties of which did not prevent him from pursuing with great success his favourite studies. Becoming known to the public as the author and editor of various mathematical works, he was soon on terms of friendship with most of the eminent scientific men of his day; and so much advantage did he derive from his immense correspondence, that he came to be considered "the register of all the new improvements made in the mathematical sciences." Most of Collins' once popular works are now completely antiquated.—J. S., G.

COLLINS, WILLIAM, a minor poet of the last century, was born at Chichester in the year 1721. His father was a hatter and an alderman of that ancient city. He was a scholar on the foundation at Winchester school for seven years, and afterwards in 1740 went up to Oxford, entering first as a commoner at Queen's college. He soon obtained a demy-ship at Magdalen college. His talent for versification had shown itself even at school; and while at Magdalen in 1742 he published some "Oriental Eclogues," but they were not successful. The consciousness of intellectual power, added to a considerable portion of vanity and ambition, led him to abandon the career marked out for him at Oxford and go up to London in search of distinction. But indolence, coupled with irresolution, caused the failure of his hopes and marred the bright promise of his genius. He planned several tragedies, besides other works, but, as Dr. Johnson says, only planned them. He became involved in debt, out of which he had not sufficient energy to extricate himself. In 1746 he published his "Odes, Descriptive and Allegorical." Miller, his bookseller, gave him a good price for the copyright, but the sale was insignificant, and Collins, as soon as he was able to afford it, repaid Miller, and caused the unsold copies of the impression to be burnt. Soon after this his uncle, Colonel Martin, died, and left him two thousand pounds. His long struggle with poverty was thus ended, but idle desultory habits long protracted, and the kind of intellectual self-indulgence to which he had yielded through life, now brought on a nervous disorder which, before long, incapacitated him from all sustained mental exertion. Finding the disease growing upon him he took to dram-drinking; but this only made matters worse. He was for some time the inmate of a lunatic asylum; after which he lived under the care of his sister at Chichester, where he died in 1756, at the early age of thirty-five years. Collins' poems form one very small volume. His once celebrated odes are now in a fair way to be forgotten.—T. A.

COLLINS, WILLIAM, was born in Great Titchfield Street, London, on the 18th September, 1788. His father, a native of Wicklow, was a picture dealer and cleaner, and the author of a three volume novel called "Memoirs of a Picture," and of a Life of his friend Morland the painter. At an early age William Collins evidenced a love of art, received lessons from Morland, and was afterwards formally despatched to the academy to pursue his studies. "Collins and myself," wrote Mr. Etty, "started as probationers in the same week. He drew the Laocoon and I the Torso. His drawings were remarkable for their careful finish and good effect." When twenty-one, Collins commenced to exhibit at the academy, and for years afterwards he continued to be a constant exhibitor. He rapidly attained success. He was very careful *what* as well as *how* he painted. He lived an easy,

successful, uneventful life—hard-working, but well paid. In 1815 he was elected an associate of the Royal Academy. He married in 1822 the daughter of Mr. Geddes, A.R.A., and the sister of Mrs. Carpenter, the portrait painter. In 1820 he had been elected an academicien, presenting as his diploma-picture the work called "The Young Anglers." For sixteen years he continued to exhibit without losing a year. He then made a mistake—following Wilkie's advice, he travelled on the continent for two years with the view of changing his style. His great successes had been coast scenes. "The Shrimpers;" "Fishermen coming Ashore before Sunrise;" "Getting out the Nets;" "Mussel Gatherers;" "Haunts of the Seafowl"—the names of his works bespeak their character. He now sought to render Italian scenes and scriptural subjects. He exhibited for some years the fruits of his Italian travels—mediocre landscapes, and worse than mediocre scripture illustrations. Before long he judiciously resumed his first line of subjects. The public welcomed back his "coast scenes" with acclamations. These works are very perfect of their class. His peasant groups are singularly happy, full of repose and quiet settled unconsciousness. His execution was extremely careful—no slovenliness ever disfigured his canvas. His colour was quiet but agreeable, with pleasant atmospheric effects, hinted at rather than forcibly insisted on. Altogether it would be hard to find more reliable renderings of English coast life. This of itself, apart from technical qualities, would always maintain the value of the works of William Collins. The highest price he ever received was five hundred guineas from Sir Robert Peel for his "Frost Scene." In 1840 Collins was appointed librarian to the academy, but resigned the office not long afterwards, finding it absorbed his attention too much. In 1844 first became apparent the symptoms of the heart disease, which resulted in his death on the 17th February, 1847, at his house in Devonport Street, Hyde Park Gardens. William Collins had two sons, Wilkie and Charles Allston.—W. T.

\* COLLINS, WILLIAM WILKIE, a dramatic author, biographer, and novelist, was born in London in 1825. He is the eldest son of the late William Collins, R.A., his mother being a daughter of Geddes the painter. Mr. Collins' literary career began with the publication of "Memoirs of William Collins, R.A.," 1848. This well-executed biography was succeeded by "Antonina; a novel," 1850; "Rambles beyond Railways, or Notes in Cornwall taken a-foot," 1851; "Basil, a Story of modern life," 1852; "Hide and Seek," 1854; "After Dark," 1856. Besides these works, Mr. Collins has written "Mr. Wray's Cash-box, or the Mask and the Mystery;" numerous tales for the various leading magazines and serials of the metropolis (amongst which *Household Words* and *Fraser* may be especially mentioned) and two very remarkable dramas, "The Light-house" and "The Frozen Deep," which have been put on the stage with decided success.

COLLINSON, PETER, an English botanist, was born in Westmoreland on 14th January, 1693, and died on 11th August, 1768. He devoted himself early to botanical pursuits, and cultivated many rare plants. He imported a number of useful species from America. He also transmitted European plants to the American continent, and is said to have introduced the culture of the vine into Virginia. He appears to have aided Franklin in his electrical experiments, and to have supplied him with instruments. He was a great antiquarian, and investigated the antiquities of England. He also contributed articles to the *Gentleman's Magazine*. Linnaeus named the genus *Collinsonia* after him.—J. H. B.

COLLOT D'HERBOIS, JEAN MARIE, one of the most prominent and sanguinary agents in the French revolution, was born at Paris in 1750. He was originally a strolling player, and performed with little success in the principal towns of France and Holland. When the Revolution broke out he repaired to Paris, and rendered himself conspicuous by the violence of his harangues. He was one of the principal instigators of the conflict of 10th August, and of the massacres of September. He was deputed by the convention in November, 1793, to punish the revolt of Lyons, and not only battered down the walls, and strove utterly to destroy the city, but in conjunction with Fouché, put to death upwards of sixteen hundred of the inhabitants—six hundred of whom were shot in one day. On his return to Paris he associated himself with Robespierre, on all occasions supported the most violent and sanguinary measures, and voted for the death of Louis XVI., and the abolition of the

monarchy. His blood-thirsty conduct gained him the well-merited designation of the "Tiger." When Robespierre's power was on the wane, Collot abandoned his cause, and, as president of the convention, exerted his utmost influence to procure the condemnation of his former friend. In March, 1795, he and Billaud were condemned to be transported to Guiana. Collot, who was almost constantly in a state of intoxication, died there, 8th January, 1796.—J. T.

COLMAN, an Irish monk of the Columbian order in the island of Iona, who lived in the seventh century, and was presented to the see of Lindisfarne. He is known for the controversy which he maintained with Wilfrid, bishop of York, upon the observance of Easter, supporting against this last the views of the Irish clergy. Colman ultimately retired to the island of Inis-bo-fin, where he founded a monastery and afterwards another in Mayo. He is said to have died on the 8th of August, 676, and to have been buried in his own church at Inis-bo-fin.—J. F. W.

COLMAN, BENJAMIN, D.D., an eminent American clergyman, born at Boston, 19th October, 1673; died 29th August, 1747. After a long residence in England, where he enjoyed the friendship of many eminent dissenters, he became pastor of a congregation at Boston, Massachusetts, in 1699.—F. B.

COLMAN, GEORGE, the Elder, born at Florence about 1733; died at Paddington in 1794. He was the son of Thomas Colman, Esq., British resident at the court of the grand-duke. He was educated at Westminster school, and at Christ church, Oxford. He graduated master of arts in 1758. He formed early friendships with Lloyd, Cowper, Churchill, and Bonnell Thornton. In conjunction with the latter, he published the *Connoisseur*, a weekly periodical, which commenced in January, 1754, and terminated September, 1756. Soon after leaving Oxford, he was called to the bar from Lincoln's Inn. He held a few briefs, but soon discontinued to attend the courts. Two amusing poems written in conjunction with Lloyd, attracted a good deal of attention. The admirers of Gray and Mason were scandalized by odes to Obscurity and Oblivion, in which their style was skillfully imitated. In 1760 appeared Colman's "Polly Honeycomb," which was acted at Drury Lane with great success. In the next year he produced "The Jealous Wife," the story of which is formed from Fielding's Tom Jones. He became co-proprietor with Thornton of the *St. James' Chronicle*, and printed in it some essays, which he afterwards republished in a collection of his miscellaneous works. In 1764 Lord Bath, whose wife was his mother's sister, left him an annuity which placed him comparatively at ease. A second annuity from Lord Bath's mother followed in 1767. About this time he published a translation of Terence in the loose dramatic verse of Beaumont and Fletcher. In 1769 he contributed the play of "the Merchant" to Bonnell Thornton's Plautus. These translations are among the best in the language. In 1768 Colman had become joint-manager of Covent Garden theatre, but disputes arose between him and the other proprietors, which ended in his selling his share, and purchasing the Haymarket from Foote. In 1783 he published a translation of Horace's Art of Poetry, with a commentary, in which he endeavoured to show that the poet's purpose was to dissuade an unpromising aspirant from publishing a dramatic poem. He has thrown the poem into a light and graceful style, not unlike the manner of the best of Garrick's prologues. In 1785 he had an attack of paralysis. In 1789 he exhibited derangement of mind, which increased till reason became quite extinct. His dramatic works, which are very numerous, have been published in four volumes, and his miscellaneous works in three.—J. A., D.

COLMAN, GEORGE, the Younger, son of the preceding, born 1762. Like his father, he was educated at Westminster school, and Christ church, Oxford. He, however, left Oxford for King's college, Aberdeen, from which, with the intention of being called to the English bar, he entered the Temple as a law student. His father's theatre, however, proved a formidable rival to Westminster hall, and the state of his father's health rendering some change in the management necessary, he undertook it at a salary of £600 a year, and did not again open his law books. While yet at Aberdeen, he published a poem, "The Man of the People," of which Fox was the hero; and in 1782 "The Female Dramatists," founded on Roderick Random, which was acted at the Haymarket for a benefit, but not repeated. This is said to have been his first work for the stage. "Two to One" was his

next piece. This was perfectly successful, and he was hailed by a poet of the day as

"A George the Second sprung from George the First."

The management of the theatre brought him into serious difficulties. Litigation unintelligible occupied both sides of Westminster hall, while Paternoster Row was in its day occupied with pamphlets now unpurchaseable at any price, and unreadable by any diligence. This state of things necessarily brought with it ruin on all concerned, and poor "George the second" lived many a long year in the "rules" of the Fleet. Relief, however, came at last, though slow to come. Through the interest of the duke of York, he was given the office of licenser of plays, and this made his latter days comfortable. Actors and authors are seldom destined to agree. One of Colman's plays, "The Iron Chest," founded on Godwin's Caleb Williams, failed—the author thought, through Kemble's fault—and he published the play with a preface, which he afterwards withdrew. Large prices are still given by book-fanciers for copies with the suppressed preface. George Colman, the Younger, published some humorous poems, many of which were very popular. He was jealous of his reputation as a dramatic author, and when he brought out farces or other pieces that could not be classed with the regular drama, it was under the assumed name of Arthur Griffinhoof.—J. A., D.

COLNET DE RAVEL, CHARLES JEAN AUGUSTE MAXIMILIAN DE, born in Picardy in 1768. He was in his school-boy days a fellow-student of Bonaparte and Bertrand at Brienne, which he left to study medicine. He opened a bookshop in the year 1797 in Paris; and while waiting for customers, wrote satires upon contemporary authors. This was unprofitable work, for the police constantly interfered with it. Colnet sought to elude his censors in writing "The Art of obtaining a Dinner," and in editing a journal of arts, sciences, and literature. Charles X. allowed him a small pension, which was enough for his few wants. He lived to witness the fall of his royal patron, and died in 1832.—J. F. C.

COLONNA, FABIO, or FABIVS COLUMNA, a musical mathematician and distinguished botanist, was born at Naples, according to Lichtenthal and others, in 1567; according to Gerber in 1578; he died at Naples in 1650. He belonged to the very ancient noble Roman family whose name he bore. He published three books of plants, with commentaries on the Greek naturalists. He became a member of the Academia Lyncei in Rome, founded by the duke of Aqua Sparta for the advancement of science. The remarkable revolution in music wrought in Florence at the close of the sixteenth century, through the origination of recitative, of which the compositions of Caccini, Peri, Monteverde, and Cavalieri furnish the first specimens, was effected by an association of literary and philosophical men, under the idea of restoring to the art the declamatory character it held in Greece. The subject of Greek music was thus brought under the consideration of the learned; and Colonna, accordingly, with the design of reviving the use of the three ancient genera, diatonic, chromatic, and enharmonic, constructed an instrument of fifty strings, on which the tone was divided into five degrees, and printed in 1618 an elaborate description of this and of the principles it illustrated, in a work entitled "Della Sambuca Linea, overo dell' instrumento musico perfetto." Burney ridicules the instrument as useless, and the principles set forth in this very scarce book as impracticable; unmindful that whatever affinity they may bear to the Greek laws of musical proportions, they are precisely analogous with the system of music which prevails in Arabia at the present day. Hawkins gives a complete account of the work and of its tenets, which, however superseded by subsequent mathematical calculations of ratios, is far from unimportant in the history of musical science.—G. A. M.

COLONNA, FRANCESCO, born at Venice in 1419; died in 1527. While yet very young he became a dominican, taught rhetoric at Treviso in 1467, and took the degree of doctor in theology at Padua in 1473. He is known by an allegorical romance, "Hypnerotomachia Poliphili, ubi humana omnia non nisi somnium esse docet." The collectors of rare books are glad to purchase at almost any price the original edition, printed at Venice in 1499 by the elder Aldus. It is a folio, with wood engravings by Giovanni Bellino. A later edition, 1545, Venice, "in casa de' figliuoli di Aldo," is more often met with, but is of little comparative value.—J. A., D.

COLONNA, GIOVANNI PAOLO, a musician, was born at

Brescia towards the middle of the seventeenth century, where his father, Antonio, obtained considerable repute as an organ-builder. He held the office of maestro di capella at the church of S. Petronio in Bologna, in which city he established a music-school that became justly famous for the eminent pupils it produced. In 1685 Colonna engaged in a controversy with Corelli on the importance of contrapuntal purity, the profound knowledge he brought to bear upon which, greatly enhanced his consideration among the musicians of the time. His first publication, his series of short Psalms for eight voices for the entire year, appeared at Bologna in 1681, and was followed by ten other extensive collections of ecclesiastical music. He produced one opera, 'Anilcare,' performed at Bologna in 1693; and he published an oratorio, "La Profezia d'Eliseo," but produced other works of the same class that were not printed. He wrote, according to the custom of his time, independent accompaniments for instruments to his choral compositions, and it is alleged that Handel imitated him in the construction of his scores; but since Colonna was not peculiar in that combination of resources, Handel cannot justly be said to have derived from this esteemed master what he shared with his contemporaries.—G. A. M.

COLQUHOUN, JANET, wife of Sir James Colquhoun, Bart., of Luss, and daughter of Sir John Sinclair, Bart., the celebrated author of the Statistical Account of Scotland, was born in London in 1781. Imbued at an early age with religious feelings of uncommon depth and fervour, Lady Colquhoun, till her latest moments, continued to be a rare example of all the christian virtues, and what more particularly entitles her to notice in these pages, one of the most active and liberal promoters of missionary enterprise, both at home and abroad, of which her country could boast. With an earnest desire to consecrate her personal gifts to the spread of evangelical religion, but with no ambition of literary distinction, Lady Colquhoun published at first anonymously, and afterwards, by the request of her father and her husband, with her name, several little works of practical religion, which attained, as they deserved, an extensive circulation. Her liberality to the poor; her munificent gifts to the church; the assistance she rendered to ministers and students whose straitened circumstances excited her compassion; her labours as a teacher among the children of her tenants; her attentions to the sick wherever she chanced to be resident; enshrine her memory in the hearts of thousands as that of one of the most amiable and beneficent of women. Lady Colquhoun died in 1846. A well-known memoir of her from the pen of Dr. Hamilton of London was published in 1849.—J. S., G.

COLQUHOUN, PATRICK, a well-known writer on economics, statistics, and criminal jurisprudence, was born at Dunbarton in 1745. At the age of sixteen he went to Virginia, where he engaged in commercial pursuits. He returned home in 1766, and settled as a merchant in Glasgow, and ultimately attained the dignity of lord provost of that city. He was the founder of the Glasgow chamber of commerce, and was most zealous and active in promoting the manufacturing and commercial interests of the country. In 1789 he removed to London, where he published in 1796 his most celebrated work, entitled "A Treatise on the Police of the Metropolis," &c. His last work, which appeared in 1814, was "A Treatise on the Population, Wealth, Power, and Resources of the British Empire." In 1797 Mr. Colquhoun received the degree of LL.D. from the university of Glasgow. He resigned his office as a police magistrate in 1818, and died in 1820.—J. T.

COLSTON, EDWARD, an English merchant and philanthropist, was born in Bristol in 1636. He acquired in the Spanish trade a large fortune, which he laid out in works of benevolence. He erected and munificently endowed several charitable institutions in his native city; gave six thousand pounds for the augmentation of sixty small livings, and liberal donations to several of the London hospitals. He had no near relations, and never married, alleging that he had all the poor widows in Bristol instead of a wife, and their orphans instead of children. This benevolent "merchant prince" died in 1721, and was buried in the church of All Saints, Bristol.—J. T.

COLTON, CHARLES CALEB, born about the year 1780, was the son of the Rev. Barfoot Colton, canon residentiary of Salisbury. He was educated at Eton and at King's college, Cambridge, where he graduated B.A. in 1801, M.A. in 1804, and in due course obtained a fellowship. For many years he held a curacy at Tiverton in Devonshire, to which he had been

presented by his college; and in 1818 he succeeded to the united living of Kew and Petersham. In 1820 he created a considerable sensation in the literary world by the publication of "Lacon, or many things in few words," one of the most valuable works in the English language. Shortly afterwards appeared "Remarks on the Talents of Lord Byron, and the Tendencies of Don Juan." Colton was a man of ready susceptibility, but very infirm in principle, eccentric in manner, extravagant in his habits, and irremediably addicted to gambling. Having contracted debts to a large amount—chiefly for diamonds and jewellery, and for wines—a fiat of bankruptcy was struck against him; wherein he was sued as the Rev. Charles Caleb Colton, late of Princes Street, Soho, wine merchant. Bewildered by the number and gravity of his pecuniary obligations, Colton secretly embarked for the United States. Returning to Europe after a sojourn of some years in America, he took up his abode in Paris, where he became acquainted with the *habitués* of the gaming saloons of the Palais Royal, and so successful was he in his speculations that, in the course of a year or two, he acquired a considerable fortune, but it was soon dissipated. After a life chequered by nearly every phase of good and of adverse fortune, preferring suicide to the endurance of a painful surgical operation, he blew out his brains at Fontainebleau in April, 1832; and this was the act of him who, in his "Lacon," proclaims this aphorism—"The gamester, if he die a martyr to his profession, is doubly ruined. He adds his soul to every other loss, and by the act of suicide, renounces earth to forfeit heaven."—E. B., L.

COLUMBA or COLUMBKILLE, one of the most important personages in Irish ecclesiastical history, was born at Gartan, in the county of Donegal in Ireland, on the 7th December, A.D. 521. Through both his parents he was descended from princely ancestors, his father, Fedilm, being a member of the reigning families of Ireland and British Dalriada, and his mother, Eithne, a descendant from an illustrious provincial king. This union of noble races no doubt contributed to the extended influence which he subsequently acquired when education, piety, and zeal, were super-added. He was baptized by the name of Colum, one then common in Ireland. The appellation of Cille, "of the cell," appears to have been added in consequence of the frequency of his coming from the cell in which he read his psalms to meet the neighbouring children. Columba was early placed under the tutelage of an ecclesiastic, "spectabilis vitæ presbyter," in his native district, where he remained till he attained a sufficient age for higher instruction, when he went to Moville, at the head of Strangford Lough, and became a pupil of the famous bishop St. Finnian or Finnan, where he received deacon's orders. Thence he proceeded to Leinster, where, after remaining for a time under the instruction of a learned scholar, called Genman, he entered the monastic seminary of St. Finnian of Clonard, and was there associated with a class of students who afterwards attained great celebrity as fathers of the Irish church. Having finished his studies, he was ordained a priest, and commenced those labours by which his fame was established. In his twenty-fifth year he founded the monastery of Derry, and in the year 553 that of Durrow; and during the interval between that and his departure from Ireland, he founded a vast number of monastic establishments, stated at one hundred by Usher, and three hundred by O'Donnell. He travelled through the whole country, awakening the people to piety, and restoring the churches which had fallen into decay. In 563 he passed over with twelve attendants to the west of Scotland, possibly on the invitation of the provincial king, Conall, to whom he was allied by blood, as his biographer, Adamson, relates an interview between them, and the Irish annals record the donation of the island of Ily or Iona as the result of the king's approval. Ily seems at the time to have been under the joint jurisdiction of the Picts and Scots, and the conversion of the former to christianity was a grand project for the saint's missionary exertions. Accordingly, as soon as he had expelled the Druids, and erected a monastery and church, he visited King Bruide at his fortress near Loch Ness, won his esteem, effected his conversion, and eventually succeeded in planting christianity throughout the district. Bruide's consent to the occupation of Ily established Columba's right to the island, and conduced to the stability of the monastic institution which he founded there. From this he extended his labours through the western isles of Scotland, erecting churches, forming christian communities, and supplying religious teachers. There is even reason to believe that to Columba is due the honour of

having been the first to give the light of the gospel to the Anglo-Saxons. Adamson mentions some of them to have been amongst the converts of Iona, who no doubt carried the new doctrines back with them. From time to time the saint visited his native land, where he continued to exercise no small influence, and to be held in high veneration. During one of these visits to Ireland, the saint made a tour through all the districts where he had established churches and monasteries, and then returned to Iona. He also visited his native land again in 585, stopping at Durrow, and thence going to Clonmacnoise. At length, in the midst of his active and beneficent ministrations in the island of his adoption, the saint felt the approach of death. The chapter of his distinguished biographer which describes the last scenes of the saint's life is, as Dr. Reeves justly observes, "as touchingly beautiful a narrative as is to be met with in the whole range of ancient biography." Retiring to an eminence that overlooked the settlement, which was the work of his piety and the last object of his earthly affections, he blessed his disciples with uplifted hands; thence descending to the monastery, he resumed his accustomed task of transcribing the psalter. At midnight prayer he was the first to enter the church, and his brethren found him kneeling before the altar, his strength failing, but his countenance full of joy and cheerfulness; and faintly raising his hand with a parting benediction, his spirit passed tranquilly away, without a struggle, on the morning of Sunday, the 9th of June, 597. The name of this illustrious man will be long remembered in his own country, as well as in the British islands, especially in that one with which it is so inseparably connected by historic associations of his various qualities, both mental and bodily. Adamson's *Life of Saint Columba* has been frequently printed. The last edition, by Dr. Reeves, Dublin, 1857, forms one of the volumes of the *Irish Archaeological and Celtic Society*, and is one of the most valuable contributions to Irish history. We acknowledge ourselves to be largely indebted to its notes and dissertations for this memoir.—J. F. W.

COLUMBANUS, an Irish saint and writer, was born in 559 in the province of Leinster, and of a noble family. He entered the monastery of Bangor in Ulster, where, under the tuition of St. Coemgall, he devoted himself to holy meditation and study for many years. At length, at the age of fifty, he resolved upon a more extended sphere of usefulness, and selecting twelve of his brother monks, he passed over to Gaul, where was then ample field for missionary labour. The place he selected was in the forests of Upper Burgundy, in the neighbourhood of the Alps, where he erected huts for his companions and himself. The fame of his eloquence and learning, and the sanctity of the brotherhood, soon drew the people in crowds about him, and the saint was soon enabled to erect the monastery of Luxeuil. The concourse of disciples, especially amongst the young nobles, was so great, that he was shortly after obliged to establish a second monastery, to which he gave the name Fontaines. Here the saint continued twenty years boldly and zealously preaching, reproofing the vices of the highest, not sparing even Thierry, the young king of Burgundy. By this conduct he was soon involved in strife with Thierry and his mother Brunehant, whose enmity and vengeance he incurred. A body of soldiers proceeded to drive him from his monastery. The whole of the brotherhood expressed their readiness to follow their abbot; but only his own countrymen and a few from Britain were allowed to accompany him. Columbanus visited successively the courts of Clotaire and Theodebert. He then passed into Italy, and was received with distinction at Milan by Agilulph the Lombard king. Columbanus selected a retired spot amidst the Appenines, where he founded the monastery of Bobio, and there passed the residue of his life, dying on the 21st November, 615. He was undoubtedly one of the most eminent men amongst the ecclesiastics of his time. Wise, learned, pious, and full of christian zeal and courage, he has left a fame that is perennial through France and Italy, as well as in his native land. As a writer, judging from what is extant of his, Columbanus must have been extensively acquainted with classical as well as ecclesiastical literature, and it appears he was versed both in Greek and Hebrew. Amongst his works are some Latin poems which display energy of thought and a vigorous style; and though in his letters to persons of high rank he has justly been censured for a stiff and inflated manner, the tone of his moral instructions, written chiefly for monks, is easy and unaffected.—J. F. W.

COLUMBUS, CHRISTOPHER, is the Latin-English name by which the Anglo-Saxon race knows one of the greatest of its benefactors, the heroic Italian navigator, Cristoforo Colombo, the "Christoval Colon" of Spanish history. The time and place of this memorable man's birth have both been themes of elaborate controversy. Twice, however, in what has been formally recognized as his will, he affirms that he was a native of Genoa. As regards the date of his birth, the evidence is unfortunately not so distinct. In one letter, Columbus has undoubtedly stated that he began his voyaging career at the age of fourteen. In another, written in 1501, he intimates that he has been a voyager for forty years. These two statements taken in connection would assign his birth to the year 1446, or thereabouts. But it has been suggested that the forty years spoken of by Columbus do not include those of his residence in Spain between 1484 and 1492. The suggestion has been made in order to reconcile the statement of Columbus himself with that of his intimate friend, Andres Bernaldes, the curate of Los Palacios, who avers that Columbus "died in the year 1506 in a good old age, being seventy years old, a little more or a little less." Columbus would thus have been born some ten years earlier, about 1436. The question is an interesting one, for, surely it would be well to know whether Columbus was a man of forty-six or of fifty-six, when he set sail on his first voyage to America. The best of his biographers Washington Irving, and Navarrete, as well as Alexander von Humboldt, favour the earlier of the two dates.

The father of Columbus was a wool-weaver or a wool-carder in Genoa. Christopher had two brothers, both associated subsequently with his fortunes, and both known to have been well educated men. Columbus himself was, for a time at least, at the university of Pavia, and in his later years he looked fondly back to his early studies of "cosmography, history, philosophy, and other sciences." At fourteen he took to the sea. The Italian mariner of those days was by necessity a fighting man. The Mediterranean swarmed with pirates, Mahometan and Christian. The maritime states of Italy, like the others, were perpetually at war, and privateering was a recognized profession, a resource of the high as well as of the low. From this wild school of Mediterranean voyaging and battling Columbus emerged, to find for a time a more peaceful and tranquil existence on terra firma. He is supposed by his biographers to have repaired to Lisbon about 1470—certainly he was a resident of the Portuguese metropolis before 1474. When Prince Henry IV. of Portugal died, in 1473, a great stimulus had been given by his exertions to the already considerable and fruitful maritime enthusiasm of his countrymen. Had the prince lived, the future of Columbus might have been a happier, but perhaps at the same time a less useful one. As it was, the sojourn of Columbus at Lisbon was most important in its results. He soon gained a wife. To this matrimonial epoch naturally belongs a description of his person and demeanour, minutely detailed by Las Casas and his son Fernando. The virtual discoverer of America was tall and well-formed, his complexion fair and inclined to ruddy; his nose aquiline, his eyes light-gray and apt to kindle. He was simple in his dress and mode of living. His sharp temper was kept well under control. He was eloquent when the discourse ran on high topics, affable and fascinating in ordinary intercourse, and his domestic amiability was as charming as his public demeanour was elevated and dignified. His devoutness was of an enthusiastic kind, and he was noted for his strict attention to the offices of religion. It was to the latter that he owed his introduction to his wife. In Lisbon, he attended service at the chapel of the convent of All Saints. Here he met—elsewhere, no doubt he wooed, and that successfully—Donna Filipa Monis de Perestrello. The lady was not rich, but she brought him a valuable dower of geographical knowledge and stimulus. Donna Filipa's father had been one of Prince Henry's navigators, and governor of Porto Santo, an island recently discovered in the very neighbourhood of Madeira. Her sister was married to another ex-governor of Porto Santo. The newly-wedded pair resided with the mother of Donna Filipa. The charts, papers, and memoranda of his wife's father were placed in the hands of Columbus, and with the conversation of his brother-in-law, excited him in the direction of new geographical discovery. When in Lisbon he devoted himself to the construction of maps and charts for a livelihood, and his mind began to compare the known of the earth's surface with the unknown. For a time he

resided at Porto Santo, where his wife had a small property, and voyagers from the Guinea coast were in the habit of touching. Sometimes he took part in expeditions to the coast of Guinea. His greatest adventure of those years, however (if at least we are to credit one plausible view of it), was a voyage to the Northern Ocean in the February of 1477.

The earliest trace of Columbus' great design belongs to the year 1474, a year otherwise memorable for the introduction of printing into England. In that year, we find him corresponding with Paolo Toscanelli of Florence, on the feasibility of a western passage, not to America, but to Asia. The learned Toscanelli approved of the design, and sent Columbus a chart of his own construction, in which the eastern coast of Asia was represented as moderately distant from the western coasts of Africa and Europe, and in the intervening ocean stood Marco Polo's Cipango (Japan), and the imaginary island of Antilla, still recognizable in the Antilles. This map, or some redaction of it, Columbus had with him on his first voyage to America. For his knowledge of the general literature of the subject Columbus was chiefly indebted to the *Imago Mundi*, a cosmographical compilation of Cardinal Pierre d'Ailly, bishop of Cambrai, written in 1410, and printed probably about 1480. Here he found, collected, the dim guesses of ancients and moderns at the true figure of the earth, and the possibility of sailing from west to east. This was the book that furnished him with weapons for his frequent controversies subsequently with the learned sceptics of Spain and Portugal. The copy of Pierre d'Ailly's work which belonged to Columbus, and which is studded with MS. notes in his handwriting, still lies in the library of the cathedral of Seville, a priceless item of the *Bibliotheca Columbina*, bequeathed by the great navigator's son, Fernando, to the library of the cathedral. But it was not only from fanciful charts and the theorizings of scholars, old and new, that Columbus derived his faith in the existence of easily accessible regions to the west. Eagerly he inquired from practical men respecting vestiges of a world beyond the western wave. By two happy mistakes he diminished the circumference of the earth, and gave a vast imaginary extension to Asia. It grew to be for his mind no mere matter of speculation, but an indubitable fact, that the eastern shore of Asia, and the magnificent civilization described by Marco Polo could be attained by a moderate voyage westward from Europe; and the belief that he had reached Asia, not that he had discovered a new continent, remained with him to his dying day. His highest religious aspirations, and his intensest worldly desires gradually grouped themselves round this central faith. He saw immense authority and illimitable wealth, the reward of his achieved discovery; but all earthly gains were subordinated to the triumphs of the Cross among new and vast populations. The certain wealth to be acquired by himself should be devoted—such was one of his dreams a few years further on—to another crusade, and to the recovery of the holy sepulchre from the hands of the infidels, with whom he had already battled in his early and obscure years of Mediterranean voyaging.

In 1481 John II. ascended the throne of Portugal. It was shortly after the accession of this monarch that Columbus—after having, it is said, vainly applied to Genoa—propounded to him the daring scheme of reaching India by the western ocean. Preoccupied probably by the idea of the south-eastern route, John at first discouraged the new enterprise, but eventually referred it to a *junto* composed of his two physicians and his confessor, the bishop of Ceuta. By them the notion was condemned as chimerical, a verdict which was ratified by a great council of civil and ecclesiastical dignitaries and learned men, whom the hesitating king constituted a court of appeal. The king still hesitated, when an ignoble compromise was offered to him and accepted. Under pretence of a wish thoroughly to examine them, the detailed plans of Columbus were procured from him. Unknown to him, a caravel was despatched westwards on a voyage of discovery. After a few days, stormy weather frightened the conductors of the expedition back to Lisbon, where they ridiculed the aim of Columbus. Indignant at this treachery, Columbus declined any further negotiations with John II., and shook the dust of Portugal from off his feet. He left Portugal, it is believed, not only poor, but in debt. His wife was dead, and he took with him a little motherless Diego, who lived to be second admiral of the Indies. It is supposed that he now applied a second time to Genoa to aid him in his enterprise, and

that during his visit to his native city, he assisted, out of his own scanty means, his aged father, whom he had already helped while struggling for a subsistence as a cartographer in Portugal. A deep affectionateness of disposition is one of the most noted of Columbus' characteristics.

It is in 1485, and in the south of Spain, that we next see Columbus distinctly. Great dukes of Medina-Sidonia and Medina-Celi, with estates and ports upon the sea-board, lent an attentive ear to his glowing projects; but his only direct gain from them was a recommendation to Queen Isabella of Spain. The astute Ferdinand and the noble-minded Isabella were then occupied with their campaigns against the Moors. At intervals they entertained the schemes of Columbus so far as to have him a frequent visitor of their camp, and to relegate his enterprise to the discussion of eminent men. From Cordova (where he became acquainted with the mother of his illegitimate and second son, his future biographer, Fernando) Columbus followed the court to Salamanca in 1486, by order of King Ferdinand, and there he held a solemn conference with a *junto*, chiefly composed of learned and scientific ecclesiastics. At the epoch of this discussion, Copernicus was a boy of thirteen, and Columbus was met with quotations from the bible and the fathers against the rotundity of the earth. The conference was adjourned without definitive result. From 1487 to 1490, Columbus hung about the Spanish court and camp, now stoutly fighting against the Moors, and summoned to consultations with the Spanish sovereigns, sometimes full of hope, sometimes so discouraged as to think of renewing negotiations with John of Portugal, or of repairing to London and Henry VII. At last, in the summer of 1490, he presses with such earnestness for a distinct reply to his application, that the old conference is ordered to give him one. Its members report against him; and the curtain drops for a time on Columbus, the rejected and disappointed, poor and isolated, beginning once more his weary pilgrimage.

When the curtain rises again it is to discover Columbus approaching the gate of the convent of Santa Maria de Rabida, near the haven of Palos in Andalusia, for the purpose of procuring a crust of bread and a draught of water for the little boy by whom he is accompanied. The prior of the convent, sauntering by, observed that he was a foreigner, and, entering into conversation with him, learned who he was. This interview with the prior of the convent of Rabida, Juan Perez de Marchena, was the turning-point in the career of Columbus. The prior was a man of sense, and he had been the queen's confessor. He talked with Columbus, grew interested in his schemes, and introduced him and them to the notables of the neighbourhood, among others, to Martin Alonzo Pinzon, the head of a flourishing family of navigators in the then thriving and adventurous port of Palos. Pinzon was convinced, and offered his co-operation, personal and pecuniary. The prior, presuming on his old connection, wrote fervently to the queen for decisive encouragement to Columbus, who spoke of repairing with his projects to the court of France, whither, it is said, Charles VII. had invited him. Isabella, perhaps alarmed lest another country should profit by Columbus' discoveries, sent for both Columbus and the prior, and with womanly thoughtfulness transmitted a considerable sum of money wherewith the impoverished adventurer might equip himself for appearance at court. He arrived in time to witness the surrender of Granada, and in the glories of the triumph did not grudge a little delay. At last he was heard once more; but, at the very threshold of the negotiations, the lofty and unbending pride of Columbus nearly proved suicidal. He insisted on high titles and privileges; he was to be admiral and viceroy of all the countries discovered; and one-tenth of all gains derived from commerce or from conquest were to be his. The courtiers laughed; the official person who more directly treated with him was the queen's confessor, the new archbishop of Granada, and he professed himself shocked at the claims of the humble projector. Even Queen Isabella wavered. It shows the genuine confidence which Columbus had in himself and in his mission, that, at this apparent crisis of his fate, he refused to give way. At the commencement of February, 1492, he mounted his mule and set forth for Cordova on his road to France. Once again Queen Isabella was strenuously appealed to by an official believer in Columbus, and once again she summoned him to her presence. When he reached the court again, he found his demands conceded. On a former occasion,

with an eye to the offer of Pinzon, he had, when twitted with his poverty, offered to bear one-eighth of the expense. This condition was embodied in the so-called "capitulations," signed by Ferdinand and Isabella on the 17th of April, 1492; and with the aid of the Pinzons of Palos a third vessel was added to the expedition, nominally at the expense of Columbus. The port of Palos, the head-quarters of the Pinzons, was fixed on by Columbus as that of equipment and embarkation. Towards the beginning of August, 1492, the squadron was ready for sea. It was, for the magnitude of the enterprise, on a wonderfully small scale, and consisted of three little vessels. Two of them were of the class called "caravels"—light vessels, somewhat like those employed in our river and coasting trade, built high at prow and stern, with forecastles and cabins for the crew, but without decks. One of these was the *Pinta*, commanded by Martin Alonzo Pinzon and his brother; the other, the *Nina*, with lateen sails, was commanded by a third of the brothers Pinzon. The largest, prepared expressly for the voyage and decked, was the *Santa Maria*, and this was the admiral's ship. The exact tonnage of the vessels cannot be ascertained, but Columbus, in a subsequent voyage, is known to have complained of the undue size of his ship, which was nearly a hundred tons burthen! In such craft did the brave voyager and his friends face the mysterious terrors of the unknown Atlantic. Amid the doubts and fears of those on shore, with prayers to heaven for mercy and guidance, the expedition set sail from the sand-bar of Sultes (near the confluence of the Tinto and Odiel, rivers of Palos and Huelva) on the morning of Friday, the 3rd of August, 1492. One hundred and twenty persons constituted the population of the *Santa Maria*, the *Pinta*, and the *Nina*.

Slight mishaps and panics ushered in this memorable voyage. The loss of the *Pinta's* rudder kept the expedition three weeks at the Canaries, in unsuccessful search for another vessel, and the volcanic flames of Teneriffe terrified the ignorant and superstitious crews. On the 9th of September, Ferro, the most south-westerly of the Canaries, faded out of sight, and lamentations broke out among the crews, promptly met by the sonorous eloquence of the confident and enthusiastic admiral. To conceal from the timid crews the real distance which lay between them and their homes, Columbus kept two reckonings. A correct one was retained for his own secret inspection; from this a number of leagues was daily subtracted, and thus the diminished log was shown to the crews. On the 13th of September, Columbus noticed, for the first time, the variation of the magnetic needle. He endeavoured to conceal it from the crews, but the pilots soon observed it and were terror-struck at the sight, fearing that the compass itself was about to desert them in the unknown waste of waters, and leave them guideless and hopeless. Columbus, with his quick ingenuity, ascribed the variation to a movement in the pole-star itself, and by one of his unfounded but lucky theories succeeded in allaying the alarm of the pilots.

Hope and fear swayed alternately in the breasts of the crews. The admiral alone knew no vicissitudes of feeling. Two days before the first notice of the variation of the needle, the seamen were dismayed by the sight of part of a mast, which had evidently been long in the water, and regarded it as a warning to themselves. Three days afterwards they were buoyed up by the appearance of a heron and a tropical bird, neither of which, it was thought, could have ventured far from land. Soon the vessels were within the influence of the trade-wind, and were wafted on by it pleasantly westward. Patches of herbs and weeds came drifting from the west, and some of them were thought to grow only in rivers. For a time the crews were in the highest spirits. Then came a false report of land to the west, which turned out to be cloudland, and after several similar disappointments the men began to murmur. Even the trade-wind was a source of alarm to them, for they feared that in those seas it blew always from the east, and they could thus never return to Spain. The crisis of their discontent arrived when the vessels were becalmed, or nearly so, amid vast masses of weeds; and it was in vain that Columbus argued with them that the calmness arose from the nearness of land. The nearer they approached the goal the more mutinous they became; and at last they began to speak of making away with the admiral and returning home. Columbus preserved his serenity—now conciliating, now stern, as suited the characters of those with whom he was dealing.

At last, after many disappointments, and when the crews could scarcely be kept from open mutiny, on the 11th of Octo-

ber there were picked up not only river-weeds, and a branch of thorn, with berries, but a reed, a small board, and a staff, artificially carved. Joy and hope were once more the order of the day. In the evening, after the singing of the usual vesper hymn, the admiral addressed his men in pious and confident accents. At ten at night, Columbus, who had long been gazing anxiously on the horizon from the poop of his vessel, descried what seemed to him a light. At two in the morning a gun from the *Pinta* announced that land was seen. The vessels lay to, until the dawn should reveal the truth. There, as day dawned, it lay, a level island, covered with trees, from which the naked natives were running astonished to the shore. It was Friday, the 12th of October, 1492, a date for ever memorable in the history of the world. The voyage had lasted seventy days. The island, of which Columbus immediately took possession in the name of Spain, he called San Salvador. It is the Cat-island of the English mariner, one of the great Bahama cluster. The claims of Turks Island have found able assertors. Columbus, believing then and ever afterwards that he had reached the confines of India, the new populations were spoken of as Indians; and those insular regions remain the West Indies to this day.

Onwards from the point reached in our narrative, the life of Columbus is so connected with history, general and special, that a rapid summary may suffice for a work avowedly biographical. Henceforth, the biography of Columbus can present little else than developments interesting indeed, but unimportant, when compared with the grand and primal fact of the discovery itself. Alas! the "little else" is of a saddening and tragical kind. After discovering, among other islands, Cuba and Hispaniola, Columbus erected on the latter the fortress of La Navidad, and established a colony. On the 15th of March, 1493, he arrived from his first voyage at the port of Palos, from which he had sailed on the preceding 3rd of August. His reception in Spain was magnificent; his triumphal entry into Barcelona was almost worthy of the man and his achievements. When with characteristic ardour he set sail on his second voyage on the 25th of September, 1493, he was attended by the blessings and prayers, the enthusiastic God-speed of a whole nation. But the seeds of future calamity were already sown. A "department of Indian affairs," as we would say, had been created, and at the head of it was placed Juan Rodriguez de Fonseca, archdeacon of Seville, afterwards patriarch of the Indies. He retained the office during thirty years, and was ever the jealous and malignant enemy of Columbus. The chief discoveries of Columbus during his second voyage were Jamaica and the Caribbee islands. He did not reach Spain again until the 28th of April, 1496, and such were the difficulties of the homeward voyage, that he and his crew disembarked, weather-worn and emaciated, and received but a cold reception from the disappointed and lukewarm Spanish public. The still-continued favour of royalty made some amends for this mortification. But Columbus soon felt that there was a power behind the throne. The eight ships which he requested for a third voyage were verbally conceded, yet official intrigue succeeded in delaying his departure until the 30th of May, 1498. Little more than six months had elapsed between his return from his first voyage and his departure on his second one. Between his arrival from his second voyage and his departure on his third one, an interval of nearly a year was interposed. During his third voyage, Columbus discovered Trinidad and for the first time the Terra Firma of the American continent, that in its immediate vicinity. True to his belief that he had reached Asia, he fancied that he had found at Paria the abode of our first parents! On reaching Hispaniola he was grieved by the spectacle of the colony disorganized and disobedient to himself. He was engaged in restoring order when a more terrible blow was struck at him from beyond the ocean. Mal-contented, who had returned to Spain, accused him of tyranny and extortion. Wearied by these complaints, which were skilfully aggravated by Fonseca, Ferdinand, in an evil hour, despatched on a mission of inquiry, and with authority to supersede Columbus if desirable, Francisco de Bobadilla [See BOBADILLA], whose treatment of the great navigator has given an infamous celebrity to his name. Arriving at Hispaniola, Bobadilla at once and without investigation superseded Columbus, seized his effects and papers, and despatched him in criminal fashion to Spain, a prisoner and in chains! The master of the caravel which bore to Spain the illustrious captive, with respectful compassion offered to remove

the irons. With characteristic pride Columbus refused to allow, without the king's command, the removal of chains which had been imposed by a delegated representative of the king. To his dying day he kept the fetters as memorials in his chamber! His arrival under such circumstances and in such a condition, produced a reaction in his favour. Ferdinand and Isabella ordered his immediate liberation, and provided for his dignified progress to court, where he was received with honour and graciousness. Bobadilla was to be removed forthwith, and Columbus to be reinstated in his governorship. But instead of this an interim-governor for two years, to pave the way for the return of Columbus, was appointed in the person of Nicholas de Ovando, whose subsequent conduct to the great discoverer was of the basest kind.

Columbus was advanced in years, broken in health, maltreated, betrayed, impoverished—such was his exceeding great reward for his magnificent discoveries. Some men would have lapsed into sullen and discontented inaction, or died of a broken heart. But he was possessed by a great idea. Still he would reach India by the west—India which Vasco de Gama, five years before, had reached by the passage round the Cape. A fourth and last expedition was organized for Columbus, but it was petty in the extreme, compared to that with which Ovando had set forth to assume the government of Hispaniola. Such as it was, it sailed on the 9th of May, 1502, under the command of Columbus. The last of his voyages was also the most perilous. In this voyage he discovered Cape Honduras; and, skirting the Mosquito coast, he experienced a terrific tempest. The name of Cape Gracias a Dios still survives to attest the "thanks to God" there offered up by the devout Columbus for his preservation. The rumoured gold mines of Veragua irradiated him with hopes of a proximity to the country of the grand khan, and a river talked of by the natives he fancied to be the Ganges! After the discovery of Puerto Bello, a series of perils and disasters, greater than any to which Columbus had been yet exposed, culminated when he reached a harbour of Jamaica with his ships reduced to mere wrecks. He ran them aground near the shore, and they filled with water to the decks. Cabins were erected for the accommodation of the crews, and a faithful coadjutor was despatched to Ovando at St. Domingo. Then there came, and for long months continued, a frightful time of hardship and danger for Columbus, even whose stout brain and heart nearly gave way. To mutinies among his men was added the refusal of provisions by the natives. Hard fighting could not quell the mutineers, but they had at least to fly. The natives were vanquished by Columbus' dexterity and astronomical knowledge. Foreseeing an eclipse of the moon, he threatened them with a darkening of the great orb of the night, as significant of the anger of the divinity. The darkness came; the terrified natives implored the European's intervention, promising all that he might ask for. When the eclipse was about to end, he came forth from his cabin, announcing that heaven relented; and as the moon recovered her brightness, the savages believed. At last the long and purposely delayed ships arrived from Ovando. Columbus and the survivors of his crew reached St. Domingo to find his own mild policy overturned, and the old native population nearly extinguished by massacre. With heavy heart he set sail for Spain, and on the 7th of November, 1504, he dropped anchor in the harbour of San Lucar.

Eighteen months more and Columbus was at last to enjoy repose—the repose of the grave. Sad and dreary months! He was steeped in poverty—his just dues were denied him. "I live by borrowing," he writes once. Yet he was more solicitous for the payment of his seamen than of himself. His health was irretrievably gone, and ultimately rheumatism prevented him from continuing to write the applications for justice to which the coldest replies were vouchsafed. His best friend, Queen Isabella, died, and with her Columbus' hopes. But to the last he preserved the pride which, in earlier years, had made him reject the offered co-operation of the crown, rather than abate one jot of his just claims. From Seville he dragged himself to Segovia, where Ferdinand received him frostily. The king offered indeed to refer to arbitration all matters in dispute between Columbus and the crown, but he insisted on including in them the claim to reinstatement in his office of viceroy. Columbus refused. All mere money-matters he would refer to arbitration, but his inalienable honours and dignities, never. Months of delay ensued, until the final voyage was to be made. Conscious

of his approaching end, Columbus made at least one will, of which the authenticity is indisputable, and having received the sacrament and performed the other offices of his faith, he gave up his soul to his Maker on the 20th August, 1506. "In manus tuas, Domine, commendo spiritum meum" (Into thy hands, O Lord, I commend my spirit), were his last words. His ashes, after many transfers, now rest in the cathedral church of the Havanna. He was buried first at Valladolid, whence his remains were removed to the Carthusian monastery of Las Cuevas, near Seville. It was there that over his grave was placed the memorable inscription, which he had in his lifetime been allowed to use by special favour of his sovereigns:—

A Castilla y a Leon  
Nuevo Mundo dió Colon—

What he received in return has been seen.—F. E.

COLUMBUS, DIEGO, eldest son of the discoverer of America, was, in spite of his illegitimacy, designated by the great Columbus as his heir. A page, when young, of the prince royal of Spain, and afterwards attached to the Spanish court, Diego aided, or tried to aid his father, in the frequent and fruitless negotiations of the latter with Spanish royalty and its representatives. Much of Diego's own life was spent in the unsuccessful assertion of his rights as the heir of his father. Recognized in 1509 as second admiral of the Indies, Diego proceeded to San Domingo, but enjoyed his vice-regal dignity for only four years. Returning to Spain in 1515, to answer in person the charges brought against him in an official letter of the council of the Indies, he had to experience the same treatment which embittered the last years of his father. Following the court from place to place, unable to obtain redress for his grievances or a decision for his claims, he spent ten weary years of solicitation and hope deferred, dying at Montalban in his forty-ninth year. His original acquisition of the admiralship of the Indies, seems to have been facilitated by his marriage to a lady of rank, the daughter of one, and the niece of another, Spanish grandee. This lady accompanied him to San Domingo, where her talents and character exercised a great and salutary influence on the vice-regal court and the general society of the island. But her influence does not appear to have been of any service to her husband in the closing years of Don Diego's life.—F. E.

COLUMBUS, FERNANDO DE, the son and biographer of the great admiral, was born in Cordova either in 1487 or 1488. His mother, Doña Beatrix Enriquez, was a lady of respectable family, but was never married to the admiral. At seven years old, Fernando and his elder brother, Diego, were placed as pages in the household of Don Juan, the son and heir of Ferdinand and Isabella. The education he received at court enabled him to turn to literary advantage the material collected in his subsequent travels. At the age of fourteen (1492) he accompanied his father to America in his fourth and last voyage, and endured all the hardships of that enterprise with a bravery which seems to have endeared him to the heart of the great navigator. We afterwards hear of him as engaged in pressing his father's claims on the Spanish court. After his father's death he appears to have made two more voyages to America, and accompanied the Emperor Charles V. to Italy, Flanders, and Germany. According to Luñiga his travels were extended over all Europe, and part of Africa and Asia. Throughout life he seems to have preserved his literary tastes, and formed a library of more than twenty thousand volumes, in print and manuscript. With the sanction of the emperor, he commenced the building of a splendid edifice at Seville, intended for an academy of mathematics, but did not live to complete the undertaking. His own most important contribution to literature is a history of his father, written in Spanish, but now extant only in a retranslation from the Italian version of Alonzo de Ulloa, full of inaccuracies, which so learned a man as Fernando de Columbus could scarcely have fallen into. Fernando died at Seville, 12th July, 1539, worn out with the fatigue of his unceasing labours. He was never married, and left no issue. His valuable library was bequeathed to the cathedral of Seville.—F. M. W.

COLUMELLA, LUCIUS JUNIUS MODERATUS, a Latin writer on agriculture, born probably at Gades (Cadiz) in Spain, about the beginning of the christian era. He possessed an estate in the country of Sa Cerdaña, near the Pyrenees, where he carried on the cultivation of the vine with great success. He seems, however, to have resided for a considerable part of his life at Rome, and to have travelled through various parts of the Roman

empire. His principal work, "De re Rustica," addressed to Publius Silvinus, is in twelve books, and treats not only of agriculture proper, but of the management of animals, poultry, and bees. The last edition is Schneider's, Lips. 1794. The *editio princeps* was printed by Nicolas Janson at Venice in 1472. A genus of plants, called Columellia, has been named after him.—F. M. W.

COLVILLE, JOHN, who figured in the turbulent and factious contests which distracted Scotland during the sixteenth century, was a member of the family of Colville, of East Wemyss in Fife. He was for some time minister of Kilbride and chantor of Glasgow; but, abandoning the clerical profession, he got introduced to court about the year 1578, and obtained the office of master of requests. He joined the party of nobles who were engaged in the raid of Ruthven, and was sent by them as their ambassador to Queen Elizabeth. For his connection with this plot he was imprisoned when King James recovered his liberty, but his offences appear to have been speedily pardoned; for, in 1587, he was appointed by the king a lord of session in the room of his uncle, Alexander Colville. We find him next associated with the notorious earl of Bothwell in his attempts to seize the king in Holyrood, and he was ultimately obliged, along with the earl, to seek refuge in France. He endeavoured, by the publication of a treatise called "The Palinode," and by various other arts, to ingratiate himself with the king, and to obtain his permission to return home; but having entirely failed in his object, he embraced the Roman catholic faith, and wrote several controversial treatises against the protestant religion. Colville died in 1607, while on a pilgrimage to Rome.—J. T.

COMBE, DR. ANDREW, a distinguished physician and writer on physiology, younger brother of George Combe, was born in Edinburgh, October 27, 1797. He was educated in his early years chiefly under the superintendence of his brother George, who has written a life of him well worthy of perusal. Having chosen the medical profession, he graduated at Edinburgh, and visited Paris for the prosecution of his studies. In 1823 he began medical practice in Edinburgh. Great delicacy of health, produced by a pulmonary disease, took him frequently from his work to seek renewed health in warmer climates, so that his career as a physician was much interrupted. In 1836 he was appointed consulting physician to the king of the Belgians. As early as 1818 he had, like his brother George, given his attention to phrenology, and become a convert to it, and for many years continued to advocate its doctrines through the *Phrenological Journal*. He was also a distinguished writer on general scientific and medical subjects. His best known works are his "Principles of Physiology applied to Health and Education," his "Physiology of Digestion," and his treatise on "Physiological and Moral Management of Infancy." His "Digestion" is, perhaps, the most original of the three. These works were written in the intervals of comparative freedom he enjoyed from the malady which he knew would one day carry him off. Dr. Combe was a singularly amiable man, remarkably free from the foibles and prejudices of invalids. His writings have done in a great measure for the human body, what those of Locke did for the mind. He explained the laws of physiology, rather than the structure of organs, and was one of the first to apply the great principles of human physiology to the prevention of disease and the prolonging of human life. His death, which was long expected, took place in Edinburgh on the 9th of August, 1847.—E. L.

COMBE, CHARLES, a learned physician, born in London in 1743, and died in 1817. He was a contemporary of Dr. Parr and Sir William Jones at Harrow. On leaving that school he returned home, and, under his father's direction, applied himself both to the study and practice of medicine. In 1768 the father died, and young Combe succeeded to his practice. He became a member of the Society of Antiquaries in 1771, and in 1776 was nominated a fellow of the Royal Society. He graduated in 1783, and soon after became physician-extraordinary to the British Lying-in-hospital in Bourbon street. Combe formed a splendid collection of Greek and Roman medals and coins, to the study of which, in connection with the history of ancient customs, he devoted much of his attention. He also published, in concert with the Rev. Henry Homer, an edition of Horace, with notes—a performance which was subjected to the adverse criticism of Dr. Parr.—R. M., A.

COMBE, GEORGE, brother of Dr. Andrew Combe, born in

Edinburgh in 1788; died near London in 1858. Few thinkers of the present age have exercised so wide an influence as Mr. Combe. Of one of his works, no fewer than one hundred thousand copies have been circulated in this country alone. The number of "The Constitution of Man" sold in America, must be prodigious; and it has been translated into most of our European languages. The exquisite clearness of its style renders the meaning of its every sentence patent to any ordinary man; and its subject-matter has been universally recognized as of immediate bearing on human happiness.—We shall briefly sketch the nature of Mr. Combe's character and philosophy. In his portraiture of the early years of his brother, he has virtually told the story of his own—a story that may be repeated, although with different results, concerning many an old Scottish family. His father—in tolerable circumstances—seems yet to have been straitened by the unusual number of his children (seventeen); and this, conjoined with the stern influences of an ultra-Calvinism not uncommon in those days, availed to banish ease and freedom from the household. While treasuring the memories, and fondly remembering the virtues of their parents, both brothers appear to have looked back on the sad constraint at Livingstone Yards, as something against which they could never warn parents enough; and it is not improbable that the recollection gave a peculiar stimulus to their long efforts on behalf of a truer and more benign treatment of the young. On finally quitting home, George entered the profession of the law, and became writer to the signet; but, although diligent and successful in his profession, his keen and active intellect unceasingly busied itself with higher inquiries. Dissatisfied with formal or dogmatic Calvinism, and feeling as little solidity in the metaphysics of the time—although expounded in the most winning manner by Dugald Stewart—his mind seems to have been ever turning to the question—Where can a doctrine of practical life be found? "Give me a philosophy that shall not pass the ear as mere sounds, but directly and immediately guide and explain actions, and so lead to effective results." About this period Spurzheim lectured in Edinburgh. Mr. Combe followed him, examined with characteristic caution and care the facts adduced by the lecturer, and was convinced by them. How earnestly and steadily he clung to phrenology, is known by every one who has heard of his name. He was no mere disciple of Spurzheim or Gall, or any other master: his ultimate system was his own; and the great work in which he finally expounded that system, is replete with sketches of character and of mental peculiarities and actions, from which any inquirer, phrenologist or not, may obtain large instruction. As to the subject itself, we do not of course discuss it here; it may be stated, nevertheless, that although not in Mr. Combe's favourite form, all recent physiology is unequivocally pointing to a closest dependence of mental action on the agency of physical conformation and processes. Having adopted phrenology as his fundamental philosophy, Mr. Combe's attention was naturally powerfully drawn to the influence of external laws—or rather the laws of what we term the material world—on human well-being; and out of his speculations in this direction a philosophy sprang much wider and more catholic than any phrenology or special physiological theory. The proposition on which that philosophy rests is so manifest and unquestionable that few at present deny it, whether they adopt its applications or not. It is not very long ago since a fancied opposition between matter, or the world, and spirit, formed the virtual basis of the greater part of our highest teaching. Mr. Combe said, there is no opposition; on the contrary there is very harmony. By God's providence we are placed in the midst of a material universe ever acting upon us, and governed by a perfect order. *We cannot change that universe, therefore we must place ourselves in harmony with it: we must ascertain and recognize its laws, and submit ourselves in willing obedience to their behests.* This is the grand and sole thesis of the "Constitution of Man;" but it is not laid down as a mere abstraction in that remarkable volume. Mr. Combe pursues it through momentous consequences, and expounds principles which have since been adopted as the ground of much valuable and important legislation. It is certainly no marvel that the volume referred to has been a favourite with the intelligent masses of this country. First of all accessible works, it opened before them a practical way towards the amelioration of their condition; showing how, independently of either social or political change, they could largely and efficiently help themselves. The essay

was certainly not a favourite with many excellent and able persons, some of whom took perhaps an exaggerated view of its supposed consequences, and attributed to the author designs which he had not in contemplation; but it has made headway, and left public opinion in a state very different from that in which it found it. Mr. Combe developed his fundamental views under various forms, never resting from applying them when public duty demanded that he should speak. His works in relation to this matter are numerous and various—works on education, on sanitary reform, on "Religion and Science," &c. Nor was his activity confined within this sphere. His pious biography of his brother is replete with interest. His pamphlet on the "Currency," although only a pamphlet, contains the whole principles of the subject, and contrasts strikingly with the volumes of trash one is doomed to read on this plain but much tortured subject. Whether on the currency, on moral philosophy, on phrenology, as a biographer, or as the writer of notes of travel, one never misses for a moment the clear and fearless thinker, the upright and benevolent man. Mr. Combe will long be missed in Edinburgh. His open and liberal hospitality made his house really a *salon*. Alongside of Lord Murray's, it was the house where every literary stranger of merit was sure to find a welcome. Nor was his kindness limited to strangers; was there a young man of apparent desert struggling and fighting his way, he could find no surer or more judicious friend than George Combe. As may be inferred from what has just been written, Mr. Combe had not arrived at any definite doctrinal creed. But he had learnt to bow humbly under the hand of his Creator; and in humility, in resignation, and firmest faith, he entered the valley of the shadow of death.—J. P. N.

COMBE, TAYLOR, son of the Dr. Charles Combe, was born in 1774, and was educated at Harrow and Oriel college, Oxford. In 1803 he was appointed to a situation in the British museum, and in 1807 was placed in charge of the department of antiquities. He was elected in 1806 a member of the Royal Society, and became its secretary in 1812. His knowledge of ancient coins, Greek, Roman, and British, was both profound and accurate. He wrote a considerable number of papers for the Society of Antiquaries. Mr. Combe died in 1826.—J. T.

COMBER, THOMAS, D.D., was born in 1645, at Westerham, Kent. He graduated in arts at Cambridge, as a member of Sidney Sussex college, and afterwards received the degree of D.D. from the archbishop of Canterbury, a privilege used by the archbishops only on rare occasions, and in the case of men of distinguished learning. That it was fitly exercised on behalf of Dr. Comber, may be proved by his "Companion to the Temple, or, a Help to Devotion in the use of the Common Prayer," a work of great research, written in a strain of earnest piety, which can scarcely fail to recommend it to every unprejudiced reader. Dr. Comber became, in succession, prebendary of York and dean of Durham, and died in 1699.—T. S. P.

COMELLA, LUCIANO FRANCISCO DE, a Spanish play-writer, flourished in 1790.—F. M. W.

COMENIUS, JOHANN AMOS, a celebrated German educator, whose real name was KOMENSKY, was born at Komna, near Brünn, 28th March, 1592. In 1614 he was chosen head master of the school at Prerau, and in 1616 of that of Fulneck. In order to escape the bloody persecution directed by the catholics against all dissenting ministers, he fled into the Bohemian mountains, where he became domestic tutor to the family of some nobleman, and wrote several works in the Bohemian language. When he was no longer safe even in this secluded spot, he resorted to Lissa, where he published in 1631 his "Janua Linguarum Reserata?" This work, in which he exhibited a new method of teaching languages, was translated into several European and even some eastern languages, and soon won so high a reputation for its author that he was invited to England in 1641 and Sweden in 1642, for the purpose of instituting and organizing schools. He then was commissioned at Elbing by Oxenstierna to write a detailed scheme for the organization of schools in Sweden—a task which it took him four years to perform. Towards the close of his life he went to Holland, settled at Amsterdam, and died at Naarden on 15th October, 1671. Among his numerous works perhaps his "Orbis Sensualium Pictus," Nuremberg, 1658, has had the greatest success. It has been many times translated and many times imitated, for instance, by Basedow. Opera Didactica Omnia, Amsterdam, 1657, fol.—K. E.

COMINES, PHILIPPE DE, Lord of Argenton, was descended

from an illustrious Flemish family, and was born in 1445. He was introduced in 1464 to the count of Charolais, afterwards Philip the Bold, duke of Burgundy, followed him in the war of the "Public Good," and was present at the battle of Montlhéry. He lived for a number of years at the court of that headstrong prince, and by his prudence and sagacity moderated many of his rash and violent projects. The impetuous temper of the duke at length became intolerable. Comines was in some way offended by the treatment he received, and was induced to transfer his services to Louis XI. of France, by whom he was loaded with honours and estates, and married to Héléne de Jambes, the heiress of a rich and noble family. In return, Comines rendered various important services to Louis, and preserved to the last the confidence of that jealous and suspicious monarch. After the death of Louis, Comines was expelled from the court on account of some intrigues against the government of Anne of Beaujeau, and attached himself to the constable de Bourbon. But that powerful noble having made his peace with the court, discarded Comines, who joined the party of the duke of Orleans (afterwards Louis XII.), and became involved in a plot formed by him and Count Dunois. He was in consequence arrested in 1486, and sent prisoner to Loches, where he was shut up for eight months in an iron cage. He was subsequently tried by the parliament, found guilty, and sentenced to banishment, and the confiscation of one-fourth of his estates. There is reason to believe, however, that the sentence was not executed. It is certain that he was employed by Charles VIII. in several important negotiations, and rendered to him most valuable services. He died at Argenton in Poitou, 16th August, 1509, at the age of sixty-four. Comines is indebted for his celebrity to his famous "Memoirs," which contain the history of his own times, from 1464 to 1498, published in Paris in 1525 and 1528. A new edition, published in 1552, has often been reprinted. The best and most recent edition is that of Dupont, 3 vols. 8vo, Paris, 1850. The work was translated into English in 1596. It is remarkable for its natural and easy style, cool and accurate discrimination of character, and profound and sagacious reflections. Its moral principles, however, do not rise above the low standard of the period. Comines has been compared to Tacitus, and he is undoubtedly one of the most sagacious historians of his own, or indeed of any other age.—(See De Barante's *History of the Dukes of Burgundy*, and Scott's *Quentin Durward*.)—J. T.

COMMANDINE, FREDERICK, born at Urbino in 1509; died in 1575. He was a good mathematician, and most valuable writer. We owe, *inter alia*, to his industry our best Latin translations, and the earliest editions of the works of Archimedes, Apollonius, Euclid, Ptolemy, Pappus, &c. They were printed by the celebrated Aldus.—J. P. N.

COMMIRE, JEAN, born at Amboise in 1625; died at Paris in 1702. His reputation for Latin verse was very great, and some graceful lines of his are often quoted.—J. A., D.

COMMODIANUS OF GAZA, a christian poet of the third century. His book, called "Institutiones," is written acrostically, in a loose kind of hexameter.—R. M., A.

COMMODUS, L. AURELIUS, one of the most profligate and cruel of the Roman emperors, was the reputed son of the virtuous M. Aurelius, and the undoubted son of his wife, the wicked Faustina, and was born at Lauvium A.D. 161. Aurelius bestowed the utmost care upon his education, and spared no expense in providing for him the most eminent teachers he could procure. His reign commenced under the most favourable auspices, but the discovery of a plot organized against him by his sister, Lucilla, A.D. 183, roused the dormant ferocity of his nature, and he plunged into excesses in cruelty and bloodshed without a parallel in the history even of the most wicked of his predecessors. His licentiousness was equal to his ferocity. He was both a glutton and a drunkard. He commanded that he should be worshipped under the name of Hercules, on the ground that his victories over the ferocious animals in the circus gave him a strong resemblance to that hero. He offered sacrifices to Isis in his palace, and appeared dressed as one of her priests with his head shaved. His atrocities at length became intolerable, and various plots were formed against his life, but without effect. At last his mistress, Marcia, when he was asleep, found her name standing first on his tablets in the list of persons to be put to death, and forthwith administered poison to him. As its operation, however, was slow, she called in the assistance of a celebrated athlete named Narcissus, who strangled the emperor in the bath, A.D. 192.

Commodus was not only the strongest man of his time, but he was eminently handsome and beautiful.—J. T.

COMNENA. See ANNA COMNENA.

COMNENUS. See the respective names of this family.

COMPTON, HENRY, a distinguished prelate, was the youngest son of the second earl of Northampton, and was born at Compton in 1632. On the completion of his studies at Queen's college, Oxford, he spent some time in foreign travel, and, returning to England at the restoration of Charles II., became cornet in a regiment of horse. The military profession, however, being not to his taste, he soon quitted it, and, after studying at Cambridge for a season, was created master of arts. He then obtained a grant of the next vacant canonry in Christ Church, Oxford, with the rectory of Cottenham. In 1667 he became master of St. Crosse's hospital, near Winchester. In 1674 he was appointed to the bishopric of Oxford, and about a year after he was translated to the see of London, made dean of the chapel royal, and sworn one of the privy council. The education of the princesses Mary and Anne was committed to him; both were confirmed by him in January, 1676, and both were also married by him. Compton laboured hard at this time to reconcile dissenters to the established church, held several conferences with this view, and corresponded on the subject with some eminent foreign divines.—(Stillingfleet's *Unreasonableness of Separation*, Appendix.) The bishop's love of protestantism was unflinching; and for his resistance to the popish measures of the court during the conclusion of the reign of Charles II., and especially under that of his bigoted successor, and for his refusal to silence Dr. Sharp, he was removed from the council, dismissed from the deanery, insulted and brow-beaten by the insolent Jeffreys, and ultimately suspended by the high commission from his episcopal functions during his majesty's pleasure. His former pupil, Mary, now princess of Orange, interceded in his behalf, but to no purpose. When the court became alarmed as to the intentions of the prince of Orange, Compton was restored. He conveyed the Princess Anne from London to Nottingham, but on the arrival of the prince he joined heartily in welcome to him, and publicly thanked him at the head of his clergy. His place in the privy council and the deanery of the chapel royal were given back to him, and, on the refusal of Archbishop Sancroft to take the oath of allegiance, he crowned William and Mary, April 11th, 1689. In the convocation of that year he made some efforts again towards union with dissenters. He spoke strongly in behalf of Nottingham's measure; but his scheme of comprehension seems to have satisfied neither those in the church nor those out of it. Soon after he was named by the king one of the commissioners of trade and plantations, and the bishop of London, as such, has or had episcopal superintendence of colonial churches without bishops of their own. In 1690-91 he attended William to the Hague, and about the same period opposed the foolish prosecution of Sacheverell. Towards the end of this reign he sided with the high church party, and his influence waned. At the accession of Queen Anne he was still without his former power, but about the conclusion of her reign his principles rose again into popularity. In 1712 he was named on the first commission to negotiate the union with Scotland, but was left out of the second in 1706. He died at Fulham, July 7, 1713, at the ripe age of eighty-one. Compton published six letters—"Episcopalia," a treatise on the holy communion, and a translation from the Italian of the life of Donna Olympia Maldachini. His character has been variously estimated. Burnet speaks of him as "a weak man and wilful," but others have eulogized him. He was evidently not a man of enlarged mind, and he was not always ingenuous in his dealings with King James; but he was generous, kind to the poor, hospitable to his clergy, and liberal in bounty to many protestant refugees. Compton's remains were deposited in the churchyard of Fulham, and not, as was usual for persons of his dignity, in the church; for he was in the habit of saying, "The church is for the living, the churchyard for the dead."—J. E.

COMPTON, SPENCER, second earl of Northampton, was born in 1601, and distinguished himself by his courage and zeal in the royal cause during the great civil war. When the king erected his standard at Nottingham in 1642, the earl of Northampton was one of the first who joined the royal forces, at the head of a troop of horse and a regiment of foot raised at his own expense, and having four of his sons officers under him. He rendered important services to the king's cause in

the counties of Warwick, Stafford, and Northampton. This gallant nobleman fell at the battle of Hopton Heath, near Stafford, 19th March, 1643.—JAMES, the eldest son and successor of the earl, and CHARLES, the second son, charged by their father's side at Hopton Heath. Sir Charles acquired great celebrity by his surprisal of Beeston castle in Cheshire, which he effected with only six followers.—Sir WILLIAM COMPTON, the third son of the earl, also a gallant and accomplished cavalier, born in 1624, at the commencement of the civil war contributed greatly to the capture of Banbury, of which he was appointed governor. In 1648 Sir William was appointed major-general of the royal forces in Colchester, and conducted the defence of that place in a manner which drew down the eulogium of Cromwell. After the restoration he was appointed a member of the privy council, and master-general of the ordnance.—J. T.

COMTE, AGUSTE, a famous French philosopher, was born at Montpellier, June 12th 1798. He entered the polytechnic school at Paris, and having pursued physical and mathematical studies with especial devotion, was appointed public examiner at that institution. For a short time he was connected with the disciples of St. Simon, but soon detached himself from an influence which he subsequently pronounced disastrous, but which his old comrades declared to have sowed the seed of many of his future speculations. Gifted with great powers of generalization, and discontented with the disorganized character of political and social science, Comte sought to introduce the same rigid system into sociology which he found existing in mathematics, and to subjugate the phenomena of life to formal, definite, and determinable laws. The first great law laid down by Comte as the fundamental condition of human progress is, that every branch of science passes through three stages—the theological, the metaphysical, and the positive. In the theological stage, man explains phenomena by the action of beings endowed with faculties kindred to his own, although working in a supernatural sphere. In the metaphysical stage man explains phenomena by the action of abstract forces inherent in all beings, and possessing a certain real existence. In the positive stage, man abandons the search after any final cause and absolute essence, and entirely confines himself to the study of the constant successions, existences, and resemblances of outward phenomena. For this law Comte claims an historical as well as a theoretical truth. He next proceeds to arrange a hierarchy of the sciences. He proposed to himself the discovery of the one natural order among all possible systems, and reached the conclusion that the fundamental sciences must be arranged according to the generality of their phenomena. We must begin with the most general or simple, going on successively to the more particular or complex. Inorganic bodies being less complex than organic, must determine the sciences to be placed first; and their subdivisions must be regulated by the fact that astronomy is more general than physics, and physics than chemistry. An analogous division arises in the science of organized bodies, physiology being less complex than sociology. Comte's famous hierarchy of the sciences therefore stands as follows:—I. Inorganic—1. Astronomy; 2. Physics; 3. Chemistry. II. Organic—1. Physiology; 2. Sociology. And he maintains that this order of decreasing generality has also been the order of historical development. Facts, however, will hardly support this ingenious generalization. The objections are well summed up in an essay on the genesis of science, by Herbert Spencer.

The whole of Comte's early and middle life was occupied in the development of the views we have indicated. And although his theories can in no respect be regarded as established discoveries, yet in their elucidation, amid many strange vagaries, he manifested unmistakable genius. In spite of all its short comings, in the "Cours de Philosophie Positive" the progress of scientific discovery is described with a master-hand; the analogies and dependencies existing among facts apparently diverse, are detected with consummate skill. The relations of historical events to general principles of human progress are often dwelt upon with a singular suggestiveness. Comte discovered what he believed the great law of human progress in 1822, in which year he published the "Système de Politique Positive." The publication of his great work, the "Cours de Philosophie Positive," extended over twelve years, from 1830 to 1842. The personal career of this writer was interrupted by a temporary attack of mental disease in 1826; by a marriage which does not appear to have been happy; and by his dismissal from the poly-

technic school in 1843-44. About this time he met a Madame Clotilde de Vaux, to whose influence he ascribes an entire reorganization of his existence by the establishment of the affections as authoritative over the understanding. Strangely instructive is the termination of Comte's philosophical history. The severely mathematical teacher of a rigid materialism, becomes the high priest of the religion of humanity, and announces himself as the type of the "regeneration of the affections," and the founder of a new worship. He substituted the adoration of an idealized humanity for that of God—the "Grand Être" is declared to be the "aggregate of co-operative beings." Every noble man after death, becomes part of the Supreme Being, who is therefore not yet fully formed! The hope of a conscious immortality he denounces as selfish; but still holds forward the expectation of a subjective existence in the heart and intellect of others—an absorption into, and identification with, the "immense and eternal being, Humanity." Many things very ludicrous, many things very sad, may be quoted from the "Catechism of the Positive Religion;" but this last stage of the philosopher's career testifies wonderfully to the fact, that it is impossible for human nature to remain at rest apart from the religious life. The "Philosophie Positive," could not satisfy its own founder. Forced by his system into scepticism, he plunges into wildest speculative adorations that he might find, if it were possible, some object of reverence. He cannot bow himself down within the christian temple, but at the same time bow down he must. By himself man cannot live, and he creates an idol, when he cannot find a God. Auguste Comte died in September, 1857. The chief English versions of his works are, "The Positive Philosophy of Auguste Comte," freely translated and condensed by Harriet Martineau, 2 vols.; Comte's "Philosophy of the Sciences," by G. H. Lewes; "The Catechism of Positive Religion," translated by Richard Congreve.—L. L. P.

COMYN, JOHN, Archbishop of Dublin, was born in the twelfth century. The place of his birth is doubtful. Dempster asserts that he was born at Banff in Scotland, and was descended from the earls of Buchan, but he gives no authority for this statement, and the probability is that he was an Englishman. Being a favourite of Henry II., he was consecrated archbishop of Dublin in 1181 by Pope Lucius III., and took possession of his see in 1184. He assisted at the coronation of Richard I. In consequence of the enmity of Hamo de Valonis, lord-justice of Ireland, Comyn fled to France, and appealed to Innocent III., who remonstrated with John, and Comyn was finally restored to the favour of the king, and compensation was made to him for his losses. He built and endowed St. Patrick cathedral in Dublin in 1190, and repaired and enlarged that of Christ church. He was a man of learning, gravity, and eloquence, and a munificent benefactor to the church. He died in Dublin, 28th October, 1212, and was buried in Christ church. His constitutions and canons are still extant among the archives of that cathedral.—J. F. W.

COMYNS, SIR JOHN, the author of the excellent "Digest of the English Law" named after him. Of this work, the first edition appeared in 1762-67 in five volumes folio, and to these a supplemental sixth was added in 1776. It was a posthumous publication, but the MSS., in law French, were left carefully prepared for the press by the author; and the editors, under the care of his nephew, also a lawyer, ably performed their task of translating it into English. Several subsequent editions appeared by Kyd, Rose, and Hammond, but they have disfigured the symmetry of the original work by inelegant patches. Two volumes of "Reports by Sir John Comyns" were published in 1744, also by his nephew. To both the "Book of Reports" and the first edition of the "Digest," the portrait of our author is prefixed. But few particulars are known of his private life. He attained the honours of judicature, and died, in the odour of learning and integrity, lord chief baron of the exchequer, 1740.—S. H. G.

CONANT, JOHN, an English divine, born in Devonshire in 1608. In 1649 he was elected rector of Exeter college, Oxford, at which he had been educated. At the restoration he refused to comply with the act of uniformity, and was consequently deprived. He was afterwards ordained by Bishop Reynolds, whose daughter he had married, and became minister of St. Mary, Aldermanbury. In 1676 he was promoted to the archdeaconry of Norwich. Ten years after he lost his sight, and died in 1693. Conant, six volumes of whose sermons have been published, was a man of great piety and learning. *Nil*

*difficile Conanti*—such was the learned pun, if we remember right, of a brother clergyman.—R. M., A.

CONCA, SEBASTIANO CAVALIERE: this celebrated painter was born at Gaeta in 1676. In the early part of his life he devoted himself to portrait painting; but at the age of forty, with his brother Giovanni, he established himself in Rome, and abandoning his brush for five years, worked hard again at the crayon, copying the antique and the best masters of the Roman schools. According to Lanzi, he possessed a fertile invention, great facility of execution, and a colour which enchanted by its lucidity, its contrasts, and its delicacy. Some of his works executed in Rome, won for him the notice of Clement XI., who gave him several of the public commissions. His best work is the "Pool of Siloam" at Siena. He etched a few plates himself, and many of his works have been engraved by Frey and others. He died at Naples in 1764.—W. T.

CONCANEN, MATTHEW, was born in Ireland in the end of the seventeenth century. At an early age he settled in London, and adopted the profession of the law. His education, wit, and agreeable manners recommended him to the favour of ministers, whom he actively supported by his pen, and took a prominent part in *The Speculatist*. The duke of Newcastle procured for him the lucrative post of attorney-general of Jamaica, which he filled for seventeen years. Returning to London on his way to Ireland, he fell into consumption, and died in 1749. Concanen wrote several poems of merit, and a comedy called "Wexford Wells." Having attacked Pope and Swift, the former elevated him to a place in the Dunciad, which Concanen did not deserve.

"Be thine my stationer, this magic gift,  
Cook shall be Prior, and Concanen, Swift."

—J. F. W.

CONCINO, CONCINI, Marechal d'Ancre, was born in Tuscany, and in the year 1600 followed the queen of Henry IV. into France. He intrigued himself, with the aid of his wife's influence, into the highest fortune. His power, however, became so intolerable that Louis XIII. gave an order for his arrest, with permission to kill him on the spot in case of resistance. Accordingly Vitri, on his refusal to deliver up his sword, shot him dead with a pistol.—R. M., A.

CONDAMINE. See LA CONDAMINE.

CONDE, JOSÉ ANTONIO, a distinguished Spanish scholar, was born in 1765 at Paralya, in the province of Cuença, and educated at the university of Alcalá. Here he appears to have laid the foundation of those Arabic studies which seem to have been most unaccountably neglected in Spain, but of which he was destined to be the restorer. He relinquished the profession of the law for which he was destined, on obtaining an appointment in the royal library at Madrid, and henceforth devoted himself to literature. In 1799 he published a translation of the Description of Spain, by the Nubian geographer Al-Edriso. He was appointed, together with Cienfuegos and Navarrete, to the task of continuing the famous collection of early Castilian poetry made by Sanchez. On the invasion of the French, Conde, unlike most of the literary men of his time, took the part of the invader, and was appointed by Joseph Bonaparte, chief librarian of the Madrid library. When the French were expelled, Conde spent some years in forced seclusion in Paris, where he arranged the materials for his great work the "History of the Dominion of the Arabs in Spain," on which his reputation chiefly rests. Some time previous to 1818 he was allowed to return to Spain, but his unpatriotic conduct had deprived him of all claim to the countenance he had formerly enjoyed from men in power. He died in London in 1820. Only one volume of his work was published during his lifetime, the remainder being completed from his manuscripts by his friends. With some defects on the score of accuracy and clearness, it still remains the best work on the subject, and has been made available to the English reader in a translation by Mrs. Jonathan Forster.—F. M. W.

CONDÉ, LOUIS DE BOURBON, Prince de, commonly called THE GREAT CONDÉ, born in Paris on the 7th September, 1621, was the fourth son of Henry II. de Bourbon, and Charlotte Marguerite de Montmorency, prince and princess of Condé. During his father's lifetime he was known by the title of Duke d'Enguien. Three elder brothers having died in their infancy, he became, on his father's demise, prince of Condé. His only sister, some years his senior, was Anne Geneviève de Bourbon, born in 1619, celebrated as the beautiful duchess of Longueville, and queen of the Fronde. His only surviving brother was Armand de Bourbon,

prince of Conti, born in 1629, whose name also became famous in the struggles of the Fronde. At an early age he was removed to Bourges, where, under the care of La Bousnière, his tutor, he went through the usual course of education given by the jesuits. In his bodily exercises, as in his studies, he surpassed all his companions; at twelve years of age he had completed his course of philosophy, and sustained several public disputations. For the completion of his education, his father sent the young duke d'Enghien to take charge of his government in Burgundy. He there made himself acquainted with all things relating to the military and judicial administration of the province, and diligently studied engineering, fortification, and the whole art of war. In 1640 he assisted under marshal de la Mèllleraye at the siege and taking of Arras in Flanders, and distinguished himself by most brilliant valour. The prince de Condé, whose ambition was insatiable, now desired for his son the command of an army. This object could only be obtained by paying court to Cardinal Richelieu; he, therefore, condescended to solicit for his son the hand of Claire Clemence de Maillé Brèzé, the cardinal's niece. The young duke d'Enghien expressed the strongest repugnance to the marriage thus arranged for him by his father; but he was obliged to submit, and the betrothal took place on the 7th of February, 1641. In the following year, shortly after the death of Richelieu, he was named general-in-chief of the army that was sent to defend the frontiers of Champagne and Picardy against the Spaniards. He was marching towards Landrecies, when he learned that the enemy had turned their steps towards the Meuse and were besieging Rocroy, which was at the point of being reduced. Gaining the heights above this place on the 18th of May, 1643, he made his attack at day-break on the 19th, and gained a brilliant and complete victory, after a battle disputed with the utmost obstinacy for six hours. He then marched to Thionville on the Moselle, which, after a siege of two months, he compelled to capitulate. By this conquest, and some others of minor importance, he became master of the whole course of the Moselle as far as Trêves, thus terminating the most glorious campaign ever made by a general of twenty-two years old. The following year, 1644, he was sent to join the army in Germany, and to take the command as generalissimo. Uniting his forces to the small army, only ten thousand men, of Turenne, he defeated the count de Mercy at the head of fifteen thousand Bavarians, besieged and retook Fribourg, which had fallen into the hands of the enemy, and effected the capture of Philipsbourg, which was followed by the capitulation of Worms, Oppenheim, and Mayence. The campaign of the following year commenced under Turenne, very unfavourably for France. D'Enghien was despatched to retrieve the fortune of the war, which he accomplished in a series of brilliant triumphs, ending in the battle of Nördlingen. In 1646 he attacked and took Dunkirk, after an obstinate defence. On 25th December this year the prince of Condé died, and the duke d'Enghien succeeded to the title of prince of Condé, but was usually called Monsieur le Prince. The queen regent conferred on him all the governments and appointments which had been held by the late prince. But this did not satisfy Condé. He laid claim to the post of high-admiral, which, at the instigation of Mazarin, was refused. This rebuff irritated him greatly against the cardinal, who, on the other hand, entertained a growing jealousy and apprehension of the power, ambition, and influence of the young prince. Early in the spring of 1647, Condé accepted the command of the army in Catalonia, which was engaged in assisting the inhabitants in their revolt against the king of Spain. On the 12th May he appeared before Lerida, and vigorously commenced the siege of that stronghold, but was compelled on the 17th June to abandon the attempt. This check, the first he had ever sustained, caused a profound impression, not only in France, but throughout Europe. Next year he accepted the command of the army of Flanders, and on the 20th of August was fought the ever memorable battle of Sens, one of the most glorious that the reign of Louis XIV. could boast. This great victory may be said to have terminated the campaign of 1648, and with it the war with Germany.

The troubles of the Fronde had been for some time agitating Paris, and immediately after the victory at Sens Condé received an order from the queen to terminate the campaign as speedily as possible, and hasten to support her with his counsels and his sword. He obeyed with regret, foreseeing the inevitable disasters of a career where moderation was almost impossible, and

success and failure both alike ruinous. The contest between the queen's party, supported by Condé, and the citizens of Paris, whose object was the dismissal of Cardinal Mazarin, continued till the spring of 1649. An accommodation was then patched up, which fell to pieces before the end of the year. Vacillating and undecided between his predilection for the throne, his dislike of Mazarin, and his contempt for the bourgeoisie, Condé listened occasionally to all, but treated none of them fairly and frankly, and displeased all by turns. The queen was at length wrought upon to consent to the arrest and imprisonment of the prince and his chief partisans. Lulled into security by the consummate dissimulation of the queen and Mazarin, the prince, with his brother and the duke of Longueville, were all three seized one night, January 18, 1650, and secretly hurried off to Vincennes, whence they were some time afterwards conducted to the Chateau de Marcoupy, and finally, for greater security, transferred to Havre. The princess of Condé escaped with her son into Berri, and assisted by the counsels of Pierre Lenet and by the count of Coligny, raised her husband's standard at his own fortress of Mountrond, displaying throughout the period of his captivity the most admirable constancy, prudence, and bravery in withstanding his enemies. At length, after thirteen months' detention in captivity, a reaction began to take place in favour of the illustrious captive. Pity for the unfortunate fate of Condé, admiration for his military exploits, sympathy for the devotion of his young wife had taken possession of all hearts. A powerful combination, headed by the coadjutor of Paris, Gondy, afterwards cardinal de Retz, and the great chief of the Fronde, effected the fall of Mazarin and the release of Condé. The prince was for a moment master of a great position, and might perhaps have employed it to the blessing of his country, had his talents been of the same high order in civil as in military affairs; but lost amidst the petty and inextricable intrigues of the second Fronde, he allowed himself to be bewildered by fears and suspicions of treachery, threatening his liberty, or even his life. But his course decided on, Condé seemed to recover all the energy and vigour of his character. He proceeded at once to take up arms in his own government of Guienne; despatched his faithful Lenet to Madrid, to seek the assistance of the king of Spain in his enterprise; and established his own head-quarters at Bourdeaux. For a moment the return of Mazarin in 1652 to his old place and favour at court excited the popular rage, and gave an impulse to the party of the Fronde; but fortune no longer smiled on Condé's career, and the king's party, as it was now called, headed by Turenne were, on the whole, successful everywhere. At length Condé, assuming the command of an expedition in person, obtained an important victory at Bleneau. He then marched on Paris, which closed its gates against his soldiers. On the 2nd July, 1652, he was encountered at the barrier of St. Antoine by the royal forces. A terrible conflict ensued, in which his troops were completely worsted. Turenne was advancing to a last decisive attack, when suddenly the cannon of the Bastille—for that fortress commanded the battle-field—opened upon the king's troops, and checked their farther advance. The gates were opened, and Condé retreated into the city, protected by the artillery that should have defended its walls against him. Soon after this engagement the Fronde began to fall to pieces of itself; many of the principal leaders had been slain, or placed hors de combat by their wounds; others submitted unconditionally to the royal authority. After much conflict of mind, Condé determined to quit the kingdom, and withdrawing from Paris, 14th October, 1658, with such of his followers as still remained to him, directed his march to the head-quarters of the Spanish army in Flanders. The next seven years of his life were passed in the service of the king of Spain, in fighting against his own country. In these contests he was generally opposed by Turenne. The battle of the Downs, as it was called, into which Condé was forced by the Spanish generalissimo against his own better judgment (June 14, 1658), was followed immediately by the surrender of Dunkirk to Turenne, and the complete humiliation of Spain. In the treaty of peace which was signed between France and Spain, Nov. 7, 1659, there were eight articles in relation to Condé, stipulating that the prince should be restored to his honours, estates, and the government of Burgundy, as well as to the pardon and favour of his sovereign, that he might receive from Spain a million of dollars, and that pardon and restoration to their estates should be granted to his partisans

who had followed him out of France. He arrived at Aix in Provence, where the court then was, on the 28th January, 1660, and had an interview with Mazarin and the king, who promised never to remember the error which had been hurtful only to the prince himself.

Condé retired to Chantilly, to which residence he was much attached, and amused himself by improving it. In February, 1671 he caused his unfortunate wife to be imprisoned in the castle of Chateauroux on an accusation of infidelity, which the historians of the time believed to have been entirely groundless, and which was certainly at variance with her irreproachable conduct during the thirty years of her married life, and with the piety, devotion, prudence, and courage she had exhibited during Condé's imprisonment. In the campaign against Holland in 1672, Condé accompanied the king, and exhibited, as usual, the highest degree of ability and courage, especially in that brilliant exploit the passage of the Rhine in face of the enemy, wherein he commanded, and wherein he received a severe wound by the shattering of his left wrist by a musket ball, which prevented his taking any further part in the campaign. In 1674 he once more commanded on the Flemish frontier, and with an army of forty-five thousand men fought, at Seneff, the prince of Orange with sixty thousand men; they fought till night, and both claimed the victory. In the following year Condé was again sent to take the command in Flanders, to replace Turenne, who had fallen at Stolhoffen in the very moment when victory seemed within his grasp. This campaign closed the military career of the great commander. His mental powers were undiminished, but his bodily strength was failing. He therefore declined the command of the army which Louis offered him the following year, and retired finally to Chantilly, where he derived his greatest pleasure in embellishing his charming retreat, and enjoying the society of men of letters, among whom the names of Boileau, Racine, and Molière were specially distinguished. He expired in the evening of December 11th, 1686. One of Bossuet's finest funeral orations is that which he pronounced over the great Condé. Almost all the memoirs and letters of the time throw some light on his history. The following are the most authentic and interesting—*Memoires par Pierre Lenet*; which alone furnish any account of the hero's childhood; *Histoire de Louis II. de Bourbon*, by Desormeaux, 4 vols. Paris, 1766; *Historical Essay on the great Condé* by his great-grandson Louis Joseph de Bourbon, prince de Condé. The Commentaries of the Emperor Napoleon on the campaigns of Condé comprised in *Pièces sur les guerres de maréchal de Turenne*, published in the *Mélanges Historiques* by Count Montholon, London, 1833, are highly interesting.—B. DE B.

CONDÉ, LOUIS JOSEPH DE BOURBON, Prince de, a French general, son of the duke of Bourbon, was born at Chantilly in 1756. He served with distinction in the Seven Years' war; presided in one session of the assembly of notables in 1787; and, having withdrawn from France when the revolutionary party triumphed, was chosen to command the army which the emigrants organized on the Rhenish frontier. After the execution of Louis XVI., he proclaimed the dauphin, and joining with his troops the army of Marshal Wurmser, distinguished himself in the campaigns of 1795 and 1796. The peace of Campo Formio compelled him to take service with Paul I. of Russia, who employed him in Poland, and afterwards on the Inn. In 1801 he took refuge in Britain, and lived to enter Paris at the restoration in the same carriage with Louis XVIII., by whom he was restored to his rank and honours; but he enjoyed them only a few years, his death taking place in 1818. He wrote in his earlier years a memoir of the great Condé.—W. B.

CONDER, JOSIAH, an English nonconformist writer, was born in 1789. He was the son of a bookseller, and followed the same business until 1819. He became the publisher and proprietor of the *Eclectic Review*, which he also edited until 1837, assisted by contributions from Robert Hall, and other eminent nonconformist divines and writers. Besides numerous articles in reviews and magazines, Mr. Conder published several religious works characterized by great ability and earnestness. In 1832 he became the editor of the *Patriot* newspaper, and continued to hold that office till his death in 1855.—J. T.

CONDILLAC, ETIENNE BONNOT DE, was born at Grenoble in 1715. His brother, Gabriel Bonnot, is well known as the Abbé Mably. Condillac also was destined for the church, and was styled Abbé. Having come to Paris while yet young, he became acquainted with Diderot and J. J. Rousseau; but the

acquaintanceship was not intimate, and he did not contract any indiscreet or compromising familiarity with contemporary philosophers. His position as a churchman gave a caution and reserve to his speculations and his conduct, and kept both within a safe range. Having acquired celebrity by his writings, he was appointed preceptor to the hereditary prince of Parma. For his use he compiled "*Cours d'Etudes*," 13 vols. 8vo, Parma, 1769-1773. He was subsequently named a member of the French Academy, in succession to the celebrated grammarian, the Abbé Olivet. Condillac died in the abbey of Flux, near Beaugency, of the revenues of which he was in possession. The first work of Condillac was "*Essai sur l'origine des Connaissances Humaines*," 2 tom. 12mo, Amst. 1746. In it he takes Locke for his guide, and traces all our ideas to experience—experience being made up of sensation and reflection. While the mind is passive in receiving sensations, he admitted that, in reflecting upon its own operations, it manifested some degree of activity. But in his "*Traité des Sensations*," 2 tom. 12mo, Paris and London, 1754, he altered his philosophy by denying the activity of the mind, and resolving all our ideas into sensations gradually transformed. In doing so he was departing from the philosophy of Locke. Of this he was quite aware; for he says, at the beginning of his "*Treatise of Sensations*," "Locke distinguished two sources of our ideas, sensation and reflection. It would be more exact to recognize only one; both because reflection, as to its principle, is just sensation; and because it is not so much a source of ideas as the channel by which ideas come from the senses." Condillac, however, although a sensationalist, was not a materialist. He did not confound psychology with physiology, but insisted without ceasing that sensation is not in the bodily organs. His "*Traité des Animaux*," 2 tom. 12mo, Amst. 1755, was directed against the opinion of Descartes, that the inferior animals are living automata, or animated machines. Condillac argued that they move about as they please; they choose what is suitable, and reject what is unsuitable. They have senses analogous to those of man, and they use them in the same way. They feel some want and seek to supply it. But they cannot reflect. They cannot rise above sensation to any higher idea; and, being incapable of merit or demerit, the pains and pleasures of this life are their all. These pains and pleasures are necessary to the existence of such creatures; and, therefore, they afford no proper objection against the goodness of God—an objection which Descartes sought to obviate by representing them as animated machines. The sensational philosophy of Condillac was widely embraced in France during the latter half of the last century. The simplicity and clearness of the writings in which it was expounded, seemed to make everything plain in the phenomena of mind; and its tendency was in favour of the reforming spirit of the times. But when closely examined, it was found to be both defective and erroneous, explaining some of the facts of consciousness, but omitting the higher functions of the intellect and the native activity and energy of the mind. Mons. Destutt de Tracy did much to give it philosophical form and consistency; but its radical defects could not long be concealed; and it is now regarded only as a partial and ingenious explanation of some of the conditions under which the faculties by which human knowledge is acquired are developed, and the energies by which human activity is prompted are called into play.—W. F.

CONDORCET, JEAN ANTOINE NICOLAS DE CARITAY, Marquis de, an illustrious French mathematician and philosopher, who occupies a notable place in the history of the revolutionary epoch, was born at Ribemont in Picardy, September 17, 1743. Educated at the jesuit college in Rheims, and at the college of Navarre in Paris, he especially distinguished himself by his mathematical attainments. His eager intellectual activity, however, was not satisfied with eminence in any one branch of knowledge, but spread itself through all the varied subjects of human thought. Nothing could be more brilliant than Condorcet's early career. Never, writes a friend, had any one such intensity of life, or such a happy abundance of resources. He had a hundred intimate friends, and each friend believed himself the all in all of his affections—a fact very characteristic of the sentimental vivacity which marked Condorcet's early years. At the age of sixteen he sustained an analytical thesis with such singular ability that D'Alembert predicted a future colleague in the academy; and in 1772 Lagrange pronounced one of his memoirs profound and sublime. Condorcet assisted in the development of the calculus of probabilities; and Arago testifies

to his successful application of analytical methods to astronomical researches. In 1769 he was elected member of the Academy of Sciences, and in 1773 became perpetual secretary. As secretary of the academy he published a series of eulogies upon eminent men, which still remain the chief monuments of his literary skill. Among the most remarkable of these are his *éloges* upon Pascal, Jussieu, Flansted, D'Alembert, Buffon, and Franklin. That upon Buffon is noticeable through its generous impartiality. No one could gather from it that Buffon had employed, both at the court and the academy, every influence he possessed to disparage Condorcet. The first of Condorcet's writings upon religious subjects was an anonymous work entitled "Lettres d'un Théologien," which was attributed to Voltaire. His fundamental doctrine was the present perfectibility of mankind both individually and socially. He held that all moral evils come from bad laws and bad institutions; and he looked forward to the time when disease and suffering should pass away; and death be only the effect of an accident, or the light and gentle decay of vital forces which had exhausted their capacities for joyful action. During the later years of his life we find him intensely involved in the political movements of that revolutionary epoch, the advent of which his writings had powerfully assisted in preparing. Until the flight of Louis XVI. he was faithful to the principle of a constitutional monarchy; but after that event he examined the question whether royalty was essential to liberty, and pronounced in the negative. Condorcet was the chief author of that famous answer of the assembly to the address from the European powers, threatening France with war; in which the idea of war for conquest was renounced, and a solemn pledge taken not to employ the national forces against the liberties of any people (1791). During the revolutionary struggles, he displayed a disposition in which timidity in action and boldness in theory curiously contended against each other. Upon the trial of Louis XIV., Condorcet voted for the gravest punishment next to death. In the struggles between the Mountain and Girondist parties, he took no decided part with either, although he was employed by the Girondists to draw up a new constitution, the plan of which was approved by the convention. He escaped the first proscriptions, but having objected to the proceedings of the dominant party, incurred the enmity of Robespierre; and, on the 3d October, 1793, the convention pronounced a decree of condemnation against "Caritat ci-devant marquis de Condorcet." The montagnards hesitated before proscribing so great a name; but the Jacobins declared the man more dangerous because of his greatness, and urged on the deed. Condorcet was concealed by his friends, and remained shut up in an attic during the autumn and winter of 1793-94; and while the storm of revolution was raging round him, and his own life was not secure for an hour, he employed himself in demonstrating the perfectibility of the human race, and wrote his famous work, "L'esquisse des progrès de l'esprit humain." Assuredly that man was great who could console himself in persecution by cherishing yet more fondly than in prosperity his glorious hopes for the very people whose victim he was; and the history of literature furnishes few more touching pictures than Condorcet writing upon the perfectibility of mankind in a garret, from which he dared not move, and in sight of the guillotine waiting for its prey. At last he could endure confinement no longer. In spite of the precautions of his friends he escaped from his concealment; was arrested as a suspected person at a cabaret of Clamart by some members of the revolutionary committee, and thrown into the prison of Bourg la Reine. In the morning of 28th March, 1794, the guard found a corpse in place of their prisoner; the philosopher had taken poison, preferring to die in quietness and peace rather than that his last agonies should be a sight for a scoffing mob. The works of Condorcet have been published in 21 vols. 8vo, Paris, 1804.—L. L. P.

CONFUCIUS, the Latinized form given originally by the jesuits to the name of the famous Chinese philosopher KOONG-ROO-TSE. He was born about 550 B.C. in the kingdom of Loo, now the province of Shang-tun, and was descended from the imperial family of the dynasty of Shang. He was early distinguished for his great abilities, his extraordinary love of learning, and his proficiency in philosophy. He married at the age of nineteen, but divorced his wife after she had borne him a son, in order, as the jesuits allege, "that he might attend to his studies with greater application." When he had reached his twentieth year he obtained his first political employment as "superintendent

of cattle," and soon became conspicuous for his zeal in reforming long-established abuses. His activity and fidelity obtained for him promotion to a more important situation, and the highest position in the kingdom seemed within his reach, when a sudden revolution in the state deprived him of his office.

The next eight years of his life he spent in traveling through the various states into which the Celestial empire was then divided, instructing all classes in the precepts of virtue and social order, and gradually increasing the number of his disciples. He returned to his native kingdom in his forty-third year, and was soon after intrusted with various responsible political offices. He was at length made prime minister, at the age of fifty-five, and received full authority to carry his theories into practice. He speedily effected a great change, both in the moral and physical condition of the country. He provided an abundant supply of food for the poor, and freed them from the oppression of the nobles. "The revenues of the state," says his biographer, "were directed to the advancement of commerce, the improvement of the bridges and highways, the impartial administration of justice, and the repression of the bands of robbers that infested the mountains." But the great reformation Confucius was effecting roused the jealousy of the neighbouring princes, and they succeeded by a base intrigue in inducing the king of Loo to abandon his faithful minister, who was in consequence once more expelled from the country, and compelled to take refuge in the northern parts of China. For twelve years he wandered about from province to province, making various unsuccessful efforts to obtain office. He made many proselytes, and at length, full of years and worn out with his wanderings and sorrows, he retired with a small band of faithful disciples to a quiet valley in his native province, and there spent the concluding five years of his life in revising and improving those works which for twenty-three centuries have been the sacred books of the Chinese. He died at the age of seventy-three in this valley, which, for all succeeding ages, has been a sacred spot to the inhabitants of the Celestial empire. His sepulchre was erected on the banks of the Loo river. The manner in which the memory of the great philosopher has been revered by posterity, presents a striking contrast to the unworthy treatment which he received from his contemporaries. The highest honours and privileges have been heaped upon his descendants, who now number many thousands, and are the only hereditary nobility in the empire. Amid all the revolutions that have taken place in China, their privileges have been preserved entire. There is at least one temple dedicated to Confucius in every city of the empire of the first, second, and third rank; and the mandarins and the emperor himself are bound to worship there, burning scented gums, frankincense, and tapers of sandal wood, offering wine, fruit, and flowers, and chanting appropriate hymns.

Confucius claimed to be a teacher of morals, rather than the founder of a religion. He made no pretensions to inspiration; and his method of teaching was as simple and natural as his manner of life. The physical system which he inculcated resembled that of the early Greek philosophers. The five elements or *kings*, as he termed them—water, fire, wood, metals, and earth—stood at its base. He held that the universe had been generated by the union of two material principles,—a heavenly and an earthly—Yang and Yn—but there is no mention of a Creator in his system; and some writers have broadly asserted that Confucius did not recognize the existence of a God. He represents man as having fallen by his own act from his original pure and happy state; and affirms that, by his own act, he can recover the purity and happiness he has lost. The object of one of his treatises is declared to be, "to bring back fallen man to the sovereign good—to what is perfect." In his doctrines there is an evident leaning to fatalism and to fortune-telling. Many of his moral precepts, such as those which regulate the duties of children to parents, and of the younger to the elder, are excellent. His political system, which is one of pure despotism, is founded on the parental relationship. A family is the prototype of his nation, of which the emperor is regarded as the father. Dr. Morrison is of opinion, that it is this feature of his doctrines which has made Confucius such a favourite with all the governments of China for so many centuries.

The classical or sacred books written, or completed and revised, by Confucius and his disciples, are nine in number, viz. the "Four Books," and the "Five Canonical Books." The

first of the "Four Books" is the "Ta-heo, or the School of Adults;" the second, the "Choong-yoong, or Infallible Medium;" the third, the "Lun-yn," consisting of the conversations and sayings of Confucius recorded by his disciples; and the fourth, the "Meng-tse," which contains the additions and commentary of Meng-tse or Mencius, one of the disciples of Confucius. The "Five Canonical Books" are—the "Y-king, or Sacred Book of Changes," which has been termed the Encyclopædia of the Chinese, and embraces a great variety of subjects—metaphysics, physics, and morals; the "Chou-king," which consists of a historical narrative of the events of early Chinese history; the "Chi-king, or Book of Sacred Songs;" the "Li-king, or Book of Rites and Ceremonies;" and the "Tchuntsiou," which is a continuation of the "Chou-king," and contains a history of the philosopher's own times. Confucius was undoubtedly a very remarkable man, and the influence which he has exercised over his countrymen has rarely been paralleled in the history of mankind. A full account of the system of the Chinese philosophers will be found in "The Works of Confucius," by Marshman, Serampore, 1809, and in the writings of Sir J. F. Davis and Dr. Gutzlaff.—J. T.

CONGLETON. See PARNELL.

CONGREVE, WILLIAM, born 1669; died 1728; a gentleman of old and good family. He was educated at Trinity college, Dublin, and on leaving it, entered of the middle temple. At twenty-one he published a novel, which neither enjoyed nor deserved success. In 1693 his first play, "The Old Bachelor," was acted under the patronage of Dryden with universal applause. Although the weakest in style and plot of his four comedies, it has some brilliant and facile writing to allay its vulgarities of conception and commonplaces of execution. Next year appeared "The Double Dealer," a better play which was less successful. All the humour and spirit of a matchless comic style could neither redeem nor conceal the defects of a machinery at once violent and intricate. Nevertheless, in this unfortunate comedy, there are scenes of such wit and power as to eclipse Sheridan at his strongest, and Molière at his weakest; no slight praise for any dramatist. "Love for Love" was brought out on the opening of a theatre in Lincoln's Inn Fields; it was the most successful of Congreve's comedies, and is all but the most perfect. In 1697 came out "The Mourning Bride," a patched and padded tragedy, rouged to the eyes, and as violent as Lady Willfort, the memorable heroine of his last and greatest work. "The Way of the World" appeared in 1700, and failed: we have had no such comedy since. Congreve, according to Swift, was rescued from early and degrading poverty by the gift of two sinecures from the political party which enjoyed and appreciated his adherence; on these and his flirtations, he lived a refined and inactive life, cut short by gout and the overturn of a carriage. At his death he left a fortune of £10,000 to the duchess of Marlborough—a legacy which might have been better employed either as a gift to Mrs. Bracegirdle the actress, or as a prop to the fortunes of his family: the former had enjoyed his friendship for years; the latter was reduced to all but destitution. The duchess expressed her regret by lavishing upon a wax figure of her deceased friend, all the attentions which he had required when alive. The minor works of Congreve are dull and empty, but for one or two songs which read like fragments of a comedy patched with metre. All that is worthy of notice in the man he has put into four plays; and his main title to our admiration is the union in these works of broad and refined humour. His intellect is clear, cold, and narrow; it has the force and brightness of steel; the edges of it, so to speak, are cut out hard and sharp. There is more weight and matter in Congreve than in any English dramatist since the restoration; and at worst he is no coarser than his time. In Congreve all is plain and clear, if hard and limited; he makes no effort to escape into the region of moral sentiment; if his world is not healthy, neither is it hollow; and whatever he had of noble humour and feeling was genuine and genial. His style is a model of grace and accurate vigour, and his verbal wit the most brilliant and forcible in English literature. We do not say that it was pure and exalted; such properties belong to other times and other minds. But, as a comic writer, he stands above the best who came after him, and beside the best who went before.—A. C. S.

CONGREVE, SIR WILLIAM, Bart., a distinguished military engineer, and inventor of the rocket called by his name, was born in 1772, and was the eldest son of Sir William Congreve

of Walton, Staffordshire. He entered the artillery service at an early age, and in 1816 attained the rank of lieutenant-general, and retired from the army in 1820. He was successively member of parliament for Gatton and Plymouth. The celebrated Congreve rockets were first used against Boulogne in 1806, and were subsequently employed with great effect in the Basque roads, at Walcheren, in the peninsular campaigns, at Leipzig, and in the attack upon Algiers, and have long been in permanent use in military and naval tactics. Sir William was rewarded for the invention by a liberal grant of money from the national funds. He published in 1812 an "Elementary Treatise on the Mounting of Naval Ordnance," and in 1815 a "Description of the Hydro-Pneumatic Lock." Sir William died at Toulouse in 1828.—J. T.

CONNOR, BERNARD, M.D., an eminent Irish physician, was born in the county of Kerry about the year 1666, and died in 1698. He became physician to John Sobieski, king of Poland, but during the latter part of his life resided as a practitioner in London. There is a curious work of his, entitled "Evangelium Medici," &c., in which, as Orme says, "the author endeavours to show that the miraculous cures performed by our Lord and his apostles may be accounted for on natural principles."

CONON, a renowned Athenian general and admiral, who held several important commands in the latter part of the Peloponnesian war. He was one of the two generals who superseded Alcibiades about 406 B.C., but was soon after completely defeated at Mitylene by Callieratides, the Lacedæmonian general. In the following year Conon and his colleagues stationed the Athenian fleet at a place called Ægospotami, in the straits of the Hellespont, and having imprudently suffered their men to go on shore, were surprised by Lysander, the Spartan commander, and totally routed. Conon himself escaped with nine triremes, but all the remaining vessels, one hundred and ninety in number, were captured, and their crews taken prisoners. This terrible disaster led to the annihilation of the Athenian empire, the capture of Athens, and the overthrow of its constitution. Conon took refuge with Evagoras, prince of Salamis, in the island of Cyprus, where he remained for seven years. He was subsequently appointed commander of the Persian fleet along with Pharnabazus, and inflicted a terrible defeat upon the Lacedæmonians, near Cnidus, 394 B.C. Their expulsion from the Ægean, the revolt of their allies, and the overthrow of their empire speedily followed. Conon then returned to Athens, restored its fortifications, and rebuilt its famous Long Walls—an event of vast importance to its future security and influence. He was afterwards, in 392 B.C., sent as envoy to the Persian court, and is supposed to have died in Cyprus, 388 B.C.—J. T.

CONRAD I., Emperor of Germany, was duke of Franconia and a grandson of the Emperor Arnulf. He succeeded to the imperial throne by national election in 911, at the death of Louis, surnamed the Child; Otto, duke of Saxony, having declined the vacant dignity. His reign was disturbed by the intrigues of Otto's son, Henry the Fowler, who defeated him, near Merseburg, in 915. Three years later, Conrad died without issue, charging his brother Eberhard to promote the election of his rival.—W. B.

CONRAD II., surnamed THE SALIC, also of the ducal house of Franconia, was elected emperor in 1024, and one of his first acts was to render the fiefs of the lesser nobles hereditary. He was solemnly crowned at Rome in 1027, and held the imperial sceptre for fifteen years, displaying much prudence and energy in the disputes respecting the succession to the Burgundian throne, in the suppression of repeated revolts in Italy, and in compelling the turbulent Poles and Hungarians to acknowledge the authority of the empire. He died in 1039, and was buried in the cathedral of Spire, which he had founded.—W. B.

CONRAD III., who was of the Hohenstauffen or Swabian family, succeeded to the throne at the death of Lothaire III., in 1138, in opposition to Henry the Proud, Lothaire's son-in-law. The contests which ensued belong to the well-known struggle between the Guelphs and Ghibellines (in German, Wolf, and Waiblinger), Henry being descended from the house of Guelph or Wolf, while the town of Wibelung in Franconia gave its name to the other party. Conrad took part in the crusades with Louis VII. of France, returned home in 1149, and died three years afterwards, being succeeded by his nephew, Frederick Barbarossa.—W. B.

CONRAD IV., son of the Emperor Frederick II., was nominated

his successor, but his father's quarrel with the see of Rome had raised a formidable opposition. He eventually took refuge with his brother Manfred of Tarentum, by whose assistance he compelled the pope to come to terms; but on the eve of his return into Germany he died in 1254.—W. B.

CONRAD V., or CONRADIN, son of the preceding, was a child of two years at the death of his father. His mother placed him under the protection of his brother, Louis of Bavaria; and afterwards attempted to establish his rights in Italy against Charles of Anjou. Her army, however, was defeated at Scurocola; and Conradin, falling into the hands of his rival, perished on the scaffold in 1268.—W. B.

CONRAD, son of William III., Marquis of Montserrat, gained his first distinction in the service of the pope against Frederick II. In 1186 he sailed for Syria to take part in the third crusade; and on his way rendered such important aid in the suppression of a revolt at Constantinople, that he was rewarded with the hand of the emperor's sister Theodora. Having narrowly escaped falling into the power of the Saracens at Acre, he landed at Tyre, undertook the defence of that city, and held it successfully against the arms and arts of Saladin, till the arrival of the French and English forces, under Philip Augustus and Richard Cœur de Lion, restored in some measure the ebbing fortunes of the crusaders. But the fame of this and other services was obscured by his intrigues to obtain the throne of Jerusalem, in which he was countenanced by the French king, but opposed by Richard. The wish of the army at length procured the concurrence of the English monarch, and Conrad was on the eve of succeeding the unfortunate Guy de Lusignan when he was slain by assassins in 1190.—W. B.

CONRADIN. See CONRAD V.

CONRART, VALENTIN, born at Paris in 1603; died in 1675. His father's family was originally from Hainault, and of the noblesse. The family were Calvinists, and Conrart's father destined his son for mercantile life. This prevented his having the ordinary advantages of a classical education, but he learned Spanish and Italian, and was a great reader of modern books. Conrart, though he wrote but little, is one who cannot at any time be forgotten in the history of French literature. He has been called the father of the French Academy, of which he was the first secretary. The origin of the academy was accidental. In 1629 a number of friends fond of literature, living at considerable distances from each other in Paris and the vicinity, arranged to meet occasionally at the house of Conrart, who lived in the Rue St. Martin. Richelieu, who had his eyes and ears everywhere, learned the fact of these meetings; suggested the idea of an academy; and offered Conrart and his friends letters patent from the king. This project was disliked by the original members of the little society, but could not be decorously refused. This is Pellison's account of the origin of the academy. At its institution it had three principal officers, a director, a chancellor, and a secretary. The first two changed from time to time; the secretary was for life, and chosen by the suffrages of the academy. Conrart was unanimously elected "perpetual secretary." He became afterwards chancellor, the offices not being inconsistent. In 1634 his duties as secretary commenced, and till his death, forty-one years afterwards, he kept the official record of all the proceedings of the academy. The closing years of Conrart's life were occupied with exercises in devotional poetry. He versified fifty-one of the psalms, or rather retouched and modernized Clement Marot's version. He also left memoirs on the history of his own times, which were published for the first time in 1825, in Petitot's well-known collection—J. A., D.

CONRING, HERMANN, one of the greatest scholars of his time, was born at Norden in Frisia on the 9th November, 1606; and devoted himself at the same time to the study of theology and medicine at Helmstedt, and afterwards at Leyden. As early as 1632 he obtained the chair of philosophy at Helmstedt, and in 1634 took his degree as M.D. Queen Cristina of Sweden proposed to make him her physician. He declined the offer, but in 1658 accepted the same appointment from Gustavus Adolphus. At the same time he was named privy councillor to the duke of Brunswick, and since 1664 had a pension granted him by Louis XIV. His counsel in political and state affairs was sought for almost throughout Europe. By his works, although the man was greater than his writings, he has rendered important services both to the history of the German empire, and

to medical science. He vigorously opposed the alchemists, and zealously advocated and promoted Harvey's doctrine of the circulation of the blood. He died at Helmstedt on the 12th December, 1681. His collected writings were edited, with a life, by Göbel, Brunswick, 1730, 6 vols.—K. E.

CONROY, FLORENCE, a learned Irish Franciscan, was born in Galway in 1560. Being designed at an early age for the priesthood, he was sent first to the Netherlands, and afterwards to Spain, for the completion of his studies. He obtained a high reputation for scholarship, and was held to be the most deeply versed in the works of St. Augustine of any man in Europe. Upon the death of O'Higgin, the Roman catholic archbishop of Tuam, at Antwerp in 1609, Conroy was appointed to succeed him. He did not, however, go to Ireland to take possession of his see, but remained at the Spanish court. Through his influence with Philip II., that monarch was induced to found an Irish college at Louvain, dedicated to St. Anthony, in 1616—an institution which afterwards became celebrated for the distinguished Irishmen connected with it, and the Irish works that issued from its press. At this place he afterwards occupied himself in preparing for the press his "Commentaries on St. Augustine" and "Compendium of the Doctrines of St. Augustine." Shortly before his death he returned to Madrid, and retired to a Franciscan convent there, where he died on the 18th November, 1629.—J. F. W.

CONSALVI, ERCOLE, Cardinal, born at Rome in 1757; died there in 1824. Pope Pius VI. appointed him *uditor di ruota*, or member of the highest Roman civil court. In 1800 Chiaramonti, who had been raised to the pontificate, made him a cardinal-deacon, and secretary of state. It was Consalvi who concluded the concordat with Napoleon in 1801; but when the first consul began to quarrel with the pope he insisted on his dismissal, which Pius had at last, however unwillingly, to concede. During the period of the pope's abdication Consalvi was permitted to join his master at Fontainebleau, and, on the pontiff's return to Rome in 1814, was reinstated in his office of secretary of state. A monument, executed by the sculptor Rinaldi, was raised to his memory in the church of S. Marcello, where he was buried.—R. M., A.

\* CONSCIENCE, HENRI, the most eminent novelist of the Netherlands, was born at Antwerp in 1812. Having lost his mother, and his father being a poor dealer, he entered the army in 1830 and rose to be a serjeant-major. His powers of observation had been sharpened by a love of reading, which, despite of no ordinary difficulties, he contrived to indulge. His first attempt at composition was a romance descriptive of the heroic rising of his countrymen against their Spanish masters, and which succeeded on its appearance in winning what would have been universal approbation, only for one exception. There was one person who saw with an angry eye the work, which he was certainly incapable of judging; and he was the author's own father. The successful author had committed the crime of spoiling the promising dealer in old iron. Expelled from the shop he was deemed not worthy to inherit, the author found a protector in no less a personage than King Leopold, who gave him assistance. In 1837 he published his "Phantasia," in imitation of Hoffman, followed by stories illustrative of Flemish life, written with that truthful simplicity and directness of purpose set off with graphic descriptions, which go home to the hearts of readers. His independence has been secured by a situation connected with the Academy of Fine Arts. In the meantime his works are increasing in popularity and making their way through translations into France, England, and other countries.—J. F. C.

CONSTABLE, ARCHIBALD, a Scotch bookseller, who acquired considerable celebrity as the publisher of the *Edinburgh Review* and the *Encyclopædia Britannica*, and of the works of Sir Walter Scott, Dugald Stewart, and other eminent writers. To Mr. Constable belongs the merit of having led the way in the great revolution which has taken place in the diffusion of cheap literature, by the publication of the series of instructive works entitled *Constable's Miscellany*. Mr. Constable, having embarked in various extensive bookselling speculations, was involved in the ruin which the commercial crisis of 1825 brought upon vast numbers of the trading section of the community. His spirit was completely broken by his reverse of fortune, and he died in Edinburgh in 1827, in his fifty-fourth year. "He was," says Scott, "a prince of booksellers; his views sharp, powerful, and liberal, too san-

guine, however, and, like many bold and successful schemers, never knowing when to stand or stop. He knew, I think, more of the business of a bookseller in planning and executing popular works than any man of his time.—J. T.

CONSTABLE, HENRY, an English poet of the sixteenth century. He was the author of "Diana, or the Excellent Conceitful Sonnets of H. C., augmented with diverse Quatorzains of honourable and learned Personages, divided into eight decads," 1594. The "Shepherd's Song of Venus and Adonis" was reprinted by Malone in the notes to the tenth volume of his edition of Shakspeare. Constable, who was a Roman catholic, having come secretly to London, was apprehended and confined in the Tower for some time on account of his religion.—R. M., A.

CONSTABLE, JOHN: this distinguished landscape painter was born in 1776 at East Bergholt in Suffolk. He was the second son of a miller, and to that fact was fond in after life of attributing the many mills and streams, dams and weirs, constantly produced and reproduced in his pictures. He was twenty-four years of age before he took up art as a profession. He received lessons from Reinagle, R.A., and was greatly patronized by Sir George Beaumont. He had visited London in 1795 and again in 1799, and in 1800 he first entered the academy as a student. Three years afterwards he was residing in America Square, and the exhibitor of a picture in the academy which attracted some attention. But his works in the first instance startled rather than convinced the connoisseurs. Constable simply thought to be truthful—to paint what he saw—and was denounced as an innovator for his pains. He worked on, however, in his fresh, genial, original manner, indebted a little only to his predecessors, Wilson and Gainsborough, and a great deal to his earnest, indefatigable study of nature. His representations of atmospheric effects are singularly striking, and in his day were even more so. For many years quite a gallery of his paintings remained on his hands, but the tide turned at last. In 1829, in his fifty-third year, he was elected an academician. Good fortune smiled on him; he could sell as fast as he could paint; he was recognized and fairly appreciated at last. He doted upon his native fields. "I love," said he, "every style and stump and lane in the village; as long as I am able to hold a brush I shall never cease to paint them." At his death another academician, his friend the late C. R. Leslie, published his memoirs and letters. Some students to do honour to his memory purchased one of his landscapes and presented it to the national gallery, in the English art division of which it may still be seen. And a high place must be awarded him in the list of great English painters. If something limited, he was very conscientious—uniting a poetic quality to his realistic views of landscape; a thorough Briton—fond and proud of the moist air of his island—of its rich wood and abundant water, and its ever-varying sky. He resided for many years on Hampstead Heath, painting there some of his most successful works; but he died suddenly and painlessly at a house, 63 Upper Charlotte Street, London, on the 30th March, 1837, no less esteemed as a man than as an artist.—W. T.

CONSTANS I., FLAVIUS JULIUS, was the third son of Constantine the Great and Fausta. In the division of the empire at his father's death in 337, Italy, Africa, and Western Illyricum were allotted to him; and three years afterwards he acquired the dominions of his eldest brother, Constantine, who had perished in an unsuccessful invasion of his Italian provinces. He was slain in 350 by the partisans of Magnentius.—W. B.

CONSTANS II., FLAVIUS HERACLIUS, eldest son of Constantine III., succeeded to the Byzantine throne in 641. Through his jealousy of his brother Theodosius, the latter was forced into holy orders, and afterwards put to death. But the guilty monarch was speedily punished by the necessity of fleeing from his indignant subjects; and he is also said to have been haunted in his restless exile by the phantom of his murdered brother. He was assassinated at Syracuse in 668.—W. B.

CONSTANT DE REBECQUE, HENRI BENJAMIN, an eminent French litterateur and statesman, was born at Lausanne, 25th October, 1767. His education was remarkably catholic in its general character. He studied English literature at Oxford, Scotch philosophy at Edinburgh, and German learning at Erlangen; while among his personal acquaintances he numbered Makintosh and Erskine, Kant and Gibbon, Goethe, Wieland, and Schiller. Possessed of quick and lively capacities, Constant displayed that power of making mysteries of abstruse thought clear,

and of bestowing life upon otherwise dull technicalities, which gives so great and special a charm to the literature of France. Familiar with the philosophies of various nations, he endeavoured to realize the conditions of their existence, and their actual relationships to human needs, by putting himself *en rapport* with the dispositions and sympathies from which they sprung, rather than by measuring them by dogmatic rules of his own construction. The breadth of his culture determined the specialities of Constant's political as well as his literary career. Delighting in free intercourse with many minds, he perceived that liberty results from the balancing of contending claims and principles, rather than from the enthronement of any sectional authority; and hence he attached himself to that constitutional party which endeavoured to preserve France from the despotism alike of emperor and mob. Constant began his political career by uniting himself to moderate republicans who wished to preserve the principles of the Revolution, while repudiating its excesses. He was intimately connected with the constitutional club, *Le Cercle Constitutionnel*, which was directed by Talleyrand, and adorned by the brilliancy of madame de Staël. When Napoleon became first consul, Constant opposed his arbitrary authority and found it necessary to quit France. He took refuge at Weimar and Göttingen, and associated with Goethe, Wieland, and Schiller. With ready versatility he forsook politics for literature, translated *Wallenstein*, and collected materials for his great work on the history of Religions. In 1814 he returned to France; and although the republican of 1795 became the supporter of constitutional monarchy, we recognize the same principles of political conduct, seeking their realization in a different outward form. He resolutely opposed, however, the reactionary policy of the Bourbons. When Napoleon returned from Elba he was for a short time minister of state, defending himself by the assertion that he had a duty to his country above and beyond external changes of government; and on the final fall of the emperor, he became the principal leader of the constitutional party in the chamber of deputies. He took a foremost part in every great question at issue between 1818 and 1830, on the side of constitutional liberty; and his general policy was in harmony with that of the greatest and best of our own British statesmen. He established the *Constitutionnel* newspaper, which through his knowledge, wit, and eloquence achieved a marvellous success. As litterateur, editor, and leader of the constitutional party, Constant achieved important influence and power in France. Louis Philippe sought to bestow favours upon him; these were accepted in the spirit of the following words, "Sire, I accept your kindness, but liberty must ever be before gratitude; I wish to be independent; and if your government commits faults, I shall be the first to summon the opposition." "I have no other expectation," replied the king.—The last and greatest of Constant's works, and the one on which his fame in foreign lands chiefly depends, is entitled "De la Religion, considérée dans sa source, ses formes et ses développements," and was completed shortly before his death. The object of this work is threefold, and whatever may be thought of the conclusions he reaches, no doubt can be started regarding its pervading spirit of sincere devotion. (1) The general action of the religious principle is illustrated as a fundamental law, authoritative and universal. (2) Religions are divided into the sacerdotal and the independent, and decision is given against a preponderant hierarchy as injurious to the highest worship. (3) An attempt is made to prove a development of faith, upwards from fetichism; and the gradual stages of spiritual growth are traced.—Benjamin Constant died at Paris, 10th December, 1830, aged sixty-three, and was buried in the Pantheon.—L. L. P.

CONSTANTIA, FLAVIA JULIA VALERIA, sister of Constantine the Great, and wife of Licinius, assisted to maintain the harmony which prevailed between them for a time. When the war broke out she left her husband for her brother, to whom she was strongly attached, and with whom she continued even after the execution of her son. She died in 329.—W. B.

CONSTANTINE, surnamed THE GREAT, the first christian emperor of Rome, was the son of the Emperor Constantius Chlorus and Helena, and was born in 272 at Naissus in Dacia. He was brought up at the court of Diocletian, and served with distinction under Galerius in the Persian war. Apprehensive of danger from the jealousy of that prince, he sought and with difficulty obtained permission to join his father who was then in

Gaul, and accompanied him on his expedition to Britain and his campaign against the Caledonians. On the death of his father at York in 306, Constantine was proclaimed emperor by the army, and Galerius reluctantly acknowledged him as the sovereign of the provinces beyond the Alps, but gave him only the title of Cæsar. Constantine took up his residence at Treviri (Treves), and employed himself for some time in improving and securing his own dominions, avoiding any intermeddling with the civil contentions which at this time raged in other parts of the Roman empire. In 307 he married Fausta, the daughter of Maximin, who conferred on him the title of Augustus; but three years later that prince perfidiously formed a plot against the life of Constantine, which terminated in his own overthrow and capture, and death by his own hand. A civil war ensued between Constantine and Maxentius, the son of Maximin. After several sanguinary conflicts the struggle was brought to a close by the total defeat of Maxentius near Rome, and he was drowned in the Tiber in his attempt to escape, in 312. Constantine entered Rome next day, and was acknowledged emperor by the senate. It was at this time that he adopted a new standard called the Labanum, at the top of which was the monogram of the name of Christ, in commemoration, it is said, of a vision of a luminous cross which Constantine is alleged to have seen in the sky with the inscription "By this conquer." The Roman empire was shortly after divided between Constantine and his brother-in-law Licinius; the former reigning over the west, including Italy and Africa; the latter over the eastern provinces, with Egypt. Constantine now openly favoured the christian religion, and discountenanced and prohibited the nocturnal assemblies and obscene rites of paganism. He bestowed certain gifts and privileges on the christian churches, and exempted the clergy from personal taxes and civil duties. The motives of his conversion have been variously stated; and there can be little doubt that it was his interest to gain the support of the numerous party of christians in the Roman empire, and that his general conduct did no great credit to his profession. War broke out in 314 between him and Licinius. Two battles were fought—one near Sirmium in Pannonia, and the other at Adrianople, in both of which Licinius was defeated. He was thus compelled to sue for peace, which was granted, on condition that he should surrender to his victorious rival Illyricum, Macedonia, and Achaia. Constantine then promulgated several excellent laws ameliorating the condition of the lower classes of his subjects, and lessening the severity of the punishment inflicted upon criminals; and in 321 he ordered the observance of the christian sabbath, and abstinence from work on that day. In the following year he defeated the Goths and other barbarous tribes on the Danube and the Rhine, and pursued them into the territories of Licinius. This was made the pretext for a new war between the two emperors, in which Licinius was defeated, and compelled to surrender to Constantine, who at first promised him his life, but ultimately put him to death. Constantine was now sole master of the Roman world; but a series of domestic tragedies—the execution of his son, his nephew, and his wife, on charges the truth of which is doubtful—disturbed the tranquillity of his government, and marred his happiness. He published various edicts in favour of christianity, forbade the consulting of oracles, and abolished the combats of gladiators. He resolved to transfer the seat of empire to Byzantium, which he called after his own name, Constantinople. The new city was solemnly dedicated to the Virgin Mary, and the emperor spared no pains or expense in embellishing it, and attracting inhabitants to the new capital by bestowing valuable privileges and donations of corn and wine upon its inhabitants. In 328 he supported the orthodox bishops at the council of Nicæa, which condemned the Arian doctrine; but, towards the close of his life, he recalled several Arian bishops who had been banished by this council, a step which led to a prolonged controversy between him and Athanasius. In 337, when preparing to march against the Persians, he fell ill at Nicomedia, and died there in his sixty-fourth year. He was baptized on his deathbed by Eusebins. His three sons, Constantine, Constantius, and Constans, succeeded him in the empire.—J. T.

CONSTANTINE II., the eldest son of Constantine the Great, on the death of his father, A.D. 337, received Gaul, Britain, Spain, and part of Africa as his share of the empire. But dissatisfied with this division, he made war on his brother Constans, and was defeated and slain A.D. 340.

CONSTANTINE III., son of the Emperor Heraclius by his

first wife, Eudoxia, succeeded his father in A.D. 641. He was of a weakly constitution, however, and his reign lasted only one hundred and three days. A belief was generally entertained that his death had been hastened by poison, alleged to have been administered by his stepmother Martina, who was punished by cutting out her tongue.

CONSTANTINE IV., surnamed POGONATUS, emperor of Constantinople, ascended the throne on the death of his father, Constans II., in 668, and died in 685.—W. M.

CONSTANTINE V., surnamed COPRONYMUS, son of Leo the Isaurian, succeeded to his father's throne in 741. Though dissolute and tyrannical, he appears to have been a prince of great ability and energy. It was during his reign that the controversy on image-worship reached its height; and he is well known for the zeal with which he endeavoured to abolish the use of images throughout the church. Died in 775.—W. M.

CONSTANTINE VI., grandson of the preceding, was at the early age of five years associated in the empire with his father Leo IV. On the death of Leo in 780, the Empress Irene was appointed regent of the empire. She formed a conspiracy to dethrone Constantine, and to establish herself in the empire. He was seized by a number of her partisans, and cruelly deprived of sight, by having their daggers thrust into his eyes. Irene succeeded him on the throne in 792, and he lived for many years afterwards a life of obscurity.—W. M.

CONSTANTINE VII., surnamed PORPHYROGENITUS, was born in 905, and succeeded to the throne in 911, but did not become sole emperor till 945. He spent a great part of his time with his books and music, his pen and pencil. He is even said to have been kept in such poverty during his minority, as to have been reduced to the necessity of selling the paintings he had executed. Constantine composed a great number of works, many of which have come down to us. His principal writings are a "Treatise on the Ceremonies of the Church and Palace of Constantinople;" an account of the Provinces or Thanes, as they were termed, in Europe and Asia; "A System of Tactics;" "An Account of the Policy of the Imperial Court with respect to Foreign Nations;" "Basilies, or the Code and Pandects of Greek Law;" "Geonics, or the Art of Agriculture;" and "Historical Collections." Constantine died in 959, it is alleged by poison administered by his sons, but the story is probably false.—J. T.

CONSTANTINE VIII., was the son of Romanus Lecapenus, and was associated in the empire with his father. He united with his brother Stephen in dethroning their father; but vengeance soon overtook the unnatural sons—they were seized, degraded from the purple, and put in prison. Constantine was afterwards banished to Samothrace, and lost his life in an attempt to escape.

CONSTANTINE IX., son of Romanus II., was born in 961, and succeeded to the throne in 976, along with his brother Basil II. Upon the death of his brother, Constantine reigned as sole emperor for about three years, and died in 1028. He was the last emperor of the Macedonian dynasty.

CONSTANTINE X., surnamed MONOMACHUS, succeeded to the Eastern empire on his marriage with Zoe, daughter of Constantine IX., in 1042. He gave himself up to a life of indolence and debauchery, which soon affected his health, and ultimately hastened his death in 1054.—W. M.

CONSTANTINE XI., surnamed DUCAS, a member of the Comnenian family, succeeded to the throne on the abdication of Isaac Comnenus in 1059. Died in 1067.—W. M.

CONSTANTINE XII., named DUCAS, was the son of the preceding, and succeeded his father in 1067, along with his brothers, Michael and Andronicus, under the regency of their mother. Constantine was confined in a monastery by the usurper Nicephorus III. Botoniates. The time and manner of his death are uncertain.

CONSTANTINE XIII., named PALÆOLOGUS, the last of the Greek emperors, was the fourth son of the Emperor Manuel Palæologus, and was born in 1391. He ascended the throne in 1448, on the death of his brother John VII. The once mighty Eastern empire was now reduced to little more than the limits of the capital, on which the Turkish sultan, Mahomet II., cast longing eyes. He soon contrived to make an occasion of quarrel with Constantine, and after vast preparations, commenced the siege of Constantinople in 1453. In this last extremity Constantine fought with heroic courage, and was bravely supported by the scanty garrison of the city. The reiterated assaults of the

besiegers, in spite of their overwhelming numbers, were repulsed with great slaughter. At length Mahomet conceived the daring scheme of transporting his lighter vessels by land, from the Bosphorus to the higher part of the harbour, a distance of ten miles, and thus was enabled to make a double attack upon the city, from the harbour as well as from the land. The garrison was at last completely worn out by the persevering assaults of the hordes of besiegers, and in May, 1453, the city was taken. Constantine, who fought to the last with desperate courage, fell amidst the tumult by an unknown hand, and his body was buried under a mountain of the slain. With him perished the Greek empire.—J. T.

CONSTANTINE, elected emperor by the Roman army in Britain in 407, had been a private soldier, and owed his elevation solely to his name. He performed his part, however, with considerable success; Gaul and Spain submitted to him; and Honorius, hard pressed by the Goths, acknowledged his sovereignty in the hope of his assistance. After the death of Alaric he was defeated by the famous general Constantius, taken prisoner, and put to death in 411.—W. B.

CONSTANTINE, Pope, was elected to the pontificate in 708. Two years later he visited the Emperor Justinian, and received from him a ratification of the privileges and rights of the church. His dispute with the archbishop of Milan respecting the consecration of a bishop, issued in securing that prerogative to the pope. He died in 715.—W. B.

CONSTANTINE, Antipope, was chosen by a party at the death of Paul I. in 767. He owed his consecration to the forcible interference of his brother, Duke Soton; but in little more than a year he was dethroned, and after being subjected to various indignities and tortures, was immured in a convent till his death.—W. B.

CONSTANTINE PAULOVICH, Grand Duke of Russia, was the second son of Paul I., and born in 1779. He displayed the spirit of a brave and hardy soldier in the military operations against Napoleon, and specially distinguished himself by his resolute stand and orderly retreat with the reserve at Ansterlitz. He afterwards held the office of commander-in-chief in Poland, and at the death of his brother Alexander would have succeeded to the throne; but he had solemnly renounced his right to it. Persisting in the act, he attended the coronation of his younger brother Nicholas, and returned to Warsaw, where the severity of his rule was one cause of the outbreak of 1830, in which he narrowly escaped falling into the hands of the insurgents. He died of cholera at Witepsk in the following year.—W. B.

CONSTANTINE VSEVOLODOVICH, born 1186, was created Prince of Novogorod by his father Vsevolod, who then held the sovereignty of Russia under the title of grand duke of Vladimir. Subsequently transferred to the government of Rostof, he refused to resign it to his brother George, in terms of their father's arrangements respecting the succession; and after the death of Vsevolod, the two princes fought in 1216, at Yourief, a battle which gave the grand dukedom to Constantine. He held it till 1219, in which year he died.—W. B.

CONSTANTINUS, surnamed AFRICANUS, a medical writer of the eleventh century. After travelling thirty-nine years in the east in search of knowledge, he returned to Carthage, his native city; but being suspected of magic, he took refuge with Duke Robert of Salerno. He spent his latter years in the monastery of Monte Cassino, where he wrote his works. These were published at Basle in 1539.—R. M., A.

CONSTANTIUS I., surnamed CILORUS, Roman emperor, A.D. 305–306, was the son of Eutropius, a noble Dardanian. He obtained the title of Cæsar by his victories in Britain and Germany, and afterwards received the government of Britain, Gaul, and Spain. Upon the abdication of Diocletian and Maximian in 305, Constantius and Galerius became the Augusti, a title that was given only to the emperors. He died fifteen months afterwards at Eboracum (York) in Britain. His son, Constantine the Great, succeeded him in his share of the government.—R. M., A.

CONSTANTIUS II., Roman emperor, A.D. 337–361, was the third son of Constantine the Great by his second wife, Fausta. On the death of Constantine, he received the East as his share of the empire. He was engaged in a war with the Persians, while his brothers Constantine and Constans were contending for empire in the West; but after the death of Constans the whole empire became subject to him. He put to death

his cousin Gallus in 354. In 355 he raised Julian to the dignity of Cæsar, and gave him the command in Gaul; but the latter having been proclaimed emperor at Paris, Constantius set out for Europe, but died on his march at Cilicia in 361.—R. M., A.

CONSTANTIUS III., Emperor of the West, A.D. 421. The success of his arms won him the hand of Placidia, the sister of Honorius, by the latter of whom he was declared Augustus in 421. He died in the seventh month of his reign.—R. M., A.

CONVERSO, GIROLAMO, a musician, was born at Correggio before the middle of the sixteenth century. He is only known by two books of madrigals published at Venice—one in 1575, and one in 1584—several pieces from which, adapted to English words, are greatly esteemed in this country.—G. A. M.

CONWAY, HENRY SEYMOUR, an English general and statesman, second son of the first Lord Conway, was born in 1720. He served in the Seven Years' war, and commanded with high reputation the British forces in Germany under Prince Ferdinand of Brunswick in 1761. On his return to England he obtained a seat in parliament, and held the office of secretary of state from 1765 till 1768. He returned to the exercise of his profession, and in 1782 was appointed commander of the forces. He was the author of a comedy called "False Appearances," and of a variety of poetical pieces and political tracts. General Conway is better known as the intimate friend of Horace Walpole. He died in 1795.—J. T.

CONYBEARE, JOHN JOSIAS, an English divine and geologist, was born in 1779, and died in 1824. He was educated at Westminster and Oxford. He was made Anglo-Saxon professor in 1807, and professor of poetry in 1812. In 1824 he preached the Bampton lecture. Conybeare was devoted to geology and chemistry, in the former of which especially he attained to considerable eminence.—R. M., A.

CONYBEARE, JOHN, D.D., a learned prelate of the church of England, born at Pinhoe, near Exeter, in 1692; died at Bath in 1755. He was educated at Exeter college, Oxford, of which he became a probationary fellow in 1710. Ordained priest in 1716, he held for some time a curacy in Surrey; became one of his majesty's preachers at Whitehall; was appointed rector of St. Clement's in Oxford in 1724; and in 1730, after taking his degree of D.D., was raised to the headship of Exeter college. Two years afterwards he published his celebrated "Defence of Revealed Religion," in answer to Tindal's Christianity as Old as the Creation. In 1750 Dr. Conybeare succeeded Butler in the see of Bristol, the latter being translated to Durham.

CONYBEARE, Very Rev. WILLIAM DANIEL, dean of Llandaff, a distinguished geologist, was the son of a clergyman in London, born on the 27th of June, 1787. He entered Christ Church college, Oxford, in January, 1805, and took his degree of B.A. in 1808, and M.A. in 1811. Mr. Conybeare was one of the earliest founders of the Geological Society, and his papers, contributed to the Transactions of that society, prove how earnestly he laboured in this field of scientific inquiry. He was the first to describe the plesiosaurus in his paper read before the Geological Society of London, a paper that procured for him from Cuvier the highest encomiums which one philosopher could bestow on another. His papers on coal-fields are most valuable—scientifically and practically. He drew up the report for the British Association in 1832 on the progress, actual state, and ulterior prospects of geological science. His published papers, according to Agassiz's Bibliography, amount to sixteen in number—all of which are of great scientific interest. Mr. Conybeare was elected a fellow of the Royal Society in 1819. He was also a corresponding member of the Royal Institute of France, and a fellow of the Geological Society. He became dean of Llandaff in 1845, having been previously public preacher in his own university, and Bampton lecturer in 1839. His death occurred on the 12th of August, 1857, at the age of seventy-one years.—E. L.

COOKE, BENJAMIN, Mus. Doc., a celebrated English musician, was the son of Benjamin Cooke, a music-seller in New street, Covent garden. He was born in 1732, and lost his father at the early age of nine years; but previously to that event he had been placed under the instructions of Dr. Pepusch, and made so rapid a progress, that at twelve years old he was competent to the duty of deputy-organist of Westminster abbey. In 1757 he succeeded Bernard Gates as lay-clerk and master of the boys at Westminster abbey; and in 1762 he was, without any solicitation on his part, appointed by Bishop Pearce, then dean of

Westminster, organist of that foundation. In 1777 the university of Cambridge bestowed on him the degree of doctor of music, on which occasion his exercise was an anthem—"Behold how good and joyful"—originally written for the installation of the duke of York as a knight of the bath in Henry VII.'s chapel, and which, we believe, continued to be performed at all subsequent installations of that order down to 1812. From an early age Dr. Cooke had been subject to frequent attacks of the gout; which, added to an affection of the lungs, brought to a close a life of unsullied integrity and virtue on the 14th of September, 1793. Dr. Cooke's chief printed works are two books of canons, glees, rounds, and duets; Galliard's Morning Hymn, with the addition of choruses and instrumental accompaniments; Collins' Ode on the Passions; and the well-known service in the key of G. Many of his glees and canons obtained prize medals at the Glee club, and are printed in Warren's collection. The "Amen" canon, engraven on his tablet in the cloisters of Westminster abbey, is well known and deservedly admired by the amateurs of that species of composition. Amongst his secular productions, the most popular have been the duets, "Thyrsis when he left me," and "Let Rubinelli charm the ear;" his Spartan chorus, "I have been young;" and his glees, "Deh Dove;" "As now the shades of Eve;" "How sleeps the Brave;" "Hark! the Lark;" "In Paper Case;" and "In the merry month of May"—the last of which is an admirable mixture of the old English madrigal and the modern glee. A list of Dr. Cooke's compositions for the church is given in Novello's Life of Purcell. That enthusiastic musician adds, "It will scarcely be believed that the whole of the above fine collection of church music has been allowed to remain unpublished and neglected; but it is earnestly to be hoped that those who are interested in the preservation and improvement of English sacred music will, without further delay, endeavour to rescue these musical treasures from the oblivion to which they are now hastening." In this appeal we most earnestly join.—E. F. R.

COOK, GEORGE, D.D., a historical and theological writer, was the second son of John Cook, professor of moral philosophy in the university of St. Andrews, where he was born in 1773. He entered the university at an early age, and was licensed to preach on the 30th of April, 1795. On the 3rd September of the same year he was ordained minister of Laurencekirk in Kincardineshire. His first work, published in 1808, was entitled "Illustration of the General Evidence establishing Christ's Resurrection." His "History of the Reformation," a work of much authority and value, appeared in 1811 in three volumes, 8vo. It was followed in 1815 by the "History of the Church of Scotland," a work of similar extent. In 1820 he published his "Life of Principal Hill," and in 1822 "A General and Historical View of Christianity." In 1825 he was chosen moderator of the general assembly, and on the 26th of July of the following year, was nominated one of the royal commissioners for visiting the universities of Scotland. In 1828 Dr. Cook was appointed to the chair of moral philosophy in the university of St. Andrews. The duties of this office he discharged with painstaking assiduity and remarkable efficiency. He began early to take a prominent part in the business of church courts, and was for nearly twenty years the acknowledged leader of the moderate party in the general assembly. His death took place suddenly at St. Andrews on the 13th May, 1845. As leader of the moderate party in the Scottish church, during the contest which terminated in the Disruption, Dr. Cook conducted the debates with singular amenity and admirable candour.

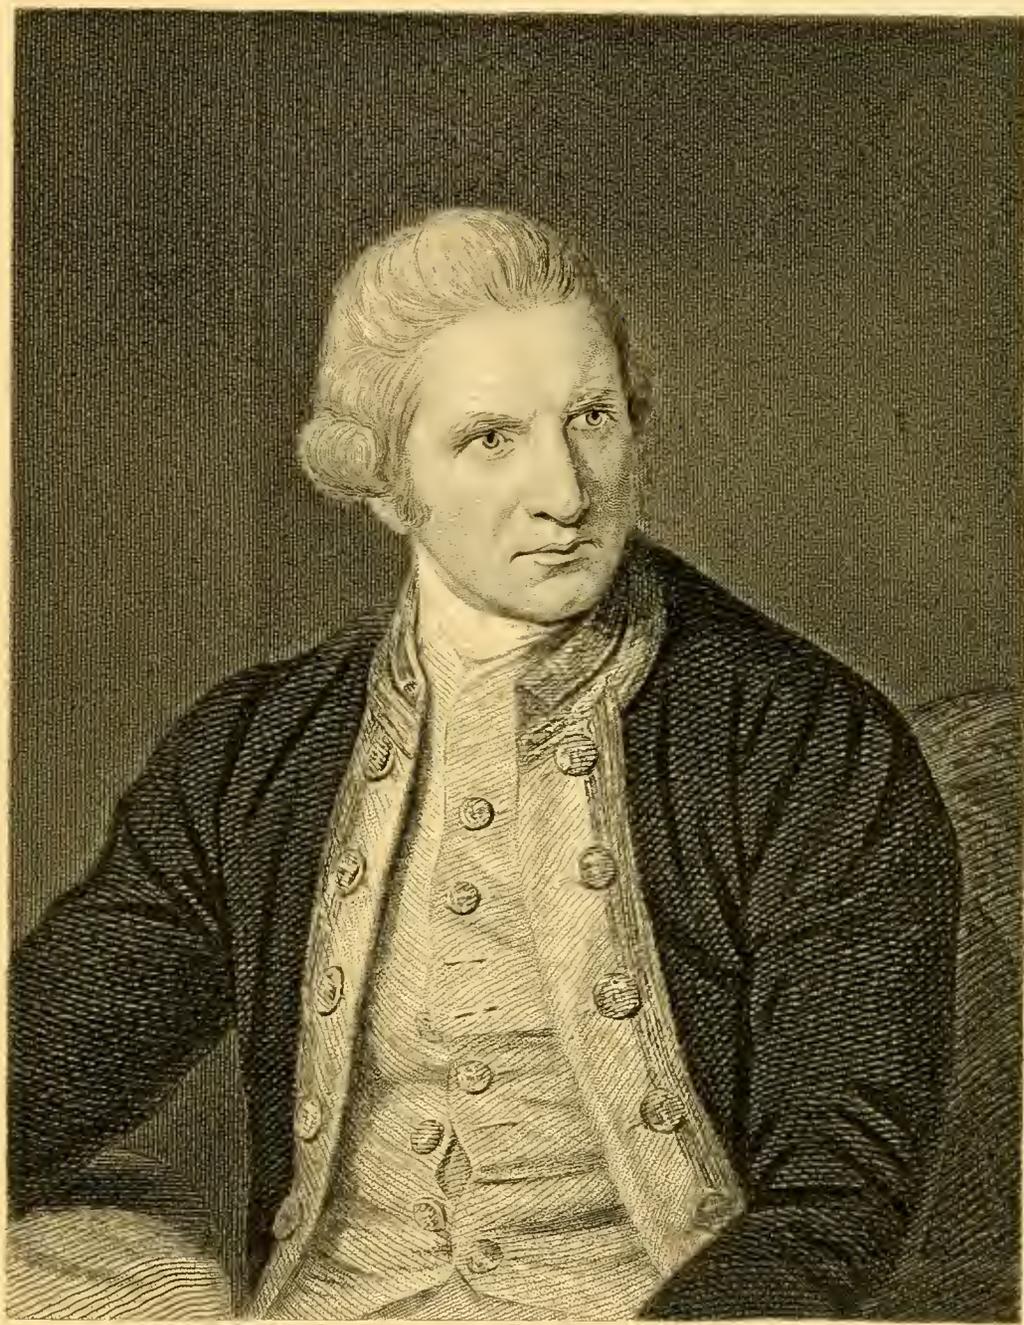

COOKE, GEORGE FREDERICK, a popular English actor, was born at Westminster in 1755. Upon the death of his father, who had been an officer in the army, young Cooke went with his mother to Berwick-upon-Tweed. He was apprenticed at the usual age to a printer, but ultimately abandoned his trade for the stage, and made his first appearance at Brentford in the character of *Dumont*, in the tragedy of *Jane Shore*. His debut in London in 1778 attracted little notice. He then went to Ireland, and after having been twenty-two years the hero of the Dublin stage, returned to London, and became the rival of Kemble. In 1810 he went to New York, where his death, which was hastened by his intemperate habits, occurred two years afterwards.—R. M. A.

COOKE, HENRY, a musician, was educated at the chapel royal in the reign of Charles I.; but at the commencement of the rebellion, he quitted it and entered the army. About the

year 1642 he had interest enough to obtain a captain's commission; and from that time he was always distinguished by the title of Captain Cook. The loyalty and skill of this musical soldier recommended him to the notice and secured him the patronage of Charles II., by whom in 1660 he was appointed master of the children of the royal chapel. In 1661 a hymn in four parts of the captain's composition, was performed instead of the litany in St. George's chapel, Windsor, by order of the sovereign and knights of the garter. None of his church music has hitherto been printed; and if we may judge from his few secular compositions that are to be found dispersed in the collections of the time, he seems to have been by no means qualified for the high office to which he was appointed. A large collection of his church music is preserved in MS. in the celebrated Aldrich collection at Christ church, Oxford. Whatever were his merits as a composer, he is at least entitled to some distinction as the first instructor of the celebrated Henry Purcell. He was also the master of Blow, Wise, and Humphrey; and Wood tells us in the Ashmolean MS., No. 8568, that he was "the best musician of his time till Mr. Pelham Humphrey, one of the children of the chapel educated by himself, began to rival him, after which he died with great discontent."—E. F. R.

COOKE, HENRY, an English painter, born in 1642, studied in Italy under Salvator Rosa. In the later part of his life he obtained considerable patronage, and was even employed by King William to repair the cartoons and other pictures in the royal gallery. He completed the equestrian portrait of Charles II., at Chelsea college, and painted the choir of new college chapel, Oxford. He died November, 18th 1700. "I have his own head by him" writes Walpole, "touched with spirit, but too dark, and the colouring not natural."—W. T.

COOK, CAPTAIN JAMES, the celebrated navigator, was born October 27th, 1728, at the village of Marton, Yorkshire. His father was an agricultural labourer there, and afterwards a farm-bailiff at Great Ayrton, where his famous son received the rudiments of instruction in writing and arithmetic. Before he was thirteen years of age James Cook was apprenticed to a haberdasher at Staiths, near Whitby, but he disliked the employment; and some disagreement having taken place between him and his master he obtained his discharge, and following the strong bent of his mind, he went as an apprentice on board a collier belonging to Whitby, and continued in the employment of its owners until he rose to the situation of mate. In 1755 he entered the royal navy as a volunteer, and soon acquired the character of a skilful and trustworthy seaman. His steadiness and activity attracted the notice of Captain (afterwards Sir Hugh) Palliser, and backed by the influence of Mr. Osbaldiston, M.P. for Scarborough, obtained for him in 1759 the appointment of master to the *Mercury*, in which he sailed to the St. Lawrence, and was present at the capture of Quebec by General Wolfe. Cook rendered important service to the expedition by taking soundings of the river opposite to the French camp, and on one occasion narrowly escaped being captured by the Indians. He afterwards surveyed and made a chart of the St. Lawrence from Quebec to the sea, which was published in London along with sailing directions for that river. In September, 1759, Cook was appointed master of the *Northumberland* man-of-war, and spent the following winter at Halifax, Nova Scotia, where he employed his leisure in the diligent study of mathematics and astronomy, and thus qualified himself for the higher situations in his profession. In 1762 he assisted in the recapture of Newfoundland. Towards the close of this year he returned to England, but was not allowed to remain long at home. Early in 1763 he was sent out to survey the whole coast of Newfoundland, and next year he was appointed marine surveyor of Newfoundland and Labrador. The valuable charts which he constructed of these countries, together with his accurate observation of an eclipse of the sun, which he had made at one of the Benger islands, gained for him a high reputation for scientific skill, and pointed him out as a fit person to conduct an expedition that was undertaken in 1767 for the purpose of making observations on the impending transit of Venus over the face of the sun, and prosecuting geographical observations in the South Pacific ocean. With this view he received the commission of a lieutenant, and was appointed to the command of the ship *Endeavour*, of 370 tons. Accompanied by Sir Joseph Banks and other scientific gentlemen, he set sail on the 26th August, 1768, and on the 13th of April, 1769, reached Otaheite (now Tahiti), which had been selected as the most eligible spot for

making the observations. The object was accomplished on the 3rd of June, with complete success. On the 13th of July Cook quitted Otaheite, and after visiting the other Society Islands sailed southward in quest of the great continent, which was then supposed to exist in the Pacific ocean. On the 6th of October, he reached New Zealand, but was prevented from exploring it by the hostility of the natives. He then proceeded to New Holland (now Australia), of which he took possession in the name of Great Britain, denominating the eastern coast, which he had explored, New South Wales. He next made for New Guinea, sailing through the strait which now bears his name, and thus proved that Australia and New Guinea were distinct islands. He thence proceeded to Batavia where he was obliged to remain two months and a half to repair his shattered ship. On the 27th of December he quitted this place, the pestilential climate of which proved fatal to many of his crew; and on the 12th of June, 1771, the *Endeavour*, after encountering many imminent dangers and narrowly escaping shipwreck, anchored safely in the Downs. The results of this voyage, which made vast additions to our scientific and geographical knowledge, excited general and deep interest, and whetted the public appetite for still further discoveries. Shortly after his return Cook was promoted to the rank of commander, and it was resolved to fit out another expedition under his charge, to circumnavigate the whole globe in high southern latitudes, with the view of solving the much-agitated question of the existence of a southern continent. Two vessels, the *Resolution* of 460 tons, and the *Adventure* of 336, with a complement in all of 193 men, were accordingly commissioned for this purpose, and sailed on the 13th of July, 1772. Captain Cook reached the Cape of Good Hope on the 30th of October, and quitting it on the 22nd of November made his traverses, as instructed, in the high latitudes in the Southern ocean, but without discovering any traces of the terra incognita. He therefore shaped his course for New Zealand, which he reached, March 26th, 1773, after having been 117 days at sea, and traversed 3160 leagues. After spending the winter months (our summer) among the Society Islands, Captain Cook resumed in November his search for the southern continent, to the eastward between the 60th and 70th parallels of latitude; and on the 30th of January reached the latitude of 71° 10' south, where he was finally stopped by the ice. He then returned southward, and navigating the southern tropic from Easter Island to the New Hebrides, discovered the large island which he called New Caledonia. After refreshing his crew at New Zealand, he traversed the Pacific in still higher latitudes in quest of the desired continent, but without effect; and giving up all hope of finding any considerable land in these latitudes, he turned homewards, and anchored at Spithead on the 30th of July, 1774, after an absence of three years and eighteen days. He was received with marked honours, was immediately raised to the rank of post-captain and appointed captain of Greenwich hospital; and soon after he was elected a member of the Royal Society, and received the Copley gold medal for the best experimental paper of the year. The remarkable success of the methods he had employed for preserving the health of his men during this voyage, attracted universal attention, and contributed greatly to his high reputation as a navigator. His own journal of this voyage is written in a plain and manly style, which does equal credit to his ability and his good sense. During the absence of Captain Cook in the southern ocean, the attention of the government had been turned towards the discovery of a north-west passage, from the north Atlantic to the north Pacific oceans, and it was resolved that an expedition should be fitted out for this purpose. Although Captain Cook had well earned a right to repose after so many years of labour and anxiety, he promptly volunteered his services to conduct the expedition. His offer was at once gladly accepted. Two vessels were accordingly fitted out for the exploratory voyage and placed under his care, namely, his old ship, the *Resolution*, and the *Discovery*, under the command of Captain Clarke. His instructions were, to reverse the usual course of arctic voyagers, and to proceed first to the Pacific, revisiting the chain of newly-discovered islands and disseminating among them a variety of useful animals, which he carried with him for that purpose. He was next to turn northwards along the western coast of America as far as latitude 65°, and then to endeavour to find a passage to the Atlantic by the high northern latitudes between Asia and America. The requisite preparations having been made, the *Resolution* quitted Ply-

mouth on the 12th July, 1776, and the *Discovery* followed soon after. They reached the Friendly Islands in the spring of 1777; and after remaining there for several months, Captain Cook set sail for the north in January, 1778. On his way he discovered a group to which he gave the name of the Sandwich Islands, after the nobleman who was then at the head of the Admiralty. He reached the coast of America on March 7th; and following the coast line to the extreme northern point of the Pacific, he explored the deep bay afterwards known as Cook's Inlet, but without discovering the expected passage. He then made sail for Behring's Strait, but on reaching latitude 70° 41' (August 18) he was stopped by an impenetrable wall of ice.

Returning to winter at the Sandwich Islands, he discovered Mowee and Owhyhee, at the latter of which his adventurous career was suddenly cut short by a tragical death. During the night of February 13, 1779, the cutter of the *Discovery* was stolen, and Cook went ashore next day to try to recover it. He put in practice his usual expedient of seizing the king of the island, with the intention of detaining him on board his ship till the stolen article was restored. On his return to the boats a scuffle ensued with the natives, and the marines were compelled to fire in self-defence. Cook, who was the last person to retire, was separated from his men, surrounded by a crowd of savages, and, in spite of a vigorous resistance, was at length overpowered and killed. His body was left in the possession of the natives, and the bones only were subsequently recovered and committed to the deep with the usual honours. The intelligence of this melancholy event was received, not in Britain only but throughout all Europe, with general lamentation; high honours were paid to his memory, and a pension was settled upon his widow and children. An account of his third voyage from his own journal, continued by Lieutenant King, was published at the expense of government.—J. T.

COOKE, JOHN, M.D., an intelligent and highly-educated physician who practised in London in the beginning of the present century. He was elected physician to the general dispensary, Aldersgate Street, the first institution of the kind established in London, and afterwards became physician to the London hospital. Here he delivered regular courses of lectures on the practice of medicine, which duty, in connection with the physiciancy to the hospital, he held for fifteen years. His health declining, his labours became restricted to private practice, in which he was very successful. Dr. Cooke received the fellowship of the college of physicians in 1809. In 1819 he was appointed to deliver the Croonian lectures at the college, and he chose for his subject, "The Nervous System." In 1830 he delivered the Harveian oration in a powerful and admirable address. He was a fellow of the Royal Society, of the Society of Antiquaries, and during the years 1822-23, president of the Medico-chirurgical Society. He died on the 1st January, 1838, having arrived, it is supposed, at the advanced age of eighty-six or eighty-seven years.—E. L.

COOKE, ROBERT, organist and master of the choristers of Westminster abbey, the son of Dr. Benjamin Cooke, was a composer of considerable ability. In addition to some clever glees and other secular music, especially a song in imitation of Purcell, which he wrote expressly for Bartleman, he produced an evening service in C., which has been printed; and an anthem beginning, "I looked, and lo! a Lamb stood on Mount Sion." He was unfortunately drowned in the Thames in the year 1814.—E. F. R.

COOKE, THOMAS, a musician, was born in Dublin in 1782, and died in London, 31st March, 1848. His precocious talent for his art was first cultivated by his father, a musician by profession, and he was afterwards taught composition by Giordani. When very young for the office, he was engaged as music director and leader of the band at the Dublin theatre, where, also, he first appeared as a vocalist in the pasticcio opera of *The Siege of Belgrade*. He came to London as principal tenor at the English Opera house, and was engaged in the same capacity at Drury Lane theatre for several years. Retiring afterwards from the stage, except for the performance of certain special characters, he officiated as music director, composer, and leader, at this latter establishment for a long period, and, alternately, at Drury Lane and Covent Garden, until Mr. Macready retired from management in 1843. He was more distinguished for his prompt facility, both in composition and performance, than for particular excellence in either; though the great popularity of many of his productions, and the important offices he filled

with honour, prove him to have possessed no ordinary talent. So great was his aptitude as an executant, that on one occasion, at his benefit at Drury Lane theatre in 1820, after singing the chief part in an opera, he played solos on nine different instruments. He was repeatedly elected director of the Philharmonic Society, and was the only person who ever alternated the duties of conductor and leader at the concerts of that institution. He was one of the leaders also at the Westminster Abbey festival of 1834, and was a member of every musical society of importance in London. His prize gleec, "The Seasons," written in 1828, was the first of many that won the same laurels, and proved his capability for that species of composition to be as felicitous, as did his many theatrical works that for dramatic music. His elementary treatise on singing was held in much esteem, and his success as a teacher was shown in his celebrated pupils, Miss M. Tree, Mrs. Austin, and Miss Rainforth. He was scarcely less noted as a wit than as a musician, and thus all the musical jokes of his time were characteristically fathered upon him. He was a brilliant companion, and his kindly encouragement of young artists influenced not a little the progress of music in England among the present generation.—His son, HENRY ANGELO MICHAEL (familiarily known as GRATTAN) COOKE, was one of the first students of the Royal Academy of Music, where he gained great distinction. He held, for many years, all the chief engagements as oboist in England, and was bandmaster of the Life Guards.—G. A. M.

COOKE, THOMAS, a poet, born about 1707, and died in 1750. When only nineteen years of age, he edited the works of Andrew Marvell. In 1728 was published his translation of Hesiod. He also translated Terence, Cicero's *De Natura Deorum*, and the *Amphitryon* of Plautus. His ridicule of Pope's *Odyssey* in the farce entitled "Penelope," secured for his name the unenviable immortality of the *Dunciad*.—R. M., A.

COOKE, WILLIAM, a miscellaneous writer, born at Cork, and died in 1824. He came to London, and having purchased a share in two public journals, devoted himself to literary labours. He wrote a poem on "The Art of Living in London," and another entitled "Conversation," besides "Lives of the Actors Macklin and Foote."—R. M., A.

COOMBE, WILLIAM, a miscellaneous writer, born at Bristol in 1741, and died in 1823. He was educated at Eton and Oxford, squandered a large fortune, and found himself dependent on literary pursuits. His best known work is "The Tour of Doctor Syntax in search of the Picturesque." He wrote also "The Devil upon Two Sticks in England;" "The Diaboliad;" "The English Dance of Death;" "The Dance of Life;" "The Royal Register," in 9 vols., &c.—R. M., A.

COOPER. See SHAFESBURY.

COOPER, SIR ASTLEY PASTON, a distinguished surgeon, was born at Brooke in the county of Norfolk, on the 23rd of August, 1768. His father, Dr. Cooper, was the curate of the place. His mother was a popular authoress in her day, and published several novels and other works, the object of which was to elevate the position of women. Astley was the fourth son of these parents. He was distinguished as a boy for his liveliness of disposition, his love of enterprise and fun, rather than for any tendency to study. A simple incident, however—in which, by binding a tight bandage over the upper part of a limb, he stopped bleeding from a wounded artery, and thus saved a boy's life—determined him to make surgery his profession. When in his thirteenth year his father was presented with the living of Great Yarmouth in Norfolk, to which place he removed. In August, 1784, young Cooper left home for London; and was bound apprentice to his uncle, Mr. William Cooper, one of the surgeons of Guy's hospital; but with him he only remained three months, being then transferred by his own desire to Mr. Cline, the eminent surgeon of St. Thomas's Hospital. He also attended the lectures of John Hunter, and was one of the few who comprehended the real value of this great man's theories and experiments. In 1787 Sir Astley visited Edinburgh for a short time, and distinguished himself at the Royal Medical Society, though he had not reached twenty years of age. On his return to London he was made demonstrator of anatomy at St. Thomas' hospital; and in 1791 he was permitted to take part, in connection with Mr. Cline, in the lectures on anatomy and surgery which were then delivered. His first class consisted of fifty students, which rapidly increased to four hundred, the largest ever known in London. He was married in the

same year to Miss Cock, a distant relation of Mr. Cline. In 1792 he visited Paris, and attended the lectures of Desault and Chopart. Here he was on the breaking out of the Revolution on the 10th of August. In the next course of lectures he delivered in London he confined himself wholly to surgery, and this was the first course given on that subject independent of anatomy. It was perfectly successful. In 1792 he commenced practice as a surgeon. His popularity soon became enormous, and he is said to have received larger fees for special operations than were ever known in the profession. As a lecturer, too, he was remarkably successful. The earliest of his literary productions was published in 1798 in the *Medical Records and Researches*. On the death of his uncle in 1800 he was appointed surgeon to Guy's hospital; and in this and the following year read two papers before the Royal Society, for which he obtained the Copleian medal of the Royal Society for 1802. In 1805 he was elected a fellow of the Royal Society. In the same year he took an active part in the formation of the Medico-Chirurgical Society, which arose out of some disagreement in the London Medical Society. Mr. Cooper is recorded to have been the first to try the possibility of tying the carotid artery in aneurism. Although his case was unsuccessful, it led the way to future success in the operation. In 1804 he published the first part of his great work on *Hernia*, and in 1807 the second part appeared. The great expense of the work prevented its extensive sale, and as a commercial speculation he was greatly the loser by it; but it added to his increasing reputation, and in 1813 his annual income amounted to twenty-one thousand pounds, probably the largest ever made by a medical practitioner. In 1813 he was appointed professor of comparative anatomy to the College of Surgeons. In 1817 he performed one of his remarkable operations—that of tying the aorta. It was not successful, but was one of the boldest attempts in the annals of surgery. In 1818, in conjunction with his former pupil and colleague, Mr. Travers, he commenced publishing a series of surgical essays, but the plan was shortly after abandoned. In 1820 Cooper was called in to attend on King George IV., although he held no official position at court. Shortly after he removed a steatomatous tumour from the head of the king, and was then offered a baronetcy, which he accepted on the condition that, having no son, the title should descend to his nephew, Astley Cooper. In 1822 he was elected one of the court of examiners of the College of Surgeons; and the same year he brought out his great work on "Dislocations and Fractures." In 1817 he became president of the College of Surgeons. The grief which the death of his wife in this year occasioned, induced him to retire from practice to his estate at Gadesbridge. Here he lived but a short time, returning to London and to his active life in 1828. The same year he married again, and was appointed serjeant-surgeon to the king. In 1830 he became vice-president of the Royal Society. In 1829 the first part appeared of a work on "The Anatomy and Diseases of the Breast," which was completed in 1840. This was a worthy companion to his previous labours. In 1832 a treatise on the "Thymus Gland" from his pen threw light on the obscure nature of this organ of the body. He was a member of the Royal Institute of France, and an intimate friend of the celebrated surgeon, Dupuytren. In 1834, on the occasion of the installation of the duke of Wellington at Oxford, he received from that university the honorary degree of doctor of civil law. In 1837 he visited Edinburgh, where new honours awaited him. He was made an LL.D. of that university, the freedom of the city was presented to him, and a public dinner was given him by the College of Surgeons. In the year 1840 attacks of giddiness, to which he had been subject, increased, and he had much difficulty of breathing. He died on the 26th of February, 1841, in the seventy-third year of his age. He was buried beneath the chapel of Guy's hospital. A statue to his memory by Bailey has been erected in St. Paul's cathedral. In his will he left £100 a year, to be given every third year to the best essay on some surgical subject.—E. L.

COOPER, DANIEL, an English naturalist, died at Leeds on 23rd November, 1842, at the age of twenty-five. He was educated for the medical profession, and devoted himself to the study of natural history, more especially of botany and conchology. He took an active part in the establishment of the Botanical Society of London, and afterwards became one of the assistants in the zoological department of the British museum. He published in 1836 a "Flora Metropolitana, or Guide to the

stations of the Rarer Plants in the vicinity of London." A supplement to the work was published in 1837. He also superintended a new edition of Bingley's Useful Knowledge.—J. H. B.

COOPER, JAMES FENIMORE, an eminent American novelist, was born at Burlington, New Jersey, September 15th, 1789. His father, Judge William Cooper, sat in congress in 1795 and 1801. His son passed his boyhood on an ancestral estate near Otsego Lake, New York, where he had ample opportunity of becoming acquainted with the pioneer settlers, the trappers and the Indians, the characters and the scenes, which he afterwards introduced with so much effect in his novels. After receiving a careful home education, he entered Yale college in 1802. The love of adventure and a longing for a sailor's life tempted him to leave college in 1805; and a midshipman's warrant being obtained for him, he entered the United States navy in that year, and continued in the service till 1811. This was the second school for the formation of the future novelist; here he acquired that familiarity with nautical manœuvres, with naval incidents and personages, which is so conspicuous in one class of his romances. Having obtained the rank of lieutenant, he resigned his commission in 1811, married, and established his home at Mamaroneck in West Chester county, near the city of New York. Henceforward his life was that of a private gentleman and a man of letters. He had no need to write for money, and fame always seemed of little account to him, as he never husbanded his reputation, but wrote freely and carelessly, with a full indulgence of his tastes, his whims, and, it must be confessed, of an irritable and wayward temper. After a residence of a few years, he left West Chester county, "the Neutral Ground" which was the scene of "The Spy," and made his home at Cooperstown, where his literary labours began. "Precaution" was his first work; it was published anonymously in two volumes, and passed quietly into oblivion, as it had little merit. "The Spy, a tale of the Neutral Ground," appeared in 1821, and had immediate and marked success. The writer's strength consisted chiefly in his descriptive power, and his skill as a narrator; and the plot, though it has some ill-fitted episodes, is better constructed than in any of his subsequent stories. In 1823 Cooper published "The Pioneers, or the sources of the Susquehanna," a novel evidently founded on his recollections of his early life. No one who had not lived in the backwoods could have sketched so happily the humours, occupations, and sports of an infant settlement. "The Pilot" came next, the first and best of Cooper's inimitable sea-stories, a department of his art in which he is confessedly without a rival. "Lionel Lincoln" and "The Last of the Mohicans" followed, and the last is probably the most generally popular of all the author's works. In 1827 "The Prairie" was published, and with this book closes the first and best series of Mr. Cooper's novels. He would have left a greater reputation if he had stopped here, and not written another line, though we should then have missed his most characteristic productions. In 1826 he visited Europe, and remained abroad till 1833, being very favourably received, as his works had already been translated into many languages, and acquired great popularity. "The Bravo;" "The Heidenmauer;" "The Headsman of Berne;" "Notions of the Americans, by a Travelling Bachelor" (1828, 2 vols. 12mo); "Sketches of Switzerland;" "Gleanings in Europe, France, and Italy;" "The Red Rover;" "The Water Witch," and "The Wept of the Wish-Ton Wish," flowed from his fertile pen in this period of six years. Several of these works betray the acrimonious temper which, on his return home, involved Mr. Cooper in endless warfare with editors and pamphleteers. About 1845 he published a series of three novels, "Satanstoe," "The Chain Bearer," and "The Redskins." His "Naval History of the United States," 2 vols. 8vo, an able and elaborate work, appeared in 1839, and was followed by a plentiful crop of personal controversies. Two other tales, "The Path-finder" and "The Deer-slayer," were published in 1840-41. We need not give the titles of Mr. Cooper's remaining works, having already enumerated enough to give some idea of his amazing industry and perseverance. The whole list comprises thirty-three different novels, and twelve miscellaneous publications, making an aggregate of over eighty volumes; an amount of literary activity paralleled in our own day and language only by Southey and Scott. It is not difficult to anticipate the verdict of posterity upon their merits. Two-thirds of them will probably never reach the honour of a second edition, and will be remembered only among the curiosities of

literature. But enough will yet remain to give their author a high rank among those who have done much to alleviate the sorrows, dissipate the ennui, and increase the stock of harmless delights of their fellow-men. Mr. Cooper was engaged upon two other works, one of history and the other of romance, when he was interrupted by fatal disease, which caused his death at Cooperstown, September 14, 1851.—Miss SUSAN COOPER, the daughter of the novelist, is the author of two volumes of merit, "Rural Hours" and "The Rhyme and Reason of Country Life."—F. B.

COOPER, JOHN GILBERT, an English poet, born in 1723, and died in 1769. He wrote "The Power of Harmony," a poem; "The Life of Socrates;" and "Letters on Taste." Cooper takes but an inconsiderable rank among English poets, and is now chiefly remembered by his beautiful song of "Winifreda."—R. M., A.

COOPER, JOHN THOMAS, born at Greenwich in 1790, was for several years a popular lecturer on chemistry in London, and teacher of the same science at the Aldersgate Street school of medicine. The following are the most important of his scientific investigations—"On some Combinations of Platina;" "Analysis of Zinc Ores;" "On Catechuic Acid;" "On the Baroscope;" and "On the Ancient Ruby Glass." He died in 1854.—F. P.

COOPER, SAMUEL, an eminent English miniature painter, was born in London in 1609. He was the first English painter that attained remarkable excellence in miniature painting. "If a glass could expand Cooper's pictures to the size of Vandyck's," wrote Walpole, "they would appear to have been painted for that proportion." He resided for many years in France and Holland, but died in London on the 25th May, 1672.—W. T.

COOPER, SAMUEL, a distinguished surgeon, who for nearly fifty years occupied positions of honour and responsibility in his profession. He was born in the year 1780, and died on the 2d December, 1848, in the sixty-eighth year of his age. He joined the College of Surgeons in 1803, and was appointed a member of the council in 1827. In 1845 he was elected president of the Royal College of Surgeons. He was a fellow of the Royal Society, and a member of the council. In early life Mr Cooper entered the army, and was raised to the rank of staff-surgeon. For many years he was surgeon to the Queen's Bench prison, and consulting surgeon to the Bloomsbury dispensary. For the long period of seventeen years Mr. Cooper held the office of professor of surgery in University college, London. As a teacher Mr. Cooper was greatly esteemed, as a friend and counsellor he was beloved. His "Surgical Dictionary," a library in itself, will long be considered a great and valuable work of reference. The "First Lines of Surgery," an epitome of the "Dictionary," was for many years the text-book in all medical schools.—E. L.

COOPER or COUPER, THOMAS, an English prelate, born about the year 1517, and died in 1594. He was educated at Oxford, and, after practising medicine for some years, entered the church. He became bishop of Lincoln in 1570. Cooper wrote, besides several other things, "An Admonition to the People of England," in which he defended the bishops against the famous pamphlet published under the name of Martin Mar-Prelate.

COOTE, SIR CHARLES, was born in the latter part of the sixteenth century, and came at an early age to Ireland from Devonshire, where his family had long been settled. He served under Mountjoy in the war against Tyrone, and was soon advanced in his profession, receiving in 1616 knighthood, in 1620 being created a privy councillor, and in the following year a baronet of Ireland. On the breaking out of the Irish rebellion in 1641, Coote was despatched to relieve the castle of Wicklow, but was shortly recalled to defend Dublin. His administration was characterized with vigour, but at the same time with horrible severity. In April Coote was sent with six troops of horse to the relief of Birr, where he exhibited extraordinary valour, coolness, and skill, accomplishing what Cox describes as "the prodigious passage through Montrath woods," for which the earldom of Montrath was conferred on his son. After assisting Ormonde at the battle of Kilrush, Coote proceeded with Lord Lisle to the aid of Lady Offaley, who, though sixty-four years old, bravely shut her gates against the rebels, and defended her castle of Geashill till relieved by the royalist forces. Coote had now to go through a difficult and dangerous district to the relief of Philipstown; the defile, however, was passed in safety, Philipstown taken, and the royalists marched on Trim on the 7th of May, 1642. At night the rebels, to the number of three

thousand, fell on the weary troopers unexpectedly. Coote was, however, too watchful, and soon succeeded in routing the enemy; but he was himself slain by a shot either from the flying crowd or the town, or, as some think, from his own party.—J. F. W.

COOTE, SIR CHARLES, son of the preceding, and first earl of Montrath, succeeded his father as provost-marshal and vice-president of Connaught, and inherited his courage and valour; distinguishing himself as a soldier at an early age, and taking an active part during the Irish rebellion of 1641. In 1649 he maintained Derry for the parliament, and ultimately secured nearly the whole of the northern provinces for the republic; and passing south, he obtained possession of Galway. After the Restoration, Coote, who had at first secretly, and, after the death of Cromwell, openly espoused the royal cause, was appointed one of the commissioners of Ireland, governor of Galway, earl of Montrath, and lord-justice of Ireland. He died of smallpox in Dublin in 1661.—J. F. W.

COOTE, SIR EYRE, a distinguished soldier, was the youngest son of Dr. Chidley Coote of Ash Hill, in the county of Limerick, and was born in the year 1726. He early embraced the military profession, and after some active service in Ireland, embarked for India. He took possession of the forts of Calcutta; and at the battle of Plassy held a prominent and responsible position, and eminently contributed to the success of that day. Being now in 1760 a colonel, he invested and took Wandemash, and in November laid siege to Pondicherry, which he reduced in two months, thereby demolishing the power of the French in India. For these services he received from the court of directors a diamond-hilted sword as a mark of their gratitude and respect. In 1770 Coote went to Madras as commander-in-chief of the company's forces, whence he soon proceeded to Bussorah, and returning to England was invested with the order of the bath, and appointed governor of the fort of St. George. On the death of General Clavering he went to Bengal as a member of the supreme council and commander of the British forces in India. His most glorious exploit was in reserve. Hyder Ali was in possession of Arcot, and was aiming at the universal conquest of India. Coote arrived at the critical moment, when the British troops were reduced and dispirited. He revived their courage, and by success in minor enterprises renewed their confidence, and incited them to be the assailants of their formidable enemy. Hyder met his advances with an enormous army that rushed forward to overwhelm the foe. But the British troops kept their ground: for eight hours the conflict was maintained with desperate valour on both sides, till victory declared for the British troops, and the Indian army was routed with fearful slaughter and the loss of Meer Saib, Hyder's favourite general. Three years after Coote went to Madras to assume the command of the army; but his health, long enfeebled, gave way, and he died in April, 1783, two days after his arrival there. His body was conveyed to Rookwood in Hampshire. In valour, skill, and energy Coote stands high amongst the great soldiers of his day.—J. F. W.

COOTE, RICHARD. See BELLAMONT, Earl of.

COPELAND, THOMAS, a distinguished surgeon, born in May, 1781; died November 19, 1855. In July, 1804, he was admitted a member of the College of Surgeons, and afterwards joined the foot guards, with whom he embarked for Spain under the command of Sir John Moore, and was present at the battle of Corunna. On his return to England, he was appointed surgeon to the Westminster general dispensary. In 1810 he published his "Observations on some of the Principal Diseases of the Rectum," the first work of a truly scientific and worthy kind on that subject which had ever appeared. Mr. Copeland also published a work entitled "Observations on the Symptoms and Treatment of Diseased Spine." He was a member of the council of the College of Surgeons and surgeon-extraordinary to the queen.—E. L.

COOPERARIO, GIOVANNI, was the Italianized name of JOHN COOPER, a distinguished musician in the first part of the seventeenth century. He was a celebrated performer on the viol-dagamba and lute, and was one of the musical preceptors to the children of James I. Under his tuition Prince Charles (afterwards Charles I.) attained considerable excellence on the viol, and Playford tells us, speaking of Charles I., that no music pleased his majesty so well "as those incomparable 'Fantasies,' for viol and bass-viol to the organ, composed by Cooperario." In conjunction with Laniere and Dr. Giles, he composed the songs in a masque written by Dr. Campion on the marriage of the earl of Somerset with Lady Frances Howard (the divorced

countess of Essex), which was represented in the banqueting-house at Whitehall on St. Stephen's night, 1614. One of the songs in this masque, beginning with the words, "Come ashore," is inserted in Smith's *Musica Antiqua*, and is a fair specimen of the flowing melody of this composer. He was also the author of "Funeral Teares for the Death of the Right Honourable the Earle of Devonshire, figured in Seven Songes," 1606; and "Songs of Mourning, Bewailing the untimely Death of Prince Henry," 1613. Many of his compositions exist in MS. in the music school, Oxford. He is supposed to have died about 1640. Henry Lawes is said to have been his pupil.—E. F. R.

COPERNICUS. See KOPERNICUS.

COPELSTON, REV. EDWARD, D.D., bishop of Llandaff, was the son of the rector of Offwell, Devonshire, and was born there, 2nd February, 1776. In 1791 he was elected to a scholarship at Corpus Christi college, Oxford. Two years later he gained the chancellor's prize for a Latin poem, and in 1795 he was elected a fellow of Oriel college. Next year he obtained the chancellor's prize for an English essay on "Agriculture," and in 1797 was appointed college tutor. In 1802 he was elected professor of poetry to the university in the room of Dr. Hurd. Copleston's character for ability and learning had hitherto been confined to a comparatively small circle; but his vindication of the university of Oxford from the attacks of the *Edinburgh Review* in 1810-11, widely extended his reputation, and was generally regarded as a triumphant defence. In 1814 Copleston was elected provost of Oriel college; in 1826 he was appointed to the deanery of Chester; and in the following year succeeded Dr. Charles Sumner in the bishopric of Llandaff and deanery of St. Paul's. He also held the honorary office of professor of ancient history to the Royal Academy of Arts, and was a fellow of the Society of Antiquaries. Dr. Copleston died in 1849, in the seventy-second year of his age. His most elaborate work is his "Inquiry into the Doctrines of Necessity and Predestination," &c., 8vo, London, 1821. His "Prelectiones Academicæ" are distinguished by the purity and elegance of their composition, and the extensive learning which they display. The bishop contributed many valuable articles to the *Quarterly Review* between 1811 and 1822, and was the author of a large number of pamphlets, speeches, and charges. A life of Dr. Copleston, with selections from his diary and correspondence, has been published by his nephew: London, 1851.—J. T.

\* COPLAND, JAMES, a celebrated physician of London, who enjoys a well-earned reputation both as a practitioner and as one of the most extensive writers of his day. He was born in the Orkney islands in November, 1791. He is the eldest of nine children. At the age of sixteen he commenced his medical studies in the university of Edinburgh, where he continued for four years. Having taken his doctor's degree, he came to London in August, 1815, and here devoted much of his time to the study of surgery. He subsequently visited France and Germany, and closely observed the diseases which prevailed there soon after the peace of 1815. He was soon after offered an appointment to the settlements on the Gold Coast belonging to the late African company. A great desire to become acquainted with the diseases of this unhealthy tropical region, and confidence in his own robust constitution, induced him to accept the position, and he left Europe in 1817. After his return to England he set out on a journey through the countries of Europe with a view to the study of disease, and in 1820 settled in London, and became a licentiate of the Royal College of Physicians. He now first began his literary career, and wrote many valuable papers as the result of his carefully-acquired knowledge. He became physician to the South London dispensary and to the Royal Infirmary for the diseases of children. In 1822 he removed from Walworth to Jernyn Street, and was elected consulting physician to Queen Charlotte's Lying-in Hospital. In this and following years he was engaged in editing the *Medical Repository*, and in writing reviews of various medical and scientific works. In 1825 Dr. Copland projected an "Encyclopedia Dictionary of the Medical Sciences," which, however, owing to the commercial panic of the period, was relinquished. In 1830 he commenced the great work of his life, the "Dictionary of Practical Medicine," under arrangements with Messrs. Longman & Co., publishers. To compile a dictionary of medical science is a herculean task to any association of men; but to be the production of one individual is an extraordinary undertaking. Dr. Copland, in the

year 1858, had the satisfaction of seeing the completion of his great and important task. As a practitioner Dr. Copland is firm and decided, without haste and rashness. He has been a member of the Royal Medico-Chirurgical Society since 1822, and was sometime president; in 1833 he was elected a fellow of the Royal Society, and in 1837 a fellow of the Royal College of Physicians.—E. L.

COPLEY. See LYNTHURST.

COPLEY, JOHN SINGLETON, an eminent historical painter of the school of Benjamin West, was born at Boston in the United States on the 3rd July, 1737. His father, who was of English extraction, had lived chiefly in Ireland, and the honour of the painter's nativity has therefore been not unfrequently claimed for Ireland. He was almost a self-taught artist, for Boston possessed no academy, and few instructors. He became first known in England as the exhibitor of a "Boy and Squirrel" at the Royal Academy in the year 1760. This work excited no inconsiderable attention. For some years he continued to follow portrait painting with great success; receiving a large income, and acquiring a fair reputation on both sides of the Atlantic. In 1774 he came to London and passed on to Italy; he stayed at Rome some months, and returning to England, settled in the metropolis. In 1777, in great part owing to the influence of West, he was elected an associate of the Royal Academy, and in 1783 received his diploma as an academician.

For many years he continued industriously to follow his profession. He died on the 9th September, 1815. Probably the best specimen of his art is his "Death of Chatham," now in the English school department of the national gallery. It was engraved by Bartolozzi on a plate of an unusual size, and was extensively subscribed for and sold. Another successful work was his "Defence of St. Heliers, Jersey, against the French, and Death of Major Pierson at the moment of victory." Copley was the father of Lord Chancellor Lyndhurst.—W. T.

COQUES, GONZALES, a celebrated artist, was born at Antwerp in 1618; and was a pupil of David Ryckaert. His first subjects were conversation-pieces after the manner of Teniers and Ostade. He afterwards devoted himself to portraits on a small scale; and in this branch of art emulated many of the characteristic excellences of Vandyck. He died in 1684. His works are few in number, and of great value.—W. T.

COQUILLE (in Latin *CONCHYLIVS*), GUI, a French lawyer, born in 1533, and died in 1603. He was procureur-general of Nivernais at the time of the massacre of St. Bartholomew, and by his enlightened vigour saved his province from the horrors of that bloody day. Coquille was a sworn enemy to the leaguers. His principal works are a dialogue, "Sur les Causes des misères de la France," written in the style of Montaigne; and a treatise entitled "Des Libertés de l'Eglise Gallicane."—R. M., A.

CORAM, THOMAS, an eminent philanthropist whose memory has been perpetuated by his establishment of the Foundling Hospital in London. He was born about 1680, and bred to the sea. He became early in life captain of a merchant ship, and his business, while in London, having often led him into the heart of the city, his compassion was so strongly excited by the sight of "young children exposed sometimes alive, sometimes dead, sometimes dying," that he resolved to make a strenuous effort to rescue them from destruction. The first hospital established by him for deserted children was in Hatton Garden, and was opened in 1740. It was afterwards removed to its present site, and a charter obtained for it. Captain Coram also originated a scheme for the education of Indian girls in America. Having spent the greater part of his slender fortune in works of benevolence, a subscription was entered into in 1749 for the purpose of purchasing for him an annuity, but the good old man did not live long to enjoy it. He died 29th March 1751.—J. T.

\* CORBAUX, FANNY, a writer and artist, was born in 1812. Her father being reduced from affluence to poverty, she began as early as her fifteenth year to turn her talents for painting to account. She gained two silver medals in 1827, and a gold one in 1830. The circumstances of her family obliged her to restrict herself, in a great measure, to portrait painting, as being more remunerative. In later life she has devoted much of her attention to biblical history and criticism—as her "Letters on the Physical Geography of the Exodus," and on the remarkable nation called "The Replaim" in the bible, testify. These were published in the *Athenæum*. She wrote also for the *Journal of Sacred Literature*.—R. M., A.

CORBET, RICHARD, an English divine and poet, was born at Ewell in Surrey in 1582, and died in 1635. He studied at Christ Church, Oxford, of which college he was made dean in 1620. In 1629 he was raised to the bishopric of Oxford. His poems were published after his death under the title of "Poetica Stromata."—R. M., A.

CORDAY D'ARMANS, MARIE ANNE CHARLOTTE, one of the most extraordinary women of modern times, was born in 1768 at St. Saturnin, near Séez in Normandy. While yet a girl she displayed singular strength of character. Her favourite author was Plutarch. On the breaking out of the French revolution, she was attracted by the boldness and novelty of its pretensions; but her whole soul was outraged by the terrible crimes which were soon deemed necessary to its success. It is said that she loved one of the proscribed Girondists; but of this there is no satisfactory evidence. She did not deem assassination a crime when directed against assassins; and secretly determined to go alone to Paris, and there to stab the foremost democrat she could find. For a time she doubted whether Robespierre or Marat was the greater monster; but eventually her patriotic rage was concentrated on the latter. At the moment of her arrival Marat was sick. She wrote him a letter and asked for an interview. She received no answer to this application. Having bought a large knife at the Palais Royal, she presented herself at the house of the monster on the following day at one o'clock. The woman who lived with him was alarmed at her appearance, and perhaps touched by the instinct of danger, refused her admission. She immediately wrote a note, in which she stated that she had an important state secret to reveal. Marat, who was reclining in a warm bath, determined to see at once the visitor, in spite of the entreaties of his mistress. While conversing on the movements of the Girondists, Marat announced his intention of guillotining them all. At this moment Charlotte Corday, with masculine force, drew her knife and stabbed him deep in the throat. He uttered one short cry, summoning the women who lived with him, and expired. They rushed into the apartment, and saw the executioner standing unmoved by her victim. The guard soon arrived and took her to the prison of the abbaye. "Sirs," said she, "you long for my death; you ought rather to build an altar in honour of me, for having delivered you from a monster." On being searched in the prison, an appeal for liberty was found in her bosom, addressed to the French people. Our limits do not permit us to detail the circumstances of her trial, or the memorable calmness with which she met her death. She was guillotined, July, 1793, at the age of twenty-five years.—T. J.

CORDOVA. See GONZALVO DE CORDOVA.

CORDUS, HENRICH, a German poet and physician, was born at Simtshausen in Hessa in 1486, and died on 24th December, 1535. He was the son of a farmer, and devoted himself to literary pursuits at Leipzig and at Erfurt. He espoused the cause of the Reformation, and was a supporter of Luther. He entered upon the study of medicine afterwards, and graduated at Ferrara in 1522. He was the author of many literary productions, and published various poetical works. In 1534 he published a work entitled "Botanologicon, or a Conversation regarding Herbs."—J. H. B.

CORDUS, VALERIUS, son of the preceding, a celebrated botanist, was born at Simtshausen in Hessa, on 18th February, 1515, and died at Rome on 25th September, 1544. He received the elements of his education at Erfurt, and he subsequently studied at the university of Marburg, where he took the degree of bachelor of medicine. In 1531 he went to Wittemberg, and studied under Melancthon. He visited Leipzig, and afterwards travelled over Prussia and Saxony, exploring the mines of Freyberg, and the flora of Switzerland. In 1540 he lectured at Wittemberg on the *Materia Medica* of Dioscorides. He afterwards paid a second visit to Switzerland, and travelled in Italy. At Venice he studied the ichthyology of the Adriatic. He was seized with fever while journeying to Rome, where he died at the age of twenty-nine. His death was looked upon as a great loss to science. Among his numerous works may be noted the following—"A Pharmaceutical Dispensatory;" "Annotations on Dioscorides;" and a "History of Plants."—J. H. B.

CORELLI, ARCANGELO, the famous violinist and composer, was born at Fusignano, near Imola, in the territory of Bologna, in February, 1653, and died at Rome on the 8th (not 18th) of January, 1713. Simonelli, a member of the papal chapel, and

Bassani of Bologna, were his instructors; from the latter of whom, besides the melodious grace that characterizes his writing, he inherited the pre-eminence on his instrument by which he soon surpassed even his honoured master. There is a statement that at the age of nineteen he visited Paris, where the jealousy of Lulli excited such cabals against him, that he was obliged to leave without obtaining a fair hearing for his talent; the authority for this account, however, is questionable. In 1680 Corelli made a tour in Germany, and was engaged by the duke of Bavaria, at whose court he remained for two years. He left this appointment to return to Italy, when he took up his permanent residence at Rome. There he published in 1683 his first work, consisting of twelve trios for two violins and bass. Cardinal Ottoboni, a distinguished supporter of art, now became his special patron, he appointed him his violinist, and made him director of his private chapel, and retained him in his service till the close of his career. It was at the weekly concerts of this munificent nobleman, that Corelli gained his world-wide reputation, both as a player and as an orchestral director, in the exercise of which latter capacity he was so strict a disciplinarian, that he compelled all his band to play with the same bowing, and thus procured an effect of precision which was as powerful upon the ear as striking to the eye. In 1685 he was engaged in a theoretical dispute, occasioned by a passage in one of his works, with G. P. Colonna, which was of great service to the reputation of the latter. Corelli's music evinces less depth of contrapuntal knowledge than superficial grace and sweetness; and he showed small judgment in entering into a discussion which technical training did not qualify him to maintain. From the year 1690 he was associated with Pasquim, a harpsichord player, and Gartani, a lutanist, in the conduct of the opera at Rome, the performances of which rose to a degree of excellence under their direction that had never before been approached. Corelli's fourth set of sonatas was first printed in 1694 with a dedication to his cardinal. In 1700 he published his well-known twelve solos, op. 5, which were dedicated to Sophia Charlotte, electress of Brandenburg. His pupil, Gemiani, transmits several anecdotes of Corelli's visit to Naples, the date of which, however, has not reached us. This was not undertaken until he had been repeatedly invited by the king; it gave him an opportunity to meet and to receive the most considerate attentions from Alessandro Scarlatti. He was greatly surprised to observe the superior condition of musical execution common at Naples than then prevailed at Rome. Accident—arising from a want of presence of mind, which was very extraordinary in a man so long habituated, as was Corelli, to control others—led to his making a less fortunate appearance on this occasion than was expected from an artist of his eminent talents; the consequence of which was that, with an exaggerated idea of his non-success, he secretly quitted Naples and returned to Rome. As powerfully as this circumstance illustrated the diffidence of his character, does another, in which he was concerned with Handel, exemplify his quiet manner and his gentle temper. It was at a rehearsal of the young German's cantata, *Il Trionfo del Tempo*, when the composer grew impatient at the spiritless style in which the overture was played, and snatched the violin from Corelli to show him the more animated way in which he wished it to be executed; and the great leader calmly observed, "But, my dear Saxon, this music is in the French style, which I do not understand." Corelli had the mortification in his latter days to find himself slighted in favour of men of far inferior merit, whose novelty was almost their only recommendation to the suffrages of the fickle Roman public; and this acted sensibly, if not fatally, upon his spirits. His prompt appreciation of the talent of others, especially in his own peculiar province of the art, was a distinguishing trait in his character; and the many incidents which prove this, as strongly show the injustice of such a man's falling into any kind of disesteem. He was an intelligent admirer of pictures, and the intimate friend of the two celebrated painters, Carlo Cignani and Carlo Maratti. Let us suppose that the pleasure this kindly genial man derived from the contemplation of the productions of a sister art, may have compensated him for whatever neglect he experienced in the exercise of his own. His seventh and last publication, the twelve "*Concerti Grossi*," appeared but a month before his death. Johann Wilhelm, prince palatine of the Rhine, to whom this work was inscribed, repaid the compliment by erecting a monument to the memory of the composer

over his mortal remains. That memory has been better preserved in the nobler monument with which his own name is associated, the still esteemed concertos. Corelli's obsequies were celebrated with great solemnity, under the arrangement of his patron the cardinal; and so long as one of his pupils was alive to direct the performance, the anniversary of his funeral was always kept by the execution of some of his music over his grave. Corelli bequeathed his valuable collection of pictures, and a large sum he had amassed, to Cardinal Ottoboni, who, however, accepted only the former, and distributed the money among the musician's poor relations.

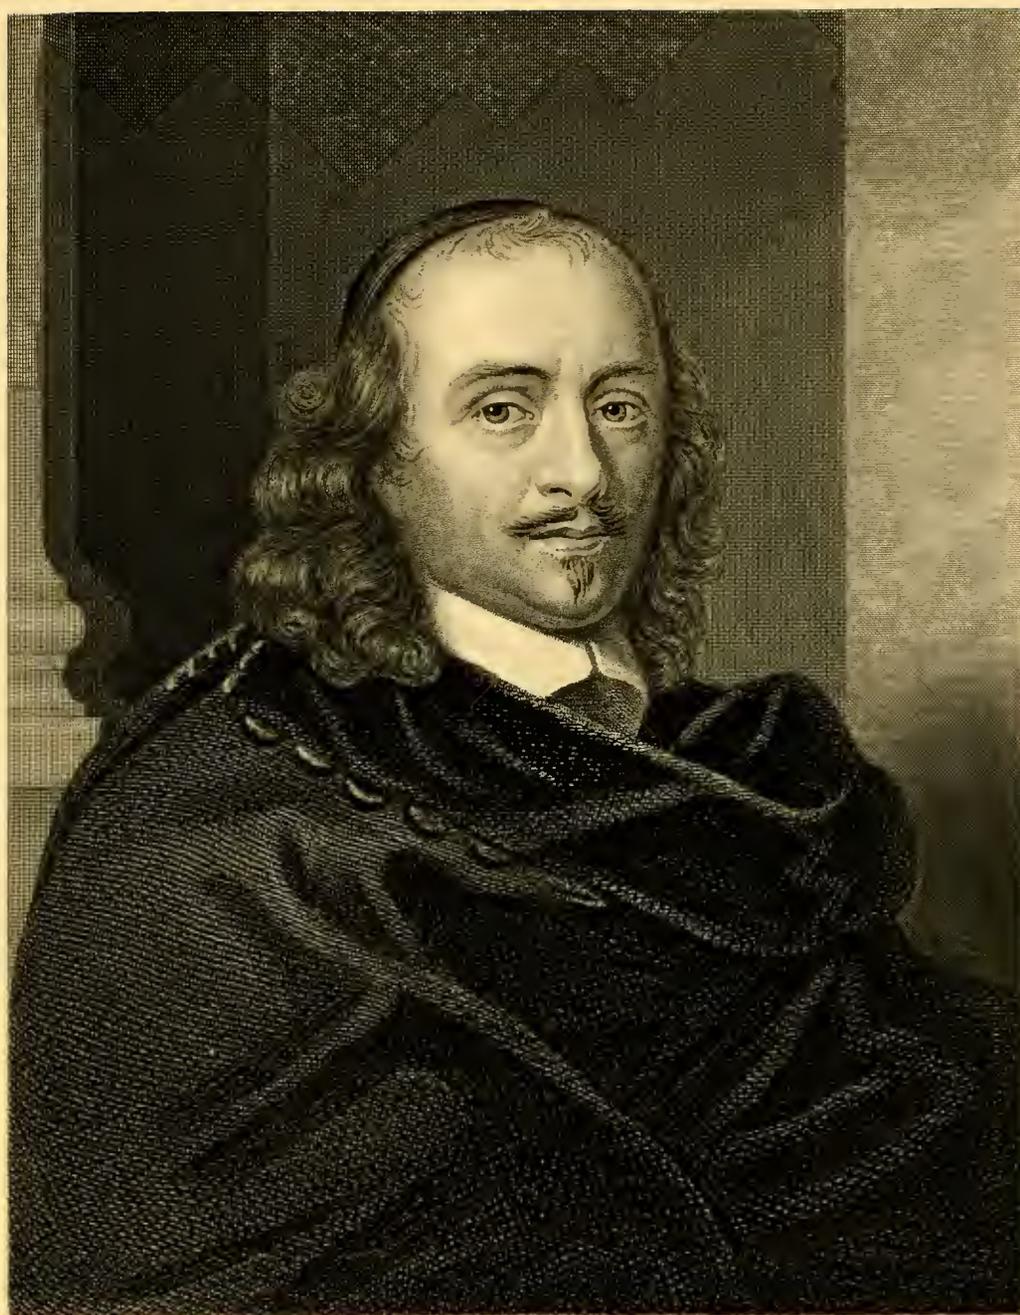

This distinguished man must be regarded as the founder of the great Roman school of violin playing. His writing is as remarkable for its more clearly defined melody than that of any instrumental music which preceded it, as his playing was famous for its grace and languishing tenderness. Although the average executive skill of the present time immeasurably exceeds that of Corelli, the greatest master of his age, yet his works now form the basis of the study of every violinist, as the true principles of the art can better be acquired from them than from any existing compositions for the instruments. Of his many admirable pupils, Gemiani became the most celebrated, and may be said to have imported his style into this country. Tartini, though not Corelli's immediate disciple, was a follower of his school, and developed his principles; he was, in fact, the medium of the influence of the great original on the players of our day.—G. A. M.

**CORIO LANUS, CAIUS MARCIUS**, a noble Roman, so sur-named for his heroic conduct at the capture of Corioli, a town of the Volsci. He first rose into notice in the wars which followed the expulsion of Tarquin, where he obtained as a reward for his valour the coveted distinction of the civic crown. His bravery in the attack on Corioli, and his generosity in refusing to accept more than his own share of the plunder of that town, raised him at one time to great popularity among the Romans, and he was induced to become a candidate for the consulship; but the people, afraid of his haughtiness and ambition, and incensed at his determined opposition to the tribunitian power, refused to confer that dignity upon him. Attached from his youth to the interests of the patrician order, and accustomed to pay little regard to the masses of the people, Coriolanus now openly advocated measures which had for their object the diminution of the popular influence in the state. A dispute about the distribution of certain supplies of corn furnished an opportunity of calling him to account; and after undergoing a formal trial, he was sentenced to perpetual banishment. Exasperated at what he deemed to be the basest ingratitude, he retired to Antium, encouraged the Volsci to declare war against Rome, and received from them the command of the army destined to invade his native country. Marching up to the very walls of the city, which was quite unprepared for so sudden an attack, he threatened to destroy it, unless the Romans would submit to his humiliating demands; but relented at last on the appeal of a band of Roman matrons, who, headed by his own mother and wife, came out to entreat him to spare his country. He returned to Antium, where, according to one account, he was murdered by the Volsci for his defection. Other accounts state that he lived among them to an advanced age.—W. M.

**CORK.** See **BOYLE**.

**CORKINE, WILLIAM**, a distinguished musician of the early part of the seventeenth century, patronized by Sir Edward Herbert, Sir William Hardy, Sir Robert Rich, and Sir Edward Dymmoche "the king's champion." He published two books of "Ayres to sing and play to the Lute and Basse-Violl," the first in 1610, the second in 1612. They contain many "ayres" of great beauty.—E. F. R.

\* **CORMENIN, LOUIS MARIE DE LA HAIE**, Viscount de, born on the 6th January, 1788. Although this celebrated man has figured as a writer on law and on morals, and has taken a practical part in the foundation of several charitable institutions, yet his fame has been altogether acquired by those pamphlets, bearing the signature of "Timon," with which he assailed Louis Philippe and his government. As the throne of the monarch of the barricades eventually succumbed to the attacks of the opposition, any one who obtained the credit of having directly aided in bringing about the fall of the dynasty of July became during the days of February, 1848, an object of conspicuous attention. No public writer did more to damage the reputation of Louis Philippe than Timon; and although M. de Cormenin never

GARNETT

opened his lips in the chamber of deputies, of which he was a member from the year 1832, yet such was the popularity of his political pamphlets, that four different departments returned him to the constituent assembly. Louis Philippe had, unhappily for himself, become open to the suspicion of thinking more of family interests than of those of the nation. Timon accordingly directed his attacks against the civil list, to the great delight of the people, who rejoiced in seeing a king castigated for daring to imitate the virtuous economy of their own private lives. A king had no business with domestic prudence, and so they hallooed on Timon against the royal Harpagon. When, in 1840, the king obliged his ministry to present a bill for allowing a dotation to his second son, the duc de Nemours, it was a pamphlet from Timon which upset the cabinet and the scheme together. Yet Timon was neither a Junius nor a Sydney Smith. He had not the scolding declamation of the one, nor the playful pleasantry and wit which corruscated over the strong common sense of the other. Like most French political writers, Timon was professedly logical, and aimed at convicting the accused of guilt by closely-drawn deductions from well established premises. This apparently scientific profundity was clothed with sharp, pungent, terse assertions, like the body of a porcupine. As he had always voted with the extreme left of the chamber of deputies, Cormenin was thought to be so thorough a republican, that he was actually named president of the committee charged with the drawing up of the constitution. Yet, so little resentment did he seem to bear towards the destroyer of a work for which he might be considered sponsor, that he was one of the first to accept Louis Napoleon's offer of a place in the council of state. It is not for us to settle the doubts which so extraordinary an instance of versatility in the person of so remarkable a censor of the care of self-interests gave rise to. We have only to add that the day M. de Cormenin abandoned his party, the works of Timon sank into contempt—J. F. C.

**CORNEILLE, MICHAEL**, a painter of merit, apparently no relation to the illustrious poet. He was born at Paris in 1642. His father, also a painter, was his first instructor in the art. The young Michael, having gained a prize at the Academy of Painting, was sent to study at Rome as one of the government pupils. On his return in 1663, he was admitted into the Academy of Painting, where in course of time he became a professor. Many of Corneille's pictures have been engraved. He himself etched the plates of several. He died at Paris in 1708.—He had a brother, **JEAN CORNEILLE**, who was also a painter of considerable celebrity, and a member of the Académie des Beaux Arts.—B. DE B.

**CORNEILLE, PIERRE**, a sublime genius, the founder of the French drama, was born at Rouen in Normandy, 6th June, 1606. He was the eldest son of Pierre Corneille, advocate-general of Rouen. Having adopted the legal profession, he practised for some time in his native city, without exhibiting any indication of the talent which was in a few years to blaze forth, and astonish the world. His first dramatic production, a comedy called "Melite," appeared in 1629, when he was only twenty-three years of age. The extraordinary success of this piece encouraged the author to follow the natural bent of his genius. Six comedies followed each other in quick succession, and laid the basis of his future reputation. In the year 1634 Louis XIII., and his minister Richelieu, visited Rouen; and the archbishop of that diocese, M. de Harlay, engaged Corneille to compose some complimentary Latin verses in honour of the occasion. These brought their author more closely within the favourable notice of the great cardinal, whose discernment had already remarked this rising genius. Richelieu, it is well known, retained certain authors in his pay, and employed them in composing plays under his own superintendence. He accorded to each a pension; and those who were most happy in pleasing him received still more substantial marks of his satisfaction. Into this corps, sometimes called the cardinal's five authors, Corneille was admitted—a great honour! for he was looked upon as the least important of the set. Quarrelling, however, with his overbearing patron, he withdrew to his private life and occupations at Rouen, where he soon produced his first attempt at tragedy—"Medea." About this time Corneille turned his attention to Spanish literature, and out of Guillen da Castro's obscure drama, grew the glories of "The Cid," represented in 1636. Voltaire remarks that the appearance of this tragedy forms an era in the dramatic poetry of

France. Its triumph was immediate and complete. "Beau comme le Cid" (As fine as the Cid), became a phrase in common usage to denote literary excellence. The cardinal, however, stood aloof, and refused to join in the general approbation; but after a time again took the poet into favour. A year or two later, we find Richelieu intervening to remove the obstacles in the way of Corneille's marriage with Marie Lamperrière, whose father, the lieutenant-general of Andely, averse to the match, opposed it with all his power. The "Cid" was followed by "Horace" (which the actors, after Corneille's death, corrupted into "*Les Horaces*"), by "Cinna," by "Polyeucte"—all masterpieces, and crowned, immediately on their appearance, with public applause. The French Academy, after twice closing their doors against the poet, now elected him in 1647 a member of their body, of which he lived long enough to become the senior. Some years earlier, Corneille, resuming for a moment the pen of the comic muse, and once more borrowing a subject from the Spanish dramatists, produced the "Menteur," "The Liar"—the first real comedy, as "The Cid" was the first perfect tragedy, the French theatre had possessed. Molière declared himself indebted to the "Menteur" for some of his best inspirations. At length, after seventeen years of triumph, the success of Corneille encountered a check. The tragedy of "Pertharise," represented in 1653, was a complete failure. During the next six years he occupied himself in translating into French verse The Imitation of Jesus Christ (begun some years before), and other devotional pieces. At the end of this period his friends, and chiefly Fouquet—Louis XIV.'s famous prime minister—persuaded him to resume the drama. He did so, with the tragedy of "Edipe," the subject proposed to him by Fouquet himself, and which was attended with his former success. Between 1659 and 1667, Corneille's prolific genius produced a tragedy every year, but symptoms of his declining power began to appear. These later works are greatly below his former masterpieces, and were received with increasing coldness by the public.

Solidity, good sense, and nobleness of sentiment, were the foundation of Corneille's character as of his poetry. A good husband and father, a sincere and tender friend, his enjoyments were centred in his domestic circle, and in a few friends whom his upright and loyal nature firmly attached to him. The several pensions which had been conferred on him by the three ministers, Richelieu, Fouquet, and Colbert, expired with the donors. For some time before his death, Corneille suffered the evils of poverty. The generous interference of Boileau, who offered to resign his own pension, provided Corneille's might be restored, obtained a grant of two hundred louis for the sick poet; but it reached him only two days before his death, too late to do him much good.

The house at Rouen in which he was born still exists, and the antique furniture and arrangements of the chamber where he first drew breath are scrupulously preserved. An inscription on a marble slab over the house announces, that "*Here in 1606 Pierre Corneille was born.*" This inscription, and that in the Rue d'Argenteuil in Paris, at the house where he died, were until recently the only memorials extant of the great poet, except, indeed, the imperishable monument of his works. After the death of his mother in 1662, Corneille fixed his residence in Paris, where he passed the remainder of his days. He died on the 1st October, 1684, in the seventy-ninth year of his age.

Pierre Corneille was undoubtedly one of the greatest geniuses the world has seen. Emancipating himself by the vigour of his own understanding and judgment from the licentious dulness and wretched affectations of the dramatists who preceded him, he sought his inspirations from truth and nature, and thus created a style for himself, both of thought and diction. His language was noble, because his conceptions were elevated. His characteristics are, unaffected dignity and force of sentiment—profound thought, uttered with energetic conciseness—and a striking power of delineating the great passions which agitate the human mind. No writer ever better understood the art of investing his personages with suitable language. He excels in the portraiture of his Romans, the artificial grandeur of whose sentiments he had well studied in their historians. His versification is admirable in his best passages, but the French classicists complain that it is unequal and without system. The historians of the time ascribe to the decency and dignity with which Corneille endowed the stage, the tolerance shown to players by the ascetic Louis XIII., and his edict in favour of theatrical amusements. "Tragedy," said Napoleon at St. Helena, "elevates

the human soul, fires the heart with a noble ambition, and forms men into heroes. To the influence of the great Corneille, France owes some of her children's grandest actions. Had Corneille lived in my day, I would have made him a prince." Some of the poet's direct descendants, the posterity of his eldest son Pierre, are yet living. Napoleon I. caused two of them to be educated at the government expense; the eldest of these is now professor of history at the college of Rouen, and his researches of late years have done much towards elucidating the life of his illustrious ancestor. The best editions of Corneille's works are those of Joly, in 6 vols. 12mo, and of the Abbé Granet, both published at Paris in 1738, the former republished in 1747; Voltaire's edition in 12 vols. 8vo, at Geneva in 1764; "Chef d'Œuvres de Corneille," 5 vols. 8vo, at Paris in 1817; "Au Profit de Mlle. J. M. Corneille;" "Œuvres choisies de Corneille L'heureux," Paris, 1822, 4 vols. 8vo; "Œuvres de P. Corneille, Lefevre," Paris, 1824, 12 vols. 8vo.—B. DE B.

CORNEILLE, THOMAS, a dramatic poet, brother of the great Corneille. His talents were likewise of a high order, and his reputation would have been brilliant had it not been lost in the splendour of his brother's. He was born at Rouen in 1625, and consequently twenty years younger than his brother Pierre. Thomas Corneille excelled in various walks of literature, but was chiefly celebrated for his theatrical compositions. Some of his tragedies obtained great success, and long kept their place on the stage, owing to the skill of his plot and his happy versification. His memory was so remarkable that he could recite any of his own plays from beginning to end. Like his illustrious brother, he was a man of great private worth—modest and candid, ready to acknowledge the merits even of his rivals, giving and receiving advice with cheerful goodwill, and preserving to the end of his long life the courteous and polite demeanour which had distinguished his youth. It was said of him that he never made an enemy. On the death of the great Corneille, Thomas succeeded him as member of the academy. Towards the close of his life, he became blind, but still continued his literary labours, which, it is to be feared, the narrowness of his circumstances rendered necessary. He died at Paris in 1709, aged eighty-four. Besides his dramatic works, of which a good edition was published by Joly, Paris, 1738, in 5 vols. 12mo, he translated the *Metamorphoses* and some other of Ovid's writings into French verse. He was one of the editors of the *Mercure Galante*, and he also published a "Universal Dictionary of Geography and History," in 3 vols. folio, and "Observations on Vaugelas."—B. DE B.

CORNELIA, daughter of Metellus Scipio, was married first to P. Crassus, and afterwards to Pompey, whom she accompanied to Egypt after the battle of Pharsalia. After her return to Rome, she received the ashes of her husband from Caesar.

CORNELIA THE YOUNGER, daughter of P. Scipio Africanus the Elder, and the famous "mother of the Gracchi," was born about 189 B.C. She married in 169 Titus Sempronius Gracchus, and bore to him the tribunes Tiberius and Caius. She was distinguished by her virtue as much as by her accomplishments, and united the strict morals of the old Roman matron with the intellectual cultivation and elegant and refined manners which then began to characterize the Roman ladies. She possessed a thorough knowledge of Greek literature, and her letters, which were in existence at the time of Cicero, were quoted as models of epistolary writing. Cornelia was idolized by the citizens of Rome, who erected a statue to her, with the inscription, "Cornelia the Mother of the Gracchi."

CORNELIUS, PETER VON, an eminent German artist, was born at Dusseldorf on the 16th September, 1787. His father was inspector of the picture gallery of the city; he died in 1803, leaving a very humble provision for his family. Already a painter, Peter was encouraged by an affectionate mother to despise poverty for a time, and prosecute his studies. At the age of nineteen he was intrusted with the painting of the cupola of the old church of Neuss, near Dusseldorf. The figures were of colossal size, executed in chiaro-scuro, and the whole conception of the subject and its execution were very remarkable. In 1810, at Frankfort, he produced a series of illustrations of Goethe's *Faust*, which created no inconsiderable sensation. He now journeyed to Rome, meeting there his eminent fellow-labourer Frederic Overbeck, and, in conjunction with Schadow, Schrow, and Philip Veit, attracting the attention of artists to the gradual rise of a new school of German art. The revival of fresco

painting is attributable very much to the influence of this remarkable band of artists. Two frescos executed by Cornelius for the villa of M. Bartoldy, the Prussian consul-general, created a passion for the new-old style of decoration. The Marquis Massini gave a commission for the adornment of his villa with a series of frescos from the *Divina Commedia* of Dante. The crown prince of Bavaria invited Cornelius to decorate the new glyptothek at Munich with frescos, and he was appointed director of the Academy at Dusseldorf. He left Rome in 1819. He reformed the academy, and illustrated the glyptothek with several colossal works. These, since their completion in 1830, have commanded the highest admiration from all quarters. Subsequently Cornelius was created director of the Munich Academy. In 1841, on the invitation of Frederic William IV., he proceeded to Berlin to paint certain frescos in the Campo Santo. He afterwards superintended the decoration of the Berlin museum, and made the design for the superb shield presented by the king of Prussia to his godson the prince of Wales at his baptism. The genius of Cornelius was of a high order. A nobility of sentiment, a subtlety of meaning, and a grandeur of conception pervade his whole works, and amply redeem certain negligences of detail which occasionally draw upon him the animadversions of those critics who prefer finish to intellect. He died on the 7th of March, 1867.—W. T.

CORNWALLIS, CHARLES MANN, second earl and first marquis of, was born 31st December, 1738, and educated at Eton and St. John's, Cambridge. He entered the army as an ensign in 1756, and served on the continent during the Seven Years' war as aid-de-camp to the marquis of Granby. On the death of his father in 1762, he succeeded to the earldom; he was made aid-de-camp to the king in 1765, colonel of the 33rd regiment in 1766, constable of the Tower in 1770, and major-general in 1778. On questions of American taxation he steadily opposed the court; but when war broke out between the mother country and the colonies, and his regiment was ordered abroad in 1776, he accompanied it without hesitation, conceiving that as a military man he had nothing to do with the policy of the service which he was commanded to perform. He served with great activity under generals Howe and Clinton, in the campaigns of 1776-79, in New York and the southern states, and in 1780 he gained a complete victory over General Gates. But in the following year he was besieged in York town by the French and American forces and the French fleet, and after an obstinate defence, was compelled to surrender, October 7, 1781. This untoward event proved a death-blow to the British interests in America; but Lord Cornwallis sustained no loss of military reputation by it, and on his return to England, was courted by both of the leading parties in parliament. In 1786 his lordship was appointed governor-general and commander-in-chief of Bengal. He introduced great reforms in the judicial system and the police, and in the collection of revenue. The principal event which occurred during his administration was the war with Tippoo Saib. The campaign of 1790 against Tippoo having proved indecisive, the governor-general resolved to take the field in person in 1791. The campaign was attended with entire success, the sultan was completely defeated in the famous night attack upon the lines of Seringapatam, and compelled to assent to a treaty which stripped him of one half of his dominions, besides a large sum of money (4th March, 1791.) As a reward of his "brilliant successes," Lord Cornwallis was raised to the rank of a marquis, and on his return to England in 1793, was appointed master-general of the ordnance. In 1798—the era of the rebellion—he was appointed lord-lieutenant of Ireland and commander-in-chief, and not only succeeded in suppressing the rebellion and capturing a French invading army, but checked the disgraceful outrages of the dominant faction in that unhappy country; and in spite of the violent clamour against his clemency, he steadfastly adhered to his moderate and merciful policy. He lent his powerful aid in passing the bill for the union of the two countries in 1800, and resigned the vice-royalty on Mr. Pitt's retiring from office in 1801. In the same year he was appointed plenipotentiary to France, and negotiated the peace of Amiens. In 1805 he was reappointed governor-general of India; and on arriving in Calcutta, though in bad health, he proceeded at once to the upper provinces, where his presence was necessary. But he was obliged to stop at Ghazapore in the province of Benares, where he died on the 5th of October. Lord Cornwallis was a statesman and a soldier of solid rather than showy qualities. He

Engr. by J. M. Meyer after the *Alphonsus* in the cathedral of Parma

CORREGGIO.

was noted for his moderation and prudence, his love of truth, and boldness in enouncing it. He had large views, a cultivated and correct understanding, a keen insight into character, much energy, much enterprise, much fertility of resource, a chivalrous attachment to king and country, and unshaken resolution in doing and enforcing what he thought right.—J. T.

CORNYSHE, WILLIAM, master of the children of the royal chapel in 1490, was a distinguished musician in his day. He was also a poet; at least he wrote some rhymes entitled, "A Treatise between Trowth and Enformation." These lines were penned in 1504, when the author was in the Fleet prison, in consequence, as he asserts, of false information given by an enemy. The treatise was written in order to restore him to favour with "King Harry," as he familiarly calls his sovereign. It was no doubt attended by the desired result; for, not very long afterwards, his name occurs again among the gentlemen of the chapel who played before the king. In 1530 was published a collection of songs, with music, by Cornyshe and other composers.—E. F. R.

CORNYSHE, WILLIAM, jun., a son of the preceding, was also an eminent musician at the end of the fifteenth, and beginning of the following century. Many of his compositions are preserved in a volume of ancient English songs for two, three, and four voices, known as the Fairfax MS.—(*Add. MS.* British Mus., No. 5465.)—E. F. R.

CORREA DE LA SERRA, JOSÉ FRANCISCO DE, born at Serpa in Portugal in 1750. After taking orders, he devoted himself with untiring energy to classical and antiquarian studies. While holding the office of secretary to a Portuguese academy of science, Correa wrote an important work on physiological botany. In 1786 he was obliged to leave Portugal, in order to avoid the religious persecution then raging. He returned after the death of Peter III., but in 1796 was a second time obliged to flee, and came to London, where he was made a fellow of the Royal Society. After the peace of Amiens he went to France, where he made good use of the scientific advantages he enjoyed. In 1813 we find him at Philadelphia, where he undertook the duties of a chair of botany, but refused the title of professor. In 1816 he was appointed ambassador of Portugal to the United States, but was recalled to Portugal in 1821, and nominated a member of the board of finance. In 1823 he was elected a member of the cortes, but died 11th September in the same year. His great work is the "Collecão de livros ineditos de historia Portugueza."—F. M. W.

CORRÉA, DON PELAYO PEREZ, a Portuguese general, who commanded a successful expedition against the Moors, undertaken by his own sovereign, Sancho, in the middle of the thirteenth century. He afterwards served with Ferdinand of Castile in the campaigns by which that monarch humbled the Moslem power in Spain, and died in 1275.—W. B.

CORREA DE SA BENAVIDES, SALVADOR, a celebrated admiral, was born at Rio de Janeiro in 1594, and died in 1688. The first part of his life was spent at sea. In 1641 he was made governor-general of Brazil, to which colony he rendered valuable services. In 1648 he drove the Dutch out of Angola, and governed that region during the three following years. The last office he held was that of governor of the countries south of Brazil. He closed a long life of important public services in unmerited neglect.—R. M., A.

CORREGGIO, ANTONIO ALLEGRI or LIETI, is commonly called Correggio, and Antonio da Correggio, from the small town of that name in which he was born, about twenty miles east of Parma, and now forming part of the duchy of Modena. The exact date of his birth is not known, but he is assumed to have been born in the winter of 1493-94; his father Pellegrino Allegri, was a merchant in good circumstances, but as is the case with many other great painters, exceedingly few facts of the life of Correggio are positively known, notwithstanding the elaborate memoirs of him by the Padre Pungileoni, *Memoire Istoriche di Antonio Allegri detto Il Correggio*, published at Parma in 1817-21, of which an abstract was published by Archdeacon Coxe, in the *Sketches of the Lives of Correggio and Parmegiano*, London, 1823. The account of Vasari represents Correggio as having been very poor and obscure, but some documents published by Pungileoni should entirely dissipate this impression, which appears to be altogether erroneous. He evidently enjoyed a great reputation in his lifetime, even as early as 1519, and he received high prices for his works.

Antonio commenced the practice of his art in his native place, and a painter of Correggio of the name of Antonio Bartolotti has the credit of being his first master. By the time he was five and twenty years of age, his fame had already reached the capital of Parma, and in 1520 we find him engaged on the extensive frescos of the cupola of San Giovanni, representing the ascension of Christ from the midst of the apostles, well-known by the prints of Vanni and the Cav. Toschi. As an additional indication of prosperity, in this same year, 1520, he was married to a young lady of Mantua, named Girolama Merlini, and with whom he received a considerable dowry; she is supposed by Pungileoni to have been the original of the Madonna in the holy family, known as La Zingarella. He had already executed several remarkable oil pictures before settling in Parma; the St. George, and the St. Sebastian—two large altarpieces, now in the gallery of Dresden—are both of this period. In 1522 he received his last extensive commission, to paint, also in fresco, the dome and choir of the cathedral of Parma, but this great work was interrupted by his early death. Correggio contracted to paint the whole for one thousand ducats (equivalent perhaps, now, to about £5000 of our money). He, however, did not live to complete even the dome, which was finished by his pupil Giorgio Gandini. The subject is the "Assumption of the Virgin," the apostles being witnesses of the event, below; these frescos were also engraved by Vanni, and in part by the Cav. Toschi. This great painter died of a fever at Correggio, 5th March, 1534, at the early age of forty, being survived by his father, and his wife was left with his only son, Pomponio, and one daughter; two of his daughters died before him. Correggio was particularly remarkable for his objective chiaroscuro, and for his violent and complicated foreshortenings; he was also a fine colourist, and pre-eminent above all his contemporaries for what is termed grace. His foreshortenings are, however, skilful as well as violent; his lights and shadows are graduated with exquisite roundness and the utmost taste; and in what has been termed *grace*—the attitude, undulating forms, and soft expression of his figures—he is still unrivalled. It was this quality, this general softness, which so fascinated Annibale Carracci and the Bolognese eclectics. Annibale, in a letter published by Malvasia, (Felsina Pittrice,) writes from Parma to his cousin Lodovico in 1580, with reference to Raphael's St. Cecilia, now in the gallery of Bologna, and some of Correggio's pictures at Parma, as follows:—"The 'St. Jerome;' the 'St. Catherine;' the 'Madonna della Scodella'—I would rather have any of them than the St. Cecilia; how much grander, and at the same time more delicate, is the figure of St. Jerome, than that of St. Paul [in the St. Cecilia], which at first appeared to me to be a miracle; but now it appears to me wooden, it is so hard." Correggio's pictures are exceedingly valuable, but most of the great European galleries possess one or two fine examples of his oil paintings. Many are still preserved at Parma, and the Dresden gallery is rich in Correggios; besides the two already mentioned, it possesses the famous "Notte," or nativity of Christ, and the small "Reading Magdalene." The Notte, somewhat damaged now, is conspicuous for its grace and foreshortenings, and for the much spoken of device of lighting up the picture from the infant Saviour; Raphael had preceded Correggio many years in this mode of lighting—in the fresco of Peter delivered from Prison, in the Vatican, all the light of the picture proceeds from the angel. Correggio is also well represented in our National gallery—in the "Cupid being taught to Read;" in the "Ecce Homo;" and in the small "Holy Family." The "Christ praying in the Garden," is now assumed to be a copy of the original in the possession of the duke of Wellington, and which was captured from king Joseph after the battle of Vittoria, and afterwards presented to the late duke by Ferdinand VII. The "Cupid reading," one of the painter's masterpieces, is a noble specimen of all Correggio's qualities of style, though the picture has somewhat suffered from time. It was formerly in the possession of Charles I., who purchased it of the duke of Mantua; and at the sale of King Charles' effects it was bought by the duke of Alva for £800, then an immense sum; it belonged afterwards to the prince of Peace, and was eventually restored to this country through the marquis of Londonderry, of whom it was purchased for the nation in 1834, together with the "Ecce Homo" by the same painter.—R. N. W.

CORRI, DOMINICO, a musician, was born in Naples in 1744, and died in London when above the age of eighty-two. He was

the pupil of Porpora for the four years preceding the death of that esteemed master in 1767. Corri came to London in 1774, where he produced an opera, "Alessandro nell Indie," at the king's theatre, which had little success. He obtained great repute as a teacher of singing, and printed a treatise on the art. Several of his English songs, of which he published a great number, became very popular. He produced also two collections of pianoforte sonatas, and the English opera of "The Travelers," which was his most successful work. His daughter, who appeared in public as a singer and a harpist, and obtained much distinction in the latter capacity, married the famous Dussek. In 1797 Corri opened a music warehouse in the Haymarket, in partnership with his son-in-law, who was at the time at the height of his career as a pianist and composer, and Corri, too, was well known to the public; but their publishing speculation did not prosper. Corri had three sons, who all followed his profession—ANTONIO, who settled in America; MONTAGUE, born in Edinburgh in 1785, who obtained some considerable note in London as a composer of small pieces for the theatres; and HAYDN, who resided as a teacher in Dublin, and whose son, HENRY, has come before the public as a singer. NATALE CORRI was the brother of Domenico; he was a teacher of singing and a composer, and lived at Edinburgh, where his daughter, FRANCES, afterwards known as Madame Corri-Paltoni, was born in 1801, whose reputation was high among the Italian vocalists of her time.—G. A. M.

CORT, CORNELIUS, a celebrated engraver, born at Horn in Holland in 1536. After engraving a number of plates from the Dutch and Flemish masters, he set out for Italy. In Venice he was cordially received by Titian, who gave him a residence in his house. He afterwards visited Rome, and instituted there a school of engraving. It is said, but apparently without much foundation, to have been under this distinguished artist that Agostino Caracci first studied the art of engraving. The plates of Cort are entirely executed with the graver, in a vigorous and masterly manner. He died at Rome.—W. T.

CORTESI, JACOPO, or rather JACQUES CURTOIS, called IL BORGOGNONE. This celebrated painter was born in 1621, at St. Hippolite in Burgundy. His father was a painter of sacred subjects, who attained but little success in his profession. On the persuasion of a French officer, Jacopo deserted the studio of his father and entered the army, in which he remained three years. This period was not entirely lost to the future painter, for he made drawings of every skirmish, attack, and military manoeuvre in which he was engaged. After relinquishing the trade of a soldier, he went to Bologna, and there formed the acquaintance of Albano and Guido, which was of much service to him. Borgognone resided some years at Florence under the patronage of Prince Mathias, whose military achievements in Germany and Italy he recorded in a historical gallery of paintings. At Rome he produced some sacred works, the "Magdalen at the feet of Christ," in the church of S. Marta, &c. But his real excellence consisted in his battle landscapes. "He imparted a wonderful air of beauty to his compositions," says Lanzi; "his combatants appear before us courageously contending for honour or for life, and we seem to hear the cries of the wounded, the blast of the trumpet, and the neighing of the horses." The original brilliance of colour has departed from the greater number of his works. His four finest works probably are in the Palazzo Pitti at Florence. In the height of his fame he was suddenly driven from the world by a malevolent rumour that he had poisoned his wife. He retired to a monastery of the jesuits, and became one of their body. He was held in high esteem by his fellow-monks, so much so that they dispensed with the second year of his noviciate. He died of apoplexy at Rome, on the 14th November, 1676. He etched a few plates of battle-pieces, very masterly in execution and powerful in their effects of light and shade.—W. T.

CORTEZ, HERNANDO, the Spanish conqueror of Mexico, was born at Medellin in Estremadura in 1485, and was thus a boy of seven when Columbus discovered America. His early youth was a stormy one, and at the age of nineteen he quitted Spain for a career of adventure in what was then "the far west." His destination was Hispaniola, of which the unworthy successor of Columbus, Ovando, was governor, and from him Cortez received a concession of land, and some slight official dignity. Seven years later, he was associated with Velasquez in the conquest of Cuba, an enterprise which brought out his soldierly qualities.

Another seven years elapsed, and Cortez was summoned from his lucrative occupancy of a Cuban estate, to follow up the discoveries of Juan de Grijalva on the Mexican coast. Velasquez designated Cortez chief of the expedition; and though he subsequently revoked the appointment, fearing the ambition of his turbulent subordinate, Cortez succeeded in making good his new position. Towards the close of 1518, Cortez set sail with a little squadron which had been partly fitted out at his own expense. The army with which he went forth to the conquest of Mexico, scarcely numbered five hundred Europeans. His first encounter with the natives was at Tabasco, which he took after severe fighting, and he proceeded thence to San Juan de Ulloa, where he heard, from the friendly natives, of the Mexican empire, and their dependency on it. Landing in the early spring of 1519 at the site of the present Vera Cruz, Cortez met with a friendly reception from the native cacique, who transmitted to the Aztec emperor, Montezuma, the expression of the Spanish visitor's wish to be allowed to repair to Mexico, the capital. Montezuma refused his permission. Cortez then prepared to march on Mexico; and being harassed by plots among his followers, he destroyed his ships, leaving them no alternative but to accompany him, since their return to Cuba was thus impossible. In the August of 1519 he began his march, his army being somewhat augmented by Indian auxiliaries. Part of his policy, indeed, was to represent himself to the natives as their deliverer from the Aztec yoke. The army of Tlascala, an independent republic, opposed his progress. With his little force he defeated, in a pitched battle, 30,000 Tlascalans, and formed an alliance with the vanquished foe. Montezuma was frightened when he heard the tidings, and received the Spaniards in his capital, not as enemies, but as friends. But the people were hostile though the monarch was friendly, and Cortez, nothing loath, took advantage of the feeling to accuse the peaceful and timid Montezuma of treachery, and to make him first a prisoner, and then a puppet in his hands. The Mexicans, naturally irritated, especially at the profanation of their temples, were cultivating a mood of mind very dangerous to the Spaniards, when Cortez was recalled from the capital to front another adversary. An army had landed, sent by Velasquez, to bring back his rebellious subordinate. With promptitude, vigour, and success, Cortez marched against the Spanish force, surprised it, took its leader prisoner, and, as formerly with the Tlascalans, so now with his own countrymen, he converted the foe into a friend, and returned to Mexico the commander of the very army which had been despatched to depose him. The cruelties of his lieutenant at this capital had caused the insurrection to explode, and when Cortez reached Mexico he found, after much hard fighting, that he was outnumbered, and he resolved to evacuate the city. During the retreat the Spaniards were nearly cut to pieces, and it was almost by a miracle that Cortez, with his diminished forces, gained, on the 8th of July, 1520, the battle of Otumba, which decided the fate of Mexico. The lapse of six months found him on his way to invest Mexico with a reinforced and reorganized army, of which the Indian portion was very numerous. The siege of Mexico lasted three months, and it was only after a very narrow escape from destruction that the Spaniards found themselves in possession of its ruins, intermingled with the innumerable corpses of its defenders. This was on the 13th of August, 1521. Confirmed by the Emperor Charles V. in his self-conferred dignity of captain-general, Cortez governed the country well—pursuing towards the natives a policy on the whole conciliatory and just. Nevertheless, in 1526, the conqueror of Mexico found himself summoned to Spain, to answer charges brought against him by accusers and enemies at home. It was not, however, until 1528 that he arrived in his native country. In spite of the cause of his recall, he was received with the utmost enthusiasm by the population, and the emperor bestowed on him every possible honour but one—that of reinstatement in the civil governorship of Mexico. Returning in 1530 to America, he made, among other important discoveries, that of California; but when he heard of the arrival of a new viceroy of Mexico, he resolved to return to Spain and assert his claims. His reception was not the same as on the occasion of his first return. The conquest of Peru seemed to have effaced, both with people and prince, the memory of the conquest of Mexico. Cortez was treated with coldness by Charles V. He took part in the disastrous expedition of the emperor against Algiers in 1541, and might perhaps have given

it another issue had his advice been asked, or his plans been executed. Six years he languished about the court, vainly seeking a settlement of his claims. Wearied of the insolence of office and the law's delay, he was about to return to Mexico, when the design was arrested by death, which overtook him near Seville on the 2d of December, 1547.—F. E.

CORTONA. See PIETRO DA CORTONA.

CORVINUS. See MATTHIAS and HUNIAGES.

CORVISART-DESMARETS, JEAN-NICOLAS, Baron, one of the most illustrious French physicians of the last century, was born in 1755, and died in 1821. He was loaded with honours by Napoleon, to whom he was introduced by Josephine, who had become acquainted with him at the house of Barras. As a professor Corvisart was eminently successful.—R. M., A.

CORVUS, M. VALERIUS, an illustrious Roman warrior. He obtained the surname of Corvus because, in a single combat with a Gallic giant, he was assisted by a raven (corvus), which alighted on his helmet, and flew in the barbarian's face. He was six times consul and twice dictator, and rendered the most valuable services to the republic. Corvus, who lived to the age of one hundred, is frequently mentioned by the later Roman writers as one of the most fortunate of men.—R. M., A.

CORYATE, GEORGE, a man who in his time had a considerable reputation as an elegant writer, particularly in Latin verse, was born at Salisbury in the early part of the sixteenth century; and having been educated at Winchester school, he obtained a fellowship of New college, Oxford, in 1562. He was appointed to the rectory of Odcombe in 1594, where he died on 4th March, 1606. A list of his works is given by Wood in the *Athenæ Oxonienses*.—J. F. W.

CORYATE, THOMAS, son of the preceding, was born at Odcombe in 1577, and received his education at Westminster school, and subsequently at Gloucester hall, Oxford. In 1608 he set out on an extensive tour, and travelled principally on foot through Germany, France, and Italy. All this he tells us he accomplished with one pair of shoes, which on his return he had the vanity to hang up in the parish church at Odcombe. The result of this wandering he gave to the world in a volume with the strange title of "Coryate's Crudities hastily gobbled up in five month's travel." He also travelled through Constantinople, Greece, Egypt, Palestine, visiting Alexandria, Jerusalem, Cairo, the pyramids, Babylon; thence he proceeded to Lahore and Agra, where he was received at the court of the Great Mogul, and finally died of a short illness at Surat in 1617.—J. F. W.

COSA, JUAN DE LA, is said to have been the pilot of Columbus on his first voyage—certainly he was with the great navigator on his second one—and he is known to have been among the most eminent cartographers of his time and country. Cosa accompanied Ojeda in the latter's final expedition of 1509 to the Darien coast, and vainly endeavoured to dissuade him from landing at Tabasco, and engaging with the fierce natives of that locality. The cautious veteran supported his chief, however, with the utmost bravery when the conflict was commenced. Separated from Ojeda in the strife, he took refuge in an Indian hut, and fought till there was only one other survivor left, while he himself felt that the poisoned arrows of the enemy were completing their deadly work. Some of his maps have escaped the destroying hand of time, and are much valued by the geographical antiquary.—F. E.

COSIERS or COSSIERS, JOHN, a painter, born at Antwerp in 1603. His repute as a historical painter attracted the notice of the king of Spain and other princes, who liberally patronized him. He was nominated director of the Academy at Antwerp in 1639. He died in 1652.—W. T.

COSIN, JOHN, D.D., Lord-bishop of Durham and Count Palatine from December, 1660, to January, 1672, was the eldest son of Giles Cosin, a citizen of Norwich, where he was born, 30th November, 1594. He was educated at the free school of Norwich, and at Gonville and Caius college, Cambridge, of which society he was scholar and fellow. In 1610 Charles I., whose chaplain he then was, made him dean of Peterborough. His faithfulness to his royal master cost him much trouble, for in 1642 he was deprived of all his preferments, for being concerned in sending the plate of the university to the king. He then went to Paris as chaplain to the protestant members of Queen Henrietta's household, and there composed several works against the Roman catholics, and kept up a friendly intercourse with the French protestants. At the restoration of Charles II.,

Cosin returned home, after seventeen years' exile, and took possession of his former offices. On the 2nd of December, 1660, he was consecrated bishop of Durham, and there was distinguished for his princely munificence. He is said to have expended, in charitable works connected with his see, the sum of £26,000. He died in Pall Mall, 15th January, 1672. His works were numerous and valuable, and were collected in 1843 in the Library of Anglo-Catholic Theology—a memoir being prefixed, which was reprinted from the *Biographia Britannica*. Some of his writings have lately been translated into French and Italian, and published by the "Society for making known on the Continent the Principles of the Church of England."—T. S. P.

COSMAS, usually called INDICOPLEUSTES (Indian navigator), was an Egyptian monk of the reign of Justinian. Cosmas, who was originally a merchant, and had in that capacity visited many countries, wrote a work entitled "*Τοπογραφία Χριστιανική*," *Topographia Christiana*, in twelve books, the greater part of which is extant.—R. M., A.

COSTA, CLAUDIO-MANOEL DE, was born at Marianno, a town of the province of Minas Geraes in Brazil, upon the 6th of June, 1729. He published in 1751 his first volume of poetry, which was followed in 1768 by a second, and both were favourably received and gave him a high reputation. His close intimacy with Ribeiro led to implicate him in a political movement, in consequence of which he was arrested by the government in 1789, and thrown into prison at Villa Rica, where he died, as it is suspected, by poison. Costa wrote with purity and elegance, and was remarkable for the classicality and harmony of his prose.—J. F. W.

COSTA Y SYLVA, JOSÉ MARIA DA, was born on the 15th of August, 1788, in Coimbra in Portugal, in which city his father held an official situation. He employed himself chiefly in the translation of works of English, French, and Italian writers, though he also wrote a few original historical plays. Such was his diligence in this branch of literature, that he is said to have ultimately reproduced near two hundred dramas. Happily for the cause of literature, Costa found time towards the decline of life to confer upon his country a more solid benefit. In 1850 he published the first volume of his "Essay, Critical and Biographical, on the best Portuguese poets, from the commencement of the monarchy to the present time." Each succeeding year he continued this work till the 7th volume appeared in 1854, when death terminated his labours, leaving still three volumes unfinished. If Costa did not fully achieve the object he had in view, he has, at all events, supplied a great want, and for the first time given his countrymen what may be called a reliable history of its poetry.—J. F. W.

COSTELEY, WILLIAM, a Scotch musician of considerable eminence in the sixteenth century, was born about 1530. He visited Paris in early life, and was appointed valet-de-chambre and organist to Charles IX. He published "Musique," Paris, Adrien le Roi, 1579, 4to; and "Chansons à quatre et à cinq Parties," Paris, Adrien le Roi, 1586, 4to. The date of his decease is unknown.—E. F. R.

\* COSTELLO, LOUISA STUART, a popular English authoress. Her first publication attracted the attention of Thomas Moore the poet, to whom she dedicated in 1835 her "Specimens of the early Poetry of France." She has written a considerable number of books of travel, memoirs, and romances; "A Pilgrimage to Auvergne;" "Bearn and the Pyrenees;" "The Queen Mother;" "Clara Fane;" "Anne of Brittany," &c. &c.—R. M., A.

COSTER, the celebrated printer, was born about 1370, and died about 1440. He is one of the four or five persons for whom severally has been claimed the honour of the invention of printing. The Dutch have zealously advocated the pretensions of Coster, but it is now all but certain that the honour rightly belongs to the German Guttenberg.—R. M., A.

COSTER, JOSEPH FRANÇOIS, the son of a banker at Nancy, where he was born in 1729. When of sufficient age he became a partner in the establishment; but in the midst of financial business he found time to apply a clear and vigorous intellect to the cognate study of political economy. He was appointed secretary to the parliament of Lorraine, and employed in many important affairs by that body. One of his publications in this capacity was "Letters of a Citizen," in opposition to certain commercial restrictions proposed to be placed upon the trade of the province of Lorraine. These letters were extremely popular, and procured for their author the title of "the Citizen." His

reputation soon spread beyond the bounds of his own duchy. He was appointed secretary to the states of Languedoc, and soon after he was placed at the head of the financial affairs of Corsica, and thence he was elevated to the post of first commissioner of finance, which he continued to hold till 1790, acquiring and preserving a high reputation for ability. Meantime he was nominated syndic general of the provincial assembly of Lorraine, and subsequently was elected mayor of Nancy. During the Revolution he was thrown into prison in 1793, but liberated soon after. Upon the establishment of the *écoles centrales*, Coster was appointed to fill the chair of history in that establishment for the department of la Meurthe. He was perpetual secretary for the academy of Nancy, of which he published the memoirs. He died in 1813.—J. F. W.

**COSWAY, RICHARD, R.A.:** this English artist was born in 1740, at Tiverton, Devonshire, his father being the master of the grammar school there. His uncle, the mayor of Tiverton, placed him as a pupil with Hudson, and afterwards at Shipley's school in the Strand. Cipriani and Bartolozzi were loud in their approval of his drawings from the antique. Cosway was a most diligent student, and between his fourteenth and twenty-fourth years he obtained five premiums from the Society of Arts. He was chiefly distinguished as a miniature painter, and he attained to very great success. The prince of Wales, afterwards George IV., expressed great admiration for his portrait by Cosway, and in consequence all the rank and beauty of the country seemed to flock to his easel. In 1771 he was elected a member of the academy. He contributed many fanciful portraits to its exhibitions—among others his "Psyche," "Cupid," "St. John," "Madonna and Child," and "Rinaldo and Armida." He married Miss Hadfield, who was born at Leghorn, but of English parents. She possessed great ability as an artist, and also as a musician. Her paintings attracted general admiration, and her musical soirées, at which she was *prima donna*, were amongst the most aristocratic haunts of the day. Cosway died on the 4th of July, 1821.—W. T.

**COSYN, BENJAMIN,** a celebrated composer of lessons for the virginals, and probably an excellent performer on that instrument, flourished in the first half of the seventeenth century. There are many of his pieces extant, somewhat in the same style with those of Dr. Bull, and very little inferior to them. He was probably a son of John Cosyn, who published in 1585 sixty psalms, in six parts, in plain counterpoint.—E. F. R.

**COTES, FRANCIS, R.A.,** an English portrait painter, was born in London in 1725. He was remarkable for his portraits in oil and crayons. At one time Hogarth maintained that he was superior to Reynolds. Like Sir Joshua, Cotes called in the aid of Toms to paint his draperies. Walpole mentions several of his pictures, and says of them that if they yield to Rosalba's in softness, they excel hers in vivacity and invention. Cotes died of the stone in July, 1770. He was one of the original members of the Royal Academy.—His brother, SAMUEL, was also a noted crayon painter. He died in 1818.—W. T.

**COTES, ROGER,** an English astronomer, born in Leicestershire in 1682. He was educated at St. Paul's, London, and Cambridge, where he was made Plumian professor of astronomy in 1706. In 1713 he took orders, and in the same year published, at the recommendation of Bentley, the *Mathematica Principia* of Newton. He also gave to the world a description of the great fiery meteor of 1716. His "*Harmonia Mensurarum*" appeared after his death, which occurred in the thirty-fourth year of his age.—R. M., A.

**COTMAN, JOHN SELL,** an English artist, born at Norwich about 1780. His water-colour drawings were remarkable for their vigour and depth of effect; but it is as an engraver of architectural and archæological drawings that he will be more especially remembered. His first undertaking of the kind was his "Miscellaneous Etchings of Architectural Antiquities in Yorkshire," in 28 plates, folio, published in 1812; "Architectural Antiquities of Norfolk" and "Sepulchral Brasses in Norfolk" followed. In 1817 he went to France, and subsequently produced the most important and valuable of his works, the "Architectural Antiquities of Normandy," published in 1820, with letterpress descriptive of the plates by Mr. Dawson Turner of Yarmouth. He afterwards resided in London, and held the appointment of teacher of drawing in King's college, London. He died in 1843.—W. T.

\* **COTTA, BERNHARD,** an eminent German geologist, was born

in 1808. He was appointed professor at Freiberg in 1842. He has prepared geognostic charts of the kingdom of Saxony and of Thuringia, and written extensively on his favourite science. Cotta advocates the theory of a progressive development of terrestrial bodies. One of his latest publications is entitled "Letters on Humboldt's Cosmos."—R. M., A.

**COTTA, CAIUS AURELIUS,** one of the most distinguished orators of his time, was born 124 B.C. In the earlier part of his life he was obliged to retire from Rome in consequence of the law of Varius, which required the banishment of all who had supported the pretensions of the Italian allies to the rights of citizenship. At this time he spent nearly ten years in exile. He was elected consul 75 B.C.; and in consequence of a proposal to restore the powers of which the tribunes had been deprived by Sylla, he became an object of dislike to the patrician order. As an orator he is frequently applauded by Cicero.

**COTTA, JOHANN FRIEDRICH FREIHERR VON,** one of the most eminent German publishers, was born at Stuttgart, 27th April, 1764. He was descended from an ancient Milanese family long settled in Germany. Johann Friedrich Cotta devoted himself to the study of jurisprudence at Tubingen, and then made a longer stay at Paris. In 1787 he began the management of the bookselling house, which, by his business-like habits, his energy and intelligence, he slowly but steadily raised to an almost unparalleled standing. He originated by degrees various highly successful newspapers and periodicals. He also formed acquaintances with almost all the literary and scientific celebrities of Germany, and published the works of Goethe, Schiller, Matthisson, Platen, Humboldt, and other classic authors. By these enterprises his fortune was greatly increased; he acquired considerable landed property, and thus was enabled to take part in the political affairs of his country. He was chosen a member, and afterwards vice-president of the Wurtemberg chamber of deputies, and in 1815 was sent to the Vienna congress by the booksellers' corporation, there to take care of their interests. In 1825 he started the first steam boat on the Bodensee. Three years later, Wurtemberg and Bavaria were joined by his negotiations to the Zollverein. He died at Stuttgart, 29th December, 1832.—K. E.

**COTTEREAU, JEAN,** usually called JEAN CHOUAN, was born in 1757, and died in 1794. Cottereau became a soldier, and at the Revolution obtained a command in the national guard. A devoted royalist, he had soon, however, to quit his regiment; upon which he betook himself with a few companions to the forest of Mison, where he carried on for some time a system of petty ambushes and surprises. When the Vendéans passed the Loire, Cottereau joined them with five hundred young men. Their enterprise having failed, he returned to his ambushes, and fell in an attempt to rescue the wife of his brother René.—R. M., A.

**COTTIN, SOPHIE RISTAUD, Madame,** a French authoress, born at Tonneins in 1773, was married in 1790 to M. Cottin, a rich banker of Paris. She published successively "Claire d'Albe;" "Malvina;" "Amélie Mansfield;" "Mathilde;" "Elizabeth, ou les Exilés de Sibérie;" and "La Prise de Jéricho." These romances are full of sensibility, spirit, and eloquence, and the moral principles which they inculcate are pure and elevated. Her "Elizabeth" is well known in Great Britain and the United States. Madame Cottin was a protestant, but all her heroines are Roman catholics. She died at the age of thirty-seven years, on the 25th of August, 1807.—T. J.

**COTTON, CHARLES,** a well-known English writer, was born at Ovingden in Sussex on the 28th April, 1630. He was the son of that Charles Cotton whom Hyde, afterwards lord chancellor, mentions along with Ben Jonson, Selden, May, and others, as one of the friends of his youth. Young Cotton was sent to Cambridge, from which he returned to his father's house, where he remained till his marriage in 1656. His father dying two years after, Charles came into possession of the family estate; but he found it so heavily burdened, that it was probably as much from necessity as from natural inclination, that he from this time devoted himself so assiduously to literary pursuits. In 1660 he published a "Panegyric to the king's most excellent majesty," and in 1664 "Scarronides, or Virgil Travestic," the coarseness and obscenity of which render it one of the worst productions of the absurd class to which it belongs. His next undertaking was a translation of the Life of the Duke of Espernon, which was followed by his "Voyage to Ireland, in

Burlesque;" an excellent poem, of which the good-humoured absurdity and temporary forgetfulness of every thing sober and solemn are not a little amusing. Some translations from the French, "The Planter's Manual," and "Burlesque upon Burlesque,"—the last a disagreeable production—preceded the "Second Part of the Complete Angler," which as the author tells us, was written off in the short space of ten days. Cotton was a great angler and a most intimate friend of Isaak Walton. But the most valuable of all Cotton's works is his admirable translation of Montaigne's Essays, which appeared in 1685 in three vols. 8vo. He was a perfect master of the French language; and his strong sympathy with the freedom and eccentricity of the old Gascon gentleman's opinions, must have rendered the version of his essays truly a labour of love. He died in 1687. A collection of his fugitive poems, many of which are translations from the Latin lyric and elegiac poets, was published after his death. Cotton was constantly harassed with pecuniary difficulties, and there is reason to believe that his life lacked much of that saintliness which characterized his adoptive father, dear old Isaak Walton.—R. M., A.

COTTON, NATHANIEL, an English physician and poet, died in 1788. He studied at Leyden under the famous Boerhaave, and after his return to England practised medicine, first at Dunstable, and afterwards at St. Albans. For some time he devoted himself to the care of insane persons, whom he received into his house. Cowper the poet, who placed himself under his tender and skilful management, had a particular regard for him. Cotton wrote "Visions in Verse, for the instruction of Younger Minds."

COTTON, SIR ROBERT BRUCE, an eminent English antiquarian, was born at Denton in Huntingdonshire in 1570, and educated at Trinity college, Cambridge. He seems to have early acquired a high reputation for learning and integrity, and was consulted on public affairs both by the king and the leading men of the times. He was first knighted, and afterwards created a baronet by James I.; but notwithstanding these proofs of the favour in which he was held by the court, Sir Robert joined the popular party, and urged the redress of grievances, though with great moderation. He was in consequence subjected to the persecution of the government; and a surreptitious copy of a MS. treatise on a political topic, which belonged to his library having been laid before the privy council, he was committed to the Tower, and his valuable library seized. This harsh and unjust treatment injured his constitution, and ultimately led to his death, 6th May, 1631. His library, which contains a great mass of records and precious manuscripts, as well as books, was improved by his son and grandson, and is now deposited in the British museum.—J. T.

\* COUCH, JONATHAN, F.L.S., &c., was born on 15th March, 1788, at Polpero, a fishing village on the south coast of Cornwall, where he has spent the greater part of his life in the practice of medicine, devoting his hours of leisure to the study of natural history. His attention has been chiefly directed to the investigation of marine zoology. As long ago as when Bewick was contemplating a history of British fishes, to be illustrated in the same manner as his other celebrated works—a labour which was interrupted by his death—Mr. Couch largely furnished him with materials; and how greatly British ichthyology is indebted to the Cornish naturalist may be seen on a perusal of Mr. Gurrett's almost national work on that subject. Mr. Couch has also been a contributor to the Transactions of the philosophical societies of his native country, and has published numerous papers on almost all branches of his favourite study, in the journals having natural history for their subject. He is also the author of "Illustrations of Instinct;" "The Cornish Fauna," Parts I. and II.; Part III., On the Zoophytes of Cornwall, being furnished by his son, RICHARD Q. COUCH, also a naturalist of repute.—M.

COUCY, RAOUL or RENAUD DE, a distinguished poet of the twelfth century. He went to the crusades with Richard Cœur de Lion, and died in battle. The date of 1192 is stated as that of the year of his death. His biography, as far as it is connected with literature would seem, if we may speak "a l'Irlandaise," to begin after his death. When dying, the sire de Coucy ordered his écuyer to take his heart to the dame de Fayel, and tell her how it had lived upon smiles and wine, and how the best of both were what had cheered him in her castle. Her husband met the luckless missionary, robbed him of the cherished treasure, had it delicately dressed, and made his wife eat it actually, not meta-

phorically. She refused all other food when she was told of what delicates her last dinner consisted. The story seems to have pleased the taste of the period and of later days, for we have the same story repeated in almost every language of Europe. Twenty-four chansons are ascribed to De Coucy. Michel published them in 1830, with an introduction and notes.—J. A., D.

COULOMB, CHARLES AUGUSTE DE, a French mechanician, born at Angoulême in 1736, and died in 1806. Coulomb entered the army at an early age, and distinguished himself as a military engineer. He was sent to Martinique, to the isle of Aix, to Rochefort, and to Cherbourg; but his public labours did not wholly interrupt his private studies. In 1779 he obtained a prize from the Royal Academy of Sciences for the best construction of the mariner's compass, and two years afterwards another for his "Theory of Simple Machines." But his reputation rests chiefly on his invention of the torsion balance (*balance de torsion*). This ingenious instrument, which was suggested by a series of experiments on the elasticity of metallic threads, is employed for increasing minute forces.—R. M., A.

COURCY or COURCEY, SIR JOHN DE, an English warrior who died about 1199. He went to Ireland with a band of English, to assist the tyrant Dermot Macmorrogh to regain the crown of Leinster, which he had lost by his violent oppressions. In 1186 Courcy succeeded John, son of Henry II., as viceroy of Ireland. Being afterwards deprived of this post he took arms, and for some time resisted the royal forces. He was at length apprehended, and thrown into prison, whence he was released by King John. He then set sail for Ireland, but was driven on the coast of France, where he died.—R. M., A.

COURT, ANTOINE, a celebrated French protestant minister, was born in 1696, and died in 1760. In 1715 he set himself to reorganize the French protestant church, which had been broken and scattered by the revocation of the edict of Nantes—a work in which he was successful beyond his most fervent hopes. He founded, about 1730, the French theological school at Lausanne, which he directed till his death.—R. M., A.

COURT DE GÉBELIN, ANTOINE, son of the preceding, was born at Nismes in 1725. He, like his father, was called to the ministry, but soon abandoned active religious ministrations to devote himself to his favourite study of mythology. In 1763 he settled in Paris, and in two years afterwards he commenced the publication of his great work, "Le Monde Primitif, Analysé et Comparé avec le Monde Moderne." Gebelin wrote a work entitled "Les Toulousaines," in favour of the reformed religion, and established in Paris an office, in which all protestants could record their complaints, grievances, and views in general, and thus he became the centre of that party throughout the kingdom, and the advocate of liberty, religious and civil. He died of a lingering and painful disease in 1784.—J. F. W.

COURTENAY, JOHN, was born in Ireland in 1741. He obtained an introduction to Lord Townshend, which his talent and conviviality improved to intimacy, so that the viceroy took his friend with him on his departure, and appointed him his secretary when he was made master-general of the ordnance. Courtenay commenced his political career in 1780, as member for the borough of Tamworth, which he continued to represent till 1796; after which he sat for Appleby, having in the meantime been made surveyor of the ordnance. On the resignation of Lord North, Lord Townshend retired from the ordnance, and Courtenay accompanied him. They were again in office for a short time under the coalition ministry. Courtenay was held in sufficient consideration to be placed on the committee for the impeachment of Warren Hastings. In 1806 he was appointed a commissioner of the treasury, and shortly after retired from public life, and died March 4, 1816. As a man of letters, Courtenay wrote with point and spirit, and some of his poetical pieces have merit. Most of them allude to the passing incidents of the day. The "Poetical Review of Dr. Johnson" is the best of these compositions. He wrote two or three pamphlets on the French revolution.—J. F. W.

COURTNEY, WILLIAM, Archbishop of Canterbury, was born in 1341, and died in 1396. When bishop of London, he summoned before him Wickliff the reformer, upon which occasion a tumult was excited amongst the citizens of the metropolis. Courtney was afterwards raised to the see of Canterbury, and is remembered as a persecutor of the Wickliffites.—R. M., A.

COURTEVILLE, RALPH, a musician, supposed to be the son

of Ralph Courteville, a gentleman of the royal chapel, who died in 1675. In 1691 he was appointed organist of St. James' church, Piccadilly, and was the author of the standard psalm tune known as St. James'. While he was of good repute as an accomplished musician, he was also a literary reviewer and critic of some celebrity. He was supposed to be in the pay of the state, for the purpose of writing up the government of Sir Robert Walpole, and was consequently stigmatized, by the opposite party, by the appellation of *Court-civil*. The dates of his birth and decease are unrecorded.—E. F. R.

COUSIN, VICTOR, a celebrated French philosopher and litterateur, was born at Paris, 28th November, 1792. After giving high early promise, Cousin was appointed in 1815 by M. Royer Collard to deliver lectures on the history of philosophy at the Sorbonne. His prelections, which were characterized by great vigour and brilliancy, attracted an unusual amount of attention. They were, however, suddenly interrupted by the reactionary measures of government, which in 1820 caused M. Royer Collard to withdraw from the council of the university. M. Guizot, who was then also a lecturer at the Sorbonne, shared the same fate. The leisure which Cousin had thus unwillingly forced upon him he employed in perfecting his philosophical studies. He travelled also for some time in Germany, where the too free expression of his liberal sentiments brought him acquainted with the prisons of Berlin. To this period, it may be added, belongs his edition of Proclus—Procli philosophi Platonici Opera, 6 vols. The reign of jesuit ascendancy having ended, Cousin was restored to his chair of philosophy in 1828, and commenced those series of lectures which immediately attained a popularity altogether unprecedented since the age of scholasticism. Two thousand auditors listened in admiration to his expositions of abstruse and difficult doctrines. "The daily journals found it necessary," says Sir William Hamilton "to gratify, by their earlier analyses, the impatient curiosity of the public; and the lectures themselves, taken in short-hand and corrected by the professor, propagated weekly the influence of his instruction to the remotest provinces of the kingdom." After the revolution of 1830 Cousin resigned his chair and became inspector-general of education. In 1832 he was made a peer of France, and in the same year published his celebrated report on the state of education in Prussia and Holland. He was meanwhile a regular contributor to the *Journal des Savants*, and, having been chosen member of the French Academy, as well as of the Academy of Moral and Political Sciences, took an active part in their various labours. Cousin again held office as minister of public instruction during the short administration of M. Thiers in 1840. Since the revolution of 1848 he has kept wholly aloof from political affairs.

M. Cousin, whose studies had embraced the entire range of moral and metaphysical philosophy, fluctuated for some time amongst its various systems. Plato, of whose works he gave a translation, Reid and the Scotch philosophy, Kant, Proclus, and Hegel, each engaged his attention in turn. He at length professed to adopt a system of impartial and universal eclecticism—a method which was to turn philosophy into a new path, and heal her manifold divisions. More of a Cicero than a Plato, he takes high rank as an expounder of philosophy rather than as a philosopher. His lectures, entitled "*Cours de l'histoire de la philosophie*," are extremely brilliant, and present a lively, if not always a just view, of the various systems of philosophy that have appeared in the world. Philosophy, according to Cousin, is nothing else than reflection elevated to the rank and authority of a method. Indeed philosophy is nothing but a method. His system, such as we understand it, may be indicated in a few words. There are three ideas necessarily inherent in human reason: the idea of the finite, revealed to the consciousness by the interaction of the *ego* and the *non ego*; the idea of the infinite or of necessary substance, the common principle of the *ego* and the *non ego*, which also is an infinite cause; and the idea of the relation that exists between these two. Ideas, it should be remarked before proceeding farther, are not mere words, neither are they *beings*, but they are the mode of existence of eternal reason, and only in some manner lent to other reason. These three terms of the fact of consciousness belong to every individual, are common to the race; and as the reason of the human race manifests itself in history, the three ideas must also necessarily reveal themselves in the sequence of human affairs, so that psychology becomes the true

interpreter of history. Accordingly M. Cousin carries his theory into history, and boldly asserts that there must be three great historical epochs corresponding to the three ideas included in human reason, and that there can possibly be no more. It is curious to compare the different results at which a Cousin, the champion of ideas, and a Carlyle who would banish all such phantoms from the mind, severally arrive in regard to the same subject. Cousin, around whom come trooping at the slightest wave of his philosophic wand, the "ideas" of all the sciences of the eighteenth century, pronounces that century "one of the greatest that have appeared in the world." Carlyle, whose keen eye, wandering over its hundred years, can discern nothing greatly noble or heroic, brands it with the stigma of unexampled poverty and meanness. In such opposite directions do hero-worship and idea-worship wander from the simple truth! "It (*i.e.* the eighteenth century) brought," says Cousin, "the middle age to a close; it fulfilled that tragic mission—it fulfilled only that; a century, a single century, is seldom charged with two missions at once." (!) And so the centuries, like so many well-drilled regiments, march in order through the philosophical imagination, each with its mission-inscribed banner flaunting in the air. And this is the philosophy of history!—M. Cousin latterly applied himself to a minute and conscientious examination of the history of France during the first half of the seventeenth century. Disgusted with the meanness and distraction of his own age, he sought relief in the greatness of the past. The period which he chose is that, to use his own words, "inspired by the genius that prompted Henry IV., Richelieu, and Mazarin; dictated the edict of Nantes, and the treaty of Munster and the Pyrenees; and whence sprung Corneille's *Cid*, Descartes' *Discours de la Méthode*, Pascal's *Provincials*, Moliere's *Misanthrope*, and all the finest sermons of Bossuet—the genius to be everywhere recalled and glorified; because it is the genius of France herself at the hour of the completest development of her national grandeur." The fruit of his studies in this direction is already, at least in part, possessed by the world in his admirable historical biographies of Madame de Longueville, Madame de Sablé, Jacqueline Pascal, and Madame de Hautefort. Cousin laboured incessantly to wean his countrymen from the utterly worthless literature which has for so many years corrupted the popular mind. And it is but right to add, that the purpose of his writings was admirably seconded by the perfect honour and consistency of his life. His principal works, besides those already mentioned, are "*Fragments Philosophiques*," 2 vols.; "*De la Métaphysique d'Aristote*;" "*Philosophie Scolastique*;" "*Leçons sur la Philosophie de Kant*;" "*Fragments Littéraires*;" together with editions of the works of Maine de Biran, Abailard, P. André, &c. M. Cousin died in January, 1867.—R. M., A.

COUSTOU, GUILLAUME, an eminent French sculptor, brother of Nicolas, born in 1678; died in 1746. He was a successful student at the academy, and was sent to Rome to perfect his resources. Returning to Paris, he was intrusted with large works, occasionally in conjunction with Nicolas.—W. T.

COUSTOU, GUILLAUME, son of the preceding, was born at Paris in 1716. Like his father and uncle, he obtained the great prize of the academy, devoted five years to study at Rome, and subsequently returned to Paris to be received with acclamation into the academy. He was the treasurer of that institution at his death in 1771.—W. T.

COUSTOU, NICOLAS, an eminent French sculptor, born at Lyons in 1658. At the age of twenty-three, obtaining the highest academy prize in his art, he was sent to Italy, provided with means by the government. On his return some most important works were intrusted by the government to his execution, and he was at once admitted into the academy. He died in 1733, having been for forty years a member of the academy. For his services to art, Louis XIV. gave him two pensions, amounting in all to six thousand francs.—W. T.

COUTHON, GEORGE, born at Orsay in Auvergne in 1756, was an advocate at Clermont when the French revolution broke out. He embraced its principles with enthusiasm, and was sent to the representative assembly by the department of Puy-de-Dôme, and soon became conspicuous as a leader of the jacobins. He voted for the death of the king, and subsequently, as too moderate in their republicanism, for the arrest of the Girondist deputies. The "Mountain" rewarded his zeal by appointing him a member of the committee of public safety. He was one of the two deputies sent to conduct the siege of Lyons. The

atrocities that followed the reduction of the city, comprised a wanton destruction of property, as well as an indiscriminate massacre of the inhabitants. Couthon fell with his chief, Robespierre. He tried to kill himself in prison, but had not sufficient nerve to inflict more than a scratch. He was guillotined, July, 1794. He was weak in constitution; bland and almost feminine in countenance; eloquent in speech; but so cruel and faithless that he was called the Panther of the Triumvirate.—T. J.

COVENTRY, THOMAS, Lord-keeper of the great seal, was born in Worcestershire in 1578, and died in 1640. He was educated at Oxford, whence he removed to the inner temple. In 1616 he received the honour of knighthood, after being appointed to the office of solicitor-general. He was made attorney-general in 1621, and four years afterwards lord-keeper by Charles I. He was, finally, made a baron of the realm, on the 10th April, 1628, with the title of Lord Coventry of Aylesborough.—R. M., A.

COVERDALE, MILES, the celebrated translator of the bible, was born in the district of Coverdale in Yorkshire in the year 1488. He was sent to the Augustine monastery in Cambridge, of which Barnes, the martyr, was then prior. Ordained in 1514, he soon after renounced popery, and devoted himself wholly to the advancement of the Reformation. During this time Coverdale found a valuable patron in Cromwell, by whom he must certainly have been often shielded from danger. In 1532 he went abroad, assisted Tyndale in his biblical labours, and in 1535, encouraged probably by the course of events in England, hastened through the press the first translation of the whole bible in English. Three years after he was employed in editing the bible, which Grafton had received permission to print in Paris. The French capital was chosen because the best paper and presswork could be commanded there. The fate of this magnificent edition is well known. Pounced upon by the harpies of the inquisition, only a small part of it escaped destruction. Some copies were fortunately brought to London, by the aid of which, with Coverdale still as editor, Grafton was enabled at last to publish what is called Cranmer's, or the Great Bible. In 1551 Coverdale was raised to the see of Exeter, but was ejected on the accession of Mary, and thrown into prison. Released in two years, he repaired to Geneva, where he assisted the English exiles with their translation of the scriptures—usually called the Geneva Translation. He returned into England on the accession of Elizabeth, but found that the principles of the Geneva reformers, which he had imbibed, would not permit him to resume his bishopric. Bishop Grindal collated him to the rectory of St. Magnus, London Bridge, which he resigned in 1566, two years before his death.—R. M., A.

COWARD, WILLIAM, an English physician, born at Winchester, and died in 1725. He devoted much of his time to literary pursuits. His book, entitled "Second Thoughts concerning the Human Soul," was followed by "The Grand Essay." The latter, which is a defence of the "Second Thoughts," was, on account of its doctrines, condemned by an order of the house of commons to be burnt by the hands of the common hangman.

COWLEY, ABRAHAM, born in London in 1618, at Fleet Street, near the end of Chancery Lane. His parents are described by Dr. Sprat, his first biographer, as "citizens of a virtuous life and sufficient estate." Before he was twelve years the reading of Spenser made him irrecoverably a poet. His early education was at Westminster school, from which he passed to Trinity college, Cambridge. He was elected scholar of the house in 1636. In the same year that he entered Westminster, he published his "Poetical Blossoms." In 1638 he published "Love's Riddle," a pastoral comedy, written while he was at Westminster, and "Naufragium Jocular," which was acted by his fellow-students at Cambridge. While at Cambridge he wrote the greater part of his poem the "Davideis." These quiet studies he was not allowed to pursue. The great civil war of England was raging—Cowley's lot was cast with the royalists. He was ejected from Cambridge by the parliamentarians, and found a temporary refuge at St. John's, Oxford. While there he published his satire of the "Puritan and Papist." On the surrender of Oxford, Cowley followed the queen to Paris, and as secretary to Lord Jermyn (afterwards earl of St. Albans), conducted the correspondence, carried on chiefly in cypher, of the king and queen. He was for ten years away from England, engaged in the service of the royalist cause, for which he had made several journeys to Jersey, Scotland, Holland, &c. In 1656 he was sent to London, to give such assistance there as circumstances might admit. He then

published, 1st, "Miscellanies;" 2nd, "The Mistress;" a series of love-poems, first printed a few years before; 3rd, "Pindaric odes;" and 4th, "The Davideis." In the year 1657 Cowley took the degree of doctor of physic at Oxford. On Cromwell's death he returned to France, and remained in the character of secretary to the royal family till the Restoration. His studies as a physician led to the composition of his Latin work on plants. The Restoration came, and with it much expectation and much disappointment. If Cowley was not rewarded in proportion to the real service he rendered, he yet was not neglected. Through the interest of the duke of Buckingham he was given a beneficial lease of some of the queen's lands, and he now retired from all public business to live in the country. Pope's account of Cowley's death represents him and Dean Sprat as walking home from the house of a friend with whom they had dined. "They did not set out for their walk till it was late, and had drunk so deep that they lay out in the fields all night. This gave Cowley the fever that carried him off" (1667). Sprat does not record this, but the statement is not inconsistent with his narrative. Cowley was in his domestic relations a kindly man. His mother lived to old age, supported and venerated by her son. Cowley was one of three brothers, of whom one survived him and inherited his property. The poet's courtesy of manners is commemorated by his affectionate panegyrist, who records with gratitude that Cowley did not, like other poets, inflict his verses on such friends as fell into his power. He was interred in Westminster abbey near Chaucer and Spenser. Eight years after his death a monument was erected to him by the duke of Buckingham. King Charles, who knew him well, said that he had not left behind him a better man in England.—J. A. D.

\* COWLEY, HENRY RICHARD CHARLES WELLESLEY, second lord, is a son of the eminent diplomatist, the first lord, who was the youngest brother of the great duke of Wellington. Lord Cowley adopted his father's career, and has been a diplomatist from his youth upwards. Born in 1804, he was attached to the embassy at Vienna at the age of twenty. In 1829 he was appointed paid attaché at the Hague, whence he was transferred to Stuttgart as secretary of legation in 1832; and in 1838 he was removed to fill the same position at Constantinople. In 1848 he was elevated to higher diplomatic rank, being sent in February as minister plenipotentiary to Switzerland, and in the July of the same year on a special mission to Frankfurt. In the June of 1851, he was appointed minister plenipotentiary to the Germanic confederation. After the *coup d'état* Lord Normanby was removed from the embassy at Paris, and Lord Cowley was appointed to the very responsible post. On him devolved the negotiations which formed the Anglo-French alliance against Russia in 1853; and his mission to Vienna in 1859, to mediate between France and Austria, he is understood to have discharged with singular tact. His lordship succeeded his father in 1847.—F. E.

COWPER, WILLIAM, an eminent English poet, was born at the parsonage house of Great Berkhamstead in Hertfordshire, on the 26th November, 1731, being the eldest son of John Cowper, who held the living of that place. The family was an ancient and distinguished one, dating from the time of Edward IV., and numbering amongst them a lord chancellor and a judge of the common pleas—the granduncle and grandfather of the poet. From his birth he was a frail child, both in physical and mental organization, and the death of a tender mother, ere he had attained his sixth year, deprived him of that care which might have counteracted the tendencies which so sadly overshadowed his whole life. Shortly after this event he was sent to a public school, whence he was sent, in his tenth year, to Westminster school. The change seems to have operated unfavourably upon his mind, increasing his constitutional despondency, which took the form of brooding over his spiritual condition, and alternately fluctuating between the extremes of hope and despair. He applied himself, notwithstanding, to his studies with diligence, and acquired a high character for scholarship. In his eighteenth year he was transferred, by his father, from the sixth form at Westminster to a stool in a solicitor's office; a change than which nothing could have been more uncongenial to him, intellectually or morally. Here it was his fortune to have as a fellow apprentice one who, as a boy, had been clever, daring, and refractory, and, as a young man, had a singular aptitude for acquiring knowledge, even without the appearance of study. This was Edward Thnrflow, afterwards lord chancellor of Eng-

land. The future poet and the future peer became friends, and the former introduced the latter to his uncle's family at Southampton Row, where their time was spent more pleasantly than in chambers. An additional attraction, which drew Cowper thither, was his handsome and accomplished cousin Theodora. Their intimacy soon assumed the tender form of mutual love, a love forbidden by the lady's father, and at length sacrificed to his commands. The separation is said to have affected Cowper less deeply and less permanently than his cousin. The lady, during a long and unwedded life, gave abundant and generous proofs of her interest in her lover's welfare. Meantime he passed from the solicitor's to chambers in the middle temple. Solitary and uninterested in the profession for which he was designed; the shadow of that dark phantom which was to pursue him through life and embitter his existence, now first cast its gloom over his mind. "I was struck," he says, "with such a dejection of spirits as none but they who have felt the same can have the least conception of. Day and night I was upon the rack; lying down in horror and rising up in despair." A twelvemonth spent in this state is succeeded by a state of constant humiliation and prayer; then a change of scene dispels the misery of the poor self-tormentor, and makes his heart buoyant once more, but the dark phantom is again near him, turning this very blessing into poison. Cowper so far obeyed the wishes of his father as to become a member of the bar in 1754, but the membership was little more than nominal; the study was uncongenial to the poetic mind of Cowper, as it has been and will be to such men in all times. The death of his father, two years after, released him from even the semblance of legal study, and though he continued to live, first, in the middle, and afterwards in the inner temple, his time was spent in the society of wits, poets, and men of general literature, with which these ancient seats of jurisprudence were abundantly stocked. Thus time was running by for Cowper unprofitably enough; the indulgence of literary tastes brought no gain, but the reverse; and, at two and thirty years of age, he found himself with his little patrimony well-nigh spent, and no appearance that he should ever repair the damage by a fortune of his own getting. In fact he was all but in want, and in his distress he expressed to a friend his hope that the clerk of the house of lords should die, the gift being in the appointment of his kinsman, Major Cowper. The wish spoken, as Cowper afterwards penitently said, "in the spirit of a murderer," was shortly accomplished. Major Cowper offered that and two other more lucrative appointments to his cousin, William, who ultimately accepted the former. The fitness of the nominee was, however, to be tested by an examination before the house. To one so shy and sensitive this prospect was full of terror; the preparation for the ordeal but increased his discomposure, and brought on a nervous fever; and in its train came the terrible malady, now fully developed, which thenceforth was to trouble his life. The details of this period we pass over as lightly as our duty permits. One shudders over the dark record which the poet himself left us, over-charged no doubt though it be by his too sensitive feelings. To evade the examination by self-destruction became the absorbing desire of his mind. Poison, drowning, and hanging, each were determined on—the former was partially attempted but interrupted; the second prevented by the state of the river; the third he essayed three times with terrible pertinacity, but each and all were over-ruled, even when life was almost extinct, so marvellously, that we cannot but concur in his own observation—"My life, which I had called my own, and claimed a right to dispose of, was kept for me by Him whose property indeed it was, and who alone had a right to dispose of it." Then followed the horrors of a half-awakening to a sense of his crime, days of agony, nights of despair; vain were the ministrations of friends, vainer the relief sought in books. At length the pressure on the mind and the brain was too great for reason. The intellect wavered, reeled, broke down, and he was placed in a private asylum at St. Albans, under the care of Dr. Cotton (see COTTON, NATH.) in December, 1763. Seven months passed ere his recovery. To profit by the kind and judicious care of his physician he prolonged his stay at St. Albans a year longer, and he then left it with a signal change wrought in him; reason restored, spiritual delusions dissolved, and hopeful and healthy views of religion to cheer and sustain him. Some poems which he composed during his residence at Dr. Cotton's exhibit this change, and contrast agreeably with the fearful supplics

which he wrote just before his restraint. He became and continued to the end of his life a thoughtful, earnest, practical christian. But the world, especially the world of London, was no longer a congenial place for Cowper. "I remembered the pollution which is in the world, and the sad share I had in it myself, and my heart ached at the thought of entering it again." His brother John procured him a quiet lodging in the town of Huntingdon, whither he repaired in June, 1765. Here he improved in health and spirits, passing his time in reading, walking, and the society of a few friends, amongst whom were the Unwins, who thenceforth occupy a prominent place in his life. This happy mode of life was interrupted by the death of the elder Mr. Unwin, in July, 1767, the result of a fall from his horse. This led to the removal of Mrs. Unwin and her son with Cowper, to whose happiness the former were essential, to the neighbouring village of Olney, attracted thither by the desire to be near the Rev. John Newton, then its curate. Newton was no ordinary character; vigorous in mind and body, earnest in the discharge of his duties, he was exacting upon those who laboured with him or were under his ministrations. The change was not a beneficial one to Cowper, from the calm domestic worship to the public prayer meetings, the active, embarrassing, and exciting ministrations in visiting the sick and the dying, and caring for the wants of a poor and populous district. Newton did not understand, or pause to consider the delicate organization of his new friend; he pressed him as he would a man of strength of mind and body in the service of the cause which he had himself so much at heart. The death of John Cowper in 1770 was a blow that almost crushed him. Then it was that Newton, injudiciously, but with the kind intention of stimulating and diverting his mind, persuaded Cowper to join him in the composition of those hymns, afterwards so well-known as the Olney hymns, one of the most valuable contributions which an uninspired muse has bestowed upon the christian church. How far this occupation conduced to the state of mental derangement that soon followed, it is not easy to say. That the effect was prejudicial there can be no doubt. Other causes combined; he had, in a great degree, abandoned the pleasant habit of reading, which was so soothing at Huntingdon; he ceased almost entirely to communicate with his friends; the younger Unwin had gone to his curacy; and thus his only society was Mrs. Unwin and Newton. We may incidentally refer here to the surmise that Cowper at this time made proposals of marriage with Mrs. Unwin. The intimate intercourse and tender attachment subsisting between them were, no doubt, sufficient to justify such a conjuncture under ordinary circumstances, but their case was exceptional; the disparity of years and the infirmity of the man made the interest of the lady rather that of the tenderest of mothers. At all events there is no evidence of the fact of any offer ever having been made, and Southey disbelieves it. In January, 1773, the old malady showed itself, but it was not till July that Dr. Cotton visited him, and then followed the second act in the terrible drama—longer, darker, than the first—ending in imbecility of the mind; and during all this time with incessant and unwearied love Mrs. Unwin watched over and soothed him. The hours of his tedious recovery were occupied in gardening, carpentry, and the taming of hares and familiarizing himself with their character. His old love of poetry, too, revived, and he composed some verses and made some translations. Newton had now removed to Newport Pagnell, and Mrs. Unwin, to divert his mind from this new deprivation, urged Cowper to undertake a poem of greater scope and magnitude than the occasional pieces with which he had heretofore occupied himself. The theme suggested by her was "The Progress of Error." Happily for the fame of Cowper the suggestion was at once acted on. Cowper set to work diligently in December, 1780, and by the following March that poem and three others, "Truth," "Table Talk," and "Expostulation," were completed. A publisher was found to undertake the publication at his own risk, and in 1782 a volume containing these four poems and some other pieces appeared with the name of Cowper as their author. The reception of the volume was not over-flattering. It was coldly noticed except by the *Monthly Review*, which had the sagacity to discover in it the true poetic genius.

It was while preparing for publication that Cowper formed an acquaintance which exercised no small influence upon him. In a neighbouring village lived a Mrs. Jones, the wife of a clergyman, and with her was a sister, the widow of Sir Robert Austen.

One day Cowper observed these ladies from Mrs. Unwin's, and he was so struck with the appearance of Lady Austen that, at his request, Mrs. Unwin invited them to tea; the invitation was accepted, and the attraction of the charming and accomplished widow captivated Cowper. She was equally pleased with the poet, the acquaintance soon ripened into a sincere regard, and finally ended in Lady Austen's taking up her residence in the next house at Olney, in order to enable her to enjoy uninterruptedly the society of Cowper and Mrs. Unwin. The sprightliness of "sister Anne," so he called her, was an efficacious remedy for Cowper when seized with a fit of his constitutional depression. She would induce him to write songs to which she would set music; and to her narration of the history of John Gilpin is due the composition of that celebrated poem which, aided by the recitation of Henderson, conduced as much as anything he ever wrote to the fame of Cowper. A higher honour was reserved for Lady Austen. Mrs. Unwin was the mind that counselled the first large poem of Cowper, so Lady Austen was the muse who inspired the "Sofa." "I want a subject for a poem," said he to her one day. "Write on any—write on this sofa," was the reply. "The Task," of which the "Sofa" was the first book, was accordingly begun in the summer of 1783, concluded in the autumn of 1784, and published the year following. The time was favourable for the production of a poem whose inspiration was nature, that appealed to universal experience, that possessed the charms of thoughtful observation, sentiment conveyed in pure, easy, and poetic diction. "The best didactic poems," says Southey, "when compared with the 'Task' are like formal gardens in comparison with woodland scenery." Its success was therefore complete and instantaneous, and the critics confessed that he whom they had scarce noticed a few years before, stood now revealed as a great and original poet, and so this latter volume created a demand for its neglected predecessor, and a second edition, comprising all heretofore published, soon made the writings of Cowper a permanent part of our literature. Before the publication, however, of the "Task," the happy relations that had caused it to be written were terminated for ever, and Lady Austen left Olney never again to meet Cowper. The blank thus left in their circle was ere long filled up by the intimacy established with the Throckmortons, a wealthy Roman catholic family residing at Weston, whither in 1786 he removed. Meantime Cowper was busy with his translation of Homer, and was in the enjoyment of better means; an anonymous friend, probably his cousin Theodora, having settled on him an annuity of fifty pounds a year. But trial was again in store for him. His friend William Unwin died of fever, and the shock so affected him that he was seized with an access of his old malady, which continued more fiercely than before for six months. His mental recovery was sudden, his health improved daily, and he resumed his occupation and regained his cheerfulness. At this time he was presented by the professors of the university of Edinburgh with a copy of the poems of Burns. He estimated them highly, though, as he said, "his light was hid in a dark lantern." The admiration was reciprocated by the Scotch bard—"What a glorious poem," said he, "is Cowper's 'Task.'"

For the next four years the record of Cowper's life may be summed in a few words. He laboured diligently at his translation, corresponded a good deal with Lady Hesketh, Newton, and other friends, contributed occasional articles to the *Analytical Review*, and wrote poems and songs; but his calm was constantly disturbed by the failing health of his dear friend, over whom in turn he now anxiously watched with sinking heart and gloomy forebodings. In 1791 his translation of Homer was published, which added still further to his reputation, and amidst other congratulations procured him those of his long-severed friend, Lord Thurlow. The depression which succeeded made it imperative that Cowper should be again engaged in literary occupation. His bookseller solicited him to undertake an edition of Milton with annotations. He accepted the engagement, but it was not to his taste; he laboured at it for a while, and at length abandoned it, the only result being that it led to an acquaintance with Hayley, then engaged in a similar work; an acquaintance which eventuated in a sincere and uninterrupted friendship. Meantime he solaced himself with composing small pieces, and amongst them one, "Yardley Oak," found by Hayley after his death, incomplete, but containing passages of great beauty. The health of Mrs. Unwin now began to break up. Two attacks of paralysis were

followed by mental failure, and all the wretchedness of a querulous and impatient sufferer. Cowper nursed her with unremitting tenderness and a devotion under which his own mind became enfeebled. Let us hurry over the sad narration—the debasing superstition which led to consultations with a wretched half-witted village schoolmaster as one divinely-inspired, oracular voices, dreams and penances. A pension from the crown of £300 a year opportunely enabled them to go from place to place in the vain hope of restoring her health. At length she died in December, 1796. Cowper was led into the presence of the dead, he flung himself to the other side of the room with a passionate expression of feeling, then he became calm and never mentioned her name or spoke of her again. Mr. Johnson, in whose house Cowper was, attended to him with the kindest solicitude during his long darkness and depression. He was at last induced to occupy himself with the revision of his Homer, an occupation that served somewhat to withdraw his mind from the contemplation of his own delusions. This task was concluded in March, 1799. He then attempted to resume his poem on the Four Ages, but the work was too great for him; but he composed "The Castaway," notable as his last poem, as well as for its terrible and despairing gloom. Feeble, gloomy, and filled with spiritual misgivings, his end approached. The last reading to which he listened was his own poems, save that he could not endure the memories connected with John Gilpin. The last expression of his state was—"I feel unutterable despair." His last words when refusing a draught—"What can it signify?" He died on the 25th April, 1800, in his sixty-ninth year. He lies buried in East Dereham in Norfolk, where, on a monument raised by his attached cousin, Lady Hesketh, is inscribed an epitaph by his friend Hayley.

As a poet Cowper deservedly holds the highest place amongst his contemporaries. He was the restorer of its vigour to blank verse, that was languishing since the days of Dryden; and his translation of Homer, though not free from faults and inequalities, is incomparably the best that has ever appeared. Of his original poems we have already spoken. Cowper had the fortune in his own day to achieve his full popularity, a popularity that has not since decreased—though, perhaps, we do not to-day form as high an estimate of his poetic powers—and will ever continue. There is that in his writings which secures their immortality—earnest sincerity, uncompromising truth, a piety that is always healthy, a tenderness that tempers the severity of satire, a playfulness that robs sarcasm of its sting.

There is another character in which we have not yet spoken of Cowper. Southey calls him the best of English letter-writers. His voluminous correspondence with Lady Hesketh and others fully justify that praise. For vividness, ease, grace, and elegance, his letters cannot be surpassed, and in their gloomier moods are painfully picturesque and affecting.—J. F. W.

COWPER, WILLIAM, a surgeon and anatomist, born at Bishop's Sutton, Hampshire, in 1666, where he now lies buried. His first work was entitled "Myotomia Reformata," 1694, being a work on the muscles of the human body. He was the discoverer of two glands in the human body, now known by his name as Cowper's glands, which had hitherto been overlooked, and which he described in a paper in the *Philosophical Transactions* of the Royal Society, vol. xxi., p. 364. In 1698 he published his great work entitled "Anatomy of Human Bodies, with figures drawn after the life, and engraven in one hundred and fourteen copperplates, illustrated with explications containing chirurgical observations." He wrote several papers in the *Philosophical Transactions*. He was also the author of some remarks in Drake's *Anthropologia*. Mr. Cowper was an indefatigable worker. He is said to have hastened his death by his laborious life. He died in 1710, aged forty-four years.—E. L.

COWPER, WILLIAM, Earl, lord chancellor of England, was born somewhere about the year 1664. His family belonged to the higher position of the middle ranks, his father, grandfather, and great-grandfather, having all played prominent parts in the troubles of their times. Cowper's first education was received at St. Albans, and thence it is probable that he was removed to Westminster. There is no trace of his having studied at any university. At the age of eighteen he entered the middle temple, and began the study of the law. This he prosecuted irregularly, having occasional fits of intense application, and leading in the intervals a life of dissipation. He never became learned either in law or general scholarship. In 1686, being

still a student, he married his first wife, a young lady of no fortune. This made exertion on his part necessary, and in 1688 he was called to the bar. He was fortunate beyond his expectations, and in a few years rose to be leader of the home circuit. In 1695 he entered parliament as member for Hertford. His natural inclinations led him to espouse the whig side, and he was rewarded for his exertions in favour of the court by an appointment as king's counsel. Success followed in parliament as rapidly and strikingly as at the bar. Cowper remained in the house till the prorogation by William in 1700. In 1702 he was again returned as member for Berceston. Queen Anne finding it advisable in 1705 to secure additional strength in her ministry by an infusion of whigs, Cowper was made keeper of the great seal. Besides actively discharging the duties as judge, between this time and 1707, he rendered important services by the duties which he performed as one of the commissioners for carrying out a union between England and Scotland. In 1707 he received the reward of his great exertions, by being created the first lord chancellor of Great Britain. The conduct of the war having rendered the ministry unpopular, they resigned in 1710. Cowper continued without office till the accession of George I., when he again became lord chancellor. During his second term of office he was concerned with various important measures. He supported the impeachment of Oxford, Bolingbroke, and Ormond; was one of the principal men to incite active steps against the rebels in 1715; and presided as lord high steward at the trials of the rebel lords in the same year. The causes of his resignation in 1718 are not well known; but it is believed to have originated in his having taken the part of the prince of Wales in some of his quarrels with George I. It was not in disgrace that he resigned, because, as Lord Campbell expresses it, he "submitted to an elevation in the peerage, being made an earl." Among the statesmen of his time Cowper stands high. He held the usual liberal creed of the day, that political privileges were to be extended to all protestants, but not to catholics; that all white men should be free, but that black men came under a different category. When the voice of public opinion was loud in its favour, he denounced the infamous South Sea bill. Among his last acts, were a strenuous opposition to a measure for imposing a special tax upon Roman catholics; and an endeavour, in a manner highly creditable to him, to mitigate the absurd and severe regulations of the British quarantine laws. In private life he had the fortune to gain the affections of all who came in contact with him. A little harmless vanity was—after he had overcome the errors of his youth—perhaps his worst defect. Without being exactly a scholar, he was liberal in his encouragement of learning and the fine arts. A fine gallery of paintings, still existing in his country house near Hertford, attests the munificence of his taste. He has left few writings. One or two of his charges as judge have been printed, and there are extant some letters written to the newspapers of the day. "An Impartial History of Parties," by Cowper, is to be found in the appendix to the first edition of the *Life in Lord Campbell's Lives of the Chancellors*, vol. iv., p. 421.—(*Historical Register*, 1723; *Welsby's Lives of eminent English Judges*.)—J. D. W.

COX, DAVID: this admirable painter was born at Birmingham in 1793. He was one of the early members of the Society of Painters in Water Colours, and few have done more to uphold the importance of that branch of art. It is a sure indication of his merits that his productions of forty years ago are still rising in value. A collection of his paintings, exhibited in the year 1859, has done much to enhance his reputation. David Cox resided the greater part of his life at a small cottage on Harborne heath, Warwickshire, though Wales and Yorkshire have furnished the principal subjects for his paintings. He died on the 7th June, 1859.—W. T.

COX, SIR RICHARD, was born in Bandon, in the county of Cork, in the year 1650. After being called to the bar he was made recorder of Kinsale by Sir Richard Southwell in 1685. The troubles which followed in Ireland upon the accession of James II. alarmed Cox, and he removed with his family to Bristol. Here he wrote "*Hibernia Anglicana*." Upon the arrival of the prince of Orange in England, Cox, who had published a pamphlet in favour of the Revolution, was made under-secretary of state, and shortly after went to Ireland as secretary. He was afterwards made recorder of Waterford, and then a justice of the common pleas, in September, 1690; and

in a few months after he was appointed military governor of Cork. In 1692 he was knighted by Lord Sidney, and in the following year he was elected a member of the philosophical society, and also one of the commissioners of forfeited estates in Ireland. On the dissolution of the commission Cox employed himself in study and research, and wrote an "Essay for the Conversion of the Irish." In 1700 he was promoted to the chief-justiceship of the common pleas, and to a seat in the privy council. On the death of William he was summoned to England, to give his advice on Irish affairs, and his clear and sagacious views and enlightened judgment were of great value to the government; and to him are due the statute "for quieting possessions," and that "for the recovery of small debts." So thoroughly were the abilities and character of Cox appreciated, that when Mr. Methuen, the lord chancellor of Ireland, was sent as ambassador to Portugal, Cox was promoted to that office. In 1705 Sir Richard, with Lord Cutts, was appointed lord justice during the absence of the duke of Ormonde in England. The duke was recalled in 1707, and the earl of Pembroke was appointed his successor. Cox soon found himself obliged to resign the seals, and meet the active enmity of those to whom his politics had made him obnoxious. This he did with the firmness natural to his character. He answered fully and ably every accusation that was brought against him, and exposed and confounded his accusers. On the death of Anne, Cox retired from public life; and in April, 1733, he was seized with apoplexy, of which he died in the following month, at the age of eighty-three.—J. F. W.

COX, RICHARD, an English prelate, born in 1499, and died in 1581. In the early part of his life he was imprisoned for heresy, but being released, was chosen master of Eton; and on the accession of Edward, one of whose tutors he had been, became a privy councillor, and chancellor to the university of Oxford. After another imprisonment—this time under Mary—he took refuge on the continent. Recalled when Elizabeth came to the throne, he was raised to the see of Ely. Cox was one of the translators of the Bishops' Bible. He contributed the four Gospels, the Acts of the Apostles, and the Epistle to the Romans.

COXCIE or COIXI, MICHEL, a famous old Flemish painter, born at Mechlin in 1497. He was for a short time a pupil of Bernard Von Orley, but afterwards residing at Rome he zealously studied the works of his great contemporary, Raphael. He decorated with paintings many of the churches of Antwerp and Brussels. He was so close a follower of the style of Raphael as by some of his countrymen to be denounced as a plagiarist of his designs. He died at Antwerp in 1592.—W. T.

COXE, WILLIAM, archdeacon of Wilts, the eldest son of Dr. W. Coxe, physician to the king's household, was born in London, 7th March, 1747, and received his preparatory education at the Mary-le-Bonne grammar school and Eton. In his eighteenth year he entered King's college, and, among other honours, obtained the bachelor's prize two years in succession, for the best Latin dissertations. Having devoted himself to the church, and not to medicine as his father intended, he was admitted to deacon's orders in 1771, and in the same year received the curacy of Denham, near Uxbridge. At different periods of his life he visited the principal countries and capitals of Europe, examined with signal diligence and zeal the great repositories of historical evidence both at home and abroad, and gave to the world in ponderous tomes the results of his extensive research. On receiving a proposal from the duke of Marlborough to become tutor to the young marquis of Blandford, he threw up his curacy, and accompanied the young nobleman on his continental travels. At the end of two years failing health obliged him to give up this appointment; but in 1775 we find him in company with Lord Herbert, travelling through France, Germany, Italy and Switzerland. His first published work, entitled "*Sketches of the Natural, Civil, and Political State of Switzerland*," was received so favourably that a second edition was called for. He next gave to the world "*Russian Discoveries*"—a book which one can no more read continuously than a logbook or a gazeteer. In 1784 appeared "*Travels into Poland, Russia, Sweden, and Denmark*," the result of his observations during a tour in the northern parts of Europe. Ecclesiastical preferments now began to flow in. Two years after the time of his last work, the society of King's college, Cambridge, presented him to the living of Kingston-on-Thames, which he resigned in 1788, on being presented to the rectory of

Bemerton by the earl of Pembroke. It was the good fortune of Mr. Coxe to have access to rare manuscripts at home, as well as in foreign countries. The Hardwicke, Grantham, Waldegrave, and Poynts collection were laid open to his inspection, as well as the Stanhope, Melcombe, and Egremont papers; from which he collected an uninterrupted narrative of the "Life and Administration of Sir Robert Walpole." In 1802 the "Memoirs of Horatio Walpole" appeared, which may be regarded as a continuation to those of his brother. In the following year Mr. Coxe was elected one of the canons residentiary of the cathedral of Salisbury; and in 1805 appointed archdeacon of Wilts by Bishop Douglas. In the same year he espoused Eleonora, daughter of W. Shairp, Esq., consul-general of Russia. Four years after his marriage the "History of the House of Austria" was published. The only works of importance which remain to be noticed are—"The Historical Memoirs of the Kings of Spain of the House of Bourbon" and "The Memoirs of the Duke of Marlborough." For these, and several other works of humbler ambition, Archdeacon Coxe was admitted to several learned societies in England, the Learned Society of St. Petersburg, and the Royal Society of Sciences at Copenhagen. He expired at Bemerton rectory, at the ripe age of eighty-one. Among the minor works of Mr. Coxe we may notice "The Literary Life and Select Works of Benjamin Stillingfleet," 3 vols.; "The Lives of Handel and Smith;" "A Vindication of the Celts;" an edition of Gay's Fables, with notes; "Sketches of the Lives of Corregio and Parmegiano," &c.—G. H. P.

COYPEL, NOËL, a French painter, born in 1628. He studied first under Poucet at Orleans, then under Quillier. He was employed by Charles Errard on the works of the Louvre. He was received into the academy in 1659. In 1672 he was appointed by the king director of the French Academy at Rome. He returned to Paris after three years' absence, and painted several frescos in the Tuileries. He seems to have aimed at a combination of Poussin and Le Sueur. He died in 1707.—ANTOINE, his son, was born in 1661. He was a wilfully bad painter. Sent to study at Rome, he preferred Bernini to Raphael! He was much employed, however, in decorating royal palaces, and was made principal painter to the king in 1715. He died in 1722. He executed several etchings in a very finished style.—NOËL NICHOLAS, was another son of Noël Coypel, but by another marriage. In his time he was highly esteemed as a painter, but posterity has not seen fit to endorse that estimation. He was received into the academy, however, at the early age of twenty-eight. He died in 1735.—W. T.

COYSEVOX, ANTOINE, a French sculptor of Spanish family, born at Lyons in 1640. He was elected a member of the French Academy in 1676. He executed some of the finest sepulchral monuments in Paris, and several admired statues for the gardens of Marly and Versailles. He died in 1720, chancellor of the academy.—W. T.

CRABBE, GEORGE, was born on the 24th December, 1754, at Aldborough in Suffolk, where his father was collector of the salt duties. He was in a great measure self-educated, and at a very early age displayed a taste for reading, and a fondness for poetry. His father observing this "bookish turn," resolved that he should be trained for the medical profession, and he was accordingly, in his fourteenth year, apprenticed to a surgeon, near Bury St. Edmund's. He remained three years in this place, and in 1771 was transferred to another practitioner at Woodbridge in Suffolk, with whom he completed his apprenticeship. Meanwhile he devoted many of his leisure hours to writing poetry, and published anonymously at Ipswich a short piece entitled "Inebriety, a Poem." About 1776 he was sent to London to complete his medical education. He returned in less than a year, and was encouraged by his friends to set up for himself as a surgeon and apothecary in his native place, but meeting with very little success, he resolved, about the close of 1779, to repair to London and apply himself to literature. The first poetical pieces which he offered for publication were rejected, and his first poem that was printed, entitled "The Candidate," yielded him no profit, in consequence of the bankruptcy of the publisher. During the whole of his first year's residence in the metropolis, he experienced nothing but disappointments and repulses. He applied for assistance to Lord North, Lord Shelburne, and Lord Thurlow, but without success. Absolute want stared him in the face, and his landlady threatened him with a gaol. In these critical circumstances the despairing

poet wrote a touching and manly appeal to Edmund Burke. The great statesman, though he was at that period (1781) engaged in the hottest turmoils of parliamentary warfare, immediately relieved Crabbe's necessities, and having examined the compositions he had on hand, and selecting the "Library," took the poem himself to Dodsley, and induced that bookseller to publish it on favourable terms. But Burke's kindness did not stop here, he invited Crabbe to Beaconsfield, where he resided for some time, was treated in every way as one of the family, and was introduced to Fox, Reynolds, Thurlow, and other distinguished friends, who took a deep interest in his welfare. By the advice of his patron, the poet resolved to enter the church. He was ordained a deacon in December, 1781, and took priest's orders in the following year. After serving a short time as curate in his native town, through the influence of Burke he obtained the situation of domestic chaplain to the duke of Rutland, and took up his residence at Belvoir castle. Through the unwearied exertions of the same generous friend, Lord Thurlow was induced in 1783 to present Crabbe with two small livings in Dorsetshire, telling him as he did so, that "he was as like Parson Adams as twelve to the dozen." Meanwhile the poem entitled "The Village," the greater part of which was written at Beaconsfield, and revised by Dr. Johnson, was published in 1783, and met with great success; and two years later the "Newspaper" appeared. The poet had for several years cherished a strong and somewhat romantic attachment to a Miss Sarah Elmy, the niece and heiress of a wealthy yeoman at Parham in Suffolk. He married this lady in 1783, and settled quietly down to the regular and faithful discharge of his clerical duties. In 1789 Lord Thurlow was induced by the duchess of Rutland, to exchange Crabbe's Dorsetshire livings for those of Muston and Allington in the vale of Belvoir. For upwards of twenty years he resided successively at Parham, to which his wife had succeeded, at Great Glenham Hall, and at Muston. In 1813 the duke of Rutland gave him the rectory of Trowbridge, Wilts, together with the smaller living of Croxton, near Belvoir, both of which he held to the time of his death.

After an interval of twenty-two years Crabbe again came forward as an author in 1807, when he published the "Parish Register," which was read in manuscript, and highly relished by Fox, who was then on his death-bed. "The Borough" appeared three years after. His last publication, "The Tales of the Hall," was published in 1819, and for these, and the remaining copyright of his previous poems, Mr. Murray gave him £3000. In 1822 he paid a visit to Sir Walter Scott at Edinburgh, of which an interesting account is given in Lockhart's Life of Scott. The latter years of Crabbe's protracted life were spent in quiet and comfort at Trowbridge, where his amiable disposition and faithful discharge of his duties gained him the esteem and affection of his parishioners. He died there after a short illness, 8th Feb., 1832, in his seventy-eighth year, and was buried in the chancel of the church.

Crabbe is entitled to a place in the foremost rank of descriptive poets. The distinguishing characteristics of his poetry are originality, vigour, and truth in description, and especially in the delineation of character. His writings abound in profound and sagacious remarks, which have all the weight and terseness of proverbs, and he exhibits great skill in inculcating the most impressive moral lessons. His graphic powers, however, were frequently wasted on unworthy objects, and his taste was by no means equal to his other qualities. His style is neither pure nor graceful, and is often not only homely and prosaic, but vulgar and clumsy. In spite of these defects, however, it may be safely predicted that Crabbe will permanently retain a high place in the roll of English poets.—(*Life of Crabbe*, by his son; Lord Jeffrey's *Essays*, vol. iii.)—J. T.

CRAIG, ADAM, a Scotch musician of some eminence at the end of the seventeenth century. He was one of the leading performers at the concert on St. Cecilia's day, in 1695, at Edinburgh. Mr. Tytler, in the Transactions of the Antiquarian Society (vol. i., 1792), says, "Adam Craig was reckoned a good orchestra player on the violin, and teacher of music. I remember him as the second violin to M'Gibbon in the gentleman's concert." He published "A collection of the choicest Scots Tunes, adapted for the harpsichord or spinnet," Edinburgh, 1730. According to Professor Mackie's MS. Obituary, he died in October, 1741.—E. F. R.

CRAIG, SIR JAMES GIBSON, Bart., was one of the most

remarkable men of his age. He was the second son of William Gibson, Esq. His mother was Mary-Cecilia, daughter of James Balfour, Esq., of Pilrig; and his father's mother, Helen Carmichael, was the sister of John, fourth earl of Hyndford. At a very early age he was admitted a member of the Society of Writers to the Signet, and commenced business on his own account; and in that department of law he speedily rose to distinction, and attained an eminence which certainly was not surpassed by any of his professional brethren, and which he maintained to the very end of his lengthened life. His professional career was indeed one of remarkable success—the well-earned result of great talents, applied with indefatigable industry, and guided by undeviating integrity.

But it is as a politician that the character of Sir James Gibson Craig belongs to the history of his country. He was one of the very few persons in Scotland who, prior to the French revolution, had the courage to avow, on the subject of political rights, opinions at variance with those of the ruling powers. While yet a young man he stood forward as the fearless champion of those whig principles from which he never swerved one inch, and which, after an arduous struggle of forty-five years, he lived to see triumphant in the passing of the reform bill in 1832. When the reform agitation arose in 1830, he had attained his sixty-fifth year; but his amazing energy, which was still unimpaired, enabled him, during the stormy period that followed, to discharge with equal boldness and skill the duties of that leadership to which his character and his services entitled him, and which was accorded to him by the universal consent of his party. It cannot be doubted that to his tact, and sagacity, and firmness, it was mainly owing that Scotland was saved from a serious convulsion during the two years that the reform agitation lasted. On all matters connected with the political affairs of Scotland he was consulted and trusted by the whig government from their first accession to power; and in 1831 he was created a baronet of the United Kingdom. This was the only acknowledgment of his services that he could ever be prevailed on to accept either for himself or his family, though it is well known that very high honours and very substantial rewards were pressed on his acceptance. His patriotism was untainted by aught that could be called selfish or sordid. Although the great object to which his political life had been devoted was achieved in 1832, he still continued to take an active interest in every important movement, whether public or local. Scarcely had the political storm subsided in Scotland, when an ecclesiastical controversy sprang up which agitated that country for ten years, and resulted in 1843 in the great secession from the established church, which is generally called "the Disruption." To this movement, which was countenanced by many of his political friends and associates, Sir James was from the first opposed; not because he was hostile to the principle of non-intrusion in the abstract, and so far as it professed to place a check on the abuse of patronage, but because he believed that the legislation of the church courts on the subject was *ultra vires* and illegal.

The more obvious characteristics of Sir James' mind—those which manifested themselves most prominently in all his acts—were energy, and firmness, and power. But the moral sentiment which exercised a controlling influence over all these, was *truthfulness*. It was the operation of this ever-present principle which mainly produced that remarkable *consistency*, which will always be admired as an honourable distinction of his lengthened career. It was his perfect truthfulness, no less than his great practical wisdom, that inspired the confidence of those (and they were not a few, even from among those most opposed to him in politics) who had recourse to him for advice in matters of delicacy or difficulty; they knew that the counsel which wisdom dictated would be truthfully tendered. Sir James was by nature essentially and eminently benevolent; his enjoyment of society was proved by his liberal and extensive hospitality; and his domestic life was one of uninterrupted purity, and harmony, and happiness. The name of Craig was assumed by him on his succession as heir of entail to the estate of Riccarton. He was born in Edinburgh on the 11th October, 1765, and died at Riccarton on the 6th March, 1850. He was survived by two sons and seven daughters, and was succeeded in the baronetcy and in the estate of Riccarton by his eldest son, Sir William Gibson Craig.—T. B., C.

CRAIG, JOHN, one of the most eminent of the Scottish

preachers at the period of the Reformation, was born in 1511, and educated at St. Andrews. His great abilities recommended him to the favour of Cardinal Pole, and by his advice Craig joined the dominicans at Bologna, where he was made rector of one of their schools, and intrusted with various ecclesiastical commissions. The perusal of Calvin's Institutes, however, having converted him to protestantism, Craig was arrested and sent to Rome, where he was tried by the inquisition, and condemned to be burnt. His life was saved, however, by the death of Pope Paul IV., on the day before his intended execution. He returned to his native country about 1560. The Reformation had shortly before been established in Scotland, and Craig was at once nominated one of the preachers. He was appointed the colleague of John Knox in the parish church of Edinburgh, and in 1579 one of the ministers of the royal household. In the following year he drew up the famous National Covenant. He also compiled part of the Second Book of Discipline, and wrote "Craig's Catechism," and an answer to an attack on the Confession of Faith. He died 12th December, 1600, at the age of eighty-eight.—(M'Crie's *Life of Melville*.)—J. T.

CRAIG, JOHN, a Scottish mathematician, who lived in the latter half of the seventeenth century. He is principally known by his "Theologiæ Christianæ Principia Mathematica," a very short treatise, published in 1699, in which he attempts to prove by mathematical calculations, that the christian religion will cease to exist in one thousand four hundred and fifty-four years from the date of his book. This absurd theory was refuted by Diton and Houtteville. It is said that Hume and other sceptical writers have been indebted to Craig's pamphlet.—R. M., A.

CRAIG, SIR THOMAS, of Riccarton, an eminent Scottish lawyer, was one of that number of learned and accomplished men who distinguished Scotland at the time of the Reformation. Tytler, in his valuable life of him, renders it probable that he belonged to the family of Craigs of Craighintry in Buchan, and that 1538 was the year of his birth. We know that in 1552 he entered St. Leonard's college at St. Andrews, where he remained three years. He probably left in 1555, after taking the degree of B.A. From St. Andrews he proceeded to study law at the university of Paris. Craig returned to Scotland in 1561, stored with all the legal and general learning that the schools could afford. He was admitted advocate in 1563, and in the following year he was appointed to the first office he held, that of justice-depute, under the earl of Argyle, then justice-general and supreme criminal judge in Scotland. Craig held this office till 1573, when he was promoted to that of sheriff-depute of Edinburgh. These offices did not preclude his practising at the bar of the court of session. In this court Craig attained a practice which was equalled only by that of the other leader at the bar, Mr. John Sharp. His son, Sir Lewis Craig, was raised to the bench, and the old man was frequently wont to plead before him. The last office which we hear of Sir Thomas occupying was that of advocate for the church in 1606.

Craig took little or almost no part in the political events of his time. In the intervals allowed by his profession he devoted himself to the production of many valuable works in law, and to what used to be called the cultivation of the muses. His poems are all in Latin, and the best of them will be found in the *Deliciæ Poetarum Scotorum*. The first of his legal works, and the only one now of any consequence, was his great treatise "De Jure Feudali." Although the immediate object of its production was to prove that there was no fundamental difference between the laws of his own country and those of England, it forms independently a very valuable systematic exposition of the law of Scotland. The work, although produced before 1605, was not printed till long after Craig's death. The first edition was produced at Edinburgh by Lord Crimond (Burnet) in 1655; the second by Menckenius at Leipzig in 1716; and the third and best edition, to which a sketch of the author's life is prefixed, by James Baillie, an advocate at Edinburgh, in 1732. This edition was from the press of the Ruddimans. The second of Craig's works was written about the same time as the "De Jure Feudali." It treats "De Jure Successionis Regni Angliæ," and was composed for the purpose of defending James' right against the attacks of Parsons (Doleman). A manuscript of the original is preserved in the advocates' library at Edinburgh, but it has never been published. A translation by a clergyman of the name of Gatherer appeared in 1703. When Craig composed the treatise "De Unione Regnorum Britannicæ,"

seems uncertain. The author accompanied James to London in 1603, and in 1604 was appointed one of the Scotch commissioners for the purpose of effecting a union between the two kingdoms. His last production was a treatise "De Hominio," written after his return from London, to confute the doctrine that the crown of Scotland owed homage to that of England. A translation was printed in 1695. Craig's death took place in 1608.—(Tytler's *Life of Sir Thomas Craig*).—J. D. W.

CRAIK, GEORGE LILLIE, LL.D., professor of English literature in Queen's college, Belfast; born 18th April, 1798, at Kennoway, Fifeshire. Dr. Craik was the eldest son of the Rev. William Craik, schoolmaster of the parish now named—a man of ripe scholarship and the purest life, to whose care and christian example may unquestionably be traced much of the honourable success that attended the career of his sons. Dr. Craik possessed indeed every good quality that could contribute to the success and sustain the position of the true literary man—an industry that rarely flagged, great good sense, extensive acquirements joined with singular ability, and an uprightness and feeling of the dignity of his calling that preserved him, during the whole period of his career, free from the shadow of impeachment or of stain. After passing through the complete curriculum, both philosophical and theological, at the university of St. Andrews, he engaged in various literary occupations in his own country; but he fortunately removed to London in 1827, and resided there until 1850, in which year he was appointed by the British government to the chair he so worthily filled. Putting altogether out of view his multitude of contributions to the best periodicals of our time—our monthlies and quarterly reviews—Dr. Craik's distinct and positive works, produced chiefly during his residence in the metropolis, do indeed testify to his indefatigable industry. The titles of some of them are these—"Pursuit of Knowledge under Difficulties;" "The New Zealanders;" "Paris and its Historical Scenes;" "English *Causes Celebres*;" "Sketches of the History of Literature and Learning in England;" "Spenser and his Poetry;" "Bacon, his Writings and his Philosophy;" "History of British Commerce;" "Romance of the Peerage;" "Outlines of the History of the English Language;" "The English of Shakspeare," &c., &c. He had much to do also with Mr. Knight's Pictorial History of England. Dr. Craik joined a powerful intellect to a susceptible imagination; hence one especial charm of his writings, and also the fact that they are characterized by exact *method*. It is no paradox, that without imagination, or the true *fusing power*, there can be no real method.—It must not be omitted, that to a pamphlet privately printed by Dr. Craik in 1846, we owe the first distinct recommendation of the method of stimulating national education since acted on by the privy council—a mode which, judging from the turn that affairs have taken year by year when the subject has been under the consideration of parliament, seems the only one in which the state can at present act, so that it avoid the checkmate of religious sects and differences. Dr. Craik will certainly be esteemed hereafter as one of the most estimable and useful literary labourers of this our time, prolific as it has been of writers in the various departments of science and literature. He died on the 2nd of July, 1866.

CRAMER, ANDREAS WILHELM, was born in Copenhagen on the 24th of December, 1760. A man of great erudition and unwearied industry, and one of the greatest contributors to the literature of Denmark in his times. He was brought up to the profession of law, and filled the chair of that science in the university of Kiel, of which he was also principal librarian. He died on 20th of January, 1833.—J. F. W.

CRAMER, GABRIEL, a Swiss mathematician, was born at Geneva in 1704, and died in 1752. The circumstance of his competing for the chair of philosophy at the age of twenty brought him into notice, and introduced him to the favour of Jean and Nicolas Bernouilli. He became professor in 1750. In the same year appeared his "Introduction à l'analyse des lignes courbes algébriques."—R. M., A.

CRAMER, JOHANN ANDREAS, a distinguished German poet, was born at Jühstadt, Saxony, 29th January, 1723, and devoted himself to the study of theology at Leipzig, where at the same time he entered upon a literary career by contributing to the *Bremische Beiträge*. In 1750 he was chosen oberhof-prediger at Auedlinburg, and four years after, on the recommendation of Klopstock, was called to Copenhagen in the same capacity. The fall of Struense, however, induced him to accept a high

ecclesiastical office at Lübeck in 1771. Here he remained but a few years; for in 1774 he was translated to the first chair of theology at Kiel, where he died on the 12th of June, 1788. Among his poetical works his Odes and his Paraphrases of the Psalms, Leipzig, 1755, 4 vols., rank highest. Besides these he published the *Nordische Aufseher*, a monthly magazine, Copenhagen, 1758–59; translated Bossuet's History of the World, Leipzig, 1757–86, 7 vols.; and wrote a valuable biography of Gellert in 1774.—K. E.

CRAMPTON, SIR PHILIP, Bart, F.R.S., born in Dublin on the 7th of June, 1777. Mr. Crampton entered the army as assistant-surgeon, and saw active service in the field during the Irish rebellion of 1798. In the autumn of the same year he was elected one of the surgeons to the Meath hospital, an office which he held for nearly sixty years. In 1800 Mr. Crampton took the degree of doctor of medicine in the university of Glasgow. In 1804 he published his essay, "On the Entropeon, or Inversion of the Eyelids," and soon after, in conjunction with the late Peter Harkan, established the first private school of anatomy and surgery in the city of Dublin. In 1813 he published in the *Annals of Philosophy*, the description of an organ by which the eyes of birds are accommodated to the different distances of objects; which paper he illustrated with a plate representing the eye of the ostrich, so prepared as to exhibit the muscle of the cornea in its whole extent. This muscle has been called *Musculus cramptonianus*, "der Cramptonsche muskel," of the Germans, and for its discovery Mr. Crampton was honoured with the fellowship of the Royal Society. About the same time he received the appointment of surgeon-general to the forces, an office which was abolished in 1833. Early in the reign of George IV., Mr. Crampton was appointed surgeon-in-ordinary to the king in Ireland, and in 1839 he was raised by Queen Victoria to the dignity of a baronet of the United Kingdom. Sir Philip Crampton was always an ardent cultivator of zoological science, and took an active part in the formation of the Royal Zoological Society of Ireland, of which he was repeatedly president. He also on three or four occasions filled the office of president of the Royal College of Surgeons. He was a member of the senates of the University of London, and Queen's University in Ireland; of the Royal Irish Academy; of the *Société de Chirurgie* of Paris; of Guy's Hospital Surgical Society, &c. In addition to the essays already mentioned, Sir Philip contributed numerous papers to the medical periodicals of the day. Sir Philip originally endowed with great talent, and possessed of extreme activity both of mind and body, loved his profession ardently, and devoted his spare moments to its advancement. In private life he was remarkable for the amenity of his manners, and for the brilliancy of his conversational powers. He died at his house in Merrion Square, Dublin, on the 10th of June, 1858, aged eighty-one years and three days, and was succeeded in the baronetcy by his elder son, his excellency Sir John Fiennes Crampton, K.C.B., envoy-extraordinary and minister plenipotentiary from her Britannic majesty to the court at St. Petersburg.—W. D. M.

CRANACH, LUCAS. See KRANACH.

CRANMER, THOMAS, the first protestant archbishop of Canterbury, was descended of an ancient and respectable family, and was born July 2, 1489, at Aslaeton in Nottinghamshire. In 1503 he was sent to Jesus college, Cambridge, where he was elected to a fellowship in 1510, and applied himself with great industry to the acquisition of Greek, Hebrew, and theology. Before he had reached his twenty-third year he married, and having, in consequence, forfeited his fellowship, he was employed as a lecturer in Buckingham (now Magdalen) college. His wife, however, died in about a year after his marriage, and he was immediately restored to the fellowship which he had vacated. He took his degree of D.D. in 1523, and was appointed lecturer on theology by Jēsus college. In 1528, while the sweating sickness was raging in Cambridge, Cranmer retired to Waltham Abbey, where he was occupied with the instruction of two pupils, the sons of a gentleman named Cressy. This was the turning-point of his fortunes. Henry VIII., who was then earnestly pressing his divorce from Queen Catherine, had at this time made an excursion to the neighbourhood of Waltham, and Gardiner and Fox, afterwards bishops of Winchester and Hereford, were in attendance upon the king, and accidentally meeting Cranmer at Mr. Cressy's table, began to discuss with him the absorbing question of the divorce. Cranmer suggested the propriety of "trying the question out of the word of God," a course

which clearly implied that it should be decided without the authority of the pope. Fox, who was then the royal almoner, mentioned this recommendation to the king, and Henry, eagerly catching at the hint, "swore by the Mother of God, that man hath the right sow by the ear." Cranmer's attendance was immediately required at the palace, and he was commanded to reduce his opinion to writing, and to devote his whole attention to the furtherance of this important matter. He was shortly after appointed archdeacon of Taunton, and one of the royal chaplains.

Henry was not yet prepared to hazard an open rupture with the pope, and sent Cranmer, along with several others, on an embassy to Rome about the close of 1529. The mission was unsuccessful, however, and shortly after his return, Cranmer was sent in 1531 as ambassador to the emperor on the same business. During his residence in Germany he married, about the beginning of 1532, Anne, niece of Osiander, the pastor of Nuremberg. Shortly after, Archbishop Warham died, and Cranmer was recalled to fill the vacant see. He was consecrated March 30, 1533. A few weeks later, 23rd May, 1533, Cranmer declared Henry's marriage with Catherine null and void; and on the 28th he publicly married the king to Anne Boleyn, whom Henry had privately espoused in the month of January. In 1536, in virtue of his office as primate, Cranmer declared the marriage of Henry to this unhappy princess void; and again, in 1540, he presided at the convocation which pronounced the unjustifiable sentence of the invalidity of the union between the king and Anne of Cleves. In these transactions, it must be admitted, that Cranmer appears to little advantage. Meanwhile the archbishop took a conspicuous part in promoting the progress of the Reformation. He assisted in passing several statutes which materially diminished the power of the pope in England. He set on foot a translation of the Bible, assisted in the correction of a second edition of the "King's Primer," and urged the king to take steps for the suppression of the monasteries, and the application of their revenues to the advancement of religion and learning. When Henry lavished these funds upon unworthy favourites, Cranmer had the boldness to remonstrate against this misappropriation of the national property. In 1538 he strenuously resisted in the house of lords, at the risk of the king's displeasure, the enactment of the obnoxious "Six Articles" proposed by the duke of Norfolk. The Reformation continued to gain ground, and Cranmer exerted himself, in the face of great opposition, to extend its benefits throughout the kingdom. Books of religious instruction were circulated among the people, and mainly through his influence every man was allowed to enjoy the inestimable boon of reading the Bible in his mother tongue. On the other hand, it must be acknowledged that Cranmer had deeply imbibed the persecuting spirit of the old religion, and the share which he took in the condemnation of John Frith, Andrew Hewat, Joan of Kent, and others who suffered for their religious belief, has left a deep stain upon the primate's character. On the death of Henry in 1547, Cranmer was appointed by his will one of the regents of the kingdom; and by his talents, learning, and high station, contributed largely to the advancement of the protestant cause. He was the author of four of the Homilies, and one of the compilers of the Service Book, and the Articles of Religion, originally forty-two in number, were mainly, if not exclusively, drawn up by him.

Edward VI. died in 1553, and the reluctant accession of the archbishop to the injudicious scheme of elevating Lady Jane Grey to the throne, combined with his religious opinions, rendered him peculiarly obnoxious to the bigotted Queen Mary. In September, 1553, he was committed to the Tower along with Latimer and Ridley; and in March, 1554, he and his fellow-prisoners were removed to Oxford, and confined in the common prison called the Bocardo. They were ultimately condemned as obstinate heretics. Ridley and brave old Latimer underwent their cruel sentence with indomitable resolution; but the fortitude of Cranmer gave way under the pressure of misery, and the prospect of tortures and death, and he was induced by the hope of saving his life to sign no fewer than six recantations. His enemies, however, had determined that his abjuration of the protestant faith should avail him nothing, and this venerable and learned prelate was, accordingly, condemned to the flames. When brought out to execution, 21st March, 1556, he was exhorted to repeat his recantation; but, to the surprise and dismay of his adversaries, he openly declared his adherence to

the reformed religion, and expressed his deep penitence for his unworthy denial of the faith. He was fastened to the stake opposite Balliol college, and suffered the cruel torture of the flames with a heroic fortitude, which his timidity and recent wavering conduct had not led his friends to expect.—J. T.

CRANSTOUN, GEORGE, Lord Corehouse, an eminent Scottish judge, the son of a landed proprietor, and grandson of William, fifth Lord Cranstoun, was admitted a member of the Faculty of Advocates in 1793. The liberality of his politics operated as a drawback to his success. Notwithstanding this he ultimately attained large practice; and for many years, along with John Clerk, enjoyed a monopoly of the leadership at the bar. He was thoroughly acquainted with law, and had the reputation at the same time, of being an accomplished scholar. In 1823 he was elected Dean of Faculty, and was elevated to the bench of the supreme court of Scotland in 1826. Some time before his death, which took place in 1850, he had resigned his seat on the bench and retired into private life.—J. D. W.

CRASHAW, RICHARD, was born in London. The precise dates of his birth and death are not recorded, but he was dead before 1652. His father was a divine of some note, and a preacher at the Temple church. Richard Crashaw's early education was at the Charterhouse; from that he passed to Pembroke hall in 1632, and took his bachelor's degree in 1634. He then removed to Peterhouse, of which he became a fellow in 1637, and took his master's degree in 1638. In 1634 he published some Latin epigrams on scriptural subjects, "Epigrammata Sacra." In 1644 he was ejected from his fellowship by the parliamentarians, and went to France, where he adopted the religion of the country. In 1646, through the interest of the poet Cowley, he was recommended to Cardinal Palotta, who found employment for him in one of the public offices at Rome. The cardinal liked Crashaw better than his brother clerks did, and they soon got rid of him by finding for him a canonry in the church of Loretto. There, soon after his appointment, he died of fever. It was reported—without, however, any grounds being stated for the belief—that he was poisoned. The poems of Crashaw are cast in the manner of George Herbert, and the pieces printed at the end of Herbert's Temple were at one time ascribed to him. Before Crashaw left England, he had adopted views of mystic devotion, and practised exercises of ascetic piety, to which the church of England gives little encouragement, and for which she makes no provision. Of his poems, those on religious themes are the best; perhaps the very best of all is his hymn to St. Teresa. It is impossible to read them without feeling that, whatever were his errors of doctrine, his was a sentiment of genuine piety. Pope praises as superior to his other poems, that on "Lessius," that on "Ashton," and his translation of "Dies Iræ," and "the Wishes to his supposed Mistress."—J. A., D.

CRASSUS, LUCIUS LICINIUS, was the most celebrated Roman orator of his time; died in 91 B.C. He first attracted notice when he was only twenty-one, by his prosecution of C. Carbo in the year 119. The law which he proposed during his consulship in 95, compelling all who were not citizens to leave Rome, contributed to the bringing about of the Social War. Crassus, who had already been proconsul of Gaul, was made censor in 92, when he suppressed the schools of the Latin rhetoricians. He was, like many of the Romans of his age, a man of luxurious habits. Cicero introduces him as one of the speakers in the *De Oratore*.—R. M., A.

CRASSUS, MARCUS LICINIUS, surnamed THE RICH, a Roman statesman and general, was descended of a family of some note. He soon became known as the wealthiest citizen of Rome. During the dictatorship of Marius and Cinna he was forced to take refuge in Spain. On his return he joined Sylla, who received him with open arms, and appointed him to a command in his army. He was prætor when the revolt of the gladiators under Spartacus took place, and he was intrusted with the command of the army which was sent against them. He defeated them in a great battle, killing, according to report, more than 12,000. Elected consul on his return, in conjunction with Pompey, he used every means to gain the favour of the people. He entertained the whole populace at a feast where ten thousand tables were spread, and distributed, at his own expense, three months' provision of corn to each guest. He was more than suspected of complicity in the conspiracy of Catiline, but escaped conviction. Of the first triumvirate, which consisted of Pompey,

Cæsar, and Crassus, the latter was for awhile not the least powerful member. He was afterwards re-elected along with Pompey to the consulship. He obtained the command of the army in Syria, and set out on an expedition against the Parthians. After various changes of fortune he was defeated and put to death by Surenæ, a Parthian general, at Charræ, B.C. 53.—W. M.

**CRATES:** flourished B.C. 448, and died B.C. 424. He was for some time an actor in the plays of Cratinus at Athens, and afterwards became his successor in the progress of the old comedy. He was the earliest among the writers in that field to abandon all political allusions in his drama. Aristotle mentions him as the first who gave up personal satire, and began to make narratives or poems on more general subjects. He showed great skill in the elaboration of his plots and humorous exhibitions of character. His comedies had a tendency towards broad farce. Fragments remain of eight of his plays, together with detached sentences of unknown reference. His language is characterized by simplicity and grace.—J. N.

**CRATES OF THEBES:** a pupil of the cynic Diogenes. He flourished B.C. 328 as one of the leaders of his sect. He was famous for his philosophical letters, had some tragedies, none of which have come down to us; but he was more celebrated for the consistency with which he carried into practice the asceticism he professed. He surrendered to his native city the whole of his considerable fortune, and lived with a characteristic contempt of all the luxuries of life.—J. N.

**CRATINUS,** a Greek comic poet. He is said, upon the authorities on which Suidas relied, but which however are disputable, to have been the son of Callimedes, and born in Athens in the year 519 B.C. Cratinus, as a comic poet, obtained several victories, some over Aristophanes. He lived to an extreme old age. His love of wine was the subject of frequent satire by his rival poets, and he good-humouredly replied to their banter in his comedy "Ποτίνης," or the Bottle. Our chief acquaintance with Cratinus is through Aristophanes. Some humorous passages in the Knights are well translated by Mitchell. Improvements in the arrangement of the chorus, and of the Greek comedy generally are referred to Cratinus.—J. A., D.

**CRATIPPUS OF MITYLENE:** one of the Greek teachers, whose talents were mainly employed in feeding the taste for philosophy which sprung up in the latter days of the Roman republic. He is known to us chiefly through allusions in the speculative works of Cicero his contemporary, and at one time his pupil. In the De Officiis he ranks him among the most distinguished of the peripatetics. Plutarch mentions his accompanying Pompey after Pharsalia, and attempting to comfort the fallen general by the maxims of his philosophy. On the establishment of Cæsar's power, Cratippus was, through the influence of Cicero, presented with the Roman franchise; but he continued to give public instructions at Athens, where M. Brutus afterwards attended some of his lectures.—J. N.

**CRAWFORD,** Earls of. See LINDSAY.

**CRAWFORD, QUENTIN,** author of numerous historical works, was born at Kilwinning in Scotland in 1743. He passed his youth in India, and was engaged first in military service, and afterwards in commercial transactions, in which he accumulated a considerable fortune. On his return to Europe in 1780 he travelled for some time on the continent, and finally took up his residence in Paris, where he formed a valuable collection of books and pictures, and enjoyed the society of the most distinguished authors and artists. He died in Paris in 1819.—J. T.

**CRAYER, GASPARD DE:** this distinguished Flemish artist was born at Antwerp in 1582. He was a pupil of Raphael Coxcie, a painter of poor repute. His merits soon gained him attention and honour. He was engaged by the court of Brussels to paint a portrait of the Cardinal Ferdinand, governor-general of the Low Countries. The success of this earned him a pension, and the title of painter to the court. Rubens is reported to have given the most unqualified praise of Crayer, and many Flemish connoisseurs have not hesitated to rank this fine artist with Vandyck and Rubens. He died in 1669.—W. T.

\* **CREASY, EDWARD SHEPHERD,** barrister-at-law, was born at Bexley in Kent in 1812. He was educated at Eton and Cambridge, and called to the bar in 1837. In 1850 he was appointed to the chair of history in the London university. Professor Creasy is author of the "Fifteen Decisive Battles of the World;" "The Rise and Progress of the British Constitution;"

and a "History of the Ottoman Turks." Of the last work only two volumes have appeared.—R. M., A.

**CRÉBILLON, CLAUDE PROSPER,** son of Prosper Jolyot, was born at Paris, 14th February, 1707, and was educated at the college of Louis le Grand. The Jesuits sought to attach him to the church, but he had no vocation that way. The theatre was his first attraction, where he assisted in writing some of the parodies on the operas. His lively and convivial talents brought him into the society of the gay young men of the day, and he was one of the originators of the celebrated Caveau. From writing poetry he turned his attention to writing romances, in which he was very successful, and is said to have won the love and the hand of an English lady of rank by the charm of his writings. One of his productions gave such offence from some political allusions that he was imprisoned in Vincennes, and, strangely enough, the patroness of his father, madame de Pompadour, procured his banishment from Paris in consequence of the indecency of his works; on which occasion he went to England, where he became acquainted, amongst other celebrities, with Richardson, Fielding, and Sterne. The latter was his particular admirer, and seems to have imitated his licentious style. Some time before his death he withdrew himself altogether from the public, and died about the year 1777. His productions are numerous, and with few exceptions are gross and immoral in their tendencies—a fact which contrasts strangely with his life, which was, though gay and convivial, yet moral and respectable.—J. F. W.

**CRÉBILLON, PROSPER JOLYOT DE,** a celebrated French tragic poet, was born at Dijon on the 13th of January, 1674. The family was respectable, but not one of distinction, as is often erroneously stated. The poet's father, Melchior Jolyot, was a notary, who purchased an estate of Crébillon, which name the son assumed. The lad gave no early indications of genius, and at school was more remarkable for breaches of discipline than progress in study. In due time he was sent to Paris to study law under a man of the name of Prieur. This man of law was also a man of letters, and actually encouraged Crébillon to leave his law-books and accompany him to the theatre. The taste of the young poet now developed itself, and at last Prieur induced him to attempt a tragedy. "La Mort des Enfants de Brutus" was the first offspring of his muse; but it was still-born—the manager read and rejected it, and the author flung it in the fire. In 1705 "Idomenee" was put upon the stage. It had some success, and though faulty in many respects, gave indications of that faculty of exciting terror which afterwards was the great power of Crébillon. Two years after he brought out his "Atrée," which had a decided success. Crébillon was now an established celebrity. After the death of his father, who left nothing that did not belong to his creditors, necessity compelled him to adopt for his daily bread, that which he had at first commenced from the love of the drama. Accordingly, in 1709 he produced the "Electre," and in 1711 the "Rhadamiste," which is justly considered his *chef d'œuvre*. "Xerxes" appeared in 1714. It was performed only once, and then received so unfavourably that it was withdrawn by Crébillon. Three years now elapsed, and then followed "Semiramis," receiving and deserving no better fate. "Pyrrhus," though cold and languid, was yet written with more care in point of style than its two predecessors. Crébillon now retired for a long interval from literary life. His wife, to whom he had been tenderly attached, was dead, and he gave himself up to a misanthropic sorrow, which the affection of his son, and the attention of friends, could not for a season dispel. In 1731 he was elected a member of the Academie Française, and obtained four years afterwards the situation of royal censor. Fortune had further favours in store for the recluse. Voltaire, who was now growing into his great fame, had assailed the beautiful Pompadour in some witty and bitter epigrams. The lady was determined to have her revenge, and so she honoured and exalted the man who was esteemed the rival of Voltaire, and against whom the latter had a private pique, as well as a literary jealousy. Crébillon was appointed librarian to Louis XV., and received a pension of a thousand francs a year. In 1748 he brought upon the stage his "Cati-line," supported by the favour of the court, with extraordinary magnificence. Once again the poet sought the public favour, in a tragedy called "Le Triumvirat," but it was a failure, and was withdrawn after the first representation. This was his last work, though another was partly written. Though now an old man he was still vigorous, when he was attacked with crysi-

pelas in the legs, which he neglected till it proved fatal. He died on the 17th June, 1762, and was interred with great pomp, all the actors attending. His eloge was pronounced by Piron, and a mausoleum was erected to his memory. Crébillon was a man of amiable manners, candid, modest, and simple; and though constitutionally subject to fits of gloom, he was often sprightly, fond of witty sallies, but never known to say anything that could offend others. In appearance he was tall, and had a fine head, with bright eyes full of expression.—J. F. W.

CREECH, THOMAS, the translator of Lucretius, Horace, and Theocritus, was born at Blandford in Dorsetshire in 1659, and was educated at Wadham college, Oxford, of which he became a fellow. He was elected probationer fellow of All Soul's in 1683. His translation of Lucretius, published in 1682, is his best work, and has been highly praised by Dryden. In 1699 he was appointed to the college living of Woburn, Bedfordshire, and two years after, in June 1701, committed suicide in his chamber at Oxford. He was of a morose temper, and this act has been ascribed to some constitutional infirmity.—J. T.

CREECH, WILLIAM, a well-known Edinburgh bookseller of facetious memory, whose name is associated with many of the literary men of the day. He was the son of the minister of Newbattle, and was born in 1795. For many years he carried on by far the most extensive bookselling business in Scotland. His shop stood at the east end of the Luckenbooths, now demolished, facing down the High Street, and was the regular haunt of the literati of Edinburgh at this period. From this place issued the works of Lord Kames, Adam Smith, David Hume, Henry Mackenzie, and Robert Burns. Creech himself was the author of some fugitive pieces of no great merit; but he was a pleasant companion, and possessed an inexhaustible fund of amusing anecdote. He was remarkably penurious in his habits, and his stinginess and keen tenacity of his own interests disgusted most of the authors who had dealings with him. Burns revenged himself for his niggardly treatment of him by a biting poetical sketch of the acute and witty, but selfish bibliopole. Creech died in 1815.—J. T.

CRESCIMBENI, GIOVANNI MARIA IGNAZIO GERONIMO SAVERIO GIUSEPPE ANTONIO, an Italian poet and litterateur, was born at Macerata in 1663, and died in 1728. He was educated in his native town, and gave promise of literary excellence before he went in 1680 to join his uncle at Rome, where he spent the rest of his life. His earlier productions were written in the vicious style of that age; but the perusal of the writings of Filicai and Leonio corrected this fault. From that time he laboured incessantly to diffuse a more correct taste amongst his countrymen. It was for this end that he founded the academy of the Arcadians, which was opened in 1690, and at the head of which he remained for thirty-eight years. Crescimbeni was a voluminous writer both in prose and verse. The most valuable of his works is "L'istoria della volgar Poesia." It should, perhaps, be mentioned that he retained only the first two of his christian names.—R. M., A.

CRESPI, GIUSEPPE MARIA, Cavaliere: this artist was born at Bologna in 1665. He was a pupil of Canuti and Cignani. From his gay apparel, he was called LO SPAGNUOLO. He was a mad reckless painter, but with a ready quick cleverness that came near to genius. Mengs condemns him as the destroyer of the Bolognese school. He had a strange talent for grotesque caricature. He died in 1747.—His two sons, LUIGI and ANTONIO, were also successful painters. Luigi was a creditable writer on art. He died in 1779.—W. T.

\* CRESWICK, THOMAS: this painter was born at Sheffield in 1811. In 1828 he first came to London, and the same year exhibited two of his landscapes at the Royal Academy. From that time he became a steady contributor to the works of the academy, seldom losing a year, and at the same time sending many works to the minor exhibition of the British institution. The excellence of his pictures soon attracted attention; but it was not until 1842 that he was elected associate. In 1851 he was made royal academician. His productions are still highly valued, though they probably reached their highest point of worth some few years ago. His pictures are chiefly from scenes in England, and he has occasionally painted in conjunction with Mr. Ausdell, who has supplied the figures to the landscapes. His colour is rich, but inclines to heaviness—a characteristic which, of late years, has rather increased than otherwise—and he is partial to a monotone of hue. But his rocky streams often

possess great vigour and reality, and his shady glens have many charms of depth and power of colour. Moreover, the popularity he has acquired, as a loving transcriber of English scenes, may enable him to disregard criticism almost entirely. His success is very nearly an answer to all cavil at his works.—W. T.

CRETIN, or as it is sometimes written, Crestin, the real name being DUBOIS, a French poet, the date or place of whose birth is not ascertained. Probably he was a Parisian, and we know from his writings that he lived in the fifteenth and commencement of the sixteenth century. Francis I. having appointed him his chronicler, Cretin undertook to write the history of France, which he accomplished in twelve books in a metrical form, but, as was the fashion with other metrical chroniclers, in a dry and prosaic style. He was a man of considerable learning and praised by his contemporaries, who called him "Souverain poete françois;" a supremacy which the witty Rabelais ignored in his Pantagruel, where, in the character of Raminagrobis, he exhibits the vices and affectation of Cretin's style. He died somewhere about the year 1525. A modern critic has happily observed of him that he never could make rhyme and reason agree.—J. F. W.

CREUZER, GEORG FRIEDRICH, an eminent German philologist, was born on the 10th of March, 1771, at Marburg, where he studied, and some years after was appointed professor of philology. In 1804 he was called to the chair of ancient literature and eloquence at Heidelberg; and from that time, till his death on the 16th of February, 1858, was one of the greatest ornaments of this university. Creuzer's fame chiefly rests upon his opus magnum, "Symbolik und Mythologie der alten Völker, besonders der Griechen," which involved him in a vehement and protracted controversy with several prominent philologists. Unlike the Symbolik, Creuzer's second great work, the "Opera Omnia of Plotinus," Oxford, 1835, 3 vols., enjoyed the general approbation. His numerous editions, as well as his antiquarian treatises, are not less distinguished by learning than by deep and original thinking. To the collected edition of his German writings, Leipzig, 1837-47, 9 vols., the author added his autobiography, "Ans dem Leben eines alten Professors," as an interesting supplement.—K. E.

CREWE, NATHANIEL, an English prelate, was the fifth son of John, Lord Crewe; born in 1633; died in 1721. He was promoted to the see of Oxford in 1671, and three years after translated to Durham. Being a member of the privy council of James II. he favoured the measures of the court, and after the Revolution his name was excepted from the act of indemnity of 1690. His pardon was afterwards procured by his friends.

CRICHTON, JAMES, "the Admirable." So much romance has been thrown around this extraordinary individual, that it is difficult to ascertain the real facts of his biography. He was born, not in the castle of Cluny, but more probably at Elliock in Dumfriesshire in August, 1560, his mother being a granddaughter of Lord Lindsay of the Byres, and daughter of Sir James Stewart of Beath, a descendant of Murdac, duke of Albany, third son of King Robert II.; his father being lord-advocate, and connected with the Crichtons of Sanquhar, the ancestors of the earl of Dumfries; and his granduncle, Lord Methven being third husband of Margaret Tudor, widow of James IV. In 1570, and when ten years of age, he was sent to St. Salvator's college, St. Andrews, then adorned by many illustrious men, and he had for some time the young king as a fellow-pupil. He took his degree of A.M. in 1575 with no little honour, his name being third in the first or highest circle of graduates. The elder Crichton espoused the doctrines of the Reformation, but the son, adhering to the old faith, went over to France. There, in the university of Paris and in the college of Navarre, he issued a universal challenge, that is, to all men upon all things, and to be held in any of twelve languages named. The rhapsodist, Sir Thomas Urquhart, repeats the programme in a style of characteristic magniloquence; adding that he spent the interval in all kinds of gymnastic exercises, in music, dancing, and pastime, but that on the appointed day he for nine hours vanquished all his opponents in all the faculties. According to another authority, not greater than the last, he went to Rome, and re-enacted the same feat there. He appears also to have been some time in Genoa, and there is no doubt that he arrived in Venice about the year 1580, and made the acquaintance of the famous printer Aldus Manutius, who dedicated exuberant eulogies to his living genius, and strewed pathetic elegies over his tomb. His appearance at Venice, both

as orator and debater, commanded universal admiration, as he seems to have had incomparable command of the "knowledges" as then taught—mathematics no less than scholastic lore—and to have been strikingly fluent in various tongues. Retiring in bad health to Padua, he there again produced unbounded astonishment, and during six hours improvised a Latin poem in praise of the city, discussed the sciences—each with some one supposed to be a master in it—and exposed also some of the errors which belonged to the reigning Aristotelian philosophy. Returning to Venice, he gave himself to the same astounding displays, and Manutius has preserved the programme in the dedication of his *Paradoxa Nobilissimo Juveni Jacobo Critono, Scoto*. The challenge is broad and formal. He pledged himself to review the schoolmen, allowed his opponents the privilege of selecting their topics either from branches publicly or privately taught, and promised to return answers in logical figure, or in numbers estimated according to their occult power, or in any one of a hundred sorts of verse. For the space of three days, in the church of St. John and St. Paul, he sustained the trial, and justified before many competent witnesses his magnificent pretensions. After such a triumph he betook himself to Mantua, and there is said to have challenged and killed in combat one of the most renowned of gladiators, who had just slain three opponents who had rashly ventured to encounter him. The duke appointed him tutor to his son, and he not long after got up a dramatic performance, in which, during five hours, he represented effectively no less than fifteen different characters, such as a divine, a lawyer, a mathematician, a physician, and a soldier. But his career came to a sudden and tragical end. Meeting some persons in the street who quarrelled with him and set upon him, he defeated them, but one of them, his own pupil, threw off his mask and begged his life. Crichton at once fell on his knees and presented his sword to the prince, who received it, but immediately stabbed him with it to the heart. At his assassination Crichton had scarcely completed his twenty-third year. What the prince's motives were is not known—whether jealousy, envy, or the momentary rage of an "irefull heart;" or perhaps the admirable Crichton simply fell a victim in a drunken frolic. The lamentation over his untimely end was great and unusual. It is difficult to form a just estimate of Crichton's mind and attainments. He was no charlatan, though erudition of any depth, or the fruits of patient study, could not be expected of one of his years. Others had the same means of education as he had enjoyed, but he stood out among all his compeers for the number and variety of his precocious accomplishments. His verses are deficient both in poetry and Latinity, nor does his genius seem to have been equal to his undoubted acquirements. But after all allowance for exaggeration, he must have possessed a thorough familiarity with all branches of knowledge current and popular in those days, a quick apprehension, a ready and retentive memory, a marvellous promptitude and presence of mind, a boldness arising from his conscious stores and powers, an unlimited command of language in declamation and reply, a fluent mastery of several tongues, along with elegant manners and a graceful figure, improved by an eager cultivation of physical games and exercises. That he was a prodigy is admitted by Scaliger, Johnson, and Bayle.—(*Life* by Sir Thomas Urquhart, "*Discovery of a most exquisite jewel*," 1652. *Biography* by Mackenzie, by Tytler, by Irving, and by Imperialis.)—J. E.

**CRIGHTON** or **CREIGHTON**, **ROBERT**, a learned prelate, was born of an ancient family at Dunkeld in 1593, and died in 1672. At the beginning of the civil war he joined the king at Oxford. He afterwards followed Charles II. abroad, and after the Restoration was promoted to the bishopric of Bath and Wells. Crichton boldly denounced the vices of the court.—R. M., A.

**CRITIAS**, son of Callæschrus, was a pupil of Socrates, and is noteworthy both as a statesman and man of letters. In 406 B.C. he was in Thessaly endeavouring to set up a democracy. On his return to Athens he became leader of the oligarchical party. He was conspicuous among the thirty tyrants named by Lysander in 404 B.C., and in the same year was killed in battle. Cicero speaks of some of the speeches of Critias as extant in his time. He wrote a work on politics, and is said to have produced some tragedies, which are now lost. Some fragments of his elegies are still preserved.—J. B.

**CRESUS**, the last king of Lydia, succeeded to the throne 560 B.C. By a rapid series of conquests, he subdued all the Greek colonies on the coast of Asia Minor, and extended his

dominions over almost all the country, from the Ægean Sea to the river Halys. He was deemed the richest monarch of his age; and the fame of his wealth, power, and magnificence, attracted to his court many of the most illustrious sages and poets of Greece. When the prosperity of the Lydian monarchy was at its zenith, a new power suddenly arose in the East, which was destined to overthrow many of the existing dynasties, and to absorb their territories. By his accession to the throne of Media, Cyrus had obtained the sovereignty of Upper Asia, and was meditating schemes of vast ambition. Jealous of his growing power, Cræsus resolved to attack him; assembled an army of four hundred and twenty thousand men; crossed the Halys, gave him battle in Cappadocia, and was defeated, on which he retreated to Sardis, his capital. Cyrus followed him, laid siege to the city, and took it B.C. 546; annexed Lydia to Persia, and condemned its vanquished king to the flames, but afterwards pardoned him and took him into favour. Cræsus survived his conqueror, and enjoyed the friendship of his son Cambyses; but the date and manner of his death are unknown.—W. M.

**CROFT**, **SIR HERBERT**, an English writer, was born in 1751, and died in 1816. After having studied law for some time, he entered the church, but devoted himself principally to literature. He wrote "*A Brother's Advice to his Sisters*;" "*Love and Madness*;" and issued proposals for an improved edition of Johnson's Dictionary—an undertaking that was never completed. The life of Young in Johnson's *Lives of the Poets* was written by Croft.—R. M., A.

**CROFT**, **HERBERT**, an English prelate, was born in 1603, and died in 1691. Sent first to Oxford, he was next, on his father's conversion to popery, placed at Douay. He returned, however, to Oxford, and rose to be bishop of Hereford. His treatise entitled "*Naked Truth*," excited much attention at the time. A reply to it by Dr. Turner of Cambridge, was answered by the celebrated Andrew Marvell, who was an admirer of the bishop.

**CROKE**, **RICHARD** (in Latin **CROCUS**), one of the revivers of classical learning in England, was born in London, and educated at Cambridge. He afterwards studied on the continent, and on his return was appointed teacher of Greek at Oxford. Henry VIII. sent him to bring over the university of Padua to his side in the matter of the divorce—a commission in which he was completely successful. He died in 1558.—R. M., A.

**CROKE** or **CROOK**, **SIR GEORGE**, an English lawyer, born in Buckinghamshire in 1559, and died in 1641. He was knighted in 1623, and in 1628 succeeded Sir John Doderidge on the king's bench. In 1636 Croke defended Hampden in the celebrated case of the ship-money, and this, strange to say, without offending the king.—R. M., A.

**CROKER**, **JOHN WILSON**, the Right Hon., LL.D., F.R.S., distinguished as a politician and man of letters, was born in the year 1780 in the county of Galway in Ireland; his father, who was of an English family, holding the office of surveyor-general in that county. Croker received his education in the university of Dublin. He was called to the Irish bar in 1802, and a few years afterwards was returned to parliament for the borough of Downpatrick. In the year 1827 he was elected a representative for the university of Dublin, which constituency he continued to represent until the passing of the reform bill in 1832, when he finally retired from public life. He attached himself from the first to the tory party, and at an early age obtained office under Lord Liverpool's government, having been appointed secretary to the admiralty in the year 1809. This influential post he held until 1830. During this period Mr. Croker had become familiarly known to the public in the capacity of a wit and man of letters. Croker established in 1809 the *Quarterly Review*, to which periodical he contributed largely for many years. Amongst the papers attributed to his pen, some reviews have been censured as exceeding the legitimate bounds of criticism, thus exposing their author to perhaps exaggerated obloquy. But the most remarkable writings with which he enriched the *Quarterly Review* had reference to Louis Philippe and the revolution of 1830, many of the materials for which were known to have been furnished by the ex-king himself, a resident at the time at Clermont, close to Mr. Croker's villa at West Molesey in Surrey, and holding constant intercourse with him. The earliest of Mr. Croker's works were poetical, none of them displaying a high order of talent. His "*Life of the Duke of Wellington*," at once adulatory in its tone and prejudiced in its views, is quite unworthy of the hero it

professes to celebrate. But his "Stories from the History of England," which suggested Scott's Tales of a Grandfather, will ever be a favourite manual in the hands of the young; and Croker's edition of Boswell's Life of Johnson, although subjected to severe criticism, has met with a success which few purely literary works have enjoyed in modern times. The popularity of this work induced Mr. Murray to propose to him the editing of Pope's works, which was accordingly undertaken several years ago; but not having been completed at the time of his death, the editorial task has passed into the hands of Mr. Peter Cunningham—a gentleman previously associated with him in the work—after a vast amount of illustration had been accumulated by the original editor for the purposes of the projected publication. Mr. Croker was married to a lady named Pennell, who survives him, and by whom he had one son, who died before he had arrived at maturity. Mr. Croker died in the year 1857, and was buried in the parish church of West Molesey, which had been restored and beautified by his exertions and liberality. A plain slab in the churchyard marks the spot where his body lies, and a bust is placed in the chancel.

CROKER, THOMAS CROFTON, was born on the 15th January, 1798, in the city of Cork. At the age of fifteen he was placed in an eminent mercantile firm in his native city, but he appears from his boyhood to have exhibited a strong taste for antiquarian and literary pursuits, rather than for the toils of business. The beautiful scenery of the county of Cork led him to make many excursions during his apprenticeship, and his mind was thus stored with the songs and legends which abound in the south of Ireland. Of these Croker made a collection, and his skill as a draughtsman enabled him to add to their value by pen and ink sketching. He furnished Moore with a large number of airs, as well as fragments of poetry and traditions for the Irish Melodies—a favour which the great lyrist did not fail to acknowledge. Upon the death of his father, Major Croker, in 1818, Thomas left Ireland; and after visiting Moore in Wiltshire, he proceeded to London, where, shortly afterwards, he procured through the aid of J. W. Croker, the secretary to the admiralty, an appointment in that department, in which he continued till 1850. In 1824 he published his "Researches in the South of Ireland, illustrative of the Scenery, Architectural Remains, and the Manners and Superstitions of the Peasantry;" and the following year "The Fairy Legends and Traditions of the South of Ireland." In 1827 a second series of the "Fairy Legends" was published in 2 volumes. Croker was now elected a member of the Royal Irish Academy, and a fellow of the Society of Antiquaries. In 1829 he edited two volumes entitled "Legends of the Lakes." Two novellettes bearing his name were published in 1832, "The Adventures of Barney Mahony," and "My Village versus Your Village." Croker took an active part in the formation of the Camden and Percy societies, serving on the council of both, and contributing many papers. The latter society published in 1843 his "Keen of the South of Ireland." He continued to edit many other works, antiquarian and national, which will be found in the proceedings of the societies to which he belonged. His collection of historical and literary manuscripts and Irish antiquities was one of the finest extant, and was sold after his death, which took place at his house at Old Brompton on the 8th of August, 1854. Croker was a man of undoubted genius and of great industry, and he has added largely to our stores of antiquarian knowledge and general literature.—J. F. W.

CROLY, REV. GEORGE, LL.D.; poet, dramatic author, novelist, and divine. This eminent writer was born in Dublin in 1785, and after receiving his education at Trinity college in that city, came to London and quickly became distinguished as a man of letters and pulpit orator. The earliest of his numerous writings, "The Times, a satire," was published about 1818. Poems, histories, dramas, followed in quick succession; besides which and a large number of published sermons and lectures, Dr. Croly contributed to literature some works of fiction, remarkable for power and originality—"Tales of the Great St. Bernard;" "Salathiel, the immortal;" and "Marston, or the Soldier and Statesman." Throughout life he was a staunch tory, and as a contributor to *Blackwood's Magazine*, an editor of the *Universal Review*, and a writer of political articles for the *Britannia* newspaper, he rendered important services to his party. But he was so fortunate as to have his labours rewarded by preferment. The living of St. Stephen and St. Benet, Walbrook, was conferred upon him by the whigs. He died 24th November, 1860.

CROMPTON, SAMUEL, the inventor of the spinning machine called the "mule," was born in 1753 at Firwood, a small estate which had belonged to his ancestors for many generations, near Bolton-le-Moors, Lancashire. The district around Bolton had long been famous as a seat of the textile manufactures; almost every house was supplied with a loom, and by far the greater number of the yeomen made more account of their weaving shops than of their lands. Crompton lost his father when he was at the age of five, and from that period till the date of his marriage he resided with his mother on the estate of Firwood. His great invention, which was completed at this place in 1779, was one of several attempts made in the same district to supplement by machinery the labour of the spinners, who, since the invention of Kay's fly shuttle, were overwhelmed with demands for yarn for the new looms, which their utmost exertions could not meet. The mule exactly met the want of the time, and was universally adopted. The result to the inventor, however, was little more than the satisfaction he derived from having given a new and signal impetus to the industry and enterprise of his country. He was persuaded to make his invention generally known without securing a patent, and to trust for his reward to the generosity of the public and the munificence of the government. From the former he received £50, and from the latter £5000. This latter sum the house of commons voted, after hearing evidence to the effect that the result of the introduction of the mule had been to add £350,000 to the yearly revenue—it was hardly adequate to defray the expenses of the application. Mr. Crompton, having expended the whole of his small fortune in pursuits connected with his invention, was during the last years of his life dependent upon a small annuity. He died 1827.—C.

CROMWELL, HENRY, the fourth and youngest son of the Protector, was born in 1627. He was educated at Felsted in Essex; at the age of sixteen entered the parliamentary army; became a colonel in 1649, and accompanied his father to Ireland, where he displayed great bravery. He was a member of Barebone's parliament, and in 1653 married the daughter of Sir Francis Russell of Chippenham. In 1654 he was appointed lord-deputy of Ireland, and discharged the duty of that important office with great ability, although his influence was greatly crippled by the want of money and the restrictions put upon him by the council in London. On the accession of his brother, Henry Cromwell was compelled by the factious and turbulent council to exchange the title of lord-deputy for that of lord-lieutenant; and shortly after the resignation of Richard he too was obliged to relinquish his office. He retired first to Chippenham and then to Soham in Cambridgeshire, where he spent the remainder of his life in the cultivation of his estate. Henry Cromwell died in 1673, leaving six children.—J. T.

CROMWELL, OLIVER, Lord-Protector of the Commonwealth of England, Scotland, and Ireland, was born at Huntingdon on the 25th April, 1599. He was the son of Robert Cromwell, M.P. for Huntingdon in the parliament of 1593, and of Elizabeth Stuart, daughter of Sir Richard Stuart. He was named after his uncle and godfather, Sir Oliver Cromwell. His father, Robert Cromwell, second son of Sir Henry Cromwell of Hinchinbrooke, was a gentleman of good family and moderate estate, who lived a rural life, and cultivated his own lands. Among his possessions may possibly have been a brewery, a circumstance that may account for the cavalier stigma that Oliver was the son of a brewer. Robert's sister, Elizabeth Cromwell, was the mother of John Hampden, who was the head of a Buckinghamshire family of great wealth and consideration, that could trace back to a period before the Norman conquest. John Hampden and Oliver Cromwell were therefore first cousins. Of Oliver's early life little is known with any degree of certainty. He appears to have lived at home, and to have received his education at a presbyterian school in the district, after which he went to Sidney college, Cambridge, and pursued his studies there from the 23rd April, 1616, to 23rd June, 1617. His father then died, and he returned to Huntingdon. At the age of twenty-one, August 22, 1620, he married Elizabeth Bourchier, daughter of Sir James Bourchier, who brought him a certain amount of dower. Whether from the influence of the rather ascetic religion that prevailed among the puritans—asceticism being a common feature where persecution has previously prevailed—or from the influence of the low-lying marsh lands which generated unwholesome vapours, certain it is that Oliver fell into hypochondriasis and low spirits, and indulged in the inconvenient practice of

sending for Dr. Simeott in the middle of the night, in the apprehension that he was about to die. Men of large brain and robust passion have commonly much difficulty in gaining the mastery of their own spirit, and Oliver appears to have known somewhat of the mental strife that forms so prominent a characteristic in the career of such men as Martin Luther and John Bunyan, with whom Oliver may be appropriately classed; although his energies ultimately found issue in the strife of war and politics rather than in that of religious reformation. He was elected to serve in parliament for the borough of Huntingdon in 1628, and there in January, 1629, when the house of commons had resolved itself into a committee on religion, Mr. Oliver Cromwell informed the house of Neile, bishop of Winchester, countenancing arminianism. Steps would probably have been taken against the bishop, notwithstanding the prohibition of the king; but on the 2nd March the house adjourned. On the 5th warrants were issued for the apprehension of some of the riotous members, and on the 10th parliament was dissolved. No parliament was held for twelve years afterwards; the king governed by prerogative, and Mr. Oliver Cromwell returned to the country to ruminate. In 1631 he sold his property at Huntingdon, and took a grazing farm at St. Ives; and in 1636, by the death of his maternal uncle, Sir Thomas Stuart, he became possessed of an estate in the Isle of Ely valued at nearly £500 a year; engaged vigorously in local politics, and earned for himself the title of "Lord of the Fens." To the short parliament which met in April, 1640, he was returned for the town of Cambridge, in opposition to the court candidate; but the commons, instead of voting supplies, began to talk of grievances, monopolies, ship-money, star chambers, high commission, breach of their privileges, innovations in religion, and other matters too stimulating for the taste of the king, who on the 5th May dissolved parliament, and committed several members to the Fleet. The affairs of the kingdom, however, were rapidly getting into confusion, and a new parliament was indispensable. It met on the 3rd November, 1640, and is known as the famous Long Parliament. To this also Mr. Cromwell was returned for the town of Cambridge.

To trace Mr. Cromwell's after proceedings, a word must be said on Charles' dispute with the parliament. The parliament which met in March, 1628, had presented a petition of right to the king, praying—1. That no loan or tax might be levied but by consent of parliament. 2. That no man might be imprisoned but by legal process. 3. That soldiers might not be quartered on people against their wills. 4. That no commissions might be granted for executing martial law. To these the king answered, "I will that right be done according to the laws and customs of the realm." This reply, however, was not satisfactory, and both houses addressed the king for a more definite settlement of the laws of the kingdom. In June, 1628, Charles gave answer in due form, "Soit droit fait comme il est désiré;" thereby converting the petition into a law of the realm, and definitely agreeing that no loans or taxes should be levied but by consent of parliament. The principle had been infringed, and Mr. Hampden, who at his own risk and cost tried the case against the crown in 1638, was cast and adjudged to pay ship-money. The parliament that met in November, 1640, where Mr. Cromwell appeared very ordinarily apparelled and without a hatband, proceeded to take up the question, and at once resolved that the levying of ship-money and the opinions of the judges upon it were illegal. Pym, Hampden, Holles, and men of kindred stamp, were the leaders of this new parliament, and with them Mr. Cromwell cast in his lot, using his sharp and untunable voice to great service, and being, as Sir Philip Warwick justly observes, "very much hearkened unto." The commons in fact urged on reforms with terrific haste. They impeached Archbishop Laud, and took him into custody; threatened the judges, and compelled them to give bail; impeached Sir Robert Berkeley, one of the judges, and actually took him off the bench in Westminster hall; passed a bill for triennial parliaments, and another to abolish the star chamber; voted the bishops out of parliament; brought Strafford to trial, and afterwards to Tower-hill; resolved that there should be no dissolution without consent of both houses, and when the king attempted to apprehend the five members—Pym, Hampden, Holles, Hazell, and Strode—resolved "that whoever should attempt to seize any of their members or their papers, the members should stand on their defence." London was in a tumult. An armed multitude carried the five members

in triumph to Westminster, and four thousand mounted gentlemen and yeomen from Buckinghamshire made their appearance, to see that no wrong was done to their member, Mr. Hampden. A civil war was about to commence, and the king quitted Whitehall, not again to visit it except as a captive.

These proceedings had carried the parliament over rather more than a year. The king and court quitted Whitehall on the 10th January, 1642. On the 7th February Mr. Cromwell offered to lend £300 for the service of the commonwealth, afterwards increased, it would seem, to £500. In August of the same year, 1642, he was already on foot, doing active service—"Mr. Cromwell in Cambridgeshire has seized the magazine of the castle at Cambridge, and hath hindered the carrying off the plate from the university, which, as some report, is to the value of £20,000 or thereabouts." In September (Sept. 14, 1642) Mr. Cromwell commenced his military career, being then forty-three years of age. Robert, earl of Essex, was "lord-general for king and parliament," which meant for parliament against the king, and William, earl of Bedford, was general of the horse, having, or about to have seventy-five troops of sixty men each; in every troop a captain, a lieutenant, a cornet, and a quartermaster. In troop 67 Oliver Cromwell, member for Cambridge, was captain, and in troop 8 another Oliver Cromwell—probably the eldest son, killed early in battle, and lost sight of in after history—was cornet. Cromwell's rise in the scale of military rank was as follows. In September, 1642, he was captain; in March, 1643, he was colonel. On the 2nd July, 1644, was fought the battle of Marston Moor, at which, according to the newspapers of the time, "upon the left wing of horse was the earl of Manchester's whole cavalry, under the command of Lieutenant-general Cromwell."

At this time General Cromwell was the first cavalry officer in England on the side of the parliament. This he was, not only in the estimation of the soldiers, but in the opinion of Sir Thomas Fairfax and the house of commons. Fairfax before the battle of Naseby wrote to the commons requesting that Cromwell might be spared from his parliamentary duties, to command the whole of the horse. When men were in a strait they needed Oliver, could depend upon him, and were not disappointed. Fairfax who had been rather worsted at Marston Moor, and perhaps supposed that Cromwell's success there depended on his command of cavalry, has "resolved to decline the usual way of a general, and to assume the command of the horse, and leave the infantry to his major in ease Lieutenant-general Cromwell come not up in time enough."

On the 14th of June, 1645, was fought the battle of Naseby, General Cromwell having arrived two days before, "amid shouts from the whole army." Oliver, as usual, routed everything, seized the train and cannon of the royalists, took many prisoners, their standard, ensigns, seventy carriages, and the king's own waggons, in one of them a cabinet of letters supposed to be of great consequence. In fact Oliver, and Oliver chiefly, shivered the royalist army to atoms, and the king's cause was ruined beyond recovery. General Cromwell now settled the club-men; stormed Bristol, Winchester, and Basing-house; finished the first civil war; and handed England over to the parliament very much in the style of a conquered country—for which he received the thanks of parliament and a grant of £2,500 a year.

In 1648 his military talents were again in requisition. He was in the north at Carlisle, Berwick, and in Edinburgh. He was commander-in-chief of the army of operation, but still remained only lieutenant-general. In December, 1648, he returned to London, and on the 29th of January, 1649, he signed the death warrant of Charles I. His position at this period is worth remarking. Practically he was the foremost man in the country; but perhaps the only party on which he could thoroughly depend was the army, and even a portion of the army was tainted with doctrines subversive of military discipline. The parliament contained all the elements of disunion, and without the army was impotent. A legislative assembly that assumes also the executive power of the state, has commonly proved itself a failure, and General Cromwell now began to occupy the chief position in the executive government. He was, however, surrounded by difficulties. After the death of the king, probably not more than one-half of England was on the side of the parliament. Also, there was in England a party of anarchy, the red republicans of that day, called Levellers, who, had it not been for Cromwell's consummate ability and

resolution, would certainly have attained a much more prominent place in the history of England. Ireland, again, was completely in favour of the Stuarts, and Scotland had proclaimed Charles II. immediately after the death of his father. General Cromwell wisely began at home. He soon settled the Levellers, and put out the smouldering fire of social anarchy like a man who neither trifled nor jested, trifling being almost the only thing that Oliver could not do. Having settled England he went to Ireland. On the 22nd of June, 1649, his commission was made out. This, however, arranged only the military part of the business. The parliament then "considered of settling the civil power of the nation of Ireland, whether by commissioners or otherwise. The house, after a short debate, voted that Lieutenant-general Cromwell be chief governor of Ireland, and likewise that the civil and military power of that nation be settled on him during the time of his commission"—three years. General Cromwell thus became lord-lieutenant of Ireland, with plenary power to do what he pleased. What he did please to do was perhaps severe enough—terrible knocking of every body on the head when they resisted, under the belief that "this bitterness will save much effusion of blood"—a belief verified in fact, and even in the opinion of those who have written against Cromwell. Drogheda (Tredah) and Wexford were taken by storm and the garrisons slaughtered. The example was successful: the other towns surrendered upon easier terms. In less than a year the country was subdued, and Cromwell leaving his son-in-law, Ireton, in command, returned to England, was met in triumph at Hounslow heath, and had the palace of St. James' allotted for his residence.

Soon after the death of the king, Prince Charles, who had taken refuge at the Hague, assumed the title of Charles II. In the spring of 1650 the commissioners from the Scots negotiated with him at Breda. In June he repaired to Scotland, but before landing was obliged to undergo the process of taking the covenant. The parliamentarians at once resolved to attack him, and General Fairfax ought from his rank to have taken the command; but his wife, a presbyterian, persuaded him to withdraw from public life, whereupon "Oliver Cromwell, esquire, was constituted captain-general and commander-in-chief of all the forces raised, or to be raised, by authority of parliament within the commonwealth of England" (26th June, 1650). The Lord-general Cromwell instantly fell to work with his new commission. On the 29th June, three days after his appointment to the supreme command, he set out for Scotland. On the 22nd July the army passed through Berwick, thence to Cockburnspath, Dunbar, Haddington, and Musselburgh, the Scottish army under General David Lesley lying between Edinburgh and Leith. Cromwell could not attack Lesley in his fastnesses, and in a fortnight he found that sickness and want of provisions compelled him to retreat. He fell back on Dunbar, Lesley following him at once. Cromwell was blocked up and surrounded, as he himself expresses it, "at the pass of Copperspath, through which we cannot get without almost a miracle." His faith, however, did not fail him. "All shall work for good," he said—"Our spirits are comfortable, praised be the Lord." On the 2nd of September Oliver observed that Lesley was altering his position, coming down the hill, and moving his left wing of horse over to his right wing—dangerous experiments, it would seem, in the face of the lord-general. A council of war was held. It was resolved not to wait for Lesley's attack, but before break of day to begin the battle of Dunbar. "The enemy's whole numbers," says Oliver, "were very great, almost six thousand horse, as we heard, and ten thousand foot at least, ours drawn down as to sound men to about seven thousand five hundred foot, and three thousand five hundred horse." "The enemy's word was THE COVENANT, which it had been for divers days; ours was THE LORD OF HOSTS." In an hour the lord-general utterly demolished the presbyterian army, with a loss to himself, as he says, of "about twenty or thirty men" (3rd September, 1650).

From Dunbar Cromwell returned to Edinburgh to besiege the Castle, which was surrendered to him by Colonel Walter Dundas, the governor, on the 24th of December. He remained in Scotland till August, 1651. He had taken possession of Perth, and being thus to the north of the Scottish royal forces, which were stationed with Charles at Stirling, Charles ventured a desperate game—a sort of double or quits for the whole stake that Oliver had gained and Charles had lost. Charles broke up his quarters,

and marched southward into England. On the 22nd of August the royal standard was raised at Worcester, and there on the 28th the lord-general was in presence of the king. Cromwell went to work without delay, threw a bridge of boats over the Severn, and another across the Teine. These boat-bridges were ready on the afternoon of the 3rd September—the same day on which had been fought the battle of Dunbar a year before; "whereupon," say the papers of the time, "the general presently commanded Colonel Inglesbie's and Colonel Fairfax's regiments, with part of his own regiment and the life-guards, and Colonel Hacker's regiment of horse, over the river—his excellency himself leading them in person, and being the first man that set foot on the enemy's ground." The battle of Worcester ended in a total rout; and about seven in the evening the king, with various dukes, earls, and lords, fled from the city by St. Martin's gate to find a refuge with the Penderels, and to take shelter in the royal oak and across the sea. Cromwell behaved magnificently. "My lord-general did exceedingly hazard himself—riding up and down in the midst of the shot, and riding himself in person to the enemy's foot offering them quarter, whereto they returned no answer but shot." This was Oliver's last battle, and the last occasion on which Scotland ever appeared in a national capacity. Scotland had gone to wreck with factions and dissensions, and her individuality as an independent kingdom had no longer a place in history. At Aylesbury, on his return to London, Cromwell was met by a deputation from the commons and council of state. Hampton Court was prepared for his residence, and an estate of four thousand pounds a year, in addition to his former grant, was voted to him.

We now briefly review this military career of Oliver. Nine years before we found him an English squire, engaged in the cultivation of his lands; now we find him the incomparable soldier who has achieved in fair and open war the conquest of England, the conquest of Ireland, and the successful invasion and annexation of Scotland; and this without anything that could be called a reverse. His progress was ever onward, forward, upward. However the fortunes of others might fluctuate, Oliver was always making way, always driving definitely toward a single point, and that point the supreme power. He was not only the man of supreme ability, but acknowledged to be so—the man to whom the nation was obliged to apply; for he alone had the master-hand that could guide the vessel of the state through the storms, the troubles, the quicksands, and the dangers which on every side beset the commonwealth. No sooner had the military operations terminated than it became necessary to settle the form of government, and it was here in all probability that Cromwell first allowed the ambition of personal aggrandizement to mix with what he conceived to be his duty to his country. The power was virtually in his own hand, and there can scarcely be a doubt that he desired its legal recognition. If the nation had placed the crown on his head at this period, he would probably have allowed it to remain there without farther question. But the parliament was jealous of his influence, and war with Holland once more withdrew the attention of the nation from the settlement of the constitution. It was absolutely necessary, however, that there should be an executive government, and Cromwell resolved to take the power into his own hands by the forcible dismissal of the members. He took a file of musketeers, went down to the house, ordered the speaker out of the chair, told the members they had sat there long enough for all the good they had done, and, waxing vehement, cried out—"You are no longer a parliament; I say you are no longer a parliament; the Lord has done with you—he has chosen other instruments for carrying on his work." He told Vane he was a juggler, Chaloner that he was a drunkard, Allan that he cheated the public, Martin and Wentworth that they were exceeding improper persons; told one of the soldiers to "take away that fool's bauble"—the mace; and finished by turning out the members and locking the door. This was on the 20th April, 1653, and in July he summoned by his own authority the little or Barebone's parliament, so called from one Praise-God Barebone, a leather-seller of Fleet Street, who was one of the honourable members.—(See BAREBONE.) On the 12th December of the same year the Barebone parliament resolved to resign its power into the hands of Cromwell, having possibly been chosen for that purpose; and on the 16th December the Lord-general became Lord-protector of the Commonwealth of

England, Ireland, and Scotland. The Instrument or document which established the protectorate was read in Westminster hall with formal ceremonies, in presence of the council of officers, the lord-mayor and aldermen, the commissioners, and other officials.

By the Instrument of government Cromwell was to call parliaments every three years. He had also power to make war or peace; and he and his council could make laws which should be binding during the intervals of parliament. By these provisions the government resembled a monarchy. But no parliament could be dissolved until it had sat five months; and bills passed in parliament were to become law after a lapse of twenty days, even if not confirmed. By these provisions the government resembled a republic with a president. But inasmuch as Cromwell was commander-in-chief of the army, as well as first magistrate of the state, and the protectorship was elective—the real nature of the government was that of an elective autocracy with nominal limitations, which must infallibly be broken down and fall to the ground. Disputes could not fail to arise regarding the authority and jurisdiction of the various powers in the state, and hence another step was still necessary to place the Protector on the highest summit. This issue came in 1657. In April of that year a committee of parliament mooted the question of kingship and royal title. The republican officers, however, declared against the assumption, probably more from antipathy to the name than to the fact, which was already sufficiently established for all practical purposes. Cromwell declined the title on the pretext that “he could not with a good conscience accept the government under the title of king.” Nevertheless his powers were enlarged by a new instrument called the *Petition and Advice*; an annual sum of £1,300,000 was allotted for the support of his government; he was empowered to create a second chamber or ostensible house of lords—which had only a brief existence, being dissolved by the Protector fourteen days after it met; and he was empowered to nominate his successor, the protectorship thereby ceasing to be elective, and his Highness becoming to all intents the autocrat of the realm, with powers which a good man might use well, but which in other hands would be nothing short of an atrocious tyranny, more dangerous to the state than the despotism of the Stuarts, and absolutely intolerable to the people of England. His government was not a monarchy in which the king reigns by law, with recognized rights and recognized limitations of prerogative, but a tyranny—a military tyranny converted into a constitutional autocracy by the powers that had been formally conferred or were immediately usurped, and which were used without reserve against the parliament and the courts of law.

The Protector, as a statesman, is one of the most remarkable studies ever submitted to the scrutiny of the politician or the student of history. He appeared to combine the elements of almost unlimited power with the elements of unlimited weakness. England under his own rule was unquestionably the strongest state in Europe, yet no sooner had he departed than it fell, as if by magic, into the utmost extremity of impotence. Its next monarch was a pensioner on the bounty of the magnificent Frenchman. In the field he was everywhere triumphant, yet no sooner was he gone, than the military operations of England became puerile and ludicrous. Oliver's flag, the red cross of St. George, swept from the ocean every hostile banner. France, Holland, and Spain, were humbled into maritime submission, and the Barbary corsairs were scourged into good behaviour—piracy was annihilated, and the naval supremacy of England was established as an unquestioned and indisputable fact. Yet Oliver gone—and the Dutch with impunity sail up the Thames and the Medway. He had the most moral court that had ever been known in the history of Europe, yet a few short years saw vice unblushingly enthroned, and the silken shoe of the courtesan treading the halls that had echoed to the jackboots of Oliver Cromwell and his pious Ironsides. In Oliver's time the judge sat in the magnificence of rectitude, and for the first time in the history of modern nations justice was administered in the fear of God. Yet Oliver gone, and Judge Jeffreys springs from the pandemonium of the corrupted English law. Everything seemed to decay and to ferment into corruption. As if the force of gravity had been removed from the terrestrial economy, no sooner was the iron-will of Oliver removed from the state of England, than chaos, confusion, and failure seemed to invade every department of the realm, and every operation of the body

politic. Defeat, disgrace, and shame, took the places of victory, honour, and estimation, until the fury of England was once more roused, and the last Stuart, in ignominious flight, took refuge with the neighbour nation, whom Oliver would have bearded with the sword. The contrast between England in the time of the Protector, and England in the days of Charles and James, is one of the most remarkable that has been recorded on the page of history. Tragedy or comedy, it is the strangest drama that has been played in England since the Saxon dynasty died out at Hastings, and England became the heritage of the feudal and punctilious Norman.

Although the Protector failed to transmit a constitution to England, he taught the great lesson of his day—the greatest lesson that England or the world has ever learnt—that of religious toleration. This, in fact, was his grand achievement—the great and noble work, which will ever weave around the brow of Oliver a chaplet of unfading glory. Oliver Cromwell was the apostle of religious toleration.

The latter portion of the protectorate was a dreary experience of the pain and trouble which attend on those who govern factious men. It was another evidence that power is not happiness, and that the highest dignities of the world confer no lasting happiness, and can never satisfy the longings of an ardent spirit. Oliver did his duty after his own fashion, and according to his own understanding, forgetful that laws made by the common judgment of the nation are quite as essential as the individual inspirations of even the wisest rulers. If he did not die the death of a martyr, he in some sense lived the life of a martyr, and faced his difficulties with a heroic soul that would not acknowledge defeat.

The time came that Oliver must die, and this, perhaps, was the noblest scene of his eventful life. He had lived with England in his heart, and he died with England in his heart, praying, in the sublimity of death, that God would give his people consistency of judgment—one heart and mutual love—interceding, as it were, with him who had been his own protector for those who had not seen so clearly into the invisible world, and praying, as all good men should pray, that God would pardon those who desired to trample on his dust. So died the great Protector on the 3rd of September, 1658, the boldest and most successful man that England has ever seen—a man who stands alone in the history of his country—yet an enigma, a dark riddle, which all men guess at, yet none are agreed about the answer.

Cromwell was taken ill at Hampton court, on the 12th August, of a fever, partly brought on, perhaps, by his deep feeling of regret at the death of his favourite daughter, Mrs. Claypole. He removed to Whitehall, and there he died on the 3rd September, in the sixtieth year of his age, having held the title of Protector four years, eight months, and eighteen days. It was the anniversary of his two great victories at Dunbar and Worcester, and the same day happened the greatest storm of wind ever known in England. On the 23rd November the state funeral took place, with great pomp, in Henry VII.'s chapel, at Westminster abbey. The coffin containing the body had been privately deposited some time before in the abbey, and it was only the effigy that lay in state at Somerset-house, and to which the official and costly honours were paid.

In 1660 the Restoration took place, for which the English church to a recent period still gave thanks, as an “unspeakable mercy;” and on the 30th January, 1661, the bodies of Oliver Cromwell, Henry Ireton, and John Bradshaw, were drawn upon sledges to Tyburn. The account is thus given in the newspapers of the time—“When these three carcasses were at Tyburn, they were pulled out of their coffins, and hanged at the several angles of that triple tree, where they hung till the sun was set, after which they were taken down, their heads cut off, and their loathsome trunks thrown into a deep hole under the gallows. The heads of those three notorious regicides, Oliver Cromwell, John Bradshaw, and Henry Ireton, are set upon poles on the top of Westminster hall by the common hangman. Bradshaw is placed in the middle, Cromwell and his son-in-law, Ireton, on both sides of Bradshaw.”

Cromwell left two sons and four daughters—Richard, who succeeded him; Henry, lord-lieutenant of Ireland; Bridget, married first to Ireton, afterwards to Fleetwood; Elizabeth, married to John Claypole, Esq., of Northamptonshire; Mary, married to Lord Fanconbridge; and Frances, married first to a grandson of Lord Hawick, and afterwards to Sir John Russell.

The last representative of the Protector was Oliver Cromwell, great-grandson of Henry Cromwell. He practised as a solicitor in London, and died at Cheshunt-park in 1821.—P. E. D.

CROMWELL, RICHARD, third son of Oliver the Protector, and the eldest who survived him, was born at Huntingdon on the 4th October, 1626. With his brothers Oliver and Henry, he was educated at Felsted in Essex, and afterwards removed to Lincoln's Inn, where he was admitted in 1647. He took no part in the military enterprises of his father, but seems to have been of an indolent and thoughtless disposition, that led him to prefer his own ease to the more onerous affairs of state. At the age of twenty-three he married Dorothy, daughter of Richard Major of Hursley in Hampshire, retired to Hursley, and lived in comparative obscurity. On the establishment of the protectorate, he became member for Monmouth and Southampton, and was appointed first lord of trade and navigation. In 1656 he was returned for Hampshire and the university of Cambridge, and in 1657 succeeded his father as chancellor of the university of Oxford. About this period he nearly lost his life by an accident, while attending the levee of the Protector. The steps upon which he was standing gave way, and Richard was precipitated to the ground with such violence as to cause him serious injury. He recovered, however, and was made a privy councillor, a colonel in the army, and president of Oliver's short-lived house of lords. In August, 1658, he was summoned to the sickbed of the Protector, and on the 3rd September the Protector was no more. The next day Richard Cromwell was proclaimed Lord Protector. He received compliments of condolence and congratulation from the ministers of foreign states, from the army and navy, from one hundred congregations and churches, and from counties, cities, and boroughs, with promises of adhering to his highness with their lives and fortunes against all opposers. For a few months the affairs of state went on with tolerable regularity. In January, 1659, Richard met his parliament, and made a speech to both houses. A financial investigation followed, and it was found that the treasury would not support the expenditure. The parliament was divided; some were protectorists, some republicans, and some probably may have had thoughts of Charles II. The country was again falling into confusion, and Richard had no governing faculty to control the approaching anarchy. The republican officers, headed by Fleetwood and Desborough, formed themselves into an opposition party known as the Wallingford-house cabal, and demanded the dissolution of parliament. With this demand Richard complied, and on the 22nd April, 1659, parliament was dissolved by proclamation, and Richard's authority virtually ceased. The members of the Long Parliament were called together by invitation of the officers, and to this parliament Richard, on the 25th May, made his submission; provision being made nominally for the payment of his debts and his removal from Whitehall. A large portion of the debt incurred for the funeral ceremonies of Oliver had descended to Richard, and, either to escape arrest or in the hope of procuring a settlement, he withdrew to France, and remained some time in Paris. In prospect of a rupture between France and England, he retired to Geneva. About the year 1680 he returned to England, and, under the assumed name of Clark, took up his residence at Cheshunt in Hertfordshire, where he lived "peaceful and forgotten to the advanced age of eighty-six, amusing himself and his friends with the memorials of the past, and exhibiting from time to time two large chests filled with the addresses and felicitations that had been presented to Oliver, portions of which he would laughingly read to his auditors." Richard died in 1712, leaving two daughters, who survived him.—P. E. D.

CROMWELL, THOMAS, Earl of Essex, an eminent statesman under Henry VIII., was the son of a blacksmith at Putney, and was born there about 1490. He spent some time at Antwerp as clerk in an English factory, and afterwards went to Rome, where he increased his knowledge of the Latin language. On his return to England he entered the service of Cardinal Wolsey, whose confidence he completely secured, and on the downfall of his patron courageously defended him in the house of commons from the charge of treason. His fidelity to the fallen minister gained for Cromwell the respect of the king, who conferred on him the honour of knighthood in 1531, made him a privy councillor, and his confidential favourite and prime minister. He held in succession the offices of chancellor of the exchequer, principal secretary of state, master of the rolls, and keeper

of the privy seal. He was also appointed chancellor of the university of Cambridge, visitor-general of English monasteries, and lord-chamberlain of England. Ultimately he was elevated to the peerage, and appointed vicar-general and vice-regent in religious matters next to the king. He employed his great influence to promote the cause of the Reformation, and zealously forwarded the overthrow of the papal authority, the reading of the holy scriptures, the dissolution of the monasteries, the demolition of images, and the religious instruction of the people. He also instituted parish registers, and various other social improvements. The king rewarded his zeal by the gift of some thirty monastic manors and valuable estates, and in 1539 created him Earl of Essex. The honours and wealth heaped upon him, as well as his energetic support of the principles of the Reformation, raised him up many powerful enemies. The haughty nobles despised him as a plebeian, while he rendered himself obnoxious to the common people by the subsidies which he exacted. Conscious of his danger, he sought to consolidate his power, and to strengthen his position at court by promoting the marriage of the king to Anne of Cleves; but this step ultimately proved his ruin. The disgust of Henry at his bride, soon led to his strong dissatisfaction with the promoter of the marriage. The enemies of the falling minister promptly availed themselves of the favourable opportunity afforded by the king's caprice to pour a flood of complaints into the royal ear. Cromwell was suddenly arrested and accused of treason, heresy, oppression, bribery, and extortion, without the liberty of reply. He was of course found guilty, and executed on Tower Hill, 28th July, 1540. Like his friend and fellow-reformer Crammer, Cromwell has been both unduly eulogized and vituperated. He was not a high-minded patriot or a sincere and consistent protestant; but an ambitious statesman, often unscrupulous and rapacious in his policy. It must be admitted, however, that he had a vigorous understanding and a very retentive memory, combined with great shrewdness and knowledge of character; and though his motives may have been often of a mixed nature, he was the author of many valuable ecclesiastical and social reforms.—J. T.

CRONE, DOMINICO PIETRO, a musician, was born at Bergamo in 1566, and died, probably at Naples, in the first quarter of the seventeenth century. His first engagement was as cantor at the cathedral of Oristano in Sardinia. Thence he proceeded to Spain in 1592, where he remained for some time without an appointment, but was at length admitted a member of the chapel of Philip II., on whose death he retained the same office under his successor, Philip III. He was next engaged as master of the royal chapel at Naples, this territory being at the time a state of Spain. Here he published, in 1609, his "Regole per il Canto Fermo," a treatise of much practical utility; and in 1613 his great work, "El Mellopeo y Maestro," in twenty-two books, extending to nearly twelve hundred folio pages. This voluminous essay, written in Spanish, is a summary of all the theoretical books upon music that had preceded it, comprising, in particular, considerable avowed quotations from Zarlino; it contains a complete course of instruction in ecclesiastical composition, with elaborate examples of the most complicated forms of canonical writing; it gives a complete description of all the instruments then known in Spain; and it devotes a large space to the discussion of the moral relationship between master and pupil, and of the important social and artistic influence the former has the power to exercise, together with the general view of the state of music at the time. In appropriating so much space to the examination of such extraneous branches of the subject as these last, the author anticipates the love of disquisition that distinguishes the writings of Dr. Marx in our own day. "El Mellopeo" was commenced before Crone left Bergamo, but laid aside for some years, and resumed in consequence of the writer's observation of the great requirement in Spain for a work on musical theory. This makes it strangely remarkable, that throughout its voluminous extent it contains no reference to the forms of song and dance music peculiar to that country. This book, though reprinted at Antwerp in 1619, is of extreme rarity.—G. A. M.

CROPPER, JAMES, a philanthropist and most efficient promoter of negro emancipation, was born at Winstanley in Lancashire in 1773, of pious parents, members of the society of Friends, to which persuasion he belonged through life. He entered a mercantile house in Liverpool, at the age of seventeen years, and soon won the confidence and respect of his employers. His mercantile career was successful and marked by high integrity.

He was one of the earliest advocates of the principles of free trade, and in 1808 took an active part in the efforts to procure the repeal of the "orders in council" which had proved so injurious to commerce. In 1816 he met with Mr. Clarkson, and soon joined the abolition party, entering warmly into their plans for the civilization of Africa, as a means of putting an end to slavery—an object which the abolition of the slave-trade in 1807 had failed to effect. In 1821 he published a series of "Letters to William Wilberforce" on the superior advantages of free labour. Two years afterwards he published two pamphlets on the economical advantages of free labour, and the importance of bringing the cotton and other productions of India into competition with the slave-grown commodities of the West Indies and America. When the last great effort to obtain the freedom of the slaves was commenced in 1831, he was the first, with counsel and means, to sustain the "agency committee," whose labours in organizing a systematic scheme of lectures all over the kingdom formed an important element in the final success of the abolitionists. He died at Fearnhead in 1840, aged sixty-seven years.—R. M., S.

CROSSE, ANDREW, an electrician, whose researches in science led him to a discovery of the laws of crystallization, and to many useful applications of electricity. The descendant of an ancient Somersetshire family, he was born in that county in 1784, at Fyne Court, Broomfield. At an early age he displayed a great love of natural science, more especially electricity. At the meeting of the British Association in 1836, which took place at Bristol, he was induced, not without difficulty, to come forward, and astonished both the chemical and geological sections with the account of his experiments. Science owes to this patient and ingenious observer the suggestion of much of which he has never reaped the honour. He appears to have been an humble and reverent man, ever anxious to share with his fellow-creatures the moral and philosophical truths which his life was spent in seeking. He died in July, 1855. Memorials of Andrew Crosse, published by Longman, 1857, supply particulars of his life and researches.—C. A. H. C.

\* CROWE, MRS. CATHERINE—the maiden name of this lady was STEVENS—was born at Borough Green in the county of Kent, and married in 1822 Lieutenant-colonel Crowe of the British army. Her first literary production was a tragedy, "Aristodemus," published in 1838; and this dramatic effort was succeeded by a great number of novels which have attained no inconsiderable popularity.

CRUDEN, ALEXANDER, author of the "Complete Concordance of the Holy Scriptures of the Old and New Testament," was born at Aberdeen in 1701, and studied at Marischal college, with the view of entering the christian ministry. Before his studies were completed, however, his mind fell into derangement, and he was confined for some time in a private asylum. On recovering he left Aberdeen for London, where, after being for some time occupied as a private tutor, he opened in 1732 a bookseller's shop under the Royal Exchange, and employed himself at the same time as a corrector of the press. In 1733 he began to draw up the Concordance, which was published in 1737, and an improved edition of it in 1761. The first edition was dedicated to Queen Caroline, who had given the author some reason to expect her patronage of the work; but her death having occurred shortly before its publication, the author's hopes from that distinguished quarter were doomed to disappointment, and, his affairs becoming embarrassed, he withdrew from trade and fell into a state of melancholy, which was accompanied with a return of some of his former mental delusions. Imagining that he had received a divine commission to rebuke and reform an ungodly and degenerate age, he assumed the style and title of Alexander the Corrector. He continued to earn his support partly by publications of his own, and partly by superintending the works of other authors in their progress through the press. He was the author of "A Scripture Dictionary, or Guide to the Holy Scriptures," 2 vols, 8vo, which appeared at Aberdeen shortly before his death, which took place November 1, 1770. He was found dead upon his knees. The Concordance is a work of immense labour, great accuracy, and of enduring usefulness to the church of Christ. He was also the compiler of the elaborate index attached to Newton's edition of Milton. It is singular that a mind so prone to run into enthusiastic heats and fancies, should have been capable of a kind of labour at once so toilsome and so mechanical and dry.—P. L.

\* CRUIKSHANK, GEORGE, a remarkable artist, born in London about 1795, the son of a caricaturist of some note in his day. His first efforts were designs for infant primers, and song-books, comic and sentimental. In the *Scourge*, and other like publications, he exhibited his masterly satiric talent. In 1817 he was allied with Mr. William Hone in the production of illustrated political pamphlets. In 1820 the trial of Queen Caroline furnished the satirist's pencil with ample occupation. "Non Mi Ricordo," and the "Queen's Matrimonial Ladder," reached an extraordinary number of editions. Soon after this, however, Mr. Hone discontinued his publications, and our satirist began to abandon what we may distinguish as his first or political manner. In his second manner, the genial generous humour of the artist found full room in the illustration of comic narrative. His aquatint plates for Mr. Pierce Egan's Tom and Jerry; his drawings on wood for the Three Courses and a Dessert; his etchings for Mr. Ainsworth's Jack Sheppard; for Mr. Charles Dickens' Sketches by Boz, and Oliver Twist; for Mr. Thackeray's Fatal Boots and Cox's Diary; his illustrated editions of Fielding and Smollett, and of Grimm's German Tales, are all widely known, and as excellent as they are famous. In 1843 was produced, with great success, "George Cruikshank's Omnibus," succeeded in 1845 by "George Cruikshank's Table Book," of which Mr. Gilbert à Beckett was the editor. In many of these plates, the delicate manipulation of the etching needle is carried to a height hardly to be matched in the whole range of the art. From about 1847 may be traced Mr. Cruikshank's third manner; in which he sought to be less the critic and the satirist than the moral teacher. Mr. Cruikshank had joined the temperance movement. He published a series of plates called the "Bottle," advocating his peculiar views with Hogarthian energy and power. These met with an extraordinary success, and the "Bottle" was dramatized at every minor theatre. The "Drunkard's Children" followed with less success. Among the oil paintings he has produced, are his "Tam o' Shanter;" "Runaway Knock;" "Cinderella;" and "Disturbing the Congregation," the last purchased by the prince consort, and engraved. Finally, it may be stated, that Mr. Cruikshank is no less excellent as a man, than he is admirable as an artist.—W. T.

CRUIKSHANK, W. CUMBERLAND, a celebrated surgeon of the last century, better known, perhaps, for his reputation as an anatomist and physiologist. He was born in Edinburgh in the year 1745. He was originally intended for the church, but this did not accord with his own views, and he was allowed to study medicine under the direction of Dr. Moore for three years. About this time Dr. William Hunter was in want of an anatomical assistant, and, through Dr. Moore's representations, Mr. Cruikshank was chosen. He therefore arrived in London in 1771, and was immediately appointed by Dr. Hunter to the care and arrangement of his library and museum. In a little time he was associated with Dr. Hunter in his lectures, which he gave with great success; and, at his death, he became connected with the highly esteemed Dr. Baillie. In addition to his anatomical engagements he had an extensive private practice. He attended Dr. Samuel Johnson, the great lexicographer and moralist, in his last illness. Mr. Cruikshank enjoyed the intimacy of most of the literary men of his day, and merited their esteem. His conversation was peculiarly brilliant and delightful. He died on the 27th June, 1800. In 1797 he was admitted a fellow of the Royal Society. He also received an honorary degree from the university of Glasgow, and was a member of the Imperial Academy of Vienna. His publications, though few in number, are of intrinsic value. In 1786 Mr. Cruikshank published the work upon which his professional merit rests, and one which fairly takes its position among the standard volumes of medical science. This was entitled "The Anatomy of the Absorbing Vessels of the Human Body." A second edition, with many additions, was published in 1790. It has been translated into French, Italian, and German. In 1798 appeared an octavo volume "Experiments on the Insensible Perspiration of the Human Body, showing its affinity to Respiration."—E. L.

CRUM, WALTER, an eminent British chemist, was born in Glasgow in 1796. Though actively engaged as a partner in one of the most extensive bleaching and calico-printing establishments in Scotland, he made a number of valuable contributions to the science of chemistry. His Memoir on Indigo, published in 1823, placed him at an early age in a distinguished

position as an original investigator; and his analysis of the blue colouring principles of that dyestuff, though made at a time when the appliances for organic research were inferior to those at present in use, is still regarded and quoted as the most satisfactory yet obtained. Several of his inquiries were directed to the application of chemistry to the industrial arts; and among them his method of examining weak solutions of bleaching powder is deserving of notice as an ingenious instance of chromatic testing. In his last and most elaborate investigation, he described one insoluble hydrate, two insoluble binacetates of alumina, and made known a remarkable allotropic of that base, which is soluble in water, gelatinized by acids, and devoid of power as a mordant. In 1852 he was chosen president of the Glasgow Philosophical Society, and subsequently of the Andersonian University. He was a fellow of the Royal Society of London, and a member of several other scientific bodies. He died on the 4th of May, 1867.—F. P.

CTESIAS, a celebrated physician, a native of Cnidus in Caria, a famed seat of medical knowledge. He was a contemporary of Xenophon. He was for about seventeen years resident at the court of Artaxerxes Mnemon, in Persia, as private physician. How he came there is not certain. Diodorus says he was a prisoner of war, retained and honoured because of his medical skill. The manner of his leaving, too, is disputed. He states himself that, desiring to return to his native city, he asked and obtained leave of the king. Ctesias wrote a great history of Persia, long since lost—there are fragments of it in Diodorus, Athenæus, Plutarch, &c.; and a treatise on India. Of this, as of the other, there is an abridgment in Photius.—J. B.

CUBIÈRES, SIMON LOUIS PIERRE, Marquis de, a French naturalist, was born at Roquemaure on 12th October, 1747, and died at Paris on 10th August, 1821. He was first a page of Louis XV., then a captain of cavalry. He was a man of the world and a courtier, and at the same time devoted attention to science. He had a good mineralogical collection, a chemical laboratory, and a small botanic garden. He made an excursion to Rome and Naples, and descended into the crater of Vesuvius. He also visited Sweden, and examined the scientific collections there. He accompanied Louis XVI. to Paris on 6th October, 1789, and on that occasion his hat was struck by a bullet intended for the king. He was afterwards imprisoned at Versailles. On his release, he went to Rome as one of the commissioners appointed to preside over the conveyance of the works of art in painting and sculpture; and he subsequently was appointed conservator of the statues in the Versailles garden.—J. H. B.

CUDWORTH, the famous philosopher, was born at Aller in Somersetshire in 1617. His father, rector of the parish, having died, his mother was married to Dr. Stoughton, under whose care his young step-son was so well prepared for the university, that in his thirteenth year he was admitted into Emanuel college, Cambridge. In 1632 he matriculated, was created M.A. in 1639, and soon after chosen a fellow. Such was his rising fame, that in a short time the number of his pupils exceeded all precedent, the famous Sir William Temple being one of them; and in 1641 he was presented to the rectory of North Cadbury in Somersetshire. In 1642 he published a discourse concerning "The true nature of the Lord's Supper," and another called "The Union of Christ and the Church Shadowed." In 1648 Cudworth took the degree of B.D., and was chosen master of Clare-hall, his predecessor having been dispossessed by the parliamentary visitors. In the following year he became regius professor of Hebrew, and now devoted himself to academical labours, and especially to the study of Hebrew antiquities. In March, 1647, he preached before the house of commons, and his sermon, on 1 John ii. 3, 4, received the thanks of the house, and was afterwards published. In 1651 he took the degree of D.D. Shortly afterwards he left the university for a season, pecuniary difficulties being usually alleged as the cause; but he returned after three years' absence, having in 1654 been chosen master of Christ's college. In 1657 he was appointed one of a committee for the revision of the English translation of the bible, but, as Whitlocke records in his Memorials, "it became fruitless by the parliament's dissolution." Through his intimacy with Thurloe, Cromwell's private secretary, he was often consulted by the Protector on university matters. But his loyalty was only in suspension, and on the restoration of Charles II. he wrote a Latin ode of welcome. In 1662 the bishop of London presented him to the

rectory of Ashwell in Hertfordshire, and in 1678 he was installed a prebendary of Gloucester. It was in this year, 1678, that Cudworth published at London in folio his "True Intellectual System of the Universe, wherein all the reason and philosophy of Atheism is confuted, and its impossibility demonstrated." The imprimatur is dated in 1671, for the publication had been virulently opposed by some parties at court. This huge and erudite work is only a fragment. There are three false theories of the universe, or three prevalent modes of atheism, or as he says, "Fatalists that hold the necessity of human actions may be reduced to three heads: 1st, Such as, asserting the Deity, suppose it irrespectively to decree and determine all things, and thereby make all actions necessary to us. 2nd, Such as suppose a Deity that, acting wisely but necessarily, did contrive the general frame of things in the world, from whence by a series of causes doth unavoidably result whatever is done in it. And lastly, Such as hold the material necessity of all things without a Deity." These propositions are discussed in the inverse order in which the author has stated them; and it is the last of them—atheistic fatalism—which occupies that portion of the "Intellectual System" which was published by its author. The "Treatise on Eternal and Immutable Morality," published after his death, seems to be the sketch of the second division; and the "Discourse on Liberty and Necessity" was apparently the rough outline of the third part. The most important of his works—that on which its author laid the greatest stress, and over which he had longest pondered—was thus never completed. In the first chapter of the "Intellectual System" Cudworth describes the old philosophy, affirming it to be theistic prior to the time of Democritus and his atomic physiology, and there is a long and learned history of the theory. In the second are rehearsed the arguments made in defence of it. In the third he passes to what he calls the hylozoic atheism, that especially of Strato, who held that a species of life without intelligence pervaded matter—"whatever is being made by certain inward natural forces and activities." The fourth chapter "swells," as he says himself, "into a disproportionate bigness," and enters into a long and very laboured argument filled with diversified proofs and criticisms, that the unity or "oneliness" of the divine essence was a common belief in antiquity. Many of the exegetical remarks are acute and powerfully supported, though not a few are recondite and fanciful, resting on expressions which are sometimes casual and not to be insisted on, and sometimes poetical and not to be taken as sober and formal avowals of belief or opinion. There may be seen in these discussions the unconscious effort which a theorist often puts forth in tenaciously grasping at what is apparently for him, and in cunningly explaining away what is hostile to his purpose. Some of his most ingenious paragraphs are rather specimens of imposition than exposition, of imposing a sense rather than edueing it. The last chapter, which is somewhat miscellaneous, readduces previous objections, and answers them; restating in other forms arguments already employed, but yet giving utterance to more original thought than is found in the previous portions of the work. In the second treatise—"On Eternal and Immutable Morality," Cudworth manifests his hostility to every form of materialism, holding that the mind possesses pure conceptions which are not "phantastical" or derived from the senses, but are themselves eternal truths. Among these are the conceptions of right and wrong, and they are not "unreal," as Hobbes maintained, because they were not perceptible by the senses; but they must have existed for ever in the divine mind, and are, therefore, as little liable to change or destruction as is the Supreme Intelligence. Cudworth, therefore, infers that those are little better than atheists who preach that God may command what is contrary to moral rules; and says truly, "That nothing which is naturally just or unjust can be made so by mere authority." Sound theism must maintain that God is unchangeably good, and holy; and that all his commands must resemble their source, the "law being holy, and just, and good." In all moral as distinct from positive duties, the statute pronounced by the divine will has its deep and immovable foundation in the divine nature. To men the expressed will of God is the rule of duty, but the ultimate basis of obligation lies in his pure and unchanging essence.

The learning in which Cudworth's idealism is set, is vast and multifarious. He was at home in every region of the classics, and he quotes them with a prolix exuberance which often retards

his progress and obscures his reasonings. Yet he does not simply retail their opinions, for their views become mingled with his own; and his apology in the spirit of the times is, that he thought that "the mixture of philology throughout the whole would sweeten and allay the severity of the philosophy." In fact, he writes in the style of the old philosophy; so thoroughly was he imbued with it, that he writes like a Neo-Platonist in disguise. It is not a series of quotations arrayed and commented on, as in Warburton; but the soul is Platonic as well as the dress and ornament. It is not borrowing Plato's clauses, but throwing off thoughts and imagery in Plato's spirit. It is not a few garlands culled from Greek philosophy, and tastefully arranged; the atmosphere is laden with the perfume of living flowers. His fault is, that he sees far too much affinity between Platonic ideas and revealed truths, though he does not go the length of Theophilus-Gale, his compeer, in tracing all Greek wisdom to Hebrew communication. Had Cudworth been less learned, he would have been reckoned more acute and original. Not so subtle as Hobbes, but vastly more erudite; equal to him in power, but below him in style—he not only demolishes the author of the Leviathan with honest and open assault, but piles up a monument of Greek lumber over his remains. The idealism of Cudworth, though not tenable on many points, was an exalted and noble protest for the dignity of human nature, which the materialism of Hobbes would have debased and fettered, robbing it of all that was ethereal and divine, and making it but a succession of sensational phenomena.

In the course of his illustration of Strato's species of atheism, which gives a kind of animated being to the universe, Cudworth propounds a theory of his own, as to an inherent energy which he calls "a plastic nature—a substance intermediate between matter and spirit"—the instrument by which laws are able to act without the immediate agency of God. But it is a needless and unsatisfactory hypothesis to ascribe causation to a reasonless thing or being, as if there dwelt in nature such a vitality as belongs to a plant. Cudworth regarded nature as something different from God; for omnipotence "would despatch its work in a moment, whereas nature makes errors and bungles when the matter is inept and contumacious;" and divine providence would appear "operose, solicitous, and distractions," did we imagine that everything was done immediately by Divinity himself. But it is a vain speculation truly to insert a power which is not God, but does his work; which is beneath him, and yet is so liable to be identified with him; and which prosecutes certain ends, and yet "cannot act electively nor with discretion."

Cudworth belonged as a divine to the "latitude-men" at Cambridge—a party, as Mackintosh says, "who came forth at the Restoration with a love of liberty inbibed from their Calvinistic masters, as well as from the writings of antiquity, yet tempered by the experience of their own agitated age." Cudworth was no polemic; he placed religion in the emotional, not in the intellectual part of man's nature. Suspicions were entertained of him that he held such views of the trinity as were ascribed to Milton and Clarke.—(Nelson's *Life of Bishop Bull*, p. 339.) His enemies, the licentious and sceptical admirers and followers of Hobbes, raised many charges against him, accusing him of the very error he had laboured so strenuously to overthrow. He was suspected, as Shaftesbury tells us, "of giving the upper hand to the atheists;" or as Warburton says, "he was held up as being an atheist in his heart, and an Arian in his book." Dryden, in his preface to his translation of the *Æneid*, insinuates that he has raised "such strong objections against the being of a God, that many think he has not answered them." Such malicious misrepresentation prevented him, according to Warburton, from finishing his great work. The "Intellectual System" was translated into Latin and annotated by Mosheim, 1733, and an edition was published with his notes in English, London, 1845. Dr. Cudworth died at Cambridge, June 26, 1688, and was buried in the chapel of Christ's college. Some of his MSS. are still preserved in the British museum, such as a "Commentary on the Seventy Weeks of Daniel," a "Treatise on the Creation," one on the "Learning of the Hebrews," and another called "An Explanation of the notion of Hobbes concerning God and of the extension of Spirits." It raises a smile to hear no less a man than Henry More saying of the discourse on the "Seventy Weeks," that "it is of as much price and worth in theology, as either the circulation of blood in phisic, or the motion of the earth in natural philosophy;" while Isaac D'Israeli

replies with a sneer, "Judaism still remains." Cudworth's daughter, Damaris, Lady Masham, was the intimate friend of Locke, and cheered the philosopher. Her father's manuscripts were left to her care, and after being for some time mistaken, nay purchased, as those of Locke, and used by Dodds in his Bible, they were, after other mischances, safely lodged in the British museum.—(*Life of Birch*, prefixed to the edition of his work, 1845.)—J. E.

CUJAS, JACQUES, born at Toulouse in 1520; died at Bourges in 1590. His father was a weaver or wool-comber, and the name was originally written Cujans. Towards the close of his life, the subject of our notice, then known all over Europe by the Latin form of Cujaccius, chose to sign himself *De Cujas*. He is said to have learned Latin and Greek without the assistance of masters. In the year 1547, Cujas commenced teaching law at Toulouse. The Institutes of Justinian formed his text, and crowds of students—some from distant countries—came to his lectures. For seven years he was thus occupied; each year his reputation increased. Till his day Roman law was everywhere taught with reference to the immediate requirements of practice in the courts of law. Alciat and Cujas introduced another mode of teaching, and may be described as the founders of the historic school of law. A professorship of law became vacant at Toulouse. Cujas' claims to the office were absurdly opposed, and at length rejected. He then passed from Toulouse to Cahors—from Cahors to the university of Bourges. Cujas and the professors whom he met at Bourges quarrelled, and he did not remain long there. In August, 1557, he went to Paris, and from it was invited to occupy a professorial chair at Valence. At this period he published his "Notes on the Institutes;" on the *Receptæ Sententiæ* of Paulus; and on some of the titles in the Digest. In 1558 he married the daughter of a Jew, who practised medicine at Avignon. In 1559 we find him again at Bourges. Margaret de Valois, duchess of Berri, was anxious for the reputation of the university, and she invited Cujas to occupy the chair of law. She was married to the duc de Savoie, and in 1566 we find Cujas at Turin, conseiller to him. In the following year he returned to France, and was given the superintendence of the university at Valence, with the important privilege of appointing to such professorships as might become vacant. Religious war drove him from Valence. He went to Lyons for refuge, but there found things worse. We afterwards find him at Besançon and Avignon, still teaching, or solicited to teach law. He thought to have settled at Avignon, but the inducements to that course were altered by the death of his wife, and he returned to Valence. Among his pupils were De Thou and Joseph Scaliger. In 1573 he was appointed conseiller honoraire du parlement de Grenoble. The religious war had created considerable confusion with respect to property in the south of France, and when something like peace was restored, Cujas was appointed one of the commissaires, to remedy, as far as possible, the mischiefs. In 1584 Gregory XIII. made some fruitless efforts to induce Cujas to settle at Bologna. In 1586 he married Gabrielle Hervé. Cujas refused to support the claims of the cardinal de Bourbon against those of Henri of Navarre to the throne of France. "I cannot," said the old jurist, "consent to falsify the laws of my country." He wished to avoid mingling in the strange distractions of the period in which his lot was cast. Cujas' death took place in 1690. He directed that his funeral should be private. This was impossible, as his pupils determined to bear the body in state. The catalogue of Cujas' books at the period of his death still exists in the imperial library at Paris. There were among them more than five hundred manuscripts. To transcribe the praises of Cujas from the works of succeeding jurists would be an endless task. D'Aguesseau says that he has written the language of law better than any modern, and perhaps as well as any of the ancient jurists. Gravina's praise is yet more high, and so in our own day is that of Lermicier.—J. A., D.

CULLEN, WILLIAM, a distinguished physician, born at Hamilton in Scotland, on the 18th April, 1712. His father was an attorney, and factor to the duke of Hamilton. Dr. Cullen was one of nine children, and gave early indications of unusual intelligence and a retentive memory. He was apprenticed first to a surgeon-apothecary in Glasgow, and in 1729 went to London to obtain further knowledge of his profession, and shortly after was appointed surgeon to a

merchant vessel trading to the West Indies, of which his uncle was captain. He soon, however, returned to his own country, and practised in the parish of Shotts, a region proverbial even in Scotland for bleakness and poverty. In the year 1734, and three following years, he attended the medical classes of Edinburgh, where he distinguished himself. In 1736 he commenced practice as a surgeon in Hamilton, and was very successful in his treatment of the duke of Hamilton, whose friendship and good offices he thus secured for the rest of his life. It was at this time that Cullen became acquainted with William Hunter. In 1740 Cullen took the degree of M.D. at Glasgow, and in 1744 commenced giving lectures there on the practice of medicine. In 1746 he began his first course of lectures on chemistry in conjunction with Mr. Carrick, and in 1756 he was called to Edinburgh to fill the chair of chemistry vacated by the death of Dr. Plumer. At the same time that he lectured on chemistry he also gave lectures on clinical medicine at the Royal Infirmary. In 1763 the professor of *materia medica* in the university, Dr. Alston, died, and Cullen was suddenly called upon to deliver his course, which he did with great success. These lectures having been published by some of his pupils, induced him subsequently to give to the world his great work entitled "A Treatise of the *Materia Medica*," which was published in 2 vols. 4to, in 1789. On the death of Dr. Whyte in 1766, Cullen was appointed to the chair of institutes, or theory of medicine. It was in this chair that he began to attract attention by the novelty of his views with regard to the functions of the nervous system. Although at the present day little that Cullen held could be regarded as conclusive, yet he grasped many of the fundamental facts of nervous physiology. He distinguished between the functions of the nerves of sensation and motion, and dwelt upon the nervous system as the seat of all psychological manifestations. Upon his physiological views he built up his great pathological doctrine of excitement and collapse, which formed the basis of his subsequent teachings in the chair of practical medicine. To this chair Cullen was appointed on the death of Dr. Rutherford in 1768. He did not, however, occupy it at first alone. He and Dr. Gregory were both candidates for the vacant chair, which resulted in a friendly compromise, by which each was to fill the chair of practical and theoretical medicine alternately. On the sudden death of Dr. Gregory in 1773, Cullen became the sole professor of the practice of medicine. From the time that Cullen began to lecture on the institutes of medicine his reputation gradually increased, and he drew to the university of Edinburgh students from all parts of the world. In 1777 he published his great work in 4 vols. 4to, entitled "First Lines of the Practice of Physic." In this work the mental training he had undergone was made evident in the introduction of views on the nature and treatment of disease, much simpler, and truer to nature than any that had hitherto been published. He had previously, in 1769, published a work on the classification of diseases, with the title, "*Synopsis Nosologiæ Methodicæ*," and his first lines may be regarded as a more complete exposition of the views of the nature of disease he had laid down in this remarkable work. Dr. Cullen resigned his professorship of medicine in 1789. He died on the 5th of February, 1790, leaving behind him only a small fortune, but an imperishable name.—E. L.

CULPEPPER, NICHOLAS, an English astrologer and herbalist, was born in London in 1616, and died there in 1654. He wrote a curious herbal, in which he describes the qualities of plants, more especially in an astrological point of view.—J. H. B.

CUMBERLAND, RICHARD, dramatic author, novelist, and poet, was born on the 19th of February, 1732, in the master's lodge of Trinity college, Cambridge, at that time the official residence of his maternal grandfather, Dr. Bentley. In his sixth year he was placed at the Bury St. Edmund's grammar school; at the age of twelve was removed to Westminster school, where Vincent Bourne was then usher of the fifth form, and where he had for schoolfellows Warren Hastings, Colman, and Lloyd; and two years afterwards became an under-graduate of Trinity college, Cambridge. Soon after taking his B.A. degree, he was elected to a fellowship of his college. This was brilliant success for a boy only eighteen years of age. Young as he was, Richard Cumberland almost immediately after obtaining his fellowship became the private secretary of the earl of Halifax, through whose interest he subsequently obtained the post of crown agent for the pro-

vince of Nova Scotia. As Ulster-secretary he afterwards accompanied Lord Halifax to Dublin, and in Dublin was offered a baronetcy by his patron. This dignity he declined, and from that date his influence with Halifax waned and speedily came to an end. On leaving Ireland he was appointed clerk of the reports in the office of trade and plantations, and some time afterwards was advanced to be secretary of the board of trade. In 1780 he was sent on a secret mission to endeavour to draw Spain away from the French interest; but the result of his diplomacy was the reverse of success, and in 1781 he was recalled under circumstances peculiarly calculated to wound his sensitiveness. The expenses of his mission, amounting to no less than £5000, Lord North's ministry declined to refund; and the unfortunate man, in order to satisfy the demands of his creditors, was compelled to part with his paternal estate. Soon after this Burke's economy bill broke up the board of trade, and Cumberland was compensated for the abolition of his post by a small pension. On this disastrous conclusion to his official career he retired to Tunbridge Wells, and for the remaining thirty years of his life devoted himself to literature. He had been an author from his earliest manhood, and from first to last his pen was alike versatile and productive. He gave the world at least thirty dramatic performances, including operatic pieces, tragedies, and comedies, several of which kept the stage for a time. Besides his dramatic writings, Cumberland was author of other but dull and now forgotten works. He wrote farther the "Memoirs of Richard Cumberland," for which the author obtained £500, and in which he gossips, with a garrulity and magnificence truly amusing, of himself, his family, his genius, and his writings. He died in London on the 7th of May, 1811. As a man Cumberland was much more admirable than as a writer; he was generous to an extreme, punctiliously honourable. Vanity, however, was his weakness, and irritability his failing. He was the original of Sheridan's Sir Fretful Plagiary in the Critic.—J. S.

CUMBERLAND, WILLIAM AUGUSTUS, duke of Cumberland, one of the princes of the English blood-royal, was the third son of George II., and was born in 1721. He selected the military profession, and became conspicuous for his extraordinary courage, rather than for his professional skill. He was wounded fighting by his father's side at the battle of Dettingen in 1743, and was defeated at Fontenoy by Marshal Saxe. He had a better fate, however, in his campaign against Prince Charles Stuart in Scotland, whom he defeated at Culloden in 1746. But he tarnished the glory of his victory by his shocking cruelty to the vanquished Highlanders, which procured him the well-earned name of the Butcher. The duke was again defeated in 1747 by Marshal Saxe at the battle of Lawfield. In 1757 he was equally unfortunate at Hastenbeck against Marshal d'Estrees, and was compelled to conclude the convention of Closterseven, surrendering his army to the enemy. The duke died in 1765, and though during the greater part of his career he had been exceedingly disliked by the people, the state of public affairs caused his death to be greatly lamented. He was a prince of vigorous understanding, courageous, truthful, and honourable; but his nature was hard, and what seemed to him justice was rarely tempered with mercy.—J. T.

CUNARD, SIR SAMUEL, Bart., was born at Halifax, Nova Scotia, in 1788. His father was descended from a Quaker family, who emigrated from Wales to Philadelphia early in the seventeenth century. At an early age, Samuel Cunard entered on a mercantile life, prospered remarkably, and, becoming a large shipowner, engaged in the West India trade and the South Sea whale fishery. In 1815 he contracted with the admiralty to convey the mails to Boston, St. John's (Newfoundland), and Bermuda, in connection with the old Falmouth packets, and this service he continued till his death, screw steamers being substituted in 1848 for sailing packets. In 1839, in conjunction with Messrs. Burns of Glasgow, and Messrs. Marson of Liverpool, he contracted with government to convey the American mails by steam-ships, and the regularity with which this service was performed her majesty's ministers acknowledged in 1859, by raising Cunard to the dignity of a baronet of the United Kingdom. He died on the 28th of April, 1865.—W. W.

CUNNINGHAM, ALLAN, was born at Blackwood, near Dalswinton in Dumfriesshire, on the 7th December, 1784. His father was factor or land-steward to Mr. Miller of Dalswinton. Allan was apprenticed to his uncle, a builder, but the scheme did not hold, probably on account of his devotion to the muses,

and the young poet proceeded to London in the year 1810. Here he connected himself with the newspaper press. In the same year appeared Cromek's *Remains of Nithsdale and Galloway Song*, nearly all the pieces in which, though published as originals, were composed by Cunningham. In 1814 he became foreman or clerk of the works to Sir Francis Chantrey, in whose establishment he continued until the death of that eminent sculptor in 1842. Perhaps no foreman ever rendered more important services to his principal than did Cunningham to Chantrey. His vivid and intelligent criticism delighted and informed all visitors to the studio, while his powers of conversation and his unflinching activity were the means of bringing to Chantrey many an important and lucrative commission. It was through Cunningham that Sir Walter Scott and Southey were induced to sit. Chantrey is said to have been indebted to him for many poetic suggestions; in particular, for the happy thought of placing a bunch of snow-drops, newly gathered, in the hand of one of the *Sleeping Children*—the celebrated monument in Litchfield cathedral. Shortly before his death, Cunningham was prostrated by a stroke of paralysis, the enfeebling effects of which can be traced in portions of his last work, "*The Memoirs of Sir David Wilkie*." He died on the 29th October, 1842. Cunningham was an indefatigable writer. Besides several novels, he was the author of a dramatic poem called "*Sir Marmaduke Maxwell*," and of an epic entitled "*The Maid of Elvar*." He wrote "*The Lives of Eminent British Painters, Sculptors, and Architects*," for the Family Library, and published an admirably edited re-issue of Burns' works, in eight volumes, to which he prefixed a life of the poet, containing many facts and anecdotes till then unknown. His poems are for the most part in the manner of Burns, but greatly inferior.—T. A.

CUNNINGHAM, ALLAN, an eminent botanist and traveller, was born on 13th July, 1791, at Wimbledon in Surrey, where his father, a native of Renfrewshire, was a gardener. Having become connected with the garden at Kew, he was introduced to Robert Brown, and was by him made known to Sir Joseph Banks. By this means his botanical merits were noticed, and he was appointed on 4th September, 1814, botanical collector in the southern hemisphere for the royal gardens at Kew. Along with Mr. James Bowie, he sailed from Plymouth on 29th October, 1814, and proceeded to Rio Janeiro. He then visited various places in the neighbourhood of Rio and in Brazil, and made extensive collections. Subsequently he visited New South Wales, and settled for a time at Paramatta. Thence he proceeded with an expedition to trace the courses of the Lachlan and Macquarie rivers, under the command of Mr. John Oxley, the surveyor-general. His next expedition was to the north and north-west coast of New Holland, under the direction of Captain Philip Parker King. Van Diemen's Land was also in part explored by him, and he likewise examined the botany of New Zealand and of Norfolk Island. In all these excursions Mr. Cunningham made extensive and valuable collections, and contributed largely to the botany of Australia. After an absence of seventeen years, he returned to England in July, 1831, in a very indifferent state of health. He was offered the situation of colonial botanist in New South Wales, on the death of Mr. Thomas Fraser, but he declined in favour of his brother Richard, also a distinguished botanist, who was killed in April, 1835, by one of the native tribes, two years after getting the appointment. Allan now accepted the office, and proceeded to Sydney. The duties of this new office appear to have been too laborious for him. His strength failed, and he died on 27th June, 1839, at the age of forty-eight. The greenhouses and conservatories of Britain owe many of their finest ornaments to the exertions of Allan Cunningham. The following are his publications—"A Specimen of the Indigenous Botany of the Mountain Country between the Colony round Port Jackson and the Settlement of Bathurst;" "*Remarks on the Vegetation of certain Coasts of Terra Australis*."—J. H. B.

CURRAN, JOHN PHILPOT, born at Newmarket in the county of Cork, Ireland, in 1750; died in London in 1817—the son of James Curran, who held the office of seneschal of Newmarket, and Martha Philpot. The future orator was educated at a classical school in Newmarket, then conducted by the Rev. Nathaniel Boyse. From Newmarket he was sent to the endowed school of Middleton, in the county of Cork, from which he entered Trinity college, Dublin. Here, in 1770, he became a scholar of the house. In 1773 he went to London to

keep law terms at the inns of court. Curran entered the middle temple, and seems from the first to have studied with great diligence, but without any guidance. He speaks in a letter written soon after he was fixed in London, of reading for ten hours a day, "seven at law, three at history and politics." He attended debating societies, and spoke at several of them. The claims of the Roman catholics were a frequent subject of discussion: from the earnestness with which he advocated their cause, and from some peculiarity in his dress, he was taken for a Romish ecclesiastic, and was called the Little Jesuit from St. Omer. His only acquaintances at this time in London were a few law students. He saw Goldsmith once in a coffee-house, Garrick two or three times on the stage, and Lord Mansfield on the bench; with Macklin he formed some acquaintance, which was afterwards renewed in Dublin.

Curran had physical defects which would have unfitted a less determined man for oratory—a stutter, a shrill voice, a provincial accent. To remove these defects he read each day aloud, imitating the tones of the most skilful speakers. His person was short and stunted, and he constantly recited before a glass, "to acquire such gesticulation as was best adapted to his imperfect stature." Curran married in the second year of his residence in London. In 1775 he was called to the Irish bar, and went the Munster circuit. It is said that his success was slow. This seems a mistake. His fee-book shows that in his first year, he received eighty-two guineas, in the second, between one and two hundred, and so on in proportion. "The monks of the screw or the order of St. Patrick," of which Curran was the prior, was a political and convivial club, instituted in 1779. It consisted of professed and lay members—the lay members had no rights, except the important one of dining in the refectory. The professed members were chiefly barristers and members of parliament. Their meetings were conducted with fantastic solemnity. They met, as they called it, "in convent," each of the members wearing the habit of the order, a black tabinet domino. Latin graces were pronounced by the precentor or chaplain before and after commons. In 1783 Curran was returned to parliament, and about the same time obtained a silk gown. He sat in parliament during this and the next session, till the summer of 1797. What Burke has called the Irish revolution, occurred in the year before Curran first sat in parliament. The right of self-government had been asserted for Ireland, as if to show of how little value are abstract rights. The representative body was entirely and utterly corrupt, the constituencies were worse. In a sentence we may state what he did in parliament. His first speech was on the right of the commons to originate money bills, December 16, 1783; attachments, February 24, 1785; commercial regulations, July 23, 1785, and August 15, 1785; pensions, March 13, 1786; catholic emancipation, October 17, 1796. The perpetual mutiny bill was repealed, a habeas corpus act was passed, an act for the independence of the judges, and an act in favour of dissenting protestants, but catholic emancipation was resisted. Curran, on one occasion, was in one of his loudest dithyrambs; his swarthy cheek burned, his black bright eyes flashed fire, his very person seemed enlarged as he listened with delight to the violent applause of his tumultuous admirers; he looked over to the treasury benches to see the effect on Fitzgibbon, then attorney-general, whom he expected to behold writhing under the lash. Fitzgibbon was fast asleep. "I envy," said Curran, who was not at the moment himself to be envied, "I envy his tranquillity. I do not feel myself so happily tempered as to be lulled to repose by the storms that shake the land. If they invite any to rest, that rest ought not to be lavished on the guilty spirit." Fitzgibbon awoke, and replied scornfully to what he was told Curran had said. A duel followed. The parties exchanged shots, and left the ground unreconciled.

Curran passed his vacations as often as he could in the neighbourhood of his birthplace. He is said to have been fond at all times of attending rustic wakes and weddings, and he describes himself as forming his first notions of eloquence from the language and the songs of the mourners over the dead—customs now falling into disuse, or existing only in retired districts of Ireland. In 1787 Curran visited France. Some compliment being paid him by the superior of a convent in a town through which he passed, he told them he was prior of a monastic institution in his own land, and in this character claimed to be intrusted with the key of the wine cellar during his stay. The

monks were amused with his playful sally, and a few days were pleasantly passed among them. In the next year he visited Holland. His views of both France and Holland were unfavourable. The next year, 1789, was a remarkable one in the history of the empire. The king's illness led to different arrangements as to a regency in England and Ireland, and more than inconvenience might have arisen had the illness continued.

Curran ceased to practise in the court of chancery. Fitzgibbon was now chancellor. The solicitors thought it unsafe to send business to a man who lost no opportunity of saying offensive things to the presiding judge; and it is probable that the judge had no wish to hear more frequently than was unavoidable so rash an advocate. The first recorded speech of Curran's in any court of judicature was at the privy council, where Fitzgibbon (now Lord Clare) presided, and Curran took the opportunity of describing Lord Clare, under the pretence of giving the imaginary portrait of the former chancellor. The circumstances of Ireland now called Curran to practise in the criminal courts. In 1794 he defended Mr. Hamilton Rowan, accused of circulating a seditious libel. His client was convicted and sentenced to a lengthened imprisonment. While in prison a charge of high treason was brought against him. He was fortunate enough to make his escape, and some years after obtained a free pardon. This was the first of a series of state trials, some for libel, some for high treason, in which Curran was engaged for the defence. In most of these trials there were convictions. In all, or almost all, the few topics of defence were necessarily the same. The guilt was undeniable, and all the advocate could do was to see that the forms of law were not violated. A good many of Curran's speeches are preserved. We are more struck by the occasional law arguments in which he addressed the court, which are generally put forward with great simplicity and propriety of language, and which, in some cases, seem to us to have deserved more success than they met. The strong language which Curran was fond of using, and which, in an English court of justice, could scarcely have been uttered, often disguised the real strength of his arguments.

Curran's zeal for his clients in these disastrous times made him an object of suspicion with government. Persons less obnoxious were at the time often thrown into prison, detained there for a long time, and then discharged without trial. From such dangers it is probable that Curran was only saved through the friendship of Wolfe (afterwards Lord Kilwarden), during part of the period attorney-general, and then chief-justice. Wolfe, who saw the madness of the people, whose official position perhaps gave him information of dangers unsuspected by Curran, entreated him in the year 1794 or 1795 to separate himself from a hopeless cause and a desperate party—"My office," he added "will be soon vacant for you, and then the way will be clear." Curran told him he knew the men with whom he acted; that they were not a desperate party, and that his fortunes were linked with theirs. This is his son's narrative, who, however, could not have heard what he states from either of the parties, and does not give any authority.

Curran did not sit in parliament after 1797. When the union was carried, he seemed to feel it as a private grief. He spoke of leaving the country—of going to America—of practising at the English bar. It was impossible for a man of Curran's age to break the ties that continued to bind him to what he now called "the dead soil." In 1802 he visited France, and disliked everything he saw. In 1803 Emmett's mad insurrection took place. Emmett had been attached, if not engaged, to a daughter of Curran. Letters of his led to suspicion and to the search of Curran's house, and to his being summoned before the privy council. He regarded this as an insult, and ascribed it, no doubt unjustly, to the enmity of Lord Clare. In 1806, Fox being prime minister, he was made master of the rolls. The office of the master of the rolls did not then incapacitate the person holding it from sitting in parliament, and Curran in 1812 was an unsuccessful candidate for the representation of Newry. In 1814 he retired from the bench in broken health and spirits. In 1814 he visited Paris; in 1815 he resided in the neighbourhood of London, between Brompton and Chelsea. Moore at the time lived not far from him. Curran's health now gradually declined. There was more than one paralytic attack. He lived in great seclusion. He had parted with his carriage; a single man-servant attended him. His apartments were small and unexpensive. A few friends now and then dined with him. In

the spring of 1817 he felt his death approaching, and with gloomy resignation would frequently say, "I wish all was over." He died in London in the following October. A public funeral was suggested; but the thought was soon relinquished, and the body was interred in one of the vaults of Paddington church, a few friends attending. Twenty-three years afterwards his remains were removed to Glasnevin cemetery in the neighbourhood of Dublin. Curran, towards the close of his life, often spoke of writing the history of his times, and he also meditated a novel. He used to repeat a few sentences as if from each, but we believe nothing was actually committed to paper.

Curran amused himself with writing verses and with music. He is said to have played well on the violin and violoncello, and while so engaged to have meditated the brilliant passages of his speeches. He denied the possibility of anything worth hearing ever being produced without study. All his own striking passages—his "white horses," as he called them—were prepared. He was fond of the society of young men, with whom he conversed with entire unreserve. When master of the rolls he would stroll into the hall of the four courts, try to meet a few acquaintances, and arrange a small dinner-party for the day. These parties are still remembered with delight by the few survivors.

It is probable that the highest praise to be found of Curran is in a letter from Byron to Moore—"I never met his equal. . . . His imagination is beyond human. . . . He has fifty faces and fifty voices when he mimics." Curran sat for Charles Matthews. As Matthews entered the room, Curran said you are a first-rate artist, and, since you are to do my picture, allow me to give you a sitting; and in his latter and feeble days, addressed him with—"Dont speak to me, you are the only Curran now." Curran's speeches are described as inaccurately reported. No doubt many of them are; but the principal passages—those which are most often referred to for praise or blame—are faithfully given. Mr. Phillips, in his life of Curran, tells us that "it is a mistake to suppose that he either trusted to the impulse of the moment, or was careless as to the graces of composition. A word cannot be displaced in any of his principal passages—such as the description of an informer, or that on universal emancipation—without destroying the euphony of the whole." He also says, that "the speeches on Rowan's and Finnarty's trials, and in the case of Massey and Headfort, and the argument in the cases of Judge Jolmson and the corporation of Dublin were corrected by himself." We should have inferred this from an examination of the speeches. The lives of Curran by his son, by Mr. Phillips, and that by Mr. Davis prefixed to the best edition of his speeches, are each in their way works of great interest. Each contains a good deal not found in the others; but everything we have heard of him confirms the estimate of Byron, who met him in 1813:—"Curran—Curran's the man who struck me the most. Such imagination! there never was anything like it I ever saw or heard of. I have heard that man speak more poetry than I have ever seen written, though I saw him but seldom; and occasionally I saw him presented to madame de Stael at Mackintosh's. It was the grand confluence of the Rhone and the Saone; and they were both so d—d ugly, that I could not help wondering how the best intellects of France and Ireland could have taken up respectively such residences."

Before concluding we must refer to Dr. Croly's character of Curran, written with very great power and consummate beauty of style. Croly had heard Curran in some of his greatest displays. The essay to which we refer was originally printed in one of the London journals a few days after Curran's death. It is fortunately preserved in the appendix to Curran's life by his son.—J. A., D.

CURRIE, JAMES, M.D., was born on the 31st of May, 1756, at Kirkpatrick-Fleming in Dumfriesshire, of which parish his father was the clergyman. Being originally intended for a mercantile life, as soon as he had received the rudiments of a general education he went to Virginia, but upon the breaking out of the American war in 1776, he returned home, and soon after commenced the study of medicine in the university of Edinburgh. He took his degree of doctor of medicine at Glasgow in 1780, and immediately proceeded to London. His intention was to go out to Jamaica, but a sudden attack of illness preventing this, he commenced practice in Liverpool in 1781. Here he soon met with great success in his profession. In 1785 he wrote a biographical memoir of a deceased friend, which appeared in the Transactions of the Manchester Philosophical Society. This was his first literary attempt. He contributed a paper on tetanus

and convulsive disorders to the Memoirs of the London Medical Society in 1790. In 1792 he was elected a fellow of the Royal Society. In 1797 he published the work on which his professional reputation chiefly rests, entitled "Medical Reports on the Effects of Water, Cold and Warm, as a remedy in Febrile Diseases." The name of Dr. Currie is best known to general readers by his edition of the works of Robert Burns, including his poems and letters, with a criticism, by himself, on the writings of Burns. This was edited by Dr. Currie for the benefit of the poet's family. In 1804 Dr. Currie felt his health giving way, and abandoning practice, he spent some time at Bath and Clifton. The following year, considering himself better, he took a house at Bath and recommenced practice; however, he soon failed again in health, and died on the 31st August, 1805, at Sidmouth.—E. L.

**CURTIUS, METTUS**, a Sabine of the time of Romulus, from whom, according to one tradition, the name of the Lacus Curtius in Rome was derived. After the rape of the Sabine women, when the two armies were opposed, two champions stood forth between them—Mettus Curtius for the Sabines, and Hostus Hostilius for the Romans—the former was victorious, but was immediately after attacked by the Romans. He fled, and in despair leaped into the marsh, the site of which ever after received his name. The other tradition traces the name to Marcus Curtius, who, it is said, in 362 B.C., leaped into a chasm which opened in the forum, and which the oracle declared could only be closed by throwing into it that on which Rome's greatness was based.—J. B.

**CUSA, CUSS, or CUSEL NICOLAS, DE**, a celebrated German cardinal, was born in 1401, and died in 1464. His real name was Chryfftz or Krebs. Cusa, who was born of poor parents, studied law, and afterwards entered the church. His influence in the great ecclesiastical assemblies which were common in those days, dates from the council of Basle, during the sitting of which, he wrote his "Catholic Concordance." He advocated reform in the church, but after the rupture between Eugene IV. and the council of Basle, his love of peace moderated the expression of his sentiments. Cusa was an humble holy man, versed in the learning and philosophy of his time, and eminent also as a writer. He was attached to the mystics, although he did not admit their doctrine of immediate intuition.—R. M., A.

\* **CUSACK, JAMES WILLIAM, M.D.**, a lineal descendant of Sir Thomas Cusack, the celebrated lord-chancellor and speaker of the Irish commons in the reign of Edward VI., was educated in Trinity college, Dublin, where he obtained a scholarship, and subsequently a classical gold medal. On receiving his testimonial-letters from the Royal College of Surgeons in 1812, he became resident-surgeon to Steeven's hospital, and was appointed surgeon to Swift's asylum for lunatics. With the former of these institutions he was connected, as resident or as visiting surgeon, during the lengthened period of forty-five years. From the time of his appointment his fame as an operating surgeon rapidly rose; and his practice soon became extensive. Mr. Cusack was one of the original projectors of the Park Street school of medicine, where he lectured for many years. On the death of the late Sir Philip Crampton, Bart., he was appointed surgeon-in-ordinary to the queen in Ireland; he is also university professor of surgery in Trinity college, Dublin, and was, in 1858, for the third time appointed president of the Royal College of Surgeons in Ireland. Mr. Cusack's contributions to medical literature are very numerous, consisting of valuable essays on practical subjects to be found in the medical periodicals of the day.—W. D. M.

**CUSACK, SIR THOMAS**, knight, lord-chancellor of Ireland, was one of the most eminent men in that country, from a period extending from 1530 to his death. Having adopted the study of the law, he rapidly rose to eminence, and filled in succession the highest offices therein and in the state. He became justice of the common pleas, chancellor of the exchequer for life, by patent dated 13th March, 1535, master of the rolls in 1542, keeper of the great seal in 1546, lord-chancellor in 1550, and was three times lord-justice of Ireland, and president of the council of English; he was in great favour with the English government, and was rewarded by several grants of priories and monasteries by Henry VIII.; he was styled by the English as "Honest Sir Thomas Cusack." Many letters are still preserved of his in the state paper office and British museum. He died 1st April, 1571, and was buried with his second wife before the high altar of Trevet church, where his tomb still exists.—J. F. W.

**CUTTS, LORD JOHN**, an English officer, died in 1707. He served under Monmouth and the duke of Lorraine, and distinguished himself greatly in the wars of William III. It was he to whom Steele, who was indebted to him for his captain's commission, dedicated his first work, entitled "The Christian Hero." He was created a baron of the kingdom of Ireland, with the title of Baron Cutts of Gowran.—R. M., A.

**CUVIER, GEORGES-CHRETIEN-LEOPOLD-DAGOBERT**, Baron, the most distinguished naturalist of his age, and eminent as a writer and statesman. He was born at Montbéliard, now in the department of Doubs, in France, but at the time of his birth the chief town of a principality dependent on the duke of Wurtemberg. His family appear to have originally come from a village in the Jura of the name of Cuvier. His father, who married late in life, was a half-pay officer of a Swiss regiment in the service of France. His mother was young and accomplished, and paid great attention to the early education of her son. He was born on the 23rd of August, 1769. His parents were protestants, and throughout life Cuvier was distinguished for his attachment to the protestant religion. When at school he was distinguished for his great memory, and the avidity with which he studied Greek, Latin, and French. He also acquired great skill in drawing. In 1784 he obtained a presentation to the Carolinian academy at Stuttgart, which had been founded by the duke of Wurtemberg for the training of young men for public and diplomatic offices. The studies in this institution were divided into five classes, and Cuvier distinguished himself most in the department devoted to the study of the principles and science of government. In his subsequent career he expressed himself strongly in favour of such a branch of study for young men. He also cultivated with great zeal the various branches of natural history, and became the favourite pupil of M. Abel, the professor in that department. Whilst in the academy he obtained prizes in every department of study, and at the end of his course was one out of five or six who were presented with a medal for their general proficiency. In this academy he was the fellow-student of Schiller, the great German dramatist, and of Soemmering, the anatomist. Although thus distinguished, he did not remain at Stuttgart long enough to obtain any public employment, and perhaps to this circumstance we may trace his distinguished career as a naturalist. At the age of nineteen he accepted the post of tutor to the only son of Count d'Henrich in Normandy. The residence of the count was near the sea, a situation well adapted to foster the love of the study of natural objects that he had acquired under the guidance of Professor Abel. The turmoil of the great Revolution, which was so soon to place him beside its hero, did not reach him in his quiet residence, and he was enabled to lay the foundations of his great natural history knowledge in seclusion and peace. But even here an event occurred which quickly brought him to the sphere of his future activity. The Abbe Tessier, known for his articles on agriculture in the Encyclopedie Methodique, was obliged to fly Paris, and, under the garb of a surgeon, sought refuge in Valmont, a small town near the residence of the count. Here a society was formed for the promotion of agriculture, and at one of its early meetings young Cuvier detected, in the surgeon of Valmont, the writer of the articles in the Encyclopedie. This incident led to a friendship between the two, which eventually resulted in the invitation of Cuvier to Paris. Whilst in Normandy, Cuvier worked with so much diligence at the anatomy and forms of the lower animals, that after Tessier's introduction he became a constant correspondent of Lacepede, Olivier, Geoffroy, and other eminent men in Paris. It was here that he pursued those researches which enabled him to reorganize the whole of the invertebrate division of animals, which had been included by Linnæus in his class *Vermes*. Here he also diligently dissected the mollusca, which subsequently enabled him to follow with so much success the classification of the mollusca, pointed out by Adanson, and founded rather upon the structure of the animal than of its shell.

In 1795, through the exertions of Tessier, he was invited to Paris as a member of the new commission of arts. He was also appointed assistant to Mertrud in the superintendence of the Jardin des Plantes, and professor of natural history to the central school of the museum. In these positions he commenced that career by which he acquired the reputation of being the greatest teacher of his day, and the museum of the Jardin des Plantes became the most famous collection of com-

parative anatomy in Europe. He now began to publish various papers, more especially on the structure of the lower animals, and in 1798 produced his work entitled "Tableau Elementaire de l'Histoire Naturelle des Animaux." In the same year he commenced the publication of his researches on fossil bones, by the publication of a paper on the "Bones Found in the Gypsum Quarries of Montmartre." In his earlier papers he had devoted considerable attention to the comparison of fossil and recent species of animals, and in the bones of Montmartre he found a rich depository for the exercise of his skill, in comparing recent with extinct species. He early seized the idea that each group of animals was formed on a plan, and that the whole structure of each species was adapted to its living requirements. He was thus enabled by small fragments of bone, to reconstruct the whole fabric of an animal, and thus to give a living picture of the creatures that inhabited the earth in past times. It was by these researches that he was enabled subsequently to give to the world his great work on the "Fossil Bones of Quadrupeds," in which numerous forms of animal life were presented which had long since been destroyed by the revolutions of the globe.

In 1796 the National Institute of France was formed, and Cuvier was made a member, and in 1798 he was made secretary. On the death of Daubenton in 1800, he was named his successor as professor of the philosophy of natural history in the college of France. He still, however, held his position of professor in the Jardin des Plantes. His lectures had been so successful here, that they were published by his pupils M.M. Dumeril and Duvernoy, in five volumes. The first appeared in 1800, and the fifth in 1805. They have since been republished, and in 1839 in ten volumes. They contain a vast mass of interesting matter on the subject of zoology and comparative anatomy, and are written as they were delivered, in an eloquent and attractive style. Cuvier lectured from copious notes, and was remarkable for his accurate and fluent style, and the interest which he threw into the subject of his discourses. But a new sphere of activity awaited him. The first consul was not long in detecting the administrative ability of the eloquent teacher of natural history. In 1802 Cuvier was appointed one of six inspectors, to establish lyceums or public schools in the principal towns of France. He established those of Marseilles, Nice, and Bordeaux. During his absence on this duty, the National Institute was remodelled, and Cuvier was appointed secretary to the section of natural sciences, with a salary of six thousand francs a year.

In 1803 he married the widow of M. Duvancel, a former fermier-general. By this marriage he had four children, none of whom survived their father. He was an attached husband and father, and few men of his eminence have been more remarkable for the regularity and simplicity of their social life. One of his children, a daughter, lived to be old enough to be betrothed, but died within a few days of her appointed marriage. She was eminent for the beauty and piety of her character; and the affections of the great philosopher were so bound up with this amiable child, that it is said her death hastened his own end.

Nothing gave a greater brilliancy to the conquests of Napoleon and the position he had thereby attained, than his appreciation of the importance of scientific pursuits. With a much sounder estimate of the value of natural science as a branch of education, than was exhibited by the other governments of Europe, he everywhere introduced into his new colleges the study of the natural history sciences, and in Cuvier he found a man profoundly convinced of the importance of these studies to the advancement of mankind. Discoverer as he was, he did not pursue science for his own self-elevation, but was supported in his labours by the thought that he was contributing to the working out of the great designs of Providence, and the welfare of the human family. One of the most brilliant productions of his pen was a report called for by Napoleon on the history of the progress of science since the year 1789. This luminous composition was presented to Napoleon in the council of state. In this remarkable treatise, which was published in Paris in five volumes in 1829, he endeavoured to show the connection between the advancement of knowledge and human happiness. He maintained that the object of science was "to lead the mind of man towards its noble destination—a knowledge of truth; to spread sound and healthy ideas amongst the working classes of the community; to draw human beings from the empire of prejudice and passion; to make reason the arbitrator and supreme guide of public opinion." From this passage it will be seen

that Cuvier's pursuit of science was founded on no mere self-glorification, but that his heart was as large as his mind was great, and that he considered the highest destination of the achievements of his genius to be the advancement of his race.

In 1809, 1810, and 1811 we find Cuvier still employed by the imperial government in reorganizing the educational institutions of the continent of Europe. The sword of the conqueror everywhere made way for the minister of education. In 1810 he organized the universities of Piedmont, Genoa, and Tuscany. In 1811 he was in Holland and the Hanseatic towns. His labours extended not alone to the higher classes in the universities, but to schools for the mass of the people. He held that instruction led to civilization, and civilization to morality; that unless the education of the working classes was sound and extensive, they could not appreciate the value of knowledge in them who governed them and exercised professions, and who had received their special education in the universities. Those only who are intimately acquainted with the continent of Europe, can fully appreciate the benefits conferred by the intelligent labours of this great man.

Successful as he had been in the other parts of Europe, he had a more delicate mission to perform when sent by the emperor to Rome to organize the university there. But such was his good sense and benignity of manner, that protestant as he was, he found no difficulty in acquitting himself of his arduous task, in a manner that gained for him the esteem and approbation of all with whom he came in contact in the capital of the Roman catholic world. On his return Napoleon appointed him master of requests in the council of state, and in 1814, just before his abdication, he named him councillor of state, an appointment which was confirmed by Louis XVIII. He was shortly after appointed chancellor of the university by the same monarch, a post which he held till his death. In 1818 he was elected a member of the French Academy, and in 1819 he was appointed president of the committee of the interior in the council of state. In the same year Louis XVIII. created him a baron. In 1822 he became grand-master of the Faculties of Protestant Theology in the university of Paris. Under his mastership fifty new protestant chairs were established in France. Numerous professorships of natural history in the minor schools of France were established under his direction. He became also at this period a vice-president of the French Bible Society. In 1826 Charles X. bestowed upon him the decoration of grand officer of the legion of honour, and his former sovereign, the king of Wurtemberg, made him a commander of the order of the crown. In 1827 he lost his daughter and only remaining child. In 1830 he commenced a new course of lectures in the college of France on the progress of science in all ages. In 1832 Louis Philippe made him a peer of France. On the 8th of May of that year he opened the third part of his course with an introductory lecture. After an unusually eloquent lecture, describing the objects of the course, he concluded:—"These will be the objects of our future investigations, if time, health, and strength shall be given me to continue and finish them with you." But the health failed, the strength went, and the time was shortened; for the next day he was seized with a fit of paralysis, and he expired on the 13th of May, in the sixty-third year of his age. He was taken in the midst of his days to his everlasting rest. But his works remain the imperishable monument of his genius. These will be the possession of humanity, when the Revolution in which he lived shall have sunk to the insignificance of a passing event in the history of a nation, and the names of its heroes shall be forgotten.

During his lifetime Cuvier twice visited England—once in 1819; and during his absence he was elected a member of the French Academy. He was here again in 1830, and this time an important event took place; for the revolution of July occurred, and the baron came the servant of one monarch, and returned the servant of another.

In this short sketch of his life, it is impossible to speak in detail of the writings of Cuvier. We have spoken of some of his papers, of his lectures, his reports, and his great work on fossil bones; but these give but a very imperfect idea of his labours. The list of his papers and works, as given in Agassiz's *Bibliographia Geologiæ et Zoologiæ*, published by the Ray Society, amount to two hundred and seven, and this is probably far below the mark. It is not necessary to refer to his papers here, remarkable as many of them are; but this notice would

Approved by the Committee from an original drawing by the artist at Paris, 1804.

1804

be incomplete did we not refer to three other of his works. We have before spoken of his "Ossemens Fossiles;" in 1825 he republished the introductory essay to this work, under the title "Discours sur les Revolutions de la surface du Globe." This work has been translated into most of the languages of Europe, and into our own by the late Professor Jamieson of Edinburgh, under the title of "Theory of the Earth." In this work we have the grand outline given of a history of the earth, and with few modifications, it is that which is held by the most distinguished geologists of the present day. To Cuvier is due the credit of having brought together the scattered facts of mineralogy, chemistry, botany, and zoology, in such a manner as to make them tell the history of the world.

Another great work was his "Regne Animal." Wherever the gross ignorance of a false education has not excluded the study of natural science this work is known. It was originally published in Paris in 1817 in four volumes. Several editions have since appeared. It has been translated twice into the English language, and into almost every other European language. It contained a resumé of all that was known on the structure and habits of the animal kingdom, and has in no way been superseded, in a zoological point of view, by any other work. In this work Cuvier was assisted, in the department of insects, by Latreille. In the department of ichthyology he obtained the services of Valenciennes. This part of zoology being in an unsatisfactory state led Cuvier, in conjunction with Valenciennes, to make further researches, the results of which have been published in the "Natural History of Fishes," a work that was commenced in 1828, and has been completed since the death of Cuvier.

In concluding this notice of his literary introductions we ought not to forget his "Eloges." It is the practice of the academy in France to devolve on some one of its members the duty of pronouncing an eloge on the death of any distinguished man. This duty often fell to the lot of Cuvier, and the eloges thus pronounced have been some of the most remarkable produced before this learned assemblage. The dead thus honoured were very numerous, but amongst them we may mention—Bruguière, Daubenton, Le Mourrier, Priestley, Adanson, Lamphere, Bonnet, Fourcroy, Pallas, Rumford, Werner, Sir Joseph Banks, Delambre, Berthollet, Lacedpede, Fabbrioni, Ramond, Sir Humphry Davy. These eloges have been published separately in three volumes. A correct view of the lives of these great men can hardly be said to be obtained without the eloges of Cuvier.—E. L.

CUYP. See KUYP.

CYPRIANUS, THASCIUS CÆCILIVS, a distinguished bishop of north Africa, born at the commencement of the third century, probably at Carthage. Belonging to a distinguished family, he obtained an education fitted to foster a nobility of spirit and understanding. His father was a heathen; and he himself became a teacher of rhetoric in his native city. By the exhortations of a christian presbyter, Cæcilivus, he was led to embrace the christian faith, and received the rite of baptism, after he had been thoroughly instructed in the new religion, in 246. He now devoted himself wholly to the study of the scriptures and church doctrines, denied himself every kind of luxury or superfluity, sold his two estates, and distributed their proceeds among the poor. Soon after his baptism he was chosen presbyter in 247; though this was contrary to the letter of the church laws. Next year, 248, the voice of the people and the majority of the clergy called him to the bishopric of Carthage. His elevation, although heartily concurred in by the people, offended some of the older presbyters, who commenced a systematic opposition to his efforts for the good of the church. His severe and rigorous character as a disciplinarian brought him into collision also with the corrupt clergy of his diocese. When the persecution of Decius broke out in 250, Cyprian was immediately selected as a victim; the cry of the multitude was, "Cyprianum ad leonem." By a timely flight from the city he escaped the rage of his adversaries. During the period of his exile he did not neglect the church, but kept up an active correspondence with many of its members. After Easter he returned to Carthage in 251. The reputation and authority of Cyprian rose very high after a pestilence which visited with fearful ravages the kingdom in general and Carthage in particular; during which he showed great kindness to the sick, and freely administered both assistance and consolation. During this dreadful time he also wrote his

celebrated epistle to Demetrianus. Cyprian soon after became involved in a controversy with Stephen, bishop of Rome, respecting the baptism of heretics, in 253. When Stephen refused to receive the African legates sent to Rome, Cyprian appealed to the Asiatic bishops, in whose name Firmilian, bishop of Casarea in Cappadocia, wrote a very strong letter to Stephen, condemning his uncharitable and arrogant pretensions. The African bishops, also, in a synod held at Carthage, unanimously protested against Rome. While these things were taking place, Valerian began to persecute the christians. Cyprian was pledged to die a martyr's death, because he had previously written a treatise "De Exhortatione Martyrii," exhorting the christians to steadfastness under the persecution of Gallus. On the 30th August, 257, he was summoned before the proconsul Aspasius Paternus, and commanded to sacrifice to the gods. Refusing to do so, he was banished to Curubis, a day's journey from Carthage. From this quiet residence he was recalled by Valerius Maximus, the successor of Paternus, before whom he had his final hearing on the 14th of September, 258, and calmly received the sentence of death, with the words—"God be thanked." Led forth to an open square without the city, his head was severed from his body by the sword. His life was written by Pontius, the African presbyter, who continued his steady friend under all circumstances. His works consist of eighty-one letters and thirteen treatises, which most reckon genuine. The best editions are those of Fell, bishop of Oxford, 1682, folio, containing Pearson's *Annales Cyprianici*, reprinted at Amsterdam, 1700, with the addition of Dodwell's *Dissertationes Cyprianicæ*; and of Baluze, completed by Maran, 1726, folio, Paris.—S. D.

CYRIL, CONSTANTINE, and METHODIVS, the apostles of the Slavonians, were natives of Thessalonica, born in the first half of the ninth century. At an early age the former, whose name was Constantine, exhibited superior talents, and was taken to Constantinople, where he acquired distinction, procured the friendship of Photius, and taught philosophy; on which account perhaps he was surnamed *THE PHILOSOPHER*. But his piety turned him in another direction; he entered into the clerical office, took up his abode in a monastery, and lived in seclusion along with his brother Methodius. In the year 860, an embassy was sent to the Greek Emperor Michael III., requesting him to send learned missionaries of the Greek church, able to dispute with Jews and Moslems, to the Chazars, a Tartar race, inhabiting the country from the north-east of the Black Sea to the lower Volga. Michael sent them Constantine. A great number embraced the new religion; though there never seems to have been an organization of the Greek church among them. Constantine afterwards laboured among the Slavic Bulgarians and southern Slavi. He translated the holy scriptures and the most important liturgical books into the Slavic. Both Constantine and Methodius, in 863, repaired to the court of Radislav, the founder of a Moravian kingdom, where they were received with every mark of respect, and liberally encouraged in their missionary work. The brothers set out for Italy in 868, and were honourably treated by Pope Hadrian II. Hadrian undertook to organize the new ecclesiastical province, and proposed to consecrate the two apostles bishops of the Slaves. The elder brother, however, worn out by his arduous labours, died shortly after in February, 869. Methodius having been consecrated archbishop of the Pannonian diocese, returned to his labours. His subsequent history is only a dreary record of opposition and disappointment, incurred through the aversion of the Germanic bishops to the establishment of an independent Moravian hierarchy. Methodius, according to the Pannonian legend, died in 885. It is now difficult, if not altogether impossible, to separate the legendary and fictitious from the true, in the lives of these Slavic missionaries.—S. D.

CYRILL OF ALEXANDRIA was born at Alexandria at the end of the fourth century. After living for some time as a monk in the Nitrian desert, he succeeded his uncle Theophilus in the episcopal chair of Alexandria in 412. Immediately upon his elevation, he shut up the churches of the Novatians, took away all the sacred vessels belonging to them, and deprived their bishop of his goods. He also banished all the Jews from Alexandria, pulled down their synagogue, and plundered it. He quarrelled with Orestes, governor of Egypt, and occasioned various insurrections in Alexandria. If he did not instigate the murder of Hypatia, the celebrated female philosopher, he had some

participation in that shameful crime. He attacked Nestorius, patriarch of Constantinople, as a heretic, and continued to persecute that eminent prelate with great rancour till his death. He drew up two works to prove his accusations against Nestorius, and sent an account of them to Celestine, bishop of Rome. Cyrill and Nestorius attended a general council at Ephesus in 431, at which their disputes were to be settled. Cyrill opened the synod with about two hundred bishops; though the imperial commissioners and Nestorius requested that the proceedings might be delayed till the arrival of John, bishop of Antioch, and the other Syrian bishops. Nestorius, who would not be present till all the bishops had arrived, was condemned as a heretic. A few days after, John of Antioch, accompanied by about thirty bishops, arrived at Ephesus; and justly thinking the council to have been an illegal one, proceeded to hold another. John presided, and sentence of deposition was passed upon Cyrill. The court of Constantinople, however, were at length gained over to the Cyrillian party; Nestorius was obliged to leave the city and go into a cloister at Antioch, while the sentence of deposition was taken off Cyrill. He enjoyed repose for four years, till his enemies, unceasing in their persecution, had him sent into exile in 435. The deposition of Nestorius caused a breach between the Eastern and Western churches, which was not completely repaired when Cyrill died in 444. His life has been written by Renaudot, Cave, Oudin, Schrœckh, Rössler, and others. The best edition of his works is that of Aubert, Paris, 1638, in seven vols. folio.—S. D.

CYRILLUS, CYRILL OF JERUSALEM, is supposed to have been born at Jerusalem about the year 315. He was ordained deacon by Macarius, about 335, and presbyter by Maximus, on whose death he was elevated to the episcopal chair in 351, in the reign of Constantius. The Arian controversy was then agitating the church; and Cyrillus having been repeatedly cited as a heretic before the ecclesiastical courts, without answering the citations, was deposed. On an appeal to a larger synodical assembly, however, held at Seleucia, he was restored to his bishopric. The vicissitudes of the bishop's existence did not terminate with this event. He was twice afterwards deposed, and twice restored. Cyrill was present at the council of Constantinople held in the year 381; and he may have attended that of 383. At the former council he finally separated from the Eusebian party, to which he had all along adhered, and adopted fully the Nicene doctrine. His death took place in March, 386. His extant works consist of twenty-three catechetical pieces (*κατηχήσεις*)—discourses preached in the church of the resurrection at Jerusalem.—S. D.

CYRNEUS, PIETRO, a Corsican historian, born at Algeria in Corsica, in 1474. According to Muratori, who has preserved his principal work, "De Rebus Corsicis libri IV.," in the *De Antiquitatibus Italiae*, Cyrneus was poor, and obliged to support himself by such humble labours as those of a teacher and corrector of the press. His annals of Corsica bring down the history of the island to the year 1506.—A. C. M.

CYRUS, surnamed THE GREAT, was the son of Cambyses, prince of Persia, and Mandane, daughter of Astyages, king of Media. The accounts of his early life, as given by the Greek historians, are of the most various and contradictory character. According to Herodotus, Astyages determined, in consequence of a dream which foreshadowed the future greatness of Cyrus, and his establishment on the throne of Media by the expulsion of his grandfather, to have him destroyed in infancy; but the child was saved by the wife of a shepherd, in whose family he lived till accident discovered him to Astyages, and brought about his restoration to his parents. The Persians were at this time a rude and warlike people, inhabiting a rugged and mountainous country. In this respect they presented a striking contrast to their neighbours the Medes, who, long accustomed to habits of

luxury, had grown feeble and effeminate in the extreme. Cyrus, to revenge himself on Astyages for the wrongs he had suffered in childhood, encouraged his countrymen to take arms against the Medes; and, assuming the command of the army, overran all Media, possessed himself of his grandfather's throne, and established the empire of the Persians over the whole of Upper Asia, about 559 B.C. His increasing power rendered him an object of jealousy to all the neighbouring sovereigns. The first of these who declared open war against him was Crœsus, king of Lydia, who took the field with a large army, but was defeated in battle, and ultimately compelled to become subject to the Persians by the capture of Sardis, 546 B.C. The two great kingdoms of Media and Lydia were now in the hands of the victor; and after sending part of his army, under a lieutenant, to subdue the Greek colonies on the coast, and the other parts of Asia Minor, he resolved to command in person an expedition against Babylon. He obtained possession of that city in 538 B.C., by the stratagem of diverting the course of the river Euphrates, and causing his troops to march into it along the channel of the river. He continued to reside at Babylon, extending his conquests in every direction, till his empire reached from the Mediterranean sea on the west to the Indus on the east, and from the Caspian sea to the Indian ocean. He was killed, according to the most credible accounts, in an engagement with a Scythian tribe in 529 B.C.—W. M.

CYRUS, called THE YOUNGER, to distinguish him from Cyrus the Great, was the son of Darius Nothus and Parysatis. He was sent by his father, at the early age of sixteen, to the Peloponnesian war, invested with several satrapies, and with the military command of all the forces assembled at Castolus. On his father's death in 404 B.C., he was charged with designs against the life of his brother Artaxerxes, who had succeeded to the throne, and would have been put to death, but for the intercession of their mother. Inflamed with revenge, he conspired to dethrone his brother, and took the field against him with an army of thirteen thousand Greeks, and one hundred thousand barbarians. The destination and object of the expedition were known only to himself and his general, Clearchus, and were disguised under manifold pretexts, till at length it reached Babylonia. Artaxerxes met him with nine hundred thousand men near Cunaxa; a protracted and bloody battle ensued; the troops of Cyrus were victorious, but he himself fell the victim of his own rashness; and the Greeks retraced their steps homeward, a journey of upwards of six hundred leagues, surrounded on every side by a powerful enemy. This was the famous retreat of the ten thousand, recorded by Xenophon in his *Anabasis*.—W. M.

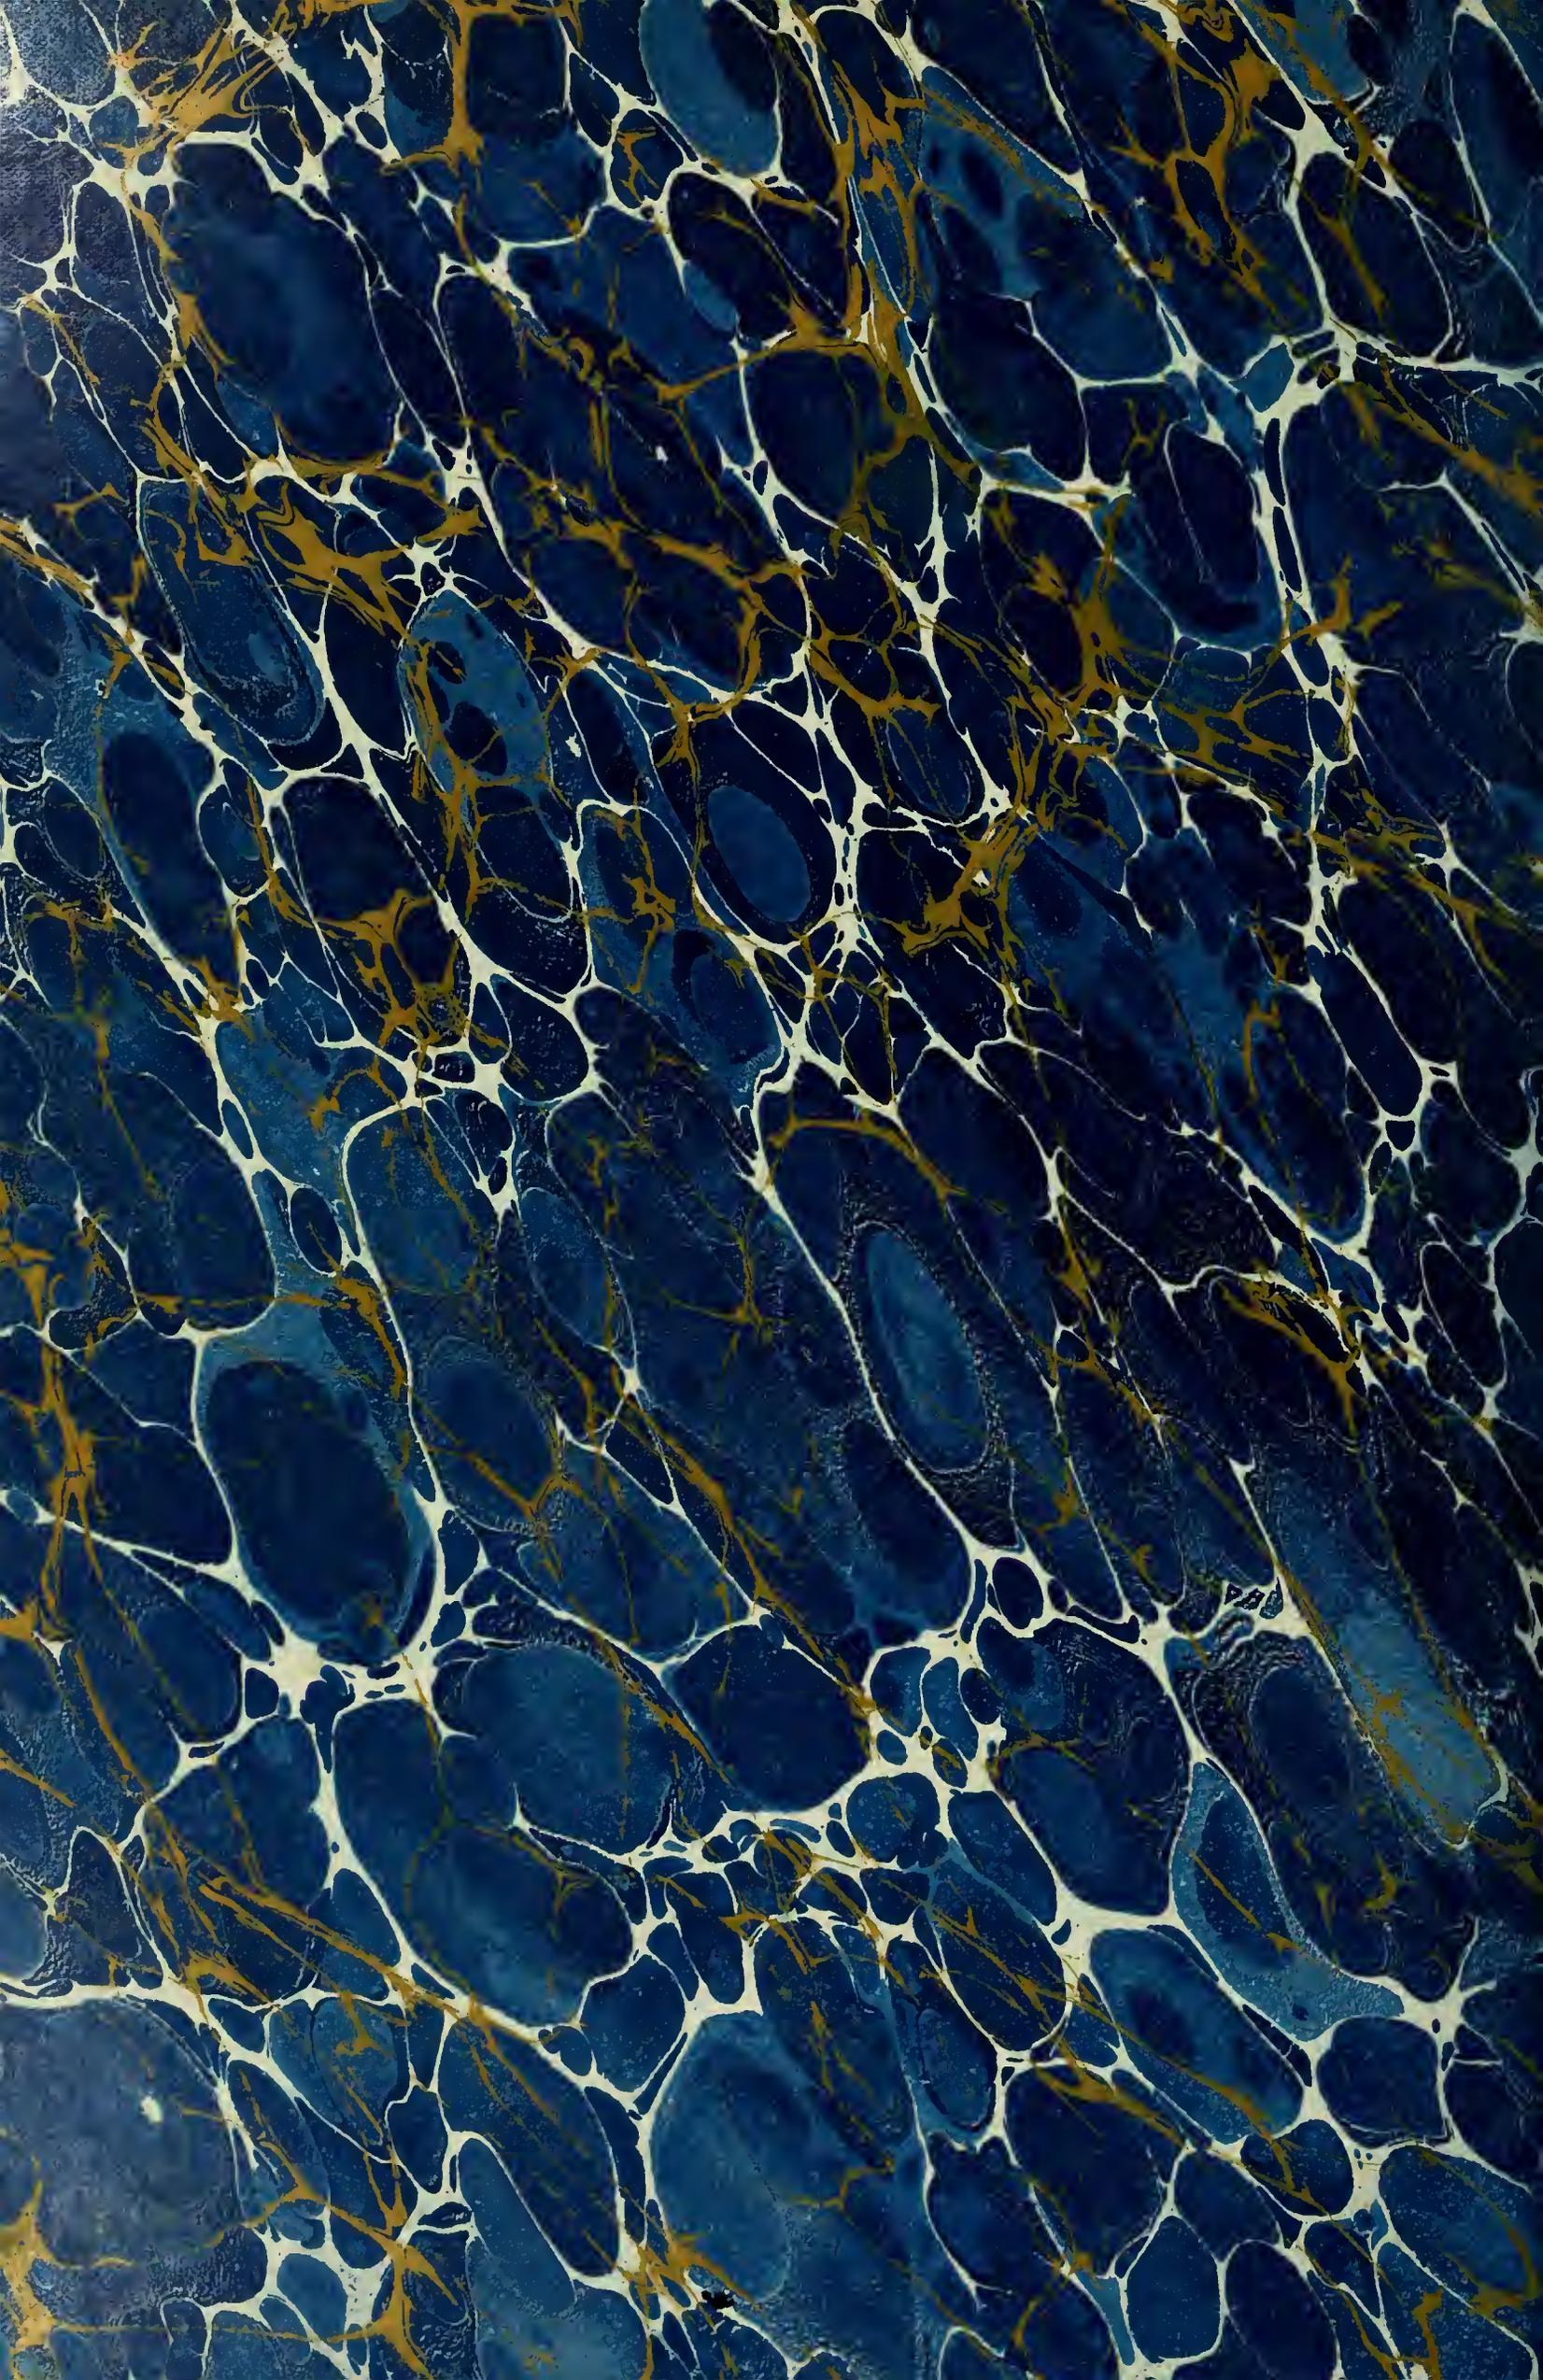

\* CZUCZOR, GREGORY, a Hungarian poet and philologist, born in 1800 at Andód in the county Nyitra in Hungary, became in 1824 a benedictine monk, and soon after a professor in the college of Raab. His epic verses made him a great name in Hungary, and his beautiful lyrics and love songs became still more popular. After having published a masterly translation of Cornelius Nepos and a "Life of Washington," the Hungarian Academy intrusted him with the redaction of the great Hungarian dictionary, which from that time remained the chief object of his life. His studies were, however, sadly interrupted in 1849, since, on account of a patriotic song written in 1848, he was arrested by the Austrians, and sentenced by Prince Windischgrätz to eight years of prison in fetters. By the intervention of Count Joseph Teleki he was relieved of the manacles, and allowed to continue his lexicographical researches in jail. Liberated by the Hungarian victories in May, 1849, he gave himself up to the Austrians in August, and was sent by them to the prisons of the fortress Kufstein in Tyrol, where he translated Tacitus. In 1850 Czuczor obtained his release, and is again fully occupied with the Hungarian dictionary.
